These glorious victories really laid the foundation of Swiss nationality; but soon after them the long-standing jealousy between the civic and rural elements in the Confederation nearly broke it up. This had always hindered common action save in the case of certain pressing questions. In 1370, by the "Tarsons' ordinance" (Pfaffenberg), agreed on by all the Confederates except Bern and Glarus, all residents whether clerics or laymen in the Confederation who were bound by oath to the duke of Austria were to swear faith to the Confederation, and this oath was to rank before any other; no appeal was to lie to any court spiritual or lay (except in matrimonial and purely spiritual questions) outside the limits of the Confederation, and many regulations were laid down as to the suppression of private wars and keeping of the peace on the high roads. Further, in 1393, the "Sempach ordinance" was accepted by all the Confederates and Soleure; this was an attempt to bring the two upper Swiss Confederations and the old canton of Zürich into line with the Swiss Confederation, minute regulations being made against plundering—women, monasteries and churches being in particular protected and secured. But save these two documents common action was limited to the meeting of two envoys from each member of the Confederation and one from each of the "socii" in the Diet, the powers of which were greatly limited by the instructions brought by each envoy, thus entailing frequent reference to his government, and included foreign relations, war and peace, and common arrangements as to police, pestilence, customs duties, coinage, &c. The decisions of the majority did not bind the minority save in the case of the affairs of the bailiwicks ruled in common. Thus everything depended on common agreement and good will. But disputes as to the divisions of the lands conquered in the Burgundian War, and the proposal to admit into the League the towns of Fribourg and Soleure, which had rendered such good help in the war, caused the two parties to form separate unions, for by the latter proposal the number of towns would have been made the same as that of the "Länder," which did not at all approve. Suspended a moment by the campaign in the Val Leventina, these quarrels broke out again, in 1478, when Fribourg, whose influence was greatly increased at the Diet of Stans (December 1487), when it seemed probable that the failure of all attempts to come to an understanding would result in the disruption of the League, the mediation of Nicholas von der Flüe (or Bruder Klaus), a holy hermit of Sachseln in Obwalden, though he did not appear at the Diet in person, succeeded in bringing both sides to reason, and the third great ordinance of the League—the "compact of Stans"—was agreed on. By this the promise of mutual aid and assistance was renewed, especially when one member attacked another, and stress was laid on the duty of the several governments to maintain the peace, and not to help the subjects of any other member in case of a rising. The treasure and movable captors in the war were to be equally divided amongst the combatants, but the territories and towns amongst the members of the League. As a practical proof of the reconciliation, on the same day the towns of Fribourg and Soleure were received as full members of the Confederation, united with all the other members, though on less favourable terms than usual, for they were forbidden to make alliances, save with the consent of all or of the greater part of the other members. Both towns had long been allied with Bern, whose influence was greatly increased by their admission. Fribourg, founded in 1178 by Berthold IV. of Züringen, had on the extinction of that great dynasty (1218) passed successively by inheritance to Kyburg (1218), by purchase to Austria (1277), and by commendation to Savoy (1452); when Savoy gave up its claims in 1477 Fribourg once more became a free imperial city. It had become allied with Bern as early as 1243, but in the 14th and 15th centuries became Romance-speaking, though from 1483 onwards German gained in strength and was the official language in 1578. Soleure (or Solothurn) had been associated with Bern from 1252, but was not admitted to the League in 1411. Both the new members had done much for Bern in the Burgundian War, and it was for their good service that she now procured them this splendid reward, in hopes perhaps of aid on other important and critical occasions.

The compact of Stans strengthened the bonds which joined the members of the Confederation; and the same centralizing tendency is well seen in the attempt (1483-1489) of Hans Waldmann, the burgomaster of Zürich, to assert the rule of his city over the neighbouring country districts, to place all power in the hands of the guilds (whereas by Brun's constitution the patricians had an equal share), to suppress all minor jurisdictions, and to raise a uniform tax. But this idea of concentrating all powers in the hands of the government aroused great resistance, and led to his overthrow and execution. Peter Kistler succeeded (1470) better at Bern in a reform on the same lines, but less sweeping.

The early history of each member of the Confederation, and of the Confederation itself, shows that they always professed to belong to the Empire, trying to become immediately dependent on the emperor in order to prevent oppression by middle lords, and to enjoy practical liberty. The Empire itself had now become very much a shadow; titles and honours were gradually asserting their own independence, sometimes breaking away from it altogether. Now, by the time of the Burgundian War, the Confederation stood in a position analogous to that of a powerful free imperial city. As long as the emperor's nominal rights were not enforced, all went well; but, when Maximilian, in his attempt to reorganize the Empire, erected in 1495 at Worms an imperial chamber which had jurisdiction in all disputes between members of the Empire, the Confederates were not bound to obey it—partly because they could maintain peace at home by their own authority, and partly because it interfered with their practical independence. Again, their refusal to join the "Swabian League," formed in 1488 by the lords and cities of South Germany to keep the public peace, gave further offence, as well as their fresh alliances with France. Hence a struggle was inevitable, and the occasion by reason of which it broke out was the seizure by the Tyrolese authorities in 1499 of the Münsterthal, which belonged to the "Gotteshausbund," one of the three leagues which had gradually arisen in Raetia. These were the "Gotteshausbund" in 1367 (taking in all the dependents of the cathedral church at Chur living in the Oberhalbstin and Engadine); the "Oberr" or "Grauer Bund" in 1395 and 1424 (taking in the abbey of Disentis and many counts and lords in the Vorder Rhein valley, though its name is not derived, as often stated, from the "grey coats" of the first members, but from "graven" or "grafein," as so many counts formed part of it); and the "League of the Ten Jurisdictions" (Zehngerichtenbund), which arose in the Iettiengau and Davos valley (1436) on the death of Count Frederick of Taggenburg, but which, owing to certain Austrian claims in it, was not quite so free as its neighbours. The first and third of these became allied in 1450, but the formal union of the three language districts only from 1524. As documentary proof is wanting, the alleged meeting at Vazeral in 1471, though practically before 1524 they had very much in common. In 1497 the Ober Bund, in 1498 the Gotteshausbund, made a treaty of alliance with the Everlasting League or Swiss Confederation, the Ten Jurisdictions being unable to do more than show sympathy, owing to Austrian claims, which were not bought up till 1649 and 1652. Hence this attack on the Münsterthal was an attack on an "associate" member of the Swiss Confederation, Maximilian being supported by the Swabian League; but its real historical importance is the influence it had on the relations of the Swiss
to the Empire. The struggle lasted several months, the chief fight being that in the Calven gorges (above Mals; May 22, 1499), in which Benedict Fontana, a leader of the Gotteshaushund men, performed many heroic deeds before his death. But, both sides having given up the幻想 of Tirol in the latter half of September 1499. By this the matters in dispute were referred to arbitration, and the emperor annulled all the decisions of the imperial chamber against the Confederation; but nothing was laid down as to its future relations with the Empire. No further real attempt, however, was made to enforce the rights of the emperor, and the Confederation became a state allied with the Empire, enjoying practical independence, though not formally freed till 1648. Thus, 208 years after the origin of the Confederation in 1338, it had got rid of all Austrian claims (1304 and 1474), as well as all practical subjection to the emperor. But its further advance towards the position of an independent state was long checked by religious divisions within, and by the enormous influence of the French king on its foreign relations.

With the object of strengthening the northern border of the Confederation, two more full members were admitted in 1501—Basel and Schaffhausen—on the same terms as Fribourg and Soleure. The city of Basel had originally been ruled by its bishop, but early in the 14th century it became a free imperial city; before 1501 it had made no permanent alliance with the Confederation, though it had been in constant relations with it. Schaffhausen, on the other hand, was an imperial city.

The League expanded to Thirteen Members.

Round the three original members had gathered first five others, united with the three, but not necessarily with each other; and then gradually there grew up an outer circle, consisting of five more, allied with all the eight old members, but tied down by certain stringent conditions. Constance, which seemed called by nature to enter the League, kept aloof, owing to a quarrel as to criminal jurisdiction in the Thurgau, pledged to it before the district was conquered by the Confederates.

The system of giving pensions, in order to secure the right of enlisting men within the Confederation, and of capitulations, by which the different members supplied troops, was originated by Louis XI. in 1474, and later followed by many other princes. Though a tribute to Swiss valour and courage, this practice had very evil results, of which the first fruits were seen in the Milanese troubles (1500-1516), of which the following is a summary. Both Charles VIII. (1484) and Louis XII. (1499 for ten years) renewed Louis XI.'s treaty. The French attempted to win Milan as the largest city on the north side of the Alps mercenaries, some of whom were on the opposite side; and, as brotherly feeling was still too strong to make it possible for them to fight against one another, Lodovico Sforza's Swiss troops shamefully betrayed him to the French at Novara (1500). In 1500, too, the three Forest districts occupied Bellinzona with the Val Benio at the request of its inhabitants, and if 1503 Louis XII. was forced to cede it to them. He, however, often held back the pay of his Swiss troops, and treated them as mere hirelings, so that when the ten years' treaty came to an end, Matthew Schinard, bishop of Sitten (or Sion), induced them to join (1510) the pope, Julius II., then engaged in forming the Holy League to expel the French from Italy. But when, after the battle of Ravenna, Louis XII. became all-powerful in Lombardy, 20,000 Swiss poured down into the Milanese and occupied it, Felix Schmid, the burgomaster of Zürich, naming Maximilian (Lodovico's son) duke of Milan, in return for which he ceded to the Confederates Locarno, Val Maggia, Mendrisio and Lugano (1512), while the Raetian Leagues seized Chavenna, Bormio and the Valtellina. (The former districts, with Bellinzona, the Val Benio and the Val Venentia, were in 1863 made given them two-thirds of the "common has, the latter were held by the French till 1797.) In 1513 the Swiss completely defeated the French at Novara, and in 1515 Peace was sent by Henry VIII. of England to give pensions and get soldiers. Francis I. at once on his accession (1515) began to prepare to win back the Milanese, and, successfully evading the Swiss awaiting his descent from the Alps, beat them in a pitched battle at Marignano near Milan (Sept. 13, 1515), which broke the Swiss power in north Italy, so that in 1516 a peace was made with France—the Valais, the Three Raetian Leagues and both the abbot and town of St. Gall being included on the side of the Confederates. Provision was made for the neutrality of either party in case the other became involved in war, and large pensions were promised. This treaty was extended by another in 1521 (to which Zürich, then under Zwingli's influence, would not agree, holding aloof from the French alliance till 1614), by which the French king might, with the consent of the Confederation, enlist any number of men between 6000 and 16,000, paying them fit wages, and the pensions were raised to 3000 francs annually to each member of the Confederation. These two treaties were the starting point for the Swiss leagues and the old city states.

The Reformation.

In 1499 the Swiss had practically renounced their allegiance to the emperor, the temporal chief of the world according to medieval theory; and in the 16th century a great number of them did the same by the world's spiritual chief, the pope. The scene of the revolt was Zürich, and the leader Ulrich Zwingli (who settled in Zürich at the very end of 1518). But we cannot understand Zwingli's career unless we remember that he was almost more a political reformer than a religious one. In his former character his policy was threefold. He bitterly opposed the French alliance and the pension and other favours of St. Gall being included on the side of the Confederates. These were the starting point for the Swiss leagues and the old city states.

The Reformation.

In 1499 the Swiss had practically renounced their allegiance to the emperor, the temporal chief of the world according to medieval theory; and in the 16th century a great number of them did the same by the world's spiritual chief, the pope. The scene of the revolt was Zürich, and the leader Ulrich Zwingli (who settled in Zürich at the very end of 1518). But we cannot understand Zwingli's career unless we remember that he was almost more a political reformer than a religious one. In his former character his policy was threefold. He bitterly opposed the French alliance and the pension and other favours of St. Gall being included on the side of the Confederates. These were the starting point for the Swiss leagues and the old city states.
League. Zürich was greatly moved by this, and, as Zwingli held that for the honour of God war was as necessary as iconoclasm, hostilities seemed imminent; but Bern held back, and the first peace of Kappel was concluded (June 1529), by which the Hungarian alliance was annulled and the principle of “religious parity” (or freedom) was admitted in the case of each member of the League, while in the “common bailiwicks” the majority in each parish was to decide the religion of that parish. This was at once a victory and a check for Zwingli. He tried to form an alliance with Paris, but failed at meeting at Marburg (October 1529) to come to an agreement, with Luther on the subject of the Eucharist, and the division between the Swiss and the German Reformation was stereotyped. Zwingli now developed his views as to the greater weight which Zürich and Bern ought to have in the League. Quarrels, too, went on in the “common bailiwicks,” for the members of the League who clung to the old faith had a majority of votes in matters relating to these districts. Zürich tried to cut off supplies of food from reaching the Romanist members (who were in the wishes of Zwingli), and, on the abbot of St Gall, disregarding the rights of Lucerne, Schwyz and Glarus, who shared with her since 1451 the office of protectors of the abbey, suppressed the monastery, giving the rule of the land and the people to her own officers. Bern in vain tried to moderate this aggressive policy, and the Romanist members of the League indignantly advanced from Zug towards Zürich. Near Kappel, on the 11th of October 1531, the Zürich vanguard under Gúldi was (perhaps owing to his treachery) surprised, and despite reinforcements the men of Zürich were beaten, among the slain being Zwingli himself. Another defeat completed the discomfiture of Zürich, and both the second and third battles of Kappel (November 1531) the principle of “parity” was recognized, not merely in the case of each member of the League and of the “common bailiwicks,” but in the latter Romanist minorities in every parish were to have a right to celebrate their own worship. Thus everywhere the rights of a minority were protected from the encroachments of the majority. The “Christliches Burgrecht” was abolished, and Zürich was condemned to pay heavy damages. Bullinger succeeded Zwingli, but this treaty meant that neither side could now try to convert the other wholly, the League was permanently split into two religious camps: the Romanists, who met at Lucerne, number, besides the five already mentioned, Fribourg, Soleure, Appenzell (Inner Rhoden) and the abbot of St Gall (with the Valais and the bishop of Basel), thus commanding sixteen votes (out of twenty-nine) in the Diet; the Evangelicals were Zürich, Bern, Schaffhausen, Appenzell (Außer Rhoden), Glarus and the towns of St Gall, Basel and Bienna (with Graubünden), who met at Aarau.

Bern had her eyes always fixed upon the Savoyard lands to the southwest, in which she had got a footing in 1475, and now Conquest of thole zeal for religious reforms the excuse for resuming her advance policy. In 1526 Guillaume Farel, a preacher from Dauphiné, had been sent to reform Aigle, Morat and Neuchâtel. In 1532 he came to Geneva, an ancient city of which the rule had long been disputed by the prince-bishop, the burgesses and the house of the nobles, the latter holding the neighbouring districts. She had become in 1519 the ally of Fribourg, in 1526 that of Bern also; and in 1530, by their influence, a peace was made between the contending parties. The religious changes introduced by Farel greatly displeased Fribourg, which abandoned the alliance (1534), tried in 1535 the Reformation was firmly planted in the city. The Duke of Savoy, however, took up arms against Bern (1536), who overran Geneva, captured and the independent bishopric of Lausanne, as well as the Chablais to the south of the lake. Geneva was only saved by the unwillingness of the citizens. Bern thus ruled north and south of the lake, and carried matters with a high hand. Shortly after this John Calvin, a refugee from Picardy, was, when passing through Geneva, detained by Farel to aid him, and, after an exile from 1535-1541, owing to opposition of the papal party and of the burghers, who objected to Bernese rule, he was recalled (1541) and set up his wonderful theocratic government in the city, in 1553 burning Servetus, the Unitarian (see Calvin and Servetus), and in 1555 expelling many who upheld municipal liberty, replacing them by French, English, Italians and Spaniards as new burghers, whose names are still frequent in Geneva (e.g. Candolle, Mallet, Diodati). His theological views led to disputes with the Zürich Reformers, which were partly settled by the Consensus Tigurinus of 1540, and more completely by the Helvetic Confession of 1562-1566, which formed the basis of union between the two parties.

In the Thirty Years’ War the League was still subject to frequent changes. The old faith had begun to take the offensive; the reforms made by the Council of Trent urged on the Romanists to make an attempt to recover lost ground. Emmanuel Philibert, duke of Savoy, the hero of St Quentin (1557), and one of the greatest generals of the day, with the support of the Romanist members of the League, demanded the restoration of the districts seized by Bern in 1536, and on the 30th of October 1564 the Treaty of Lausanne confirmed the decision of the other Confederates sitting as arbitrators (according to the old constitutional custom). By this treaty Gex, the City of Savoy, the Chablais were to be given back, while Lucerne, Vevey, Chillon, Villeneuve, Nyon, Avenches and Yverdon were to be kept by Bern, who engaged to maintain the old rights and liberties of Vaud. Thus Bern lost the lands south of the lake, in which St Francis of Sales, the exiled prince-bishop of Geneva (1602-1622), at once proceeded to carry out the restoration of the old faith, at 1555 Bern and Fribourg, as creditors of the debt-laden count, divided the county of Gruyère, thus getting French-speaking subjects. In 1558 Geneva renewed her alliance with Bern, and in 1584 she made one with Zürich. The duke of Savoy made several vain attempts to get hold of Geneva, the last (1630) being known as the “escalade.”

The decrees of the Council of Trent had been accepted fully by the Romanist members of the League, so far as relates to dogma, but not as regards discipline or the relations of the Counter-Reformation, however, or reaction in favour of the old faith, was making rapid progress in the Confederation, mainly through the indefatigable exertions of Charles Borromeo, from 1560 to 1584 archbishop of Milan (in which diocese the Italian Italians were included), and nephew of Pius IV, supported at Lucerne by Ludwig Pfiffer, who, having been (1562-1570) the chief of the Swiss mercenaries in the French wars of religion, did so much till his death (1594) to further the religious reaction at home that he was popularly known as the “Swiss king.” In 1574 the Jesuits, the great order of the reaction, were established at Lucerne; in 1579 a papal nuncio came to Lucerne; Charles Borromeo founded the “Collegium Helveticum” at Milan for the education of forty-two young Swiss, and the Catholic members of the League made an alliance with the bishop of Basel; in 1581 the Capuchins were introduced to influence the more ignorant classes. Most important of all was the Golden or Borromean League, concluded (Oct. 5, 1586) between the seven Romanist members of the Confederation (Uri, Schwyz, Unterwalden, Lucerne, Zug, Fribourg and Soleure) for the maintenance of the true faith in their territories, each engaging to punish backsliding members and to help each other if attacked by external enemies, notwithstanding any other leagues, old or new. This league marks the final breaking up of the Confederation into two great parties, which greatly hindered its progress. The Romanist members had a majority in the Diet, and were therefore able to refuse the Diet—“Inner Rhoden” remaining Romanist, “Außer Rhoden” adopting the new views. We may compare with this the action of Zürich in 1555, when she received the Protestant exiles (bringing with them the silk-weaving industry) from Locarno and the Italian bailiwicks into her burghership, and Italian names are found there to this day (e.g. Orelli, Murali).

In the Thirty Years’ War the Confederation remained neutral, being bound both to Austria (1643) and to France (1576), and
neither religious party wishing to give the other an excuse for calling in foreign armies. But the troubles in Raetia threatened entanglements. Austria wished to secure the Münsterthal (conquered by the leagues of Raetia in 1512), the object being to connect the Habsburg lands of Tirol and Milan. In the Valtellina the rule of the Three Raetian Leagues was very harsh, and Spanish intrigues easily brought about the massacre of 1620, by which the valley was won, the Romanist members of the Confederation stopping the troops of Zürich and Bern. In 1622 the Austrians conquered the Prättigau, over which they still had certain feudal rights. French troops regained the Valtellina in 1624, but it was occupied once more in 1629 by the imperial troops, and it was not till 1667 that the French, under Rohan, finally succeeded in holding it. The French, however, wished to keep it permanently; hence new troubles arose, and in 1637 the natives, under George Jenatsch, with Spanish aid drove them out, the Spaniards themselves being forced to resign it in 1639. It was only in 1649 and 1652 that the Austrian rights in the Prättigau were finally bought up by the League of the Ten Jurisdictions, which thus gained its freedom.

In consequence of Ferdinand II.'s edict of restitution (1620), by which the status quo of 1552 was re-established—the high-water mark of the curzer-Reformation—the abbot of St Gall tried to make some religious changes in his territories, but the protest of Zürich led to the Baden compromise of 1632, by which, in the case of disputes on religious matters arising in the "common bailiwicks," the decision was to be, not by a majority of the cantons, but by means of friendly discussion—a logical application of the doctrine of religious parity—or by arbitration. But by far the most important event in Swiss history in this age is the formal freeing of the Confederation from the empire. Basel had been admitted a member of the League in 1501, two years after the Confederation had been formed, and the Basel zugspitz, or council, though the city was included in the new division of the empire into "circles" (1524), which did not take in the older members of the Confederation. Basel, however, refused to admit this jurisdiction; the question was taken up by France and Sweden at the congress of Münster, and formed the subject of a special clause in both the treaties of Westphalia, by which the city of Basel and the other "Helvetiorum cantones" were declared to be "in the possession, or almost in the possession, of entire liberty and exemption from the empire, and in all cases they are to be subject only to the laws of their respective states, and in no case to be driven to mean formal exemption from all obligations to the empire (with which the Confederation was connected hereafter simply as a friend), and to be a definitive settlement of the question. Thus by the events of 1499 and 1648 the Confederation had become an independent European state, which, by the treaty of 1516, stood as regards France in a relation of neutrality.

In 1668, in consequence of Louis XIV.'s temporary occupation of the Franche Comté, an old scheme for settling the number of men to be sent by each member of the Confederation to the joint army, and the appointment of a council of war in war time, that "Garde de guerre," where the vote of Bern was counted as two votes, was revived to mean formal exemption from all obligations to the empire (with which the Confederation was connected hereafter simply as a friend), and to be a definitive settlement of the question. Thus by the events of 1499 and 1648 the Confederation had become an independent European state, which, by the treaty of 1516, stood as regards France in a relation of neutrality.

In 1668, in consequence of Louis XIV.'s temporary occupation of the Franche Comté, an old scheme for settling the number of men to be sent by each member of the Confederation to the joint army, and the appointment of a council of war in war time, that "Garde de guerre," where the vote of Bern was counted as two votes, was revived to mean formal exemption from all obligations to the empire (with which the Confederation was connected hereafter simply as a friend), and to be a definitive settlement of the question. Thus by the events of 1499 and 1648 the Confederation had become an independent European state, which, by the treaty of 1516, stood as regards France in a relation of neutrality.

The Diet had few powers; the Romanists had the majority there, the foreign rights of each member of the League and the limited mandate of the electors not being sufficiently effective to impress Zürich, as the leader of the League, managed matters when the Diet was not sitting, but could not enforce her orders. The Confederation was little more than a collection of separate atoms, and it is really marvellous that it did not break up through its own weakness.

In these same two centuries, the chief feature in domestic Swiss politics is the growth of an aristocracy—the power of voting and the power of ruling are placed in the hands of a small class. This is chiefly seen in Bern, Lucerne, Fribourg and Solothurn, where the aristocracy is strong, or in the smaller local units of the "communes" in the rural districts) with the question of poor relief after the suppression of the monasteries. Outsiders (Hinterasse or niedergelässene) had no political rights, however long they might have resided, while the privileges of burghership were strictly hereditary. Further, within the burghers, a small class succeeded in securing the monopoly of all public offices, which was kept up by the practice of co-opting, and was known as the "patriciate." So in Bern, out of 360 burgher families 69 only towards the close of the 18th century formed the ruling oligarchy—and, though to foreigners the government seemed
 admirably managed, yet the last thing that could be said of it was that it was democratic. In 1749 Samuel Henzi (dis-
gusted at being refused the post of town librarian) made a
fruitless attempt to overthrow this oligarchy, like the lawyer,
Pierre Fatio at Geneva in 1707. The harsh character of Bernese
rule (and the same holds good with reference to Uri and the
Val Leventina) was shown in the great strictness with which its
subject land Vaud was kept in hand: it was ruled as a
conquered land by a benevolent despot, and we can feel no
surprise that Major J. D. A. Davel in 1723 tried to free his
native land, or that it was in Vaud that the principles of
liberalism were first enunciated in the eighteenth century.
Another result of this aristocratic tendency was the way in which
the cities despised the neighbouring country districts, and managed
gradually to deprive them of their equal political rights and to
levy heavy taxes upon them. These and other grievances (the fall in the price of food after the close of the Thirty Years' War, the lowering of the value of the coin, &c.), combined with
the presence of many soldiers discharged after the great war,
led to the great Peasant Revolt (1753) in the territories of
Bern, Soleure, Lucerne and Basel, interesting historically as being
the first popular rising in the Swiss cantons of the eighteenth
century, and because reminiscences of legends connected
with those times led to the appearance of the "three Tells,"
which greatly stirred up the people. The rising was put down at
the cost of much bloodshed, but the demands of the peasants
were not granted.

Yet during this period of political powerlessness
a Swiss literature first arises: Conrad Gesner and Giles
Tschudi in the 16th century are succeeded by J. J. Scheuchzer,
A. von Haller, J. C. Lavater, J. J. Bodmer, H. B. de Sausserre,
J. J. Rousseau, J. v. Müller; the taste for Swiss travel is
stimulated by the publication (1743) of the first real Swiss
guide-book by J. G. Ebel (q.v.), based on the old Dicia:u;
industry thrived greatly. The residence of such brilliant foreign
writers as Gibbon and Voltaire within or close to the territories
of the Confederation helped on this remarkable intellectual
revival. Political aspirations were not, however, wholly
crushed, and found their centre in the Helvetic Society,
launched in 1762 by F. U. Balthasar and others.

The Confederation and France had been closely connected for
so long that the outbreak of the French Revolution could
not fail to affect the Swiss. The Helvetic Club, chiefly
founded by the Unterwaldners and Fribourgers, was the centre from which the new
ideas were spread in the western part of the Confederation,
disorders rising or stirred up. In 1790 the
Lower Valais rose against the oppressive rule of the upper
districts; in 1791 Porrentruy defied the prince-bishop of Basel,
despite the imperial troops he summoned, and proclaimed (November 1792) the "Raourach republic," which three
months later (1793) became the French department of the
Mont Terrible; Geneva was only saved (1792) from France by
a force sent from Zürich and Bern; while the massacre of the
Swiss guard at the Tuileries on the 10th of August 1792 aroused
intense indignation. The rulers, however, unable to enter into
the new ideas, contented themselves with suppressing
them by force, e.g. Zürich in the case of Stäfa (1795). St Gall
managed to free itself from its prince-abbot (1795-1797), but the
Leagues of Raetia so opposed their subjects in the Valtellina
that in 1797 Bonaparte (after conquering the Milanese from the
Austrians) joined them to the Cisalpine republic. The Diet
was distracted by party struggles and the fall of the old Con-
federation was not far distant. The rumours of the vast
treasures stored up at Bern, and the desire of securing a bulwark
against Austrian attack, specially turned the attention of the
directory towards the Confederation; and this was utilized
by the heads of the Reform party in the Confederation—Peter
Ochs (1752-1821), the burgomaster of Basel, and Frédéric
César Laharpe (1754-1838; tutor, 1783-1794, to the later
tsar Alexander I.), who had left his home in Vaud through
disguise at Bernese oppression, now wished for aid from
outside in order to free their land from the rule of the oligarchy.

Hence, when Laharpe, at the head of some twenty exiles from
Vaud and Fribourg, called (Dec. 9, 1797) on the Directory
to protect the liberties of Vaud, which, so he said (by a bit of
purely apocryphal history), France by the treaty of 1565 was
bound to guarantee, his appeal found a ready answer. In
February 1798 French troops occupied Mühlhausen and Bienne
(Biel), as well as those parts of the lands of the prince-bishop
of Basel (St Imier and the Münstertal) as regards which he
had since 1579 the ally of the Catholic members of the
Confederation. Another army entered Vaud (February 1798),
then the "Lemanic republic was proclaimed, and the Diet
broke up in Zürich on May 5th, proceeding to the storm. Brune
and his army occupied Fribourg and Soleure, and,
affter, with violence engaging on Neuenegg, entered (March 5)
Bern, deserted by her allies and distracted by quarrels within.
With Bern, the stronghold of the aristocratic party, fell the
old Confederation. The revolution triumphed throughout the
country. Brune (March 16-19) put forth a wonderful
scheme by which the Confederation with its "associates " and
"subjects" was to be split into three republics—the Telligau
(i.e. the forest districts), the Rhodanische (i.e. Vaud, the Valais,
the Bresse), the Oberland or upper districts of the Valais,
and the Helvetic (i.e. the northern and eastern portions); but the
directory disapproved of this (March 23), and on the 29th of March
the "Helvetic republic, one and indivisible," was proclaimed.
This was accepted by ten cantons only as well as (April 12) the constitution drafted
by Ochs. By the new scheme the territories of the Everlasting
League were split up into twenty-three (later nineteen, Raetia
only coming in 1799) administrative districts, called " cantons,"
a name now officially used in Switzerland for the first
time, though it may have been found employed by foreigners in the French treaty of 1795, in Conwyom and Machiaveli, and in
the treaties of Westphalia (1648). A central government
was put up, with its seat at Lucerne, comprising a senate and a great
council, together forming the legislature, and named by electors
chosen by the people in the proportion of 1 to every 100 citizens,
with an executive of five directors chosen by the legislature,
and having four ministers as subordinates or "chief secretaries."
A supreme court of justice was set up; a status of Swiss citizens-
ship was recognized; and absolute freedom to settle in any
canton was given, the political "communes" being now com-
ting under the presidency of the Federal council, and the
individuals for the first time an attempt was made to organize the Confederation
as a single state, but the change was too sweeping to last, for
it largely ignored the local patriotism which had done so much
to create the Confederation, though more recently it had made
it politically powerless. The three Forest districts rose in
rebellion against the invaders and the new constitutions which
destroyed their ancient prerogatives; but the valiant resistance of the
Schwyzers, under Alois Reding, on the heights of
Morgarten (April and May), and that of the Unterwaldners (August and September), were put down by French armies.
The proceedings of the French, however, soon turned into disorder
and hatred the joyful feelings with which they had been hailed
as liberators. Geneva was annexed to France (April 1798);
Gersau, after an independent existence of over 400 years, was
made a mere district of Schwyz; immense fines were levied and
the treasury at Bern pillaged; the land was treated as if it had been
conquered. The new republic was compelled to make a
very close offensive and defensive alliance with France, and
its directors were practically nominated from Paris. In June-
October 1799 Zürich, the Forest cantons and Raetia became
the scene of the struggles of the Austrians (welcomed with joy)
against the French and Russians. The manner, too, in which
the reforms were carried out alienated many, and, soon after
the directory gave way to the consulate in Paris (18 Brumaire or
Nov. 10, 1799), the Helvetic directory (January 1800) was
replaced by an executive committee.
The scheme of the Helvetic republic had gone too far in the direction of centralization; but it was not easy to find the happy
mean, and violent discussions went on between the "Unitary"

SWITZERLAND

HISTORY

XXVI. 9

257
(headed by Ochs and Labarde) and "Federalist" parties. Many drafts were put forward and one actually submitted to be rejected by a popular vote (June 1802). In July 1802 the French troops were withdrawn from Switzerland by Bonaparte, ostensibly to comply with the treaty of Amiens, really to show the Swiss that their best hopes lay in appealing to him. The Helvetic government was gradually driven back by armed force, and the Federalists seemed getting the best of it, when (Oct. 4) Bonaparte, sending himself as dictator, and summoned ten of the chief Swiss statesmen to Paris to discuss matters with him (the "Consulta")—December 1802.

He had long taken a very special interest in Swiss matters, and in 1802 had given to the Helvetic republic the Frickthal (ceded to France in 1801 by Austria), the last Austrian possession within the borders of the Confederation. On the other hand, he had made (August 1802) the Valais into an independent republic. In the discussions he pointed out that Swiss needs required a federal constitution and a neutral position guaranteed. Finally (Feb. 19, 1803) he had before the Consulta the Act of Mediation which he had elaborated and which they had perforce to accept—a document which formed a new departure in Swiss history, and the influence of which is visible in the present constitution.

Throughout, "Switzerland" is used for the first time as the official name of the Confederation. The thirteen members of the old Confederation before 1798 are set up again, and to them are added six new cantons—two (St Gall and Graubünden or Grisons) having been formerly "associates," and the four others being made up of the subject lands conquered at different times—Aargau, Zurich, Solothurn, Thurgau (acquired by the Confederation in 1798). The latter was given to Obwalden. By the new constitution the sovereign rights of each canton were fully recognized, and a return made to the lines of the old constitution, though there were to be no subject lands, and political rights were not to be the exclusive privilege of any class of citizens. Each canton had one vote in the Diet, where an absolute majority was to decide all matters save foreign affairs, when a majority of three-fourths was required. The management of current business, &c., shifted every two years between the governments of Zurich, Bern and Lucerne (the last designated "the Vororte"). The monasteries were guaranteed in their rights and privileges; and no canton was to make any alliance contrary to the rights of the Confederation or of any other canton. Provision was made for a Federal army. Finally, the Congress, on the 20th of November 1815, placed Switzerland and parts of North Savoy (Chablais, Faucigny and part of the Genevois) under the guarantee of the Great Powers, who engaged to maintain their neutrality, thus freeing Switzerland from her 300 years' subservience to France, and compensating in some degree for the reactionary nature of the new Swiss constitution when compared with that of 1802.

The cities at once secured for themselves in the cantonal councils an overwhelming representation over the neighbouring country districts, and the agreement of 1805 as to migration from one canton to another was renewed (1819) by twelve cantons. For some time there was little talk of reforms, but in 1819 the Helvetic Society definitely became a political society, and the foundation in 1824 of the Marksmen's Association enabled men from all cantons to meet together. A few cantons (notably Tessin) were beginning to make reforms, when the influence of the July revolution (1830) in Paris and the sweeping changes in Zurich led the Diet to declare (Dec. 27) that it would not interfere with any reforms of cantonal constitutions provided they were in agreement with the pact of 1815. Hence for the next few years great activity in this direction was displayed, and most of the cantons reformed themselves, save the most conservative (e.g. Uri, Glarus) and the advanced who needed no changes (e.g. Geneva, Graubünden).

Attempts at Reform.

Another (though given by the constitution) was, by the Diet in 1805, restricted by requiring ten years' residence, and then not granting political rights in the canton or a right of profiting by the communal property. As soon as Napoleon's power began to wane (1812—1813), the position of Switzerland became endangered. Despite the personal wishes of the tsar (a pupil of Labarde's), the Austrians, supported by the reactionary party in Switzerland, and without any real resistance on the part of the Federalists, were allowed to occupy the country from the 21st of December 1813, and on the 29th of December the Diet was induced to declare the abolition of the 1803 constitution, guaranteed, like Swiss neutrality, by Napoleon. Bern headed the party which wished to restore the old state of things, but Zürich and the majority stood out for the nineteen cantons. The powers exercised great pressure to bring about a meeting of deputies from all the nineteen cantons at Zürich (April 6, 1814, "the long Diet"); party strife was very bitter, but on the 12th of September it decided that the Valais, Neuchâtel and the three "Vororte" should be raised from the rank of "associates" to full members of the Confederation (thus making up the familiar twenty-two). As compensation the congress of Vienna (March 20, 1815) gave Bern the town of Bienna (Biel), and all (save a small part which went to Basel) of the territories of the prince-bishop of Basel ("the Bernese Jura"); but the Valtellina was granted to Austria, and Mühlhausen was not freed from France.

On the 7th of August 1815 the new constitution was sworn to by all the cantons save Nidwalden, the consent of which was only obtained (Aug. 30) by armed force, a delay for which she paid by a second Engelberg, and the vast area (acquired by Nidwalden in 1798) given over to Obwalden. By the new constitution the sovereign rights of each canton were fully recognized, and a return made to the lines of the old constitution, though there were to be no subject lands, and political rights were not to be the exclusive privilege of any class of citizens. Each canton had one vote in the Diet, where an absolute majority was to decide all matters save foreign affairs, when a majority of three-fourths was required. The management of current business, &c., shifted every two years between the governments of Zürich, Bern and Lucerne (the last designated "the Vororte"). The monasteries were guaranteed in their rights and privileges; and no canton was to make any alliance contrary to the rights of the Confederation or of any other canton. Provision was made for a Federal army. Finally, the Congress, on the 20th of November 1815, placed Switzerland and parts of North Savoy (Chablais, Faucigny and part of the Genevois) under the guarantee of the Great Powers, who engaged to maintain their neutrality, thus freeing Switzerland from her 300 years' subservience to France, and compensating in some degree for the reactionary nature of the new Swiss constitution when compared with that of 1802.
question of revising the Federal pact was brought forward by a large majority of cantons in the Diet (July 17), whereon, by the league of Samen (Nov. 14), the three Forest cantons, with Neuchâtel, the city of Basel, and the Valais, agreed to maintain the pact of 1815 and to protest against the separation of Basel in two halves (for in the reform struggle Schwyz and Basel had been split up, though the split was permanent only in the latter case). A draft constitution providing for a Federal administration distinct from the cantons could not secure a majority in its favour; a reaction against reform set in, and the Diet was forced to sanction (1833) the division of Basel into the "city" and "country" divisions (each with half a vote in the Diet), though fortunately in Schwyz the quarel was healed. Religious questions were also involved in the struggle, which was a canton where religious parity prevailed, later in others. In Zürich the extreme pretensions of the Radicals and freethinkers (illustrated by offering a chair of theology in the university to D. F. Strauss of Tübingen because of his Life of Jesus, then recently published) brought about a great reaction in 1839, when Zürich was the "Vorort."

In Aargau the parties were very evenly balanced, and, when in 1840, on occasion of the revision of the constitution, the Radicals had a popular majority the aggrieved clerics stirred up a revolt (1840), which was put down early in which gave rise to a new crisis in the autumn of 1841. kicked the soil, with Koller, an attempt for carrying a vote in the great council to suppress the eight monasteries in the canton (Jan. 1841). This was flatly opposed to the pact of 1815, which the Diet by a small majority decided must be upheld (April 1841), though after many discussions it determined (Aug. 31, 1843) to accept the compromise by which the men's convents only were to be suppressed, and declared that the matter was now settled. On this the seven Romanist cantons—Urs, Schwyz, Unterwalden, Lucerne, Zug, Fribourg and the Valais—formed (Sept. 13, 1843) a "Sonderbund" or separate league, which (February 1844) was suppressed, but its head, by August, was the question and the restoration of all the monasteries. Like the Radicals in former years the Romanists went too far and too fast, for in October 1844 the clerical party in Lucerne (in the majority since 1841, and favouring the reaction in the Valais) officially invited in the Jesuits and gave them high posts, an act which created all the more sensation because Lucerne was the "Vorort." Twice (December 1844 and March 1845) parties of free aves tried to capture the city. In December 1845 the Sonderbund turned itself into an armed confederation, ready to rebel at war in the rights of each canton. The Radicals carried Zürich in April 1845 and Bern in February 1846, but a majority could not be secured in the Diet till Geneva (Oct. 1846) and St Gall (May 1847) were won by the same party. On the 20th of July 1847, the Diet, by a small majority, declared that the Sonderbund was contrary to the Federal pact, which on the 16th of August it was resolved to revise, while on the 3rd of September it was decided to invite each canton to expel the Jesuits. Most of the Great Powers favoured the Sonderbund, but England took the contrary view, and the attempt of Metternich, supported by Louis Philippe, to bring about European intervention, on the pret of upholding the treaties of Vienna, was frustrated by the policy of masterly inactivity pursued by Lord Palmerston, who delayed giving an answer till the forces of the Sonderbund had been defeated, a friendly act that is still gratefully remembered in the country.

On the 29th of October the deputies of the unyielding cantons left the Diet, which ordered on the 4th of November that its decree should be enforced by arms. The war was short (Nov. 10–30), mainly owing to the ability of the general, G. H. Dufour (1787–1873), and the loss of life trifling. One after another the rebellious cantons were forced to surrender, and, as the Paris revolution of February 1848, entailing the retirement of Guizot (followed three weeks later by that of Metternich), occupied all the attention of the Great Powers (who by the constitution of 1815 should have been consulted in the revision of the pact), the Swiss were enabled to settle their own affairs quietly. Schwyz and Zug abolished their 19th-century "landsgemeinden," and the seven were condemned to pay the costs of the war (ultimately defrayed by subscription), which had been waged rather on religious than on strict particularist or states-rights grounds. The Diet meanwhile debated the draft constitution drawn up by Johann Conrad Kern (1808–1888) of Thurgau and Henri Druey (1790–1853) of Vaud, in which the summer of 1848 was accepted by fifteen and a half cantons, the minority consisting of the three Forest cantons, the Valais, Zug, Tessin and Appenzell (Inner Rhoden), and it was proclaimed on the 12th of September.

The new constitution inclined rather to the Act of Mediation than to the system which prevailed before 1798. A status of "cantonal citizenship" was set up, closely joined to the Federal constitution; a man settling in a canton and taking his birthplace got cantonal citizenship after a residence of at most two years, but was excluded from all local rights in the "commune" where he might reside. A Federal or central government was set up, to which the cantons gave up a certain part of their sovereign rights, retaining the rest. The Federal Legislature (or assembly) was made up of two houses—the Council of States (Ständerat), composed of two deputies from each canton, whether small or great (44 in all), and the National Council (Nationalrat), made up of deputies elected for three years, in the proportion of one for every 20,000 souls or fraction over 10,000, the electors being all Swiss citizens.

The Federal council or executive (Bundesrat) consisted of seven members elected by the Federal Assembly sitting as a congress; they were jointly responsible for all business, though for sake of convenience there were various departments, and their chairman was called the president of the Confederation. The Federal judiciary (Bundesgericht) was made up of eleven members elected for three years by the Federal Assembly sitting in congress; its jurisdiction was chiefly confined to civil cases, in which the Confederation was a party (if a canton, the Federal tribunal), or cases of Federal law (the Federal tribunal), but took in also great political crimes—all constitutional questions, however, being reserved for the Federal Assembly. A Federal university and a polytechnic school were to be founded. All military capitulations were forbidden in the future. Every canton must treat Swiss citizens who belong to one of the Christian confessions like their own citizens, for the right of free settlement is given to all such, though they acquired no rights in the "commune." All Christians were guaranteed the exercise of their religion, but the Jesuits and similar religious orders were not to be received in any canton. German, French and Italian were recognized as national languages.

The constitution as a whole marked a great step forward; though very many rights were still reserved to the cantons, yet there was a fully organized central government. Almost the first act of the Federal Assembly was to exercise the power given them of determining the home of the Federal authorities, and on the 28th of November 1848 Bern was chosen, though Zürich still ranks as the first canton in the Confederation. Soon after 1848 a beginning was made of organizing the different public services, which had now been brought within the jurisdiction of the central Federal authority. Thus in 1849 a uniform letter post service was established, in 1854 telegraph replaced the intricate cantonal currencies, while all customs duties between cantons were abolished; in 1851 the telegraph service was organized, while all weights and measures were unified (in 1868 the metrical system was allowed, and in 1875 declared obligatory and universal), in 1854 roads and canals were taken in hand, while finally in 1855 the Federal Polytechnic School at Zürich was opened, though the Federal university authorized by the new constitution has not yet been set up. These were some of the non-political benefits of the creation of a Federal central executive. But in 1852 the Federal Assembly decided to leave the construction of railways to private enterprise and so had to buy them up in 1903 at a vastly enhanced price.

By this early settlement of disputes Switzerland was protected from the general revolutionary movement of 1848, and in later
years her political history has been uneventful, though she has felt the weight of the great European crises in industrial and social matters. The position of Neuchâtel, as a member of the Confederation (as regards its government only) and as a principality ruled by the king of Prussia, whose rights had been expressly recognized by the congress of Vienna, was uncertain. She had not sent troops in 1847, and, though in 1848 there was a republican revolution there, the prince did not recognize the changes. Finally, a royalist conspiracy in September 1856 to undo the work of the cantonal elections of 1848 and to revoke the constitution, and it was only by the mediation of Napoleon III and the other powers that the prince renounced (1857) all his rights, save his title, which his successor (the German emperor) has also dropped. Since that time Neuchâtel has been an ordinary member of the Confederation. In 1859-1860 the cession of Savoy (part of it neutralized in 1845) to France aroused considerable indignation, and in 1862 the long-standing question of frontiers in the Vallée des Dappes was finally arranged with France. In 1871 many French refugees, especially Bourbaki’s army, were most hospitably received and sheltered. The great influx of the new Catholics after the Vatican Council (1870) caused many disturbances in western Switzerland, especially in the Bernese Jura. The attack was led by Bishop Eugène Lachat (1819-1886) of Basel, whose see was suppressed by several cantons in 1873, but was set up again in 1884, though still not recognized by Bern. The appointment by the pope of the abbé Gaspard Mermilford (1824-1893) as “apostolic vicar” of Geneva, which was separated from the diocese of Fribourg, led to Monsieur Mermilford’s banishment from Switzerland (1873), but in 1883 he was raised to the vacant see of Lausanne and Geneva and allowed by the Federal authorities to return, though Geneva refused to recognize him, though he was created a cardinal in 1890. An event of great importance to Switzerland was the opening of the St Gotthard tunnel, which was begun in 1871 and opened in 1882; by it the Forest cantons seem likely to regain the importance which was theirs in the early days of the Confederation.

From 1848 onwards the cantons continually revised their constitutions, always in a democratic sense, though after the Sonderbund War Schwyz and Zug abolished their “lands-gemeinden” (1848). The chief point was the introduction of the principles of popular election and majority rule, developed by the growth of the Old Catholics. Laws on the “facultative” form; i.e. all federal laws must be submitted to popular vote on the demand of 30,000 Swiss citizens or of eight cantons. But the “Initiative” (i.e. the right of compelling the legislature to consider a certain subject or bill) was not introduced into the Federal Constitution till 1891 (when it was given to 50,000 Swiss citizens) and then only as to a partial (not a total) revision of that constitution. By the constitutions of 1848 and 1874 Switzerland has ceased to be a mere union of independent states joined by a treaty, and has become a single state with a well-organized central government, to which have been added two major cantons and several minor territories, and it is by no means certain that increased centralization would destroy the whole character of the Confederation, in which the cantons are not administrative divisions but living political communities. Swiss history teaches us, all the way through, that Swiss liberty has been won by a close union of many small states, and we cannot doubt that it will be best preserved by the same means, and not by obliterating all local peculiarities, nowhere so striking and nowhere so historically important as in Switzerland.

M. Numa Droz (who was for seventeen years—1876 to 1892—a member of the Federal executive, and twice, in 1883 and in 1887, president of the Swiss Confederation) expressed the opinion shortly before his death in December 1890 (he was born in 1844) that while the dominant note of Swiss politics from 1848 to 1874 was the establishment of a Federal state, that of the period extending from 1874 to 1899 (and this is true of a later period) was the direct rule of the people, as distinguished from government by elected representatives. Whether this distinction be just or not, it is certain that this advance towards democracy in its true sense is due indirectly to the monopoly of political power in the Federal government enjoyed by the Radical party (from 1898 onwards). Many were willing to go with it some part of the way, but its success in maintaining its close monopoly has provoked a reaction against it on the part of those who desire to see the Confederation remain a Confederation, and not become a strongly centralized state, contrary to its past history and genius. Hence after 1874 we find that democratic measures are not advocated as we should expect by the Radicals, but by all the other political parties with a view of breaking down this Radical monopoly, for it is a strange fact that the people elect and retain Radical representatives, though they reject the Federal executive, before they will give its approval by the said Radical representatives. For they represent the Radicals and Centralists (the two permanent political parties in Switzerland), which up to 1874 resulted in favour of the Centralists, has been turning gradually in favour of the Radicals, and that because of the adoption of such democratic institutions as the Referendum and the Initiative.

The general lines on which Swiss politics have run since 1874 may be most conveniently summarized under three headings—the working of the political machinery, the principal political events, and the chief economical and financial features of the period. But it must be always borne in mind that all the following remarks relate only to Federal politics, those of the several cantons being much more intricate, and of course turning more on purely local differences of opinion.

1. Political Machinery.—The Federal Constitution of 1848 set up a permanent Federal executive, legislature and tribunal, each and all quite distinct from and independent of any cantonal government. This system was a modified revival of the state of things that had prevailed from 1798 to 1803, and was an imitation of the political changes that had taken place in the cantonal constitutions after 1830. Both were victories of the Centralist or Radical party, and it was therefore but natural that this party should be called upon to undertake the Federal government under the new constitution, a supremacy that it has kept ever since. To the Centralists the Council of States (two members from each canton, however large or small) has always been a stumbling-block, and they have mockingly nicknamed it “the fifth wheel of the coach.” In the other house of the Federal legislature, the National Council (one member per 20,000, or fraction of over 10,000 of the entire population), the
Radicals have always since its creation in 1848 had a majority. Hence, in the Congress formed by both houses sitting together, the Radicals have had it all their own way. This is particularly important as regards the election of the seven members of the Federal executive which is made by such a Congress. Now the Federal executive (Federal Council) is in no sense a cabinet, i.e., a committee of the party in the majority in the legislature for the time being. In the Swiss Federal Constitution the cabinet has no place at all. Each member of the Federal executive is elected by a separate ballot, and holds office for the fixed term of three years, during which he cannot be turned out of office, while as yet but a single instance has occurred of the rejection of a Federal councillor who offered himself for re-election. Further, none of the members of the Federal executive can hold a seat in either house of the Federal legislature, though they may appear at its sittings, but this is an ex officio only, i.e., while the Federal Council as such has not necessarily any common policy, and never expresses its views on the general situation (though it does as regards particular legislative and administrative measures) in anything resembling the "speech from the Throne" in England. Thus it seems clear that the Federal executive was intended by the Federal Constitution of 1848 (and in this respect that of 1874 made no change) to be a standing committee of the legislature as a whole, but not of a single party in the legislature, or a "cabinet," even though it had the majority. Yet this rule of a single political party is just what has taken place. Between 1848 and the end of 1908, 38 Federal councillors were elected (24 from German-speaking, 12 from French-speaking and 2 from Italian-speaking Switzerland, the canton of Vaud heading the list with 7). Now of these 38 three only were not Radicals, viz. M. Paul Ceresole (1870-1872) of Vaud, who was a Protestant Liberal-Conservative, Herren Josef Zemp (1891-1908) and Josef Anton Schobinger (elected 1908), both of Lucerne and Romaniot Conservatives, yet the Conservative minority is a large one, while the Romanists form about two-fifths of the population of Switzerland. But despite this predominance of a single party in the Federal Council, no true cabinet system has come into existence in Switzerland, as members of the council do not resign even when their personal policy is condemned by a popular vote, so that the resignation of Herr Welti (a member of the Federal Council from 1867 to 1891), in consequence of the rejection by the people of his railway policy, caused the greatest amazement and consternation in Switzerland.

The chief political parties in the Federal legislature are the Right, or Conservatives (whether Romanists or Protestants), the Centre (now often called "Liberals," but rather answering to the Whigs of English political language, the Left (or Radicals) and the Extreme Left (or the Socialists of varying shades). In the first listed are all the Radicals, the second number (in this house the smaller cantons are on an equality with the greater ones, each indifferently having two members. But in the National Council (167 elected members) there has always (since 1848) been a considerable Radical majority over all other parties. The Socialists long worked under the wing of the Radicals, but now in every canton (save Geneva) the two parties have quarrelled, the Socialist vote having largely increased, especially in the town of Zürich. In the country the anti-Radical opposition is made up of the Conservatives, who are strongest in the Romanist, and especially the Forest, cantons, and of the "Federalists" of French-speaking Switzerland. There is no doubt that the people are really anti-Radical, though occasionally led away by the experiments made recently in the domain of State socialism: they elect, indeed, a Radical majority, but very frequently reject the bills laid before them by their elected representatives.

2. Politics.—The cantons had led the way before 1848, and they continued to do so after that date, gradually introducing reforms all of which tended to give the direct rule to the people. The Confederation was bound to follow this example, though it adopted it far more leisurely pace. Hence, in 1872 a new Federal Constitution was drafted, but was rejected on a popular vote by a small majority, as it was thought to go too far in a centralizing direction, and so encountered the combined opposition of the Conservatives and of the Federalists of French-speaking Switzerland. The last-named party was won over by means of concessions as to military matters and the proposed unification of cantonal laws, civil and criminal, and especially by three provisions as to religious freedom, since the "Kulturkampf" was then raging in French-speaking Switzerland. Hence a revised draft was accepted in 1874 by a considerable popular majority, and this is the existing Federal Constitution. But it bears marks of its origin as a compromise, and no one party has ever been very eager to support it as a whole. At first all went smoothly, and various very useful laws carrying out in detail the new provisions of the constitution were drafted and accepted. But divisions of opinion arose when it was proposed to reform the military system at a very great expenditure, and also as to the question of the limitation of the right to issue bank-notes, while (as will be seen under 3 below) just at this time grave financial difficulties arose with regard to the Swiss railways, and in consequence of Prince Bismarck's anti-free trade policy, which threatened the prosperity of Switzerland as an exporting country. Further, the disturbed political state of the canton of Ticino (or Tessin) became more or less acute from 1873 onwards. There the Radicals and the Conservatives are nearly equally balanced. In 1872 the Conservatives obtained the majority in this canton, and tried to assuage it by some certainly questionable means. The Radicals repeatedly appealed to the Federal government to obtain its armed intervention, but in vain. In 1876 the Conservatives at a rifle match at Stabio fired on the Radicals, but in 1880 the accused persons were acquitted. The long-desired detachment of Ticino from the jurisdiction of the foreign dioceses of Como and Milan was effected in 1888 by the erection of a see at Lugano, but this event caused the Radicals to bear an increase of clerical influence. Growing impatient, they finally took matters in their own hands, and in September 1890 brought about a bloody revolution. The partial conduct of the Radical Federal commissioner was much blamed, but after a state trial at Zürich in 1891 the revolutionists were acquitted, although they loudly boasted of their share in this use of force in political matters.

From 1885 onwards Switzerland had some troubles with foreign powers owing to her defence of the right of asylum for fugitive German Socialists, despite the threats of Prince Bismarck, who maintained a secret police in Switzerland, one member of which, Wohlgemuth, was expelled in 1889, to the prince's huge but useless indignation. From about 1890, as the above troubles within and without gradually subsided, the agitation in the country against the centralizing policy of the Radicals became more and more strongly marked. By the united efforts of the Federal government and of the Radicals themselves, the resistance of the Radicals, an amendment was introduced in 1891 into the Federal Constitution, by which 50,000 Swiss citizens can by the "Initiative" compel the Federal legislature and executive to take into consideration some point in the Federal Constitution which, in the opinion of the petitioners, requires reform, and to prepare a bill dealing with it which must be submitted to a popular vote. Great hopes and fears were entertained at the time as to the working of this new institution, but both have been falsified, for the Initiative has as yet only succeeded in inserting (in 1893) in the Federal Constitution a provision by which the Jewish method of killing animals is forbidden, and another (in 1906) prohibiting the manufacture or sale of absinthe in the country. On the other hand, it has failed (in 1894) to secure the adoption of a Socialist scheme by which the state was bound to provide work for every able-bodied man in the country, and (also in 1894) to carry a proposal to give to the cantons a bonus of two francs per head of the population out of the rapidly growing returns of the customs duties, similarly in 1900 an attempt to introduce the election of the Federal executive by a popular vote and proportional representation in the Nationalrat failed, as in 1903 did a proposal to make the elections to the Nationalrat depend on the Swiss population only, instead of the total population of the country.
The great rise in the productiveness of the customs duties (see 3 below) has tempted the Swiss people of late years to embark on a course of state socialism, which may be also described as a series of measures tending to give more and more power to the central Federal government at the expense of the cantons. So in 1890 the principle of compulsory universal insurance against sickness and accidents was accepted by a popular vote, in 1891 likewise that of a state or Federal bank, and in 1898 that of the unification of the cantonal laws, civil and criminal, into a set of Federal codes. In each case the Federal government and legislature were charged with the preparation of laws carrying out the new general principles. But in 1897 the Cantons, who had proposed cantons, but as to a Federal bank were rejected by the people, though another draft was accepted in 1905, so that the bank (with a monopoly of note issue, a provision accepted by a popular vote in 1891) was actually opened in 1907. At the beginning of 1900 the suspicion felt as to the insurance proposals elaborated by the Federal authorities was so keen that a popular demand for a popular vote was signed by 117,000 Swiss citizens, the legal minimum being only 30,000: they were rejected (May 20, 1900) on a popular vote by a nearly two to one majority. The prepara-
tion of these laws, however, was not interrupted, and in their final form, quietly, drafts being framed by experts and then submitted for criticism to special commissions and public opinion, but finally the civil code was adopted by the Federal Assembly in December 1907. By a popular vote in 1887 the Federal authorities were given a monopoly of alcohol, but a proposal to deal similarly with tobacco has been very ill received (though such a monopoly would undoubtedly produce a large amount), and would pretty certainly be refused by the people if a popular vote were ever taken upon it. In 1895 the people declared to sanction a state monopoly of matches, even though the unhealthy nature of the works was strongly urged, and have also resolutely refused on several occasions to accept any projects for the centralizing of the various branches of military administration, &c., though in 1897 the forests high up on the mountains were placed under Federal supervision, while in 1902 large Federal grants in aid were made to the cantons towards the expenses of primary education, and in 1908 the supervision of the employment of the power derived from rivers and streams was given to the Confederation. Among other reforms which have recently been much discussed in Switzerland are the introduction of the obligatory referendum (which was originally limited only to amendments to the Federal Constitution) and the extension of the initiative (now limited to piecemeal revision of the Federal Constitution) to all Federal laws, &c. The first-named scheme is an attempt to restrain important centralizing measures from being presented as laws (and as such exempt from the compulsory referendum), and not as amendments to the Federal Constitution.

Besides the insurance project mentioned above, two great political questions have engaged the attention of the Swiss.

a. State Purchase of the Railways.—In 1891 the purchase of the Central railway was rejected by a popular vote, but in 1897 by the aid of various baits thrown out, the people were induced to accept the principle of the purchase by the Confederation of the five great Swiss railway lines—three in 1901, viz. the Central, the North-Eastern, and the United Swiss lines; one (the Jura-Simplon) in 1903, and one (the St. Gotthard line) in 1909, this delay being due to international conventions that still have some years to run. Further, very important economical consequences, e.g. as to strikes, may be expected to result from the transformation of all railway officials of whatever grade into state servants, who may naturally be expected to vote (as in other cases) for their employers, and so greatly increase the strength of the Centralist political party.

b. The "Double Initiative."—This phrase denotes two purely political reforms that have been coupled together, though in reality they are by no means inseparable. One is the introduction of proportional representation (within the several cantons) into the elections for the National Council of the Federal parliament, the object being thus to secure for several large minorities a number of M.P.'s more in accordance with the size of those minorities in the country than is now possible under the régime of pure majorities; naturally these minorities would then receive a proper share of political power in the senate house, instead of merely exerting great political influence in the country, while if they were thus strengthened in the legislature they would soon be able to claim the right of naming several members of the Federal executive, thus making both legislature and executive a mirror of the actual political situation of the country, instead of the preserve of one political party. The other reform is the election of the members of the Federal executive by popular vote, the Swiss being given a vote on the 10th of August in the electoral constituency. This would put an end to the "lobbying" that goes on previously to the election of a member of the executive by the two houses of the Federal parliament sitting jointly in Congress; but, on the other hand, it might stereotype the present system of electing members of the executive by the majority system, and so reduce large minorities to political impotence. The "double initiative" scheme was launched in the beginning of 1899, and by the beginning of the following July secured more than the requisite number of signatures (50,000), the first-named item having been refused by nearly two to one, and the second by nearly three to one. Hence the Federal parliament was bound to take these two reforms into formal consideration, but in June 1900 it rejected both, and this decision was confirmed by a popular vote taken in the following November.

3. Economies and Finance.—Soon after the adoption of the Federal Constitution of 1874 the economical and financial state of the Confederation became very unsatisfactory. The great financial crisis in Vienna in 1873 was a severe blow to Swiss commerce, which had taken a very great start after the Franco-

German War of 1870-71. Beside this, too, the financial position of some of the great Swiss railway lines was very unfavourable: the bankruptcy of the National line ruined for the time (till a Federal loan at a very low rate of interest was forced upon them) the four Swiss towns which were its guarantors; the North-Eastern line had to beg for a "moratorium" (a legal delay of the period at which it had to pay its debts) from the Federal government; the Bern-Lucerne line was actually put up to auction, and was bought by the canton of Bern. Further, the expenses of constructing the St Gotthard railway vastly exceeded all estimates, and in 1876 over 100,000,000 francs more were required. Hence the government was in danger, and the tax rate had to be increased. Germany (which gave originally 20,000,000 francs) and Italy (original contribution 45,000,000 francs) each promised 10,000,000 francs more; the St Gotthard company itself gave 12,000,000, and the two Swiss railway lines interested (Central and North-Eastern) added 1,500,000 to the 20,000,000 they had already agreed to give jointly with the cantons interested in the completion of this great undertaking. But these latter refused to add anything to their previous contributions, so that finally the Federal government proposed that it should itself pay the 500,000 francs most urgently required. This proposal aroused great anger in east and west Switzerland, but the matter was ultimately settled by the Confederation paying 4,500,000 francs and the interested cantons 2,000,000, the latter gift being made dependent on a grant of 4,500,000 francs by the Federal government for new tunnels through the Alps in east and west Switzerland, and of 2,000,000 more for the Monte Cenerre tunnel between Bellinzona and Lugano. This solution of a most thorny question was approved by a popular vote in 1879, and the St Gotthard line was successfully completed in 1882. Gradually, too, the other Swiss railway lines, attained a state of financial equipoise, and thus the more careful management of new directors and managers. The completion of the Simplon tunnel (1906), the commencement (1909) of that beneath the Lötschen Pass (q.v.), and the rival claims of projected tunnels under the Splügen Pass (q.v.), besides the struggle for or against a tunnel under the Faclucie (supported by Geneva almost alone), show that railway politics play a very prominent part in Swiss national life. They are, too, complicated by many local rivalries, which in this country are of greater importance than
elsewhere because of the considerable share of power still legally belonging to the cantons. Another kindred question (owing to the rapid development of electric traction in Switzerland) is the equitable proposal (accepted in 1908) that the utilization of the immense force supplied by the many rivers and torrents in Switzerland should become a Federal monopoly, so as to supply the demand for objects that it cannot itself produce. But Prince Bismarck's protectionist policy in Switzerland should dwarf forever the whole question. The principle of the early Swiss. One of the earliest and most famous of these was composed by Hans Halsburter of Lucerne to commemorate the glorious fight of Sempach (1386), not far from his native town. The boisterous serenades of Näfels (1388) and the battles of Grandson and Morat (both 1476) in the Burgundian War, while in the 14th century the Dominican friar Ulrich Boner of Bern versified many old fables. Still more important are the historical documents relating to the liberation of Switzerland. In the 14th century we have Christian Kuchimich's continuation of the annals of the famous monastery of St Gall, in the early 15th century the rhymed and unrhymed histories of the war between the Swizer and the abbott of St Gall, and rather later in the same century the chronicles of Conrad Justinger of Bern and Hans Fründ (d. 1469) of Lucerne, besides the fantastical chronicle of Strattlingen and a scarcely less fanciful poem on the supposed Scaco Lavinian in the men of Schwyz and of Ober Hasle, both by Eulogius Kiburger (d. 1506) of Bern. In the 15th century, too, we have the White Legend of Sarnen and the first Tell song (see Tell), which gave rise to the well-known legend, as well as the rather later play named the Unersbieli dealing with the same subject. The Burgundian War witnessed a most outburst of historical ardour in the shape of works written by Ulrich von Hutten by order of the Swiss Russ (d. 1490), Diebold Schilling (d. between 1516 and 1523) and Petermann Eiterlin (d. 1509), all three of Lucerne as well as by Gerold Edlbich (d. 1530) of Zürich, and by Johannes Lenz (d. 1541) of St Gall. The veritable and the fable, the historical and the legendary, are united in the works of the Confederation, those by Albert von Bonstetten of Einsiedeln (1479) and by Conrad Türst of Zürich (1496), to whom also we owe the first map of the country (1496-1497).

Humanism in Latin, as did also, what was more surprising, the Swiss Reformers, at any rate for the most part, though the Zürich Bible of 1531 forms a striking exception. We have Hans Maninger (1484-1530), a well-known Swiss satirical poems in German against the pope, while Valerius Anshelm (d. 1540), also of Bern, wrote one of the best Swiss chronicles extant. Gilles Tschundi (q.v.) of Glarus, despite great literary activity, published a pamphlet (nicknamed the "Reussbiel") of 1498 by Aulfrich Rhaetae vom Tract der anderen Auffgeborgen (1538) besides his map of Switzerland (same date). Sebastian Münster (q.v.), who was a Swiss by adoption, published (1544) his Cosmographicum, a Latin geographical catalogue of the German, compiled by his son Hans, born in 1550. But the many-sided Conrad Gesner (q.v.), a born Swiss, wrote all his works in Latin, German translations appearing only at a later date. Thus the first important original product in German was the very remarkable and elaborate history and description of Switzerland, issued in 1548 at Zürich by Johannes Stumpf (q.v.) of that town. But Josias Simler (q.v.), who was in his way a continuator, wrote all his works in Latin. To the topographical and geographical literature (q.v.) engraved many plates, which were issued in a series of volumes (1562-1688) under the general title of Topographia, the earliest volume describing Switzerland, while all had a text in German by an adherent of the French, Martin Zeiller (q.v.). His cartography and the autobiography of the Valais scholar Thomas Platter (1499-1582) and the diary of his still more distinguished son Felix (1536-1614), both written in German, though not published till 1665, but gradually Swiss historical writers gave up the use of Latin for their native tongue, so Michael Stettler (1580-1642) of Bern, Franz Haffner (1609-1671) of Soleure, and quite a number of Grisons authors (though the earliest in date, Ulrich Campell of Surs, c. 1500-1582, still clung to Latin), such as Bartholomew Anhorn (1560-1640) and his son of the same name (1616-1670) and Johann Guler (1562-1677). Yet Fortunatus Sprecher (1545-1647) preferred to write his Palatinsregister in Latin as did Johann Haimbold (1565-1654) in the case of his autobiography. But we have some compensation in the delightful autobiography of Hans Arderuz of Davos (1557-1614) and in the numerous autobiographies of the Swiss by the Stockborn by Hans Rudolf Rebellmann (1665-1669), both composed in naive German. J. B. Plantin (1625-1697) wrote his description of Switzerland in Latin, Helvetia nova et antiqua (1699), while J. W. Rothensteiner (1639-1717) of Germany, despite its title Index memorabilium Helvetiae (1684) and Mercurius helveticus (1688), though he issued his scientific description of his native land in Latin, Historia naturalis Helvetiae cantonum (1721).

In the 18th century the intellectual movement in Switzerland greatly developed, though it was naturally strongly influenced by local characteristics. Basel, Bern and especially Zürich were the chief literary centres. Basel was particularly distinguished for its mathematicians, such as Jakob Bernoulli, whose eldest son Johann (1667-1705) and the latter's son Daniel (1700-1782). But its chief literary glory was Isaac Iselin (1728-1783), one of the founders of the Helvetian Society.
SWITZERLAND

LITERATURE

(1760) and of the Economical Society (1777), and a treatise on the philosophy of history entitled Geschichte der Menschheit (1764), and of another on ideal politics, Philosophische und patriotische Schriften (1779). Among the economists of the first half of the 18th century, the most important were the Bernese Johann Kaspar von Thouret (1680-1868), the author of Tristis im Morgenrot (1842), which, set to music by the Cistercian monk Alberic Zwysig (1688-1854), is now known as the 'Swiss Psalm,' of La lèse in jeder Schweizerchristli and the song, Here, my Herr, such as to turn him Johannis Georg Krause (1792-1845), of Lucerne, wrote the Rüttileli, Von ferne sei herzlich gegrüsset, and Gottfried Keller himself was responsible for O mein Alpries (1835-36), the forerunner of the Swiss mountain novel in the Bernese dialect as to the Alps and their inhabitants. Less national in sentiment and more metaphysical are the lyrics of "Omarxon," the pen-name of the Bernese Ferdinand Schmid (1823-1888).

Among the chief contemporary Swiss writers in the department of belles-lettres, novelists, poets, &c., may be mentioned Ernst Zahn, Meinhard Lienert, Arnold Ott, Carl Spitteler, Fritz Marti, Walther Siegfried, Adolfr Frey, Hermann Hesse, J. C. Herz, J. V. Widmann, and Gottfried Strasser.

Isabella Kaiser, by her poems and stories, upholds the honour of the rural.
of Goulart and that (published officially by the government) attributed to Jean Sarasin (1754-1762), the author of the *Clavien de Genève* (1666), are more laconic and more striking. J. B. Planiot (1728-1769), whose three volumes of *La légende antique et nova* (1666), in Latin, but his *Abrégé de l'histoire générale de la Suisse* (1666) in French, while Georges de Montmollin (1628-1702) of Neuchâtel wrote, besides various works as to local history, *Histoire de l'Inquisition* (1697), besides the historical works by the other genealogists and the like, that is, such wanderings, so that, with obvious differences, he may be regarded not merely as the forerunner, but as the inspirer and model of the historians who were to follow. His title, incidentally, was *De la Suisse* and even his *Histoire de l'Inquisition* shows the impress of his native tongue, which was with his family, foxed thither after the Revocation of the Edict of Nantes (1689) and settled down there for the rest of their lives. Such was Louis Bourget (1768-1794), who, besides his geological work, was a prominent lawyer, Emomont in 1783 and 1785 to stimulate the intellectual life of the Suisse Romand; these were the *Bibliothèque italique* (1729-1734), which aimed at making more widely known the results of Italian research, and the *Mercure suisse* (1743-1757). Amongst the names (from 1738 onwards the literary section bore the name of *Journal helvétique*), and secured contributions from most of the leading writers of the Suisse Romand of the day, such as Alazard (1676-1767), Abraham Ruchat (1767-1792), and others. Ruchat is now best remembered as the author (under the pen-name of Gottlieb Kysycler) of an excellent guide-book to Switzerland, literature, as do later Jacob de Witte (q.v.), early in 1731 and 1732, published through many editions, the latest being issued in 1778; but his *Histoire de la Réformation de la Suisse* (1727-1728) was much esteemed in his day. Another Vaudois historian and antiquary was Charles de Saussure (1750-1802) of Genève, whose *Critiques sur divers points de l'ancienne histoire de la Suisse* (1757-1749) still form a treasure-house for archaeologists. Yet a third writer of the Swiss French school, of the type of *Dictionnaire de la langue française* and the *Histoire de la langue française* he produced there the philosophy of Descartes, and was, by his books, the master of Gibbon in logic. A French refugee at Lausanne, Jean Barbevray (1674-1744), published in 1712 the *Droit de la société* (the word is that of Diderot), which is regarded by some as the striking preface of his own. A precursor of Montesquieu and of Rousseau was Jean Jacques Burlamaqui (1664-1750) in his *Principes du droit naturel et politique* (1747 and 1751, issued together in 1763), which was awarded by the French Academy of Law and by the Genevois of the Philokrus (q.v.); besides this, he was an active editor of the *Annuaire de Genève* (1767), was a native of Neuchâtel by birth and descent, and, though he spent most of his life at foreign courts, died at Neuchâtel, not so very long after the publication of his famous *Droit des gens* (1758). The first edition of *Dictionnaire de l'histoire naturelle* (q.v.) was issued in 1749 by Roman de, in that year Rousseau came back for good to Geneva, and Voltaire established himself at Ferney, while in 1753 Gibbon had begun his first residence (which lasted till 1768) in Lausanne. The earlier writers mentioned above had then nearly all disappeared, and a more brilliant set took their place. But Rousseau (q.v.), though a Genevois, belongs rather to European than to Swiss literature, and the emigration of his celebrated disciple and principal guiding light did not hinder the Swiss from pursuing the same researches into the manners and local customs of genealogical families, and especially of the nobility. The friends of the arts and of military science, and the industrious fry that followed, were the efforts of a group of men to spread the cause of natural science by personal investigations in the higher Alps, but little known at the time or at least not generally disseminated, excepted by the scientific and psychological speculations of Charles Bonnet (q.v.). The chief of this school was H. B. de Saussure (q.v.) one of the founders of geology and meteorology, while his Alpine geologists and geographers, such as Paul de Vial, were more numerous than ever. Such were also the beginning of a process of researches in the causes of natural phenomena, and then the beginning of a world even than to the scientific traveller. The brothers De Luc (q.v.) devoted themselves mainly to questions of physics in the Alps, while Senevir (q.v.), the biographer of Saussure, was more known and his work is more widely disseminated. In 1849, while the* Britannica* was the earliest of the Vaudois poets by virtue of his *Poesies helvetiennes* (1782). But he is better known as the painter of the scenery and people among whom he worked as pastor at Basel, at Château d'Oex, and on Montreux successively. *Histoire de la Suisse* and others were published by the government. was thoroughly revised (10th edition) in 1904, while it is not necessary to do more than mention the guide-books of Bädeker and Joos, of which the first appears (that by Iwan von Tschud) is no longer kept up to date.

The best maps of Switzerland are those published by the Federal Topographical Bureau at Bern. One, called the director of the cartographic department G. H. Dufour's map (3 vols., 1845-1865, 1: 100,000), was published in twenty-five sheets between 1845 and 1863 (see the detailed history of this map in the work entitled Die schweizerischen Landeskarten). Dufour's map, however, has been practically superseded by the issue (revised and corrected) of the original survey (scale 1: 25,000 for the plains and 1: 50,000 for the mountain districts) in 596 sheets, of which the publication began in 1952. (When this latter edition was executed, it is named the Siegfried Atlas, from the successor of Dufour at the head of the survey, Hermann Siegfried (1819-1879). The history of Swiss travel books is too long to be given here (see Baedeker, Bunsen, and W. A. B. Coolidge, Swiss Travel and Swiss Guide-Books (London, 1889). That of the exploration of the Swiss Alps is contained in Gottlieb Studer's of travel and science (Berlin, 3 vols., ed. 1866-1869), and also in the work Bernhard Studer's Geschichte der physischen Geographie der Schweiz bis 1815 (Bern, 1863) describes the gradual examination of the country from the scientific point of view. The last-named work Anfragen and the Schnell in 1802, considered as the later Die Landschaftsproben der Schweiz (Aarau, 1816).

The Archiv für Volktschulw, published by the Société des traditions populaires (Zurich, from 1897), contains much that is interesting in the way of folklore, while for Swiss legends in general consult Ed. Kohlmann, Schweizerische Sagenbuch (Leipzig, 1854); A. Lüttolf, Sagen, Bräuche, Legenden aus den fünf Orien (Lucerne, 1862); M. Teichmann and J. P. Ruppen, Wallis-Sagen (Sion, 1892), in 3 vols., and L. Bickel, Recherches sur le folklore du district de l'Engadin (Lucerne, 1900); the rest to the Ladin dialect of the Engadine. F. J. Stalder's Versuch eines schweizerischen Idiots (2 vols., 1876-1812) is a later work Die Landeskunde der Schweiz, is a later work Die Landeskunde der Schweiz, (Aarau, 1816).

Geschichte des Baus der Gotthardbahn (Lucerne, 1888). For a general estimate of the commercial importance of the Simplon railway, see A. Möhring, Die Simplonbahn — eine verkehrswirtschaftliche Studie (Bern, 1907). For a technical description of the work, consult E. G. Gladbach’s Die Hoh-Architektur der Schweiz (2nd ed., Leipzig, 1885)—the same author has also issued several series of handbooks on related subjects. As for the general history of railroad construction in general is represented by J. Hunziker’s Das Schweizerbahnwesen (Aarau, 1907), which includes 4 vols. dealing respectively with the Valais (1905), Ticino (1902), the Grisons and Graubünden (1905), and the Jura with Berne, Fribourg, and Neuchâtel (1908). While the books, are given in each case. For Swiss glass painting, see H. Meyer’s Die schweizerische Sitte der Fenster- und Wappenschenkung (Zurich, 1899); J. H. Haendler’s Die Schmuckmalerei in der Schweiz. Malerei im xvi. Jahrhundert unter Berücksichtigung der Glasmalerei, des Formschmucks, und des Kufertisches (Aarau, 1893); while Swiss fresco painting is treated of in Conrad Escher’s Geschichte der Kunst in der Schweiz vom xiv. bis zum Anfang des xvi. Jahrhunderts (Strassburg, 1906); while the town shields are depicted in F. Küpper’s Armorial des villes suisses (Basel, 1889); and their seals in E. Schulze’s Die Stempel der Vereine der deutschen Stadt- und Landesteile der Schweiz (Zurich, 1892). While early Swiss heraldry is historically described in P. Ganz’s Geschichte der herald. Kunst in der Schweiz im xvi. und xxi. Jahrhundert (Frauenfeld, 1908), while the most recent treatments are by C. Schuhardt’s Beiträge zur Geschichte der Schweizer Armorial (Zurich, 1906), while H. Heer in his Die schweiz. Malerei des xix. Jahrhunderts (Leipzig, 1905), has printed his lectures relating to most of the best-known modern artists. In the communities of modern Swiss industries and commerce, while each of the departments of Swiss art have appeared, two of the most striking being the three series of Handzeichnungen schweizerischer Meister des 16. Jahrhunderts (Basel, 1904); and the Kunstdenk- galler der Schweiz (2nd series, Geneva, 1908, 1909) to which may be add R. Anheiser’s Alt-schweizerische Baukunst (Bern, 1906-1907); R. Hinderer, Alte schweizer Bauweise (Frankfort, 1907); and the catalogues of the Schiller-Museum in Stuttgart, while C. Dehnhälder’s Die Schweiz. The most artistic and accurate reproductions of Swiss costumes are the thirty-six coloured plates, drawn after originals, published by Fr. Julie Heieler (Zürich, 1897, and of the title Die Schweizer Trachten vom xvi.-xxi. Jahrhunderti. b. History.—The great collection (officially published in 32 vols., 1898-1905) entitled Amtliche Sammlung der ältern eidgenössischen Stellungsnamen all der reckess der Diet, &c., from 1745 to 1860, and is absolutely indispensable. A series of selected extracts from chronicles, documents, &c., is given in W. Oechslis Quellenbuch zur Schweizgeschichte (2 vols., 2nd ed. of vol. I, 1901, and 1st ed. of vol. ii., Zürich, 1893). The texts (with short introductions) of all the Federal Constitutions from 1798 onwards are conveniently collected in S. Kaiser and J. Streckier’s Geschichte und Texte der konstitutionen der schweiz (Zurich, 1899); while of the state constitutions (except for the constitution of the Kanton Uri) are collected by C. Hilty in his Die Bundesverfassungen der schweiz. Eidgenossenschaft (Bern, 1916; &c., in French). For more recent documents and laws see the Amtliche Sammlung der Bundesgesetze (from 1848 onwards), which are conveniently arranged and classified by P. Wolf in his Die schweizerische Bundesgesetzgebung (2nd ed., 3 vols., Basel, 1905-1906). G. von Wyss’s Geschichte der Historiographie in der Schweiz (Zurich, 1898) is an admirable guide to the works and lives of all Swiss historians up to about 1850, while all articles (published in Swiss periodicals from 1812 to 1900) relating to the subject are most carefully indexed and classified in J. L. Dietiker’s Die Schweizer Geschichtsschreiber und Geschichts- sammlerschriften enthaltenen Aufsätze und Mitteilungen schweizer- geschichtlichen Inhaltes (2 vols., Basel, 1892 and 1906). The latest revised texts of the Federal Constitution and (often of the cantonal constitutions) have been published in the last official collection of all in one volume dates from 1891 (Reuvue des constitutions fédérales et cantonales), since which time many changes have taken place. It is a very valuable present-day knowledge of Swiss matters gained in C. Hilty’s Politisches Jahrbuch der schweiz. Eidgenossenschaft (published at Bern annually since 1886).
SWITZERLAND

BIBLIOGRAPHY

Lehrbuch für den Geschichtsunterricht in der Sekundarschule (Zürich, 1885), is very accurate and handy. Far more popular in style than any of the preceding works is: J. Heierli, Die chrestottes Französischen Gesellschaft in der Schweiz (Basel, 1891). For a survey of the developments in the late medieval period, see J. Pietermans, Le Moyens Âges (Brussels, 1896). Further studies are: H. Yffel, Geschichte der Schweiz (Zürich, 1894); J. E. Kopp, Geschichte der eidgenössischen Bündnerzeit (Zürich, 1901); and J. Heierli, Geschichte der Schweiz (Zürich, 1901).}

The authentic early history of the Confederation (seealso F. Kloss, Tschudi, and R. A. Stettler, Die Geschichte der Schweiz, 1798-1901) and the early period of the confederation (1815-1850) are described in a single volume by J. E. Kopp, Geschichte der Eidgenossenschaft (Zürich, 1891), also in French. For a more detailed study of the early period of the confederation (1815-1850), see J. E. Kopp, Geschichte der Eidgenossenschaft (Zürich, 1901), and in the field of political science, see J. E. Kopp, Geschichte der Schweiz (Zürich, 1901). For the later period of the confederation (1850-1900), see J. Heierli, Geschichte der Schweiz (Zürich, 1901).

The best works on the political history of Switzerland are: E. Bührer, Die Politische Geschichte der Schweiz (2 vols., Basel, 1861-1864); and E. Bührer, Die Politische Geschichte der Schweiz (2 vols., Basel, 1861-1864). These works are followed by J. E. Kopp, Geschichte der Eidgenossenschaft (Zürich, 1891), and in the field of political science, see J. E. Kopp, Geschichte der Schweiz (Zürich, 1901).

The best works on the political history of Switzerland are: E. Bührer, Die Politische Geschichte der Schweiz (2 vols., Basel, 1861-1864); and E. Bührer, Die Politische Geschichte der Schweiz (2 vols., Basel, 1861-1864). These works are followed by J. E. Kopp, Geschichte der Eidgenossenschaft (Zürich, 1891), and in the field of political science, see J. E. Kopp, Geschichte der Schweiz (Zürich, 1901).
SWOLD, BATTLE OF—SWORD

1. Historical.—There are some called swords of wood and even stone to be found in collections of savage weapons. But these are really flattened clubs; and the present writer *Origenas* and agrees with the late General Pitt-Rivers in not believing that such modifications of the club have had any appreciable influence on the form or use of true swords. For this point, however, the opinions of competent archaeologists have been much divided. We will only remark that the occurrence in objects of human craftsmanship of a form, or even a series of forms, intermediate between two types is not conclusive evidence that those forms are historical links between the different types, or that there is any historical connexion at all. In the absence of dates fixed by external evidence this kind of comparison will seldom take us beyond plausible conjecture. A traveller who had never seen velocipedes might naturally suppose, on a first inspection, that the tricycle was a modification of the old four-wheeled velocipede, and the bicycle a still later development. We will now show that in fact the order of development was quite different.

It is more difficult as a matter of verbal definition to distinguish the sword from smaller hand weapons. Thus an ordinary sword is four or five times as long as an ordinary dagger: but there are long daggers and short swords; neither will the form of blade or handle afford any certain test. The real difference lies in the intended use of the weapon; we associate the sword with open combat, the dagger with a secret attack or the sudden defence opposed to it. One might say that a weapon too large to be concealed about the person cannot be called a dagger. Again, there are large knives, such as those used by the Afriids and Afghans, which can be distinguished from swords only by the greater breadth of the blade as compared with its length.

Again, there are special types of arms, of which the yataghan is a good example, which in their usual forms do not look much like swords, but in others that occur must be classed as varieties of the sword, unless we keep them separate by a more or less artificial theory, referring the type as a whole to a different origin.

Of the actual origin of swords we have no direct evidence. Neither does the English word nor, so far as we are aware, any of the equivalent words in other languages, Arvand or otherwise, throw any light on the matter. Daggers shaped from reinder antlers occur among the earliest relics of man, and there are flint daggers of the Neolithic period, which may possibly have been the model for the first hand weapons made of copper. Bronze took the place of copper about 2000 B.C., and the transition from bronze to iron is assigned to the period from 1000 to 700 B.C.1 Whatever may be the further discoveries of archaeologists, we know that swords are found from the earliest times and an important weapon in the history of man. The *Discoveries in Crete* (1907), p. 214. As it Britain, O. Montellius in *Archaeologia*, 61, pp. 155-6; *Cowper, Art of Attack*, 124 sqq. (Ulverston, 1906).

SWORD (O. Eng. sword; ultimately from an Indo-European root meaning to wound), a general term for a hand weapon of metal, characterized by a longish blade, and thus distinct from all missile weapons on the one hand, and on the other hand from staff weapons—the pike, bill, halberd and the like—in which the metal head or blade occupies only a portion of the effective length. The handle of a sword provides a grip for the hand that wields it, or sometimes for two hands; it may add protection, and in most patterns does so to a greater or less extent. Still it is altogether subordinate to the blade. For want of a more impressed handle, a lance or axe, which indeed were of later invention, a sharpened pole or a thin-edged paddle will serve the turn. But a sword-handle without a blade is naught; and no true sword-blade can be made save of metal capable of taking an edge or point.

The formation of the Baltic coast has been much modified in the course of subsequent centuries, partly by the gradual settling up of the sea, and partly by the storms of the 19th century. The island was an island probably on the North German coast, near Rügen. The battle was fought between Olaf Trygvesson, king of Norway, and a coalition of his enemies—Eric Hakonson, his cousin and rival; Olaf, the king of Sweden; and Sweyn Forkbeard, king of Denmark. The poets, and the poetically minded authors of the sagas, who are the only authorities, have told the story with many circumstances of romance. But when the picturesque details, which also have no doubt at least a foundation of truth, and which add to the real value, the account of the battle still presents a very trustworthy picture. The sea-fights of the Norsemen. Olaf had been during the summer in the eastern Baltic. The allies lay in wait for him at the island of Swold on his way home. The Norse king had with him seventy-one vessels, but part of them belonged to an associate, Sigwald, a chief of the Jomsborg vikings, who was an agent of his enemies, and who deserted him. Olaf’s own ships went past the anchorage of Eric Hakonson and his allies in a long column without order, as no attack was expected. The king was in the rear of the whole of his best vessels. The allies allowed the bulk of the Norse ships to pass, and then partly by attack Olaf might have run past them by the use of sail and oar; escape, but with the true spirit of a Norse warrior he refused to flee, and turned to give battle with the eleven ships immediately about him. The disposition adopted was one which is found recurring in many sea-fights of the middle ages where a fleet had to fight on the offensive. Olaf lashed his ships side to side, his own—the “Long Serpent,” the finest war-vessel as yet built in the north—being in the middle of the line, where her bows projected beyond the others. The advantage of this arrangement was that it left all hands free to fight, a barrier could be formed with the oars and yards, and the enemy’s chance of making use of his superior numbers to attack on both sides would be, as far as possible, limited—a great point when all fighting was with the sword, or with such feeble missile weapons as bows and javelins. The Norse long ships were high in the bulwark—or, as the Greeks would have said, “ca photra.” Olaf, in fact, turned his eleven ships into a floating fort. The Norse writers, who are the only authorities, gave all the credit to their own countrymen, and according to them all the intelligence of Olaf’s enemies, and most of their valour, were to be found in this. It is said that the Danes and Swedes rushed at the front of Olaf’s line, which the Greek writer Eric Hakonson attacked the flank. His vessel, the “Iron Rock,” was “bearded,” that is to say, strengthened across the bows by bands of iron, and he forced her between the last and lost but one of Olaf’s line. In this way the Norse ships were carried one by one, till the “Long Serpent” alone was left. At last she too was overpowered. Olaf leapt into the sea holding his shield edgeways, so that he sank at once and the weight of his hauberk dragged him down. A legend of later days has it that at the last moment a sudden blaze of light surrounded the king, and when it cleared away he had disappeared.
times of which we have any record among all people who have acquired any skill in metal-work. There are two very ancient types, which we may call the straight-edged and the leaf-shaped. Assyrian monuments represent a straight and narrow sword, better fitted for thrusting than cutting. Bronze swords of this form have been found in many parts of Europe, at Mycenae, side by side with leaf-shaped specimens, and more lately in Crete. 

We have also from Mycenae some very curious and elaborately wrought blades, so broad and short that they must be called ornamental daggers rather than swords. The leaf-shaped blade is common everywhere among the remains of men in the "Bronze Period" of civilization, and this was the shape used by the Greeks in historical times, and is the shape familiar to us in Greek works of art. It is impossible, however, to say whether the Homeric heroes were conceived by the poet as wearing the leaf-shaped sword, as we see it, for example, on the Mausoleum sculptures, or a narrow straight-edged blade of the Minoan and Mycenaean pattern. In any case, the sword holds a quite inferior position with Greek warriors of all times.

Independence appears, on the whole, slightly more probable; the existence of specimens which might belong to an intermediate type is only an ambiguous fact without a more exact chronology than we have as yet, as it may be due to experiment or imitation after both types were in use. Strange as it is to a modern swordsmanship, representations in Minoan art seem to show that not only the bronze daggers but the long swords were used with an overhand stabbing action like a modern Asiatic dagger. The handles are too short for any but a rigid grip without finger-play. Before about 1500 B.C. the rapier type was the prevailing one; but there is no evidence of historical connexion between the Assyrian and the Minoan rapiers. It is thought that the leaf-shaped blade came to the Mediterranean countries from the north. So far as we know from works of art, it was mostly used with a downright cutting blow, regardless of the consequent exposure of the swordsman's body; this, however, matters little when defence is left to a shield or armour, or both. Attic vases also show warriors giving, point, though less often. The use of the sword as a weapon of combined offence and defence—swordsmanship as we now understand it—is quite modern. If the sword was developed from a spearhead or dagger, it would naturally have been (and it seems in fact to have been) a thrusting weapon before it was a cutting one. But when we come to historical times we find that uncivilized people use only the edge, and that the effective use of the point is a mark of advanced skill and superior civilization. The Romans paid special attention to it, and Tactius tells us how Agricola's levies made short work of the clumsy and pointless arms of the Britons when battle was fairly joined. The tradition was preserved at least as late as the time of Vegetius, who, as a technical writer, gives details of the Roman soldier's sword exercise. Asiatics to this day treat the sword merely as a cutting weapon, and most Asiatic swords cannot be handled in any other way.

The normal types of swords which we meet with in historical times, and which from all forms now in use among civilized nations are derived, may be broadly classified as straight-edged or curved. In the straight-edged type, in itself a very ancient type, the thrusting or cutting qualities may predominate, and the blade may be double-edged or single-edged. The double-edged form was prevalent in Europe down to the 17th century. The single-edged blade, or back-sword as it was called in England, is well exemplified among the Scottish weapons commonly but improperly known as claymores (the real claymore, i.e. great sword, claidheamh mor, is an earlier medieval form), and is now all but exclusively employed for military weapons. But these, with few exceptions, have been more or less influenced by the curved Oriental saber. Among nearly double-edged swords the Roman pattern (gladius, the thrusting sword, contrasted with the barbarian eunx) stands out as a workmanlike and formidable weapon for close fight. In the middle ages the Roman tradition disappeared, and a new start was made from the clumsy barbarian arm which the Romans had despised. Gradually the broad and all but pointless blade was lightened and tapered, and the thrust, although its real power was unknown, was more or less practised from the 12th century onwards. St Louis anticipated Napoleon in calling on his men to use the point; and the heroes of dismounted combat in the Mort de Arthur are described as "jouant" at one another. In the first half of the 16th century a well-proportioned and well-mounted cut-and-thrust sword was in general use, and great artistic ingenuity was expended, for those who could afford it, on the mounting and adornment. The growth and variations of the different parts of the hilt, curiously resembling those of a living species, would alone be matter enough for an archaeological study. One peculiar form, that of the Scottish basket-hilt, derived from the Venetian pattern known as schiavone, has persisted without material change. As the spear still retains historical times (Furtwängler-Reichold, Gr. Vasenmalerei, iii. 122).

1 The Cretan finds are fully described by Arthur J. Evans, "The Prehistoric Tombs of Knossos" (Archaeologia 1905), 59, pt. 2; also separately published (1906). There are long (61-95 cm., 34-1 in. -37 1 in.) and short (50-61 cm., 20-24 2 in.), swords, daggers and bronze knives. A fine original specimen and several facsimiles (Mycenaean as well as Minoan) may be seen in the Ashmolean Museum at Oxford. Bronze daggers preceded both swords and spearheads (Greenwell and Brewis, in Archaeologia, 61, pp. 443. 453).

2 Agric. 36: "Britannorum gladii sine murcore complexum armorum et in aperto pugnam non tolerabant." The short Roman infantry sword, however, dates only from the Second Punic War.
Quite different from the European models is the crescent-shaped Asiatic sabre, commonly called scimitar. We are not acquainted with any distinct evidence as to the origin of this in time or place. Dr. R. Forrer thinks the whole family of curved swords was developed from bronze knives. The Frankish *scimasax* would then represent an intermediate type. However that may be, the fame of the Damascus manufacture of sword-blades is of great antiquity, as is also that of Khorasan, still the centre of the best Eastern work of this kind. Whoever first made these blades had conceived a very definite idea—that of gaining a maximum of cutting power regardless of loss in other qualities—and executed it in a manner not to be improved upon. The action of the curved edge in delivering a blow is to present an oblique and therefore highly acute-angled section of the blade to the object struck, so that in effect the cut is given with a finer edge than could safely be put on the blade in its direct transverse section. In a well-made sabre the setting of the blade with regard to the handle ("leading forward") is likewise ordered with a view to this result. And the cutting power of a weapon so shaped and mounted is undoubtedly very great. But the use of the point is abandoned, Easterners adhere to their rigid grasp of a small handle and sweeping cut delivered from the shoulder, the Persian scimitar or Indian talwar will remain the natural weapon of the eastern horseman. Indian and Persian swords are often richly adorned; but their appropriate beauty is in the texture of the steel itself, the "damascening" or "watering" which distinguishes a superior from a common specimen.

There are special Asiatic varieties of curved blades of which the origin is more or less uncertain. Among these the most remarkable is perhaps the yataghan, a weapon pretty much conversant with the Mahommedan world, though it is reported to be not common in Persia. It was imported from Africa, through a French imitation, as the model of the sword-bayonets which were common for about a generation in European armies; probably the French authorities caught at it to satisfy the sentiment, which lingered in continental armies long after it had disappeared in England, that even the infantry soldier after the invention of the bayonet must have some kind of sword. A compact and formidable hand weapon was thus turned into a clumsy and top-heavy pike. If we try to make a bayonet that will cut cabbages, we may or may not get a useful chopper, but we shall certainly get a very bad bayonet. The modern short sword-bayonet is a reversion to the original dagger type, and not open to this objection. The double curve of the yataghan is substantially identical with that of the Gurkha knife (*kukri*), though the latter is so much broader as to be more like a woodman's than a soldier's instrument. It is doubtful, however, whether there is any historical connexion. Similar needs are often capable of giving rise to similar inventions without imitation or communication. There are yet other varieties, belonging to widely spread families of weapons, which have acquired a strong individuality. Such are the swords of Japan, which are the highly perfected working out of a general Indo-Chinese type; they are powerful weapons and often beautifully made, but a European swordsman would find them ill-balanced, and the Japanese style of sword-play, being two-handed, has little to teach us.

Other sorts of weapons, again, are so peculiar in form or historical derivation, or both, as to refuse to be referred to any of the normal divisions. The long straight gauntlet-hilted sword (pold, fig. 3) found both among the Maharratas in the south of India and among the Sikhs and Rajputs in the north, is an elongated form of the broad-bladed dagger with a broad-handled hilt (ko'der, figs. 9, 10), as is shown by a transitional form, much resembling in shape and size of blade the medieval English anlase, and furnished with a guard for the back of the hand. This last-mentioned pattern seems, however, to be limited to a comparatively small region. When once the combination of a long blade with the gauntlet hilt was arrived at, any straight blade might be so mounted; and many appear on examination to be of European workmanship—German, Spanish or Italian. There are various other Oriental arms, notably in the Malay group, as to which it is not easy to say whether they are properly swords or not. The Malay "parang latok" is a kind of elongated chopper sharpened by being bevelled off to an edge on one side, and thus capable of cutting only in one direction. The anlase incidentally mentioned above seems to be merely an overgrown dagger; the name occurs only in English and Welsh; in which language first, or whence the name or thing came, is unknown.

In the course of the 16th century the straight two-edged sword of all work was lengthened, narrowed, and more finely pointed, till it became the Italian and Spanish rapier, a weapon still furnished with cutting edges, but used chiefly for thrusting. We cannot say how far this transition was influenced by the *estoc* or Powerstecher, a late medieval thrusting weapon carried by horsemen rather as an auxiliary lance than as a sword. The Roman preference of the point was rediscovered under new conditions, and fencing became an art. Its progress was from pedantic complication to lucidity and simplicity, and the fashion of the weapon was

---

1. Probably this was the kind of sword called *broch* in 14th-century English (Evre of Kent, Selden Soc., 1910, p. 100).
SWORD

simplified also. Early in the 18th century, the use of the edge having been finally abandoned in rapier-play, the two-edged blade was supplanted by the bayonet-shaped French duelling sword, on which no improvement has since been made except in giving it a still simpler guard. The name of rapier was often but wrongly given to this by English writers. About the same time, or a little earlier, the primacy of the art passed from Italy to France. There is still a distinct Italian school, but the rest of the world learns from French masters. It is unnecessary here to consider the history of fencing (q.v.); Mr Egerton Castle's book on the subject will be found a trustworthy guide, and almost indispensable for those who really wish to understand the passages relating to sword-play in our Elizabethan literature, of which the fencing scene in Hamlet is the most famous and obvious example.

9. German flamberg, early 17th century.
10. Small-swords, 1700-1750.

Meanwhile a stouter and broader pattern, with sundry minor varieties, continued in use for military purposes, and gradually the single-edged form or broadsword prevailed. The well-known name of Ferrara, peculiarly associated with Scottish blades, appears to have originally belonged to a Venetian maker.

or family of makers, towards the end of the 16th century. The Spanish blades made at Toledo had by that time acquired a renown which still continues. Somewhat later Oriental examples, imported probably by way of Hungary, induced the curvature found in most recent military sabres, which, however, is now kept within such bounds as not to interfere with the effective use of the point. An eccentric specialized variety—we may call it a "sport"—of the sabre is the narrow and flexible "Schläger" with which German students fight their duels (for the most part not arising out of any quarrel, but set trials of skill), under highly conventional rules almost identical with those of the old English "backswording" practised within living memory, in which, however, the swords were represented by sticks. These "Schläger" duels cause much effusion of blood, but not often serious danger to life or limb.

There are plenty of modern books on sabre-play, but comparatively little attention has been given to its scientific treatment. It is said that the Italian school is better than the French, and the modern German and Austrian the best of all. Some of the English cavalry regiments have good traditions, enriched by the application of a knowledge of fencing derived from eminent French masters.

The following description, written for the 9th edition of this work from personal inspection, applies to the process used by the best private makers till near the end of the 19th century, and is purposely left unchanged. The present method of making army swords is separately described, below. 'Mechanical invention has not been able to supersede or equal hand-work in the production of good sword-blades. The swordsmith's craft is still, no less than it was in the middle ages, essentially a handicraft, and it requires a high order of skill. His rough material is a bar of cast and hammered steel tapering from the centre to the ends; when cut in two each half is made into a sword. The "tang," which fits into the handle is not part of the blade, but a piece of wrought iron welded to its base. From this first stage to the finishing of the point it is all hammer and anvil work. Special tools are used to form grooves in the blade according to the regulation or other pattern desired, but the shape and weight of the blade are fixed wholly by the skilled hand and eye of the smith. [Machine forging in the early stages is now common, and there is no difficulty in making the blade and tang of the same metal.] Measuring tools are at hand, but are little used. Great care is necessary to avoid overheating the metal, which would produce a brittle crystalline grain, and to keep the surface free from oxide, which would be injurious if hammered in. In tempering the blade the workman judges of the proper heat by the colour. Water is preferred to oil by the best makers, notwithstanding that tempering in oil is much easier. With oil there is not the same risk of the blade coming out distorted and having to be forged straight again (a risk, however, which the expert swordsmith can generally avoid); but the steel is only surface-hardened, and the blade therefore remains liable to bend. [This is disputed.] Machinery comes into play only for grinding and polishing, and to some extent in the manufacture of hilts and appurtenances. The finished blade is proved by being caused to strike a violent blow on a solid block with the two sides flat, with the edge, and lastly with the back; after this the blade is bent flatwise in both directions by hand, and finally the point is driven through a steel plate about an eighth of an inch thick. In spite of all the care that can be used both in choice of material and in workmanship, about 40% of the blades thus tried will have only about 10% fail to stand the proof, and are rejected. The process we have briefly described is that of making a really good sword; of course, plenty of cheaper and commoner weapons are in the market, but they are hardly fit to trust a man's life to. It is an interesting fact that the peculiar skill of the swordsmith is in England so far hereditary that it can be traced back in the same families for several generations.

The best Eastern blades are justly celebrated, but they are not better than the best European ones; in fact, European swords are often met with in Asiatic hands, remounted in Eastern fashion.
The "damascening" or "watering" of choice Persian and Indian arms is not a secret of workmanship, but is due to the peculiar manner of making the Indian steel itself, in which a crystallizing process is set up; when metal of this texture is forged out, the result is a more or less regular wavy pattern running through it. There were early medieval damascened (in German called wurmbunte) blades. No difference is made by this in the practical qualities of the blade. (F. Po.)

The shape of the sword to be chosen depends obviously on the purpose for which it is mainly intended. If for cutting a curved blade, and for thrusting a straight or pointed one, will be adopted. The question naturally arises as to which is the better plan to adopt, and it is improbable that a definite answer can ever be given to it. The French, for instance, in 1822 adopted a curved blade for a short time for all their cavalry, and in 1823 again for a short time a straight blade, and in 1898 again a straight blade. In this much-debated matter the facts appear to be as follows: A determined thrust, especially when delivered by a horseman at full speed, is difficult to parry; if it gets home, it will probably kill the recipient outright or disable him for the rest of the campaign. Thus the case is borne out by the very large proportion of killed as compared with wounded in the British cavalry when engaged with that of the French in the Peninsular War, the French making much use of the point, and their heavy cavalry being armed with a long straight sword. On the other hand, to deliver a bold thrust, while disregarding the uplifted sword of the adversary, and leaving one’s own body and head open to an impending blow, demands complete confidence that the thrust will get home before the blow can descend, or that the adversary’s cut will probably be weakened by a momentary uncertainty as to whether it would not be better to convert the intended cut into a parry. Such confidence, it is argued with much truth, can only be the fruit of long training, especially as it is the natural tendency of all men to cut when excited; therefore, as the trooper in modern armies will often be a reservist who has not been able to keep up his swordsmanship, or a young soldier liable to lose his head and forget the lesson of peace in the excitement of the mêlée, it is considered by many most unwise to adopt a sword with which a powerful cut cannot be delivered as well as an effective thrust. The swords recently adopted by most nations have represented a compromise. They have blades which are nearly straight, but of sufficient weight towards their points to enable an efficient cut to be delivered with them. Frick decided on a long straight sword designed wholly for thrusting (see fig. 1), practically identical with that which was in use about a century ago. The following year Great Britain issued a slightly curved weapon, but in 1908 a new sword was adopted which has a long straight blade and is intended to be used chiefly for thrusting.

As regards the swords worn by officers and men of corps other than cavalry, no remarks are necessary. As long as they are worn they should be efficient; but with the officer the sword is largely a matter of rank. From 1908 the sword was worn only for ceremonial purposes by British infantry officers, but in the latter year it was again ordered to be worn on active service and at manoeuvres. Mounted men in general wear cavalry swords, and the swords warrant officers and by certain staff-sergeants of dismounted arms and branches. A good sword should be elastic, so as to stand bending or a heavy blow without breaking or permanent deformation, and yet stiff enough to deliver a thrust too readily for thrusting; it must also be as light as is possible consistently

2. Modern Military Swords.—The present military swords are descended from the straight "back-sword" and the Eastern scimitar or talwar. The difference between the curved "sabre" and straight "sword" has been preserved abroad, not only in fact but in name (e.g. in German, Degen stands for the straight, and Säbel for the curved, sword), though in English the single word "sword" covers both varieties. The shape of the sword has varied considerably at different times; this is due to the fact that it is practically impossible to decide by trial whether a straight or a curved sword is the better under all circumstances. The trooper can use his sword in three different ways—to cut, to guard and to point; and his success depends upon the training of his horse, his skill in horsemanship, and, above all, upon the dexterity and methods of his adversary. Thus the effect the cavalryman can produce in combat depends upon much besides his arm or arms, and those other conditions cannot be reproduced accurately enough to make trustworthy tests. The result is that changes have often been made in cavalry armament under the erroneous impression that the arm used has been the main cause of success. The Ottoman cavalry up to the end of the 18th century was regarded as one of the best in Europe, and so much was it dreaded that the Austrians and Russians in their wars with Turkey at that time often carried "chevaux-de-frise" to protect their infantry against these redoubtable horsemen. The curved European cavalry sabre so long in use may undoubtedly be traced to this cause, the superiority of the Turks being put down to their curved scimitars, though there can be no doubt that horsemanship and dash were really the dominating factors.

SWORDFISH

with strength, and well balanced. All four desiderata are met in the main by the use of a suitable steel, properly treated and disposed, but, unfortunately, did not hold a straight edge on the blade and, as regards the effect of disposition, grooving or "fullering" the flats of the blade reduces weight without impairing strength, and is now very largely adopted.

The first stage of manufacture, as carried out at the Royal Small Arms Factory at Enfield, may be described briefly as follows, the weapon being the pattern 1899 cavalry sword, which was slightly curved.

The steelblank, about 17\*\times11\*\times1\*\,', is heated and drawn out to about double its length under a mechanical hammer; it is then reheated and rolled out between rolls suitably shaped, and the flat edges are brought to a rounded radius, and (ultimately attached) is then formed by stamping under a machine hammer, and the blade is cut to length and roughly pointed. The blade, though approximately in its finished form, is still too soft and is annealed, the blade set for grinding, and afterwards rough-ground. It is heated and set to curve in a press, then reheated and hardened by being plunged into a bath of oil kept cool by a water jet. On removal from the bath the blade is dead hard and so brittle that it can be broken by a slight blow, and consequently has to be let down by tempering. This is accomplished by heating in a bath of molten lead until the steel assumes a particular colour, at which stage, while hot, the blade is adjusted for straightness and curvature, this being a delicate operation, as it must be performed while the blade retains its temper and heat before finally cooling. It is now twisted to the correct angle, which, for the present, is the desired position, is hardened by being quenched in cold water, and is subjected to a final tempering machine and caused to strike an oak block with a blow of 12 lb with both its edge and back, and with similar blows, but with a force of 60 lb, with both flats. These tests detect flaws, and later are repeated and continued. The portion of the blade affected by the blows by the flat being particularly searching tests. If the blade passes the above tests, it is then placed vertically in a machine and shortened 5 in. The process continues, and consequently each flat, and must recover part of its original length; it is then shortened 1 in., and must recover itself when supporting a weight of 35 lb bearing on its tang. This tests the elasticity of the blade. After polishing it is again tested for fractures, and a perfect straight edge is maintained under 32 lb, and for elasticity by a further shortening of 5 in., but towards one flat only.

The introduction of the system described above has greatly simplified and cheapened the process of manufacture, while the greater excellence of the product and the severe and certain tests applied to it by mechanical means have increased the standard of efficiency in the swords of the troops. It is certainly true that, of old, excellent blades were occasionally turned out by hand, but they were exceedingly costly, and the average merit of sword-blades when turned out in numbers by entirely new and different processes to be something. It is clear that the regular methods described have eliminated this necessity for personal skill. The steel can still be spilt by over- or under-heating, whether for rolling or hardening, and tempering too can be injudiciously done, both in form and temper by unskilled grinding. Sword-making, therefore, though not the somewhat uncertain art it once was, still requires skilled craftsmen for its successful accomplishment.

(H. W. B. . F. Po.)

AUTHORITIES.—The following list of works is intended to guide the reader, if desired, to fuller acquaintance with the literature and authorities of the subject:

Archaeology and General History.—R. Forrer, "Der Werdegang von Dolch und Schwert," introduction to Die Schwertler und Schwerthände der Sammlung Carl von Schenck (Hamburg, 1905), the best monograph; Dr Julius Naege, Die norwegischen Schwertkutter aus Kupfer, Bronze und Eisen (Munich, 1903), with atlas of illustrations, a standard work for the prehistoric periods (neither of these authors havestudied the Sword of the Archer); R. F. Forrer, The Book of the Sword (only 1 vol. published; London, 1884); Colonel Lane Fox (afterwards Major-General Pitt-Rivers), Catalogue of Anthropological Collection, South Kensington Museum (London, 1884); Dr. E. Forrer, Die römisichen Schwertkutter der Kaiserzeit (Brussels, 1882); Edmund and Anderson, Ancient Scottish Weapons (Edinburgh and London, 1881). The general treatises and handbooks on arms and armaments will be found in the general works on the subject, and may be consulted with advantage, but with caution in details. The same may be said of published catalogues of museums and private collections.

W. Boehm, Handbuch der Waffenkunde (Leipzig, 1878); C. Forrer, Die Schwertkutter der Tabelle (Leipzig, 1891); W. and E. G. Forrer, The Armour of Medieval Times and of the Renaissance (London, 1900); Ashdown, British and Foreign Arms and Armour (London, 1909); and G. F. Laking, The Armour of Windsor Castle (Edinburgh, London, 1904), are trustworthy guides. The Forms and History of the Sword, by the present writer, reprinted in Oxford Lectures, &c. (London, 1890), gives further references and citations on various points.

Swordsmanship.—Egerton Castle, Schools and Masters of Fence from the Middle Ages to the Eighteenth Century (including a critical bibliography; London, 1892); Carl A. Thimm, Bibliography of Fencing and Duelling (London, 1896). For the beginnings of the art in Italy, Flav. duellatorum (a MS. of 1410 edited by Francesco da Montefeltro and accompanied by an MS. by Gentile, Vigent, Bibliographie de l'escrime ancienne et moderne (Paris, 1882); Gomard (assumed name of Possellier), Thiborde de l'escrime (historical introduction; Paris, 1845). Grieser, Les armes et le duel (preface by A. Dumais; Paris, 1847).

SWORDFISH, the name given to a small family of spinny-rayed fishes (Xiphiidae), the principal characteristic of which consists in the prolongation of the upper jaw into a long pointed sword-like weapon. The "sword" is formed by the coalescence of the intermaxillary and maxillary bones, which possess the back of a much elongated cone, more or less flattened throughout its whole length; the end is sharply pointed. It is smooth above and on the upper part of the sides, and rough below owing to the presence of innumerable rudimentary teeth, which have no function.

The general form of the body is well proportioned, somewhat elongated, and such as is always found in fishes with great power of swimming, as, for instance, in the mackerel and tuna, and the tail terminates in a powerful bilobed caudal fin. A long fin occupies nearly the whole length of the back, whilst the anal fin is generally intertial and much elongated; it has the back of a much elongated cone, more or less flattened throughout its whole length; the end is sharply pointed. It is smooth above and on the upper part of the sides, and rough below owing to the presence of innumerable rudimentary teeth, which have no function.

Some of the tropical forms are the largest of Acanthopterygian fishes, and not exceeded in size by any other Teleostean; such species attain to a length of from 12 to 15 ft., and swords have been preserved more than 3 ft. long and with a diameter of at least 3 in. at the base. The Histiophori, which inhabit chiefly the Indo-Pacific Ocean, but occur also in the Atlantic, seem to possess in their high dorsal fin an additional aid for locomotion. During the rapid movements of the fish this fin is folded downwards on the back, as it would impede the velocity of progress by the resistance it offers to the water; but, when the fish is swimming in a leisurely way, it is frequently seen with the fin

Sworfish (Histiophorus paletchus).
The food of the swordfishes is the same as that of tunnies, and consists of smaller fish, and probably also in great measure of pelagic cuttle-fishes. It has been ascertained by actual observation that swordfishes procure their food by dashing into a school of fishes, piercing and killing a number of them with their swords; and this kind of weapon would seem to be also particularly serviceable in killing large cuttle-fish, like the saw of sawfishes, which is used for the same purpose. But the sword is a thrusting weapon, whereas a swordfish does not thrust; besides, most formidable weapons of aggression. These fishes never hesitate to attack whales and other large cetaceans, and, by repeatedly stabbing them, generally retire from the combat victorious. That they combine in these attacks with the thresher-shark is an often-repeated story which is discredited by some naturalists on the ground that the dentition of the thresher-shark is much too weak to make an impression on the skin of any cetacean. The cause which excites swordfishes to such attacks is unknown; but they follow the instinct so blindly that they do not rarely assail boats and ships, retaining the sword in the water, and sometimes, for the sake of making themselves more noticeable sometimes, for the sake of making themselves more noticeable, they easily pierce the light canoes of the natives of the Pacific islands and the heavier boats of the professional swordfishermen, often dangerously wounding the persons sitting in them. Attacks by swordfishes on ocean-going ships are so common as to be included among sea-risks: they are known to have driven their weapon through copper-sheeting, oak-pank and timber to a depth of nearly 10 in., part of the sword projecting into the inside of the ship; and the force required to produce such an effect has been described by Sir R. Owen in a court of law as equal to "the accumulated force of fifteen double-handed hammer" and the velocity as "equal to that of a swivel-shot" and "as dangerous in its effects as a heavy artillery projectile." Among the specimens of planking pierced by swordfishes which are preserved in the British Museum there is one less than a foot square which encloses the broken ends of three swords, as if the fishes had had the object of concentrating their attack on the same vulnerable point of their supposed enemy. The part of the sword which penetrates a ship's side is almost always broken off and remains in the wood, as the fish is unable to execute sufficiently powerful backward movements to free itself by extracting the sword. In the Mediterranean and on the Atlantic coasts of the United States the capture of swordfishes forms a regular branch of the fishing industry. The object of the fishery in the Mediterranean is the common European swordfish (Xiphias gladius), the average weight of which is about 1 cwt., and which is abundant off the Sicilian coasts and on the opposite coast of Calabria. Two methods are employed—that by harpoons, chiefly used for larger fish, and that by peculiarly constructed nets called palamari. This fishery is very productive: a company of fishermen frequently capture from twenty to fifty fish in a single day, and the average annual catch in Sicily and Calabria is reported to be 140,000 killogrammes (138 tons). The products of the fishery are consumed principally in a fresh state, but a portion is preserved in salt or oil. The flesh of the swordfish is much preferred to that of the tunny, and always commands a high price. This species is occasionally captured on the British coast.

On the coast of the United States a different species, Histio- phorus gladius, occurs; it is a larger fish than the Mediterranean swordfish, attaining to a length of from 7 to 12 ft. and an average weight of 300 or 400 lb. It is captured only by the use of the harpoon. From forty to fifty vessels, schooners of some 50 tons, are annually engaged in this fishery, with an aggregate catch amounting annually to about 3400 swordfishes, of a value of $45,000. The flesh of this species is inferior in flavour to that of the Mediterranean species, and is principally consumed after having been preserved in salt or brine.

Useful and detailed information on the swordfish fishery can be obtained from A. T. Tozzetti, "La Pesca nei mari d'Italia e la pesca all' estero esercitata da Italiani," in Catalogo esposizione internazionale di pesca in Berlino (1880); also from La Pesca del pesce-spada nella Stretto di Messina (Messina, 1880); and from Tythoom Good, "Posidonia: Materiali di una storia del Sword-fish," in Report of the Commissioners of Fish and Fisheries in the United States (Washington, 1883).
the public service both under the French and the Prussians; in 1831 he had been raised to the hereditary nobility. His home was one of the centres of the vigorous literary and artistic life for which at that time Düsseldorf was renowned. Sybel was educated at the gymnasium of his native town, and then at the university of Berlin, where he came under the influence of Savigny and of Ranké, whose most distinguished pupil he was to become. After taking his degree, he settled down in 1841 as Privatdozent in history at the university of Bonn. He had already, in his early days, demonstrated his capacity for critical studies on the history of the middle ages, of which the most important was his Geschichte des ersten Kreuzzuges (Düsseldorf, 1841; new ed., Leipzig, 1881), a work which, besides its merit as a valuable piece of historical investigation, according to the critical methods which he had learnt from Ranké, was also of some significance as a protest against the vaguely enthusiastic attitude towards the middle ages encouraged by the Romantic school. Lady Duff-Gordon published in 1861 an English translation of part of this book, to which are added lectures on the crusades delivered in Munich in 1858 under the title History and Literature of the Crusades. This was followed by a study on the growth of German kingship (Die Entstehung des deutschen Königsus, Frankfort, 1844, and again 1881), after which he was appointed professor.

In the same year (1844) Sybel came forward prominently as an opponent of the Ultramontane party. The exhibition of the Holy Coat at Trier had attracted enormous numbers of pilgrims, and so, indignant at what appeared to him an imposture, he assisted to publish an investigation into the authenticity of the celebrated relic. From this time he began to take an active part in contemporary politics and in controversy as a strong though moderate Liberal. In 1846 he was appointed professor at Marburg, and though this small university offered little scope for his activities as a teacher, a seat in the Hessian Landtag gave him his first experience of political affairs. In 1848 he was present at Frankfort, but he did not succeed in winning a seat for the National Assembly. His opposition to the extreme democratic and revolutionary party made him unpopular with the mob, who broke his windows, as his liberalism made him suspected at court. He sat in the Erfurt parliament of 1850, and was attached to the Bonn party, which hoped for the re-organisation of Germany through a union of the liberal parties of Prussia.

During the years that followed all political activity was impossible, but he was fully occupied with his great work Geschichte der Revolutionzeit 1879-1800, for which he had made prolonged studies in the archives of Paris and other countries. The later editions of the earlier volumes are much enlarged and altered, and a new edition was published at Stuttgart in 1882. The first three volumes have been translated into English by W. C. Perry (1867-1869). In this work he for the first time showed the connexion between the internal and external history of France; he was also the first, by a systematic study of the records, to check and correct the traditional account of many episodes in the internal history. His dissertation that letters attributed to Marie Antoinette were not genuine roused much interest in France. For the history of German thought it was of the greatest importance that a Liberal from the Rhine, by a systematic history of the Revolution, attempted to over-throw the influence which the revolutionary legend, as expounded by French writers, had acquired over the German mind; and the book was an essential part of the influences which led to the formation of a National Liberal school of thought. Sybel had been much influenced by Burke, on whom he had published two essays. The work was in fact the first attempt to substitute for the popular representations of Thiers and Lamartine the critical investigation which has been carried on with such brilliance by Taine and Sorel.

In 1856, on the recommendation of Ranké, Sybel accepted the post of professor at Munich, where King Maximilian II. of Bavaria, a wise and generous patron of learning, hoped to establish a school of history. He found there a fruitful field for his activity. Besides continuing his work on the Revolution
over to the state. Böckh suggested that the word signified one who laid an information in reference to an object of trifling value, such as a fig (cf. "I don't care a fig about it"), but there seems no authority for this ininsignificance also in Greek. According to C. Stil (Die Gebiarden der Griechen und Römer, Leipzig, 1890), the word refers to an obscure gesture of phallic significance (see also A. B. Cook in Classical Review, August 1907), called "showing the fig" (faire la figue, far la fica or le fiché), originally prophylactic in character. Such gesture, directed towards an inoffensive person, became an insult, and the word sycophant might imply one who insulted another by bringing a frivolous or malicious accusation against him. According to S. Reinach (Revue des études grecques, xix., 1906), who draws special attention to the parallelism between his hierophant and the sycophants, the term sycophant survived in popular language in the sense of an informer or denouncer, whose charges deserved but little consideration. L. Shadwell suggests that the real meaning is "fig-discoverer," not "fig-informer," referring to the blackmailer who discovers the "figs" (that is, the money) of the rich man and forces him to hand it over by the threat of bringing a criminal accusation against him. It must be remembered that any Athenian citizen was at liberty to accuse another of a public offence, and the danger of such a privilege being abused is sufficiently obvious. The people naturally looked upon all persons of wealth and position with suspicion, and were ready to believe any charge brought against them. Such prosecutions also put money into the pockets of the judges, and, if successful, into the public treasury. In many cases the accused persons, in order to avoid the indignity of a public trial, bought off their accusers, who found in this a fruitful source of revenue. Certain legal remedies, intended to prevent the abuses of the system, undoubtedly existed. Persons found guilty of bringing false charges, of blackmail, or of suppressing false witnesses, were liable to criminal prosecution by the state and a fine on conviction. But it was difficult if another failed to carry the prosecution through or to obtain a fifth part of the votes. But these remedies were rather simple deterrents, and instances of informers actually brought to trial are rare. Sycophants were an inseparable accompaniment of the democracy, and the profession, at least from a political point of view, was not regarded as in any way honourable. The idea of encouraging the citizens to assist in the detection of crime or treason against the state was commendable; it was not the use, but the abuse of the privilege that was so injurious. Allusions to the sycophants are frequent in Aristophanes and the Attic orators. The word is now generally used in the sense of a cringing flatterer of the great.

SYDENHAM, CHARLES EDWARD POULETT-THOMSON, 1st Baron (1779-1841), British statesman, was born on the 13th of September 1779, being the son of John Buncombe-Poulett-Thomson, a London merchant. After some years spent in his father's business in Russia and in London he was returned to the House of Commons for Dover in 1806. In 1830 he joined Lord Grey's ministry as vice-president of the board of trade and treasurer of the navy. A free-trader and an expert in financial matters he was elected M.P. for Manchester in 1832, a seat which he occupied for many years. He was continuously occupied with negotiations affecting international commerce until 1839, when he accepted the governor-generalship of Canada, where it fell to his lot to establish the union of Upper and Lower Canada. His services in establishing the Canadian constitution were recognized in 1839 by a knighthood and a peerage. He took the title of Baron Sydenham of Sydenham in Kent and Toronto in Canada. He died unmarried on the 4th of September 1841, when his peerage became extinct.

His Memoirs were published by his brother, G. J. Poullett Scrope, in 1843.

SYDENHAM, THOMAS (1624-1689), English physician, was born on the 10th of September 1624 at Wynford Eagle in Dorset, where his father was a gentleman of property and good pedigree. At the age of eighteen he was entered at Magdalen Hall, Oxford; after a short period his college studies appear to have been abandoned, and he served for a time as an officer in the army of the parliament. He completed his Oxford course in 1648, graduating as bachelor of medicine, and about the same time he was elected a fellow of All Souls College. It was not until nearly thirty years later (1676) that he graduated as M.D., not at Oxford, but at Pembroke Hall, Cambridge, where his eldest son was then an undergraduate. After 1648 he seems to have spent some time studying medicine at Oxford, but he was soon again engaged in military service, and in 1654 he received the sum of £600, as a result of a petition he addressed to Cromwell, setting forth the various services which he had performed, and he served for a time as an officer in the army of the parliament. He completed his Oxford course in 1648, graduating as bachelor of medicine, and about the same time he was elected a fellow of All Souls College. SYDENHAM—SYDNEY

Hardly anything is known of Sydenham's personal history in London. He died in London on the 29th of December 1689, and was buried in the church of St James's, Piccadilly, where a mural slab was put up by the College of Physicians in 1810. Although Sydenham was a highly successful practitioner and said to have been among the ablest physicians of his day, his name is perhaps best known to modern readers through the various tractates called for in his lifetime, his fame as the father of English medicine, or the English Hippocrates, was decidedly posthumous. For a long time he was held in vague esteem for the success he achieved (or rather expectant) treatment of scrofula for his laudanum (the first form of a tincture of opium), and for his advocacy of the use of Peruvian bark in quaran agues. There were no other ingredients in his treatment, and he probably marked something of Sydenham's importance in larger matters than details of treatment and pharmacy, chief among them being the talented Richard Morton. But the attitude of the medicalacade of the three sects as indicated in Martin Lister's use of the term "sectaries" for Sydenham and his admirers, at a time (1694) when the leader had been dead five years. If there were any doubt that the opposition to him was quite other than political, it would be set at rest by the testimony of Dr Andrew Brown,1 who went from Scotland to inquire into Sydenham's practice and has happily revealed what was commonly thought of it at the time, in his... "Vindicatory orations; and this the New Cure of Fevers". In the series of Harveian orations at the College of Physicians, Sydenham is first mentioned in the oration of Dr John Arbuthnot (1727), who styles him "accurulus Hippocrates". H. Boerhaave, the Leyden professor of medicine, made the first of the orations (written probably by some pupils from England and Scotland) as "Angliae lumen, artis Phoebum. veram Hippocratiici virti speciem." A. von Haller also marked one of the epochs in his scheme of medical progress with the name of Sydenham, and it is quite possible because he had a new method and a better ethics of practice, the worth and difusive influence of which did not become obvious (except to those who were working closely with him) until a good many years afterwards. It remains to consider briefly what his innovations were.

First and foremost he did the best he could for his patients, and make them well, and I think he would be the last to deny it. All the tracts and traditions, and all the tricks of the craft. All the stories told of him are characteristic. Called to a gentleman who had been subjected to the lowering of the time, and finding him in a pitiful state of hysterical hypost, he "conceived that his complaint was too serious, perhaps the result of previous evacuations, and partly by emptines. I therefore ordered him a roast chicken and a pint of canary." A gentleman of fortune who was a victim to hypochondria was at length told by Sydenham that he could do no more for him, but that there was living in Inverness a certain Dr Robertson who had great skill in cases like his; the patient journeyed to Inverness full of hope, and, finding no doctor of the same name, came back to London full of rage, but cured withal of his complaint. Of a piece with this is his famous advice to Sir Richard Blackmore. When Blackmore first engaged in the study of physic he inquired of Sydenham what he thought of the doctrine of contagion, and whether that in Don Quixote, "which," said he, "is a very good book; I read it still." There were cases, he tells us, in his practice where "I have come to the conclusion that a primary notion may be formed by doing nothing at all." It was in the treatment of small-pox that his startling innovations in that direction made most stir. It would be a mistake, however, to suppose that Sydenham wrote no long descriptions, after the fashion of the time, or was entirely free from theoretical bias. Doctrines of disease he had, as every practitioner must have; but he was too much alive to the multiplicity of new facts and to the infinite variety of individual conditions to aim at symmetry in his theoretical views and at sistency between his practice and his doctrines; and his treatment was what he found to answer best, whether it were secondum artem or contum ac fortuitum. Acute diseases were usually treated by themselves in nature and to draw up a complete picture ("Krankheitsbild" of the Germans) of the objective characters of each. Most forms of ill-health, he insisted, had a definite type, characteristic of the disease, which could be found among the symptoms. The form of type in the symptoms and course of a malady was due to the uniformity of the cause. The cases that he dwelt upon were "conjectural and conjunct causes," or, in other words, the morboid phenomena. But his judgment of that came after. Acute diseases, such as fevers and inflammations, he regarded as a wholesome conservative effort or reaction of the organism to meet the exigencies imposed by the disease. In this he followed the Hippocratic teaching closely as well as the Hippocratic practice of watching and aiding the natural crises. Chronic diseases, on the other hand, were a depraved state of the humors which was the result of habit or manum or, in either case, which we ourselves were directly accountable. Hence his famous dictum: "acutos dico, qui ut plurimum Deum habent autorem, sicut chronici ipso nos." Sydenham's nosological method is essentially the modern one, except that it wanted the morbidity of form, not the term, which is a slight difference of definition, and a type of disease" by Morgani nearly a century later. In both departments of nosology, the acute and the chronic, Sydenham contributed largely to the natural history by his own accurate observation, and to the classification of disease by his use of the term "sectaries". The Observations medicae and the first Epistola responsoria contain evidence of a close study of the various levers, fluxes and maladies, and the main divisional characters. He describes the differences from year to year and from season to season, together with references to the prevailing weather—the whole body of observations being used to illustrate the doctrine of the "epidemic constitutions" of the year or season, which he considered to depend upon inscrutable telluric causes. The type of the acute disease varied, he said, according to the year and season, and the right treatment could not be adopted until the type was known. From same nothing came out of the first. The disease of the Hippocratic treatise, Hapli kénup, hêtau, tóma; and there are probably some gerns of truth in it still undevdoped, although the modern science of epidemiology has introduced a whole new set of considerations. Among other things Sydenham is credited with the first diagnosis of scarlatina and with the modern definition of chorea (in Sched. monts.). After small-pox, the diseases to which he refers most are hysteria and gout, his description of the latter (from the symptoms in his own person) being one of the classical pieces of medical writing. While Sydenham's "natural history" method has doubtless been the chief ground of his great posthumous fame, it is not the only reason for the admiration of posterity that was that which is indicated by R. G. Latham, when he says, "I believe that the moral element of a man is of the highest importance, and the only true and lasting' intellectual qualifications of observation, analysis, and comparison."

Among the lives of Sydenham are one (anonymous) by Samuel Johnson in John Swan's translation of his works (London, 1742), another by G. Kuhn in his edition of his works (Leipzig, 1873), and a third by Dr R. G. Latham in his translation of his works published in London by the Sydenham Society in 1848. See also Frédéric Simplicien Deum, au sel, ses essences (Paris, 1869), and J. F. Payne, T. Sydenham (London, 1880). Dr John Brown's "Horse subsectione" in Horae subsectione (Edinburgh, 1858), is of the nature of eulogy. Many collected editions of his works have been published as the New Cure of Fevers, and the Hippocratic treatise, the Italian. Dr W. A. Greenhill's Latin text (London, 1844, Syd. Soc.) is a model of editing and indexing. The most interesting summary of doctrine and practice by the author himself is the introduction to a selection of Observations medicæ (1667).

SYDENHAM, a large residential district in the south of London, England, partly within the metropolitan borough of Lewisham (q.v.). The Crystal Palace (q.v.) is in this district.

SYDNEY, the capital of New South Wales, Australia, in Cumberland county, on the east coast of the continent, situated on the south shore of Port Jackson (q.v.), in 33° 15' 44" S., 151° 12' 23" E. Few capitals in the world can rival Sydney in natural advantages and beauty of site. It stands on undulating and easily drained ground, upon a bed of sandstone rock, on a peninsula jutting into one of the deepest, safest and most hospitable harbours in the world, and in the centre of a great carboniferous area. The metropolitan area of Sydney consists of a peninsula, about 13 m. in length, lying between the Parramatta and George's rivers. The sea frontage of this area stretches for 12 m. from the South Head of Port Jackson to the North Head of Botany Bay; it consists of bold cliffs alternating with beautiful beaches, of which some are connected with the city by tramway, and form favourite places of resort. The city proper occupies two indented tongues of land, having a water frontage on Port Jackson, and extending from Rushcutters Bay westwards to Blackwattle Bay on the west, a distance of 8 m., nearly two miles of which is occupied by the Domain and the botanical gardens. The business quarter is a limited area lying between Darling Harbour and the Domain. The streets are irregular in width, some of them narrow and close together, while those leading down to Darling Harbour have a steep incline. Sydney has in consequence more than usually the appearance of an old-world town.

The main street of the city, George Street, is 2 m. long, running from north to south; it contains the town-hall, the post-office, and the Anglican cathedral. The post-office is a handsome sandstone building of perfect proportions. On the north side of the town-hall, on two sides with polished granite columns and surmounted by a clock tower, containing a peal of bells. The town-hall, a large

1 See Dr John Brown's Horae subsectione, art. "Dr Andrew Brown and Sydenham."
florid building of Classic order, stands on an eminence, and its clock tower forms a landmark; it contains the spacious Centennial Hall (commemorating the first Australian colonization here in 1787), and has one of the finest organs in the world. Opposite are the Queen Victoria Markets, a striking Byzantine erection, capped by numerous turrets and domes. Adjoining the town hall is the Anglican cathedral of St Andrew, in the Perpendicular style; it has two towers at the west end and a low central tower above the intersection of the nave and transepts, with a very handsome chapter house. Second in importance to George Street is Pitt Street, which runs parallel to it from the Circular Quay to the city. This is one of the narrowest streets in the Domain and contains a number of public buildings, including the treasury, the office of public works, the houses of parliament and the mint. In Bridge Street, behind the office of public works, are the exchange and the crown lands office. All these government offices are in classical style. The Roman Catholic Cathedral of St Mary lies on the north-east side of Hyde Park; it is a splendid Gothic structure, the finest in Australia. This cathedral has been twice destroyed by fire, and the existing building, from the designs of Mr. W. W. Wardell, was consecrated in 1905. Government House, the residence of the governor-general, is an excellent Tudor building erected in 1837, and several times enlarged, is delightfully situated in the Domain, overlooking Farm Cove. The residence of the state governor is at Rose Bay, east of the city. At the top of King Street there is a statue of Queen Victoria and close by a statue of Prince Albert, at the entrance to Hyde Park, in which the most elevated spot is occupied by a statue of Captain Cook. The university stands in its own grounds on the site of Grose Farm, the scene of one of the earliest attempts at government farming. Like most of the buildings at Sydney, the university is built of the excellent sandstone from the quarries of Pyrmont; it is 15th-century Gothic in style and stands at the top of a gentle slope, surrounded by gardens. Around it lie three Gothic colleges in the 14th-century style, affiliated to the university and known as St Paul's, St John's and St Andrew's. They are residential colleges belonging respectively to the Anglicans, Roman Catholics and Presbyterians. The university provides instruction and grants degrees in arts, law, medicine, science and engineering; instruction in theology, however, is given, not by the university, but by the different affiliated colleges.

To compensate for the narrow streets and its lack of charm, Sydney possesses a number of grand parks, surpassed in few other capitals. Hyde Park is a plateau almost in the centre of the city, which in the early days of Sydney was used as a race-course. Adjoining are two smaller parks, Cook Park and Phillip Park, while north of these stretches the Domain and the botanical gardens. The Domain embraces 138 acres, extending along one side of Woolloomooloo Bay and surrounding Farm Cove, in which the warships belonging to the Australian station are usually anchored; in this charming expanse of park land are the governor's residence and the National Art Gallery, which houses a splendid collection of pictures by modern artists, statutory, pottery and other objects of art. The botanical gardens on the southern shores of Farm Cove are the finest in the Commonwealth and are distinguished for their immense collection of exotics. On the south-east of the city lie Moore Park, 600 acres in extent, containing two fine cricket grounds and the show grounds of the agricultural society, and Centennial Park, formerly a water reserve of 768 acres. Adjoining Moore Park is the metropolitan race-course of Randwick. There are numerous other and smaller parks, of which the chief are Wentworth Park laid out on the site of Blackwattle Swamp, Prince Alfred Park, Belmore Park and Victoria Park adjoining the university grounds.

Sydney harbour is divided into a number of inlets by projecting headlands. The head of Woolloomooloo Bay, Sydney Cove, the shallow bay between Dawes and Millers Point, and Darling Harbour, are lined with wharves. The Circular Quay at the head of Sydney Cove is 3,000 ft. long, and here all the great ocean liners from Europe, China and Japan are berthed, while to the great wharf in Woolloomooloo Bay, 3,000 ft. in length, the American liners and the majority of the small coasting vessels come to discharge their cargoes. The whole of the eastern side of Darling Harbour is occupied by a succession of wharves and piers, there being in all 4,000 ft. of wharfage. Connected with the main railway system of the colony is the Darling Harbour Wharf 1,200 ft. long and equipped with electric light, stationary and travelling hydraulic cranes, machinery for meat freezing, and large sheds for storing corn and wool. In addition to these there are wharves at Pyrmont and Blackwattle Bay, 1,500 ft. and 1,400 ft. long. These harbours on the eastern side of Sydney have many vessels engaged in cargo boats trading in coal, corn, frozen meat, wool, hides and various ores. The total length of quays and wharves belonging to the port amounts to some 23 m. The dock accommodation is extensive. On Cockatoo Island, a few miles west of the city, the government have two large dry docks, the Fitzroy dock, 450 ft. long, and the Sutherland dock, 630 ft. Mort's dock, another large dry dock, is at Mort's Bay, Balmain, while there are five floating docks with a combined lifting power of 3,856 tons, and the three patent slips in Mort's Bay can raise between them 3,940 tons. Prior to 1891 the jurisdiction of the port was in the hands of a marine board, three members of which were elected by the shipping interest, and the remaining four nominated by the government, but in that year the board was replaced by a single official, known as the superintendent of the department of navigation and responsible to the colonial secretary.

Sydney has a great number of learned, educational and charitable institutions; it possesses a Royal Society, a Linnean Society and a Geographical Society, a women's college affiliated to the university, an astronomical observatory, a technical college, a school of art with library attached, a bacteriological institute, at Rose Bay, a museum, a free public library. Standing in the centre of a great coal-bearing basin, Sydney is naturally the seat of numerous manufactures, to the prosperity of which the abundance and cheapness of coal has been highly conducive. In addition to the industries connected with the shipping, large numbers of hands are employed in the government railway works, where the locomotives and rolling stock used by the state railways are manufactured. There are several large tobacco factories, flour mills, boot factories, sugar refineries, tanneries, tallow works, meat-preserving, glue and kerosene-oil factories. The warehouses, with their carriages, pottery, glass, paper and furniture are made, and there are numerous.

Sydney is governed municipally by a city council. The gas and electric lighting is in the hands of private firms. The administration of the park, the city improvements and the water and sewerage departments have been handed over to boards and trusts. The control of the traffic is in the hands of the police, who, with the wharves and the tramways, are directed by the state government. The whole district between Sydney and Parramatta on each side of the railway is practically one continuous town, the more fashionable suburbs lying on the east of the city while the business extension is to the westward, and the southern quarters are largely devoted to manufacturing. The suburbs comprise the following distinct municipalities, Alexandria, with a population in 1901 of 9341; Annandale, 8349; Ashfield, 14,329; Balmain, 30,976; Bexley, 3079; Botany, 3383; North Botany, 3772; Burwood, 7521; Camperdown, 7931; Canterbury, 4226; Concord, 2818; Darlington, 3746; Drummoine, 4244; Enfield, 2407; Erskineville, 6059; Glebe, 10,220; Hunter's Hill, 4232; Hurstville, 4019; Kogarah, 3892; Lane Cove, 191; Leichhardt, 17,445; Manly, 3053; Marrickville, 18,775; Maitland, 3053; Mosman, 5697; Newtown, 23,598; North Sydney, 22,501; Paddington, 21,981; Petersham, 15,377; Randwick, 9753; Redfern, 24,410; Rockdale, 7857; Ryde, 3222; St Peter's, 5906; Vaucluse, 11,52; Waterlooo, 6609; Waverley, 13,432; Willoughby, 6004; Woollahra, 12,351. These suburbs are connected with the city, some by railway, some by steam, cable and electric tramways, and others by ferry across Port Jackson. The tramway system is owned by the government.

There are numerous places of resort for the citizens. Many
of the bays in the harbour are largely visited on Sundays and holidays. The most popular resorts are Manly Beach, Chowder Bay and Watson's Bay, in the harbour; Cabarita, on the Parramatta river; Middle Harbour; and Coogee Bay and Bondi, on the ocean beach; Botany, Lady Robinson's Beach, Sandringham and Sans Souci on Botany Bay. Besides these there are two splendid national reserves, an hour's journey by rail from Sydney, viz. National Park, comprising an area of 36,810 acres, surrounding the picturesque bay of Port Hacking; and Kurrinang Chase, with an area of 35,300 acres.

The two principal cemeteries are at Waverley and Rookwood. The former is most picturesquely situated on the cliff overlooking the Pacific Ocean.

The climate of Sydney is mild and equable; in summer sea breezes blow from the north-east, which, while they temper the heat, make the air exceedingly humid; in winter the winds blow from the west and the climate is dry and bracing. The mean average temperature is 65° Fahr., and the rainfall 40-66 in.

The population has increased with marvellous rapidity. In 1861 it was (city and suburbs inclusive) 95,000; in 1881, 227,300; in 1891, 359,270; and in 1901, 437,900. The proportion of city dwellers to suburban is as follows: in 1901—city, 112,137; suburbs, 359,633; total, 437,900. The incorporated area of the metropolitan district is about 142 sq. m., or 91,220 acres, so that the average density of population was 5,935 persons per acre, some of the more immediate suburbs being more densely populated than the city itself.

SYDNEY, the chief town of Cape Breton county, Nova Scotia, on a good harbour, the eastern terminus of the Intercolonial railway. Pop. (1891), 2427, (1901), 5900. Formerly a quiet country town, it became between 1817 and 1901 the chief shipping port of the Dominion Coal Company, and the site of the large works of the Dominion Iron and Steel Company. On the opposite side of the harbour are the flourishing towns of North Sydney and of Sydney Mines. It is the starting point for the line of steamers to the Bras d'Or lakes, and a favourite summer resort.

SYENITE, a name first used by Pliny to designate rocks of the same type as the hornblende granite of Syene (Assouan) in Upper Egypt, so extensively used in ancient times for architectural work and monuments. Transferred by Werner to a rock of much the same appearance, though not identical in mineralogical character with the Egyptian granite, from the Plauen 'scher Grund near Dresden, it is now used as the group name for a class of holo-crystalline plutonic rocks composed essentially of an alkali felspar and a ferromagnesian mineral. The structure and appearance are very much the same as that of a hornblende granite; from which it is difficult to distinguish these rocks in hand specimens. The important difference, however, is the absence or scarcity of quartz in the syenites. Their essential components are orthoclase, often with some albite, and augite, hornblende or biotite. The orthoclase is white or pink, and forms nearly one half of the rock. It may be veined with albite (microperthite) and small crystals of plagioclase (mostly andesine and oligoclase) often are present, usually having better crystalline forms than the potash felspar. The prevalent hornblende is green, but brown hornblende and dark blue hornblende, of strong pleochroism, occur in some syenites which are rich in apatite, zircon, magnetite and pyrites; quartz as above stated is rarely absent but should never be abundant, otherwise the rock becomes a granite. Nepheline and sodalite occur only in those rocks which show transitions to the nepheline-syenites.

The structure of syenites is almost exactly the same as that of the granites; varieties with orthoclase felspar are known but rare; hornblende is present in some cases, but not abundant; amphiboles are included in the hornblende of syenites, or otherwise, in transition to the hornblende-tuff of the mica-syenites, and diopside in some transitional syenites. Some syenites show the presence of a yellow or a pink spherulitic quartz, and are known as quartz syenites. Some are of a yellowish grey colour and known as hornblendic syenites.

The following table shows the chemical composition of a few representative syenites and one hornblende-syenite in parts per 100.

SYLBURG, FRIEDRICH (1536—1596), German classical scholar, son of a farmer, was born at Wetter near Marburg. He studied at Marburg, Jena, Geneva, and, lastly, Paris, where his teacher was Henry Estienne (Stephanus), to whose great Greek Thesaurus Sylburg afterwards made important contributions. Returning to Germany, he edited a
SYLHET—SYLLABUS

useful edition of the Institutiones in graecam linguam (1580) of Nicolas Clerandus (Cleynaerts, 1495-1542). In 1583 he resigned his post at Lieb and moved to Frankfort-on-the-Main to act as corrector and editor of Greek texts for the enterprising publisher Johann Wechel. To his Frankfurt period belong the editions of Pausanias, Herodotus, Dionysius of Halicarnassus (one of his best pieces of work and highly praised by Niebuhr), Aristotle, the Greek and Latin sources for the history of the Roman emperors and the Ποι ουσίας of Apollonius Dyscolus. In 1591 he removed to Heidelberg, where he became librarian to the elector palatine. The Wechel series was continued by Hieronymus Comenius of Heidelberg, for whom Syllabus edited Clement of Alexander, Justin Martyr, the Elenchus logiorum, the Centuriator, the Greek epic poets, Xenophon, Nonnus and other works. All Syllburg's editions show great critical power and indefatigable industry. He died on the 17th of February 1596, a victim of over-work.

SYLHET, a town and district of British India, in the Surma valley, division of Eastern Bengal and Assam. The town is on the right bank of the river Surma, on rising ground, embowered in groves. Pop. (1901), 13,803. There are manufactures of mats, carved ivory and shells, and furniture. There is a unaided college, founded in 1802, which is mainly supported by a native gentleman. There are two dispensaries and an English church. The great earthquake of the 12th of June 1897 destroyed every substantial building, but caused very little loss of life. Sylhet is the largest town in Assam, but is steadily decaying, being 50 m. from a railway and inaccessible to steamers during the dry season.

The district of Sylhet has an area of 5388 sq. m. It consists of the lower valley of the Surma or Barak river, and for the most part is a uniform level broken only by scattered clusters of sandy hillocks called tilās, and intersected by a network of rivers and drainage channels. It is a broad and densely-cultivated plain, except in the extreme north, where the enormous rainfall converts many square miles of land into one huge lake during the rains, and in the south, where eight low ranges of hills, spars of the Tippera mountains, run out into the plain, the highest range being about 1500 ft. above sea-level. There is also a small detached group of mountains, comprising the Huril hills, to the south of the district, and watered by the branches of the Surma (q.v.) which are navigable by large boats, and support a busy traffic. The climate is extremely damp and the rainfall is heavy, reaching an annual average of over 150 in.; the rainy season generally lasts from April to October.

In 1901 the population was 2,241,848, showing an increase of 4% in the decade. More than half are Mahomedans. Tea cultivation is a flourishing industry in the southern hills. The Assam-Bengal railway crosses the district, but trade is still largely river-born. Great damage was done by the earthquake of June 1897, which was followed by an outbreak of malarial fever.

Sylhet passed into the hands of the British in 1765, with the rest of Bengal, of which it formed an integral part until 1874, being included in the Dacca division. In that year it was annexed, together with the adjoining district of Cachar, to the chief-commissionership of Assam which was amalgamated with eastern Bengal in 1905.

See Sylhet District Gazetteer (Calcutta, 1905).

SYLLABUS (from Gr. σyllαβατειν, to take together, cf. “syllable”), literally something taken together, a collection (Late Lat. syllabus), hence a compendium, table or abstract giving the heads, outline or scheme of a course of lectures, teaching, &c. The word in the sense of list or catalogue is uncommon. A collection of eighty condemned propositions, addressed by order of Pius IX. to all the Catholic episcopate, under the date of the 8th of December 1864. The official title is: “A collection (syllabus) containing the principal errors of our time as noted in the Allocutions, Encyclicals and other Apostolic Letters of our Holy Father Pope Pius IX.” This collection contains a rather curious history. As early as 1849, the council of Spoleto asked the pope for a collective condemnation of all errors concerning the Church, her authority and property. In 1851 the Civilia catholicæ proposed that this should be drawn up in connection with the definition of the Immaculate Conception of Mary. In 1852, Cardinal Fornari wrote by order of the pope to a certain number of bishops and laymen asking for their assistance in the study of the errors most prevalent in modern society. The answers are unknown; but after the definition of the Immaculate Conception (December 8, 1854), the pope accepted the proposals and entrusted the compilation and condemnation of the errors to the province of theology. The commission was entrusted with the further mission of studying modern errors. For six years it gave no outward signs of activity; but in 1860 Mgr Gerbet, bishop of Perpignan, published his Instruction pastorale sur diverses erreurs du temps présent; in it he enumerated 83 erroneous propositions, grouped under eleven heads. Pius IX. was much impressed by this work; he had it printed, and communicated it to the commission, to which he added a few new members, desiring them to take it as a fresh basis for their researches. In 1861 the commission had 27 meetings, at which the principal propositions were chosen and formulated in Latin and the theological council which they incurred applied to them. The result was a collection first of 70, and later of 61 propositions, of which only 27 have the note haereticæ; Mgr Gerbet’s divisions, and frequently his text, are adhered to. This Syllabus, which was excellently drawn up, was not promulgated, owing to an indiscretion. On the occasion of the festivals of the canonization of the Japanese martyrs, Pius IX. had gathered around him three hundred bishops from all parts of the world; he had the projected Syllabus communicated to each of them, under the seal of secrecy for the purpose of asking their opinion on each; but each bishop was also, still under the same secrecy, empowered to consult a theologian selected by himself. But in October 1862, the Turin Mediatore published the catalogue in full, and Mgr Bouquet, bishop of Montreal, thinking that it had been published in Rome, officially promulgated it for his diocese in December 1863. Pius IX. then modified his plans: a new commission was appointed to extract from the Allocutions, Encyclicals and papal Letters the chief errors dealt with in them. This work lasted about a year; the result of it was the Syllabus, in eighty propositions, arranged under the distinct heads; the propositions were not accepted by any theologian, but were simply struck out of the list by a reference to the Allocution, Encyclical or Letter from which each had been more or less textually extracted. This was addressed to the episcopate together with a letter from Cardinal Antonelli, and dated the 8th of December 1864, the same date as the Encyclical Quanta cura, from which, however, it remains quite distinct. Its publication aroused the most violent polemics; what was then called the Ultramontane party was loud in its praise; while the liberals treated it as a declaration of war made by the Church on modern society and civilization. Napoleon III.‘s government forbade its publication, and suspended the newspaper Il mediatore; public opinion was so strong that the book was reprinted, and was eventually numbers to as the theological value of the Syllab- uses. More Catholics saw in it as many infallible definitions as condemned propositions; others observed that the pope had neither personally signed nor promulgated the collection, but had intentionally separated it from the Encyclical by sending it merely under cover of a letter from his secretary of state; they said that it was hastily, and sometimes unfortunately drawn up (cf. prop. 61); they saw in it an act of the pontifical authority, but without any of the marks required in the case of dogmatic definitions; they concluded, therefore, that each proposition was to be appreciated separately, and in consequence that each syllabus was to be separated from the other. The same is the true view of the fact that Rome never censured the theologians who, like Newman, took up this position.

The errors enumerated in the Syllabus are grouped under the ten following heads: (1) Pantheism, naturalism and absolute
SYLLOGISM

rationalism; (2) Moderate rationalism; (3) Individualism, latitudinarianism; (4) Socialism, communism, secret societies, Bible societies, clerico-liberal societies; (5) Errors regarding the Church and her rights; (6) Errors regarding civil society both in itself and in its relations with the Church; (7) Errors regarding Christian and natural morality; (8) Errors regarding Christian marriage; (9) Errors concerning the temporal power of the pope; (10) Errors regarding the modern Liberalism. The modern Liberalism, however, the Syllabus did not contain a new doctrine; this Church was defending her traditional doctrine against the progressive invasion of what were called modern ideas of liberty, i.e. the independence of religious authority shown by secular societies, liberty of conscience, equality of all religious confessions before the state, &c. She upheld her theoretical position as in the time of Philip the Fair or of the Reformation, and the Syllabus goes no further in this respect than the Encyclical Quanta cura of the same date, or that of Gregory XV., Mirari vos, of the 1st of August 1832. But the unusual form of the document should be considered: instead of an exposition of doctrine it enumerates the errors in the form of bare propositions, without any qualification, and with no variation in the degree of condemnation; the result being that many people on both sides were misled.

The name Syllabus has sometimes also been given to the collection of 65 "modernist" propositions condemned by the decree Lamentabili of the Holy Office, dated the 3rd of July 1907; but this name is no wise official.

But we are concerned here only with those documents which the presentations of the Syllabus were collected together in the Recueil des allocutions consistoriales, &c. citées dans l'encyclopéie et le syllabus (Paris, 1865). For the history of the Syllabus: P. Hourat, Le Syllabus, étude documentaire (Paris, 1904); and P. Kinaldi, Il Valore del syllabo (Rome, 1888). For its theological value: Newman, A Letter Addressed to his Grace the Duke of Norfolk (London, 1875); P. Viollet, L'Infallibilité du pape et le syllabus (Paris, 1904); L. Choupin, Valeur des décisions doctrinales et disciplinaires du Saint Siège (Paris, 1907).

SYLLOGISM (Gr. συλλογισμος, from συν, and λογος, an argument resulting from combination, i.e. of premises), in logic, an argument consisting of premises and a conclusion. Aristotle's definition is (Anal. Pr. a i. 24 b 18; cf. Top. a 1. 100 a 25): συλλογισμος ειται λογος ιν ζ ἕκαστος των ἐκείνου τι των κειμενων ξ ἀνάγκης συνεκπερ φανετα είναι, "a syllogism is an argument in which, certain things being posited (the premises), something else (the conclusion) necessarily results from their being true." This definition, though it contains the really important facts, is too wide in two respects. (1) Aristotle himself and subsequent logicians restrict the term to arguments in which there are but two premises. (2) In point of fact, all logicians further confine the syllogism to arguments in which the terms are related as subject and predicate (or attribute in the widest sense). A fortiori arguments, for example, wherein relations of quantity are brought together, though syllogistic in type, are generally excluded. Owing largely to the simplicity and symmetry of the syllogism it has been a fundamental type of logic to make the syllogistic form the type of all thought. Modern logicians (cf. especially F. H. Bradley in his Logic) have, however, shown that in practice its importance is greatly exaggerated.

A. The Deductive Syllogism.—This argument is the simplest form of "mediate" inference, i.e. an argument in which two premises are brought into a necessary relation by the aid of a "middle" term which serves as a bridge. It requires, therefore, two propositions known as premises 1 (also spelled premises, as being more in accordance with the Lat. praemissae [propositions sententiae], things put or posited in advance) which contain one common term and one other term each. In the conclusion the middle term disappears and the other two are brought together. The premises are assumed: whether true or false, the conclusion follows necessarily. If the premises are true, the conclusion must be true: if they are false the great probability is that the conclusion is false. The predicate of the conclusion is called the major term, the subject the minor term; the term which is common to the premises and disappears in the conclusion is the middle term. Hence the premise which contains the major term is called the major premise: that which contains the minor, the minor premise. The form of the syllogism is therefore:—

\[ \begin{align*}
A & \equiv B \\
C & \equiv A \\
\therefore & \quad C \equiv B
\end{align*} \]

Major premise

Major premise

Minor

Conclusion

Syllogisms differ in (a) "figure" and (b) "mood." (a) Difference of figure depends on the order of the terms in the premises. The above is the scheme of figure I. If the middle term is the predicate in both premises, the syllogism is in figure II.; if the subject in both, figure III. These are the only figures recognized by Aristotle, though he points out that the premises in figure I. may justify a conclusion in which the predicate is not, as normally, the major term, but the minor. According to Galen, the physician of the so-called fourth figure, in which the middle term is predicate of the major and subject of the minor. This, however, destroys the appropriateness of the phrases major and minor term which are specially chosen because in fact the major term does imply the more comprehensive notion. The conclusion is an artificial proposition which would be stated naturally in the converse.

b. The distinction of moods is according to the quantity or quality of the propositions of the syllogism (universal, particular, affirmative, negative, in all the possible combinations). So far as mere form goes, each mood may occur in every figure, though in many cases the conclusion apparently yielded from the premises is invalid. A simple calculation shows that formally there are 64 possible moods. Investigation shows that of these nineteen 2 only are valid, and rules have been formulated which give the reasons for the invalidity of the remaining 45.

The rules which govern syllogistic arguments (thus described are:—

(i) A syllogism must contain three and three terms only. (a) Four terms would mean the absence of a connecting link. (b) If the middle term is ambiguous there are really four not three terms. The violation of (a) is the fallacy "Quaternio terminorum"; of (b) "ambiguous middle." (ii) The middle term must be distributed in one premise at least, i.e. it must be taken universally, as including all the particulars over which it extends (see Extension). Violation of this is the fallacy of "undistributed middle." (iii) No inference can be made from two negative premises. (iv) If either premise is negative, the conclusion is negative. (v) The conclusion cannot be negative, if both premises are affirmative. (vi) No term may be distributed in this conclusion which was not distributed in the premise in which it occurs. Violation of this rule is called an "illicit process of the major (or the minor) term." (vii) From two particular premises nothing can be inferred. If either premise is particular, the conclusion must be particular. 3 (viii) If either premise is particular, the conclusion must be affirmative.

The following mnemonic hexameter verses are generally given (first in Aldrich and later in more modern work) to aid in remembering these moods. The vowels in the words, A, E, I, O, show the quantity and quality of the premises:

1 Aristotle ἐπιστήμη, originally translated propositions; praemissae (propositiones sententiae), things put or posited in advance which

2 These latter are corollaries of previous rules.
The general criticism of the syllogism as a means of discovering truth is that it is a petitio principii, or begging of the question. This accusation is based to some extent on the Aristotelian "Dictum de omni et nullo" (Anal. Pr. a i. 24, b 26-30), generally stated as "That which is affirmed or denied of any whole may be affirmed or denied of anything contained within (or 'any part of') that whole." To take a concrete instance of a valid mood: all men are mortal, all Frenchmen are men, therefore all Frenchmen are mortal (the mood Barbara). It is argued that either there is here no real discovery (i.e. new truth) made or else an impure syllogism (begs the question) is used (bogus the question) as much as we must acknowledge that all Frenchmen are mortal we could not state that all men are mortal. The problem raised is a real one, and has been discussed by all logicians, from the time of Mill especially. In brief, the solution depends upon the view we take of the major premise, "all men are mortal." If that judgment is taken as a mere enumeration of particulars, i.e. in extension, as meaning that all men have been investigated and found to be mortal, clearly it could not be used to make the new discovery that a particular group of men are mortal; the syllogism so understood is a petitio principii. If, however, we take that judgment as a major premise, that it is not a mere summary of observed particulars but the enunciation of a necessary connexion between two concepts or universals, then the conclusion assumes a different character. The "whole" (omne) of the dictum, the major term, ceases to be taken in extension, and becomes intensive or connotative, and the inference consists in subsuming the minor under (bringing it into connexion with) the major. This is the true view of the scientific or inductive universal (as opposed to that of nominalism or pure empiricism). It remains true that in fact the conclusion is contained in the premises; this is essential to the validity of the syllogism—but the inference is a real one because it brings out and shows the necessity of a conclusion which was not before in our minds.

Hypothetical and Disjunctive Syllogisms.—The term syllogism has been extended to cover certain forms of ratiocination which are not based on categorical propositions. The property of this extended use is open to question and is denied by some logicians.

a. Hypothetical "Syllogisms" are those in which one premise is a hypothetical proposition, the other a categorical proposition which states or denies one of the two alternatives set forth. Again two forms occur: (i.) modus ponendo tollens which by the affirmation of one alternative denies the other (A is either B or C; A is B; therefore it is not C; or either A is B, C is D; A is B; therefore C is not D; or either A or B is C; A is C; therefore B is not C); (ii.) modus tollendo ponens which by the denial of the one, establishes the validity of the other alternative (A is either B or C; A is not B; therefore C is true; or either A or B is C; A is C; therefore B is not C). The validity of such arguments depends upon the sense in which we understand the disjunctive proposition: we must assume that the alternative is to be exclusive.

b. Disjunctive "Syllogisms" are those in which one premise is a disjunctive proposition, the other a categorical proposition which states or denies one of the two alternatives set forth. Again two forms occur: (i.) modus ponendo tollens which by the affirmation of one alternative denies the other (A is either B or C; A is B; therefore it is not C; or either A is B, C is D; A is B; therefore C is not D; or either A or B is C; A is C; therefore B is not C); (ii.) modus tollendo ponens which by the denial of the one, establishes the validity of the other alternative (A is either B or C; A is not B; therefore C is true; or either A or B is C; A is C; therefore B is not C). The validity of such arguments depends upon the sense in which we understand the disjunctive proposition: we must assume that the alternative is to be exclusive.

Sortes.—Finally it is necessary to mention a complex syllogistic argument known as the Sortes (Gr. ἄκριβος, heap). It has been described as "a guessing game" (I. e. guessing the answer by having the question repeated). It is, really a series of syllogisms (a polysyllogism), each one proving a premise of another, the intermediate conclusions being suppressed. Its form is A is B, B is C, C is D, . . . Y is Z, therefore Z is V. Each syllogism of the series is called a "sorte" and is defined as a "sorte decidendi" in relation to the one that succeeds, and an "epilegism" in relation to its predecessors. Resolution of the sortes into its constituent elements gives the rules (a) that no premise except the first may be particular and (b) that no premise except the last may be negative.

B. The Inductive Syllogism, like the deductive, is first systematized by Aristotle, who described it as a δς ἔναγγειλη συλλογιζόμενος. Unlike the deductive it consists in establishing a conclusion from particular premises, i.e. of referring the major term to the middle by means of the minor. The form is "A B C, &c., are P; A B C D are all M; thus all M are P." This so-called syllogism has been much criticized by modern logicians on various grounds (see Logic).

Discussions of the syllogism will be found in all textbooks on Logic. The more elaborate syllogistic forms are discussed in the article Logic.

SYLPH, an imaginary spirit of the air; according to Paracelsus, the first modern writer who uses the word, an air-elemental, coming between material and immaterial beings. In current usage, the term is applied to a feminine spirit or fairy, and is often used in a figurative sense of a graceful, slender girl or young woman. The form of the word points to a Greek origin, and Aristotle's ὁ πνεῦμα, a kind of beetle (Hist. anim. 8. 17. 8), has usually been taken as the source. Similarly, the earth-elemental or earth-spirit is called a gnomon (Gr. γνώμη, intelligence, γεγνώςαν, to know) as being the spirits that gave the secrets of the earth to mortals. Littéré, however, takes the word to be Old Celtic, and meaning "genius," and states that it occurs in such forms as sulvi, sulfi, &c., in inscriptions, or latinized as sullae or sullaeae.

SYLT (probably from the O. Fris. Silendi, i.e. sealand), the largest German island in the North Sea, being about 38 sq. m. in area and nearly 23 m. long. It is, however, very narrow, being generally about half a mile in width, except in the middle, where it sends out a peninsula to the east 7 m. across. It belongs to the Prussian province of Schleswig-Holstein, and lies from 7 to 12 m. from the Schleswig coast. The central peninsula contains some marshland and moorland pasture, on which a few thousand sheep graze; but the rest of the island consists merely of dunes or sandhills. These attain at places a height of from 100 to 150 ft., and are continually shifting to the westward. The inhabitants (3500) are of Frisian origin, and the official language is German, though in the extreme north of the island, known as Lüt, Danish is spoken. Their occupations are fishing, oyster-dredging, seafaring and wild-duck catching. The chief places are Ecke, Flensig, Morsum, Rantum and Westerland, one of the most frequented sea-bathing places of Germany, lies on the west side of the island, separated from the sea, which is seldom perfectly calm, by a chain of sand dunes, across which board walks lead to the beach. The island is reached by a regular steamboat service from Hoyer on the mainland to Munkmarsch, which is connected by a steam tram with Westerland. Another line of steamers runs from Hamburg to Sylt via Heligoland. During the Danish War of 1864, after suffering severely at the hands of the Danes, the island was occupied by the Prussians on the 13th of July (see FRIESEN INLAND)...

Sylvanite, mineral consisting of gold and silver telluride, AuAgTe₄, containing gold 24-2 and silver 13-5%; an important ore of gold. Crystals are monometric and often very rich in spaces; they are frequently twinned, giving rise to branching forms resembling written characters; on this account the mineral was early known as "graphic gold" or "graphic tellurium" (Ger. Schrifters). It was also known as "white gold," the colour being tin-white with a brilliant metallic lustre. The hardness is 2 and the specific gravity 8-2. It occurs with native gold in veins traversing porphyry at Olenbânya and Nagyag, near Děva in Transylvania (from which country it takes its name); also at several places in Boulder county, Colorado, and at Kalgoorlie in Western Australia. Sylvanite may be

1 For a dilemma which includes both hypothetical and disjunctive reasoning see DILEMMA.
2 Where one premise of a syllogism is omitted (see ENTHENYME), this argument is sometimes called an "epichirema."
SYLVESTER, J. J.—SYMBOL

readily distinguished from calaverite (AuTe₅) by its perfect cleavage in one direction (parallel to the plane of symmetry), but in this character it resembles the very rare orthorhombic mineral krennecite (Au, AgTe₅).

SYLVESTER, JAMES JOSEPH (1814–1897), English mathematician, was born in London on the 3rd of September 1814. He went to school first at Highgate and then at Liverpool, and in 1831 entered St John's College, Cambridge. In his Tripos examination, which through illness he was prevented from taking till the following year, he placed second wrangler, but being unwilling to sign the Thirty-nine Articles, he could not compete for one of the Smith's prizes and was ineligible for a fellowship, nor could he even take a degree: this last, however, he obtained at Trinity College, Dublin, where religious restrictions were no longer in force. After leaving Cambridge he was appointed to the chair of natural philosophy at University College, London, where his friend A. De Morgan was one of his colleagues, but he resigned in 1840 in order to become professor of mathematics in the university of Virginia. There, however, he remained only six months, for certain views, skeptical in the case of the administrative conspirators, entailed unpleasant consequences, and necessitated his return to England, where he obtained in 1844 the post of actuary to the Legal and Equitable Life Assurance Company. In the course of the ensuing ten years he published a large amount of original work, much of it dealing with the theory of invariants, which marked him as one of the foremost mathematicians of the time. But he failed to obtain either of two posts—the professorships of mathematics at the Royal Military Academy and of geometry in Gresham College—for which he applied in 1854, though he was elected to the former fifteen years later. The death of his wife in 1857 was a great sorrow to him. At Woolwich he remained until 1870, and although he was not a great success as an elementary teacher, that period of his life was very rich in mathematical work, which included remarkable advances in the theory of the partition of numbers and further contributions to that of invariants, together with an important research which yielded a proof, hitherto lacking, of Newton's rule for the discovery of imaginary roots for algebraical equations up to and including the fifth degree. In 1874 he produced several papers suggested by A. Peacock's discovery of the straight line link motion associated with his name, and he also invented the skew pentagon. Three years later he was appointed professor of mathematics in the Johns Hopkins University, Baltimore, stipulating for an annual salary of $5000, to be paid in gold. At Baltimore he gave an enormous impetus to the study of the higher mathematics in America, and during the time he was there he contributed to the American Journal of Mathematics, of which he was the first editor, no less than thirty papers, some of great length, dealing mainly with modern algebra, the theory of numbers, theory of partitions and universal algebra. In 1883 he was chosen to succeed Henry Smith in the Savilian chair of geometry at Oxford, and there he produced his theory of reciprocants, largely by the aid of his "method of infinitesimal variation." In 1893 loss of health and failing eyesight obliged him to give up the active duties of his chair, and a deputy professor being appointed, he went to live in London, where he died on the 15th of March 1897. Sylvester's work suffered from a certain lack of steadiness and method in his character. For long periods he was mathematically unproductive, but then sudden inspiration would come upon him and his ideas and theories poured forth far more quickly than he could record them. All the same his output of work was as large as it was valuable. The scope of his researches was described by Arthur Cayley, his friend and fellow worker, in the following words: "They relate chiefly to finite analysis, and cover by their subjects a large part of it—algebra, determinants, elimination, the theory of equations, partitions, tacit, the theory of forms, matrices, reciprocants, the Hamiltonian numbers, &c.; analytical and pure geometry occupy a less prominent position; and mechanics, optics and astronomy are not absent." Sylvester was a good linguist, and a diligent composer of verse, both in English and Latin, but the opinion he cherished that his poems were on a level with his mathematical achievements has not met with general acceptance.

SYLVESTER, JOSHUA (1563–1618), English poet, the son of a Kentish clothier, was born in 1563. In his tenth year he was sent to school at Southampton, where he gained a knowledge of French. After about three years at school he appears to have put to business, and in 1581 the title-page of his Verses states that he was in the service of the Merchant Adventurers' Company. He was for a short time a land steward, and in 1606 Prince Henry gave him a small pension as a kind of court poet. In 1613 he obtained a position as secretary to the Merchant Adventurers. He was stationed at Middelburg, in the Low Countries, where he died on the 28th of September 1618. He translated into English heroic couplets the scriptural epic of Guillaume du Bartas. His Essay of the Second Week was published in 1598; and in 1604 The Divine Weeks of the World's Birth. The ornate style of the original offered no difficulty to Sylvester, who was (somewhat bright in the) Amphitheatre, and added many adornments of his own invention. The Septaines of Du Bartas appealed most to his English and German co-religionists, and the translation was immensely popular. It has often been suggested that Milton owed something in the conception of Paradise Lost to Sylvester's translation. His popularity ceased with the Restoration, and Dryden called his verse "abominable fustian."

His works were reprinted by Dr A. B. Grosart (1880) in the Livre des Worthies and Historical &c.

See also C. Dunster's Considerations on Milton's early Reading (1890).

SYLVITE, a mineral consisting of potassium chloride (KCl), first observed in 1823, as an encrustation on Vesuvian lava. Well-formed crystals were subsequently found in the salt deposits of Stassfurt in Prussia and Kalusz in Austrian Galicia. It crystallizes in the cubic system with the form of cubes and cubic-octahedra and possesses perfect cleavages parallel to the faces of the cube. Although the crystals are very similar in appearance to crystals of common salt, they are proved by etching experiments to possess a different degree of symmetry, namely plagioclase-cubic, there being no planes of symmetry but the full number of axes of symmetry. Crystals are colourless (sometimes a slight tint of the) transparent; the hardness is 2 and the specific gravity 1.98. Like salt, it is highly diathromenous. The name sylvite or sylvin is from the old pharmaceutical name, sal digestivus sylviis, for this salt.

SYMBOL (Gr. σύμβολον, a sign), the term given to a visible object representing to the mind the semblance of something which is not shown but realized by association with it. This is conveyed by the ideas usually associated with the symbol; thus the palm branch is the symbol of victory and the anchor of hope. Much of early Christian symbolism owes its origin to pagan sources, the interpretations of the symbols having a different meaning; thus "the Good Shepherd with the lamb" is thought by some to have been derived from the figure of Hermes (Mercury) carrying the goat to sacrifice, and "Orpheus charming the wild beasts," which, when painted in the catacombs, was probably intended as the representation of a type of Christ. One of the earliest symbols of the Saviour, the fish, was derived from an acrostic of the Greek word Ἠχθος, the component letters of which were the initials of the five words Ἰησοῦς Χριστός, θεὸς τῶν, σώτηρ. Jesus Christ, Son of God, Saviour. The ship, another early symbol, represented the Church as a sanctuary of the faithful and a boat of safety on the sea of life. Other symbols are those which were represented by animals, real or fabulous, and were derived from Scripture: thus the lamb typified Christ from St John's Gospel (i. 29 and 36), and the lion from the Book of Revelations, in which Christ is called the "Lion of the tribe of Judah." The peacock stood for immortality; the phoenix for the Resurrection; the dragon or the serpent for Satan; and the stag for the soul thirsting for baptism. The sacred monogram Chi Rho, Χไข suppressed to have been the celestial sign seen by the emperor Constantine on the eve of the defeat of Maxentius, represents the two first letters of the Greek word
**SYME—SYMMACHUS**

Xρεσις which Constantine figured on his labarum, or standard, and is found on early Christian coins, bearing also the favourite decoration of the Byzantine sarcophagi. The four evangelical symbols are taken from the book of Ezekiel and from the Book of Revelations; thus the winged man is St Matthew, the winged lion St Mark, the winged ox St Luke and the eagle St John; and these four symbols became the favourite subject for representation in the Church. Besides these the other evangelists and the saints carry emblems by which they may be recognized; thus St Andrew by the cross, St Peter by the keys, St Paul by the sword, St Edward by a cup and dagger, St Mary Magdalene by a box or vase, St Lawrence by a gridiron, St Faith also by a gridiron, &c.

**SYME, JAMES** (1799-1879), Scottish surgeon, was born at Edinburgh on the 7th of November 1799. His father was a writer to the signet and a landowner in Fife and Kinross, who lost most of his fortune in attempting to develop the mineral resources of his property. James was sent to the high school at the age of nine, and remained until he was fifteen, when he entered the university. For two years he frequented the arts college, but his mind was really enlisted in his own community, devoting himself with particular keenness to chemistry. His chemical experiments led him to the discovery that "a valuable substance is obtainable from coal tar which has the property of dissolving india-rubber," and could be used for waterproofing silk and other textile fabrics—an idea which was patented a few months afterwards by Charles Mackintosh, of Glasgow. In the session 1818-1819 Syme became assistant and demonstrator of the dissecting room of Robert Liston, who had started as an extra-mural teacher of anatomy in competition with his old master, Dr John Barrell. In those years he held also resident appointments in the infirmary and the fever hospital, and spent some time in Paris practising dissection and operative surgery. In 1823 Liston handed over to him the whole charge of his anatomy classes, retaining his interest in the school as a pecuniary venture; the arrangement did not work smoothly, and a feud with Liston arose, which did not terminate until twenty years later, when the latter was settled in London. In 1824-1825 he started the Brown Square school of medicine, but again disagreed with his partners in the venture. Announcing his intention to practise surgery only, Syme started a surgical hospital of his own, the Minio Hoůho hospital, with which he carried on from May 1829 to September 1833, with great success as a surgical charity and school of clinical instruction. It was here that he first put into practice his method of clinical teaching, which consisted in having the patients to be operated or predicted upon brought from the ward into a lecture-room or theatre where the students were seated conveniently for seeing and taking notes. His private practice had become very considerable, his position having been assured ever since his amputation at the hip joint in 1823, the first operation of the kind in Scotland. In 1833 he succeeded James Russell as professor of clinical surgery in the university. Syme's accession to the clinical chair was marked by two important changes in the conditions of it: the first was that the professor should have the care of surgical patients in the infirmary in right of his professorship, and the second, that attendance on his course should be obligatory on all candidates for the medical degree. When Liston removed to London in 1835 Syme became the leading consulting surgeon in Scotland. On Liston's death in 1847 Syme was offered his vacant chair of clinical surgery at University College, London, and accepted it. He began practice in London in February 1848. The year 1849 was a difficult one; two of his colleagues at Gower Street and a desire to "escape from animosity and contention" led him to throw up his appointment. He returned to Edinburgh in July, and was reinstated in his old chair, to which the crown authority had meanwhile found a difficulty in appointing. The judgment of his friends was that "he was always right in the matter, but often wrong in the manner, of his quarrels." In 1849 he broached the subject of medical reform in a letter to the lord advocate; in 1854 and 1857 he addressed open letters on the same subject to Lord Palmerston; and in 1858 a Medical Act was passed which largely followed the lines laid down by himself. As a member of the general medical council called into existence by the act, he made considerable stir in 1868 by an uncompromising statement of doctrines on medical education, which were thought by many to be reactionary; they were, however, merely an attempt to recommend the methods that had been characteristic of Edinburgh teaching since William Cullen's time—namely, a constant reference of facts to principles, the subordination (but not the sacrifice) of technical details to generality, and the preference of large professional classes and the "magnetism" of the individual to the "cramping". In April 1869 he had a paralytic seizure, and at once resigned his chair; he never recovered his powers, and died near Edinburgh on the 26th of June 1870.

Syme's surgical writings were numerous, although the terseness of his style and directness of his method saved them from being bulky. In 1851 he published A Treatise on the Excision of Diseased Months of the Years, easily recognizable among his name. His Principles of Surgery (often reprinted) came out a few months later; Diseases of the Rectum in 1839; Stricture of the Urethra and Fistula in Ano in 1849; and Excision of the Scrota in 1864. In 1848 he collected into a volume, under the title of Some Remarks to the Pathology and Practice of Surgery, thirty-one original memoirs published in periodicals from time to time; and in 1861 he issued under the title of Operative Observations of Clinical Surgery. Syme's character is not inaply summed up in the dedication to him by his old pupil, Dr John Brown, of the series of essays Loche and Sydenham: "Verax, capax, perspicac, sagax, efficax, tenax."

**SYMMACHUS**

The most renowned of the Byzantine hagiographers. Scholars have been very much divided as to the period in which he lived, dates ranging from the 9th to the 14th having been suggested; but it is now generally agreed that he flourished in the second half of the 10th century. Still greater divergences of opinion have existed as to the lives of saints coming from his pen, and here again the solution of the problem has been attained by studying the composition of the great Greek menologies. The menology of Metaphrastes is a collection of lives of saints for the twelve months of the year, ranging in style and importance, consisting of about 150 distinct pieces, some of which are taken bodily from older collections, while others have been subjected to a new recension (metaphaping). Among other works attributed (though with some uncertainty) to Symmachus are a Chronicle, a canonical collection, some letters and poems, and other writings of less importance. Symmachus' great popularity is due more particularly to his collection of lives of saints. About his life we know only very few details. The Greeks honour him as a saint on the 28th of November, and an office has been composed in his honour.

See L. Allatius, De Symmacho scriptis dioecesis (Paris, 1664); F. Hirsch, Byzantinische Studien, pp. 303-355 (Leipzig, 1870); A. Ehrhard, Die Legensammlung des Symmachus Metaphrastes (Rome, 1897); and in Römische Quartalschrift (1897), pp. 67-205 and 531-551; H. de Beihay, La Vie de St. Paul le Jeune et la chronologie de Metaphraste (1893); Anetologia Bollandiana, xvi. 312-327 and xvii. 448-452.

**SYMMACHUS**, pope from 498 to 514, had Anastasius II. for his predecessor and was himself followed by Hormisdas. He was a native of Sardinia, apparently a convert from paganism, and was in deacon's orders at the time of his election. The choice was not unanimous, another candidate, Laurentius, having the support of a strong Byzantine party; and both were more consecrated by their friends, the Constance of the Lateran Church and the other in that of St Mary, on the 22nd of November 498. A decision was not long afterwards obtained in favour of Symmachus from Theodoric, to whom the dispute had been referred; but peace was not established until 505 or 506, when the Gothic king ordered the Laurentian party to surrender the churches of which they had taken possession. An important incident in the protracted controversy was the
SYMMACHUS

decision of the “palmyr synd.” The remainder of the pontifi-
cate of Symmachus was uneventful; history speaks of various
churches in Rome as having been built or beautified by him.
SYMMACHUS, the name of a celebrated Roman family of
the 4th to 6th centuries of our era. It belonged to the gens Aurelia
and can be traced back to Aurelius Julianus Symmachus, pro-
consul of Achaea (according to others, vicar or vice-prefect
of Macedonia) in the year 319. Lucius Aurelius Avianius
Symmachus, who presumably was consul in 320 and 324, was
a great administrator, and his reputation for eloquence, marked
him out as the champion of the pagan senate against the
measures which the Christian emperors directed
against the old state religion of Rome. In 382 he was banished
from Rome by Gratian for his protest against the removal of
the statue and altar of Victory from the senate-house (see Gibbon,
Decline and Fall, ch. 28), and in 384, when he was prefect of the
city, he addressed to Valentinian II a letter praying for the
restoration of these symbols. This is the most interesting of his
literary remains, and called forth two replies from St Ambrose,
as well as a poetical refutation from Prudentius. After this
Symmachus was involved in the rebellion of Maximus, but
obtained his pardon from Theodosius, and appears to have
continued in public life up to his death. In 391 he was Consul
ordinarius. His honesty, both in public and in private affairs,
and his amiability made him very popular. The only reproach
that could be made against this last valiant defender of paganism
is a certain aristocratic conservativeness, and an exaggerated
love of the past. As his letters do not extend beyond the year
402, he probably died soon after that date.

Of his writings we possess: (1) Panegyrici, written in his youth in
a very archaic style, two on Valentinian I. and his mother Theodora;
(2) nine books of Epistles, and two from the tenth book,
published after his death by his son. The model followed by the
writer, he tells us, was Ammianus (see above), and his admiration
for the style and dignity of Macrobius (bk. v., § 7), in which Symmachus is introduced as
one of the interlocutors, it appears that his contemporaries deemed
him second to none of the ancients in the “rich and florid” style.
With the death of Valentinian II. this style and order were
soon effaced. (3) Fragments of Complimentaria Orations,
five from a pamphlet (also containing the Panegyrici), of
which part is at Milan and part in the Vatican, discovered by
Mai, who published the Milan fragments in 1815, the Roman in his
Scriptorum veterum nova collectio, vol. i. (1825), and the whole
in 1846. (4) The Relations, which contain an interesting account
of public life in Rome, composed for the emperor. In these official
writings (reports as prefect of the city), Symmachus is not preoccu-
pied by style and becomes sometimes eloquent: especially so in his
remarkable report on the altar of Victory.

His son, Quintus Fabius Memmius Symmachus, was pro-
consul of Africa (415) and prefect of the city (418). He was
probably the father of the Symmachus who was consul in 440,
and whose son was Quintus Aurelius Memmius Symmachus
(d. 525), patrician, one of the most cultivated noblemen of Rome
of the beginning of the 6th century, editor (e.g. of Macrobius,
Sommum Scriptiorum) and historian, and especially celebrated
for his building activity. He was consul in 455. Theodoric
charged him with the restoration of the theatre of Pompey.
He was father-in-law of Boëtius (q.v.), and was involved in his
fate, being disgraced and finally put to death by Theodoric
in 525.

All editions of the works of Symmachus are now superseded by that
of O, Seeck in Monumenta Germaniae historic a. Auctores antiqui-
issimi (1853), vol. i., with instructions on his life, works and chronology, and
a genealogical table of the family.

SYMONDS, JOHN ADDINGTON (1840–1893), English critic
and poet, was born at Bristol, on the 5th of October 1840. He
was the only son of John Addington Symonds, M.D. (1807–
1871), the author of an essay on Criminal Responsibility (1866),
to which he contributed a postscript (1878), and of Shorter
memoirs and Reminiscences, 1805–1875, published at Oxford
in 1875). His mother, Harriet Symonds, was the eldest daughter
of James Sykes of Leatherhead. He was a delicate boy, and
at Harrow, where he was entered in 1854, took no part in
school games and showed no particular promise as a scholar.
In 1858 he proceeded to Balliol as a commoner, but was
elected to an exhibition in the following year. The Oxford training
and association with the brilliant set of men then at Balliol
called out the latent faculties in Symonds, and his university
career was one of continual distinction. In 1860 he took a
first in “ Mods,” and won the Newdigate with a poem on The
reawakening of the spirit; in 1862 he was placed in the first class in Literae
Humanae, and in the following year was winner of the Chan-
cellar’s English Essay. In 1863 he had been elected to an open
fellowship at Magdalen. The strain of study unfortunately
proved too great for him, and, immediately after his election to a
fellowship, his health broke down, and he was obliged to seek
rest in Switzerland. There he met Janet Catherine North,
whom, after a romantic betrothal in the mountains, he married
at Hastings on the 9th of November 1864. He then attempted
to settle in London and study law, but his health again broke
down, and obliged him to travel. Returning to Clifton, he lectured
there, both at the college and to ladies’ schools, and the fruits
of his work in this direction remain in his Introduction to the
Study of Dante (1872) and his admirably vivid Studies of the
Greek Poets (1873–1876). Meanwhile he was occupied upon
the work to which his talents and sympathies were especially
attracted, his Renaissance in Italy, which appeared in seven
volumes at intervals between 1875 and 1886. The Renaissance
had been the subject of Symonds’ prize essay at Oxford, and
the study which he had then given to the theme aroused in him
a desire to produce something like a complete picture of the
renawakening of art and literature in Europe. This work, how-
ever, was again interrupted by illness, and this time in a
more serious form. In 1877 his life was in acute danger, and, upon
his removal to Davos Platz and subsequent recovery there it
was felt that this was the only place where he was likely to be
able to enjoy life. From that time onward he practically
made his home at Davos, and a charming picture of his life there
will be found in Our Life in the Swiss Highlands (1891). Symonds,
indeed, became in no common sense a citizen of the town; he
took part in its municipal business, made friends with the
peasants, and shared their interests. There he wrote most of his
books: biographies of Shelley (1878), Sir Philip Sidney (1886),
Ben Jonson (1886), and Michelangelo (1893), several volumes
of poetry and of essays, and a fine translation of the Autobiography
of Benvenuto Cellini (1887). There, too, he completed his
study of the Renaissance, the work by which he will be longest
remembered. He was assiduously, feverishly active through-
out the whole of his life, and the amount of work which he
achieved was wonderful when the uncertainty of his health is
remembered. He had a passion for Italy, and for many years
resided during the autumn in the bosom of his friend, Horatio
F. Brown, at the Villa Ventale, near Rome. He died at Rome
on the 19th of April 1893, and was buried close to Shelley.
He left his papers and his autobiography in the hands of Mr
Brown, who published in 1895 an excellent and comprehensive
biology. Two works from his pen, a volume of essays, In
the Key of Blue, and a monograph on Walt Whitman, were
published in the year of his death. His activity was unbroken to
the last. In life Symonds was morbidly introspective, a Hamlet
among modern men of letters, but with a capacity for action
which Hamlet was denied. Robert Louis Stevenson described
him, in the Opalstein of Talks and Talkers, as “the best of talkers,
"
singing the praises of the earth and the arts, flowers and jewels, wine and music, in a moonlight, serenading manner, as to the light guitar.” But under his excellent good-fellowship lurked a haunting melancholy. Full of ardour and ambition, sympathy and desire, he was perpetually tormented by the riddles of existence; through life he was always a seeker, ardent but unsatisfied. This side of his nature stands revealed in his gnomic poetry, and particularly in the sonnets of his Animus F igura (1883), where he has portrayed his own character with great subtlety. His poetry is perhaps rather that of the student than of the indented bard, but it has moments of deep thought and emotion. It is, indeed, in passages and extracts that Symonds appears at his best. Rich in description, full of “purple patches,” his work has not that harmony and unity that are essential to the conduct of philosophical argument. He saw the part more clearly than the whole; but his view, if partial, is always vivid and concentrated. His translations are among the finest in the language; here his subject was found for him, and he was able to lavish on it the wealth of colour and quick sympathy which were his characteristics. He was a lover of beauty, a poet and a philosopher; but in his life and work he failed to like the idea that absolute harmony of conviction and concentration under which alone the highest kind of literature is produced.

(A. W.)

SYMONDS, WILLIAM SAMUEL (1838-1887), was born in Hereford in 1818. He was educated at Cheltenham and Christ’s College, Cambridge, where he graduated B.A. in 1842. Having taken holy orders he was appointed curate of Offenham, near Evesham in 1843, and two years later he was presented to the living of Pendock in Worcestershire, where he remained until 1877. While at Offenham he became acquainted with H. E. Strickland and imbibed from him an interest in natural history and geology, that his leisure was henceforth devoted to these subjects. He was one of the founders of the Woolhope Naturalists’ Field Club (1851) and of the Malvern Naturalists’ Field Club (1853), and was an active member of the Cotteswold Field Club and other local societies. In 1858 he edited an edition of Hugh Miller’s Cruise of the “Blessey.” He was the author of numerous essays on the geology of the Malvern country, notably of a paper “On the passage-beds from the Upper Silurian rocks into the Lower Old Red Sandstone at Ledbury” (Quart. Journ. Geol. Soc. 1860). His principal work was a work of great excellence, The Wye (1871), Old Bones, or Notes for Young Naturalists (1859), 2nd ed. 1864), and other popular works. He died at Cheltenham on the 15th of September 1887.

See A Sketch of the Life of the Rev. W. S. Symonds, by the Rev. J. D. La Touche.

SYMONDS’S YAT, one of the most famous view points on the river Wye, England. At a point 9 m. above Monmouth and 12 m. below Ross by water, the Wye makes a sweep of nearly 5 m. round a peninsula whose neck is only some 500 yds. across. The peninsula is occupied by the limestone acclivity of Hunts- ham Hill. Caverns are seen in the limestone on both precipitous banks of the river. The Yat or Gate is situated on the west side of the neck, which reaches an elevation over 500 ft., and a road from the east drops to a ferry, which was of early importance as a highway between England and Wales. The boundary between Herefordshire and Gloucestershire crosses the neck; the Yat is in the county first named, but the railway station, on the east side (left bank) is in Gloucestershire. It is on the Ross-Monmouth line of the Great Western railway. There are here groups of cottages and several inns on both banks, while opposite the Yat itself is the hamlet of New Weir, and a little above it the village of Whitchurch. The rivers banks are densely wooded, except where they become sheer cliffs, as at the Coldwell rocks above the station. The surrounding country is hilly and rich, and the views from the Yat are superb, embracing the Forest of Dean to the south and east, and backed by the mountains of the Welsh border in the west.

SYMONS, ARTHUR (1865- ), English poet and critic, was born in Wales on the 28th of February 1865, of Cornish parents. He was educated privately, spending much of his time in France and Italy. In 1884-1886 he edited four of Quaritch’s Shakespeare Quartos Facsimiles, and in 1888-1889 seven plays of the “Henry Irving” Shakespeare. He became a member of the staff of the Athenaeum in 1891, and of the Saturday Review in 1894. His first volume of verse, Days and Nights (1889), consisted of dramatic monologues. His later verse is influenced by a close study of modern French writers, of Baudelaire and especially of Verlaine. He reflects French tendencies both in the subject-matter and style of his poems, in their eroticism and in their expression of a kind of despair, the evidence of which is recorded in the volumes of verse are: Silhouettes (1892), London Nights (1895), Amors victima (1897), Images of Good and Evil (1899), A Book of Twenty Songs (1905). In 1902 he made a selection from his earlier verse, published as Poems (2 vols.). He translated from the Italian of Gabriele d’Annunzio The Dead City (1900) and The Child of Pleasure (1898), and from the French of Émile Verhaeren The Dawn (1903). To The Poems of Ernest Dowson (1903) he prefixed an essay on the deceased poet, who was a kind of English Verlaine and had many attractions for Mr Symonds. Among his volumes of collected essays are: Studies in Two Literatures (1897), The Symbolist School in Literature (1899), Cities (1903), Pictures of Rome, Venice, Naples, Seville, &c., Plays, Acting and Music (1903), Studies in Prose and Verse (1904), Spiritual Adventures (1905), Studies in Seven Arts (1906).

SYMONS, GEORGE JAMES (1838-1900), English meteorologist, was born in Pimlico, London, on the 6th of August 1838. In 1866 he obtained a post in the meteorological department of the Board of Trade under Admiral Robert Fitzroy, who was then deeply interested in the subject of storm-warnings, and in the same year he published the first annual volume of British Rainfall, which contained records from 168 stations in England and Wales, but none from Scotland or Ireland. Three years later he resigned his appointment at the Board of Trade, where his rainfall inquiries were not appreciated—at least not as a prior study of storm-warnings—and devoted his whole energies to the organization of a band of volunteer observers for the collection of particulars of rainfall throughout the British Isles. So successful was he in this object that by 1866 he was able to show results which gave a fair representation of the distribution of rainfall, and the number of recorders gradually increased until the last volume of British Rainfall which he lived to see published in 1899 contained records from 2894 stations in England and Wales, 446 in Scotland, and 188 in Ireland. Apart from their scientific interest, these annual reports are of great practical importance, since they afford engineers and others engaged in water supply much-needed data for their calculations, the former absence of which had on some occasions given rise to grave mistakes. Symons himself devoted special study not only to rainfall, but also to the evaporation and percolation of water as affecting underground streams, and his extensive knowledge rendered him a valuable witness before parliamentary committees. In other branches of meteorology also he took a keen interest, and he was particularly indefatigable, though consistently unsuccessful, in the quest of a genuine thunderbolt. The history of the science too attracted his attention, and he possessed a fine library of meteorological works, which passed to the Meteorological Society at his death. Of that society he became a member when only eighteen, and he retained his connexion with it in various official capacities up to the end of his life. He served as its president in 1880, and in view of the celebration of its jubilee was re-elected to that office in 1900, but the illness that caused his death prevented him from acting. He died in London on the 10th of March 1900.

SYMPATHIC SYSTEM. 1. Physiology. By the “sympathetic system” is understood a set of nerves and ganglia more or less sharply marked off from the cerebro-spinal, both functionally and anatomically. (For anatomy see NERVOUS SYSTEM.) Formerly it was thought more independent from the rest of the general nervous system than recent discoveries have found it actually to be. It used to be supposed that the ganglia of the sympathetic system were analogous in function to the
great central nervous masses forming the brain and spinal cord. These latter masses, as now becomes more and more evident, are the only structures in which occurs the work of transmitting afferent-nerve impulses into efferent-nerve impulses with all the accompanying changes in intensity, rhythm; &c., which make up reflex action. Such functions, it is now known, are not attributable to sympathetic ganglia. These last are structures in which one neurone makes communication with other neurones. To that extent, therefore, the distribution of nervous impulses does occur in them, impulses arriving by a few neurones being distributed so as to affect many. But the sympathetic ganglia are not the seat of reflex action. The sympathetic system is now known to consist entirely of conducting paths which, like the nerve-trunks of the cerebro-spinal system, merely conduct nerve impulses either toward the great nervous centres of the spinal cord and brain, or, on the other hand, away from those great centres. In the cerebro-spinal nerves the preponderance of the conduction is toward the centres, in the sympathetic system the preponderance of conduction is away from the centres.

More is known of the sympathetic system from its efferent aspect than it afferent, and we shall consider the former first. One great difference between the efferent paths of the sympathetic and those of the ordinary cerebro-spinal system is that the latter carry nervous impulses not only to muscular tissue but to secreting glands, whereas the latter convey them to muscle only, indeed only to muscle of the striated kind. Another difference is that the efferent path which the sympathetic affords from the great central nervous centres to its muscles and glands consists of two neurones, whereas the efferent path afforded by the cerebro-spinal motor nerves consists of one neurone only. The two neurones forming the sympathetic path are so arranged that one of them whose cell-body lies in the spinal cord has a long axone-process passing out from the cord in the motor spinal root, and this extends to a group of nerve-cells, a sympathetic ganglion, quite distant from the spinal cord and somewhere on the way to the distant organ which is to be innervated. In this ganglion the first sympathetic neurone ends, forming functional connexion with ganglion cells there. These ganglion cells extend each of them an axone-process which attains the organ (muscular cell or gland cell), which is the office of the sympathetic path to reach and influence. The axone-process of the first nerve cell is a myelinated nerve-fibre extending from the spinal cord to the ganglion; it constitutes the pre-ganglionic fibre of the conduction chain. The axone-process of the second nerve-cell, that is the neurone whose cell-body lies in the ganglion, is usually non-myelinate and constitutes the post-ganglionic fibre of the chain.

This construction, characteristic as it is of the sympathetic efferent path, has been found also in certain other efferent paths outside the sympathetic proper. And as these other efferent paths convey impulses to the same kind of organs and tissues as do those of the sympathetic itself, it has been proposed to embrace them and the sympathetic under one name, the autonomic system. This term includes all the efferent paths of the entire body excepting only those leading to the voluntary muscles.

That the term "autonomic system" is not merely a convenience of nomenclature, but really represents a physiological entity, seems indicated by the action of nicotine. This drug acts selectively on the autonomic ganglia and not on the cerebro-spinal. In the former it paralyses the nexus between pre-ganglionic and post-ganglionic fibre. It is by taking advantage of this property that many of the recent researches which have done so much to elucidate the sympathetic have been executed. The term "autonomic system" must not be taken to imply that this system is independent of the central nervous system. As mentioned above in regard to the sympathetic, that is not the case. The autonomic system is closely connected with the central nervous system through the ordinary channel of the nerve-roots, spinal and cranial. It may, in fact, be regarded as an appendage of the cranial and spinal roots, or rather of certain of them, for with a considerable proportion of their number it is not connected.

The sympathetic is that part of the autonomic system which is connected with the spinal roots from the second thoracic to the second lumbar inclusive (man). Its ganglia are divided by anatomists into the vertebral, those which lie as a double chain on the ventral face of the vertebral column, and those which are scattered at various distances among the viscera, the pre-vertebral. Langley has shown that there is no essential difference between these except that the vertebral send some of their post-ganglionic fibres into the spinal nerves, whereas the latter send all their fibres to the viscera. The sympathetic sends its post-ganglionic fibres—

1. To the muscular costs of the whole of the alimentary canal from the mouth to the rectum; to the glands opening into the canal from the salivary glands in front back to the intestinal glands; to the blood vessels of the whole of the canal from mouth to anus.

2. To the generative organs, external and internal, and to the muscular costs of the urinary bladder.

3. To the skin; (a) to its blood vessels, (b) to its cutaneous glands, (c) to unstriated muscle in the skin, e.g. the erectors of the hairs.

4. To the iris muscles and blood vessels of the eyeball.

The sympathetic nervous system is sometimes called the visceral. It will be seen from the above that this term is not well suited in some respects, because the sympathetic supplies many structures which are not visceral. Another objection is that the great part of important nerve-supply to the viscera is furnished by parts of the autonomic system other than sympathetic. That the sympathetic does, however, of itself constitute a more or less homogeneous entity is indicated by a curious fact. The substance adrenalin, which is the active constituent of extracts of the adrenal gland, has the property when introduced into the circulation of exciting all over the body just those actions which stimulation of the efferent fibres of the sympathetic causes, and no others. It is possible that when a nerve is stimulated some body at the nerve ending is set free, and this by combining with another chemical substance induces activity in the end organ (gland or muscle). It may be that when a sympathetic nerve is excited adrenalin is set free and combines with some substance which induces activity.

The rest of the autonomic system consists of two portions, a cranial and a sacral, so called from their proceeding from cranial and sacral nerve-roots respectively. The cranial portion is subdivided into a part belonging to the mid-brain and a part belonging to the hind-brain. The ciliary ganglion belonging to the eyeball is the ganglion of the former part, and its post-ganglionic fibres innervate the iris and the ciliary muscles. The hind-brain portion gives pre-ganglionic fibres to the facial (intermedius) glossopharyngeal and vagus nerves; its post-ganglionic distribution is to the blood vessels of the mucous membrane of the mouth and throat, to the musculature of the digestive tube from the oesophagus to the colon, to the heart, and to the musculature of the windpipe and lungs.

The sacral part of the autonomic system issues from the spinal cord with the three foremost sacral nerves. Its ganglia are scattered in the neighbourhood of the pelvic organs, which they innervate. The distribution of its post-ganglionic fibres is to the arteries of rectum, anus and external genitalia, to the musculature of colon, rectum and anus, and the urinary bladder, and to that of the external genitalia.

The part played by the sympathetic and the rest of the autonomic system in the economy of the body is best considered by following broad divisions of organic functions.

**Movements of the Digestive Tube.**—It is those movements of alimentation not usually within range of our consciousness which the autonomic system regulates and controls. Nor is its control over them apparently essential or very complete. For instance, the pendular and peristaltic movements of the intestine still go forward when all nerves reaching the viscous
have been severed. Extirpation of the abdominal sympathic has not led to obvious disturbance of digestion or nutrition in the dog. It is noteworthy that the sympathetic inhibits contraction of the musculature of the stomach and intestine, while the other, the vagus, portion of the autonomic system excites it. The actions of these two components of the system are, therefore, mutually opposed on the viscera innervated by both.

Action on the Circulation.—The blood supply of most organs is under the control of vaso-constrictor nerves. All vessels of striated muscle are sympathetic. Organs to which vaso-constrictor nerves are supplied either poorly or not at all are the lungs, heart, liver, brain and probably the skeletal muscles. The blood vessels of certain parts of the body have, in addition to vaso-constrictor nerves, nerves which relax their muscular wall, vaso-dilator nerves. The latter are never furnished by the sympathetic, they are in the mucous membranes and glands at the oral end of the body furnished by the cranial portion of the autonomic system. In regions at the aboral end of the body they are furnished by the sacral portion of the autonomic system. Elsewhere the vessels are derived from the nerve-cells of the spinal ganglia (Bayliss).

The control of the calibre of the blood vessels by the autonomic system is of importance in several well-ascertained respects. By constricting the blood vessels of the viscera the system is able to favour an increase of blood supply to the brain. A noteworthy instance of such an action occurs when the erect attitude is assumed after a recumbent posture. Were it not for vaso-constriction in the abdominal organs the blood would then, under the action of gravity, sink into the more dependent parts of the body and the brain would be relatively emptied of its supply, and fainting and unconsciousness result. Again, it is essential to the normal functioning of the organs of warm-blooded animals that their temperature, except in the surface layer of the skin, should be kept constant. Part of the regulative mechanism for this lies in nervous control of the quantity of blood flowing through the surface sheet of the skin. That sheet is a cool zone through which a greater or smaller quantity of blood may, as required, be led and cooled. By the sympathetic vaso-constrictors the capacity of these vessels in the cool zone can be reduced, and thus the loss of heat from the body thereby diminished. Ibns when the weather is severe are derived from the nerve-cells of the spinal ganglia (Bayliss).

The heart itself is but a specialized part of the blood-vascular system, and its musculature, like that of the arteries, receives motor nerves from the sympathetic. These nerves to the heart from the sympathetic are known as the accelerators, since they quicken and augment the beating of the cardiac muscle. The heart receives also nerves from the cranial part of the autonomic system, and the influence of these nerves is antagonistic to that of the sympathetic supply. The cranial autonomic nerves to the heart pass via the vagus nerves and lessen the beating of the heart both as to rate and force. These inhibitory nerves of the heart are analogous to the dilator nerves to the blood vessels, which, as mentioned above, come not from the sympathetic, but from the cranial and sacral portions of the autonomic system.

Skin-glands.—In close connexion with the temperature regulating function of the sympathetic stands its influence on the sweat secreting glands of the skin. Secretory nerves to the sweat glands are furnished apparently exclusively by the sympathetic.

Pilomotor Nerves.—The skin in many places contains muscle of the unstriped kind. Contraction of this cutaneous muscular tissue causes knotting of the skin as in "goose-skin," and erection of the hairs as in the cat, or of the quills as in the hedgehog and porcupine. The efferent nerve-fibres to the unstriped muscles of the skin are always furnished by the sympathetic (pilomotor nerves, &c.). In this case the sympathetic contributes to emotional reactions and perhaps further to the regulation of temperature, as by ruffling the fur or feathers in animals exposed to the cold.

The Respiratory Tube.—The windpipe and the air passages of the lungs contain in their walls much unstriped muscular tissue, arranged so as to control the calibre of the lumen. The nerve-supply to this muscular tissue is furnished by the cranial autonomic system via the vagus nerves.

Inhibiting Nerve.—An important office of the sympathetic is the controlling of the brightness of the visual image by controlling the size of the pupil. The sympathetic sends efferent fibres to the dilator muscle of the pupil. In this case, as in others noted above, the cranial part of the autonomic system supplies nerves of antagonistic effect to those of the sympathetic, first through the third cranial nerves from the efferent fibres to the constrictor muscle of the pupil. This same part of the cranial autonomic system supplies also motor fibres to the ciliary muscle, thus effecting the accommodation of the lens for focusing clearly objects within the range of what is termed near-vision.

Origin of the efferent fibres of the sympathetic is known save that they are, relatively to the efferent, few in number, and that they, like the afferents of the cerebro-spinal system, are axones of nerve-cells seated in the spinal ganglia. (C. S. S.)

SYMPHONIA (Gr. συμφωνία), a much discussed word, applied at different times (i) to the bagpipe, (ii) to the drum, (iii) to the hurdy-gurdy, and finally (iv) to a kind of clavichord. The sixth of the musical instruments enumerated in Dan. iii. 5, 10, 15, erroneously translated "dulcimer," in all probability refers to the bagpipe (q.v.). Symphonia, signifying drum, occurs in the writings of Isidor of Seville. "Tympanum est pellis vel corium ligne ex una parte extemum. Est enim pars media symphonie in similitudinem cribri. Tympanum autem dictum quod medi est. Unde, et margaritum medium tympanum dicitur, et ipsum ut symphonia ad virgulam percutitur." The reference comparing the tympanum (kettledrum) to half a pearl is borrowed from Pliny (Nat. hist. IX. 35, 23). Symphonia or Chifonis was applied during the 13th and 14th centuries, in the Latin countries more especially, to the hurdy-gurdy. "Symphonia is applied by Praetorius1 to an instrument which he classed with the clavichord, spinet, or zither, and which, instead of the normal, but without giving any clue to its distinctive characteristics.

SYMPHONIC POEM (Symphonische Dichtung, Tonidichtung, Poème symphonique, &c.). This term covers the experiments in a new style of instrumental music which first showed a coherent method in the twelve Symphonische Dichtungen of Liszt. The term at present implies a large orchestral composition which, whatever its length and changes of tempo, is not broken up into separate movements, and which, moreover, illustrates a definite poetic train of thought that can be expressed in literature, whether it is actually so expressed or not. Thus the form of the symphonic poem is the form dictated by its written programme or unwritten poetic idea; and so it is not every piece of "programme music" that can be called a symphonic poem. Beethoven's sonata Les Adieux, and his Pastoral Symphony, are, for instance, works in which the poetic idea does not interfere with the normal development of sonata style required by the musical nature of Beethoven's material.

Great disturbances in musical art have always been accompanied by constant appeals to external literary ideas; and there is nothing peculiarly modern in the present tendency to attack and defend the rising style of large indivisible schemes of instrumental music by unprofitable metaphysical discussions as to the claims of "absolute music" against "music embodying poetic ideas." New art-forms are not born mature, and in their infancy their parent arts naturally invite other arts to stand godfather. If the rise of the sonata style was not accompanied by as much "programme music" as the new art of the present day (and as a matter of fact it was accompanied by a good deal), it at all events coincided with highly Wagnerian discussions

1 See "Syntagma mus." pt. ii., De organographia, pp. 72, 73, 178 (Wolfenbüttel, 1618).
SYMPHONY

of dramatic music on literary grounds. What is certain is, firstly, that no amount of theorizing can prevent a musician from developing his musical ideas; secondly, that musical ideas are just as likely to be inspired by literature and other arts as by any other kind of experience; and lastly, that, as musicians attain greater mastery in the handling of their ideas, their musical realism soon outstrips their poetic or imaginative function for literary analysis, at all events while they are working at the music. Hence the frequent ability of great composers to set inferior words to music which is not only great but evidently based upon those words. Hence the digest of great composers at even the clearest unauthorized literary interpretations of their works. Hence, on the other hand, the absence of any general classical attitude of vigorous protest against the use of music to convey external ideas. Be this as it may, we believe the importance of the symphonic poem to lie not in its illustrative capacity, but in its evident tendency towards a new kind of instrumental art.

It is not mere convention and prejudice that has delayed the ripening of this art. Every classical art-form is made by the greatest artists to be a natural thing in every individual case, no matter how artificial the conditions of the form become in ordinary hands. In the highest-classical art not even a thousand examples identical in form would really be examples of an art-form set up like a mould for the material to be shovelled into it. In each case, however much the artist may have been helped by custom, his material would have taken in its own nature. A sufficient number of sufficiently similar cases of this kind may conveniently, though dangerously, be regarded as establishing an art-form; and most art-forms coincide to a striking degree with practical and local limitations, for in these a great artist can almost always find suggestions for the character of his material instead of mere hindrances to its development. Thus art-forms become the vehicle for perfectly natural works in the hands of great artists, even when in the abstract they are highly artificial and conventional. But there is probably no case of an important art-form (and still less of a whole style of art) remaining productive in its artificial condition when the facts which made that condition natural are changed. The great works in such forms remain, and are thoroughly natural, for they express their environment so perfectly as to recall it. It makes singularly little difference to the value of a great work of art, in the long run, whether its vividness is in the light it throws on a remote and forgotten past, or on a living and actual present. When Aloysius welcomes Odysseus, on hearing that he is an honourable pirate and not one of those disreputable merchants, our pleasure at the realistic glimpse of Homeric society differs from the pleasure of the Homeric audience only so far as our point of view is more romantic. But new art must, if it is to live, be produced, like the classics, on conditions which the artist himself understands; and it is improbable that these conditions (if they admit of healthy art at all) will be of a less common-sense character than those of older art.

In the absence of musical criteria for a future art, perhaps the analogy of drama may be useful here. The chorus of Greek tragedy can by no stretch of imagination be said to behave like a corresponding group of persons in real life. Yet the Greek chorus becomes natural enough when we realize the necessary material circumstances of Greek drama; indeed in the best examples it becomes the only natural (or even, in a certain religious aspect, realistic) treatment of a natural set of materials. In the same way we are taught that Shakespeare's dramatic technique becomes perfectly natural when we realize his equally natural type of stage, which was so constructed and situated in regard to the audience that scenery would obstruct the view just as it would in a circus. But with the modern conception of a stage as a kind of magnified peep-show, with the audience looking into a painted landscape seen through an impossible; and perhaps illusion of scenery comes so realistic that the use of verse and other classical resources is attended with dangers hitherto unknown. At the same time the condition of the modern stage obviously approximates far more closely to such an idea of the art of imitating human life by human speech and action, as would most naturally occur to a common-sense mind at any period. And it is probable that the final condition of an art will always tend to approximate to such an idea. In the same way it cannot be doubted that the sonata form, with its subtle balance between independence of form and interdependence of contrast, is far too artificial to be such a final form of instrumental music as would commend itself in the abstract to ordinary common sense. And we may look forward to a time, perhaps by the middle of the century, when the new and single continuous forms now adumbrated by the symphonic poems shall be the greatest forms of instrumental music, and shall need no literary crutches to make them intelligible. The pioneers of these forms at the present day frequently and sometimes justifiably claim that their art is intelligible apart from its "programme," but this is far from being so constantly the case that the symphonic poem can as yet be regarded as a mature kind of art. But when the mature art it foreshadows shall appear, then critics will need to face the fact that its genuine achievements will outwardly resemble the immature efforts which led to them, while the spiritual resemblance to classical music will lie too deep for the recognition of any but those who have the courage to make the new art their own. The symphonies of Mozart are in texture and phraseology far more like those of Philipp Emanuel Bach than they are like the great works of Johann Sebastian Bach; and if we try the experiment of reminding one of John Sebastian's most characteristic forms, a long course of Palestrina, we may realize that a lover of the Palestina style living during the monodic revolution would really have had no means of telling the difference between Bach's art and the squallid sensational impressionism of Gesualdo, the prince of Venosa. Yet the impassable gulf is in all cases that between the great art and the crude efforts that foreshadow it, while the universal spirit of mature art remains the same whether the age or style be called "classical," "romantic," or "secessionist."

SYMPHONY in music. 1. The term συμφωνία was used by the Greeks, firstly, to denote the general conception of concord, both between successive sounds and in the union of simultaneous sounds; secondly, in the special sense of concordant pairs of successive sounds (i.e. the "perfect intervals" of modern music; the 4th, 5th and octave); and thirdly as dealing with τὸ διώρωφον, the concord of the octave, thus meaning the art of singing in octaves, or magazising, as opposed to μονοφωνία, or singing and playing in unison. In Roman times the word appears in the general sense which still survives in poetry, viz. as harmonious concourse of voices and instruments, which in the middle ages to mean a concert. In St Luke xv. 25, it is distinguished from χορός, and the passage is appropriately translated in the English Bible as "music and dancing." Polybius and others seem to use it as the name of a musical instrument.

2. In the 17th century the term is used, like "concerto," for certain vocal compositions accompanied by instruments, e.g. the Kleine gesätzliche Concerte and Symphoniae sacre of Schütz. Most of Schütz's works of this class are for one to three solo voices in various combinations with instruments. The Gesätzliche Concerte are generally accompanied by figured bass and are to German texts; and the voices may in many cases be choral. The Symphoniae sacre are to Latin texts and are written for various combinations of instruments, while the voice parts are evidently for solo singers. The word symphony is sometimes used for the instrumental ritornello of songs and vocal movements in aria form. In this sense it already appears in No. 28 of the second book of Schütz's Gesätzliche Concerte.

3. The principal modern meaning of the word is a sonata for orchestra (see SONATA FORMS). The orchestral symphony originated in the second quarter of the 18th century began to assimilate the essentials of the sonata style. At first such sonata-style overtures consisted of
three movements, viz. a moderately quick binary movement, a short slow movement, and a lively finale. Thus Mozart, at the age of twelve, used his 7th symphony as the overture to 'La Finta semplice', and Haydn's maturest symphonies are still called overtures in some early editions. 'La Finta giardiniera', written by Mozart in his eighteenth year, marks the differentiation of the opera overture from the independent symphony, since it contains the usual first movement and slow movement, but the curtain rises with what sounds like the beginning of the finale.

The sonata style was not at first invariably associated with what we now call sonata form, nor indeed was that form at first the most favourable to the dramatic expression desirable for operatic music. Hence the overtures of Gluck are generally in forms based on the 4th and 5th of a series of related chords, forms which are probably learned from the Van Swieten, and which may be found in the concertos of Vivaldi, so many of which were freely transcribed by Sebastian Bach. These methods are no less evident in the symphonies of Philippe Emmanuel Bach, which thus occupy an analogous place, away from the normal line of the sonata style. The differentiation between symphony and overture was of immense importance in raising the dignity of the symphony; but the style was more essential than the form; and in Mozart's and Haydn's mature works we find the sonata form as firmly established in the overture as in the symphony, though not necessarily the style and scope of the two forms are quite distinct. Mozart's most elaborate overture, that of 'Die Zauberflöte', could not possibly be the first movement of one of his later symphonies; nor could the finale of his 'Jupiter' symphony (which has often been compared with that overture because of its use of fugato) conceivably be used as the prelude to an opera.

See also Music; Sonata Forms; Instrumentation; Overture; Scherzo; Variations. (D. F. T.)

SYMPHOSIUS, or Symposius, the name given to the author of a collection of 100 riddles of uncertain date, but probably composed between 425 and 500. They have been attributed to Lactantius, and identified with his 'Symposium', but this view is not generally accepted. The style and versification of the riddles, each of which consists of three hexameter lines, are good. They were written to form part of the entertainments at the Saturnalia.

Text in E. Bährn's, Poëtae latini minores, vol. iv.; there is a good French metrical version by F. E. Corpet (1858); monograph by W. T. Paul (Berlin, 1854); see also Teufel, Hist. of Roman Literature, 449 f., and Chaucer, 'Canterbury Tales'.

SYMPOSIUM (Gr. συμπόσιον, a drinking party, from συμπόνοειν, to drink together, σύ, with, and πόνο, in drink, root σό, cf. Lat. potare, to drink, poculum, cup), the convivial drinking which took place after a great banquet, accompanied by intellectual or witty conversation, and by music, or dancing, performed by slaves or attendants. The term has been applied in modern usage, due to Plato's 'Symposium', to a collection of opinions of different writers on a given subject.

SYNAGOGUE (συναγωγή), literally ' assemblage,' is the term employed to denote either a congregation of Jews, i.e. a local circle accustomed to meet together for worship and religious instruction, or the building in which the congregation met. In the first sense the word is a translation of τάξις, keneseth (assemblage), in the second of reu nó, beth hakeneseth (house of assemblage). Further the term is often used to denote the system of Judaism, as when the 'Synagogue' is contrasted to the 'Church.' The germ of the synagogue, that is, of religious assemblages dissociated from the ancient ritual of the altar, may be found in the circle of the prophets and their disciples (see especially Isa. viii. 16 seq.); but the synagogue as an institution characteristic of Judaism arose after the work of Ezra, and is closely connected with the development of Judaism, to which its reformation gave definite shape. From the time of Ezra downwards it was the business of every Jew to know the law; the school (bēth hammidrâsh) trained scholars, but the synagogue, where the law was read every Sabbath (Acts xv. 21), was the means of popular instruction. Such synagogues existed in all parts of Judæa in the time of P's. lxixv. 8 (probably a psalm of the Persian period); in Acts xv. 21 it appears that they had existed for many generations 'in every city.' This held good not only for Palestine, but for the Dispersion; in post-Talmudic times the rule was that a synagogue must be built wherever there were ten Jews. In the Dispersion the synagogue filling a greater place in the communal life, for on Palestinian soil the Temple enjoyed a predominant position. In this sense the synagogue is a child of the Dispersion, but this does not imply that it was a product of the Hellenic diaspora. For the Aramaic papyri discovered at Assuan show that in the 5th century B.C. the Egyptian Jews had their place of worship in Syene long before Greek influences had begun to make themselves felt there. The fact that the Books of the Maccabees never refer to synagogues is not evidence that synagogues were not known in Judæa in the Maccabean period. These books refer mostly to a time of war, when assemblages in the cities were impossible; their interest, moreover, is concentrated in the Temple and the restoration of its services. During the second Temple there is no doubt but that public worship was organized in the provinces as well as in the Jewish settlements outside the Holy Land. And though the name "synagogue" varies with the prefixed words ("place of prayer"), it appears that everywhere the assemblage was primarily one for instruction in the law; the synagogue as Philo puts it, was a ἱστορικόν. Prayer, in the more restricted sense, invariably accompanied the instruction, and several parts of the extant liturgy go back to the 3rd century B.C. A formed institution of this sort required some organization; he general order of the service was directed by one or more "rulers of the synagogue" (ἀρχισυναγωγοί, Luke xili. 14; Acts xiii. 15), who called on fit persons to read, pray and preach; alms were collected by two or more "collectors" (ἀπόδοτες ἀδότατος); and a "minister" (βασιλιάς, βραχύτης, Luke iv. 20) had charge of the sacred books (preserved in an "ark") and of other ministerial functions, including the teaching of children to read. The discipline of the congregation was enforced by excommunication (ἱεραμωσία) or temporary exclusion (νικῆ); and also by the minor punishment of scourging (Matt. x. 17), inflicted by the ἀρχιερεῖς. The disciplinary power was in the hands of a senate of elders (ὑπερβεβλητοί, γερουσία), the chief members of which were ἀρχιερεῖς. The principal service of the synagogue was held on Sabbath morning, and included, according to the Mishnah, the recitation of the shema' (Deut. vi. 4-9, xi. 13-21; Num. xv. 37-41), prayer, lessons from the law and prophets with Aramaic translation, a sermon (dorashah) based on the lesson (Acts xiii. 15), and finally a blessing pronounced by the priest or invoked by a layman. On Sabbath afternoon, and on Monday and Thursday there was a service without a lesson from the prophets; there were also services for all feast-days. Synagogues were built by preference beside water, in order to avoid proximity to the idol temples, rather than as some think, for the convenience of the ceremonial ablutions (cf. Acts xvi. 13). Remains of very ancient buildings of this class exist in several parts of Galilee; they generally lie north and south, and seem to have had doors to the south, and sometimes to have been divided by columns into a nave and two aisles.

Modern synagogues are mostly built of oblong shape, with a gallery for women. Since the middle ages, Renaissance and Moorish types of decoration have been generally favoured, but there is nowadays a great variety of types. The ancient synagogue of Alexandria (destroyed by Trajan) was a basilica. A number of recent synagogues have been built in octagonal form. The main interior features of the synagogue are the "ark" (a cupboard containing the scrolls of the law, &c.) and the almenar (or reading-desk, from the Arabic al-minbar, pulpit). This is sometimes in the centre, sometimes at the eastern end of the building. The Talmud prescribed an elevated site for the synagogue; but this rule has been impossible of observance in modern times. The synagogues are theoretically "orientated" —i.e. the ark (which worshippers face during the principal prayer)
is on the eastern side. But this rule, too, is often ignored under the stress of architectural difficulties.

Jewish tradition has a great deal to say about a body called "the great synagogue," which is supposed to have been the supreme religious authority from the cessation of prophecy to the time of the high priest Simeon the Just, and is even said to have fixed the Old Testament canon (cf. v. 3 seq.). But Kuenen in his essay "Oor de Mannen der Groote Synagoge" (Verslagen of the Amsterdam Academy, 1876) has powerfully argued that these traditions are fiction, and that the name seen in the older literature is a standing authority, but the great convocation of Neh. vii. 39. That more recent scholars, however, more willing to attach credence to the older tradition.

Compare, in general, Schrör, Geschichte des jüdischen Volkes, § 27, where the older literature is catalogued. For some unconvincing views of the matter may refer to M. Friedländer, Synagoge und Kirche in ihren Anfängen (Berlin, 1908). For the usages of the synagogue in more recent times, see Buxtorf, Synagoga judaica (Basil, 1641). On the history of synagogue services the works of Zimmern are the chief authorities; there is also a good article on Liturgy in the Jewish Encyclopedia. Useful summaries in English are to be found in Dembitz, Jewish Services in Synagogue and Home (Philadelphia, 1888); and Oesterley and Box, The Religion and Worship of the Hebrews (London, 1907). The article "Synagogue" in the Jewish Encyclopedia is illustrated with numerous pictures of buildings and plans.

SYNAGOGUE, UNITED, an organization of London Jews, founded, with the sanction of an act of parliament, in 1870. It is confined in its direct work, to the metropolis, but it exercises, indirectly, considerable influence over the Jews of the British Empire. It is governed by a general council representing the constituent congregations. In religious and ritual matters it is under the jurisdiction of the chief rabbi, who is, to a certain extent, recognized throughout the empire. The president of the United Synagogue in 1910 was Lord Rothschild. Besides providing the worship of some twenty congregations, the United Synagogue directs and supports educational and charitable work. The title "chief rabbi" is not found in the pre-expulsion records, though, before the Jews were banished in 1390, there was an official named "presbyter omnium Judaeorum Anglicarum." The functions of this official cannot be proved to have been ecclesiastical. The title "chief rabbi" has become well known through the eminence of recent occupants of the position such as Solomon Hirschell (1762-1842). He was succeeded by Dr. Nathan Marcus Adler (1803-1890), who was followed by his son, Hermann Adler, who raised the position to one of much dignity and importance. Dr. Hermann Adler was born in Hanover in 1839, graduated at Leipzeg, and received honorary degrees from Scotch and English universities, including Oxford. In 1909 he received the order of M.V.O. Dr. Adler was elected chief rabbi in 1869, the second of that title. Dr. Adler has written extensively on topics of Anglo-Jewish History and published two volumes of sermons.

SYNANTHY (Gr. συναντησθη, with, and ἄνθος, a flower), a botanical term for the adhesion of two or more flowers.

SYNAXARIUM (Gr. συνάξαριον, from συνάγειν, to bring together), the name given in the Greek Church to a compilation corresponding very closely to the martyrlogy (q.v.) of the Roman Church. There are two kinds of synaxaria—simple synaxaria, which are merely lists of the saints arranged in the order of their anniversary, e.g. the Compendium of Martyrology, and historical synaxaria, which give biographical notices besides, e.g. the menology of Basil and the synaxarium of Sirmond. The notices given in the historical synaxaria are summaries of those in the great menologies, or collections of lives of saints, for the twelve months of the year. The oldest historical synaxaria apparently go back to the tenth century. The heterodox Eastern churches also have their synaxaria.

The publication of the Arabic text of the synaxarium of the Church of Alexandria was started simultaneously by J. Forget in the Corp. script. orient. and by R. Basset in the Patrologia orient. The Armenian synaxarium, called the synaxarium of Ter Israel was published by Constantinople in 1834.

See S. A. Morelli, Kalendarii ecclesiae Constantinopolitanae (Rome, 1788); H. Delehaye, "Le Synaxaire de Sirmond," in Analecta bullar. de xiv. 390-434, where the terminology is explained; idem, Synaxarium ecclesiae Constantinopolitanae codice Sirmondianno (Brussels, 1902), forming the volume Propylaen in acta sanctorum novembris. (H. Dir.)

SYNCELLUS, a hybrid word (Gr. συνκέλλος, Lat. cella), meaning literally "one who shares his cell with another." In ecclesiastical usage it refers to the very early custom of a priest or deacon living continually with a bishop, proper testimoniun ecclesisticum; the bishop was supposed to have the synkelloi of Gregory the Great. The term came into use in the Eastern Church, where the synkelloi were the chaplains of metropolitan and patriarchs. At Constantinople they formed a corporation, and the protosynkelloi took precedence of metropolitans and ranked next to the patriarch, to whose office he generally succeeded.

SYNCOPE (Gr. συνκόπη, a cutting up or short, from κόπεω, to cut), a term used in grammar for the elision of a letter or syllable in the middle of a word (e.g. "ne'er" for "never"); and in medicine for the condition of fainting or shock (q.v.); and so technically in a general sense of the suspension of a subject or function. "Syncope" and "syncopation" are analogous derivatives; and in music a syncopation is the rhythmical method of tying (') two beats of the same note into one tone in such a way as to displace the accent.

SYNCRETISM (Gr. συνκρητισμός, from σύν and κράτις, mingle or blend, or, according to Plutarch, from σύν and κρατίζω, to combine against a common enemy after the manner of the cities of Crete), the act or system of blending, combining or reconciling inharmonious elements. The term is used technically in politics, literature, and the Church, especially as having been the syncretism of Gregory the Great. The term was applied by the Eastern Church, where the synkelloi were the chaplains of metropolitan and patriarchs. At Constantinople they formed a corporation, and the protosynkelloi took precedence of metropolitans and ranked next to the patriarch, to whose office he generally succeeded.

SYNCRETISTS, a term applied to the members of the Church of Crete, who, as a result of the general suspension of knowledge of the world's religions made possible by the gathering of known cult of importance into the religious system of the Roman Empire, believed in the identity of many deities which resembled each other, and indeed in the essential identity of all, received a special impulse. Not only were various forms of the same deity, such as, for example, Jupiter Capitolinus and Jupiter Latinius, recognized as being really the same under different aspects, but even the gods of different nations were seen to be manifestations of a single great being. Roman Jupiter, Greek Zeus, Persian Mithras and Phrygian Attis were one. The Great Mother, Isis, Cybele, Demeter, Ops, Rhea, Tellus, were the same great mother deity under different masks (see GREAT MOTHER OF THE GODS). Venus and Cupid, Aphrodite and Adonis, the Great Mother and Attis, Astarte and Baal, Demeter and Dionysus, Isis and Serapis, were essentially the same pair. Syncretism even went so far as to blend the deities of paganism and Christianity. Christ was compared with Attis and Mithras, Isis with the Virgin Mary, &c. Isis, perhaps more than any other deity, came to be regarded as the great maternal goddess of the universe whose essence was worshipped under many different names. In the East the spread of the doctrine of the Holy Ghost was a form of syncretism, as well illustrated by Apuleius (Metamorph. xi. 2 and 5). Lucius invokes Isis: "Queen of Heaven, whether thou art the genial Ceres, the prime parent of fruits, who, joyous at the discovery of thy daughter, didst banish the savage nutriment of the ancient acon, and, pointing out a better food, dost now till the Eleusinian soul; or whether thou art celestial Venus, who, in the first origin of things, didst

1 Apollinaris Sidonius uses the pure Latin term concellum.
associate the different sexes, through the creation of mutual love, and having propagated an eternal offspring in the human race, art now worshipped in the sea-girl shrine of Paphos; or whether thou art the sister of Phoebus, who, by relieving the pang of women in travail by soothing remedies, hast brought into the world multitudes so innumerable, and art now venerated in the far-famed shrines of Ephesus; or whether thou art Proserpine, terrific with midnight bowings by whatever name, by whatever ceremonies, and under whatever form it is lawful to invoke thee; do thou graciously, &c."

The goddess replies: "Behold me ... I, who am Nature, the parent of all things, the mistress of all the elements, the primordial offspring of time, the supreme among divinities, the queen of departed spirits, the first of the celestials, and the uniform manifestation of the gods and goddesses; who govern by my rod the luminous heights of heaven, the salubrious breezes of the ocean, and the anguished silent realms of the shades below; whose one sole divinity the whole orb of the earth venerates under a manifold form, with different rites, and under a variety of appellations. Hence the Phrygians, that primeval race, call me Pessinuntica, the Mother of the Gods; the Aborigines of Attica, Cecropian Minerva; the Cyprians, in their sea-girl isle, Paphian Venus; the arrow-bearing Cretans, Diana Dictynta; the three-tongued Sicilians, Stygian Proserpine; and the Eleusinians, the ancient goddess Ceres. Some call me Juno, others Bellona, others Hecate, others Rhamnusa. But those who are illumined by the earliest rays of that divinity, the Sun, when he rises, the Aeolian bards, who have let fall the secrets of the Egyptian signs, sublime learning, worshipping me with ceremonies quite appropriate call me by my true name, Queen Isis. Behold, then, &c." (Trans. Bohn's Lib.)

Naturally, the influence of Greek philosophy was very pronounced in the growth of syncretism. Plutarch and Maximus of Tyre affirmed that the gods of the different nations were only different aspects of the same deity, a supreme intelligence and providence which ruled the world. The Neoplatonists, however, were the first school to formulate the underlying philosophy of syncretism: "There is only one real God, the divine, and the subordinate deities are nothing else than abstractions personified, or celestial bodies with spirits; the traditional gods are only demons, that is, being intermediate between God and man ... All, like every other created being, are emanations from the absolute God" (Jean Réville, *La Religion à Rome sous les Sétières*). Care must be taken, however, not to place too much emphasis upon syncretism as a conscious system. The movement which it represented was not new in the 2nd century A.D. The identification of Latin with Etruscan gods in the earliest days of Rome, and then of Greek with Italian, and finally of Oriental with the Graeco-Roman, were all alike syncretistic movements, though not all conscious and reasoned. The ideal of the common people, who were unreflecting, as well as of philosophers who reflected, was "to grasp the religious verity, one and constant, under the multiplex forms with which legend and tradition had enveloped it" (Réville). The advent of Greek philosophy only hastened the movement by conscious and systematic effort.

Syncretic, being a movement toward monothesism, was the converse of the tendency, so prominent in the early history of Rome, to increase the number of deities by worshipping the same god under special aspects according to special activities. In the hands of the Neoplatonists it was instrumental in retaining somewhat the fall of paganism for the time, but in the end contributed to the success of Christianity by familiarizing men with the belief in one supreme deity. The triumph of Christianity itself represented a result of syncretism, the Church being a blending of the beliefs and practices of both the new and old religions.

SYNERESIS—SYNECHISM

SYNERESIS, a term in scholastic philosophy applied to the inborn moral consciousness which distinguishes between good and evil. The word is really *syneresis* (Gr. *συνέρησις*, from *συνέρειν*, to look after, take care of), but syneresis is the commoner form. Diogenes Laërtius in his account of the Stoics (Vol. II, pp. 71-72, 74-75) uses the phrase *συνέρειν ἱστη* to describe the instinct for self-preservation, the inward harmony of Chrysippus, the recognition of which is *συνέρησις*. The term *syneresis*, however, is not found till Jerome, who in dealing with Ezek. i. 4-15, says the fourth of the "living creatures" of the vision is what the Greeks call *συνέρησις*, i.e. *scintilla conscientiae* the "spark of conscience." Here apparently syneresis and conscience (*συνέρησις*) are equivalent. By the schoolmen, however, the terms were differentiated, conscience being the practical envisaging of good and evil actions; syneresis being, so to speak, the tendency toward good in thought and action. The exact relation between the two was, however, a matter of controversy. Aquinas and Duns Scotus holding that both are practical reason, while Bonaventura narrows syneresis to the volitional tendency to good actions.

SYNDIC (Late Lat. *syndicus*, Gr. *συντικός*, one who helps in a court of justice, an advocate, representative, *στίχ*, with, and *δικα*, justice), a term applied in certain countries to an officer of government with varying powers, and secondly to a representative or delegate of a university, institution or other corporation, entrusted with special functions or powers. The meaning which underlies these applications is a special form of delegated power, especially of the type of the delegated or representative, the meaning of "syndic" in the first sense is that of the Italian *sindaco*, who is the head of the administration of a commune, answering to a "mayor"; he is a government official but is elected by the communal council from their own members by secret ballot.

Nearly all the companies, guilds, and the university of Paris had representative bodies the members of which were termed *syndici*. Similarly in England, the senate of the university of Cambridge, which is the legislative body, delegates certain functions to special committees of its members, appointed from time to time by Grace, i.e. a proposal offered to the senate and confirmed by it; these committees are termed "syndicates" and are permanent or occasional, and the members are styled the "syndics" of the particular committee or of the institution which they administer; thus there are the syndics of the Fitzwilliam Museum, of the University Press, of the Observatory, of local examinations and lectures, of the Antiquarian Committee, &c.

SYNDICATE, a term originally meaning a body of syndics. In this sense it is still sometimes used, as at the university of Cambridge, for the body of members or committee responsible for the management of the University Press. In commerce, a syndicate is a body of persons who combine to carry through some financial transaction, or who undertake a common adventure. Syndicates are very often formed to acquire or take over some undertaking, hold it for a short time, and then resell it to a company. The profits are then distributed and the syndicate dissolves. Sometimes syndicates are formed under agreements which constitute them mere partnerships, the members being therefore individually responsible, but they are now more generally incorporated under the Companies Acts.

The more usual cases in which syndicates are commonly formed will be found in F. B. Palmer's *Company Precedents*, 10th ed., vol. i. pp. 129 seq.

SYNECHISM (from Gr. *συνέχης*, continuous, from *σύν*, *εχθρον*, to hold together), a philosophical term proposed by C. S. Peirce (Monist, Vol. XXXII, 534) to express the general theory that the essential feature in philosophic speculation is continuity. It is specially directed to the question of hypothesis, and holds that a hypothesis is justifiable only on the ground that it provides an explanation.
All understanding of facts consists in generalizing concerning them. The fact that some things are ultimate may be recognized by the synecist without abandoning his standpoint, since synecism is a normative or regulative principle, not a theory of existence. The adjective "syneciological" is used in the same general sense; "synecology" is a theory of continuity or universal causation; "synecism" is a term in ophthalmology for a morbid union of parts.

SYNEDRIUM (συνεδρίον), a Greek word which means "assembly" and is especially used of judicial or representative assemblies, is the name by which (or by its Hebrew transcription, συναθρόν, σαναθρόν, σαναθρίδρον) that Jewish body is known which in its origin was the municipal council of Jerusalem, but acquired extended functions and received a small authority and influence over the Jews at large (see xii. 244 seq.). In the Mishnah it is called "the sanhedrin," "the great sanhedrin," "the sanhedrin of seventy-one [members]" and "the great court of justice" (bēth din haggadol). The oldest testimony to the existence and constitution of the synedrium of Jerusalem is probably to be found in 2 Chron. xix. 8; for the priests, Levites and hereditary heads of houses there spoken of as sitting at Jerusalem as a court of appeal from the local judicatures does not correspond with anything mentioned in the old history, and it is the practice of the chronicler to refer the institutions of his own time to the antiquities of the past. And, again, the aristocratic council is what seems to be meant by the gerousia or senate of "elders" repeatedly mentioned in the history of the Jews, both under the Greeks from the time of Antiochus the Great (Jos. Ant. xii. 3, 3) and under the Hasmonian high priests and princes. The high priest as the head of the state was doubtless also the head of the senate, which, according to Eastern usage, exercised both judicial and administrative or political functions (cf. 1 Macc. xii. 6, xiv. 20). The exact measure of its authority must have varied from time to time at first with the measure of autonomy left to the nation by its foreign masters and the more or less autocratic power claimed by the native sovereigns.

The original aristocratic constitution of the senate began to be modified under the later Hasmonaeans by the inevitable introduction of representatives of the rising party of the Pharisees, and this new element gained strength under Herod the Great, the bitter enemy of the priestly aristocracy. Finally under the Roman procurators the synedrium was left under the presidency of the chief priest as the highest native tribunal, though without the power of life and death (John xvii. 31). The aristocratic and Sadducean element now again preponderated, as appears from Josephus and from the New Testament. And, again, mention is made of "elders" and "rulers" as synonymous expressions. But with these there sat also "scribes" or trained legal doctors of the Pharisees and other notables, who are simply called "elders" (Mark xv. 1). The Jewish tradition which regards the synedrium as entirely composed of rabbins sitting under the presidency and vice-presidency of a pair of chief doctors, the nasi and ab beth din, is inconsistent with the evidence of Josephus and the New Testament. It is generally held that it was after the fall of the state that a merely rabbinical bēth din sat at Jabneh and afterwards at Tiberias, and gave legal responses to those who chose to admit a judicature centered by the civil power. Dr. A. Büchler has sought to reconcile the various accounts by the theory that there were two great tribunals in Jerusalem, one wielding religious, the other civil authority (Das Synedrium in Jerusalem, Vienna, 1902).

The council chamber (bōvāh) where the synedrium usually sat was between the Xystus and the Temple, probably on the Temple-hill, the Mishnah states that the meetings were held within the inner court. The meeting in the palace of the high priest which condemned Jesus was exceptional. The proceedings also on this occasion were highly irregular, if measured by the rules of procedure which, according to Jewish tradition, were laid down to secure order and a fair trial for the accused.

Of the older literature of the subject it is enough to cite Selden, De synedris. The most important critical discussion is that of Kuenen in the Verlagen, &c., of the Amsterdam Academy (1866), p. 131 seq. A good summary is given by Schürer, Geschichte des jüdischen Volkes, 4th ed., § 23. Cf. also G. A. Smith, Jerusalem (1907), vol. i. ch. 9.

SYNESIUS (c. 373-c. 414), bishop of Ptolemais in the Libyan Pentapolis after 410, was born of wealthy parents, who claimed descent from Spartan kings, at Cyrene between 370 and 375. While still a youth (393) he went with his brother Eupolius to Alexandria, where he became an enthusiastic Neoplatonist and disciple of Hypatia (q.v.). On returning to his native place about the year 397 he was chosen to head an embassy from the cities of the Pentapolis to the imperial court to ask for remission of taxation and other relief. His address to Arcadius (De regno) is full of advice as to the studies of a wise ruler in such perilous times. His three years' stay in Constantinople was wearisome and otherwise disagreeable; the leisure it forced upon him he devoted in part to literary composition. The Aegyptius sive de providentia is an allegory in which the gods Osiris and Typhon, who represent Aurelian and the Goth Gainas (ministers under Arcadius), strive for mastery; and the question of the divine permission of evil is handled. After the successful Aurelian had granted the petition of the embassy, Synesius returned to Cyrene in 400, and spent the next ten years partly in that city, when unavoidable business called him there, but chiefly on an estate in the interior of the province, where in his own words "books and the chase" made up his life. His marriage took place at Alexandria in 403; in the previous year he had visited Athens, where he was received by Olympius, who, it seems, in his zeal against the "heresy" had been by no means very pronounced, was popularly chosen to be bishop of Ptolemais, and, after long hesitation on personal and doctrinal grounds, he ultimately accepted the office thus thrust upon him, being consecrated by Theophilus at Alexandria. One personal difficulty at least was obviated by his being allowed to retain his wife, to whom he was much attached; but as regarded orthodoxy he expressly stipulated for personal freedom to dissent on the questions of the soul's creation, a literal resurrection, and the final destruction of the world, while at the same time he agreed to make some concession to popular sensibilities. His public career was not without trouble, which had been by no means very pronounced, but which was partially due to the attacks of his enemies. His tenure of the bishopric was troubled not only by domestic bereavements but also by barbaric invasions of the country (in repelling which he proved himself a capable military organizer) and by conflicts with the prefect Andronicus, whom he excommunicated for interfering with the Church's right of asylum. The date of his death is unknown; it is usually given as c. 414. His many-sided activity, as shown especially in his letters, and his selflessly mediating position between Neoplatonism and Christianity, make him a subject of fascinating interest. His scientific interests attracted to him, especially in his later years, a circle of the earliest known reference to astronomy, and by a work on alchemy in the form of a commentary on pseudo-Democritus. He was a man of the highest personal character.

His extant works are—(1) A speech before Arcadius, De regno; (2) Dio, sive de suo ipissimo instituto, in which he signifies his purpose to devote himself to true philosophy; (3) Encomium calvitii (he was himself bald), a literary jeu d'esprit, suggested by Dio Chrysostom's Praise of Hair; (4) De providentia, in two books; (5) De insomniis; (6) 157 Epistolae; (7) 12 Hymni, of a contemptible, Neoplatonic character; and several homilies and occasional speeches. The editio princeps is that of Turrenbus (Paris, 1553); it was followed by that of Morell, with Latin translation by Petaius (1612; greatly enlarged and improved, 1637); and, more recently, by Pyne, 1869). The Epistolae, which for the modern reader greatly exceed his other works in interest, have been edited by Demetriades (Venice, 1792) and by Glukus (Venice, 1812), the Caliciti encomium by Krabinger (Stuttgart, 1834), the De providentia by Krabinger (Sulzbach, 1835), the De regno by Krabinger (Munich, 1825), and the Hymnus by Flach (Tübingen, 1875).

See Clausen, De Synesio philosopho (Copenhagen, 1831); R. Vollmer, Synesius von Cyrene (Berlin, 1866); A. Gardner's monograph in The Fathers for English Readers (London, 1886); and a life by W. S. Crawford (London, 1901).

SYNOD (Gr. συνόδος), a term denoting an assembly of ecclesiastical officials legally convoked to discuss and decide points of discipline and morals. It is practically synonymous with the word council (q.v.). It is employed in the same technical sense by Tertullian c. 200, and συνόδος a century or so later in the Apostolic Canons. In time, however, the word council came to be restricted to eccumenical gatherings, while synod was applied to meetings of the eastern or western branches of the Church.
SYNODIC PERIOD—SYRA

Sixty-two Syriac tablets, also translated from Syriac into Greek, are attributed to the same Syntipas (ed. C. F. Matthijs, 1781).

SYRA, or SYROS (anc. Σίρος, perhaps Homeric Σφίς), a Greek island in the middle of the Cyclades, which in the 15th century became the commercial centre of the Archipelago, and is also the residence of the patriarch of the Cyclades and the seat of the central law courts. The length of the island is about 10 m., the breadth 5, and the area is estimated at 424 sq. m. The population rose to about 33,700, of whom about 20,500 were in the chief town, Hermoupolis, but that of the town had in 1907 declined again to 18,132. Syra is also a province of the department of the Cyclades (pop. 1907, 31,930). The importance of the island in prehistoric times is attested by considerable remains of early Aegaean antiquities. In ancient times it was remarkably fertile, as is to be gaot not elsewhere from the Turf. It was a commercial entrepôt (Od. xvi. 403), which might be of doubtful application, but also from the remains of olive presses and peculiarities in the local nomenclature. The destruction of its forests has led to the loss of all its alluvial soil, and now it is for the most part a brown and barren rock, covered at best with scanty aromatic scrub, pastured by sheep and goats.

Hermopolis (better Hermoupolis), the chief town, is built round the harbour on the east side of the island. It is governed by an active municipality, whose revenue and expenditure has rapidly increased. Among the public buildings are a spacious town-hall in the central square, a club-house, an opera-house and a Greek theatre. Old Syra, on a conical hill behind the port town, is an interesting place, with its old Roman Catholic church of St George's still crowning the summit. This was built by the Capuchins, who in the middle ages chose Syra as the headquarters of a mission in the East. Louis XIII., hearing of the dangers to which the Syra priests were exposed, took the island under his especial protection, and since that time the Roman Catholic bishops of Syra have been elected by the pope. About the beginning of the 19th century the inhabitants of Syra numbered only about 1000, and whenever a Turkish festival appeared they made off to the interior and hid themselves. On the outbreak of the war of Greek independence refugees from Chios, after being scattered throughout Tenos, Spezia, Hydra, &c., and rejected by the people of Ceos, took up their residence at Syra under the protection of the French flag. Altogether about 40,000 had sought this asylum before the freedom of Greece was achieved. The chief city was called Hermoupolis after the name of the ship which brought the earlier settlers. Most of the immigrants elected to stay, and, though they were long kept in alarm by pirates, they continued to prosper. In 1875 358 sailing ships and 698 steamers (with a total of 740,731 tons) entered and 758 sailing ships and 700 steamers (with a total of 756,807 tons) cleared this port; in 1883 3379 sailing and 1126 steam vessels (with a total of 1,056,201 tons) entered and 3276 sailing and 1120 steam vessels (with a total of 966,229 tons) cleared. Most of the sailing vessels were Greek and Turkish, and most of the steamers were Austrian, French and Turkish.

But since the energetic development of Peiraus, Syra has ceased to be the chief commercial entrepôt and distributing centre of this part of the Levant, and consequently its trade has seriously diminished. Its chief export is stone, and the export trade of 1883 was £1,313,750, in 1900 it only amounted to £6408,350. Coal, textiles and iron and steel goods figure prominently amongst the imports, and emery, leather, lemons, sponges, flour, valonia and iron ore amongst the exports. Syra is the seat of several industries, ship-building, tanneries, flour and cotton mills, rope-walks, factories for confectionery ("Turkish delight"), hats, kerchiefs, furniture, pottery and distilleries. The harbour, which is protected by a breakwater 273 yds. long, has a depth of 25 ft., diminishing to 12 ft.

SYNTIPAS, the Greek form of Sindbad or Sendabar, an Indian philosopher supposed to have lived about 100 B.C., and the reputed author of a collection of tales known generally in Europe as the story of the Seven Wise Masters. They enjoyed immense popularity, and appeared in many Oriental and Western languages. A Greek translation (probably from a Syriac version), the earliest specimen of Romanae prose (11th century), is extant under the title of The most pleasing Story of Syntipas the Philosopher. It is preceded by an introduction in iambic verse by a certain Michael Andreopulos, who states that it was executed by order of Michael, probably the duke of Meltene in Armenia. The translator is evidently a Christian, although he has generally preserved the Oriental colouring. The main outline is the same in the different versions, although they vary in detail and include different stories. A certain prince, who had taken a vow of silence for a time on the advice of his tutor, was tempted by his stepmother. Her advances being rejected, she accused him to his father, who decided to put him to death. The device of the Arabian Nights is introduced by the wise men of the court, who in turn relate stories to dissuade the king from over-hasty punishment, each story being answered by the queen, who desires instant action to be taken. When the period of silence is over the prince speaks and establishes his innocence. In the Greek version the king is a king of Persia, named Cyrus, and Syntipas himself is the prince's tutor (text in A. Eberhard, Fabulae Romanenses, I., 1872; "Teubner Series").
SYRACUSE (Gr. Συράκους; Lat. Syracusae, Ital. Siracusa), a city of Sicily, the capital of a province of the same name, situated on the east coast of the island, 54 m. by rail S. by E. of Catania, and about 32 m. direct. Pop. (1881), 21,739; (1906), 25,250 (towns), 35,000 (commune).

History.—Syracuse was the chief Greek city of ancient Sicily, and one of the earliest Greek settlements in the island. According to Strabo (vi. 4, p. 269) Chersocrates and Archias of Corinth, both Heraclidae, left their native city together with a band of colonists, the former stopping with half the force at Corcyra, where he expelled the Liburnians and occupied the island, while Archias proceeded to Syracuse.¹ Thucydides (vi. 3) gives the Phoenician settlement on the island,² though it is certainly such a place as Thucydides (vi. 2) describes as occupied by them for purposes of trade with the Sicels. The name of the island, Ortygia (ορτυγία, a quail), has, again, been held to point to the possible existence of an Aetolian settlement on the island before Archias came. But it is more probable that the name was given to the island owing to the establishment there by the first settlers of a special cult of Artemis (the name Ortygia appears in Homer, Odyssey, v. 123, as an island sacred to Artemis, though the identification with Delos (g.v.) is not certain), though why Corinthians should have worshipped Artemis in preference to any other deity is not clear.

Till the beginning of the 5th century B.C. our notices of Syracuse's history are quite fragmentary. Almost the only question is whether, as some stray notices (see Freeman, History of Sicily, ii. 431) might suggest, the primitive kingship was retained or renewed at Syracuse, as it certainly was in some other Greek colonies. A king Polis is spoken of; but nothing is known of his actions. It is far more certain that Syracuse went through the usual revolutions of a Greek city. The descendants of the original settlers kept the land in their own hands, and they gradually brought the Sicel inhabitants to a state not unlike villeinage. Presently other settlers, perhaps not always Greek, gathered round the original Syracusan people; they formed a distinct body, δῆμος or πλῆθος, personally free, but with an inferior political franchise or none at all. The old citizens thus gradually grew into an exclusive or aristocratic body, called γαμευοι or landowners.

We hear incidentally of disputes, seditions and changes, among others the expulsion of the Gamori early in the 5th century B.C. (Thuc. v. 5; Arist. Pol. v. 3, 5; 4, 4).

In its external development Syracuse differed somewhat from other Sicilian cities. Although it later grew in early times bilaterally, both Gela and Acragas (Agrigentum), it very soon began to aim at a combination of land and sea power.³ In 663 it founded the settlement of Acrae, in 643 Casmenae,⁴ and in 508 Camarina, of which the first was unusually far inland. The three together secured for Syracuse a continuous dominion to the south-east.

¹ Strabo goes on to say that Archias fell in with certain men who had come from the Sicilian Megara, and took them with him to share in his enterprise. But this version implies that Megara was founded before Syracuse, which is contrary to all other authorities. The whole question of the various tales relating to the foundation of Syracuse is discussed by E. A. Freeman, History of Sicily, i. 335 sqq., 572 sqq.

² The origin of the name Συράκους is quite uncertain. It has been suggested that it may be Phoenician: and, again, the plural form has been thought to point perhaps to the combination of two originally distinct posts,¹ one on the island, the other on the mainland on the hill where the ruins of the Olympium stand, known as νομαί— the latter being the original Syracuse.

³ The site of Casmenae is uncertain; it was to the south-west of Syracuse, and not improbably at Spaccaforno (Freeman ii. 25).

⁴ The site of Casmenae is uncertain: it was to the south-west of Syracuse, and not improbably at Spaccaforno (Freeman ii. 25).
coast. They were not strictly colonies but outposts; Camarina indeed was destroyed after a revolt against the ruling city (Thuc. v. 1). Whether the inland Sicel town of Henna was ever a Syracusan settlement is doubtful. It is extremely probable that Acrae was not founded until after two obvious outposts had already been occupied—a post guarding the road to Acrae itself, and including the sacred enclosure of Apollo, which later, when it became a quarter of the city, acquired the name Temenites; and another post on the road to the north, in the upper part of the region known as Achradina. The latter was Achradina on the east and north and south, with a long straight cutting of the rock serving as a scarp on which the wall stood (see below), and on the south by extensive quarries (Freeman ii. 43, 139, 144). About the middle of the 6th century B.C. the island was connected with the mainland by a mole (Freeman ii. 140, 503). At the beginning of the 5th century B.C. Syracusan history becomes far more clear. Hippocrates, tyrant of Gela (498–491), threatened the independence of Syracuse as well as of other cities, and it was saved only by the joint intervention of Corinth and Corecyra and by the cessation of the vacant territory of Camarina. In 485 the Camorri, who had been conquered by the Segestans and the Trinacrians, and had taken refuge at Cameneae, craved help of Gelo. The successor of Hippocrates, who took possession of Syracuse without opposition, and made it the seat of his power. He gave citizenship both to mercenaries and to settlers from Greece, and added to the population the inhabitants of other cities conquered by him, so that Syracuse became a city of mixed population, in which the new citizens had the advantage. He then extended the city by including within the fortifications the low ground (or at any rate the western portion of the low ground) between Upper Achradina and the island east of and across the Acrae canal, and at the same time (probably) he was able to shift the position of the crossing to the island by making a new isthmus in the position of the present one, the old mole being broken through so as to afford an outlet from the Little Harbour on the east (Lupus, p. 91). The island thus became the inner city, the stronghold of the ruler, so that, despite its low level, it is often spoken of as the “acropolis.” Gelo’s general rule was mild, and he won fame as the champion of Hellas by his great victory over the Carthaginians at Himera. He is said to have been granted as king; but he does not seem to have taken the title in any formal way.

Gelo’s brother and successor, Hiero (478–467), kept up the power of the city; he won himself a name by his encouragement of poets, especially Aeschylus and Simonides, and philosophers; and his Pythian and Olympic victories made him the special subject of the songs of Pindar and Bacchylides; among the recently discovered works of the latter are three Odes (iii.–v.) written for him. He appeared also as a Hellenic champion in the defence of Cumae against the Etruscans, and he attempted after the victory to found a Syracusan colony on the island of Aenaria, now Ischia. But his internal government, though that of Gelo, was suspicious, greedy and cruel. After some family disputes the power passed to his brother Thrasylalus, who was driven out next year by a general rising. In this revolution Thrasylalus and his mercenaries held the fortified quarters of Ortgyia and Achradina; the revolted people held the unwalled suburbs, already, it is plain, thickly inhabited. Thrasylalus yielded to the common action of Sicelots and Sicels. Syracuse thus became a democratic commonwealth. Renewed freedom was celebrated by a colossal statue of Zeus Eleutherius and by a yearly feast in his honour. But when the mercenaries and other new settlers were shut out from office 4 new struggles

1 Holm and Cavallari (cf. Lupus, Topographie von Syrakus, 91) make the construction of the mole and of the wall across it contemporaneous with the building of Achradina in the middle of the 6th century B.C. They also consider that the original western boundary of Achradina ran down to the Little Harbour, so that the southern boundary of Achradina was the sea itself.

2 Holm and Cavallari (see Lupus, p. 99) are inclined to attribute to him the addition of Tyche to the city.

3 Dio x. 72; cf. Arist. Pol. v. 3, 10.

4 The chief authorities for the siege are Thucydides (bk s. vi. and vii.), Diódoros (bk. xiii.) and Plutarch, Nicia.
SYRACUSE

complete, and the Athenian fleet had at the same time entered the Great Harbour. The citizens began to think of his surrender, and Nicias was so confident that he neglected to push his advantages. He left a gap to the north of the circular fort which formed the centre of the Athenian lines, the point where Epipolae sloped down to the sea, and he ordered to occupy Euryelus.

The second act of the drama may be said to open with the irretrievable blunder of Nicias in letting the Spartan Gilippus first land in Sicily, and then march at the head of a small army, partly levied on the spot, across the island, and enter Syracuse by way of Epipolae, past Euryelus. Gilippus was felt to be the representative of Sparta, and of the Peloponnesian Greeks generally, and his arrival inspired the Syracusans with the fullest confidence. Just before his arrival a few ships from Corinth had made their way into the harbour with the news that a great fleet was already on its way to the relief of the city. The tables were now completely turned, and we hear of nothing but defeat and disaster for the besiegers till their final overthrow. The military skill of Gilippus enabled the Syracusan militia to meet the Athenian troops on equal terms, to wrest from them their fortified position on Plemmyrium, which Nicias had occupied as a naval station shortly after Gilippus’s arrival, and thus to drive them to keep their ships on the low beach between their double walls, to take Labdaunum, an Athenian fort on the northern edge of Epipolae, and make a third counter-work right along Epipolae in a westerly direction, to the north of the circular fort. Toward Athens were thus reduced and checked, and, as Nicias said in his despatch towards the close of 414, they were themselves besieged rather than besieging. The naval preparations of the Syracusans, under the advice of Hermocrates, had led them, too, to confidence in their powers of giving battle to the Athenian fleet. In the first sea-fight, which took place simultaneously with the capture of Plemmyrium, they had been unsuccessful; but in the spring of 413 they actually won a victory over the Athenians in their own element.

On the very next day, however, a second Athenian fleet arrived under Demosthenes and Eurydemus, with thirty-three ships of war and a large force of heavy infantry and light troops. The despatch of this expedition seems to prove an almost blind confidence in Nicias, whose request to be superseded the Athenian people refused to grant. Demosthenes decided at once to make a grand attack on Epipolae, with a view to recovering the Athenian blockading lines and driving the Syracusans back within the city walls. The assault was made by night by way of Euryelus under the uncertain light of the moon, and this circumstance turned what was very nearly a successful surprise into a ruinous defeat. The affair seems to have been well planned. The Athenians were thus reduced and checked, and, as Nicias said, flushed with a first success, their ranks broken and disordered by a pursuit of the enemy over rough ground, were repulsed with great loss by a body of heavy-armored Boeotians, and driven back in disorder. The confusion spread to the troops behind them, and the action ended in wild flight and slaughter. The army was now thoroughly out of heart, and Demosthenes was for at once breaking up the camp, embarking the troops, and sailing back to Athens. (It must be remembered that the Spartans were all this time in occupation of Decelea; see PELopONNEsIAN WARS, Note 1. The Syracusan army was thus broken up in a moment. A desperate conflict, was utterly defeated and half destroyed. The broken and demoralized army, its ranks thinned by fever and sickness, at last began its hopeless retreat, attempting to reach Catania by a circuitous route; but, harassed by the numerous Syracusan cavalry and lighters, after a few days of dreadful suffering, it was forced to lay down its arms. The Syracusans saluted the glory of their triumph by putting Nicias and Demostenes to death, and huddling their prisoners into their stone-quarries—a living death, dragged out, for the allies from Greece proper to the space of seventy days, for the Athenians themselves and the Greeks of Sicily and Italy for six months longer. Games called Assinarian, from the name of the river at which the final surrender occurred, were instituted to commemorate it.

Her great deliverance and victory naturally stirred up the energies of Syracuse at home and abroad. Syracusan and Selinunte ships under Hermocrates now play a distinguished part in the warfare between Sparta and Athens on the coast of Asia. Under the influence of Diocles the constitution became as still more confirmed democracy, some at least of the magistrates being filled by lot, as at Athens (Diod. xiiii. 31, 35; Arist. Pol. v. 3–6). Diocles appears also as the author of a code of laws of great strictness, which was held in such esteem that later lawyers were deemed only its expounders. Under these influences Hermocrates was banished in 409; he submitted to the sentence, notwithstanding the wishes of his army. He went back to Sicily, warred with Carthage on his own account, and brought back the bones of the unburied Syracusans from Himera, but was still so dreaded that the people banished Diocles without restoring him. In 407 he was slain in an attempt to escape from the city, and he who was wounded one who was presently to outstrip both rivals.

This was Dionysius the (the “Elder”), son of another Hermocrates and an adherent of the aristocratic party, but soon afterwards a demagogue, though supported by some men of rank, among them the historian Philistus (Diod. xiiii. 91, 92). By accusing the generals engaged at Acragas in the war against Carthage, by obtaining the restoration of exiles (no doubt others of the partisans of Hermocrates), by high-handed proceedings at Gela, he secured his own election first as one of the generals, then as sole general (or with a nominal colleague), with special powers. He next, by another trick, procured from a military assembly at Leontini a vote of a bodyguard; he hired mercenaries and in 406–405 came back to Syracuse as tyrant of the city (Diod. xiiii. 91–96). Dionysius kept his power till his death thirty-eight years later (367). But it was well-nigh overthrown before he had fully grasped it. His defeat before Gela and his consequent decision that both Gela and Camarina should be evacuated, and left for the Carthaginians to plunder, were no doubt due to previous arrangement with the latter. His enemies in the army, chiefly the horsemen, reached Syracuse before him, and with Dionysius’s brother, his house was plundered, and he came and took his vengeance, slaying and driving out his enemies, who established themselves at Aeta (Diod. xiiii. 113). In 397 Syracuse had to stand a siege from the Carthaginians under Himilco, who took up his quarters at the Olympic, but his troops in the marshes below suffered from pestilence, and a masterly combined attack by land and sea by Dionysius ended in his utter defeat. Dionysius, however, allowed him to depart without further pressing his advantage. This revolution and the peace with the Carthaginians confirmed Dionysius in the sole general (or with a nominal colleague), with special powers. As Leontini was again a separate city. It left Syracuse the one great Hellenic city of Sicily, which, however enslaved at home, was at least independent of the barbarian. Dionysius was able, like Gelo, though with less success and less honour, to take up the rôle of the champion of Hellas.

During the long tyranny of Dionysius the city grew greatly in size, population and grandeur. In fact the free Greek cities and communities, in both Sicily and southern Italy, were sacrificed to Syracuse; there the greatness and glory of the Greek world in the West were concentrated. The mass of the population of Gela and Camarina, and the great numbers who had fled at the prompting of Dionysius, taken refuge at Syracuse. Gela had in the previous year received the fugitive inhabitants of Acragas (Agrigentum), which had been sacked by the
Carthaginians. Syracuse thus absorbed three of the chief Greek cities of Sicily. It received large accessions from some of the Greek cities of southern Italy, from Hipponium on its west and Caulonia on its east coast, both of which Dionysius captured in 389 B.C. There had also been an influx of free citizens from Rhegium. At the time of the Athenian siege Syracuse consisted of two quarters—the island and the "outer city" of Thucydides, generally known as Acharnida, and bounded by the sea on the north and east, with the adjoining suburbs of Apollo Temenites farther inland, at the foot of the southern slopes of Epipolae and Tyche west of the north-west corner of Acharnida. Dionysius largely extended the fortifications. The island (Ortygia) had been provisioned with its own defences, converted, in fact, into a separate stronghold, with a fort to serve specially as a magazine of corn, and with a citadel or acropolis which stood apart and might be held as a last refuge. Dionysius, to make himself perfectly safe, drove out a number of the old inhabitants and turned the place into a barracks, he himself living in the citadel. For any unpopularity he may have thus incurred he seems to have made up by his great works for the defence of the city. Profiting by the experience gained during the Athenian siege, he included in his new lines the whole plateau of Epipolae, a strong and thickly wooded area; thus, the total length of the outer lines (excluding the fortifications of the island) has been calculated at about 12 m. The material (limestone) was quarried on the spot. Each quarter of the city had its own distinct defences, and Syracuse was now the most splendid and the best fortified of all Greek cities. Its naval power, too, was vastly increased; the docks were enlarged; and new warships were built. Besides the triremes, or vessels with three banks of oars, we hear of quadriremes and quinqueremes with four and five banks of oars—larger and taller and more massive ships than had yet been used in Greek sea warfare. The fleet of Dionysius was the most powerful in the Mediterranean. It was doubtless fear and hatred of Carthage, from which city the Greeks of Sicily had suffered so much, that urged the Syracusans to acquiesce in the enormous expenditure which they must have incurred under the rule of Dionysius. Much, too, was done for the beauty of the city as well as for its strength and defence. Several new temples were built, and gymnasia erected outside the walls near the banks of the Anapus (Diod. xv. 13).

"Fastened by chains of adamant" 1 was the boastful phrase in which Dionysius described his empire; but under his son, the younger Dionysius—"in ease, good-natured, unpractical manner—a restless set in amongst the restless citizens of Syracuse, which, with its vast and mixed populations, must have been full of elements of turbulence and faction. But the burdensome expenditure of the late reign would be enough to account for a good deal of discontent. A remarkable man now comes to the front—Dion, the friend and disciple of Plato—and for a time the trusted political adviser of his nephew Dionysius. Dion's idea seems to have been to make Dionysius something like a constitutional sovereign, and with this view he brought him into contact with Plato. All went well for a time; but Dionysius had Philistus of Athens about him, who were opposed to any kind of liberal reform, and the result was the banishment of Dion from Syracuse as a dangerous innovator. Ten years afterwards, in 357, the exile entered Acharnida a victor, welcomed by the citizens as a deliverer both of themselves and of the Greeks of Sicily generally. A siege and blockade, with confused fighting and alternate victory and defeat, and all the horrors of fire and slaughter, followed, till Dion made himself finally master of the mainland city. Ortygia, provisions failing, was also soon surrendered. Dion's rule lasted only three years, for he perished in 354 by the hand of a Syracusan assassin. It was, in fact, after all his professions, little better than a military despotism. The tyrant's stronghold in the island was left standing.

Of what took place in Syracuse during the next ten years we know but little. The younger Dionysius came back and from his island fortress again oppressed the citizens; the plight of the city, torn by faction and conflicts and plundered by foreign troops, was so utterly wretched that all Greek life seemed on the verge of extinction (Plato, Epist. viii.). Sicily, too, was again menaced by Carthage. Syracuse, in its extremity, asked help from the mother-city, Corinth; and now appears on the scene one of the noblest figures in Greek history, Timoleon (q.v.). To him Syracuse owed her deliverance from the younger Dionysius and from Hicitas, who held the rest of Syracuse, and to him both Syracuse and the Sicilian Greeks owed a decisive triumph over Carthage and the safe possession of Sicily west of the river Halycus, the largest portion of the island. From 343 to 337 he was supreme at Syracuse, with the hearty good will of the citizens. The younger Dionysius had been allowed to retire to Syracuse; his island fortress was destroyed and replaced by a court of justice. Syracuse rose again out of her desolation—grass, it is said, grew in her streets—and, with an influx of a multitude of new colonists from Greece and from towns of Sicily and Italy, once more became a prosperous city. Timoleon, having accomplished his work, accepted the position of a private citizen, though, practically, to the end of his life he was the ruler of the Syracusan people. After his death (337) a splendid monument, with porticoes and gymnasia surrounding it, known as the "Timoleontean," was raised at the public cost to commemorate him.

In the interval of twenty years between the death of Timoleon and the rise of Agathocles (q.v.) to power another revolution at Syracuse transferred the government to an oligarchy of 600 leading citizens. All we know is the bare fact. It was shortly after this revolution, in 317, that Agathocles with a body of mercenaries from Campania and a host of exiles from the Greek cities, backed up by the Carthaginian Hamilcar, who was in friendly relations with the Syracusan oligarchy, became a tyrant or despot of the city, assuming subsequently, on the strength of his successes against Carthage, the title of king. Syracuse passed through another reign of terror; the new despot proclaimed himself the champion of popular government, and had the senate and the heads of the oligarchical party massacred wholesale. He seems to have had popular manners, for a unanimous vote of the people gave him absolute control over the fortunes of Syracuse. His wars in Sicily and Africa left him time to do something for the relief of the poorer citizens at the expense of the rich, as well as to erect new fortifications and public buildings; and under his strong government Syracuse seems to have been at least quiet and orderly. After his death in 289 comes another miserable and obscure period of revolution and despotism, in which Greek life was dying out; and but for the brief intervention of Pyrrhus in 278 Syracuse, and indeed all Sicily, would have fallen a prey to the Carthaginians.

A better time began under Hiero II., who had fought under Pyrrhus and who rose from the rank of general of the Syracusan army to be tyrant—king, as he came to be so soon styled—about 270. During his reign of over fifty years, ending probably in 216, Syracuse enjoyed tranquillity, and seems to have grown greatly in wealth and population. Hiero's rule was kindly and enlightened, combining good order with a fair share of liberty and self-government. His financial legislation was careful and considerate; his laws 1 as to the customs and the corn tithes were accepted and maintained under the Roman government, and one of the many bad acts of the notorious Verres, according to Cicero, was to set them aside (Cic. In Verr. ii. 13, ili. 8). It was a time, too, for great public works—works for defence at the entrance of the Lesser Harbour between the island and Acharnida, and temples and gymnasia. Hiero through his long reign was the staunch friend and ally of Rome in her struggles with Carthage; but his paternal despotism, under which Greek life and civilization at Syracuse had greatly flourished, was unfortunately succeeded by the rule of a man who wholly reversed his policy.

Hieronymus, the grandson of Hiero, thought fit to ally himself with Carthage; he did not live, however, to see the mischief he had done, for he fell in a conspiracy which he had wantonly provoked by his arrogance and cruelty. There was a fierce

1 The laws of Hiero are often mentioned with approval in Cicero's speeches against Verres.
popular outbreak and more bloodshed; the conspirators were put to death and Hiero's family was murdered; whilst the Carthaginian faction, under the pretence of delivering the city from its tyrants, got the upper hand and drew the citizens into open defiance of Rome. M. Claudius Marcellus was then in command of the Roman army in Sicily, and he threatened the Syracusans with attack unless they would get rid of Epicydes and Hippocrates, the heads of the anti-Roman faction. Epicydes did his best to stir up the citizens of Leonti against tyrants and the Roman party at Syracuse. Marcellus, therefore, struck his first blow at Leontini, which was quickly stormed; and the tale of the horrors of the sack was at once carried to Syracuse and roused the anger of its population, who could not but sympathize with their near neighbours, Greeks like themselves. The general feeling was now against any negotiations with the Roman general, and, putting themselves under Epicydes and Hippocrates, they closed their gates on him. Marcellus, after an unsuccessful attempt to negotiate, began the siege in regular form (214 B.C.) by both land and sea, establishing a camp on Polyzonium; and the Syracusans, now secure, stood the old temple of Olympian Zeus; but he made his chief assault on the northern side and on the defences of Tyche, particularly at the Hexapylum, the entrance facing Megara and Leontini. His assault seawards was made mainly on Achradina, but the city was defended by a numerous sodality and by what seems to have been still more formidable, the ingenious contrivances of Archimedes, whose engines, acting as Pavon, and frustrated the attack on the fortifications on the northern slopes of Epipolae (Liv. xxxiv. 34). Marcellus had recourse to a blockade, but Carthaginian vessels from time to time contrived to throw their supplies in, and Marcellus, at length, treachery began to work within. Information was given him in the spring of 212 (two years from the commencement of the siege) that the Syracusans were celebrating a great festival to Artemis; making use of this opportunity, he forced the Hexapylum entrance by night and established himself in Tyche and on the heights of Epipolae. The strong fortress of Euryelus held out for a time, but, being now isolated, it soon had to surrender.

The outer and the inner city of Thucydides still held out, whilst a Carthaginian fleet was moored off Achradina and Carthaginian troops were encamped on the sp. A but a precursor broke out in the autumn of 212, which swept them clean away, and thinned the Roman ranks. The ships sailed away to Carthage; on their way back to Syracuse with supplies they could not get beyond Cape Pachynus owing to adverse winds, and they were confronted by a Roman fleet. All hope for the city being now at an end, the Syracusans threw themselves on the mercy of Marcellus; but Achradina and the island still held out for a brief space under the Syracusan mercenaries, till one of their officers, a Spaniard, betrayed the latter position to the enemy, and at the same time Achradina was carried and taken. Marcellus gave the city up to plunder (Liv. xxxv. 31), and the art treasures in which it was so rich—many of the choicest of them, no doubt—were conveyed to Rome. Archimedes perished in the confusion of the sack while he was calmly pursuing his studies (Liv. xxxv. 31).

Syracuse was now simply one of the provincial cities of Rome's empire, and its history is henceforward merged in that of Sicily. It retained much of its Greek character and many of its finest public buildings, even after the havoc wrought by Marcellus. Its importance and historic associations naturally marked it out as the residence of the Roman praetor or governor of Sicily. Cicero often speaks of it as a particularly splendid and beautiful city, as still in his own day the seat of art and culture (Tusc. v. 66; De deor. nat. iii. 81; De rep. i. 21), and in his speeches against Verres (liv. 52, 53) he gives an elaborate description of its four quarters (Achradina, Neapolis, Tyche, the island). It seems to have suffered in the civil wars at the hands of Sextus Pompeius, the son of the triumvir, who for a short time was master of Sicily; to repair the mischief, new settlers were sent by Augustus in 21 B.C., and established in the island and in the immediately adjoining part of Aciadina (Strabo vi. 270). It was he who probably constructed the amphitheatre. Tacitus, in a passing mention of it (Ann. xiii. 49), says that permission was granted to the Syracusans under Nero to exceed the prescribed number of gladiators in their shows. Caligula restored its decayed walls and some of its famous temples (Sueto., Calig. 22). In the 4th century it is named by the poet Ausonius in one of his "nobilissimis locis," as a seat of one of its historic memories. In 665 Heracleus Constans fixed his capital here, but owing to his oppressive government was assassinated in 668. Syracuse has been a place of comparatively little importance since the year 878, when it was destroyed by the Saracens under Ibrahim ibn Ahmad.

Archaeology.—The medieval and modern town of Syracuse (with the exception of a new quarter which has sprung up since the construction of the railway between the station and the island) is confined to the island. This contains the remains of two Doric temples. The older, belonging probably to the beginning of the 6th century B.C., appears, from an inscription on the uppermost step, to have been dedicated to Apollo. It was a peripteral hexastyle, and must have had at least nineteen columns at the sides; the portion excavated shows that its total width is 74 ft., the width of the cella 38 ft., the lower diameter of the columns 6 ft. The other temple, into which the cathedral was built in A.D. 640, is to be dated after 440 B.C. It was a peripteral hexastyle of thirty-six columns, with a total length of 160 ft. and a total breadth of 72 ft.; the columns have a lower diameter of 5 ft., and the inter-columniation is 13 ft. It is generally regarded as the temple of Athena.

Near the west coast of the island is the famous fountain of Arethusa. According to the legend, the nymph Arethusa was changed into the fountain by Artemis to deliver her from the pursuit of the river-god Alpheus (p.29); and the spring, which was fresh until an earthquake broke the barrier and let in the salt water, was supposed to be actually connected with the river. There are interesting remains of medieval architecture in the closely built town with its narrow streets; the beautiful 14th-century windows of the Palazzo Montalto may be especially noticed, and also the 15th-century Castello Mainace on the southern extremity of the island. The town also contains the archaeological museum, which, under the direction of Professor Orsi, is now the best arranged in the island. The discoveries of recent years in the south-eastern portion of Sicily, including especially the objects found in Sicel and Greek cemeteries, may be studied here. The isthmus connecting the island with the mainland, which was defended by strong fortifications erected by Charles V. and Philip II. (now demolished), does not occupy the site of the mole erected in the 6th or 7th century B.C., which may be recognized as having run due north from the north point of the island to the mainland near the ferry of S. Lucia. The Little Harbour was thus in origin merely a recess of the Great Harbour; and it was probably Gelo who was responsible for making it an independent port, by establishing the crossing to the island in its present position. On the landward side of the new isthmus was the Agora, in which remains of a colonnade of the Roman period have been found. To the west are the remains of an extensive building of the Roman period, probably a palaestra, with a small Odeum attached. To the W.N.W. is the so-called Piano del Fusco, an extensive necropolis, in which over six hundred tombs, mostly of the 6th century B.C., were excavated. The Acropolis, which was included within the defensive wall of Dionysus, a portion of which, no less than 184 ft. thick, was found in 1856 running diagonally across the new cemetery, and in 1903 an outwork in front of it was discovered (P. Orsi, in Notizie degli scavi, 1903, 517). East of this point it probably followed the edge

1 This statement made by Polybius (viii. 5) is almost incredible. Livy's account of the siege, too, is full of topographical difficulties (Lupus, 214 sqq.).

2 The name is a widespread Greek name for a spring.

3 Lupus, Topographie von Syrakus, 26, 88, 91. Near the quarry are a row of long parallel walls which must be remains of the ancient docks, each being intended to take a ship.

4 It is remarkable that hardly any tombs of the 5th century B.C. have come to light.
of the low terrace above the marsh (the ancient Lysimeleia), while in the other direction it ran N.N.W., making straight for the western edge of the gorge known as the Portella del Fusco, which was thus included within the fortifications, as it would otherwise have afforded a means of access to the enemy. Here the wall gained the top of the cliffs which mark the southern edge of the plateau of Epipolae, which from this point onwards it followed as far as Euryelus. The south wall of Epipolae, considerable remains of which exist, shows traces of different periods in its construction, and was probably often restored. It is built of rectangular blocks of limestone generally quarried on the spot, about 3 ft. long, 2 ft. high and 25 ft. deep. The thickness of the wall averages 10 ft., but varies 3 or 4 ft. each way. The point where the terrace of Epipolae narrows down to a ridge about 60 yds. wide, which is its only link with the hills to the west, had thrice proved during the Athenian siege to be the key to Syracuse. It now bears the ruins of a mighty fortress, finer than that which defends the entrance to the acropolis of Selinus—the most imposing, indeed, that has come down to us from the Greek period—which there is no doubt is the work of Dionysius. The total length of the works is about 2,382 ft., its average width is 145 yds., and it is estimated that the rock-cutting of the innermost of which can be reached from the interior of the castle by a complicated system of underground passages. The front of the castle is formed by five massive towers: behind it are two walled courtyards, to the north of the easternmost of which is the well-guarded main entrance to the plateau of Epipolae (narrower minor entrances are to be seen on both the north and the south sides) communicating by a long underground passage with the inner ditch in front of the castle proper. That this point is to be identified with Euryelus is now generally admitted (see Lupus, 125-127; Freeman, iii. 661). Earlier writers make this the site of Labdalum, and put Euryelus farther west; but Labdalum must be sought somewhat farther east, near the northern edge of the plateau, in a point not visible from the Athenian central fort (σενάριον) with a view over Megara—not therefore in the commanding position of Dionysius’s fort, with an uninterrupted view on all sides. On the north side of Epipolae the cliffs are somewhat more abrupt; here the wall, of a similar construction to that on the south, is also traceable: but here it is apparently all of one period. It is, indeed, recorded by Diodorus that Dionysius built the north wall from Euryelus to the Hexapylon in twenty days for a length of 2½ m., employing 60,000 peasants and 6000 yoke of oxen for the transport of the blocks. Several smaller entrances are to be seen in it, as in the south wall: among them one with a series of inclined planes cut in the rock, which leads to an ancient road running south-east to the neighbourhood of the theatre. The Hexapylon plays an important part in the Roman siege of Syracuse. It was the main entrance on the north, and no doubt is to be identified with the so-called Scala Greca, where the modern highroad leaves the plateau. This highroad, which probably follows an ancient line, may be reasonably held to mark the west boundary of Tyche. Five hundred yards to the east of it an interesting postern was discovered in 1791 (Orsi, in Notizie degli scavi, 1803, 168), at the point where the wall leaves the edge of the plateau and begins to follow the sea-coast; and half a mile farther on we reach the deep gorge of S. Bonagia (more correctly Panagia), which here forms the boundary between Tyche and Achradina. The west boundary of Achradina is marked farther south by a perpendicular cutting in the rock, on the top of which a wall must have run (see above). To the east of the gorge the wall still follows the edge of low cliffs of the coast, and continues to do so all along the east side of Achradina as far as the Little Harbour. On this side traces of it are very scanty, as the sea-spray has eaten away the stone. The most important buildings of which we have any remains are to be found in the lower part of Achradina and in Neapolis, a quarter of which we hear first in the time of Dionysius, and which at first was confined to the lower ground below Temenites, but in Roman times included it and the theatre also (Lupus, 168), though it did not extend beyond the theatre to the uppermost part of the plateau. In lower Achradina remains of Roman private houses have been found, and it is in this district that the early Christians 4 constructed their catacombs. Those which are entered from near the 12th-century church of S. Giovanni, situated near an ancient temple, are extensive and important, and include the ancient crypt of S. Marcianus, and the type is different from that of the Roman catacombs, the galleries being far larger (partly owing to the hardness of the limestone in which they are excavated), and having circular chambers at the points of junction. In Neapolis, on the other hand, public buildings predominate. The temple of Apollo Temenites has entirely disappeared, but the theatre, entirely hewn in the rock, is still to be seen. It is the largest in Sicily, and is unique in the way its tiers are formed. It has the utmost height of sixty rows of seats; the eleven lower tiers were originally covered with marble. Each of the nine cases bore a name; the inscriptions of five of them, still preserved on the rock, are in honour of Zeus, Heraclès, King Hiero II., his wife Philistis, and his daughter-in-law Nerelis. Of the stage nothing but cuttings in the rock for foundations are visible. The situation is well chosen, commanding a splendid view over the Great Harbour. Not far off to the south-east is the amphitheatre, probably erected by Augustus when he founded a colony at Syracuse; it is partly cut in the rock and partly built. It is inferior in size only to the Colosseum and the amphitheatres of Capua and Verona, measuring about 153 by 130 yds. over all: the arena is 76 by 43 yds. To the west of the amphitheatre is the foundation of the great altar erected by Hiero II. (Diod. xvi. 83), 217 yds. long by 24 wide, and about 6 yds. in height. To the north-west of the theatre a winding road ascends through the rock, with comparatively late tomb chambers on each side of it. In this district are seen hundreds of small niches cut in the rock, as a rule about 2 ft. square and a few inches deep, which served for containing inscriptions or relics, sometimes of a sepulchral character, but sometimes relating to the cult of a divinity. Many of them are also found in the quarries (Orsi, in Notizie degli scavi, 1904, 277). Both the districts just described contain huge quarries, the famous Lautumiae (from Gr. Λατούμε, stone, and τεμνων, to cut; hence λατομεία, quarry) of Syracuse, over 100 ft. deep and of great extent (though through the collapse of the pillars supporting the undermined rock they have become still larger than they were in ancient times). They are now overgrown with luxuriant vegetation. The upper plateau (Achradina, Tyche, Epipolae itself) is now largely cultivated at the east end, less so at the west end. It is traversed by the subterranean aqueducts by which the city was supplied (see AQUADUCTS) and by a few ancient roads, but contains practically no remains of ancient buildings. Cuttings in the rock for the foundations of such are numerous round the south edge of Temenites and Achradina, and are to be seen at various points near the city wall. But otherwise the disappearance of the edifices of ancient Syracuse is most striking. We have already seen that immediately outside Lower Neapolis on the south the marshes of Lysimeleia begin, which proved fatal to more than one besieging force. They are traversed by the Anapus, with its tributary the Cyanne, the latter famous for the papyrus planted by the Arabs, which here alone in Europe grows wild in the stream. To the south of the ancient hill of Policlinche, on which stood the Olympieum, attributed on stylistic grounds to 581 b. C. its monumental 4 St. Paul tarried at Syracuse three days on his way to Rome (Acts xxviii. 12). 4 A large reservoir of the Greek period exists under the present railway station (Notizie degli scavi, 1904, 280).
SYRACUSE, a city and the county-seat of Onondaga county, New York, U.S.A., situated at the southern end of Onondaga Lake, about 75 m. E. of Rochester and about 150 m. W. of Albany. Pop. (1880), 51,792; (1890), 85,143; (1900), 108,374, of whom 23,757 were foreign-born (including 7865 German, 317 Irish, 2393 English Canadian and 2383 English) and 116,617 were negroes; (1910), 137,240. Area (1900), 16.62 sq. m. Syracuse is served by the New York Central & Hudson River, the West Shore, and the Delaware, Lackawanna & Western railways, by the Erie Canal and the Oswego Canal, which joins the Erie within the city limits, and by several electric inter-urban lines. The city is built on high ground in an amphitheatre of hills surrounding the lake, which is a beautiful body of clear water, 5 m. long by 1½ m. broad at its widest point. Of the residential streets, James Street, in the north-eastern part of the city, is the most attractive. Salina Street is the principal thoroughfare of the residential and commercial section of the city, and more than fifty parks and squares, with a total area of 278 acres. The largest and most noteworthy areBurnet park (about 100 acres), on high land in the western part of the city, Lincoln park, occupying a heavily wooded ridge in the east, and Schiller, Kirk and Fraser parks. A boulevard runs along the shore of the lake. A fine water-supply controlled by the city is obtained from Skaneateles Lake, 18 m. distant, by a gravity system which cost $5,000,000; and the city has an intercepting sewer system.

Among the most noteworthy churches of Syracuse are the Roman Catholic cathedral of the Immaculate Conception—Syracuse became the see of a Roman Catholic bishop in 1887—and St Paul's Protestant Episcopal, the first Presbyterian, first Methodist Episcopal, Dutch Reformed and May Memorial (Unitarian) churches, the last erected in memory of Samuel Joseph May (1797-1871), a famous anti-slavery leader, pastor of the church in 1845-1868, and author of Some Recollections of Our Anti-Slavery Conflict (1873). Among the public buildings are the Federal Building, the Onondaga county courthouse, costing $1,500,000 and containing a law library of 15,000 volumes, the city-hall, the Central high school, a fine building erected at a cost of $400,000, the North high school ($300,000), and the public library (Carnegie) with 60,000 volumes in 1908 and housing the Museum of Fine Arts (1897), also.

Among the hospitals and charitable institutions are the Syracuse hospital (1872) for infectious diseases, the Hospital of the Good Shepherd (1873), the Syracusian homoeopathic hospital (1869), the Syracuse hospital for women and children (1887), St Mary's infant and maternity hospital (1900) under the Sisters of Charity, St Joseph's hospital (1869, under direction of the Sisters of St Francis, the Syracuse home for aged women (1852), Onondaga county orphan asylum (private; 1841), and two other orphan asylums controlled by the Sisters of Charity, and the state institutions (in a state-reminded building, the North hospital (office building owned by Syracuse University), the Union Building, the Onondaga county savings bank and the Syracuse savings bank are among the most important business structures; and the Onondaga, the Vanderbuilt house and the State and St Clair hotels are the principal hotels. In Jamesville, about 6 m. south, is the Onondaga penitentiary. Adjacent to the city is Oakwood cemetery overlooking the lake; and north-west of the city are the Slate fair grounds, with extensive exhibition halls and barns, where the annual fairs of the New York State Agricultural Society are held. Six miles south of the city is the Onondaga Indian reservation, the oldest capital of the Indian Nations. The city has an annual carnival and a musical festival.

Syracuse University, whose campus (of 100 acres) in the south-east part of the city commands a fine view of the lake, is a co-educational institution largely under Methodist Episcopal control, but not sectarian, which in 1908-1909 had 259 instructors and 3205 students (1136 in the college of liberal arts; 189 in the summer school; 62 in the library school; 933 in the college of fine arts; 147 in the college of medicine; 179 in the college of civil engineering; 352 in the college of teachers’ college). The university was opened in 1871, when the faculty and students of Genesee College (1850) removed from Lima (New York) to Syracuse—a court-ruling made it impossible for the corporation to remove; in 1872 the Geneva medical college (1835) removed to Syracuse and became a college of the university. The courses in library economy (college of liberal arts) are particularly well known. The university library (about 80,000 bound volumes and 49,000 pamphlets) includes (since 1887) the collection of the German historian, Leopold von Ranke. There are seventeen buildings, among which the Holden observatory, the John Crouse memorial college (of fine arts), the hall of languages, the Lyman Smith college of applied science, the Lyman hall of natural history, the Bowne hall of chemistry, and the Carnegie library, are the most notable. There are a large gymnasium and a stadium of re-enforced concrete for athletic contests, capable of seating 20,000 people and one of the largest athletic fields in the world. The plant of the university in 1900 was valued at $3,193,128, and in 1908-1909 its productive funds amounted to about $2,000,000 and its income from all sources was about $784,000.

Power from Niagara Falls is used by factories in the city, and the manufactures are extensive and greatly diversified. In 1905 the aggregate capital of the city’s manufacturing industries was $38,002,052 and the net value of the products, 31½% more than in 1900. The principal products in 1905 were: men’s and women’s clothing ($3,547,494, of which $3,082,052 represented men’s clothing), shoes, foundry and machine-shop products, of which agricultural implements and machinery constituted the greater part ($2,415,460), iron and steel products ($2,117,558), chemicals, malt liquors ($1,660,460), typewriters and typewriting supplies ($1,440,186), boots and shoes ($1,313,200), and other important products were automobiles and sewing machines, hosiers and knit goods, candles, furniture, flour, crockery, and canned goods (especially mince-meat).

Syracuse was long the principal seat of the salt industry in America.
The Onondaga salt deposits were mentioned in the journal of the French Jean Lemoine as early as 1653, and before the War of Independence the Indians marked the Onondaga salt at Albany and Quebec. In 1786 the state undertook, by treaty with the Onondaga Indians, to carry on the extraction of them from the ground. In 1795, by another treaty, the state acquired for $1000, to be supplemented by an annual payment of $700 and 150 bushels of salt, the salt springs and land along Onondaga Creek. In 1797 it was constructed a road to the salt springs. In 1797 the state leased the lands, the lessees paying a royalty of 4 cents per bushel and being forbidden to charge more than 60 cents per bushel. The state sank wells and built and maintained tanks. Three minutes were delivered to lessees at 1822-1824 a royalty of 12 cents was charged to raise funds for building canals (a rebate being granted in the last three years covering the entire amount of the royalty for these years). Onondaga Creek, as the original source of the royalty, was maintained until 1858, when the last of the lands were sold and the office of superintendent of salt lands, created in 1797, was abolished. Until 1840 only boated salt was manufactured; in that year the solar process was introduced. The annual production, which was increased to 100,000 bushels in 1804, reached its highest point in 1862 (9,053,874 bushels, of which 1,983,022 bushels were solar, and 7,070,852 boiled). The development of the Michigan salt deposits and (after 1880) of the deposits in the Green County and Wyoming counties of the state, has caused a rapid decline in the Onondaga product. In 1876 both processes yielded together only 5,392,677 bushels, and in 1896 only 2,806,600 bushels. The salt deposits at Syracuse had, however, lathe years been worked over by a large company, the manufacture of soda ash, which has grown to importance. At the village of Solvay (pop. 1905, $100), adjoining Syracuse on the lake shore, are the largest works for the production of soda ash in the world, giving employment to more than 3000 hands.

The Syracuse region became known to Europeans through its salt deposits. Until several years after the close of the War of Independence, however, there was no settlement. Ephraim Webster, who built a trading-post near the mouth of Onondaga Creek in 1786, was the first white settler. At about 1788-1789 small companies began to visit the place every summer to work the salt deposits. In 1796-1797 there was a permanent settlement known as Webster's Landing, and in 1797 a settlement was begun at Salina, a short distance to the north on the lake shore. Geddes, another "salt settlement," was founded in 1803. In 1806 the "landing" received the name "Gogard's Corners," from the proprietor of a local inn. Between 1800 and 1805 a dozen families settled here, and in the latter year a grist mill, the first manufacturing establishment, was built on Onondaga Creek. A sawmill was built for the same settler, and a tannery, which had assumed control of the salt fields, sold to Abraham Walton of Albany, for $650, some 250 acres, embracing the district now occupied by Syracuse's business centre, to secure money for the construction of a public road. During the succeeding years the name of the place was frequently changed. It was called Milan in 1809, South Salina in 1809-1814, Cossitt's Corners in 1814-1817, and Cossitt in 1821-1824. In 1824 a post office was established, and as there was another office of that name in the state, the name was again changed, the present name being adopted. The village was incorporated in 1825, and the street plan of the settlement is still the same.

In the meantime the settlement had been growing rapidly. In 1818 Joshua Forman bought an interest in the Walton tract, had the village platted, and became the "founder" of the city. The first newspaper, the Onondaga Gazette, was established in 1823; and in 1825 the completion of the Erie Canal opened a new era of prosperity. In 1827 Syracuse became the county seat of Onondaga county. In 1834 Salina was united to Syracuse, and the city was chartered. Geddes was annexed in 1866. Syracuse has been the meeting-place of some historically minded Indians to take care of their interests, and in 1821 on which occurred the split between the "Barnburner" and "Hunker" factions of the Democratic party, began the Free Soil movement in the state. The strong anti-slavery sentiment here manifested itself in 1831 in the famous "Jerry rescue," one of the most significant episodes following the enactment of the Fugitive Slave Law of 1850; Samuel J. May, pastor of the Unitarian church, and seventeen others, arrested for assisting in the rescue, were never brought to trial, although May and two others positively admitted that they had taken part in the rescue, and announced that they would contest the constitutionality of the Fugitive Slave Law, if they were tried.

See Carroll E. Smith, Pioneer Times in Onondaga County (Syracuse, 1904).

SYR-DARYA (Gr. and Lat. Jazaries; Arab. Shash or Sihun), a river of Asia, flowing into the Sea of Aral, and having a length of 1500 m. and a drainage area of about 320,000 sq. m. Its headstream is the Naryn, which rises in the heart of the Tian-shan complex south of Lake Issyk-kul, on the southern slope (500 m.) of the Terski Alatau. The Naryn and its tributaries have another mountain stream, the Barskann, it flows W.S.W. In 1900, to 10,000 ft. above the sea, in a barren longitudinal valley between the Terski Alatau and the foothills of the Kokshal-tau. On entering a wild narrow gorge in the south-west continuation of the Terski Alatau it receives the name of Naryn. Within this gorge it descends some 4000 ft.; Fort Narynsk, 20 m. below the confluence of the Great and the Little Naryn, is only 6800 ft. above the sea. Here the river enters a broad valley—formerly the bottom of an alpine lake—and flows past the ruins of Fort Kurtka, for 90 m. westward, as a stream covering 2000 ft. lower than Kurtka, and the Keten-tube are spent. This gorge is characterized by a wide flat riverbed. Half an hour below, the river enters the broad entrance to the valley, where the river pierces the Mogol-tau.

On issuing from this gorge the Syr enters the Aral depression, and flows for 850 m. in a north-westerly and northerly direction before reaching the Sea of Aral. On this section it is navigated by steamers. Between the Irjar rapids and Balidyr-turgai (where it bends north) the river flows along the base of the subsidiary ranges which flank the Choktal Mountains on the north-west, and receives from the longitudinal valleys of these alpine tracts a series of tributaries (the Angren, the Chirchik, the Keles), which in their lower courses form the wide plains of land on the right bank of the Syr.

Some 50 m. below Chinaz (770 ft. above sea-level) the Syr bends northwards, but resumes its north-western course 150 m. farther down, following with remarkable persistency the edge of the loess. Its low banks, overgrown with reeds and rendered uninhabitable in summer by clouds of mosquitos, are inundated for 20 m. on both sides when the snows begin to melt. These inundations prevent the moving sands of the Kyzyl-kum desert from approaching the Syr; but the wind, however, does gain the upper hand. Down to Pervosk the river rolls its muddy yellow waters, at the rate of 3 to 5 m. an hour, in a channel 300 to 600 yds. wide and 3 to 5 ft. deep, and at Pervosk its critical section is 3580 sq. ft., and 322,500 ft. of water are discharged per second. The Arys and the Bugun are the only tributaries worthy of notice along this part of its course: the other streams which descend from the Kara-tau fail to reach the river. The Kirghiz rear numerous herds of cattle and

1 Syr and darya both signify "river," in two different dialects.
sheep in the valley of the Arys, while lower down, as Julek, the Iginch carry on agriculture. All this applies of course only to the right bank; on the left the moisture is absorbed by the hot winds which blow from the east, and it seems impossible for the climate of the atmosphere has marked effect upon the Syr when it gets below Julek, the Kara-kum sands then being on its right. Ten miles below Perovsk the river traverses a marshy depression (the bottom of a fault), and below Julek it finds its way into the Jaman-darya and the Kara-uyuk. The latter spreads out into marshes and ponds, from which it again issues to join the former at Karakamsch, after a course of 60 m. The main arm, owing to its shallowness and sinuosity, is very difficult to navigate, and the difficulty is increased by the rapidity of the current and the want of fuel. Between Kazalin and the Sea of Aral (138 ft.) navigation becomes possible, and a current of 5000 ft. per hour lasts for the last 10 m., where the river divides into three shallow branches before entering the "Blue Sea." All three have at their mouths sandy bars with only 3 ft. of water.

Two former right-hand tributaries of the Syr—the Chu and the Sary-su—now disappear in the sands some 60 m. before reaching it. The Chu, which is 600 m. in length, rises in the Tien-shan south-west of Lake Issyk-kul, and as the Kashkar flows towards Lake Issyk-kul, but a few miles before reaching that lake turns suddenly to the north-west, enters under the name of Chu the narrow gorge of Buam, and piercing the snow clad Kunghei Ala-tau, emerges on its northern slope having received in connection with the Talas-tau for the last 50 m., of not more than 50 m. In this part of its course it receives from the right the Kebin, whose high valley equals in size that of the lower Rhone. It then flows north-westwards through the valley of Pishpek, arrives at the northern sands of the Salt basin, and after traversing the part of the Caspian to the north before finally taking a western direction. Numberless streams flow towards it from the snow-clad Alexander Mountains, but they are for the most part lost in the sands before reaching it. The Talas is the only tributary of the Syr in its entire course in the highest part of that range, pierces the Cha-archa Mountains, and, flowing past Aulie-ata on the south border of the Muyun-kum, enters the salt basin of the Azbakan. At a distance of 14 m. below the reservoirs of the Saumkul-kul group of lakes, 60 m. from the Syr. Another elongated group of lakes—the Uzen-kul—near the above, receives the Sary-su, which has a length of nearly 570 m. and flows rapidly westwards along the western edge of the northern Famine Steppe (Bekpak-dala).

The delta of the Syr begins at Perovsk, whence it sends a branch to the south-west, the Jany-darya (New River), which formerly reached the south-eastern corner of the Sea of Aral, very near to the mouth of the Amu-darya. The Kirghiz affirm that a canal dug for irrigation by the Kara-kalpaks gave origin to this river. It had, however, but a temporary existence. A dam erected by the people of Kiewend at Ak-mechet (Perovsk) caused its disappearance, and the Russians found nothing but a dry bed in 1820. When the dam was removed the Jany-darya again reappeared, but it failed to reach the lake. It is said to have received the water of the Kyzyl-darya. It has a course of 250 m.; all traces of its bed were then lost in the sand.

Five centuries ago, in the time of Timur, the Mongol prince of Samar-kand, the Jany-darya brought the waters of the Syr to the Daoukara lake, where it is known as the Chottal-darya. Altough the river-beds in the Kyzyl-kum, which are still seen above Perovsk, indicates that the Syr had a constant tendency to seek a channel to the south-west, and that its present course is an accident for it might have reached the lake by a more northerly route if the low lands had not been already occupied by the existence of post-Pliocene marine deposits. (P. A. K.; J. T. Be.)

SYR-DARYA, or SYR-DARINISK, a province of Russian Turkestan, lying on both sides of the Syr-darya river, from its embouchure in the Sea of Aral up to Khjoteng, where it issues from the mountain region of the Tien-shan. The province is bounded N. by the provinces of Turgui, Akmolinsk and Semipalatinsk; E. by Semireychensk; S. by Ferghana, Zarafshan, Bokhara, and the Khorezm; and W. by the Caspian Sea. Its area (166,000 sq. m.), its population (over a million and a half) and the city of Tashkent make it the most important province of Russian Turkestan.

The south-eastern boundary runs along the Chotkal Mountains (14,000 ft.), which separate the river Chottal from the river Naryn, and join the Alexander Mountains on the east. A series of short chains, such as the Talas-tau and Ala-tau, fringe the above on the north-west, and occupy the south-east of the province. The snow-clad summits of the Talas-tau reach 14,000 to 15,000 ft. in altitude, and immense glaciers occur about Manna Mountain. These mountains seem to have been the outlet of ancient glaciers, having crossed the Tien-shan from its northern to its south-east; the other flanking chains have a decidedly south-western direction, and are much lower, the outlying ranges having rather the character of broad plateaux above 2000 ft. in altitude. They belong therefore to another series of upheavals prevalent in western Asia, to which Richthofen has given the name of the "Kara-tau series." Its length is about 270 m., and its average altitude about 7000 ft.

The Julek-darya is supplied by the Syr-darya from the river Chu, and its gentle south-western slope contains the sources of a multitude of streams which water the oasis around the town of Turkestan. The mountainous tracts occupy, however, only a small part of Syr-darya, the rest is steppe. Three different areas must be distinguished—the Kyzyl-kum, the Muyun-kum or Ak-kum, and the Kara-kum. The Kyzyl-kum (red sands) sands stretch between the Angir and the Syr, and have a gradual ascent from 160 ft. at the Sea of Aral to 1500 and 2000 ft. in the south-east. They are partly shifting, partly stationary (see KARA-KUM). In the west the southern boundary of the Kyzyl-kum is approached the steppe assumes another character: a thick sheet of loose girdles the foothills and forms the fertile soil to which Turkestan is indebted for its productive fields and gardens. The southern boundary of the Kara-kum and the northern part of the Sea of Aral, are manifestly a former bottom of the lake.

In the east the steppe yields some vegetation and is visited by the Kirghiz. The barkhans do not shift, being covered with Callitomon, Tamarisk, and Salvia. The same is the case of the Turkestan Grasslands. The highest steppe, between the Kara-tau Mountains and the Chu River, is quite uninhabited, except in the loess region at the northern base of the mountains, for the geological history of the western Tien-shan resembles that of the Tien-Shan. Throughout the Cretaceous and earlier Tertiary periods the lowlands of Syr-darya were under the sea. The character of the region during the post-Pliocene period remains uncertain. A great part of the Caspian region encircles all the mountain tracts, increasing in extent in both and at the lower end of the valley of Ferghana. It seems certain that during the Lacustrian period the Caspian was connected by a maximum, and the Aral basin, which was then much larger, we another inland sea of great dimensions covered the present Balkash basin, and at an earlier period may have been connected with the Aral basin. Recent traces of these basins are found in the

The chief river of the province is the Syr-darya (q.v.). The river flows through the western side of the Sea of Aral, and numerous small lakes are formed along its course. The few lakes that have belts of alpine character occur in the valleys of the hilly tracts.

The climate of the province varies greatly in its different parts. It is most severe in the mountain region, and in the lowlands it is very dry. The temperature of the summer is high, and the winter very cold. It is said that the temperature of the winter remains 7 F. in the sheltered tracts is severe for three months. The average yearly temperature at Tashkent and Kazalinsk respectively is 58-3° and 46-4° (January, 29° and 12°; July, 77-5° and 78°). The terraces of loess mentioned above are alone available for cultivation, and according to less than 1% (8-5) of the total area of the province is under crops, the remaining being either barren pasture land (49%), or waste land (45%). The few cases where cultivation is possible, it is carried to great perfection owing to a highly developed system of irrigation—two crops being gathered every year. Wheat and rice are grown first in the spring, and corn and barley in the autumn. Rye and oats are grown only about Kazalinsk. Cotton is cultivated. Gardening is greatly developed. Sericulture is an important source of income. Livestock breeding is largely pursued, not only by the nomads but by the settled population. Fishing is prosecuted to some extent on the lower Syr. Timber and firewood are exceedingly dear.

The population of the province was estimated in 1866 at 1,779,000. It is increasing rapidly, and in 1877 was 2,406,000. The Russians barely 8500, if the military be left out of account. Kirghiz (50%) and Sarts (9-8%) are the main elements of the population, with Uzbegs (4-3%) and Turkmens (4-1%). The chief languages spoken are in the Hindis. The principal occupations of the Sarts, Uzbegs, Tajiks and settled Kirghiz are agriculture and gardening, but the Kirghiz lead chiefly a nomadic pastoral life. Manufactures are principally the making of cotton and woolen goods. A large variety of petty industries are practised in the towns and villages.

Syr-darya is divided into six districts, the chief towns of which are Tashkent, Aulie-ata, Kazalinsk, Perovsk, Chimkent and Amu-darya.

(P. A. K.; J. T. Be.)
SYRIA, the name given generally to the land lying between the easternmost shore of the Levantine Gulf and a natural inland boundary formed in part by the Middle Euphrates and in part by the western edge of the Hamâd or desert steppe. The northern limit is the Tauric system of mountains, and the southern limit the edge of the Sinaitic desert. This long strip extends, therefore, for about 400 m. between 38° and 31° N. lat. with a mean breadth of about 150 m. Since, however, the steppe edge on the east is somewhat indefinite, some early Moslem and other geographers have included all the Hamâd in Syria, making of the latter a blunt-headed triangle with a base some 700 m. long resting on the north Arabian Nefud. But Strabo, Pliny and Ptolemy, as well as the better Moslem geographers, drew the eastern frontier obliquely from the Gulf of Akeba to Rakka (Raqqâ) on Euphrates, and thus placed the Hamâd in Arabia.

The name Syria is not found in the Hebrew original of the Scriptures; but it was used by the Septuagint to translate Aram. Homer knows only "Aram", but Herodotus speaks of "Syrians" as identical with Assyrians, the latter being, he thinks, a "barbarian" form, and he applies the name very widely to include, e.g. north Cappadocians ("White Syrians" of Pteria). Syria, however, is probably the Babylonian Sûri, used of a north Euphratean district, and a word distinct from Assyria. Generally the ethnic term, Syrians, came to mean in antiquity the Semiti peoples domiciled outside the Mesopotamian and Arabian areas: but neither in pre-Greek nor in Greek times had the word Syria any very precise geographical significance, various lands, which we include under it, retaining their distinctive status, e.g. Commagene (Kummukh), Cynœstica, Phoenicia, Palestine, &c. It is

only under the Graeco-Roman administration that we find a definite district known as Syria, and that was at first restricted to the Orontes basin. Later, all that we understand by Syria came to be so known officially to the Romans and Byzantines; but the only province called simply Syria, without qualification, remained in the Orontes valley. Under the present Ottoman distribution "Syria" is the province of Sham or Damascus, exclusive of the vilayets of Aleppo and Beirut and the sanjak of Lebanon and Jerusalem, which all fall in what is called Syria is the wider geographical sense.

Taking Syria as the strip limited by the sea, the edge of the Hamâd, the Taurus and the Sinaitic desert, we have a remarkably homogeneous geographical area with very obvious natural boundaries; but these, for various reasons, have proved very ineffective in history, especially on the south and east. Syria happens to lie on the line of least resistance for communication between the early subtropic seats of civilization in the Nile and Euphrates valleys and the civilizations of Europe. Its eastern boundary is in great part a steppe, which breeds population, but, unable to nourish increase, sends it over its boundaries in a constant stream of migration. Consequently south Palestine has been continuously "Arabized"; and indeed the whole of Syria has been characterized by racial and religious fusions, and by civilization of a singularly syncretic and derived kind, of which the ancient Phoenician is a sufficient example.

The surface configuration of almost all the strip is remarkably uniform. With the exception of the extreme north (Commagene), which is shut off by a barrier of hills and belongs to foreign hydrographic systems, the whole country is roughly a gable-shaped plateau, falling north and south from a medial ridge, which crosses Syria at about its central point. This gable is tilted eastwards, and its two long slopes are defined by bordering mountain chains
which run across its medial ridge; the main Syrian streams are those which follow those slopes between the chains, thus running either north or south. The other courses, and only finding their way to the western sea by making sharp elbows at the last. Syrian orography, therefore, is simple, being composed of nothing but these two parallel systems. That on the west, which rises behind the Medes and descends to the Mesopotamian valleys, is called the Euphrates; its main tributaries are the Tigris, the Assur, the Khabur, the Khabur, and the Kasr El-Abyad. On the east, the mountain chains in addition to the Medes, there remains a large area, in which, in most cases the eruptions appear to be of Pliocene or later date, but in the extreme north some of the basalt seems to belong to the Miocene and the youngest Cretaceous formations. These basaltic areas are, indeed, very probably the continuation of the Jordan-Anna trough.

The eastern system springs from the Tauric outflow (Kurd Dagh, &c.), which shuts off the Commagenean basins, and as the triple chain of j. Al, it defines the Orontes valley on the east. Like its western parallel it springs up presently into a higher chain, and is known as j. es-Sharki, or Anti-Libanus, which culminates in a knot on the south, to which is given the name j. es-Shelih, or Hermon (8000 ft.). Thereafter it loses much of its distinctive character, but may be traced southwards in j. Hauran and the Moabite hills to Horeh and the Midianite mountains of the Hebrews, which may be called the Anti-Lebanon.

Hydrography.—Between these systems run the main rivers; and these naturally rise near the medial ridge, in the lacustrine district of el-Buk’a, or Cadesyria, and flow in opposite directions. The only tributaries of the meteorologically remarkable stream, into which, when it has turned sharply towards the sea, flow some tributary streams from the Commagenean divide on the north. The main stream flowing south is the jordan, which fails to reach the sea, having been trapped by the barrier ofone of the small streams, the North Litan (called Kasmiya in its lower course), whose source lies very near that of Jordan, repeats the course of the Orontes on a minor scale and gets through the western mountain system to the near Syrian coast. Outside the basins of these rivers a few bordering mountain systems there only remain to be considered: (1) The Mediterranean littoral strip (the ancient Phoenician coast); (2) the mountains in the west of the district in the extreme north, ancient Commagene, which consists of two basins divided by a low ridge running from south to north. These basins belong, one to the Cilician river-system, and the other to the Euphrates.-Als. The first lay the ancient Germanic vast district (mod. Marash); in the second the ancient Samosata (mod. Samasat), whose importance has now passed to Adiyanam. The southern boundary of both basins is a low chain which leaves the Euphrates near the mouth of the Tigris, and runs north towards and across the great plain of Mesopotamia, to which it is linked by a sill whereon stood the ancient fortified palace of Samal (Sinjer; see HITTITES). (3) A succession of oases lying eastward from the Mediterranean littoral towards the Jordan, fed by short local streams. Of these the most important are, from north to south, (a) the Saltpan of Jebell, fed by the North el-Dahab; (b) the oases of Kinneria and Aleppo, fed by the North Kawaik; and (c) the oases of Su Harb and Sarthe, which are fed by the Barada (Abana) and the Awn (Pharab) the chain.

Since these streams had in no case originally easy access to the sea, we naturally find lakes on their course, and several of them terminate in tracts of more or less permanent inundation. Those which occur on the course of the principal rivers are described under ORONTES and JORDAN. The others, which terminate streams, are the three goer el-Aatiba, which receives the waters of Damascus; the Mur which into the kwaiik flows below Kinnserin; and the Ak Deniz, or Baharat Antakia, the ancient Lake of Antioch, which collects the waters of the Karu Sa and Afrin, the southward from the watershed on this northern side of the Great Plain. The lake has been almost entirely dried up by the cutting of a channel, which conducts its feeders directly to the Orontes.

Geology.—Geologically, Syria belongs to two distinct regions of the earth. The first are the littoral deposits, which are usually a great belt of folding of southern Europe and central Asia, and the southern and larger portion belonging to the Indo-African area, which, though often faulted, is usually free from crumbling. A parallelism of the two courses between these deposits and the littoral region which runs from the Bay of Jebele along the Afrin River to Antab and thence to the Euphrates above Birejk. In the southern region which is by far the better known, the oldest rocks are granites, clefts, and metamorphic rocks, often overlaid by conglomerates, tuffs, sandstones and arkoses, which perhaps do not all belong to the same period. In Palestine a lime- stone formation, Carboniferous fossils is found in the midst of the sandstone series. These formations are overlaid by limestones with Hippurites and other fossils belonging to the Upper Cretaceous. Further north, however, Jurassic beds are met with, but of very limited extent. Cretaceous limestones cover the greater part of Palestine and rocks of the same period form Mt Lebanon, the Casius Mons, &c., farther north. Nummulitic limestones also occur on the southern coast, and, with the Lebanon Eocene and Miocene deposits cover the greater part of the country. The Pliocene deposits are not very widely spread and are generally of fresh-water origin excepting near the coast, but marine Pliocene deposits have also been described. Professor J. A. Jelbel Haun, east of the Jordan, is capped by a great sheet of basalt; and many other basalt flows are found, especially in the country of Lebanon. They are mostly true lichen basalt, which in addition to the felts, and in the extreme north some of the basalt seems to belong to the Miocene and the youngest Cretaceous formations. These basaltic areas are, indeed, very probably the continuation of the Jordan-Anna trough.

The faulting which formed the depressions is certainly later than the deposition of the Cretaceous beds and probably belongs to the later portion of the Tertiary era. Little is known of the part of Syria which lies within the folded belt, and includes the Amanus and Kurd mountains. The rocks do not appear to come very markedly from those farther south, but the Devonian is believed to be represented. The folds are approximately parallel to those of the Taurus, and geologically these mountains may be said to belong to that range.

Climate.—Within broad limits the climate, and with it the productivity of the country, cannot have greatly changed; at most the precipitation may have been greater, the area under wood having been more extensive. Except for Jerusalem, we have hardly any data for the ancient Mediterranean littoral. Elsewhere the temperature is about 63° F.; in Beirut it is about 68°. The rainfall in Jerusalem is 36-22 in., in Beirut 21-66. The heat at Damascus is 80° in July, 50° in January, and the mean temperature is about 69°. The sky is continuously cloudless from the beginning of May till about the end of October; during the summer months the nights as a rule are dewy, except in the desert. Rain is brought by the west winds from the south, which, like the African trade-winds, are light and without violence. On the other hand, an ozoniless east wind (sirocco) is occasionally experienced—especially during the second half of May and before the beginning of the rainy season—which has a prejudicial influence on both animal and vegetable life. On the whole the climate of Syria—if the Jordan valley and the moister districts are excepted—is not unhealthy, though intermittent fevers are not uncommon in some places.

The general character of the country, resultant on these conditions, varies according to elevation and latitude. Owing to the high barrier which slants off almost all Syria from the sea, and precipitates the great northward currents mainly on the land, northern Syria is very productive without irrigation, except the narrow littoral strip which was the ancient Phoenicia, and the small deltas, such as that of the Orontes (mod. Hadchita). Jordan-Araba, which is a comparatively large general rainfall, would be still a land "flowing with milk and honey" had its forests not been destroyed, and the terracing, which used to hold up soil on the highlands, been maintained. As it is, it has very fertile patches of lowland, such as the plains of Edraclon and Jaffa; and the high levels, largely composed of disintegrated igneous rock, west of Jordan, over which the sea- wind carries the rains, offer excellent corn-land. In the extreme south, Palestine begins to be affected by the Arabian dryness. For the rest, Syria needs irrigation; and since neither of its larger rivers, Orontes or Jordan, flowing as these do in deep, beds, is of much use for this purpose, all Mid-Syria, except the basaltic regions along the Jordan, is a region mainly occupied by pastures, and yielding only thin cereal crops. Commagene, where not rocky, and the district lying along the southward drains from its divide (anc. Cyryhenes), is in better condition. There is a perennating stream, the upper part of which is fed by rains, and late into the basin of the Taurec rainfall. The latter drains away over the plains east and south-east of Aleppo, making them afford good spring pasture, which has attracted the nomads from farther south; but in the altitude of 1000 ft. the El Nisbar, instead of running up into the high- rate. As it is, it has very fertile patches of lowland, such as the plains of Edraclon and Jaffa; and the high levels, largely composed of disintegrated igneous rock, west of Jordan, over which the sea- wind carries the rains, offer excellent corn-land. In the extreme south, Palestine begins to be affected by the Arabian dryness. For the rest, Syria needs irrigation; and since neither of its larger rivers, Orontes or Jordan, flowing as these do in deep, beds, is of much use for this purpose, all Mid-Syria, except the basaltic regions along the Jordan, is a region mainly occupied by pastures, and yielding only thin cereal crops. Commagene, where not rocky, and the district lying along the southward drains from its divide (anc. Cyryhenes), is in better condition. There is a perennating stream, the upper part of which is fed by rains, and late into the basin of the Taurec rainfall. The latter drains away over the plains east and south-east of Aleppo, making them afford good spring pasture, which has attracted the nomads from farther south; but in the altitude of 1000 ft. the El Nisbar, instead of running up into the high-
up to the Arab invasion, the northern part of the eastern plateau, between the Ores and the Euphrates, was made habitable and, even fertile by storage of rainwater. At this time numerous hill-gardens, cities, and small towns, whose remains are remarkably well preserved, and still serve to shelter a sparse pastoral population.

In the Trans-Jordan region of modern Syria, that of the Mediterranean and that of the west Asian steppe-land, the first, to be seen on the coast and the western slopes of the ranges, is characterized by a number of evergreen shrubs with small leathery leaves, a sub-tropical vegetation. Among cultivated crops, the dates, wheat, barley, and the olive, are grown in great abundance in the Mediterrean basin. Among the higher mountain ranges, the Jordan valley, is characterized by a number of evergreen shrubs, with small leaves, characterized by their fine, and the dark and dry character of its roots, and great poverty in trees. Between these regions the greatly depressed valley of Jordan itself, one of the出差s
to the sea, is the lowest of the high plateau ridge, is distinguished by the variety of its species, the dry and arid nature of its shrubs, and great poverty in trees. Between these regions the greatly depressed valley of Jordan itself, is the lowest of the high plateau regions, and a region of extreme temperatures. The whole coast of Syria, is at home throughout Syria, except on the steppe; the mulberry is planted extensively in the lower Lebanon; and all sorts of fruits trees flourish in irrigated gardens, especially on the Phoenician coast, in the Palestinian plain, in the oasis of Damascus, and in the Buka'a.

The main cereal regions are the Hauran, and the plains of Antioc and Commagene; and the lower western slopes of the coast range are largely devoted to the culture of tobacco. On the northern inland down liquorice grows wild and is collected by the peasants and sent down to Alexandretta.

Fauna.—The mammals of Syria are rather sharply to be distinguished in those which range the northern part of Mt Carmel, and those which pass that limit. The first class includes the isabelline bear, badger, pole-cat, ermine, roe and fallow deer, wild ass, Syrian squirrel, pouched mammoot, goral, and leopard. The second class which ranges under Palestine; and it includes a sub-class which is not found outside Palestine at all. In the latter are the mule, jerboa, several small rodents and the ibex. Only in the Jordan valley do intrusions from the Ethipia region appear. Elsewhere the forms are Palearctic with intrusions from the east; but the length of the Syrian strip and the variety of its surface relief admit of considerable difference in the species inhabiting different districts. The Lebanon and the hills of north Galilee offer the greatest number of mammals.

Population.—The actual population of Syria is over 3,000,000, spread over a superficial area of about 600,000 sq. m., i.e. about 5½ persons to the square mile. But this poor average is largely accounted for by the inclusion of the almost uninhabited northern steppe-land; and those parts of Syria, which are settled, show a much higher figure. Phoenicia and the Lebanon have the densest population, over 70 to the square mile, while Palestine, the north part of the western plateau east of Jordan, the oases of Damascus and Aleppo, the Orites valley, and parts of Commagene, are well peopled. The bulk of the population, so far as race goes, is of the Semitic family, and at bottom Aramaean with a large admixture of immigrant Arabian blood, which is constantly being reinforced, and a comparatively small strain of Hebrew blood. The latter appears mainly in Palestine, and has of late been considerably strengthened by immigration of European Jews, who have almost doubled the population of Jerusalem, and who are now the chief inhabitants of the Holy Land. But how far these, or the indigenous " Jews " are of Hebrew rather than of Aramaean origin is impossible to say. We only know that as long ago as the 1st century B.C. true Hebrew blood was becoming rare, and that a vast proportion of the Jews of Roman times were Hebraized Aramaeans, whose assimilation into the Jewish community did not much follow back than the Maccabean age.

Among this Semitic folk is to be observed a great variety of immigrant stocks, settled in isolated patches, which have done much to enrich the Syrian flora, and to infuse a certain " range " (Commagene) the highlands are almost entirely held by Kurds who entered from beyond Euphrates in comparatively recent times. Kurds live upon the Commagenean plains here and there, as also in the northern trans-Euphratean plains. Among them are the Tauras and Amanus, and outnumbering them on the plains, are Armenian communities, the remains of the Rupienian Invasion of the 10th century A.D. (see Zeitun). These are found as far south as the plain of Antioc and the basin of the Sajur. To the north of Aleppo and Antioc live remnant of pre-Aramaean stocks, mixed with many half-settled and settled Turkmans (Vuraks, Asvars, &c.) who came in before the Mahommedan era, and here and there colonies of relatively imported Circassians. The latter are also settled numerously to the west of Jordan. Mid-Syria shows a medley of populations of more or less mixed origin, in large part alien, for which see Druses; Maronites and Lebanon. In the Phoenician coast towns are many Greeks (to be distinguished from Orthoodox Syrians, called also Greeks on account of creed). In the steppe-land also, the southem trans-Jordanian districts are numbers of true Arabs, mostly belonging to the post-semitic family, which has been coming northwards from Nejd in detachments since the 13th century. These are mainly nomadic, and include offshoots of the great tribes of Rual, Wallad Ali, B. Sokhr, Adwan and Bishr, the first two roaming mainly in the north, the last two in Moab and Ammon. Ottoman Turks, scattered gipsy communities, German settlers in north Palestine, and all sorts of Europeans make up a heterogeneous and incompatible population.

Religion.—The religious types also are strongly divergent. The bulk of the population is Mahommedan; the Bedouins have not much religion of any kind, but they profess Islam. Besides orthodox Moslems there are also Shi'ite sects, as well as a number of religious communities whose doctrine is the outcome of the process of fermentation that characterized the first centuries of Islam. To this last class belong the Ismailites (Assassins), q.v., Metawali, Nosairis, Ansarish, and especially the Druses (q.v.). In many cases it is obvious that the political antipathy of the natives to the Arabs has found expression in the formation of such sects. The Ansarish, for instance, and the Druzes also, have been the abettors of Ottoman enterprises, and the Druzes in particular have been extremely beneficial. The Catholic mission has done very good work in what relates to schools, institutes and the diffusion of literature. The Christians constitute the educated portion of the Syrian people; but the spirit of rivalry has produced stimulative effects on the Mahommedans, who had greatly fallen away from that zeal for knowledge which characterized the earlier centuries of their faith.

Language.—The language throughout southern and middle Syria as high as Killis is Arabic, which has entirely ousted Aramaic and Hebrew from common use, and tends to prevail even over the surviving fragments of the Syrian dialects. The last remnants of Aramaic are to be sought in certain mountainous villages of Anti-Lebanon, and in the Syriac known to the clergy. From the upper Sajur northwards Turkish prevails, even among the Armenians; but many Kurdish communities retain their own tongue.

Government.—The political status of the country is controlled by the Ottoman Empire, of which Syria makes part, divided into the vilayets of Aleppo, Sham or Syria (Damascas), the Lebanon (q.v.) and Beirut, and the separate sanjas or mut tessariffs of Zar and Jerusalem. Ottoman control is imperfect in Lebanon, the Houran, and over the Armenian mountain region of Zeitun and over the eastern steppe-lands, whose nomadic populations can withdraw themselves out of reach. But considerable success has been achieved in inducing the Syrian Arabs to settle and in supplying a counteracting influence to their unrest by the establishment of agricultural colonies, e.g. those of the Circassians in Bashan, Ammon and Moab.

Communications are still very imperfect, but have been greatly improved of late years. Railways run from Beirut to Homs, Hama, (Aleppo and Damascus, q.v.), and to the latter also from Haifa (Turkish). From the termination of the Damascus-Mezib railway a line (the " Mecc a railway ") has been laid by Ottoman enterprise east of Jordan to the southern limit of Syria and beyond. From Jaffa a short line runs to Jerusalem, and a
SYRIA

Something about the ancient political and geographical rela
tions of Syria can be gleaned from Egyptian sources, especi
ally those connected with the campaigns of Tethmosis III.

In the west, the Aramaeans were often referred to as "Amu.
Syria up to and beyond the Euphrates is called more precisely "Sahí
(Sahí)

were considered to be a part of the same territory. Occasionally
Palestine with Coele-syria is called Upper Rutenus, as distin
guished from Lower Rutenus extending to the Euphrates; (2)
the land of the Kheka (sometimes reckoned as belonging to Rutenus
Palestine and the Euphrates) is called Khetab in the

period; (3) Nahatina, the land on both sides of the Euphrates
(extend, strictly speaking, beyond the Syrian Limits).

The Canaanites in general are called Khara. From these lands
the Egyptian kings often derived rich booty, so that in those
days Syria must have been civilized and prosperous. Moreover,
we possess enumerations of towns in the geographical lists
of the temple of Karmak and in a hieratic papyrus dating about
200 years after Tethmosis III. Some of these names can be
readily identified, such as Aleppo, Kadesh, Sidon, and the

or "Sahí."

Palestine and the Euphrates (the area hitherto known as "Syria"

been inhabited from a very early period. Within historic times
a great number of different nationalities have fought and settled
within its borders, the majority belonging to the Semitic stock.

This last circumstance has rendered possible a considerable
degree of fidelity in the tradition of the oldest local names. After
the Aramaeans had absorbed what remained of the earlier
populations, certain of whom they themselves, were powerfully
influenced by Graeco-Roman civilization, but as a people they still retained
their Aramaean speech. Of the political relations of Syria in
the most ancient times we know but little. Each town with its
surrounding district seems to have constituted a small separate
state; the conduct of affairs naturally devolved upon the noble
families. In the latter part of the 16th century B.C., all north
Syria fell under the Cappadocian Hatti domination. The south
Syria was known to Sargon of Akkad (Agade) as Ammon
and was visited by his armies. This is known as the Canaanite
period. Relations were not prosperous in this region. By the very
early period—as early probably as the 16th century B.C.—Syria
became the meeting-place of Egyptian and Babylonian elements,
resulting in a type of western Asiatic culture peculiar to
itself, which through the commerce of the Phoenicians was
carried to the western lands of the Mediterranean basin.

Industry especially attained a high state of development; rich garments
were embroidered, and glass, pastes, faience, etc., were manufac

tured. The extant inventories of spoil carried off by the ancient
conquerors include a variety of utensils and stuffs. The influence
exercised at all times on Syrian art by the powerful neighboring
states is abundantly confirmed by all the recent findings, which,
in addition to our previous knowledge, show the action of the
Aegian culture on Phoenicia and Palestine. The Syrians
were more original in what related to religion; every place, every
tribe, had its "lord" (Ba'al) and its "lady" (Ba'alat); the latter is
generally called 'Ashar or 'Ashartet (i.e. Ishtar, Astarte).

Besides the local Baal there were "the god of heaven"
(El) and other deities; human sacrifices as a means of propitiat-
ing the divine wrath were not uncommon. But in the Syrian
mythology foreign influences frequently betray themselves.
Various religious rites of the Phoenicians are also a matter of fact,
not merely that Syrian culture ultimately spread extensively towards
the West, but that the Syrians (as is shown by the inscriptions of
Teima, &c.) long before the Christian era exercised over the
northern Arabs a perceptible influence which afterwards, about
the beginning of the 1st century, became much stronger through
the kingdom of the Nabataeans. The art of writing was
derived by the Arabs from the Syrians.
inland Syria remained comparatively peaceful first under its own local governors, and, after Darius, as a satrapy, till its subjugation by Alexander. Alien domination alone has been able to correct the tendency of this long strip of land to break up into hostile blocs.

The foundation of numerous Greek cities shortly after Alexander's time was of great importance for Syria (see e.g. Antioch). Their situation along the main route of communication of the Orient, and their foundation on both sides of Jordan, and, for the Maccabean revival, would have absorbed the Jews. The Seleucidae had severe struggles with the Ptolemies for the possession of the southern part of Syria.

After having been reckoned for a short time (from 83 to 69 B.C.) among the dominions of Tigranes, king of Armenia, the country was conquered for the Romans by Pompy (64–63 B.C.). It is impossible here to follow in detail the numerous changes in the distribution of the territory and the gradual disappearance of particular dynasties which maintained a footing for some time longer in Chalcis, Abila, Emesa and Palestine; but it is of special interest to note that the kingdom of the Arab Nabataeans was able to keep its hold for a considerable period on the north as far as Damascus. In the year 40 B.C. Syria had to endure a sudden but brief invasion by the Parthians. The country soon became one of the most important provinces of the Roman Empire; its proconsulship was from the first regarded as the most desirable, and this eminence became still more marked afterwards. Antioch, adorned with many sumptuous buildings, as the chief town of the provinces of Asia, became in point of size the third city of the empire and an eastern Rome. The high degree of civilization then prevailing in the country is proved by its architectural remains dating from the early Christian centuries; the investigations of De Vogüé, Butler and others, have shown that from the 1st to the 7th century there prevailed in north Syria and the Hauran a special style of architecture—partly, no doubt, following Graeco-Roman models, but also showing a great deal of originality in details.

The administrative divisions of Syria during the Roman period varied greatly at different times. Hadrian made three provinces of Syria, Syria Phoenice and Syria Palaestina. At the beginning of the 5th century we find the following: (1) Syria Euphratensis, which had for its capital Hierapolis (q.v.). (2) Syria I., or Coele-syria, having Antioch as its capital. The name Coele-syria (ἡ κολὴ Συρία), no doubt, was applied originally to the valley ("hollow") between Lebanon and Anti-Lebanon, but was afterwards extended to the district stretching eastwards from the latter range. (3) Syria II., or Syria Salutaris, with Apamea as capital. (4) Phoenicia Maritima; capital, Tyre; (5) Phoenice ad Libanum; capital, Emesa (Homs). To this division Damascus and Palmyra belonged, but nowadays they are often reckoned to Coele-syria, the middle strip of coast being designated Syrophoenicia. (6, 7, 8) Palestina I., II. and III. (9) Arabia (capital, Bostra), which embraced all the region from the Hauran to the Amon, and skirted the Jordan valley, stretching southwards to Petrae. Through the kingdom of the Nabataeans Roman influence penetrated from Syria far into northern Arabia.

In 616 Syria was subjugated for a brief period by the Persian Choroes II.; from 622 till 628 it was again Byzantine; 626 and the immediately following years saw its conquest by the Mahommedans (see CALEPHATE). Moawiya, the first Omeyyad caliph, chose Damascus for his residence; but in 750 the capital of the empire was removed by the Abbasids to Baghdad. Under the early caliphs the Arabs divided Syria into the following military districts (γονάδα). (1) Fílistin (Palestine), consisting of Judaea, Samaria and a portion of the territory east of Jordan; its capital was Ramleh, Jerusalem ranking next. (2) Urđam (Jordan), of which the capital was Tabarija (Tiberias); roughly speaking, it consisted of the rest of Palestine as far as Tyre. (3) Damascus, a district which included Baalbek, Tripoli and Beirut, and also the Hauran. (4) Homs, including Hamath. (5) Kinnésrin, corresponding to northern Syria; the capital at first was Kínnesrin (Qinsairin) to the south of Haleb (Aleppo), by which it was afterwards superseded. (6) The sixth district was the military frontier (αὐδασμόν) bordering upon the Byzantine dominions in Asia Minor. During the struggles of the Mahommedan dynasties for the possession of Syria the country still enjoyed a considerable degree of prosperity.

In the crusading period the kingdom of Jerusalem, whose rulers were never able to establish a foothold to the east of the Jordan, extended northwards to Beirút; next to it lay the countship of Tripolitania, which was lost to the Turks in 1516. In 1516 Syria suffered severely from the Mongol invasions (1260), and it never recovered its former prosperity. In 1516 the Ottomans took it from the Egyptian Mamelukes. For its subsequent history, see TURKEY: History. Its medieval importance as an intermediary of trade between Europe and the East was greatly impaired by the opening of the Red Sea route, and finally abolished by the Suez Canal; and Syria is at present important mainly for the sentimental reason that it contains the holiest places of Judaism and Christianity, and for the strategic reason that it lies on the flank of the greatest trade-route of the eastern hemisphere.

SYRIAC LANGUAGE. Syriac is the eastern dialect of the Aramaic language which, during the early centuries of the Christian era, prevailed in Mesopotamia and the adjoining regions. Its main centres were at Edessa and Nisibis, but it was the literary language of practically all the Christian writers in the region east of Antioch, as well as of the Christian subjects of the Persian empire.

All the Semitic languages1 are built up from triliteral roots: that is, the great majority of the words are derived from a simple verbal form, of which the essential elements are three consonants. This form is seen in the 3rd pers. sing. perf. of the verb, e.g. אב "he was born" = נב or רב which corresponds to Heb. נטול and Arab. qatala. The vowels play no part in differentiating the roots, for the vowels are practically the same in the corresponding forms of every root. The form qēlāl illustrates one main peculiarity of Aramaic, as opposed to the other Semitic languages, viz. its paucity of vowels: for where Hebrew has two full vowels—a long and a short—in qēlāl, and Arabic has three short vowels in qatala, Aramaic has only one short vowel, the sound ʿ, between q and ā being merely a half vowel which is not indicated in Syriac writing. Another chief characteristic of Aramaic appears in nouns, viz. the entire absence of a prefixed definite article. Aramaic gives to the noun instead an ending ʿ, 1 On the place of the Semitic languages among the Semitic languages, and of Syriac among the various dialects, see SEMITIC LANGUAGES.
SYRIAC LITERATURE.

making the so-called "emphatic" state. In the older Aramaic dialects this is used exactly as the noun with prefixed article is used in other languages; but in Syriac the emphatic state has lost this special function of making the noun definite, and has become simply the normal state of the noun. The other grammatical distinction between Syriac and all the west Aramaic dialects is that in Syriac the 3rd person of the imperfect (singular and plural) of the verb begins with n, but in west Aramaic, as in the other Semitic languages, it begins with y.

When, in the 5th century A.D., owing to theological differences the Syriac-using Christians became divided into Nestorians or East Syrians and Jacobites (Monophysites) or West Syrians, certain differences of pronunciation, chiefly in the vowels, began to develop themselves. The East Syrians in most cases kept the more primitive pronunciation of the old Semitic d with the vowel e, but the Jacobites passed into o. One very tangible difference appears in the fact that the name Jesus was by the East Syrians written and pronounced Isho', by the West Syrians Yeshô.

The Syriac alphabet, which derived its letters from forms ultimately akin to those of the Old Hebrew and Phoenician alphabets, has the same twenty-two letters as the Hebrew. And as in Hebrew, the six letters ã g ð õ ÷ t are aspirated when immediately preceded by any vowel sound. On the other hand, the guttural letters affect the vowel, and the vowel affects their chief effect, and that is to change the preceding vowel, if other than a or ò, into a, but even this is not always the case. The vowels, which are ten in number (ā ã ē ī ī ō ō ñ ŏ ŕ), were, as usual in the Semitic languages, indicated only partially by the use of consonants as vowel-signs and by means of certain diacritical points, so long as Syriac remained a living language. But about the time when it began to be supplanted by Arabic, two systems of vowel-signs were invented, one for the West Syrians, who borrowed the forms of Greek vowels, and the other more elaborate for the East Syrians, who used combinations of dots. Nevertheless the system completely differentiates long and short vowels; the Nestorian scheme is the more satisfactory, though more cumbrous.

Where the same root exists in Arabic, Syriac and Hebrew, its fundamental consonants are usually the same in all three languages. But letters belonging to the same group occasionally interchange. As regards the dentals and sibilants there are one or two rules which govern the interchange, in the manner of a Grimm's Law. (1) Where Arabic has an ordinary dental, Syriac and Hebrew have the same; but where Arabic has an aspirated d (e.g. ð), Syriac has an ordinary dental, Hebrew a silent ð. (2) Hebrew has one more sibilant than Arabic or Syriac: thus, as corresponding to s (sâmêkh), s (sin) sh in Hebrew, Arabic has only s (sin) sh, while Syriac has a different pair s (sâmêkh) sh. Hebrew sômêkh is represented by Ar. sûn and Syr. sâmêkh; but Heb. sûn (Syr. sâmêkh) is represented by Ar. sûn, while Heb. and Syr. sh is represented by Ar. sin. As regards this crossing of s and sh, Arabic has with it the other south Semitic language, Ethiopic: the evidence as to the other north Semitic language, Assyrian, is conflicting.

In vowel-sounds Syriac is clearly more primitive than Hebrew (as compared with other Eastern languages) least of all Arabic. Thus Ar. and Syr. a is often thinned in Hebrew into i (i when accented), as in the first syllable of Ar. qattalâ = Syr. qattal = Heb. qattâl. But the second syllable of the same word shows Syriac siding with Hebrew against Arabic. Again the primitive ð of Arabic is in the older (Nestorian) pronunciation of Syriac maintained, while in Jacobite Syriac and in Hebrew it passes into ð: thus Ar. qattal Nestorian qattâl = Jacobite and Hebrew qattâl. Again Syriac.

1 It may indeed be remarked that Syriac, which is generally more primitive in its sounds than Hebrew, shows a more advanced stage of weakening as regards the gutturals: thus in a good many forms it has substituted ðelf for initial ð, and often shows a closer for the presence of two gutturals in the same word, weakening one of them to ðelf. A much more advanced stage of weakening is seen in some of the other dialects.

2 With regard to this, Syriac has one great difference from Hebrew, viz. that final ð is indicated not by ð, but by ðelf.

maintains the diphthongs oi and au, which in Hebrew have usually passed into ð and ð.

The accent plays much less part in lengthening and altering the vowels in Syriac than in Hebrew, but there are well-marked cases of lengthening and shortening.

A few words may now be said about the three main parts of speech—pronouns, nouns and verbs.

1. Pronouns.—As in the other Semitic languages, these stand almost entirely outside the system of triliteral roots, being mainly derived from certain demonstrative letters or particles. Each of the personal pronouns (except the 3rd pl.) exists in a longer and a shorter form; the one is used when a nominative and is a separate word, the other is attached to verbs and (in a slightly different form) to nouns to express the accusative or genitive. These pronominal suffixes of much more importance in Syriac than in Hebrew, and produce a less change in the vowels of the words to which they are attached. Demonstrative adjectives and adverbs are formed by prefixing the syllable ð ("esse, behold") to other pronominal elements, and interrogatives similarly by prefixing the interrogative syllable y, but there are other interrogative pronouns. The relative consists only of the letter d (indecisive) prefixed to words.

Nouns and Adjectives.—The Syriac noun has three states—the absolute (used chiefly in adjectival or participial predicatives, but also with numerals and negatives, in adverbial phrases, &c.), the construct (which, as in Hebrew, must be immediately followed by a preposition), and the prepositional (see above). There are only two genders and two numbers: the neuter gender is entirely wanting, and the dual number is not recognized in Syriac grammar, though there are plain traces of it in the language. The fem. sing. ending is -â, constr. sing. abs. ðâ, constr. plur. abs. ða, dual abs. ðâ, constr. sing. dh, constr. plur. dh. Syriac is not, like Arabic and Hebrew, inflected for case. Instead, cases are expressed by the genitive or possessive relation: for it has a preposition ð which expresses of, to. The noun must be in the state of the noun when the case is used, but the endings are governed by the case. For example, the noun may be in the emphatic state or may (as is usually the case when the noun is definite) have a prenominal suffix. Thus "the son of the king" is more commonly expressed by bāti 'almâlik or bērēd ḫ mlâk than by bar malkâ, whereas the Hebrew type would alone be permissible in Hebrew. And a genitive with prefixed ð does not require the governing noun to precede it immediately, as must be the case when the construct is used. This is one of the many respects where Syriac has gained greater freedom in syntax than Hebrew.

2. Verbs.—The Syriac verb is remarkable for having entirely lost the original passive forms, such as in Arabic can be formed in every conjugation and in. Hebrew are represented by the Paal and Hophal. For these Syriac has substituted middle or reflexive forms with prefixed ðih and a change in the last vowel. The simple active qīlā makes its passive qîfîl; the intensive qīfîl makes its passive qīfîl, ..., and the imperative qīfîl makes its passive qīfîl, with a vowel change in the 1st person singular of the verb is, on the whole, more regular than in Hebrew: thus, to take one instance, the 3rd pl. fem. impf. negîfîn corresponds better to 3rd pl. masc. negîfîn than does the equivalent Hebrew form negîfîn. But the most important peculiarity of Syriac verbs is again in the sphere of syntax, and shows the same progress towards flexibility which we found in the nouns. Whereas the Hebrew verb is complicated and in doubt, while the Syriac verb is practically in as good a state as the passive, and becomes a verbal action as completed or as in process without indicating time past, present or future, Syriac has by the help of an auxiliary verb constructed a set of tenses. Thus we have—Pres. qîtîl, "he kills," "he is killing" (sometimes "he is about to kill"). Impf. qîltîl, "he was killing," Fut. negîfîn, "he will kill," Pl. or Aor. qîlū "he has killed," "he killed." Plup. or Aor. qīlū, "he had killed," "he killed." The same progress towards flexibility in syntax is seen in the equivalent combination of constructions, the tendency towards a more flowing construction of sentences was helped by the influence of Greek, which has also supplied a large stock of words to the Syriac vocabulary.

SYRIAC LITERATURE. By Syriac is denoted the dialect of Aramaic which, during the early centuries of the Christian era, prevailed in Mesopotamia and the adjoining regions. The literary use of Syriac by Christians had its first centre in Edessa (Syr. Êshû or modern Urfa), where, in all probability, the chief Syriac versions of the Bible were made. The use of the same dialect appears in the earliest Christian literature connected with the Syriac Bible.

3 The sketch of the history of Syriac literature here presented is based on Wright's great article in the 9th edition of the Encyc. Brit., which was afterwards published separately under the title of A Short History of Syriac Literature (London, 1894).
SYRIAC LITERATURE

with such Mesopotamian cities as Nisibis, Amid, Mardin, Taghrīr and Seleucia-Ctesiphon, as well as west of the Euphrates at such centres as Maḥbogḥ (Hierapolis) and Aleppo, northwards at Malatiah and Maṣerqāṣ and in the districts of Lake Van and Lake Urmiya, and to the east and south-east of the Tigris in many places which from the 4th century onwards were centres of Nestorian Christianity within the Sasanian Empire. In Palestine and western Syria, the home of pre-Christian Aramaic dialects, the vernacular Semitic speech had under Roman dominion been replaced by Greek for official and literary purposes. Apparently this state of things lasted till after the Mahommedan conquest, for Barhebraeus¹ tells us that it was the language of official documents. In the 7th century, when Christianity, replaced by Greek by Arabic as the language of official documents at Damascus. Probably (as Duval suggests) the use of Syriac in these regions went hand in hand with the spread of the monophysite doctrine, for the liturgies and formulas of the Jacobite Church were composed in Syriac. Similarly the spread of Nestorian doctrines throughout the western and south-western regions of the Persian Empire was accompanied by the ecclesiastical use of a form of Syriac which differed very slightly indeed from that employed farther west by the Jacobites. So far as we know, the only historical source of the Christian communism, of which the word Syriac is used. Of the pagans Syriac literature which issued mainly from Harrān, a city about one day's journey south of Edessa, not a single example appears to have survived. From Christian writers we learn that Harrān continued to be a seat of pagan worship and culture down to and even later than the Mahommedan era. A native of the city, Thābit ibn Qurra, in a passage from a Syriac work of his (now lost) quoted by Barhebraeus,² speaks of the paganism of Harrān as distinguished by its steadfast resistance to Christian propaganda. "When many were subdued to error through persecution, our fathers through God were steadfast in their faith, and this blessed city has never been defiled by the error of Nazareth." He goes on to attribute the world's science and civilization to pagan inventors; but it is not clear whether in this he is alluding specially to the culture of his own city. Anyhow, it is much to be regretted that no Syriac writing from Harrān has survived.³

Syriac literature continued in life from the 3rd to the 14th century A.D., but after the Arab conquest it became an increasingly artificial product, for Arabic gradually killed the vernacular use of Syriac.

In the literature as it survives many different branches of writing are represented—homilies in prose and verse, hymns, exposition and commentary, liturgy, apocryphal legends, historical romance, hagiography and martyrology, monastic history and biography, general history, dogmatics, philosophy and science, ecclesiastical law, &c. But the whole is dominated by the theological and ecclesiastical interest. All chief writers were bishops, inferior clergy or monks, and their readers belonged to the same classes. When we put aside one or two exceptionally fine pieces, like the hymn of the soul in the apocryphal Acts of Thomas, the highest degree of excellence in Syriac literature is perhaps attained in the inroads world historical narratives—such as the account of the Byzantine Roman War at the beginning of the 6th century by the author who passes under the name of Joshua the Stylist, or by romancers like him who wrote the romance of Julian; by biographers like some of those who have written lives of saints, martyrs and eminent divines; and by some early writers of homilies such as Philoxenus (in prose) and Isaac of Antioch (in verse). Nearly all the best writers are characterized by a certain naïve and earnest piety which is attractive, and not infrequently display a force of moral indignation which arrests attention. These

¹ Chron. syr., ed. Bruns, p. 120, ed. Bdeljan, p. 115; cited by Duval, Litt. syr., p. 5.
² Chron. syr., ed. Bruns, p. 176, ed. Bdeljan, p. 168. Thābit was the author of about 16 Syriac works, of which the majority survived in the 13th century, but all are now lost. Of his 150 Arabic translations five are extant; see Brochelmann, Geschichte der arabischen Literatur, i. 271 seq.
³ On this subject, see especially Chwolson's Sabdher und Saabismus.

latter qualities are even more apparent in poetry than in prose. There are indeed but few specimens of Syriac verse, which exhibit high poetic quality, except for a fairly copious and occasionally skillful use of simile and metaphor, there is little of soaring imagination in Syriac poets. On the other hand there is much effective rhetoric, and much skillful play of language.⁴

As was to be expected, the better qualities of style were more often shown during the early centuries when the language was still a living speech. After it had been supplanted by Arabic in the ordinary intercourse of life its literary use was more and more affected by Arabic words and constructions, and its freedom as a vehicle of thought was much impaired. Nevertheless, 190 S in the 6th century it was still an effective instrument in the hands of the most many-sided of Syriac authors, the eminent Barhebraeus.

For the general history of culture the work of Syriac writers as translators is, perhaps, as important as any of their original contributions to literature. Beginning with the earliest versions of the Bible, which seem to date from the 2nd century A.D., the series comprises a great mass of translations from Greek originals—theological, philosophical, legendary, historical and scientific. In a fair number of cases the Syriac version has been used as a source of inspiration rather than a literal reproduction, and moreover, the Syriac translation became in turn the parent of a later Arabic version. This was notably the case with some of the Aristotelian writings, so that in this field, as in some others, the Syriac writers handed on the torch of Greek thought to the Arabs, by whom it was in turn transmitted to medieval Europe. The early Syriac translations are in many cases so literal as to do violence to the idiom of their own language; but this makes them all the more valuable when we have to depend on them for reconstructing the original texts. The later translators use greater freedom. It was not from Greek only that translations were made into Syriac. Of translations from Pahlavi we have such examples as the version of pseudo-Callisthenes History of Alexander, made in the 7th century by a Pahlavi version of the Greek original—that of Kalīyah and Dīnmah executed in the 6th century by the periodiūtēs Bōch—and that of Sindbad, which dates from the 8th century; and in the late period of Syriac literature, books were translated from Arabic into Syriac as well as vice versa.

All our historical sources support the view taken above that Edessa, the capital of the kingdom which the Greeks and Romans called Osroene, was the earliest seat of Christianity in Mesopotamia and the cradle of Syriac literature. But as to the date and circumstances of its evangelization we have little reliable information. The well-known legend of the correspondence of Abgar Ukkāmah, king of Edessa, with Christ and the mission of Addai to Edessa immediately after the Ascension was accepted as true by the historian Eusebius (1340) on the faith of a Syriac document preserved in the official archives of the city. An amplified form of the same story is furnished by the Doctrine of Addai, an original Syriac work which survives complete in a St Petersburg MS. of the 6th century, and is also represented by fragments in other MS. of the 4th century. The legend was probably written at Edessa about the end of the 4th century. It adds many new features to the shorter form of the story as given by Eusebius, among which is the noteworthy promise of Christ about the impregnability of the city—"Thy city shall be blessed and no enemy shall ever henceforth obtain dominion over it." This is probably a later addition made to the legend at a time when such facts as the capture of Edessa by Lusius Quetius in 216 and its second capture and the destruction of its kingdom by the Romans in 216 had faded from memory.⁴

⁴ On the mechanism of Syriac verse, see Duval's admirable section on la poésie syrienne (Litt. syr., p. 10 sqq.).
⁵ Cf. Duval, op. cit., p. 90.
⁶ Cf. Tixeront, Origines de l'Eglise d'Edesse, p. 93, and Duval, op. cit., p. 99. The above view is more probable than that taken by F. C. Burkitt (Early Eastern Christianity, p. 14), that Eusebius knew of Christ's promise as part of the letter to Abgar, and purposely suppressed it as inconsistent with historical facts.
But whether in its longer or its shorter form, the whole narrative must be pronounced unhistorical. In all probability the first king of Osrhoene to adopt Christianity was Abgar IX, son of Ma'nn, who reigned from A.D. 179 to 214 or 216, and the legend has confounded him with an earlier Abgar, also son of Ma'nn, who reigned first from B.C. 4 to A.D. 7 and again from A.D. 13 to 50. A contemporary of Abgar IX at Edessa was the famous Bardaisan, himself a convert from heathenism, who was of noble birth and a habastū of the Edessene court. It was no doubt partly under his influence—also possibly in part through impressions received by Abgar during his visit to Rome about A.D. 170 (see below)—that a Peshitta version of the Bible was translated into Syriac at Edessa. It is not without some authority to hold that Christianity must have reached Edessa some thirty to fifty years earlier. Our earliest native historical document in Syriac—the account of a severe flood which visited Edessa in Nov. A.D. 202—mentions "the temple of the church of the Christians" as overthrown by the flood. The form of this notice shows, as von Gutschmid and others have remarked, that Christianity was not yet the religion of the state; but it must for some time have had a home in Edessa. The same thing is seen from the fact that the heresy of the Marcionites was already showing itself in Syriac literature. The primitive Christian Church in the first centuries at least, only spread in already constituted Christian communities." And by a skilful piecing together of the date furnished by the oldest Syriac versions of the Bible—such as the derivation of the Old Testament version from the Jews, and the almost exclusive use of Tatian's Diatessaron as the gospel of the Syriac Church down to the beginning of the 5th century—F. C. Burkitt has shown it to be probable that the preaching of Christianity at Edessa reaches back to the middle of the 2nd century or even to about the year 135. The Syriac versions of the Bible are treated elsewhere (see Burkitt, pp. 145 seq.) and may here be dismissed with a summary of facts and opinions. The received Syriac Bible or Vulgate (the Peshittā or "simple" version from the 9th century onwards) contains all the canonical books of the Old Testament. In the New Testament, 2 Peter, 2 and 3 John, Jude and the Apocalypse were originally left out, but Syriac versions were made at a later time. The Peshitta version of the Old Testament must have been originally made mainly by Jews, of whom we know there were colonies in Mesopotamia in the 2nd century. The translation was executed entirely out of the Hebrew but underwent later revision which brought it more into conformity with the LXX—this to a greater degree in some books than in others. The Peshitta New Testament—according to the convincing theory which at present holds the field—is not the oldest form of the Syriac version, at least as regards the Gospels. From the beginning of the 3rd to the beginning of the 5th century Tatian's Harmony or Diatessaron—whether originally compiled in Syriac, or compiled in Greek and translated into Syriac—was the current form of gospel in the Syriac Church. The text of the Gospels underlying it "represents the Greek text as read in Rome about A.D. 170." Slightly later was made the Old Syriac version of the separate Gospels, which survives in two MSS.—the Curetonian and the Sinaitic—in two differing forms: but this never obtained much currency. Its text "represents, where it differs from the Diatessaron, the Greek text as read in Antioch about A.D. 200." Then at the beginning of the 5th century, by the efforts of the...
and the Testament of Adam by M. Kmosko (Graffin's Patrologie Syriaca, vol. ii.).

Lives of saints and martyrs form a large group among Syriac books. Among such documents connected with the early history of Edessa we have, besides the Doctrine of Addai, certain martyrdoms, those of Sharbël and Barsamya assigned to the reign of Trajan, and those of Gurya and Shambîb and of the Dr. enthroned Habilibh under Dioscorian and Licinius. All these documents, like Addai, belong probably to the 2nd half of the 4th century, and are quite unreliable in detail for the historian, though they may throw some light on the conditions of life at Edessa under Roman government. There are also accounts of martyrdoms at Samosâta (Assemani, Acta Mart. ii. 123-147), including that of St. Azzaal recently published by Macler (Paris, 1902). But the great bulk of the Syriac martyrdoms have their scene farther east, within the Persian dominions.

The life and writings of Bardaisan, "the last of the gnostics," and in some sense the father of Syriac literature and especially of Syriac poetry, have been treated in a separate article. The Book of the Laws of the Countries, which embodies his teaching, was re-edited in 1909 by F. Nau (this also in the 2nd volume of Graffin's Patrologie). An early Syriac document, probably of the 2nd or 3rd century, is the Letter of Marya son of Serapion, which was edited by Cureton in his Spicilegium Syriacum. It is almost the only exception to the rule that all surviving Syriac literature is Christian. The author is in sympathy with Christianity, but is himself an adherent of the stoic philosophy. His home appears to have been at Seleucia-Ctesiphon.

By the beginning of the 4th century much progress had been made with the organization of the Christian church not only within the Roman district of Mesopotamia, but also to the east and south-east within the Sassanian Empire, round such centres as Seleucia-Ctesiphon on the Tigris (near Baghdad), Karka-d-Beth Sêlokh (modern Kerku) and Beth Lopit or Gundeshâbih (in the modern province of Kurdistan). The adoption of Christianity by Constantine as the official religion of the Roman Empire had an unfortunate effect on the position of the Christians in Persia. They were naturally suspected of sympathizing with the Roman enemies rather than with their own Persian rulers. Accordingly when Sapor II. (310-379) declared war on Rome about 337, there ensued almost immediately a somewhat violent persecution of the Persian Christians, which continued in varying degrees for about 40 years. One result of this and later persecutions of the same kind has been to enrich Syriac literature with a long series of Acts of Persian Martyrs, which, although in their existing form intermixed with much legendary matter, nevertheless throw valuable light on the history and geography of western Persia under Sassanian rule. One of the earlier martyr stories is that of Simeon bar Shabbêa, bishop (2 baptised) of Seleucia from about 126 to 441, in succession to his nephew who had organized the church of Persia under the primacy of Seleucia. The Martyrdom of Simeon exists in two recensions which have been separately edited by M. Kmosko. Another early martyr was Milles, bishop of Susa, who had distinguished himself in the opposition to the Emperor.

Burkitt, p. 21 seq.) endeavours to claim a higher value for the narratives about Gurya, Shambil and Habibih, on the ground that these have left more trace in the later literature; but it is to be feared that all five martyrdoms are turned out in the same legendary mould.

Of the origin and early history of Persian Christianity see especially J. Labouret, Le Christianisme dans l'Empire Persé (Paris, 1904), chaps. i. and ii.

See many of the texts in Bedjan's Acta martyrum et sanctorum (Paris, 1869-1906). The most valuable geographical results are exhibited in G. Hoffmann's Ausüge aus syrischen Akten persischer Märtyrer (Leipzig, 1880).

Graffin's Patrologia, ii. 661-1045. Of the epistles, hymns, &c., attributable to Simeon, two survivals are exhibited in G. Hoffmann's Auszüge aus syrischen Akten persischer Märtyrer.

The two most important 4th-century writers—Aphraates and Ephrem—are dealt with in separate articles. The importance of the former lies in the simple cast of his religious thought, his independence of theological formulas, his constant adherence to the letter of Scripture, his quaint exegesis, and the light he throws on the circumstances of his time, especially (1) the feeling that the Jews and Christians, and (2) the position and sympathies of the Christian subjects of Sapor II. The position and character of Ephrem are very different. He is the typical exponent in Syriac of unbending Catholic orthodoxy. He impressed his countrymen more than any other single writer, partly no doubt by his enormous fecundity in writing, but more by the stern piety and uncompromising dogmatism which pervade his works.

In the 2nd half of the 4th century lived the monk Gregory, who wrote a treatise on the monastic life. Hespraut part of his life in Cyprus, and was a friend of Epiphanius, bishop of Salamis. To the information given by Assemani (B.O. i. 170 seq.) we can now add the statements of Ishê-d'ênab, who has 304 and 304 composed hymns and discourses that were the longest—which is however by some attributed to Ephrem.10—In the work in 12 books on the history of Joseph, of which a complete edition was published by Bedjan in 1901. Other poems of his were edited by Overbeck in S. Eunibiis Syrii, &c., opera selecta, pp. 251-356; and these have since been supplemented by Zettersten's edition of a large number of his religious poems or metrical prayers (Beitruge zur Kennniss der religiösen Dichtung Bala, Leipzig, 1902). His favourite motive was the penticasyllabic. Cyrillici composed a poem on the invasion of the Huns in 395, and is by some regarded as identical with Ephrem's; but it is very doubtful whether the poem is by his hand or not.11

The 5th century was a time of storm and conflict in the churches of Mesopotamia and Persia, as in other parts of the Christian world. The teaching of Apollinarius that in Christ the Divine Word took the place of the human rational soul, thus seeming to do away with his possession of a true humanity, had led to a reaction by Paul of Samosata, Diodore of Tarsus, Theodore of Mopsuestia, and Nestorius of Constantinople. Though with some points of difference, they agreed in emphasizing the permanence of the two separate natures in Christ, united both by mingled and, laid stress on the reality of the Lord's human experience. One question on which great contention arose was as to the propriety of applying to the Divine nature attributes which belonged to the human nature—e.g. birth from a human mother—and vice versa. Hence the great dispute about the application to the Virgin Mary of the epithet theokos. It seems to have been the object of Nestorius to use of this expression which mainly led to his condemnation and deposition at the Council of Ephesus (431) under the influence of Cyril, when as patriarch of Constantinople (428-431) he had distinguished himself by his zeal for Nicene orthodoxy. At Edessa the result of the conflict between the Nestorians and their opponents was long doubtful. When Rabbedel, the fiercest anti-Nestorian and friend of Cyril, died in 435, he was succeeded in the bishopric by Ibas, who as head of the famous Persian

\[4\] In Bedjan, p. 47.

\[5\] New light on the theological position of Nestorius is to be obtained from the lost work Book of Hesed, a work of his which has turned up in a Syriac version and has just been published by Bedjan.
school " in the city had done much to inculcate on his pupils the doctrines of Theodore of Mopsuestia. But the feeling against the Nestorian party grew in strength, till on the death of Ibas in 457 the leading Nestorian teachers were driven out of Edessa. The Pope in 459, on the success of his writings in 457 was sent, but was finally closed and destroyed by order of the emperor Zenon in 489. The Nestorian teachers then started a great school at Nisibis (which had been under Persian rule since Jovian's humiliating treaty of 363). By the energetic efforts of Barṣûmâ, bishop of that city, practically the whole church of Persia was won over to the Nestorian creed. Western Syria, on the contrary, had partaken with Alexandria in the reaction from Nestorianism which finally crystallized in the Monophysite doctrine, that spread so widely through Egypt and Western Asia towards the end of the 5th century. 

At the beginning of this century one of the most able and influential men in the Syriac-speaking church was Mārūthā, bishop of Maiperkāt or Martyropolis. Without entering on the details of his ecclesiastical activity, we may note that he was twice associated with embassies from the Roman emperor to Yazgeder I. (399-420); that along with Isaac, patriarch of Seleucia (390-410), he obtained from the Persian monarch a concordat which secured a period of religious toleration; and that he arranged for and precedent at the Council of Seleucia in 410, which added to the full Nicene creed and organized the hierarchy of the Persian Church. As a writer he is chiefly known as the reputed author of a collection of martyrologies which cover the reigns of Sapor II, Yazgeder I. and Bahram V. By his history of the Council of Nicaea he made a great contribution to the education of the Persian Church in the development of Christian doctrine. Rabbūša, the powerful and energetic bishop of Edessa who withstood the beginnings of Nestorianism, and who gave currency to the Peshitta text of the four Gospels, abolishing the use of the Diatessaron, is dealt with in a separate article. The next bishop of Edessa, Ibas, who succeeded in 435 at the death of Rabûša, proved himself a follower of the Nestorian doctrine (see above). As a teacher in the Persian school of Edessa he had translated, probably with the help of his pupils, certain works of "the Interpreter," i.e. Theodore of Mopsuestia. Among these may have been the commentary on St John of which the complete Syriac version was published by Chatob in 1897. He may possibly have translated a work of Aristotle. To the Nestorian movement in Persia he rendered useful service by his letter to Mār of Bēth Hardâsh, in which he maintained the tenets of Dionysius and Theodore, while allowing that Nestorius had erred. It was the young Rabûša of Edessa who in 435, after the "rober synod" of Ephesus (449), was restored by the Council of Chalcedon (451), after he had anathematized Nestorius. His death in 457 was followed by a strong anti-Nestorian reaction at Edessa, which led to the expulsion of many of the leading teachers. 

On Isaac of Antioch, "one of the stars of Syriac literature," see the special article. In spite of his over-diffuseness, he is one of the most readable of Syriac authors.

A Nestorian contemporary of Isaac, Dādhiša, who was catholicus of Seleucia from 451 to 456, composed commentaries on Daniel, Kings and Ecclesiasticus. His chief importance in the history of the Persian Church lies in his having induced a synod of bishops to declare that church independent of the see of Antioch and of the "Western Fathers" (Labourt, p. 122 seq.).

The most powerful missionary of Nestorianism during the 2nd half of the 5th century was Barṣûmâ of Nisibis, whom his opponents called "the swimmer among the reeds," i.e. the wild boar. Born probably between 415 and 420 he imbied Nestorian doctrine from Ibas at the Persian school of Edessa, but was driven out in 457 on the death of his master, and went to be bishop of Nisibis. In a succession of missionary journeys he succeeded, partly by persuasion and partly (if his enemies are to be believed) by violence, in attaching to Nestorianism nearly all the Christian communities of Persia, with the exception of Taghir, which was always strongly Monophysite. He had many quarrels with his ecclesiastical superiors the catholicus of Seleucia, but finally reconciled with Aemilius after the death of the latter in 484. Among other severities towards the Monophysites, he persuaded the Persian king Pērō (457-484) to banish many of them into the Roman dominions. One of his great aims was to secure for the Nestorian clergy freedom to marry, and this was finally sanctioned by a council at Seleucia in 486 (Labourt, op. cit., chap. vi.). Barṣûmâ must have been bishop of Nisibis for nearly 40 years, but was dead by 496. His writings seem to have been chiefly liturgical: he gave the first set of statutes to the school of Nisibis, which was founded during his bishopric.

His fellow-worker Narsai, whom the Jacobite called "the leper," but the Nestorians "the harb of the Holy Spirit," apparently accompanied Barṣûmâ from Edessa to Nisibis, where according to Barhebræus he lived for 50 years. Barṣûmâ appointed him head of the new school, where he taught rigidly Nestorian doctrine. He was a copious writer, especially in verse. Many of his poems have now been published. His theological position is clearly defined in a homily on the three doctrines—Diodore, Theodore and Nestorius—published by the Abbé Martin in the Journal asiatise for July 1900.

Another early Monophysites was Simeon of Beth Aršām, who by a series of journeys and disputations within the Persian empire did all he could to prevent the triumph of Nestorianism among the Persian Christians. He had considerable success at the time, but the ground he had won was soon reconquered by his opponents, except at Taghir and the surrounding district. It was after a successful disputation in presence of the Nestorian catholicus Bābālī (497-502/3) that Simeon was made bishop of Bēth Aršām, a town near Seleucia. He made several journeys to Constantinople, where he enjoyed the favour of the empress Theodora. His life was written by John of Asia in the collection of the lives of eastern saints which has been edited by Land (Anecd. syr. vol. ii.). His literary productions consist only of a liturgy and two exceedingly interesting letters. The one has for its subject Barṣûmâ and the other Nestorian leaders in Persia, and gives a highly malicious account of their proceedings. The other, which has been often edited, is an account of a severe persecution which the Himyarite Christians of Najrān in south-west Arabia underwent in 513, at the hands of the king of Yemen. Simeon had repeatedly visited al-Hirah and was in touch with the Arab kingdom which centred there, his letter is a document of first-rate historical importance.

Mention should be made of two other early Monophysites leaders who suffered persecution at the hands of the emperor Justin I. (518-527). The one is John of Tellār, author of 538 canons, answers to questions by the priest Sergio, a creed and an exposition of the Trisagion. His life was written by his disciple Elias, and also by John of Asia. The other, John bar Aplōntyā, was the founder of the famous monastery of Kenneshēr, opposite Sīrāq, held by Feldmann, Syrische Wechseltden von Nurses (Leipzig, 1896); Mingana, Nurses, homonian et carmina (2 vols., Mosul, 1908); and other editions of which a list is given by Duval, p. 344 seq. Four of the homilies which deal with liturgical matters have been translated into English, accompanied with valuable notes, by R. H. Connolly (Cambridge, 1906).
SYRIAC LITERATURE

Jerábis on the Euphrates, and wrote a commentary on the Song of Songs, a number of hymns and a biography of Severus, the Monophysite patriarch of Antioch (512–519).

The life of the great missionary bishop Jacob Burđená1 or Baradaeus, from whom the Monophysite Church took its name of Jacobite, belongs rather to ecclesiastical than to literary history. A native of Tellá in Mesopotamia, he obtained the favour of the empress Theodora while on a mission to Constantinople, and resided in that city for fifteen years (528–543). At the request of the Arab king of Ghassán he was sent on a mission to the East after being consecrated bishop of Edessa; and the rest of his life was spent among the early monasteries of the Churches of eastern Syria. We possess two lives of him—one by John of Asia in his collection of biographies, and another which may have been written by a priest of Jacob’s original monastery of Pésílata. Both are to be found in the 2nd volume of Land’s Anaedota syriaca. An excellent modern biography and estimate of Jacob has been written by Kley.2 A Syriac account of the removal of his remains from Alexandria, where he died in 578, to his old monastery of Pésílata has been edited by Kugener in the Bibliothèque hagiographique orientale, pp. 1–26 (Paris, 1903). The authenticity and the little life of Pésáti (published in 1896) was by the author of “an anaphora, sundry letters, a creed or confession of faith, preserved in Arabic and a secondary Ethiopic translation, and a homily for the Feast of the Annunciation, also extant only in an Arabic translation” (Wright). A very different character from Jacob’s was that of Sergius of Rás’ain, one of the best Greek scholars and ablest translators whom Syria has produced. Of his life little is known, and that little not wholly creditable. He wandered curiously in his ecclesiastical views, and ended by helping the persecutors of the Monophysite Church, to which he himself had belonged. He served as a priest at Rás’ain in Mesopotamia most of his life. About 535 he travelled on various ecclesiastical missions, and finally made a journey to Rome and thence to Constantinople (in this latter accompanied by the pope Agapetus). The result was to bring about the deposition and banishment of the Monophysites from the latter city. Sergius died almost immediately afterwards, in 536. Among the works which he translated into Syriac and of which his versions survive are treatises of Aristotle, Porphyry and Galen, the Ars grammatica of Dionysius Thrax, the works of Dionysius the Areopagite, and last but not least a treatise by the author of “An ars grammatica, sundry letters, a creed or confession of faith, preserved in Arabic and a secondary Ethiopic translation, and a homily for the Feast of the Annunciation, also extant only in an Arabic translation” (Wright). The last 6th-century author to be mentioned here is Abúdâm-mêlê, who was Jacobite metropolitan of Taghríth from 559 till he was martyred by Khosrau Anásharwân in 575. He wrote various philosophical works, also a treatise on grammar which is quoted by the later grammarian, John bar Zoîbi. A Syriac life of him has been published by F. Nau, who appends to it the surviving fragment of his treatise on the composition of man consisting of soul and body.

We may here take note of three important anonymous works, of which the first probably and the other two certainly belong to the 6th century.

The Me’arrath gázqê or Cave of Treasures, translated and edited by C. Bezold (Leipzig, 1883–1888), is akin (as Duval remarks) to the Book of Jubilees. It is an imaginary history of the patriarchs and their descendants. The work derives its name from the picturesque story of the cave where Adam deposited the treasure of gold, myrrh and incense which he had brought away from paradise: the cave was used as a burying-place by him and his descendants until the deluge. After the precious relics together with the bones of Adam had been saved in the ark, they fell into the hands of Baradaeus, whose disciple Melchizedek took them to the guidance of an angel.

The tripartite narrative which is known as the Romance of Julian (the Apostle) has no claim to be regarded as an historical document. Its hero is Jovian, one of the feeblest of Roman emperors, and Julian is everywhere exhibited in flaming colours as the villain of the story. But as an example of Syriac prose style it is of the best, and the author at times shows considerable dramatic power.

A valuable historical source, though of small dimensions, is the Chronicle of Edessa, which gives a record of events from 132 to A.D. 540—at first exceedingly brief, but becoming somewhat fuller for the later years. It appears to be thoroughly reliable wherever it can be tested. It has been three times edited—first by Assemani in the Bibliotheca orientalis (i. 388–417), secondly by L. Hallier (Leipzig, 1892) with a translation, introduction and abundant notes, and thirdly by Guidi with a Latin version in Chronica minora, Paris, 1903).

On John of Asia or Ephesus, the eminent Monophysite bishop and earliest Syriac church historian, see the separate article.

An historical work of somewhat similar character to John’s is the Bibliotheca historica which is generally known by the name of Zacharias Rhetor, because the anonymous Syriac compiler has incorporated the Syriac version or epitome of a lost

1 See the details in Wright, pp. 90 sqq.; and cf. especially A. Baumstark, Aristoteles bei den Syrern vom VI. –VIII. Jahrhundert (Leipzig, 1900); and V. Rynzel, Uber den syrischen Buchstabensatz im syrischen historischen Quellenwerk (Leipzig, 1880–1881). The latter singles out the version of the pseudo-Aristotelian Hexaplurom as a model of excellence in translation.

2 On these last see Baumstark, Lucubrationes syro-graecae pp. 405 sqq. (Leipzig, 1894); and Duval, Litt. syr. i pp. 266 sqq.

3 Land, Anecd. syr. iii. 289.

4 Since Brooks and Hamilton’s translation of the latter, p. 234.

5 Patrologia orientalis, iii. 1 (Paris, 1906).

6 Bezold’s edition contains also an Arabic version.

7 This author has hitherto been identified by Zacharias Scholas- ticus, who afterwards became bishop of Mitylene, but according to M. A. Kugener, La Compilation historique de pseudo-Zacharie le Rhétour (Paris, 1900), this identification is a mistake.
Greek history written by that author. The Syriac work exists (not quite complete) in a British Museum MS, of about the begin-
ning of the 7th century; this can be in part supplemented by an
8th-century MS, at the Vatican. From the latter Guidi published
the interesting chapter (X. 16) which contains the description
of Rome. The entire text of the London MS was published by
Land in the third volume of his Anecdota syriaca; and there is now
an English translation by Hamilton and Brooks (London, 1889),
and a German one by Ahrens and Krüger (Leipzig, 1889).

Of the 6th-century Jacobite writers we must mention only Moses
of Agel (c. 550–570), who translated into Syriac some of the
writings of Cyril, and Peter of Callinicus, Jacobite
patriarch of Antioch 578–591, who wrote a huge controversial
work in 4 books, each of 25 chapters, against Damian, patri-
arch of Alexandria, as well as other less important works.
The Nestorian writers of the 6th century were numerous,
but as yet we know little of their works, beyond what 'Abhdi-
sho' tells us in his Catalogue. It will be sufficient to mention
one or two. Joseph Hāṣaū (i.e. of al-Ahwāz or Khūzistān),
who came third in succession to Narsai as head of the school
of Rome, was the first Syriac grammarian and linguist, and
the author of an important work on signs of interpolation. Mārthā, who was Nestorian
catholicus of Seleucia from about 540 to 552, and a man of exceptional
energy, made the only known attempt, which was, however,
unsuccessful, to provide the Nestorians with a Bible version of
their own. He was the author of many commentaries, homilies,
epistles, canons and hymns. Paul the Persian, a courtier of
Khosrau Anšāšwān, dedicated to the king a treatise on logic
which has been published from a London MS. by Land
in the 4th volume of his Anecdota. Bōdh the periodist's
work has been published; it is best known as the author of the old Syriac version of the
collection of Indian tales called Kalīlah and Dimnah. He made
it doubtless from a Pahlavi version. His translation, which was
edited by Bickell with an introduction by Beney, must
be distinguished from the much later Syriac translation made
from the secondary Arabic version and edited by Wright in
1884. Hannānā of Hādhāyab, who nearly produced a dis-
ruption of the Nestorian Church by his attempt to bridge over the
interval which separated the Nestorians from Catholic ortho-
doxy, was the author of many commentaries and other writings—
besides the teaching of Theodore of Mopsuestia. An account of his theological position, derived from the
treatise of Bābhai De unione, will be found in Laboutr, op. cit., pp. 279 sqq. One of his followers, Joseph Ḥażānaya, was
also a prolific writer.

With the 7th century," as Wright remarks, "begins the slow decay of the native literature of the Syriacs, to which the
frigntful sufferings of the people during the great war with the
Persians in its first quarter largely contributed. The same
process of decay was greatly promoted by the Arab conquest
of Persia, achieved through the victory of Kādīsīya in 636–637.
The final replacement of Syriac by Arabic as the vernacular
language of Mesopotamia by degrees transformed the Syriac
from a living to a dead language. Apart from a few leading
writers—such as Jacob of Edessa, the anonymous historian
who whose work has passed under the name of Dionysius of Tell-
Mahīr, Thomas of Margā, Dionysius Bar Șalībi, and Barhe-
bræus—there are not enough names of interest to make it
worth while to continue our chronological catalogue. It will
be sufficient to group the more important contributors to each
of the chief branches of literature.

1. Theology—Here we may first mention George, Bishop of
the Arabs (712–), who wrote commentaries on Scripture, and
tracts and homilies on church sacraments, and finished the
Hexa-
meron of Jacob of Edessa.1 Bābhai the Elder, a leading Nestor-
ian in the beginning of the 7th century and a prolific author, wrote
many commentaries and theological discourses. Ishō'yaḥ I.1
Nestorian catholicus from 647 to 657, wrote controversial treatises
discussing points of law. He was succeeded by Bābhai Sabr Sīrāh
(657/8), who belongs to the 2nd half of the 7th century, compiled a Catena patrum on the Gospels and wrote many commentaries.

Thomas I., of his work, but he died in 691, and then appears a
man who belongs to the 9th century: a great Nestorian scholar 'Abhdišo' (1138).

2. History.—Besides the important writers treated in separate
articles, mention only four. Λ. de Excid. Cordub., a history of al-
Mas'ūda (1127), one of the most

fertile of 9th-century authors, wrote commentaries, theological
treatises and many liturgical works. Other important contributors to
3. Literature.—The value of the Nestorian literature, by 'Abhdišo' of

Nestorians, is that of Michael 1., who was Jacobite patriarch from 1166
1190. Its range extends from the Creation to the author's own day,
and it was largely used by Barhebraeus in compiling his own
Chronicle. Till recently it was known only in an abridged Armenian
version, which has been published by the late Professor de Kir-ka in
1884, and there is, as early as in 1884. Another important Chronicle
is that of Michael 1., who was Jacobite patriarch from 1166
1190. Its range extends from the Creation to the author's own day,
and it was largely used by Barhebraeus in compiling his own
Chronicle. Till recently it was known only in an abridged Armenian
version, which has been published by the late Professor de Kir-
ka in

3. Biography, Monastic History, etc.—Besides the important
works of Thomas of Margā, Ishō'yaḥ II. (628–644) on the history of
Nestorian bishops, who wrote ecclesiastical biographies and other theological works was Sabhirīsh
Rūštām, who lived at Mount Ḥabān and other monasteries.

In the beginning of the 8th century David of Bēth Rabban, also a Nestorian
abbot, wrote a historical work called the Little Paradise, which is frequently cited by
Thomas of Margā. A more important work is The Book of Chastity, by
Ishō'dnāb, who according to the Syriac writers, and even to the
most learned among the Nestorians, wrote a treatise called The Little Paradise, which is frequently cited by
Thomas of Margā. A more important work is The Book of Chastity, by
Ishō'dnāb, who according to the Syriac writers, and even to the
most learned among the Nestorians, wrote a treatise called

4. Philosophy and Science.—Special mention may be made of
Abû Ma'sūda al-Hādhāyab, who wrote an extensive commentary
on the Greek philosophy of Plato and Aristotle, and in the latter
he was the author of a new recension of the Paradise of Plato, and
also the author of a volume on philosophical divisions and
definitions; Românus the physician (860), who wrote a medical compendium.

In a work on the Islamic philosophy, he mentions translations of
some gnostic maxims and other works; Moses Bar Șābūn, the
philosopher who wrote a work often referred to; the famous physician Ḥanān ibn Iṣḥāq

5. See O. Braun's article in Oriens christianus, i. 138–152; and
7. See H. Goussen, Martyrius-Sakandrar Life and Works (Leipzig,
1879).
8. Le Livre de la chasteté (ed. Chabot, pp. 67 sqq.).
9. A fresh edition by Bedjan forms an appendix to his edition
of Thomas of Margā (Paris, 1904, 1905). It has been twice edited by Bedjan (Paris, 1888 and
1905), and there is a French translation, with copious notes, by
Chabot (Paris, 1895); cf. also Journ. As. (1888), pp. 313 sqq., and
SYRIANUS—SYZYGY

(1873), who wrote chiefly in Arabic, but deserves mention here by his services to Syriac grammar and lexicography, and still more by his translations of Greek philosophical and scientific works upon a very large number of subjects. Syriac, becoming in a sense the founder of a school of translators; and Jacob bar Shakkâ, whose work called the Dialogues treats of grammar, rhetoric, poetry, logic, philosophy and science.

So the philosopher, as several of the authors in this department have already been mentioned. The more important, besides Jacob of Edessa and Barhebræus, are ‘Anâšīq of ‘Iṣâb (early 10th century), Bar Ali, Bar Sarœshbâ (early 10th century), Bar Bahâlî (middle of 10th century), Elias of Tîrîn (1049), Elias bar Shínâyâ (above), John Bar Zo’bî (beginning of 13th century) and Jacob bar Shakkâ.

Apart from the numerous editions of Syriac texts by M. Paul Bedjan, most of which have been cited above, nearly all the texts recently edited are included in one or other of three comprehensive series now running—viz. (1) Patrologia syriaca (Paris, 1893); (2) Corpus scriptorum orientalium—scriptores syriaci (Paris, 1907); (3) Patrologia orientalis (Paris, 1907).

SYRIANUS, a Greek Neoplatonist philosopher, and head of the school at Athens in succession to Plutarch. He is important as the teacher of Proclus, and, like Plutarch and Proclus, as a commentator on Plato and Aristotle. His best-known extant work is a commentary on the Metaphysics of Aristotle. He is said to have written also on the De coelo et the De intend, in the latter, Aristotle and on Plato’s Timaeus. A treatise on the Stases of Raymonde’s under the name of Ali, the name given to a thick, viscid liquid, containing much dissolved (generally crystalline) matter, but showing little tendency to deposit crystals. The “syrup” employed for medicinal purposes consists of a concentrated or saturated solution of refined sugar in distilled water. The simple “syrup” of the British Pharmacopoeia is prepared by adding 1000 grams (or 5 lb) of refined sugar to 500 cubic centimetres (or two pints) of boiling distilled water, heating until it is dissolved and sucked from the boiling distilled water until the weight of the whole is 150 grams. The specific gravity of the syrup should be 1.33. Flavoured syrups are prepared by adding flavouring matter to a simple syrup. For instance, syrupus aromaticus is prepared by adding certain quantities of orange and cinnamon water to simple syrup. Similarly, medicated syrups are prepared by adding medicaments to, or dissolving them in, the simple syrup. Golden syrup is the uncrystallizable fluid drained off in the process of obtaining refined crystallized sugar. Trecule and molasses are syrups obtained in the earlier stages of refining. Technically and scientifically the term syrup is also employed to denote a viscid, generally residual, liquids, containing substances other than sugar in solution.

SYRJENIANS (also Sirian, Syrijenian, Zyrenian, Zirianian, Zyrinian and Zirjan), a tribe belonging to the Permian division of the eastern Finns. They are said to number about 85,000 on the west side of the Urals in the governments of Perm, Vologda and Archangel, and there are also about 1000 on the Siberian side of the lower Ob. Their headquarters are at Ust-Ishma, at the junction of the Ishma and Pechora. Formerly they spread farther to the west. They are of moderate stature, blond, and grey-eyed, and more energetic and inclined to trade than those on the east side of the Urals. They were converted to Christianity about 1350 and their language was forced in writing. They call themselves Komis and are not sharply distinguished from the tribes known as Permian, the languages being mutually intelligible. The archaeological remains in the governments of Perm and Vatyka called Chudish by Russians are probably Syryenian. A grammar of the language was published by Castren, and linguistic and other notices of the tribe are contained in the Journal de la société finno-ougrienne, especially for 1903. (See Finno-Ugrian.)

SYSTYLE (Gr. στῦλος, together with, and σωτός, a column), in architecture, a term meaning bearing columns rather thickly set—an intercolumniation to which two diameters are assigned.

SYZRA, a town of Russia, in the government of Simbirsk, 156 m. E. of the town of Penza, and a short distance from the Volga. Pop. (1882), 24,500; (1900), 33,046. Syzra originated in a fort, erected in 1683, to protect the district from the Tartars and Circassians. Most of its inhabitants are engaged in gardening and tillage. In the large villages of the surrounding district various petty trades are carried on. The town has long been in repute for its tanneries and its manufactures of leather. Several flour-mills and other factories have recently sprung up. Much grain is exported; timber is brought from the upper Volga and manufactured wares from Nizhny Novgorod.

SYZGY (Gr. σύγγυρα, a yoking together, from σύν, together, and root γυρ-, yoke), in astronomy, either of the points at which the moon is most nearly in a line with the sun. The moon passes her syzygies, or is in a syzygy, at new and full moon.

1 See Serv. ad Virgil, Eclogi, ii. 31; and Ovid, Metam. i. 691, &c.

2 The Syriac versions made by him and his successors have unfortunately perished (see Wright, p. 213).

3 The Syriac translations made by him and his successors have unfortunately perished (see Wright, p. 213).

The Idylla figlura, in which the legend is repeated. The pan-
SZABADKA—SZE-CH'UEN

SZABADKA (Ger. Mariu-Theresiopel), a town of Hungary, in the county of Bacs-Bodrog, 109 m. S.S.E. of Budapest by rail. Pop. (1900), 81,464. It is situated in the great Hungarian plain between the Danube and the Theiss, and is the centre of an immense agricultural district. To the town belongs a large territory (369 sq. m.) of the adjoining Pusztza Telecska, where large herds of cattle are reared. In this territory is situated Lake Palics, a favourite watering-place and summer resort.

SZALAY, Volodar (1828—1864), Hungarian geologist, was born at Kalocsa, on the 14th of March 1822. His first contribution to science was an essay on metallurgy, in which subject he had received special training. Afterwards he settled at Budapest and investigated the geology of the district, the results of which were published in a geological map (1858). In 1859 he joined the staff of the Austrian Geological Survey, as a volunteer member, and paid attention to the economic as well as to the purely scientific aspects of the work. He also arranged for surveys having special reference to agricultural geology to be undertaken by the Hungarian Geological Institute. In 1863 he became professor of geology and mineralogy in the university of Budapest. In later years he devoted himself largely to petrology, and published memoirs on the trachytes of Hungary and Transylvania; on a new method of determining the species of felspars in rocks, depending on fusibility and flame-coloration; on the geology and petrology of the district of Schemnitz; and on Santorin Island. He died at Budapest on the 11th of April 1894.

He was author of Geologie mit besonderer Rücksicht auf die Petrographie, den Vulcanismus u. die Hydrographie (1853).

SZALAY, LADISLÁS (1813—1864), Hungarian statesman and historian, was born at Buda on the 18th of April 1813. After the completion of his studies, he became a member of the Hungarian parliament, and in 1848 he represented Hungary in the German national parliament at Frankfort. He took part in the revolution of 1848—49, and was obliged to seek refuge in Switzerland, where he wrote his History of Hungary. This important work, published at Budapest (1856—1860), extends to 1707. Szalay also wrote remarkable studies on Pitt, Fox, Mirabeau and other statesmen, and contributed very considerably to the codification of Magyar law. In later life he returned to Hungary, but he died at Salzburg on the 17th of July 1864.

See Alexander Flegler, L. von Szalay (Leipzig, 1866).

SZÉCHÉNYI, ISTVÁN, COUNT (1791—1860), Hungarian statesman, the son of Ferencz Széchenyi and the countess Juliana Festetics, was born at Vienna on the 21st of September 1791. Very carefully educated at home till his seventeenth year, when he entered the army, he fought with distinction at the battle of Raab (June 14, 1809), and on the 19th of July brought about the subsequent junction of the two Austrian armies by conveying a message across the Danube to General J. G. Chasteler at the risk of his life. Equally memorable was his famous ride, through the enemy's lines on the night of the 16th—17th of October 1813, to convey to Blücher and Bernadotte the wishes of the two emperors that they should participate in the battle of Leipzig on the following day, at a given time and place. In May 1815 he was transferred to Italy, and at the battle of Tolentino scattered Murat's bodyguard by a dashing cavalry charge. From September 1815 to 1821 he visited France, England, Italy, Greece and the Levant, carefully studying the institutions of the countries through which he passed, and everywhere winning admirers and friends. A gifted scientific writer, with his brother Miklos Wesselenyi, taught him much about trade and industry, which knowledge he subsequently applied to his country's needs. In 1825, when he went to France in the suite of Prince Pál Esterházy, to attend the coronation of Charles X., the canal du Midi especially attracted his attention and suggested to him the idea of regulating the rivers Danube and Theiss. At the Diet of 1825, when the motion for founding a Hungarian academy was made by Pál Nagy, who bitterly reproached the Magyar nobles for so long neglecting their mother-tongue, Széchenyi offered to contribute a whole year's income (60,000 florins) towards it. His example was followed by three other magnates who contributed between them 58,000 florins more. A commission was thereupon appointed to settle the details, and on the 18th of August the project received the royal assent. Another of his great projects was the opening up of the Danube for trade from Buda to the Black Sea. He satisfied himself of the practicability of the scheme by a personally conducted naval expedition from Pest to Constantinople. The basis of Joseph I. reform the nation was already divided into two parties, though only the minority held with Széchenyi. But neither this fact nor the gradual loss of his popularity restrained Széchenyi, both in the Diet and at county meetings, from fulminating conscientiously against the extreme demands of Kossuth. His views at this period are expounded in the pamphlet Politikai program töredékek ("Fragments of a Political Programme"). He held the portfolio of ways and communications in the first responsible Magyar administration (March 23, 1848) under Báthory, but his increasing apprehension of a revolution, with its inevitable corollaries of civil war and a rupture with the dynasty, finally affected his mind, and on the 5th of September he was removed to an asylum. Here he remained for many years, but recovered sufficiently to correspond with his friends and even to meditate writing fresh books. In 1859 he published the pamphlet Ein Blick in which he implored his countrymen to accept the Bach system as the best constitution attainable in the circumstances. The sudden death of his old friend Baron Samuel Jósvika and the once more darkening political horizon led him, in a moment of despair, to take his own life (April 8, 1866). He richly deserved the epithet "the greatest of the Magyars" bestowed upon him by his political antagonist Kossuth.

Most of his numerous works on political and economical subjects have been translated into German. The best complete edition of his writings has been published, in nine volumes, by the Hungarian Academy of Arts, 1884—1898, by J. Milich, J. Szechenyi, by Zagdond Kemény (Hung.; Pest, 1870); Aurel Kecskeméthy, The Last Years and Death of Count Széchenyi. (Hung.; Pest, 1866); Menhyert Lowyai, Count Széchenyi and his Posthumous Writings (Hung.; Budapest, 1875); Max Falk, "Der Graf Stephen Széchenyi und seine Zeit" (in the Oesterreichische Revue, Vienna, 1867); Antal Zichy, Count Széchenyi as a Pedagogue (Hung.; Budapest, 1876); Pál Gyulai, Széchenyi as a Writer (Hung.; Budapest, 1892); Antal Zichy, Count Stephen Széchenyi (1791—1860) (2 vols., Budapest, 1896—1897).

SZE-CH'UEN (Four Rivers), a western province of China, bounded N. by Kokonor, Kan-suh and Shen-shi, E. by Hu-pei and Hu-nan, S. by Kwei-chow and Yun-nan, and W. by Tibet. Estimates of its population vary from 45,000,000 to 68,000,000; estimates of its area from 185,500 to 218,000 sq. m. It is considerably larger than any other province of China, Yun-nan, which comes next in size, covering less than 150,000 sq. m. Sze-ch'uen contains twelve prefectural cities, inclusive of Ch'êng-tu Fu, the provincial capital. The western portion forms part
of the mountain-lands of Central Asia and much of it is over 10,000 ft. high, while heights of 16,000 to 19,000 ft. occur. The northern portion is also mountainous, but the east central part of Beyond-ruen consists of a red sandstone table-land (see Cittiva, § 1). Toward the north-east end of this plateau, commonly known as "the red basin," is Ch'eng-tu Fu (pop. 450,000–
500,000), the provincial capital. The plain in which the city stands is about 70 m. long and 30 wide, and is noted for the density of its population (about 5,000,000), its wealth, and its splendid irrigation works.

The fauna includes bears, yaks, various kinds of antelope, monkeys and parrots. The flora includes magnificent yews, a great variety of bamboos, tallow, varnish, soap, and wax trees, rhododendrons and giant azaleas. The ethnological and commercial features are shared by the physical features. The mountain districts are poorly cultivated, and are inhabited by Ijin or barbarians, who are distinguished under the tribal names of Si-fan, Lo-lo and Man-tse, and who maintain a semi-independence. Tibetans are also scattered over the western region and are numerous in the districts of Pa-tang. The table-land is inhabited by Chinese, and is one of the most thriving and populous regions in the empire. These Chinese exhibit great diversity of type, due in part to immigration from other provinces in the 17th century—

The province of Kiangsu, in the north-eastern part of the empire, is one of the richest and most densely populated in the world. It is bounded on the north by the Huai-hai plain, on the west by the Yangtsze-kiang, and on the south by the Hizen Sea. It is divided into two districts, one on the north-west and one on the south-east.

The north-west district is more fertile and produces a larger variety of crops. It is also more densely populated. The capital of the province is Hankow (pop. 250,000), a commercial centre and a port of call for the Chinese junks. The city is renowned for its beautiful gardens and parks, and for its fine temples and pagodas. The north-west district is also noted for its minerals, particularly coal and iron. The south-east district, on the other hand, is more thinly populated and is mainly agricultural. The capital of the south-east district is Nanking (pop. 300,000), a centre of trade and culture. It is also the seat of the university.

The Yangtsze-kiang, the chief river of the empire, flows through the province of Kiangsu. It is one of the longest rivers in the world, and is navigable for a distance of 1,500 miles. The river is also of great importance for irrigation, and is used to irrigate a large area of the plain. The province is also noted for its salt production, which is carried out on the shores of the sea. The salt is produced by boiling the seawater in large pans, which are then left to dry in the sun. The resulting salt is collected and transported to market in large jars.

The province is also famous for its porcelain, which is produced in the city of Ching-chow (pop. 100,000). The porcelain is highly regarded for its fine quality and delicate designs. It is exported to many countries, and is much prized by collectors. The province is also noted for its silk production, which is carried out in the city of Peking (pop. 1,500,000), the capital of the empire. The silk is produced by feeding silkworms with mulberry leaves, and the cocoons are then boiled to extract the silk. The silk is then woven into fine fabrics, which are exported to many countries.

The province is also noted for its tea production, which is carried out in the city of Ch'ing-chow (pop. 500,000), the second largest city of the empire. The tea is grown on the hillsides, and is harvested in the late summer. The tea leaves are then dried in the sun, and are then shipped to market.

The province is also noted for its rice production, which is carried out in the city of Peking (pop. 1,500,000), the capital of the empire. The rice is grown in the paddy fields, and is harvested in the late summer. The rice is then dried in the sun, and is then shipped to market.

The province is also noted for its cotton production, which is carried out in the city of Peking (pop. 1,500,000), the capital of the empire. The cotton is grown on the plains, and is harvested in the late summer. The cotton is then ginned, and is then shipped to market.

The province is also noted for its tobacco production, which is carried out in the city of Peking (pop. 1,500,000), the capital of the empire. The tobacco is grown on the hillsides, and is harvested in the late summer. The tobacco is then dried in the sun, and is then shipped to market.

The province is also noted for its brick production, which is carried out in the city of Peking (pop. 1,500,000), the capital of the empire. The bricks are made from clay, which is dug from the hillsides, and is then mixed with water to form a paste. The paste is then rolled into balls, which are then dried in the sun. The bricks are then used to build houses and other structures.
red pepper largely used in Hungary, and of a pastry called tarkonya; and has factories of soap, leather, boots, saw-mills and distilleries. Szeged is the centre of the commerce and industry of the great Hungarian Alföld, being an important railway junction and the principal port on the Theiss.

Since the 15th century Szeged has been one of the most prominent cities in Hungary. From 1541 till 1686 it was in possession of the Turks, who fortified it. It is also notorious for its many witchcraft trials. In 1848 it sent strong detachments to the national Hungarian army. In July 1849 the seat of the government was transferred hither for a short time.

SZÉKESFEHÉRVÁR (Ger., Stuhlwiessebn, Lat., Alba Regalis or Alba Regio), a town of Hungary, capital of the county of Székesfehérvár in Pusztaújváros Hagymás Pop. (1900), 30,451.

It is situated in a marshy plain and is a well-built and prosperous town. Székesfehérvár is the seat of a Roman Catholic bishopric, one of the oldest in the country, and was formerly a town of great importance, being the coronation and burial place of the Hungarian kings from the 10th to the 16th century. Amongst its principal buildings are the cathedral, the episcopal palace, several convents, of which the most noteworthy is the Jesuit convent, now a Cistercian secondary school with a handsome church, and the county hall. The town carries on a brisk trade in wine, fruit and tobacco, and is one of the chief centres of Hungarian distilleries.

SZÉKELERS, or Székels (Szeke, Lat. Siculi), a Finno-Ugrian people of Transylvania, akin to the Magyars. They form a compact mass of rather more than 450,000, extending from near Kronstadt on the south to Maros-Vásárhely and Gyergyó St Miklós on the north. Their origin is unknown and has been the subject of much learned debate. Their own ancient tradition affirms their descent from Attila's Huns. According to Procopius (De bello gothic. iv. 18) 3000 Huns entered Transylvania (Erdelem, i.e. the Magyar Erdély) after their defeat, calling themselves, not Hungarians, but Zekei, and the Székelys (or descendants of the Hun, as they were styled by the Hungarians) remained in Transylvania till the return of their kinsmen under Árpád; the anonymous scribe of King Béla speaks of them as "formerly Attila's folk." Von Rethy (Ung. Rev. vii. 812) suggests that they were originally a band of Black Ugrics who sought refuge in Transylvania after their defeat by the Pechenegs. Timon, however (Magyar Alkotmány és Jogtörténete, p. 73), points out that their language proves that their separation from the main Magyar stock must have taken place after the Magyar tongue had been fully developed (see also Hunfalvy, Magyarság Étnographiája, 1900). According to another theory they were Magyars transplanted by St Ladislaus to Transylvania in order to form a permanent frontier guard. Some such origin would, indeed, seem to be implied by the name Székeli, if this be derived, as Czetseni surmises ("Die Szeklerfrage," Ung. Rev. i. 411-438), from zek, seat, i.e. an administrative district (cf. the Stuhl of the Transylvanian Saxons); Székely would thus mean simply "frontier-guards."

SZIGILGETI, EDE (1614-1679), Hungarian dramatist, whose original name was Jászfalyc Szathmáry, was born at Nagyvárad-Olaszi, on the 8th of March 1614. His parents would have made him a priest; he wanted to be a great doctor; finally he entered the office of an engineer. But his heart was already devoted to the drama and, on the 15th of August 1634, despite the prohibition of his tyrannical father, he actually appeared upon the stage at Budapest. His father thereupon forbade him to bear his name in future, and the younger Szathmáry henceforth adopted instead the name of Edé Szigilgeti, the hero of one of Sandor Kisfaludy's romances. He supported himself for the next few years precariously enough, earning as he did little more than twelve florins a month, but at the same time he sedulously devoted himself to the theatre and sketched several plays, which differed so completely from the "original" plays then in vogue (The Played-out Trick actually appeared upon the boards) that they attracted the attention of such connoisseurs as Vörösmarty and Bajza, who warmly encouraged the young writer. In 1640 the newly founded Hungarian Academy crowned his five-act drama Rosa, the title-role of which was played by the brilliant actress Barbara Rakodczay, who was afterwards (1858) elected a member of the Academy. In 1645 he was a member of the Kisfaludy Society. He was now the leading Hungarian dramatist. Three of his plays were pronounced by the National Theatre and sixteen by the Academy. His verdict on all dramatic subjects was for years regarded as final, and he was the mentor of all the rising young dramatists of the 'sixties. During the half-century of his dramatic career Szigilgeti wrote no fewer than a hundred original pieces, all of them remarkable for the inexhaustible ingenuity of their plots, the technical perfection of their construction, and the humourous and satirical vein of their style. To the last he was an incisive and unscrupulous author used striking and unexpected effects to produce his dÉnouement. He wrote, perhaps, no work of genius, but he amused and enthralled the Magyar playgoing public for a generation and a half. Szigilgeti's most successful tragedies were Gritti (1844), Paul Bélki (1856), Light's Shadows (1865), Strange (1871), Velia and The Pretender (1868). His tragedies, as a rule, lack pathos and sublimity. Much more remarkable are his comedies. He is a perfect master of the art of weaving complications, and he prefers to select his subjects from the daily life of the upper and upper-middle classes. The best of his comedies are The Three Commandments of Matrimony (1850), Sweet Sweeney (1855), Momma (1857), The Reign of Woman (1862), and especially the farce Young Lilly (1869). He also translated Goethe's Egmont and Shakespeare's Richard III., and wrote a dramatical work entitled The Drama and its Varieties. A few of his plays have appeared in German.

See P. Rakodczay, Edward Szigilgeti's Life and Works (Hung.; Pressburg, 1901); F. Gyulai, Memorial Speeches (Hung.; Budapest, 1869).

SZOMBATHELY (Ger., Steinemseren), the capital of the Hungarian county of Vas, 162 m. W. of Budapest by rail. Pop. (1900), 23,309. It is the seat of a Roman Catholic bishop, and possesses a beautiful cathedral (1797-1821) with two towers, 180 ft. high. Other buildings are the episcopal palace, to which is attached a museum of Roman antiquities, the county hall, the convent of the Dominicans and the seminary for Roman Catholic priests. Szombathely is an important railway and industrial centre, and has a state railway workshop, manufactory for agricultural machinery, foundries and steam mills. About 5 m. south of Szombathely lies the small village of Ják, with a Dominican convent from the 11th century, which has a remarkably beautiful chancel and some of the best specimens of Romanesque architecture in the country. About 16 m. by rail south of the town is Körmend (pop. 6173), with a beautiful castle belonging to Count Bathynyi. About 16 m. by rail, west of Körmend is the small town of Szent Gotthard (pop., 2055, mostly Germans), with a Cistercian abbey, founded by King Béla III. in 1183, where General Montecucculi gained a decisive victory over the Turks in 1664.

Szombathely occupies the site of the Roman town Sabaria Savaria, which was the capital of Pannonia. Here in A.D. 193 Septimius Severus was proclaimed emperor by his legions. Many remains from the Roman period have been excavated, such as traces of an amphitheatre, a triumphal arch, the old fortifications, an aqueduct, &c. The remains are preserved partly in the museum at Budapest, and partly in the municipal museum. The bishopric was created in 1777.
the last letter in the Semitic alphabet, where, however, its form in the earliest inscriptions is that of a St. Andrew's Cross X. In both Greek and Latin, however, although the upright and cross stroke are frequently not exactly at right angles and the upright often projects beyond the cross stroke, the forms approach more nearly to the modern than to the Semitic shape. The name Taaffe was taken over in the Greek Ῥαθ. The sound was that of the unvoiced dental stop. The English t, however, is not dental but alveolar, being pronounced, as ð also, not by putting the tongue against the teeth but against their sockets. This difference is marked in the phonetic differentiation of the dental and the alveolar t by writing them respectively t and ð. The alveolar sound is frequent also in the languages of India, which possess both this and the dental sound. The Indian ḯ, however, is probably produced still farther from the teeth than is the English sound. In the middle of words when t precedes a palatal sound like ʃ (y) which is not syllabic, it would lie with it into the sound of ʃ as in position, nation, &c. The change to a sibilant in these cases took place in late Latin, but in Middle English the ḱ following the t was still pronounced as a separate syllable. A later change is that which is seen in the pronunciation of nature as nelts’. This arises from the pronunciation of u as ʌ, and does not affect the English dialects which have not thus modified the u sound. Similar changes had taken place in some of the local dialects of Italy before the Christian era. At the end of words the English t is really aspirated, a breath being audible after the t in words like bit, kit, pit. This is the sound that in ancient Greek was represented by ð. In medieval and modern Greek, however, this has become the unvoiced sound represented in English by th in thin, thick, pitch. Though represented in English by two symbols this is a single sound, which may be either interdental or, as frequently in English, produced “by keeping the tongue loosely behind the upper front teeth, so that the breath escapes partly between the tongue and the teeth, and partly, if the teeth are not very closely set, through the interstices between them” (Jespersen). In English ð represents both the unvoiced sound ð as in thin, ð, and the voiced sound ɹ which is found initially only in nominal words like this, that, there, then, those, is commonest medi ally as in father, bother, smoker, either, and is found also finally in words like with (the preposition), both. Early English used ð and ð indiscriminately for both voiced and unvoiced sounds, in Middle English ð disappeared and þ was gradually assimilated in form to y, which is often found for it in early printing. It is, however, to be regretted that English has not kept the old symbols for sounds which are very characteristic of the language. In modern Greek the ancient ð (d) has become the voiced spirant (ð), though it is still written ð. Hence to represent ð, Greek has now to resort to the clumsy device of writing NT instead.

(P. Gl.)

TAAFFE, EDUARD FRANZ JOSEPH VON, COUNT [11th Viscount Taaffe and Baron of Ballymote, in the peerage of Ireland] (1833–1895), Austrian statesman, was born at Vienna on 24th February 1833. He was the second son of Count Ludwig Patrick Taaffe (1791–1855), a distinguished public man who was minister of justice in 1848 and president of the court of appeal. As a child Taaffe was one of the chosen companions of the young archduke, afterwards emperor, Francis Joseph. In 1852 he entered the public service; in 1865 he was Statthalter of Upper Austria, and the emperor offered him the post of minister of the interior in Beust’s administration. In June he became vice-president of the ministry, and at the end of the year he entered the first ministry of the newly organized Austrian portion of the monarchy. For the next three years he took a very important part in the confused political changes, and probably more than any other politician represented the wishes of the emperor. He had entered the ministry as a German Liberal, but he soon took an intermediate position between the Liberal majority of the Berger ministry and the party which desired a federalistic amendment of the constitution and which was strongly supported at court. From September 1868 to January 1870, after the retirement of Auersperg, he was president of the cabinet. In 1870 the government broke up on the question of the revision of the constitution: Taaffe with Potocki and Taaffe wished to make some compromises to the Federalists; the Liberal majority wished to preserve undiminished the authority of the Reichsrath. The two parties presented memoranda to the emperor, each defending their view, and offering their resignation: after some hesitation the emperor accepted the policy of the majoriy, and Taaffe with his friends resigned. The Liberals, however, failed to carry on the government, as the representatives of most of the territories refused to appear in the Reichsrath: they resigned, and in the month of April Potocki and Taaffe returned to office. The latter failed, however, in the attempt to come to an understanding with the Liberals, standing with the Czechs, and in their turn had to make way for the Clerical and Federalist cabinet of Hohenwart. Taaffe now became Statthalter of Tirol, but once more on the breakdown of the Liberal government in 1879 he was called to office. At first he attempted to carry on the government without change of principles, but he soon found it necessary to come to an understanding with the Feudal and Federal parties, and he was responsible for the conduct of the negotiations which in the elections of this year gave a majority to the different groups of the National and Clerical opposition. In July he became minister-president: at first he was completely at loggerhead with the Liberals, but this was soon made impossible, and he was obliged to turn for support to the Conservatives. It was his great achievement that he persuaded the Czechs to abandon the policy of abstention and to take part in the parliament. It was on the support of them, the Poles, and the Clericals that his majority depended. His avowed intention was to unite the nationalities of Austria: Germans and Slavs were, as he said, equally integral parts of Austria; neither must be oppressed; both must unite to form an Austrian parliament. Notwithstanding the growing opposition of the German Liberals, who refused to accept the equality of the nationalities, he kept his position for thirteen years. Not a great creative statesman, he had singular capacity for managing men; a very poor orator, he had in private intercourse an urbanity and quickness of humour which showed his Irish ancestry. For the history of his administration see AUSTRIA-HUNGARY, History (Sec. II. “Austria Proper”). Beneath an apparent cynicism and frivolity Taaffe hid a strong feeling of patriotism to his country and loyalty to the emperor. It was no small service to both that for so long, during very critical years in European history, he maintained harmony between the two parts of the monarchy and preserved constitutional government in Austria. The necessities of the parliamentary situation compelled him sometimes to go farther in meeting the demands of the Conservatives and Czechs than he would probably have wished, but he was essentially an opportunist: in no way a party man, he recognized that the government must be carried on, and he cared little by the aid of what party the necessary majority was maintained. In 1863 he was defeated on a proposal for the revision of the franchise, and resigned. He retired into private life, and died two years later at his country residence, Ellerschau, in Bohemia, on 29th November 1895.

By the death of his elder brother Charles (1825–1873), a colonel in the Austrian army, Taaffe succeeded to the Austrian and Irish titles. He married in 1862 Countess Irma Tásky, by whom he left four daughters and one son, Henry. The family history presents points of unusual interest. From the 13th century the Taaffes had been one of the leading families in the north of Ireland. In 1628 Sir John Taaffe was raised to the peerage as Baron Ballymote and Viscount Taaffe of Corven. He left fifteen children, of
whom the eldest, Theobald, took a prominent part in the Civil War, accompanied Charles II. in exile, and on the Restoration was created earl of Carlisle. He was sent on missions to the duke of Lorraine and to the emperor, by which he was established the friendship of the house of Habsburg and Lorraine, which has continued to this day. His eldest son was killed in the Turkish wars. He was succeeded in the title by his second son, who had served in the Spanish wars and was killed at the Boyne. The next brother, Francis, the third earl, was one of the most celebrated men of his time: he was brought up at Olmizzt, at the imperial court, and in the service of the Elector of Saxony. He had many diplomatic commissions, and at the end of his life was chancellor and chief minister to the duke of Lorraine. Notwithstanding the Jacobite connexions of his family, the title of Lord of Lorraine was surrendered to William III., and the attainder and forfeiture of the estates incurred by his brother was repealed. This favour he owed to his position at the court of the emperor, William's most important ally. On his death the title and estates went to his nephew Theobald, whose father had fallen during the siege of Derry, and who himself had served with distinction in the Austrian army. On his death the title of earl of Carlisle became extinct; both the Austrian and Irish titles were continued in the Irish line by the marriage of Nicholas (1677–1706). Like so many of his family, he was brought up in Lorraine and passed into the Austrian army; he fought in the War of the Austrian Succession, and was in command of the forces in the Hanoverian army. His Irish estates were, however, claimed under the Act of 1703 by a Protestant heir: a lawsuit followed, which was ended by a compromise embodied in a private act of parliament, 961 Geo. II., Feb. 22, 1731. The paper was sent to him with the money he acquired the castle of Ellerschau, in Bohemia; he had also inherited other property in the Austrian dominions. He was naturalized in Bohemia, and left on record that the reason for this step was that he could not expect to be exposed to the temptation of becoming Prot- estants so as to avoid the operation of the penal laws. His great-grandson Nicholas (1777–1836), the last of the line who served in the British army, was a member of the Privy Council of the House of Lords in 1856, and the right of his family to hold the Irish title continued. See Wurzbach, Biographisches Lexicon Oesterreichs, Memoirs of the Times (1810–30), vol. 1, p. 466; (1838–61), vol. 1, p. 439, by E. B. Lanige. The Prague Politik published in December 1904 contains some interesting correspondence collected from Taaffe's papers. (J. W. Hc.)

TAAL, a town of the province of Batangas, Luzon, Philippine Islands, on the Pansipit river, opposite Lemery, with which it is connected by a bridge, and about 50 m. S. of Manila. Pop. of the municipality (1900) 17,525. Taal is built, chiefly of stone, on the shores of a lake, or lake-island, lying in the Gulf of Balayan into which the Pansipit river flows. It has a cool and healthy climate, is an important military station, and a port for coastwise vessels. Extensive agricultural lands in the vicinity produce rice, Indian corn, sugar-cane, pepper, cocoa, and cotton, but the great coffee plantations which were formerly to be seen in its vicinity have been destroyed by insects. The inhabitants are also engaged in raising horses and cattle, in fishing, and in carrying on a considerable trade in cotton goods, sugar, coffee, &c. Taal is the only town in the Philippines where effective efforts have been made to exclude the mosquito. The hospitality of the inhabitants, as of the rest of the island, was such that none succeeded in establishing a residence here until the latter days of the revolution against the American government. The town was founded in 1754 after the destruction by Taal volcano of an old town of the same name on Lake Taal. The language is Tagalog.

TABACO, a town and port of entry of the province of Albay, Luzon, Philippine Islands, on Tabaco bay, about 20 m. N. of the town of Albay. Pop. (1903) 21,046. The men of Tabaco are largely engaged in the cultivation of hemp; the women in weaving, spinning, and basket-making. The town has a deep and well-protected harbour, and its shipping is extensive. The language is Bicol.

TABARD, a short coat, either sleeveless, or with short sleeves or shoulder pieces, emblazoned on the front and back with the arms of the sovereign, and worn, as their distinctive gar- ment, by heralds and pursuivants. A similar garment with short sleeves or without sleeves was worn in the middle ages by knights on their armour, and was also emblazoned with their arms or worn plain. The name was also given in earlier days to a much smaller similar garment, a stuff frieze worn by peasants; the ploughman wears a "tabard" in the same manner to the Canterbury Tales. Similarly at Queen's College, Oxford, the scholars on the foundation were called "tabarders," from the tabard, obviously not an emblazoned garment, which they wore. The word itself appears in Fr. tabard or tabart, &c., Ital. tabarro, Ger. taschert, Med. Lat. tabardus, tabardium, &c. It is of doubtful origin, but has usually been connected with "tippet," "tapestry," from Lat. tæpetus, hangings, painted cloths; Gr. τάπητας, carpet.

Mohammad ibn Jarir ut-Tabarî (838–923), Arabian historian and theologian, was born at Amol in Tabaristan (south of the Caspian), and studied at Rei (Rai), Tabaristan and in Syria and Egypt. Cast upon his own resources after his father's death, he was reduced to great poverty until he was appointed tutor to the son of the vizier 'Ubaidallah ibn Yabây. He afterwards journeyed to Egypt, but soon returned to Bagdad, where he remained as a teacher of tradition and law until his death. His life was simple and dignified, and characterized by extreme diligence. He is said to have often refused valuable gifts. A Sha'â'ite in law, he claimed the right of the 'ulama' over all schools, and ended by establishing a school of his own, in which, however, he incurred the violent wrath of the Hanbalites.

His works are not numerous, but two of them are very extensive. The one is the Tabârî ur-Rusul wal-Muluki (History of the Prophets and Kings), generally known as the Annals (cf. ARABIA, Literature, "History"). This is a history from the Creation to A.D. 931, and is renowned for its detail and accuracy. It has been published under the editorship of M. J. de Goeje in three series, comprising thirteen volumes, with two extra volumes containing Indexes, introduction and glossary. A convenient digest of this work, made in 1963 by the Sâmanid vizier al-Bal'ami, has been translated into French by H. Zotenberg (vols. i.–iv., Paris, 1867–1874). A Turkish translation of this was published at Con- stantinople (1844). His second great work was the commentary on the Koran, which was marked by the same fullness of detail as the Annals. The size of the work and the independence of judgment in it seem to have prevented it from having a large circulation, but scholars such as Baghari and Suyuti used it largely. It has been published in thirty vols. (with extra index volume) at Cairo, 1902–1903. An account of it, with brief extracts, has been given in F. Zotenberg, Die Geschichtsdrucke des Deutschen Mittelalters, vol. xxv. (1881), pp. 588–628. Persian and Turkish translations of the commentary exist in manuscript. A third great work was projected by Tabari. This was to be on the traditions of the prophets, the apostles, and the ancestors. (Leiden, 1857, not published.) Other smaller works are mentioned in the Fikrist, pp. 234–235. (G. W. T.)

TABARIN (Fr. tabard, Ital. tabarrine, a small cloak), the name assumed by Jean Salomon (c. 1584–1633), a Parisian street charlatan, who amused his audiences in the Place Dauphine by farcical dialogue with his partner Mondor (Philippe Girard), with whom he reaped a golden harvest by the sale of quack medicines. A contemporary portrait shows him in the dress of a clown, but with a moustache and pointed beard, carrying a wooden sword and wearing a soft grey felt hat capable of assuming countless amusing shapes in his deft fingers. His regular evening antics were varied by more elaborate weekly performances in which others appeared, notably his wife. In these he took the part of a fat old fool, but his jokes, while usually coarse, were frequently clever, and his extemporized speeches were full of originality. He is said to have influ- enced both Molière and La Fontaine. The latter praises him, and he is also well spoken of by Boileau and Voltaire. He retired about 1628, and died on the 16th of August 1633.

The farces and pantomimes in which he performed, and whose répertoire, were credited to him, and long series of cheap leaflets purporting to be his complete works began to appear as early as 1622. Two rival editions, in two volumes and one volume respectively, were published as late as 1838. The word Tabarin, spell with a t, has been adopted into the French language to designate the comic performer of a street booth.
The Tabernacle

Tabasco, a state of Mexico, bounded N. by the Gulf of Mexico, E. by the state of Campeche and Guatemala, S. by Guatemala and Chiapas, and W. by Vera Cruz. Area 10,672 sq. m. Pop. (1900) 155,834. The surface is generally low and flat, largely covered with lagoons, watercourses and swamps. In the S. and S.E. there is an area belonging to the rough higher formation of Chiapas. Dense forests cover the whole region, and there are valuable fine woods and dyes-woods. There are several large lagoons on the coast, two of which are called Sant' Ana and Tupilco bays. Two large rivers, the Grijalva and Usumacinta, traverse its territory. The Grijalva, also called Tabasco, the upper course of which is known as the Chiapas, has its most distant sources in western Guatemala and flows N.W. up the river that stood the altar of burnt offering, thence to the frontier of Tabasco, and thence N.E. to the coast; it is navigable for 93 m. The Usumacinta likewise has its sources in western Guatemala. It forms the boundary between Guatemala and Chiapas until the frontier of Tabasco is reached, where its N.W. course turns to the N. and then N.W. to a junction with the Grijalva—the two rivers having a common outlet. The Usumacinta, including its head streams, is about 500 m. long; excluding them about 330 m. long; for about 270 m. it is navigable, for about 180 m. for large steamers. There are no railways and no good roads, and these rivers and the navigable channel of the San Juan, called its portiere, are the principal practical thoroughfares in the state. The capital is San Juan Bautista (pop., 1900, 10,548), formerly called Villa Hermosa, on the Grijalva river, about 70 m. above its mouth. The next most important town is Frontona (pop., 1895, 6794), a port 3 m. within the mouth of the Grijalva.

Tabernacle

Tabernaculum, a hut, tent, specifically the name given in the English Bible to the portable sanctuary which, according to the priestly sources of the Pentateuch, was erected by Moses in the wilderness as the place of worship of the community of Israel. The word is derived from the Arabic tabana, to huddle, crowd together, and thus it may be derived from the Hebrew tebenu, to huddle. From the Latin tabernaculum, the term was applied to the portable structure erected by Moses in the wilderness as the place of worship of the Israelites. The word has been used to refer to the portable temple erected by Moses in the wilderness, as well as to the various structures that were built in later periods, such as the tabernacle of the Israelites in the wilderness, and the tabernacle of the people of Israel in the Promised Land.

The Tabernacle and its Furniture

The Tabernacle proper is represented as standing within a rectangular area, measuring 100 cubits by 50, approximately 150 feet by 75, which formed the centre of the camp in the wilderness. This area, termed the "court of the tabernacle," was fenced off from the rest of the encampment by a series of curtains suspended from 100 pillars standing at intervals of 5 cubits, and lay east and west with its entrance on the eastern side. Of the two squares, each measuring 50 cubits by 50, into which the court may be divided, the more easterly was that in which the worshippers assembled. In the centre of this square stood the altar of burnt offering, a hollow chest of acacia wood overlaid with bronze. The tabernacle itself also stood east and west, with its entrance towards the east, on the edge of the second square. The essential part of the structure, to which everything else was subsidiary, was that termed in the original the mishkan, i.e. dwelling (Eng. Vers. tabernacle, but see Exod. xxv. 9, Rev. Vers. margin). It was formed of ten curtains, in two sets of five, of the finest linen with inwoven coloured figures of cherubim, the whole making an artistic covering measuring 40 cubits by 28. Instead of being suspended on poles after the manner of an ordinary tent, the curtains were made to form a wall of open frames of acacia wood overlaid with gold, each 10 cubits in height by 1½ in breadth. These frames, 48 in all, were so arranged as to form the southern, western and northern sides of a rectangular structure, 30 cubits in length and 10 cubits in breadth and height. Over the frames, as has been said, were thrown the two sets of tapestry curtains above described, while the eastern end, forming the entrance, was closed by a special portiere suspended from five pillars. The dwelling was divided into two parts by a second hanging, the "veil," 10 cubits from the western end. These two parts were termed respectively

1 For the philological and other arguments in favour of open frames in place of the traditional solid beams—the "boards" of the English version—as supports of the curtains, see the writer's article "Tabernacle" in Hastings's Dict. of the Bible, iv. 659 f., with illustrative diagrams.
TABERNACLE, as a general term in architecture, a species of niche or recess in which an image may be placed. In Norman work there are but few remains, and these generally over doorways. They are shallow and comparatively plain, and the figures are often only in low relief, and not detached statues. In Early English work they are deeper, and instead of simple arches there is often a canopy over the figure, which was placed on a small, low pedestal. Later in the style the heads of the tabernacles became cusped, either as trefoils or cinquefoils, and they are often placed in pairs side by side, or in ranges, as at Wells. In the late Decorated Period and in the Perpendicular, more ornamental, the heads are sometimes richly cusped and surmounted with crocketed gables, as at York, or with projecting canopies, very much like the arcade at Lincoln. In this case the under side of the canopy is carved to imitate groined ribs, and the figures stand either on high pedestals, or on corbels. Perpendicular tabernacles possess much the same features, but the work is generally more elaborate (see Corneli, Canopy, Niches, &c.). The word tabernacle is also often used for the receptacle for relics, which was often made in the form of a small house or chapel (see Canopy). The term "tabernacle work," or to be observed "to have tabernacles," i.e. to have the exteriors ornamented, similar to that employed on the upper part of a tabernacle, decorated with canopied niches which contain statues. The Eleanor crosses in England are enriched with tabernacle work on the sides, as also the chapels of Bishops Nicholas West (1461-1533), and John Aloeck (1430-1500) in Ely cathedral, both dating from the beginning of the 16th century.

TABERNACLES, FEAST OF, the autumn festival of the Israelites, beginning on the 15th of Tishri and celebrated by residing for the seven succeeding days in rustic booths (Heb. Sukkah, in the Vulgate Tabernaculis, whence the English name of the feast). Among the Hebrews it was the third and chief of the three annual pilgrimage festivals connected respectively with the harvesting of the barley (Passover), of wheat (Pentecost), and of the vine (Tabernacles). Hence it is referred to as "the Feast for excellence" (Heb. Hebag, cf. Arab. Hajj) even as late as 2 Chron. vii. 9. Being of the nature of a pilgrimage feast the booths were temporary erections for the accommodation of the pilgrims. But in early Jewish tradition, in both Yahvist and Elohist sources of the Pentateuch (Exod. xxxiv. 22, xxiii. 16) it is called simply the Harvest Feast (A.V. "Feast of Ingathering") and is to be observed "at the end of the year," i.e. of the agricultural year. In Deut. xvi. 13 seq., it is termed the Feast of Tabernacles and is to be kept seven days after the produce of the threshing-floor and winepress has been gathered in. In the Holiness Code (Lev. xxiii. 39) it is to be kept for seven days after the first, the first of which is to be "a sabbath," and the eighth "a sabbath" (possibly originally a lunar quarterly-day): branches of four trees are to be taken. In the Priestly Code (Lev. xxiii. 33 seq.; Num. xxix. 12-38) the first and eighth day are to be days of holy assembly, and in the latter passage elaborate details are given of the sacrifices to be presented, including a series of bullocks, thirteen on the first day, twelve on the next, and so on down to seven on the seventh day. Only one is to be sacrificed on the concluding feast (Heb. &p;eroh) of the eighth day.

The higher criticism sees, in these successive enactments of the various codes included in the Pentateuch (q.v.), a development in the character of the festival. At first held at any of the local shrines, such as Gilgal, Bethel, Shiloh, as well as Jerusalem, it was held at an indefinite date during the harvest in the fall of the year. Then with the concentration of the cultus at Jerusalem represented by Deuteronomy, the celebration was restricted to the Judæan capital, and its duration fixed at seven days, though its date was still left indeterminate. This was fixed in the Priestly Code at the 15th of the seventh month, and an eighth day of solemn assembly added after the return from the exile.

Against this hypothetical reconstruction is the fact that Solomon appears to have selected the occasion of the feast for the dedication of the temple, and that it lasted, even in his time, seven days (1 Kings viii. 2, 65). Jeroboam arranged for a similar feast in the northern kingdom on the 15th day of the eighth month, "like unto the feast in Judah" (ibid. xii. 32). The determination of a fixed date must therefore have been much earlier than Deuteronomy or the alleged period of the Priestly Code. A pilgrimage feast must be fixed in date to ensure the simultaneous presence of the pilgrims. There are, besides, seeming references to the feast in the early prophets, as Hosea xii. 9, Amos v. 21, as well as in Isaiah ix. 2 (Heb.).

The concluding feast does not seem to refer to tabernacles properly so called, but to the worship offered under the tabernacles in the descending series of the sacrifices of bullocks as given in Numbers. In Jewish practice the concluding feast is not held in booths, and Maimonides (Morch, iii. 42) suggests that its object was to give opportunity for final proceedings in assembly halls.

The existence, therefore, of much variation in the practice of the festival in historic times is scarcely proved by the seeming variations of the enactments concerning it in the Pentateuch. It is possible, however, that there may have been differences of custom in the carrying out of the feast. In Neh. xii. 15 the trees whose branches were used for making the booths appear to differ from those mentioned in Lev. xxiii. 40, though in Jewish tradition the latter passage was taken to refer to the Lulab, or a combination of twigs of willow and myrtle, with a palm branch, which, together with a citron, are held in the hand during processions in the synagogue. The Sadduccees and Karaites did not carry these in their hand, but used them as decorations of the booths. In the second temple there was a water libation every morning of the festival, and on the evening of the first day the great golden candelabrum was lit up and the men danced a torch dance around it (Mishnah, Sukkah, v. 2-4). It is reported by Josephus that, when Alexander Jannaeus, in the year 95 B.C., was acting as high-priest in the temple on the Feast of Tabernacles, instead of pouring the water libation on the altar, according to the Pharisaic custom, he poured it at his feet, giving rise to a riot in which 6000 men are said to have lost their lives (Ant. xii., xiii., 5; Talmud, Sukkah, 48b).

The festival is certainly an agricultural one, and is so termed in the Pentateuch. Whether it was derived from the Canaanites, who had similar festivals (Judges xxix. 27), is uncertain. All nations have similar harvest festivals, but the connection to the vintage feasts; as, for instance, the Athenian Oschophoria. The Syrians celebrated every three years a "Booth Festival." At the Hindu Festival of Dasara, which lasted nine days from the new moon of October, tents made of canvas or booths made of branches were erected in front of the temples. The Spartans had a nine days' festival termed Carnea, during which they dwelt in pavilions and tents in memory of their old camp life (Athenaeus, iv. 19). The Feast of Tabernacles is one of the few Jewish festivals described in classical writers. Plutarch (Symposion iv., vi. 2) compares Tabernacles with the Bacchic rites. It was pre-eminently the period of exultation in ancient Jewish rite, and the Mishnah declares that "He who has not seen the joy of the libations of Tabernacles has never in his life witnessed joy." So much importance was attributed to this festival that it was chosen as the occasion on which the Law should be recited during the sabbatical year (Deut. xxxi. 9-12), and the Messianic vision of Zechchariah xiv. 16 sees the remnant of all the nations coming up to Jerusalem to worship the Lord of Hosts, and to keep the Feast of Tabernacles.

In later Jewish custom the one-year cycle of reading of sections from the Pentateuch ends on the concluding day of Tabernacles, which is therefore known as the Rejoicing of the Law (Simhat Torah). The custom of dwelling, for part of the day at least, in booths, is still kept up by orthodox Jews, who have temporary huts covered with branches erected in their courtyards, and those who are not in possession of a house with a backyard often go to pathetic extremes in order to fulfil the law by making holes in roofs, across which branches are placed.

(J. J.A.)
TABLE.—TABLE, MATHEMATICAL 325

TABLE (Lat. tabula), a flat, oblong slab supported upon legs or pillars; originally anything flat. As one of the few indispensable pieces of domestic furniture, the table is of great antiquity. It was known, in a small and rudimentary form, to the Egyptians, who used wood for its construction; the Assyrians certainly employed metal and stone, at times in its manufacture. Greek tables were also often of metal, with three or four legs and of considerable variety of form; they were small and low. By Roman times the table had apparently become somewhat more common. The favourite form was the tripod, but one and four legs were also used. Already the shape varied considerably, and in addition to wood, there were tables of marble, ivory, bronze and the precious metals. The more costly examples were carved, inlaid or otherwise ornamented; cedar and the finely marked or grained woods generally were much sought after. As in Greece the tables were low; they were intended for reclining, rather than sitting; their legs were those of wild beasts, or were formed of sphinxes, termini and other figures. Some of those which remain are of extreme grace and most delicate workmanship; to them the Empire style is immensely indebted. In antiquity tables of any kind can only have been the appannage of the rich. In the early middle ages, although there was variety of form—the circular, semi-circular, oval and oblong were all in use—tables appear, save in rare instances, to have been portable and supported upon trestles fixed or folding, which were cleared out of the way at the end of the meal. The custom of serving dinner at its manufacture. For hands tables were reserved. Even at a period when domestic furniture was of a very primitive character and few modern conveniences had been evolved, costly tables were by no means unknown—some dim traditions of Rome’s refinements must necessarily have filtered through the centuries. Thus Charlemagne possessed three tables of silver and one of gold—no doubt they were of wood covered with the precious metals. In the 15th century the number of tables properly so called was small; hence very few of earlier date than the middle of that century have come down to us. In the chapter-house of Salisbury cathedral is a restored 13th-century example which stands practically alone. In point of age it is most nearly approached by the famous pair of trestle tables in the great hall at Penshurst.

When the table became a fixed and permanent piece of furniture the word “board,” which had long connoted it, fell into disuse save in an allusive sense, and its place was taken by such phrases as “joyed table” and “framed table,” that is, jointed or framed together by a joiner, to whose name people spoke of a “standing” or “dormant” table. They were most frequently oblong, some two feet or two feet six inches wide, and the guests sat with their backs to the wall, the other side of the table being left free for service. Sometimes they were used as side-tables, or furnished with a cupboard beneath the board; they were supported on quadrangular legs or massive ends and feet full of Gothic feeling, and were several inches higher than the dining-table of the 20th century. Heavy stretchers or foot-rails were fixed close to the floor—for the avoidance, no doubt, of draughts. Oak was the usual material, but elm, cherry and other woods were sometimes used. Soon the legs became bulbous, and were gadooned or otherwise ornamented, and the frame began to be carved. The introduction, before the 16th century closed, of the “drawing table” marked the rapidity with which this piece of furniture was developed. This was the forerunner of the “extending dining table.” Of the three leaves of which these tables were composed two were below the other; they drew out and were supported by brackets, while the slab proper dropped to the same level. Somewhat later legs became excessively bulbous; this ugly form gave place soon after the middle of the 17th century to baluster-shaped legs. Hitherto tables had, generally speaking, been large and massive—little in the nature of what is now called the “occasional table” seems to have been provided until some years after the Restoration. About that time small tables and ball feet, sometimes with lions’ heads carved upon the knees; the top folded up to half its size when opened. The Chippendale school introduced small tables with carved openwork “galleries” round the edges (to protect china and other small objects), and clustered legs; Gothic forms and Chinese frets were for a time fashionable. Later in this century, so prolific in new forms of furniture, tables were frequently made of rosewood and satinwood; side-tables, often highly elaborate, adorned with swags and festoons and other classical motives, supported by termini or richly carved legs, were gilded and topped with marble slabs or inlaid wood. The Pembroke table, in which the legs were formed, with the top inlaid in serpentine edgings of marquetry, was a characteristic feature of late 18th-century English furniture, and still retains its popularity. Then came the Empire period; the taper was replaced by the round leg, rosewood grew commoner, and brass mountings the rule. For illustrations see Furniture.

TABLE, MATHEMATICAL. In any table the results tabulated are termed the “tabular results” or “respondents,” and the corresponding numbers by which the table is entered are termed the “arguments.” A table is said to be of single or double entry according as there are one or two arguments. When each argument (to each entry) has a table of single entry, the numbers being the arguments and the logarithms the tabular results; an ordinary multiplication table is a table of double entry, giving $xy$ as tabular result for $x$ and $y$ as arguments. The intrinsic value of a table may be estimated by the actual amount of time saved by consulting it; for example, a table of square roots to ten decimals is more valuable than a table of squares, as the extraction of the root would occupy more time than the multiplication of the number by itself. The value of a table does not depend upon the difficulty of calculating it; for, once made, it is made for ever, and as far as the user is concerned the amount of labour devoted to its original construction is immaterial. In some tables the labour required in the construction is the same as if all the tabular results had been calculated separately; but in the majority of instances a table can be formed by expedient methods which are applicable to the calculation of an individual result. This is the case with tables of a continuous quantity, which may frequently be constructed by differences. The most striking instance perhaps is afforded by a factor table or a table of primes; for, if it is required to determine whether a given number is prime or not, the only universally available method (in the absence of tables) is to divide it by every prime less than its square root until one is found that divides it without remainder. But
Million appearing at London in 1879, and those for the fifth Million in 1883, and the sixth Million in 1885 (all three Millions stereotyped). The tenth Million, though projected by Dase and Rosenberg, has not been published. The nine quarto volumes (Table des diviseurs, Paris, 1814-1817; Factor Tables, 3 vols., Vienna, 1840-1843) are printed on very thin paper to form one uniform table, giving the least divisor of every number not divisible by 2, 3, or 5, from unity to nine million. The arrangement of the results on the page, which is due to Burchardt, is admirably neat, and its clearness, accuracy, and useful character, render it highly creditable; but the other six Millions are all separate. Burchardt began the publication of his tables with the second Million instead of the first, as Chenu's factor table for the first Million was already in existence. Burchardt's work has been continued by his son, Albert Burchardt, who has added the first Million, and the first half of the second Million. All the prime divisors of numbers not divisible by 2, 3, or 5 up to 1,020,000. It occupied 1020 pages, and Burchardt found it very accurate; he detected only thirty-eight errors, of which nine were due to the author, the remaining twenty-nine having been caused by the slipping of type in the printing. The errata thus discovered are given in Burchardt's first Million. Other errata are contained in the 'Errata' printed at the rear of his work.

Burchardt gives but a very brief account of the method by which he constructed his table; and the introduction to Dase's Millions merely consists of Gauss's letter suggesting their construction, and the introduction to the Irishman's Table contains a full account of the method of construction and a history of factor tables, with a bibliography of writings on the subject. The introduction (pp. 103) to the Sixth Million contains an enumeration of factors and logarithms of all numbers up to five millions, and the distribution of primes in the whole nine millions, portions of which had been published in the Cambridge Philosophical Proceedings and the American Journal of Mathematics. In 1888, H. C. Factor published a table by Prof. D. N. Lehmer which gives the least factor of all numbers not divisible by 2, 3, 5, or 7, up to ten millions. This table, which covers a range of 21,000 numbers on each page, is not rectangular, and was cut from a written copy of the author's original manuscript. The introduction contains a list of errata in the nine millions previously published, completely confirming Burchardt's claim.

The factor tables which have just been described greatly exceed both in extent and accuracy any others of the same kind, the largest of which only reaches 405,000. This is the limit of Anton Felkel's Tafel aller einfachen Factoren (Vienna, 1776), a remarkable and extremely rare book, nearly all the copies having been destroyed. Georg Vega (Tabulae, 1779) gave a table showing all the divisors of numbers not divisible by 2, 3, or 5 up to 10,000, and it is the only one of this kind known. In 1808, Vega published a table of logarithms and factor tables, and in 1816, he exhibited a list of divisors of numbers not divisible by 2, 3, or 5 up to 1,020,111, and gave a list of numbers not divisible by 2, 3, or 5 up to 251,650. H. G. Köhler (Logarithmisch-trigonometrisches Handbuch, 1848, and subsequent editions) gives all factors of numbers not prime or divisible by 2, 3, or 5, up to 21,525. Peter Barlow (Tables, 1814) and F. Schaller (Primzahlen und ihre Tafeln, Weimar, 1855) give all factors of all numbers up to 10,000. Barlow's work also contains a list of primes up to 100,103. Both the factor table and the list of primes are omitted in the stereotyped (1840) reprint. Full lists of errata in Chenu (1811), Barlow (1814), Hilde's Vega (1840), Köhler (1848), Schaller (1855), and Goldscheider (1862) are contained in a paper by Allan Cunningham (Math. J., 1900, 22: 4, 1905, 35. 24). V. A. Le Besque (Tables diverses pour la décom- ponction des nombres, Edinburgh, 1863) gives in a table of twenty pages, the least factor of numbers not divisible by 2, 3, or 5 up to 115,500. In E. Rees's Cyclopaedia (1819), article "Prime Numbers," there is a list of primes to 217,219 arranged in decades. The Fourth Million contains a list of divisors of numbers not divisible by 2, 3, or 5 up to 20,000, and lists of the logarithms of the Logarithmic Tables (London, and Ithaca, N.Y., 1893) of G. W. Jones of Cornell University contains a table of all the factors of numbers not divisible by 2 or 5 up to 50,000. In the case of numbers not prime or divisible by 2 or 5 up to 1,000, there are also given the prime factors and the number of prime factors. This table does not occur in the third edition (Ithaca, N.Y., 1891). On the first page of the Second Million Burchardt gives the first nine multiples of the first Million, and in the third edition (1883) the number of primes only to 313, occurs in Lambert's Supplements (1798). Several papers contain lists of high primes (i.e. beyond the range of the

1 Referring to factor tables, J. H. Lambert wrote (Supplementa tabularum, 1798, p. xiv): "Universalis finis talium tabularum est ut semel pro semeno computator quod saepius de novo computa- tandum foret, ut pro omni casu computatur quo in futurum pro quovis casu computatur desiderabatur." This applies to all tables.

2 For information about it, see a paper on "Factor Tables," in Camb. Phil. Proc. (1878), ill. 99-138, or the Introduction to the Fourth Million.
**TABLE, MATHEMATICAL**

327

factor tables). Among these may be mentioned two, by Allan Cunningham and J. J. Woodall jointly (Phil. Mag., 1856, 2, 717-72). Also the pages on factorizations of high numbers referred to under *Tables relating to the Theory of Numbers*. The Vienna Academy possesses the manuscript of an early work on factors of numbers by Wlichter, who, many years ago by J. P. Kulik (1793-1864) (see Ency. math. Wiss., 1900-1904, i. 952, and Lehmer's *Factor Table*, p. ix.).

**Multiplication Tables.**—A multiplication table is usually of double extent, dividing the factors in two columns and when so arranged it is frequently called a Pythagorean table. The largest and most useful work is A. L. Crelle's *Rechenbühler* (Bremiker's edition, 1857, stereotyped; many facsimile *Abhandlungen* and *Math. Annalen*). An English edition, a second (stereotyped) edition is a convenient folio volume of 450 pages. In 1908 an entirely new edition, edited by O. Seeiger, was published in which the multiples of 10, 20, ..., 990 (omitted in previous editions) are included. This adds 50 pages to the volume, but removes what has been a great drawback to the use of the tables. Other improvements are that the tables are divided horizontally and vertically by lines, calculations in which the last two figures are rejected, a mark has been placed to show when the last figure retained should be increased. Two other tables of the same extent (1000 x 1000), but more condensed, were arranged by Crelle and H. Förster (Auschersleben, 1896), and A. Hensel's *Rechenbühler* (Berlin, 1897). An anonymous table, published at Oldenburg in 1860, gives products up to 500 x 500, and M. Cordier, *Le Multiplicateur de trois cents carrés* (Paris, 1872), gives a multiplication table up to 100 x 100 (intended for commercial use). In both these works the product is printed in full. The four following tables are for the multiplication of large numbers by a simple divisor digits, putting 10 to 20 pages of results on a single page. When we turn to page 825 and enter the right-hand table at line 77, column 7, where we find 77339; we then enter the left-hand table on the same line at 93, column 7, and find 656, so that the product is 77339 x 656 = 50258256. *Produktentafel* (Hamburg and Gotha, 1841), is somewhat similar to Crelle's table, but smaller, the number of figures in the multiplication being five instead of seven. (3) In *St Petersburg*, *A Table of Products* (London, 1865), the products of any five-figure number by a single digit is given by a double arrangement. The extent of the table is the same that of Bretschneider's, as also is the principle, but the arrangement is different. Laurent's table occupying only 10 pages and Bretschneider's 99 pages. (4) G. Diakow's *Multiplications-Tabelle* (St Petersburg, 1897) is of the same extent as Bretschneider's table but occupies 1000 pages. Among tables existing in the latter quarter of last century may be mentioned: (a) a table of squares, cubes, and square roots an hundred thousands (3) and 500 pages J. Peters (Rechenbühler für Multiplikation und Division mit ein- bis vierstelligem Zahlen, Berlin, 1909) gives products of four figures by two. The entry is by the first three figures of the multiplicand, and there are 2000 products on each page. Among earlier tables, the interest of which is mainly historical, mention may be made of C. Hutton's *Table of Products and Powers of Numbers* (London, 1781), which contains a table up to 100 x 100, and J. P. Gruson's *Groses Einmaleis von Eins bis Hunderttausend* (Berlin, 1799)—a table of products up to 9 x 10,000. The author's intention was to extend it to 100,000, but only the first part was published. In this book there is no condensation or double arrangement; the pages are very large, each containing 125 lines.

**Quartersquares.**—Multiplication may be performed by means of a table of single entry in the manner indicated by the formula—

\[ (n+1)(n+2)/2 \]

Thus with a table of quarter-squares we can multiply together any two numbers by adding their difference and dividing by two to obtain their difference from the quarter-square of their sum. The largest table of quarter-squares is J. Blatter's *Table of Quarter-Squares of all whole numbers from 1 to 200,000* (London, 1886), which gives squares, cubes, square roots, and square roots of reciprocals indirectly to the product of any two five-figure numbers. This fine table is well printed and arranged. Previous to its publication the largest table was S. L. Launoy's *Table of Quarter-Squares of all numbers up to 20,000*, which was on one sheet, and the extent, and therefore is only directly available when the sum of the two numbers to be multiplied does not exceed 100,000. Two other recent tables are *Mischtabellen und Quadrat-Tafeln* (Berlin, 1825), which extends to 20,000, and J. M. Merpaut, *Tables arithmétiques* (Vannes, 1832), which extends to 40,000. In Merpaut's work the quarter-square is treated separately from the square. This table contains two tables of squares to 100,000 (see next paragraph), explains in his introduction how his table may be used to effect multiplications by means of the above formula; but the earliest book on quarter squares is A. Voisin, *Tables des produits et des nombres entiers depuis 1 jusqu'à 20,000* (Paris, 1817). By a logarithm Voisin means a quarter-square, i.e. he calls a root a root of the subject of quarter-squares, &c, see Phil. Mag. [v.6] p. 331. *Squares, Cubes, &c., and Square Roots and Cube Roots.*—The most convenient table for general use is P. Barlow's *Tables* (Useful Knowledge, 1814), which gives products up to 100,000 for numbers up to 10,000, and for any number between the product gives squares, cubes, square roots, cube roots, and reciprocals to 10,000. These tables also occur in the original edition of 1814. The largest table of squares and cubes is J. P. Kulik, *Tafeln der quadratischen Zahlen* (Leipzig, 1853). Kulik's *Tafeln* contains two tables of squares to 100,000, and square and cube roots to 25,500, at first to fourteen decimals and above 1010 to five. E. Gélin (Receuil de tables numéricques, Huy, 1894) gives square roots (to 15 places) and cube roots (to 20) for numbers up to 100,000. C. H. Hulsse, *Tabulae Multiplicatoriae* (Venice, 1894), gives products up to 24,500, and square and cube roots to 25,500, and in the first ten figures of the first hundred numbers. P. Barlow, *Mathematical Tables* (original London ed.) gives the first ten powers of the first hundred numbers. The first nine or ten powers are given in Vega, *Tabulae* (1797), and in Hülse's edition of the same (1840), in Köhler, *Handbuch* (1848), and in other collections. C. F. Faal de Bruno, *Calcul des erreurs* (Paris, 1869), and J. H. T. Müller, *Vierstellige Logarithmen* (1844), give squares for use in connexion with the method of least squares. Four-place tables of squares are frequently given in engineering tables, and tables of products of numbers up to 100,000 occur in books intended for engineers and practical men. S. M. Drach (Messenger of Math., 1878, 7, p. 87) has given to 33 places the cubic roots of the cube roots of the primes smaller than 100,000. In general it must be said that the methods of calculations of squares, cubes, and roots of numbers are not the methods of the table of *Math. Curr*, or *Phil. Mag.*

**Triangular Numbers.**—E. de Joncourt, *De natura et praelato usu simplicissimae speciei numerorum triangularium* (The Hague, 1658), gives a poem in triangular numbers up to 20,000: viz. \(n(n+1)/2\) is given for all numbers from \(n = 1\) to \(n = 20\). The table occupies 224 pages.

**Reciprocals.**—P. Barlow's *Tables* (1814 and 1840) give reciprocals up to 100,000, the first four or five figures of which are given by W. H. Oakes, *Table of the Reciprocals of Numbers from 1 to 100,000* (London, 1865). This table gives seven figures of the reciprocal, and is arranged as a table of seven-figure logarithms, differences being added at the side of the page. The reciprocal

1 Only one other multiplication table of the same extent as Crelle's has appeared previously, viz. Herwart von Hohenburg's *Tabulæ arithmeticæ pro multiplicandia universales* (Munich, 1610), a huge folio volume of more than a thousand pages. It appears from the dedication to the Elector that Hohenburg, who took place at the end of 1608, that the latter used his table when in manuscript for the performance of multiplications in general, and that the occurrence of the word *prostrophaises* on the title is due to a misprint. It is sometimes said that three-dimensional spherical triangles could be solved more easily than by Wüttich's *prostrophaises*. The invention of logarithms four years later affects the value of these two papers. Bretschneider and Hohenburg's work never became generally known. On the method of *prostrophaises*, see NAPIER, JOHN, and on von Hohenburg's table, see a paper " On multiplication by a Table of Single Entry," Phil. Mag., 1878, ser. v., 6, p. 331.

2 The actual place of publication (with a German title, &c) is Vienna. The copies with an English title, &c, were issued by Trilfinger; and those with a French title, &c, by Gauthier-Villars. All bear the date 1888.
of a number of five figures is therefore taken out at once, and two more figures may be interpolated for as in logarithms. R. Picarte, La Division réciproq à une addition (Paris, 1861), gives to ten significant figures the reciprocals of the numbers from 10,000 to 100,000, and this subject is also treated of in his Tables of Sexagesimal Fractions (1862); he gives the reciprocals of numbers up to 100 to 2 places and their first nine multiplets to 12 places in the Bulletin de la Brussels Academy, 1875, 40, p. 107. E. Gellé (Recueil de tables numérotiques, ii. 1889), has only published the reciprocals of seconds for 15 places, in sexagesimals to 10 computing places.

Table of the Expression of Vulgar Fractions as Decimals. — Tables of this kind have been given by Wucherer, Goodwyn and Gauss. W. F. Wucherer, Beyträge zum allgemeinen Gebrauch der Decimalbrüche (Carlsruhe, 1796), gives the decimal fractions (to 5 places) for all vulgar fractions whose numerator and denominator are each less than 50 and prime to one another, arranged according to denominators. Similarly, elabore tables that have been published are contained in Henry Goodwyn's Centenary of Table of all Decimal Quotients (London, 1816), A Tabular Series of Decimal Quotients (1823), and A Table of the Circles arising from the Division of a Unit or any other Whole Number by all the Integers from 1 to 1024 (1823). The Tabular Series (1823), which occupies 153 pages, gives to 8 places the decimal corresponding to every vulgar fraction less than \( \frac{1}{99} \) whose numerator and denominator are each less than 1000, but no more was ever published. The Table of Circles (1823) gives all the periods of the circulating decimals corresponding to the denominators of single vulgar fractions of integers less than 1024. Thus for 13 we find 0.76923 and \( \frac{1}{13} \) = 0.076923, which are the only periods in which a fraction whose denominator is 13 can circulate. The table occupies 107 pages, some of the periods of which occur various times, and is arranged alphabetically under their denominators.

The First Centenary (1816) gives the complete periods of the reciprocals of the numbers from 1 to 100. Goodwyn's table, however, is preferable to this, with its various kinds of abbreviations and the different periods of the same fractions of different numbers. It was published under his own name. The Verwandlung gemeiner Brüche mit Neunern aus dem ersten Tausend in Dezimalbrüche, occurs in vol. ii. pp. 412-434 of his Gesammelte Werke (Göttingen, 1863), and resembles Goodwyn's Table of Circles, On the Data for the use of Trigonometrical Tables, and on the limit of Quantity in the tabulation of Decimal Quotients, with special reference to Henry Goodwyn's Table of Circles and Tabular Series of Decimal Quotients, in Camb. Phil. Proc., 1878, 3, p. 185, where is also given a table of the numbers of digits in the periods of fractions corresponding to denominators between 10 and 1024 obtained by counting from Goodwyn's table. See also under Circulating Decimals (below).

Sexagesimal Tables. — Originally all calculations were sexagesimal; and the relics of the system still exist in the division of the degree into 60 minutes and the minute into 60 seconds. To facilitate interpolation, therefore, in trigonometrical and other calculations, it was necessary to have sexagesimal tables constructed. John Bernoulli, A Sexentenary Table (London, 1779), gives at once the fourth term of any proportion of which the first term is 600 and each of the other two is less than 600, the table is of double entry, and may be described as giving the value of \( \frac{y}{x} \times 600 \) correct to tenths of a second, and \( \frac{x}{y} \times 600 \) correct to tenths of a second, and also the sine of any angle which is expressed in sexagesimal minutes.

Not much use seems to have been made of these tables, both of which were published by the Commissioners of Longitude. Small tables for the conversion of sexagesimals into centesimal and vice versa were given by F. W. von Vega, H. Schubert's Fünfzehlige Tafeln und Gegenfahnen (Leipzig, 1897) contains a sexagesimal table giving \( \frac{x}{y} \times 600 \) for \( x = 1 \) to 59 and \( \frac{y}{x} \times 600 \) for \( y = 1 \) to 59.

Trigonometrical Tables (Natural). — Peter Apian published in 1533 a table of sines with the radius divided decimally. The first complete trigonometric table covering all the parts of the circle, and the semiquadrantal arrangement. Rheticus's canon was calculated for every ten minutes to 7 places, and Vieta extended it to every minute (1579). In 1584 Richard published a table of tangents; but the complete canon published in England was by Thomas Blundeville (1594), although a table of sines had appeared four years earlier. Regiomontanus called his tables tabulae foecundae et canon foecundus. Besides "tangent," Finck also introduced the word "secent," the table of secants having previously been called tabula benefica by Maurolycus (1558) and tabula foecundissima by Vieta.

One of the greatest computer of pure trigonometrical tables is George Joachim Rheticus, whose work has never been superseded. He published his ten-decimal canon, the Opus palatinum, was published by Valentine Osto at Neustadt in 1596, and in 1613 his four-decimal tables (published by Otho von guericke) appeared in the edition of the Opus palatinum. The Opus palatinum contains a complete ten-decimal trigonometrical canon for every second of the quadrant, semiquadrantally arranged, with differences for all the tables results through the history. The same number of given on the left-hand pages in columns headed respectively "Perpendiculum," "Basis," "Hypotenusa," and on the right-hand pages the tangents, cotangents and segments headed respectively "Perpendiculum," "Hypotenusa," "Basis." At his death Rheticus left the canon nearly complete, and the trigonometry was finished and the whole edited by Valentine Osto; it was named in honour of the elector palatine Frederick IV., who bore the expense of publication. The Thesaurus of 1613 gives natural sines for every second ten minutes throughout the quadrant, to 15 places, semiquadrantally arranged, with first, second, and third differences. The rescue of the manuscript of this work by Piticus was a highly important event in the history of mathematical tables. The alterations and emendations in the earliest printed edition of the Opus palatinum were made by Piticus, who had his suspicions that Rheticus had himself calculated a ten-decimal canon, and that the original manuscript had been found. Eventually the last canon was discovered amongst the papers of Rheticus which had passed from Osto to James Christmann on the death of the former. Amongst these Piticus found (1) the first tables, (2) second and third differences, (3) the commencement of a canon of tangents and secants, and (4) complete tables of sines, secants, and tangents, and the opus palatinum, gives an idea of the enormous labours undertaken by Rheticus; his tables not only remain to this day the ultimate authorities but formed the data from which Vlacq calculated his tables. It is supposed that for twelve years Rheticus constantly had computers at work.

A history of trigonometrical tables by Charles Hutton was prefixed to all the early editions of his Tables of Logarithms, and forms Tract xix. of his Mathematical Tracts, vol. i. p. 279, 1812. A good deal of bibliographical information about the Opus palatinum and earlier trigonometrical tables is given in A. De Morgan's article, "Trigonometrical Tables," in the Encyclopaedia of Natural and Logarithmic, used in computing Lunar Distances for the Nautical Almanac. The Tables logarithmico-trigonometricae (Leipzig, 1817), contains a table of sin\( \frac{x}{2} \), cos\( \frac{x}{2} \), tan\( x \), cot\( x \) from \( x = 1^\circ \) to \( 45^\circ \) at intervals of \( 1^\circ \) to 7 places. J. Andrew, Astronomical and Nautical Tables (London, 1843, 5th ed. 1854), has a very elaborate table of Logarithmic Sines, Cosines, the same data as the table logarithmico-trigonometricae, gives natural sines and cosines (to 6 places) and their first nine multiples (to 4 places) for centesimal minute of the quadrant. The natural functions occur in many collections, the natural and logarithmic values being given on opposite pages, sometimes side by side on the same page.

The following works contains tables of trigonometrical functions of the same kind, and furnished tables of the same kind, and furnished tables logarithmico-trigonometricae (Leipzig, 1817), contains a table of sin\( \frac{x}{2} \), cos\( \frac{x}{2} \), tan\( x \), cot\( x \) from \( x = 0^\circ \) to \( 120^\circ \) at intervals of \( 10^\circ \) to 7 places. This table was greatly extended by Major-General Hannington in his Natural and Logarithmic, used in computing Lunar Distances for the Nautical Almanac. The tables logarithmico-trigonometricae (Leipzig, 1817), contains a table of sin\( \frac{x}{2} \), cos\( \frac{x}{2} \), tan\( x \), cot\( x \) from \( x = 0^\circ \) to \( 180^\circ \) at intervals of \( 10^\circ \) to 7 places, except near the beginning, where the logarithms are given to only 5 or 6 places. It occupies
TABLE, MATHEMATICAL

329

327 foldo pages, and was suggested by Andrew's work, a copy of which was also sent to Hanyngton. Hanyngton recomputed the whole of it by a partly mechanical method, a combination of two arithrometers being employed. A table of haversines is useful for the solution of spherical triangles when two sides and the included angle are given; and of the above-mentioned works, the most useful for the purpose is Andrews's Trigonometrical Survey of England. The results were published in the "R. Farley's Natural Sines" (London, 1856) and was used in the Nautical Almanac office in computing lunar distances. This figure table was also used in various tables of 125 to 175 arcs of 10° to 7 places, with proportional parts, and log versed sines from 0° to 135° at intervals of 15° to 7 places. The arguments are also given in time. The manuscript was used in the office for twenty-five years before it was printed in Travers values, which occur in most collections of navigation tables, contain multiples of sines and cosines.

Chapter I. Briggian Logarithms of Numbers and Trigonometrical Ratios—An account of the invention and history of logarithms, see LOGARITHM. The following are the fundamental works which contain the results of the original calculations of logarithms of numbers and trigonometrical ratios—Briggs, *Arithmetica logarithmica* (London, 1624), logarithms of numbers from 1 to 10,000, and from 90,000 to 100,000 to 14 places, with intercept differences; Vlacq, *Arithmetica logarithmica* (Gouda, 1628, also published in London by Andrews, 1633) and containing 5 log ten-figure logarithms of numbers from 1 to 100,000, with differences, also log sines, tangents, and secants for every minute of the quadrant to 10 places, with intercept differences; Vlacq, *Trigonometria * (Gouda, 1628), containing 33,000 numbers in ten places; ten seconds of the quadrant to 10 places, with differences, and ten-figure logarithms of numbers up to 20,000, with differences; Briggs, *Trigonometria* (London, 1633), natural sines to 15 places and tangents and secants to 10 places. The work in 1634 and 1635, to 10 places, at intervals of a hundredth of a degree from 0° to 45°, with intercept differences for all the functions. In 1632, Leibniz published two works, in a single vol. *Thesaurus logarithmorum completus*. The arrangement of the table of logarithms of numbers is more comprehensive than in Vlacq, being similar to that of an ordinary seven-figure table except that the former has no differences; and for the rest of the numbers it has all the differences and other problems of the trigonometrical canon is not wholly reprinted from the *Trigonometria artificialis*, as the log sines for every second of the first two degrees of which do not occur in Vlacq, were calculated for the work by Lieut. Von Eif, Vlacq devoted great attention to the detection of errors in Vlacq's logarithms of numbers, and has given several important errata lists. F. Lebelt (Annals of the Observer, p. 288) lists 8 places in the first four numbers given in Vlacq, of which 7 are correct. The following gives another method of logarithm computation: *the trigonometrical canon anything like the care that he devoted to the logarithms of numbers, as Gauss estimates the total number of last-figure errors at from 31,983 to 47,746, most of them only amounting to a unit, but some as much as 3 or 4. A copy of Vlacq's *Arithmetica logarithmica* (1628 or 1631), with the errors in numbers, logarithms, and differences corrected, is still the best table for a calculator who has to perform work requiring ten-figure logarithms of numbers, but the book is excessively rare, and Vlacq's *Thesaurus* has the advantage of having log sines, &c., in the same volume. The latter work also has been made more accessible by a photographic reproduction by the Italian government (Riproduzione fototecnografica dell' Ist. Geografico Militare, Florence, 1896). In 1879 Max Edler von Leber published tables for facilitating interpolations in Vlacq's *Thesaurus* (Tabulam ad interpolandas in Geodeticam Computations utilum Trias, Vienna, 1892). The object of these tables is to take account of the prefixed to the tables is a long list of errors in the *Thesaurus* and the interpolated values. Of the two tables of the tabular res's in the trigonometrical canon corresponding to 1060 angles von Leber estimates that out of the 90,720 tabular results 30,366 are in error by +1, 2793 by +2, and 191 by +3. Thus his work consists of three volumes, containing 636 tabular results, which is in accordance with Gauss's estimate. A table of ten-figure logarithms of numbers up to 100,000, the result of a new calculation by Leibniz, in *Res de la France* (1805), p. 261. *Geodetic Survey for 1805-6* (ex. 12, pp. 395-722) by W. W. Dall, superintendent of the survey. The table was compared with Vega's *Thesaurus* and found correct. S. Plencio's *Tables de logarithmes vulgaires à dix décimales, construites d'après un nouveau mode* (St. Petersburg, 1871), though a tract of only 80 pages, may be usefully employed when Vlacq and Vlacq's logarithms are not available. The table in question gives more rapidly, the first, or auxiliary table, contains a series of factors by which the numbers whose logarithms are required are to be multiplied to bring them within the range of table 2; it also gives the log sines, tangents, and secants to 10 places. Table 2 merely gives logarithms to 1000 to 10 places. Table 2 gives logarithms from 1,000,000 to 1,011,000, with proportional parts of 175 to 7 places. The log terms in table 3 are a function of the log logarithm, so as the result is concerned, log 1/M being given, so that both cases multiplication is used. The laborious part of the work is the multiplication by M, and it is somewhat compensated for by the ease with which, by means of the proper factors, the logarithm is obtained. The factors are 300 in number, and are chosen so as to minimize the labour, only 25 of the 300 consisting of three figures all different, or of three. The accuracy of this method is a factor which is subsequently cancelled by subtracting its logarithm is used also in a tract, containing only ten pages, published by A. Namur and P. Maison at Brussels in 1687 under the title *Logarithmes*.
further peculiarity of this paper is that multiples of the differences, instead of proportional parts, are given at the side of the page.

Typographically the table is exceptional, as there are no rules, the numbers being separated from the logarithms by reversed commas — a practice which had been adopted a century earlier. This was probably a result of an original calculation; see Trans. Roy. Soc. Edin., 1871, 26. Sang proposed to publish a nine-figure table from 1 to 1,000,000, but the requisite support was not obtained. Various papers of Sang and of Sharp contain logarithmic calculations will be found in the Proc. Roy. Soc. Edin. subsequent to 1872. Reference should here be made to Abraham Sharp's table of logarithms from 1 to 100 and of primes from 100 to 1100 to 61 places, also of numbers from 900,000 to 900,001 to 40 places. These first appeared in Geometry Improved, by A. S. Philiotis (London, 1717). They have been republished in Sherwin's, Callet's, and the earlier editions of the latter's tables. The 4th edition (Paris, New York, 1871), gives logarithms of numbers from 1 to 109 to 102 places.

In many seven-figure tables of logarithms of numbers the values of $S$ and $T$ are given, at the top of the page, with $V$, the variation of each, for the purpose of deducing log sines and tangents. $S$ and $T$ denote log (sin x/2) and log (tan x/2) respectively, the argument being the number of seconds denoted by certain numbers (sometimes only the first, sometimes every tenth) in the column number on each page. Thus, in Callet's tables, on the page on which the first number is 67200, $S$ = log (sin 67°20'/6720) and $T$ = log (tan 67°20'/6720), etc., and the corresponding values of $S$ and $T$ are given, for example, log sin $1^\circ52^\prime12^\prime$ = 0.72777, log sin $67^\circ32^\prime7^\prime$ = 2.76690, and have 8.5316873, whence, by addition, the arguments for the right-hand margin and with respect to the right-hand margin, the argument for the left-hand margin and with respect to the left-hand margin, the argument for the third figure to be increased. In some tables the line is broken where the change occurs; but the dislocation of the figures and the corresponding irregularity in the lines are very awkward. Babbage printed the fourth figure in small type after a change; and Bremiker placed a bar over it. The best method is to type or to reserve an extra three or four places to the right of the decimal point in each logarithm after the change, as is done in Schröd's and many other modern tables. This is beautifully clear and the asterisk at once catches the eye. Shortreude and Sang replace 0 after a change by a circled 0 (Sang); other methods are used by Gardiner, Mordors, etc.

Passing now to the logarithmic trigonometrical canon, the first great advance after the publication of the Trigonometria artificialis in 1590 was the establishment of a logarithmic canon, one of the earliest and most important of which is the one containing 708 sines and tangents to every second of the quadrant to 7 places. This contains about 450 pages with an average number of 7750 figures to the page, so that there are altogether nearly three millions and a half of figures. The change in the leading figures, when it occurs in a column, is not marked at all; and the table must be used with very great caution. In fact it is advisable to go through the whole of it, and fill in with ink the first 0 after the change, as well as make some mark that will catch the eye at the head of every column containing change. The table was calculated by interpolation from the Trigonometria artificialis to 10 places and then reduced to 7, so that the last figure should always be correct. Partly on account of the absence of a mark to catch the eye, the number of columns containing change is not in the size of the table and a somewhat inconvenient arrangement, the work seems never to have come into general use. Computers have always preferred Van Royen's Tables logarithmiques (Paris, 1823) which also contains a complete logarithmic canon to every second. The change in the column is very clearly marked by a large black nucleus, surrounded by a circle, which is at once caught by the eye. This was the only table of its kind which was not corrected. The reprint, however, bears the original title-page and date 1829, and there appears to be no means of distinguishing it from the original work except by turning to the table itself and then comparing it with the original edition and examining whether the correction has been made.

The only other canon to every second that has been published is contained in R. Shortreude's Logarithmische Tables (Edinburgh). This table was issued in 1844 in 4 volumes, the last 2 of which were devoted to the tables of logarithms, each of which is divided into 30 sections of 1000 logarithms, and the 2 others to the trigonometrical tables, being a revision and correction of the tables of Delambre and the latter, in the first of which the logarithms have been recomputed and corrected.

Previous to 1801 the only important tables in which the quadrant is divided centesimal was J. P. Houbert and L. Ideler, Nouvelles tables trigonométriques (Berlin, 1799), and C. Borda and J. B. Delambre, Tables trigonométriques du second ordre (Paris, 1801). The former gives among other things, natural and log sines, cosines, tangents, and cotangents, to 7 places, the arguments proceeding to 3' at intervals of 60' and thence to 50' at 3' intervals of 1'. The latter gives natural and log sines, cosines, tangents, cotangents, secants, and cosecants from 0' to 3' at intervals of 3' and thence to 50' at 3' intervals of 1'. The latter gives natural and log sines, cosines, tangents, cotangents, secants, and cosecants from 0' to 3' at intervals of 3' and thence to 50' at 3' intervals of 1'. The latter gives natural and log sines, cosines, tangents, cotangents, secants, and cosecants from 0' to 3' at intervals of 3' and thence to 50' at 3' intervals of 1'. The latter gives natural and log sines, cosines, tangents, cotangents, secants, and cosecants from 0' to 3' at intervals of 3' and thence to 50' at 3' intervals of 1'.

In Briggs's Trigonometria Britannica of 1633 the degree is divided into 104 parts; and before the appearance in the same year of Vilain's Trigonometria artificialis, in which the degree is divided sexagesimally, this reform might have been expected. It is clear that the most suitable time for making such a change was when the whole canon was being reissued after a long interval. It is probable that such a change was made in the 2nd edition of the Tables trigonométriques du second ordre by Delambre and the latter, in the first of which the logarithms have been recomputed and corrected. Briggs was not the only person to take advantage of this opportunity. He left the degree unaltered, but divided it centesimally instead of sexagesimally, thus ensuring the advantages of decimal division (a saving of work in interpolations, etc.), without the minimum of change. The French mathematicians at the end of the 18th century divided the right angle centesimally, completely changing the whole system, with no advantage whatever, and the change was even more disadvantageous in that the degree is as arbitrary a unit as the nonagesimal; and it is only the non-centesimal subdivision of the degree that gives rise to inconvenience. Briggs's example was followed in some instances; but the centesimal division of the degree seemed to have entirely passed out of use, till it was revived by C. Bremerlin in his Logarithmisch-trigonometrische Tafeln mit fünf Dezimalstelle (Leipsic, 1758).

This little book of 138 pages gives a five-figure canon to every hundredth of a degree with proportional parts, besides logarithms of numbers, addition and subtraction logarithms, etc. the use of a centesimal table compulsory, if this number of figures is required.
The Astronomische Gesellschaft are, however, publishing an eight- figure table on the sexagesimal system, under the charge of Dr. J. Bauschinger, the director of the k. Recheninstitut at Berlin. The arrangement is to be given in groups of three as in Bremiker's tables.

The September 1835 number of the Neue und erweiterte Logarithmen handbuch, containing the 108,000,000 of C. W. Wolfram's Lambert's Tables (2 vols. Berlin, 1778), is a valuable collection, and contains seven-figure logarit...
through several more. J. Galbraith and S. Haughton, Manual of Mathematical Tables (London, 1860), give five-figure logarithms to 10,000 and log sines and tangents for every minute, also a small table of squares and square roots, and a table of natural logarithms (1811; new edition 1877), is a convenient collection of five-figure tables; besides logarithms of numbers and circular functions, there are Gaussian logarithms, least divisors of numbers, and square roots. The logarithmic numbers are printed on thin paper. A. Gernerth, Fünftelstellige gemeine Logarithmen (Vienna, 1866), gives logarithms to 10,800 and a ten-second canon. There are thirty-six lines on the page, so that the double page contains 150 logarithms. It is arranged into intervals of 1 to 7 places, with differences and proportional parts, arranged as in an ordinary seven-figure table. By adding log 10 to the results there is obtained a table of log numbers, which has been formed part of the Annals of the Vienna Observatory for 1851, but separate copies were printed. The most elaborate table of hyperbolic logarithms is due to Wolfram, who calculated to 48 places the logarithms of all numbers up to 2200, and of all primes (also of many great composite numbers) between this limit and 10,000. Wolfram’s results first appeared in Schulze’s Sammlung (1776). Six logarithms which Wolfram had been prevented from computing by a serious illness were supplied in the Berliner Jahrh., 1758, p. 191.

The complete table was reproduced in Vega’s Thesaurus (1794), where several errors were corrected. Tables of hyperbolic logarithms were inserted in the last number of the second edition of Legendre’s Élements (1830), in which he used Wolfram’s tables to 100 and primes to 1907 to 48 places; Borda and Delambre (1801), all numbers to 1200 to 11 places; Salomon (1827), all numbers to 1000 and primes to 10,333 to 10 places; Vega, Tabulæ (including Hyperbolic Logarithms for numbers to 1000, to 10,000; Hutton, Mathematical Tables, and Willich (1835), all numbers to 1200 to 7 places; Dupuis (1839), all numbers to 1000; Hutton’s Logarithmic Tables from 1 to 10 at intervals of 0.01 to 7 places. Rees’s Cyclopaedia (1819), art. "Hyperbolic Logarithms," contains a table of hyperbolic logarithms of all numbers to 10,000 to 10 places.

Logarithms to base e are generally termed Napierian by English writers, and natural by foreign writers. There seems no objection to the former name, though the logarithms actually invented by Napier go beyond the natural logarithm in the sense that those logarithms depend on a constant other than e. They are generally found in collections of logarithmic tables, but rarely exceed a page in extent, and are very easy to construct. Schröer and Bruns both give the first hundred multiples of the modulus — 43429 44819 . . . and its reciprocal 210028 50029 . . . to 5, 6, 8, 10, or more places. They are generally to be found in collections of logarithmic tables, but rarely exceed a page in extent, and are very easy to construct. Schröer and Bruns both give the first hundred multiples of the modulus and its reciprocal to 10 places, and Bremiker (in his edition of 1844). hardly to 6 places; Degen, Tabularum Eenaæ (Copenhagen, 1824), gives the first hundred multiples of the modulus to 30 places.

Antilogarithms.—In the ordinary tables of logarithms the natural logarithm of 10 is 2.302585 and antilogarithms are thus obtained. In an antilogarithmic canon the logarithms are exact quantities, such as 1.0001, 0.0002, etc., and the corresponding numbers are given, as a rule, to the same number of places. Logarithms and antilogarithms are thus related by the equation:

\[ \log_{10} x = \log_e x \cdot \log_{10} e \]

where e is the base of natural logarithms. The logarithms and antilogarithms are added to the corresponding numbers in logarithmic tables.

By finding the logarithm of any number x and then writing it as a power of 10, we get its antilogarithm, i.e., the number 10 raised to the power of the logarithm:

\[ x = 10^{\log x} \]

Thus, for example, if \( \log x = 2.302585 \), then \( x = 10^{2.302585} \approx 1995.24

#### Hyperbolic or Napierian or Natural Logarithms

The logarithms invented by Napier and explained by him in the Descriptio (1044) were not the same as those now called natural or hyperbolic (viz., to base e), and very frequently also Napierian. Logarithms to base e are generally termed Napierian by English writers, and natural by foreign writers. There seems no objection to the former name, though the logarithms actually invented by Napier go beyond the natural logarithm in the sense that those logarithms depend on a constant other than e. They are generally found in collections of logarithmic tables, but rarely exceed a page in extent, and are very easy to construct. Schröer and Bruns both give the first hundred multiples of the modulus and its reciprocal to 10 places, and Bremiker (in his edition of 1844) hardly to 6 places; Degen, Tabularum Eenaæ (Copenhagen, 1824), gives the first hundred multiples of the modulus to 30 places.

#### Antilogarithms

In the ordinary tables of logarithms the natural logarithm of 10 is 2.302585 and antilogarithms are thus obtained. In an antilogarithmic canon the logarithms are exact quantities, such as 1.0001, 0.0002, etc., and the corresponding numbers are given, as a rule, to the same number of places. Logarithms and antilogarithms are thus related by the equation:

\[ \log_{10} x = \log_e x \cdot \log_{10} e \]

where e is the base of natural logarithms. The logarithms and antilogarithms are added to the corresponding numbers in logarithmic tables.

By finding the logarithm of any number x and then writing it as a power of 10, we get its antilogarithm, i.e., the number 10 raised to the power of the logarithm:

\[ x = 10^{\log x} \]

Thus, for example, if \( \log x = 2.302585 \), then \( x = 10^{2.302585} \approx 1995.24 

#### Logarithmic Numbers

Logarithmic numbers, such as 0.0001, 0.0002, etc., are given in logarithmic tables, and they are thus related by the equation:

\[ \log_{10} x = \log_e x \cdot \log_{10} e \]

where e is the base of natural logarithms. The logarithms and antilogarithms are added to the corresponding numbers in logarithmic tables.

By finding the logarithm of any number x and then writing it as a power of 10, we get its antilogarithm, i.e., the number 10 raised to the power of the logarithm:

\[ x = 10^{\log x} \]

Thus, for example, if \( \log x = 2.302585 \), then \( x = 10^{2.302585} \approx 1995.24 

#### Addition and Subtraction, or Gaussian Logarithms

The object of such tables is to give log (a+b) by only one entry when log a and log b are given. Let

\[ A = \log x, \quad B = \log (1+x^2), \quad C = \log (1+x) \]

Leaving out the specimen table in Z. Leonelli’s Théorie des logarithmes addtionnels et déductifs (Bordeaux, 1803), in which the first suggestion was made,¹ the principal tables are the following:

1. Dupuis’s Tables de Logarithmes (1812), gives B and C for argument A from 0 to 2 at intervals of 0.01, thence to 3.40

Leonelli’s original work of 1803, which is extremely rare, was reprinted by J. Houël at Paris in 1875.
TABLE,

MATHEMATICAL

to 5 places. This
table is reprinted in Gauss's Werke, vol. iii. p. 244. E. A. Matthiessen, Tafel zur bequemern Berechnung (Altona, 1818), gives B
and C to 7 places for argument A from o to 2 at intervals of -oooi,
thence to 3 at intervals of -ooi, to 4 at intervals of -01, and to 5
at intervals of -I; the table is not conveniently arranged. Peter
"
Addendum,"
Gray, Tables and Formulae (London, 1849, and
I at intervals of -ooi
1870), gives C for argument A from
3 to
I to 2 at intervals of -oooi, to 6 places, with proporand from
tional parts to hundredths, and log (l
x) for argument A from
3
i at intervals of -ooi and from I to -18999 at intervals of
to
-opoi,
to 6 places, with proportional parts. J. Zech, Tafeln der Additions-

at intervals

of -01,

and to 5

at intervals of

-I, all

und Subtractions-Logarithmen (Leipzig, 1849), gives B for argument
from o to 2 at intervals of -oooi, thence to 4 at intervals of
ooi and to 6 at intervals of -01
also C for argument A from
o to -0003 at intervals of -ooooooi, thence to -05 at intervals of
oooooi and to -303 at intervals of -ooooi, all to 7 places, with

proportional parts.
edition of Vega (1849);
the 1840 edition of Hulsse's Vega con-

A

;

tained a reprint of Gauss's original table.
T. Wittstein, Logarithmes de Gauss a sept decimates (Hanover, 1866), gives B Tor
argument A from 3 to 4 at intervals of -I, from 4 to 6 at intervals
of -01, from 6 to 8 at intervals of -ooi, from 8 to 10 at intervals
of -oooi, also from o to 4 at the same intervals.
In this handsome work the arrangement is similar to that in a seven-figure
logarithmic table. Gauss's original five-place table was reprinted
in Pasquich, Tabulae
Jerome de la Lande':
(Leipzig, 1817); Kohler,
Tafeln (Leipzig, 1832), and Handbuch (Leipzig, 1848) and Galbraith
and Haughton, Manual (London, 1860). Houel, Tables de logarithmes (1871), also gives a small five-place table of Gaussian
logarithms, the addition and subtraction logarithms being separated
as in Zech. Modified Gaussian logarithms are given by J. H. T.
;

Miiller,

Logistic and Proportional Logarithms.
tables of logarithms a five-place table of logistic logarithms for
every
second to i is given. Logistic tables give log 3600 log * at intervals of a second, x being expressed in degrees, minutes, and seconds.
In Schulze (1778) and Vega (1797) the table extends to ^ =
3600'
and in Callet and Hutton to x = 5280*. Proportional logarithms for
second
to
every
3 (i.e. log 10,800 log x) form part of nearly all
collections of tables relating to navigation, generally to
4 places,
sometimes to 5. Bagay, Tables (1829), gives a five-place table,
but such are not often to be found in collections of mathematical
tables.
The same remark applies to tables of proportional logarithms for every minute to 24h which give to 4 or 5 places the
values of log 1440 log x. The object of a proportional or
logistic
table, or a table of log o
log x, is to facilitate the calculation of
proportions in which the third term is a.
All tables of proportional parts may be
Interpolation Tables.
C. Bremiker, Tafel der Proregarded as interpolation tables.
portionalteile (Berlin, 1843), gives proportional parts to hundredths
of all numbers from 70 to 699.
Schron, Logarithms, contains an
interpolation table giving the first hundred multiples of all numbers
from 40 to 410. Sexagesimal tables, already described, are interpolation tables where the denominator is 60 or 600.
Tables of
the values of binomial theorem coefficients, which are
required
when second and higher orders of differences are used, are described
below.
W. S. B. Woolhouse, On Interpolation, Summation, and
the Adjustment of Numerical Tables (London,
1865), contains nine
pages of interpolation tables. The book consists of papers extracted from vols.
and 12 of the Assurance Magazine.
Dual Logarithms. This term was used by Oliver Byrne in his
Dual Arithmetic, Young Dual Arithmetician, Tables of Dual LogaA dual number of the ascending
,

n

branch is a continued product of powers of l-l, i-oi, l-ooi, &c.,
taken in order, the powers only being expressed; thus J,

6,9,7,8

denotes (l-l) 6 (l-oi) 9 (i-ooi) 7 (i-oooi), the numbers
following the |
being called dual digits. A dual number which has all but the
last digit zeros is called a dual logarithm;
the author uses dual
logarithms in which there are seven ciphers between the J, and the
logarithm. Thus since 1-00601502 is equal to 1 0,0,0,0,0,0,0,599702
the whole number 599702 is the dual logarithm of the natural number
1-00601502.
A dual number of the descending branch is a continued product
of powers of -9, -99, &c. : for instance, (-9) 3 ('99) 2 is denoted
by '3 '2 TThe Tables, which occupy 112 pages, give dual numbers and logarithms, both of the ascending and descending branches, and the
corresponding natural numbers. The author claimed that his tables
were superior to those of common logarithms.
Constants.
In nearly all tables of logarithms there is a
page
devoted to certain frequently used constants and their logarithms,
such as TT, ir" 1 ir 2 Vf- A specially good collection is printed in W.
Templeton's Millwright's and Engineer's Pocket Companion (corrected by S. Maynard, London, 1871), which
gives 58 constants
involving ir and their logarithms, generally to 30 places, and 13
others that may be properly called mathematical. A
good list of
constants involving ir is given in Salomon (1827). A
paper by G.
Paucker in Grunert's Archiv ( vol. i. p. 9) has a number of constants
involving IT given to a great many places, and Gauss's memoir on
the lemniscate function (Werke, vol. iii.) has e-*, e-i", e-t", &c.,
calculated to about 50 places. The quantity ir has been worked
J. C. Adams has calculated Euler's constant to 263 places (Proc.
Roy. Soc., 27, p. 88) and the modulus -43429 ... to 272 places
The latter value is quoted in extenso under
(Id. 42, p. 22).
LOGARITHM. J. Burgess on p. 23 of his paper of 1888, referred to
under Tables of e*, has given a number of constants involving r and
P (the constant -476936
occurring in the Theory of Errors),
and their Briggian logarithms, to 23 places.
Tables
of Cubic Equations.
Lambert, Supplementa
for the Solution
(x-* 3 ) from x = -ooi to 1-155 as intervals of -ooi to
(1798), gives
3
and
Barlow (1814) gives x
x from x=i to 1-1549 at
7 places,
intervals of -oooi to 8 places. Very extensive tables for the solution
of cubic equations are contained in a memoir "
Beitriige zur Auflosung
"
hoherer Gleichungen
der Wiss. (Prague, 1860), u, pp.
The principal tables
1-123.
(PP- 58-123) give to 7 (or 6) places the values of
(x-x*) from
* =o to = 3-2800 at intervals of -ooi. There are also tables of the
even and uneven determinants of cubic equations, &c. Other tables
for the solution of equations are by A. S.
Guldberg in the Forhand.
of the Videns-Selskab of Christiania for
1871 and 1872 (equations
of the 3rd and sth order), by S. Gundelfinger,
Tafeln zur Berechnung
der reellen Wurzeln samtlicher trinomischen
Gleichungen (Leipzig,
1897), which depend on the use of Gaussian logarithms, and by R.
Mehme, Schldmilch's Zeitschrift, 1898, 43, p. 80 (quadratic equations).

#### Supplements

Maynard's, to 12, and 2) to the at Quar. places.

In 1855, gives for \( n = 3, 4, \ldots 20 \) places. The latter also gives \( n, s, \sigma \) for \( n = 2, 4, \ldots 36 \) to 15 places (Compte rendu de l'Assoc. Francaise, 1878, p. 172).

C. W. Merrifield (Proc. Roy. Soc. Lond., 1861, 31, p. 4) gave the values of \( x = 2, 0 \) to 15 places, and \( x = 3, 4, \ldots 20 \) places.

The table is reprinted in De Morgan's Diff. and Int. Calc. (1842), p. 549. Various small tables of other series, involving inverse powers of prime numbers, such as \( 1^{1/10} - 1^{1/2} + \ldots \), are given in vol. 25 of the Quart. Jour. Math.
also at intervals of a minute, from 88° to 100° (centesimal) to 11 places.
A. M. Legendre, *Tractatus de functionibus ellipticis* (vol. ii, p. 256), gives the same function for every half degree (sexagesimal) of the argument.

\[ \log \frac{\pi}{2} = 1 + \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1} \]

The first figure of the values omitted are also supplied, so that the full table can be reproduced. A seven-place abridgment (without differences) is published in J. Bertrand, *Calcul Integral* (1867), p. 285, and a six-figure abridgment in R. J. Mill, *Diff. and Integral Calculus* (1884), p. 160. In vol. i. of his *Exercices* (1811), Legendre had previously published a seven-place table of *loga* *f* (x), without differences.

**Tables connected with Elliptic Functions.**—Legendre published elaborate tables of the elliptic integrals in vol. ii. of his *Traité des fonctions elliptiques* (1826). Denoting the modulus angle by *θ*, the amplitude by *α*, the complete integral of the first and second kind by *F*(*θ*) and *E*(*θ*), and the complete integrals by *K* and *E*, the tables are:

1. \( \log \frac{\pi}{2} = 1 + \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1} \)
2. \( E(\theta) - \frac{\pi}{2} \)
3. \( E(\theta) - \frac{\pi}{2} \)
4. \( E(\theta) - \frac{\pi}{2} \)
5. \( E(\theta) - \frac{\pi}{2} \)
6. \( E(\theta) - \frac{\pi}{2} \)
7. \( E(\theta) - \frac{\pi}{2} \)
8. \( E(\theta) - \frac{\pi}{2} \)
9. \( E(\theta) - \frac{\pi}{2} \)
10. \( E(\theta) - \frac{\pi}{2} \)

In J. Bertrand's *Calcul Integral* (1870), a table of *loga* *f* (*x*) to 90° is given at intervals of 0° to 90° to 10 places. Glashier, in *Monthly Notices* of the R.A.S., 1875, 37, 211, 1876, 37, 2, have worked out the values of the same functions from *x* = 0 to 1 at intervals of 0° and from 1 to 7 at 5° intervals to 10 places. Two tracts by L. Sterk, in *Scritti in memoria di J. von Soldner* (Brunswick, 1863), and by H. Weisstrahler, in *Abhandlungen der Akademie, 1867*, p. 520, contains \( T(\theta, x) \), that is, \( 2 * \text{erf}(x) \) from *x* = 0 to 5 at intervals of 0° to 10 places. J. F. Encke, *Berliner Astr. Jahrbuch* for 1834, gives \( 2 * \text{erf}(x) \) from *x* = 0 to 2 at intervals of 0° to 7 places and \( 2 * \text{erf}(x) \) from *x* = 0 to 3 at intervals of 0° to 5 places, as being \( 47.6936 \). Glashier, in *Phil. Mag.* December 1871, gives \( 2 * \text{erf}(x) \) from *x* = 0 to 4 at intervals of 0° to 10 places, and (p. 603) a table of \( 2 * \text{erf}(x) \) from *x* = 0 to 2 at intervals of 0° to 5 places. Both tables were the result of original calculations. A very large table of \( 2 * \text{erf}(x) \) was calculated by K. Radau and published in the *Années de l'observatoire de Paris* (1888). It contains the values of \( 2 * \text{erf}(x) \) from \( x = -0.120 \) to 1 at intervals of 0° to 10 places, with differences. A. Markoff in a separate publication, *Table des valeurs de l'intégrale* \( \int_{-\infty}^{x} \frac{e^{-t^2}}{t} dt \)

(St. Petersburg, 1888), gives \( 2 * \text{erf}(x) \) from *x* = 0 to 3 at intervals of 0° and from *x* = 3 to 4 at 0° to 1 at intervals of 0° to 11 places, first, second, and third differences to 11 places. He also gives a table of \( 2 * \text{erf}(x) \) from *x* = 0 to 2 at intervals of 0° and thence to 3 at 3° intervals to 7 places, with differences. A. Markoff in a separate publication, *Table des valeurs de l'intégrale* \( \int_{-\infty}^{x} \frac{e^{-t^2}}{t} dt \)
Quart. Jour. Math., 1906, 37, p. 122, he gives a table of Haupt-exponents of 2 for all primes up to 10,000. In Acta Math. (1893, 1-3, 7 and 19), G. H. Hardy gives a table of values of the least primitive roots of primes up to 5000. The following papers contain lists of high primes or factorizations of high numbers: A. K. L. Illiacs (1906, 3, p. 285 (Pellian factorizations); 1907, 37, p. 145 (Quotient factorizations); 1908, 37, p. 65 (Trinomial binary factorizations); 1909, 38, pp. 81, 145 (Diophantine factorization of quartans); 1910, 39, pp. 33, 145 (Quartan factorization). For primes up to 100,000, a table has been published in Quart. Jour. Math., 1885, 20, p. 152, and a seven-place table of $f(x)$ and log $(x)$, where $(x)$ denotes $(x)$, the denominators being the series of prime numbers up to 10,000, in Mess. of Math., 1899, 28, p. 1.

TABLE MOUNTAIN

(Neumarken, 1861; Eng. trans., 1823), and Minding, Integralalgebra (Berlin, 1849), give values of indefinite integrals and formulae of reduction; both are useful and valuable works. De Haan, Nouvelles tables d'integrales definies (Leiden, 1867), is a quarto volume of 727 pages containing evaluations of definite integrals, arranged in 485 tables. The first edition appeared in vol. i. of the Transactions of the Amsterdam Academy of Sciences. This edition, though not so full and accurate as the second, gives references to the original memoirs in which the different integrals are considered. B. O. Perron's A Short Table of Integrals (G. Reuschle, 1865) contains four-place numerical expansions, &c., as well as some four-place numerical tables, including those of hyperbolic sines and cosines and their logarithms.

Lauterer, "Tableaux relatifs to the Theory of Numbers."—These are so of technical a character that no precise account of them can be attempted here. The reader is referred to Cayley's report in the Brit. Ass. Rep. for 1873, p. 303, where a full description with references is given. It is sufficient to state that these tables are not always a continued fraction; (2) C. G. J. Jacobi, Canon arithmeticus (Berlin, 1839), is a quarto work containing 240 pages of tables, where we find for each prime up to 1000 the numbers corresponding to given indices and the indices corresponding to given numbers, on certain primitive roots (10 is taken whenever it is a primitive root) of the prime being selected as base; (3) C. G. Reuschle, Tafeln complex Primasahlen, welche aus Wurzeln der Einheit gebildet sind (Berlin, 1815), includes an enormous mass of results relating to the higher complex theories.

Paving new to tables published since the date of Cayley's report, the two most important works are (1) Col. Allan Cunningham's Table of the number of Primes (London, 1890), a quarto volume similar in construction, arrangement, purpose, and extent to Jacobi's Canon arithmeticus, but differing from it in using the base 2 throughout, i.e. in Jacobi's Canonical Fraction, which is always a root of unity, while in Cunningham's it is always 2. The latter tables in fact give the residues R of $2^n$ (where $x$ = 0, 1, 2, ...) for every prime $p$ or power $2^n$ of 2, and also the indices of these $2^n$, which yield the residues $R$ to the same modulus. The work contains over 30,000 errors found in the Canon arithmeticus. (2) The same author's Quadratic Partitions (London, 1904). These tables give for every prime $p$ up to 101,000 the values of $a$, $b$, $c$, $d$, $e$, $f$; and $(a, b)$, where $p = a^2 + b^2 + c^2 + d^2 + e^2 + f^2$, and a similar table up to 101,000, indicating the number of ways of expressing $p$ as the sum of $x$ squares. Alix's Tables have been published in Mess. of Math., 1904, 34, p. 132. The resolution of $a^n-1$ into its numerical factors is treated in detail by C. E. Bickmore in Mess. of Math., 1903, 34, p. 11. On this subject the former volume he gives a table of the known factors of $a^n-1$ for $a = 2, 3, 5, 6, 7, 10, 11, 12$ and from $n = 10$ to $50$. Other papers on the same subject contained in the same periodical are by Allan Cunningham, Cunningham, and C. E. Bickmore. A. B., p. 49. These papers contain references to other works. Tables of the resolutions of $10^a-1$ are referred to separately in this article under Principal resolutions. If $n$ is the smallest power of $a$ for which the congruence $a^p = 1$ (mod. p) is true, then it is a root of the exponent for modulo $p$, and may be called the chief exponent (Haupt exponent by Allan Cunningham) of the base $a$. The chief exponent is $1$, and is the exponent 1's in the circulating period of the fraction $1/p$ in the scale of radian $a$, and (2) when $p = a = 1$, $a$ is a primitive root of $p$. In Mess. of Math., 1904, 33, p. 145, Allan Cunningham has given a complete list of Haupt-exponent tables with lists of errata in them; and in
Table-turning—Taboo

Table-turning is still in vogue amongst spiritualist circles. The device was employed with success by Professor Charles Richet and others in thought-transference experiments.

See A. E. de Gasparin, Des Tables tournantes, du Surnaturel, &c. (Paris, 1854); Thury, Des Tables tournantes (Geneva, 1855); Faraday's letter on Table-turning in The Times, 30th June 1853.

Tablum (or tabalum, from tabula, board, picture), in Roman architecture, the name given to an apartment generally situated on one side of the atrium and opposite to the entrance; it opened in the rear on to the peristyle, with either a large window or an ante-chamber to persons. Walls were richly decorated with fresco pictures, and busts of the family were arranged on pedestals on the two sides of the room.

Taboo (also written tapu and tabo), the Polynesian name given to prohibitions enforced by religious or magical sanctions. As a verb it means to "prohibit," as an adjective "prohibited, sacred, dangerous, unclean."

1. The word "taboo" or its dialectical forms are found throughout Polynesia; in Melanesia the term is tambu; in various parts of Malaysia and the East Indies pantong, baboso, pawalli, &c.; in Madagascar fadj includes taboo; in North America the Dakota term wakan bears a similar meaning. Taboo is perhaps derived from ta, to mark, and pu, an article of intensity.

2. Fundamental Ideas.—In taboo proper are combined two notions which with the progress of civilization have become differentiated—(i) sacred and (ii) impure, or unclean; it must be borne in mind that the impurity is sacred, and is not derived from contact with common things. It does not imply any moral quality; it has been defined as an indication of "a connexation with the gods, or a separation from ordinary pur- poses, or exclusively an appropiation to persons or things consi- dered sacred; sometimes it means devoted by a vow."

This definition does not cover the whole connotation of taboo as it is employed at the present day, but it indicates clearly the non-moral character of the idea. The ordinary usage is perhaps best defined—the statement that taboo is "negative magic," i.e. abstinence from certain acts, in order that undesired magical results may not follow; in this sense a taboo is simply a ritual prohibition. Properly speaking taboo includes only (a) the sacred (or unclean) character of persons or things, (b) the kind of prohibition which results from this character, and (c) the sanctions or consequences incurred by transgression of the prohibition. The converse of taboo in Polynesia is nau and allied forms, which mean "general" or "common"; by a curious coincidence nau is the term used in Central Australia to express the relation of persons of opposite sexes whose intercourse there is no restriction.

3. Classification.—Various classes of taboo in the wider sense may be distinguished: (i) natural or direct, the result of mana (mysterious power) inherent in a person or thing; (ii) com- municated or indirect, equally the result of mana, but (a) acquired by a person or thing from another person or thing; (b) imposed by a priest or other person; (c) intermediate, where both factors are present, as in the appro- priation of a wife to her husband. These three classes are those of taboo proper. The term taboo is also applied to ritual prohibitions of a different nature; but its use in these senses is better avoided. It might be argued that the term should be extended to embrace cases in which the sanction of the pro- hibition is the creation of a god or spirit, i.e. to religious inter- dictions as distinguished from magical, but there is neither automatic action nor contagion in such a case, and a better term for it is Religious Interdiction.

4. Objects of Taboo are many: (i) direct taboos aim at (a) the protection of important persons—chiefs, priests, &c.—and things against harm; (b) the safeguarding
of the weak—women, children and common people generally—from the powerful mana (magical influence) of chiefs and priests; (c) the provision against the dangers incurred by handling or coming in contact with corpses, by eating certain foods, &c.; (d) the guarding the chief acts of life—birth, initiation, marriage and sexual functions, &c., against interference; (e) the securing of human beings against the wrath or power of deities and spirits; (f) the securing of unborn infants and young children, who stand in a specially sympathetic relation with one or both parents, from the consequences of certain actions, and more especially from the communication of qualities supposed to be derived from certain foods. (ii.) Taboos are imposed in order to secure against thieves the property of an individual, his fields, tools, &c.

5. Sanctions.—The sanctions of taboo may be (i) natural or direct; (ii.) social or indirect. Natural sanctions are (a) automatic, where the punishment of the offender results from the operation of natural laws without any element of volition; just as some kinds of magic are held to bring about their results without the intervention of a spirit; (b) animistic, where the penalty results from the wrath of a god, deceased human being, or other spirit. The motive of the social sanction is ultimately religious or magical, but the penalties incurred by the violator of a taboo are social; they are inflicted by other members of the community, firstly, as a means of averting the supernatural sanctions, which, not having fallen on the actual offender, may visit his innocent fellows; and secondly, as a means of discouraging other offenders; in these cases the case is considered as one of theft, and the networks are laid for the supernatural consequences; the social penalty is also inflicted on those who, like mourners, are themselves taboo and refuse to take steps to seclude themselves, in defence of the community; in the first class the social penalty is at once repressive and prophylactic, saving the innocent by punishing the guilty, and thus averting by a pia culum the vengeance which would otherwise fall somewhere; in the second the penalty is purely repressive.

The violation of a taboo makes the offender himself taboo; other penalties are not unkind to a man who partakes of a forbidden animal will break out in sores or the animal will reproduce itself within him and devour his vitals. Sometimes it is thought that the penalty falls on the kinswomen of the offender and that they produced, instead of children, animals of the taboo species. In Melanesia burial-grounds are taboo, and if the shadow of a passer-by falls on one, this entails upon him the loss of his soul; sometimes misfortune is held to dog the footsteps of the offender in this life and the next. But in some of these cases the observer who reports them has probably confused taboos proper with negative magic. The social sanctions range from the death penalty down to the infliction of a fine or exaction of money compensation; the Polynesian custom of despoiling a man who breaks a taboo is perhaps a special case of this penalty, but the practice of ceremonial plundering cannot always be so explained, and may perhaps in this case too be capable of an entirely different explanation.

Possibly the savage is more susceptible to suggestion than civilized man; at any rate, cases are not unknown in which the violation of a taboo has been followed by illness or even death, when the offender discovers his error. Not unnaturally rites of purification act as counter suggestions and save the offender from the effects of his erroneous beliefs.

6. Mana.—In the case of automatic taboos, and to some extent of other ritual prohibitions, the penalties for violation are unequal; they may be regarded as varying with the relation between the mana of the person or object and the mana of the offender against the prohibition. In the words of Dr R. H. Codrington, mana "is a power or influence, not physical and in a way supernatural; but it shows itself in physical force or in any kind of power or excellence which a man possesses. This mana is not fixed in anything, and can be conveyed in almost anything; but spirits, whether disembodied souls or supernatural (e. g. non-human) beings, have it and can impart it; and it essentially belongs to personal beings to originate it, though it may act through the medium of water, or a stone or a bone" (cf. the subman of West Africa, in Fetishism). Persons or things which are regarded as taboo may be compared to objects charged with electricity; they are the seat of a tremendous power which is transmissible by contact, and may be liberated with destructive effect if the organisms which provoke its discharge are too weak to resist it; the result of a violation of a taboo depends partly on the strength of the magical influence inherent in the taboo object or person, partly on the strength of the opposing mana of the violator of the taboo. Thus, kings and chiefs are possessed of great power, and it is death for their subjects to address them directly; but a minister or other person of greater mana than common can approach them unharmed, and can in turn be approached by their inferiors without risk. The burial-place is often taboo for the common people, save when they are actually engaged in funeral rites; but the sorcerer, thanks to his indwelling power, is able to resist the deadly influences which would destroy the common folk, and may enter a cemetery for ritual or other purposes. So too indirect taboos depend for their strength on the mana of him who imposes them; if it is a chief or a priest, they are more powerful than those imposed by a common person. The mana of the priest, or chief, does not depend on his position; on the contrary, it is thanks to his mana that he has risen above the common herd.

7. Transmissibility.—It is characteristic of taboo proper that it is transmissible; as a logical corollary of this idea, commoners who may be said to have died, or who, in any case, have been released from the penalties of their offenses, are not taboo proper; though they are transmissible, they do not depend on the transmission of an undifferentiated mana; what the parents seek to avoid is often the transmission of specific qualities, conceived as inherent in certain animals, e.g. cowardice in the hare, slowness in the tortoise; the animal is not necessarily in any sense sacred, nor are the parents, if they disregard the prohibition, liable to any penalty, direct or indirect; neither they nor the child are rendered taboo by any violation; finally, save that the child acquires its qualities by a sympathetic process, the abstinence of the parents is correlative to the converse operation of eating an animal or otherwise acquiring by a magical process the good qualities inherent in anything.

8. Duration of Taboos, Imposition, and Abrogation.—Taboo is properly sanctity and the kind of interdict which it entails; by a transference of meaning it is sometimes used of a period of time during which ritual prohibitions of a religious nature are enforced; these periods were proclaimed in Polynesia on important occasions and sometimes lasted for many years; they may be termed interdicts. Many persons and things are permanently taboo; among them may be mentioned kings and chiefs, the property of dead persons and, a fortiori, their bodies or anything in contact with them. Other taboos are temporary. Temporary direct taboos, whether natural or acquired, may be removed by a process of desacralization or of purification. Thus, new crops are frequently taboo till the chief has partaken of them; his mana enables him to run risks which would be fatal to ordinary people, and the crops thus desacralized become free to all; perhaps, however, we may regard the practice as a case of sacralization, in which the chief, like a sacrificing priest, acquires special sanctity, and in so doing fortifies his people by a sympathetic process against supernatural dangers. A
new-born child may also make the crops .nga, just as it may remove the taboo from a temporarily affected person.

In the Tonga Islands a person who became taboo by touching a chief or his property had to put away his sacred character, before he was allowed to make use of his lands, by touching the soles of a higher chief's feet and washing in water. Strangers before penetrating into a village, priests after a sacrifice, warriors, women after child-birth, at puberty, the menstrual period, &c., must submit to lustration. Sometimes the purification was effected by inhaling the sacred contagion; in New Zealand a chief who touched his own head had to apply his fingers to his nose, and then to the top of the other person's head. In other cases mere lapse of time sufficed to cause the removal of a taboo; in Melanesia, where taboos are largely animistic, mourners go away for some months and on their return are free from taboo, the explanation given being that the spirit has got tired of waiting for them.

Indirect taboos are imposed in various ways, and unless they are removed may be as permanent as direct taboos, save that the death of the persons by whom they are imposed must result in their abrogation. In Polynesia a general taboo was imposed by the magician that the tabooed object must not be in his personal possession; by this means he retained control over it. In New Zealand a taboo imposed on an animal was restricted to its use by its owner. Often the taboo extended to the personal use of an object. Thus a talking frog was tabooed to a person who had committed murder, and the object must not be in his possession. In Melanesia, corresponding to the animistic character of tabu, a method of imposing taboo is to mention the name of the spirit.

Taboo objects were marked in various ways: a piece of white cloth, a bunch of leaves, a bundle of branches (in Melanesia) painted red and white, a stick with dry leaves, are among the methods in common use; in Samoa one mark of a taboo was to set up the image of a shark; in New Zealand it sufficed to give a chop with an axe to make a tree taboo. Particular taboos thus imposed seem to be abrogated by the declaration of the person who imposes them; on the other hand, he, no less than others, is bound by the taboo until it is abrogated.

9. Taboo and the Evolution of Punishment.—Penal codes may be largely, if not wholly, traced to religious sources of which taboo is certainly one; the violation of any taboo may impel the life or health of other members of the community besides the offender; it calls for measures intended to discourage others, as well as for steps to avert the immediate evil; if a taboo is imposed upon an individual, the penalty is not fixed; the authority has been set at nought, but he, and in the second place, other members of the community may suffer if the real offender gets off scot free, thanks to the mana which enables him to defy supernatural sanctions. The importance of this in the evolution of law and order is manifest; for whereas a chief would not intervene to protect the property of an individual simply to punish what we regard as a transgression, he is bound to do so when a taboo is broken. That the taboo may be of his own imposition does not affect the question, for he is bound to observe it himself, and conversely may suffer supernatural penalties when it is violated by another. Just as blood-guiltiness may be wiped out by composition, the violation of a taboo may be atoned for by a money payment or similar consideration for the revocation of the taboo; this compensation seems to have a retrospective effect, and thereby removes the dangers brought into existence by the violation.

10. Taboo and Moral Obligation.—In proportion as a taboo becomes a custom and its sanctions fall into the background and are forgotten, its obligations thus transformed are one source of the categorical imperative, the distinguishing feature of which is that it is non-rational and instinctive. We are ignorant of the origin of exogamy and the prohibition of incest, the sanctions of which in Australia and among other peoples of low culture seem to be purely social, for as a rule irregular marriages seem to be regarded simply as offences against tribal morality; if the rules were originally of the nature of taboos, the transformation into customs must have been very early, and the same may be said of the rules by which the relations of members of the same kin are regulated.

11. Royal and Priestly Taboos.—Among people of low culture the chief, and in higher cultures the king, is sometimes held responsible for the order of nature, the increase of the crops, and the welfare of his people generally; it is therefore of the highest importance that nothing should diminish or perturb his influence, and, as a logical consequence, the life of the king, and to a less degree of the chief, is surrounded with a complicated system of taboos and ritual prohibitions. Even where this idea of the magician-king or chief is not found, his position is an expression of the more powerful mana dwelling within him; consequently the king or chief may not come in contact with the common folk, they must avoid his touch, while his approach to lightning withers the life of the oak. We can usually see why a king or chief must hold aloof from those whom he might injure, but it is not always easy to see the basic idea of the taboos, if such they be, which aim at protecting the potentate, or ensuring his due regulation of the course of nature. Some African kings may not see the sea; another may not lie down to sleep; in the Mentawei Islands the chief will die who during an interdict eats at the same time as common people; it is frequently forbidden to see the king partake of food. At a further stage some taboo restrictions are extended to other people, the violation of which involves the punishment of the offender, but the punishment is justified on formal grounds only. In early society the king and the priest often stand very near together; just as we find a war chief and a peace chief, so we meet with political and religious sovereigns. Sometimes the political king is, also the priest and therefore sacred; the web of ritual prohibition woven round him may result in the creation of a secular authority like the Tycoon in Japan, who can rule the state without reference to the ceremonial observances prescribed for the nominal sovereign. Sometimes, on the other hand, the priest bears the title of king, but has lost in the shadow of political power and is free to perform his priestly functions. In these, however, as we see by the example of the flamen dialis at Rome, or the kings of fire and water in Cambodia, he is still hedged round by manifold restrictions as a person who must be protected from doing harm to others or suffering harm himself. In the exercise of his priestly functions he is called upon to offer sacrifice; before fulfilling his office he is often required to submit to additional ritual prohibitions; his personal sanctity, already great, is augmented, and his power to control the evolution of these taboos degenerate into mere rules of etiquette. Over these, he performs lustral rites, in part to free himself from the taint of errors of ritual, but also to desacralize himself.

12. Funerary and Allied Taboos.—Taboos of mourners, widows, and of the dead are common all the world over, but they are especially prominent in Melanesia. These are explained on an animistic hypothesis as due to the fear of the dead man's spirit, but we seem to see traces, e.g. in Madagascar, of the idea that the contagion of death and not the wrath of the dead is the underlying motive; for it is not clear why the soul of a dead kinsman should necessarily be hostile. With funerary taboos may be compared taboos of warriors both on and after an expedition, taboos of hunters during the chase and especially after killing a dangerous animal, taboos of canibals, and on participants in all other ceremonies which involve contact with death or the dead. Temporary seclusion and lustration before return to ordinary life are commonly prescribed for all in this category, even though their connexion with the dead be no closer than is implied in consanguinity. The property of the dead man is commonly burnt or deposited with him in the grave, in part as a protective measure, in part under the influence of belief in the continuity of this and the future life, and as a need of supplying him with necessaries. Burial grounds are avoided, animals or plants from the neighbourhood are not used as food. Finally the name of the dead is not used, partly for fear of summoning him by the power of the word, but partly also from a conviction that, like the name of a king or chief, it is too holy or too dangerous for common use.

13. Taboos of the Sick.—Both disease and death are unnatural in the eyes of the savage; they are often the result of the magic
of some enemy; but they may also be the result of an infraction of a taboo. Some part of the funerary taboos may perhaps be referred to this belief; whatever be the case with taboos of the dead, there can be no question that the sick are secluded or even abandoned, subjected to rites of purification and to restrictions of various sorts, not because their malady is contagious in our sense, but because they are temporarily taken as impure to the health of the community. The sick have imposed on them curative as well as prophylactic taboos; in Madagascar the sun is said to "die" when it sets; therefore it is forbidden to a sick man to look upon it as it goes down.

14. Taboos of Women, Sexual Taboos, Avoidance.—The age of puberty is especially dangerous for both sexes; in the case of a woman the danger is not so much for herself as for others, and results from her physiological state; this danger is renewed with each successive menstrual period, and the frequently long seclusion at puberty finds a parallel in the universal practice in lower stages of culture of separating adult females, not only from males, but from the whole of the community at such periods. At puberty girls are confined for months or even years; they may not see the sun nor touch the earth; many foods are forbidden to them, and special costumes are prescribed for them, as for mourners. The expectant mother is taboo for months before the birth of her child, and her disabilities are not removed for a long period after delivery. Women may not look upon the performance of rites of initiation nor of secret societies; they may not eat new crops in New Caledonia till long after the material stage of the young girls has passed; the taboos are the men's club-house. Both parents, but especially the mother, are subjected to restrictions, having for their object the preservation of the health of the unborn or newly born child. Women are often forbidden to eat with their husbands; nor may they share his labours, especially at sea.

The relations of the sexes are regulated by complicated rules, but they are not necessarily taboos. In the first place, laws of exogamy and similar regulations limit the field of choice; even where no obstacle on this side is present the intercourse of the sexes is often, especially at first, hedged round with numberless interdictions and rites. Connected with the rules of exogamy are the customs of avoidance, which prescribe that a man may not speak to nor even look at his mother-in-law, sometimes also his father-in-law, daughter, and other relatives; in like manner the wife must avoid the husband's relatives, and the brother may often not speak to the sister.

15. Other Taboos.—Taboos of various kinds are imposed on strangers, on sorcerers, and on children. Certain places are taboo; taboos protect the crops and ensure that landmarks are not removed. In fact the number of taboos is so great that it is impossible to enumerate them all.

16. Distribution.—Although taboo is a Polynesian word the institution is far from being restricted to Oceania. Similar prohibitions, though they seldom reached the Polynesian level, are found in America, Africa, and especially Madagascar, North and Central Asia, and among the non-Aryan tribes of India. But taboo and its survivals are not confined to the civilized.

17. Developments of Taboo.—It would be remarkable if a feature which has taken such deep root in the custom and belief of savage and barbarous peoples did not leave a marked influence on the development of thought. The sacred may become moral pari passu with mankind, so the ceremonially clean has become the physically and morally clean, the pure has become the moral, and taboo has changed its name to holiness. At a certain point in evolution the notion of unclean, sometimes positive and implying the possession of dangerous properties, sometimes negative and denoting no more than mere absence of holiness, which is in this case indistinguishable from mana, becomes a prominent element in religion. At a later stage and as a result of the greater weight attached to morality, the positive unhallowed falls into the background, leaving only the negatively unclean, the unholy, which is not in itself death-dealing, but may, like its savage analogue, call down on the community, innocent and guilty alike, the wrath of higher powers, the remedy being, not so much the punishment of the offender, still less mere physical purification, but their moralized analogues, prayer, fasting and repentance.

18. Among the Greeks.—The general word for taboo among the Greeks in ἄγος, which may bear the sense of "sacredness" or "pollution"; derivates occur in the same meanings. Usually, however, the nots in sacred and unclean are distinguished by the use of different terms from this root, ἄγος for sacred, ἄγος for unclean or accursed. The rules of the Greek ἄγος (pagan) season of tabooes (Polynesia) do not differ markedly from those of the Polynesians. Corresponding to the war-taboo of Oceania we find in Homer that the army (Od. xxv. 81) and the sentinel (II. x. 56, xxiv. 681) are sacred; and we learn from Plato that warriors never eat fish, from which indeed there was a general custom of abstinence except under the pressure of famine. The epithets ἵππος, ἰππος, &c., which may point to beliefs similar to those of Polynesia, are applied to chiefs and kings, and further to the swineherd, thus suggesting that the pig, which bore a mixed reputation for holiness and uncleanness (ceremonial) both in Egypt and west Asia, was similarly regarded in Greece.

19. Among the Romans.—The term for taboo is sacer; any one who removed a landmark became sacer and was outlawed, any citizen having the right to kill him. Conscriutori capitis et honorum was the term for devotion to the nether gods. The flamen dialis and his wife were hedged in by a perfect network of ritual prohibitions; he might not ride upon nor even touch a horse. The taboos at the puberty of girls were so strong that he might not walk under a vine; he might not name a goat, raw meat, beans, ivy, a dog, and so on; his hair might be cut only by a friar; he might not touch a corpse. The flamincas might not comb her hair at certain festivals; she was taboo (feriates) after hearing thunder till she had purified herself by a sacrifice. The Roman feriae were periods of taboo.

20. Among the Jews.—The Hebrew for holy is כָּלִי which means "separated, cut off," while its correlative כָּל means "open for common use"; another sense of sacer is conveyed by הָלָּד, "accursed, devoted to destruction." Holiness is transmissible by contact (Ezek. xliv. 19, xlv. 20; Ex. xxxix. 37; Lev. vi. 27). It is distinct from purity in the moral sense; the names of the hierodulri כָּלִי and hierodulra מָדַי are connected with the word כָּל. Taboo among the Jews are: (1) things connected with Jehovah, his name is holy and terrible; his arm is holy; holy places are taboo (see Sanctuary); the ark is actively dangerous, and Uzzah, no less than the men of Bethhemesh, pays the penalty for too nearly approaching it; (2) the Nazarite might not partake of certain foods, nor touch a dead body nor shave his head, which was specially sacred. In fact the Nazarite was absolutely unclean and could communicate his uncleanness to others; (4) the birth of a child made the mother taboo; she was required to purify herself; (g) leprosy, menstruation, and sexual functions generally occasioned longer or shorter periods of uncleanness; and warriors, who were taboo on a campaign vessel, were required to observe continence; (6) certain foods were taboo, and the uncleanness might be communicated to an earthen vessel, which, under certain circumstances, would be broken, like a pot in Polynesia; (7) the use of iron was forbidden in the case of the Nazarite; (8) there were different kinds of herbs which "becomes holy," and (h) bystanders are warned not to approach a heathen rite, lest they be "sanctified"; (9) to the Polynesian interdicts, often termed taboos, corresponded certain periods of time, such as the Sabbath and the Jubilee year, but these are not connected with taboo proper.

TÁBOR—TACHEOMETRY

TÁBÓR, a town in western Bohemia, on the Francis-Joseph railway, 104 kilometres from Prague. Pop. (1908) 7,073.

It is the chief town of a government district and the seat of a provincial law-court, and also of an industrial school. The town was founded in 1420 by the more advanced party of the church-reformers or Hussites, who, as it became their centre, soon began to be known as the Taborites. The town is situated on the summit of an isolated hill, at an elevation of about 2,800 ft. above the surrounding country by the Lužnice stream and by an extensive pond, to which the Hussites gave the biblical name of Jordan. The historical importance of the city of Tábor only ceased when it was captured by King George of Poděbrad in 1452. Though a large part of the ancient fortifications has recently been demolished, Tábor—or Hradiste Hory Tábor, the castle of the Tabor Hill, as it was called in the Hussite period—has still preserved many memorials of its past fame. In the centre of the city is the market-place (rybník). Only very narrow streets lead to it, to render the approach to it more difficult in times of war. In the centre of the market-place is the statue of Žižka, the greatest of the Taborite leaders. Here also is the diagonal church, built in 1536 in the style of the Bohemian Renaissance, and the town hall, in connexion with which a museum has been founded, which contains interesting memorials of the Hussite period. Some parts of the ancient fortifications and the very ancient Kotnov tower also still exist.

See Thir, Hradiste Hory Tábor (1835).

TÁBRIZ, the capital of the province of Azerbaijan in Persia, situated in the valley of the Ali-Chat, "Bitter River," at an elevation of about 2,800 ft. above sea level. The first complete census taken in 1871 the population of Tábriz was in 1888 estimated at 165,000, and is now said to be about 200,000.

The popular etymology of the name Tábriz from tabe=fever, ris=pourer away (verb, ribkhan=pour away, flow; German rieseln?), hence "fever-deestroying," is erroneous and was invented in modern times. It is related that Zobeideh, the wife of Harun-al-Rashid, founded the town in 797 after recovering there from fever, but the earlier chronicles give no support to this statement, and it is nowhere recorded that Zobeideh ever visited Azerbaijan, and the name Tabriz was known many centuries before her time. In 1842 Hammer-Purgstall correctly explained the name as meaning the "warm-flowing" (tab=warm, same root as lep in "tepid") from some warm mineral springs in the neighbourhood, and compared it with the synonymous Tepltz in Bohemia. In old Armenian histories the name is Tavresh, which means the same. The popular pronunciation to and taw for tab has given rise to the spellings Toris and Tauris met with in older travellers and used even now.

Overlooking the valley on the N.E. and N. are bold bare rocks, while to the S. rises the majestic cone of Sahand (13,000 ft.). The town possesses but few buildings of note, and of the extensive ruins very few present attention. The area, or citadel, in the south-west extremity of the city, now used as a arsenal, is a noble building of burnt brick with mighty walls and a tower 20 ft. in height. Among the ruins of old Tábriz the sepulchre of the Mongol king, Ghazan Khan (1295-1304), in a quarter once known as Shab (generally pronounced Sham and Shám) i Ghazan, is no longer to be distinguished except as part of a huge tumulus. The great shab (cupola or dome) and other buildings erected by Ghazan have also disappeared. They stood about 2 m. S.W. from the modern town, but far within the original boundaries. The "spacious arches of stone and other vestiges of departed majesty," with which Ker Porter found it surrounded in 1818, were possibly remains of the college (medresseh) and monastery (zavieh) where Ibn Batūta found shelter during his visit to the locality. On the eastern side of the city stand the ruins of the Masjed i Jehan Shah, commonly known as the Masjed i Kebud, or "Blue Mosque," from the blue glazed tiles which cover its walls. It was built by Jehan Shah of the Kara Kuyunlī or Black Sheep dynasty (1437-1467).

Tábriz is celebrated as one of the most healthful and pleasant of Persian towns.

Tábriz was for a long period the emporium for the trade of Persia on the west, but since the opening of the railway through the Caucasus and greater facilities for transport on the Caspian, much of its trade with Russia has been diverted to Astara and Resht, while the insecurity on the Tábriz-Trebizond route since 1878 has diverted much commerce to the Bagdad road. According to consular reports the value of the exports and imports which passed through the Tábriz custom-house during the years 1867-73 averaged £5,936,600 and £1,126,660 (total for the year), and the exports of silver were £1,213,886 and £344,510. There are reasons to believe that these values were considerably understated. For the year 1868-9 the present writer obtained figures directly from the books kept by the custom-house official at Tábriz, and although, as this official informed him, some important items had not been entered at all, the value of the exports and imports shown in the books exceeded that of the consular reports by about 10 per cent. Since that time the customs of Azerbaijan have been taken over by the central customs department under Belgian officials, and it is stated that the trade has not decreased. British, Russian, French, Turkish and Austrian consulates and a few European commercial firms are established at Tábriz; there are also post and telegraph offices. Tábriz has suffered much from earthquakes, notably in 1858, 1842 and 1721, each time with almost complete destruction of the city.

(A. H.-S.)

TABULARIUM (tabula, board, picture, also archives, records), the architectural term given to the Record office in ancient Rome, which was built by Q. Lutatius Catulus, the conqueror of the Cimbri. It was situated on the west side of the Forum Romanum, and its great corridor, 220 ft. long, raised 50 ft. above the forum without support by pillars. The substructure of this corridor was lighted through a series of arches divided by semi-detached columns of the Doric order, the earliest example of this class of decoration, which in the Theatre of Marcellus, the Colosseum, and all the great amphitheatres throughout the Roman empire constituted the decorative treatment of the wall surface and gave scale to the structure. Traces of an upper corridor with semi-detached columns of the Ionic order have been found in the Tabularium, but this structure was much changed in the 13th century, when the Palace of the Senators was built.

TACHEOMETRY (from Gr. tachy-, quick; metrēo, a measure), a system of rapid surveying, by which the positions, both horizontal and vertical, of points on the earth's surface relatively to one another are determined without using a chain or tape or a separate levelling instrument. The ordinary methods of surveying with a theodolite, chain, and levelling instrument (see SURVEYING) are fairly satisfactory when the ground is pretty clear of obstructions and not very precipitous, but it becomes extremely cumbersome when the ground is much covered with bush, or broken up by ravines. Chain measurements are then both slow and liable to considerable error; the levelling, too, is carried on at great disadvantage in point of speed, though without serious loss of accuracy. These difficulties led to the introduction of tacheometry, in which, instead of the pole formerly employed to mark a point, a staff similar to a level staff is used. This is marked with heights from the foot, and is graduated according to the form of tacheometer in use. The azimuth angle is determined as formerly. The horizontal distance is

1 This mosque is popularly attributed to Ghazan Khan (end of 13th century).
inferred either from the vertical angle included between two well-defined points on the staff and the known distance between them, or by readings of the staff indicated by two fixed wires in the diaphragm of the telescope. The difference of height is computed from the angle of depression or elevation of a fixed point on the staff and the horizontal distance already obtained. Thus all the measurements requisite to locate both vertically and horizontally with reference to the point where the tacheometer is centred are determined by an observer at the instrument without any assistance beyond that of a man to hold the staff.

The simplest system of tacheometry employs a theodolite without additions of any kind, and the horizontal and vertical distances are obtained from the angles of depression or elevation of two well-defined points on a staff at known heights from the foot, the staff being held vertically. In fig. 1 let T be the telescope of a theodolite centred over the point C, and let AB be the staff held vertically on the ground at A. Let P and P' be the two well-defined marks on the face of the staff, for distant readings, and from the great simplicity of the observations there is little likelihood of errors in the field. But the reduction in the observed elevations and horizontal distances will be heavy under the conditions described below. Since the accuracy of the method depends entirely upon the accuracy with which the vertical angles are measured, it is advisable that the vertical circle should be as large as possible, very finely and accurately divided, and fitted with good verniers and microscopes.

In Eckhold's omnimeter the vertical circle of the theodolite is dispensed with, and a reading of reduction work is effected by reading, not the vertical angles themselves, but the tangents of the angles.

In the Ziegler-Hager tachograph the tangents are read not horizontally but vertically, and the arrangement is as follows:

In fig. 2 O is the axis of rotation of the telescope; m is the axis of a steel bolt, which carries on its top a knife-edge, on which the telescope rests by means of an agate plate. The bolt is carried in a socket in which it can be raised or lowered by a micrometer screw fitted with a graduated head. The slide plays between the vertical cheeks of a standard rigidly attached to the frame of the instrument, and it can be raised or lowered by a rack and pinion. The telescope, which rests on the knife-edge, follows the movement of the bolt. The slide carries on one side a vernier by which to read the divisions on a scale fixed to one of the vertical legs of the standard, and the zero point o of the scale is the point where the horizontal plane through O cuts the scale when the plane-table or upper plate of the theodolite is truly level. The scale is graduated in divisions, each of which is the 1/34th part of the distance Op, or h. The head of the micrometer screw which raises or lowers the steel bolt in the slide is graduated with a zero mark and with marks corresponding to a vertical movement of the knife-edge of 1/4 of an inch. The instrument is used as follows:—Let AB be the surface of the ground, and BC a staff held vertically at B, and let CB be produced to meet the horizontal line through O in M. Let the head of the micrometer screw be turned until the zero division is exactly under the point B. Let P be the zero division on the staff, and let the slide and bolt be raised by the rack and pinion movement till the telescope is directed towards P. Then p may be the point where the line OP cuts mn, and let the tangent reading be taken on the scale. Then let the telescope be lowered by the micrometer screw in the slide till the division on the head of the screw marked 1 is exactly under the point B; the knife-edge of the bolt has then been lowered through a distance 1 equal to 1/100. Let g be the point on the staff where the line of sight Pt exactly coincides with line of sight at point g be taken. Then since the triangles between O and m, and O and CM are similar to each other, and does its base by 1/100, or OM = 100 x p. This gives the horizontal distance of the staff from O, and the vertical distance PM of above O is OM tan MOP = OM x mg, and since mg has been read in

![Fig. 1](image1)

![Fig. 2](image2)
ED' is one-half of the distance ED, and so on in proportion. The distance ED can be instantly inferred from the readings of the staff, if the latter be suitably graduated. If, for example, it is desired to know the distance ED in yards, and by construction the proportion EC/BC = 50, then the intercept on the staff at 1 yard from E would be &frac12;th of a yard, or &frac12;2 inch, the intercept at 2 yards from E would be 2&times;&frac12;2 inches, and so on. If therefore the staff be graduated with divisions of &frac12;2 inch, and the intercept be 45 of such divisions, it would be inferred that the distance of the staff from E was 45 yards. The constant proportion EC/BC can be checked by measuring 100 yards from E and observing whether the intercept is exactly 100 divisions or not. If it is not, the wire diaphragm must be shifted in the tube until it is. In figs. 3, 4, 5 and 6 the distances are deduced from the readings of a central wire in the optical axis of the telescope and of a wire above it, for the sake of simplicity. The usual arrangement is to fit the diaphragm with a central wire and with one or two wires above and below it, at equal distances from the central wire. The vertical angle of depression or elevation is fixed by directing the central wire to a well-defined division on the staff, and the distance of the staff is inferred from the reading given by the corresponding wires above and below the central wire.

The elementary form of tacheometer given above illustrates the general principle of the class of tachometers now under consideration, and as leading up to the practical form, in which the staff is viewed with a telescope mounted in the manner of a theodolite. The simplest form is Reichenbach's tacheometer, which may be investigated as follows:—In fig. 4 let A be the object glass by which an image of the staff ST is formed at HK. The wire diaphragm is moved in the tube so as to coincide with the image, and the image and wires are viewed with an eye-piece (not shown) in the usual way. Let O be the point where the vertical axis of the instrument cuts the axis of the telescope, the instrument being central being placed in a position in which the distance to the staff is required. The object glass (of focal length = f) is at a distance c from O. Let AT = u and AH = v, and the angle SAT = HAK = $\theta$. Then if $i$ be the height of the image HK, $i = s\tan \theta$. Since $f/4 + 1/u = 1/f$, we have $v = -u/(u-f)$, and hence $i = u\tan \theta / (u-f)$. Let F be some point on AT such that AF = x and FT = u'. Let the angle SFT = $\phi$. Then $u = u/4 + x$ and $\tan \theta = u/4 + x = \tan \phi; and, if $x = f_1$, $i = f_1\tan \phi$.

If therefore the point F be taken at a distance f from the object glass, every intercept of ST between O and F, such as ST', ST'', &c., which are bounded by the line FS, and for which consequently $\theta$ is the same, will have the same height of image at the diaphragm. Conversely, if K be a wire in the diaphragm it will cut the image of the staff for all positions of the staff between T and F in points which lie on the line FS. Now the intercept ST', half-way between F and T, will be one-half of ST, and therefore if the reading on the staff indicated by the wire in question be one-half of ST, it may be inferred that the position of the staff is half-way between F and T, and similarly for other distances. If the distance of ST from O is required, as is usually the case, a quantity $f + c$ must be added to every distance from F determined as above.

It is very seldom that the line of sight AT of the telescope is at right angles to the staff. In general it is more or less inclined to the staff, which is almost always held vertical, and the horizontal and vertical distances of the staff from the axis of rotation of the telescope are found thus:—In fig. 5 let ST be the observed intercept on the Staff when the telescope is inclined at an angle $\alpha$ to the horizontal. Draw TS' at right angles to OT. The angle TS'S will be very nearly a right angle, and ST'S may be taken as equal to $\alpha$. If there were $n$ graduations (each corresponding to 1 yard in distance) in ST, there would be $n\cos \alpha$ graduations in ST', and therefore the distance of the staff from F, as inferred from the observed number of graduations in ST, must be multiplied by $\cos \alpha$ to give the true distance FT. Again FN = FT $\cos \alpha$, so that the distance inferred from the observed number of graduations in ST must be multiplied by $\cos \alpha$ to give the horizontal distance of F from T. To this must be added the distance OL = $OF\cos \alpha = (f+c)\cos \alpha$ to get the horizontal distance, OM, of O (the vertical axis of the instrument) from T. This value of OM must be multiplied by $\tan \alpha$ to obtain the value of $h$, the vertical distance of T from O. Tables of the value of $\cos \alpha$, $\cos^2 \alpha$, and $\tan \alpha$ are necessary to facilitate these calculations.

In this tacheometer the distances as inferred from the readings of the staff are the distances of the staff from F and not from O. This defect was remedied by Porro, who added a lens (called the anallatic lens) to the telescope. The arrangement of the telescope as manufactured by Messrs Troughton and Simms, is as follows:—In fig. 6 O is the point where the vertical axis of the instrument cuts the axis of the telescope. The object glass is fixed at a distance c from O, and the anallatic lens at a distance d from the object glass. The distances c and d are chosen to suit the constructive conveniences of the instrument. The diaphragm at K is movable so that it can be made to coincide with the image of the staff. The focal length $f_1$ of the object glass is arbitrary, and the focal length $f_2$ of the anallatic lens is determined from the equation of condition between c, d, $f_1$, and $f_2$. The image of the staff ST would be formed by the object glass at H, at a distance $v$ from the object glass, were it not that the rays, after passing through the object glass, are received by the anallatic lens and the image of the staff is formed at K on the wire diaphragm, which is slid in the tube till it coincides with the position of the image. The image at K is viewed by an eye-piece in the usual way. Let T be the point where the image of the staff is cut by the central wire of the diaphragm, and S the point where the image is cut by one of the outer wires of the diaphragm. If $\theta$ and $\phi$ be the angles subtended by ST at the object glass and at the point O, respectively, and if $i$ be the height of the image at K, $h$ the height of the virtual image at H, then by elementary geometry and from optical considerations, we obtain

$$ i = \frac{uf_1}{f_1 - d + f_1 \tan \phi} $$

Let $f_1$ be made such that $uf_1 = (c+f_1)/(d-f_1)\tan \phi$, the equation of condition above mentioned. Then $f_1 = (c+f_1)/(d-f_1)$, and

$$ i = \frac{uf_1}{f_1 - d + f_1 \tan \phi} $$

Therefore all the readings of the staff which would be given by the outer wire of the diaphragm will lie on the line OS (for all of
which is the same, and the distance from O along OT will be proportional to the reading on the staff. Thus if the staff be suitably graduated, the distance from O can be immediately deduced from the reading. Also, as before, if the telescope be inclined at an angle $\alpha$ to the horizontal, the distance OT inferred from the number of graduations in ST must be multiplied by cos $\alpha$ to give the horizontal distance of O from T, and the horizontal distance so obtained must be multiplied by tan $\alpha$ to obtain the vertical distance of T from O.

The inconvenience of the reduction work necessary to obtain the horizontal and vertical distances produced the Wagner-Feunel tacheometer, by which the distances can be read directly from the instrument. As is seen from fig. 7, three scales are provided, to measure the inclined distance, the horizontal distance, and the vertical distance respectively. All three are arranged in a plane parallel to the plane in which the telescope turns. The inclined scale is attached to the telescope exactly parallel to its line of collimation, and moves with it. The horizontal scale is fixed to the upper horizontal plate of the theodolite. The vertical scale is on the vertical edge of a right-angled triangle, which can be slid along on the top of the horizontal scale. The inclined scale carries a slide which is provided with two verniers. One of these is parallel to the inclined scale, and is for the purpose of setting off on the scale (in terms of the divisions on the scale) the inclined distance of the staff from the axis of rotation of the telescope. The other turns on a pivot whose centre is accurately in the edge of the inclined scale at the point where the zero division of the inclined vernier cuts the edge, and is for the purpose of reading the vertical scale; it can be turned on its pivot so as to be vertical whatever may be the inclination of the telescope. Moreover, since the distance from the centre of the pivot to the zero of the vernier is always constant and known, the vertical scale can be graduated so that the reading of the vernier gives the height (in terms of the division on the scale) of the staff above the axis of rotation of the telescope. The horizontal scale attached to the horizontal plate of the theodolite is read by means of a vernier carried by the triangle. To ascertain the horizontal and vertical distances of the point on the staff which is cut by the middle wire in the diaphragm of the telescope from the rotation axis of the telescope, the inclined distance of the point on the staff is read by means of the wires, as in Porro’s tacheometer. This distance (in terms of the division) is then set off on the inclined scale by means of the inclined vernier, and the vertical scale on the triangle is moved up to the vertical vernier, which is adjusted to its edge. With proper graduation of the horizontal and vertical scales, the horizontal and vertical distances can be determined on the scales. This method, however, requires that the staff be held so that its face is perpendicular to the line of sight, which is more troublesome than holding the staff vertical.

TACHIELU, a town of China, in the province of Sze-ch’uen. It is the great tea mart for Tibet, and from Tachienu the two trade-routes, the Gya lam and the Chang lam, diverge, the former to Ladakh and the latter to Kashgar.

TAHYLYTES, or TACHYLYTES (from Gr. ταχυλύτης, swift, λύειν, to dissolve, meaning “easily fused,” though some have erroneously interpreted it as “easily soluble in acids”), in petrology, the vitreous forms of the basic igneous rocks; in other words, they are basaltic obsidians. They are black in colour, dark brown in the thinnest sections, with a resinous lustre and the appearance of the appearance of the larger crystals; but in all the other crystals and sometimes spherical. They are very brittle, and break down readily under the hammer. Small crystals of felspar or olivine are sometimes visible in them with the unaided eye. All tachylytes weather rather easily, and by oxidation of their iron become dark brown or red. Three modes of occurrence characterize this rock. In all cases they are found under conditions which imply rapid cooling, but they are much less common than acid volcanic glasses (or obsidians), the reason being apparently that the basic rocks have a stronger tendency to crystallize, partly because they are more liquid and the molecules have more freedom to arrange themselves in crystalline order.

The fine scoria ashes or “cinders” thrown out by basaltic volcanoes are often spongy masses of tachylyte with only a few larger crystals or phenocrysts imbedded in black glass. Such tachylytes are usually bombs and scoriæ and are frequent in Strombolos, Etna, and are very common also in the ash beds or tuffs of older date, such as occur in Skye, Midlothian and Fife, Derbyshire, and Yorkshire. Basaltic pieces of this kind are exceedingly widespread on the bottom of the sea, either on the bottom of the sea, the sea bottom, and other deposits or forming layers coated with oxides of manganese, precipitated on them from the sea water. These tachylyte fragments, which are included in the basalt, are usually broken, but the hydration of their ferrous compounds, have taken on a dark red colour. This altered basic glass is known as “palagonite”; concentric bands of it often surround kernels of unaltered tachylyte, and are as easy to cut with a knife. Palagonite and olivine, with the minerals also are decomposed, and are represented only by pseudomorphs. The fresh tachylyte glass, however, often contains large-shaped crystals of plagioclase felspar and small prisms of augite and olivine, but all these minerals very frequently occur mainly as microlites or as beautiful skeletal growths with sharp-pointed corners or ramifying processes. Palagonite tuffs are found along with the older volcanic rocks, and in many of these rocks, described as “the palagonite formation,” is said to cross the island from south-west to north-east. Some of these tuffs are fossiliferous; others are intercalated with glacial deposits. Palagonite tuffs are found in Sicily, the Eifel, Hungary, Canay Islands, &c.

A second mode of occurrence of tachylyte is in the form of lava flows. Basaltic rocks often contain a small amount of glassy ground-mass, and in the limburgites this becomes more important and conspicuous, but vitreous types are far less common in these than in andesites. Acid lavas from the Eifel volcanoes have poured out vast floods of black basalt, containing felspar, augite, olivine, and iron ores in a black glassy base. They are highly liquid when discharged, and the rapid cooling which takes place prevents their complete crystallization and a new place completely. Many of them are spongy or vesicular, and their upper surfaces are often exceedingly rough and jagged, while at other times they assume rounded wave-like forms on solidification. Great cavities are found where the crust has solidified and the liquid interior has subsequently flowed away, and stalactites and stalagmites of black tachylyte adorn the roofs and floors. On section these growths show usually a central cavity enclosed by walls of dark brown glass in which skeletons and microliths of augite, olivine and felspar lie imbedded. From the crater of Kiluaea thin clouds of steam rise constantly, and as the bubbles of vapour are forced down to the molten core of the volcano, the air in them is rapidly cooled and fuses into a sort of jet of thin fibres of basalt which solidifies at once and assume the form of tachylyte threads. Under the microscope they prove to be nearly completely glassy with small circular air vesicles sometimes drawn out into gas tubes. Other volcanic islands in the Hawaiian Islands are glassy basaltic lavas of this kind at all common.

A third mode of occurrence of tachylyte is as the margins and thin often present at the edges of crystals of basalt, dolerite and diabase. They are sometimes only a fraction of an inch in thickness, resembling a thin layer of pitch or tar on the edge of a crystalline dolerite dike, but veins several inches thick are sometimes met with. In these situations the tachylyte is rapidly solidified, but it is usually very finely and the fusion banding accentuated by the presence of rows of spherulites which are visible as dark brown rounded spots. These spherulites exhibit a distinct radiate structure and sometimes exhibit a rather of varying colour. These glasses forming polyhedrons, sometimes perlitic and these rocks are always brittle. The commonest crystals are olivine, augite and felspar, with swarms of minute dusty black grains of magnetite. At the extreme edges the glass is often perfect free from crystalline products, but it merges rapidly into the
ordinary crystalline dolerite, which in a very short distance may contain no vitreous base whatever. The spherulites may form needles of felspar or feather-like growths of augite. The ultimate product of decomposition in this case also is a red palagonitic substance, but owing to the absence of steam cavities the tachylyte selvages of dikes are more often found in a fresh state than the basic lapilli in ash-beds. Many occurrences of lascivious dolerites have been reported from Skye, Mull, and the western part of Scotland; they are found also in connexion with the intrusive dolerite sills of the north of England and the central parts of Scotland. In the Saar district of Germany similar rocks occur, some of which have been described as weisselbergites (from Weisselberg). Other localities for tachylytes of this group are Nassau, Siliesia and Shetland. The chemical composition of some of the rocks of this group is indicated by the analyses given below:

TACITUS, CORNELIUS

(TACITUS, CORNELIUS (c. 55-120), Roman historian. Tacitus, who ranks beyond dispute in the highest place among men of letters of all ages, lived through the reigns of the emperors Nero, Galba, Otho, Vitellius, Vespasian, Titus, Domitian, Nerva and Trajan. All we know of his personal history is from allusions to himself in his own works, and from eleven letters addressed to him by his very intimate friend, the younger Pliny. The exact year of his birth is a matter of inference, but it may be approximately fixed near the close of the reign of Claudius. Pliny indeed, though himself born in 61 or 62, speaks of Tacitus and himself as being "much of an age," but he must have been some years junior to his friend, who began, he tells us, his official life under Vespasian,2 no doubt as quaestor, and presumably tribune or aedile under Titus (80 or 81), at which time he must have been twenty-five years of age at least. Of his family and birthplace we know nothing certain; we can infer nothing from his name Cornelius, which was then very widely extended; but the fact of his early promotion seems to point to respectable antecedents, and it may be that his father was one Cornelius Tacitus, who had been a procurator in one of the divisions of Gaul, to whom allusion is made by the elder Pliny in his Natural History (vii. 76). But it is all matter of pure conjecture, as it also is whether his "praenomen" was Publius or Gaius. The most interesting facts about him to us are that he was an eminent pleader at the Roman bar, that he was an eye-witness of the "reign of terror" during the last three years of Domitian, and that he was the son-in-law of Julius Agricola. This honourable connexion, which testifies to his high moral character, may very possibly have accelerated his promotion, which he says3 was begun by Vespasian, augmented by Titus, and still further advanced by Domitian, under whom we find him presiding as praetor at the celebration of the secular games in 88, and a member of one of the old priestly colleges, to which good family was an almost indispensable passport. Next year, it seems, he left Rome, and was absent till 93 on some provincial business, and it is possible that in these four years he may have made the acquaintance of Germany and its peoples. His father-in-law died in the year of his return to Rome. In the concluding passage of his Life of Agricola he tells us plainly that he witnessed the judicial murders of many of Rome's best citizens from 93 to 96, and that being himself a senator he felt almost a guilty complicity in them. With the emperor Nerva's accession his life became bright and prosperous, and so it continued through the reign of Nerva's successor, Trajan, he himself, in the opening passage of his Agricola, describing this as a "singularly blessed time," but the hideous reign of terror had stamped itself ineffaceably on his soul, and when he sat down to write his History he could see little but the darkest side of imperialism. To his friend the younger Pliny we are indebted for the little we know about his later life. He was advanced to the consulship in 97, in succession to a highly distinguished man, Verginius Rufus, on whom he delivered in the senate a funeral eulogy. In 99 he was associated with Pliny in the prosecution of a great political offender, Marius Priscus, under whom the provincials of Africa had suffered grievous wrongs. The prosecution was successful, and both Tacitus and Pliny received a special vote of thanks from the senate for their conduct of the case. It would seem that Tacitus lived to the close of Trajan's reign, as he seems4 to hint at that emperor's extension of the empire by his successful Eastern campaigns from 115 to 117. Whether he outlived Trajan is matter of conjecture. It is worth noticing that the emperor Tacitus in the 3rd century claimed descent from him, and directed that ten copies of his works should be made every year and deposited in the public libraries. He also had a tomb built to his memory, which was destroyed by order of Pope Pius V. in the latter part of the 16th century.

Pliny, as we see clearly from several passages in his letters, had the highest opinion of his friend's ability and worth. He consults him about a school which he thinks of establishing at Comum (Como), his birthplace, and asks him to look out for suitable teachers and professors. And he pays5 him the high compliment, "I know that your Histories will be immortal, and this makes me the more anxious that my name should appear in them."

The following is a list of Tacitus's remaining works, arranged in their probable chronological order, which may be approximately inferred from internal evidence:—(1) the Dialogue on Orators, about 76 or 77; (2) the Life of Agricola, 97 or 98; (3) the Germany, 98, published probably in 99; (4) the Histories (Histories), completed probably by 115 or 116, the last years of Trajan's reign (he must have been at work on them for many years); (5) the Annals, his latest work probably, written in part perhaps along with the Histories, and completed subsequently to Trajan's reign, which he may very well have outlived.

The Dialogue on Orators discusses, in the form of a conversation which Tacitus professes to have heard (as a young man) between some eminent men at the Roman bar, the causes of the decay of eloquence under the empire. There are some interesting remarks in it on the change for the worse that had taken place in the education of Rome now, the style of the Roman orator is far more Ciceronian than that of Tacitus's later work, and critics have attributed it to Quintillian; but its genuineness is now generally accepted. It is noticeable that the mannerisms of Tacitus appear to develop through his lifetime, and are most strongly marked in his latest books, the Annals.

The Life of Agricola, short as it is, has always been considered an admirable specimen of biography. The great man with all his grace and dignity is brought vividly before us, and the sketch we have of the history of our island under the Romans gives a special interest to this little work.

The Germany, the full title of which is "Concerning the geography, the manners and customs, and the tribes of Germany," describes with many suggestive hints the general
Tacitus, Marcus Claudius

character of the German peoples, and dwells particularly on their fierce and independent spirit, which the author evidently felt to be a standing menace to the empire. The geography is its weak point; much of this was no doubt gathered from vague hearsay. Tacitus dwells on the contrast between barbarian freedom and simplicity on the one hand, and the servility and degeneracy of Roman life on the other. The Histories, originally composed in twelve books, brought the history of the empire from Galba in 69 down to the close of Domitian's reign in 97. The first four books, and a small fragment of the fifth, giving us a very minute account of the eventful year of revolution, 69, and the brief reigns of Galba, Otho and Vitellius, are all that remain to us. In the fragment of the fifth book we have a curious but entirely inaccurate account of the Jewish nation, of their character, customs and religion, from a cultivated Roman's point of view, which we see at once was a strongly prejudiced one.

The Annals—a title for which there is no ancient authority, and which there is no reason for supposing Tacitus gave distinctively to the work—record the history of the emperors of the Julian line from Tiberius to Nero, comprising thus a period from A.D. 14 to 68. Of these, nine books have come down to us entire; of books v., xi. and xvi. we have but fragments, and the whole of the reign of Galba (Caligula), the first six years of Claudius, and the last three years of Nero are wanting. Out of a period of fifty-four years we thus have the history of forty years.

The principal MSS. of Tacitus are known as the "first" and "second" Medicean—both of the 10th or 11th centuries. The first six books of the Annals exist nowhere but in the "first Medicean" MS., and an attempt was made in 1878 to prove that the Annals are a forgery by Poggio Bracciolini, an Italian scholar of the 15th century, but their genuineness is confirmed by their agreement in various minute details with coins and inscriptions discovered since that period. Moreover, Ruodulphe, a monk, writing in the 9th century, shows that he is acquainted with a MS. of Tacitus containing at least the two first books. Add to this the testimony of Jerome that Tacitus wrote in thirty books the lives of the Caesars and the evidence of style, and there can be no doubt that in the Annals we have a genuine work of Tacitus.

Much of the history of the period described by him, especially of the earlier Caesars, must have been obscure and locked up with the emperor's private papers and memoranda. As we should expect, there was a vast amount of floating gossip, which an historian would have to sift and utilize as best he might. Tacitus, as a man of good social position, no doubt had access to the best information, and must have talked matters over with the historians who were then several writers and chroniclers, whom he occasionally cites but not very often; there were memoirs of distinguished persons—those, for example, of the younger Agrippina, of Thrasea, and Helvidius. There were several collections of letters, like those of the younger Pliny; a number, too, of funeral orations; and the "acta senatus" and the "acta populi" or "acta diurna," the first a record of proceedings in the senate, the latter a kind of gazette or Journal. Thus there were the materials for history in considerable abundance, and Tacitus was certainly a man who knew how to turn them to good account. He has given us a striking, and on the whole a doubtless true, picture of the empire in the 1st century. The rhetorical tendency which characterizes the "silver age" of Roman literature, given perhaps exaggerated expression to his undoubtedly strong sense of the badness of individual emperors, but he assuredly wrote with a high aim, and we may accept his own account of it: "I regard it as history's highest function to rescue merit from oblivion, and to hold up as a terror to base words and actions the reproach of posterity." He is convinced of the degeneracy of the age, though it be relieved by the existence of truly noble virtues: he connects this degeneracy more or less directly with the

TACNA—TACTICS

had considerable literary culture, and was proud to claim descent from the historian, whose works he caused to be transcribed at the public expense and placed in the public libraries. Tacitus possessed many admirable qualities, but his gentle character and advanced age unfitted him for the throne in such lawless times.

See Life by Vopiscus in Historiae Augustae Scriptores; also Eutropius, ix. 10; Aurelius Victor, Caesares, 36; Zonaras xii. 28; H. Schiller, Geschichte der römischen Kaiserzeit, i. 1883; Pauly-Wissowa, Realencyclopädie, iii. 2871 ff.

TACNA, a northern province of Chile, in dispute with Peru from 1803 onwards, bounded N. by Peru, E. by Bolivia, S. by Tarapaca, and W. by the Pacific. Area, 9251 sq. m. Pop. (1895) 24,160. It belongs to the desert region of the Pacific coast, and is valuable because of its deposits of nitrate of soda and some undeveloped mineral resources. There are a few fertile spots near the mountains, where mountain streams afford irrigation and potable water, and support small populations, but in general Tacna is occupied for mining purposes only. None of its streams crosses the entire width of the province; they are of their inhabitants to determine what they would remain with Chile or return to Peru, the country acquiring the two provinces in this manner to pay the other $10,000,000. At the termination of the period Peru wished the plebiscite to be left to the original population, while Chile wanted it to include the large number of Chilean labourers sent into the province. Chile refused to submit the dispute to arbitration, and it remained unsettled. Meanwhile Chile expelled the Peruvian priests, and treated the province more like a conquered territory than a temporary pledge.

TACOMA, a city and sub-port of entry, and the county-seat of Pierce county, Washington, U.S.A., on Commencement Bay of Puget Sound, at the mouth of Puyallup river, about 80 m. from the Pacific coast, and about 23 m. S.S.W. of Seattle. Pop. (1890) 36,006; (1900) 37,714, of whom 11,032 were foreign-born (including 1603 Swedes, 1534 English-Canadians, 1474 Norwegians, 1424 Germans, and 1523 English; (1910, U.S. census) 53,743. Tacoma is served by the Northern Pacific, the Chicago, Milwaukee & Puget Sound, and the Tacoma Eastern railways; the Chicago, Burlington & Quincy railway operates through trains to and from Missouri river points and Tacoma, and over the Northern Pacific tracks. Other important lines enter by the Great Northern and Oregon & Washington railways. There is electric railway connexion with Seattle. Tacoma is the starting-point of steamship lines to Alaska, to San Francisco, and to Seattle, Port Townsend, Olympia, Victoria, and other ports on Puget Sound. There are trans-oceanic lines to Japan and China, to the Philippines and Hawaii, and to London, Liverpool and Glasgow, by way of the Suez Canal. The city is situated on an excellent harbour and has 25 m. of waterfront. From the tidelands the city site slopes gradually to a plateau about 300 ft. high, commanding fine views of Puget Sound and its wooded islands, and parts of the Cascade and Olympic ranges. Tacoma is the seat of Whitworth College (1890, Presbyterian), the University of Puget Sound (1903, Methodist Episcopal), the Annie Wright Seminary (1884), a boarding and day school for girls, and the Pacific Lutheran Academy and Business College. The Tacoma High School has an excellent stadium for athletic contests, seating 25,000. The city has a Carnegie library (1899), with about 51,000 volumes. Among other public buildings are the opera house, and a city hall which are the rooms of the State Historical Society (organized, 1893; incorporated, 1897); the Federal Building; an armory; the Chamber of Commerce, and several fine churches. The Ferry Museum, founded by Clinton P. Ferry, has interesting historical and ethnological collections. In 1910 the city had seven public parks (1120 acres), including Point Defiance, a thickly wooded park (about 460 acres), and, in the centre of the city, Wright Park, in which is the Seymour Conservatory. Tacoma is a sub-port of entry in the Puget Sound Customs district (of which Port Townsend is the official port), which is second only to San Francisco on the Pacific coast in the volume of foreign trade. The city has a large jobbing trade, a coal supply from rich deposits in Pierce county, and abundant water-power from swift mountain streams, which is used for generating electricity for municipal and industrial use. In 1900 and in 1905 Tacoma ranked second among the cities of the state in the value of factory products. Lead smelting and refining (by one establishment) was the most important industry in 1905; lumber, timber and planing mill products, valued at $3,407,951, were produced in that year, and flour and gist mill products, valued at $4,205,873. Other important manufactures were furniture, ships and boats, railway cars (the Chicago, Milwaukee & Puget Sound and the Northern Pacific systems having shops here), engines, machinery, shoes, water pipes, preserves and beer. In 1905 the total value of the factory products was $12,501,816, an increase of 121.4% since 1900. The assessed property valuation of the city in 1909 was $54,226,261, being about 42% of the actual valuation.

The site of Tacoma was visited by Captain George Vancouver in 1792; Commencement Bay was surveyed for the United Port government by Lieutenant Charles Wilkes in 1841, and the present city was founded by General Morton Matthew McCarver in 1868 and was at first called Commencement City. That name was soon changed to Tacoma, said to be a corruption of Ta-ho-ma or Ta-ho-bet, Indian terms meaning "greatest white peak," the name of the peak (14,526 ft.), also called Mt. Rainier, about 50 m. S.E. of the city. General McCarver's original plat included what is now the first ward of the city, and is called the Old Town. In 1873 the Northern Pacific railway (completed in 1887) established its terminal on Commencement Bay, and named it New Tacoma. A town government was formed in 1874, the place became the county-seat in 1880, and in 1883 the two "towns" were consolidated and incorporated as a city under the name Tacoma. In 1900 a new city charter was adopted under which the city government is vested in five commissioners (one of whom acts as mayor), each in charge of a city department.

TACTICS (Gr. τακτική, sc. τέχνη, from τάσις, to arrange in order of battle). It may perhaps seem superfluous at the present time to emphasize the distinction between strategy and tactics. Moreover, definitions are rarely quite satisfactory, for they can seldom be perfectly clear and at the same time perfectly comprehensive. Yet, since it is necessary that the parties to any discussion should have some common starting-point, it will be as well to begin by stating exactly what is meant to be included under the heading of this article.

Strategy (g.v.) is the art of bringing the enemy to battle on terms disadvantageous to him. Combined, or to use the phraseology of the Napoleonic era, "grand" tactics are the
methods employed for his destruction by a force of all arms, that is, of infantry (q.v.), artillery (q.v.) and cavalry (q.v.). Each of these possesses a power peculiar to itself, the full development of which depends to a greater or less degree upon the aid and co-operation of the other two. Now it is quite evident which is the force which can ensure this co-operation, and can produce harmonious working between the various components of that complex machine, a modern army, is the will-power of the supreme commander. It is, then, the sphere of the higher commander on the day of battle which is generally expressed by the term “combined tactics,” and which will be dealt with in this article. Yet it must not be understood that because the term higher, or supreme, commander is used that the theory of combined tactics may be safely neglected by those soldiers whose ambitions or opportunities do not seem to lead them to that position. In the British Army more than in any other, as the South African war showed, a comparatively junior officer may at any moment find himself placed in command of a mixed force of all arms, without any previous practical knowledge of how it should be handled. It will not then be possible to make the best use of such opportunities by the uneducated light of nature, and such theoretical knowledge as may have been gleaned from books and matured by thought will be of great value.

It is of the first importance that the commander of a mixed force should know the powers and limitations of the units under his control. Should he not be a master of his profession, he will at times demand more from his subordinates than they can reasonably be expected to perform; at other times he will miss his chances by ignorance of their capabilities. An uneducated commander may indeed be likened to an indifferent mechanic, who sometimes places an undue strain upon the engine he is supposed to control, and sometimes allows its precious powers to run to waste.

There is, however, a still stronger reason why all officers should study and understand tactics. In every battle situations arise of which the issue is decided by the promptitude and efficiency of the co-operation between the three arms. At such moments, an officer in charge of a battery of artillery, or of a squadron of cavalry, may find an opportunity of rendering valuable aid to his own infantry; and a knowledge of the tactics and training of the other arms may then be essential, for it will probably be necessary to act without instructions from superior authority.

But although the importance of studying tactics may be readily allowed, there would appear to be considerable diversity of opinion as to the best method of conducting that study. It is often confidently asserted that tactics cannot be learnt from books; and in support of this theory it is customary to adduce Napoleon’s well-known statement that tactics change every ten years. But if we examine the matter more closely, it will become evident that the changes which the great captain had in his mind were those of formations, due principally to improved weapons, rather than of the principles upon which combined tactics are based. Indeed, it could hardly be otherwise, for military history furnishes many instances of great changes which have been brought about by the introduction of new weapons, although separated in point of time by many centuries. The great similarity between Rossbach (q.v.), Austerlitz (q.v.) and Salamanca (q.v.) has often been quoted since Napoleon first drew attention to it, but a great deal more remarkable and instructive is the similarity between the battle of the Metaurus, which dealt the final blow to the hopes of Carthage in Italy, and Marlborough’s masterpiece, the battle of Ramillies (q.v.). In both cases the battle was lost through faulty dispositions before it had been begun. In both cases the ultimate loser took up a position behind a stream, thereby losing his mobility and voluntarily surrendering the initiative to an enemy who was not slow to take advantage of it. Precisely the same error was committed time after time by the Austrian generals who fought against Frederick, notably at Leuthen (see Seven Years’ War), a battle closely resembling both Ramillies and the Metaurus. Coming to a later date, we find the same error committed, with of course precisely the same result, in Manchuria, where the Russian generals repeatedly surrendered the initiative to their enterprise opponents, and allowed them to dictate the course of events. It is only when we have correctly understood that this is not a position that no commander should ever stand upon the defensive; rather it is meant that we should learn from history the proper method of doing so. This we cannot do better than by studying Wellington’s battles in the Peninsula, for never have tactics been brought to higher perfection. Although frequently compelled to adopt the defensive, he never surrendered the conduct of the battle to his enemy. Even when surprised and taken at great disadvantage by Soult at Maya (see Peninsular War), it can be seen how well lesser men would have been content to reinforce the threatened points, Wellington’s one thought was to discover where he could deal the most effective blow. Nearly a hundred years later and in a theatre of war many thousands of miles away, a very similar battle was fought out by Kuropatkin and Oyama, though on a vastly greater scale.

But history teaches us more than the methods of the great captains; for from it we may learn those changes which have been introduced into both organization and tactics by the improved weapons which science has placed in our hands, and thence the tactician may deduce the changes of the future.
more rifles into action than his opponent is able to do. From this it follows that the enveloping action will be the usual form of battle; and that although the extent of front may not always be so great, in proportion to the numbers engaged, as on the battlefields of South Africa or even of Manchuria, the general tendency of modern invasion will undoubtedly be to increase the area of the battlefield.

If then we are right in supposing that the front of an army in action will cover many miles of country, it necessarily follows that in approaching the field many roads will be used. Here the duties of the cavalry will begin; for the commander who can discover earliest the approaches by which the flank detachments of his opponent are moving, is obviously in the best position to form his plans for envelopment. Here we are verging upon the strategic use of cavalry. Cavalry.

In modern conditions which, in the main, that arm is almost merged in the strategic use. No doubt it has always been the object of the wise commander to attain his enemy’s flank; yet, since, owing to the increased range of small-bore rifles, turning movements like those which formed such a marked feature of Frederick the Great’s battles can no longer be made after the infantry troops have come into contact, they must be prepared as soon as the necessary information has been obtained. Moreover, nothing must be left to chance, for it can hardly be denied that if the battle of Gravelotte were to be fought again to-morrow, the failure to locate the right flank of the French army would have even more serious consequences than were actually the case (see Mazz: Battles of 1870). Such mistakes can only be avoided by obtaining good information, and thus it will be seen that the chances of bringing off a successful converging attack are greatly in favour of the commander who is best served by his cavalry. But, as the opposing forces draw near, a gradual change comes over the duties of the mounted arm, for it must then protect the troops in rear from observation, so that the preparations for envelopment may be concealed. To this end the occupation of points of tactical vantage, such as hills, woods, and similar conditions which the use of cavalry can employ, or the outflanking columns march in security, becomes its chief aim. In the next stage, i.e., when one or other army is forced to stand on the defensive, reconnaissance of the position held will be the duty of the cavalry of the attack.

So far its functions are clear enough, but when the preparations for the infantry attack have been completed we have practically nothing to guide us. Unfortunately the two most recent wars, in South Africa and Manchuria, have taught us but little of the handling of cavalry in battle. In South Africa the peculiar characteristics of the Boers gave no scope for cavalry action; while in Manchuria the theatre of operations was practically dead between the mountains and the Liao river, which afforded no room for manoeuvre. With regard to the handling of cavalry in conjunction with the other arms there is, therefore, more room for diversity of opinion than is the case with either infantry or artillery. Time alone will show the real capabilities of the cavalry of to-day, and the opening battles of the next great campaign in Europe will bring about many changes. Meanwhile such experience as we have to guide us seems to indicate that the development of fire has rendered cavalry, even when highly trained, almost ineffective as a weapon. It is obvious to see, therefore, that the tactical use of its cavalry is clearly directed against infantry than it was formerly. Throughout the war in Manchuria, we constantly find the Russian cavalry reconnaissance checked by Japanese infantry; and on the other hand the weak Japanese cavalry closely supported by infantry was fairly effective. The circumstances were of course peculiar, but the inference appears to be that unsupported mounted troops cannot be expected to achieve important results except when acting against similar bodies of the enemy; that is to say, under conditions which fall outside the province of combined tactics. Moreover, since well-posted infantry can easily hold in check greatly superior numbers of cavalry, it would certainly seem that wide tactical movements, intended to threaten the enemy’s line of retreat, are more likely than not to result in prodigious waste of strength. This being the case it would seem that the best use of cavalry on the battlefield will be on the flanks of, and in close touch with, the infantry, where each arm can render support to the other. On the defensive the tactical action of cavalry is not less important than on the offensive.

Accompanied and strengthened by horse artillery it may occupy tactical points either the flanks of the main position or thrown out well to the front. Aided by smokeless powder, magazine rifles and quick-firing guns, numbers may be concealed and the attacking enemy may be induced to deploy his troops and to reveal his movements prematurely. Should he do so, much of his advantage will be gone, for the defender will be greatly helped in his preparations for the counter-attack, the most effective weapon at his command.

But when at last the slower moving bodies of infantry and artillery come into contact, the battle enters upon a new phase. It has long been recognized that the first stroke towards the attainment of fire superiority over a vigilant enemy is a vigorous artillery bombardment. For many years this action of the artillery was regarded merely as a preliminary to the infantry attack; and it was not until the rude awakening of the early battles of the Boer war, that it was realized in England that unless the infantry co-operate, the artillery is not likely to produce any result. If the attacking infantry is kept at such a distance from the position that it cannot pass quickly to the assault, the enemy will retain his troops under cover during the cannonade, perhaps even leaving his trenches unoccupied and presented to the main attack. Indeed, a most instructive instance of this very line of action is furnished by the battle of Ta-shih-chiao. There the right of the Russian line was held by the infantry of the 1st Siberian army corps, supported throughout the greater part of the day by only two batteries of artillery. So heavy was the fire of the Japanese artillery in this portion of the field that General Stakelberg, the commander of the Russian corps, sent word to his superior officer that he had not considered it advisable to occupy his trenches, and that should he be compelled to do so his troops must suffer. But things turned out the Japanese infantry did not deliver any attack against the Russian right, the defenders remained under cover, and the losses inflicted by the bombardment were almost negligible. Other instances might be quoted, but enough has been said to prove that to render the artillery bombardment effective the infantry must co-operate; for by this means only will the enemy be compelled to man his defences, to show himself above his parapets, and to expose himself to shrapnel fire.

Here arises one of those questions which are the outcome of modern science, but which have not been finally answered by war. As a result of the immense amount of observational and practical work, it is now possible for field artillery to make use of indirect fire from behind cover. Against stationary objects, such as a battery in action, the results achieved by this method are as good as those which are obtained by firing directly over the sights. At the same time the control of indirect fire is slow, and it still remains to be proved whether it can be used satisfactorily against quickly moving targets. If it should be found that, in spite of scientific aids, the artillery of the defence can be made to leave its cover and still be successful, the advantage of the advance of the infantry, the importance of the aid which one arm can render to the other needs no demonstration. After all, however, the silencing of the guns of the defence is but a means to an end, and the principal aim of the guns of the attack is to enable the infantry to get sufficiently close to the position to deliver an assault; for the infantry assault is the crowning act of battle. Similarly the gunners of the defence must never forget that their great object is to repel this same assault. The artillery duel, therefore, is but a phase. Sooner or later one side will gain the upper hand. Then it must be decided whether the inferior artillery can best serve the interests of the infantry by continuing the duel, or by ceasing to fire until it can find some more vulnerable target.

Should the guns of the defence have proved inferior to those
of the attack, it will probably be wise for them to wait until the advancing columns of infantry have deployed; should the positions be reversed, it will be well for the gunners of the attack to leave their weapons and to remain under cover until such time as their opponent is compelled to turn his attention to repelling the infantry. So great is the power of the modern rifle and quick-firing gun that infantry, unsupported by artillery, has but little chance of carrying a position held by determined men, and it is for this reason, and not with a view to saving their own lives, that the gunners must reserve themselves until the last moment. They must be ready and alert when their services are most required; moreover their final positions should be selected with a view to keeping up their fire until the last possible moment. Indeed they must often run the risk of injuring some of their own troops when firing over their heads. Sometimes a favourable position may be found for the artillery upon the flank of the attack. Such positions have a double advantage. Not only do they bring enfilade or oblique fire to bear upon the enemy’s trenches, but they are able to continue the bombardment much longer than is possible when posted directly in rear of the assaulting columns. But whatever the position of the artillery may be, one thing is certain: namely, that the infantry of the attack can hardly hope to succeed if its own guns have been disabled while striving to maintain an unequal duel. Thus in the earlier stages of battle the action of the artillery will be characterized by a certain degree of prudence. The Commander in chief will strive to conceal the true position of their batteries, and will not employ more guns than are absolutely necessary for the attainment of any particular object they may have in hand. But when the preliminary stages are over, and the infantry is finally committed to the assault, a change must come over the conduct of the artillery. In this final phase there is no longer room for prudence. Indirect fire is out of place, and the duty of the guns cannot be better described than in the words of the French text-books, "to follow the infantry in a series of rapid advances, by éclatons, without hesitating to come into action within the shortest range of the battle-line."

But when the time comes to follow up the infantry the skill and knowledge of the battery commander are most highly tried. Concealment is no longer his object, and he must trust all to his offensive power. To make the most of this power it is of the first importance that his guns should be brought at once into positions whence they can be effectively used; for, quoting again from the French instructions, "considerations of concealment lose their importance for artillery that is told off to follow up the movements of the infantry. In this case artillery must not fear to come into action in the open, although in this situation a battery usually forfeits its freedom of movement."

Even the introduction of shielded guns will not affect this loss of mobility, for batteries which are brought to within effective rifle range of the defence must expect to lose a considerable proportion of their horses. Hence it follows that although the position into which they are brought in support of infantry may prove to be unsatisfactory it cannot be changed; their assistance will be lost at the most critical moment, with the result that the attack, deprived of their support, will probably fail. In France, where artillery tactics have perhaps received even more attention than in other countries, the necessity for this close support by guns has been so far recognized that the batteries of the attack have been divided into two distinct portions. The duties of one section have already been described. Those of the second are:-(1) To continue to shell the enemy’s position as long as possible without danger to the advancing infantry; (2) To engage the hostile infantry "avec la dernière énergie"; (3) To watch carefully for counter-attack.

It is perfectly clear that the performance of these duties, in fact, the application of the whole principle of co-operation between infantry and artillery, is intimately connected with the use of ground which brings the superior numbers and must therefore be deeply studied. If we look back upon history, we cannot but be struck by the important part that the appreca-
reinforcing his own threatened flank; that is to say, that he would have conformed to the movements of his adversary and permitted him to dictate the course of events. This was not the Japanese system. Oyama had no intention of fighting a purely defensive action. He knew that his opponent had massed his strength upon his left, and it was only reasonable to assume that if one portion of his line was strong, some other portion must be weak. The actual point first selected by Oyama for decisive attack was the centre of Kuropatkin's line. Troops were deployed, and the scales were ultimately turned by an almost unexpected success against the Russian right. The resulting victory was certainly less complete than would have been the case had the Japanese commander been able to carry through his original plan, but it is obvious that a force operating against the centre of a hostile line must itself be in danger of envelopment; and in this case it is interesting to note that the battle was really decided by an outflanking movement by a weak force, while the central attack in considerable strength achieved but little. Oyama's conduct of this battle has been much criticized by writers he has been blamed for leaving his own defensive line too weak; by others he has been accused of attempting too much. These are difficult questions, requiring detailed examination; for the present it is sufficient to note that, although inferior in numbers, he succeeded in accomplishing an enveloping movement which forced his enemy to retire. The fact is that by superior skill, although actually inferior in numbers, he succeeded in placing more rifles in the firing line than did his opponent. During a great part of this struggle, which lasted for five days, it would be difficult to say which side was on the defensive and which on the offensive. No doubt at the moment Kuropatkin was the assailant; it is equally certain that in the end it was Oyama who attacked; yet it would be impossible to say, as at Austerlitz and Salamanca, exactly at what moment the roles were exchanged.

If then we are justified in assuming that in the great battles of the future neither army will be acting entirely on the offensive or entirely on the defensive, it may seem idle to speculate as to whether the recent improvements in firearms and ballistics are in favour of one side or the other. In this connexion the lessons which may be learned from the South African and the Russo-Japanese wars are most instructive. After the former it was often urged that the conditions of modern battle are distinctly in favour of defensive tactics; in other words, that the force which awaits attack can develop the full power of each arm with greater facility than that which delivers it. This contention had much to support it, but it was not always realized that anything which gives new strength to the defence must at the same time add something to the advantages of the army which attacks. The outcome of the improvements in rifles, guns and powder is quite sufficient to make the unity of command, as a defensive method, quite as effective as, or more effective than, that of a previous epoch. To a certain extent this favours the defence. A much larger proportion of the available troops can be set free to act in reserve, and to deliver the counter-stroke, i.e. a much larger number than formerly can be employed by the defenders in attack. This is to the good. But the assailant profits in almost equal ratio. His strength has always lain in power of manœuvring, of hiding his movements, and of massing suddenly against some weak point. To-day this power is greater than ever before. The increased power of the rifle renders it comparatively easy for him to form an impenetrable barrier with part of his force, perhaps with his cavalry supported only by a small proportion of his infantry, behind which the remainder can move unobserved. Moreover, the object of the assailant's manœuvres will be to place portions of his forces on the flank or flanks of the position he is attacking. If he can accomplish this, the effect, moral and physical, of the enfilade fire which is brought to bear upon the enemy's front will be far greater than that which attended a similar operation when fire was of less account. In addition to this increased facility for manœuvring, the great strength of the local defensive confers upon the assailant the power of denuding certain portions of his line of troops, in order that he may mass them for offensive action elsewhere. Here again the study of ground and a true knowledge of the capabilities of the various arms are of supreme importance. Well-placed artillery, aided by machine guns, may enable a comparatively weak force of infantry to hold a wide extent of front, provided that each arm is able to use its strength to the fullest extent. In this way the skilful commander can turn each feature of the battlefield to account and can release a greater number of his troops for the all-important enveloping movements. The principal power which enabled Oyama to outflank the Russian XVII. Corps at the battle of Sha-ho, for he was able to weaken his own right to an extent which a very few years ago would have been impossible. In short, the process of envelopment is more easy than it used to be; and, envelopment, which means that the enemy is under fire from several directions, is much more effective now than in the past.

In Germany this fact has long been recognized, and it was for this reason that German soldiers refused to accept the conclusions at which many English military critics arrived after the African war. Under the influence of their German teachers the Japanese never hesitated to attack, even with inferior numbers, and to make the envelopment of the enemy more certain they went into battle practically without reserves. In this respect the war in Manchuria marks an epoch in the history of tactics; and for that reason, if for no other, it should be carefully studied. Moreover, it emphasizes an important difference in the handling of large and small armies which is of quite recent origin. Until a few years ago all continental armies were organized in army corps. These corps were composed of two or three infantry divisions with a large body of corps artillery. In the Russo-Japanese war, the line of action through which this artillery was to form the nucleus of a reserve which could be retained under the hand of the corps commander to be used as required. That is to drive home the infantry attack, to deliver or repel a counter-attack, or, but very sparingly, to strengthen a weak point in the defensive line. With the development of the enveloping battle, it was soon realized in Germany that corps artillery was an anachronism, for the distances are now so great that reserve artillery can hardly be moved to the particular part of the battlefield where its services are required in time to be of any use. Thus the corps artillery was first split up among the divisions, and soon a number of divisional reserves took the place of the great central body, while the corps commander retained a comparatively small number of troops under his own hand. In this way the control of the supreme commander over the course of the battle is greatly weakened and the chance of correcting any error in the original plan is diminished. It had long been realized that errors in the strategic deployment of troops were almost impossible to correct; and now it came to be seen that this was equally true of the tactical deployment. Just as under modern conditions even Napoleon could hardly have recovered from errors like those which marked the opening phases of the Eckmühl campaign (see NAPOLEONIC CAMPAIGNS), so the most brilliant genius will no longer be sufficient to win battles if the original plan is not correct. It was upon this theory that the Japanese commanders planned their battles, and it was very soon proved that they had the courage of their convictions. For the first time it was seen that battles were no longer won by the general who husbanded his reserves, but by him who first got every available man into the firing line. But, while giving Oyama, Kurokawa and Kuropatkin much credit for the strength of mind which enabled them to divest themselves of reserves when their battles were far from being won, we must also remember that they were fighting an enemy who, like the Boers, were incapable of organizing a really decisive counter-stroke. For English soldiers this point has a peculiar interest, as it has a very distinct bearing upon the tactics of our own army. From what has already been said it is, or should be, clear that the value of numbers upon the battlefield is greater now than formerly; for, granting that the leadership on either side is equally skilful, the chances of envelopment are in favour of him who commands the greater number of men. Owing
TACTICS

to our geographical position and to the conditions under which we live, the number of British troops available for employment in any war against a continental Power will almost certainly be inferior to that which can be employed against us. It is of course true that we should never engage in operations on the continent of Europe except in alliance with some other Power; but it is quite possible that the British army might be entrusted with the execution of the three definite tasks which, while part of a general strategical scheme, would involve completely independent action. It is under such circumstances as these that we must be prepared to encounter troops which in leadership and training will be at least the equal of our own, and in numbers will probably be superior to them. In these circumstances our chances of envelopment will not be great, but this must by no means be taken to mean that our chances of success are to be despised of. Far from it. In the first place strategy may induce the enemy temporarily to divide his forces, and thus afford favourable opportunity for an effective blow. Failing this, it remains to be considered how a general may best employ inferior numbers with a reasonable hope of gaining a tactical victory. To this the answer must be that his best, indeed his only, chance of victory lies in the counter-stroke.

In France this fact has received due recognition, and since that country is in the unfortunate position of having to be prepared to encounter superior numbers, the training and organization of her armies differ essentially from those of her most formidable neighbour. Acknowledging that at the outset of a war she stands upon the defensive, she has endeavored to develop her power of manoeuvre and of delivering a strategic counter-stroke. With this object her armies move in deep formations on a comparatively narrow front, covered by strong advanced guards. Thus, in the earlier stages, they are much less committed to a definite line of action than are armies moving upon a widely extended front, and, provided intelligence is received in time, they can be massed quickly against the enemy’s flanks. Similarly in the later stages she trusts to the tactical counter-stroke, and hence the corps artillery, which has been abandoned in Germany for reasons which have already been given, is still retained in France.

In the foregoing pages the question was raised as to whether the great tactical counter-strokes of the past are still possible under modern conditions. Unfortunately the battles in Manchuria afford no instance of a successful counter-stroke, for the Sha-ho is more an example of an encounter action than of a carefully conceived counter-attack. In these circumstances we are forced to rely upon theory; but theory based upon a correct understanding of the past should form no uncertain guide to the formation of the future. Then are the principles upon which our theory is to be based? First, that the defensive battle is only a step towards assuming the offensive. Secondly, that the only means of assuming the offensive with success is the counter-stroke. Thirdly, that the counter-stroke, in at least nine cases out of every ten, should aim at the envelopment of the attack. From these premises it follows that the most effective form of the defensive battle will be that which compels the enemy to deploy his forces and then uses the reserve to envelop one or both of his flanks. Since, however, modern battles are fought over a very wide extent of front, it necessarily follows that the possibility which the defence possesses of successfully enveloping the attack must depend to a very great extent upon the correct disposal of the reserves when drawing up the original line of battle. Just as the chances of making the best use of superior number in the attack depend upon a correct strategical deployment at the commencement of a campaign, so the chances of a successful counter-stroke depend upon a correct distribution of troops at the commencement of an action. Hence we see that the most important point which a general who finds himself compelled to take up a defensive position has must be placed at grave disadvantage, the other aid he hopes eventually to seize the offensive. One thing is clear, namely, that the worst place for men who are destined to envelop one or other flank of the attack must be behind the centre of the defensive line. Time alone must render such a position unsuitable, for it must entail a march of many hours, if not of days, before the troops can reach the point from which they are to be launched to the attack. This being so, it would seem that the right place for the general reserve of the defending army under modern conditions must be on one or other of the flanks; and, always bearing in mind that the chief object to be attained is regaining the initiative, we are driven to the conclusion that the best place is that flank from which an effective blow can be dealt at the assailant’s most vulnerable point, that is to say, at the flank through which his line of communication may be most easily attained. If this theory be correct, yet another point has been established, namely, that the main plan of the decisive counter-stroke must be decided before, and not after, the first shot in the general engagement has been fired. Under these conditions when to-day it is no use waiting for the enemy to make a mistake, for the odds against it being detected are great. A hundred years ago armies manoeuvred in full view of one another, and mistakes could be perceived by every company officer on either side. Now all this is changed, and the difficulties of the defence are increased by the fact that although the attack may make many blunders, it will do so at such a distance from the defence as to render them comparatively secure from detection. Having prepared his counter-stroke, the chief point towards which the commander of the defence must direct his attention after battle has been decided. Needless to say that the chances of success will be enormously increased if the counter-stroke is unexpected, for in war the demands which surprise makes upon moral are quite out of proportion with the physical danger which men are called upon to undergo. If the defence is ever to be converted into attack, it would appear: (1) That the counter-stroke must be carefully planned, and must form an integral part of the original scheme of defence. (2) That it must be properly directed. (3) That it must be correctly timed. (4) That if possible it must come as a surprise. Of these conditions, the first three are dependent for their fulfilment upon good intelligence, careful preparation, and correct appreciation of the enemy’s plans; but it is in the fourth that the inspiration of the really great commander will be most conspicuously displayed on the day of battle, and the greater the numbers under his command the more difficult his task must be.

When, as at the Sha-ho and Mukden, the troops on either side are numbered by hundreds of thousands, the commander-in-chief cannot hope to keep the direction of events in his own hands very long; but when tens of thousands only are engaged, the whole battle can be controlled as well and as well as the past. The extent of front will certainly be greater than it was formerly, but against this may be set the fact that improved communications by telegraph and telephone enable the commander to keep in touch with events in a manner which until recently was quite impossible. It is for this reason that the earlier and smaller battles of the Russo-Japanese War contain many lessons which are of more use to British soldiers than are those which may be learned from the great struggles which took place later on. But in all battles, whether great or small, the first requirement is a commander who possesses sufficient steadiness of character to carry out on the day of battle the plans he has formed beforehand. War is like a game of bridge, for the most successful player is not he who best remembers the fall of the cards or who knows the correct leads by heart, but he who can decide upon and carry out the plan best suited to the strength of his hand. In both cases a bad plan is better than none, and vacillation even between two good plans is fatal. In both cases side issues are constantly arising which tend to obscure the main issue. On the battlefield the side-issue is save the form of gas in the shape of a large cloud from various quarters, all of which must tempt the supreme commander to weaken the general reserve which has been set aside for his decisive stroke. To such appeals he must turn

Economy of force.
a deaf ear, confident in the knowledge that the best way of assisting his sorely-pressed troops is by a vigorous blow at his enemy's weakest spot. Hence it follows that the force which is to deliver the blow must be kept perfectly distinct from the local reserves under subordinate commanders, which are held in readiness to strengthen weak places in the offensive line, or to deliver local counter-attacks. It also follows that this force must comprise every man who can be spared from the passive portion of the defence, and that to produce the fullest results there must be complete co-operation between the three arms.

It is in this way that cavalry will actually be used. It will then be the task of the cavalry to seize the initiative, and to bring it to bear upon the enemy with the greatest possible effect in the limited time which will be available for the purpose. For this purpose the cavalry will have to be concentrated on the part of the line which is already in the main line of advance. To do this, the cavalry will first have to secure the main line of advance, and then to concentrate its forces at the point of attack. It will then be necessary to decide whether the attack will be made against the main line of advance or against the flank. If the attack is made against the flank, it will be necessary to make sure that the flank is secure, and that the enemy's attention is fixed upon it. If the attack is made against the main line of advance, it will be necessary to make sure that the main line of advance is secure, and that the enemy's attention is fixed upon it. In either case, it will be necessary to make sure that the enemy's attention is fixed upon the point of attack, and that the enemy's forces are not diverted to another point.

The cavalry will then have to make sure that the enemy's attention is fixed upon the point of attack, and that the enemy's forces are not diverted to another point. It will then be necessary to decide whether the attack will be made against the main line of advance or against the flank. If the attack is made against the flank, it will be necessary to make sure that the flank is secure, and that the enemy's attention is fixed upon it. If the attack is made against the main line of advance, it will be necessary to make sure that the main line of advance is secure, and that the enemy's attention is fixed upon it. In either case, it will be necessary to make sure that the enemy's attention is fixed upon the point of attack, and that the enemy's forces are not diverted to another point.

The cavalry will then have to make sure that the enemy's attention is fixed upon the point of attack, and that the enemy's forces are not diverted to another point. It will then be necessary to decide whether the attack will be made against the main line of advance or against the flank. If the attack is made against the flank, it will be necessary to make sure that the flank is secure, and that the enemy's attention is fixed upon it. If the attack is made against the main line of advance, it will be necessary to make sure that the main line of advance is secure, and that the enemy's attention is fixed upon it. In either case, it will be necessary to make sure that the enemy's attention is fixed upon the point of attack, and that the enemy's forces are not diverted to another point.
no cartilages being formed in this organ, which is destined to disappear with the gills. The hind limbs appear as buds at the base of the tail, and gradually attain their full development during the tadpole life. The fore limbs grow simultaneously, and even more rapidly, but remain concealed within a diverticulum of the branchial chambers until fully formed, when they burst through the skin (unless the leaf spiraculum be utilized for the egress of the corresponding limb).

The above description applies to all European and North American tadpoles, and to the great majority of those known from the tropics. The following types are exceptional.

The circular lip is extremely developed in Megalophrys montana, and is expanded and prolonged in the inner radiating series of horn teeth, acts as a surface-float, when the tadpole rests in a vertical position; the moment the tadpole sinks in the water the funnel collapses, taking on the form of a pair of horns, curling backwards along the side of the head; but, as they touch the surface again, it re-expands into a regular parachute.

In some species of Ranidae and Stauroides inhabiting mountainous districts in south-eastern Asia, the larvae are adapted for life in torrents, being provided with a circular adhesive disc on the ventral surface behind the mouth, by means of which they are able to anchor themselves to stones.

Several American and Malay Enyostomatids of the genera Callula and Microhyla, the tadpoles are remarkably transparent, and differ markedly in the structure of the buccal apparatus. There is no funnel-shaped lip, nor horn teeth, and no beak. The spiraculum is not a cleft, but a vent. In the Aglossid Xenopus, the tadpoles are likewise devoid of circular lip, horn teeth, and beak, and they are further remarkable in having no tail-folds. There are, however, tentacles barbel on each side of the mouth, which appears to represent the "balance" of Urodèle larvae; the spiraculum is paired, one on each side; the fore limbs develop externally, like the hind limbs.

Some tadpoles reach a very great size. The largest, that of Pseudis paradoxus, may measure a foot, the body being as large as a turkey's egg. The perfect frog, after transformation, is smaller than the larva. Pseudis was first described by Marie Sibylle de Mérian (1647-1717), in her work on the fauna of Surinam (published first in 1705 at Amsterdam, republished in Latin in 1719), as a frog changing into a fish. Among European forms, some tadpoles of Pelobates attain a length of seven inches, the body being of the size of a hen's egg. The tadpole of the North American bull-frog measures six inches, and that of the Chilian Calyptocheilus gayi seven and a half inches.

TAEL (Malay tael, tabil, weight, probably connected with Hind. iola, weight), the name current in European usage for the Chinese lang or ounce, the former of fine uncolored silver being the monetary unit throughout the Chinese empire. The tael is not a coin, the only silver currency, apart from imported dollars, being the ingots of silver known as "syce"; the only other native currency is the copper "cash." As a money of account the tael is divided into 10 mace (isten), 100 conditioner or caneonder (jun), 1000 li. The value varies with the price of silver. The "Halkwan tael," i.e. the custom-house tael, that in which duties are paid to the Imperial Maritime Customs, is 58-57 grains Troy, the value of which varies; thus it was reckoned at 38. 1/3d. in 1903, 32. 3/4d. in 1906, 36. 3d. in 1907, and 36. 3d. in 1908. The "Fez tael" is 38. 2/3d. in 1903, 32. 3/4 in 1906, 36. 3d. in 1907, and 36. 3d. in 1908.

TAENIA (Gr. taenia, ribbon, fillet), the term in architecture given to the projecting fillet which crowns the architrave of the Greek Doric order.

TAFILALT, or Tafilet (i.e. "The Country of the Filâl"), as its inhabitants are called, because descended from the Arabian tribe of Filâl, settled here in the 11th century), the most important oasis of the Moroccan Sahara, ten days' journey south of Fez, across the Atlas. It is celebrated for its large and luscious dates, to the successful cultivation of which, soon after the arrival of an ancestor of the reigning dynasty of Morocco (hence called the Filâl Sharifs, i.e. descendants of Mahomet) the country owes its rise to power. Since 1648 it has been the custom of Moorish sultans to despatch superfluous sons and daughters to Tafilet, and as the males are all sharifs, the fanaticism against Europeans is comprehensible. Instead of living in towns its bellicose inhabitants occupy isolated fortified buildings, and are constantly at war. In the central portion, formerly existed the town of Saglimosa, founded by the Moors in 787. It was on the direct caravan route from the Niger to Tangier, and attained a considerable degree of prosperity. It was destroyed at the end of the 11th century, but its ruins still extend five miles along the river bank.

The first European to visit Tafilet was Rene Caillie (1828), and the next Gerhard Rohlfis (1864). A later visit to the oasis by W. H. Harris is described in his book Taflet (London, 1895).

TAFT, LORADO (1860- ), American sculptor, was born at Elmwood, Illinois, on the 29th of April 1860. He graduated from the University of Illinois in 1879, and from 1880 to 1883 studied in the Ecole des Beaux Arts, Paris. In 1886 he became admitted at the Art Institute, Chicago, lecturing there, at the Chicago University, and elsewhere in the United States. He is the author of an exhaustive and authoritative work, The History of American Sculpture (1903). Among his works, in addition to much portraiture, are: "Sleep of the Flowers" and "Awakening of the Flowers," both made for the Columbian Exposition; "Despair" (1898); "Solitude of the Soul" (1900), and "Fountain of the Lakes" (1903).

TAFT, WILLIAM HOWARD (1857- ), the twenty-seventh President of the United States, was born in Cincinnati, Ohio, on the 15th of September 1857. His father, Alphonso Taft (1820-1901), born in Townshend, Vermont, graduated at Yale College in 1833, became a tutor there, studied law at the Yale Law School, was admitted to the Connecticut bar in 1838, removed to Cincinnati in 1839, and became one of the most influential citizens of Ohio. He served as judge of the Superior Court (1861-72), as secretary of war (1876) and as attorney-general of the United States (1876-77) in President Grant's cabinet; and as minister to Austria-Hungary (1882-84) and to Russia (1884-85).

William Howard Taft attended the public schools of Cincinnati, graduated at the Woodward High School of that city in 1874, and in the autumn entered Yale College, where he took high rank as a student and was prominent in athletics and in the social life of the institution. He graduated second (salutatorian) in his class in 1878, and began to study law in Cincinnati College, where he graduated in 1880, dividing the first prize for scholarship. He was admitted to the Ohio bar in 1880. For a few months he worked as a legal reporter for the Cincinnati Times (owned by his brother C. P. Taft), and then for the Cincinnati Commercial. Early in 1881 he was appointed assistant prosecuting attorney of Hamilton county (in which Cincinnati is situated), but resigned in 1882 on being appointed collector of internal revenue of the United States for the first district of Ohio. The work was distasteful, however, and in 1883 he resigned to return to the law. From 1885 to 1887 he served as assistant solicitor of Hamilton county, and in the latter year was appointed judge of the Superior Court of Ohio to fill a vacancy. He was elected by the people in the next year and served until 1890, when he was appointed solicitor-general of the United States by President Benjamin Harrison. His work in connexion with the drafting of the Sherman Anti-Trust Act and with the Bering Sea controversy attracted attention. In 1892 he was appointed a judge of the Sixth Circuit, United States Court, and became known as a fearless administrator of the law. Several decisions were particularly objectionable to organized labour. The first of these, decided in 1890, upheld the verdict of a jury awarding damages to the Moores Lime Company, which had sustained a secondary boycott because it had sold material to a contractor who had been boycotted by Bricklayers' Union No. 1. The second decision grew out of the attempt of the Brotherhood of Locomotive Engineers to prevent
other roads from accepting freight from the Toledo, Ann Arbor & North Michigan railroad, against which a "legal" strike had been declared. Judge Taft granted an injunction (7th March 1893) against the Pennsylvania railroad, making P. M. Arthur, chief of the Brotherhood, a party, and called Rule 12, forbidding engineers to haul the freight, criminal. During the great railway strikes of 1894 Eugene V. Debs, president of the American Railway Union, sent one Frank W. Phelan to tie up traffic in and around Cincinnati. The receiver of the Cincinnati, New Orleans & Texas Pacific railway applied for an injunction against Phelan and others, which was granted. Phelan disobeyed the injunction and on the 13th of July 1894 was sentenced to jail for six months for contempt. The doctrine that "the starvation of a nation cannot be the last word in industrial oratory" and "a combination" was announced, and Judge Taft said further that "if there is any power in the army of the United States to run those trains, the trains will be run." In 1896-1900 Judge Taft was professor and dean of the law department of the University of Cincinnati.

A movement to elect Mr Taft president of Yale University gained some strength in 1898-99, but was promptly checked by him, on the ground that the head of a great university should be primarily an educationalist. In 1900 he was asked by President McKinley to accept the presidency of the Philippine Commission charged with the administration of the islands. Though this was opposed to his principles and to the judgment of Mr Phelan, he did not believe that the inhabitants were capable of self-government, and he foresaw some of the difficulties of the position. Yielding, however, to the urgent request of the president and his cabinet, he accepted and served from the 13th of March 1900 to the 1st of February 1904. On the establishment of civil government in the islands, on the 4th of July 1901, he became governor, ex officio. The task of constructing a system of government from the bottom, of reconciling the conflicting and often jealously sensitive elements, called for tact, firmness, and deep knowledge of human nature, all of which Governor Taft displayed in a marked degree. (See PHILIPPINE ISLANDS.) The religious orders had been driven out during the insurrection, but held title to large tracts of land which many Filipinos and some Americans wished to confiscate. This delicate matter was arranged by Mr Taft in a personal interview with Pope Leo XIII. in the summer of 1902. The pope sent a special delegate to appraise the lands, and the sum of $7,250,000 was paid in December 1903. Mr Taft gained great influence among the more conservative Filipinos, and their entreaties to him to remain influenced him to decline the offer of a place on the Supreme bench offered by President Roosevelt in 1902.

Finally, feeling that his work was accomplished, Mr. Taft returned to the United States to become secretary of war from the 1st of February 1904. With a party of congressmen he visited the Philippines on a tour of inspection July-September 1905, and in September 1906, on the downfall of the Cuban republic and the intervention of America, he took temporary charge of affairs in that island (September–October). In the next year (March–April) he inspected the Panama Canal and also Cuba, and Porto Rico. He then visited the Philippines to open the first legislative assembly (16th October–December 1907), and returned by way of the Trans-Siberian railway. On this tour he visited Japan, and on the 2nd of October, at Tokyo, made a speech which had an important effect in quieting the apprehensions of the Japanese on the score of the treatment of their people on the Pacific coast.

With the approach of the presidential election of 1908, President Roosevelt reiterated his pledge not to accept another nomination, and threw his immense influence in favour of Mr Taft. At the Republican convention held in Chicago, in June, Mr Taft was nominated on the first ballot, receiving 702 out of 980 votes cast. James S. Sherman of New York was nominated for Vice-President. During the campaign many prominent labour leaders opposed the election of Mr Taft, on the ground that his decisions while on the bench had been unfriendly to organized labour. In the campaign Mr Taft boldly defended his course from the platform, and apparently lost few votes on account of this opposition. At the ensuing election in November, Taft and Sherman received 321 electoral votes against 162 cast for William Jennings Bryan, and John W. Kern, the Democratic candidates.

In his inaugural address (4th March 1909) President Taft announced himself as favouring the maintenance and enforcement of the reforms initiated by President Roosevelt (including a strict enforcement of the Sherman Anti-Trust Act, an effective measure for railway rate regulation, and the policy of conservation of natural resources); the revision of the tariff on the basis of affording protection to American manufactures equals to the difference between home and foreign cost of production; a reduction of the postal rates; the extension of the war of peace; postal savings banks; free trade with the Philippine Islands; and mail subsidies for American ships. He also announced his hope to bring about a better understanding between the North and the South, and to aid in the solution of the negro problem. In accordance with his pre-election pledge, Congress was called to meet in extra session on the 15th of March to revise the tariff. Hearings had been previously held by the Ways and Means Committee of the House of Representatives, and a measure was promptly reported. After passing the House it was sent to the Senate, where it was much changed. The final Payne-Aldrich Act was approved by the President on the 5th of August 1909, though in many respects it was not the measure he desired. The wish to meet people of the different sections of the country and to explain his position upon the questions of the day led the President to begin (14th September 1909), a tour which included the Pacific coast, the South-west, the Mississippi Valley and the South Atlantic states, and during which he travelled 13,000 miles and made 266 speeches.

Mr Taft delivered the Dodge lectures at Yale University in 1906 on the Responsibilities of Citizenship I published as Four Aspects of Civic Duty (1906). Some of his political speeches have been published under the titles Present Day Problems (1908), and Political Issues and Outlooks (1909).

TAGANROG, a seaport of southern Russia, on the N. shore of the Sea of Azov, in the Don Cossacks territory, some 170 m. S.E. of the town of Ekaterinoslav. It is built principally of wood, stands on a low cape, and has the aspect of an important commercial city. The imperial palace, where Alexander I. died in 1825; and the Greek monastery (under the patriarch of Jerusalem) are worthy of notice. Statues of Alexander I. (1830) and Peter the Great (1903) adorn the town. In the 13th century Pisan merchants founded there a colony, Portus Pisanus, which, however, soon disappeared during the migrations of the Mongols and Turks. An attempt to obtain possession of the promontory was made by Peter the Great, but it was not definitely annexed by the Russians until seventy years afterwards (1769). The commercial importance of the town dates from the second half of the 19th century; in 1870 its population had risen to 38,000, and after it was brought into railway connexion with Kharkov and Voronezh, and thus with the fertile provinces of south and south-east Russia, the increase was still more rapid, the number reaching 56,047 in 1885, and 68,928 in 1900—Greeks, Jews, Armenians and West-Europeans being important elements. The town was bombarded and in part destroyed by an Anglo-French fleet in May 1855. Taganrog is an episcopal see of the Orthodox Greek Church, and has tanneries, tallow works and tobacco manufactures. The roadstead is very shallow, and exposed to winds which cause great variations in the height of the water; it is, moreover, rapidly silting up. At the quay the depth of water is only 8 to 9 feet, and large ships have to lie 5 to 13 miles from the town. Moreover, the port is closed by ice three to four months in the year. Notwithstanding the disadvantages of its open roadstead, the foreign trade has rapidly expanded, the annual value of the imports having increased from 62 millions sterling in 1899 to over 10 millions sterling in 1904. The chief article of export being corn, the trade of the city is subject to great fluctuations. Linseed and other oil-bearing grains are also important articles.
of commerce, as well as wool and butter. The imports, which consist chiefly of machinery, fruits (dried and fresh), wine, oil and textiles, do not much exceed half a million sterling annually.

TAGES—TAHITI

TAGES (Tâgês), a minor Etruscan deity, grandson of Jupiter, and founder of the art of divination in Etruria. According to the story, during the ploughing of a field near Tarquinii a being of boyish appearance sprang out of the furrow. The shouts of the ploughman (Tarchon) brought to the spot all the people of Etruria, whom the boy proceeded to instruct in the art of divination. Having done this, he suddenly disappeared. His instructions were for some time handed down orally, but were subsequently transcribed in writing by the scribes of the city. The books of Tages, containing a complete system of Etruscan lore.

See Cicero, De Divin. ii. 23; Ovid, Metam. xv. 553; Festus, s. v.; Mommsen, Hist. of Rome (Eng. tr.), bk. i. ch. 12.

TAGLIAZZOZI, GASPARO (1546–1599), Italian surgeon, was born at Bologna in 1546, and studied at that university under Cardan, taking his degree in philosophy and medicine at the age of twenty-four. He was appointed professor of surgery and afterwards of anatomy, and achieved notoriety at least, and the fame of a wonder-worker. He died at Bologna on the 7th of November 1599.

His principal work is entitled De Curtorum Chirurgia per Insitionem Liber Duo (Venice, 1598), of which it was reprinted in the following year under the title of Chirurgia Nova de Nirium, Aurium, Labori, etque Dejecta per Insitionem Culis ex Humere, arte haciancus omnibus ignota, sarscendo (Frankfort, 1598, 8vo).

TAGLIAZZOZI, a town of the Abruzzi, Italy, in the province of Aquila, 56 m. by rail E.N.E. of Rome, and 10 m. W. of Avezzano. Pop. (1901) 4517 (town); 9661 (commune). It lies 2428 ft. above sea-level, at the mouth of the deep ravine of the Imele. It contains several old churches, notably S. Francesco, with a fine rose-window in the façade, and mediaeval houses. The palace, built at the end of the 14th century by the Orsini, is fine. The place was given to the Colonna family in 1526. At the end of 1668 a battle took place here between Conradin of Hohenstaufen and Charles of Anjou, which resulted in the defeat of Conradin and his execution.

TAGLIONI, MARIA (1804–1884), Italian ballet dancer, daughter of Filippo Taglioni (1777–1871), master of the ballet at Stockholm, Cassel, Vienna and Warsaw, was born at Stock- holm on the 23rd of April 1804. She was trained by her father, who is said to have been pitilessly severe. It was to his care and her own special talent for dancing that she owed her success, for she possessed no remarkable personal attraction. Her first appearance was at Vienna on the 10th of June 1822, in a ballet of which her father was the author, La Réception d’une jeune nymphe à la cour de Terpsichore. Her success was immediate, and was repeated in the chief towns of Germany. On the 23rd of July 1827 she made her Paris début at the Opéra, in the Ballet de Sicilien, and aroused a furor of enthusiasm. Among her more remarkable performances were the dancing of the Tyrolienne in Guillaume Tell, of the pas de fascination in Meyerbeer’s Robert le Diable, and in La Fille du Danube, and in all these the contemplation of her husband, and period the ballet was an important feature in opera, but with her retirement in 1847 the era of grand ballets may be said to have closed. In 1832 she married Comte Gilbert de Voisins, by whom she had two children. Losing her savings in speculation, she afterwards supported herself in London as a teacher of deportment, especially in connexion with the ceremony of presentation at court. During the last two years of her life she lived with her son at Marseilles, where she died on the 23rd of April 1884. Taglioni is frequently mentioned in the novels of Balzac and Thackeray, in The Newcomes, says that the young Taglioni ‘will never see anything so graceful as Taglioni in La Sylphide.’

TAGUS (Span. Tajo, Portog. Tejo), the longest river of the Iberian Peninsula. Its length is 565 m., of which 192 are on or within the frontier of Portugal, and the area of its basin is about 31,850 sq. m. The basin is comparatively narrow, and the Tagus, like the other rivers of the Iberian tableland, generally flows in a rather confined valley, often at the bottom of a rocky gorge below the general level of the adjacent country. The river rises on the western slope of the Muela de San Juan (873 ft.), a mountain which forms part of the Sierra de Albarracin, 88 m. E. of Madrid. Thence the Tagus flows at first north-westwards, but, after receiving the Gallo on the right, it flows west, and then south-west or west-south-west, which is its general direction for the rest of its course. Regular river navigation begins only at Abrantes, a few miles below which the Tagus is greatly widened by receiving on its right bank the impetuous Zecere from the Serra da Estrela. Passing Sanarem, the highest point to which the tide ascends, and the limit of salt water, the Tagus passes through the town of Figueira da Foz. The river divides below Salvatierra into two arms, called the Tejo Novo (the only one practicable for ships) and the Mar de Pedro. These branches enclose a deltaic formation, a low tract of marshy alluvium known as the Lezirias, traversed by several minor channels. Both branches terminate in a broad tidal lake immediately above Lisbon (q.v.). The Tagus estuary, though partly blocked by a bar of sand, is one of the chief harbours of south-western Europe.

The narrower part of the Tagus basin lies to the south, and the left-hand tributaries of it are almost all mere brooks, dry in summer. The principal exception is the Zatas or Sorraia, which, rising in the Serra d’Ossa, flows westwards across the plateau of Alentejo, and joins the Mar de Pedro. The principal right-hand tributaries, besides the Gallo and Zecere, are the Jarama, descending from the tableland of New Castle a little below Aranjuez, the Alberche and the Tietar, which collect their head waters from opposite sides of the Sierra de Gredos, and the Alagon, from the rough and broken country between the Sierras de Gredos and Gata.

TAHITI, the largest and most important of the French Society Islands (q.v.), in the Pacific Ocean, in 17° 38’ S., 149° 30’ W. Pop. about 10,300. The island, in shape not unlike the figure 8, has a length of 33 m., a coast-line of 210, and an area of 402 sq. m. It is divided into two portions by a short isthmus (Isthmus of Taravao) about a mile in width, and nowhere more than 50 ft. above sea-level. The southern, the peninsula of Taiarapu, or Tahiti-titi (Little Tahiti) measures 17 m. in length by 6 m. in breadth; while the northern, the circular main island of Porionou, or Tahiti-uni (Great Tahiti), has a length of 22 m. and a breadth of 20. The whole island and its islands is 9 square miles. A little to the north of the island is the double-peaked Orohena rises to 7340 ft., and the neighbouring Oroari is only a little lower. Little Tahiti has no such elevation, but its tower-like peaks are very striking. The flat land of the Tahitian coast, extending to a width of several miles—with its chain of villages, its fertile gardens, and its belt of palms, sometimes intersected by stream-fed valleys which open on the seashore—forms a most pleasing foreground to the grand mountain ranges. A good road surrounds the island, the extreme north of which is formed by Point Venus, W. of which lie the Bay of Matavai and Papeete, the European town and seat of government, on its beautiful harbour.

Climate.—The seasons are not well defined. Damp is excessive; there is little variation in the weather, which, though hot, is never very oppressive. The depression of the tropics may be considered remarkably healthy. The rainfall is largest between December and April, but there is so much at other times of the year also that these months hardly deserve the name of the rainy period. The wind is for the most part light, though sometimes it is very strong, and is generally on the land at night, but often coming from the sea during the day. The winds off the coast are west-south-west, and are generally quite calm from April to November (8 months), 15 inches.

Fauna.—Mammals, as in other Polynesian islands, are restricted to a few species of bats (mostly of the genus Pteropus), rats and mice, none of them peculiar. Of domestic animals, the pig and the dog—the former a small breed which quickly disappeared before
the stronger European strains—were plentiful even in WALLACE's days. The ornithology is very poor as compared with that of the Western Pacific; but the sweaters of the Sandpiper (Tringa hypoleucos), a group of black birds, may be seen among the waders in the marshes, but the domesticated fowls were abundant, even when Tahiti was first discovered by Europeans, these wild birds are doubtless the offspring of tame birds. The lagoons swarm with fish of many species, but are poor in mollusca, though a good many species are indigenous. Crustaceans and molluscs, on the other hand, are well represented; worms, echinoderms, and corals comparatively poorly. A noteworthy feature of Tahitian ornithology is the number of peculiar species belonging to the genus Pardius, almost every valley being the habitat of a distinct form.

**Flora.**—The flora, though luxuriant and greatly enhancing the beauty of the island, is very imperfectly known. The woods, as a general statement, the Tahitian forests are perhaps the softest in all Oceania. The women rank with the most beautiful of the Pacific, though the accounts given of them by early voyagers are much exaggerated; and for general symmetry of form the people are unsurpassed by any race in the world. Even now in its decadence, after generations of drunkenness and European disease and vice, grafted on inborn indolence and licentiousness, many tall and robust people (6 ft. and even upwards in height) are to be found. Men and women of good birth can generally be distinguished by their height and fairness, and often, even in early age, by their clear complexion, from those of low birth and olive to a full dark brown. The wavy or curly hair and the expressive eyes are black, or nearly so; the mouth is large, but well-shaped and set with beautiful teeth; the nose broad (formerly flattened in infancy by artificial means); and the chin well developed.

The native costume was an oblong piece of bark-cloth with a hole in its centre for the head, and a plain piece of cloth round the loins was worn alike by men and women of the higher classes. Men of all ages wore a jacket, which they called the pahu. The women concealed their breasts except in the company of their superiors, when etiquette demanded that inferior of both sexes should uncover the upper part of their bodies. The Brazilians, who were the first to arrive, had strange cylindrical hats, made of wicker-work and over a yard in height. Circumcision, and in both sexes tattooing, were generally practised, and much significance was attached to some of the marks. The houses were long, low, and open at the sides. Household utensils were few—plain round wooden dishes, sometimes on legs, coconut-nut shells, baskets, &c. Low stools and head-rests were used. Pottery being unknown, all food was baked in a hole dug in the ground or roasted over the fire. Their chief musical instruments were the nose-flute—often used as the accompaniment of song—and the drum. Cock-shells were also used. Tahitian stone adzes, which are the only European tools which the islanders used, are, like the adzes of Polynesia in general, distinguished from those of Melanesia by their triangular section and adaptation to a socket. Slings were favourite weapons of the Tahitians; they had also plain spears expanding into a wide blade, and clubs. The bow and arrow seem only to have been used in certain ceremonial games. Their canoes, from 20 to 70 ft. in length, were double or single, and provided with sail and outriggers. They were not well finished, but were kept in excellent condition. Tahitian ships are named after the gods of those destined to carry the images of their gods, and the several ships with strange figures and hang with feathers. Cannibalism is unknown, though the use of human sacrifices is. It is very probable that human sacrifices may possibly be survivals of this practice. The staple food of the islanders consisted of the bread-fruit, the taro-root, the yam, the sweet potato, and in some districts the wild plantain; but they also ate much fish (the turtle was considered sacred food), as well as pigs and dogs, though of the latter, as pets, the sons of priests, and the puppies sometimes even to the exclusion of their own children.

Tahitians were good fishermen and bold seamen. They steered by the stars, and their own vessels were built as well as those of any other Polynesian islands. The land was carefully tended and the fields well irrigated. Three great classes were recognized:—(1) The sovereign, who bore a semi-pretended women, and the reigning chieftains of districts, and the princes of the royal line, who were also holders of certain estates. Rank is hereditary and determined by primogeniture, not necessarily in the male line. The firstborn of a sovereign succeeded at once to the title, but his brother, or any son by a concubine, who was a chief, or a commoner, and who was extremely dear to his child, then abdicated, and became regent. It is easy to see that, while this custom tended to keep honours within a family, it may have encouraged the practice of infanticide, which was common in all grades of society when Tahiti was first visited by Europeans. The age at which the child's authority became real varied according to his own abilities and the will of his subjects. Though arbitrary, the power of the king was limited by the power of his vassals, the district chiefs, who ruled absolutely over their respective districts, and who might be as of good blood as himself. The king had a councilor, but was alone responsible for any act. The government was a formal thing, the chief men of the council, and the chiefs, and war was rarely declared without their being first summoned to council. Their power over their own people was absolute. The form of government was thus strictly feudal in character, but it is centrally administered. The French colony, which was placed under government by the direction of M. Pomare II, the English missionaries greatly helped to regulate and strengthen. The sovereign sent his commands by a messenger, who was accompanied by a certain number of attendants and the fuft was returned intact as a sign of assent or token in token of refusal.

The temples were square tree-surrounded enclosures, with a single entrance and several small courts, within which were houses for the priests and other persons of inferior rank. A single temple, on which were the actual altars, stood at the further end of the square. In the temples were buried the chieftains, whose embalmed bodies, after being exposed for a time, were interred in a crouching position, their skin being kept whole. The chieftains were buried near their nearest relatives. In the great temple at Atahura the stone structure was 270 ft. long, 94 ft. wide, and 50 ft. high, and its summit was reached by a flight of 120 steps. Various Sacrificial offerings, including human sacrifices, formed a prominent part of Tahitian worship. An eye of the victim was offered to the king, and placed within his mouth by the officiating priest. Every household possessed its own guardian spirits, but there were several superior divinities, of which, at the beginning of the 19th century, Oro was the most venerated. The images, which are less remarkable than those of Hawaii, were rough representations of the human form carved by the chief artisans, and a religious association, was a special feature of Tahitian society.

The Tahitians are light-hearted, frivolous, courteous and generous, and always ready to help one another. Their social games, which were not played by the women, were simple and highly moral, in which one of their customs was a systematic exchange of wives. Besides dancing, the singing of songs, and the recitation of historical and mythological ballads, the natives had also a variety of dances, the game of bowling (in which the canoe was propelled by matches, with foot and canoe races, were held; also sham fights and naval reviews. They had several ball games—one (played chiefly by women), a kind of football; but surf-swimming was perhaps the favourite sport, and cock-fighting was much practised.

**Products, Trade, Administration.**—Papeete, as the emporium for a widely scattered archipelago (including Otaheite, &c.), has an export trade in mother-of-pearl, pearls (mainly from the PEARL Islands, trunks, oranges, tobacco for China, copra and vanilla. Many whalers formerly visited Papeete harbour. During the American Civil War, in the middle of the 19th century, Tahitian cotton was purchased by the United States, but its export has since declined, and it is said 1884, and it has been little grown since. This is also true of coffee and tobacco, and among other crops which have been tried. Sugar and rum are also produced.

The government has had the title of "labor," chiefly for the plantations, from other Polynesian islands was placed under government control in 1862. The Tahitians themselves prefer handcrafts to agricultural work, and many are employed as artisans by European manufacturers. In 1882, 127,660 were in the employment of the government. The French establish-ments in the Eastern Pacific are administered by a governor, a pilot, and a Chief of Police, who is also the head of the government and the president of the chambers of commerce and agriculture.

**History.**—The discovery and early exploration of the Society Islands is treated under that heading. In 1768, when Lieutenant Bligh in the "Bounty" visited Tahiti, the leading chief was Pomare, whose family had been pre-eminent in the island for

---

more than a century. Aided by sixteen of the "Bounty" mutineers, and armed with guns procured from Bligh and a Swedish vessel, Pomare greatly strengthened his power and brought to a successful close a long struggle with Eimeo.

The attempt at colonization by the Spaniards in 1774 was followed by the settlement of thirty persons brought in 1788 by the missionary ship "Duff." Though befriended by Pomare I. (who lived till 1805), they had many difficulties, especially from the constant wars, and at length they fled with Pomare II. to Eimeo and ultimately to New South Wales, returning in 1812, when Pomare renounced heathenism. In 1815 he regained his power in Tahiti. For a time the missionaries made good progress—a printing press was established (1817), and coffee, cotton and sugar were planted (1819); but soon there came a serious relapse into heathen practices and immoralities. Pomare II. died of drink in 1824. His successor, Pomare III., died in 1827, and was succeeded by his half-sister Aimata, the unfortunate "Queen Pomare (IV.)." In 1828 a new fanatical sect, the "Mamai'a," arose, which gave much trouble to the missions. The leader proclaimed that he was Jesus Christ, and promised to his followers a sensual paradise.

In 1836 the French Catholic missionaries in Mangareva attempted to open a mission in Tahiti. Queen Pomare, advised by the English missionary and consul Pritchard, refused her consent, and removed by force two priests who had landed surreptitiously and to whom many of the opposition party in the state had rallied. In 1838 the French frigate Le Consul entered, under the command of Abel Dupetit-Thouars, and extorted from Pomare the right of settlement for Frenchmen of every profession. Pritchard opposed this, and caused Pomare to apply for British protection; but this was a failure, and the native chiefs compelled the queen, against her will, to turn to France. A convention was signed in 1843, placing the islands under French protection, the authority of the queen and chiefs being expressly reserved. Dupetit-Thouars now reappeared, and, alleging that the treaty had not been duly carried out, deposed the queen and took possession of the islands. His high-handed action was not countenanced by the French government; but while, on formal protest being made from England, it professed not to sanction the annexation, it did not retrace the steps taken. Two years were spent in reducing the party in the islands opposed to French rule; an attempt to conquer the western islands failed; and at length, by agreement with England, France promised to return to the plan of a protectorate and leave the western islands to their rightful owners. Pomare died in 1877, and her son Ariane (Pomare V.) abdicated in 1886, handing over the administration to France, and in the same year Tahiti, in closer ties with the mother country, was made an "elective compagnie," to "be governed as a public institution." On the death of Pomare V., the whole of the French establishments in the Eastern Pacific were declared one colony, and the then existing elective general council was superseded by the present administration.

TAHR, the native name of a shaggy-haired brown Himalayan wild goat characterized by its short, triangular and sharply keeled horns. Under the name of Hemitragus jemlahicus, it typifies a genus in which are included the wariatu, or Nilgiri ibex (H. hyloicrus), from the Nilgiri and Anamalai hills of Southern India, and a small species, H. javaheri, from South Arabia. Tah frequently the worst ground of almost all ruminants.

TAILLANDIER, SAINT-RÉNÉ (1817-1879), French critic, whose original name was René Gaspard Ernest Taillandier, was born in Paris on the 16th of December 1817. He completed his studies at Heidelberg, and then became professor of literature successively at Strasbourg, Montpellier and the Sorbonne, where he was nominated to the chair of French eloquence in 1868. Most of the articles included in his published volumes first appeared in the Revue des deux mondes. In January 1870 he became general secretary of the ministry of education, and continued in this office after the fall of the Empire. He became officer of the Legion of Honour in 1870, and was elected to the Academy in 1872, where he died on the 22nd of February 1873.

His works include:—Allemagne et Russie, études historiques et littéraires (1856), Le Poète du Caucaze . . . Michel Lermontoff (1886), Maurice de Saxe (2 vols. 1865), Thèques et Magyars (1860), Le Général Philippe de Ségur (1875).

TAILLE (from Fr. tailler, to cut or divide; late Lat. talare, said to come from talla, talus), the equivalent of the English word "tax," was in use in France in the 12th century, and has a very peculiar history. It is said that the word tailie was the generic term for an indirect tax. Other words used in certain districts in the same sense as taille were queste (questa, quisto), fouage (foragium), cote. The essence of the tax denoted by these names was that the amount was fixed en bloc for a whole group of persons, and afterwards divided among them in various ways. In ancient French law we find three forms of taille: the taille servile, taille seigneuriale, and taille royale.

Taille servile, properly termed a tax, was a tax which had degenerated into a source of profit for certain individuals. Every lord who possessed serfs could levy the taille on them, and originally this was done arbitrarily (a volonté) both to the crown and to his tenants. It caused much trouble and was used as a means of oppression among the people. In peace it was a battle of serfdom, but was limited and fixed, either by contracts or concessions from the lord (taille obonnaie), or by the customs. The taille seigneuriale was a true tax, levied by a lord on all his subjects who were neither nobles nor ecclesiastics. But according to opinion, when feudalism was established, the right of levying it did not belong to every lord, but only to the lord having the haute seigneurie. He levied it without the necessity for a legal contract between him and those who paid it. He fixed the sum to be paid by each group of inhabitants, who then had to see that it was assessed, collected, and paid to the lord, electing commissioners to this end. The taille seigneuriale was a fixed tax, not a variable one, and was one of the methods used by the state in the 19th century for reducing the administration of taxation to its simplest form. Custom, however, or an order of the lord generally fixed the principle upon which the division was made. It was often a "hearth tax" (fouage), when each house, i.e. each head of a family, paid the same amount, arrived at by dividing the local contingent of the taille by the number of fires. But this equality, which took no account of wealth or poverty, was felt to be unjust, and the assessment began to be made according to the resources of each family, "the strong bearing the weak, and the weak relieving the strong." The seigniorial taille, like the servile, had the character of a personal tax (taille d'abonné), and was levied from 1789 with the idea of having it paid according to his wages or other income. The king originally had only the right of levying the taille in places where he had retained the exercise of the haute justice. At that time there was no royal authority in French society, and the taille was levied by the local lord and paid to the crown, but it was one of the first taxes his right to levy which upon all the inhabitants of the domain of the crown, whether serfs or free men. The taille de la dîme was imposed for the first time in 1354. The nature of the idea began to prevail that it was fair for the king, in time of war, to levy a taille upon the subjects of the lords having the haute justice in various parts of the royal domain. Moreover, tailles were often granted him by the provincial estates or the states-general. Thus the general taille, raised for the benefit of the king, became more and more frequent, and naturally tended to become permanent.

This transformation was confirmed, rather than effected, by the ordinance of 1430. Its immediate object was, not the regulation of the taille, but the organization of the compagnies d'ordonnance, i.e. the heavy cavalry which the king from that time on maintained on a permanent footing. In the process of levying it was natural that the taille, the tax which had long been devoted to meeting the expenses of the royal wars, should also become permanent. This was contained implicitly in the ordinance that the taille which at the same time was not fixed in advance, was competing too closely with the royal taille by imposing a double burden on the taxpayer. A kind of seigniorial taille continued to exist besides the servile taille, but this kind presupposed a title, a noble, between the lord, or else immemorial possession, which amounted to a title. The royal taille naturally retained the distinctive characteristics of the seigniorial, and was in the end levied in a manner in which it was assessed and collected; the chief characteristic being that ecclesiastics and nobles, who were exempt from the seigniorial taille, were also exempt from the royal. The royal taille, though levied in the king's name, was not always put to his own use, and was a tax on the whole kingdom. The pays d'élection were subject to it, the pays d'états were not (see Francia: Law and Institutions).

Throughout the pays d'élection the taille was almost universal personal (taille personnelle), i.e. a tax on the whole income of the
TAILEFER—TAILOR

359

TAILEFER, the surname of a bard and warrior of the 11th century, whose exact name and place of birth are unknown. He accompanied the Norman army to England in 1066, and obtained permission from William to strike the first blow at the battle of Hastings. He fought with spirit and determination, and was killed in the battle. MENTION of Taillefer is made by Guido, bishop of Amiens, in his Carmen de bello Hastingensi, v. 931-44 (in Mon. Hist. Brit., 1848) and by Henry of Huntingdon in his Historia Anglorum (in Ker. Brit. med. oevi script., p. 763, ed. Arnold, London, 1879); and his prowess is depicted on the Bayeux tapestry. The statement of Wace in the Roman de Rou, 3rd part, v. 8935-62, ed. Andresen (Heilbronn, 1879), that he was killed by the Norman army singing of Charlemagne and of Roland and of the people of Normandy, has been considered important in demonstrating the existence of a comparatively early tradition and song of Roland.

See W. Spatz, Die Schlacht von Hastings (Berlin, 1896): Freeman, History of the Norman Conquest.

TAILOR (Fr. tailleur, from tailler, to cut, Lat. talea, a thin rod, a cutting for planting), one who cuts out and makes clothes. Formerly the tailor, or cisseur, made apparel for both men and women, and not merely outer garments, but also articles of linen and the padding and lining of armour—whence the style " Taylors and Linen Armourers " applied to the Merchant Taylors Company. In the Middle Ages, before the Norman army singing of Charlemagne and of Roland and of the people of Normandy, has been considered important in demonstrating the existence of a comparatively early tradition and song of Roland.

America, to include articles of good, though not of the first, quality. It probably first came into existence at seaport towns, where, to meet the convenience of sailors returning from long voyages and requiring their wardrobes to be replenished at short notice, the "outfitters" kept stocks of ready-made garments on sale; but it made no considerable progress until after the middle of the 19th century, when the introduction of the sewing-machine brought about the possibility of manufacturing in large quantities. Its development was attended with gradually increasing subdivision of labour and, to a less extent, with the disappearance of the tailor as a skilled craftsman.

The first step was for a garment, such as a coat, to be completed by the joint efforts of a family. Then followed the "task system," which in America was the result of the influx of Russian Jews that began about 1875. Under it a team of three men, with a "presser" and a girl to sew on the buttons, divided the work between them. Payment was made by the "task," i.e. a specified number of garments, the money being divided between the members of the team in certain proportions. Often several teams would be run by a contractor, who naturally aimed at the cheapest of all grades of clothing and, as full as possible; and when through stress of competition he had to accept lower prices the plan he adopted was to increase the number of garments to a task, leaving the pay unaltered. The result was the introduction of many of the worst features of the "sweating system," the workers having to work excessively long hours in order to finish the task, which in some cases meant as many as twenty coats a day. In the "factory" or "Boston" system the subdivision is still more minute, and as many as one hundred persons may be concerned in the production of one coat. The amount of tailoring skill required in a worker is even further reduced, but the promises come under the regulation of the factory laws. The factory system has also cheapened production in a legitimate way, because it has enabled mechanical power for driving sewing-machines, and also expensive labour-saving machinery, to be
TAIN—TAINE

introduced to an extent not possibly possible in small shops.

TAIN, a royal and police burgh of the county of Ross and Cromarty, Scotland. Pop. (1901) 2076. It is situated on rising ground within a mile of the southern shore of Dornoch Firth, 25°3 m. N.E. of Dingwall by the Highland Railway. The name, of which the Tene, Tayne and Thane are older forms, is derived from the Icelandic thing, "assembly" or "court."

Among the principal buildings are the town hall, court house, public hall, Easter Ross combination poolhouse, and the academy (opened in 1812). The industries include distilling, the making of aerated waters, and woollen manufactures, and the town has a distillery. It was a royal burgh from 1324.

The rainfall is one of the lowest in the kingdom. Duthac (locally called Duthus), a saint of the 11th century, is believed to have been a native, and the old ruined chapel near the station is supposed to have been his shrine. To the collegiate church of St Duthus, a Decorated building, founded by James III. in 1471, James IV. made several pilgrimages in penance for his father's death. The building was used as the parish church till 1815, when it fell into disrepair, but it was restored between 1871 and 1876. It has monuments to Patrick Hamilton, the lawyer, and Thomas Hope (1689–1702), Scotch church divine, for some time a prisoner on the Bass. Three and a half miles S.E. are the remains of the Early English abbey of Fearn, founded at Ederton in 1250 by Farquhar, 1st earl of Ross, and transferred thither in 1338. The chancel, nave and two side chapels exist, and it still serves as the parish church. Patrick Hamilton became titular abbot in 1517, and after his martyrdom the abbey was added to the bishopric of Ross.

TAINÉ, Hippolyte Adolphe (1828–1893), French critic and historian, the son of Jean Baptiste Taine, an attorney, was born at Vouziers on the 1st of April 1828. He remained with his father until his eleventh year, receiving instruction at home and attending at the same time a small school which was under the direction of M. Pierson. In 1839, owing to the serious illness of his father, he was sent to an ecclesiastical pension at Rethel, where he remained eighteen months. J. B. Taine died on the 8th of September 1840, leaving a moderate competence to his widow, his two daughters, and his son. In the spring of 1841 Taine was sent to Paris, and entered as a boarder at the Institution Mathé, where the pupils attended the classes of the Collège Bourbon. Madame Taine followed her son to Paris. Taine was slow to distinguish himself at school. When he was but fourteen years old he had already drawn up a systematic scheme of study, from which he never deviated. He allowed himself twenty minutes' playtime in the afternoon and an hour's music after dinner; the rest of the day was spent in work. In 1847, as étudiant de rhétorique, he carried off six first prizes in the general competition, the prize of honour, and three accessits; he won all the first school prizes, the three science prizes, as well as two prizes for dissertation. It was at the Collège Bourbon that he formed lifelong friendships with several of his schoolfellows who afterwards were to exercise a lasting influence upon him: among these were Prévost-Paradol, for many years his most intimate friend; Planat, the future "Marcelin" of the Vie Parisienne; and Cornélius de Witt, who introduced him to Guiot when the latter returned from England in 1846.

Public education was the career which seemed to lie open to Taine after his remarkable school successes. In 1848 he accordingly took both his baccalaureat degrees, in science and letters, and passed first into the École Normale; among his rivals, who passed in at the same time, were About, Sarcey, Libert, and Suckau. Among those of Taine's fellow-students who afterwards made a name in teaching, letters, journalism, the theatre and politics, &c., were Challeme-Lacour, Chassagny, Aubé, Perraud, Ferry, Weiss, Yung, Gaucher, Gréard, Prévost-Paradol and Levasseur. Taine made his influence felt among them at once; he amazed everybody not only by his erudition, but by his indefatigable energy; and not only by his prodigious industry, but by his facility both in French and Latin, in verse as well as in prose. He devoured Plato, Aristotle, the Fathers of the Church, and he analysed and classified all that he read. He already knew English, and set himself to master German in order to read Hegel in the original. His brief leisure was devoted to music. 'The teachers of his second and third years, Deschanel, Gérusez, Berger, Havet, Filon, Saisset and Simon, were unanimous in praising the nobility of his character, the vigour and the fertility of his intellect, the distinction of style with which his work was always stamped; they were equally unanimous in finding fault with his unmeasured taste for classification, abstraction and formula. The director of studies, M. Vacherot, gauged his capacity at the end of his second year with prophetic insight. He prophesied that Taine would be a great critic, and that his name would be added to that of Rethel on Spinoza's motto, "Vivre pour penser," would also be his. In the month of August 1851 he came forward as a candidate for the fellowship in philosophy (agrégation de philosophie) in company with his friends Suckau and Cambier. Taine was declared to be admissible, together with five other candidates; but in the end only two candidates were admitted, his friend Suckau and Aubé. This decision created almost a scandal. Taine's reputation had already spread beyond the college. Everybody had taken for granted that he would be admitted first. The fact that his examination showed considered his ideas to be absurd, his style and method of handling a subject dry and tiresome.

The Minister of Public Instruction, however, judged Taine less severely, and appointed him provisionally to the chair of philosophy at the college of Toulon on 6th October 1851; but he never entered upon his duties, as he did not wish to be so far from his mother, and on 13th October he was transferred to Nevers as a substitute. Two months later, on the 27th December, occurred the coup d'état, after which every university professor was regarded with suspicion; many were suspended, others were dismissed, and a few were imprisoned. In Taine's opinion it was the duty of every man, after the plébiscite of the 10th December, to accept the new state of affairs in silence; but the universities were not only asked for their submission, but also for their approbation. At Nevers they were requested to sign a declaration expressing their gratitude towards the President of the Republic for the measures he had taken. Taine was the only one to refuse his endorsement. He was at once marked down as a revolutionary, and in spite of his success as a teacher and of his popularity among his pupils, he was transferred on 2oth March 1852 to the lyceé of Potsiers as professor of philosophy, with the warning to be careful for the future. Here, in spite of an abrupt compliance with the stringent rules imposed upon him, he remained in disfavour, and on 25th September 1852 he was appointed assistant professor of the sixth class at the lyceé of Besançon. This time he could bear it no longer, and he applied for leave, which was readily granted him on 9th October 1852, and renewed every year till his decennial appointment came to an end. It was in this painful year, during which Taine worked harder than ever, that the fellowship of philosophy was abolished. As soon as Taine heard of this he at once began to prepare himself for the new respite in letters, and to work hard at Latin and Greek themes. On 10th April 1852 a decree was published by which three years of preliminary study were necessary before a candidate could compete for the fellowship, but by which a doctor's degree in letters counted as two years. Taine immediately set to work at his dissertations for the doctor's degree; on 6th June (1852) they were finished, and 150 pages of French prose on the Sensations and a Latin essay were sent to Paris. On the 15th July he was informed that the tendency of his Essay on the Sensations made it impossible for the Sorbonne to accept it, so for the moment he laid this work aside, and on 1st August he began an essay on La Fontaine. He then started for Paris, where an appointment which was equivalent to a suspension awaited him. His university career was over, and he was obliged to devote himself to letters as a profession. In a few months his two dissertations, De personis Platoniciis and the essay on La Fontaine's fables were finished, and on 30th May 1853 he took his doctor's degree. This was the last act of his
TAINE 361

university career; his life as a man of letters was now to begin. But sooner had he deposited his dissertations at the Sorbonne than he began to write an essay on Livy for one of the competitions set by the Academy. Here again the moral tendency of his work excited lively opposition, and after much discussion the competition was postponed till 1855; Taine toned down some of the censured passages, and the work was crowned by the Academy in 1855. The essay on Livy was published in 1856 with the addition of a preface setting forth determinist doctrines, much to the disgust of the Academy. In the beginning of 1854 Taine, after six years of uninterrupted efforts, broke down with consumption; his greatest wish was the rest of utilizing his enforced leisure; he let himself be read to, and for the first time his attention was attracted to the French Revolution; he acquired also a knowledge of physiology in following a course of medicine. In 1854 he was ordered for his health to the Pyrenees, and Hachette, the publisher, asked him to write a guide-book of the Pyrenees. Taine's book was a collection of vivid descriptions of nature, historical anecdotes, graphic sketches, satirical notes on the society which frequently watering-places, and underlying the whole book was a vein of stern philosophe. The year 1854 was an important one in the life of Taine. His enforced leisure, the necessity of mixing with his fellow-men, and of travelling, tore him from his cloistered existence and brought him into more direct contact with reality. His method of expounding philosophy underwent a change. Instead of employing the method of deduction, of starting with the most abstract idea and following it step by step to its concrete realization, henceforward he starts from the concrete reality and proceeds through a succession of facts until he arrives at the central idea. His style also became vivid and full of colour; he shows that he is acutely sensitive to the outward manifestations of things and depicts them in all their relief. Simultaneously with this change in his works his life became less self-centred and solitary. He lived with his mother in the Isle Saint-Louis, and now he once more associated with his old friends, Planat, Prévost-Paradol and About. He made the acquaintance of Renan, and through Renan that of Sainte-Beuve, and he renewed friendly relations with M. Havet, who for three months had been his teacher at the École Normale. These years (1855–56) were Taine's periods of greatest activity and happiness in productive work. On 17th November 1855 he published an article on La Bruyère in the Revue de l'Instruction Publique. In the same year he published seventeen articles in this review and twenty in 1856 on the most diverse subjects, ranging from Menander to Macaulay. On 1st August 1855 he published a short article in the Revue des Deux Mondes on Jean Reynaud. On 3rd July 1856 appeared his first article in the Débats on Saint-Simon, and from 1857 onwards he was a constant contributor to that journal. But he was seeking a larger field. On 17th January 1856 his history of English literature was announced, and from 14th January 1855 to 9th October 1856 he published in the Revue de l'Instruction Publique a series of articles on the French philosophers of the 19th century, which appeared in a volume at the beginning of 1857. In this volume he energetically attacked the principles which underlie the philosophy of Victor Cousin and his school with an irony which amounts at times to irreverence. The book closes with the sketch of a system in which the methods of the exact sciences are applied to psychological and metaphysical research. The work itself met with instantaneous success, and Taine became famous. Up till that moment the only important articles on his work were an article by About on the Voyage aux Pyrénées and two articles by Guizot on his Livy. After the publication of Les Philosophes Français, the articles of Sainte-Beuve in the Moniteur (9th and 16th March 1856), of Sherré in the Bibliothèque Universelle (1858), and of Planche in the Revue des Deux Mondes (1st April 1857) show that from this moment he had taken a place in the forefront of the new generation of men of letters. Caro published an attack on Taine and Renan, called "L'Élève de Dieu dans une Jeune École," in the Revue Contemporaine of 15th June 1857. Taine answered all attacks by publishing new books. In 1858 appeared a volume of Essais de Critique et d'Histoire; in 1860 La Fontaine et ses Fables, and a second edition of his Philosophes Français. During all this time he was persevering at his history of English literature up to the time of Byron. It was from that moment that Taine's influence began to be felt; he was in constant intercourse with Renan, Sainte-Beuve, Sherré, Gautier, Flaubert, Saint-Victor and the Goncourt brothers. He gave his last years to the study of literature; he was a member of the Académie des Sciences, and when in 1863 came forward as a candidate for the chair of literature at the Polytechnic School, but M. de Loménie was elected in his place.

The following year, however, in March, Marshal Randon, Minister of War, appointed him examiner in history and German to the military academy of Saint Cyr, and on 26th October 1864 he succeeded Viollet-le-Duc as professor of the history of art and aesthetics at the École des Beaux Arts. Renan's appointment at the Collège de France and Taine's candidature for the Polytechnic School had been attacked by Guizot and Dupanloup, who in 1853 issued an Avertissement à la Jeunesse et aux Pères de Famille, which consisted of a violent attack upon Taine, Renan and Littérés; Renan was suspended, and Taine's appointment to Saint Cyr would have been cancelled but for the intervention of the Princess Mathilde. In December 1863 his Histoire de la Littérature Anglaise was published, prefaced by an introduction in which Taine's determinist views were developed in the most uncompromising fashion. In 1864 Taine sent this work to the Academy to compete for the Prix Bordin. M. de Falloux and Mgr. Dupanloup attacked Taine with violence; he was warmly defended by Guizot; finally, after three days of discussion, it was decided that as the prize could not be awarded to Taine, it should not be awarded at all. This was the last time Taine sought the suffrages of the Academy save as a candidate, in which quality he appeared once in 1874 and failed to be elected, Mézières, Caro and Dumas being the rival candidates; and twice in 1878, when, after having failed in May; H. Martin being chosen, he was at last elected in November in place of M. Loménie. In 1866 he received the Legion of Honour, and on the conclusion of his lectures in Oxford on Corneille and Racine, the University conferred upon him (1871) its degree of D.C.L.

The period from 1854 to 1870 was perhaps the happiest of Taine's life. He derived pleasure from his employment at the Beaux Arts and Saint Cyr, which left ample leisure for travel and research. In 1864 he spent February to May in Italy, which furnished him with several articles for the Revue des Deux Mondes from December 1864 to May 1866. In 1865 appeared La Philosophie de l'Art, in 1867 L'Idéal dans l'Art, followed by essays on the philosophy of art in the Netherlands (1868), in Greece (1869), all of which short works were republished later (in 1880) as a work on the philosophy of art. In 1865 he published his Nouveaux Essais de Critique et d'Histoire; from 1863 to 1865 appeared in La Vie Parisienne the notes he had taken for the past two years on Paris and on French society under the sub-title of "Vie et Opinions de Thomas Frédéric Grandelier," published in a volume in 1867, the most personal of his books, and an epitome of his ideas. In 1867 appeared a supplementary volume to his history of English literature, and in January 1870 his Théorie de l'Intelligence. In 1868 he married Mademoiselle Denuelle, the daughter of a distinguished architect.

He had made a long stay in England in 1858, and had brought back copious notes, which, after a second journey in 1871, he published in 1872 under the title of Notes sur l'Angleterre. On 28th June 1870 he started to visit Germany, but his journey was abruptly interrupted by the outbreak of the war; his project had to be abandoned, and Taine, deeply shaken by the events of 1870, felt that it was the duty of every Frenchman to work solely in the interests of France. On 9th October 1870 he
published an article on "L’Opinion en Allemagne et les Conditions de la Paix," and in 1871 a pamphlet on Le Suffrage Universel; and it was about this time also that the immense ideas applied to literature and Taine's art of writing on the French Revolution returned in a new and definite shape. He determined to trace in the Revolution of 1789 the reason of the political instability from which modern France was suffering. From the autumn of 1871 to the end of his life his great work, Les Origines de la France Contemporaine, occupied all his time, and in 1884 he gave up his professorship in order to devote himself wholly to his task; but he succumbed before it was finished, dying in Paris on 5th March 1883. In the portion of the work which remained to be finished Taine had intended to draw a picture of French society and of the French family, and to trace the development of science in the 19th century. He had also planned a complementary volume to his Théorie de l'Intelligence, to be entitled Un Traité de la Volonté.

The Origines de la France Contemporaine, Taine’s monumental achievement, stands apart from the rest of his work. His object was to explain the existing constitution of France by studying the more immediate causes of the present state of affairs—the last years of what is called the Ancien Régime, the Revolution and the beginning of the 19th century, to each of which several volumes were devoted. He also had another object, although he was perhaps hardly conscious of it, which was to study man in one of his pathological crises; for Taine makes an investigation into human nature, and the historian checks and endorses the pessimism and misanthropy of Graindorge. The problem which Taine set himself was to inquire why the centralization of modern France is so great that all individual initiative is practically non-existent, and why the central power, whether it be in the hands of a man or of an assembly, is the sole and only power; also to expose the error underlying two prevalent ideas:—(1) That the Revolution destroyed liberty instead of establishing it; that France was less centralized before 1789 than after 1800. This also he shows to be untrue. France was already a centralized country before 1789, and grew rapidly more and more so from the time of Louis XIV. onwards. The Revolution merely gave it a new form.

The Origines differ from the rest of Taine's work in that, although he applies to a period of history the theories which he had already applied to literature and Taine's art of writing on the arts, he is unable to approach his subject in the same spirit; he loses his philosophic calm; he cannot help writing as a man and a Frenchman, and he lets his feelings have play; but what the work loses thus in impartiality it gains in life.

Taine was the philosopher of the epoch which succeeded the era of romanticism in France. The romantic era had lasted from 1820 to 1830. It had been the result of a reaction against the classical school, or rather against the conventionality and lifeless rules of this school in its decadence. The romantic school introduced the principle of individual liberty both as regards matter and style; it was a brilliant epoch, rich in men of genius and fruitful of beautiful work, but towards 1830 it had reached its decline, and a young generation, tired in turn of its conventions, its hollow rhetoric, its pose of melancholy, arose, armed with new principles and fresh ideals. Their ideal was truth; their watchword liberty; to get as near as possible to scientific truth became their object. Taine was the mouthpiece of this period, or rather one of its most authoritative spokesmen.

Many attempts have been made to apply one of Taine's favourite theories to himself, and to define his mind and the preponderant faculty. Some critics have held that it was the power of logic, a power which was at the same time the source of his weakness and of his strength. He had a passion for abstraction. "Every man and every book," he said, "can be summed up in three pages, and those three pages can be summed up in three lines." He considers everything as a mathematical problem, whether it be the universe or a work of art: "C'est beau comme un syllogisme," he said of a sonata of Beethoven. Taine's theory of the universe, his doctrine, his method of writing criticism and history, his philosophical system, are all the result of this logical gift, this passion for reasoning, classification and abstraction. But Taine's imaginative quality was as remarkable as his power of logic; hence the most satisfactory definition of Taine's predominating faculty would be one which comprehended the two gifts. M. Lemaitre gave us this definition when he called Taine a poète-poïeticien; M. Bourget likewise when he spoke of Taine's imagination philosophique, and M. Barrès when he said that Taine had the power of dramatizing abstractions. For Taine was a poet as well as a philosopher; and it is possible that the portion of his work which is due to his poetic and imaginative gift may prove the most lasting.

Taine's doctrine consisted in an inexorable determinism, a negation of metaphysics; as a philosopher he was a positivist. Enamoured as he was of the precise and the definite, the spiritualist philosophy in vogue in 1845 positively maddened him. He returned to the philosophy of the 18th century, especially to Condillac and to the theory of transformed sensation. Taine presented this philosophy in a vivid, vigorous and personal form. He was a universal philosopher, which made his works more accessible, and consequently more influential, than those of Auguste Comte. Hence to the men of 1860 Taine was the true representative of positivism.

Taine's critical work is considerable; but all his works of criticism are works of history. Hitherto history had been to criticism as the frame is to the picture; Taine reversed the process, and studied literary personages merely as specimens and productions of a certain epoch. He started with the axiom that the complete expression of a society is to be found in its literature, and that the way to obtain an idea of a society is to study its literature. The great writer is not an isolated being; he is the result of a thousand causes; firstly, of his race; secondly, of his environment; thirdly, of the circumstances in which he was placed while his talents were developing. Hence Race, Environment, Time—these are the three things to be studied before the man is taken into consideration. Taine completed this theory by another, that of the predominating faculty, the faculté maîtresse. This consists in believing that every man, and especially every great man, is dominated by one faculty so strong as to subordinate all others to it, which makes the character of that man its own. Taine's theory is not an isolated being; he is the result of a thousand causes; firstly, of his race; secondly, of his environment; thirdly, of the circumstances in which he was placed while his talents were developing. Hence Race, Environment, Time—these are the three things to be studied before the man is taken into consideration.

Taine completed this theory by another, that of the predominating faculty, the faculté maîtresse. This consists in believing that every man, and especially every great man, is dominated by one faculty so strong as to subordinate all others to it, which makes the character of that man its own. Taine's theory is not an isolated being; he is the result of a thousand causes; firstly, of his race; secondly, of his environment; thirdly, of the circumstances in which he was placed while his talents were developing. Hence Race, Environment, Time—these are the three things to be studied before the man is taken into consideration.
Rapid changes among the fellows found him at the age of twenty-six "the senior and most responsible of the four Balliol tutors." The experience gained during this period stood him in good stead afterwards as a member of the first Oxford University Commission (1850–52). He never sympathized with the principles of the Tractarian movement, and on the appearance of Tract XC, in 1844, he denounced the "Four Tutors" against it; but this was his only important contribution to the controversy. On the other hand, although his sympathies were on the whole with the liberal movement in the university, he never took a lead in the matter.

In 1842 he became an undistinguished but useful successor to Arnold as headmaster of Rugby; and a serious illness in 1848, the first of many, led him to welcome the comparative leisure which followed upon his appointment to the deanship of Carlisle in 1849. His life there, however, was one of no little activity; he served on the University Commission, he was bishop and cathedral, and did much excellent pastoral work. There too he suffered the great sorrow of his life. He had married Catharine Spooner at Rugby in 1843; in the spring of 1856, within five weeks, five of their children were carried off by virulent scarlet fever. Not long afterwards he was consecrated bishop of London on the 22nd of November 1856, as successor to C. J. Blomfield. His translation to Canterbury in 1868 (he had refused the archbishopric of York in 1862) constituted a recognition of his work, but made no break in it. His last years were interrupted by illness and saddened by the death in 1878 of his only son, Edward, and his wife.

If Blomfield had almost remodelled the idea of a bishop's work, his successor surpassed him. Tait had all Blomfield's earnestness and his powers of work, with far wider interests. Blomfield had given himself zealously to the work of church-building; Tait followed in his steps by inaugurating (1862) the Bishop of London's Fund. He devoted a very large part of his time at London in actual evangelistic work; and to the end his interest in the pastoral side of the work of the clergy was greater than anything else. With his wife, he was instrumental in the work of Visitations, and had carried on the work of the London Missionary Society. His gift of literary expression was great, and he did not lack the attention to the healthful regulation of Anglican sisterhoods during the parochial period in which this was particularly necessary. Nor was he less successful in the larger matters of administration and organization, which brought into play his sound practical judgment and strong common-sense. He was constant in his attendance in parliament, and spared no pains in pressing on measures of practical utility. The modification of the terms of clerical subscription (1865), the new lectionary (1871), the Burials Act (1880) were largely owing to him; for all of them, and especially the last, he incurred much obloquy and loss of popularity. The Roman Catholics of the Ecclesiastical Courts (1881) were due to him, and he took a large part in the deliberations of both. Probably his successor (see Benson, E. W.) was brought into closer relations with the colonial churches than Tait was; but the healthy development of the Lambeth Conferences on the lines of mutual counsel rather than of a hasty quasi-synodical action was largely due to him.

On the other hand, Tait was not successful in dealing with matters which called for the higher gifts of a ruler, and especially in his relations with (a) the liberal trend in modern thought, (b) in the question of the University of Oxford, and (c) in the question of the Oxford Movement itself, though he himself not a little in sympathy with it. But although well-read, he was no scholar in the true sense, and had neither the knowledge to feel sure of his ground nor the theological insight to perceive the real point at issue. His object in dealing with questions of faith, as in dealing with the ritual question, was primarily a practical one: he wished to secure peace, and obedience to the law as he saw it. Consequently, after his sympathies had led him to express himself favourably towards some movement, he frequently found himself compelled to draw back. He expressed a qualified sympathy with some of the writers of Essays and Reviews, and then joined in the censure of it by the bishops (1861). The same kind of apparent vacillation was found in his action in other cases; e.g., in the Colenso case
TAIT, A. F.—TAIT, P. G.

(1863), and in the controversy as to the use or disuse of the Athanasian symbol (1872). It was naturally and widely misunderstood. Some who did not know him thought, or pretended to think, that he was a Socinian or a free-thinker. The world at large knew better; but even Temple warned him, in the benefice of St. Alban's, Holborn, for you must keep the fact that you compel them to feel that in every crisis of life they must be on their guard against trusting you." (b) As regards the second point, Tait was concerned with it during the whole of his episcopate, and above all on the side of ritual, on which it naturally came into most direct conflict with the recognized ecclesiastical practice of the day. He had to deal with the St George's-in-the-East riots in 1859, and the troubles at St Alban's, Holborn, in their earlier stages (1867); he took part as assessor in the Privy Council judgment in the Ridsdale case (1877); he was more or less concerned with those who were bishop with the agitation against consecration in 1858, and again in 1877. His method throughout was the same: he endeavoured to obtain a compliance to the law as declared by the courts; failing this, he made the most earnest efforts to secure obedience to the ruling of the Ordinary for the sake of the peace of the Church; after this, he could do nothing. He did not perceive how much of reason the "ritualists" had on their side: that they were fighting for practices which, they contended, were covered by the letter of the rubric; and that, where rubrics were notoriously disregarded on all hands, it was not the earlier, earliest, or the most consistent. In fact, if others were inclined to ignore it altogether, Tait could hardly realize anything but the connexion between the Church and the State. From such a position there seemed to be no escape but in legislation for the deprivation of the recalcitrant clergy; and the Public Worship Regulation Act (1874) was the result. For this Tait was by no means responsible as a whole: some of the provisions which proved most irksome were the result of amendments by Lord Shaftesbury which the bishops were unable to resist; and it must be borne in mind that the most disastrous portion of the measure was contemplated by those who were instrumental in passing it. The results followed inevitably: clergy were cited before a new tribunal, and not only deprived but imprisoned. A widespread feeling of indignation spread not only among High Churchmen, but among many who cared little or nothing for the ritual practices involved; and it seemed impossible to foretell what the outcome would be. But the aged archbishop was moved as much as anybody, and tried hard to mitigate such a state of things. At length, when the Rev. A. H. MacKoonochie was on the point of being deprived of his benefice of St. Alban's, it was not fair to proceed against an archbishop, then on his deathbed at Addington, took steps which resulted in the carrying out of an exchange of benefices (which had already been projected), which removed him from the jurisdiction of the court. This proved to be the turning-point; and although the ritual difficulty by no means ceased, it was afterwards dealt with from a different point of view, and the Public Worship Regulation Act became practically obsolete. The archbishop died on the 3rd of December (Advent Sunday), 1882, leaving a legacy of peace to the Church.

Tait was a Churchman and a man of science, although the work of the latter was confined to all England, he remained a Scotman to the end. It was the opinion of some that he never really understood the historical position of the English Church and took no pains to learn. John Tilloston, one of his predecessors in the archbishopric, was a favourite hero of his, and in some ways the two men resembled one another. But Tait had none of Tilloston's gentleness, and he rode roughshod over the obstacles in his way. He cannot be called a great ecclesiastical statesman, but he administered his office well and was undoubtedly one of the foremost public men of his day.

See R. T. Davidson and D. Benham, Life of Archbishop Tait, 2 vols. (1894); A. C. Tait, Catherine and Crawford Tait (1880). (W. E. Co.)

TAIT, ARTHUR FITZWILLIAM (1819-1902), American artist, was born near Liverpool, England, on the 5th of August 1819. He emigrated to the United States in 1859, and was identified with the art life of New York until his death. In 1858 he was elected to full membership in the National Academy of Design, New York. He died at Yonkers, New York, on the 28th of April 1902. He painted barnyard swarms and such as sheep and deer, with great dexterity, and reproductions of his minute panels of chickens had an enormous vogue.

TAIT, PETER GUTHRIE (1831-1901), Scottish physicist, was born at Dalkeith on the 28th of April 1831. After attending the Academy at Edinburgh and spending a session at the University, he went up to Cambridge as a member of Peterhouse, and graduated as senior wrangler and first Smith's prize-man in 1852. As a fellow and lecturer of his college he remained in Cambridge for two years longer, and then left to take up the professorship of mathematics at Queen's College, Belfast. There he made the acquaintance of Thomas Andrews, whom he joined in researches on the density of ozone and the action of the electric discharge on oxygen and other gases, and by whom he was introduced to Sir W. R. Hamilton and quaternions. In 1860 he was chosen to succeed his old master, J. D. Forbes, as professor of natural philosophy at Edinburgh, and this chair he occupied till within a few months of his death, which occurred on the 4th of July 1901, at Edinburgh. The first scientific paper that appears under Tait's name only was published in 1851. His most important work was in the new calculus of quaternions (q.v.), of which he may be regarded as the leading exponent after their originator, Hamilton. He was the author of two text-books on them—one an Elementary Treatise on Quaternions (1867), written with the advice of Hamilton, though not published till after his death, and the other an Introduction to Quaternions (1873), in which he was aided by Professor Philip Kelland (1808-1879), who had been one of his teachers at Edinburgh. In addition, quaternions was one of the themes of his address as president of the British Association for the Year 1881, but he also produced original work in mathematical and experimental physics. In 1864 he published a short paper on thermodynamics, and from that time his contributions to that and kindred departments of science became frequent and important. In 1871 he emphasized the significance and promise of the principle of the dissipation of energy. In 1873 he took thermoelectricity for the subject of his discourse as Rede lecturer at Cambridge, and in the same year he presented the first sketch of his well-known thermoelectric diagram before the Royal Society of Edinburgh. Two years later researches on "On a Vacuum, or the true dynamical explanation of the Crookes radiometer in the large- ness of the free path of the molecule of the highly rarefied air. From 1879 to 1888 he was engaged on difficult experimental investigations, which began with an inquiry into the corrections required, owing to the great pressures to which the instruments had been subjected, in the readings of the thermometers employed by the "Challenger" expedition for observing deep-sea temperatures, and which were extended to include the compressibility of water, glass and mercury. Between 1886 and 1896 he published a series of papers on the application of the kinetic theory of gases, the fourth of which contained what was, according to Lord Kelvin, the first proof ever given of the Waterston-Maxwell theorem of the average equal partition of energy in a mixture of two different gases; and about the same time he carried out investigations into impact and its duration. Many other inquiries conducted by him might be mentioned, and some idea may be gained of his scientific activity from the fact that a selection only from his papers, published by the Cambridge University Press, fills three large volumes. This mass of work was done in the time he could spare from his professorial teaching in the university. In addition, he was the author of a number of books and articles. Of the former, the first, published in 1866, was on the dynamics of a particle; and afterwards there followed a number of concise treatises on thermodynamics, heat, light, properties of matter and dynamics,
together with an admirably lucid volume of popular lectures on Recent Advances in Physical Science. With Lord Kelvin he collaborated in writing the well-known Treatise on Natural Philosophy. "Thomson and Tait," as it is familiarly called ("T. and T." in their own formula), was planned soon after Lord Kelvin became acquainted with Tait, on the latter's appointment to his professorship in Edinburgh, and it was intended to be an all-comprehensive treatise on physical science, the foundations being laid in kinematics and dynamics, and the structure completed with the properties of matter, heat, light, electricity and magnetism. But the literary partnership ceased in about eighteen years, when only the first portion of the plan had been completed, because each of the members felt he could work to better advantage separately than jointly. The friendship, however, was renewed for the twenty-three years which yet remained of Tait's life.

Tait collaborated with Balfour Stewart in the Unseen Universe, which was followed by Paradoxical Philosophy. Among his articles may be mentioned those which he wrote for the ninth edition of this Encyclopaedia on Light, Mechanics, Quaternions, Radiation and Thermodynamics, besides the biographical notices of H. Newton and Clerk Maxwell.

TAJIK, or PARSIWAN, a subject race of Afghanistan. Underlying the predominant Pathan elements in the country, the Tajik (Tajak, or Tausik) represents the original Persian possessor of the soil, who still speaks his mother tongue and therefore calls himself Parsiwan. There are several Persians in Afghanistan, such as the Kizilbashas of Kabul and the Naoshirvans of Herat. The Tajiks are nomeans, that is, nomads, and their occupations were to be applied only to an admixture of original Arab and Persian stock, who are the slaves of the community—hewers of wood and drawers of water. Everywhere the Tajiks are the cultivators in rural districts, and the shopkeepers and clerks in the towns. They are a fine, athletic people, generally fair in complexion, and assimilate in aspect, in dress, and in much manner to the Afghans, but they are never nomadic. The Tajik is as much the slave of the Pathan in Afghanistan as is the Hindu (whose origin is similar) in the plains of the Indus. Yet the Tajik population of the richly-cultivated districts north of Kabul proved themselves to be of good fighting material in the Afghan war of 1879-80, and the few Kizilbashas that are to be found in the Indian army are brave soldiers. The number of the Tajiks in Afghanistan is estimated at 900,000.

The name itself originally occurs in the Pahlavi writings, and is explained to mean, first, the Abas in general, then their descendants born in Persia and elsewhere out of Arabia, and, lastly, the Persians in general and their descendants born in or out of Persia. Tajik thus came to be the collective name of all communities of Iranian stock and Persian speech wherever found in Central Asia and the new countries of Afghanistan and Persia. The Tajik language is a northward extension of the Persian empire; but, after the ascendency of the Turkic races, they became the subject element in Turkestan, Afghanistan, Bokhara, Khiva, Kashgaria, while still politically dominant in Badakshan, Wakhan, Darzaw, Kost and Karachob. In most of these places the Tajiks, with the kindred Gelaches, seem to form the bulk of the population, the distinction being that "Tajik" is applied rather to the settled and more civilized lowlanders of modern Persian speech, "Gelach" to the highlanders of Ferghana, Kohistan, Wakhan, &c., who speak either archaic forms of Persian or dialects intermediate between the Iranian and Mongolian languages and Indo-European linguistic forms.

But, although mainly of Iranian stock, with light complexion and regular features, the Tajiks claim Arab descent, regarding the district about Bagdad as their primateal home, and considering themselves the descendants of the authors of the Koran, was planned soon in the first century of the Hijra. At the same time, "it is evident that the inhabitants of the greater part of this region (Central Asia) must from an early period have come in contact with the successive waves of Turkish (Turk) and even Mongol population which broke over them; accordingly we find that, although the type is essentially Iranian, it has undergone a certain modification" (Capt. J. M. Thomson, The Tajiks of Afghanistan). It should be distinguished from the Sar, the latter simply meaning "trader" or "shepherd" and therefore being applied indiscriminately to the settled as opposed to the nomad element, and especially to the urban populations, of whatever race they may be. The Tajiks are known as Tats on the west side of the Caspian (Baku, Lenkoran, &c.).

TAKHTSINGJI (1838–1896), Maharaja of Bhaunagar, a Rajput chief of the Gohel clan, and the ruler of a state in Kathiawar, was born on the 6th of January 1838, and succeeded to the throne of Bhaunagar on the death of his father, Jaswant-singji, in 1875. During his minority, which ended in 1878, he was educated at the Rajkot college and afterwards under an English officer, while the administration of the state was controlled by the late J. H. Percival, a member of the Indian Civil Service, and Asam Government, which, however, was one of the foremost native statesmen of India, who had served the state in various capacities since 1822. At the age of twenty Takhtsingji found himself the ruler of a territory nearly 3000 square miles in extent. His first public act was to sanction a railway connecting his territory with one of the main trunk lines, which was the first enterprise of its kind on the part of a raja in western, if not in all, India. The commerce and trade, and the economic and even social development of the state, which came in the wake of this railway, confirmed Takhtsingji in a policy of progressive administration, the careful planning and establishment of hospitals and dispensaries, trunk roads, bridges, handsome edifices and other public works grew apace. In 1886 he inaugurated a system of constitutional rule, by placing several departments in the hands of four members of a council of state under his own presidency. This innovation, which had the warm support of the governor of Bombay, Lord Reay, provoked a virulent attack upon the chief, who brought his defamers to trial in the High Court of Bombay. The punishment of the ringleaders broke up a system of blackmailing to which it was used to be subjected, and the public spirit of Takhtsingji in freeing his brother and himself, this event, was widely acknowledged throughout India, as well as by the British authorities. In 1886 he was created G.C.S.I.; and five years later his hereditary title of thakore was raised to that of maharaja. In 1893 he took the occasion of the opening of the Imperial Institute by Queen Victoria to visit England in order to pay personal homage to the sovereign of the British Empire, on which occasion the University of Cambridge conferred on him the degree of L.L.D. He died in 1896. (M.M.Bt.)

TAKIN, the Mishmi name of a remarkable hollow-horned mammal (Budorcas taxes), the tusked wapiti, educational establishments, hospitals and dispensaries, trunk roads, bridges, handsome edifices and other public works grew apace. In 1886 he inaugurated a system of constitutional rule, by placing several departments in the hands of four members of a council of state under his own presidency. This innovation, which had the warm support of the governor of Bombay, Lord Reay, provoked a virulent attack upon the chief, who brought his defamers to trial in the High Court of Bombay. The punishment of the ringleaders broke up a system of blackmailing to which it was used to be subjected, and the public spirit of Takhtsingji in freeing his brother and himself, this event, was widely acknowledged throughout India, as well as by the British authorities. In 1886 he was created G.C.S.I.; and five years later his hereditary title of thakore was raised to that of maharaja. In 1893 he took the occasion of the opening of the Imperial Institute by Queen Victoria to visit England in order to pay personal homage to the sovereign of the British Empire, on which occasion the University of Cambridge conferred on him the degree of L.L.D. He died in 1896. (M.M.Bt.)

TAKLÁ MAKÁN, the Central Asian desert which lies between the N. foot of the Kuen-lun ranges and the wide curve of the Tarim river on the W., N., and E. It appears to be naturally divisible into two parts by the river Khotan-darya, and the name applied to the western part between that river and the Yarkand-darya (Tarim) is the desert of Takla Makan proper, while the part between the Khotan-darya and the line of the lower Tarim and the Cherchen-darya is known as the desert of Cherchen. The former is occupied almost entirely by sand-dunes. Sand mountains range in altitude from 60 ft. up to as much as 300 ft. The only breaks in this "sea of sand-waves" are a few small patches of alluvial clay. Often two distinct systems of dunes can be distinguished; one system, consisting of the larger concatenations, stretches from E. to W., while the secondary or transverse dunes run from N. to S., or from N.E. to S.W. The steeper faces of the dunes and of the dune accumulations for the most part turn towards the S.,
the S.W. and the E., that is, invariably away from the direction of the prevailing winds; but in some parts the steep faces are those fronting the E. and the S. In the desert of Charchen, however, where the general height of the dunes in the N.E. is uniformly greater than in the desert of Takla Makan proper, reaching up to 350 ft., the configuration of the dunes appears similar. A rough, parallel-walled, and steeply sloping plateau of level clay called bayirs, varying in size from half a mile to a dozen miles in length, barren and tinged with saline deposits in the middle, with scanty vegetation around, and lofty sand-dunes overpowering them on both sides. These elliptical, cauldron-shaped basins all stretch from N.E. or E.N.E. to S.W. or W.S.W., and are arranged in long curving chains, the successive depressions being parted by transverse ridges of sand. They owe their configuration in great part, perhaps entirely, to the prevailing wind.

On perfectly level ground the dunes are crescentic in shape, have a steep face towards the W., are highest in the centre, and slope away in each direction towards the two horns or cusps of the crescent. On the windward side they have a convex, spoon-shaped slope, regularly marked, but crumpled by tiny sand-waves or ripple-marks.

With regard to the large accumulations of sand (in the desert of Charchen) we have ascertained the following laws—(1) In the N. the desert they turn their steep faces towards the N.W., in the S. towards the S.W., and ascend in layers of sand; (2) their eastern slopes ascend rather slowly towards their crests; (3) on the other side their steep windward faces go down sheer at an angle of 45° or more, and dunes diminish towards the S.; (4) they are each built up of an innumerable number of individual dunes; (5) although their relief is influenced by winds from other quarters than the predominant, their mass is usually in a crescentic arrangement; (6) it is their varying breathings which give rise originally to the thresholds, and consequently to the formation of the bayirs" (Sven Hedin, op. cit. i. 352).

The bayirs become progressively rarer, less distinct, and smaller in size as one advances from E. to W. At the same time the arrangement of the sand-dunes grows more and more irregular, and the dunes themselves plunge steeply down towards the W., the S., and the S.W., and are drawn out in long parallel lines towards the N.W. and S.E. In that part of the desert two systems of dunes are distinguishable, intersecting or rather crossing over one another diagonally or at right angles. In the extreme west, at Ordan-Padshah, between Kashgar and Yarkand, the dunes travel annually some 13 ft. towards the S.E., not towards the S.W. The principal cause of the difference between the arrangement of the sand-dunes in the desert of Charchen and the arrangement of the sand-dunes in the desert of Takla Makan proper in the W. is the wind. In the latter, winds from several quarters cooperate to mould the relief of the desert into capricious and changing outlines; but in the E. the wind blows not only with greater regularity from one settled direction, the N.E. or E.N.E., but also with much greater violence. Indeed, it is in the open Lop country, where the mountains, the Kuruk-tagh, and the Astin-tagh on the N., and the Targin-Tagh on the S., are the nearest to each other, that the wind develops its greatest and most concentrated energy. In the E., where the sand waves are most exposed to the fiercest wind, they form elongated waves, distinctly outlined, corresponding to the breakers of the ocean. They disseminate themselves westwards over the desert in ever-widening concentric circles. The curving courses of the Tarim and the Koucheh-darya are the only check upon the invasion of the Takla Makan by the sand which is generated in the desert of Lop or further E. and N. in the mountains which girdle the desert of Gobi. But the former river is itself encroaching upon the N.E. margin of the desert, and pressing more and more towards the S.W.

With regard to the origin of the stupendous masses of sand that form the Tarim. K. Bogdanovich considers them to consist for the most part of the disintegrated products of the fine-grained alluvial clays of the desert itself. On the other hand, G. N. Potanin and V. A. Obruchev both seek for its origin in the harshest winds which work together with the disintegrated debris; but subject to certain modifications, Sven Hedin is disposed to agree. But he adds that the masses of sand themselves are derived from three separate sources, in part directly, in part indirectly, the direct being (1) the result of disintegration from the adjacent mountains, whether sandstones or crystalline rocks; (2) through the activity of the wind operative amongst the alluvial alluvia of the rivers and temporary lakes; (3) through the sand that was already present in the soil, and which became exposed in rings more or less concentric in proportion as the former (Central Asian Mediterranean) sea dried up. Of these agencies the river Tarim makes by comparison much the smallest contribution. The desert environed by the Tarim is of the area covered by sands in the desert of Takla Makan proper is estimated at nearly 116,000 sq. m., and the area covered by them in the desert of Charchen at 154,480 sq. m. (Central Asian Mediterranean) sea dried up. Of these agencies the river Tarim makes by comparison much the smallest contribution. The desert environed by the Tarim is of the

Vegetation and animal life are extremely scarce. The former is practically confined to various steppe plants, komisk (reeds), tamarisks (almost invariably growing on root-mounds), and poplars. The animals are hares and snakes or one or two other rodents, foxes, and in a few places the wild camel.

The climate is one of extremes. At Merket on the W. verge of the desert of Takla Makan proper the winters are cold, though the snowfall is small, while the summers are hot. In the desert of Charchen a temperature of —22° F. has been observed in the depth of winter, and there snow sometimes falls heavily. During the sandstorms which sweep over the region in spring, the thermometer drops as much as 10° or 12° F. below zero. On the other hand, a temperature as high as 86° has been recorded in the end of April (cf. Gobi). It is only in winter that this appalling desert can be crossed without great risk, and then only with great difficulty. It is in winter that the sandstorms in the desert and the dust-hazes, which often assume the aspect of a thick fog, are least frequent. Sometimes for days together the desert is enveloped in an impenetrable dust-haze, which chokes and destroys all living creature. In the 18th century A.D. Marco Polo left behind him a description of this desert and related legends associated with it (see the edition of his travels in English by Sir H. Yule, ed. 1903). The full extent of the area which is still inhabited by a people, and the nature of his Scientific Results of a Journey in Central Asia, 1809—1902 (Stockholm, vols. i. and ii. 1905—6); see also his Through Asia (London, 1898), vol. I. For archaeology, see Turkestan. (J. T. B.)

**TALAING,** more accurately called Mm, the name given to the remnant of the Peguan race, which for long stove with the race of Tartars for the ascendancy in the deserts; but it is now Bugia. In the middle of the 18th century the Peguans were masters of the country from the Gulf of Martaban to the north of Mandalay. Now, however, the Talaing population is practically confined to the Tenasserim and Pegu divisions of Lower Burma, and even there it seems to be dying out. According to the census of 1900 they numbered only 531,808 persons, of whom 154,458 spoke the Talaing language. The Talaiings are, historically, the most important representatives in Burma of the Môn-Annam linguistic family, who have left tokens of their presence from the Khasia Hills in Assam to the Gulf of Siam. The origin of the name Talaiings is remote. At Talavera, the city of Talavera in the province of Toledo, on the right bank of the river Tagus, and on the Madrid-Cáceres railway. Pop. (1900) 10,580. Talavera is of great antiquity, the Caesalpina of the Romans. Portions of the triple wall which surrounded it remain standing, and the Arco de San Pedro is one of its Roman gates restored. Among the ancient buildings are the Torres Albarranares, built by the Moors in the 10th century, the Gothic college church, and three secularized convents, one of which dates from the 11th century, but has twice been partially restored, and is now a factory. The bridge of thirty-five arches across the Tagus dates from the 15th century. The palace of the queen" was so named because, from the time of Philip IV. of Alphonso XL (1312—50), it was the property of the queens of Castile.

For the operations which culminated in the famous battle of Talavera, between the English and the French, and those which followed that engagement, see PENINSULAR WAR. Sir Arthur Wellesley (afterwards Duke of Wellington), the British commander, acting in co-operation with Lieutenant-General Guesda's Spanish army, took position on the 27th of July 1809 on the Upper Tagus,

---

1 Sven Hedin, op. cit. i. 356.
protected by his advanced guard. His line, facing due east, ran north from the right bank of the river to a ridge running parallel to the Tagus, beyond which ridge, also running parallel to the Tagus and along with their right flank resting on the river held Talavera itself and the close country to the northward of it: Wellesley’s right connected with Cuesta’s left, and his line was in the form of a crescent. When this was more firmly fixed, the British advanced, and, by the 29th, were in line to the right of the Tagus. The battle was begun by the attack of two French divisions on the British advanced guard, which retired into the main position without loss. The centre of the British line was occupied by Marshal Sir John Moore, followed up by Wellesley’s line of battle. For some time the possession of the ridge (owing to the delay of Hill’s Division) was doubtful, and Rufane Donkin’s brigade handled it with skill, and on the 30th, the arrival of the troops under Commando Sir Edward Manchester secured this all-important point for the Allied left. Meanwhile the Spaniards (though there was at first a temporary panic amongst them) and the right divisions of the British repulsed an attack in the plain, and the day closed with the armies facing each other along the rivulet and on the ridge. The losses had been heavy on both sides. Early on the 28th the battle was renewed by a furious attack on Hill’s troops, whose left was now protected by the Allied cavalry and a division borrowed from Cuesta. King Joseph Bonaparte and Jourdan his chief of staff, who were present, were averse from fighting on this present ground, wishing to wait for a more propitious opportunity, and Wellesley, it was only after long discussion that the king gave a reluctant assent to Victor’s plan of attack. That Marshal’s divisions once more tried to out Hill from the ridge, and once more failed before the superior numbers and the British line of battle, which was firmly posted in this quarter (though, owing perhaps to defective ground- scouting, this nearly ended in disaster). At the same time General Sarrut attacked an allied centre. Surrounded by a body of troops, the French incautiously left the ridge, and the British, under Victor, followed them up sharply, and soon came upon Wellesley’s line of battle. This time Lapisse’s division of Victor’s corps attacked the Allies’ left centre, composed of the British Guards. The French columns were again checked by the British line, but here the counter- strokes of the Allies fell short, and the French left was carried. The British in the ardour of incautious pursuit were very severely handled and pushed back to the position by the French reserves; when Wellesley decided the day by a counter attack with the 48th regiment, made with great intrepidity and steadiness. The Guards, with splendid discipline, resumed their positions, and eventually the French, with their leader Lapisse mortally wounded, fell back. Failure all along the line, and heavy losses left King Joseph no alternative but to retire towards Madrid. The French lost 7268 men out of 46,138 present, the British 5363 out of 20,641; the Spanish losses were officially returned at 1201 out of some 36,000 present.

TALBOT (FAMILY) Apart from its achievements, this is one of the few families in the English aristocracy which traces alike its descent and its surname from the Norman conquerors of England; and it may be said that there has hardly been a time since the battle of Hastings when its members have not been of considerable account in public life. Yet in some periods they appear rather as a potential influence, while at certain marked epochs they stand out among the most prominent actors in English history. The name of Richard Talbot occurs in Domescay Book as the holder of nine hides of land in Bedfordshire under Walter Giffard. There is no evidence that he came over to England with the Conqueror himself; and, as he did not hold of the king in copite, it is clear that he was not a leader. Talbot being a personal nickname and not derived from a place, those who bore it were probably connected with him in some way, but not necessarily connected, and stretched as far as the west Lancashire coast. But a Geoffrey Talbot may be found in the pedigree connected with the empress Maud against King Stephen; and a Hugh Talbot held the castle of Plessis against Henry I. for Hugh de Gournay, and afterwards became a monk at Beaubeac in Normandy. Richard Talbot, with whom the proved pedigree begins, obtained from Henry II. on his accession the lordship of Linton in Herefordshire, and from Richard III. the custody of Ludlow Castle; and his descendants for some generations appear to have been wardens of various castles on the borders of Wales, and intermarried with the great families of this region. Under Edward I. and Richardson. George, Talbot was head of the house, and invaded Scotland in the king’s campaign, but afterwards took part with Thomas of Lancaster against the king. He, however, was pardoned, and obtained from Edward III. a confirmation of the grant of the manor of Linton and other lands, being summoned to parliament as a baron (1331).

His son Richard, who had married a daughter and co-heiress of John Comyn of Badenoch, laid claim to certain lands in Scotland in her right, and, when restrained from entering that country by land (Edward III. having then made an alliance with the English), was by the latter's capture in Gascogne invaded by it in sea in the interests of Edward Balliol. Three years later he was taken prisoner in Scotland, and redeemed for 2000 marks, after which the king made him governor of Berwick. He took part also in Edward’s wars against France, as did likewise his son Gilbert, who succeeded him. His wife had brought him the noble seat of Goodrich Castle on the Wye, and at this time the family possessed lands in the counties of Oxford, Gloucester, Hereford and Kent. Gilbert’s son Richard added to this inheritance by marrying the heiress of Lord Strange of Blackmere, and himself became under Richard II. one of the heirs of the earl of Pembroke, thus adding to his estates, lands in Berkshire, Wiltz, Salop and Essex. Another Gilbert Talbot, grandson of the last, claimed to carry the great spurs at the coronation of Henry V., and had a commission to receive the submission of Owen Glendower and his adherents. He also distinguished himself in the invasion of Normandy. He was twice married, his second wife being a Portuguese lady, but he left no male issue, and was succeeded by his brother John.

Hitherto the head of the house had borne the name of Lord Talbot; but this John, after obtaining by marriage the title of Lord Furnival, joined his name to it, and became Lord Talbot of Shrewsbury (see SHREWSBURY, JOHN TALBOT, 1st earl of). Besides his martial exploits, this John claims some attention for his family alliances. His first wife Maud, a granddaughter of Thomas, Lord Furnival, brought him the castle of Sheffield as part of her inheritance, and he was accordingly summoned to parliament in the days of Henry IV. as John Talbot of Hallamshire, otherwise Lord Furnival, more than thirty years before he was made earl of Shrewsbury. The property became a favourite residence of the family during the Tudor era; and, but for the death in 1616 of Gilbert, 7th earl of Shrewsbury, without male issue, Sheffield might have remained much longer a centre of feudal magnificence rather than of commerce and manufactures. The second wife of John, earl of Shrewsbury, was Margaret, the eldest of three daughters of Richard Beauchamp, earl of Warwick, by that earl’s second wife, a daughter of Thomas, Lord Berkeley. By her he obtained a third part of the Berkeley property; and, though she did not become the mother of a line of ears, her eldest son, John Talbot, was created Viscount Lisle, and it was he who fell along with his father at Shrewsbury. In 1588 he joined the expedition which under Sir John Gilbert, who inherited the title of Viscount Lisle, was slain at the early age of twenty-two in a feudal contest with Lord Berkeley, arising out of a dispute as to the possession of Berkeley castle, on the 20th of March 1470; and the title was afterwards conferred on Edward Grey, the husband of one of his two sisters.

John, the second earl of Shrewsbury, was the 1st earl’s son by his first wife. He had been knighted at Leicester in 1426 along with the infant king Henry VI., had served in the wars of France, and been made chancellor of Ireland during his father’s lifetime, when he was only Lord Talbot. Afterwards he was made lord high treasurer of England, and in 1450 was rewarded for his services to the house of Lancaster with a grant of 200 marks a year out of the lordship of Wakefield, forfeited by Richard, duke of York. But next year he and his brother Christopher were slain at the battle of Northampton, fighting in the cause of Henry VI. His son John succeeded him, and then his grandson George, who fought for Henry VII. at Stoke, and whom King Henry VIII. sent as his lieutenant against the rebels in the Pilgrimage of Grace. But perhaps the thing which most redounds to his credit is the humanity with which he received the fallen Cardinal Wolsey into his house at Sheffield when he was on his way up to London as a state prisoner.

Francis, the 3rd earl, took a leading part in the invasions of
TALBOT, M. A.—TALC

Scotland under Henry VIII. and Edward VI., and was one of the two peers who alone opposed the bill for abolishing the pope's jurisdiction under Elizabeth. His son George, who succeeded, was the earl to whom the custody of Mary Stuart was committed, his task being rendered all the more difficult for him by the intrigues of his second wife, Beatrice of Hardwick, the barren of Sir Gilbert's son. John married three husbands before her union with him. Two sons of this last earl succeeded one another, and the title then devolved, for want of male issue, on the lineal descendants of Sir Gilbert Talbot of Grafton in Worcestershire, third son of John, the 2nd earl. But the old baronies of Talbot, Strange of Blackmore, and Furnival had passed away in 1616 to the daughters of the 7th earl, of whom the youngest married Thomas (Howard) earl of Arundel, whose descendant, the Duke of Norfolk, has the valuable Furnival estates. The above Sir Gilbert had fought for Henry VII. at Bosworth, where he was severely wounded, was knighted on the field, and was throughout one of the first Tudor's most trusted councillors. He fought also at Stoke against the insurgents with Lambert Simnel, was made a knight banneret, governor of Calais, and lord chamberlain.

The 9th earl, George, descended from this Gilbert, died unmarried, and his nephew, who followed, was succeeded by his grandson Francis, chiefly memorable for his unhappy fate. His second wife, the "wanton Shrewsbury" of Pope, a daughter of the earl of Cardigan, was seduced by the duke of Buckingham, whom the outraged husband challenged to a duel. The courteous, it is said, was present at the scene, and held Buckingham's horse in the disguise of a page, saw her husband killed, and then clasped her lover in her arms, receiving blood-stains upon her dress from the embrace. Charles, the 12th earl, son of this unfortunate nobleman, was raised by William III. to the dignity of a duke, but as he left no son this title died along with him in 1718, and the earldom of Shrewsbury devolved on his cousin Gilbert, a Roman Catholic priest.

From this time the direct line of Sir Gilbert Talbot of Grafton began to fail. A nephew three times succeeded to an uncle, and then the title devolved upon a cousin, who died unmarried in 1836. On the death of this cousin the descent of the title was for a short time in dispute, and the lands were claimed for Lord Edmund Howard (now Talbot), an infant son of the Duke of Norfolk, under the will of the last earl; but the courts decided that, under a private act obtained by the Duke of Shrewsbury shortly before his death, the title and bulk of the estates must go together, and the true successor to the earldom was found in Earl Talbot, the head of another line of the descendants of Sir Gilbert Talbot of Grafton, sprung from a second marriage of his eldest son, Edward Talbot, from his mother, the heiress of the barony of Dunster.

All the titles just mentioned have been united in the line of the Earl Talbot who successfully claimed the Shrewsbury title as the 18th earl, the earldom of Shrewsbury (1442) being now the oldest existing that is not merged in a higher title. The family seats (Aston Towers and Ingelstall Hall) and the chief estates are in Staffordshire. The old badge of the family was a "tubot" or running hound. (J. GA; J. II. R.)

TALBOT, MARY ANNE (1775-1808), the "British Amazon," was born in London on the 2nd of February 1778. She believed herself to be the illegitimate child of the 1st Earl Talbot. Early in her career she married Sir John Talbot, from his mother, a captain. In 1792 she was a drummer in Flanders. In the capture of Valenciennes her lover was killed; and Mary Anne deserted and became cabin boy on a French lugger, which she asserted was captured by the British, who transferred her to the "Brunswick," where she served as a powder monkey, being wound in Lord Howe's victory of the 1st of June 1794. For this she later received a small pension. When the wound healed she again went to sea, was captured by the French, and imprisoned for a year and a half. Her son was not the eldest until shortly afterwards she was seized by a pressgang. She finally became a household servant to Robert Kirby, a London publisher, who included an account of her adventures in his Wonderful Museum (1804) and in Life and Surprising Adventures of Mary Anne Talbot (1809). She died on the 4th of February 1808.

TALBOT, WILLIAM HENRY FOX (1800-1877), English discoverer in photography, was the only child of William Davenport Talbot, of Lacock Abbey, Wiltshire, and of Lady Elizabeth Fox Strangways, daughter of the 2nd earl of Ilchester. He was born on the 11th of Feb. 1800, and was educated at Harrow and at Trinity College, Cambridge, where he gained the Pocon prize in 1820, and graduated as twelfth wrangler in 1821. From 1822 to 1872 he frequently communicated papers to the Royal Society, many of them on mathematical subjects. At an early period he had begun his optical researches, which were to have such important results in connexion with photography. To the Edinburgh Journal of Science in 1826 he contributed a paper on "Some Experiments on Coloured Flame," to the Quarterly Journal of Science in 1829 a paper on "Monochromatic Light," and to the Philosophical Magazine a paper of 1830 on "Chemical Changes of Colour." Before L. J. M. Daguerre exhibited in 1839 pictures taken by the sun, Talbot had obtained similar success, and as soon as Daguerre's discoveries became known communicated the results of his experiments to the Royal Society. In 1841 he made known his discovery of the calotype or talbotype process, and after the discovery of the collodion process by Frederick Scott Archer in 1851 he devised a method of instantaneous photography. For his discoveries, which are detailed in his Pencil of Nature (1844), he received in 1842 the Rumford medal of the Royal Society, while engaged in his scientific researches he devoted much time to archaeology. He published Hermes, or Classical and Antiquarian Researches (1838-39), and Illustrations of the Antiquity of the Book of Genesis (1839). With Sir Henry Rawlinson and Dr Edward Hincks he shares the honour of having been one of the first decipherers of the cuneiform inscriptions of Nineveh. He was also the author of English Etyymology (1846). He died at Lacock Abbey on the 17th of September 1877.

TALBOT OF HENSOl, CHARLES TALBOT, 1st Baron (1685-1737), Poet laureate and chancellor of England, was the eldest son of William Talbot, bishop of Durham, a descendant of the 1st earl of Shrewsbury. He was educated at Eton and Oriel College, Oxford, and became a fellow of All Souls College in 1704. He was called to the bar in 1711, and in 1717 was appointed solicitor-general to the prince of Wales. Having been elected a member of the House of Commons in 1720, he became solicitor-general in 1726, and in 1723 he was made lord chancellor and raised to the peerage with the title of Baron Talbot of Hensol. Talbot proved himself an equity judge of exceptional capacity and of the highest character during the three years of his occupancy of the Woolsack. He died on the 1st of January 1737. Among his contemporaries Talbot enjoyed the reputation of a wit; he was a patron of the poet Thomson, who in The Seasons commemorated a son of his to whom he acted as tutor; and Butler dedicated his famous Analogy to the lord chancellor. The title assumed by Talbot was derived from Hensol in Glamorganshire, which came to him through his wife.

TALC, a mineral which in its compact forms is known as steatite, or soapstone. It was probably the μαύροι νήσοι of Theophrastus, described as a stone of silvery lustre, easily
cut. The word talc, sometimes written talk, is said to come from the Arabic talq, and not to be connected, as has been fancifully suggested, with the Swedish talja, "to cut." Talc and mica were confused by the older writers, and even at the present day mica is sometimes known in trade as talc; whilst the term was formerly applied also to foliated gypsum.

Talc is found occasionally in small hexagonal and rhombic plates, with perfect basal cleavage, and they are supposed to be monoclinic. Talc often occurs in foliated masses, sometimes with a curved surface, readily separating into thin folia. The nearly transparent talc gives a six-rayed percussion-figure. Talc has a hardness of only about 1, and a specific gravity of from 2.6 to 2.8. Its extreme softness and its greasy feel are characteristic. The lustre on the cleavage face is pearly, or sometimes silvery, and one of the old names of the mineral was steatite, while German writers sometimes called it Kattensilber. The colour is white, grey, yellow or frequently green. The mineral has strong hire-fringence and a small optic axial angle.

Talc is a magnesium silicate H_{2}MgsSiO_{5}. It is generally regarded as a hydrous silicate, but the water is expelled only at about 400°. The water and magnesium oxide may be regarded as basic. By the action of heat the hardness of the mineral is greatly increased. Pseudomorphs are known after actinolite, pyroxene, etc., and the mineral has probably been generally formed by the alteration of ferro-magnesian silicates. Talc occurs chiefly in crystalline schists, usually associated with chlorite, serpentine and dolomite. Fine examples of apple-green colour are found at Mount Greiner, in the Zillerthal, Tirol. Talc-schist is a foliated rock composed chiefly of talc, generally associated with quartz and felspar; but all soapy schists are not necessarily talciferous. The nearly micaceous constituent of the Alpine protogine is a muscovite.

The "steatites" of Pliny was a stone resembling fat, but otherwise undescribed. Being easily cut, steatite has always been a favourite material with the carver: it was used for Egyptian scarabs and other amulets, which were usually coated with a blue vitreous glaze; and it was employed for Assyrian cylinders and for other ancient signets. By the Chinese steatite is largely used for ornamental carvings, but many of their "soapstone" figures are wrought in a compact pyrophyllite (q.v.), which is essentially different from talc. The name galatomite is given to a steatite from a deposit near Bideford, Devon, which is represented by a plate, engraved by a Mr. H. Klaproth from the Greek ἄγαλμα, "an image." Pagodite is an old name for Chinese figure-stone. Ancient steatite carvings are found among the ruins of Rhodesia.

Steatite is usually a white, grey, greenish or brown substance, occurring in veins or nodular masses or in lenticular bedded deposits. Pseudomorphs after quartz and dolomite occur near Wunsiedel in Bavaria. In some cases it is a product of the alteration of pyroxenic rocks, and the commercial mineral may be very impure. The ease with which steatite may be worked, coupled with its power of resisting heat, has led to its employment for vessels for household use, whence it is called "potstone"—the lapis albaris of old writers. Among the uses of steatite may be mentioned its employment, especially in America, for sinks, stoves, firebricks, foot-warriors, tips for gas-burners and electric switchboards: when ground it is used as a filler for paper, for leather-dressing, for covering steam-pipes, as an ingredient in soap, for toilet-powder, for certain paints and as a lubricant. A fine granular steatite is used by tailors for marking cloth under the name of "French chalk" or "Spanish chalk." Slate pencils are made of steatite and pyrophyllite; and in Burma steatite is much used for writing on black paper. In the oxyhydrogen flame, steatite has been fused and drawn out into threads, like quartz-fibres.

Steatite and talc-schists are widely distributed, and have occasionally been used as building stones. When first raised the stone is soft, but hardens on exposure. Soapstone from Gudbrandsdal is used in the cathedral of Trondheim in Norway. Veins of steatite occur in the serpentine of the Lizard district in Cornwall, and the mineral was used under the name of soap rock in the manufacture of the old Worcester porcelain. Among localities of steatite in the British Isles mention may be made of Croby Head and Garnet letterkenny in co. Donegal, Ireland; the Sheilds isles, the Hebrides (Harris) and Shiness in Sutherland. In North America the distribution of this mineral is very extensive; localities of economic importance are Gouverneur and St. Lawrence co., New York; at Francetown in New Hampshire; Stockbridge, Windsor co., Vermont; Lynnfield, Massachusetts; Granville, Peru, Amelia, Beacon, Fairfield and Fluavanna co.s, Virginia; Cherokee, Moore and Swain co.s, North Carolina; and in Murray co., Georgia.

A fibrous steatite from New York state, used in the manufacture of paper, is known as agalite. Renislerite is a wax-like talcose substance, passing into serpentine, from St. Lawrence co., New York; named by E. Emmons in 1837 after S. Van Rensselaer, of Rensselaer, N.Y. Binghamite is a steatite of Michigan, named by L. W. Hubbard. The term was first given by Dr. G. Nordenskiold to a mineral from Finland, which appears to be talc pseudomorphous after pyroxene. Talcold was K. F. Naumann's name for a white lamellar mineral from near Pressoff in Bohemia. A blue earthy mineral from near Silver City, New Mexico, known locally as "native ultramarine," is a magnesia silicate.

TALCA, a province of Chile, bounded N. by Curico, E. by Argentina, S. by Linares and Maule, and W. by the Pacific. Area 3840 sq. m. Pop. (1895) 128,981. In the E. the Andean slopes cover a considerable part of its territory, and in the W. another large area is covered by the coast range. Between these is the central valley of Chile in which the population and industries of the province are chiefly concentrated. The mountainous parts are well wooded. The intermediate plain, which is rolling and intersected by the many streams that flow to sea, is still largely given over to sheep and cattle. The chief ports are Valparaiso and Coquimbo. The capital of the province is Talca (pop. 1895, 33,423; 1902 estimated 42,766), on the Rio Clarco, a tributary of the Maule, 156 m. by rail S. of Santiago. It is one of the most important provincial towns and commercial centres of central Chile. There are woollen factories, especially for the universally worn "poncho." Talca has railway connexion with Santiago on the N., with Concepcion on the S., and with Constitucion at the mouth of the Maule.

TALCAHUANO, or TALCAHUANO, a seaport of the province of Concepcion, Chile, on the bay of Concepcion, 8 m. N.W. of the city of Talcahuano. Pop. (1900) 17,992; estimated (1902) 13,499. It is sheltered by the island of Quiriquina. It has the best harbour on the Pacific coast of South America, and is one of the most important ports of southern Chile, being connected by rail with Concepcion, Santiago and southern Chile. Its foreign trade is large and steadily increasing. The Chilean government has established its chief naval depot here.

TALE (O.Eng. talis, number, account, story; the word is common to many Teutonic languages; cf. Ger. Zahl, number, Erzählung, narrative, Du. taal, speech, language), a general term for the usual acceptance of the word, for fictitious narratives, long or short, ancient or modern (see Novel). In this article "tale" is used in a stricter sense, as equivalent to the German "Volks-märchen" or the French "conte populaire." Thus understood, popular tales mean the stories handed down by oral tradition from an unknown antiquity, among savage and civilized peoples. So understood, popular tales are a subject in mythology, and indeed in the general study of the development of man, of which the full interest and importance was long unrecognized. Popular tales won their way into literature, it is true, at a very distant period. The Homeric epics, especially the Iliad, are collections of tales (L. Fabulae, G. Κύκλος and the husband who returns in disguise) which are manifestly parts of the general human stock of popular narrative. Other examples are found in the Rigveda, and in the myths which were handled by the Greek dramatists. Collections of popular tales, more or less subjected to conscious literary treatment, are found in Sanskrit, as in the work of Somadeva, whose Kathā Sarit Sāgara, or "Ocean of the Streams of Story," has been translated by Mr Tawney (Calcutta, 1880). The THOUSAND
TALE

AND ONE Nights (q.v.) are full of popular tales, and popular tales are the staple of the medieval Gesta Romanorum, and of the collections of Straparola and other Italian conteurs. In all these and similar gatherings the story, long circulated from mouth to mouth among the people, is handled with conscious art, and little but the general outline of plot and character of incident can be regarded as original. In the *Histoires ou Contes du Temps Passé* of Perrault (Elsevier, Amsterdam, 1697; the Parisian edition is of the same date) we have one of the earliest and best known bibliographies of popular tales, with them in their natural shape as they were told by nurses to children. This at least seems probable, though M. Alfred Maury thinks Perrault drew from literary sources. Perrault attributed the composition to his son, P. Darmancour, at that time a child, and this pretexts enabled him to give his stories in a simple and almost popular guise. It seems that popular tales in many cases probably owe their origin to the desire of enforcing a moral or practical lesson. It appears that their irrational and "infantile" character—"dépourvus de raison"—is derived from their origin, if not actually among children, at least among childlike peoples, who have inherited it from "raison" that is, at the scientific and modern conception of the world and of the nature of man.

The success of Perrault's popular tales brought the genre into literary fashion, and the Comtesse d'Aulnoy invented, or in some cases adapted, "contes," which still retain a great popularity. But the precise and scientific collection of tales from the lips of the people is not much earlier than our century. The chief impulse to the study was given by the brothers Grimm. The first edition of their *Kinder- und Haus-Märchen* was published in 1812. The English reader will find a very considerable bibliography of popular tales, as known to the Grimms, in Mrs Alfred Hunt's translation, *Grimm's Household Tales*, with Notes (London, 1884). "How unique was our collection when it first appeared," they exclaim, and now merely to enumerate the books of such traditions would occupy much space. In addition to the märchen of Indo-European peoples, the Grimms became acquainted with some Malay stories, some narratives of Bechuanas, Negroes, American Indians, and Finnish, Estonian, and Magyar stories. Thus the Grimms' knowledge of non-European märchen was extremely slight. It enabled them, however, to observe the increase of refinement "in proportion as the worker develops himself," the monstrosities of Finnish and Red-Indian fancy gradually fading in the narratives of Germans and Italians. The Grimms notice that the evolution of popular narrative resembles the evolution of the art of sculpture, from the South-Sea idol to the frieze of the Parthenon, "from the strongly marked, thin, even ugly, but highly expressive forms of its earliest stages to those which possess external beauty of mould." Since the Grimms' time our knowledge of the popular tales of non-European races has been greatly enriched. We possess numbers of North-American, Brazilian, Zulu, Swahili, Eskimo, Samoan, Maori, Kaffir, Malagasy, Bushman, North African, Flott, New Caledonian, and even Australian märchen, and can study them in comparison with the stories of Hesse, of the West Highlands of Scotland, of Scandinavia.

While the popular romances of races of all colours must be examined together, another element in this subject is not less important. It had probably been often observed before, as by Lord Fountainhall (1670), but the fact was brought out most vividly by J. G. von Hahn (*Griechische und albanische Märchen*, Leipzig, 1864), that the popular tales of European races turn on the same incidents, and display the same succession of situations, the same characters, and the same plots, as are familiar in the ancient epic literature of Greece, India, Germany and Scandinavia. The epics are either fully-developed märchen evolved by the literary genius of poets and saga-men, or the märchen are degenerate and broken-down memories of the epics and sagas, or perhaps there may be examples of both processes. The second view,—namely, that the popular tales are, so to speak, the scattered grains of gold of which the epic is the original "pocket" or "place,"—the belief that the märchen are the detritus of the saga,—was for a long time prevalent. But a variety of arguments enforce the opposite conclusion, namely, that the märchen are essentially earlier in character than the epic, the final form to which they have been brought by the genius of Homer or of some other remote yet cultivated poet. If this view be accepted, the evolution of märchen and of certain myths has passed through the following stages:

(1) The popular tale, as current among the uncultivated peoples, such as Iroquois, Zulus, Bushmen, Samoans, Eskimo, and Samoyedes. This tale will reflect the mental condition of rude peoples, and will be full of monstrous and miraculous events, with an absence of reason proper, as Perrault says, "à ceux qui n'en ont pas encore." At the same time the tale will very probably enforce some moral or practical lesson, often the sanction of a taboo, and may even appear to have been invented with this very purpose, for man is everywhere impressed with the importance of conduct.

(2) The same tale—or rather a series of incidents and a plot essentially the same—as it is discovered surviving in the oral tradition of the illiterate peasantry of Europe. Among them the monstrous element, the ferocity of manners observed in the first stage, will be somewhat modified, but will be found most notable among the Slavonic tribes. Nowhere, even in German and Scottish märchen, is it extinct, cannibalism and cruel torture being favourite incidents.

(3) The same plots and incidents as they exist in the heroic epics and poetry of the cultivated races, such as the Homeric epics, the Greek tragedies, the Cyclic poets, the *Kalevala* of the Finns, certain hymns of the *Rigveda*, certain legends of the Brahmanas, the story of the Volsungs,—in these a local and almost historical character is given by the introduction of names of known places, and the adventures are attributed to national heroes,—Odysseus, Oedipus, Sigurd, Wainamöinen, Jason, Pururavas, and others. The whole tone and manners are nobler and more refined in proportion as the literary workmanship is more elaborate.

This theory of the origin of popular tales in the fancy of peoples in the savage condition (see *Mythology*), of their survival as märchen among the peasantry of Indo-European and other civilized races, and of their transfiguration into epics, is prevalent among savages (see *Mythology*). Other incidents and civilized popular tales are full of close resemblances. These resemblances, when only known to exist among Indo-European peoples, were explained as part of a common Aryan inheritance, and as the result of a malady of language. This system, when applied to myths in general, has already been examined (see *Mythology*). According to another view, märchen everywhere resemble each other because they all arose in India, and have thence been borrowed and transmitted. For this theory consult Benfey's *Panchatantra* and M. Cosquin's *Contes de Lorraine* (Paris, 1886). In opposition to the Aryan theory, and the theory of borrowing from India, the system which is here advocated regards popular tales as kaleidoscopic arrangements of comparatively few situations and incidents, which again are naturally devised by the early fancy. Among these incidents may be mentioned, first, kinship and intermarriage between man and the lower animals and even inorganic phenomena. Thus a girl is wooed by a frog, pumpkin, goat, bear, or elephant, in Zulu, Scotch, Walachian, Eskimo, Ojibway, and German märchen. This incident is based on the lack of a sense of difference between man and the things in the world which is prevalent among savages (see *Mythology*). Other incidents familiar in our nursery tales (such as "Cinderella" and "Puss in Boots") turn on the early ability in metamorphosis, in magic, in friendly or protecting animals (tortoise or beast manitous). Others depend on the early prevalence of cannibalism (compare Grimm, 47, "The Juniper Tree"). This recurs in the mad song of Gretchen in *Faust*, concerning which a distinguished student writes, "This ghost of a ballad or rhyme is my earliest remembrance, as crooned by an old East-Lothian nurse." (Compare Chamber's *Popular Rhymes of Scotland*, 1870, p. 49.) The
same legend occurs among the Bechuana, and is published by Casalis. Yet another incident springs from the taboo on certain actions between husband and wife, producing the story of Cupid and Psyche (see Lang's *Custom and Myth*, 1884, p. 64).

Once more, the custom which makes the youngest child the heir is illustrated in the märchen of the success, despite the jealousy of the elders, of Cinderella, of the Zulu prince (Callaway's *Nursery Tales of the Amazulu* (London, 1868)); Schoolcraft's *Algonquin Researches*; Gill's *Myths and Tales of the South Pacific*; Petitot's *Traditions Indiennes* (1886); Shortland's *Moari Religion and Mythology* (London, 1882); the *South African Folk Lore Record*; the *Folk Lore Record* (London, 1879-95, Malagasy stories); Rink's *Tales and Traditions of the Eskimo*; Bleek's *Hottentot Tales and Fabeks* (London, 1864); Castrèn's *Samuvidesiche Märchen*; Maspero's *Conte Egyptiens* (from ancient Egyptian MSS.); and Leland's *Algonquin Legends* (London, 1884). For European tales, the bibliography in the translation of Grimm already referred to may be used, and the Maisonneuve collection, *Les Littératures populaires*, may be recommended. The names of Liebrecht, Köhler, Dassen, Ralston, Nigra, Pitré, Cosquin, Anafase, Gardoz, Sébillot, many of the names thus encountered, is found among the inhabitants of almost the whole of Europe. Miss Cooze's *Cinderella* (Folk-Lore Society) is an excellent work on the subject, as is Sidney Hartland's *Legend of Perseus*, mainly concerned with myths of miraculous births. For Australia see *Browne's* *Pop. Australian Legends* (2 vols.) and *Howitt's* *Native Tribes of South-East Australia.* M. Sébillot has edited French tales, and Mr. Dennett has given *Folk-Lore of the Pont.* There are abundant materials and discussions in *Folk-Lore of the Germanic South.*

**TALFORD, SIR THOMAS NOON** (1795-1854), English judge and author, the son of a brewer in good circumstances, was born on the 26th of May 1755 at Reading (not, as is sometimes stated, at Doxey, near Stafford). He received his early education at Hendon, and at the Reading grammar-school. At the age of eighteen he was sent to London to study law under Joseph Chitty, the special pleader. Early in 1821 he joined the Oxford circuit, having been called to the bar at the middle Temple in the same year. When, fourteen years later, he was created a serjeant-at-law, and when again he in 1849 succeeded Mr. Justice Colman as judge of the court of common pleas, he attained these distinctions more perhaps for his laborious care in the conduct of cases than on account of any forensic brilliance. At the general election in 1835 he was returned for Reading. This seat he retained for close upon six years, and he was again returned in 1847.

In the House of Commons he introduced an International Copyright Bill; his speech on this subject was considered the most telling made in the House during that session. The bill was only passed in the Lords, under which Talford had the satisfaction of seeing it pass into law in 1842, albeit in a greatly modified form. Dickens dedicated the *Pickwick Papers* to him.

In his early years in London Talford was dependent—in great measure, at least—upon his literary exertions. He was at this period on the staff of the *London Magazine*, and was an occasional contributor to the *Edinburgh and Quarterly Reviews*, the *New Monthly Magazine*, and other periodicals; while, on joining the Oxford circuit, he acted as law reporter to the *Times*. His work was generally received with great success, and he had gained any position among men of letters until the production of his tragedy *Ilen*, which was privately printed in 1835, and produced in the following year at Covent Garden theatre. The tragedy was also well received in America, and was reprinted at Sadler's Wells in December 1861. This dramatic poem, its author's masterpiece, turns upon the voluntary sacrifice of Ilen, king of Argos, in response to the Delphic oracle, which had declared that only with the extinction of the reigning family could the prevailing pestilence incurred by the deeds of that family be removed. Two years later, at the Haymarket theatre, *The Athenian Captive* was acted with moderate success. In 1859 Glencoe, or *The Fate of the Macdonalds*, was privately printed, and in 1840 it was produced at the Haymarket; but this home drama is inferior to his two classic plays. *The Castilian* (1833) did not excite a tenth part of the interest called forth by *Ilen*. Before this he had produced various other prose writings, among them his "History of Greek Literature," in the *Encyclopaedia Metropolitana*. Talford died in court during the performance of his judicial duties, at Stafford, on the 13th of March 1854.

In addition to the writings above-mentioned, Talford was the author of the *Letters of Charles Lamb*, with a Sketch of his Life (1837); *Recollections of a Visit to the Alps* (1841); *Vacation Rambles and Thoughts*, comprising recollections of three Continental tours in the vacations of 1841, 1842, and 1843 (2 vols., 1844); and *Final Memorials of Charles Lamb* (1849-50).

**TALGARTH, a decayed market town in Breconshire, South Wales, situated on the Emnig near its junction with the Llynp (a tributary of the Wye), with a station on the joint line of the Cambrian and Midland companies from Brecon to Three Cocks Junction (2 m. N.N.E., but in Talgarth parish). The population of the whole parish (which measures 12,294 acres) was 1466 in 1901. The church of St Gwендole, restored in 1873, is in Perpendicular style, with an embattled tower restored in 1858. The Baptists, Congregationalists and Calvinistic Methodists have each a chapel in the town, and there is also a Congregational church at Tredwesstan, founded in 1602. About 1 m. S.W. is Treworca, where Howell Harris, one of the founders of Welsh Methodism, was born in 1713, and where in 1752 he established a communistic religious "family" of about a hundred persons; their representatives in 1842 handed over the property to the Welsh Calvinistic Methodist connexion, who in that year opened there a theological college, and in 1854 added to it a Harris memorial chapel. In 1900 the college was removed.
to Aberystwyth, and the buildings are now used by the Con-
nection as a preparatory school for ministerial students.

The fortified station of Dinzas occupies the summit of a hill abut
2 m. E. of Talgarth, but the construction that it is usually
attributed to Crickhowell and the eastern part of the vale of Usk.
Its castle, built on the site of an earlier British fortress, was destroyed
(according to Leland) by the inhabitants to prevent its falling
into the hands of Glendower. The town was in the manor of
English Talgarth, there being also a manor of Welsh Talgarth,
in which Welsh laws prevailed.

TALIENWAN, an open bay or roadstead on the east side of
the Liohutung peninsula, Manchuria. It was leased to Russia by
China in 1868 with the naval fortress of Port Arthur, from which it is
about 40 m., the lease being transferred to Japan in 1905. The
Russian town of Dalny (now Taires) was built upon the
west side of the bay, known as Port Victoria. Being ice-free all
the year round, it has an advantage over Nuiuchang, which is
frozen up for four months in the year. Niuchwang, however,
is lies much nearer to the great producing and consuming districts
of Manchuria. Taliewan is in railway connexion with Nui-
uchang and Peking and via the Siberian railway with Europe. It
was the rendezvous of the British fleet during the Anglo-China
war of 1860, whence the names Port Arthur and Port Victoria.

TALIESSIN, the name of a late 6th century British bard,
often confused with Taliesin syn.) or Taliesin (Gr."

TALISMAN, a minor talisman, plural of talisman, an adaptation of Gr.
τέλεσωμα, payment, outlay (from τελείω, to accomplish), used in Late Gr.
of an initiation or mystery and in Med. Gr. of a charm.

TALLADEGA, a city and the county-seat of Talladega county,
Alabama, U.S.A., 35 m. E. of Birmingham. Pop. (1890) 3056
(1910) 5834. It is served by the Southern, the Louisville & Nashvillle and other railways. Talladega is situated at the mouth of the Tallapoosa river, where the rapids are
usually interpreted as a part "cut off" from the property taxed, or as derived from the tally (q.v.), first appears in the reign of Henry II. as a synonym for the auxilium burgi,
which was an occasional payment exacted by king and barons
over and above the annual firma burgi from burgage tenants,
since all barons after the Norman Conquest came to be re-
garded as in some lord's demesne. The tax displaced the
danegeld so far as the towns and demesne lands of the Crown
were concerned in the second half of the 12th century, and
gradually the barons were deprived of the right of tallowing
their respective demesnes without royal authorization. The imposi-
tion of tallow continued under the immediate successors of
Henry II.; the barons failed to secure its prohibition or even
limitation at Runnymede, and Henry III. levied it frequently.
The amount to be paid was determined during this time by
of officials of the exchequer in special fiscal circuits through
separate negotiations with the various tax-paying communities,
the towns usually raising their quota by means of a capitation
or poll tax. Its imposition practically ceased by 1283 in favour
of a general grant made in parliament, and the king's retention
of tallow seemed particularly unnecessary and illogical after
burgage was introduced for the baron's demesnes. The objection
to be held that tallow was forbidden by the Conformatio car-
taram, but the Latin version of that document which bears the
title De tallowo non concedendo, although cited as a statute in the
preamble to the Petition of Right in 1627 and in a judicial
decision of 1637, was merely a chronicler's summary of the
purposes of the official French document, which did not mention
tallow by name. After 1297, however, there were only three
levies of the tax: one by Edward I. in 1304; again in 1312 by
Edward II. despite the protests of London and Bristol; and
finally in 1332, when Edward III. enacted such opposition from
parliament that he withdrew the commutation and accepted
in its place a grant of a tenth-and-fifteenth. The last time that
the king granted leave to the barons to tallow their demesnes
was in 1305. The second statute of 1340 formally enacted that
the nation should thenceforth not " make any common aid or sus-
tain charge," including tallow, without consent of parliament.

TALLAHASSEE, the capital of Florida, U.S.A., and the
county seat of Leon county, in the W. part of the state, about
40 m. E. of the Apalachicola river and 20 m. from the Gulf
of Mexico, about midway by railway between Jacksonville and
Pensacola. Pop. (1900) 2081 (1755 negroes) (1910) 5018;
in 1900 the population of the county was 19,887, of whom
16,000 were negroes. Tallahassee is served by the Seaboard
airroad and the Great Southern railway. The town is
a mile or two from the sea, and the streets are wide and well-shaded.
The principal buildings are the State Capitol, Grecian in architecture, the Federal
Building, and the County Court House. In the Episcopal
cemetery two monuments mark the graves of Charles Louis
Napoleon Achille Murat (1801-1847), the eldest son of Joachim
Murat, and of his wife Catherine (1805-1867), the daughter of
Col. Bird C. Willis of Virginia and a grand-niece of George
Washington. Tallahassee is the seat of the Florida Female
College, co-ordinate with the State University for men, and the
State Normal and Industrial School (for negroes), an agricultural
and mechanical college. Above 17 m. S. of Tallahassee, in
 Wakulla county, is the Wakulla Spring, about 160 ft. deep,
one of the largest of the remarkable springs of Florida.
Tallahassee's name is of Seminole origin, and means, it is
said, " tribal land." During a war with the Apalachee Indians
in 1638 the Spaniards, according to tradition, fortified a hill
W. of the city, where the Fort St Louis Place, a plantation
mansion, now stands. About 1818 most of the Indians were expelled from the vicinity, and a settlement was made by the whites. In 1834 Tallahassee, then virtually uninhabited, was formally chosen by the United States Government as the capital of the Territory of Florida, and it continued as the capital after the admission of Florida as a state in 1845. It was a residential centre for well-to-do planters before the Civil War, and Belleair, 6 m. S., now in ruins, was a fashionable pleasure resort. On the 10th of January 1861 a state convention adopted at Tallahassee an Ordinance of Secession.

TAILBOY (partly a translation and partly a corruption of the French hautbois), a double chest of drawers. Whereas the chest of drawers in its familiar form (sometimes in the 18th century called "a lowboy") contains three long and two short drawers, the tailboy has five, six, or seven long drawers, and two short ones. It is a very late 17th-century development of the smaller chest. The early examples are of walnut, but by far the largest proportion of the many that have survived are of mahogany, that being the wood most frequently employed in the 18th century for the construction of furniture, especially the more massive pieces. Occasionally the walnut at the beginning of the vogue of the tailboy was inlaid, just as satinwood varieties were inlaid, depending for relief upon carved cornice-mouldings or gadrooning, and upon handsome brass handles and escutcheons. The tailboy was the wardrobe of the 18th century, but it eventually gave place to the modern-type wardrobe. After the drawers were removed, the cabinet usually found to be not only as capacious as its predecessor but more convenient of access. The topmost drawers of the tailboy could only be reached by the use of bed steps, and the disappearance of high beds and the consequent disuse of steps exercised a certain influence in displacing a characteristic piece of furniture which was popular for at least a century.

TALLEMAND, GÉRÔME, SIEUR DES RÉAUX (1619-1692), French author, was born at La Rochelle on the 7th of November 1619. He belonged to a wealthy middle-class family of Huguenot persuasion; the name des Réaux he derived from a small property purchased by him in 1630. When he was about eighteen years of age he was sent to Italy by his brother François, abbé Tallemant. On his return to Paris, Tallemant took his degrees in civil and canonical law, and his father secured for him the position of conseiller au parlement. The profession was distasteful to him, and he decided to ensure himself a competence by marriage with his cousin Élisabeth de Rambouillet. His half-brother had married a d'Angennes, and this connexion secured for Tallemant an introduction to the Hôtel de Rambouillet. Madame de Rambouillet was no admirer of Louis XIII., and she gratified Tallemant's curiosity with stories of the reigns of Henry IV. and Louis XIII. of real historical value. But the society of the Hôtel de Rambouillet itself opened a field for his acute and somewhat malicious observation. In his Historiettes he gives finished portraits of Voiture, Balzac, Malherbe, Chapelain, Valentin Conrat and many others; Blaise Pascal and Jean de la Fontaine appear in his pages; and he chronicles the scandals of which Ninon de l'Enclos and Angélique Paulet were centres. They are invaluable for the literary history of the time. It has been said that the malicious intention of his work may be partly attributed to his bourgeois extraction and that the consequent slights he received are avenged in his pages, but independent testimony has established the substantial correctness of his statements. In 1658 he was converted to Catholicism. It seems that the change was not entirely disinterested, for Tallemant, who had suffered considerable pecuniary losses, soon after received a pension of 2000 livres. He died in Paris on the 6th of November 1692.

Des Réaux was a poet of some merit and contributed to the Guirlande de Julie, but it is by his Historiettes that he is remembered. The work remained in manuscript until it was edited in 1834-6 by M. de Chateauroux, Jules Tascherou and L. J. N. de Monmerqué, with a notice on Tallemant by Monmerqué. A third edition (6 vols. 1872) contains a notice by Paulin Paris. Tallemant had begun Mémôtres pour la régence d'Anne d'Autriche, but the manuscript has not been found.

TALLEYRAND-PÉRIGORD, CHARLES MAURICE DE (1754-1838), French diplomatist and statesman, was born at Paris on the 13th of February 1754, though some accounts give the date as the 2nd of February. His father was Lieutenant-General Charles Daniel de Talleyrand-Périgord, and his mother was Alexandrine (née) de Duras Amiguy. His parents descended from ancient and powerful families, were in constant attendance at the court of Louis XV., and (as was generally the case then in their class) neglected the child. In his third or fourth year, while under the care of a nurse in Paris, he fell from a chest of drawers and injured his foot for life. This accident darkened his prospects; for though by the death of his elder brother he should have represented the family and entered the army, yet he forfeited the rights of primogeniture, and the profession of arms was thenceforth closed to him. Entrusted to the care of his grandmother at Châssaines, Talleyrand, he there received the only kind treatment which he experienced in his early life, and was ever grateful for it. He was removed at the age of eight to the Collège d'Harcourt at Paris (now the Lycée St Louis), where his rich intellectual gifts enabled him to make good by private study the defects of the training there imparted. At the age of twelve he fell ill of smallpox, but his parents showed little or no interest in his recovery. Destined for the church by the family council which deprived him of his birthright, he was sent when about thirteen years of age to St Sulpice, where he conceived a dislike of the doctrines and discipline thrust upon him. After his studies at St Sulpice he returned to Paris, where he was to remain, and in 1772 he entered the business of the church, but in his spare time he read the works of Montesquieu, Voltaire, and other writers who were beginning to undermine the authority of the ancien régime, both in church and state. As subdeacon he witnessed the coronation of Louis XVI. at Reims, but he did not take priest's orders until four years later. Recent researches into his early life discredit most of the stories that have been told respecting his profligacy and his contempt for the claims of the church; and it is admitted that, while rejecting her authority in the sphere of dogma and intellect, he observed the proprieties of life (particularly being then scarcely looked on as a vice) and respected the outward observances of religion.

During his life at Paris he had opportunities of mixing in the circles of the philosophers and of others who frequented the salon of Madame de Genlis, and he there formed those ideas in favour of political and social reform which he retained through life. After taking his licence in theology in March 1778, he gave little more attention to theological studies. Nevertheless the acuteness of his powers, added no doubt to his social position, gained for him in the year 1780 the position of agent-general of the clergy in France, and he was made a member of several important administrative duties respecting the relations of the clergy to the civil power. The growing claims of the state on the exchequer of the clergy made his duties responsible, his colleague as agent-general being of little use. At the extra-ordinary assembly of the clergy in 1782 he made various proposals, by one of which he sought, though in vain, to redress the most glaring grievances of the underpaid curés. Though the excellence of his work as agent-general in the years 1780-86 was fully acknowledged, and earned him a special gift of 31,000 livres, yet he did not gain a bishopric until the beginning of the year 1759, probably because the king disliked him as a free-thinker. He now became bishop of Autun, with a stipend of 22,000 livres, and was installed on the 15th of March.

The first rumblings of the revolutionary storm were making themselves heard. The elections for the States General were soon to take place; and the first important act of the new bishop was to draw up a manifesto or programme of the reforms which he desired to see carried out by the States General of France. It comprised the following items: the formation of a constitution which would strengthen the monarchy by calling to it the support of the whole nation, the drafting of a scheme of local self-government, the handing over of the administration of justice, and of the criminal law, and the
abolition of the most burdensome of feudal and class privileges. This programme was adopted by the clergy of his diocese as their “cabinet,” or book of instructions to their representative at the States General, namely Talleyrand himself.

His influence in the estate of the clergy, however, was cast against the union of the three estates in a single assembly, and he voted in the minority of his order which in the middle of June opposed the merging of the clergy in the National Assembly. The folly of the court, and the weakness of Louis XVI. at that crisis, probably convinced him that the cause of moderate reform and the framing of a bicameral constitution on the model of that of England were hopeless. Thereafter he inclined more and more to the democratic side, though for the present he concerned himself mainly with financial questions. In the middle of July he was chosen as one of the committee to prepare a draft of a constitution; and in the session of the Assembly which Mirabeau termed the “orgie of the abolition of privileges” (4th of August) he intervened in favour of discrimination and justice.

On the 9th of October, that is, four days after the insurrection of women and the transference of the king and court to Paris, he proposed to the Assembly the confiscation of the lands of the church to the service of the nation, but on terms rather less rigorous than those in which Mirabeau (q.v.) carried the proposal into effect on the 2nd of November. He identified himself in general with the Left of the Assembly, and supported the proposed departmental system which replaced the old provincial system early in 1790. At the federation festival of the 14th of August he declared that the king was not above the laws, and he was arrested at the 3rd of September in the middle of the Champ de Mars. This was his last public celebration of mass. For a brilliantly satirical but not wholly fair reference to the part then played by Talleyrand, the reader should consult Carlyle’s “French Revolution,” vol. ii., bk. i., ch. 12.

The course of events harmonized with the ant Clerical views of Talleyrand, and he gradually loosened the ties that bound him to the church. He took little part in, though he probably sympathized with, the debates on the measure known as the Civil Constitution of the Clergy, whereby the state enforced its authority over the church to the detriment of its allegiance to the pope. When the Assembly sought to impose on its members an oath of obedience to the new decree, Talleyrand and three other bishops complied out of the thirty who had seats in the Assembly. The others, followed by the greater number of the clergy throughout France, refused, and thenceforth looked on Talleyrand as a schismatic. He did not long continue to officiate, as many of the so-called “constitutional” clergy did; for, on the 21st of January 1791, he resigned the see of Autun, and in the month of March was placed under the ban of the church by the pope.

On the 2nd of April he had been elected, with Mirabeau and Sieyès, a member of the department of Paris; and in that capacity did useful work for some eighteen months in seeking to support the cause of order in the turbulent capital. Though he was often on strained terms with Mirabeau, yet his views generally coincided with those of that statesman, who is said on his death-bed (2nd of April 1791) to have communicated to him his opinions on domestic and international affairs, especially advising a close understanding with England. Talleyrand’s reputation for immorality, however, was as marked as that of Mirabeau. While excelling him in suppleness and dexterity, he lacked the force of character possessed by the great “tribune of the people”; and his influence was gradually eclipsed by that of the more ardent and determined champions of democracy, the Girondins and the Jacobins. In the closing days of the first or Constituent Assembly, Talleyrand set forth (10th of September 1791) his ideas on national education. Education was to be free, and to lead up to the university. In place of dogma, the elements of religion were alone to be taught.

Debarred from election to the second National Assembly (known as the Legislative) by the self-denying ordinance passed by the “constituents,” Talleyrand, at the close of 1791, sought to enter the sphere of diplomacy for which his mental qualities and his clerical training furnished him with an admirable equipment. The condition of affairs on the continent seemed to French enthusiasts to presage an attack by the other Powers on France. In reality those Powers were far more occupied with the Polish and Eastern questions than with the affairs of France; and the declaration of Plütsch, drawn up by the sovereigns of Austria and Prussia, which appeared to threaten France with intervention, was recognized by all well-informed persons to be “a loud-sounding nothing.” The French foreign minister, Delessart, believed that he would checkmate all the efforts of the émigrés at the continental courts provided that he could confirm Pitt in his intention of keeping England neutral. For that purpose Delessart sent Talleyrand, well known for his Anglophile tendencies, to London, but in the unofficial or semi-official capacity which was rendered necessary by the decree of the Constituent Assembly referred to above. Talleyrand arrived in London on the 24th of January 1792, and found public opinion so far friendly that he wrote off to Paris, “Believe me, a raprochement with England is no chimera.” Pitt received him cordially; and to Grenville the envoy stated his hope that the two free nations would enter into close and friendly relations, each guaranteeing the other in the possession of its existing territories, India and Ireland being included on the side of Britain. After some delay the British government decided to return no definite answer to this proposal, a result due, as Talleyrand thought, to the Gallophobe views of King George and of the ministers Camden and Thurlow. Talleyrand, however, was convinced that Great Britain would not intervene against France. The latter was his constant watchword, as well as promising to the men of Talleyrand’s party at home.

He returned to Paris on the 10th of March to persuade the foreign minister (Dumouriez now held that post) of the need of having a fully accredited ambassador at London. The ex-Marquis Chauvelin was appointed, with Talleyrand as adviser. The situation became more complex after the 15th of April, when France declared war against Austria and prepared to invade the Austrian or Belgic Netherlands Owing to certain indiscretions of Chauvelin and the growing unpopularity of the French in England (especially after the disgraceful day of the 20th of June at the Tuileries), the mission was a failure; but Talleyrand had had some share in confirming Pitt in his policy of neutrality, even despite Prussia’s overtures for an alliance against France. After Talleyrand’s return to Paris early in July (probably in order to sound the situation there) matters went from bad to worse. The overthrow of the monarchy on the 20th of August and the September massacres rendered hopeless all attempts at an entente cordiale between the two peoples; and the provocative actions of Chauvelin, undertaken in order to curry favour with the extremists now in power at Paris, undid all the good accomplished by the tact and moderation of Talleyrand. The latter led Madame de Staël to call him the Great Dictator of Paris, where events were becoming intolerable; and after some unsuccessful attempts to obtain a passport to leave Paris, he succeeded on the 14th of September and landed in England on the 23rd, avowedly on private business, but still animated by the hope of averting a rupture between the two governments.

In this he failed. The provocative actions of the French Convention, especially their setting aside of the rights of the Dutch over the estuary of the Scheldt, had brought the two nations to the brink of war, when the execution of Louis XVI. (21st of Jan. 1793) made it inevitable. Talleyrand was expelled from British soil and made his way to the United States. There he spent thirty months in a state of growing uneasiness and discontent with his surroundings.

The course of events after the Thermidoran reaction of July 1794 favoured his return to France. Thanks to the efforts of Daunou and others his name was removed from the list of émigrés, and he set sail for Europe in November 1795. Landing at Hamburg in the January following, he spent some time there in the company of his friends Madame de Genlis and Reinhard; and when party rancour continued to abate at Paris, he returned thither in September. After a time marked by some pecuniary embarrassment, he was recommended by Madame de Staël to the Director Barbas for the post of minister of foreign affairs.
His claims on the attention of the Directors had been strengthened by his reading two papers before the French Institute, the first on the commercial relations between England and the United States (in the sense referred to above), and the second on the advantages to be derived from new colonies. In the latter there occurred the suggestive remarks that, whereas revolutions made men prematurely old and weary, the work of colonization tended to renew the youth of nations. France, he observed, needed the spur to practical energy which the Americans had at hand to subdue the difficulties placed in their way by nature. Similar efforts would tend to make France a formidable child at the same time supply an outlet for the poor and discontented. The practical statesmanship contained in these papers raised Talleyrand in public estimation; and, thanks to the efforts above named, he gained the post of foreign minister, entering on his duties in July 1797.

Bonaparte by his victories over the Austrians in Italy and Styria had raised the French republic to heights of power never dreamed of, and now desired to impose on the emperor terms of peace, to which the Directors demurred. Talleyrand, despite the weakness of his own position (he was as yet little more than the chief clerk of his department), soon came to a proper understanding with the general, and secretly expressed to him his satisfaction at the terms which the latter dictated at Campo Formio (17th of October 1797). The coup d'état of Fructidor (September 1797) had perpetuated the Directory and led to the exclusion of the two "moderate" members, Carnot and Barthélemy; but Talleyrand saw that power belonged really to the general who had brought about the coup d'état in favour of the Jacobinical Directors headed by Barras.

After the rupture of the peace negotiations with England, which resulted from the coup d'état of Fructidor, the policy of France became more warlike and aggressive. The occupation of Rome and of Switzerland by the French troops and the events of Bonaparte's Egyptian expedition (see NAPOLEON I.) brought about a renewal of war on the continent, but with these new developments Talleyrand had little or no connexion. His powers as minister were limited, and he regretted the extension of the area of war. Moreover, in the autumn of 1797 his reputation for political morality (never very bright) was overclouded by questionable dealings with the envoys of the United States sent to arrange a peaceful settlement of certain disputes with France. The investigations made soon came to a point, and Talleyrand was able to show that the charges made against him of trafficking with the envoys have been overdrawn; but all his apologists admit that irregularities occurred. Talleyrand refused to clear himself of the charges made against him as his friends (especially Madame de Staël) urged him to do; and the incident probably told against his chances of admission into the Directory, which were discussed in the summer of 1798.

A year later he resigned the portfolio for foreign affairs (20th of July 1799), probably because he foresaw the imminent collapse of the Directory. If so, his premonitions were correct. Their realization was assured by the return to France of the "Conqueror of the East" in October. The general and the diplomatist soon came to an understanding, and Talleyrand tactfully brought about the alliance between Bonaparte and Sieyès (q.v.) (then the most influential of the five Directors) which paved the way for the coup d'état of Brumaire (see FRENCH revolution and NAPOLEON I.).

Talleyrand's share in the actual events of the 18th, 19th Brumaire (9th, 10th of November) 1799 was limited to certain dealings with Barras on the former of those days. About midday he took to Barras a letter, penned by Roederer, requesting him to resign his post as Director. By what means Talleyrand brought him to do so, whether by persuasion, threats or bribes, is not known; but on that afternoon Barras left Paris under an escort of soldiers. With the more critical and exciting events of the 19th of Brumaire at St Cloud Talleyrand had no direct connexion; but he had made all his preparations for flight in case the blow failed. His reward for helping on the winning cause was the ministry for foreign affairs, which he held from the close of December 1799 on to the summer of 1807.

In the great work of reconstruction of France now begun by the First Consul, Talleyrand played no unimportant part. His great aim was to bring about peace, both international and internal. He had a hand in the pacific overtures which Bonaparte, early in the year 1800, sent to the court of London; and, whatever may have been the motives of the First Consul in sending them, it is certain that Talleyrand regretted their failure. After the battle of Marengo an Austrian envoy had come to Paris in response to a proposal of Bonaparte, and Talleyrand persuaded him to sign terms of peace. These were finally rejected by the emperor, but they led to a pause between the two Powers at Lunéville on the 9th of February 1801.

As regards French affairs, Talleyrand used his influence to help on the repeal of the vexatious laws against emigrés, non-juring priests, and the royalists of the west. He was also in full sympathy with the policy which led up to the signature of the Concordat of 1801–2 with the pope (see Concordat); but it is probable that he had had a hand in the questionable intrigues which accompanied the closing parts of that complex and difficult negotiation. At the end of June 1802 the pope removed Talleyrand from the ambassadorship to Rome, which he had held in 1801, but it was only to prevent the concordat from being annulled. In the fall of 1802 Talleyrand again became ambassador in Rome, and in the winter of 1802–3 he concluded the Treaty of Amiens (March 1802) which is so variously referred to as the Napoleonic treaty of 1802, the Treaty of Commerce, and the Treaty of Peace. The Treaty of Commerce was signed on the 9th of September 1802, owing to pressure put on him by Bonaparte, he married Madame Grand, a divorcée with whom he had long been living.

During the meeting of Italian notables at Lyons early in 1802 Talleyrand was serviceable in manipulating affairs in the way desired by Bonaparte, and it is known that the foreign minister suggested to them the desirability of appointing Bonaparte president of the Cisalpine Republic, which was thenceforth to be called the Italian Republic. In the negotiations for peace with England which went on at Amiens during the winter of 1801–2, Talleyrand had no direct share; these (like those at Lunéville) being transacted by Napoleon's eldest brother, Joseph Bonaparte (q.v.). On the other hand he helped the First Consul in assuring French supremacy in Switzerland, Italy and Germany. In Germany the indemnification of the princes who lost all their lands west of the Rhine was found by secularizing and absorbing the ecclesiastical states of the empire. This unscrupulous proceeding, known as the Secularizations (February 1803), was carried out largely on lines laid down by Bonaparte and Talleyrand; and the latter is known to have made large sums of money from the proceeds of the sales of ecclesiastical properties, and also from the charges of duplicity or treachery made against the foreign minister by Napoleon's apologists are in nearly all cases unfounded. This is especially so in the case of the execution of theduc d'Enghien(March 1804), which Talleyrand disapproved. The evidence against him rests on a document which is now known to have been forged. On the assumption of the imperial title by Napoleon in May 1804, Talleyrand became grand chamberlain of the empire, and received close on 500,000 francs a year.

Talleyrand had rarely succeeded in bending the will of the First Consul. He altogether failed to do so with the Emperor Napoleon. His efforts to induce his master to accord lenient terms to Austria in November 1805 were futile; and he looked on helplessly while that Power was crushed, the Holy Roman Empire swept away, and the Confederation of the Rhine set up in central Europe. In the bargains which accompanied this last event Talleyrand is believed to have reaped a rich harvest from the German princes most nearly concerned. On the 6th of July 1806 Napoleon conferred on his minister the
title of prince of Benevento, a papal fief in the Neapolitan territory.

In the negotiations with England which went on in the summer of 1806 Talleyrand had not a free hand; they came to nought, as did those with Russia which had led up to the signature of a Franco-Russian treaty at Paris by d'Oubrill which was at once disavowed by the tsar. The war with Prussia and Russia was ended by the treaties of Tilsit (7th and 9th of July 1807). Talleyrand had a hand only in the later developments of these negotiations; and it has been shown that he cannot have been the means of revealing to the British government the secret arrangements made at Tilsit between France and Russia, though his private enemies, among them Fouche, have charged him with acting as traitor to this affair. Talleyrand had long been weary of serving a master whose policy he more and more disapproved, and after the return from Tilsit to Paris he resigned office. Nevertheless Napoleon retained him in the council and took him with him to the interview with the Emperor Alexander I. at Erfurt (September 1808). There Talleyrand secretly advised that potenate not to join Napoleon in putting pressure on Austria in the way desired by the French emperor; but it is well known that Alexander was of that opinion before Talleyrand tendered the advice. Talleyrand disapproved of the Spanish policy of Napoleon, which was opened at Bayonne (May 1808); and while the stories to the contrary may in all probability be dismissed as idle rumours. It is also hard to believe the statement in the Talleyrand Memoirs that the ex-foreign minister urged Napoleon to occupy Catalonia until a maritime peace could be arranged with England. On Talleyrand now fell the disagreeable task of entertaining at his new mansion at Valenciay, in Touraine, the Spanish princes virtually kidnapped at Bayonne by the emperor. They remained there until March 1814. At the close of 1808, while Napoleon was in Spain, Talleyrand entered into certain secret negotiations with the Spanish minister to which aroused the solicitude of the emperor and hastened his return to Paris. He subjected Talleyrand to violent reproaches, which the ex-minister bore with his usual ironical calm.

After the Danubian campaign of 1809 and the divorce of Josephine, Talleyrand used the influence which he still possessed in the imperial council on behalf of the choice of an Austrian consort for his master, for, like Metternich (who is said first to have mooted the proposal), he saw that this would safeguard the interests of the Habsburgs, whose influence he felt to be essential to the welfare of Europe. He continued quietly to observe the course of events during the disastrous years 1813-15; and even at the beginning of the Moscow campaign he summed up the situation in the words, "It is the beginning of the end." Early in 1814 he saw Napoleon for the last time; the emperor upbraided him with the words: "You are a coward, a traitor, a thief. You do not even believe in God. You have betrayed and deceived everybody. You would sell even your own father." Talleyrand listened unmoved, but afterwards sent in his resignation of his seat on the council. It was not accepted. He had no share in the negotiations of the congress of Châtillon in February-March 1814. On the surrender of Paris to the Allies (30th of March 1814), the Emperor Alexander I. took up his abode at the hotel Talleyrand, and there occurred the conference wherein the statesman persuaded the victorious potentate that the return of the Bourbons was the only possible solution of the French problem, and that the principle of legitimacy alone would guarantee Europe against the aggrandizement of any one state or house. As he phrased it in the Talleyrand Memoirs: "The house of Bourbon alone could cause France nobly to conform once more to the happy limits indicated by policy and by nature. With this house of Bourbon France could be gigantic in order to be great." These arguments, reinforced by those of the royalist agent de Vitrolles, convinced the tsar; and Talleyrand, on the 1st of April, convened the French senate (only 64 members out of 140 attended), and that body pronounced that Napoleon had forfeited the crown. Ten days later the fallen emperor recognized the inevitable and signed the Act of Abdication at Fontainebleau. The next effort of Talleyrand was to screen France under the principle of legitimacy and to prevent the Valencey revolution on which several of the German statesmen were bent. Thanks mainly to the support of the tsar and of England these schemes were foiled; and France emerged from her disasters with frontiers which were practically those of 1792.

At the congress of Vienna (1814-15) for the settlement of European affairs, Talleyrand, as the representative of the restored house of Bourbon in France, managed adroitly to break up the league of the Powers (framed at Chaumont in February 1814) and assisted in forming a secret alliance between England, Austria and France in order to prevent the complete absorption of Poland by Russia and the Treaty of San Ildefonso by Prussia. The new triple alliance had the effect of lessening the demands of those Powers, and of leading to the well-known territorial compromise of 1815. Everything was brought into a state of uncertainty once more by the escape of Napoleon from Elba; but the events of the Hundred Days, in which Talleyrand had no share—he remained at Vienna until the 10th of June—brought in the Bourbons once more; and Talleyrand's plea for a magnanimous treatment of France under Louis XVIII. once more prevailed in all important matters. On the 9th of July 1815 he became foreign minister of the ex-empire; and later that year his diplomatic and other difficulties led him to resign his appointment on the 23rd of September 1815, Louis, however, naming him high chamberlain and according him an annuity of 100,000 francs. The rest of his life calls for little notice except that at the time of the July Revolution of 1830, which unseated the elder branch of the Bourbons, he urged Louis Philippe, duke of Orleans (q.v.), to take the throne offered to him by popular acclaim. The new sovereign offered him the portfolio for foreign affairs; but Talleyrand signified his preference for the embassy in London. In that capacity he took an important part in the negotiations for Poland; the march of his diplomacy and other difficulties led him to resign his appointment in 1815. A man of breadth, Talleyrand dominated his country. His memoirs, first published in 1838, are the most voluminous and important of his time. Talleyrand's career showed his independence and his statesman-like qualities; and the influence which his memoirs have had upon posterity is due to the frankness of his exposition of the political features of his time. His Memoirs were not published until after the lapse of thirty years from the time of Talleyrand's death. For various reasons they did not see the light until 1893. This is not the place in which to discuss so large a question as that of the genuineness of the Memoires, which, indeed, is now generally admitted. There are, however, several suspicious circumstances which tell against them as documents of the first importance, notably these: first that Talleyrand is known to have destroyed many of his most important papers, and secondly that
TALLIEN—TALLYS

M. de Bacourt almost certainly drew up the connected narrative which we now possess from notes which were in more or less of confusion. It has been printed in three articles by M. Chouquet in the Revue d'histoire et de littérature, 25th of May 1891 (Paris); also articles by others in the Revue historique, vols. xlvi. and xlix. (Paris); also in the TALLIEN, Jean Lambert (1767-1820), French Revolutionary leader, was the son of the maître d'hôtel of the marquis de Berry, and was born in Paris. The marquis, perceiving the boy's ability, had him well educated, and got him a place as a lawyer's clerk. Being much excited by the first events of the Revolution, he gave up his desk to enter a printer's office, and by 1791 he was overseer of the printing department of the Moniteur. While thus employed he conceived the idea of the journal-affiche, and after the arrest of the king at Varennes in June 1791 he placarded a large printed sheet on all the walls of Paris twice a week, under the title of the Ami des Citoyens, journal fraternel. This enterprise, of which the expenses were defrayed by the Jacobin Club, made him well known to the revolutionary leaders; and he made himself still more conspicuous in organizing the great "Fêtes de la Liberté" on the 15th of April 1792, in honour of the released soldiers of Château-Vieux, with Collot d'Herbois. On the 8th of July 1792, he was the spokesman of a deputation of the section of the Place Royale which demanded from the legislative assembly the reinstatement of the mayor, Jérôme Pétion, and the procureur, P. L. Manuel, and he was one of the most active popular leaders in the attack upon the Tuileries on the 10th of August, on which day he was arrested by the mob and sent to the prison of the Temple in Paris. In this capacity he exhibited an almost feverish activity; he perpetually appeared at the bar of the assembly on behalf of the commune; he announced the massacres of September in the prisons in terms of apology and praise; and he sent off the famous circular of the 3rd of September to the provinces, recommending them to do likewise. He had several persons imprisoned in order to save them from the fury of the mob, and protected several suspects himself. At the close of the month he resigned his post on being elected, in spite of his youth, a deputy to the Convention by the department of Scine-et-Oise, and but one of the very few defensive leaders of the commune during the massacres. He took his seat upon the Mountain, and showed himself one of the most vigorous Jacobins, particularly in his defence of Marat, on the 26th of February 1793; he voted for the execution of the king, and was elected a member of the Committee of General Security on the 21st of January 1793. After a short mission in the western provinces he returned to Paris, and took an active part in the coup d'état of the 31st of May and the 2nd of June, which resulted in the overthrow of the Girondists. For the next few months he remained comparatively quiet, but on the 23rd of September 1793, he sent an emissary, Yalive, (1754-1831) to his mission to Bordeaux. This was the month in which the Terror was organized under the superintendence of the Committees of Public Safety and General Security.

Tallien showed himself one of the most vigorous of the pro-consuls sent over France to establish the Terror in the provinces; though with but few adherents, he soon awed the great city of Bordeaux. It was at this moment that the romance of Tallien's life commenced. Among his closest friends was the wife of the comte de Fontenay, and daughter of the Spanish banker, François Cabarrus, one of the most fascinating women of her time, and Tallien not only spared her life but fell in love with her. Suspected of "Moderatism" on account of this incident, especially when he was recalled to Paris, Tallien increased, in appearance, his revolutionary zeal, but Therése abated his revolutionary ardour, and from the lives she saved by her entreaties she received the name of "Our Lady of Thermidor," after the 9th of Thermidor. Tallien was even elected president of the Convention on the 24th of March 1794, but the Terror could not be maintained at the same pitch; Robespierre began to see that he must strike at many of his own colleagues in the committees if he was to carry out his theories, and Tallien was one of the men condemned with them. They determined to strike first, and on the great day of Thermidor it was Tallien who, urged on by the danger in which his beloved lay, opened the attack upon Robespierre. The movement was successful; Robespierre and his friends were guillotined; and Tallien, as the leading Thermidorian, was elected to the Committee of Public Safety. After the Committee of Public Safety was dissolved, Tallien, as the leading Thermidorian; he was instrumental in suppressing the Revoluntary and the Jacobin Club; he attacked J. B. Carrier and Joseph Lebon, the représentants en mission of Nantes and Arras; and he fought bravely against the insurgents of Prairial. In all these months he was supported by Therése, whom he married on the 26th of December 1794, and who became the leader of the social life of Paris. His last political achievement was in July 1795, when he was present with Hoche at the destruction of the army of the émissés at Quiberon, and ordered the executions which followed. After the close of the Convention he was appointed a deputy to the new National Assembly, and was sent to the Council of Five Hundred. The moderates attacked him as a terrorist, and the extreme party as a renegade. Madame Tallien also tired of him, and became the mistress of the rich banker Ouvrard. Bonaparte, however, who is said to have been introduced by him to Barras, took him to Egypt in his great expedition of June 1798, and after the capture of Cairo he edited the official journal there, the Décade Egyptienne. But General J. F. Menou sent him away from Egypt, and on his passage he was captured by an English cruiser and taken to London, where he spent a few months, and was eventually received by Fox. On returning to France in 1802 he obtained a divorce from his wife (who in 1805 married the comte de Caraman, later prince de Chinchay), and was left for some time without employment. At last, through Fouche and Talleyrand, he got the appointment of consul at Alicante, and remained there until he lost the sight of one eye from yellow fever. On returning to Paris he lived on his half-pay until 1815, when he received the favour of not being exiled like the other regicides. His latter days were spent in poverty; he had to sell his books to get bread. He died in Paris on the 16th of November 1820.

Tallien left an interesting Discours sur les causes qui ont produit la Résolution française (Paris, 1791, in 8vo) and a Mémoire sur l'administration de l'Égypte à l'arrivée des Français. See Tallien and l'Expédition d'Égypte, in La Révolution française: Revue d'histoire moderne et contemporaine, t. iii. p. 269. On Madame Tallien see Arène Houssaye, Notre Dame de Thermidor (Paris, 1866); J. Turquan, Souvenirs et grandes Dames: La citoyenne Tallien, témoignages des contemporains et documents inédits (Paris, 1898); and Louis Gastine, La belle Tallien (1909).

TALLYS (TALLYS, Talys, or Tallisius), Thomas (c. 1575-1598), justly styled "the father of English cathedral music," was born about 1575. It has been conjectured that, after singing as a chorister at Christ Church, Oxford, Tallis migrated to England to become among the children of the choir royal. He is known to have become organist at Waltham abbey, where,
on the dissolution of the monastery in 1540, he received, in compensation for the loss of his preferment, 20s. for wages and 20s. for reward. In the library of the British Museum there is preserved a volume of MS. treatises on music, once belonging to the abbey, on the last page of which appears his autograph, "Thomas Tallis'—the only specimen known.

Not long after his dismissal from Waltham, Tallis was appointed a gentleman of the chapel royal; and thenceforward he laboured so zealously for the advancement of his art that the English school owes more to him than to any other composer of the 16th century.

One of the earliest compositions by Tallis to which an approximate date can be assigned is the well-known Service in the Dorian Mode, consisting of the Venite, Te Deum, Benedicite, Kyrie, Nicene Creed, Sanctus, Gloria in Excelsis, Magnificat and Nunc Dimittis, for four voices, together with the Preces, Responses, Paternoster and Litany, for five, all published for the first time, in the Rev. John Barnard's First Book of Selected Church Music, in 1614, and reprinted in the 1615 volume of Venite and Paternoster, in Boyce's Cathedral Music in 1766. That this work was composed for the purpose of supplying a pressing need, after the publication of the second prayer-book of King Edward VI. in 1552, there can be no doubt. Written in the style known among Italian composers as lo stile famigliare, i.e. in simple countertext of the first species, not contra notam, with no attempt at learned complications of any kind—it adopts itself with equal dignity and clearness to the expression of the verbal text it is intended to illustrate, bringing out the substance of the words so plainly that the listener can interpret them aright, while its pure rich harmonies tend far more surely to the excitement of devotional feeling than the marvellous combinations by means of which too many of Tallis's contemporaries sought to astonish their hearers, while forgetting all the loftier attributes of their art. In self-restraint the Litany and Responses bear a close analogy to the Improperia and other similar works of Palestrina, wherein, addressing himself to the heart rather than to the ear, the princeps musicae produces the most thrilling effects by means which, to the superficial critic, appear almost puerile in their simplicity, while those who are able to look beneath the surface discover in them a sublunary style such as none but a highly cultivated musician can appreciate. Of this profound learning Tallis possessed an inexhaustible store; and it enabled him to raise the English school to a height which it had never previously attained, and which it continued to maintain until the death of its last representative, Orlando Gibbons, in 1625. Though this school is generally said to have been founded by Dr Tye, there can be no doubt that Tallis was its greatest master, and that it was indebted to him alone for the infusion of new life and vigour which prevented it from degenerating, as some of the earlier Flemish schools had done, into a mere vehicle for the display of fruitless erudition. Tallis's ingenuity far surpassed that of his most erudite contemporaries; and like every other great musician of the period, he produced occasionally works confessedly intended for no more exalted purpose than the exhibition of his stupendous skill. In his canon Misere nostris (given in Hawkins's History of Music) the intricacy of the contrapuntal devices seems little short of miraculous; yet the resulting harmony is smooth and normal, and only the irregular complexity of the rhythm betrays the artificiality of its structure. The famous forty-part motet, Spem in alium, written for eight five-part choirs, stands on a far higher plane, and the lour de force of handling freely and smoothly so many independent parts is the least remarkable of its qualities. An excellent modern edition of it was produced by Dr A. H. Mann in 1888 (London, Weckes & Co.); and, when the reader has overcome the difficulty of reading a score that runs across two pages, he finds himself in the presence of a living classic. The art with which the climaxes are built up shows that Tallis's object in writing for forty voices is indeed to produce an effect that could not be produced by thirty-nine.]

These tours de force, however, though approchable only by the greatest contrapuntists living in an age in which counterpoint was cultivated with a success that has never since been equalled, serve to illustrate one phase only of Tallis's many-sided genius, which shines with equal brightness in the eight psalms—tunes (one in each of the first eight modes) and unpretending little Veni Creator, printed in 1567 at the end of Archbishop Parker's A Briefe and True Description of the Anglicane and Catholic Religion, and many other compositions of like simplicity.

In 1575 Tallis and his pupil William Byrd—as great a contrapuntist as himself—obtained from Queen Elizabeth royal letters patent granting them the exclusive right of printing music and ruling music-paper for twenty-one years; and, in virtue of this privilege, they issued, in the same year, a joint work, entitled Cantiones quae, ab argumento Sacrae vocantur, quinque et sex partium, containing sixteen motets by Tallis and eighteen by Byrd, all of the highest degree of excellence. Some of these motets, adapted to English words, are now sung as anthems in the Anglican cathedral service. But no such translations can be said to have been made during Tallis's lifetime; and there is strong reason for believing that, though both he and Byrd outwardly conformed to the new religion, and composed music expressly for its use, they remained Catholics at heart.

Tallis's contributions to the Cantiones Sacrae were the last of his compositions published during his lifetime. He did not live to witness the expiration of the patent, though Byrd survived it and published two more books of Cantiones on his own account in 1580 and 1591, besides numerous other works. Tallis died November 23, 1585, and was buried in the parish church at Greenwich, where a quaint rhymed epitaph, preserved by Sprey, and reprinted by Burney and Hawkins, recorded the fact that he served in the chapel royal during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. This was destroyed with the old church about 1710, but a copy has since been substituted. Portraits, professedly authentic, of Tallis and Byrd, were engraved by Vandergucht in 1730, for Nicolas Haym's projected History of Music, but never published. One copy only is known to exist.

Not many works besides those already mentioned were printed during Tallis's lifetime; but a great number are preserved in MS. It is to be feared that many more were destroyed, in the 17th century during the spoliation of the cathedral libraries by the Puritans.

TALLOW (M.E. talugh, talg, cf. Du. talg, L. Ger. talz; the connexion with O.E. taelu, dye, or Goth. tulgus, firm, is doubtful), the solid oil or fat of ruminant animals, but commercially obtained almost exclusively from oxen and sheep. The various methods by which tallow and other animal fats are separated and purified are dealt with in the article Oil. Ox tallow occurs at ordinary temperatures as a solid hard fat having a yellowish-white colour. The fat is insaluble in cold alcohol, but it dissolves in boiling alcohol, in chloroform, ether and the essential oils. The hardness of tallow and its melting-point are to some extent affected by the food, age, state of health, &c., of the animal yielding it, the firmest ox tallow being obtained in certain provinces of Russia, where for a great part of the year the oxen are fed on hay. New tallow melts at from 42°-5° to 43° C., old tallow at 43°-5°, and the melted fat remains liquid till its temperature falls to 33° or 34° C. Tallow consists of a mixture of two-thirds of the solid fatty substances and one-third of the liquid fat olein. Mutton tallow differs in several respects from beef tallow, and is obtained from oxen. It is whiter in colour and harder, and contains only about 30 per cent. of olein. Newly rendered it has little taste or smell, but on exposure it quickly becomes rancid. Sweet mutton tallow melts at 46° and solidifies at 36° C.; when old it does not melt under 49°, and becomes solid on reaching 44° or 45° C. It is sparingly soluble in cold ether and in boiling alcohol.

TALLOW TREE, in botany, the popular name of a small tree, Stillingia sebifera, belonging to the family Euphorbiaceae, a native of China, but cultivated in India and other warm countries. The seeds are thickly coated with a white greasy
substance—so-called vegetable tallow—from which candles are made, and which is also used in soap-making and dressing cloth. The butter tree or tallow tree of Sierra Leone is *Pendesmus butyracea*, a member of the family Guttiferae. The fruit, which is 4 to 5 in. long and about 3 in. in diameter, has a thick fleshy rind abounding in a yellow greasy juice.

**TALLY**, an old device, now obsolete, formerly used in the English exchequer for the purpose of keeping accounts. The tally was a willow or hazel stick about one inch in depth and thickness, and roughly shaped like a thick knife-blade (see Fig. 1). Notches (see Fig. 2) were cut on it showing the amount paid, a gauged width of 1½ inches representing £1000, 1 inch £100, ½ inch £10, half a notch of this size representing £1; ¼ inch ½s, and the smallest notch ½d.; half-pennies were represented by small holes. The account of the transaction was written on the two opposite sides, the piece of wood being then split down the middle through the notches; one half, called the tally, being given as a form of receipt to the person making the payment, while the other half, called the counter-tally, was kept in the exchequer. Payments made into the exchequer were entered into an account-book, from which they were transferred to a strip of parchment, or teller's bill; this was then thrown down a pipe into the tally-court, a large room directly under the teller's office. In the tally-court were officers of the clerk of the "pells"1 and of the auditor as representing the chamberlain of the exchequer. The teller's bill was then entered in the introitus or receipt-book by the officer of the clerk of the pells, and in another book, called the bill of the day, by the auditor's clerk. A tally was then made of the teller's bill, and it was given on application, generally on the following day, to the person paying in the money. At the end of the day, the bill of the day was passed on to the clerk of the cash-book, by whom all the day's receipts were entered (see the "Great Account of Public Income and Expenditure", part ii, app. 13, July 1860, by H. W. Chisholm).

The practice of issuing wooden tallies was ordered to be discontinued by an act of 1782; this act came into force on the death of the last of the chamberlains in 1826. The returned tallies were stored in the room which had formerly been the Star-chamber. This room was completely filled by them, so that in 1834, when it was desired to use the room, the tallies were ordered to be destroyed. They were used as fuel for the stoves which warmed the houses of parliament. On the 16th of October 1834 the houses of parliament were burnt down by the overheating of the stoves through using too many of the tallies.

The so-called *tally-trade* was an old system of dealing carried on in London and in the manufacturing districts of England, by which shopkeepers furnished certain articles on credit to their customers, the latter paying the stipulated price for them by weekly or monthly instalments (see Mc'Cutloch, *Dictionary of Commerce*)—the precursor, in fact, of the modern installment system.

---

1 So called from the pells or sheepskins (Lat. *pellis*, skin) on which the records were written. The clerk of the pells was originally the private clerk of the treasurer. His duty was to keep separate records of all monies entering and leaving the exchequer. These records were kept on two rolls, the *pellis introitus*, or pells receipt roll, and the *pellis exitus*, or pells issue roll. The office gradually became a sinecure, its duties being discharged by deputy. Previously to 1783 the salary of the office was derived from fees and percentages, but in that year parliament settled the salary at £1500 a year. The office was abolished in 1834.
The Mishnah is a more or less careful arrangement of the extant Oral Law (see § 2). It forms the foundation of the Gemara, and is divided into six parts (Sederot), each containing a number of Masssekhoth ("weavings," cf. the English word "text") or Tractates. These are subdivided into Pirqot ("sections") or chapters, and these again into paragraphs or sentences.

I. Że’rōt ("seeds"), the first Order, on agriculture, is introduced by (1) Bērākot ("blessings"), on daily and other prayers and blessings. (2) Pēḏah ("corner"), deals with Lev. xix. 9, seq., Deut. xv. 19, and xxv. 1-5; or rather Dammat ("doubtful"), on doubtful cases relating to the tithing of fruit offerings. (4) Kûḏāyim ("of two sorts"), on forbidden mixtures (Lev. xix. 19; Deut. xxii. 9-11). (5) Shēḇiḥot ("checks"), on the establishment of tithes (Deut. xvi. 1 sqq.). (6) Têrômedōth ("heave offerings"), in the laws in Num. xviii. 8 sqq., Deut. xvii. 4. (7) Ma’asërōth ("tithe") or the "first tithe" (from reference to the Levites, Num. xix. 21-24. (8) Ma’asēr Shĕdôn ("second tithe"), with reference to the tithe eaten at Jerusalem, Deut. xiv. 22-26. (9) Ḥallōl ("coat"), on Num. xvi. 18-21. (10) Ṭorah ("foreskin") and the defilements (Lev. xx. 23-25. (11) Bikkurîm ("first-fruits"), on Ex. xxiii. 19, Deut. xxvi. 1 sqq. The fourth chapter of this treatise, printed in most editions, is properly a Baraitha.

II. Mō ed ("festival"). (1) Shabbōth, on the Sabbath as a day of rest (Gen. ii. 2, xxvi. 5, xxvii. 1-3, 18, 19; 1 Sam. xiv. 20). (2) Ḥārāmīm ("mixtures" or amalgamations), on legitimate methods of avoiding inconvenient restrictions on the Sabbath. (3) Pēlē, on the "seven small M" or "seven days," and the "seven great days," on the ritual of the week and the week after. (4) Ḥarōd ("harmony"), on the festivals in the year (Lev. xxiii. 26-32, useful edition by H. L. Strack, Brooklyn, 1904). (6) Sukkōth or Sāḇkōth ("booths"), on Lev. xxiii. 34 sqq., Num. xxi. 12 sqq., Deut. xvi. 15-16. (7) Bēḏōt ("camps"), on the opening of their camp on the 1st of Ḥeshvan. (8) Ḥesdā-Shānāh ("New Year festival"), on the calendar, and more particularly on the first of the Seventh Month (cf. Num. x. 10, xxvii. 11 sqq., &c.). (9) Ta’antōth or Ta’antōth Torah, the special days for the Jewish people; the calendar, and public fasts appointed in time of drought. (10) Mīṣgâr ("roll" of Esther), the reading of it at Purim, &c. (11) Mi’ēḏ qōṭ ("the small M"), the tabernacles festival of this order, &c. (12) Māshāk ("the first word"), regulations for the intermediate festivals at Passover and Tabernacles. (12) Ḥaggâdî ("festival"), on the three principal festivals, Deut. xvi. 16, the duty of pilgrims to be avoided (tranl. by Bab. Talm. by A. W. Streane, Camb., 1891).

III. Nēzīm ("women"). (1) Yêḇēmōth ("sisters-in-law"), on the levirate, &c. (2) Kōḏēhōth ("marriage contracts"), rights of daughter-in-law (Gen. xxxvii. 4, 5, 7, 20, 21 antiquity, etc.). (3) Nâzîr ("Nazrite"), on Num. vi. (4) Gīṭîn ("documents"), on divorce and separation. (5) Sēḇiḥ ("the faithless wife") on Num. v. (6) Yadim ("the first and second sacrifices") of marriage, on the contraction of legal marriage.

IV. Nēḏēqin ("damages"), also known as Yēḇādōth ("deeds of help"). (1) Bēḏōṯ gōmēṯ (Aram. the first gift), on injuries and dedicated animals (cf. Lev. xvi. 18, B. Midr. 437) Aḥarōn ("the little gift"), on sales, leases, lost property. (3) B. Bēṭād (Aram. the last gift), on real estate, succession, &c. (4) Saḥēḥrōn (awkwlaw), on procedure and criminal law. (5) Māḥēhōth, "blows," on the oner or to be indicted (Deut. xxv. 1-5), and for what offence, &c. (6) Šēḇaṭōth ("oaths"), on Lev. v. 4 sqq. (7) Edūyūt ("testimonies," viz. of later teachers regarding their predecessors, on the schools of Hillel and Shammai, &c., &c. (8) Ḥēḏeḥōth ("decisions," on judicial and other errors (Lev. iv. 1 sqq.).

V. Qōdēshim ("holy things"). (1) Zēḇēōshād ("sacrifices"), the first-horn, &c. (2) Mēbārēḵōth ("meat-offerings"), on Lev. ii. 5, 11-13, vi. 7-16, xiv. 10-20, &c. (3) Ḥullīn or Shebēṭēh H. ("the sacrifice of common things"), on non-sacrificial meat. (4) Yeḥidōth, on the first-born, &c. (5) Shehīrāh ("cutting off"), on Excommunication, &c. (6) Mēbārēḵ ("trespas"), on Lev. v. 15 sqq. (7) Yāḏ ("battle") on Num. v. 6-8. (8) Tāmāh, on the continual or
perpetual (daily burnt offering)," Ex. xxix. 28-42; Num. xxviii. 2-8. (10) Midrash ("measures"), an important tractate on the temple (measurements, gates, halls, &c.). (11) Qumran ("nest on the side") for the support of doves for the poor (cf. Lev. l. 14-17, v. 1 seq.; xii. 8). VI. Toḥerath or Ṭeh., "purifications," an euphemism for things which are ritually or ceremonially "unclean." (1) Kilum ("inactivity of the uncumstained"), the uncumstained state (Num. xic. 14 seq.; xiv. 20 seq.). (2) Olot Ṭeh ("tents"), defilement through a corpse (Num. xix. 14-20), &c. (3) Negidim ("plagues," i.e. leprosy), on Lev. xii. seq. (4) Parshah (the [red] "heifer"), on Num. xix. (epurificatory ceremony in the expansion of the "teh" defilements). (5) Miqvaṭ (ritual baths), bathing for the defiled (cf. Lev. xiv. 8, xv. 5 seq.; Num. xxii. 23; also Mark vii. 4). (6) Niddah (female impurity), on Lev. xv. 19-33. (7) Mekhilath (same as "miknah"). (8) Mikneh (defilement of wet, unclean things (cf. Lev. vii, 14 seq.; Num. xii. 8), and those who have taken a ritual bath and must not confess the sinnett before becoming circumcised, see Lev. xv. 15 seq.; Num. xix. 6 seq.; Num. xiii. 19). (11) Yadāyim, "hands," their purification (cf. Matt. xv. 2, 20; Mark vii. 2-4, &c.). (12) Ḫṭin ("stems"), on the relation between fruit and the stems and stalks as regards defilement, &c. To Order IV. The Babylonian recension of the Talmud adds seven treatises, which are of later origin and are regarded as more as less extra-canonical. (1) Ḫṭib al Ṭeh Ṣahibin, an expansion of IV. 9, attributed to a second-century Rabban, but post-Talmudic (ed. S. Schechter, 1887). (2) Sopherim ("scribes"), on the writing of the scroll. (3) Šabath ("sabbath"), the day of rest. (4) later addition) on the liturgy (ed. J. Müller, Leipzig, 1878). (5) Bezä Rabbah ("great weeping"), or, euphemistically, Semahōth ("joy"), on mourning customs and rules. (6) Ṣalebat (betrothed, bridegroom, &c.), on chassidic and eschatological questions. (7) Ḫer ("a large," &c.), and "a small," treatise on various rules of conduct and social life. (8) Pérshe ha-Ṣahibon, a "chapter on peace," (peacefulness). In addition to these seven, other small treatises are still reckoned (edited by R. Kirchheim, Frankfurt-on-Main, 1890). These deal with (1) the writing of the rolls of the Law; (2) Ḫin (Deut. vi. 9, xi. 20); (3) Tephethim (prayers, phylacteries); (4) the Ḫinim (Num. xxv. 38); (5) slaves; (6) the Samaritans (cf. H. A. Montgomery, The Samaritans, pp. 196 seq.); and (7) proselytes. The Mishnah itself contains 63 tractates, or, since IV. 1-3 originally form a single tractate, 64 of which are unitary. A further number is also given as 70 (cf. 2 Esd. xiv. 44-46), perhaps by including seven or smaller treatises appended to IV. There are 513 chapters (or 525, see l. 11, IV. 9). 2. The Origin of the Mishnah. —A careful distinction was drawn between the Written Law, the Mosaic Toraḥ, and the rest of the Scriptures (יָדוֹתָן, παπαία) and the Oral Law, or Toraḥ, by mouth (יֵדָעָה נַפְתָּלָה). The origin of the latter, which has become known as the Mishnah or Ḫṭin, is unknown. It was supposed that it had been handed down by Ezra; that it was indebted to Joshua, David or Solomon; that it was as old as Moses, to whom it had been communicated orally or in writing, complete or in its essence. The traditional view is well illustrated in the words ascribed to R. Simeon Lakish, 3rd century a.d.1 "What is that which is written, I will give thee the tables of stone, and the Law and the Commandment, which I have written, that thou mayest teach them (Ex. xxiv. 12)? 'Tables,' these are the Ten Words (the Decalogue); the 'Law' is the Scripture; 'and the commandment' is the Mishnah: 'which I have written,' these are the Tractates and Writings (i.e. the Halakhot), 'to teach them,' that is the Gemara—thus instructing us that all these were given to Moses from Sinai.' Literary and historical criticism places the discussion on another basis when it treats the Mosaic Toraḥ in its present form as a post-exilic composition (about 5th century B.C.) from sources differing in date, origin and history. There is no a priori reason why other legal enactments should not have been current when the compilation was first made; the Pentateuchal legislation is incomplete, and covers only a small part of the affairs of life in which legal decisions 1 For the sake of convenience Ben ("son") and Rabbi are, as usual, abbreviated to b. and R. For the quotation which follows, see Oesterley and Box, The Religion and Worship of the Synagogue (London, 1907) p. 51; and, on the subject, S. Schechter, Studies in Judaism (London, 1898), ch. viii. —"the history of Jewish tradition" —E. L. Hamburger (Leipzig, 1911), p. 35 seq., Strack, op. cit., p. 8 seq.; W. Boussuet, Relig. d. Judéismes (Berlin, 1906), pp. 176 seq., and Jew. Ency., iv. 423 seq.; see also G. B. Gray's art. "Law Literature" in The Ency. Bib. might be needed. There must have been a large body of usage to which Jewish society subscribed; customary usage is one of the most binding of laws even among modern Oriental communities where laws in writing are unknown, and one of the most interesting features is the persistence in the East of closely-related forms and principles of custom from the oldest times to the present day. Laws must be adjusted from time to time to meet changing needs, and new necessities naturally arose in the Greek and Roman period for which the older codes and usages may be insufficient; therefore, a system of uniform Jewish law was derived from the Twelve Tables, the Jewish written laws were used as the authority for subsequent modifications, and the continuity of the religious-legal system was secured by a skilful treatment of old precedents.2 In the article Midraṣ it will be seen that new teaching could justify itself by a re-inter-pretation of the old writings, and that the traditions of former authoritative figures could become the framework of a teaching considerably later than their age. It is probable that this process was largely an unconscious one; and even if conscious, the analogy of the conventional "legal fiction" and the usual anxiety to avoid the appearance of lawlessness is sufficient to show that it is not to be condemned. By the help of a tradition —a "haggadic" or "halakic" Midrash (g.v. 1)—contemporary custom or ideals could appear to have ancient precedents, or by means of an exegetical process they could be directly connected with old models. In the Old Testament many laws in the Mosaic legislation are certainly post-Mosaic and the value of not a few narratives lies, not in their historical or biographical information, but in their treatment of law, ritual, custom, belief, &c. Later developments are exemplified in the pseud-epigraphical literature, notably in the Book of Jubilees, and when we reach the Mishnah and Talmud, we have only the first of a new series of stages which it may be said, culmi-nate in the 16th-century Shulḥan Arakh, the great compendium of the then existing written and oral law. Thus, the problem of the origin or antiquity of the unwritten Oral Law, a living and fluid thing, lies outside the scope of criticism; of greater utility is the study of the particular forms the laws have taken in the written sources which from time to time embody the ever-changing legacy of the past. The course of development between the recognition of the supremacy of the Pentateuch and the actual working-down the Mishnah and Gemara can be traced only in broad lines. It is certain that a great mass of oral tradition was current, and there are a number of early references to written collections, especially of haggadah. These, together with the long-hand (cf. IV. 5), gives a strong opposition to writing down the Oral Law. It is possible, therefore, that written works were in circulation among the learned, and that these contained varying interpretations which were likely to be due to the efforts to make the written laws fit the changing needs of men of his people. Also the Book of Jubilees knows of secret written traditions containing regulations regarding sacrifices, &c., and Jacob hands over "all his books and the books of his fathers to Levi his son that he might preserve them and renew them for his children (i.e. the priestly caste) unto this day" (xiv. 16). 3. Growth of the Mishnah and Gemara.—According to the traditional view the canon of the Old Testament closed with the work of Ezra. He was followed by the Sopherim,3 "scribes" (or the Men of the great Synagogue), to the Maccabean age, and these again by the "Pairs" (צָהָאָה, גֵּרֵוהוּ), the reputed heads of the Sanhedrin, down to the Herodian age (150-30 B.C.). The last culminates in Hillel (q.e.) and Shammai, the founders of two great rival schools, and to this famous pair the work

2 See W. R. Smith, Old Test. in the Jewish Church, p. 51 seq., 160.
of collecting halakhah ("legal decisions") has been ascribed. The ensuing period of the Tannaiti", "teachers" (about A.D. 10–220), is that of the growth of the Mishnah. Among the best known representatives of the schools are Rabban (a title given to Hillel's descendants) Gamaliel, the Phil-Hellenic and teacher of the apostle Paul (Acts xxii. 3) and his son Simeon (Josephus, Life, § 38 seq., Wars, iv. 3, 9), and Rabban Johanan b. Zakai, founder of the seat of learning at Jamnia (Jabneh). A little later (about 90–130 A.D.) are the famous Gamaliel II, Eleizer b. Hyrqunos (at Lydda), and Ishmael b. Elisha, the last of whom founded the school at Usha and is renowned for his Judeo-Greek knowledge and for his sermons by Hillel. With Rabbi Agaba (q.v.) and the scribes of Jamnia (about 90 and 118 A.D.) a definite epoch in Judaism begins. At Jamnia, under the presidency of Gamaliel II and Eleazar b. Azariah, a collection of traditional halakhah was formed in the tractate Edwyoth (larger than and not to be identified with IV., 7 above). Here, too, was discussed the canonicity of the Song of Songs and of Ecclesiastes, and it is probable that here Agaba and his colleagues fixed the official text of the canonical books. Agaba had an important share in the early development of the Mishnah (Strack, pp. 19, 86); and, in the collecting of the period was followed notably by the school of Ishmael (about 130–160 A.D.), which has left its mark upon the early halakic Midrashim (see Midrash, §§ 5–3). The more interesting names include R. Meir, a well-known haggadist, R. Simeon b. Yoḥai, R. Joseph b. Ḥalapha and R. Jehudah b. Elai. But, as collections of decisions were made by prominent teachers from time to time, confusion was caused by their differences as regards both contents and teaching (Sotah, 22a; Shabb. 138b). Consequently, towards the close of the second century a thoroughly comprehensive effort was made to reduce the halakhah to order. Judah, grandson of Gamaliel II, known as the Prince or Patriarch (nasi'at), as Robbenu ("our teacher"), or simply as "Rabbi" par excellence, was the editor. He gathered together the material, using Meir's collection as a basis, and although he did not write the Mishnah as it now is, he brought it into essentially its present shape. His method was not free from arbitrariness; he would attribute to "the wise" the opinion of a single authority which he regarded as correct; he would ignore conflicting opinions or those of scholars which they themselves had afterwards retracted, and he did not scruple to use his own opinions. In the period of the 'Amora'i-, "speakers, interpreters," (about 220–500 A.D.), witnessed the growth of the Gemara, when the now "canonical" Mishnah formed the basis for further amplification and for the collecting of old and new material which bore upon it. In Palestine learning flourished at Caesarea, Sephoris, Tiberias and Usha; Babylonia had famous schools at Nehardea (from the 2nd century A.D.), Sura, Pumbeditha and elsewhere. Of their teachers (who were called Rabbi and Rab respectively) several hundreds are known. R. Ḥiyya was redactor of the Sifra on Leviticus (Midrash, § 5, 2); b'hm and to R. Hoshaiya the compilation of the Ta'asephah is also ascribed. Abbā Arīka or Rab, the nephew of the first mentioned, founded the school of Sura (215 A.D.). Rab and Shemuel (Samuel) "the astronomer" (died 254 A.D.) were pupils of "Rabbi" (i.e. Judah, above), and were famed for their knowledge of law; so numerous were their points of difference that the Talmud will emphasize certain decisions by the statement that the two were agreed. The Gemara is much indebted to this pair and to Johanan b. Nappāh (190–279). The latter, founder of the great school of Tiberias, has indeed been venerated, on the authority of Maimonides, as the editor of the Palestinian Talmud; but the presence of later material and of later names, e.g. Mani b. Jona and Jose b. Abin (Abun), refute this view. The Babylonian Rabbbah b. Ḡamnāni (d. c. 330) had a dialectical ability which won him the title "uprooter of mountains." His controversies with R. Joseph b. Ḥiyya (known for his learning as "Sinai"), and those between their disciples Abayi and Raba are responsible for many of the minute discussions in the Babylonian Gemara. Meanwhile the persecutions of Constantine and Constantius brought about the decay of the Palestinian schools, and, probably in the 5th century, their recension (which the Talmud calls "the redaction of Nahmanides") having, however, learning still flourished, and with Rab Ashi (352–427) the arranging of the present framework of the Gemara may have been taken in hand. Under Rabba Toseph'a (died 470) and Rabina, i.e. Rab Abina (died 499), heads of the academy of Sura, the Babylonian recension became practically complete.

Finally, the Sabbā'ēt, "explaners, opiners" (about 500–550), made some additions of their own in the way of explanations and new decisions. They may be looked upon as the last editors of the now unwieldy thesaurus; less probable is the view, often maintained, that in the 12th century, that it was first compiled in that age.

4. The Two Talmuds.—The Palestinian recension of the Mishnah and Gemara is called "the Talmud of the Land of Israel," or "T. of the West"; a popular but misleading name is "the Jerusalem Talmud." It is an extremely uneven compilation. "What was reduced to writing does not give us a work carried out after a preconcerted plan, but rather represents a series of jottings answering to the needs of the various individual writers, and largely intended to strengthen the memory" (Schechter). Political troubles and the unhappy condition of the Jews in the last centuries of the Roman Empire are the main causes of Palestinian haggadic literature in the Midrashim, whose "words of blessing and consolation" appealed more to their feelings than did the legal writings. The Pal. Talmud did not attain the eminence of the sister recension, and survives in a very incomplete form, although it was perhaps once fuller. It now extends only to Orders I–IV., with the omission of IV. 7 and 9, and with the addition of part of VI. 7. The Babylonian Talmud (or Tal. Bab.) contains the Gemara to 356 tractates, but the material is relatively very full, and it is about three times as large as the Pal., although the Gemara there extends to 90 tractates. In the latter the Gemara follows each paragraph of the Mishnah; in the former, references are usually made to the leaves (the two pages of which are called a and b), the enumeration of the editio princeps being retained in subsequent editions. The Mishnah is written in a late literary form of Hebrew; but the Gemara is in Aramaic (except the Baraithas), that of the Bab. T. being an Eastern Arama. dialect (akin to Mandartic), that of the Pal. T. being Western Arama. (akin to Biblical Aram. and the Targums). Greek was well understood in cultured Palestine; hence the latter recension uses many Greek terms which it does not explain; whereas in the Bab. T. they are much less common, and are sometimes punningly interpreted.

The Pal. Tal. is the more concise, but it is remarkable for the numerous repetitions of the same passages; these are useful for the criticism of the text, and for the light they throw upon the incompleteness of the work of compilation. The Bab. Tal., on the other hand, is diffuse and freer in its composition, and it is characterized by the exuberance of Halakah, which is usually rather subtle and far-fetched. Both Talmuds offer a good field for research (see below). Especially interesting are the Bab. Middoth, which are preserved in the Gemara in Hebrew; they are "external" decisions not included in the more authoritative:

4 See Strack, p. 16 seq. The view has little in its favour, although memory played a more important part than now. For early mnemonic aids to the Mishnah, see Strack, p. 68, Jew. Ency., xii. 19.

4 The Mishnah was first critically edited by W. H. Low (Cambridge, 1883).

Mishnah, but they differ and are sometimes older than the Mishnic material, with which they sometimes conflict (so in particular as regards the rejected decisions of the school of Shammai). They usually begin: "our Masters taught," "it is taught," "the teacher taught," the verb "אָמַר (cf. Tanhûm, "teachers") being employed (see further Jew. Ency., ii. 513 seq.). Parallel to the Mishnah is the Tosephîth, an independent compilation associated with R. Nehemiah (a contemporary of Meir and Simeon b. Yoḥai). R. Hisya b. Abba and others; it is arranged according to the Mishnic orders and tractates, but lacks IV. 9 and V. 9–11. The halakhoth are fuller and sometimes older than the corresponding decisions in the Mishnah, and the treatment is generally more haggadic. The method of making the discussions part of an interpretation of the Old Testament (halakic Midrash), as exemplified in the Tosephîth, is apparently older than the abstract and independent decisions of the Mishnah—which presuppose an acquaintance with the Pentateuchal basis—and, like the employment of narrative or historical Midrash (e.g. in the Pentateuch, Chronicles and Jubilees), was more suitable for popular exposition than for the academies. For other halakic literature which goes back to the period of the Tanna'im, see the Meḥîlat, Sîphrî and Sîphrê, Art. Mîdrash, § 5, 1–3.

The Palestinian Talmud, although used by the Qaraites in their controversies, fell into neglect, and the Babylonian recension became, what it has since been, the authoritative guide. With the Čîonîm, the heads of Sura and Pumbeditha (about 580 A.D.) the two great collections of the Mishnah and Gemara were now the objects of study, and the scattered Jews appealed to the central bodies of Judaism in Babylonia for information and guidance. The Geonim in their "Responses" or "Questions and Answers" supplied authoritative interpretations of the Old Testament or of the Talmud, and regulated the application of the teaching of the past to the changed conditions under which their brethren now lived. The legal, religious and other decisions formulated in the pontifical communications of one generation usually became the venerated teaching of the next, and a new class of literature thus presupposed an acquaintance with the Tanna'im. As the Babylonian schools decayed, Talmudic learning was assiduously pursued outside its oriental home, and some Babylonian Talmudists apparently reached the West. However, the fortunes of the Talmud in a hostile world now become part of the history of the Jews, and the many interesting vicissitudes cannot be recapitulated here. (See Jews, §§ 44 seq.) To the use of the Pal. Talmud by the Qaraites in their controversies with the Rabbis we owe the preservation of this recension, incomplete though it is. To the intolerance of Christians are no doubt due the exaggerated MSS., and the impure state of the text of both Talmuds. At the same time, the polemical value results since the literary controversy in the 16th century (when Johann Reuchlin took the part of the Jews) led to the editio princeps of the Babylonian Talmud (Vienna, 1520–23). A change shows itself in the second edition (Basil, 1578–81), when the "Abbâdîh Zârûîh (above, § 1. IV. 8) was omitted, and passages which offended the Christians were modified or deleted.

Owing to the nature of its contents the Talmud stood sorely in need of aids and guides, and a vast amount of labour (of varying value) has been devoted to it by Jewish scholars. Of the many commentaries in force place must be given to that of R. Solomon b. Izhak of Troyes (see Rashi); his knowledge of contemporary tradition and his valuable notes make it a new starting point in the interpretation of the Talmud. To Rashi's disciples are due the Tosephîth "additions," which, with the commentary of "the Commentator," as he was styled, are often reproduced in printed editions of the Talmud. This school (France and Germany, 12th to 13th century) developed a casuistical and over-ingenious interpretation in contrast to that of the Spanish Talmudists who were interested in simplification and codification—and it drew upon it the saying of Naḥmanides (13th cent.): "They try to force an elephant through the eye of a needle." Important also are the introduction to and commentary upon the Mishnah by Malmendy (c. 1600), and the translation of its six remaining tractates of R. Moses ben Samuel b. Judah Alfazi (1635). The Mikraôth Yevîl (Mishneh Torah, otherwise called Sepher ha-Ḥadôd) has been revised by S. H. Schâkin (1823). The latter is a presentable summary of all Jewish religious and ethical teaching. The Talmud is presented in a standardized and modern form from the 16th century onwards based their studies—and also their criticisms—of early Rabbinism. Jacob b. Asher b. Yebiel in his Târîm ("rows") presented a well-arranged collection of those laws which had not been included in the midrash. This is the work of many hands, of new ones. Most important of all, however, is Joseph Caro's Shûbalân A'rûk ("prepared table"), which came in the age of printing (1565), and has remained the chief work of this kind. Its numberless editions, translations, and new forms of expression have made it the most popular one. It has been, in its turn, the subject of many commentaries and reading-books. This great work develops Talmudic law in all its developments, ancient and modern, written and oral. (I. Abrahams, Jew.Lit., London, 1916, p. 147 seq.; see also Jew. Ency., iii., 58 seq.) The lengthy history of the written and oral law thus reached its last stage in a work which grew out of the Talmud but had its roots in a more distant past. It was at the dawn of a period when the ancient codes which had been continuously reinterpreted or readjusted were to be re-examined under the influence of newer ideas and methods of study. The haggadic portions of the Talmud were collected: (a) from the Babylonian, in the Codex Constantiopolitanus, 1511 and in Jacob ibn Habîb's Ep (eye, well of) Jacob b. Ḥasdai, the Islamic authorities. (b) from the Talmud of Jerusalem (see MiDrash, §§ 9). These are superseded by the English translation made by A. Wünsche (J. T., Zürich, 1880; Bab. T., Leipzig, 1886–9).

The standard lexicon was the Arekh by Nathan b. Yebiel of Rome (c. 1190) which underlies all subsequent works, notably the great German dictionary Completum Ter. (Leipzig, 1878–1910), and also the excellent work of W. Bacher's Exeget. Terminologie d. jüd. Traditions-üll. (Leipzig, 1905).

The grammatical aids are modern. For Mishnic Hebrew, see A. J. Buber, Exposition of the Old Testament (Breslau, 1905) and (Paris, 1908). For the Tosephîth, R. Luzzatto's Ter. (Venice, 1784, 1785) and M. H. Sella's essay on the relation between Mishnic and Biblical Hebrew (Jew. Quart. Rev., xx. 467–73); for Western Aramaic, especially G. Dalman, Jüd. Pal. Aron. (Leipzig, 1905); for Eastern Aramaic, E. S. M. Augustin, Dialektdicke Aramäisch (Cincinnati, 1900), M. L. Margolis (London, 1910), and also T. Noldeke's Mandäische Gramm. (Halle, 1875).

The text of the Talmud has been badly reserved; much useful critical work has been done by R. Rabinovitsch. Various Lexicones (Munich, 1870–86) for the Bab. T., and by B. Rattner, Ahavath Zion (in Heb., Wilna, 1901–2) for the Jer. T. As regards translations, E. A. Cowden's English translation (Leipzig, 1889) and M. Cohen's (Eng., 1905) are the best. The standard editions, covering the whole work, are the one of 1845 (for the Rabbinic Talmud), the other of 1843); and that of C. H. Keil and J. Weiss (Completum Ter., New York, 1882) see also Jew. Ency., iv. 580 seq. Modern dictionaries of the older Rabbinical writings have been made by Levy (Leipzig, 1878), M. R. Morrow (London and New York, 1886), G. Dalman (Frankfort-on-Main, 1901); and also, B. S. Wacher's Exeget. Terminologie d. jüd. Traditions-üll. (Leipzig, 1905).

Features of Interest and Value.—Although the Midrashim do not hold the authoritative position which the Talmud enjoys, the two groups cannot be kept apart in any consideration of the interesting or valuable features of the old Rabbinic writings. Viewed as a whole they have the characteristics of other Palestinian literature, the merits and defects of other oriental works. As regards the Talmud, neither the Mishnah nor the subsequent Gemara are in any sense a digested corpus of law. It is really a large collection of opinions and views, a remarkably heterogeneous mixture of contents, for which the history of its growth is no doubt largely responsible. It appeals the reader with its irregularity of treatment, its variations of style, and its abrupt transitions from the spiritual to the crude and trivial, and from superstition to the purest insight. Like the Koran it is often concise to obscurity and cannot be translated literally;

1 Lat. transl. of Orders I–III., V, by Ugolino, Tesh., xvii.–xx., recent ed. by M. S. Zuckermandel (Pasewalk, 1880); see Jews Ency., xii. 207 seq.

2 The censorship and burning of the Talmud, see Jew. Ency., iii. 642 seq., xii. 22; Strack, 71 seq., 78 seq.
it presupposes a knowledge which made commentaries a necessity even, as we have seen, to the Jews themselves. The opening of Order II. 6, for example, would be unintelligible without a knowledge of the law in Levit. xxiii. 42: "A booth (the interior of which is) about 20 cubits high is disallowed. R. Judah allows it. One which is not ten hands high, one which has not three walls, or which has more sun than shade is disallowed." 2 An old booth? (made of eucalyptus wood) be supposed. The school of Shammai disallows it; but the school of Hillel allows it," &c. In the Gemara, the decisions of the Mishnah are not only discussed, explained or developed, but all kinds of additional matter are suggested by them. Thus, in the Bab. Gem. to III. 5, the reference in the Mishnah to the Zealots (צלאט) is the occasion for a long romantic account of the wars preceding the destruction of the Second Temple. In IV. 3 the incidental prohibition of the cutting up of a roll of Scripture leads to a most valuable discussion of the arrangement of the Canon of the Old Testament, and other details including some account of the character and date of Job. There are numerous haggadic interpolations, some of considerable interest. Prose mingles with poetry, wit with wisdom, the good with the bad, and as one thing goes on to suggest another, it makes the Talmud a somewhat rambling compilation. It is scarcely a law-book or a work of divinity; it is almost an encyclopedia in its scope, a store-house reproducing the knowledge and the thought, both unconscious and speculative, of the first few centuries of the Christian era.

A good idea of its heterogeneity is afforded by the English translation of the Talmud and other commentaries by P. L. Hershon (London, 1880-5). For miscellaneous collections of excerpts, see H. Polano (in the Chandos Classics); Henchery, Legends from the Midrash; I. Myers, Gems from the Talmud; S. Rapport, Tales and Analogies from the Talmud (New York, 1894); M. W. E. van de Velde, Zanen voor het Talmud. A valuable general introduction to the Rabbinical literature (with numerous excerpts) is given by J. Winter and A. Wünsche, Gesch. d. Jud.-Heiligen u. Talm. Literatur (Tübingen, 1894). The Talmud is still the focal point of the various branches of antiquarian research. On the animal fables, most of them found also in Indian and in classical collections, see J. Jacobs, Fables of Assop (London, 1886); for myth, superstition and folklore, see D. Joel, Aberglave (Breslau, 1881), and M. Grünbaum, Semi. Sagenbude (Leiden, 1893), Ges. Aufsätze (Berlin, 1901); for mathematics, see B. Zuckermann (Breslau, 1878); for medicine, J. Bergel (Leipzig, 1889), &c. For these subjects, and for law, zoology, geography, &c., &c., see the full and classified bibliographies in M. L. Rodkinson, Hist. of Talmud (New York, 1903), vol. ii. ch. vii., and Stracke's Einleitung, pp. 164-175.

Ordinary estimates of the Talmud are often influenced by the attitude of Christianity to Judaism and Jewish legalism, and by the preponderating interest which has been taken in the religious-legal side of the Rabbinical writings. The canonization of the Mishnah by the Masoretes is held by the majority of writers to be an advantage and the disadvantages of a legal religion, and controversialists have usually seen only one side. The excessive legalism which pervades the Talmud was the scholarship of the age, and the Talmud suffers to a certain extent because accepted opinions and isolated views are commingled. To those who have no patience with the minutiae of legislation, the prolix discussions are as irksome as the arguments appear arbitrary. But the Talmudical discussions were often merely specialist and technical—they were academical and ecclesiastical debates which did not always touch every-day life; sometimes they were for the purpose of reconciling earlier conflicting views, or they even seem to be mere exhibitions of dialectic skill (cf., perhaps, Mk. xii. 18-23). It may be supposed that this predilection for casuistry stimulated that spirit which impelled Jewish scholars of the middle ages to study or translate the learning of the Greeks. Once again it was—from a modern point of view—old-fashioned scholarship; yet one may now recognize that in the development of European science and philosophy it played a necessary part, and one can now realize that again the benefit was for common humanity rather than for the Jews alone. It may strike one as characteristically Jewish that extravagant and truly oriental encomiasts were passed upon such legalists and Talmudists as Isaac Alfazi, Rashi or Maimonides; none the less the medieval Jews were able to produce and appreciate excellent literature of the most varied description. In any case, the Talmud must be judged, like other authoritative, religious literature, by its place in history and by its survival. From age to age groups of laws were codified and expanded—the Priestly law of the Old Testament, the Mishnah, the complete Talmud, the subsequent codifications of Alfazi, Maimonides, and finally Joseph Caro. Thus, the Talmud occupies an intermediate place between the older sources and its later developments. At each step disintegration was arrested, but not Jewish genius; and the domination of the Law in Judaism did not as a matter of fact have the petrifying results which might have been anticipated. The explanation may be found partly in the intense feeling of solidarity uniting the Deity with his worshippers and his worshippers among themselves. No distinction was drawn between secular and religious duties, between ceremonial, ethical or spiritual requirements. Modern distinctions of moral and ceremonial being unknown, ancient systems must be judged in the light of those modes of thought which could not view religion apart from life. The Talmud discusses and formulates rules upon points which other religions leave to the individual; it sets down the conditions and the spiritual life of man with such up most lofty ethical standards. The bonds, rigorous and strange as they often appear to others, were a sacrament enshrined in the imagination of the lowest follower of the Talmud. Some of the keenest legalists (e.g. the Babylonian Rab) are famous for their ethical teaching, and for their share in popular exposition; one of the best ethical systems of medieval Judaism (by Bahya ibn Pekuda) is founded upon the Talmud; the last exponent of Rabbinical legalism, Joseph Caro, was at the same time a mystic and a pietist; and the combination of the poetical with the legal temperament is frequent. The Talmud outlived the reactionary tendencies of the Qaraite (q.v.), and of the Kabbalah (q.v.), and fortunately, since these movements, important though they undoubtedly were for the evolution of thought, had not within them the power to be of lasting benefit to the rank and file of the community. Finally, no religion has been without exhibitions of fanaticism and excess on the part of its followers, and if the Old Testament itself was the authority for witch-burning among Christians, it is no longer profitable to ask whether the Talmud was responsible for offences committed by or alleged against those whose lives were regulated by it. In the other hand, Judaism has never been without its heroes, martyrs or saints, and the fact that it still lives is sufficient to prove that the mechanical legalism of the Talmud has not hindered the growth of Jewish religion.

Apart from the general interest of the literature for history and of its contents for various departments of research, the exegetical methods of the Talmud are especially instructive. There were rules of interpretation, and they give expression to one dominant idea: there is an infinite potentiality in the words of the Old Testament, none is fortuitous or meaningless or capable of only a single interpretation, they were said for all time, "for our sake also" and "for our learning" (cf. Paul in Romans iv. 24, xv. 4). This was not conducive to critical inquiry; questions of the historical background of the biblical passage or of the trustworthiness of the text scarcely found a place. The interpretation itself is markedly subjective; by the side of much that is legitimate exegesis, there is much that appears arbitrary in the extreme. The endeavour was made to interpret, not necessarily according to the letter, but according to individual conceptions of the spirit and underlying motive. Thus, the same evidence could give rise to widely differing conflicting interpretations, which may not be directly deducible from or justified by the Scripture. Hence the value

1 The whole subject of Jewish legalism should be compared with Islam, where again law and religion are one; as regards the legal aspect, see the extremely suggestive and instructive study, "The Bukhari Style of the Medina Talmud," by J. Bryce, Studies in History and Jurisprudence (1901), ii. No. xii.
2 Some of the most influential of the Greek works in the middle ages had passed through Syriac, Arabic and Hebrew translations before they appeared in their more familiar Latin dress.
of the teaching, whether halakic or aggadist, rests upon its intrinsic worth, and not upon the exegetical principles which were the tools common to the age. Moreover, it was also considered necessary that teaching should be authenticated, as it was, by its association with older authority whose standing guaranteed its genuineness. For this reason anonymous writings were attributed to famous names, and traditions were judged (as in Islam), not so much upon their merits, as by the chain of authorities which traced them to their supposed source. All evidence that has already been pointed out in the article Midrash, it may be noticed that the familiar penalty of the "forty stripes save one" (2 Cor. xi. 24; Josephus, Ant., iv. 8, 23) is discussed in the Mishnah (Makkoth, iv. 5), and is subsequently explained by an extremely artificial interpretation of Deut. xxv. 2–3 (as though " to the number 40"). But the penalty is obviously older than, and entirely independent of, the arbitrary explanation by which it is supported. Again, the rending of clothes on the occasion of a charge of blasphemy (Matt. xxvi. 65) is actually connected with Joseph b. Qobhah of the New Testament original (Sanhedrin, vii. 5), although elsewhere this halakah is anonymous. Here the effort was made to substantiate a practice, but the tradition was not unanimous; and it often happens that the Talmud preserves different traditions regarding the same teaching, different versions of it, or it is ascribed to different authorities (see Jев. Ency., xii. p. 15, col. 2). The fact that certain teaching is associated with a name may have no real significance for its antiquity, even as a law ascribed to the age of Moses—the recognized law-giver—may prove to be of much earlier or of much later inception. This nature naturally complicates all questions affecting record and originality, and cannot be ignored in any study of the Talmud in its bearing upon the New Testament. Similar or related forms of interpretation and teaching are found in the Talmud, in Hellenistic Judaism, in the New Testament, in early Church Fathers and in Syriac writers. As regards the New Testament itself, the points of similarity are many and often important. It has been asserted that "the writings of recent Jewish critics have tended on the whole to confirm the Gospel picture of external Jewish life, and where there is discrepancy these critics tend to prove that the blameworthy is not the biblical writer but the interpreter." The Talmud also makes "creditable details which many Christian expositors have been rather inclined to dispute. Most remarkable of all has been the cumulative strength of the arguments adduced by Jewish writers favourable to the authenticity of the discourses in the Fourth Gospel ..." The points of contact between the phraseology in the Gospel of John and the early Midrashim are especially interesting. The popularity of the parable as a form of didactic teaching finds many examples in the Rabbinical writings, and some have noteworthy parallels in the New Testament. It is known that there were theological controversies between Jews and Christians, and in the Midrash Bereshith Rabbah (Midrash, § 5, 5) is a passage (translated in Jев. Ency., viii. 558) directed against the Christian view which found support for the doctrine of the Trinity in Gen. i. 26. But it is uncertain how far the doctrines of Judaism were influenced by Christianity, and it is even doubtful whether the Talmud and Midrash may be used to estimate Jewish thought of the 1st or 2nd century A.D. Much valuable work has been done by modern Jewish scholars on the "higher criticism" of these writings, which, it must be remembered, range over several centuries, but it still remains difficult to date their contents. Moreover, in endeavouring to sketch the theology of early Judaism it has been easy to find in the heterogeneous and conflicting ideas a system which agreed with preconceived views, and to reject as late or exceptional whatever told against them. Nevertheless, considering the evidence it is a delicate task to avoid confusing its meaning for all generations; there is no longer any natural or appropriate one to subsequent interpreters (whether Jewish or Christian) who have been necessarily influenced by their environment and by contemporary thought. At all events, if these writings have many old elements and may be used to illustrate the background of the New Testament, they illustrate not only the excessive legalism and ritualism against which early Christianity contended, but also the more spiritual and ethical side of Judaism. Upon this latter phase the pseudigraphical and apocryphal writings have shed much unexpected light in linking the Old Testament with both Christian and Rabbinical theology. The various problems which arise are still under discussion, and are of great importance for the study of Palestinian thought at the age of the parting of the ways. They touch, on the one hand, the absolute originality of Christianity and its attitude to Jewish legalism, and, on the other, the true place of the pseudepigrapha in Jewish thought and the antiquity of the Judaism which dominates the Talmud. They do not, however, exclude the possibility that by the side of the scholasticism of the early Jewish academical writer, the modern speculative thought which, forming a link between Jews and Christians, ultimately fell into neglect as Judaism and Christianity formulated their theologies.

On the close relation between the thought of the age, see B. Ritter, Pflüge u. d. Halaicha (Leipzig, 1879); M. Grünwald in Königseger's Monatsblätter (Berlin, 1890); N. I. Weinstein, Zur Genesis d. Agada (Frankfort-on-Main, 1901); W. Boussert, Relig. Intelligenz, ed. H. Graffin (Paris, 1894), p. xiii, seq.; S. Funk on the haggadic elements in Apocrypha (Vienne, 1891); and art. Midrash, § 4. In this respect the pseudepigraphic lit. is frequently of the greatest interest; thus Mark, iv. 24 finds a close parallel in "the Testament of Zebulun," viii. 3 (R. H. Charles, Test. of xii. Patriarch., p. 117), and does not differ essentially from the saying ascribed to Gamaliel II. (Shabb. 51b) and others. A close parallel to Matt. vii. 3 is ascribed to R. Tarpon, latter half of 1st century A.D. (Arab. 16b: "If one says, take the mote from thy eye, he answers, take the beam from thy eye"); it seems to have been a popular saying (see BDB s.v. Pflüge). See further W. Bittel, Die Talmudische Sprache in Bezug auf das Ubertragen der lateinischen Sprache in das Hebräische (Leipzig, 1890); with Schechter's essay in his Studies (1896), pp. 283–305; H. Loeb, Jesus Christus im Talmud (Berlin, 1891); R. T. Herford, Christianity in Talmud and Midrash (London, 1903; with W. Bacher's review in Jев. Quart. Ren., xvii. 171–183); R. G. Price (1890); Boussert, op. cit.; Oesterley and Box, op. cit. (with C. G. Montefiore's review in Jев. Quart. Ren., 1908, pp. 347–357); I. Abrahams in Swete's Jev. Bibli. Essays (1909), pp. 193–192; C. G. Montefiore, Synoptic Gospels (1909); H. L. Strack, Die Häretiker u. die Christen (1910).

The Talmud itself is still the authoritative and practical guide of the mass of the Jews, and is too closely connected with later Rabbinical and earlier Palestinian history to be neglected by Christians. With the progress of modern research the value of this and of the other old Rabbinical writings is being re-evaluated, and criticism has forced a modification of many old views. Thus, an early reference to the title of a work does not prove that it is that which is now current; this applies, for example, to the tractate 3 Edryyyoth (see Jев. Ency., viii. 611), and to the Midrash Siphre, which frequently differs from that as known to the Talmud (ib., xi. 331). It has been found that a tradition, however

Results of criticism.

---

1 There are many details in the Talmud which cannot be dated; if some are obviously contemporary, others find parallels in Ancient Babylonian, for example the code of Hammurabi. L. N. Dembitz, Jев. Quart. Ren., xix. 109–126, and the literature on the code (see Babylonian Law). Numerous miscellaneous examples of the intimate relationship between the Rabbinical and older oriental material will be found in H. Pick, Assyriisten u. Talmudisches (Berlin, 1903); A. Jeremias, Bab. im N. Test. (Leipzig, 1905). Alle Test. im Lichte d. Altert Orientis (ib., 1906); E. Bischoff, Babylonische und Persische Texte i. Talmud u. Midrash (ib., 1897).

talukdar—tamarisk

TAMUKTDAR—TAMARISK

tenacious or circumstantial, is not necessarily genuine, and that too in spite of the chain of authorities by which its antiquity or genuineness appeared to be confirmed. Implicit reliance can no longer be necessarily placed upon the reputed authorship or editorship of a work; yet, although many of the works were made by Jews in this region, they prove to be erroneous (e.g. on the authorship of the Zohar; see KABBALAH), they may sometimes preserve the recollection of a fact which only needs restatement (e.g. R. Johanan as the editor of the Pal. Talmud).

Finally, the Talmud comes at the end of a very lengthy development of Palestinian thought (see PALESTINE: HISTORY). It is in the direct line of descent from the Old Testament—intervening literature having been lost—the essence of which it makes its own. Forced by the events of history, this legacy of the past was subjected to successive processes and adapted to the needs of successive generations and of widely different historical and social conditions. Legal compendiums and systems of philosophy served their age and gave place to later developments; and the elasticity of interpretation which characterizes it enabled it to outlive Karaites and Kabbalists. It also escaped the classicism of the Renaissance with its insistence upon the text—either fact or fiction. As an oriental work among an oriental people the moral and spiritual influence of the Talmud has rested upon its connexion with a history which appealed to the imagination and with its heterodox character of all moods and minds, and upon the unifying and regulative effects of its legalism. The relationship of Talmudism to the Old Testament has been likened to that of Christian theology to the Gospels; the comparison, whether fitting or not, may at least enable one to understand the varying attitudes of Jewish thinkers to their ancient sources. With closer contact to the un-oriental West and with the inevitable tendencies of modern western scholarship the Talmud has entered upon a new period, one which, though it may be said to date from the time of Moses Mendelssohn (see JEWS, § 48), has reached a more distinctive stage at the present day. In the weakening of that authority which had been ascribed almost unanimously to the Talmud, and invariably to the Old Testament, a new and greater stress has been laid upon Judaism to reinterpret its spirit once more to answer the diverse wants of its adherents. This is part of that larger and pressing psychological problem of adjusting the "authority" ascribed to past writings to that of the collective human experience; it does not confront Judaism alone, and it must suffice to refer to the writings of "Reformed Judaism"; see e.g. C. G. Montefiore, Liberal Judaism (London, 1903); The Talmud (1907); I. Abrahams, Judaism (1907), and the essays of S. Schechter.

The writer desires to express his indebtedness to Mr Israel Abrahams for bibliographical and other assistance. (S. A. C.)

TALUKDAR (Hind. from taluk, district, and dar, holding), the name of (1) an official in the state of Hyderabad, India, equivalent to magistrate and collector, and (2) a landholder with peculiar tenures in various parts of India, particularly in Ceylon.

TALUS (Lat. for the "ankle-bone"), in architecture, the slope of an embankment wall, which is thicker at the bottom than at the top, to resist the pressure of the earth behind it.

TAM, JACOB BEN MEIR (1100-1171), a grandson of Rashi (q.v.), was the most famous French glossator (josefist) on the text of the Talmud. In 1147 he was attacked and injured by a disorderly band who had attacked themselves to the Crusaders. He escaped to the neighbouring Tropes, where about 1150 was held the first of the Jewish Synods, for which the Rhinefolds became celebrated. At this meeting it was laid down that disputes between Jew and Jew were not to be carried to a Christian court, but were to be settled by fraternal arbitration. New conditions of life had arisen owing to the closer terms on which Jews and Christians lived, and Jacob Tam was foremost in settling the terms which were to govern the relations, from the Jewish side. Many others of his practical ordinances (Tukkanot), connected with marriage and divorce, trade and proselytism, as well as with synagogal ritual, had lasting influence, and bear invariably the stamp of enlightened independence within the limits of recognized authoritative tradition and law. Of his legal work the most important was collected in his Sefer ha-yashar. He was also a poet and grammarian.

See Gross, Gallia Judaica (Index); M. Schloessinger in Jewish Encyclopedia, vii. 36-39. (A. L.)

TAMAQUA, a borough of Schuylkill county, Pennsylvania, U.S.A., on the Tamaqua (Little Schuylkill) river, about 20 m. above its junction with the Schuylkill, about 17 m. E.N.E. of Pottsville, and about 98 m. N. of Philadelphia. Pop. (1890) 6054; (1900) 7267, (625 foreign-born); (1910) 9462. Tamaqua is served by the Central railroad of New Jersey, by the Philadelphia and Reading railroad, and by an electric line connecting with Mauch Chunk, Pottsville, and other places. Tamaqua is in a rich anthracite coal district, and coal-mining is its chief industry. Among manufactures are foundry and machine-shop products, powder, stoves, furniture, hosery, &c. The borough owns the water-works. The first settlement here was made in 1799 and anthracite coal was discovered in 1817. In 1829 Tamaqua was laid out and received its present name, an Indian word meaning "running water." It was incorporated as a borough in 1833. Between 1860 and 1875 the Molly Maguires were active here.

TAMARIND. This name is popularly applied to the pods of a leguminous tree, which are hard externally, but within filled with an acid juicy pulp containing sugar and various acids, such as citric and tartaric, in combination with potash. The acid pulp is used as a laxative and a refrigerant, the pods being largely imported both from the East and the West Indies. The tree is now widely distributed in tropical countries, but it is generally considered that its native country is in eastern tropical Asia, and that Aysonian and Abyssinian (meaning in Arabic "Indian date") shows that it entered medieval commerce from India, where it is used, not only for its pulp, but for its seeds, which are astrigent, its leaves, which furnish a yellow or a red dye, and its timber. The tree (Tamarindus indica) attains a height of 70 to 80 ft., and bears elegant pinnate foliage and purplish or orange veined flowers arranged in terminal racemes. The flower-tube bears at its summit four sepals, but only three petals and three perfect stamens, with indications of six others. The stamens, with the stalked ovary, are held away from the part of their base, but are directed towards them at their apices. The anthers and the stigmas are thus brought into such a position as to obstruct the passage of an insect attracted by the brilliantly-coloured petal, the inference of course being that insect visits are necessary for transference of pollen and the fertilization of the flower.

TAMARISK. The genus Tamarix gives its name to a small group of shrubs or low trees constituting the tamarisk family Tamaricaceae. The species of tamarisk and of the closely allied genus Myricaria grow in salt-deserts, by the sea-shore, or in other more or less sterile localities in warm, temperate, and tropical regions of the earth's hemisphere. Their long slender branches bear very numerous small appressed leaves, in which the evaporating surface is reduced to a minimum. The flowers are minute and numerous, in long clusters at the
ends of the branches or from the trunk. Each has 4-5 free sepals, and as many petals springing with the 4-10 stamens from a fleshy disk. In Tamarix the stamens are free, while in Myricaria they are united into one parcel. The free ovary is one-celled, with basal placentas, and surmounted by 3-5 styles. The fruit is capsular, and contains numerous seeds, each with a long tuft of hairs at one end. The great value of these shrubs or trees lies in their ability to withstand the effects of drought and a saline soil, in consequence of which they grow where little else will flourish. On this account the Tamarisk, *T. gallica*, is planted on sea-coasts, and affords shelter where none other could be provided. Some species produce galls, valued for their tannin, while the astringent bark of others has occasionally been used for medicinal purposes. The ashes of the plant, when grown near the sea, are said to contain soda. For tamarisk manna, see Manna.

**TAMATAVE** (called by the natives Toamánina), the chief seaport of Madagascar, situated nearly on the centre of the eastern coast in 18° 10' S., 40° 32' E. It owes its importance to the existence of a coral reef, which forms a spacious and fairly compact barrier. There is also a service railway partly by railway and partly by steamer, along the coast lagoons, connecting the port with Antsânârîvô. Pop. about 4600.

**TAMAYO Y BAUS, MANUEL** (1829-1898), Spanish dramatist, was born at Madrid on the 15th of September 1829. He came of a family connected with the theatre, his mother being the eminent actress Joaquina Baus. It is interesting to note that she appeared as Geneviève de Brabant in an arrangement from the French made when he was in his twelfth year. Through the influence of his uncle, Antonio Gil y Zárate, minister of education, Tamayo's independence was secured by his nomination to a post in a government office. The earliest of his printed plays was *La Comedia de los Inocentes*, which appeared in 1847, and has been printed under the title of *Una Aventura de Richelieu*, which the author has not himself preserved, is said to be an imitation of Alexandre Dvau. The general idea of his *Angela* (1852) was derived from Schiller's *Kabale und Liebe*, but the atmosphere is Spanish, the situations are original, and the phrasing is Tamayo's own. His first great success was *Virgina* (1853), a dramatic essay in Alfieri's manner, remarkable for its ingenuity and noble diction. In 1854 Tamayo was expelled from his post by the new Liberal government, but was restored before long by Cándido Nocedal, a minister who had been struck by the young man's talent. He collaborated with Aureliano Fernández-Guerra y Orbe in writing *La Richa- hembra* (1854), a historical drama which recalls the vigour of Lope de Vega. *La Locura de Amor* (1855), in which Juana la loca, the passionate, love-sick daughter of Isabel the Catholic, figures as the chief personage, established Tamayo's reputation as Spain's leading playwright. *Hijo y Madre* (1855) is a failure, and *La Bola de Nieve* (1856) is notable solely for its excellent workmanship. It is unfortunate that Tamayo's straitened means forced him to put original work aside and to adapt pieces from the French. Examples of this sort are fairly numerous. *La Passiva* (1862), imitated from Adrien-Augustín-Léon Laya's *Duc Job*, is well-nigh forgotten, though the Spanish version is a dexterous piece of stagecraft and contains some elements of original value. *Del dicho al hecho* (1864) is from *La Pierre de touche* of Jules Sandeau and Émile Augier, and a pleasing proverb, *Más vale Muerta que Fuerza* (1866) is a great improvement upon Mme Caroline Berton's *Diplomatie du Ménage*. The revolution of 1868, which cost Tamayo his post at the San Isidro Library, is indirectly responsible for *No hay mal que por bien no venga* (1868), a clever arrangement of *Le Feu au Courant*, by Henri Murger's friend, Théodore Barrière. During these seven years Tamayo wrote a terminal piece, *Lances de Honor* (1865), which turned upon the immorality of dulling, and led to a warm discussion among the public. Written in prose, the piece is inspired by a breath of medieval piety which had not been felt in the Spanish theatre since the 17th century. This renaissance of an old-world motive has induced many critics to consider *Lances de Honor* as Tamayo's best work, but that distinction should be accorded rather to *Un Drama nuevo* (1867), a play in which the author has ventured to place Shakespeare and Yorick upon the scene. *Los Hombres de bien* (1870) was
Tambov's final contribution to the Spanish stage. His last years were spent in recasting his *Virginia*, and the result of his efforts may be read in the posthumous edition of his *Obres* (Madrid, 1898-99). In 1858 Tamayo was elected a member of the Spanish Academy, to which he afterwards became permanent secretary; and in 1884 the Conservative minister, Alejandro Pidal y Mon, appointed him director of the National Library. He died on the 20th of June 1898. (J. F.-K.)

**TAMBOUR** (Fr. for “drum”), the term in architecture given to the inverted bell of a Corinthian capital round which were carved the acanthus leaves decorating it: applied also to the wall of a circular structure, whether on the ground or raised aloft on pendentives and carrying a dome; and to the drum of a column which is built in several courses.

**TAMBOUTINE** (Fr. tambour de Basque; Ger. baskische Trommel, Tambourin, or Schellen-trommel), a popular instrument of percussion of indefinite musical pitch, used for marking the rhythm in dance or bacchanalian music. The tambourine consists of a flat wooden or metal ring, over one end of which is stretched a parchment or vellum head; in the circumference of the ring are fixed nine or ten metal disks or small bells which jingle as the tambourine is struck by the hand, or merely waved through the air. A tremolo effect is obtained by stroking the head of the instrument lightly with the thumb and forefinger. (Cf. Sloane 3083, fol. 13) a tambourine of modern appearance with a snare bears the inscription “Tympanum.” The tambourine is of the highest antiquity, and was known at different times under the names of *timbrel* or *tabel*, *tympanon* or *tympanum*, and *symphonia*. (K. S.)

**Tambov**, one of the largest and most fertile governments of central Russia, extending from N. to S. between the basins of the Oka and the Don, and having the governments of Vladimir and Nizhni-Novgorod on the N., Penza and Saratov on the E., Voronezh on the S., and Orel, Tula and Ryazan on the W. Tambov is 203 sq. m. on an undulating plain intersected by deep ravines and broad valleys, ranging 450 to 800 ft. above sea-level. Cretaceous and Jurassic deposits, thickly covered with boulder-clay and loess, are widely spread over its surface, concealing the underlying Devonian and Carboniferous strata. These last crop out in the deeper ravines, and seams of coal have been noticed at several places. Iron ore (in the north-west), limestone, clay and gypsum are obtained, and traces of petroleum have been discovered. The mineral waters of Lipetsk, similar to those of Franzensbad in their alkaline character, are also much esteemed. (Cf. *Pallone* and Sloane 3083, fol. 13) are well known in Russia. The Oka touches the north-west corner of the government, but its tributaries, the Moksha and the Tsna, are important channels of traffic. The Don also merely touches Tambov, and of its affluents none except the Voronezh and the Khoper and the Vorona, a tributary of the Khoper, are at all navigable. As a whole, it is only in the north that Tambov is well drained; in the south, which is exposed to the dry south-east winds, the want of moisture is much felt, especially in the district of Borisoglyebsk. The climate is continental, and, although the average temperature is comparatively cool (January, 13°F; July, 68°F), the rivers remain frozen for four months and a half. Forests occupy about 72 per cent. of the total area, and occur chiefly in the west; in the south-east wood is scarce, and straw is used for fuel. The soil is fertile throughout; in the north it is clayey and sometimes sandy, but the rest of the government is covered with a sheet, 2 to 3 feet thick, of black earth, of such richness that in Borisoglyebsk cornfields which have not been manured for eighty years still yield good crops.

The estimated population in 1906 was 3,205,500. The government is divided into twelve districts, the chief towns of which are Tambov, Borisoglyebsk, Yelatma, Kisranov, Kozev, Lebedyan, Lipetsk, Morshansk, Shatsk, Spask, Ternikov and Usman. The inhabitants are Great Russians in the centre, but there is a notable admixture of Mordvinians and Meshcheryaks in the west and north-west, as also of Tatars. The Mordvinians are rapidly becoming Russified. Nonconformity has a relatively strong hold in the government. Notwithstanding a high birth-rate (45 in the thousand), the annual increase of population is but slow (0.5 per cent. annually). The prevailing occupation is agriculture, modern machinery being used on the arable farms. More than two-thirds of the area is arable, and of this proportion 53 per cent. belongs to the peasant communities, 36 per cent. to private individuals, and 11 per cent. to the crown. The principal crops are rye, wheat, oats, barley and potatoes.

Grain is exported to a considerable extent from the south, although the yield is deficient in the north. Hemp and linseed are also cultivated, and the production of tobacco is yearly increasing.

Beetroot is extensively grown for sugar. Live- stock breeding, though less extensively carried on than formerly, is still important. Excellent breeds of horses are met with, not only on the larger estates, but also in the hands of the wealthier peasants, those of the Bityug river being most esteemed. Manufacturers are represented chiefly by distilleries, tallow-melting works, sugar factories, flour-mills and woolen-cloth mills. Commerce is brisk, owing to the large grain export—Kozlov, Morshansk, Tambov and Borisoglyebsk being the chief centres for this traffic, and Lebedyan for the trade in horses and cattle. This government is backward educationally. A distinctive feature is its large villages of crown peasants. The government was settled by Russians during the earliest centuries of the principality of Moscow, but until the end of the 17th century the fertile tracts in the south remained too insecure for settlers. In the following century a few immigrants began to come in from the steppe, and landowners who had received large grants of land from the tsars began to bring their serfs from central Russia. (P. A. K.; J. T. Be.)

**Tambov**, a town of Russia, capital of the government of the same name, 300 m. by rail S.E. from Moscow, on the Tsna river, and on the railway to Saratov. Pop. (1884) 34,000; (1899) 40,000. The town is almost wholly built of wood, with broad unpaved streets, lined with low houses surrounded by gardens; but it is an archiepiscopal see of the Orthodox Greek Church. Woolens, tobacco, oil and various other commodities are manufactured. The trade in grain, and in cattle purchased in the south and sent to Moscow, is far less important than that of Morshansk and Kozlov.

**Tamburello** (called in Piedmont *Tabasso*), a court game popular in Italy, particularly in the northern provinces. It is a modification of the ancient game of *Pallone* (p.e.), bearing the same general name as the modern Italian game of *Tamburello*. It is usually played in the open air, on a large field divided by a rope (cordino) into two equal spaces, the *batteuto* and the *rimessa*. Three players regularly form a side, each carrying in one hand an implement called *tamburello*, resembling a tambourine (whence the name), which is a round frame of wood upon which is tightly stretched a cover of horse-hide. A rubber ball about the size of a lawn-tennis ball is used. One of the players opens the service (*batteuto*), which is made from a small square called *transpolino*, situated at one corner of the *batteuto* but outside the court. The service must be over the middle line. The ball must then be hit from side to side over the line, the side failing to return it or sending it out of court losing a point. The game is scored like lawn-tennis, four points constituting a game, counting 15+15+10+10. Tamburello, a less expensive game than Pallone, is popular with the lower classes, who use it as a medium for betting.

**Tamils.** The word *Tamil* (properly Tamil) has been identified with Dravida, the Sanskrit generic appellation for the south Indian peoples and their languages; and the various stages through which the word has passed—Dravida, Dramila, Damila—have been mainly discussed by Bishop Caldwell in his *Comparative Grammar of the Dravidian Languages* (2 ed., 1875, p. 10 seq.). The identification was first suggested by Dr Graul (Reise nach Ostindien, vol. III., 1854, p. 349), and then adverted to by Dr G. U. Pope (*Tamil Handbook*, 1859, Introduction) and Dr Gundert (*Malayalama Dictionari*, 1872, i.e.). Dr Pope
however, believed Tamil to be a corruption of tenmott, southern speech, in contradistinction to yawggu, the northern, i.e., Telugu language. As in the case of the Kaïr, Turkish, Tagala and other typical languages, the term Tamulic or Tamilian has occasionally been employed as the designation of the whole class of Dravidian peoples and languages, of which it is only the most prominent member. The present article deals with Tamil in its restricted sense only. The Tamils proper are smaller and of weaker build than Europeans, though graceful in shape. Their physical appearance is described as follows:—a pointed and frequently hooked pyramidal nose, with conspicuous nares, more long than round; a marked sinking in of the orbital line, producing a strongly defined orbital ridge; hair and eyes black; the latter, varying from small to middle-sized, have a peculiar sparkle and a look of calculation; mouth large, lips thick, lower jaw not heavy; forehead well-formed, but receding, inclining to flattat, and seldom high; beard considerable, and often strong; colour of skin very dark, frequently approaching to black (Manual of the Administration of the Madras Presidency, Madras, 1885, vol. i., Intro., p. 36; see also Caldwell, Comparative Grammar of the Dravidian Languages, 1875, pp. 538–70).

The Tamils have many good qualities—frugality, patience, endurance, politeness—and they are credited with astounding memories; their worst vices are said to be lying and lasciviousness. Of all the South-Indian tribes they are the least sedentary and the most enterprising. Wherever money is to be earned, there will Tamils be found, either as merchants or in the lower classes of domestic service. The tea and coffee districts of Ceylon are peopled by about 65,000; Tamils serve as coolies in the Mauritius and the West Indies; in Burma, the Straits, and Siam the so-called Klings are all Tamils (Graul, Reise nach Ostindien, Leipzig, 1855, vol. iv. pp. 113–22).

**Language.**—The area over which Tamil is spoken extends from a few miles north of the city of Madras to the extreme south of the eastern side of the peninsula, throughout the country below the Eastern Ghats, from Pulicat to Cape Comorin, and from the Ghats to the Bay of Bengal, including also the southern part of the western side of the Ghats and the northern part of Ceylon. According to the census of 1901, the total number of Tamil-speaking people in all India was 16,525,500. To these should be added about 160,000 in the French possessions. But as of all the Dravidian languages the Tamil shows the greatest tendency to spread, its area becomes ever larger, encroaching on that of the contiguous languages. Tamil is a sister of Malayâlam, Telugu, Kanares, Tulu; and, as it is the oldest, richest, and most highly organized of the Dravidian languages, it may be looked upon as typical of the family to which it belongs. The one nearest akin to it is Malayâlam, which, with proper reservations, has been simply a dialect of Tamil, but differs from it now both in pronunciation and in idiom, in the retention of old Tamil forms obsolete in the modern language, and in having discarded all personal terminations in the verb, the person being always indicated by the pronom (F. W. Ellis, Dissertation on the Malayâlam Language, p. 2; Gundert, Malayâma Dictionary, Intro.; Caldwell, Comparative Gr., Intro., p. 23; Burnett, Specimens of South Indian Dialects, No. 2, p. 13). Also, the proportion of Sanskrit words in Malayâlam is greater, while in Tamil it is less, than in any other Dravidian tongue. This divergence between the two languages cannot be traced farther back than about the 10th century; for, as it appears from the Cochin and Travancore inscriptions, previous to that period both languages were still substantially identical; whereas in the Râmâcharitam, the oldest poem in Malayâlam, composed probably in the 13th century, at any rate long before the arrival of the Portuguese and the introduction of the modern character, we see that language already formed. The modern Tamil characters originated "in a Brahmanical adaptation of the old Grantha letters corresponding to the so-called Vaṭṭēḻuttu," or round-hand, an alphabet once in vogue throughout the whole of the Pâñḍya kingdom, as well as in the South Malabar and Coimbatore districts, and still sparsely used for drawing up conveyances and other legal instruments (F. W. Ellis, Dissertation, p. 3). It is also used by the Moplahs in Tellicherry. The origin of the Vaṭṭēḻuttu itself is still a controverted question. Dr. Burnett, the greatest authority on the subject, stated his reasons for tracing that character through the Pahlavi to a Semitic source (Elements of South Indian Palaeography, 2nd ed., p. 62). From the 10th century the Vaṭṭēḻuttu existed side by side and together with the Grantha, an ancient alphabet still used throughout the Tamil country in writing Sanskrit. During the four or five centuries after the conquest of Madura by the Cholas in the 11th it was gradually superseded in the Tamil country by the modern Tamil, while in Malabar it continued in general use down to the end of the 17th century. But the earliest works of Tamil literature, such as the Tolkâppiyam and the Kutil, were still written in it. The modern Tamil characters, which have but little changed for the last 500 years, differ from all the other modern Dravidian alphabets both in shape and in their phonetic value. Their angular form is said to be due to the widespread practice of writing with the style resting on the end of the left thumb-nail, while the other alphabets are written with the style resting on the left side of the thumb.

The Tamil alphabet is sufficiently well adapted for the purpose of the twelve vowels of the language (a, ä, i, i̯, u, u̯, e, ê, o, o̯, e̯, ou),—the occasional sounds of ū and ū̯, both short and long, being covered by the signs for e, i, i̯; but it is utterly inadequate for the expression of any other sounds. The character k has to do duty also for kh, gh, and similarly each of the other surd consonants ch, j, t, p represents also the remaining surd consonant of the same class. The letter h has, in the occasional sound of k, and that of s. Each of the five consonants k, ch, j, t, p has its own nasal. In addition to the four semifonals, the Tamil possesses a cerebral r and j, and has, in many cases, with the Malayâlam, obtained a liquid l, corresponding to all the Dravidian languages, the sound of which is so difficult to fix graphically, and varies so much in different districts, that it has been rendered in a dozen different ways (Manual of the Administration of the Madras Presidency, vol. ii., pp. 246 ff.). Fr. Müller is probably correct in approximating it to that of the Bohemian r. There is, lastly, a peculiar n, differing in function but not in pronunciation from the dental n. The three sibilants and h of Sanskrit have no place in the Tamil alphabet; but ch often does duty as a sibilant in writing foreign words, and the four corresponding letters as well as j and ksh of the Grantha alphabet are now frequently called to aid. It is obvious that many of the Sanskrit words imported into Tamil at various periods (Caldwell, loc. cit., Intro., pp. 86 seq.) have, in consequence of the incongruity of the Sanskrit and Tamil notation of their respective vocabularies, assumed forms unsuited to the modern characters; scarcely recognizable: examples are ulagu (loka), urwain (rupa), arukken (arka), arupom (addhutam), naṭhabhram (naksabhatram), arukkaṇ (ukhaṇ), etc. These are the Dravidian inventions, the commonest words of which the individual portions are the same as in Sanskrit, e.g., butiler, abī, act, kulūb, club, kannar, governor, pinâkalû, penal code, stikē, sick, mejastirattu, magistrate. But, as compared with its literary sister languages, it has preserved its Dravidian character singularly free from foreign influence. Of Tamil words which have found a permanent home in English may be mentioned curry, (bātī), mulligatawny (mīlaṭu), pepper, (tāppu), cold water, (ceroct) (surutti), pariah (gecēiyī).

The laws of euphony (avoiding of hiatus, softening of initial consonants, contact of final with initial consonants, hard complicated in Tamil than in Sanskrit. But, while they were transferred to Italic and many other European languages ("Perfect" Tamil), there is a growing tendency to neglect them in the language of the present day (Kodun-Tamil). It is true the Tamil rules totally differ from the prevailing Sanskrit; still the remaining letters and words in the latter case appear to follow Sanskrit models. Thus, iru nīkkhen becomes intru nikkhān; pon pāṭsrm, purpāṭsrm; vajīl kōṇdēn, vajīl kōṇe; vālīś-yūme, vālīś-yūnē; the third person plural, nouns in the common plural, which is indicated by change of a final n (feminine j) into r; but the neuter plural termination kō ṣ̄ (sāl) may be super-added in every case. Certain nouns change their base termination according to whether the determinative is singular or plural. They are for the acc. ei, instr. dā, social bāḥu (ādu, udān), dat. ku, loc. li (lūtali, in), abl. ilirundu (inirū), gen. uthreya (ādu). There is, besides, a general oblique affix in, which
is not only frequently used for the genitive, but may be inserted between the subject of the affirmative and the object of the negative. The particle $\delta$ may also be superadded. In the old poetry there is a still greater variety of affixes, while there is an option of dispensing with all. Adjectives, when attributive, precede the noun and are unmarked; when substantive, they follow it. It came to be the practice to use a number of affixes. The pronouns of the 1st person are sing. $\text{nâm} (ydn)$, in- flexional base $\text{en}$, plural $\text{nam} (ydm)$, inf. nom. containing, $\text{tnagal}$, inf. en-gal, excluding the personal pronoun of the 2nd person $\text{nt}$, inf. $\text{ntagal}$, inf. en-gal. (sîr $\text{tnagal}$, $\text{tnagal}$, $\text{ntagal}$, $\text{ntagal}$). To each of these forms, inclusive also of the reflexive pronouns $\text{dn}$, $\text{ldm}$, $\text{tngal}$, a place is assigned in the scale of honorific pronouns. As in the Dravidian languages the verb is the root, and is used with i indicate nearness, those with a distance, and (in the old poetry) those with u what is between the two, so the same forms beginning with o (or yd, or yr, who?) express the interrogative, and the forms of three persons the same, the singular with $\text{en}$ reducible to one syllable, the tense characteristic, and the personal affix. There are three original moods, the indicative, imperative, and infinitive. The last is singular, and is generally identical with the root, as well as three original tenses, the present, past, and future. The personal affixes are—sing. (1) $\text{en}$; (2) $\text{dy}$, honorific $\text{tr}$; (3) masc. $\text{dn}$, fem. $\text{dtn}$, honor. $\text{dn}$, neuter $\text{dn}$; plural (1) $\text{nent}$; (2) $\text{nten}$; (3) $\text{nten}$. All post-positions were originally active, not verbal forms. $\text{Oritio indirecta}$ is unknown in Tamil, as it is in all the other Indian languages, the gerund $\text{emra}$ being used, like $\text{iti}$ in Sanskrit. The verbal and prepositive are the same; the verb is the root. The noun is used, the singular in the prepositive, the dual and plural in the postpositive. This is an exact counterpart of the structure of words, inasmuch as such that which qualifies always precedes that which is qualified. Thus the attributive precedes the substantive, the substantive precedes the prepositive. Thus $\text{tiru-}$ and $\text{tpu}$- are interchangeable, the former, primary one, and the verb closes the sentence. The sentence— 

"Hailing the woman who had killed the child, he asked why she had committed such infanticide," runs in Tamil as follows—

$\text{Kilanthen sengapattuverai}$

The child $\text{her} \text{who had killed}$

made $\text{child-murder dhan}$

$\text{Thus why thus}$

$\text{having caused to be called,}$

$\text{asking}$

$\text{having said he asked.}$

Much as the similarity of the structure of the Tamil and its sister languages to that of the Ugro-Tartar class may have proved suggestive of the assumption of a family affinity between the two classes, such an affinity, if it exist, must be held to be at least very distant, inasmuch as the assumption receives but the faintest shade of support from an inspection of the radical and least variable portion of the respective languages.

Literature.—The early existence, in southern India, of peoples, localities, animals and products the names of which, as mentioned in the Old Testament and in Greek and Roman writers, have been identified with corresponding Dravidian terms, goes far to prove the high antiquity, if not of the Tamil language, at least of some form of Dravidian speech (Caldwell, loc. cit., Intro., pp. 81-106; Madras District Manual, 1, Intro., pp. 134 seq.). But practically the earliest extant records of the Tamil language do not ascend higher than the middle of the 8th century of the Christian era, the grant in possession of the Israelites at Cochin being assigned by the late Dr Burnell to about the year 1100 A.D. when the number of stanzas of distinctive韈s. (beauty), which is marked in the old literature (Burnell, loc. cit., p. 127, note). The earlier of these may have been Saiva books; the more prominent of the others were decided Jain. Though traces of a north Indian influence are palpable in all of them that have come down to us (see, e.g., F.W. Ellis's notes to the Kuru), we can at the same time appreciate, as we should, the desire of the authors to oppose the influence of the Vedas, as far as possible, and create a literature that should rival Sanskrit books and appeal to the sentiments of the people at large. But the refinement of the poetical language, as adapted to the genius of Tamil, has been carried to greater excess than in Sanskrit; and this artificial character of the so-called Sen-Tamil is evident from a comparison with the old inscriptions, which are a reflex of the language of the people, and clearly show that Tamil has not undergone any essential change (Burnell, loc. cit., p. 142).

The rules of Sen-Tamil appear to have been fixed at a very early date. The Tolkâppiyum, the oldest extant Tamil grammar, is assigned by Dr Burnell (On the Andra School of Sanskrit Grammar, pp. 8, 55) to the 8th century (best edition by C. V. Thiru-
daram Pillai, Madras, 1885). The Visâreddiyum, another grammar, is of the 11th century. Both have been superseded by the Nannul, which, after the 12th century, was composed by numerous commentators, and continues to be the leading national grammar (English editions in Pope's Third Tamil Grammar, and an abridgment by Lazarus, 1884). The period of the prevalence of the latter school is generally reckoned to be about the 14th century, is justly termed the Augustan age of Tamil literature. To its early days is assigned the Nâlalâvâdu, an ethical poem on the three objects of existence, which is supposed to have preceded the Nâlalâvâdu of Tiruvalluvar, the finest poetical expression of the whole range of Tamil composition. Tradition, in keeping with the spirit of antagonism to Brahmanical influence, says that its author, a brother of the poet, was a pariah, who lived a life of poverty, with a virtuous, and even, perhaps, a noble purpose. "It has often been edited, translated and commented upon; see the introduction to the excellent edition published by the Rev. Dr. Pope, in which also a comprehensive account of the influence of the Nâlalâvâdu on the poetry of the Tamil schools is given." (p. 171). The author is a reputed sister of Tiruvalluvar, but probably of a later date, and the Dikkârâm, the oldest dictionary of classical Tamil. The former is one of the finest poems in the language; but no more than the first and part of the third of its thirteen books have been edited and translated. Kamban's Râmâyânum (about 1100 A.D.) is the only other Tamil epic which comes up to the Chînâmâtârâm in greatness of design and extent of narrative. It is a Buddhist work, which appeared in the period of the Saiva revival (13th and 14th centuries) are two collections of hymns addressed to Siva, one called Tirâsvûkatam, by Mâalîka-Vâsakam, and a later and larger one, Tirûvûkatam, composed by Neigadâ and Sundaran and Appan. Both these collections have been printed, the former in one, the latter in five volumes. They are rivalled in number and extent the collection of poems of various forms of the contemporary collection of Vaishnava hymns, the Nâdïyâ-brahândam (also printed at Madras). The third section of it, called Tirâsvûkatam, or "Words of the Sacred Mouth," has been published in Telugu characters, with ample commentaries, in ten quarto volumes (Madras, 1875-76). After a period of literary torpor, which lasted nearly two centuries, King Vâllabha Deva, better known by his assumed name Alivârâma Pâñyând (second half of the 16th century), endeavoured to revive the love of poetry by compositions of his own, the most celebrated of which are the Neigadâ, somewhat exaggerated imitation of Sri Harsha's Sanskrit Nâlalâvâdu, and they have now been printed at Madras. A collection called Neigadâvatam of numerous followers, who made this revival the most prolific in the whole history of Tamil literature, none of the compositions of any kind, mainly translations and bombastic imitations of Sanskrit poems, with what pertinence they follow it and recede, was occupied by certain Tamil sectarians called ñllâr (i.e. siddhas or sages), whose mystical poems, especially those contained in the Neigadâvatam, are said to be of singular beauty. Two poems of high merit, and perhaps at the head of the rest, are the notice—the Nâttirivijâkam, an ethical treatise by Kumârâgurappura Desikan, and the Prabhûlîngûpali, a translation from the Kannarese language, by the celebrated text-book editor. See the analysis in W. Taylor's Catalogue, vol. ii. pp. 837-47.

The modern period, which may be said to date from the beginning of the last century, is ushered in by two great poets, one native and the other learned in a foreign language. The former, a schoolmaster, composed 1453 stanzas (pâdâl) which have a high reputation for sublimity both of sentiment and style; and the Italian Jesuit Joseph Beschi (d. 1742), under the name Virâmâlîn, elaborated, on the model of the Chînâmâtârâm, a religious epic Têmbandâni, which.
TAMLUK-TAMMANY HALL

Peacock dynasty, and a seatport at which the Chinese Buddhist pilgrims embarked. It is now 60 m. from the sea, and the ruins of the old city lie deep beneath river silt. It contains the palace of a local raja, and some temples of peculiar construction.

TAMMANY HALL, a political organization in New York City, U.S.A., claiming to be the regular representative of the Democratic party in that city. It takes its name from a sacheam or chief of the Delaware Indians, Tammany or Tammany, the name itself meaning “the Affable.” Before the War of Independe

ence there were Whig societies called “Sons of St. Tam

many” and “Sons of Liberty,” with rituals in which Indian elements were suggested. The American character of the lodges.

manny Hall in fourteenth Street. The society, thus, secret organiza-

tion, divided into tribes, with sachems (the most important being the Grand Sachem) as the chief officials, a sagemate, or master of ceremonies, and a wiskinske, or door-keeper, and with a ritual of supposedly Indian character. This “Tammany Society” is not itself the well-known political organization, but rents its hall to the Tammany Hall General Committee, the “Tammany Hall” of political notoriety; the leading members, however, of the “Society” and of the “Hall” are identical, and the “Society” controls the meeting-place of the “Hall,” so that the difference between the two is little more than nominal.

Almost from the beginning Tammany has been actively engaged in politics, being part of, and during the greater period of its existence actually representing in New York City, the Democratic party, though always subordinating the interests of the party as a whole to its own selfish interests. It has had local rivals at different times, but these, though successful for a while, have not lived long; on the other hand, the Hall has not generally been regarded with favour by the Democratic party throughout the country at large.

Soon after its founding, Tammany came under the influence of Aaron Burr, with whom it worked for the election of Jefferson as President. It bitterly opposed De Witt Clinton for many years and was hostile to his large Irish constituency; but, after it secured in 1822 the constitutional amendments providing for manhood suffrage and for the abolition of imprisonment of debtors, and especially after 1837 when Tammany first tried to reduce the five-year period of residence necessary for naturalization, the foreign-born element gradually came into control of the Society” and of the “Hall.” About 1842 Irish “gangs,” which used physical violence at election time, became a source of Tammany strength. It reached its height of power about 1870, under the leadership of William Marcy Tweed (1823–28), who used his popularity as a volunteer fireman to advance himself in Tammany and who was the first “boss” of the organization, which had formerly been controlled by committees. In the mayoralty and the other administrative offices and in the common council of the city, in the chief executive office of the state, in the state legislature, and even in some of the judges’ seats, Tweed had placed (or had secured the election of) accomplices or tools, or else controlled votes by purchase. In April 1870 Tweed secured the passage of a city charter which put the control of the city into the hands of the mayor, the comptroller, and the commissioners of parks and public works. A system of official plunder then began that has had few parallels in modern times. How much was actually stolen can never be known; but the bonded debt of the city, which was $36,000,000 at the beginning of 1869, was $97,000,000 in September 1871, an increase of $61,000,000 in two years and
eight months; and within the same period a floating debt of $20,000,000 was incurred, making a total of $81,000,000. For this vast sum the city had little to show. The method of plunder was the presentation of excessive bills for work done, especially in connexion with the new court-house then being erected. The bills were ostensibly paid in full, but in reality only in part, the rest being retained by Tweed, and divided amongst his followers in proportion to their importance. The total cost of the court-house to the city was about $13,000,000—many times the actual cost of construction. The amount paid in these two years for the city printing and stationery was not so large as the cost of the new court-house, and came through a petty auction over the division of the spoils. One of the plunderers, dissatisfied with the office he had received, gave to the New York Times a copy of certain sworn accounts which showed conclusively the stealing that had been going on. When Tweed was interviewed about the frauds his only reply was, "What are you going to do about it?" The better classes, however, were now thoroughly aroused, and with Samuel J. Tilden, afterwards governor of the state, at their head, and with the assistance of the Times and of Harper's Weekly, in the latter of which the preservation of Tammany Hall, as the Tammany of the old times, was identified with the success of Tammany's candidate Thomas H. Bayard, Tweed was tried and convicted, but was afterwards released on a technicality of law; he was re-arrested, but managed to escape and flee to Spain; he was identified and was brought back to gaol, where he died. The rest of the gang fared little better. Within a few years and under a new leader, John Kelly, Tammany was again in control of the city. Kelly was succeeded by Richard Croker, whose reign as "boss" continued until 1901. Since 1881 Tammany has been in virtual control of the city government about one-half the time, a Tammany and a reform mayor often alternating. There were elaborate investigations of Tammany's control of the city by committees of the legislature in 1890, 1894, and 1899. The most conspicuous overthrows of Tammany since the days of Tweed were in 1894, in 1901, when practically the whole reform ticket from mayor to alderman was elected, and in 1909, when the mayor (not a member of Tammany) was the only Tammany nominee on the general ticket elected. The grosser forms of corruption that prevailed under Tweed did not as a rule prevail in later years. Instead, the money raised by and for the Hall and its leaders has come from the blackmailing of corporations, which find it easier to buy peace than to fight for their rights; from corporations which desire concessions from the city; or which do not wish to be interfered with in encroachments on public rights; from liquor-dealers, whose licences are more or less at the mercy of an unscrupulous party in power; from other dealers, especially in the poorer parts of the city, whose business can be hampered by the police; from office-holders and candidates for office; and, lastly, indirectly through corrupt police officials, from the criminal classes and gambling establishments in return for non-intervention on the part of the police. The power of Tammany Hall is the natural result of the well-regulated machine which it has built up throughout the city, directed by an omnipotent "boss." Each of the "assembly districts" into which the city is divided sends a certain number of representatives to the General Committee of Tammany Hall. Each district also has a "boss" or leader and a committee, and these leaders form the Executive Committee of the Hall. There is also a "captain" for each of the voting precincts, over 1000 in number, into which the city is divided. The patronage of the city filters down from the riches of the Hall and from the man who leads the hall, to the party leaders, and from them often having one or more small municipal offices at his disposal; he also handles the election money spent in his precinct. The party headquarters in the different assembly districts are largely in the nature of social clubs, and it is in considerable degree through social means that the control of the Hall over the poorer classes is maintained. The headquarters are generally over or near a saloon, and the saloon-keepers throughout Manhattan belong as a rule to the Hall—in fact, are its most effective allies or members. It should be remembered too that the Hall is not subject to divided counsels, but is ruled by one man, a "boss" who has risen to his position by sheer force of ability, and in whose hands rest the finances of the Hall, for which he is accountable to no one. When the "Greater New York" was incorporated the power of Tammany seemed likely to grow less because it was confined to the old city (Boroughs of Manhattan and the Bronx), and the Democratic organizations in the other boroughs were hostile to it. The power of the organization in the state and in the nation is due to its frequent combination with the Republican organization, which controls the state almost as completely as Tammany does the city.

See Gustavus Myers, The History of Tammany Hall (New York, 1901).

TAMMERS (Finnish Tampero), the chief industrial city of Finland, capital of the province of Tavastehus, on the rapids connecting Lakes Näsijärvi and Pyhäjärvi, 125 m. by rail N.W. of Helsingfors. Pop. (1904) 40,261. Tammer是我的重要中心，用于棉花、亚麻、亚麻纸、纸板和皮革制造。这座城市拥有自己的水位，它位于泰伯河。它是一个重要的棉花、亚麻、亚麻纸制造中心，并且是通往美国以及与大西洋的太平洋的门户。这座城市的发展得益于其丰富的水力资源和便利的交通条件。这座城市的主要工业是棉花、亚麻和亚麻纸的制造。这座城市以其丰富的水力资源而闻名，这使得其工业生产更具竞争力。这座城市的工业发展也得益于此。这座城市拥有自己的水位，它位于泰伯河。它是一个重要的棉花、亚麻、亚麻纸制造中心，并且是通往美国以及与大西洋的太平洋的门户。
manufactures are boilers, pottery products, lumber and fertilizer; and there are two shipyards.

Tampa Bay was the landing-place of the expeditions of the Spanish explorers, Pánfilo de Narváez and Hernando de Soto. (See Florida.) In January 1812, the United States government established here a fort, Fort Brooke, which was an important base of supplies during the second Seminole War, and around it a settlement gradually developed. The fort was abandoned in 1860, and its site is now a public park. During the early part of the Civil War a small Confederate force was in possession, but in November 1862 it was driven out by United States gunboats. Tampa grew rapidly after the completion of the first railway thither in 1884, and in 1886 it was chartered as a city and became a port of entry. During the Spanish-American War United States troops were encamped in De Soto Park in Tampa, and Port Tampa was the point of embarkation for the United States army that invaded Cuba.

**Tampico**, a city and port of Mexico, in the state of Tamaulipas, on the N. bank of the Panuco river, about 6 m. from the Gulf of Mexico. Pop. (1906) 17,590, including the neighbouring settlements connected with the port works. The climate is hot, humid and unhealthy, and the city has suffered frequently from epidemics of yellow fever. A modern sewer system and waterworks, constructed in 1903-1906, have improved its sanitary condition and will in time reduce its heavy death-rate—about 78 per 1000 in 1903, when an epidemic of yellow fever caused 327 deaths, and the births numbered 512 against 1335 deaths. The eastern and poorer part of the town stands on low ground only 2 or 3 ft. above the river, and is subject to inundations. The western part rises about 150 ft., consists largely of private residences, and is provided with water and good drainage. The business section is well built, largely of stone and brick, and its streets are well paved and provided with gas and electric light. The neighbourhood is swampy and malarial. Tampico has two important railway connections: the Monterrey and Gulf line running north to the head of navigation on the Panuco, and a branch of the Mexican Central running westward to San Luis Potosí. There is also a line of river boats on the Panuco running up to the mouth of the Tamazunchale about 135 m., and another running to Tamiahua on the lagoon of that name by way of the Tuxpan canal, about 77 m. Industries include an electric light and power plant, factories for making ice, clothing, and fruit conserves, saw-mill, oil refinery, and a shipyard for small river boats. The modern port works, which have made Tampico accessible to a larger class of steamers, include two stone jetties at the mouth of the Panuco, which have increased the depth of water on the bar to 23 ft. at low water and 30 ft. at high water; seven wharves on the N. bank of the river to accommodate fourteen steamers at a time; steel sheds with railway tracks, and railway connections at the wharves. The depth of water at the wharves varies from 18 to 25 ft. The exports include sugar bullion (from San Luis Potosí, Agucalcientes, Torreón and Monterrey), axle fibre, sugar, hides, live cattle, cotton-seed cake, deer skins, honey, fustic, sarsaparilla, coffee, rubber, broom-root, copper ores and asphalt.

**Tamworth**, a municipal borough of Inglis county, New South Wales, Australia, is reached by rail from the south coast of New South Wales via Newcastle, and by boats on the Cooks rivers, 283 m. by rail N. of Sydney. Pop. (1901) 5799. It is an attractive town in a pleasant situation, with fine broad streets lined with shady trees, and was the first town in Australia to be lighted by electricity. Tamworth is the centre of several goldfields, at one of which, Bingara, diamonds are found. It is also the market of a pastoral and agricultural district. Brewing, malting, steam, saw and flour milling, coach building and the manufacture of boots and galvanized iron are its principal industries.

**Tamworth**, a market town and municipal borough of England, in the Lichfield parliamentary division of Staffordshire and the Tamworth division of Warwickshire, on the river Tame, a southern tributary of the Trent. Pop. (1901) 7271. It is 110 m. N.E. from London by the London and North-Western railway, and is also served by the west and north line of the Midland railway (Bristol-Birmingham-Derby). The castle, situated on a height above the Anker near its junction with the Tame, is chiefly of the Jacobean period, but is enclosed by massive ancient walls. Here was a residence of the Mercian kings, and, after being bestowed on the Marmions by William the Conqueror, the castle remained for many years an important fortress. Formerly the town was surrounded by a ditch called the King's Dyke, of which some trace remains. The church of St Editha, originally founded in the 8th century, was rebuilt, after being burned by the Danes, by Edgar, who made it collegiate, but the existing Decorated building, was erected after a fire in 1345. The free grammar school, refounded by Edward IV., was rebuilt in 1577, and again in 1667. The charities include Guy's almshouses, endowed in 1678 by Thomas Guy, founder of Guy's Hospital, London. On the common for moors, burgesses have rights of pasturage. Coal, fireclay and blue and red brick clay are dug at the Tealby drift; and there are also market gardens. In the town are a clothing factory, paper-mills, and manufactures of small wares. The town is governed by a mayor, 4 aldermen, and 12 councillors. Area, 285 acres.

Tamworth was incorporated by Elizabeth in 1560 by letters patent, which state that it is an "ancient mercate town," and suggest that the charters have been lost or burned. The governing charter in 1835 was that of Charles II., incorporating it under the title of the bailiffs and commonalty of the borough of Tamworth in the counties of Stafford and Warwick. The town council still kept up in 1792, to be held respectively on St George's day and the feast day of St Edward; another ancient fair, in honour of St Swithin, or perhaps originally of St Editha, is still held (July 26). Tamworth sent two members to parliament from 1562 to 1885, when its representation was merged in that of the county.

**Tana**, a river of British East Africa, which gives its name to the Tanaland province of that protectorate. It has a course, following the main windings only, of over 500 m. Its sources are along the watershed close to the eastern wall of the eastern rift-valley, and it enters the Indian Ocean in 2° 40' S., about 450 m. N.E. of the town of Tanga, where it joins the Great African river, the Tana, which receives the headwaters of the rivers from the Bamburi to the Pungo. Many of these streams flow direct to the coast, and their headwaters are fed by the mountains of the Pare range. The Tana runs over hills and through the moors of the Pare range, and its valley is intersected by numerous small streams, and is overhung by green vegetation. It is also a source of water-power for the railways of the central railway system. The river is navigable by small steamers near its mouth and by coaster vessels a few miles above. Its bed is sandy in places, and has a depth of 4 or 5 fathoms near its mouth, but the sea is shallow, and the river can be entered by the coasting steamers. Its banks are diversified with scenery, and its shores well wooded.
TANAQUIL—TANCRED

many others mostly belonging to the southern portion of the New World, now recognized by ornithologists as forming a distinct family Tanagraeidae of the Ocinus division of Passerine birds allied to the Fringillidae (see Finch); and distinguished from them chiefly by their feebler conformation and more exposed nostrils. They are confined to the New World, and are specially characteristic of the tropical forests of Central and South America.

The tanagers have been examined systematically by P. L. Sclater, and in the British Museum Catalogue (xi. pp. 49-307) he admits the existence of 375 species, which he arranges in 59 genera, forming six subfamilies, Procniatinae, Euphonini, Tanagrae, Lamproini, Phaeocichlina, Dicrurina, Melanocyllina, and Pachyramphina. There are only very unequal numbers of genera for, while the first of them consists of but a single species, Procnias tertia—the position of which may be for several reasons still open to doubt—the third includes more than 200. Nearly all are birds of small size, the largest barely exceeding a song-thrush. Most of them are remarkable for their gaudy colouring, and this is especially the case in those forming the genus called by Sclater, as by most other authors, Caecilia, to which the name of Tanagra of right seems to belong, while that which he names Tanagra should probably be known as Thraupis. The whole family is almost confined to the Neotropical region, and there are some 50 similar genera. In the United States, and two of them, P. rubra and P. aestiva, known as the scarlet tanager and the summer redbird, reach Canada and British America. Although a very intensive migration of the tanagers takes place annually, some numbers of the species reach even southern Mexico, and not a dozen appear in the northern part of that country. Of the genus Pyranga, which has the most northern range of all, three if not four species are commonly seen in the interior or other parts of the United States, and one of them, P. rubra and P. aestivalis, known as the scarlet tanager and the summer redbird, reach Canada and British America. Among the tanagers, there is a very special native of California, which by some authors is not recognized as a distinct species. The males of all these are clad in glowing red, P. rubra having, however, the wings and tail black. The remaining species, P. ludovician#, the males of which are mostly yellow and black, with the head only red, does not appear eastward of the Missouri plains, and has not so northerly a range. Another species, P. hepatica, has shown itself within the limits of the United States. In all these, the males are plainly attired, but generally possessed of the bright plumage, however bright may be their coloration, both sexes are nearly alike in plumage. Little has been recorded of the habits of the species which inhabit the United States, and those of the north have not been as closely observed as the rather retiring nature of the birds renders possible, and it is known that insects, especially in the larval condition, and berries afford the greater part of their food. They have a pleasing song, and build a shallow nest, in which the eggs, generally three in number, and of a greenish-blue marked with brown and purple, are laid. A few species are regularly or sparingly imported into Europe alive, and do well as cage birds.

TANAGRAEIDAE may perhaps be considered to hold the same relation to the Fringillidae as the Icteridae do to the Sturnidae and the Muscicapidae to the Sylviidae and Paridae, in each case the purely New-World family being the "teecker" family (A. N.)

TANACIL, the Etruscan name of the wife of Tarquiniius Priscus, or of one of his sons. After her immigration to Rome she is said to have received the name Gaia Caecilia. She was famous for her shrewdness and prophetic gifts, which enabled her to foretell the future greatness of her husband and of Servius Tullius. There was a statue of her as Gaia Caecilia in the temple of Sancus, which possessed magical powers. She was celebrated as a spinner of wool, and was supposed to exercise influence over Roman brides. Tanaquil and Gaia Caecilia are, however, really distinct personalities. The anecdotes told of Gaia Caecilia are aetiological myths intended to explain certain usages at Roman marriages.

See Livy, i. 34; 41; Pliny, Nat. Hist., viii. 74. xxxvi. 70; Schweigler, Römische Geschichte, bk. xv. 8.

TANAUAN, a town of the province of Batangas, Luzon, Philippine Islands, about 38 m. S.S.E. of Manila. Pop. (1903) 15,000. It is situated on the coast, and is a pleasant landing place. It formerly produced much sugar, but its inhabitants are now engaged chiefly in the cultivation of rice, Indian corn and fruit. Oranges and hogs are sent from Tanauan to the Manila market. The language is Tagalog.

TANCRED (d. 1112), nephew of Bohemund and a grandson of Robert Guiscard on the female side, was the son of a certain Marchius, in whom some have seen a marquis, and some an Arab (Makrati). He took the Cross with Bohemund in 1096, and marched with him to Constantinople. Here he refused to take an oath to Alexius, escaping across the Bosphorus in the disguise of a peasant; but after the capture of Nicaea he consented to follow the example of the other princes, and became the man of Alexius. At Heraclea, in the centre of Asia Minor, he left the main body of the Crusaders, and struck into Cilicia, closely followed by Baldwin of Lorraine. He may have been intending, in this expedition, to prepare a basis for Bohemund's eastern principality; in any case, he made himself master of Tarsus, and when he was evicted from it by the superior forces of Baldwin, he pushed further onwards, and took the towns of Adana and Mamistra. He joined the main army of Antioch, and took a great part in the siege. When, in the spring of 1098, two castles were erected by the crusaders, it was Tancred who undertook the defence of the more exposed castle, which lay by St. George's Gate, on the west of the city. In the beginning of 1099 he was serving in the ranks of Ray- mund's army, whether to observe his movements in the interests of Bohemund, or only (as is more probable) to be in the front of the fighting and the march to Jerusalem. But he soon left the count, like so many of the other pilgrims (see under Ray- mund); and he joined himself to Godfrey of Lorraine in the spring of 1099. After Bohemund's humiliating treaty at Durazzo in 1100 (his future rival) in the capture of Bethlehem; and he played his part in the siege of Jerusalem, gaining much booty when the city was captured, and falling into a passion because the security he had given to the fugitives on the roof of Solomon's temple was not observed by the crusaders. After the capture of Jerusalem he went to Napolis, and began to found a principality of his own. He took part in the battle of Ascalon in August; and after it he was invested by Godfrey with Tiberias and the principality of Galilee, to the north of Napolis. In 1100 he attempted, without success, to prevent Baldwin of Lorraine (his old enemy in Cilicia) from acquiring the throne of Jerusalem, possibly having ambitions himself; and in any case fearing the foundation of a strong non-Norman power in Palestine. Falling in this attempt, and being urgently summoned from the North to succeed Bohemund (now a prisoner with Danishmend) in the government of Antioch, he surrendered his smaller possessions to Baldwin, on condition that he should be restored if he returned in a year and three months, and finally left the kingdom of Jerusalem. He acted as regent in Antioch from 1100 to 1103, when Bohemund regained his liberty. During these years he twice marched in the Crusades, in 1101 and 1106, and in recapturing Laodicea (1103); he imprisoned Raymund of Toulouse, and only gave him his liberty on stringent conditions; and he caused the restoration of the deposed patriarch of Jerusalem, Dagobert, if only for a brief season, by refusing to aid Baldwin I, on any other terms. When Bohemund was set free, Tancred had to surrender Antioch to him; but he soon found fresh work for his busy hands. In 1104 he joined with Bohemund and Baldwin de Burg (now count of Edessa in succession to Baldwin of Lorraine) in an expedition against Harran, in which they were heavily defeated, and Baldwin was taken prisoner. Tancred, however, profited doubly by the defeat. He took over the government of Edessa in Baldwin's place; and in 1105 Bohemund surrendered to him the government of Antioch, while he himself went to Europe to seek reinforcements. Ruler of the two northern principalities, Tancred carried on vigorous hostilities against his Mahommedan neighbours, especially Ridwan of Aleppo; and in 1106 he succeeded in capturing Apamea. In 1107, while Bohemund was beginning his last expedition against Alexius, he wrested the whole of Cilicia from the Greeks; and he steadfastly refused, in June the same year, Baldwin's overtures to make a treaty with him, and refused to agree to any of its stipulations with regard to Antioch and Cilicia. To the hostility of the Mahommedans and the Greeks, Tancred also added that of his own fellow Latins. When Baldwin de Burg regained his liberty in 1108, it was with only difficulty that he was induced to restore Edessa to him, and the two continued unfriendly for some time; while in 1109 he also interfered in the civil war in Tripoli between the nephew and the eldest son of Raymund of Toulouse. But it was against the emirs of Northern Syria that his arms were chiefly directed;
and he became the hammer of the Turks, relentlessly attacking the emirs on every side, but especially in Aleppo, and exacting tribute from them all. He died in 1172, leaving the government to his brother-in-law, Roger de Principapu, until such time as Bohemund II should come to his inheritance.

**Bibliography.**—Tancred's *Gesta* were recorded by Ralph of Caen, who drew his information from Tancred's own conversations (see *Gesta Francorum ... Sive Gesta Benedicti Principis* (Freiburg, 1852)); and Tancred's career is also described by Rey, in the *Revue de l'orient latin*, iv. 334-340. (E. Br.)

**TANCRED** (d. 1194), King of Sicily, an illegitimate son of Roger, the eldest son of King Roger II., was crowned in January 1190 in succession to William II. (q.v.). He was supported by the chancellor Matthew d'Ajello and the official class, while the rival claims of Roger II.'s daughter Constance and her husband, Henry VI., king of the Romans and emperor, were supported by most of the nobles. Tancred was a good soldier, though his tiny stature earns from Peter of Eboli the nick-name "Tancredulus." But he was ill-supported in his task of maintaining the Norman kingdom, faced with heresy, heresy, and threatened by a baronial revolt, and, in addition, Richard Coeur-de-Lion, at Messina, 1190, threatened him with war. Henry, skilfully winning over Pisa, Genoa and the Roman Commune, isolated Tancred and intimidated Celestine III., who, on the 14th of April 1191, crowned him emperor at Rome. He, however, failed to capture Naples in August and retired north, leaving garrisons along the frontiers of the Regno. Tancred now sought to win over the towns by extensive grants of privileges, and at Gravina (June 1192) was recognized by the pope, whose interest in his success he gained by surrendering the royal legateship over Sicily. In 1192 and 1193 he commanded personally and with success against the Apulian barons, but his death at Palermo (20th of February 1194) a few days after that of Roger, his son and joint-king, made Henry's path clear. His wife Sibilla indeed maintained a regency for her second son William III., but on Henry's final descent, Naples surrendered almost without a blow in May 1194, and the rest of the Regno followed. Sibilla and the loyal Margarito prepared to defend Palermo, but the citizens admitted the emperor on the 20th of November 1194. Tancred's family fell into Henry's hands, and William III. seems to have died in Germany in 1198.

**TANDY, JAMES NAPPER** (1740-1803), Irish rebel, son of a Dublin ironmonger, was born in Dublin in 1740. He started life as a small tradesman; but turning to politics, he became a member of the corporation of Dublin, and made himself popular by his denunciation of municipal corruption and by his proposal of a boycott of English goods in Ireland, in retaliation for the restrictions imposed by the government on Irish commerce. In April 1780 Tandy was expelled from the Dublin volunteers (see *P flood, Henry*) for proposing the expulsion of the duke of Leinster, whose moderation he had offended the extremists. He was one of the most conspicuous of the small revolutionary party, chiefly of the shopkeeper class, who formed a permanent committee in June 1784 to agitate for reform, and called a convention of delegates from all parts of Ireland, which met in October 1784. Tandy persuaded the corporation of Dublin to condemn by resolution Pitt's amended commercial resolutions in 1785. He became a member of the Whig club founded by Grattan; and he actively co-operated with Theobald Wolfe Tone in founding the Society of the United Irishmen in 1791, of which he became the first secretary. The violence of his opinions in this capacity, and the capacity itself, which brought him into the revolution later, was partly due to his personal ugliness, provoked him into sending a challenge; this was treated by the House of Commons as a breach of privilege, and a Speaker's warrant was issued for his arrest, which however hallowed to elude till its validity expired on the prorogation of parliament. Tandy then took proceedings against the lord lieutenant for issuing a proclamation for his arrest; and although the action failed, it increased Tandy's popularity, and his expenses were paid by the Society of the United Irishmen. Sympathy with the French Revolution was at this time rapidly spreading in Ireland. A meeting of some 6,000 persons in Belfast voted a congratulatory address to the French nation in July 1791. In the following year Napper Tandy took a leading part in organizing a new military association in Ireland modelled after the French National Guards; they professed republican principles, and on their uniform the cap of liberty instead of the red cap of St. George was sewn. The revolts which happened in the south, with the purpose of bringing about a fusion between the Defenders and the United Irishmen, took the oath of the Defenders, a Roman Catholic society whose agrarian and political violence had been increasing for several years; but being threatened with prosecution for this step, and also for libel, he fled to America, where he remained till 1798. In February 1798 he went to Paris, where at this time a number of Irish refugees, the most prominent of whom was Wolfe Tone, were assembled, planning rebellion in Ireland to be supported by a French invasion, and quarrelling among themselves. None of these was more quarrelsome than Napper Tandy, who was exceedingly affected by it, and had totally drunk; his vanity was wounded to find himself of less account than Tone in the councils of the conspirators. Wolfe Tone, who a few months before had patronizingly described him to Talleyrand as "a respectable old man whose patriotism has been known for thirty years," was now disgusted by the lying braggadocio with which Tandy persuaded the French authorities that he was a personage of great wealth and influence in Ireland, at whose appearance 30,000 men would rise in arms. Tandy was not, however, lacking in courage. He accepted the charge of a petit comité, the "Anacreon," placed at his disposal by the French government, in which accompanied by a few leading United Irishmen, and supplied with a small force of men and a considerable quantity of arms and ammunition for distribution in Ireland, he sailed from Dunkirk and arrived at the isle of Arran, off the coast of Donegal, on the 16th of September 1798. The populace showed no disposition to welcome the invaders. Napper Tandy, who was drunk during most of the expedition, took possession of the village of Rutland, where he hoisted an Irish flag and issued a bombastic proclamation, but learning the complete failure of Humbert's expedition, and that Cornwallis, instead of being in open rebellion was perfectly quiet, the futility of the enterprise was apparent to the French if not to Tandy himself; and the latter having been carried on board the "Anacreon" in a state of intoxication, the vessel sailed round the north of Scotland to avoid the English fleet, and reached Bergen in safety, whence Tandy made his way to Hamburg with three or four companions. In compliance with a peremptory demand from the English government, and in spite of a counter-threat from the French Directory, the refugees were surrendered. Tandy remained in prison till April 1801, when he was tried, pleaded guilty, and was sentenced to death; he was, however, reprieved and allowed to go to France. This leniency may have been partly due to doubts as to the legality of the demand for his surrender by the Hamburg authorities; but the government was probably more influenced by Cornwallis's opinion that Tandy was "a fellow of so very contemptible a character that no person in this country (Ireland) seems to care the smallest degree about him." Moreover, Bonaparte vigorously intervened on his behalf, and is even said to have made Tandy's release a condition of signing the treaty of Amiens. Notwithstanding his vices and his lack of all solid capacity, there is no reason to suppose that Napper Tandy was dishonest or insincere; and the manner in which his name was introduced in the well-known ballad, "The Wearing of the Green," proves that he succeeded in impressing the popular imagination of the rebel party in Ireland. In France, where his release was regarded as a French diplomatic victory, he was received, in March 1802, as a person of distinction; and when he died on the 24th of August 1803 his funeral was attended by the military and an immense number of the civil population.

TANEGA-SHIMA—TANGANIKA

TANEGA-SHIMA, an island lying to the south of Kiusiu Island, Japan, in 29° 54' N. and 136° E., 369 m. long and 74 m. broad at its widest part. It is a long low stretch of land, carefully cultivated, and celebrated as the place where Mendez Pinto landed when he found his way to Japan in 1543. Until modern times firearms were colloquially known in Japan as "Tanega-shima," in allusion to the fact that they were introduced by Pinto.

TANEY, ROGER BROOKE (1777–1864), American jurist, was born in Calvert county, Maryland, on the 17th of March 1777, of Roman Catholic parentage. He graduated from Dickinson College, Carlisle, Pennsylvania, in 1795, began the study of law at Annapolis in 1796, and was admitted to the bar in 1799. In 1806 he married Anne Phoebe Key, sister of Francis Scott Key. He entered politics as a Federalist, and was a member of the Maryland House of Delegates in 1799–80. His faith in Federalism was weakened by the party's opposition to the War of 1812, and he gradually became associated with the Jacksonian wing of the Republican party. He served in the state Senate in 1816–21, was attorney-general of Maryland in 1827–31, and in July 1831 entered President Jackson's cabinet as attorney-general of the United States. He was the President's chief adviser in the contested election of 1836, and when the Chief Justice's seat became vacant in 1837, he was appointed to the court in the Ireland case. He died of a stroke in 1864. His son, Roger Taney Jr., was a United States Supreme Court justice.

TANZI, TANGA ("the salt"), a seaport of German East Africa, lying opposite the island of Pemba in 5° 6' S., 39° 7' E. The town is regularly laid out on elevated ground on the southern shore of Tanga Bay, and has a population of about 6,000. The large public buildings are the administrator's residence, the hospital, the boma (barracks), Protestant and Catholic churches, and the government and mission schools. Tanga is the port of the Usambara district, where are many thriving plantations. The harbour is entered by a broad channel five to eight fathoms deep. It is a port of call for the German mail steamers, and the starting-point of a railway to the Usambara highlands.

TANGANYIKA (mainly by V. E. Cameron to signify a "mixing-place"), a vast lake in East-Central Africa, the longest freshwater lake in the world, measuring just over 400 m., with a general breadth varying from 30 to 45 m., and an area of about 12,700 sq. m. It lies at an altitude of about 2,600 ft. above the sea, and occupies the southern end of the great central rift-valley, which terminates suddenly at its southern point, the line of depression being represented farther south by the more easterly trough of Lakes Nyasa and Rukwa, from which Tanganyika is separated by the Fipa plateau, composed of old granitic rocks, though even here traces of old valley-walls are said by Dr Kohlschützer to exist. North of Tanganyika the valley is suddenly interrupted by a line of ancient eruptive ridges, which dam back the waters of Lake Kivu (q.v.), but have been recently cut through by the outlet of that lake, the Rusizi, which enters Tanganyika by several mouths at its northern end. The flat plain traversed by the lower Rusizi was evidently once a portion of the lake floor. Tanganyika has been formed by the subsidence of a long narrow tract of country relatively to the surrounding plateaus, which fall to the lake in abrupt cliffs, some thousands of feet high in places. The geological formations that have been exposed at the places of the two great new outlets are the more recent material, overlaid by enormous deposits of reddish sandstones, conglomerates and quartzites, exposed in parts to a depth of 2,000 ft. Besides the plain to the north, a considerable area to the west, near the Lukuga outlet (see below), shows signs of having been once covered by the lake, and it is the opinion of Mr J. E. S. Moore that the sandstone ridges which here bound the trough have been recently elevated, and have been cut through by the Lukuga during the process. The past history of the lake has long been a disputed question, and Mr Moore's view that it represents an old Jurassic arm of the sea, of any remains of Jurassic faunas which still exist in the Tanganyika forms with those of undoubted Jurassic age in neighbouring regions. The formation of the existing rift-valley seems in any case to date from Tertiary times only.

Although drinkable, the water of the lake seems at times at least to be very slightly brackish, and it was supposed by some that no outlet existed until, in 1874, Lieutenant Cameron showed that the surplus water was discharged towards the upper Congo by the Lukuga. The second, about 100 m. below the first outlet, was further examined in 1876 by Mr (afterwards Sir Henry) Stanley, who found that a bar had formed across the outlet, and it has since been proved that the outflow is intermittent, ceasing almost entirely after a period of scanty rainfall, and becoming again established when the lake-level has been raised by a series of rainy years. About 1850 it was running strongly, but about this time a gradual fall in the lake-level set in, and was continued, with occasional pauses, for some twenty years, the amount being estimated by Wissmann at 2 feet annually. In 1896 Captain H. Ramsay found that a wide level plain, which had before been considered as water, was at times blocked by a bar about 2 m. below the first level of water was found flowing down by Mr Moore in 1899; while in 1901 Mr Codrington found the level 4 or 5 feet higher than in 1900, the outlet having again silted up. A continued rise was also reported in 1907. In any case, the alternations in level appear...
TANGERMÜNDE—TANGIER

937

to be merely periodic, and due to fluctuations in rainfall, and do not
point, as some have supposed, to a secular drying up of the lake.

The lake is fed by a number of rivers and small streams which
descend from the uplands surrounding it. The Mloggera (or
Malagarasi), perhaps the largest feeder, derives most of its water
from the rainy districts east of the strip of high ground which
separates the lake from the main stream of the Usambaras. This
has a nearly circular course, rising in 4° 40'S., only some 10 miles
from the lake shore and less than 40 miles from its mouth, though
its length is at least 220 miles. The other branches of the
Malagarasi, which traverse the somewhat arid granite plateau
between the lake and 33° E., bring comparatively little water to
the main stream. In its lower course the river is a rapid stream
flowing between steep jungle-clad hills, with one fall narrowing
and converting the river into several channels. Various channels of its
delta are also obstructed with sand-banks in the dry season. The
Rusizi, the next (or perhaps equal) in importance among the
tributaries of the lake, has its source in the vicinity of the
principal tribe of the Karanga, and is at all events navigable.

The remaining feeders are of distinctly less importance, the
Lofu, which enters the south-west, being probably the largest.

Tanganyika Lake is almost wholly of fresh water and its
secondary lakes, all of which are connected with the main body
of water, are also fresh. The surrounding highlands are
covered with forest of various kinds. The lakeshore and
coastline are all free from sand. No salt glands are to be found
in the lake. The shores of the lake are of various kinds.

The shores of the lake are of various kinds. There are flat
bamboos, or meadows, inhabited by elephants and zebras. The
shores are also planted with various species of fruit, such as
mangoes, bananas, and sugar-plants, which are grown as
exotics. The lake is also the breeding ground for many species
of fish, of which the tilapia is the most abundant. The
shores are inhabited by the Bantu, who have a number of
villages along the lake. The Bantu are of the same language,
but differ in various respects. The Bantu speak a language
which is the same as that of the Swahili, and are

TANGIER, a town of Germany, in the Prussian province of Saxony, on the Elbe, 43 m. E. of Magdeburg, by rail via Stendal. Pop. (1905) 12,829. It contains iron
foundries, shipbuilding yards, refineries, and other industrial
establishments, and enjoys a considerable river trade in grain
and coal. It is ornamented by numerous brick buildings of the
14th and 15th centuries, including the turreted walls of the
church of St Stephen (1376), and the late Gothic town hall.
The castle, built in the 14th century, was the chief residence of the
margraves of Brandenburg.

See Grote, Geschichte der Burg Tangermünde (Stendal, 1871).

TANGIER (locally Tanjam), a seaport of Morocco, on the
Straits of Gibraltar, about 14 m. E. of Cape Spartel, nestles
between two eminences at the N.W. extremity of a spacious bay.
The town, which has a population of about 40,000, presents a
picturesque appearance from the sea, rising gradually in the
form of an amphitheatre, with the citadel, the remainder of the
English mole and York Castle to the right: in the central valley
is the commercial quarter, while to the left along the beach runs
the track to Tetuan. Though rivalry between European Powers
led to many public works being delayed, through the action of
the public Sanitary Association the streets, which are narrow
and crooked, have been re-paved as well as cleaned and
partially lighted, and several new roads have been made outside
the town. In some of the older streets European shops have
replaced the picturesque native cupboards; drinking dens have
sprung up at many of the corners, while telephones and electric
light have been introduced by private companies, and European
machinery is used in many of the corn-mills, &c. The main
thoroughfare leads from Báb el Marsa (Gate of the Port) to
the Báb el Sok (Gate of the Market-place) known to the English
as Port Catherine. The sok presents a lively spectacle, especial-
ly upon Thursdays and Sundays.

Tanger is almost destitute of manufactures, and while the
trade, about 75,000 a year, is considerable for Morocco, it is
confined chiefly to imports, about two-fifths of which come from
Great Britain and Gibraltar, and one-quarter from France.

The harbour formed by the Bay of Tangier is an extensive one,
the best Morocco possesses, and good in all weathers except
during a strong east wind, but vessels of any size have to anchor
a mile or so out as the shore to the west is shallow and sandy,
and to the east, rocky and shingly. Since 1903 a basin with an
outer and inner mole has been built. It does not, however,

Cameron Bay: Belgian: Mtowa or Albertville in 6° S. Mission-
aries, especially the Catholic "White Fathers," are also
active on its shores. A small steamer, the "Good News," was
placed on the lake by the London Missionary Society in 1884,
but afterwards became the property of the African Lakes Cor-
nporation; a larger steamer, the "Hedwig von Wissmann," carrying
a quick-firing Krupp gun, was launched in 1900 by a German
expedition under Lieutenant Schloffer; and others are owned by
the Tanganyika Northern and Katanga companies.

The greater part of the trade with Tangier is carried on by the
African Lakes Corporation by the Shiré-Nyasa route, but the
Germans have opened up overland routes from Dar-es-Salaam.

accommodate large vessels. The climate is temperate and healthy, and good for consumptives.

As the seaport nearest to Europe, Tanjore is the town in the empire in which the effects of progress are most marked, and since the end of the 18th century it has been the diplomatic headquarters. The nucleus of a cosmopolitan society thus formed has expanded into a powerful community enjoying privileges and immunities unknown to natives not receiving its protection. The steadily increasing number of visitors has induced the opening of first-class hotels, and necessitated extensive building operations, resulting in the immigration of some thousands of artisans, chiefly Spanish. The number of European inhabitants (1905) was about 9000 (7500 Spaniards); of Jews about 10,000.

The Roman Tingis, which stood in the immediate vicinity of the site of Tanjore, was of great antiquity; under Augustus it became a free city, and when Otho placed the western half of Mauretania under a procurator, he called it Mauretania Tingitana after its capital Tingis. It was held by Vandals, Byzantines and Arabs, and when Mulai Idris passed from Tlemcén to Fez in 788, Tingis was "the oldest and most beautiful city" of the Maghrib. After many futile attempts the Portuguese obtained possession of it in 1471, but it passed to Spain in 1580, returning again to the Portuguese in 1656. In 1662 as part of the dowry of Catherine of Braganza on her marriage to Charles II., it came into the possession of the English, and they defended it against Mulai Imsal in 1686, but in 1684 it was decided, on account of expense, to abandon the place to the Moors. El Utrani wrote that "it was besieged so closely that the Christians had to flee on their ships and escape by sea, leaving the place ruined from bottom to top." It was reoccupied in 1684 by the French, then at war with Morocco. In the early years of the 20th century the shafir Raisulî terrorized the district round Tanjier and made captive several Europeans. As one result of the Algerian conference of 1906 a regular police force was organized, and the control of the customs passed into European hands (see Morocco: § History).

See A. Cousin, Tanger (Paris, 1902); Archives Marocaines (Paris, 1904-5).

TANGYE-SIR RICHARD (1832-1906), British manufacturer, was born at Illogan, near Redruth, Cornwall, on the 24th of November 1832, the son of a small farmer. As a young boy he worked in the fields, but when he was eight years old he was incapacitated from further manual labour by a fracture of the right arm. His father then determined to give him the best education he could afford, and young Tangye was sent to the Friends' School at Sidcot, Somersetshire, where he progressed rapidly and became a pupil-teacher. Tangye was not long contented with this position, and through an advertisement in The Friend obtained a clerkship in a small engineering firm in Birmingham, where two of his brothers, skilled mechanics, subsequently joined him. Here Richard Tangye remained four years, obtaining a complete mastery of the details of an engineer's business, and introducing the system of a Saturday half-holiday which was subsequently adopted in all English industrial works. In 1856 he started business in a small way in Birmingham as a hardware factor and commission agent. His first customers were the Cornish mine-owners in the Redruth district, and the business prospering, he was able before long to start manufacturing hardware goods on his own account, his two brothers joining him in the enterprise. The rivalry of the brothers Tangye was the manufacture of machinery, and their hydraulic lifting jacks were successfully employed in the launching of the steamship "Great Eastern." In 1858 the firm, who now confined themselves to making machinery, built their own works, and shortly afterwards secured the sole right of manufacturing the newly invented differential pulley-block, thereby materially adding to their business, which came to include every kind of power-machine—hydraulic, steam, gas, oil and electricity. The business was subsequently turned into a limited company, and in 1894 Richard Tangye was knighted. He died on the 14th of October 1906.

TANISTRY (from Gaelic tan, lordship), a custom among various Celtic tribes, by which the king or chief of the clan was chosen from among the heads of the sept and elected by them in full assembly. He held office for life and was required by custom to be of full age, in possession of all his faculties and without any remarkable blemish of mind or body. At the same time, and subject to the same conditions, a tanist or next heir to the chiefship was elected, who if the king died or became disqualified, at once became king. Usually the king's son became tanist, but not because the system of primogeniture was in any way recognized; indeed, the only principle adopted was that the dignity of chiefship should descend to the eldest and most worthy of the same blood. These epithets, as Hallam says, were not necessarily synonymous, but merely indicated that the preference given to seniority was to be controlled by a due regard to desert (Constit. Hist., vol. iii. c. xviii.). This system of succession left the headship open to the ambitious, and was a frequent source of strife both in families and between the clans. Tanistry was abolished by a legal decision in the reign of James I. and the English land system substituted.

TANJORE, a city and district of British India in the Madras presidency. The city is situated on the right bank of the river Cauvery, and is an important junction on the South Indian railway, 216 m. S. of Madras. Pop. (1901) 57,870. As the last capital of the ancient Hindu dynasty of the Cholas, and in all ages one of the chief political, literary and religious centres of the south, the city is full of interesting associations. It was the scene of the earliest labours of Protestant missionaries in India. The modern history of Tanjore begins with its conquest by the Maharrattas in 1674 under Venkaji, the brother of Sivaji the Great. The British first came into contact with Tanjore by their expedition in 1749 with a view to the restoration of a deposed raja. In this they failed, and a subsequent expedition was bought off. The Maharrattas practically held Tanjore until 1799. In October of that year the district was ceded to the East India Company in absolute sovereignty by Raja Sharakhoji, pupil of the missionary Schwartz. The raja retained only the capital and a small tract of country round. He died in 1833 and was succeeded by his son Sivaji, on whose death in 1855 without an heir the house became extinct. The mission at Tanjore was founded in 1778 by the Rev. Christian F. Schwarz or Schwartz (1726-1768). The mission establishments were taken over in 1826 by the Society for the Propagation of the Gospel, which subsequently founded new stations in several parts of the district. Roman Catholic missions date from the first half of the 17th century. St Peter's College, founded by a German schoolmaster, is now a first-class college affiliated to the university of Madras. His church dates from 1779. Among interesting ancient buildings may be mentioned the palace within the fort, containing an armoury and fine library; and the Brihadiswaraswami temple, of the 11th century, enclosed in two courts, surmounted by a lofty tower and including the exquisitely decorated shrine of Subrahmanya. Though the city has specialties of jewelry, carpets, modelling in pith, &c., there are no large industries.

The District of Tanjore has an area of 3710 sq. m. On account of its fertility it has been called the "Garden of Southern India." It is irrigated by a elaborate system of dams, cuts and canals in connexion with the rivers Cauvery and Coleroon, and the soil is exceedingly productive. The delta of the Cauvery occupies the flat northern part, which is highly cultivated, dotted over with groves of coco-nut trees, and is one of the most densely populated tracts in India. The staple crop is rice, which is grown on 77 per cent. of the cultivated area. Tanjore is a land of temples, many of them being of very early date. The district is traversed by the main line and several branches of the South Indian railway, some of which have been constructed by the district board. The chief seaport is Nagapattom, and the principal export is rice to Ceylon. The population in 1901 was 2,245,929.

See Tanjore District Gazetteer (Madras, 1906).
TANKARD, a type of drinking vessel. The word was formerly used loosely of many sizes, usually large, of vessels for holding liquids; thus it was applied to such as held two or more gallons and were used to carry water from the conduits in London in the 16th and early 17th centuries. The word is now generally applied to a straight, flat-bottomed drinking vessel of silver, pewter or other metal, or of glass or pottery mounted on metal, with a hinged cover and handle, holding from a pint to a quart of liquor (see DRINKING VESSELS). The derivation is obscure. It appears in O. Fr. as tampair and in O. Du. as tankaart. It may have been, as is suggested, metamorphosed from Gr. κάβαρος, Lat. cantharus, a large vessel or pot. It is used to gloss amphora in the Prompatorium Parvulorum (c. 1440). It is not connected with "tank," a cistern or reservoir for water, which was formerly "stank," and is from Port. tânque, mod. âng, pool; Lat. stagnum, whence Eng. "stagnant."

TANNA (Aramaic, "teacher"). The root tini or tana corresponds philologically to the Hebrew shana, from which comes the word Mishnah (see MIDRASH AND TALMUD), the great Rabbinic code which (with certain parts of the Mishra and other Rabbinic books) was the main literary product of the activity of the tannaim (plural of tanna). The term tanna is used in the Talmud of those teachers who flourished in the first two centuries of the Christian era. The tannaim from the date of the destruction of the Temple may be grouped: (1) 70–100, representative name Johanan ben Zakkai (q.v.); (2) 100–150, representative name Aqiba (q.v.); (3) 150–160, representative name Judah the Prince, compiler of the Mishnah. The successors of the tannaim were called "amoraim" (see AMORA).

See W. Bacher, Die Agoda der Tannaiten. An alphabetical list of tannaim and "amoraim" is given in the Jewish Encyclopedia, xii. 49–54.

TANNAHILL, ROBERT (1714–1810). Scottish song-writer, son of a Paisley silk-weaver, was born on the 3rd of June 1714. He was apprenticed to his father's trade at the age of twelve, and, inspired by the poetry of Robert Burns, he wrote verses as he drove the shuttle to and fro, with shelf and ink-bottle rigged up on his loom-post. He was shy and reserved, of small and delicate physique, and took little part in the social life of the town. The steady routine of his trade was broken only by occasional excursions to Glasgow and the land of Burns, and a year's trial of work at Bolton. He began in 1803 to contribute verses to Glasgow and Paisley periodicals, and published an edition of his poems by subscription in 1807. Three years later, in 1810, the life of the country poet is lost. His only son and despondent poet was brought by his own act to a tragic end. Tannahill's claims to remembrance rest upon half a dozen songs, full of an exquisite feeling for nature, and so happily set to music that they have retained their popularity. "Loudon's Bonnie Woods and Braes," "Jessie, the Flower o' Dunblane," and "Gloomy Winter's Noo Awa," are the best of them. "Jessie, the Flower o' Dunblane" and "The Farewell" tell the story of the poet's own unhappy love for Janet Tennant.

Tannahill's centenary was celebrated at Paisley in 1874. See edition by D. Semple (1876) for details of his life.

TANNER, HENRY OSSAWA (1859– ), American artist, of negro descent, was born at Pittsburg, Pennsylvania, on the 21st of June 1859. He was the son of Benjamin Tucker Tanner (b. 1825), who became bishop of the African Methodist Episcopal Church in 1888, edited the Christian Recorder, the organ of his church, from 1867 to 1883, founded, and from 1884 to 1888 edited, the African Methodist Episcopal Church Review, and published several pamphlets, poems and hymns, and an A pology for African Methodism (1867). The son was a pupil of Thomas Eakins, in Philadelphia, and of J. P. Laurens and Benjamin Constant in Paris. He first exhibited at the Salon in 1895. His "Daniel in the Lions' Den" received an honourable mention at the Salon of 1896. "The Raising of Lazarus," which received a third-class medal in 1897, was purchased by the French government for the permanent collection of the Luxembourg. Other pictures are, "The Annunciation" (Salon, 1898), "Nicodemus Coming to Christ" (1899), "The Jews' Walling Place," and "Christ in the Temple."

TANNER, THOMAS (1674–1735). English antiquary and prelate, was born at Market Lavington in Wiltshire on the 25th of January 1674, and was educated at Queen's College, Oxford, taking holy orders in 1694. Next year he became chaplain and then fellow of All Souls College, and a few years later private chaplain to John Moore (1666–1714), bishop of Norwich and afterwards of Ely, who appointed him chancellor of the diocese of Norwich. In 1706 he became rector of Thorpe near Norwich, in 1713 a canon of Ely, in 1724 a canon of Christ Church, Oxford, and in 1732 bishop of St Asaph. He died in Oxford, where he had passed most of his life, on the 14th of December 1735. Tanner's chief work is his Notitia Monastica, a short account of all the religious houses in England and Wales. This was published at Oxford in 1665; it was reprinted with additions by the author's brother, John Tanner, in 1744; and was reprinted again with further additions by James Nasmith (1740–1808) in 1787. He also wrote Bibliotheca Britannico-Hibernica, a dictionary of all the authors who flourished in England, Scotland and Ireland before the opening of the 17th century, at which he laboured for forty years. This was not published until 1748, thirteen years after the author's death. The bishop collected materials for a history of Wiltshire and worked for some time on a new edition of the Life of John Wiltshire and valuable collection of books and manuscripts is in the Bodleian library at Oxford.

Another writer of this name was THOMAS TANNER (1630–1682), the author of The Entrance of Massarini (Oxford, 1657–58). Educated at St Paul's School, London, and at Pembroke Hall, Cambridge, he became a barrister and later a clergyman, being vicar of Colyton, Devon, and afterwards of Winchfield, Hants.

TANNHÄUSER, or TANNHEUSER, German Minnesinger of the 13th century, who lived for a time at the court of Frederick II., duke of Austria. After Duke Frederick's death he was received at the court of Otto II., duke of Bavaria; but, being of a restless disposition, he soon left, and has been described as in wandering about Germany. He also went as a Crusader to the Holy Land. His poems belong to the decadence of the Minnesang, and combine a didactic display of learning with descriptions of peasant-life in a somewhat coarse tone. His adventurous life led him to be identified, in the popular imagination, with the knight Tannhäuser who, after many wanderings, comes to the Venusberg, or Hörselberg, near Eisenach. He enters the cave where the Lady Venus—the Fräu Hulda of German folk-lore—holds her court, and abandons himself to a life of senseless enjoyment. But he has been promised by Venus, and by the aid of the Virgin Mary, souls in Purgatory, that he may return for a while to the outer world. He then goes as a pilgrim to Rome, and entreats Pope Urban to secure for him the forgiveness of his sins. The pope declares it is impossible for him to be pardoned as for the staff he has in his hand to blossom. Tannhäuser departs in despair, and returns to the Venusberg. In three days the staff begins to put forth green leaves, and the pope sends messengers in all directions in search of the penitent, but he is never seen again. This legend was at one time widely known in Germany, and as late as 1830 it survived in a popular song at Eutelsburg in Switzerland, a version of which was given by Uhland in his Alto hoch- und niederdeutsche Volkslieder. Among the attendant of Hulda was the faithful Eckhart, and in the preface to the Heldenbuch he is said to sit before the Venusberg, and to warn passers-by of the dangers to which they may be exposed if they linger in the neighbourhood. The legend has been reproduced by several modern German poets, and by R. Wagner in an opera.

For Tannhäuser's lyric poetry, see F. H. von der Hagen's Minnesinger, ii. (1838); K. Bartsch, Deutsche Liederdichter des 12. bis 14. Jahrhunderts (3rd ed. 1893). For Tannhäuser's life and work see the Tannhäusereage and der Minnesinger Tannhäuser (1858); J. G. T. Gräwe, Die Sage von Tannhäuser (1846; 2nd ed. 1861); A. Ohlke Zu Tannhäusers Leben und Dichten (1890); J. Siebert, Tannhäuser in Form seiner Lied (1894).

TANNIN, or TANNIC ACID, the generic name for a widely disseminated group of vegetable products, so named from their property of coagulating raw hide into leather (q.v.). They
are soluble in water, their solutions having an acid reaction and an astringent taste; the solutions are coloured dark blue or green by ferrous salts, a property utilized in the manufacture of ink (q.v.). Their chemistry is little known. Some appear to be glucosides of gallic acid, since they yield this acid and a sugar on hydrolysis, e.g. oak tannin; whilst others yield protocatechuic acid and phloroglucin, e.g. moringa-tannin; common tannin, however, is a digallic acid.

Common tannin, or tannic acid, \( C_{7}H_{4}O_{6} \cdot 2H_{2}O \) occurs to the extent of 50% in gall-nuts, and also in tea, sumach and in other plants. It is a white, powdery substance, mixed with a mixture of ether and alcohol, whereupon the tannin is taken up in the lower layer, which on separation and evaporation yields the acid. When pure the acid forms a colourless, amorphous mass, which, when heated in air, or in an atmosphere practically free from air, forms a black mass. Common salt precipitates it from aqueous solutions. It forms a pentacetae. It may be obtained artificialy by heating gallic acid with phosphorus oxychloride or dilute arsenic acid (C. P. Biggeln, *Casets*, 1909, 39, II, pp. 268 et seq.) and conversely on boiling with dilute acids or alkalies it takes up a molecule of water and yields two molecules of gallic acid, \( C_{7}H_{4}O_{6} \). It is optically active—a fact that was of the utmost importance to the chemistry of tannin (Ber., 1906, 39, p. 2497). The chemistry has also been investigated by M. Nierenstein and L. F. Iljin (see papers in the *Ber.*, 1908, et seq.).

Tannin of oak, \( C_{7}H_{4}O_{6} \) which is found, mixed with gallic acid, ellagic acid and quercite, in oak bark, is a red powder; its aqueous solution is coloured dark blue by ferric chloride and boiling with dilute hydrochloric acid yields protocatechuic acid and tannic acid or coffee, \( C_{7}H_{4}O_{6} \), found in coffee beans, is not precipitated from its solutions by gelatin. Hydrolysis by alkaline solutions gives a sugar and caffeic acid; whilst fusion with phosphorus trioxide in vacuum yields protocatechuic and moringa-tannin or maclurin, \( C_{7}H_{4}O_{6} \cdot H_{2}O \), found in *Morus sinctoria*, hydrolyses on fusion with caustic potash to phloroglucin and protocatechuic acid. Catechu-tannin occurs in the extract of *Mimus catechu*; and kino-tannin is the chief ingredient of *kino* (q.v.).

Medicine.—Tannic acid is official in both the British and United States Pharmacopoeias. It is incompatible with mineral acids, alkalis and certain drugs, and is not readily soluble in alkali, alkaloids and gelatin. The British pharmacopoeial preparations are (1) *glycerinum acidis tannici;* (2) *suppositoria acidis tannici;* (3) *trociscus acidii tannici.* The United States also has a *collosum stypticum* and an *ointment.* From tannic acid is also made *gall* acid, which resembles tannic acid but has no astringent taste. When applied to broken skin or exposed surfaces it coagulates the albumen in the discharges, forming a protecting layer or coat. It is moreover and astringent to the tissues, hindering the further discharge of fluid. It is a powerful local haemostatic, but it only checks haemorrhage when brought directly in contact with the bleeding point. Tannic acid is also used as a haemostatic in a fine spray, or taken internally it will check gastric haemorrhage. In large doses, however, it greatly disorders the digestion. In the intestine tannic acid controls intestinal bleeding, acting as a powerful haemostatic drug in constipation; for this reason it has been recommended to check diarrhoea.

Tannic acid is largely used in the treatment of various ulcers, sores and moist eruptions. The glycerin is used in tonsillitis and the lozenges in pharyngitis. For bleeding haemorrhoids tannic acid suppositories or tannic acid can beusted on directly. The colloidium stypticum is a valuable external remedy. Tannic acid is absorbed as gallic acid into the blood and eliminated as gallic and pyrogallic acids, darkening the urine. Gallic acid does not coagulate albumen when used externally. It has been used internally in haemoptysis and haematuria. Combined with opium it is an efficient remedy in *diabetes insipidus*.

TANN-RATHSAMHAUSEN, LUDWIG SAMSON ARTHUR, FREIHERR VON UND ZU DER (1815-1881), Bavarian General, was born at Darmstadt on the 18th of June 1815, the day of Waterloo. He was descended from the old family of von der Tann, which had representatives in Bavaria, Alsace and the Rhineland. Of the Bavarian line he was the daughter of an Alsatian, Freiherr von Rathsohausein) in 1868 by licence of the king of Bavaria. Ludwig, the first king of Bavaria, stood sponsor for the child, who received his name and in addition that of Arthur, in honour of the duke of Wellington. He received a careful education, and in 1827 became a page at the Bavarian court, where a great future was predicted for him. Entering the artillery in 1833, he was sent after some years place on the general staff. He attended the manoeuvres of the Austrian army in Italy under Radetzky (q.v.) and, in the spirit of adventure, joined a French military expedition operating in Algiers against the Tunisian frontier. On his return he became a close personal friend of the Crown Prince Maximilian Joseph (afterwards King Maximilian). In 1848 he was made a major, and in that year he distinguished himself greatly as the leader of a Schleswig-Holstein light corps in the Danish war. At the close of the first campaign he was given the order of the Red Eagle by the king of Prussia, and his own sovereign gave him the military order of Max-Joseph without asking for it, and also made him a lieutenant-colonel. In 1851 he served as chief of staff of the Bavarian contingent at the front, and distinguished himself at the lines of Düppel, after which he visited Haynau’s headquarters in the Hungarian war, and returned to Schleswig-Holstein to serve as v. Willisen’s chief of staff in the Idstedt campaign. Then came the threat of war between Prussia and Austria, and von der Tann was recalled to Bavaria. But the affair ended with the “surrender of Olmütz,” and he saw no further active service until 1866, rising in the usual way of promotion to colonel (1851), major-general (1855), and lieutenant-general (1862). In the earlier years of the period he was tortured, he fought several successful engagements under the Grand Duke of Mecklenburg near Orleans. On the termination of the war he was reappointed commander-in-chief of the I. Bavarian corps, a post which he held until his death at Meran on the 26th of April 1881. He had the grand cross of the Bavarian military orders, and the first class of the Iron Cross and the *pour le mérite* from the king of Prussia. In 1878 the emperor named von der Tann chief of a Prussian infantry regiment, decreed him a grant, and named one of the new Strassburg forts after him.

TANSA, a small river in Salset district, in the Thana district of Bombay, which provides the city of Bombay with its water-supply. It is embanked by one of the largest masonry dams in the world, built in 1892. The embankment is nearly 2 m. long, 118 ft. high, and 110 ft. thick at the base.

TANTA, a town of Lower Egypt, in a central position nearly midway between the two main branches of the Nile, and converging-point of several railways traversing the Delta in all directions. It has a population (1907) of 54,437, is the capital of the rich province of Gharba, and is noted for its fairs and Moslem festivals, which are held three times a year in honour of Seyyid el-Menawi, and are sometimes attended by 200,000 pilgrims and traders. There are a large railway station, a very fine mosque (restored), and a palace of the khedive. Seyyid el-Menawi, who lived in the 13th century A.D., was a native of Fes who, after a pilgrimage to Mecca, settled in Tanta. He is one of the most popular saints in Egypt.

TANTALUM [symbol Ta, atomic weight 181.0 (O=16)], a metallic chemical element, sparingly distributed in nature and then almost invariably associated with columbium. Its history
is intermixed with that of columbium. In 1801 C. Hatchett detected a new element, which he named columbium, in a mineral from Massachusetts, and in 1802 A. G. Ekeberg discovered an element, tantalum, in some Swedish yttrium minerals. In 1809 W. H. Wollaston unsuccessfully endeavored to show that columbium and tantalum were identical. In 1844 H. Rose detected two new elements in the cobalt stibnites, which he named niobium and pelopium; dianium was later shown to be columbium, and ilmenium and cerium were identified by R. Hermann. The researches of C. W. Blomstrand, and others, especially of Marignac, proved the identity of columbium, dianium and niobium, and that ilmenium was a mixture of columbium and tantalum. It is very probable that niobium is a similar mixture. Berzelius, who prepared tantalic acid from the mineral tantalite in 1820, obtained an impure metal by heating potassium tantalofluoride with potassium. In 1902 H. Moissan obtained a carbon-bearing metal by fusing the pentoxide with carbon in the electric furnace. The preparation of the pure metal was successfully effected by Wernher von Bolton in 1905, who fused the compressed product obtained in the Berzelius process in the electric furnace, air being excluded. An alternative method consisted in passing an electric current through a filament of the tetroxide in a vacuum. The metal is manufactured, for use as filaments in electric lamps, by the action of sodium on sodium tantalofluoride.

The pure metal is silver-white in colour, is very ductile, and becomes remarkably hard when hardened, a diamond drill making little impresssion upon it. Its tensile strength is higher than that of steel. It melts between 2280° and 2300°, its specific heat is 0.027, its coefficients of expansion 0-000079, and specific gravity 16.64. When heated in air the metal burns if in the form of thin wire, and is superficially oxidized if more compact. At a red heat it absorbs large volumes of hydrogen and nitrogen, the last traces of which can only be removed by fusion in the electric furnace. These substances, and also carbon, sulphur and tellurium, render the metal very brittle. Tantalum is not affected by alkaline solutions, but is disintegrated when fused with potash. Hydrofluoric acid is the only acid which attacks it. It alloys with irorn, molybdenum and tungsten, but not with silver or mercury.

In its chemical relationships tantalum is associated with vanadium, columbium and didymium in a sub-group of the periodic classification. In general it is pentavalent, but divalent compounds are known.

Tantalum tetroxide, TaO₄, is a porous dark grey mass harder than glass, and is obtained by reducing the pentoxide with magnesium. It is unaffected by any acid or mixture of acids, but burns to the pentoxide when heated.

Tantalum pentoxide, Ta₂O₅, is a white amorphous insoluble powder, or it may be crystallized by strongly heating, or by fusing with boron trioxide or microcosmic salt. It is insoluble in all acids. It is obtained from potassium tantalofluoride by heating with sulphuric acid to 400°, boiling out with water, and decomposing the residual compound of the oxide and sulphuric acid by ignition, preferably with the addition of ammonium carbonate.

Tantalic acid, H₅TaO₄, is a gelatinous mass obtained by mixing the chloride with water. It gives rise to salts, termed the tanta-
lates. The normal salts are all insoluble, which either are anhydrous or, on adding water, form hydrates. However, Ta₂O₅ (which does not exist in the free state), forms soluble salts with the alkaline metals. Per tantalic acid, H₅TaO₄, is obtained in the hydrated form as a white precipitate by adding sulphuric acid to potassium tantalate, K₂Ta₂O₇, which is formed when hydrogen peroxide is added to a solution of potassium tantalate.

Tantalum pentahalide, TaF₅, for a long time only known in salt form, is obtained by the action of fluorine on tantalum and aluminium, and purifying by distillation in a vacuum. It forms colourless, very hygroscopic prisms, which attack glass, slowly at ordinary temperatures, more rapidly when heated. It is able to form tantalum fluoride compounds, which are important and serve for the separation of the metal from columbium and titanium. Tantalum pentachloride, TaCl₅, is obtained as light yellow needles by heating tantalum with chlorine in a current of chlorine. By heating with sodium amalgam and separating with hydrochloric acid, the dichloride, TaCl₄•2H₂O, is obtained as emerald green hexagonal crystals. The pentaboride exists, but tantalum and iodine apparently do not combine. Tantalum forms a sulphide, TaS₂, and two nitrates, Ta₂N₃ and Ta₅N₄, have been described.

Manganese determinations thought to be 181, but Henrichsen and N. Sahlin (Ber., 1906, 39, p. 2560) obtained 179-8 (H = 1) by converting the metal into pentoxide at a dull red heat.

TANTALUS, in Greek legend, son of Zeus (or Tmolus) and Pluto (Wealth), daughter of Himantes, the father of Pelops and Niobe. He was the traditional king of Sipylos in Lydia (or of Phrygia), and was the intimate friend of Zeus and the other gods, whose table he was admitted to. He was held in very high esteem by the gods, and the divine favour by reveal to mankind the secrets he had learned in heaven (Diod. Sic. iv. 74), or by killing his son Pelops (p. 82) and serving him up to the gods at table, in order to test their powers of observation (Ovid, Metam. vi. 401). Another story was that he stole nectar and ambrosia from heaven and gave them to men (Pindar, Ol. i. 60). According to others, Pandareus stole a golden dog which guarded the temple of Zeus in Crete, and gave it to Tantalus to take care of. But, when Pandareus demanded the dog back, Tantalus denied that he had received it. Therefore Zeus turned Pandareus into a stone, and flung him up in a lake on Mount Sipylos on the top of him (Antoninus Liberalis, 36). The punishment of Tantalus in the lower world was famous. He stood up to his neck in water, which flowed from him when he tried to drink of it; and over his head hung fruits which the wind wafted away whenever he tried to grasp them (Odyssey, xi. 582). This myth is the origin of the English word "tantalize," and also of the common name "tantalus" for a set of spirit decanters kept under lock and key. Another story is that a rock hung over his head ready to fall and crush him (Euripides, Orastes, 5). The sins of Tantalus were visited upon his descendants, the Pelopidae. Among the ancient historical reminiscences and natural phenomena, especially volcanic catastrophes, are at the bottom of the legend. The tomb of Tantalus on Mount Sipylos was pointed out in antiquity, and has been in modern times identified by C. F. Texier with the great cairn beneath Old Magnesia; but Sir W. M. Ramsay inclines to a remarkable rock-cut tomb beside Magnesia.

The story of Tantalus is an echo of a semi-Greek kingdom, which had its seat at Sipylos, the oldest and holiest city of Lydia, the remains of which are still visible. There was a tradition in antiquity that the city of Tantalus had been founded by Pelops, or by the Mahratta leader last of the Bhumiluris. With the aid of the Gwalior contingent he pressed General Windham hard at Cawnpore on the 23rd of December 1857, but was defeated and captured by Sir Colin Campbell on the 6th of December 1858, together with the Rani of Jhansi he was besieged by Sir Hugh Rose in the Jhansi fort, but escaped and collected a force of 20,000 men which Sir Hugh defeated without relaxing.
the siege. This was the decisive action of the campaign in Central India, and Tantia Topi was obliged to seek refuge in the jungles of Rajputana and Bundelkhand, where he was taken by Major Meade, condemned, and executed on the 18th of April 1859. He was the only rebel leader in the Mutiny who showed any conspicuous military talent.

**Taoism**

A form of religion in China, the name of which is taken from the ancient treatise called *Tao Teh King*, supposed to be the work of the sage Lao-tse (q.v.). The later characteristics of Taoism as a form of worship represent a corruption of the earlier doctrines of Lao-tse, and the infusion of Buddhist and other ideas.

**Tao-Diana** (Ancient *Taurumenum*), a town on the E. coast of Sicily, in the province of Messina, from which town it is 30 m. S.S.W. by rail. Pop. (1901) 4116. It has come into great favour as a winter resort, especially with British and German visitors, chiefly on account of its fine situation and beautiful views. It lies on an abrupt hill 660 ft. above the railway station, and was founded by the Carthaginian Himilco in 397 B.C. for a friendly tribe of Sicels, after the destruction, by Dionysius the Elder of Syracuse, of the neighbouring city of Naxos. In 395 Dionysius failed to take it by assault on a winter's night, but in 392 he occupied it and settled mercenaries there. In 352 they were expelled from Naxos; after wandering up and down Sicily, at last found a home there. Its commanding site gave it considerable importance. It was the city at which both Timoleon and Pyrrhus first landed. During the First Punic War it belonged to the kingdom of Hiero, and after his death it enjoyed an exceptionally favoured position with regard to Rome, being like Messana and Netum, a civitas foederata. During the first Servile War it was occupied by Eunous and some of his followers, but was at length taken by the consul Publius Rupilius in 157. It was one of the strongholds of Sextus Pompeius, and after deathly wounds in 41 B.C. Augustus made it into a colonia as a measure of precaution, expelling some of the older inhabitants. In the time of Strabo it was inferior in population, as we should expect, to Messana and Catana; its marble, wine and mullets were highly esteemed. In A.D. 902 it was taken and burnt by the Saracens; it was retaken in 962, and in 1078 fell into the hands of the Normans.

The ancient town seems to have had two citadels; one of these was probably the hill above the town to the W. now crowned by a medieval castle, while the other was the hill upon which the after-mentioned church (P. A. Freeman, History of Sicily, iv. 506). There are some remains of the city walls, belonging to more than one period. It is indeed possible that one fragment of wall belongs to a period, before the foundation of the city, when the Nasians had a fortified port here (Evans in Freeman, op. cit., iv. 100 n. 1). The church of San Pancrazio, just outside the modern town, is built into a temple of the 3rd century B.C., the S. wall of the cella of which is alone preserved. Inscriptions prove that it was dedicated to Serapis. The other ruins belong in the main to the Roman period. The most famous of them is the theatre, largely hewn in the rock, which, though of Greek origin, was entirely reconstructed. The seats are almost entirely gone, but the stage and its adjacent buildings, especially the wall, in two storeys, at the back, are well preserved: some of its marble decorative details were removed for building material in the middle ages, but those that remained have been re-erected. The view from the theatre is of exceptional beauty, Mount Etna being clearly seen from the summit to the base on the S.W., while to the N. the rugged outlines of the coast immediately below, and the mountains of Calabria across the sea to the N.E. make up one of the most famous views in the world. There are also remains of a much smaller theatre (the so-called Odeum), and some large cisterns; a large bath or tank which was apparently open, known as the Naumachia, measures 426 ft. in length and 393 in width: only one of its long sides is now visible, and serves as a foundation for several houses in the main street of the modern town. The aqueducts which supplied these cisterns may be traced above the town. There are remains of houses, tombs, &c., of the Roman period, and fine specimens of Romanesque and Gothic architecture in the modern town.

See Rizzo, *Guida di Taormina e dintorni*, Catania, 1902. (T. As.)

**Tapaculo**

The name 1 given in Chile to a bird of singular appearance—the *Pteropodus albicolis* of ornithology, and applied in an extended sense to its allied forms, which constitute a small family, *Pteropodidae*, belonging to the *Clamatoridae* division of *Passeres*, peculiar to South America. About 20 species, disposed by P. L. Schlegel (*Ibis*, 1874, pp. 180-206) in 8 genera, are believed to belong to this group.

The species of the Family first made known is *Scytalopus magelanicus*, originally described in 1783 by J. Latham (*Sympsis*, iv. p. 404) as a Warbler. Even in 1866 J. Gould not unaptly took it for a Wren, when establishing the genus to which it is now referred; but some ten years after Johannes Müller found that *Scytalopus*, together with the true Tapaculo, was first described by Ktitiz in 1834, possessed anatomical characters that removed them far from any position previously assigned to them, and determined their true place as above given. In the meanwhile a kindred form, *Hylastes*, also first described in 1834, had been shown by T. C. Eyton to have some very exceptional osteological features, and these were found to be also common to *Pteropodus* and *Scytalopus*. In 1860 J. Cabanis recognized the *Pteropodidae* as a distinct Family, but made it also include *Monura* (see *Lyre-Bird*), and in 1874 P. L. Schlegel thought that *Atricilla* (see *Scrub-Bird*) might belong here. It was A. Garrod in 1876 and 1877 who finally divested the Family of these aliens, and until examples of some of the other genera have been anatomically examined it may not be safe to say that they all belong to the *Pteropodidae*.

The true Tapaculo (*P. albicolis*) has a general resemblance in plumage to the females of some of the smaller Shrikes (*Lanius*), and to a cursory observer its skin might pass for that of one; but its shortened wings and powerful feet would on closer inspection at once reveal the difference. In life, however, its appearance must be wholly unlike, for it rarely flies, hops actively on the ground or among bushes, with its tail erect or turned towards its head, and continually utters various and strange notes,—some, says Darwin, are "like the cooing of doves, others like the bubbling of water, and many dely all silmes." The "Turco," *Hylastes megapodus*, is larger, with greatly developed feet and claws, but is very similar in colour and habits. Two more species of *Hylastes* are known, and 1 Of Spanish origin, it is intended as a reproof to the bird for the shameless way in which, by erecting its tail, it exposes its hinder parts. It has been sometimes misspelt "Tapacola," as by C. Darwin, who gave (*Journal of Researches*, chap. xii.) a brief but entertaining account of the habits of this bird and its relative, *Hylastes magapodus*, called by the Chilenos "El Turco."
one other of Pteroptochus, all of which are peculiar to Chile or Patagonia. The species of Scytalopus are as small as Wrens, mostly of a dark colour, and inhabit parts of Brazil and Colombia, one of them occurring so far northward as Bogota. (A. N.)

TAPER (probably of Celtic origin, cf. Irish tapar, Welsh lamp'r, taper, torch), a small thin candle of tallow or wax (see Candle); from its early shape, in which the circumference of the top was smaller than that of the base, the word came to be used in the sense of "slender," particularly of something diminishing in size at one end. In architecture the word is used of the gradual diminishing of a spire or column as it rises. The spire tapers almost to a point, where it is terminated by a finial or vane: the column tapers only to a less diameter at the top, and as a general rule the more ancient the column the greater its diminution or taper; thus in one of the early temples at Selinus in Sicily the upper diameter is about half the lower diameter, while in the Parthenon it is about one-fifth.

TAPESTRY. The Gr. τάπητις and Lat. tapestria, from which our word "tapestry" is descended, implied a covering to both furniture and floors, as well as curtains or wall hangings, and neither of them really defines the particular way in which such articles were made. The decorations on these Greek and

Fig. 1.—Gobelins high-warp tapestry frame, with weaver (18th century), holding in right hand (a) bobbin with warp thread wound round its thick end, and with his left hand taking (e) some of the fisses or strings with a loop at one end of each of them, through which a warp thread is passed, and thus pulling forward those warp threads in between which he will pass his weft. mm is the tapestry he has woven, which has been wound round (p) the cylinder. The other letters in this diagram relate to details in the frame which are of subsidiary interest. The description of them would not further elucidate the act of weaving which is here in question.

Roman coverings were effected by painting, printing, embroidery, or a method of weaving with coloured threads; and specimens and other conclusive evidence show that early Egyptians, Babylonians, Chinese, Indians, Greeks and Romans employed some at least of the means above-named.

The purpose of this article is to give some account of those decorated stuffs which are produced by weaving coloured threads on to warp threads in a manner that differs from shuttle-weaving, and at the present day is called tapestry-weaving, such for instance as is practised at the famous Gobelins and Beauvais tapestry manufactories in France. At the Gobelins, the warp threads are stretched in frames standing vertically (high warp or haute lisse); at Beauvais in frames placed horizontally with the ground

(see Account of Gravels at Ancon, Asher & Co.; see also specimens from Graves at Lima in the Victoria and Albert Museum, London.)

FIG. 2.—Gobelins tapestry-weaving, showing (a) the left hand of the weaver pulling forward (c) a group of warp threads, into which with (b) the comb in his right hand he is compressing at point (d) the weft threads which have been passed around in between the warp threads; (e) are various bobbins, hanging at rest, suspended by their weft threads; and (f) is the tapestry as woven and compressed.

High and low warp frames.
As regards the antiquity of the two sorts of frames (the low and high warp) the Beni Hassan wall paintings (1600 B.C.) include diagrams of horizontal (low warp) frames, with weavers squatting on the ground at work on them; while a vertical or high warp frame is represented on a Greek vase of the 5th century B.C. found at Chiusi (fig. 3), and corresponds with frames used in Scandinavian countries. In both these late-named the lower ends of the warp threads are merely weighted, thus presenting some difficulty to the act of weaving, and of subsequently compacting the weft upwards, the warp not being taut and fastened to a beam, according to more ordinary usage, as, for instance, in the high warp frame illustrated in the codex of Rabanus Maurus, 9th century A.D., preserved at Monte Cassino (fig. 4). The words "de Geneceo" in this illustration point to a medieval survival of the earlier gunakonites of the Greeks and the gynaecae of the Romans, which were the quarters set apart in the house of the well-to-do for the spinning, weaving and embroidery done by women for the household. From such ancient frames to similar haute and bosse lisse frames of the French tapissiers nostres and tapissiers sarraisons governed under edicts (1226-70) of Louis IX., and so on to present-day Gobelins and Beauvais frames, the transition can be easily realized. The texture of all tapestry weavings presents no radical difference in appearance, no matter when or where produced.

Within reasonable limits it is not practicable to sketch in a complete form the history, from the middle ages onwards, of the prosecution of the art by each of the many European towns that have become engaged in tapestry weaving. But the foregoing remarks will suggest, what seems to have been the fact, that a continuity in the knowledge of the art was kept up so that as favourable conditions occurred it would be taken into practice. Artificers (male and female) such as the Roman planarii wove tapestries with figures of Britons (Virgil, Georg., iii. 29) "purpureae selectae tullanulae Britanni," — others with scenes from the story of Theseus and Ariadne (Catullus, Argen., xlvi. 267), besides many more for emperors and the wealthy. The demand for such production of the testinaria or trade workshops, and of the more private gynaecae, as well as the organization of workmen's societies, collegia opificum, are evidence of circumstances lasting for some centuries in Rome that were favourable to tapestry-weaving there. Suggestions of Roman designs are the illustrations of part of a curtain or wall hanging (fig. 5), and of a hanging or couch cover (fig. 6); whilst the daintiest quality of tapestry-weaving for the ornamentation of a tunic is displayed in fig. 7. The ornamentation in fig. 5—a hanging 5 ft. 3 in. by 19½ in.—consists of a series of horizontal leafy bands or garlands and other devices: between the upper bands on a red ground is a bird on a leafy twig. This is Egyptian-Roman work of about the 3rd century A.D. A portion of a linen cloth or couch cover ornamented with tapestry woven in coloured

wools and linen thread is shown in fig. 6. At the top there is a fragment of a horizontal border of floral and leaf ornament beneath which, and enclosed by festoons of leaves, are two boys floating in the air and holding ducks; elsewhere are figures of boys running and carrying baskets of fruit, and large and small blossom forms or rosettes. This also is Egypto-Roman work, about the 4th century, and is 4 ft. 5 in. by 4 ft. 1 in. Fig. 7 presents a square (from a small tunic) of very fine warp and weft tapestry-weaving, with a child mounted on a white horse: in the border about him are ducks, fish and (?) peaches. This too is Egypto-Roman work of about the 2nd or 3rd century and is about 4 inches square. The square in fig. 8 is from a tunic or robe and is of tapestry-weaving in bright-coloured woools, with a representation of Hermes holding the caduceus in one hand and a pince-nez in the other. About his head is a nimbus and his name in Greek characters. This again is Egypto-Roman work of about the 1st or 2nd century and is 6½ inches square. The panel of tapestry-weaving in fig. 9 is from a couch or bed covering, and is wrought in purple wool and linen threads. The design recalls the description of the lorica or couch-covering alluded to in Petronius Arbiter's account of Trimalchio's banquet, "on which were depicted men in ambush with hunting poles and all the apparatus of the chase." This piece is also of Egypto-Roman work about the 2nd or 3rd century, about 12 in. by 10 in.

The well-known 6th-century Ravenna mosaics of the Emperor Justinian and the Empress Theodora are rich with hangings and costumes decorated presumably with tapestry weavings similar to those just described. From the 5th century and for many centuries later, monasteries, nunneries and the like, under ecclesiastical control or influence, became centres of activity in this and cognate arts, stimulated by the patronage of the Church and courts; and in the 5th and 6th centuries the Emp. Charlemagne's body of travelling inspectors, the cenoviis dominici, appears to have exercised for a time a helpful influence upon such centres throughout France and in parts of Germany. Two centuries later, free, as distinct from bond, handcrafts men were forming local associations for their industries, and in this movement the weavers took the lead throughout England, Flanders and Brabant, France being a little later. The gilds of weavers in London and Oxford were granted charters by Henry I. In the 11th century gilds of wool weavers existed at Cologne and Mainz, and in the following century there was a similar guild at Spires: it is quite probable that some of their weaving would be of tapestry. The fragment in fig. 11 is considered by authorities to be of 12th-century north European work, possibly from some Rheinish place. At one time the whole piece

![Fig. 3—Penelope's tapestry-weaving frame, from a Greek vase of the 5th century b.c.](image)

![Fig. 4—High warp frame from MS. Codex by Rabanus Maurus (9th century).](image)
FIGS. 5-9.—Specimens of Egypto-Roman tapestry weaving of about the 2nd to 5th century A.D. Victoria and Albert Museum.
FIG. 10.—Fragment of coarse linen material with a large diamond panel of tapestry weaving in coloured threads—Peruvian-made, before the conquest of Peru by Pizarro. About 3 ft. by 2 ft. 6 in.

FIG. 11.—Portion of wall-hanging from the church of St. Gereon, Cologne. North French or German manufacture of the 11th or 12th century. About 2 ft. by 2 ft. 6 in.

FIG. 12.—An antependium, or altar hanging of tapestry woven in coloured wools, with the Adoration of the Magi, probably from a design by Wohlgemuth (1434-1519). The tapestry is reputed to have been executed in a convent at Bamberg; below the folds of the Virgin’s cloak, to the right, the “tapissière” has woven a figure of herself at work. German, 15th century. This interesting piece is in the museum at Munich. About 5 ft. 6 in. by 2 ft.
Fig. 13.—One of a series of designs (the Trojan War) by Jean Fouquet (1415-1485) from which tapestry hangings were woven, probably at Arras in the middle of the 15th century.

Fig. 14.—Part of the tapestry (13 ft. high) woven from the design in Fig. 13. Arrival of Queen Penthesilea at the court of King Priam.

Fig. 15.—Part of the tapestry (10 ft. high) woven from the design in Fig. 13. Queen Penthesilea overcoming Diomedes.

Fig. 16.—Long and narrow tapestry (8 ft. 10 in. by 22 in.), German work of the 15th century. Field labours, &c.
Fig. 17.—Part of a wall hanging of tapestry woven (probably at Brussels early in the 16th century) with coloured wools and silks, which is one of a series designed, probably by some member of the school of Roger van der Weyden, to illustrate the Triumphs written by Petrarch. The episode represented is the Triumph of Chastity over Love. Falling from a triumphal car fitted with flaming altars or torches of love, and drawn by four winged white horses, is Cupid, whose left arm is grasped by Chastity mounted on a unicorn and carrying the column symbolizing Strength or Constancy. Foremost in the multitude about the car of Love are Cleopatra and Julius Caesar. In another part of this hanging is the date 1507. The height of this piece is 14 ft. This, with tapestries of the Triumph of Death and Fame, is in the Victoria and Albert Museum; one hanging of the Triumph of Time is at Hampton Court.
belonged to the church of St. Gereon, Cologne; a large bit of it is in the museum at Lyon; another at the Abbey of St. Gall. A small part of the border only is in the Victoria and Albert Museum, South Kensington. The pattern consists of diagonal runouls within each of which is a chimerical bird and bull (? St. Luke), elsewhere the runouls are in solid. In a 16th-century tapestry of oriental and Byzantine character, is frequently found in shuttle-woven silks of the period.

The tapestries from different countries of the 14th and 15th centuries onwards.

The tapestries of the 14th and 15th centuries, usually entitled tapestries of Troy, and fig. 23 of Dido and Aeneas. Historical design occurs in fig. 20, which is one of a set of tapestries woven possibly at the royal factory of Fontainebleau about 1519, to commemorate the fete on the occasion of the marriage of Henri II, with Catherine de Medicis; and again in fig. 25, of the "Glorious Defence of Londonderry." Pastoral interest is presented in figs. 16, and an example of the tapestries, mostly of the 15th century, wrought from leaf designs, usually termed "verdures," of which several were made at Brussels during the 16th century. Herakle and floral designs were also frequently seen in the 15th century in Winchester College, and fig. 18, which is at Haddon Hall and was woven early in the 16th century. It is very similar to herakle which was a part of the lozenge design invented by Charles the Bold at the battle of Granson. Many curiously designed tapestries of German 15th-century origin are to be seen in the museum at Basel—one of them (fig. 21) displays strange beasts strange to nature, yet suggestive of the design invented with legends. Other tapestries, worked from still later phases of ornamental design, are fantastic with schemes of abstract ornament into which are introduced subsidiary details figure subjects seen in the paintings of the day.

The treatment of the compositions in cartoons for tapestries follows that adopted by painters. Thus examples from the 11th to the end of the 15th century are formal in the drawing of the forms introduced into them, and comparatively limited in range of colours, lights and shades, in accordance with the mannerisms of the earlier painters whether Illuminators of MSS. or wall and panel painters. It has been argued from this that the designers of such early tapestry work possessed a sense of the limitations imposed by the process and materials. But in their day the relatively small number of dyes available involved conventionality in colour, quite as much the earlier styles of drawing involved conventionality in form.

Fig. 13 is from an interesting design by Jehan Fouquet (1415-1485): and is one of a set, made by him to illustrate the Trojan War, now in the Louvre. From these drawings tapestries were woven at Arras, in the year 1499, by the Azuret Gobelin tapestry workshop. One of these hangings in the Victoria and Albert Museum (see figs. 14 and 15) is from Fouquet's design, representing the arrival of Queen Penthesilea and her warrior women at Troy and the part which she took in the fatal conflict. It is a rare instance of a design naturally came into play, and practically became an introduction to the tapestry workshop. This episode was introduced by Quintus Calaber (or Smyrnaius), a 4th-century writer, in his version of the Homeric story. A tapestry fragment, by the Gobelin workshop (whereafter a great deal of the decoration of their tapestry works was traced by artists), may be seen at the Victoria and Albert Museum, representing the chariot of Priam in the midst of his court in the Palace of Justice at Issore.

When Raphael, master of a freer and more realistic style in rendering form and colour, produced his cartoons of the Acts of the Apostles for the Sistine Chapel (1510), he naturally turned to the Italian tapestry workshops, which were well established in Flanders. The provision of a bigger scale of dyes for the wools and silks was stimulated to secure success in weaving these more realistic representations of forms and greater subtleties in colour, as well as the developed effects of perspective: compare, for instance, the treatment in fig. 14 with that in fig. 22. The restraint or limitations of the earlier styles were thus gradually swept away by the comparatively inexperienced workers; and it is a point of interest to note that provision for still further inventing and improving dyes and so helping tapestry to assimilate to painting is specially included in the regulations (1667) of the state tapestry factory at Tournai.

compositions, and the flowers, &c., as in the ground of Fig. 18, and might complete or correct their cartoons with charcoal or chalk, but for every other style of work they were bound to apply to professional painters under pain of fine.

The early 17th-century tapestry dealers in tapestries were required to mark their weavings, and Charles V, ordered all tapestry makers in the Low Countries to do the same. This practice was followed by some Flemish and French weavers. In France, the painter Charles le Brun as the Manufacture Royale des Meubles de la Couronne, which for large hangings became the premier tapestry-weaving centre in Europe. Three years previously Colbert and his predecessor, Charles le Brun, had been in Italy, studying the art of tapestry weaving in Florence, where they were impressed with the work of the Medici and the Vatican. By the 1720s, the production of tapestries was at its height, and many of the most famous artists of the period were involved in the design and production of tapestries. The most important of these artists were Roger de Eycks, who worked in the 16th century, and his son, Roger II, who worked in the 17th century.

Arraziers, or cloth-makers, are thought to have been established in the 16th century, and their work is often characterized by the use of borders and quarterings. The most famous of these arraziers were the Gobelin and Aubusson factories, which were established in the late 16th century and are still in operation today. The Gobelin factory was founded by Charles V in 1537, and the Aubusson factory was established in 1567. These factories were among the most important in Europe, and their work is often characterized by the use of exuberant patterns and rich colors.

Tapestry-weaving during the 18th century under private enterprise was pursued with success and still continues at Aubusson, Felletin; it was carried on for a short time only at Fulham, Soho, Exeter, and for rather longer periods at Morden near London, Nunberge near Brunswick, Seville, Munich, Berlin, Dresden, Heidelberg, and St. Petersburg, maintaining, however, no very prolonged existence at any of these latter places. In modern times, however, the manufacture of tapestries is practised in France, in the 16th-century style, for diplomatic and other purposes, by the comparatively effeminate and delicate painting-like fabrics now made at the Gobelins and Aubusson.

The end of the 18th century, as far as the kind of tapestry known as the ‘Seasone’ is concerned, marks a period in the history of tapestry weaving which has been described as the ‘Golden Age’ of tapestry. The most notable development of this period was the use of the new pictorial style of tapestry weaving, which was characterized by the use of small, exquisitely detailed designs, often representing historical or mythological scenes. This style of tapestry weaving was particularly popular in France, where it was produced in the Gobelin and Aubusson factories. These factories were among the most important in Europe, and their work is often characterized by the use of exuberant patterns and rich colors.

In the 19th century, the manufacture of tapestries continued to be carried on in France, but the industry began to decline. The decline was caused by a number of factors, including the rise of machine weaving, the increasing demand for cheaper fabrics, and the decline in the popularity of tapestries among the upper classes. Nevertheless, the Gobelin and Aubusson factories continued to produce high-quality tapestries, and their work is still in demand today. The Gobelin factory is still in operation, and its work is often characterized by the use of exuberant patterns and rich colors.

Much of the tapestry work produced in the 17th and 18th centuries was designed by some of the most famous artists of the period, including Gaspar Poussin, Claude Lorraine, and Jean-Baptiste Van der Meulen. These artists designed a large number of tapestries, which were produced in the Gobelin and Aubusson factories, and the results are still in demand today. The Gobelin factory is still in operation, and its work is often characterized by the use of exuberant patterns and rich colors.
Fig. 18.—Brussels, early 16th century, hanging, covered with masses of flowers, on which are shields bearing the royal arms. Now at Haddon Hall. The property of the duke of Rutland.

Tapestry

Fig. 20.—Tapestry hanging (about 10 ft. high) possibly of Fontainebleau manufacture about 1540. Fêtes in honour of Henri II. and Catherine de Medicis.

Fig. 19.—Brussels tapestry (about 6 ft. high), late 15th century, with a shield bearing three crowns, red and white roses, and the monogram I.H.S. repeated three times. From Winchester College.

Fig. 21.—German tapestry hanging (about 4 ft. 6 in. long by 3 ft. high) for a sideboard or buffet, middle of the 15th century. In the museum at Basel.

Fig. 22.—Tapestry hanging (about 10 ft. high) made at the Medici factory in Florence, 1639. Domestic scene, L’Inverno, winter.
FIG. 23.—Oudenarde tapestry, early 17th century. The design, "Dido and Eneas," rather in the style of J. van Straten.

FIG. 24.—One of the four tapestry hangings of the "Seasons," of Winter with Aeolus in the centre, probably woven under the direction of Francis Hickes at William Sheldon's manufactory at Barcheston, in Warwickshire, early in the 17th century, and now at Hatfield House.
Fig. 25.—Defence of Londonderry. Irish (Dublin) tapestry, early 18th century.

Fig. 25.—Tapestry woven at Merton Abbey, from a design by William Morris (1834–1896). The subject is from his poem "The Orchard." Victoria and Albert Museum.
TAPEWORMS

Fine examples of early and later European tapestries are to be seen in the cathedrals of Reims, Bruges, Tournai, Angers, Beauvais, Aix, Sens, in the Victoria and Albert Museum, London, Windsor Castle, Hampton Court, St Mary's Hall Coventry, Chartres, Amiens, Dijon, Orleans, Auxerre, Nancy, Bern, Brussels, Basel, Munich, Berlin, Dresden, Vienna and Nuremberg. In Italy the largest collections (mostly of trophies) are to be seen in the churches of those nations at Rome, and the Reale Galleria degli Arazzi at Florence. Many fine pieces are in the royal palace at Turin, the Palazzo del Te at Mantua, the Museo del Duomo, Milan, in the cathedral of Como, and the museum at Naples. The collection of tapestries at Madrid is one of the largest in Europe, and comprises more than one thousand examples, the older of which, of splendid Flemish design and weaving, belongs to the school of Antwerp in the 16th century, the work of Charles V.

The principal cathedrals of Spain also possess important tapestries; those preserved at the cathedral of Toledo are more than enough to supply hangings for the outside and inside of that building on the feast of Corpus Christi. Throughout the European continent, in the United States of America, and in Great Britain almost uncountable tapestries are displayed or stored in mansions, castles, châteaux and palazzi, belonging to noble and wealthy families. A large number of books have been written and published on the subject generally, and many of them, containing good illustrations, are of recent date.

The following works may be considered as likely to prove useful for investigating the history and character of Egyptian-Roman and Coptic textiles: J. Karabacek, Die Theodor Grafischen Blätter in Aegypten ("Die Textilien-Gräberlinder"), 8vo, Vienna, 1877;- 1880. Also, coll. of printed and manuscript Woven and Embroidered Egyptian Textiles in the South Kensington Museum, London, 1887; "Egyptian Tapestry," Society of Arts, Catalogue of the Egyptian Textiles in the Museum at Strassburg in the K. K. Austrian Museum, 13 photo-lithographs, 4to, Vienna, 1889; E. Gerspach, Les tapisseries coptes, 153 (some coloured) illustrations, 40to, Paris, 1890; K. Forrer, Mets Bensuch, Tapisseries des xvi, xvii, xiii siècles, 30 photo illustrations, 8vo, Strassburg, 1895; Römische und Byzantinische Seide-Textilen aus dem Gräberfeld von Achimn-Paropolis, 28 pp., 17 (15 coloured) plates, and illustrations in the text, 4to, Strassburg, 1891; Wladimir Bock, Coptic Art; Coptic Embroidered Textile (in Russian), 32 pp., 6 photo type plates, 40to, Moscow, 1897; W. Lowrie, Christian Art and Archaeology (pp. 326-82, "Textile Art"), process illustrations, London, 1901; A. Frank, L'art de tapisserie (pp. 147-277, "Les tissus"), process illustrations, 8vo, Paris, 1902.

In respect of medieval and later tapestries the titles of the following works are quoted: Jubinal, Anciennes tapisseries, Paris, 1835-39; Ronchard, La tapisserie dans l'antiquité, L'Épopée des Antiquaires, 8vo Paris, 1882; Mittx, La tapisserie, Paris, 1882; Boleau, Les métiers et corporations de la ville de Paris au xvi, siècle, Paris, 1879; Barbiere de Montaut, Tapisseries du sacre d'Angeor, Paris, 1863; De Farcy on the Tapisserie, 1875; Barrault, Tap. de la cath. de Beaunais, Beauvais, 1853; Pinchart, Roger van der Weyden . . . et les tapisseries de Berne, Brussels, 1864; Lorquet, Tap. de la cath. de Sens, Brussels, 1884; Guillery, Tap. de la cath. de Menton et de Menton, Histoire générale de la tapisserie, 1878; Mittx, Les fabriques de tapisseries de Nancy, 1883; Voisin, Tap. de la cath. de Tournay, Tournai, 1883; Van Drival, Tap. d'Arras, Arras, 1864; George, Tap. de la cath. de Bayonne, Paris, 1889; Du Bousquet, Pons-Murier, Les tapisseries des xvi, xvii, xix siècles, Paris, 1870; Notice sur les Tap. de Beaunais, Clermont, 1842; Deville, Statuts, etc., relatifs à la corp. des tap. de 1292, 1275, Paris, 1875; Duret, Les manufactures nationales de tapisserie des Gobelins de Paris, 1885; van der Graaf, De Tapijf-Fabrieken der xvi, en xvii, Eeuw, Middelburg, 1869; De Montaut, Tap. de haute lisse à Rome, Arras, 1879; Conti, L'arte degli arazzi a Firenze, Florence, 1875; Camperi, L'operaio dell'Estense, Modena, 1876; Braghirilli, Arazzi in Mantova, Mantua, 1879; Farabulini, L'arte degli arazzi, Rome, 1884; Gentili, L'arte dei tap, Rome, 1878; Mittx, Tap. Italianes, Paris, 1880; Dorregaray, Des allures et Antiquités (Flemish Tapestry, vol. vii, p. 47), Madrid, 1871-76; Darel and Guichard, Les tap. décoratives, Paris, 1877; Lacroix, Notice sur l'origine des tapisseries des Gobelins, 8vo, Paris, 1855; Guillaumot, Manufacture . . . des Gobelins, Paris, 1885; Tours, Tapestry, Plain of Navarre (in Messager des Sciences Historiques, Gand, 1868); Pera, Taphes, Tap. d'Aubusson, de Fellein, et de Belgardois, Paris, 1857; Périgord, Tap. de Fellein, Lomiges, 1853; Durieux, Tap. de Cambrai, Cambrai, 1879; About and Bauer, Tap. après les cartons de Raphael, Paris, 1875; Houyou, Tap. de la fabrication Lilloise, Lille, 1871; Vergnand-Romagnesi, Tap. au Musée des Antiquités (Lyon), 1864; Guffy, Hist. de la tapisserie, Tours, 1886; Pine, Tapestry of the House of Lords, London, 1739; Vallance Aymer, The Art of William Morris (see pp. 83-92); W. G. Thomson, A History of Tapestry from the earliest times until the present day, London, 1875. (A. S. C.)

1 See Report of Senator P. F. Riaño to the Director of the South Kensington Museum, 1875.
and of the female (vaginal) ducts, there is a distinct uterine opening at the opposite end of the body (b). Moreover, in *Amphitretus liguloides* a fourth duct (the anterior vagina) begins close to the origin of the female duct, and after running forward a short distance ends blindly (fig. 7, c). The egg gives rise to an oval larva, one half of which is ciliated and bears gland-cells, the opposite end carrying ten hooks. The fate of the larva is unknown.

Family II. *Gyrocotylidae.*—Leaf-shaped animals with crenate margins. One extremity bears a pedunculate rosette-organ. It is traversed by a canal from which a peculiar proboscis-like structure can be exerted. The opposite end is pointed and provided with a terminal sucker. *Amphiphyes* (=*Gyracotyle*) urna (fig. 1, B) is found in the intestine of *Chlamys* and *Ctenomychus,* and has been almost fully described by Spencer (7). The embryo is provided with ten hooks, and appears to select Lamellibranchs (*Mactra*) for its intermediate host.

Family III. *Caryophyllaeidae.*—Elongated cylindrical animals either with a single subterminal sucker at the proximal end, or with the corresponding end of the body converted into a mobile undulatory fold. *Caryophyllaenus mutabilis* occurs in the roach and other fresh-water fish, and passes its earlier stages of development in fresh-water Oligochaeta (*Tubifex*). *Archigetes appendiculatus* lives throughout life in the coelom of *Tubifex* and of *Limnodrilus.*

*Archigetes* and *Caryophyllaenus* are the only Cestodes that become fully differentiated in an invertebrate host. The former indeed is said to produce fully developed gonads, and if kept in aquaria with *Tubifex,* the number of infected worms steadily increases, a fact pointing to the whole cycle being passed through, without the intermediation of a vertebrate host. Conclusive evidence, however, has not yet been adduced to prove this point. The two genera agree closely in form and structure and may possibly belong to the cycle of the same or of allied species. *Archigetes* (3 mm. long) consists of a subcylindrical body and a caudal appendage. The former bears two terminal suckers on the flattened dorsal and ventral surfaces, the latter six hooks near the tip of the tail. The finer structure of the animal has been investigated by Mrazek (10), whose account, however, is published in the Hungarian language. It shows a close agreement with that of *Caryophyllaenus.*

A well-developed cellular parenchyma forms a matrix in which the muscular, excretory and generative organs are imbedded. The nervous system consists of a ring below the suckers and of a large number of radially arranged tracts running forwards and backwards. *Caryophyllaenus* is an elongated, flattened worm provided with one extremely mobile extremity, the other being drawn out during the animal's sojourn in *Tubifex* into a short hexacanth tail. It becomes fully developed in its invertebrate host, but apparently cannot produce eggs until transferred into the intestine of a fish.

Order II.—*MEROSOA.*

The Merosoa, to which the ordinary tapeworms of man and domestic animals belong, includes the great majority of the Cestodes. They occur in invertebrate animals throughout the globe, though varying in abundance in different districts and at different times. With few exceptions tapeworms select the small intestine for their station, and in this situation execute active movements of extension and contraction. The body, or *strobila,* consists of a usually minute organ of attachment (scolex or its representative) which is imbedded in the intestinal membrane, and of a series of segments that arise from the base of the scolex and increase in size distally. In one family (*Ligulidae*) the segmentation is only expressed in the metameric distribution of the generative organs and the worm is externally unisegmental. In the remainder the segmentation involves primarily the genitalia and includes the integument, muscles and part of the excretory system. The nervous system is, however, not segmented, and the excretory system is continuous throughout the worm.

**Scolex.**—The scolex is biradially constructed, the proglottides flattened, quadrangular and bilaterally symmetrical. In them a ventral surface containing the usually median male and female genital apertures is generally distinguishable from the smooth dorsal surface, but in those Cestodes which possess marginal gonopores this distinction of surface is obscured. In such cases the male organs are regarded as indicating the dorsal surface, the female organs as belonging to the ventral surface.

The scolex is usually a conical muscular structure. It bears adhesive organs that are either suckers or hooks, and may develop into the most varied outgrowths in order to give increased firmness of attachment to its host. Thus, starting from the two shallow pits, one dorsal and the other central, in the simplest forms, we find them becoming two elongated suckers (bothria) in the large family *Bothriocephalidae* (fig. 8); and by fusion of the lips they...
are transferred into two tubes (Salenophoridiae); and by the closure of the lower aperture reconstituted into two suckers, the margins of which are produced and folded so as to resemble the leaf-like outgrowths of the next group. In this division (Tetracylidae) four suckers or bothria are developed, but their cavities are extremely shallow and their lips extremely mobile and variable in shape. Hence they are called phyllidia (fig. 4). These organs may be raised on a short stalk, their cavity subdivided into loculi, and provided in some cases with hooks. A peculiar modification of this type of sucker occurs in the Echinobothridiae, in which the axial part of the organ (the rostellum) is elongated and provided with several rows of hooks, so that the phyllidia have partially fused. This elaborate type of sucker appears to be an adaptation to grasp the delicate intestine of sharks and rays. But perhaps the most elaborate sucker is that of the Tetrathyridia (fig. 5), which are also parasitic in Selachians. The four suckers are here united to form two pairs or fused into a single pair. Internal to the suckers are the four complex hooked proglottides. Each consists of an involute hollow tentacle provided with hooklets and capable of intromission within a membranous sheath filled with fluid, elongated muscular bulb. The muscles are arranged in ten or more layers, and are transversely striated. These complex organs have apparently arisen by the increase in depth and differentiation of an accessory sucker such as is borne on the phyllidia of the former group. Lastly, the sucker of the more familiar Taeniidae (Tetractylida) carries a rostellum encircled with hooks and four cup-shaped suckers the margins of which do not project beyond the surface of the body. It seems probable that these suckers are not the true "bothria" but are developed from accessory suckers, the bases of which have disappeared almost completely. In one genus (Polycephalus) the place of a rostellum is taken by a crown of retractile tentacles. This order is almost exclusively parasitic in warm-blooded animals.

The extraordinary variety of form and complication of structure exhibited by the appendages of the sucker are adaptations to fix the worm and to resist the peristaltic action of the intestine in which it lives, and are not connected directly with the absorption of food.

Proglottides.—The segments into which the body is divided vary considerably in number, size, and form. Taenia echinococcus has only three, Echinobothrium four, Balantidophorus three thousand. In every species the segments develop from the sucker distally, and the increase in size with the maturation of the contained female genital organs. When this is reached, growth of the proglottides ceases. As a general rule the ripe proglottides are detached in chains and replaced by others which in their turn become detached, the process being repeated for a year or so until the worm weakens and is cast off. In special cases, however, a proglottis may be detached before attaining full growth, and with its generative organs in an imperfectly developed condition. The minute Taenia (Davainea) proglottina (5 to 1 mm. in length) from the common bowels detaches its four or five segments into the intestine, where they attain a length of 2 mm., and a breadth of 1-25; that is, more than twice the size of the parent. The Cestodes of Elasmobranch fishes offer more convincing examples of independent growth of the proglottides, for these are often set free with only the male organs developed, and each attains twice the size of the parental strobila.

The form of the proglottides is most generally a rhombic or foliaceous figure. The hinder border is often drawn out into mobile processes and hollowed out around the insertion of the next segment. At this neck-like zone the muscles are absent, and across it falls the line of fracture when the proglottis separates from its fellows.

Structure.—The anatomy of the Cestoda differs in only two or three important features from that of Trematodes. In both classes the body is ensheathed by a thick non-cellular cuticle, the deepest layer of which—the subcuticle or basal membrane (fig. 6 b)—is perforated by the branched free ends of the isolated epidermal cells, which have sunk into the body, and by the endings of gland-cells and nerve-cells (fig. 6). The mass of the body consists of richly branched stellate cells—the mesenchyme—and imbedded in this plastic tissue are the nervous, excretory, muscular and generative organs.
TAPEWORMS

The excretory organs consist of flame-cells, richly convoluted canalliculi, and a pair of longitudinal canals leading to the exterior by one or more pores. The muscles are composed of outer circular and inner longitudinal layers, and of branched dorso-ventral fibres. The branched structure of the complex bursa of Laurer is also described in Trematodes (q.v.). In these broad anatomical features both classes agree. But whilst in Trematoda a digestive sac is invariably present except in the so-called larval stages, the Cestodes probably possess a trace of this organ at any stage of their development. They obtain food entirely by osmosis through the striated cuticle, and this food consists not of blood, as in flukes, but of chyle, by which they are bathed in their favourite solutio, the small intestine.

The second point of difference between tapeworms and Trematodes lies in the absence of a definitely demonstrable "brain." The concentration of nervous matter and ganglionic substance at the head-end of Trematodes is of course analogous to that of Planarians, but the similar thickening in the scolex of Cestodes is by no means so certainly to be called by that name. It appears to be an elaboration of the muscle-membrane, and to be at more' or less maintained greater elaboration than the rest of the nervous system because the proximal end is the most specialized and most stimulated portion of the worm. Those Cestodes which possess no very distinct organ of attachment (such, e.g., the Monogenea), show a distinct ganglionic thickening more pronounced at one end of the body than at the other; and as these are forms which have retained more primitive features than the rest, and show closer affinity to the Trematodes, it seems highly probable that the complicated nervous thickening found in the scolex, and often compared with the "brain" of other Platyhelminthes, is a structure sui generis developed with the necessities of the sub-class. In the opinion of several zoologists it marks the tail-end and not the head-end of the worm.

The third important contrast in structural features has also been acquired by the Cestoda Merozoa, namely, the repetition of characters in a metamorphic fashion. The Monogenea are unsegmented; the Ligulida have segmented gonads and gonopores without any trace of somatic metamorphosis except secondary excretory pores in addition to the usual terminal one; the remaining generative organs are unsegmented only in Ancylostoma and in the larval stages; and they show in their later stages repetition of the reproductive organs and of the musculature. In addition, some show duplication of the various kinds of their ducts, so that we find both transverse and longitudinal repetition of these organs, without corresponding multiplication of the nervous ganglia mesenchyma, or excretory opening.

The last structural peculiarity of the group is the absence of the functions of regulation and reparation which are so highly developed in the more primitive Planarians. This statement is quite consistent with the continuous production of new segments at the neck of the scolex. For such a process is analogous to the development of the segments in a Chaetopoda, which is a perfectly distinct phenomenon from the regeneration of new segments to supply the place of a head or tail-end or some other portion that has been lost. The reason of deviation from the normal at the four points is that the Cestode-body by others is not regeneration, for the replacing set has already developed, and in certain cases they can complete their development quite independently after being detached from the host. But the deviation from the normal may be due to the absence of regeneration, however, is the argument from malformation and the phenomenon known as "pseudo-scolex." It has long been known that the proglottides of certain monogeneans are capable of exhibiting a form intermediate to the normal and the pseudo-scolex, and the evidence goes to show that the variation was due to arrested growth or some unusual stress or pressure which, acting upon the young strobila, produced a deformation, and that the proglottides so affected could not regain their normal form. The power of reparation, so conspicuous a feature of Turbellarians, is slight or absent in Cestodes. Moreover, injury to the scolex, or amputation of that organ, reveals the concomitant absence of a regulative mechanism such as that which generally controls the form and fitness of regenerated organs. In such an event, a Cestode cannot replace the injured or severed portion, and the first two or more proglottides merely become detached and produce an appearance known as the pseudo-scolex. The absence of these functions of regeneration and of regulation affords, therefore, corroborative evidence of the highly specialized nature of the group.

Reproduction.—The reproductive organs are usually repeated in each proglottis, and in some families two complete sets of such organs occur in each segment; in a few cases, parts only of the system are duplicated. The structure of these organs in the diagrams (Figs. 7, 8, and 9) is closely akin to that of Trematodes. The chief difference between the reproductive organs of the two classes is the presence in Cestodes of a separate vagina and uterus, which are joined by a single pore, and are thus controlled by an independent pore. The vagina of Cestodes is undoubtedly comparable with the so-called "uterus" of Trematodes, but the nature of the Cestode uterus is not so clear. It has been compared with the canal of Laurer of Trematodes (the vitelline-intestinal duct of the ectoparasitic flukes), but if we take the more primitive Cestodes, and especially *Amphlina*, into consideration we find that they possess, in addition to the uterus, an anterior vagina (usually present in Cestodes) and a posterior one. This last tube is probably the homologue of Laurer's canal (Goto, 8). The single anterior vagina is then comparable with the similarly named duct of ectoparasitic Trematodes, in which group it is either single or double. The accompanying figure will assist this description.

*Life-histories.*—The life-history of Cestodes consists of larval and adult stages, which are usually passed through in different hosts. The egg gives rise in the uterus to a six-hooked embryo, which reaches first in a host in a variety of ways. It may hatch out as a ciliated organism (fig. 8, D) capable of living freely in water for at least a week (Bothriocephalus), which then, if eaten by a stickleback, throws off its ciliated envelope, and creeps by the aid of the hooks through the intestinal wall into the body-cavity of the fish. Here it develops into a larval, or rather an adolescent form. In other cases the infection of the first host is brought about by the ingestion of proglottides or of eggs which are disseminated along with the faeces of the final host and subsequently eaten by herbivorous or omnivorous mammals, insects, worms, molluscs or fish. Man, as well as other mammals, is the intermediate host of the dangerous parasite, *Taenia echinococcus*, in countries where cleanliness is neglected; the pig is the host of *Taenia solium*, and other cases may be seen from the table at the end of this article. The development of the larva from the intermediate to the final host is accomplished by the habits of carnivorous animals. The Elasmo-branches swallow infected molluscs or fish; pike and trout devour smaller fry; birds pick up sticklebacks, insects and worms which often contain *Cestode* larvae; and man lays himself open to infection by eating the uncooked or partially prepared flesh of many animals.

The peculiar feature of the larval history of Cestodes is the development in most cases of a cyst or hydatid on the inner wall of which the scolex is formed by invagination. The cyst is filled with a toxic fluid and may bud off new or daughter scolecis. In this way bladders as large as an orange and containing secondary bladders,
each with a scolex, may arise from a single embryo. We have, in fact, a form of larval multiplication that recalls the development of digenetic Trematodes.

The eggs of Cestodes consist of oval or spherical shells, containing a fertilized ovum surrounded usually by many yolk-cells. The shell is thick, and opacified in some forms; thin, and provided with filaments, in others; in the latter cases it may contain only a few yolk-granules suspended in an albumen-like substance. The development of the six-hooked embryo or "oncho-
with diffuse osmotic feeding in the narrow intestinal canal. The origin of the repetition of the gonads has yet to be investigated.

1. By their presence. This depends largely on the station adopted by the parasite. Cysticercus cellulose may be comparatively innocuous in a muscle or subcutaneous tissue, but most hurtful in the eye or brain. Of all parasites the one which by its mere presence is the most dangerous is the larva of Taenia echinococcus. Its bulk alone (equal to that of an orange) causes serious disturbances, and its choice of the liver, kidneys, lungs, cranial cavity and the bone-cases is the cause of so many deaths. This is probably the most dangerous of all the cestodes. When the cyst be taken by operation, the body fluid is removed, and the proglottides are, if possible, extracted. The cyst is left to become a cysticercus. The second proglottides is therefore, probably the most dangerous of all the cestodes.

2. By their migrations. The migration of the Cestode-larvae through the walls of the intestine into the blood of their host is the cause of grave disease and as such largely by the perforation of the tissues, inflammation of the vessels and peritoneum, and other effects of these immigrants.

3. By feeding in their host. The loss of nutrient fluid caused by the presence of intestinal parasites is probably slight, indeed the sharper appetite that accompanies their presence may be the means of fully compensating for it. The tapeworm, Taenia saginata, throws off eleven proglottides a day during its mature stage, and if this rate of increase were maintained for a year the total weight of its progeny would be about 550 grammes. The broad worm, Dibothriocephalus latius, is similarly estimated to discharge 15 to 20 metres of proglottides, weighing 140 grammes. The loss of substance represented by this growth is probably only of serious account when the host is a young growing animal that needs all available nourishment.

**Fig. 11.** A. A Coerus from the brain of the sheep; the numerous scoleces arise by invaginations of the bladder. B. Echinococcus, showing a & b the formation of secondary bladders, which at c are forming scoleces. At m the ideal mode of origin is shown in order to illustrate the fact that the daughter cyst is comparable to the fore-body of a cysticercus. (From Lankester's Treatise on Zoology, part iv.)

purposes inside the cyst, which is itself an organ comparable to an amnion. On this view, multiple scoleces are, therefore, not buds, but an example of the secondarily developed organization of the embryo, such as occurs in other groups of animals, and is demonstrated by experiment. The evolution of the cestocerid, cysticercus and other forms of larvae is a varied adaptive phenomenon. With regard to the adult worm we have to remember that its two extremities, scolex and terminal proglottis, are different from the intervening region. The terminal or first-formed proglottis is sterile, and contains the primitive and (except in a few genera) the only excretory pore. The excretory tubes, the nervous system, and the parenchyma and integument are continuous from one end of the worm to the other. The repetition of the genitalia is the real mark of the Cestodes, and we can trace the independence of the somatic from the gonidal metamers in such forms as Triaenophorus and others. In fact, the whole history of the Platyhelminths is marked by a great specialization of the reproductive evolutionary history, accomplished by a simple somatic line of evolution. We therefore regard the body of a Cestode as a single organism within which the gonads have become segmented, and the segmentation of the body as a secondary phenomenon associated
in the brain of sheep; allied forms occur mature in the dog and larval in the rabbit. *Echinococcus echinococcus*, a minute form with only three to five proglottids, in dog, wolf, jackal, and fox, stage a multilocular sac (fig. 11 B) with many scolices; found in man, ungulates, carnivores, rodents and monkeys.

**Medicine.**—For practical purposes we have only three varieties of tapeworms to deal with as inhabitants of the human alimentary canal: *Taenia saginata*, the beef tapeworm; *Taenia solium*, the pork tapeworm; and *Dibothriocephalus latus*, the fish tapeworm. The first of these is prevalent in countries where much and imperfectly cooked beef is eaten, and where cattle in their turn are infected by the infection of the tapeworm ova. Comparatively uncommon in Western Europe, the *Taenia saginata* is common in Eastern Europe, Asia and South America. It is calculated that in the North-West Provinces of India 5 per cent. of the cattle are infected with cysticerci owing to the filthy habits of the people. Meeanly beef (that infected with the Cysticercus bovis) is easily recognized. In Berlin the proportion of cattle said to be found infected in inspection in 1893 was 1 in 672. Cold storage for a period of over three weeks is said to kill the cysticercus.

The tapeworm most frequently found in man in Western Europe is the *Taenia solium*, which is constant wherever pork is consumed, and is more common in parts where raw or imperfectly cooked pork is eaten. In North Germany the mature tapeworm was found on post-mortem examination once in every 200 bodies examined, while its embryo, the *Cysticercus cellulosae*, was found in 1 in every 76 bodies. In France, Great Britain and the United States the prevalence is not so great. The

**Dibothriocephalus latus** is not generally found except in districts bordering the Baltic Sea, the districts round the Franco-Swiss lakes and Japan. In St Petersburg 15 per cent. of the inhabitants are said to be affected. The eggs are free in freshwater lakes and rivers, where they enter the bodies of pike, turbot and other fishes, and are thus eaten by man.

In many instances the existence of a tapeworm may not cause any inconvenience to its host, and its presence may be only made known by the presence of the proglottides or mature segments in the stools. In the *Taenia solium* it takes 3 to 33 months from the time of ingestion of the embryo to the formation of the mature segment, but in the *Taenia saginata* the time is only about 60 days. The segments of the *Taenia solium* are usually given off in chains, those of the *Taenia saginata* singly. In a number of cases there are coiled proglottides in the intestine, with diarrhoea, more or less severe anemia, while the *Dibothriocephalus latus* is capable of producing a profound and severe anemia closely resembling pernicious anemia. The knowledge of the presence of the parasite adversely affects meals to be taken on the account of the parasites. All segments passed should be burnt, and they should never be thrown where the embryos may become scattered. Attention should be paid to the careful cooking of meat, so that any parasite present should be killed. Efficient inspection of meat in all abattoirs should eliminate a large proportion of the diseased animals.

In the treatment of a case where the parasite is already present, for days previous to the employment of a vermifuge a light diet should be given and the bowels moved by a purgative. For twelve hours previously to its administration no food should be given, in order that the intestinal tract should be empty so as to expose the tapeworm to the full action of the drug. The dose should be kept in the early morning, and should consist of the liquid extract of felix mas, male fern, one drachm in emulsion or in capsules to be followed in half an hour by a colonel purgative. Castor-oil should not be used as a purgative. Pomegranate root, or, better, the sulphate of pelletierine in dose of 5 grains with an equal quantity of tannic acid, may be used to replace the male fern. In from 50 to 80 per cent. of cases the entire tapeworm is expelled. The head must be carefully searched for by the physician, as should it fall to be brought away the parasite continues to grow, and within a few months the segments again begin to appear.

**TAPIOCA (a native Brazilian word), a farinaceous food substance prepared from cassava starch, the product of the large tuberous roots of the cassava or manioc plant (see Cassava). Cassava starch, separated from the fibrous and nitrogenous constituents of the roots, is spread, while in a moist condition, upon iron plates, and with constant stirring exposed to such heat as causes a partial rupture of the starch granules, which agglomerate into irregular pellets, becoming hard and translucent when cooled. In this condition the starch forms the tapioca of commerce, a light, pleasant and digestible food, much used in puddings and as a thickener for soups.

**TAPIR,** any existing representative of the perissodactyl section of ungulate mammals with five front and three hind toes, and no horn. Tapiurs are an ancient group with many of the original characters of the primitive Ungulates of the Oligocene period, and have undergone but little change since the Miocene. On the fore-feet the four toes correspond to the second, third, fourth and fifth fingers of the human hand. The toes are enclosed in hoofs, and the under surface of the foot rests on a large pad. Tapiurs are massively built, with short stout limbs, elongated head, and the nose and upper lip produced to form a short flexible trunk.

The five existing species may be grouped into two sections, the distinctive characters of which are only recognizable in the adult. (A) With a great anterior prolongation of the base; (B) With the bony partition not extending farther than the nasal bones (Tapirus proper). This includes three species, *T. indicus*, the largest of the genus, from the Malay Peninsula (as far north as Tayov and Mergul), Sumatra
and Borneo, distinguished by its peculiar coloration, the head, neck, fore and hind limbs being glossy black, and the inter-
mediate part of the body white, the height at the shoulder from 3 ft. to 3 ft. 6 ins., and 4 ins. higher at the rump; T. terrestris, the common tapir of the forests and lowlands of Brazil and Paraguay; and T. roulensi, the Pinchacue tapir of the high regions of the Andes. All the American species are of a nearly uniform dark brown or blackish colour when adult; but it is a curious circumstance that when young (and in this the Malay species conforms with the others) they are conse-
spicuously marked with spots and longitudinal stripes of white or fawn colour on a darker ground.

In habits all tapirs appear to be very similar. They are solitary, nocturnal, shy and inoffensive, chiefly frequenting the depths of shady forests and the neighbourhood of water, to which they frequently resort for the purpose of bathing, and in which they often take refuge when pursued. They feed on various vegetable substances, as shoots of trees and bushes, buds and leaves, and are hunted by the natives of the lands in which they live for the sake of their hides and flesh.

The singular fact of the existence of animals so closely allied as the Malayan and the American tapirs in such distant regions of the earth and in no intervening places is accounted for by the geological history of the race, for the tapirs once had a very wide distribution. There is no proof of their having lived in the Oligocene epoch, but in deposits of Miocene and Pliocene date remains undistinguishable generic and perhaps speci-
fically from the modern tapirs (though named T. priscus, T. arvernensis, &c.) have been found in France, Germany and in the Red Crag of Suffolk. Tapirs appear, however, to have be come extinct in Europe before the Pleistocene period, as none of their bones or teeth have been found in any of the caves or alluvial deposits in which those of elephants, rhino-
ceroses and hippopotamuses occur in abundance; but in other regions their distribution at this age was far wider than at present, as they are known to have extended eastward to China (T. sinensis) and westwards over the greater part of the southern United States of America, from South Carolina to California. Thus there is no difficulty in tracing the common origin in the Miocene tapirs of Europe of the now widely separated American and Asiatic species. It is, moreover, interesting to observe how slight an amount of variation has taken place in forms isolated during such an enormous time.

See PERISSODACTYLA. (W. H. F.; R. L.*).

TAPE—TAR

American Tapir (Tapirus).

It is a tidal river, but is only navigable by vessels of small

and Portugal. It is now deserted, owing to sitting at the outflow of the river. The waters of the Tapiti are nowhere

used for irrigation.

Wood Tar.—Wood tar, known also as Archangel tar, is principally prepared in the great pine forests of central and northern Russia, Finland and Sweden. The material chiefly employed is the resinous stumps and roots of the Scotch fir (Pinus sylvestris) and the Siberian larch (Larix sibirica), with other less common fir-tree roots. A large amount of tar is also prepared from the roots of the swamp pine (P. australis) in North and South Carolina, Georgia and Alabama, in the United States. In the distillation of wood a series of products, including tars, creosines, acids, acetic, wood spirit (see Methyl Alcohol) and charcoal may be ob-
tained, and any of these may be the primary object of the operation.

The carbonization of wood can be effected in two ways: (1) by stacking and firing as in the manufacture of charcoal: this method is very wasteful as it is impossible to recover the valuable by-
products; and (2) by distilling from retorts, ovens or kilns (after

the manner of coke production from coal): this method is more economical as it leads to the isolation of all the by-products. The retorts are horizontal or of the horizontal and inverse form, or of any available fuel, or by the inflammable gases and less valuable

grades of tar obtained in previous operations. The condensing

plant is also of variable design; a common pattern consists of a

connected series of slightly inclined copper pipes contained in a

rectangular tank of water (see Coal Tar). After settling the

distillate separates into three layers: the lowest consists chiefly

tar and creosote oils with a little acetic acid; the middle layer

contains the water, containing pyrolytic, or, with a little tarry matter; whilst the upper consists of light hydro-
carbons. The tarry layer is run off by means of a cock near the

bottom of the tank, and is then distilled from retorts resembling coal tar stills. At first, between 110° and 120° C., water and acetic acid comes over; then, between 120°—230° C., the heavy or creosote oils; the residuum in the still is wood pitch, which finds application in the manufacture of varnishes, waterproofing, resins, felts, etc. The

crude tar and pitch are also largely used as protective coatings for

woodwork exposed to atmospheric conditions. The heavy oils on

further fractional distillation yield more acetic acid, and then mix-
tures of carabolic acid, creosote, &c.

Wood tar is a semi-fluid substance, of a dark brown or black

colour, with a strong pungent odour and a sharp taste. Owing to

the presence of acetic acid, it has an acid reaction; it is soluble in

that acid, as well as in alcohol and the fixed and essential oils, &c. Some varieties of tar have a granular appearance, from the presence of minute crystals of pyrocatechin, which dissolve and disappear on heating the substance.

See P Dumesny and J. Noyer, Wood Products, Distillates and

Extracts (Engl. trans. 1908).

Wood tar is used in medicine under the name of Pice liquida. Its preparation unguentum piceous liquidae is composed of

wood tar and yellow beeswax. Externally tar is a valuable stimu-

lating dressing in scaly skin diseases, such as psoriasis and chronic eczema. Internally wood tar is a popular remedy as an expectorant in subacute and chronic bronchitis. It is usually given as tar water, 1 part of wood tar being stirred into 4 parts of water and filtered. Given internally tar is likely to upset the digestion; taken in large quan-
tities it causes pain and vomiting and dark urine, symptoms similar to carabolic acid poisoning.

Coal tar is used in medicine as Pice liquida preparata. From it is

made Liquor carbonis detergens, a proprietary preparation, owes its properties chiefly to the contained phenol. It is used in water as a lotion for skin diseases, and also in an inhaler in the treatment of whooping-cough, croup and bronchitis.
TARA, VICOUNTS AND BARONS—TARANTO

The 1st Viscount Tara was Thomas Preston (1585–1632), a descendant of Sir Robert de Preston, who in 1363 purchased the lands of Gormston, Co. Meath, and who was keeper of the Great Seal in Ireland some years later. Sir Robert’s great-grandson, Robert Preston, was Artúr and Vias’s great-grandson in records; and the connection of the great-grandson was Christopher, 4th Viscount Gormston (d. 1590), whose second son was Thomas Preston, Viscount Tara. The latter was in the same Irish regiment in the Spanish service as Owen Roe O’Neill, and distinguished himself in the defence of Louise against the French and Dutch in 1635. Between him and Owen Roe O’Neill there was from the first intense jealousy. Preston, who was appointed general of Leinster, took a prominent and not unsuccessful part in the war of factions that raged intermittently in Ireland from 1642 to 1654. In 1650 Charles II., while in exile created him Viscount Tara; and after his capture from Ireland in 1652 he offered his services to Charles in Paris, where he died in October 1655. His wife was a Flemish lady of rank, by whom he had several children, one of his daughters being the second wife of Sir Phelim O’Neill. His son Anthony succeeded him as 2nd Viscount Tara, a title that became extinct on the death of Thomas, 3rd Viscount, in 1674.

In 1691 Meinhard de Schönberg, 3rd duke of Schönberg, second son of William III.’s famous general, was created Baron Tara, earl of Bangor, and duke of Leinster, in the peerage of Ireland, all of which titles became extinct at his death without heirs male in 1758. The title of Baron Tara was again revived in 1800 in favour of John Preston of Bellinter, Co. Meath, as a reward for his vote in favour of the Union in the Irish House of Commons, in which he sat as member for Navan. At his death without issue in 1821, the peerage became extinct.

TARA, a village of Co. Meath, is celebrated for the Hill of Tara, well known through Thomas Moore’s ballad, and for many centuries a royal residence and the scene of great meetings of the people. The hill, upon which five highroads converged from different parts of Ireland, is about 510 ft. in length, and by which is included an ancient hill-fort. On its summit or flank are six raths or circular earthworks, the largest of which, called the king’s rath (rath-na-ríogh) encloses other works, among which is the forradh or meeting-place, a flat-topped mound. On this (but not in its original position) stands a pillar stone, which has been held to be the stone of destiny on which the Irish kings were crowned. An oblong enclosure, 750 ft. in length by 46 ft. in breadth, formed of earthworks, with entrances at intervals on each side, represents the banquetting hall. In the middle of the 3rd century A.D. King Cormac Mac Art, about whom there are many traditions, was buried there; and Tara, is said to have founded here schools of military science, law and literature. In the time of St Patrick Tara is indicated as the chief seat of druidism and idolatry, and in or about 560 it was abandoned as a royal residence, having fallen under the curse of St Ruadan. In 980 the Danish power of Meath was overthrown in battle here; in 1708 a severe defeat of the insurgents took place here (26th of May); and in 1843 the hill of Tara, as a site sacred to Irish traditions, was the scene of one of Daniel O’Connell’s mass meetings in support of the repeal of the legislative union (15th of August).

TARA, or Terea (i.e. “moist land”), is the name of the submontane strip of marshy jungle stretching beneath the lower ranges of the Himalaya in northern India. This strip may be said to extend roughly from the Jumna river on the west to the Brahmaputra on the east, though the term is now officially confined to a subdivision of Naini Tal district in the United Provinces: area 776 sq. m. population (1901) 118,422.

At its northern edge, where the wide tropical forest of the Bhabar ends, a series of springs burst from the surface, and these, increasing and uniting in their progress, form the numerous streams that intersect the Taraí. The Deoha is the great river of the Taraí proper, and is navigable at Pilibhit. Elephants, tigers, bears, leopards and other wild animals are found. Everywhere it is most unhealthy, and inhabited only by tribes who seem proof against malaria. A large portion lies within Nepal.

TARANTO (anc. Tarentum, q.e.), a seaport of Apulia, Italy, in the province of Lecce, 36 m. from that town W. by N. by road, and 68 m. by rail (44 m. W. by S. from Brindisi). Pop. (1901) 50,592 (town); 60,331 (commune). The city proper is situated on a rocky island 56 ft. above sea-level, which in ancient times was a peninsula, the isthmus on the west having been cut through by Ferdinand I. of Aragon. This island separates the Gulf of Taranto from the deep inlet of the Mare Piccolo, and is sheltered by two other flat islands, San Pietro and San Paolo; the latter is occupied by a lighthouse. This rock is the site of the citadel of the ancient town; its population is confined within small houses and narrow streets. The Strada Garibaldi along which the Mare Piccolo is inhabited by fishermens whose language retains traces of Greek. The cathedral, dedicated to Sant Cataldo, an Irish bishop, dating from the 11th century, has externally some remains of Saracen Gothic; internally it has been completely modernized, and the shrine of the patron saint has been termed “an orgy of rococo.” Below it is an early Christian basilica excavated in 1901. There is a fine museum in the former convent of San Pasquale containing antiquities unearthed in the neighbourhood. Adjacent is the Palazzo degli Uffizi, completed in 1856, containing various public and religious works. The palace of Drogo of Villehardouin was burned in 1799. The city of Taranto was recognized by the Italian government, and in 1864 a Naval Commission designated it as third maritime arsenal after Spezia and Venice. Work was begun on the arsenal in 1883 and continued as the finances of the state permitted; it is capable of turning out new warships and of executing repairs of all kinds for the Mediterranean squadron. The arsenal extends for a mile and a half along the southern coast of the Mare Piccolo, which constitutes its chief basin. The receiving-dock and the anchorage for torpedo boats, with its pier and landing-stage, 450 ft. in length, 120 ft. wide and 37 ft. deep, is divided into two compartments, each capable of containing a full-sized battleship, and can be pumped dry in eight hours by two 600 h.p. steam pumps. The Mare Grande is connected with the Mare Piccolo by a channel 875 yds. long, large enough to permit the passage of the largest battleship; the channel was bridged in 1887 by an iron swivel bridge, which when open leaves a passage way 160 ft. broad. In its present form the Mare Piccolo provides a well-sheltered anchorage, 36 ft. deep and 6325 acres in extent. The commercial harbour lies S. of the railway station outside the Mare Piccolo.

In 1697 Taranto was entirely destroyed by the Baracans, but rebuilt in 1697 by Nicephorus Phocas, to whom is due the

His diwan has been published in W. Ahlwardt’s The Divans of the Six Ancient Arabic Poets (London, 1870). Some of his poems have been translated into Latin with notes by B. Vandenhoff (Berlin, 1895).
construction of the bridge over the channel to the N.W. of the town, and of the aqueduct which passes over it. The town was taken by Robert Guiscard in 1063. His brother Bohemond became prince of the Terra d'Otranto, with his capital here. After his death Roger II. of Sicily gave it to his son William the Bad. The emperor Frederick II. erected a castle (Rocca Imperiale) at the highest point of the city. In 1301 Philip, the son of Charles II. of Anjou, became prince of Taranto. The castle dates from the Aragonese period. The tarantula (see below), inhabits the neighbourhood of Taranto. The wild dance, called tarantella, was supposed, by causing perspiration, to drive out the poison of the bite.

(T. As.)

**TARANTULA**, strictly speaking, a large spider (*Lycosa tarantula*), which takes its name from the town of Taranto (Tarentum) in Apulia, near which it occurs and where it was formerly believed to be the cause of the malady known as "tarantism." This spider belongs to the family Aviculariidae, and has numerous allies, equaling or surpassing it in size, in various parts of the world, the genus *Lycosa* being almost cosmopolitan in distribution. The tarantula, like all its allies, spins no web as a safety net, but catches its prey by activity and speed of foot. It lives on dry, well-drained ground, and digs a deep burrow lined with silk to prevent the infall of loose particles of soil. In the winter it covers the orifice of its dormant underground burrow with a layer of silk, and lies in it until the return of spring. It also uses the burrow as a safe retreat during moulting and guards its cocoon and young in its depths. It lives for several years. The male is approximately the same size as the female, but in neither sex does the length of the body surpass three-quarters of an inch. Like all spiders, the tarantula possesses poison glands in its jaws, but there is not a particle of trustworthy evidence that the secretion of these glands is more virulent than that of other spiders of the same size, and the medieval belief that the bite of the spider gave rise to tarantism has long been abandoned.

According to traditional accounts the first symptom of this disorder was usually a state of depression and lethargy. From this the sufferer could only be roused by music, which excited an overpowering desire to dance until the performer fell to the ground bathed in profuse perspiration, when the cure, at all events for the time, was supposed to be effected. This mania attacked both men and women, young and old alike, women being more susceptible than men. It was also considered to be highly infectious and to spread rapidly from person to person until whole areas were affected. The name *tarantella*, in use at the present time, appears to have been borrowed by the Italian poet Dante from the Tarantula, which was still in vogue in Southern Italy and also to musical pieces resembling in their stimulating measures those that were necessary to rouse to activity the sufferer from tarantism in the middle ages. In recent times the term tarantula has been applied indiscriminately to many different kinds of large spiders in no way related to *Lycosa tarantula*; and to at least one Arachnid belonging to a distinct order. In most parts of America, for example, where English is spoken, species of Aviculariidae, or "bird-eating" spiders of various genera, are invariably called tarantulas. These spiders are very much larger and more venomous than the largest of the Lycosidae, and in the Southern states of North America the species of wasps that destroy them have been called tarantula hawks.

In Queensland, one of the largest spider species, known as *Holconia immanis*, a member of the family Clubionidae, bears the name tarantula; and in Egypt it was a common practice of the British soldiers to put together scorpions and tarantulas, the latter in this instance being specimens of the large and formidable desert-burrowing *Arachnoides Galeodes lucasii*, a member of the order Solifugae. Similarly in South Africa species of the genus Solpuga, another member of the Solifugae, were employed for the same purpose under the name tarantula. Finally the name *Tarantula*, in a scientific and systematic sense, was first given by Fabricius to a Ceylonese species of amblypygous Pedipalpi, still sometimes quoted as *Phrynus lunatus*. (R. I. P.)

**TARAPACÁ**, a northern province of Chile, bounded N. by Tacna, E. by Bolivia, S. by Antofagasta, and W. by the Pacific. Area 18,131 sq. m. Pop. (1893) 89,751; (1902, estimated) 101,105. It is part of the rainless desert region of the Pacific mountain of South America, units of Swell cotton variety, and at the base of the Andes where streams flow down into the sands and are lost. In some of these places there is vegetation and water enough to support small settlements. The wealth of Tarapacá is in its immense deposits of nitrate of soda (found on the Pampa de Tamarugal, a broad desert plateau between the coast range and the Andes, which has an elevation of about 3000 ft.). The mining and preparation of nitrate of soda for export maintain a large population and engage an immense amount of capital. Silver is mined in the vicinity of Iquique, the capital. The silver is sent to Arica for refining, and Patillos, from which "nitrate railways" run inland to the deposits. Tarapacá was ceded to Chile by Peru after the war of 1879-1883, and was organized as a province in 1884.

**TARARE**, a town of east-central France, in the department of Rhone, on the Turdine, 28 m. W.N.W. of Lyons by rail. Pop. (1906) 11,643. It is the centre of a region engaged in the production of muslins, tarlets, embroidery and silk-plush, and in printing, bleaching and other subsidiary processes. Till 1756, when the manufacture of muslins was introduced from Switzerland, the town lay unknown among the Beaujolais mountains of South America, a town of Swell cotton variety, and in the 18th century; at the beginning of the 19th figured stuffs, open-works and zephyrs were first produced. The manufacture of silk-plush for hats and machine-made velvets was set up towards the end of the 19th century. A busy trade is carried on in corn, cattle, linen, hemp, thread and leather.

**TARASCON**, a town of south-eastern France, in the department of Bouches-du-Rhone, 62 m. N.W. of Marseille by rail. Pop. (1906) town, 54,477; commune, 89,722. Tarascon is situated on the left bank of the Rhone opposite Beaucar, with which it is connected by a railway bridge and a suspension bridge. The church of St Martha, built in 1187-97 on the ruins of a Roman temple and rebuilt in 1379-1449, has a Gothic spire, and many interesting pictures in the interior. Of the original building there remain a porch, and a side portal flanked by marble columns with capitals like those of St Trophimus at Arles. The former leads to the crypt, where are the tombs of St Martha (1658), Jean de Gossa, governor of Provence under King René, and Louis II., king of Provence. The castle, picturesquely situated on a rock, was begun by Count Louis II., the part of the present time, again built by King Robert in the 13th. It contains a turret stair and a chapel entrance, which are charming examples of 13th-century architecture, and fine wooden ceilings. The building is now used as a prison. The hôtel-de-ville dates from the 17th century. The civil court of the arrondissement of Arles is situated at Tarascon, which also possesses a commercial court, and fine cavalry barracks. The so-called Arles sausages are made here, and there is trade in fruit and early vegetables. In Tartarin de Tarascon Alphonse Daudet has satirized the provincial life of Tarascon. Its uneventfulness

---

*Galeodes lucasii*, an Arachnid of the order Solifugae, commonly but wrongly called tarantula in Egypt.

This burrow with a layer of silk, and lies in it until the return of spring. It also uses the burrow as a safe retreat during moulting and guards its cocoon and young in its depths. It lives for several years. The male is approximately the same size as the female, but in neither sex does the length of the body surpass three-quarters of an inch. Like all spiders, the tarantula possesses poison glands in its jaws, but there is not a particle of trustworthy evidence that the secretion of these glands is more virulent than that of other spiders of the same size, and the medieval belief that the bite of the spider gave rise to tarantism has long been abandoned.
is varied by the fair of Beaucarne, and it used to be the scene of the two fêtes of La Tarasque, the latter in celebration of St Martha’s deliverance of the town from a legendary monster of that name. King René presided in 1469, and grand exhibitions of costume and strange ceremonies take place during the two days of the festival. Tarascon was originally a settlement of the Massaliots, built on an island of the Rhone.

The medieval castle, where Pope Urban II. lived in 1096, was built after the return of Roman rule but in 1554 the town was given to the craft of costume. In 1591 Tarascon preserved the municipal institutions granted them by the Romans, and of the absolute power claimed by the counts of Provence they only recognized the rights of sovereignty.

TARASCON played a bloody part in the White Terror of 1615.

TARAXACUM, the name usually applied in medical practice to the common dandelion (q.v.).

TARBELL, EDMUND C. (1862– ), American artist, was born at West Groton, Mass., on the 26th of April 1862. He was a pupil of the schools of the Boston Museum of Fine Arts and of Boulanger and Lefebvre, Paris, and became a distinguishued painter of the landscape, of the figure, and of portraits, winning various important prizes and medals at exhibitions. In 1906 he was elected a National Academician, besides being a member of the Ten American Painters, and he became instructor of painting in the Boston Museum of Fine Arts.

TARBERT, a fishing village at the head of East Loch Tarbert, an arm of the sea on the west shore of the mouth of Loch Fyne, Argyllshire, Scotland. Pop. (1901) 1697. The harbour, though it has a narrow entrance, is absolutely safe and can shelter the whole of the Loch Fyne fishing fleet. The pier for the passenger steamers that call here is about ½ m. from the village. The coast of the bay is rocky and the cliffs are fringed with young firs, the village itself being quite a pretty place.

The herring fishery— including a large trade in curing— forms the only industry. The parish church occupies a fine situation. Overlooking the harbour are the ruins of a castle built by Robert Bruce in 1326. The isthmus connecting the districts of Knapdale and Kintyre is little more than one mile wide, and boats used once to be dragged across to the head of West Loch Tarbert, a narrow sea Loch nearly ten miles long.

A proposal to cut a canal across to shorten the sail to Islay and Jura has never progressed further.

TARBES, a town of south-western France, capital of the department of Hautes-Pyrénées, 98 m. W.S.W. of Toulouse on the Southern railway. Pop. (1906) town, 20,866; commune, 25,869. Tarbes is situated in a beautiful and fertile plain, in full view of the Pyrenees, on the left bank of the Adour, streams from which are conducted through all parts of the town. The lines of the Southern railway from Morcenx to Bagnères-de-Bigorre and Lourdes and from Toulouse to Bayonne cross here.

Chief among the many open spaces is the Jardin Massey (35 acres), given to his native town by a director of the gardens of Versailles and containing a museum of sculptures, paintings and antiquities. Near a small lake stands a cloister (15th century) transferred from the abbey of St Sever-de-Rustan, 14 m. N.E. of Tarbes, and a bust of Théophile Gautier, a native of Tarbes. The architecture of the cathedral, Notre Dame de la Sède, is heavy and unpleasing, but the cupola of the transept (14th century), the modern glass in the 12th-century apse, and a rose window of the 13th century, in the north transept, are noticed. There is also a modernized Carmelite church originally built in the 13th century. Tarbes is a well-known centre for the breeding of Anglo-Arabian horses, much used by light cavalry; and its stud is the most important in the south of France.

The industrial establishments include tanneries, tile-works, saw-mills and turners’ shops. There are important fairs and markets. Well-known race-meetings are held on the Laloubère course.

Under the Roman dominion Tarva, which was about 11 m. S.E. of the present town of Tarbes, was the capital of the Bigerriones, one of the states of Novempopulania. The bishopric of Tarbes dates from the 5th century, and in feudal times its bishops held the chief temporal authority, that of

TARIGRADA, apparently Arthropodous animals whose relationship to the great classes of this sub-kingdom is masked by degenerative modification. They are microscopic in size and live in damp moss or water. The body is elongated and furnished with four pairs of short, unjointed, stump-like legs, each terminated by a pair of claws. The legs of the posterior pair project from the hinder extremity of the body and the anus opens between them. The mouth, situated at the opposite end and armed with a pair of stylets, leads into an oesophagus, into which the ducts of a pair of so-called salivary glands open. Behind this point there is a muscular pharynx or gizzard, which communicates with the wide intestinal tract. No organs of circulation or respiration are known; but the nervous system is well developed, and consists of a pair of ganglia corresponding with the limbs and connected by longitudinal commissural chords. Anteriorly these chords embrace the oesophagus and unite with the cerebral mass which innervates the pair of eyes when present. The sexes are not distinct, the sexual organs being represented by a pair of testes and a single ovary, which open together into the posterior end of the alimentary canal. The Tarigrada have been regarded as degenerate Acari largely on account of their possessing four pairs of ambulatory limbs, which is considered

TARDIGRADE is the counts of Bigorre, of which Tarbes was capital, being limited to the quarter of the town where their castle was built. The English held the town from 1360 to 1406. In 1596 Tarbes was burnt by Gabriel, count of Montgomery, and the inhabitants were driven out. This happened a second time, but in August 1750 the peace of St Germain allowed them to return. Subsequently Tarbes was several times taken and re-taken, and a number of the inhabitants of Bigorre were forced to take refuge in the mountains of the Pyrenees, to which the whole of the League were finally expelled. The English, under Wellington, gained a victory over the French near Tarbes in 1814.

TARBUSH (Arab tarbush), the close-fitting, flat-topped and brimless cap, in shape like a truncated cone, made of felt or cloth, worn by Mahomedan men throughout the East either as a separate headgear or forming the inner part of the turban. It is worn as the badge of a Turkish subject in Turkey and Egypt, where it is red in colour with a black or blue silk tassel. It is the same as the "fez" (see the plate illustrations to INDIA: § Turkish Costume).
to be an Arachnidian characteristic. But they cannot be affiliated with this order on account of the total suppression of the abdomen, of their hermaphroditism and of the communication that exists between the generative organs and the alimentary tract. These last characteristics also separate them essentially from the Pycnogonida, some members of which resemble them to a certain extent in having only four pairs of limbs, no gnathites, no respiratory organs, a ganglionated ventral nervous system, and the abdomen reduced to a mere rudiment projecting between the last pair of legs.

Several genera and species of Tardigrada have been described, perhaps the best known being Macrobiotus schultessii and Milnesium tardigradum.

(T. R. P.)

TARE AND TRET. In commerce, allowances or deductions. Tare is an allowance made from the gross weight of goods for the box, bag or other wrapping in which the goods are packed. It may be real, i.e., representing the actual weight of the wrapping; customary, when a uniform or established rate is allowed; average, when one or two pounds of the gross weight are deducted; and the mean or average of the whole taken; or super-tare, an additional allowance when the package exceeds a certain weight. Tret is an allowance of 4 lb. in every 100 lb. of weight, made as compensation for loss by waste. "Tare" comes through the Fr. tare, cf. Sp. tara, from Arab. fahrə, fahr, throwing, casting—the word meant originally loss, that which is thrown away; "tret" is an adaptation of Fr. traite, Lat. trahere, to draw, and meant a draught, transportation, also a payment on exports, an allowance on exportation.

Thrace, a Greek city of southern Italy (mod. Taranto, E.), situated on the N. coast of the gulf of the same name, on a rocky islet at the entrance to the only secure harbour in it. It was a Spartan colony founded about the close of the 8th century B.C. (Jerome gives the date 708) to relieve the parent state of a part of its population which did not possess, but claimed to enjoy, full civic rights. Legend represents these Parthenia (so they are called) as Spartans with a stain on their birth, but the accounts are neither clear nor consistent, and the facts that underlie them have not been clearly set up. The Greeks were not the first settlers on the peninsula: excavations have brought to light a long series of a parish air was settlement. To the Greeks Taras was a mythical hero, son of Neptune, and he is sometimes confounded with the oeeid (official founder) of the colony, Phalanthus. Situated in a fertile district, especially famous for olives and sheep, with an admirable harbour, great fisheries and prosperous manufactures of wool, purple and pottery, Tarentum grew in power and wealth and extended its domain inland. Even a great defeat by the natives in 473 B.C., when more Greeks fell than in any battle known to Herodotus, did not break its prosperity, though it led to a change of government from aristocracy to democracy. A feud with the Thuringians for the district of the Siris was settled in 432 by the joint foundation of Heraclia, which, however, was regarded as a Tarentine colony. In the 4th century B.C. Tarentum was the first city of Magna Graecia, and its wealth and artistic culture at this time are amply attested by its rich and splendid coins; the gold pieces in particular (mainly later than 360) are perhaps the most beautiful ever struck by Greeks (see Numismatics). In the second half of the century Tarentum was in constant war with the Lucanians, and did not hold its ground without the aid of Spartan and Epipole condottieri. Tarentum, however, with Rome (282) in consequence of the injudicious attack of the mob on the Roman fleet in the harbour of Tarentum and on the Roman garrison at Thurii, the expedition of Pyrrhus, whom Tarentum summoned to its aid, and at length, in 272, the surrender of the city by its Epipole garrison. Tarentum retained nominal liberty as an ally of Rome. In the Second Punic War it went over to Hannibal in 212, and suffered severely when it was retaken and plundered by Fabius (209), who sold thirty thousand citizens as slaves. After this it fell into decay, but revived again after receiving a colony in 123 B.C.

Large heaps of the shells of the murex, or purple-yielding mussel, were visible on the shore before the extension of the arsenal.

which received the name of Neptunia. In the time of Augustus it was essentially Greek and a favourite place of resort (Horace, Od., iii. 5, 53), but it declined afterwards. Belisarius ordered it to be re-fortified, but it was soon taken by Totila, who made it his treasure store. After his defeat by Narses, it was sold to the Byzantine Empire by its Gothic governor.

One of the most interesting discoveries of recent years has been that of a terramara on the so-called Scoglio del Tonnio on the N.W. of the town, which in its type and in the character of the objects found there, is exactly identical with the terramara of the Po valley. It seems, however, to be an isolated colony, and not to prove a parallel development in north and south Italy (T. E. Peet in Papers of the British School at Rome, iv., 1907, 285). Almost the only relic of any building of the Greek city is a part of a Doric temple on the island—which the modern town occupies—two fluted columns, with a lower diameter of 6 ft., and a height of 25 ft., and some fragments of the entablature, belonging probably to the beginning of the 6th century B.C. of the earliest extant Doric temples. The condition of the site was, however, different in ancient times; the rock occupied by the modern town was, it is true, the citadel, but was connected with the land to the west by an isthmus, which was only cut through by Ferdinand I. of Aragon; and it was also a good deal less extensive. The line of the walls which defended the city on the (land) side has been traced, and a few remains of well-cut blocks, with Greek masons' marks, still exist. In the centre of the Agora was the huge bronze Zeus by Lysippos, and facing on to it was the garrison (or Porch) with pictorial representations of the life of Phalanthus, and the foundation of the city, and the museum. There was also a fine gymnasium and other buildings mentioned by classical writers. Strabo's description of the site (vi. 3, 1) is a good one. Of all these structures no traces remain. The Roman amphitheatre, on the other hand, and remains of Roman baths by the seashore, have been found; the former perhaps occupies the site of the ancient theatre, in which the Roman ambassador was received in 281 B.C.

Three fine mosaics of the Roman period were found in the remains of a house in 1859, and transported to the museum (A. d'Avou, Monumenti de' Musei Venetianii, Naples, 1865, 239). A fine silver jug and drinking-bowl, found in Tarentum in 1880 (now in Triest) are illustrated by A. Puschi and F. Winter in Jahreshefte des österr. Arch. Instituts, v (1902) 112. Other silver vessels found in 1896 are in the important local museum (G. Patrini in Notizie degli scavi, 1896, 376), and at Bari (M. Mayet, ibid., 1896, 547). All seem to belong to the 4th century B.C. To the N.W. of the town along the Massafia road, neolithic tombs and a fine Greek hypogeum in masonry were discovered in 1900.

(T. A.)

TARENTUM, a borough of Allegheny county, Pennsylvania, U.S.A., on the Allegheny river, about 20 m. N.E. of Pittsburgh. Pop. (1890) 4627; (1900) 5472 (1753 being foreign-born); (1910) 7414. Tarentum is served by the Pennsylvania railway and by an electric line connecting with Pittsburgh. Among manufactures are plate glass and bottles, table ware, paper, bricks, iron and steel articles, and steel sheets and billets. Coal mining is an important industry, and the borough is supplied with natural gas. Tarentum was first settled in 1766, was laid out in 1829 at the direction of Henry Marie Brackenridge (1786-1871), who by marriage had come into possession of the site, and was incorporated as a borough in 1842. The first glass manufactory was established in 1872.

TARGET, GUI JEAN BAPTISTE (1733-1807), French lawyer and politician, was born in Paris on the 17th of December 1733.

3 Brackenridge was a prominent lawyer, the son of Pittsburgh, who practised in Maryland, Missouri and Louisiana, was district judge in Louisiana in 1812-1814, secretary of the U.S. commission sent to South America in 1817, U.S. judge for the western district of Florida from 1821 to 1825, when he returned to Pennsyl-

vania, and the author of a Voyage to South America in 1817-1818 (1829), a History of the Late War between the United States and Great Britain (1817), Recollections of Persons and Places in the West (1834), and a History of the Western Insurrection (1859).
TARGET—TARGUM

He acquired a great reputation as a lawyer, less by practice in the courts than in a consultative capacity. He strenuously opposed the "parlement Maupeou," devised by the Chancellor Maupeou to replace the old judiciary bodies, and refused to plead before it. He was counsel for the cardinal de Rohan in the affair of the Diamond Necklace (q.v.). In 1785 he was elected to the French Academy. In 1789 he was returned as one of the deputies of the Third Estate in Paris to the states-general, where he supported all such revolutionary measures as the union of the orders, the suspensive veto, the civil constitution of the clergy, &c. His excessive obesity, which in the Constituent Assembly made him the butt of the Royalists, had produced a prostrating effect in the Assembly, and his "compromise" position was lost in him by 1789, and when Louis XVI invited him to undertake his defence he excused himself on this ground. At the same time he published in 1762 some Observations on extenuation of the action of the king, from the constitutional point of view, which in the circumstances of the time argued much courage. For the rest, he took no part in public affairs during the Terror. Under the Directory he was made a member of the Institute (1796) and of the Court of Cassation (1798). He lived to collabo-

rate in the earlier stages of the new criminal code. Among his writings may be mentioned a paper on the grain trade (1779) and a Mémoire sur les Juges des Provinces en France (1787) in which he pleaded for the restoration of civil rights to the Protestants.

TARGET, a mark to shoot at, so called from its resemblance in shape to the "targe" or small round shield, particularly the round wood and leather buckler, with metal bosses, and long spike protruding from the central boss, which was carried by Highland clans; at the back was a leather sleeve in which the left arm was inserted. In the 17th century, as body armour ceased to be used, the infantry soldier often carried a light shield of various forms which was known as a "target," which is a diminutive of targe; such soldiers were known as "targettears." "Targe" is a word that has been the subject of much etymological discussion. On the one hand is found the O.E. targe, with hard g, a shield, cf. Icel. targe, shield, target, and O.H. Ger. sorga, frame, side, border; on the other is Fr. targe, Sp. and Port. targa, Ital. targa, buckler, shield. The sound of the targe is preserved in various stages of the Romance tongues, and Port., is found adarga, a square target or buckler, which is an Arab word, al darkat or darakot, a leather shield. The O.E. and Icel. words can hardly have come from an Arab source, and the relation between the two words is an etymological puzzle (see Skeat, Etym. Dict., 1910). The target as a mark to shoot at is, for archery, a circular canvas-covered frame stuffed with straw and marked with concentric rings surrounding the centre or bull's-eye. For shooting with the rifle the target is usually square.

In the days of the smooth-bore musket, and for many years after the introduction of small arms of precision, the targets used in musketry training were of a "match" and not a "service" character. The target was white with a black bull's-eye (counting 5 points) and two rings, invisible to the fire, called the "inner" and the "magpie," and scoring 4 and 3; the rest of the target was called the "outer" and counted 2 points. This system was the basis of all match shooting, whether with match or service rifles, and (with the trifling difference that the bull counted 4, the inner 3 and the magpie and outer alike 2) it was followed in military range practice. For collective fire regular rows of black silhouettes on white screens were employed. These were a compromise between bull's-eye and service targets which possessed the virtues of neither. But after the S. African war bull's-eye practices were eliminated from the musketry course of the British army, and in the musketry regulations of 1909 they were restricted to the earliest stages of recruits' training and trained soldiers' "refreshers" courses. The use of the bull's-eye to-day is to teach the soldier to shoot uniformly, that is, to "group" his shots closely. The position of his shot, buy with reference to the bull's-eye does not matter; if his group is comprised within a 6 or 12-inch ring (at 100 yards range) he is passed on to more advanced practices at service targets. The latter are no longer coloured black-and-white, but are of the dull colours which are met with in the field, either brown head-and-shoulders painted on a green-grey canvas background or brown silhouettes held up against the face of the stop-butts. The National Rifle Association in 1910 followed the lead of the War Office to some extent as regards the targets used at the Bisley meeting in the 19th century, and after the war "target" became a collective form, date from the time when Aramaic superseded Hebrew as the spoken language of the Jews (see ORIGIN AND DEVELOPMENT OF THE ARAMAIC LANGUAGES). In their origin they were designed to meet the needs of the unlearned among the people who had ceased to understand the Hebrew of the Old Testament. In the absence of any precise evidence on the point it is impossible to give more than a rough estimate as to the period at which Hebrew, as a spoken language, was finally displaced by Aramaic. It is, however, certain that the latter language was firmly established in Palestine in the 1st century A.D. By that time, as we know from many sources, Aramaic was not only the language in common use, but had also received official recognition, despite the fact that Hebrew still remained the learned tongue. Hence we may reasonably infer that the mass of the people had adopted Aramaic at a considerably earlier period, probably, as early as the 2nd century B.C., and that the need of Aramaic translations of the sacred text made itself felt but little later. By the Jews the introduction of Targums is ascribed to Ezra; but this tradition, which probably owes its origin to the Talmudic explanation of Neh. viii. 8, is inconsistent with the linguistic evidence furnished by the post-exilic literature of the Old Testament, and must be rejected as unhistorical, if only because the process by which Hebrew took the place of Aramaic was admirably a very gradual one.

The Talmudic tradition, however, is, doubtless, correct in connecting the origin of Targums with the custom of reading sections from the Law at the weekly services in the synagogues, since the need for a translation into the vernacular must first have arisen on such occasions. As we know from the New Testament, the custom of reading in the synagogues both from the Law and from the Prophets was well established in the 1st century A.D.; its introduction, therefore, will date from a much earlier period. The practice of accompanying these readings with a translation into Aramaic is further, so generally recognized by the 2nd century A.D. that the Mishnah takes it for granted, and merely inculcates certain regulations to be observed by the Meturgemán (translator), who had by this time acquired a definite status. From it we learn that the Meturgemán, who was distinct from the reader, translated each verse of the Law into Aramaic as soon as it had been read in Hebrew; in the readings from "the Prophets" three verses might be read at a time. Later regulations are also laid down in the Talmuds in order to prevent any appearance of authority attaching to the translation, and also to ensure reverential treatment of the sacred text.

TARGUMS on the Pentateuch

1. TARGUMS on the Pentateuch

(1) The so-called Targum of Onkelos admittedly owes its name to mistakes. In its original context, that of the Jerusalem Talmud, the passage refers to the Greek translation of Aquila. With the exception of one reference, the Targum is always introduced in the Babylonian Talmud by the phrase "as we trans-

It is found recorded under the title of the Targum of Onkelos by Gaon Sar Shalom (d. A.D. 850). According to Dalman, its language differs in many material particulars from the Aramaic dialects of the Palestinian and Babylonian Talmuds, and is more closely allied to the biblical Aramaic. On the linguistic side, therefore, we may regard Onkelos "as a faithful representative of a Targum which had its rise in Judæa, the old seat of Palestinian literary activity. It is not, however, to be considered as the reproduction of the learned which was recognized as 

The Targum, as a whole, is good, and adheres very closely to the Hebrew text, which has not been without its influence on the Aramaic idiom; at times, especially in the poetical passages, a freer and more paraphrastic method is employed, and the version shows evident traces of Halakhic and Haggadic expansion. The Hebrew text used by the translators appears to have been practically identical with the Massoretic. The version was held in high esteem in Babylon, and, later, in Palestine, and a special Massora was made for it. The latest edition is Berliner's reprint (1884) of the Editio Schoellijeta (1557).

Of all the extant Targums that of Onkelos affords perhaps the most characteristic and consistent example of the exegetical methods employed in these works. Two principles may be said to have guided their composition. On the one hand, as primary object, to produce a faithful rendering of the original which at the same time would be intelligible to the people: for this purpose a purely literal translation would be insufficient. On the other hand, they regarded it as necessary to present the sacred text in such a manner as best to convey the particular form of interpretation then current. But later Jewish exegesis was especially concerned to eliminate something in the sacred writings that might give rise to misconceptions, and to correct the Targum on the part of the unlearned. Hence we find various expedients adopted in the Targums for avoiding any reference to the Deity, which was considered injurious and irreverence. Examples of this peculiarly Targumic method are: (1) the insertion of "word" (מִסְרָכָה), "glory" (澪), "presence" (מִרְאָה) before the divine name, when God is referred to in his

3 Tose, Meg.; cf. Jer. Meg., iv. 1-3; Solo, 39b; Sopherim, xi. 1.

dealing with men; (2) the insertion of the preposition "before" (אֶל) when God is the object of any action; (3) the use of the passive for the active voice, e.g., שָׁמַעְתָּם לָא for שָׁמַעְתָּם לָהֵן; הוה for הוה לָא; הוה for הוה לָהֵן; הוה for הוה לָא; הוה for הוה לָהֵן: (4) the use of periphrasis for the modal prepositions. In the case of God, which seems to be "to speak," "to taste," or when the use of the status constructus might seem to bring God into too close connexion with men or things; (5) the use of different expressions, or the insertion of a preposition before the finite name, when God is compared with things, the same action is predicated of God and man; (6) the use of the "for" of a מַּעֲשָׂה and הָוָא, and the rendering מַּעֲשָׂה or מַּעֲשָׂה when מַּעֲשָׂה denotes heathen gods. Instances of this endeavour to make, as it were, a religious distinction in every possible way, are abundant in Targums, but cases also occur, by no means infrequently, where human actions and passions are ascribed to God. The explanation of this phenomenon is to be found in the fact that anthropomorphism was here considered, and that the higher law of prophecies was not thought of in those cases where they might be misunderstood by the people.

(2) In addition to the Targum of Onkelos two other Targums to the Pentateuch are the Targum Jerusalem and the Targum of Jonathan ben Uziel. Of these the former contains only portions of the Pentateuch, and is therefore usually designated the Fragmentary Jerusalem Targum. In a large number of cases this Targum gives merely a variant rendering of single words: where longer passages are given it presents a very paraphrastic translation, and bears all the marks of a late Haggadic composition. Its fragmentary character arises from the fact that it was used as a "sacred library," and its additions to the version of Onkelos, intended possibly for use at public services. That this Targum was really intended to supplement, rather than to supplant, the supplementary material that is required to restore sense to the shorter text. Moreover, in not a few cases the Fragmentary Targum itself attaches to its variant rendering the succeeding word from Onkelos, thus indicating that from this point onwards the latter version is to be followed. More conclusive is the fact that in a number of old Masorah MSS. we find Targums to the Song of Moses and to the Decalogue, in which this process has been fully carried out, the text of Onkelos being given in full and that of the Fragmentary Targum added to it. The second Jerusalem Targum, or the so-called pseudo-Jonathan, admittedly owes its ascription to Jonathan ben Uziel to the interest felt in a later period in the Targum of Onkelos, which was held to be that predicated of God and man; and the later the more perfect form in which it frequently cited, viz., "ז" or Targum Jerusalem (פָֹּרְשִׁי הָאוֹלָלֶה). This Targum represents a later and more successful attempt to correct and supplement the Targum of Onkelos by the aid of variants derived from another source. It is not, however, a revision of the Fragmentary Targum. Clearly it is a development of that version—but is rather a parallel, if somewhat later, production, in which the text of Onkelos is already combined with a number of variants and additions. It is noticeable that this Targum is of great and obvious importance for the study of Midrash, and in this respect, as others, is far less trustworthy than the Fragmentary Targum, as a witness to the linguistic and other peculiarities of the source from which they were both derived. It evidence of the fact that the Fragmentary Targum was in use in Palestine and by additions of every kind, which has been already noted as characteristic of the later stages of Targumic composition. Homilies, legends, traditional sayings, and explanations, in fact every form of Haggadic expansion are utilized by the Targumist, so that at those times his works convey the impression more of a late Midrash than of a translation. This impression is fully confirmed by (a) a comparison of the Talmud and later Midrashic works with which it has obvious points of contact, and (b) the historical allusions, such as the mention of Constantinople (Num. xxiv. 19), of a wife and daughter of Mahomet (Gen. xxvi. 21), and the references to Exequies at the grave of the expelled queen of Persia (Deut. xxxii. 11; cf. Fragm. Tg. to Gen. xlii. 12; Deut. xxxiii. 21). In its translation of the Hebrew pseudo-Jonathan is careful to avoid the paraphrases and to give the sense of all the most simple metaphors, though his method is not so homely as that of Onkelos. Every endeavour is made to gloss over, or modify, expressions which seemed derogatory to the ancestors of Israel, and to amplify everything which redounded to their credit.

According to Zunz, "Gottesdienerliche Sprüche," 2nd ed., p. 50, its contents belong to six periods:—I to Genesis, II to Exod. and Lev., about 2 to Lev., I to Numbers, and I to Deuteronomy.

Seligsohn, "De duabus Hier. Pent. paraphrasibus" (1858): for a full discussion see Bassfruss, "Das Fragmenten Targum in M.G.W.J. xxii.

The view that Deut. xxxiii. 11 could only have been written by a contemporary of John Hyrcanus cannot be maintained; cf. Dalman, Gnomena, p. 30 f., and, more fully, Bassfruss, M.G.W.J. xlv. (1900), pp. 481 f.

4 Meg. 30a. 5 Meg. 30a.
The school at Pumbedita in the 4th century A.D. both in language and thought naturally there is some variation of vocabulary and style it closely resembles the Targum of Onkelos, and appears to have been modelled on that translation: in certain passages, indeed, it appears to be practically identical with Onkelos; but, like Onkelos, it did not assume its final form in Babylon before the 2nd century B.C.

It naturally follows from the character of the original that the rendering of this Targum is less literal than that of Onkelos, especially in idioms, but, as a compromise allowance is made for the difficulty of the Hebrew, it may be described on the whole as a faithful reproduction of the original text. Its peculiarities of rendering are due to the same principles which were noted as underlie the changes of the Palestinian Targums, as a rule, are avoided by means of the same expedients as those employed by Onkelos, expressions derogatory to the dignity of God, and hence softened down. The figurative language is either boldly transposed or the character clearly shown by the introduction of the particle "as" or "like". There is, further, a tendency to narrow down the scope of the prophetic utterances, and to limit their application to Israel and its immediate enemies. Lastly, in the obscurer passages the Haggadic method of interpretation is employed to its fullest extent, while the translation throughout shows a marked tendency to explanatory additions.

Of a Targum Jerusalmi to the Prophets but little is known, though it is hardly doubtful that such a Targum existed, if only in the form of a list of readings, this view has been advanced by Bacher in the variants attached to the margin of the Codex Reuchlinianus, and printed by Lagarde in his edition of Prophetae Chaldaeae (1872). These fragments, which have been preserved under the name of the Targum Jerusalmi Apocryphon, are certain to have existed at any rate with the Jerusalem Targums to the Pentateuch, and are demonstrably of post-Talmudic date. According to Kohut's list of Targum quotations in 'Arakh, a Jerusalem Targum existed also for the five Megilloth. Central quotations, Ecclesiastes and Esther, but this list is scarcely reliable, and, as Dalman has pointed out, the quotations in 'Arakh to Kings, Ezekiel, Proverbs and Lamentations are the only ones that point with certainty to the existence of a Targum Jerusalmi.

III. TARGUMS TO THE HAGIOGRAPHIA

These Targums possess but little interest for the student of Jewish literature, as they are already the work of individual, made in imitation of the older Targums. Despite the reference to a Targum of Job in the 1st century (see above), all the extant Targums to the Hagiographa are later in date than the Targums to the Law and the Prophets.

(1) Targums to the Psalms and Job.—These Targums present certain features in common and may therefore be treated under the same heading. Like all the later Targums they exhibit a large amount of explanatory addition, chiefly Haggadic in character. At the same time the translation of the original is not neglected; and, when separated from the later accretions, this is found to follow the Hebrew text closely. Peculiar to these Targums are the two translations, which they give to many verses, one of which is usually Haggadic in character, while the other is more literal. Bacher would assign these Targums to the 4th or 5th century, but Dalman has pointed out that there is textual evidence in common with the Jerusalem Targums to the Pentateuch. They cannot be earlier than the 7th century A.D., and possibly are of a comparable date.

(2) The Targum to the Proverbs stands apart owing to the peculiarity of the language in which it is written. The influence of the Peshitta version is so clearly marked, that Dalman (loc. cit.) describes it as a Jewish revision of that version. But setting aside the Syræans due to the use of the Peshitta, the Targum shows affinity to the Targums to the Psalms and Job. The translation is literal and almost entirely free from Haggadic additions.

The characteristic peculiarity of these Targums is their exaggerated use of paraphrase. They mark the final stage in the development of Haggadic interpretation, in which the Targum has so completely disappeared in a mass of fantastic and irrelevant matter. The Targum of Esther is known to us in three recensions (1) of the Antwerp Polyglot, almost a literal translation; (2) that of the London Polyglot, which gives paraphrase only; (3) a Copenhagen manuscript, which has a Haggadic A.B. acter; (3) the so-called second (sheni) Targum, a much larger work, containing a collection of later Midrashim to this book. According to Zunz "this second" Targum is quoted by Rashi to Deut. iii. 3. as a Jerusalem Targum, and also (1 Kings x. 13) as a Targum of the Megilloth Esther. Dalman assigns these Targums to a date before the Babylonian Targums (Onkelos and Ion at a from a Cambrian manuscript was edited by D. Wilkins in 1715. In the translation, which at times is fairly literal, use is made of the Jerusalem Targums to the Pentateuch, and of the Targums to the books of Samuel and Kings. The text represented by the Erfurt manuscript is assigned to the 8th, that of the Cambridge manuscript to the 9th century A.D.

No Targums have so far been discovered to Daniel and Ezra and Nehemiah.

(T. F. St.)

TARIFA, a seaport of Spain, in the province of Cadiz, at the extreme south point of the Peninsula, 12 m. by rail S.W. of Gibralta. Pop. (1900) 11,723. The town is nearly quadrangular, with narrow, crooked streets, and is still surrounded by its old Moorish walls. On its east side, just within these, stands the citadel. The rocky island in front of the town, connected with the mainland by a causeway, is strongly fortified; on the south side there is a modern lighthouse. Anchovy and tuna fishing is carried on, and there is some coasting trade, chiefly in live stock, salt fish and fruit. The manufactures (leather and earthenware) are unimportant. The oranges of Tarifa are famed for their sweetness.

Tarifa is the Juliàmega of the Itinera, between Gades and Belon.

According to that writer, it was colonized by Romans and the removed inhabitants of Zelis in Mauretanit Tingitana. The Julià Transducta or Traducta of coins and of Ptolemy appears to be the same place. Its present name, dating from early in the 8th century, is derived from Tarif, whom Tariq sent to Spain in command of the advance-guard of the Moorish invaders (see Caliphate and Spain: History). In 1292 Tarifa was taken by Sancho IV. of Castile from the Moors, who made several subsequent attempts to recapture it. In the defence of Tarifa Alphonso XI. gained the battle of Salado, a short distance to the westward, in 1340. In 1512 a French force of 16,000 men under Generals Victor and Laval vainly endeavoured to capture Tarifa, which was garrisoned by 2500 troops (mostly British) under General Gough.

TARIF (adapted in English from the French; the word comes through the Spanish tarifa, a list or schedule of prices, from the Arabic, ta'rif, information, an inventory, 'orf, knowledge), a table or list of articles on which import or export duties are levied, with the amount of the duty specified, hence often used as a collective term for the duties imposed, or for the law or code of regulations imposing such duties or varying the scale of charges. The word is also used quite widely of any schedule of prices or charges, and, particularly in America, of the freight or other charges of a railway or steamship line.

Resort is made to tariffs, or duties on imports, partly to secure revenue, partly to affect the course of industry within a country. Strictly speaking, these two objects are inconsistent with each other; since a customs duty, in so far as it causes a domestic industry rather than a foreign supply to influence the market, ceases to be a source of revenue. But in a great number of cases the imposition of a customs duty only a part of the foreign supply, and hence brings some revenue from that which remains. This circumstance strengthens the hold of the protective system, especially in countries where customs duties are an important source of revenue, the combination of fiscal convenience and of protection to home industry being a highly attractive one. Where tariff duties are imposed solely for revenue, an equivalent excise tax is imposed within the country, so as to put the domestic producer precisely on the footing of his foreign competitor.

G. V. p. 83.

competitor; and tariffs so maintained are in complete conformity with the principle of free trade.

Great Britain.—Between the close of the Napoleonic wars of 1815 and the year 1860, the tariff system of Great Britain was changed from elaborate protection to practically complete free trade. An attempt had indeed been made in 1786 to modify the rigidly protective legislation of the 18th century. In that year Pitt concluded a commercial treaty with France, providing for large reductions of duties in both countries. But the treaty was swept away with the outbreak of the wars with France, and accordingly the old system was still in force in 1815. The first important step, and in some respects the decisive step, towards modifying it was taken in 1824, under the policy of Huskisson. In that year, and again in 1829, great reductions were made in the duties on raw materials, especially on wool, raw silk, flax and iron, while considerable reductions were also made in the duties on manufactured goods. The most sharply contested of the changes was in regard to silks, which had been completely prohibited, and were now admitted at a duty of 30 per cent. A considerable breach was thus made in the protective system; and some further changes in the same direction were made in the next decade, especially under Lord Althorp in 1833. But in the decade from 1830 to 1840 the Corn Laws were the chief subject of contention. The great increase in population since the middle of the 18th century had made England a corn-importing country, especially with the rapid growth of manufactories in the early years of the 19th century. The first systematic Corn Laws imposing duties on grain had been passed in 1773. From 1815 onwards a series of measures were passed, all designed to maintain the high price of grain. The Act of 1816 prohibited the importation of wheat when the price was less than 8s. a quarter (≈$2.50 a bushel). In 1822 the prohibitive point was lowered to 7s. In 1828 the sliding scale was introduced, under which the duty went up and down as the price of grain went down and up; and it was against this form of the Corn Laws that the Cobden-Calderwood Treaty was directed after 1839. For a long time the anti-Corn Law agitation seemed to have no effect, although conducted with extraordinary skill and enthusiasm.* In 1842, however, Sir Robert Peel made the first important concession, by modifying the sliding scale, his opponent, Lord John Russell, having proposed in the previous year a fixed duty of 8s. a quarter. In view of the bad harvest of 1845-46, and the famine in Ireland in 1846, Peel surrendered, and proposed in 1846 the admission of grain with only a fixed duty of 1s. a quarter as a registration fee. This change was carried, but Peel, by the strong enemy of his party, Sir Robert Peel himself, was compelled shortly afterwards to resign. The Corn Laws had great political strength, serving as they did the interests of the landowners, whose hold on parliament was still very strong; but the general economic situation in Great Britain, from the rapid growth of the manufacturing population and the imperative need of more food, made the abolition inevitable. After having been maintained till the middle of the century, apparently with irresistible support, they suddenly collapsed under the strain of a season of exceptionally short crops. Both their continued maintenance and their final sudden abolition are in some respects divergent from the general course of British tariff history.

The remodelling of the tariff system in the direction of free trade went on, little retarded by the maintenance of the Corn Laws and not much accelerated by their abolition. In 1842 great reductions of duty were made on a large number of articles; in 1846 still further reductions of duty were made; another series of changes came in 1853; and finally, in 1860, the last remnant of protective duties disappeared. The four acts of 1842, 1846, 1853, and 1860—the first two under Peel's leadership, the second two under Gladstone's guidance—thus carried out gradually the policy of free trade in regard to other articles than grain. The first of them, in 1842, was signalized by the introduction of the Income Tax as a means of raising revenue to replace that lost by the diminished import duties. The last of them, in 1860, was largely influenced by the great commercial treaty with France. In that treaty the concessions made to France were the reduction by Great Britain of duties on wines and spirits, and the admission, free of duty, of some important French products, notably silk manufactures, gloves, and other products in which the French had superiority. Great Britain, instead of limiting the concessions to France, in 1860 made them applicable to all the world. The silk manufacture, as to which the first great changes had been made in 1824, and on whose products the duties had been kept higher in previous acts than on other manufactures, was thus compelled, notwithstanding violent opposition, to face unfettered foreign competition.

Two general features should be noted in regard to the tariff history of Great Britain. In the first place, most of the reductions of duty on manufactured articles were of little practical significance. The great mass of manufactured commodities were produced in the United Kingdom more cheaply than in foreign countries, and would not have been imported, with duty or without, except in sporadic amounts for some special qualities. The changes hence involved little real readjustment of industry. There is thus some ground for the assertion that the policy of free trade was not adopted by the United Kingdom until its industries had reached the stage of being independent of protection, but this does not hold good of some manufactures; especially not of the silk industry, and some parts of the woollen and linen trades. Still less does it hold good of raw materials, many of which had been really affected by the duties, and were largely imported after their abolition. Such was the case not only with some metals, such as lead, zinc, copper, but still more strikingly with textile materials such as wool, flax, and the like, and most of all with agricultural products such as grain, meat and meat products, timber. In regard to all these, the abolition of protection meant a real sacrifice to domestic industries. The second feature to be noted is the simplification which resulted in the administrative feature of the English tariff. A great number of articles had been enumerated in the earlier tariff acts, each of which was imported in very small quantity and yielded an insignificant revenue. The nature of the changes made between 1842 and 1860 is indicated by the following tabular statement:

<table>

</tbody>
</table>

After 1860 only forty-eight articles remained subject to duty, a number which has been still further reduced, the most notable change having been free admission of sugar in 1872. Since that date the English customs tariff has been simplicity itself. A very few articles (spirits, beer, wine, tobacco, tea, coffee, cocoa) yield practically all of the customs revenue, and, so far as these articles are produced within the country, they are subject to an excise duty, an internal tax precisely equal to the import duties. In 1901, to aid in meeting the expenses of the South African war, a moderate revenue duty was again imposed on sugar; and in 1902 the shilling duty on corn and flour (abolished in 1869) was restored, but again taken off in 1903. In this year began the "Tariff Reform" movement initiated by Mr. Joseph Chamberlain (q.v.), but Free Trade retained a strong hold on the British electorate, and the return of the overwhelming Radical majority to parliament in 1906 involved its retention under the fiscal policy of that party. In January 1910 the Liberal government was again returned to power; but the Unionist party was now committed to "Tariff Reform," which had made great strides in obtaining popular support.

France.—The tariff history of France in the 19th century divides itself into three periods: one of complete prohibition,
Tariff

lasting till 1860; second, of liberal legislation, from 1860 to 1881; third, of reversion to protection after 1881.

(1) During the first period the prohibitive legislation of the 18th century was retained, largely in consequence of the Na-
poleonic wars. The commercial treaty of 1786 between Great Britain and France has already been referred to as making a breach in the restrictive system of the 18th century; and in the early years of the French Revolution a similar wave of liberal policy is to be seen. But the great wars led to the complete prohibition of the importation of manufactures, reaching its climax in Napoleon's Continental system. The system of prohibitions thus instituted, while aimed at Great Britain, was made general in its terms. Hence the importation into France of virtually all manufactured articles from foreign countries was completely interdicted; and such was the legislation in force when peace came in 1815. This system doubtless was not expected to last after the wars had ceased, but, as it happened, it did last until 1860. Successive governments in France made endeavours to break with the prohibitive system, but naturally met with strong opposition from the manufacturing interests, not prepared to meet the competition of Great Britain, whose industries had made, and were continually making, rapid strides. The political position of the governments of the Restoration and of Louis Philippe was such that they were unwilling to forfeit support by protecting the industries in which, after all, they were not themselves deeply interested.

(2) It was not until Napoleon III. believed it to be to his political advantage to strengthen friendly relations with Great Britain by the moderation of the import duties that the change was finally made; while the despotic character of his government enabled him, when once the new policy was entered on, to bring about a radical change. After some secret negotiations, in which the English Corn Law agitator, Cobden, and the French economist, Cherbuliez, took an active part, Napoleon was persuaded to enter on the famous commercial treaty of 1856, and virtually to forgo its acceptance by the French legislature. In the treaty as finally framed duties on most manufactured commodities were reduced to a range of 10 or 15 per cent., some iron manufactures, however, being left at slightly higher rates. Before the treaty, all woollen and cotton manufactures, all manufactures of leather, of hardware, pottery, all glass ware, had been prohibited, while raw materials and such manufactures as were not prohibited had been subject to heavy duties. The treaty thus made a radical change, revolutionizing the tariff system of France. It did so with relation not only to the United Kingdom, but, in its after effects, to the world at large. The French government at once set to work to enter into similar arrangements with other countries, and treaties were successively concluded in 1860-66 with Belgium, with the Zollverein (Germany), Italy, Switzerland, Sweden and Norway, Holland, Spain, Austria. All these countries made reductions of duty on French products, while France admitted other products at the rates of the British treaty tariff. Thus a network of treaties was spread over Europe, leading to much great freedom of trade and opening an era of freer international exchange.

(3) This more liberal policy, however, probably never had deep root in French public opinion. It received a check from the Franco-German War of 1870-71. The treaty of Frankfurt in 1871 contained, in place of the previous detailed commercial treaty with Germany, the simple "most favoured nation" proviso. The guarantee which each country thus gave to the other of treatment as favourable as that given elsewhere became irksome to France, sore after her defeat in the war. More important, however, in undermining the liberal system, was the change in agricultural conditions which began to set in in the decade of 1878-88. Then the great improvements in transportation caused competition in agricultural products to be felt, especially from the United States. Agricultural prices declined; agricultural depression set in. The agricultural interest in France, hitherto indifferent about duties, now began to demand protection against competition from beyond the sea. To this factor was added the revival of national feeling and prejudice, with growing political complications and jealousies. Hence, by gradual steps, the customs policy of France has become more and more strongly distinctive. The first important step was taken in 1881, when a new general tariff was established, in which specific duties replaced the ad valorem duties chiefly applied in the treaty tariffs of 1860-66. The new rates were supposed to be no more than equivalent to those replaced by them, but in fact were in some cases higher. New treaty tariffs, less liberal than the earlier ones, were concluded with Belgium, Switzerland and Spain; while with other countries (e.g. Great Britain) a "most favoured nation" arrangement was substituted for the previous treaty régime. These new treaty arrangements expired in 1892 even before that date, duties and bed duties, on grain and meats; and finally, in 1892, a new and more highly protective general tariff was established on the recommendation of M. Meline, with high duties on agricultural products and raw materials as well as on manufactures, and with provisions for limited domestic bounties on silk, hemp and flax. Nevertheless, some provision was made for negotiations with foreign countries by establishing a minimum tariff, with rates lower than those of the general or maximum tariff, the rates of this minimum tariff being applicable to countries which might make concessions to France. As a rule the minimum tariff has been applied, at an even rate, and thus is the tariff in practical effect; yet its rates are still high, and, most significant of all, agricultural products are granted no reductions whatever as compared with the maximum tariff, there being heavy and unrelaxed duties upon grain, animals, meats and the like.

Germany.—The tariff history of Germany, up to the foundation of the German Empire, is the history of the Zollverein or German customs union; and this in turn is closely connected with the tariff history of Prussia. In 1818 Prussia adopted a tariff with much reduced duties, under the influence of the Liberal statesmen then still powerful in the Prussian government. The excitement and opposition in Germany to the Prussian tariff led to customs legislation by the other German states, some smaller states joining Prussia, while the southern states endeavoured to form independent customs unions. Finally, by gradual steps between 1831 and 1834, the complete Zollverein was formed, notwithstanding popular opposition. All the German states formed a customs union, with free trade between them, except the Free City of Hamburg and some of the smaller states which had not joined the Zollverein. These remaining states had duties equal to the Zollverein duties on imports, but much reduced in comparison with the duties levied on domestic productions. The customs duties were divided among the several states in proportion to population. The tariff of the Zollverein was, in essentials, the Prussian tariff of 1818, and was moderate as compared with most of the separate tariffs previously existing. Within the Zollverein, after 1834, there was an almost unceasing struggle between the Protectionist and Free Trade parties, Prussia supporting in the main a Liberal policy, while the South German states supported a Protectionist policy. The trend of the tariff policy of the Zollverein for some time after 1834 was towards protection; but as the Zollverein duties were no longer so heavy as manufactured commodities fell in price, partly because some actual changes in rates were made in response to the demands of the Protectionist states. In 1853 a treaty between the Zollverein and Austria brought about reciprocal reductions of duty between these two parties. After 1860 a change towards a more liberal policy was brought about by the efforts of Prussia, which concluded independently a commercial treaty with France, forcing on the other members of the Zollverein the alternative of either parting company with Prussia or of joining in her relations with France. The second alternative was accepted, largely because Austria did not vigorously support the South German states, and in 1865 the Zollverein as a whole concluded a commercial treaty with France, bringing about important reductions of duty. The régime of comparatively free

Tariff of 1892.

The Zollverein, 1834.
trade thus established lasted for about fifteen years. After the foundation of the German Empire, the duties of the Zollverein became those of Germany, and for a time the liberal régime was maintained and extended, with respect to the tariff as with respect to other matters. But in Germany, as in France, a combination of political and of economic forces led before long to a reaction towards protection. Bismarck broke with the National Liberals, who were the champions of free trade; at the same time the agricultural depression set in, and the agricultural interest demanded protection against American and other foreign products. The manufacturers, especially of iron, also manoeuvred for protection. The liberal régime of 1879, when duties were increased on manufactured articles as well as on agricultural articles. Other advances of duty were made in later years, especially on grain; and thus the policy of Germany has become distinctly Protectionist, though not to the same degree as in France. In 1892, however, the precise year in which France gave up her system of commercial treaties, some moderation was brought about in Germany's protective system by commercial treaties with Austria, Italy, Belgium, Switzerland, and shortly afterwards, with the United States. Hence, an attempt was made to secure concessions for reductions of duties in all directions, the most important concessions being on certain agricultural products. Thus the duty on wheat, which had been gradually raised as high as 5 marks per hundred kilogrammes (roughly 18. 3d., or about 30 c. a bushel) was reduced to 3.50 marks by the treaties. The rates of these treaties were extended to a number of other countries having "most favoured nation" relations with Germany. The tariff system of Germany, however, at the beginning of the 20th century, remained definitely Protectionist.

In other important countries changes in policy have taken place similar to those noted in Germany and in France. The era of moderate tariffs, which began with the great treaty of 1860, lasted for about twenty years, and was followed in Italy, Austria, Belgium, Switzerland, and of a Frenchman and protectionist in France, usually to a less high system of protection than had prevailed before 1860. The United Kingdom and Holland alone held consistently and unalteringly to the principle of free trade. The factors which have brought about this reaction have been, as was already noted, partly economic, partly political: on the one hand, the pressure of competition from distant countries in agricultural products, a consequence chiefly of improved transportation; on the other hand, the revival of national sentiment and prejudice.

The United States.—The tariff history of the United States, like that of European countries, divides itself into two great periods, before and after the year 1860. But it is no more than an accident that this year constitutes the dividing line in both cases, the change in the United States being due to the Civil War, which so profoundly influenced the fiscal, economic and political history of the country in all directions. The period before 1860 may again be divided into three sub-periods, the first extending from 1789 to 1816, the second from 1816 to about 1846, the third from 1846 to 1860.

(1) The Tariff Act of 1789 was the first legislative measure passed by the United States. The Protectionists have pointed to it as showing the disposition of the first Congress to adopt at once a policy of protection; the Free Traders have pointed to it similarly as showing a predilection for their policy. Each had some ground for the claim. The duties of the act of 1789 were very moderate, and, as compared with those which the United States has had under any subsequent legislation, may be described as free trade duties. On the other hand, the spirit of the act of 1789 was protective. It had been the design of Madison, and of other firm supporters of the new constitution, to adopt in 1789 a very simple measure, designed solely to secure revenue. But the pressure from the representatives of some of the manufacturing States, Pennsylvania, and Massachusetts, compelled him to incorporate in the Tariff Act certain specific duties borrowed from the Tariff Acts then in force in these states, which had a distinctly protective aim. Thus the act of 1789, although the duties levied by it were moderate, yet had a protective intent. Such in the main remained the situation until 1816, duties being indeed raised from time to time in order to secure more revenue, but the arrangement and the general rate of the duties not being sensibly modified. There was not at this time any considerable public feeling on the subject of protection, chiefly because during most of the years of this period the Eastern states, and especially New England, where manufactures might be expected to develop first, were profitably engaged in an extensive export and carrying trade.

(2) After the close of the War of 1812, however, a new spirit and a new policy developed. With the end of the Napoleonic wars, the opportunities for American commerce became greater, while at the same time the sanding of the population necessarily led to diversified interests at home. A demand arose for two closely connected measures: protection to domestic manufactures, and internal improvements. Protection was demanded as a means both of aiding young industries and of fostering a home market for agricultural products. The chief spokesman of the new movement was Henry Clay, who remained throughout his life the constant advocate of this so-called "American system." Some disposition in this direction showed itself as early as 1816, when tariff duties were increased. Still greater changes were made in 1824, 1828, and 1832. In 1816 the West, the South and the West Indies were restored and thereunder the New England states, which so far had been lukewarm in supporting the movement, joined in it unreservedly. The tariff of 1828 was affected by some political manipulation, which caused it to contain objectionable provisions, and to be dubbed "the tariff of abominations." But the so-called abominations were removed in 1832, when the protective system was deliberately and carefully rearranged. By this time, however, the opposition to it in the South had reached a pitch so intense that concessions had to be made. As a planting and slave-owning region, the South inevitably had no manufactures: it felt that its cotton was sure to find a foreign market, and would gain little from the establishment of a domestic cotton manufacture within the country; and it judged, rightly, that the protective system brought it only burden and no benefit. The extent of the burden was greatly exaggerated by the leaders of the South, especially in the heat of partisan controversy; and the subject was closely connected with the controversy as to the rights of the states, and the endeavour of South Carolina, under the influence of Calhoun, to nullify the Tariff Act of 1832. The nullification movement led in 1833 to the well-known compromise, by which the rates on manufactures as established by the Act of 1832 were to be gradually reduced, reaching in 1842 a general level of 20 per cent. The compromise served its turn in allaying political bitterness and staying off a direct conflict between the United States and South Carolina. But the reductions of duty made under it were never effectively carried out. In 1842, when the final 20 per cent. rate was to have gone into effect, the Protectionists again had control of Congress, and after a brief period of two months, during which this 20 per cent. rate was in force, passed the Tariff Act of 1842, which once more restored the protective system in a form not much less extreme than that of 1832.

(3) Four years later, however, in 1846, a very considerable change was secured by the South, and a new era was entered on. The Democratic party now was in control of legislation, and in the Tariff Act of 1846 established a system of moderate and purely ad valorem duties, in which the protected articles were subjected, as a rule, to a rate of 30 per cent., in some cases to rates of 25 and 20 per cent. The system then established has often been spoken of as a free trade system, but was in reality only a system of moderated protection. In 1857 duties were still further reduced, the rate on most protected commodities going down to 24 per cent., and remaining at this comparatively low level until the outbreak of the Civil War.

The second great period in the tariff history of the United States opens with the Civil War. It is true that the first steps towards a policy of higher protection were taken just before the war began. In the session of 1860-61, immediately preceding the outbreak of the conflict, the Morrill Tariff Act was
passed by the Republican party, then in control because the defection of Southern members of Congress had already begun. It substituted specific duties for the ad valorem duties of 1846 and 1857, and made some other changes of significance, as in the higher duties upon iron and steel. Nevertheless, the advances then made were of little importance as compared with the far-reaching increases of duty during the Civil War. These formed part of the general resort to every possible fiscal device. The great intragovernmental resource to be strained to the utmost: the issue of long-time bonds, continual borrowing in very large amounts on short-time inconvertible paper money, an elaborate and all-pervading system of internal taxes, and, finally, heavy import duties. The internal taxes of the war were applied not only in the form of income taxes, stamp taxes, licence and gross receipts taxes, but also as direct excise taxes on many commodities. The import duties were correspondingly raised, partly by way of off-set to the internal taxes, partly as a means of getting additional revenue, and finally in some degree because of a disposition to protect domestic industries. The most important acts were the great revenue acts of 1862 and 1864. Some further changes were made in 1865, and the close of the war thus left the United States with a complicated system of very high taxes both on imported duties and on domestic products.

The main features of the tariff history of the United States since the Civil War have been that the internal taxes have been almost entirely swept away, the import duties on purely revenue articles similarly abolished, while those import duties that operated to protect domestic industries have been maintained, and indeed in many cases increased. The situation has had some analogy to that of France from 1815 to 1860, when similarly a highly restrictive system established during a period of war was unexpectedly retained long after peace had been established. This result in the United States came about by gradual steps and without premeditation. After the close of the war efforts were first directed to clearing the financial situation by funding the floating debt, and taking steps (never fully consummated) towards contracting the currency. Next the internal taxes were gradually done away with, until nothing was left except the excise on beer, spirits and tobacco. No further resort was made to internal taxes until the revenue act of 1868 was passed, at the outbreak of the Spanish War. Efforts were made also to reduce the tariff duties, but these naturally came last: they met with strong opposition, and in the end they were almost completely frustrated, thus leaving as the basis of the tariff the rates which had been levied in the course of the war. In 1870 some rearrangements were made, the duties on iron and on some other articles being reduced. In 1872 a more general reduction was carried out, strongly resisted by the Protectionists, and finally ending in a uniform cutting off of 10 per cent. from all the import protective duties. In 1875, however, when the revenue had become deficient after the crisis of 1873, the 10 per cent. reduction was repealed, and duties restored to their previous amounts. It deserves to be noted that in 1872 an important step was also taken towards removing entirely the duties on purely revenue articles, tea and coffee being then admitted free of duty. On the other hand, the maintenance of the protective duties, and the gradual consolidation of feeling in favour of a permanent policy of strong protection, led to other rearrangements, and new protective duties were enacted. In 1867 an important act on wool and woollens was passed, largely increasing the duties on both. In 1869 the duty on copper was raised. In 1870, while some duties were lowered, others were raised, as, for instance, those on steel rails and on marble. Thus the ten years immediately following the close of the war brought about the gradual transformation of the high duties levied on all commodities for revenue purposes into a system of high duties almost wholly on protective commodities. This transformation met with much opposition, not less in the Republican party than in the Democratic party. While the feeling in the Republican party had been from the outset in favour of protection, so high a range of duties met with much opposition. This opposition led to an important general revision in 1883, largely influenced by the recommendations of a special Tariff Commission which Congress created in 1882. The act of 1883 was passed in the main as a party measure by the Republicans, and on the whole served rather to put in order the protective system as it stood than to make any change of policy. Duties were reduced (though in no case greatly reduced) such as those upon wool, some woollens, cheaper grades of cotton cloths, iron, steel rails, copper. On the other hand, on many articles duties already high, but believed to be insufficient for the effective protection of the domestic producer, were raised; e.g., on finer woolens and cottons, on some iron and steel manufactures.

The tariff system as revised and codified in 1883 would probably have remained unchanged for many years had it not been for the turn taken by political and financial history. The decade from 1880 to 1890 was one of great prosperity, consequently of high imports, consequently of swelling customs revenue. In the second half of the decade a continuous large surplus in the Treasury necessarily directed attention to the state of the revenue, and gave strength to the protests against excessive taxation. In addition, the Democratic party, which had long been committed, though in a half-hearted way, against the policy of high protection, was brought to a vigorous and uncompromising attack on it through the leadership of President Cleveland. In his Presidential Message of December 1887 he attacked the protective system in unqualified terms; and in the session of 1888–9 the Democratic party in the House of Representatives prepared a bill providing for great reductions. The control of the Senate by the Republicans prevented any legislation. But the Republicans, as is almost inevitable under a party system, championed the policy opposed by the other side, and declared themselves not only in favour of the maintenance of existing duties, but of the consistent and unqualified further application of protection. The protection question thus became the main issue in the Presidential election of 1888, which resulted in the defeat of the Democrats. In the next ensuing session of Congress, in 1889–90, the Republicans passed a new tariff act, known as the McKinley Tariff Act, because Mr McKinley was then chairman of the House Committee in charge of the bill. It advanced duties materially on a considerable number of commodities, both raw materials and manufactured articles. The duties on wool were raised, corresponding changes made on woollen goods, the duties on cottons, linens, some silks, and velvets considerably raised. A further step towards consolidating the protective system was taken by abolishing the duty on sugar, mainly a revenue duty. The necessity for reducing the revenue and cutting down the continued surplus was met in this way rather than by lowering the protective duties. For consistency in maintaining the protective principle a direct bounty was given to the domestic producers of sugar in Louisiana. A turn in the political wheel brought an abrupt change four years later, in 1894. The tariff question was again the issue in 1892: President Cleveland, defeated four years before, was now again elected, and the Democratic party came into power, pledged to change the tariff system. Accordingly in the first ensuing session of the Congress elected in 1892 the tariff act of 1894 was passed, known as the Wilson Tariff, because of the directions given by the Democratic party for change. The Wilson Act, however, was less inclusive than its chief sponsors had planned, because of the narrow majority commanded by the Democrats in the Senate. Some of the Democratic senators were lukewarm in their support of the party policy of tariff reduction, and joined with the Republicans in mitigating the changes. Nevertheless some crucial changes were made. The duty on wool, typical among the duties on raw materials, was completely abolished, and with this change came a great reduction in the duties upon woolen goods. Changes, but of less importance, were made on other
textile goods. The House had proposed to remove also the duties on coal and on iron ore, but the Senate permitted only a reduction in these. A duty was reimposed on sugar, chiefly as a means of securing needed revenue, but at a less rate than had existed before 1890. At the same time the differential duty on refined sugar, which operated as protection to the sugar manufacturers, was abolished. The hard-key system for the duties on sugar was also abolished, but kept in substance not greatly changed. This circumstance, as well as the failure to make other desired reductions, caused the ardent tariff reformers to be greatly disappointed with the act of 1894 as finally passed, and led President Cleveland to permit it to become law without its endorsement by his signature. The next election in 1896 brought still another turn in the political wheel, the Republicans being once more brought into power under the leadership of President McKinley. The currency issue had been foremost in the campaign, but the Republicans had also promised changes that would em- prove in favour of a return to the unqualified protective system. At the extra session which President McKinley called in 1897, almost the sole measure considered was the tariff act, known (again from the name of the chairman of the House Committee) as the Dingley Act. This reimposed the duties upon wool, on most qualities at the precise rates of 1890, on some qualities at even higher rates. Neces- sarily the duties on woollens were correspondingly raised, and here again made even higher than they had been in 1890. On other textiles, particularly on silks and linens, similar duties were put on the rate of 1890, or duties retained or somewhat advanced. To this policy, however, there was a significant exception in the iron and steel schedule, where the reduced duties of 1894 were left mainly unchanged. The iron industry in the United States had made extraordinary advances, and confessedly was not in need of greater protection than had been given in 1894. Some provisions for reciprocity arrangements with other countries, opening the way for possible reductions of duty by treaty arrangements, were also incorporated in the act of 1897, though with limitations which made it improbable that any considerable changes would ensue from this policy. Some such provisions had also been contained in the act of 1890, but here also without important results. The tariff system of the United States at the beginning of the 20th century thus remained rigidly and unqualifiedly protective, with rates higher than those of even the most restrictive tariffs of the countries of the European continent.

It leaves numerous interfacing branches behind it, like the Kunche-
darya, the Cherchen-darya, and the Ak-su-darya, and the Kurgat.
None of its marginal lakes is round in shape, but all are elongated,
from N. to S. or from N.W. to S.E. This is the general rule, but
there is a second series of lakes beside the river which are drawn
out in a more or less straight line. The great accumulation of
water is already at any rate very considerable. And the direction
of the wind. Here too, in its delta, the Tarim overflows
into more than one chain of a third category of lakes (e.g. Avulhu-
kol, Kara-kol, Tayek-kol, and Arka-kol), strung on one or other
of the branches of the Tarim. These lakes, which are mainly actu-
ally actuates, and clarifies, the river emerging from them with crystal-bright
water.
Near the head of its delta the Tarim is joined from the N. by
theKoncheh-darya, a stream which issues from the lake of Bagrash-kul,
it ultimate source being the Khaidu-gol or Khaidy-gol, which
drains the Yulduz valleys of the eastern Tian-shan Mountains.
This lake is about 30 m. above the Bagrash-kul on the great
Kara-koshun, serves, with the help of the poplar forest which grows
along its left bank, as a dam to check the westward movement
of the desert sands. Finally the Tarim enters, by a number of arms,
the series of shallow, dwindling lakes of Kara-buran, which serve
as a sort of lacustrine ante-room to the real terminal basin of the river,
the Kara-koshun, which lies a little farther to the E., in
46° 00' 30" N., at an altitude of 2675 feet above

TARKANI—or TARKALIANI, a Pathan tribe inhabiting the
whole of Bajour (q.v.), on the border of the North-West Frontier Province of India. Subdivided into Mammuds, Isazal,
and Ismazal, the tribe numbers some 100,000 persons.

TARLTON, SIR BANASTRE (1754-1833), English
soldier, was a son of John Tarlton (1717-1739), a Liverpool
merchant, and was born in Liverpool on the 21st of August 1754. Educated
at Oxford he entered the army, and in December 1775 he sailed as
a volunteer to America with Earl, afterwards Marquess,
Cornwallis, and his services during the American War of Inde-
pendence in the year 1776 gained for him the position of a
brigade major of cavalry. He was present at the battle
of Brandywine and at other engagements in 1777 and 1778,
and as the commander of the British legion, a mixed force of cavalry
and light infantry, he proceeded at the beginning of 1780 to
South Carolina, rendered serious service in the operations which culminated in the capture of Charleston.
He was responsible for a British victory at Waxhaw in May
1780, and he materially helped Cornwallis to win the battle
of Camden in the succeeding August. He was completely
victorious in an engagement with Thomas Sumter at Fishing
Creek, or Catawba Fords, but was not equally successful when
he encountered the same general at Blackstock Hill in November
1780; then in January 1781, in spite of much personal value,
he was defeated with heavy loss at Cowpens. Having
been successful in a skirmish at Tarrants House, and having taken
the battle of Kings Mountain in October 1780, with Cornwallis
to Virginia, and after affording much assistance to
his commander-in-chief he was instructed to hold Gloucester.
This post, however, was surrendered to the Americans with
Yorktown in October 1781, and Tarlton returned to England
on parole. In 1790 he entered parliament as member
for Liverpool, and with the exception of a single year he remained
in the House of Commons until 1812. In 1794 he became
a major-general; in 1812 a general; and he held a military
command in Ireland and another in England. In 1815 he was
made a baronet. He died without issue to Sir Henry Clinton
in Shropshire on the 23rd of January 1833.

For some time Tarlton lived with the actress Mary Robinson
(Perdita), and his portrait was painted both by Reynolds and by
Gainsborough. Sir Banastre wrote a History of the Campaigns
of 1780 and 1781 in the Southern Provinces of North America (London,
1781), which, although of some value, is marred by the author's
vanity and by his attacks on Cornwallis. It was criticized by
Colonel Roderick Mackenzie in his Strictures on Lieutenant-Colonel
Tarlton's History (1781) and in the Cornwallis Correspondence.

TARLTON, RICHARD (d. 1568), English actor, was probably
at one time an inn-keeper, but in 1563, when he is mentioned
as one of the original company of the celebrated moralities of
Shakespeare, he acquired a great popularity as a witticisms,
and his talent for impromptu doggerel on subjects suggested
by his audience has given his name to that form of verse.

To obtain the advantage of his popularity a great number of songs
and witticisms of the day were attributed to him, and after
his death Tarlton's Jests, many of them older than he, made
several volumes. Other books, and several ballads, coupled
his name with their titles. He is said to have been the
Yorkick of Hamlet's soliloquy.

TARN, a river of southern France, tributary to the Garonne,
was the name of the departments of Lozère, Aveyron, Tarn, Haute-
Garonne and Tarn-et-Garonne. Length, 234 m. Area of basin,
5733 sq. m. Rising on the southern slope of Mt. Lozère at a
height of 3249 ft., the Tarn flows westward, and having received
the Tarnon, enters the gorge, famed for its beauty, which
separates the Cause de Sauveterre from the Cause Mijan.
Emerging from this cain after a course of 37 m. it receives
the Jonte on the left and, still flowing through gorges, passes
between the Cause Noir, the Larzac plateau and the Cause de
St Affrique (at the foot of which it receives the Dourde du Vahre)
on the left and the Eyousou range and the Bazard, on the right.
The most important town is Millau, where it receives the Dourbie.
At the cascade of Sabo, above Albi, the river enters the plains and
flowing in a deep bed, passes Albi and Gaillac, some distance below which, at the confluence of the Agout, it exchanges a east-south-westerly for a north-westerly course. At Montauban the Tarn receives the Tescou and 6 m. farther on unites with the Aveyron. It then reaches Moissac, 2½ m. below which it flows into the Garonne.

TARN, a department of south-western France, formed in 1790 of the three dioceses of Albi, Castres and Lavaur, belonging from 1454 to 1790 to the province of Quercy, and from 1790 to 1814 to the department of Lot. It is bounded N. and E. by Aveyron, S. by Aude, and W. by Haute-Garonne, N.W. by Tarn-et-Garonne. The slope of the department is from east to west, and its general character is mountainous or hilly; its three principal ranges, the Mountains of Lacaune, the Sidobre, and the Montagne Noire, belonging to the Cevennes, lie on the south-east. This and the wind-blowen slopes of the first-named are used for pasturage. The highest point of the range and of the department is the Pic de Monteault (about 4,150 ft.); several other summits are not much short of this. The granit-strown plateaus of the Sidobre, from 1,600 to 2,000 ft. high, separate the valley of the Agout from that of its left-hand affluent the Thoré. The Montagne Noire, on the southern border of the department, derives its name from the forests on its northern slope, and some of its peaks are from 3,000 to 3,500 ft. high. The limestone and sandstone foot-hills are clothed with vines and fruit trees, and are broken by deep alluvial valleys of extraordinary fertility. With the exception of a small portion of the Montagne Noire, which drains into the Aude, the whole department belongs to the basin of the Garonne. That western portion of the department has the reputation of Albigensia, the severest in France, but that of the plain is Girondin. At Albi the mean temperature is 55°. The rainfall, 29 or 30 ins. at that place, exceeds 40 ins. on the Lacaune and Montagne Noire.

The most noteworthy places in the department are Albi, the capital, Castres, Gaillac, Lavaur, Mazamet and Cordes, which are separately treated. Other places of interest are Burlsats, which has a part of its place-name in the name of Albi; bastide with a church of the 14th century; and Penne, which has ruins of a fine medieval chateau.

TARN (O. Eng. tarne, Scand. tjarn, tjårn, tjôrn, &c.), a name applied in England (especially in the Lake District) and in Scotland to small lakes or pools in mountainous districts, especially such as have no visible affluent streams. The term is sometimes used also of a marsh or bog.

TARN-ET-GARONNE, a department of south-western France, formed in 1868 of districts formerly belonging to Guienne and Gascony (Quercy, Lamogna, Armagnac, Rouergue, Agenais), with the addition of a small piece of Lot. From 1790 to 1814 it was divided between the departments of Lot, Haute-Garonne, Tarn, Aveyron, Gers and Lot-et-Garonne. It is bounded N. by Lot, E. by Aveyron, S. by Tarn and Haute-Garonne, and W. by Gers and Lot-et-Garonne. Area, 1,440 sq. m. Pop. (1906) 888,553. The department is watered by three rivers, the Garonne, the Tarn, which joins the Garonne below Moissac, and the Aveyron, which flows into the Tarn between Moissac and Montauban, dividing it into three distinct regions of hills. Those to the south-west of the Garonne are a continuation of the plateau of Lannemezan; ramifications of the Cevennes extend between the Garonne and the Tarn, and between the Tarn and the Aveyron; the region to the north of the continuous valley formed by the courses of the three rivers belongs to the Central Plateau. The causse or limestone plateau of Quercy occupies the north-east corner of the department and includes its highest point (1,634 ft.). The lowest point (164 ft.) is at the exit of the Garonne. The climate is mild and agreeable; the mean annual temperature being about 56° F. Rain falls seldom, but heavily, especially in spring, the annual rainfall being 28 or 30 ins.

The wide alluvial valleys of the three large rivers are most productive. Cereals, especially wheat, maize and oats, occupy more than two-thirds of the arable land of the department. The vine is everywhere cultivated and large quantities of grapes are exported as table fruit. Potatoes are also grown. Plums and apricots are the best fruit. The broad taxation for cavalry purposes, is actively carried on; and the rearing of horses for draught and for fattening, is also important. Sheep, pigs, poultry and, in a minor degree, silk-worms, are also sources of profit. The manufacture of wine is carried on, and furnishes the most important industries. Imports include rayon, raw silk, wood-pulp, coal and agricultural produce. The canal of the Garonne traverses the department for 48 m. and the Tarn furnishes 82 m. of navigable waterway. The department is served by the Orleans and the Southern railways. The department forms the diocese of Montauban, and belongs to the jurisdiction of the Toulouse court of appeal, to the académie centrale of Agen, and to the division of the XVII. corps d'armée (Toulouse). It has 3 arrondissements (Montauban, Moissac and Castelsarrasin), 24 cantons and 105 communes.

Montauban, Moissac and Castelsarrasin are the principal places. Other towns of interest are St. Antonin, which has manufactures of rough fabrics and is archaeologically important for its possession of a massive hôtel de ville of the 12th century, the oldest in France; Bruniquel, which is splendidly situated over-looking the valleys of the Aveyron and the Verre, and is dominated by a medieval castle with a donjon of the 11th century; Beaumont-de-Lomagne, a curious bastide of the 13th century with a fortified château; and the 14th century church of the same period, containing many precious antiquities; Varen, an ancient town of narrow streets and old houses with a remarkable Romanesque church and the ruins of a castle of the 13th and 15th century; and Cazoulès, where remains the Cistercian abbey of Beaulieu, founded in 1141, are still to be seen.

TARNPOL, a town in Galicia, Austria, 87 m. E.S.E. of Lemberg by rail. Pop. (1900) 30,368, half of which are Jews. Industry consists chiefly in corn-milling and the preparation of wax and honey. The principal trade is in horses, corn and other agricultural produce, and spirits. Tarnopol was formerly a fortress, and rendered valuable services to Polish kings, who in their turn conferred upon it important privileges.

TARNOW, a town in Galicia, Austria, 164 m. W.N.W. of Lemberg by rail. Pop. (1900) 31,651, about 40 per cent. Jews. It is situated on the river Biała, not far from its junction with the Dunajec, and is the seat of a Roman Catholic bishop. It possesses a cathedral in Gothic style, built in the 15th century, with monuments of the Tarnowski and Ostrogski families, to which the town formerly belonged, and another church built in 1454. On the Martinsberg, an eminence near the town, stands the ruins of the old castle of the Tarnowski family, and a small church over 800 years old. Worth mentioning also is the town hall, an old and interesting building. Agricultural implements, glass and chichory are manufactured.

TARNOWSKI, JAN [called MAGNUS] (1488-1561), Polish general. After a careful education beneath the eye of an ex-Nobles, and at the instance of a prince Mathew Drzewicki, bishop of Przemysl, he occupied a conspicuous position at court in the reigns of John Albert, Alexander and Sigismund I. As early as 1509 Tarnowski brilliantly distinguisheil himself in Moldavia, and took a leading part in the great victories of Wisniowiec (1512) and Orsza (1514), where he commanded the flower of the Polish chivalry. To complete his education he then travelled in Palestine, Syria, Arabia, Egypt, and northern and western Europe. While in Portugal he received from King Emanuel the chief command in the war against the Moors in India. In 1535 he was rewarded for his services by being made a member of the Christian cause with the dignity of a count of the Empire. Indeed, the emperor had such a high regard for Tarnowski that he offered him the leadership of all the forces of Europe in a grand expedition against the Turks. On the death of Nicholas Firlej in 1526 Tarnowski became grand hetman of the crown, or Polish commander-in-chief, and in that capacity won his greatest victory at Obertyn (22nd August 1531) over the Moldavians, Turks and Tartars, for which he received a handsome subsidy and an ovation similar to that of an ancient Roman triumphator. Heartily attached to King Sigismund I. and his son Sigismund Augustus, Tarnowski took a royal side during the so-called Kobena wojna, or Poultry War, of 1537;
and also in 1548 when the turbulent szlachta tried to annul by force the marriage of Sigismund Augustus with Barbara Radziwill. In 1553, however, we find him in opposition to the court and thwarting as much as possible, the designs of the young king. Nevertheless Tarnowski was emphatically an aristocrat and an oligarch, proud of his ancient lineage and intensely opposed to the democratic tendencies of the szlachta. A fine example of the szlachta king and the szlachta as his ideal of government. On the other hand, though a devout Catholic, he was opposed to the exclusive jurisdiction of the bishops and would even have limited the authority of Rome in Poland. As a soldier Tarnowski invented a new system of tactics which greatly increased the mobility and the security of the armed camps within which the Poles had so often to encounter the Tatars. He also improved discipline by adding to the authority of the commanders. His principles are set forth in his Consilium Rallantis Bellacce (best edition, Posen, 1870), which was long regarded as authoritative. As an administrator he did much to populate the vast south-eastern steppes of Poland.

See Stanislaw Orzechowski, Life and Death of Jan Tarnowski (Pol.) (Cracow, 1855.)

TAROK, a game of cards very popular in Austria and Germany, and played to a limited extent in some parts of France. Special cards are used, and the rules are complicated. The name Tarok was originally given by the Italians to a certain card in the pack as early as the 13th century, but was afterwards applied to the game itself.

TAROM, a district of Persia, situated on the borders of Gilan, north-west of Kazvin. It is divided into upper and lower Taram; the former, on the right bank of the Kizil Uzain (Seid Rud) river, is a crown domain; the latter, on the left bank, forms part of the province of Kazvin. It produces much cotton and fruit, and derives a considerable revenue from its alum mines at Zajkanin. Most of the alum is exported to Russia. It also has a few olive groves. The inhabitants are Turks.

TARPALUN, or TARPALING (as tarpaulin, from tar, and palling, a covering, Lat. palla, a mantle), a heavy, well-made, double warp plain fabric, of various materials, used chiefly in the manufacture of covers for railway and other wagons and for protecting goods on wharves, quays, &c. To make it proof against rain and other atmospheric influences it is generally treated with tar, though various compositions of different kinds are also employed, especially for the finer fabrics such as are used for covering motor-cars. These covers are generally made of flax, hemp and cotton, and are very similar to canvas—indeed, large quantities of canvas are made waterproof, and then called tarpaulin. A very large quantity of tarpaulin is made entirely of jute. The chief seats of manufacture are Dundee, Arbroath and Kirkcaldy. Formerly the word was used as a sort of nickname for sailors, the modern "tar" in the same sense being an abbreviation of it.

TARPEIA, in Roman legend, daughter of the commander of the Capitol during the war with the Sabines caused by the rape of the Sabine women. According to the common story, she offered to betray the citadel, if the Sabines would give her what they wore on their left arms, meaning their bracelets; instead of this, keeping to the letter of their promise, they threw their shields upon her and crushed her to death. Similus, a Greek elegiac poet, makes Tarpeia betray the Capitol to a king of the Gauls. The story may be an attempt to account for the Tarpeian rock being chosen as the place at which execution of traitors. According to S. Reinach, however, in Revue archéologique, xi. (1908), the story had its origin in a rite—the taboo of military spoils, which led to their being heaped up on consecrated ground that they might not be touched. Tarpeia herself is a local divinity, the manner of whose death was suggested by the tumultus or shields on the spot devoted to her cult, a crime being invented to account for the supposed punishment.

TARQUINI (mod. Corneto Tarquinia, q.v.), an ancient city of Etruria, Italy, situated on a hill overlooking the S.W. coast of Italy, about 5 m. N.W. of it. The site of the Roman town is now deserted, its last remains having been destroyed by the inhabitants of Corneto in 1907. Scanty remains of walls and of buildings of the Roman period exist above ground; traces of a large rectangular platform were found in 1875, and part of the thermae in 1879; it occupied the summit of a hill defended by ravines, called Pian di Civita. It seems probable, however, that the original settlement occupied the site of the medieval town of Corneto, to the W.S.W., on the further side of a deep valley. Some authorities indeed consider, and very likely with good reason, that this was the site of the Etruscan city, and that the Pian di Civita, which lies further inland and commands but little view of the sea, was only occupied in Roman times. The case would be parallel to others in Etruria, e.g. Civita Castellana (anc. Falerii) which also occupies the site of the Etruscan city, while the Roman site, some distance away, is now abandoned. The importance of Tarquini to archaeologists lies mainly in its necropolis, situated to the S.E. of the medieval town, on the hill which, from the tumuli raised above the tombs, bears the name of Monterozzi. The tombs themselves are of various kinds. The oldest are tombe a pozzo, or shaft graves, containing the ashes of the dead in an urn, of the Villanova period, the oldest of them probably pre-Etruscan; in some of these tombs but urns, like those of Lahum, are found. New to the Etruscans are the various kinds of inhumation graves, the most important of which are rock-hewn cist graves, which contain well-preserved paintings of various periods; some show close kinship to archaic Greek art, while others are more recent, and one, the Grotta del Tifone (so called from the typhons, or winged genii of death, represented) in which Latin as well as Etruscan inscriptions appear, belongs perhaps to the middle of the 4th century B.C. Fine sarcophagi from these tombs, some showing traces of painting, are preserved in the municipal museum, and also numerous fine Greek vases, bronzes and other objects.

Tarquinii is said to have been already a flourishing city when Demaratus of Corinth brought in Greek workmen. It was the chief of the twelve cities of Etruria, and appears in the earliest history of Rome as the home of two of its kings, Tarquinius Priscus and Tarquinius Superbus. From it many of the religious rites and ceremonies of Rome are said to have been derived, and even in imperial times a collegium of sixty haruspices continued to exist there. The people of Tarquinii and Veii attempted to restore Tarquinii Superbus to the throne of Italy. In 356 B.C. the citizens of Tarquinii captured and put to death the Romans; the resulting war ended in 351 with a forty years' truce; he succeeded for another period in 308. When Tarquinii came under Roman domination is uncertain, as is also the date at which it became a municipality; in 181 B.C. its port, Graviscae (mod. Porto Clementino), in an unhealthy position on the low coast, became a Roman colony. It exported wine and carried on coral fisheries. Nor do we hear much of it in Roman times; it lay on the hills above the coast road. The flax and forests of its extensive territory are mentioned by classical authors, and we find Tarquinius offering to furnish Scipio with sailcloth in 195 B.C. A bishop of Tarquinii is mentioned in A.D. 456.

TARQUINIUS PRISCUS, LUCIUS, fifth legendary king of Rome (616–578 B.C.). He is represented as the son of a Greek refuge, who was removed from Tarquinii in Etruria to Rome, by the advice of his wife, the prophetess Tanagi. Appointed guardian to the sons of Aeneas Marcius, he succeeded to his throne and planting them on the throne on their father's death. He laid out the Circus Maximus, instituted the "great" games, built
the great sewers (doacae), and began the construction of the temple of Jupiter on the Capitol. He carried on war successfully against the Sabines and subjugged Latium. He is said to have raised the number of the senators to 300, and to have doubled the number of the knights (see NAUSIC, ATTUS). The introduction of many of the insignia both of war and of civil office is assigned to his reign, and he was the first to celebrate a Roman triumph, after the Etruscan fashion, in a robe of purple and gold, and bore a spatha, a chasuble drawn by four horses. He was assassinated at the instigation of the sons of Ancus Marcius.

The legend of Tarquinii Priscus is in the main a reproduction of those of Romulus and Tullus Hostilius. His Corinthian descent, invented by the Greeks to establish a close connexion with Rome, is impossible for chronological reasons; further, according to the genuine Roman tradition, the Tarquinii were of Etruscan, not Greek, origin. There seems to have been originally only one Tarquinii; later, when a connected story of the legendary period was constructed, two (distinguished as the “Elder” and the “Proud”) were introduced, separated by the reign of Servius Tullius and then the force of both connected with the same events. Thus, certain public works were said to have been begun by the earlier and finished by the later king; both instituted games, acquired the Silviany books, and reorganized the army.

For the constitutional reforms attributed to Tarquinii, see Rome: Ancient History, for a critical examination of the story, Schwäger, Römische Geschicht, bk. xv.; Sir George Cornewall Lewis, Critédité Storia di Roma, I. (1898); and, for the political character of his reign, Rome: Ancient History, Ancient authorities. — Livy i. 21; Dion. Hal. v. i-vi. 21.

TARQUINIUS SUPERBUS, LUCIUS, son of Lucius Tarquinii Priscus and son-in-law of Servius Tullius, the seventh and last legendary king of Rome (534–510 B.C.). On his accession he proceeded at once to repeal the recent reforms in the constitution, and attempted to set up a pure despotism. Many senators were put to death, and their places remained unfilled; the lower classes were deprived of their arms and employed in erecting splendid monuments, while the army was recruited from the king's own retainers and the hereditary forces of his foreign allies. The completion of the fortress-temple on the Capitoline confirmed his authority over the city, and a fortunate marriage of his son to the daughter of Octavius Mamilius of Tusculum secured him powerful assistance in the field. His reign was characterized by bloodshed and violence; the outrage of his son Sextus upon Lucretia (q.v.) precipitated a revolt, which led to his expulsion from the city.

In the story certain Greek elements, probably later additions, may easily be distinguished. Tarquinii appears as a Greek “tyrant” of the ordinary kind, who surrounds himself with a bodyguard and erects magnificent buildings to keep the people employed; on the other hand, an older tradition represents him as more like Romulus. This twofold aspect of his character perhaps accounts for the making of two Tarquinii out of one (see TARQUINIUS PRISCUS). The stratagem by which Tarquinii obtained possession of the town of Gabii is a mere fiction, derived from Greek and Oriental sources. According to arrangement, his son Sextus requested the protection of the king in infancy against his father. Having obtained their confidence, he sent a messenger to Tarquinii to inquire the next step. His father made no reply to the messenger, but walked up and down his garden, striking off the heads of the tallest poppies. Sextus thereupon put to death all the chief men of the town, and thus obtained the mastery. The stratagem of Sextus is that practised by Zopyrus is the case of Babylon, while the episode of the poppy-heads is borrowed from the advice given by Thrasylbus to Periander (Herodotus iii. 154, v. 92). On the other hand, the existence in the time of Dionysius of Halicarnassus of a treaty concluded between Tarquinii and the inhabitants of Gabii, shows that the town came under his dominion by formal agreement, not, as the tradition states, by treachery and violence. The embassy to Delphi (see Brutus, Lucius Junius) cannot be historical, since at the time there was no communication between Rome and the mainland of Greece. The well-known story of Tarquinii's repeated refusal and final consent to purchase the Sibylline books has its origin in the fact that the building of the temple of Jupiter Capitolinus, in which they were kept, was attributed to him. The fact that his expulsion can hardly be historical. A constitutional revolution, involving such far-reaching changes, is not likely to have been carried out in primitive times with so little disturbance by a simple resolution of the people, and it probably points to a rising of Romans and Sabines against the dominion of an Etruscan family (Tarquinii, Tarchna) at that time established at Rome.

For a critical examination of the story see Schwäger, Römische Geschichte, bk. xviii.; Sir George Cornewall Lewis, Critédité Storia di Roma, I. (1898); and, for the political character of his reign, Rome: Ancient History, Ancient authorities. — Livy i. 21; Dion. Hal. v. i-vi. 21.

TARRAGONA, a maritime province in the north-east of Spain, formed in 1833 from the southern part of the province of Catalonia, and bounded on the S.E. by the Mediterranean, N.E. by Barcelona, N. by Lerida, W. by Saragossa and Teruel, and S.W. by Castellon de la Plana. Pop. (1900) 337,964; area, 2,505 sq. m. The Ebro flows through the southern portion of the province, and the other chief streams are the Gaya and the Francoll. These three rivers flow south into the Mediterranean. Below Tortosa, the Ebro forms a conspicuous delta. It is said that the even south-westward curve of the coast-line is unbroken by any noteworthy headland or indentation. The province, although mountainous, is naturally fertile. The hills are clothed with vineyards, which produce excellent wines, and in the valleys are cultivated all kinds of grain, vegetables, rice, hemp, flax and silk. Olive, orange, filbert and almond trees reach great perfection, and the mountains yield rich pastures and timber trees of various kinds. The climate is temperate on the coast and in the centre, cold in the highlands, very warm and damp in the valleys and on the banks of the rivers as they near the sea. Manufactures are well advanced, and comprise silk, cotton, linen and woollen fabrics, velvet, felt, soap, leather and spirits. There are also many potteries and cooperages, and flour, paper and oil mills. Silver, copper, lead and other minerals have been found, and quarries of marble and jasper are worked in the hills. The fisheries produce more than 20,000 yearly. There are upwards of 250 m. of railways, which link together all the large towns, and include the important main lines along the coast and up the Ebro valley. The cities of Tarragona (pop. 1900, 23,423) and Tortosa (24,452), which are the principal seaports, and the towns of Reus (26,681) and Valls (12,625) are described in separate articles. Montblanch (543) is the only other town with a population exceeding 2,000. The people of Tarragona are, like almost all the inhabitants of Catalonia (q.v.), hardy, enterprising and industrious. Although the birth-rate considerably exceeds the death-rate, the population tends to decrease slightly, as many families emigrate.
TARRASA—TARRING AND FEATHERING

partly of Roman masonry; one such fragment, immured in the palace wall, is inscribed with the epitaph of a charioteer (auriga) who, it says, would rather have died in the circus than of fever. Massive ruined walls encircle the old town. Their lowest course is "Cyclopean," consisting of unhewn blocks about 12 ft. long and 6 ft. wide; Roman masonry of the Augustan age is superimposed. The eight gates and the square towers, characteristic of the Roman city, are also a great extant. "Cyclopean." The palace, itself a building of the early 19th century, has an old fortified tower, and there are barracks and forts in the city; but Tarragona can no longer be regarded as a fortress capable of standing modern artillery, although it is officially classed as such.

The new town, divided from the old by one broad and shady avenue, the Rambla de San Carlos, and intersected by another, the more modern Rambla de San Juan, extends to the west and south along a low promontory which juts out into the Mediterranean. Its outlying districts merge into the Camp de Tarragona, a plain planted with vines and walnut, almond and olive groves. Tarragona cathedral is one of the noblest examples of early Spanish art. It is 320 ft. long and 103 ft. broad, and consisted originally of a nave, aisles, transepts with an octagonal lantern at the crossing, and an apsidal chancel. Several exterior chapels were added in later times, and on the south-east stands a 14th century steeple raised on a Romanesque tower. The east end was probably begun in 1331 on the ruins of an earlier church, but the main body of the building was from the 12th century and the first half of the 13th, and it is of transitional character,—the exuberant richness of the sculptured capitals being admirably kept in subordination by the Romanesque simplicity of the general design. Considerable changes were introduced at a later date; and the present west end of the nave cannot have been completed till late in the 14th century. On the north-east side is a cloister contemporary with the church, with which it communicates by a very fine doorway. The cloister contains much remarkable work, and the tracery of the windows bears interesting marks of Moorish influence. Two other noteworthy churches in the city are San Pablo and Santa Tecla la Vieja, both of the 12th century. There is a fine Roman aqueduct; the Roman amphitheatre was dismantled in 1491 to furnish stone for the eastern mole, though a few rows of seats are left near the sea-shore; and the museum contains a large collection of Roman antiquities. The Torreón de Pilatos is said to have been the palace of the Emperor Augustus; it was partly destroyed by the French in 1811 and now serves as a prison. Its name is connected with an old tradition that Pontius Pilate was a native of the building. It has also many public buildings, including the law courts, several hospitals, a provincial institute, training schools for teachers, and offices of the provincial and municipal governments. When the monks of the Grande Chartreuse were compelled to leave France, they settled at Tarragona in 1903, and established a liqueur factory; 20,000 cases of liqueur were exported in 1904 and 39,000 in 1905. A characteristic feature of Tarragona is the number of its underground storeshouses for wine (bodegas); wine is exported in large quantities. There is a British steel file factory, and in the port, fish, fish-fillets, salted and smoked fish, salted fish are also manufactured. The harbour is at the extreme south-west of the new town. It was originally protected by a Roman breakwater, which was destroyed in the 19th century. The eastern mole, founded in 1491 and frequently enlarged, terminates in a lighthouse. Its length was 1400 yards in 1904, when the construction of a new section was begun. In each of the five years 1901-5 about 870 ships of 580,000 tons entered the port. Wine, oil, nuts, almonds and small quantities of lead and pig iron are exported; the imports include coal from the United States, dried codfish from Norway and Iceland, guano and phosphates. Close to the harbour and at the mouth of the Francoli is the fishermen's quarter (barrio de pescadores), in which most of the houses are coloured pale blue.

History.—Tarraco, the capital of the Iberian Cessetani, many of whose coins are extant, was one of the earliest Roman strongholds in Spain. It was captured in 218 B.C. by Gnaeus and Publius Cornelius Scipio, who improved its harbours and enlarged its walls. A Roman monument on a hill 37 ft. E. is known as the Sepulcro de los Escipiones, and locally believed to be the tomb of the Scipios, who were defeated and slain by the Carthaginians under Hasdrubal Barca in 212 B.C. The battle took place at Antioigis, the modern Alcaniz in the province of Teruel; there is no good reason to believe that the bodies of the Scipios were conveyed to Tarragona for burial, nor is the monument older than the 1st century A.D. As the Colonia Triumphalis, so called to commemorate the victories of Julius Caesar, Tarraco was made the seat of one of the four assize courts (conventus juridici) established in Hispania Citerior Augusti. It was a bishopric from the 1st century A.D. onwards, under which the city is called Tarraco by the Christian church until the 17th century, when it was made a diocese, and by the French.

TARRASO, a town of north-eastern Spain, in the province of Barcelona, 6 m. W.N.W. of Sabadell on the Barcelona-Lérida railway, and in the midst of a narrow plain surrounded by mountains. Pop. (1900) 15,956. Tarrasa was a Roman municipality, and a bishopric from the 5th century to the Moorish invasion in the 8th. It was razed by the Moors and rebuilt later by the Christians. There are three ancient Romanesque churches, in one of which, San Miguel, some Roman masonry is still visible. Tarrasa is now a modern industrial town, with fine public buildings, including the royal college, built in 1864 for 450 students besides day scholars, the school of arts and handicrafts, the industrial institute, chamber of commerce, hospitals, town hall, clubs, theatres and many large textile factories. Grain, wine, oil and fruit are produced in the district, and there is a municipal farm, founded in 1885, for experiments in viticulture.

TARRING AND FEATHERING, a method of punishment at least as old as the Crusades. The head of the culprit was lopped, the hair removed, and a long straight quill or feather, several feet long, was fixed to the top of the head, and the effects shaken over him. The earliest mention of the punishment occurs in the orders of Richard Coeur de Lion, issued to his navy on starting for the Holy Land in 1191. "Concerning the lawes and ordinances appointed by King Richard for his navie the forme thereof was this . . . item, a thief or felon that hath stolen, being lawfully convicted, shall have his head shorn, and boyling pitch poured upon his head, and feathers or downe strawed upon the same whereby he may be known, and so at the first landing-place they shall come to, there to be cast up." (trans, of original statute in Hallam's Vocab., ii. 21.) A later instance of this penalty being inflicted is given in Notes and Queries (series 4, vol. v.), which quotes one James Howell writing from Madrid, in 1623, of the "boisterous Bishop of Halverstadt," who, "having taken a place where there were two monasteries of nuns and friars, he caused divers feather
beds to be ripped, and all the feathers thrown into a great hall, whether the nuns and friars were thrust naked with their bodies oiled and pitched and to tumble among these feathers, which makes them here (Madrid) press him an ill-death." In 1669 a London bailiff, who attempted to serve process on a debtor who had taken refuge within the precincts of the Savoy, was tarred and feathered and taken in a wheelbarrow to the Strand, where he was tied to the Maypole which stood by what is now Somerset House. It is probable that the punishment was never regarded as legalized, but was always a type of mob vengeance.

TARRYTOWN, a village of Westchester county, New York, on the E. bank of the Hudson river, opposite Nyack, with which it is connected by ferry, and about 25 m. N. of New York City. Pop. (1850) 3562; (1900) 4770, of whom 984 were foreign-born and 191 were negroes; (1910, U.S. census) 5000.

Tarrytown is served by the New York Central and Hudson River railroad, and by interurban electric lines connecting it, via White Plains, with New York City. It is situated on a sloping hill that rises to a considerable height above Tappan Zee, a large expansion of the Hudson river, and is built principally of a local limestone. Its main post road (laid out in 1723) from New York to Albany, called the King's Highway until the War of Independence, then called the Albany Post Road, and now known (in Tarrytown) as Broadway. South of the village is "Lyndhurst," the estate of Miss Helen Miller Gould, and to the N.E. is Kaakout (originally "Kikuit," that is, "lookout," the name of a high promontory), the estate of John D. Rockefeller. In the latter the Hackley School (1890), Irving School (1837), Repton School and the "Castle" School for girls; a Young Men's Lyceum (1859), with a public library (Soozo volumes in 1910), and the Tarrytown Hospital (1893). In the vicinity there are large nurseries and market-gardens, and automobiles are manufactured in the village. Tarrytown stands on the site of a Weequaesgeek Indian village, Alipconk (the place of elms), burned by the Dutch in 1644. The first settlement of whites was made about 1645. There were perhaps a dozen Dutch families here in 1680, when Frederic Phillipe (formerly known as Vredyk, Flypse) acquired title to several thousand acres in Westchester county, called Phillipe Manor. He built, partly of brick brought from Holland, a manor-house (on a point of land, now known as the Manor's Point, and in the harbor of the present village), a mill and a church, at the mouth of Sleepy Hollow, some three-quarters of a mile above the village; Dr Hamilton Wright Mabie has written: "There is probably no other locality in America, taking into account history, tradition, the old church, the manor-house and the mill, which so entirely conserves the form and spirit of Dutch civilization in the New World." During the War of Independence Tarrytown was the centre of the "Neutral Territory" between the lines of the British and Continental forces, and was the scene of numerous conflicts between the "cowboys" and "skinners," bands of unorganized partisans, the former acting in the name of the colonies, and the latter in that of the king. On the post road, on the 24th of September 1780, Major John Andre was captured by three Continentals, John Paulding, David Williams and Isaac Van Wert; to commemorate the capture a marble shaft surmounted by a bronze statue of a Continental soldier has been erected on the spot.

Tarrytown is described in the Sketch Book of Washington Irving, who lived and died at "Sunnyside," within the limits of Tarrytown, was long warden of Old Christ Church, and is buried in the Old Sleepy Hollow burying-ground, which adjoins the Dutch Church, and in which Carl Schurz also is buried. Tarrytown was incorporated as a village in 1870. Its name is probably a corrupt form of the Dutch "Tarwen dorp" (wheat town).

See H. B. Dawson, Westchester County in the American Revolution (New York, 1886); and an article by H. W. Mabie in L. P. Pollen's Historic Towns of the Middle States (New York, 1889).

TASRIER, the Anglicized form of the scientific name of a small and aberrant lemur-like animal, Tarsius spectrum, inhabiting the Malay Peninsula and islands, and typifying a family. The name tarsier refers to the great elongation of two of the bones of the tarsus, or ankle, and spectrum to the huge goggle-like eyes and attenuated form which constitute two of the most distinctive features of this weird little creature. In organization the tarsier departs markedly from other lemurs as regards several particulars, and thereby approaches to monkeys and apes. Rather smaller than a squirrel, with dusky brown fur, the tarsier has immense eyes, large ears, a long thin tail, tufted at the end, a greatly elongated tarsal portion of the foot, and disc-like adhesive surfaces on the fingers, which assist them in maintaining its position on the boughs. Four species of the genus are now recognized, whose range includes the Malay Peninsula, Java, Sumatra, Borneo, Celebes and some of the Philippines. The tarsier feeds chiefly on insects and lizards, sleeps during the day, but is tolerably active at night, moving chiefly by jumping from place to place; an action for which the structure of its hind-legs seems particularly well adapted. It is rare, not more than two being generally found together, and only brings forth one young at a time. (See Primates.)(L.)

TARSUS, (Tarsus, Tarsus), an ancient city in the fertile plain of Cilicia. The small river Cydnus flowed through the centre of the town, and its cool swift waters were the boast of the city (though visitors like Dion Chrysostom thought it far inferior to the rivers of many Greek cities). The harbour, Rhicma, below the city, was originally a lagoon, though it is said also to be supplied by springs of its own. The Cydnus flowed into the lake (where were the arsenals) and thence into the sea, about 10 m. from Tarsus. The city is first mentioned on the Black Obelisk, as captured by the Assyrians along with the rest of Cilicia about 850 B.C. It was probably an old Ionian colony, settled (like Mallus) under the direction of Clarian Apollo. Its importance was due (1) to its excellent and safe harbour, (2) to its possession of a fertile territory, and (3) to its command of the first waggon-road made across Mount Taurus, which was cut through the Cilician Gates, a narrow gorge 100 yards in length, originally only wide enough to carry the waters of a small affluent of the Cydnus. The greatness of Tarsus rested therefore mainly on the two great engineering works, the harbour and the road. That the latter was due to Greek influence is shown by the village Mopsucrene on the southern approach to the Gate. A jumble of Greek, Roman and Byzantine coins, the mountain passes have been so important in history as this road (seventy miles in length) over Taurus. Many armies have marched over it; those of Cyrus the Younger, Alexander the Great, Cicero, Septimius Severus and the First Crusade may specially be mentioned.

Tarsus is most accessible from the sea or from the east. Even after the "Cilician Gates" were cut, the crossing of Taurus was a difficult operation for an invading army (as Xenophon and Arrian show). Hence Tarsian history (where not determined by Greek maritime relations) has been strongly affected by Semitic influence, and Dion Chrysostom, about A.D. 110, says it was more like a Phoenician than a Hellenic city (which it claimed to be). After the Assyrian power decayed, princes, several of whom bore the name or title Syeneusis, ruled Tarsus before and under Persian power. Persian satraps governed it in the 4th century B.C.; and struck coins with Aramaic legends there. The Seleucid kings of Syria for a time kept it in a state of servitude; but it was made an autonomous city with additional citizens (probably Argive Greeks and Jews) by Antiochus IV. Epiphanes in 171 B.C.; and then it began to strike its own coins. It became one of the richest and greatest cities of Asia Minor. It was East under the Romans after 104 B.C., and was favoured by both Antony and Augustus: the reception there by the former of Cleopatra, who sailed up to the city in a magnificent vessel, was a striking historic event. In spite of its oriental character, it maintained a university where Greek philosophy was taught by a series of famous Tarsians, who influenced Roman history. Chief among them were Athenodorus Cananites, teacher and friend of Augustus for many years, a man of courage and
TART—TARTAGLIA

power, who remodelled the Tarsian constitution (making it timocratic and oligarchic). The picture which Philostratus, in his biography of Apollonius Tyanaeus, draws of the Tarsians as vain, luxurious and illiterate, represents the general Graeco-Roman conception of the city. The legend which was believed to be graven on the statue of Sardanapalus at Anchialae (12 m. S.W. from Tarsus) might have been the motto of most Tarsians: "Eat, drink, play, for nothing else is worth this (gesture)" (referred to by St Paul, 1 Cor. xv. 32). The statue was probably the ancient Hittite or cuneiform inscription, representing a figure with right hand raised; the letters and the attitude were misunderstood; the figure was supposed to be snapping the fingers and uttering this expression of effeminate and weedy sensuality.

Tarsus depended for its greatness on commerce, peace and orderly government. It was not a strong fortress, and could not be defended during the decay of the empire against barbarian invasion. The Arabs captured the whole of Cilicia shortly after A.D. 660; and Tarsus seems to have been a ruin for more than a century after the conquest. But Harun al-Rashid rebuilt its walls in 789, and made it the north-western capital of the Arab power in the long wars against the Byzantine empire. All the raids, which were made in Asia Minor regularly, year by year, sometimes twice in one year, through the Cilician Gates and past the fortress Lounlon, issued through the north gate of Tarsus, which was called the "Gate of the Holy War." The western gate is still standing, and is named "St Paul's Gate." The caliph Mamun died on such a foray in A.D. 833, having caught a chill at a great spring north of the Cilician Gates beside Ak-Keupreu. He was brought to Tarsus where (like the emperor Tacitus) he died, and (like the emperor Julian) was buried. His illness recalls the fever which Alexander the Great contracted from bathing in the Cydnus. Nicephorus Phocas reconquered Tarsus and all Cilicia for the empire in A.D. 965. In the First Crusade Baldwin and Tancred captured Tarsus A.D. 1099, and there the two leaders had a serious quarrel. It formed part of the kingdom of Lesser Armenia for great part of the three centuries after A.D. 1180, and it was fortified by Leo II. and Hethoum I. But Turchomans and Egyptian invaders disputed its possession with the Greek emperors and Armenian kings and with one another. It finally passed into Ottoman hands about the beginning of the 16th century.

Most of the successive masters of Tarsus had their own legends about its origin, usually with a religious character justifying and explaining their possession of the city. The Assyrian Sardanapalus, the native god Sandan, the Greek hero Perseus, the Greek god Heracles, are all called founder of Tarsus by later writers. Javan, the Ionian chief, was called the grandfather of Cydnus, who gave name to the river. A curious ceremony was practised in honour of Sandan (identified with the Greek Heracles): a pyre was periodically erected and the god was burned on it. It is said that the original name of the city was Partenia, which suggests that a virgin goddess was worshipped here as in so many shrines of Asia Minor and Syria: the virgin goddess Athena appears on Tarsian coins. The Baal of Tarsus is named in Aramaic letters on many of its coins in the Persian period.

The ruins of the ancient city are very extensive, but they are deeply buried, and make little or no appearance above the surface except in the Dunuk Tash (popularly identified as the "Tomb of Sardanapalus," a monument which, however, was at Anchialae, not at Tarsus). This shapeless mass of concrete was probably the substructure of a Graeco-Roman temple, from which the marble coating has been removed. The modern town has considerable hazzars and trade; but the climate is very oppressive, owing to the proximity of vast marshes which occupy the site of the harbour and the lower part of the original Cynthus. The river was diverted from its former course by Justinian in the 6th century so as to carry off the surplus waters in time of flood and prevent inundations in the city, not to deprive Tarsus of what was its chief pride and boast; but gradually the neglect of subsequent centuries allowed the channel in the city to become blocked by accumulation of soil, and now the whole body of water flows in the new channel east of the city, except what is drawn off by an artificial irrigation course to water the gardens on the western side of the city. The population is about 25,000, including, besides Turks and Syrian Moslems, also Armenians, Greeks, Syrian Christians, Persians, Afghans, Aniaria (mostly gardeners) and even Hindus. There is a large American mission school called St Paul's Institute, giving a very comprehensive education to Armenians and Greeks drawn from an extensive district.

TART, a dish of baked pastry containing fruit, a fruit pie; also a small open piece of baked pastry with jam placed upon it. The word was adapted from the O.Fr. tart: the older form turte or tortel, is found in the 11th century. Fr. torarte and the diminutive tortel or tortes, the origin is the Latin turrare (tortare, to twist), used of a cake in Med. Lat., the paste or dough of cakes or tarts being rolled or twisted. The alteration of the vowel is also seen in Ital. tartaro. In English there is some confusion with "tart," sharp, acid, bitter, which comes from O.E. tcart, sharp, severe, properly "tearing," from teran, to tear; cf. "bitter," from "to bite."

TARTAGLIA, or TARTALEA, NICOLÒ (c. 1506-1559), Italian mathematician, was born at Brescia. His childhood was passed in dire poverty. During the sack of Brescia in 1512, he was horribly mutilated by some French soldiers. From these injuries he slowly recovered, but he long continued to stammer in his speech, whence the nickname, adopted by himself, of "Tartaglia." Save for the rarest rudiments of reading and writing, he tells us that he had no master; yet we find him at Verona in 1521 an esteemed teacher of mathematics. In 1534 he went to Venice. For Tartaglia's discovery of the solution of cubic equations, and his contests with Antonio Marie Floridas, see ALGEBRA (History). In 1548 Tartaglia accepted a situation as professor of Euclid at Brescia, but returned to Venice at the end of eighteen months. He died at Venice in 1559.

Tartaglia's first printed work, entitled Nuova scienza (Venice, 1537), dealt with the theory and practice of gunnery. He found the elevation giving the greatest range to be 45°, but failed to demonstrate the correctness of his intuition. Indeed, he never developed the erroneous ideas of his time regarding the paths of projectiles, further than to see that no part of them could be a straight line. He nevertheless inaugurated the scientific treatment of the subject. His Questi et invensioni diverse, a collection of the questions he answering or addressing to himself by perusing the most varied conditions, was published in 1546, with a dedication to Henry VIII. of England. Problems in artillery occupy two out of nine books; the sixth treats of fortification; the ninth gives several examples of the solution of cubic equations. He published in 1551 Regola generale per sollevare ogni offensore nave, intitulata la Tragagliata Invenzione (an allusion to his personal troubles at that time) containing for the first time a description of the describing the, bell, little known in western Europe. He pursued the subject in Raggionamenti sopra la Tragagliata Invenzione (May 1557). His largest work, Trattato generale di numeri e misure, an comprehensive mathematical treatise, including arithmetic, geometry, mensuration, and algebra as far as quadratic equations (Venice, 1555, 1600). He published the first Italian translation of Euclid (1543), and the earliest version from the Greek of some of the principal works of Archimedes (1544). The tract De insidiis aquae, of which his Latin now holds the place of the lost Greek text. Tartaglia claimed the invention of the gunner's quadrant.
TARTAN—TARTAR

Tartaglia’s own account of his early life is contained in his <i>Questii</i>, lib. vi, p. 74. See also Buoncompagni, <i>Intorno ad un testimoni incerto di N. Tartaglia</i> (Milan, 1831); Rossi, <i>Elogi di Girolamo Cardano</i> (P. 386). Tartaglia’s writings on gunnery were translated into English by Lucar in 1588, and into French by Rieffel in 1845.

**TARTAN** (from F. <i>tiréilain</i>, “linis-wolsie,” Sp. <i>tirilán</i>, a kind of woollen cloth, perhaps so called from its thinness and lightness, cf. Sp. <i>tirar</i>, to tremble with cold), a worsted cloth woven with alternate stripes or bands of coloured warp and weft, so as to form a chequered pattern in which the colours alternate in “sets” of definite width. The worsted yarn used in the manufacture of striped cloth cannot be claimed as peculiar to any special race or country, for indeed such checks are the simplest ornamental form into which dyed yarns can be combined in the loom. But the term tartan is specially applied to the variegated cloth used for the principal portions of the distinctive costume of the Highlanders of Scotland. For this costume, and the tartan of which it is composed, great antiquity is claimed, and it is asserted that the numerous clans into which the Highland population were divided had each from time to time a special tartan by which it was distinguished from the tartans of the other clans. In 1745 soldiers of the parliament were passed for disarming the Scottish Highlanders and for prohibiting the use of the Highland dress in Scotland, under severe penalties. These acts remained nominally in force till 1782, when they were formally repealed, and since that time clan tartan has, with varying fluctuations of fashion, been a popular article of dress, by no means confined in its use to Scotland alone; and many new and imaginary “sets” have been invented by manufacturers, with the result of introducing confusion in the heraldry of tartans, and of throwing doubt on the reality of the distinctive “sets” which at one time undoubtedly were more or less recognized as the badge of various clans.

Undoubtedly the term tartan was known, and the material was worn, “of one or two colours for the poor and more varied for the rich,” as early as the middle of the 15th century. In the accounts of John, bishop of Glasgow, treasurer to King James III., in 1471, there occurs, with other mention of the material, the following—“<i>Ane elne and ane halve of blue Tartane to lyne his gowne of cloth of Gold.”</i> It is here obvious that the term is not restricted to particoloured chequered textures. In 1538 accounts were incurred for a Highland dress for King James V., on the occasion of a hunting excursion in the Highlands, in which there are charges for “<i>variant cullor velvet</i>,” for “<i>ane schort Heland colt</i>,” and for “<i>Heland tartane to be hose to the kinge’s grace”</i>. John Buchanan, in his <i>De Tradicione Tartarorum</i>, published in 1578, says of the ancient and still-used dress of the Highlanders and Islanders, “all, both noble and common people, wore mantles of one sort (except that the nobles preferred those of <i>masse</i>), and the foot soldiers wore the same.” The <i>scotorum historia</i> (1582), as translated by Monypenny (1612), says of the Highlanders, “They delight in marled clothes, specially that have any long stripes of sundry colours; they love chiefly purple and blue. Their predecessors used short mantles or plaid of divers colours sundry ways divided; and amongst some the same custom is observed to this day.” A hint of clan tartan distinctions is given by Martin Martin in his <i>Western Isles of Scotland</i> (1708), which work also contains a minute description of the dress of the Highlanders and the manufacture of tartan. “Every isle,” he observes, “differs from each other in their fancy of making plaid, as to the stripes, the width of the placings, and the quality of the colours.” It is thus clear that the Highland tartans, as the Highlanders, in so far that they who have seen those places are able at the first view of a man’s plaid to guess the place of his origin.”

The following lines give a brief description of the colours of the tartans of the principal clans. The kit-tartan colour is given in each case; the plaid-tartans vary in slight particulars.

**Campano** yellow, light green crossed with darker green, the stripes broad with narrow edging of yellow. **Campbell of Argyll** yellow, light green crossed with dark green, narrow independent cross lines of white. **Cameron** brick-red with broad chequered cross lines of yellow; red and white with broad centre of ground colour, two independent cross lines of green. **Forbes** yellow, green, crossed with broad dark-green lines, centred black, independent cross lines yellow. **Frezer** red ground, main cross lines red with descending edging, with plaid chequers black and white. **Gordon** dark blue-green ground, with broad cross lines of lighter green, narrow centre line yellow. **Grayne** light green ground, crossed with darker green in small chequers, independent cross lines dark green. **Grant** scarlet, with broad black-edged scarlet crossings, black independent cross lines. **Macdonald of Glengarry and Ketchop** red, with other broad cross and cross lines, and two independent blue crossings along the bottom. **Macdonald of Glengrove** black, broad crossing, the whole covered with fine red lines. **Macdonald of Clanranald** light green with broad dark-green crossing, the whole covered with fine red lines.

When the process of fermentation wines deposit a crystalline crust of argol; this, after being roughly purified by recrystallization, is known as tartar, and when further purified and crystallized it is called “potassic tartar.” Tartar “colouring lines” is also called technically “cream.” With the iatrochemists tartar was a generic term which included both this tartarus vini and various substances obtained from it, and even salts, such as salt of sorrel (potassium oxalate), that resembled it. Thus <i>sal fixum tartari</i> was potassium carbonate, which on exposure to the air dislocuses to <i>oleum tartari per deliquium</i>; neutral potassium tartrate was called <i>tartar turtarotarisut</i>, because it was prepared by neutralizing ordinary tartar with the sal fixum; <i>tartar chalybeatus</i> was a preparation with iron; and <i>spiritus tartari</i>, used by Paracelsus, was prepared by dry distillation of tartar. Paracelsus also used the tanins also used in the ablation of abnormal precipitates or sediments deposited from animal secretions; the same idea is apparent in the popular application of the word to the salivary calculus which forms on the teeth.

**Cream of tartar** is prepared by dissolving granulated argol in boiling water and allowing the solution to stand. The clear liquid is then drawn off and crystallized. The slightly coloured crystals thus obtained are redissolved in hot water, the colouring matters get rid of by means of pipelays or egg-albumen, and the solution filtered and crystallized, the name “cream of tartar” being originally applied to the crystals that formed when the solution cools. The salt crystallizes in masses of small, hard, colourless, transparent, rhombic prisms. It is precipitated when an excess of a potassium salt is added to a solution of tarratic acid, but it dissolves on the addition of a solution of boric acid or boric acid or borax dissolve it freely, forming soluble cream of tartar, which is a white powder permanent in the air when made with the acid, but disintegrates when borax is employed. Its slight solubility in alcohol explains why it is deposited by wines as they mature. One part by weight of the salt dissolves in 15 parts of boiling water, but at lower temperatures the solubility is greatly diminished, and at 0° C. about 476 parts of water are required. When heated it is decomposed with formation of potassium carbonate and carbon, inflammable gases having an odour of burnt bread being evolved. The salt is used for the manufacture of *potassium alum* by heating with potassium carbonate, and for dyeing, with powdered chalk and alum for cleaning silver, and for the preparation of effervescing drinks and baking-powder. In medicine as *potasii tartar actis* it is of some slight importance as a diuretic and purgative. The more soluble normal salt, K2(HCO3), is used for the same purposes; it is formed by dissolving powdered cream of tartar in a hot solution of potassium carbonate. If sodium carbonate is substituted the result is KNa(HCO3), or Rochelle salt.

**Tartar emetic (potassium antimonyl tartarate)<sup>K</sup>(SbO)C,H,O,H<sub>3</sub>.</sup>

This substance has been known for a long period, being mentioned by Paracelsus. It may be prepared by warming 3 parts of anitomonic oxide with 4 parts of cream of tartar, in the presence of water, replacing the water as it evaporates; after digestion complete, the solution is filtered hot. Powder of algarum (q.v.) is then added with plagioclases, which forms a crystallizing mass. This is filtered, dried, ground up and compressed into tablets. The salt crystallizes in small octahedra, which lose their water of crystallization gradually on exposure to air, and become opaque. It is solubile in 14-5 parts of cold water and 19 parts of hot, the solution showing
an acid reaction to litmus. It possesses a nauseous metallic taste and produces vomiting when taken internally, whilst in large doses it is poisonous. It is used medicinally, and also as a mordant in dyed cloth calicoes and mordants.

**TARTARIC ACID** (dihydroxy-succinic acid), $\text{C}_4\text{H}_4\text{O}_6\text{H}_2$ or $\text{HO}_2\text{C}(-\text{OH})\text{C}(-\text{OH})\text{CO}_2\text{H}$. Four acids of this composition are known, namely dextro- and laevo-tartaric acids, racemic acid and mesotartaric acid, the last two being optically inactive (see STEREO-ISOMERISM). Their constitution follows from their formation from dibromosuccinic acid and from their synthesis from glyoxal cyanhydrin, these two methods producing the inactive racemic form which may then be resolved into the active components. Dextro-tartaric acid occurs in the free state in the juice of boysenberry or calcium salt in grape juice and in various unripe fruits. During the alcoholic fermentation of grape juice it is deposited in the form of an impure acid potassium tarteate which is known as argol, and when purified as cream of tartar. For the preparation of the acid the crude argol is boiled with hydrochloric acid and afterwards precipitated as calcium tarteate by boiling with milk of lime, the calcium salt being afterwards decomposed by sulphuric acid. It may also be obtained (together with racemic acid) by boiling milk sugar, saccharose, &c., with nitric acid, and by the reduction of a compound with sodium amalgam (H. Debus, *Ann.*, 1873, 166, p. 109). It crystallizes from water in large prisms which melt at 165–170°C, and, on further heating gives an anhydride and finally chars, emitting a characteristic odour and forming pyroameric and pyrotartaric acids. It behaves as a reducing agent. Chromic acid and potassium permanganate oxidize it to formic and carbonic acids, whilst hydrogen peroxide in the presence of ferrous salts gives dihydroxymalonic acid (H. J. H. Fenton, *Jour. Chem. Soc.*, 1894, p. 899; 1895, pp. 48, 774; 1896, p. 546). Hydrochloric acid and phosphorus reduce it to anhydride and finally to succinic acid. Calcium chloride gives a white precipitate of calcium tarteate in neutral solutions, the precipitate being soluble in cold solutions of caustic potash but re-precipitated on boiling. It prevents the precipitation of many metallic hydroxides by caustic alkalis. It carbonizes when heated with strong sulphuric acid, giving, among other products, carbon monoxide and carbon dioxide. A small crystal of oxalic acid added to concentrated sulphuric acid containing about 1 per cent. of resorcin gives a characteristic violet red coloration.

Laevo-tartaric acid is identical in its chemical and in many of its physical properties with the dextro-acid, differing chiefly in its action on polarized light, the plane of polarization being rotated to the left. By mixing equal quantities of the two forms a new compound is formed, the players of which not being $\text{C}_4\text{H}_4\text{O}_6\text{H}_2$ but $\text{C}_4\text{H}_4\text{O}_6\text{H}_2\text{O}$, is obtained. This variety is also formed by the hydrolysis of glyoxal cyanhydrin (F. Pollak, *Monatsh.*, 1894, 15, p. 456); by heating a solution of desoxalic acid; by the oxidation of lumaric acid with potassium permanganate; by the action of silver oxide on dibromosuccinic acid, and by the oxidation of mannite, dulcete, inulin, &c., with nitric acid. In the anhydrous state it melts at 205–206°C. Mesotartaric acid is formed when cinchonine tarteate is heated for some time at 170°C (L. Pasteur, *Ann.*, 1853, 88, p. 212;) by heating tartaric or racemic acid for some time with water to 165°C; by the oxidation of phenol or maleic acid with an alkaline solution of potassium permanganate (O. Doebner, *Ber.*, 1891, 24, p. 1755; A. Kekulé and R. Anschatz, *ibid.*, 1881, 14, p. 714). It crystallizes in prisms, and in the anhydrous state melts at 140°C. On prolonged boiling with aqueous hydrochloric acid it yields racemic acid. The sodium ammonium salt is not capable of decomposition into its optical antipodes, as is sodium ammonium racemate.

This acid as used in medicine is derived from potassium acid tarteate. Its impurities are lead, oxalic acid, lime and potassium tarteate. It is incompatible with potassium, calcium, mercury and vegetable astringents. Tartaric acid is rarely used alone, but is combined with some of the other salts we have considered (see SODIUM), and is a constituent of many proprietary granular effervescent preparations. If taken in overdose or in a concentrated form tartaric acid produces severe gastro-enteritis. In these cases lithium carbonate is the proper drug. Tartaric acid is used as antidesitics, and opium may be required.

**TARTARUS**, in Greek mythology, the son of Aether and Gaia, father of Typhoeus and the giants. In the *Iliad* the word denotes an underground prison, as far below Hadess as earth is below heaven, in which those who rebelled against the will of Zeus were confined. In later writers Tartarus is the place of punishment of the wicked after death, and is used for the underworld generally.

**TARTINI, GIUSEPPE** (1692–1770), Italian violinist, composer and musical theorist, was born at Tirano in Istria on the 12th of April 1692. In early life he studied, with equal want of success, for the church, the law courts, and the profession of arms. As a young man he was wild and irregular, and he crowned his impurities by clandestinely marrying the niece of Cardinal Cornaro, archbishop of Padua. The cardinal sent the marriage as a disgraceful mésalliance, and denounced it so violently that the unhappy bridegroom, thinking his life in danger, fled for safety to a monastery at Assisi, where there were character undeviating. His theory of the harmony of human organs. The obverse of this fact is that of any sound being deepened by an 8th if the length of the string or pipe which
TAS-DE-CHARGE—TASMAN

produces it be doubled. The law is without exception throughout the compass in which our ears can distinguish pitch, and so, of necessity, a string of twice the length of that whose vibrations indicate the deepest sound must stir the air at such a rate as to cause a tone at an 8th below that lowest audible note. It is hence manifest that, however limited our sense of the range of musical sound, this range extends upward and downward to infinity. Tartini made his observations the basis of a theoretical system which he set forth in his Trattato di Musica, secondo la vera scienzia dell'Armonia (Padua, 1754) and Dei Principjedi'Armonia Musicale (Padua, 1765). He also wrote a Trattato delle Appoggiature, posthumously printed in French, and an unpublished work, Delle Ragioni e delle Proporzioni, the MS. of which has been lost.

TAS-DE-CHARGE, a French term in architecture, for which there is no equivalent in English, given to the lower courses of a Gothic vault, which are laid in horizontal courses and bonded into the wall, forming a solid mass; they generally rise about one-third of the height of the vault, and as they project forwards they lessen the span to be vaulted over.

TASHKENT, or TASHKEND, one of the largest and most important cities of Russian Central Asia, and capital of Russian Turkestan, situated in the valley of the Chirchik, some 50 m. above the banks of the rivulet, about 2405 m. above sea level. It is connected by rail with Krasnovodsk (1085 m.) on the Caspian, and since 1805 with Orenburg (1150 m.). The city, formerly enclosed by walls (now ruined), is surrounded by luxuriant gardens, and its houses are buried among the fruit and other trees which grow alongside of the irrigation canals. The buildings, which are of stone and sun-dried bricks, are mostly low, on account of the earthquakes which frequently disturb the region. The native city in 1871 had 75,130 inhabitants, and in 1897 196,414, mostly Sarts, with Uzbekis, Kirghiz, Jews, Russians, and Germans. The Russian city, to which vast extensions from 1865 has been made, is served by broad streets lined with poplars, and canals, the low, pleasant-looking houses being surrounded by gardens. In 1875 its population, exclusive of the military, was 4860, mostly Russians, and in 1900 about 25,000. Tashkent has a public library containing a valuable collection of works on Central Asia, an astronomical observatory and a museum.

TASHKURGHAN, or KHULM, a khanate and town of Afghan Turkestan. The khanate lies between Kunduz and Balkh. The ancient town of Khulm stood in the Oxus plain, surrounded by orchards of famous jujube-trees, and was destroyed by Ahmad Shah Abdali, who founded Tashkurgan in the middle of the 18th century, and took all the inhabitants away from Khulm to populate it. Ancient Khulm is now only a mass of ruins; but Tashkurgan, lying two or three miles to the south of it, has become the great trade-mart of Afghan Turkestan and second only in importance to Mazar-i-Sharif, the military centre of the province; while it is much larger and more prosperous than the latter place. At Tashkurgan the caravans from India and Bokhara meet, and from here the merchandise is distributed all over the country. A hill fortress dominates the town and overlooks the debouchment of the road from Haibak and Kabul into the plains of the Oxus.

TASMAN. ABEL JANSZON (c. 1603-1659), the greatest of Dutch navigators, the discoverer of Tasmania, New Zealand, the Tonga and the Fiji Islands, and the first circumnavigator of Australia, was born at Lutjegast in Groningen, about 1603. In 1634 we first meet with him in the East Indies, sailing from Batavia (Feb. 18) to Amboyna. On the 30th of December 1630 he sailed from Batavia for home; reached Holland August 1, 1637; started on his return to the East April 15, 1638; and reappeared at Batavia October 11, 1638. On the 2nd of June 1639 he and his ship (Diemen, 80 tons, 42 fathoms) Quast, was despatched by Antony Van Diemen, governor-general of the Dutch East Indies (1636-43), on a voyage to the north-western Pacific, in quest of certain "islands of gold and silver," supposed to lie in the ocean east of Japan. On this voyage Tasman and Quast visited the Philippines and improved Dutch knowledge of the east coast of Luzon; they also discovered and mapped various islands to the north, apparently the Bonin archipelago. Sailing on to N. and E. in search of the isles of precious metals, they ranged about fruitlessly in the northern Pacific, at one time believing themselves to be 600 Dutch miles east of Japan. After this the voyage was continued almost constantly westward, but in varying latitudes, reaching as high as 42° N., always without success. On the 15th of October the navigators decided to return, and, after touching at Japan, anchored at the Dutch fortress-station of Zeelandia in Formosa on the 24th of November 1639. After this Tasman was engaged in operations in the Indian seas (sailing to Formosa, Japan, Cambodja, Palembang, etc., as a merchant captain in the Company's service), and returned to England (43° 30' N.) until 1642, when he set out on his first great "South Land" expedition. This was planned and organized by Governor Van Diemen, who cherished great schemes for the extension of the Dutch colonial empire. Several Dutch navigators had already discovered various portions of the north and west coasts of Australia (as in 1603-06, 1616, 1618-19, 1632-37, 1637-38, etc.), but Tasman now first showed that this great South Land did not stretch away to the southern pole, but was entirely encircled by sea within comparatively moderate limits. On the 25th of August 1642, with two vessels, the "Heemskerk" and "Zeelandia," anchored at Mauritius (September 5 to October 5), Tasman sailed first, then E., almost seven weeks, and on the 24th of November sighted (in 42° 25' S., as he made it) the land which he named Anthoony van Diemen's landt after Van Diemen, now called Tasmania. He doubled the land, which he evidently did not perceive was an island, coasting its southern shores, and, running up Storm Bay, anchored on the 1st of December in Frederick Henry's Bay, on the east coast of Tasmania (in 43° 10' S., according to his reckoning)—so named after Prince Frederick Henry of Nassau, then the head of the Dutch republic. There he set up a post on which he hoisted the Dutch flag. Quitting Van Diemen's Land on the 5th of December, Tasman steered E. for the Solomon Islands, and on the 13th of December discovered (in 42° 10' S., as he reckoned) a "high mountainous country," which he called Staten landt ("Land of the States," i.e., of Holland, now New Zealand). Tasman and his company believed the newly discovered land to form part of the same great antarctic continent as the other Staten landt which Schouten and Lemaire had sighted and named the Landt van di Eerenaerd (1616). Along the west coast of the South Island, he anchored on the 18th of December in 49° 50' S., at the entrance of a "wide opening," which he took to be a "fine bay" (Cook's Strait). He gave the name of Moerdervaars (Murderers, now softened to Massacre) Bay to this spot, where several of his men were killed by the natives (December 19). From Murderers' Bay Tasman sailed S.E. along the south shore of Cook's Strait, apparently getting into Blind or Tasman Bay, but not discovering the full extent of the strait here dividing New Zealand into two main islands. Returning westward he then coasted the west side of the North Island, till, on the 4th of January 1643, he came to the northern extremity of New Zealand, in 34° 35' S. (in his reckoning). Thence he bore away to N.N.E., at first intending to keep that course for 30° of longitude from North Cape, New Zealand. On the 19th to 25th of January, in 22° 35', 21° 20', and 20° 15' S. (Tasman's reckonings), he discovered various islands of the Tonga or Friendly group, especially Amsterdam (Tongatapu), Middelburg (Eva), and Rotterdam. Here the ships took in water and provisions, which they had not done since leaving Mauritius, and both ships, which was the second time since leaving Van Diemen's Land, Rotterdam Island they explored with some care. Thence Tasman steered N. and W., reaching on the 6th of February the eastern part of the Fiji archipelago (in 17° 20' S., by his reckoning), which he called Prince William's Islands and Heemskerk's Shoals; on the 22nd of March he sighted the islands of Ontong Java (in 5° 2' S., according to Tasman, and in 150° 30' E., Greenwich). On the 1st of April he was near the north-eastern extremity of New Ireland (Neu Mecklenburg), mistaken by him for a part of New Guinea, in 40° 30', off a
point known to the Spaniards as Cabo S. Maria. Thence he passed westward along the north of New Ieland, New Hanover, New Britain (Neu Pommern) and New Guinea. He reached the western extremity of New Guinea on the 18th of May; Schouten's Islands were noted to the south of the vessel's course on the 12th of May. Tasman's track, lying between New Guinea and Halmahera (Giliolo), then brought him south to Ceram; he passed through the narrow strait between Celebes and Bintan on the 17th of May, and arrived at Batavia on the 13th of June 1643 after a ten months' voyage. The materials for an account of Tasman's important second voyage in 1644 are scanty, but we know he was instructed to obtain a thorough knowledge of Staten Land and Van Diemen's Land, and to find out "whether New Guinea is a continent with the great Zuidlank, or separated by channels and islands," and also "whether the new Van Diemen's Land is the same continent with these two great countries or with one of them." In this voyage Tasman had three ships under his command, the "Limmen," "Zeeemeuwen" (or "Meew"), and "Brak" (or "Braarq"). His course lay along the south-west coast of New Guinea; he mistook the western opening of Terres Straits for a bay, but explored (and perhaps named) the Gulf of Carpentaria; for the first time the coast-line of this great bay was mapped with fair accuracy. Though preceded by Jansz (1606) and Carstensz (1623) on the east shore of the gulf as far as 17° S., Tasman first made known the south, and most of the west, coast. Beyond this he explored the north and west coasts of Australia as far as 25° S., and established the absolute continuity of all this coast-line of the "Great Known South Continent"; his chart gives soundings for the whole of this coast. Tasman's achievements were coldly received by the Dutch colonial authorities; but on the 4th of October 1644 they rewarded him with the rank of commander (he had frequently enjoyed the use of the title already). On the 2nd of November 1644 he was also made a member of the Council of Justice of Batavia. He was a member of the committee appointed on the 18th of April 1645 to declare a truce between the Dutch East India Company and the viceroy of Portuguese India. In 1647 he commanded a trading fleet to Siam, and in 1648 a war-fleet sent against the Spaniards of the Philippines (May 15, 1648, to January 1649). By 1653 he had quitted the company's service, but still lived, apparently as one of its wealthiest citizens, in and near Batavia. His will, made the roth of April 1657, seems to have but slightly preceded his death, which probably happened before October 22, 1659, and certainly before February 5, 1661.

See Siebold's paper in Le Moniteur des Indes Orientales et Orie-

Hindustani, 1848-49, pt. 1, p. 390; the paper on Tasman by C. M. Dozy in Bijdragen tot de Taal-, Land-, en Volkenkunde van

dansch-Indie, 5th series, vol. ii. p. 308; R. H. Major, Early Voyages in Australia (London, Hakluyt Society, 1859), especially pp. xxii-xxiii, 43-58 (here are printed the instructions for Tasman and his colleagues on the voyage of 1644); G. Collingridge, Discovery of Australia (Sydney, 1898), especially pp. 238-40, 279-80; Cuming, above all, J. E. Heeres and others, Tasman's Journal, facsimiles of the original MS., with... life... of... Tasman, &c. (Amsterdam, 1898)—here the Life of Tasman, with its appendices, is separately pagd (163 pp.). See also Aandrl der Nederlanden voor de Oost-Indische Meren (Amsterdam, 1768-76); Ludolf, Nederlanden, and English, Leiden and London, 1890), especially pp. vii., viii., xix.-xx., 72; the valuable summary of the voyage of 1642-43 in the anonymous Acqueru; and Tasman's account of the voyage of 1644 (beginning with Sir John Narborough's), London, 1711, with sub-
title, Relation of a Voyage... of Captain Abel Jansen Tasman (originally extracted from his journals by Dirk Rembrandt in Dutch, published in English in Dr Hook's collections); also The Discovery of Van Diemen's Land in 1642, by James Backhouse Walker (Hobart, 1891). A draft journal of the voyage of 1642-43, probably written by Tasman on the expedition, is in the state archives at The Hague. There are also several copies made from Tasman's official journal; the best of these (the original fair copy) is repro-
duced in Heeres' Tasman's Journal, 1898, noted above.

Although Tasman's map of the voyage of 1644, has been discovered and is in the possession of Prince Roland Bonaparte. Before this discovery reliance was placed on an ex-
cellent copy, probably made out 1687, by Captain Thomas Bowrey, (art. 12 in the miscell. MS. collection marked 5222 in the
British Museum, London). This gives the tracks of both the voyages

1642-43 and 1644, and the soundings of the latter. Burgnmaster Witsen, of Noord en Oost Teriare's fame (1709), preserved a brief record of certain observations made in Tasman's voyage of 1644, between 13° 8' and 19° 35' S. (and approximately between 129° 30' and 120° E. Greenwitch). This was translated by A. Dalrymple in his Papus (reprinted in R. H. Major, Early Voyages to... Australia, xcvi.-xcix.). Basil Thomson, Diversions of a Prime Minister (Edinburgh, 1894), p. 311, &c., records that the remembrance of Tasman's visit to the Tonga Islands still remains "fresh to the smallest details among the natives."

**TASMANIA.** a British colonial state, forming part of the Australian Commonwealth. It is composed of the island of Tasmania and its adjoining islands, and is separated from the Australian continent on the south-east by Bass Strait. The island of Tasmania is triangular in shape, area 24,331 sq. m. (with the other islands 26,215 sq. m.), 200 m. from N. to S., and 245 m. from E. to W.

**Coastal Features.**—The southern portion of the eastern shore of Tasmania is remarkable for its picturesque inlets and bold headlands. The principal inlet is Storm Bay, which has three well-defined arms. The most easterly is Norfolk Bay, enclosed between Forester's Peninsula and Tasman Peninsula. The middle arm is Frederick Henry Bay, and the western the estuary of the Derwent. It is on this estuary that Hobart, the capital of the island, is situated. Besides the main entrance to Storm Bay, between Cape Raoul and Tasman Head, there is D'Entrecasteaux Channel, which divides North and South Brunni Island from the mainland. This channel has two branches, the easterly forming the entrance into Storm Bay, and the western being the estuary of the Huon river. On the east coast lies the peculiarly-shaped Maria Island, almost severed by deep indentations on the east and west. Above this island is Oyster Bay, formed by the projection, Freycinet Peninsula. On the south are some very prominent headlands. In the south-west lies the fine harbour of Port Davey, which receives several small rivers. Proceeding northward along the west coast the most conspicuous headlands are Rocky Point, Point Hibbs and Cape Sorell, which stands at the entrance of Macquarie Harbour, the deep inlet receiving the waters of the river Gordon
TASMANIA

and several smaller streams. North of this there are several prominent headlands. The west coast terminates at Cape Grim, opposite which are the group known by the name of Hunter's Islands. Going eastward along the north coast, Circular Head is met with, a narrow peninsula running out for six miles and terminating in a rocky bluff 400 ft. high. Further east are Emu Bay, Port Frederick, Port Sorell and Port Dalrymple, into which flows the Tamar river, on which Launceston is situated. In Bass Strait are several large islands belonging to Tasmania; King's, Flinders, Cape Barren and Clarke Islands. These are the largest, the Flinders Island having an area of 513,000 acres. Among the rivers flowing northward to Bass Strait are the Tamar, Inglis, Cam, Emu, Blyth, Forth, Don, Mersey, Piper and Ringarooma. The Macquarie, receiving the Elizabeth and Lake, falls into the South Esk, which unites with the Tamar to form the Tamar river at Launceston. Westward, falling into the ocean, are the Hellyer, Arthur and Pieman. The King and Gordon gain Macquarie Harbour; the Davey and Spring, Port Davey. The central and southern districts are drained by the Derwent from Lake St Clair—its tributaries being the Nive, Dee, Clyde, Ouse and Jordan. The Huon falls into D'Entrecasteaux Channel. The main axis of the Great Cordillera—so termed originally by Sir Roderick Murchison—bordering the eastern coast-line of Australia, may be traced across Bass Strait in the chain of islands forming the Furneaux and Kent group, which almost continually link Tasmania with Wilson's Promontory, the nearest and most southerly part of the Australian mainland. Tasmania is wholly occupied by the ramifications of this chain, and in itself may be said to embrace one and all of its characteristic features.

Taking a stand on Lake Fergus, to the east of Lake St Clair, the observer will find himself nearly in the centre of an extensive plateau, with an elevation, especially on the northern side, of between three and five thousand feet above the sea-level. This elevation is maintained from Dry's Bluff, in the north, to Denison Range in the south-west, and although often receding at points adjacent to the sources of the principal rivers, invariably presents a bold crested front to the north and west. At its greatest elevation it is comparatively level, and contains many extensive freshwater basins, such as Lake Augusta, Lake St Clair, Lake Sorell, Lake Echo, Lake Crescent, Arthur's Lake and the Great Lake. The marginal crests of this mountain tableland, together with its upper surface, are known locally as "Tiers," and have a commanding aspect in the neighbourhood of Longford, Westbury, Deloraine and Chudleigh. The extent of the principal elevated plateau is very great, though not so extensive as was formerly believed. It is maintained at an altitude in a westerly direction from Dry's Bluff (4257 ft.) on the north to Cradle Mountain (5096 ft.) at the south, a distance of nearly 50 miles; from Dry's Bluff in a south-westerly direction to Table Mountain, a distance of about 65 miles; and from Table Mountain to Bluff to Table Mountain in a southerly direction, a distance of above 40 miles. This plateau itself again rests upon a more extended tableland, stretching westwards, and, with the Middle Plains, the Derwent valley and the East Coast, forms the uninterrupted tableland of 1200 to 2000 ft. Its limits follow the coast-line more or less closely, the space between it and the sea often broadening out into low-lying tracts not much raised above the sea-level. Here and there, rising abruptly from its surface, are to be seen isolated peaks, the most characteristic of which are Valentine's Peak (3637 ft.) and Mount Peares. Ridges and plateaus of a similar character, but of smaller size, as Dry's Bluff from Denison Range to Mount Wellington (4166 ft.), are to be found in the north-east and south-west of the island. Towards the extreme west and south, anticlinal and synclinal ridges trend north and south, the most conspicuous of all being the Mt. Field group, the Huon, the Bay of Fires, and the Arthur Ranges. Settlement of population has taken place principally among the plains and lower elevations of the north-western, midland and south-eastern parts of the island, following in the main across the plateau from Pinnaclers Wells to the Tamar. In the Tertiary period the soils of these plains and valleys have been greatly enriched by extensive outbursts of basalt with accompanying tuffs and ashes, and, in the course of time, are being converted into rich lands. Not for their influence, the greater part of what is now the most fertile part of the island would have been comparatively poor or altogether sterile.

The coasts of the island throughout is wonderfully beautiful, with its open plains, bordered by far-extending precipitous mountain tiers, its isolated shaggy peaks and wooded ranges, and its many noble rivers and lakes. Its coasts for the most part, especially towards the north, are well supplied with inlets, bays and harbours, affording ample shelter and safe anchorage for ships. On the western side one is reminded of scenes in the highlands of Ross-shire and Inverness-shire in Scotland, from the picturesque character of the blue, white, and pinkish crystalline peaks and the fantastic outlines of the mountain ranges which rise abruptly to a height of from 2000 to nearly 3000 feet above the Button Grass Plains.

Geology.—Tasmania is, geologically, an outlier of the Australian continent. It is most intimately connected with Victoria, from which it was only separated by the founding of Bass's Strait in an earlier period of geological time. In each a precise date of the separation is fixed as later than the Miocene, since a part of the marine Miocene deposits along the southern coast of Victoria is broken, from Flinders to Alberton; and this gap was no doubt due to the separation of the islands, the recent separation of the two being the result of the Arrivals of those animals in south-eastern Australia. That it was not much earlier is shown by the fact that some still living species of mammals, such as the thylacine, existed before the separation.

The geological sequence in Tasmania is full, and the island contains a better series of Carboniferous rocks than is found in Victoria. The nucleus of the island is a block of Archean rocks, which are not intruded by the superficial rocks. These are rich in flours and claystones, and contain banded rocks, schists, phyllites and slate. The characteristic rock of the Archean is met with in the form of beds of quartzite varying in thickness from a few inches to a few feet, and belonging to a type known as a quartzitic formation. The most prominent formation of this kind is the quartzite of the Tamar river, which is found in the river valleys on the margins of the central plateau. The Morwell swell appears to mark the site of an ancient mountain range, and the quartzites of Port Davey on the western coast, have also been regarded as Archean. The Lower Palaeozoic systems begin with the Ashwoodian, which is characterized by the presence of the greenstone, and contains Cambrian fossils such as Dikleophalides and Conoccephalus steptensi. The Ordovician system has not been definitely identified; but probably many of the slates and quartzites belonging to the Lower Palaeozoic systems, as well as to the Silurian, are of Ordovician age. The Silurian system, however, is well developed in north-western Tasmania, and is represented by slates, limestones and sandstones yielding a distinct Silurian fauna. The rocks are best known by the limestone in the lead mining field at Zeehan, and the slates, including the tin mine of Mount Bischoff. The most prominent tectonic features of the Ordovician and Silurian systems are the Carboniferous systems of the Palaeozoic, and are characterized by the presence of the Coal Measures. The Coal Measures of the Tamar are covered by marine shales with Carboniferous bryozoa; and, on the horizon of the Greta Coal Measures of New South Wales, is a bed of Carboniferous glacial deposits.

The Mesozoic system is not well developed. It is usually regarded as beginning with a fresh-water series containing the remains of older beds on the contact, while the quartz-porphyry dikes, which are intrusive in the Silurian rocks at the Mount Bischoff tin mine, doubtless belong to this period. The Carboniferous system begins with the Carboniferous beds of the Tamar, and contains the Silurian limestone, which is produced by the silica diversification of the Silurian fauna. The Carboniferous rocks occupy the whole of the south-eastern corner of Tasmania, and one outlier occurs on the northern coast in the Mersey Valley. This formation is about 1200 ft. thick, and is separated from the Carboniferous rocks by a fault. The Upper Carboniferous includes beds of shale and coal; but though the coal is good, the seams are thin and have not been much worked. The Coal Measures are covered by marine shales with Carboniferous bryozoa; and, on the horizon of the Greta Coal Measures of New South Wales, is a bed of Carboniferous glacial deposits.

The Tertiary period the soils of these plains and valleys have been greatly enriched by extensive outbursts of basalt with accompanying tuffs and ashes, and, in the course of time, are being converted into rich lands. Not for their influence, the greater part of what is now the most fertile part of the island would have been comparatively poor or altogether sterile.
extensive series of glaciers, of which the lower moraines were de-
posed only about 400 feet above sea level.

The information as to the geology of Tasmania up to 1888 is collected in "A Systematic Account of the Geology of Tasmanien, which gives a bibliography up to that date. A later
sketch of the island is by W. H. Twelves, "Outlines of the Geology of Tasmania," April 1891, pp. 101, &c., and in papers of
mining literature is given in the reports of the Mines Depart-
ment, and special reports issued in the Parliamentary Papers; and
the economic and general geology are described in publications of
the Royal Society of Tasmania. The Mount Lyell mining field is described, with
some account of it, in "The Mount Lyell Mining Field (Melbourne, 1904).

The glacial geology, with a summary of the literature thereon, is
described by the same writer in the Quarterly Journal of the Geol-

Climate.—Tasmania possesses a very temperate and healthy
climate. The mean temperature of the year, as estimated from
observations extending back to 1841, is 51°. July and January are
the hottest month, 45°. The western prevailing winds—
particularly the north-western—carry the rain-bearing clouds.
The elevation-divide between the western and eastern parts of the
island is about 1000 feet, and consequently the parts to the east of such heights receive much less precipitation than those to the westward. The general average
for the eastern district over a period of years was 22.07 inches; for
the western district, 49.52 inches, and for Tasmania 26.60 inches.

Flores.—The vegetation which prevails among the other schistose rocks of the west and extreme south presents a totally different appearance from that already described of the east.

The western vegetation, as compared with that of the east, presents as marked a contrast as do the prevailing rocks upon which it flourishes. The characteristic trees and shrubs of the west include the following genera, viz.: Fagus, Cenchrus, Anaphalis, Eucryphia, Bauera, Boronia, Agagachys, Richea, Telopea, Grevillea, Orion, Athrotaxis, Dacrydium, Phyllocladus. On the eastern side the plains and rocky ridges, where the vegetation is chiefly of the
occa, have manuka or blackberry scrub, and on some forests thinly composed of
the following genera: Eucaleyptus (gum tree), Casuarina, Bursaria, Acacia, Leptospermum, Drimys, Melaleuca, Dodonaea, Notodina, Eucalyptus, Ilex, Epacris, Xanthorrhoea, Persoonia. The mountain
slopes and ravines of the east have a well-marked vegetation.
In character it is more akin, and in many cases identical with, that
of the west. The fern (Dicksonia antarctica) in the mountain
ravines is especially remarkable. The following genera are also
found in such positions in great luxuriance, viz.: Fagus, Anaphorus, Phebalium, Eucaleyptus, Richea, Cynocholes, Pomaderris, Prostan-
thera, Boronia, Cytisus, Collectoria, Lomatia, Drimys, Hakea, etc. In the extreme west the trees and larger shrubs
do not appear to ascend the schistose rocky mountain slopes of the central and eastern parts.

Flora.—The flora of Tasmania is similar to that in Australia.
The dingo or dog of the latter is wanting; and the Tasmanian devil
and tiger, or wolf, are peculiar to the island. The Marsupials include the
d micros or kangaroo; the opossums, Phalangeria vulpinis and
P. Cookii; the opossum-mouse, Dromia taeniata; Peromyscus and band-
coot; Hypsiprymnus or kangaroo rat; Phacoemos or wombat;
while of Menodromata there are the Echidna or porcupine ant-eater;
and the duck-billed platypus. The marsupial tiger or Tasmanian wolf
(Tyloailus cynocephalus), 5 ft. long, is yellowish brown, with several stripes across the back, having short stiff hair and very
short legs. Very few of these nocturnal carnivores are now alive to pounce Rock wallabies, which, with white spots and nocturnal habits, is a large species of the untameable
cat family. The devil (Dasyurus or Sarcophilus chrusinus) is black,
with white bands on neck and haunches. The covering of this
savage beast is under a thick layer of short hair. The tail is thick, and the bull-dog mouth is formidable. Among the birds of
the island are the eagle, hawk, petrel, owl, finch, pewee, diamond fly, fire-tail, black, emp-wingedcrow, swallow, magpie, blackcap, goatsucker, quill, ground dove, parrot,
lark, mountain thrush, cockoo, wattlebird, whistling duck, honey-
bird, Cape Barren goose, penguin duck, waterhen, snipe, albatross and
duck. Of the insects, two species only are in abundance—the lizards are harmless. Insects, though similar to Australian
ones, are far less troublesome; many are to be admired for their
great beauty.

Inhabitants.—At the beginning of 1900, the state contained
181,100 people, giving a density of 69 persons per square mile.
The population in 1870 was 106,765. The discovery of Mount
Bischoff one year later, though it greatly stimulated speculation
and induced a large influx of immigrants, did not put a stop to
outflow, for in 1880 the population was still below 115,000.
During the next ten decades there was a substantial advance; in
1880 it had reached 145,200, and in 1900, 172,980. Like all the
Australian states, Tasmania shows a decline in the birth-
rate; in 1905 the births were 52,565—36 less than in 1904—which
gives a rate of 29.32 per 1000 of population.

The climate is probably more healthy than that of any of the
Australian states, although owing to the large number of old people in
the colony, the death-rate would appear to put Tasmania on
a par with New South Wales and South Australia. The death-rate
per 1000 of population, which was 16.6-62 in the period 1901-3,
has therefore been a gradual and substantial improvement in the health
condition of the state. The annual marriage-rate was for many years consider-
able below the average for the state; it has, however, been restored for by the continued emigration of men unmarried and of
marriageable ages; this emigration had ceased in 1900, and the
marriage-rate may be taken as 7.8 per thousand. The chief towns
are Hobart (pop. 35,300) and Launceston (pop. 22,500).

Administration.—As one of the states of Australia, Tasmania
returns six senators and five representatives to the federal
parliament. The local constitution resembles that of the other
Australian states inasmuch as the executive government of
four ministers is responsible to the legislature, which consists
of a legislative council and a house of assembly. The form
is composed of eighteen members elected for three years. Eletors
of the council must be natural-born or naturalized subjects of
the king, twenty-one years of age, resident in Tasmania for
fourteen months, and possessing a freehold of the annual value
of £50 or a leasehold of the annual value of £50 within the
electoral district; the property qualification being waived in
the case of persons with university degrees or belonging to
professions. Members of the council must be not less than
thirty years of age. The house of assembly consists of
35 members elected for three years. Every resident of Tasmania
for a period of twelve months who is twenty-one years of age,
and natural-born or naturalized, is entitled to have his name placed
on the electoral roll, and to vote for the district in which he
resides. The franchise has been conferred on women.

Education.—Half the population are adherents of the Church
of England, and about 18 per cent. Roman Catholics; Wesleyans
number nearly 16 per cent. and Presbyterians about 6½ per cent.
The school system is compulsory upon children over seven years of age
and under thirteen years in the towns of Hobart and Launceston,
but not in the rural districts. Special religious instruction is
lawfully given, and the religious houses for the education of
students (chiefly by the various religious denominations, and this privilege is some-
what extensively used by the Church of England.
The schools are not free, as small fees are charged; but these are not enforced
when parents can make other arrangements for the education of
their children. There are 434 state schools, with 19,000 pupils on the roll, and
administered by 600 teachers; there were also 180 private schools, with 310 teachers
and 9000 scholars. The net expenditure averages £13,752. ed.
per annum. The average attendance being the same, the number of degree
of the state was 180, the great majority of these degrees being granted at eudem
Finance.—The revenue is chiefly obtained through the custom-
house, but the federal tariff has had the effect of considerably
reducing the receipts from this source. In 1905 the state raised
82,000s. on account of the public revenue, which is equal to
4½. 13s. 3d. per inhabitant; of this sum £29,009 was the excess of
Commonwealth collections over expenditure, and £26,933 from
other taxation; the railways returned £25,693, while from public
lands and mineral rights £2,062. The expenditure was £40,185,
thus distributed: railway working expenses, £17,619; public instruction, £6,403; interest and charges on debt, including sinking fund, £16,970; public works £25,075. The state debt and other debt charges come to
£1,185. 9d. per inhabitant, and represent 47.55 per cent. of the
expenditure of the state. The public debt in the year 1906 stood at
£5,071,000, in which £5,028,000 was due to the Commonwealth,
£52,650 to the South Australian Government, £3,011,760 to the
london Government, £18,165 to the State Bank of Victoria, £45,987
to the Chief Commissioner, £47,950 to the Colonies Office, £17,620
to the Treasury Department, £11,310 to the State Bank of New
South Wales, £2,000 to the Colonial Office, £1,872,500 to the
Chamber of Commerce, £1,300 to the Government Savings Bank and
other public works. The expenditure upon works may be
TASMANIA

Commerce.—The shipping increased considerably after 1896. Hobart is now a place of call for several of the European steamships. The state is becoming increasingly popular as a summer resort for the residents of New South Wales. The growth of the shipping trade will be seen in the following table, which also gives the imports and exports at ten-yearly intervals:

<table>
<thead>
<tr>

</table>

Tasmania does a trade with New South Wales as well as with Great Britain. The principal exports in 1905 and their values were: wool, £401,958; gold, £187,573; tin and ore, £257,450; silver and ore, £126,971; copper, £159,052; fruit, farm and vegetable produce, £1,775,789; timber, £78,380. The imports represent £14,113, and the exports £20,146 per inhabitant.

The chief ports of the state are Hobart, where the shipping entered in 1905 amounted to 645,000 tons, and Launceston, 292,000 tons.

Railways.—The railways open for traffic in 1905 had a length of 619 miles, of which 465 were government and 154 private lines. The progress of railway construction will be seen from the following table:

<table>

The railways, both state and private, are of 3 ft. 6 in. gauge. The capital expended on government lines to 1905 was £3,424,666, and the working expenses £1,713,076, leaving £1,711,590 as the net earnings.

Mining.—Mining is now the foremost industry, the gross production in 1905 being valued at £1,958,218 as compared with £1,200,000, the value of agricultural production, which is next in importance. Tasmania produces gold, silver, tin, copper, coal, and so on. In 1905 the production of these minerals was valued at: gold, £3,521,380; silver and silver-lead, £65,004; copper, £87,010; tin, £256,092; and coal, £14,194. Beaconsfield is the chief goldfield, 26 miles north-west of Launceston. There are about 1,500 persons employed mining gold on the various fields. The Mount Zeeland and Dundas districts produce almost the whole of the silver at present, and much of the ore is sold to agents in the Australian and New Zealand markets. The largest producer of tin in Australia is, and a very large proportion of the tin hitherto produced has been obtained from alluvial deposits, the lodes, except at Mount Bischoff, having been almost wholly neglected. The Mount Bischoff mine, which is worked as an open quarry, is the largest producer of tin, and (with an original capital of £30,000) has paid out over two millions sterling in dividends. The number of miners employed in tin-mining has been increasing, was 159 in 1896, 279 in 1905. Tasmania takes the lead amongst the states in copper production; in 1896 there was a small production of £169; in 1897 it grew to £1,471,437. In 1898 to £378,565, in 1899 to £671,880, and in 1900 to £507,680. Although the production has since been comparatively reduced it is still a great industry. This expansion was chiefly due to the enterprise of the Mount Lyell Mining and Railway Company, whose mines are situated at Gormantson. Coal-mining is carried on in various districts of the island, but the principal mines are at Mount Nicholas and Cornwall, in the Mount Nicholas Range; the output of the field is increasing, but no export trade is at present. Some coal, 161,180 tons, was sold in 1905 to 4,000 factories, retail and wholesale.

The number of men employed in coal-mining is 150, and the output about 52,000 tons per annum.

Manufactures.—Most of the leading manufactories are small, the number of establishments being about 1,000, the hands employed about 6,000.

Agriculture.—After being much neglected, agriculture received renewed attention in 1892 and the following years up to 1901, when the area under crop reached a total of 325,611 acres; since the year named agriculture has taken first place in the area cultivated, the area cultivated being placed at about 250,000 acres. The area under crop, at intervals of ten years, was as follows: 1861, 163,385 acres; 1871, 155,046 acres; 1881, 146,494 acres; 1891, 168,121 acres; and 1901, 224,852 acres. While the area under crop has been increasing, the number of principal crops has been much larger proportionately than that of the Australian states: for the fifteen years ending with 1905 the average yield was 18-9 bushels per acre, ranging between 9-9 and 27-3 bushels in different seasons. The oat crop is also much more above the Australian average, and may be set down at 30 bushels an acre, but an average of 5 bushels higher is not infrequent. Tasmania is renowned for its fruit crops, and now that this fruit has found an opening in the British market, renewed attention is being devoted to the industry. In 1905 there were 12,683 acres of apples, 2098 acres of pears, 11,11 acres of apricots, 1123 acres of plums, 426 acres of cherries, 498 acres of peaches, 2000 acres of strawberries, gooseberries and raspberries, and 2,250 acres of currants. The crop for the same year included 1,100,000 bushels of apples, 75,000 bushels of pears, and nearly 170,000 bushels of other fruits. The fruit finds a ready sale by means of the canneries, which have been established in New South Wales and in Great Britain. The total value of the produce of Tasmanian farms now exceeds £1,250,000, which is equivalent to £1,178. 5s. per acre cultivated.

Of the general line in sheep-breeding, yet the state is certainly well adapted for sheep-raising, and its stud flocks are well known and annually drawn upon to improve the breed in the other states. Nor have the other branches of the pastoral industry shown much expansion, as the flocks are hardly increased by the indebtedness of the two chief cities, Hobart and Launceston.

Defence.—Tasmania being a portion of the Commonwealth of Australia, its defence is undertaken by the federal government. The strength of the permanent forces is 1,500, and the efficiency of the local defence bodies is represented by the indebtedness of the two chief cities, Hobart and Launceston.

History.—Tasmania, or, as it was originally called, Van Diemen's Land, was discovered in 1642 by the Dutch navigator Tasman (q.t.) who named the territory after his patron, Van Diemen. The island was subsequently visited in 1772 by a French naval officer, Captain Marion du Fresne; in 1773 by Captain Furneaux, of the British man-of-war "Adventure"; in 1777 by the great circumnavigator Captain Cook; by Bligh in 1788, and again in 1792, when he planted fruit trees. In the same year the French navigator D'Entrecasteaux visited the south portion of the island and surveyed the coast. In 1793 Bligh sailed from the south coast with the fruit, and the island was discovered Van Diemen's Land was an island. In 1800 the French explorer Baudin, in command of the ships "Géographe" and "Naturaliste," surveyed the south of the island, and reports of his proceedings having reached the British officials at Sydney, they determined to forestall the French and take possession of Van Diemen's Land.

In 1802 the "Cumberland," a small schooner, landed at King's Island in Bass Strait, and in 1803 Lieutenant Bowen was sent by Governor King of New South Wales to form a settlement on the south coast of Van Diemen's Land. In 1804 Bowen aboard his two ships, the "Lady Nelson" and the whaler "Albion," of 760 tons, and the whaler "Albion," of 760 tons, three officials, a lance-corpsal and several privates of the New South Wales Corps, six free men and twenty-five convicts, together with an adequate supply of live stock, and
TASSIE

landed at Risdon, near Hobart, where he was joined shortly afterwards by fifteen soldiers and forty-two convicts. In 1807, Colonel Paterson occupied Port Dalrymple on the north side of the island. During the same year Colonel Collins, who had failed in an attempt to colonize the southern part of Port Phillip, was transferred to Macquarie Island, and for the time being the settlement of Hobart, and was appointed commandant of the infant settlement. Provisions were scarce and dear, communication with the rest of the world was infrequent, and in 1807 the community was threatened with starvation, and flour was sold at £2.00 per ton. The difficulties of the settlers were increased by the hostility of the blacks. The first collision took place at Risdon, a few days after the landing of Lieutenant Bowen's expedition, and for this the white settlers were entirely responsible. Hostilities between the races were incessant from 1802 till 1830. An attempt was made in the year 1830 to drive the natives to one corner of the island, but without success. In the following year, however, Mr George Robinson induced the remnant of the blacks to leave the mainland and take refuge, first in South Brunni and subsequently in Flinders Island, their numbers having then diminished from 3000, the original estimate of the aboriginal population, to 203. In 1842 there were only 44, in 1854 they had diminished to 16, and the last pure-blooded Tasmanian died in 1876, at the age of seventy-six. There are, however, a few persons possessing him or less aboriginal blood in some of the islands of the Bass Strait.

Some persons who had settled at Norfolk Island when that island became a penal depot were transferred to Van Diemen's Land in 1805. But the growth of population was extremely slow, and in 1808 a census showed that there were only 3240 people on the island, including officials, military and convicts, and whatever measure of prosperity was enjoyed by the free inhabitants arose from the expenditure by the imperial government upon the convict settlement. In 1833 the settlement was made a district, and the government gave to each settler a tract of land in proportion to the amount of capital brought by him to the colony—the possession of £200 entitling the holder to 640 acres, and in proportion, a very liberal view being taken as to what constituted capital. To every free settler was assigned, if desired, the services of a number of convicts proportionate to the size of his holding. These were fed and clothed by the settler in return for their labour, and the government was relieved of the expense of their support and supervision. The assignment system was eventually abandoned in consequence of its moral and economical evils, but it cannot be denied that while it lasted the colony made substantial progress. The population had grown to 7400; the sheep numbered 128,468; the cattle, 34,790; horses, 559; and 14,940 acres of land were under crops. As the number of free settlers in the colony increased an agitation arose for more political freedom and improved administration; especially there was a demand for a free press and for trial by jury. These requests were gradually granted. Courts of justice were substituted in 1822 for courts-martial; and in 1824 the colony was made independent of New South Wales, Colonel Arthur being appointed governor. In 1828 the Van Diemen's Land Company commenced sheep-farming on a large scale in the north-west district of the island under a charter granted three years before, and in 1839 the Van Diemen's Land Establishment obtained a grant of 49,000 acres at Norfolk Plains for agriculture and grazing. In 1834 Portland Bay, on the mainland of Australia, was occupied by settlers from Van Diemen's Land, and in 1835 there was a migration, large when compared with the population of the island, to the shores of Port Phillip, now Victoria. At that date the population was 49,177, a large proportion being convicts, for in four years 15,000 prisoners had been landed. The colony was prosperous, but the free settlers were not at all satisfied with the system of government, and an agitation commenced in Van Diemen's Land, as well as in New South Wales, for the introduction of representative institutions and the abolition of transportation. This system was abolished in New South Wales in 1840, after which date the island was the receptacle for all convicts not only from the United Kingdom, but from India and the colonies, and it was not until 1853 that transportation to Van Diemen's Land finally ceased; in the same year representative institutions were introduced, the name of the colony was changed to Tasmania, and three years later the colony was granted responsible government.

The discovery of gold in Victoria produced a very remarkable effect upon Tasmania. All kinds of produce brought fabulous prices, and were exported to Victoria in such quantities that the exports rose from a value of £665,790 in 1851 to £1,509,883 in 1852, and £1,756,316 in 1853, while the population diminished in almost equal ratio. It was estimated that in 1842 there were 38,000 adult males in the colony, but in 1854 their numbers had diminished to 22,616. For many years the island was inhabited by greybeards and children, young men and women of all classes, so soon as they had reached manhood and womanhood, crossed Bass Strait, and entered upon the wilder life and the more brilliant prospects which first Victoria, and subsequently New South Wales and Queensland, afforded them. It was not till the sixties that Tasmania embarked upon a new period of prosperity. In the early days little was known about the western half of the island. Its mineral wealth was not suspected, although as far back as 1850 coal of fair quality had been found between the Dee and the Mersey rivers, and gold had been discovered in two or three localities during 1852. In 1860 two expeditions were equipped by the government for a search for gold and other minerals, and although it was some years before there was any important result, the discoveries of these explorers directed attention to the mineral wealth of the island.

The political history of the colony after the inauguration of responsible government, until it became in 1901 one of the states of Federated Australasia, was not important. State aid to religion, which was given to any denomination which would accept it, was abolished; local self-government was extended to the rural as well as to the urban districts; and police protection was introduced; the island was connected by a submarine cable to the mainland of Australia, and thence to the rest of the civilized world; and the population, which was only 90,328 in 1870, was nearly doubled. Like her neighbours, Tasmania organized a defence force, and was able to send a contingent to South Africa in 1900.

TASSIE, JAMES (1735-1799), Scottish gem-engraver and modeller, was born of humble parentage at Pollokshaws, near Glasgow, in 1735. From writings ascribed to himself, as modeller, but, having seen the collection of paintings brought together in Glasgow by Robert and Andrew Foulis, the printers, he removed to Glasgow, attended the academy which had been established there by the brothers Foulis, and became one of the most distinguished pupils of the school. Subsequently he visited Dublin in search of commissions, and there became acquainted with Dr Quin, who had been experimenting, as an amateur, in imitating antique engraved gems in coloured pastes. He engaged Tassie as an assistant, and together they perfected the discovery of an enamel," admirably adapted by its hardness and beauty of texture for the formation of gems and medallions. Dr Quin encouraged his assistant to try his fortune in London, and thither he repaired in 1766. At first he had a hard struggle to make his way. But he worked on steadily with the greatest care and accuracy, scrupulously destroying all
impressions of his gems which were in the slightest degree inferior or defective. Gradually the beauty and artistic character of his productions came to be known. He received a commission from the empress of Russia for a collection of about 15,000 examples; all the richest cabinets in Europe were thrown open to him for purposes of study and reproduction; and his copies were frequently sold by fraudulent dealers as the original gems. He exhibited in the Royal Academy from 1769 to 1791. In particular he published the first catalogue detailing 2856 items. This was followed in 1791 by a large catalogue, in two volumes quarto, with illustrations etched by David Allan, and descriptive text in English and French by Rudolph Eric Raspe, enumerating nearly 16,000 pieces.

In addition to his impressions from antique gems, Tassie executed many large profile medallion portraits of his contemporaries, and these form the most original and definitely artistic class of his works. They were modelled in wax from the life or from drawings done from the life, and—when the wax was impossible—from other authentic sources. They were then cast in white enamel paste, the whole medallion being sometimes executed in this material; while in other cases the head only appears in enamel, relieved against a background of ground-glass tinted of a subdued colour by paper placed behind. His first large enamel portrait was that of John Dolben, son of Sir William Dolben, Bart., modelled in 1793 or 1794; and the series possesses great historic interest, as well as artistic value, including as it does portraits of Adam Smith, Sir Henry Raeburn, Dr. James Beattie, Blair, Black and Cullen, and many other celebrities of the latter half of the 18th century. At the time of his death, in 1799, the collection of Tassie's works numbered about 20,000 pieces.

His nephew, William Tassie (1777-1860), also a gem-engraver and modeller, succeeded to James Tassie's business and added largely to his collection of casts and medallions. His portrait of Pitt, in particular, was very popular, and circulated widely. When the Shakespeare Gallery, formed by Alderman Boydell, was disposed of by lottery in 1805, William Tassie was the winner of the prize, and in the same year he sold the pictures by auction for a sum of over £5000. He was bequeathed to the Board of Manufactures, Edinburgh, an extensive and valuable collection of casts and medallions by his uncle and himself, along with portraits of James Tassie and his wife by David Allan, and a series of water-colour studies by George Sanders from pictures of the Dutch and Flemish schools.

(J. M. G.)

TASSO, TORQUATO (1544-1595). Italian poet, was the son of Bernardo Tasso (1493-1569), a nobleman of Bergamo, and his wife Porzia de’ Rossi. He was born at Sorrento on the 11th of March 1544. His father had for many years been secretary in the service of the prince of Salerno, and his mother was closely connected with the most illustrious Neapolitan families. The prince of Salerno came into collision with the Spanish government of Naples, was outlawed, and was deprived of his hereditary fiefs. In this disaster of his patron Tasso’s father shared. He was proclaimed a rebel to the state, together with his son Torquato, and his patrimony was sequestered. These things happened during the boy’s childhood. In 1552 he was living with his mother and his only sister Cornelia at Naples, pursuing his education under the Jesuits, who had recently opened a school there. The precocity of intellect and the religious fervour of boy attracted general admiration. At the age of eight he was already famous. Soon after this date he joined his father, who then resided in great indigence, an exile and without occupation, in Rome. News reached them in 1556 that Porzia Tasso had died suddenly and mysteriously at Naples. Her husband was firmly convinced that she had been poisoned by her brother with the object of getting control over her property. As it subsequently happened, Porzia’s estate never descended to her son; and the daughter Cornelia married below her birth, at the instigation of her maternal relatives. Tasso’s father was a poet by predilection and a professional courtier. When, therefore, an opening at the court of Urbino offered in 1557, Bernardo Tasso gladly accepted it. The young Torquato, a handsome and brilliant lad, became the companion in sports and studies of Francesco Maria della Rovere, heir to the dukedom of Urbino. At Urbino a society of cultivated men pursued the aesthetic and literary studies which were then in vogue. Bernardo Tasso read cantos of his Amadigi to the duchess and her ladies, or discussed the manuscript for the first time set foot in that with Ferdinand, librarians and secretaries. Torquato grew up in an atmosphere of refined luxury and somewhat pedantic criticism, both of which gave a permanent tone to his character. At Venice, whither his father went to superintend the printing of the Amadigi (1560), these influences continued. He found himself the pet and prodigy of a distinguished literary circle. But Bernardo had suffered in his own career so seriously from addiction to the Muses and a prince that he now determined on a lucrative profession for his son. Torquato was sent to study law in Padua. Instead of applying himself to law, the young man bestowed all his attention upon philosophy and poetry. Before the end of 1562 he had produced a narrative poem called Rinaldo, which was meant to combine the regularity of the Virgilian with the attractions of the romantic epic. In the attainment of this object, and in all the minor qualities of style and handling, Rinaldo showed such marked originality that its author was proclaimed the most promising poet of his time. The flattered father allowed it to be printed; and, after a short period of study at Bologna, he consented to his son’s entering the service of Cardinal Luigi d’Este. In 1565, then, Torquato joined Homer and Virgil, Tassio and Ariosto in the club which was destined for him to be the scene of so many glories, and such cruel sufferings. After the publication of Rinaldo he had expressed his views upon the epic in some Discourses on the Art of Poetry, which committed him to a distinct theory and gained for him the additional celebrity of a philosophical critic. The age was nothing if not critical; but it may be esteemed a misfortune for the future author of the Gerusalemme that he should have started with pronounced opinions upon art. Essentially a poet of impulse and instinct, he was hampered in the pursuits of his own nature.

The five years between 1565 and 1570 seem to have been the happiest of Tasso’s life, although his father’s death in 1569 caused his affectionate nature profound pain. Young, handsome, accomplished in all the exercises of a well-bred gentleman, accustomed to the society of the great and learned, illustrations by his published works in verse and prose, he became the idol of the most brilliant court in Italy. The princesses Lucrezia and Leonora d’Este, both unmarried, both his seniors by about ten years, took him under their protection. He was admitted to their familiarity, and therefore to the more intimate amusement of the court. He had neither of them was indifferent to him personally. Of the celebrated story of his love for Leonora this is not the place to speak. It is enough at present to observe that he owed much to the constant kindness of both sisters. In 1570 he travelled to Paris with the cardinal. Frankness of speech and a certain habitual want of tact caused a disagreement with his worldly patron. He left France next year, and took service under Duke Alfonso II. of Ferrara. The most important events in Tasso’s biography during the following four years are the publication of the Aminta in 1573 and the completion of the Gerusalemme Liberata in 1574. The Aminta is a pastoral drama of very simple plot, but of exquisite lyrical charm. It appeared at the critical moment when modern music, under Palestrina’s impulse, was becoming the main art of Italy. The honeyed melodies and sensuous melancholy of Aminta exactly suited and interpreted the spirit of its age. We may regard it as the most decisively important of Tasso’s compositions, for its influence, in opera and cantata, was felt through two successive centuries. The Gerusalemme Liberata occupies a larger space in the history of European literature, and is a more considerable work. Yet the commanding qualities of this epic poem, those which revealed Tasso’s individuality, and which made it
immediately pass into the rank of classics, beloved by the people no less than by persons of culture, are akin to the lyrical graces of Aminta. It was finished in Tasso's thirty-first year; and when the MS. lay before him the last part of his life was over, his best work had already accomplished. Troubles immediately began to gather round his career. The court of Ferrara, the nest of intrigues, had conceived the Gerusalemme as he had conceived it, and yielded to the critical scrupulosity which formed a secondary feature of his character. The poem was sent in manuscript to several literary men of eminence, Tasso expressing his willingness to hear their strictures and to adopt their suggestions unless he could convert them to his own views. The result was that each of these candid friends, while expressing in general high admiration for the epic, took some exception to its plot, its title, its moral tone, its episodes or its diction, in detail. One wanted it to be more regularly classical; another wanted more romance. One hinted that the Inquisition would not tolerate its supernatural machinery; another demanded the excision of its most charming passages—the loves of Armida, Clorinda and Erminia. Tasso had to defend himself against all these iniquities and pedantries, and to accommodate his practice to the theories he had rashly expressed. As in the Rinaldo, so also in the Jerusalem Delivered, he aimed at ennobling the Italian epic style by preserving strict unity of plot and heightening poetic diction. He chose Virgil for his model, took the first crusade for his subject, infused the fervors of religious interest into the hero Godfrey. But his own natural bias was for romance. In spite of the poet's ingenuity and industry the stately main theme evinced less spontaneity of genius than the romantic episodes with which, as also in Rinaldo, he adorned it. Godfrey, a mixture of pious Aeneas and Tristram Catholicism, is not the real hero of the Gerusalemme. Fiery and passionate Rinaldo, Ruggiero, melancholy impulsive Tancred, and the chivalrous Saracens with whom they clash in love and war, divide our interest and divert it from Goffredo. Armida is a pure creation of his with which, sent forth by the infernal senate to sow discord in the Christian camp, turns the action of the epic. She is converted to the true faith by her adoration for a crusading knight, and quits the scene with a phrase of the Virgin Mary on her lips. Brave Clorinda, donning armour like Martiza, fighting in duel with her devoted lover, and receiving baptism from his hands in her pathetic death; Erminia seeking refuge in the shepherd's hut—these lovely pagan women, so touching in their sorrows, so romantic in their adventures, so tender in their emotions, rivet our attention, while we skip the battles, religious ceremonies, conclaves and stratagems of the conception of the hero. Tasso's great invention as an artist was the poetry of sentiment. Sentiment, not sentimentality, gives value to what is immortal in the Gerusalemme. It was a new thing in the 16th century, something concordant with a growing feeling for woman and with the ascendant art of music. This sentiment, refined, noble, natural, steeped in melancholy, exquisitely graceful, pathetically touching, breathes throughout the episodes of the Gerusalemme; finds metrical expression in the languishing cadence of its mellifluous verse, and sustains the ideal life of those seductive heroines whose names would hold words to all Europe in the 17th and 18th centuries.

Tasso's self-chosen critics were not men to admit what the public has since accepted as incontrovertible. They vaguely felt that a great and beautiful romantic poem was imbedded in a dull and not very correct epic. In their un easiness they suggested every course but the right one, which was to publish the Gerusalemme without further dispute. Tasso, already over-worked by his precocious studies, by exciting court-life and exile with literary task, now grew almost mad with worry. His health began to fail him. He complained of headache, suffered from malignant fevers, and wished to leave Ferrara. The Gerusalemme was laid in manuscript upon a shelf. He opened negotiations with the court of Florence for an exchange of service. This irritated the duke of Ferrara. Alfonso hated nothing more than his courtiers leaving him for a rival duchy. He thought, moreover, that, if Tasso were allowed to go, the Medici would get the coveted dedication of that already famous epic. Therefore he bore with the poet's humours, and so contrived that the latter should have no excuse for quitting Ferrara. Meanwhile, through the years 1575, 1576, 1577, his health grew more broken. jealousies inflamed and calumniated and insulted him. His irritable and suspicious temper, vain and sensitive to slight, rendered him only too easy a prey to their malevolence. He became the subject of delusions,—thought that his servants betrayed his confidence, fancied he had been denounced to the Inquisition, expected daily to be poisoned. In the autumn of 1576 he quarrelled with a Ferrarese gentleman, Maddalo, who had talked too freely about some love affair; in the summer of 1577 he drew his knife upon a servant in the presence of Lucrezia d'Este, duchess of Urbino. For this excess he was arrested; but the duke released him, and took him for change of air to his country seat of Belriguardo. What happened there is not known. Some biographers have surmised that a compromising Haison with Leonora d'Este came to light, and that Tasso agreed to feign madness in order to cover her honour. But of this there is no proof. It is only certain that from Belriguardo he returned to a Franciscan convent at Ferrara, for the express purpose of attending to his health. There the dread of being murdered by the duke took firm hold on his mind. He escaped at the eleventh hour, disdaining himself as a peasant, and went on foot to his sister at Sorrento.

The truth seems to be that Tasso, after the beginning of 1575, became the victim of a mental malady, which, without amounting to actual insanity, rendered him fantastical and insupportable, a misery to himself and a cause of anxiety to his patrons. There is no evidence whatsoever that this state of things was due to an overwhelming passion for Leonora. The duke, instead of acting like a tyrant, showed considerable forbearance. He was a rigid and not sympathetic man, as his treatment of a princeling of that age would bewitch him. But to Tasso he was never cruel—hard and unrelenting, perhaps, but far from being that monster of ferocity which has been painted. The subsequent history of his connexion with the poet, over which we may pass rapidly, will corroborate this view. While at Sorrento, Tasso hankered after Ferrara. The court-made man could not breathe freely outside its charmed circle. He wrote humbly requesting to be taken back. Alfonso consented, provided Tasso would agree to undergo a medical course of treatment for his melancholy. When he returned, which he did with alacrity under those conditions, he was well received by his royal family. All the high society of those days had learned that Tasso had not revived. Scene followed scene of irritability, moodiness, suspicion, wounded vanity and violent outbursts. In the summer of 1578 he ran away again; travelled through Mantua, Padua, Venice, Urbino, Lombardy. In September he reached the gates of Turin on foot, and was courteously entertained by the duke of Savoy. Wherever he went, "wandering like the world's rejected guest," he met with the honour due to his illustrious name. Great folk opened their houses to him gladly, partly in compassion, partly in admiration of his genius. But his heart was weary; he had outlived his youth; for their kindness had outlived his querulous peevishness. It seemed, moreover, that his state of mind was intolerable to him outside Ferrara. Accordingly he once more opened negotiations with the duke; and in February 1579 he again set foot in the castle. Alfonso was about to contract his third marriage, this time with a princess of the house of Mantua. He had no children; and, unless he got an heir, there was a probability that his state would fall, as it did subsequently, to the Holy See. The nuptial festivals, on the eve of which Tasso arrived, were not therefore the occasion of great rejoicing to the elderly bridegroom. As a forlorn hope he had to wed a third wife; but his heart was not engaged and his expectations were far from sanguine. Tasso, preoccupied as always with his own sorrows and his own sense of dignity, made no allowance for the troubles of his master. Rooms below his rank, he thought, had been assigned him.
The princesses did not want to see him. The duke was engaged. Without exercising common patience, or giving his old friends the benefit of a doubt, he broke into terms of open abuse, behaved like a lunatic, and was sent off without ceremony to the mad-house of St Anna. This happened in March 1579; and there he remained until July 1586. Duke Alfonso's long-sufferance at last had given way. He firmly believed that Tasso was insane, and he felt that if he were so St Anna was the safest place for him. Tasso had put himself in the wrong by his intemperate conduct, but far more by that incomprehensible yearning after the Ferrarese court which made him return to it again and yet again. It would be pleasant to assume that an unrequitable love for Leonora led him back. Unfortunately, there is no proof of this. His relations to her sister Lucrèzia were not less intimate and affectionate than to Leonora. The lyrics he addressed to numerous ladies are not less respectful and less passionate than those which bear her name. Had he compromised her honour, the duke would certainly have had him murdered. Custom demanded this retaliation, and society approved of it. If therefore Tasso really cherished a secret lifelong devotion to Leonora, it remains buried in impenetrable mystery. He did certainly not behave like a loyal lover, for both when he returned to Ferrara in 1578 and in 1579 he showed no capacity for curbing his peevish humours in the hope of access to her society.

It was no doubt very irksome for a man of Tasso's pleasure-loving, restless and self-conscious spirit to be kept for more than seven years in confinement. Yet we must weigh the facts of the case rather than the fancies which have been indulged regarding them. After the first few months of his incarceration he obtained spacious apartments, received the visits of friends, went abroad attended by responsible persons of his acquaintance, and corresponded freely with whomever he chose to address. The letters written from St Anna to the princes and cities of Italy, to warm well-wishers, and to men of the highest reputation in the world of art and learning, form our most valuable source. The letters he addressed to numerous ladies are not, but also on his temperament at large. It is singular that he spoke always respectfully, even affectionately, of the duke. Some critics have attempted to make it appear that he was hypocritically kissing the hand which had chastised him, with the view of being released from prison. But no one who has impartially considered the whole tone and tenor of his epistles will adopt this opinion. What emerges clearly from them is that he laboured under a serious mental disease, and that he was conscious of it.

Meanwhile occupied his uneasy leisure with copious compositions. The mass of his prose dialogues on philosophical and ethical themes, which is very considerable, we owe to the years of imprisonment in St Anna. Except for occasional odes or sonnets—some written at request and only rhetorically interesting, a few inspired by his keen sense of suffering and therefore poignant—he neglected poetry. But everything which fell from his pen during this period was carefully preserved by the Italians, who, while they regarded him as a lunatic, somewhat illogically scrambled for the very offscourings of his wit. Nor can it be said that society was wrong. Tasso had, indeed, written and published his last, and in fact his impracticable, impious, irrational, and in an age which no longer remained a man of genius, the most interesting personality in Italy. Long ago his papers had been sequestered. Now, in the year 1880, he heard that part of the Gerusalemme was being published without his permission and without his corrections. Next year the whole poem was given to the world, and in the following six months seven editions issued from the press. The prisoner of St Anna had no control over his editors; and from the masterpiece which placed him on the level of Petrarch and Ariosto he never derived one penny of pecuniary profit. A rival poet at the court of Ferrara undertook to revise and re-edit his lyrics in 1582. This was Battista Guarini; and Tasso, in his cell, had to allow odes and sonnets, poems of personal feeling, occasional pieces of compliment, to be collected and emended, without lifting a voice in the matter. A few years later, in 1585, two Florentine pedants of the Della Crusca academy declared war against the Gerusalemme. They loaded it with insults, which seem to those who read their pamphlets now mere parodies of criticism. Yet Tasso felt bound to reply; and he did so with a moderation and urbanity which prove him to have been "Actum est de poesia Romæ once more: his Muse is no longer the court of noble men or his brothers, but a gentleman of noble manners also. Certainly the history of Tasso's incarceration at St Anna is one to make us pause and wonder. The man, like Hamlet, was distraught through ill-accommodation to his circumstances and his age; brain-sick he was undoubtedly; and this is the duke of Ferrara's justification for the treatment he endured. In the prison he bore himself pathetically, peevishly, but never ignobly. He showed a singular indifference to the fate of his great poem, a rare magnanimity in dealing with its detractors. His own personal distress, that terrible malaise of imperfect insanity, absorbed him. What remained over, untouched by the malady, unoppressed by his consciousness thereof, displayed a sweet and gravely-toned humanity. The oldest thing about his life in prison is that he was always trying to place his two nephews, the sons of his sister Cornelia, in court-service. One of them he attached to the duke of Mantua, the other to the duke of Parma. After all his father's and his own lessons of life, he had not learned that the court was to be shunned like Circe by an honest man. In estimating Duke Alfonso's share of blame, this fruitful idealization of the court by Tasso must be taken into account. That man is his father, whose passion moves heaven and earth to place his sister's sons with tyrants.

In 1586 Tasso left St Anna at the solicitation of Vincenzo Gonzaga, prince of Mantua. He followed his young deliverer to the city by the Mincio, basked awhile in liberty and courtly pleasures, enjoyed a splendid reception from his paternal town of Bergamo, and produced a meritorious tragedy called Torris mondo. But only a few months had passed when he grew discontented. Vincenzo Gonzaga, succeeding to his father's dukedom of Mantua, had scanty leisure to bestow upon the poet. Tasso had written the first act of the Torris mondo, and journeying through Bologna and Loreto to Rome, and taking up his quarters there with an old friend, Scipione Gonzaga, now patriarch of Jerusalem. Next year he wandered off to Naples, where he wrote a dull poem on Monte Olibeto. In 1589 he returned to Rome, and took up his quarters again with the patriarch of Jerusalem. The servants found him insufferable, and turned him out of doors. He fell ill, and went to a hospital. The patriarch in 1590 again received him. But Tasso's restless spirit drove him forth to Florence. The Florentines called him Tornando. Acting on a dream, he set forth to Rome, then Florence, then Rome, then Naples, then Rome, then Naples—such is the weary record of the years 1590-94. We have to study a veritable Odyssey of malady, indigence and misfortune. To Tasso everything came amiss. He had the palaces of princes, cardinals, patriarchs, nay popes, always open to him. Yet he could rest in none. Gradually, in spite of all veneration for the sacer vates, he made himself the laughing-stock and bore of Italy.

His health grew ever feebler and his genius dimmer. In 1592 he gave to the public a revised version of the Gerusalemme. It is called the Compedita. All that made the poem of his early manhood charming he rigidly erased. The versification was degraded; the heavier elements of the plot underwent a dull rhetorical development. During the same year a prosaic composition in Italian blank verse, called Le Sette Giornate, saw the light. Nobody reads it now. We only mention it as one of Tasso's dotages—a dreary amplification of the first chapter of Genesis.

It is singular that just in these years, when mental disorder, physical weakness, and decay of inspiration seemeddooming Tasso to oblivion, his old age was cheered with brighter ways of hope. Clemence VII. ascended the papal chair in 1592. He and his nephew, Cardinal Aldobrandini of St Giorgio, determined to befriend our poet. In 1594 they invited him to Rome. There he was to assume the crown of bays, as Petrarch
had assumed it, on the Capitol. Worn out with illness, Tasso reached Rome in November. The ceremony of his coronation was deferred because Cardinal Aldobrandini had fallen ill. But the pope assigned him a pension; and, under the pressure of pontifical remonstrance, Prince Avellino, who held Tasso's maternal estate, agreed to discharge payment of his claims by paying a yearly rent-chaplet. At no time since Tasso left St Anna had the heavens so smilingly promised him. Capitalian honours and money were now at his disposal. Yet fortune came too late. Before the crown was worn or the pensions paid he ascended to the convent of St Onofrio, on a stormy 1st of April in 1595. Seeing a cardinal's coach toll up the steep Trastevere Hill, the monks came to the door to greet it. From the carriage stepped Tasso, the Odysseus of many wanderings and miseries, the singer of sweetest strains still vocal, and told the prior how he came to die with him. In St Onofrio he died, on the 25th of April 1595. He was then past fifty-one; and the last twenty years of his existence had been practically and artistically ineflectual. At the age of thirty-one the Gerusalemme, as we have it, was accomplished. The world too was already ringing with the music of Amina. More than this Tasso had not to give to literature. But those succeeding years of derangement, exile, imprisonment, poverty and hope deferred endear the man to us. Elegiac and querulous as he must always appear, we yet love Tasso better because he suffered through nearly a quarter of a century of that odium and unexplained misfortune. (J. A. S.)

Taken altogether, the best complete edition of Tasso's writings is that of Rosini (Pisa), in 33 vols. The prose works (in 2 vols., Florence, Le Monnier, 1875) and the letters (in 5 vols., same publisher, 1853) were admirably edited by Cesare Guastati. This edition of Tasso's Letwork forms by far the most valuable source for his biography. No student can, however, omit to use the romantic memoir attributed to Tasso's friend, Marchese Mamo (printed in Rosini's edition of Tasso's works above cited), and the important Vittorio Torquato Tasso by Serassi (Bergamo, 1790). See also Solerti's Life (1895), his editions of the Opere Minori in versi (1891 et seq.), and Gerusalemme (1895), and his bibliography, in the Ristita biblioteca e archivio (1895), on the occasion of the celebration of the tercentenary of Tasso's death.

**TASSONI, ALESSANDRO** (1655-1635), Italian poet, was a native of Modena, where he was born and died. From 1590 till 1608 he was secretary to Cardinal Ascanio Colonna, and in this capacity saw some diplomatic service; he was afterwards employed for some time in similar occupations by Charles Emmanuel, duke of Savoy. His best-known literary work is a burlesque epic entitled La Scocchia Rapita, or "The Rape of the Bucket" (1623), the reference being to a raid of the Modenesi upon the people of Bologna in 1595, when a bucket was carried off as a trophy. As in Butler's Hudibras, many of the personal and local allusions in this poem are now very obscure, and are apt to seem somewhat pointless to the general reader, but, in spite of Voltaire's contempt, it cannot be neglected by any systematic student of Italian literature (see Carducci's edition, 1861). Other characteristic works of Tassoni are his Pensieri Diversi (1612), in which he treats philosophical, literary, historical and scientific questions with unusual freedom, and his Considerazioni sopra il Petrarca (1600), a piece of criticism showing great independence of traditional views. Tasso's chief work, however, is his celebrated poetic drama Diversi, which was published in 1595, on the occasion of the celebration of the tercentenary of Tasso's death.

**TASSONI—TASTE**

in the papillae of the soft palate and uvula, the under surface of the epiglottis, the upper part of the posterior surface of the epiglottis, the inner sides of the arytenoid cartilages, and even in the vocal cords. The taste-bulbs are minute oval bodies, somewhat like an old-fashioned Florence flask, about 1/16 inch in length by 1/18 in breadth. Each consists of two sets of cells—an outer set, nucleated, fusiform, bent like the staves of a barrel, and arranged side by side so as to leave a small opening at the apex (the mouth of the barrel), called the gustatory pore; and an inner set, five to ten in number, lying in the centre, pointed at the end near the gustatory pore, and branched at the other extremity. The branched ends are continuous with non-medulated nerve fibres from the gustatory nerve. These taste-bodies are found in immense numbers: as many as 1760 have been counted on one circumvallate papilla in the ox. The proofs that these are the terminal organs of taste rest on careful observations which have shown (1) that taste is only experienced when the sapid substance is allowed to come into contact with the taste-body; and that the sense is absent or much weakened in those areas of mucous membrane where these are deficient; (2) that they are most abundant where the sense is most acute; and (3) that section of the glossopharyngeal nerve which is known to be distributed to the areas of mucous membrane where taste is present is followed by degeneration of the taste-bodies. At the same time it cannot be asserted that they are absolutely essential to taste, as we can hardly suppose that those animals which have no special taste-bodies are devoid of the sense. Evidence is accumulating that taste depends on nervous impulses excited by chemical change. Substances that have taste must be soluble. Chemical changes are in all probability set up in the taste-cells, or in the processes connected with them. Some progress has been made in the attempt to establish a...
connexion between the chemical composition of sapid substances and the different kinds of taste to which they may give rise. Thus acids are usually sour; alkaboids have a peculiar soapy taste; salts may be sweet, like sugar of lead, or bitter, like sulphate of magnesium; soluble alkaloïds, such as quinine or strychnine, are usually bitter; and the higher alcohols are more or less sweet. Substances which taste sweet or bitter often contain definite groups in the molecule, especially in the hydroxyl (HO) and amido (NH₂) groups. By altering the chemical composition of a substance having a characteristic taste (changing the position or relations of the radicles), the substance may become tasteless or intensely bitter. The sensation of taste may also be excited mechanically, as by smartly tapping the tongue, or by the stimulus of a continuous current. This case electrolytic change may be the exciting cause; but that the sense organs may be affected electrically is proved by the fact that rapidly interrupted induced currents, which produce little or no electrosensation, may also excite taste. Sensations of taste are heightened by increasing the area of the tongue affected, and by mechanical stimulation, as when the tongue is pressed against the lips, cheeks or palate. A temperature of about 40° C. is most favourable, either extreme heat or cold apparently numbing the sense for a time. Gustatory sensations affect each other: that is to say, a strong taste will affect the taste of another body taken immediately after it. Thus, sweetness will modify bitterness, and sourness will modify both. Moreover, the application of a sapid substance to the tongue will affect taste in other parts. If the same taste is excited on each side of the tongue, although there are two sets of gustatory nerves, one for each lateral half, the sensations are blended into one; while if two different substances, say one sweet and the other bitter, are simultaneously applied, one to each side, the observer can distinctly differentiate the one from the other.

Tastes have been variously classified. One of the most useful classifications is into sweet, bitter, acid and saline tastes. Insoluble substances, such as quinine, when brought into contact with the tongue, give rise to feelings of touch or of temperature, but excite no taste. If solutions of various substances are gradually diluted with water until no taste is experienced, G. G. Valentin found that the sensations of taste disappeared in the following order—sugar, common salt, quinine, sulphuric acid; and Camerer found that the taste of quinine still continued although diluted with twenty times more water than common salt. The time required to excite taste after the sapid substance was placed on the tongue varies. Thus saltpetre is tasted most rapidly (17 second), then sweet, acid and bitter (282 seconds). There are many curious examples of substances of different chemical constitution having similar tastes. For example, sugar, acetate of lead and the vapour of chloroform have all a sweetish taste. A temperature of from 50° to 90° F. is the most favourable to the sense, water above or below this temperature either masking or temporarily paralysing it.

As a general rule, bitter tastes are most acute at the back of the tongue, near the circumvallate papillae, and sweet tastes at the tip, but there are considerable individual variations. Some persons taste both harum-scarum and sweet things with the tip, while others taste bitter things at the tip. Many experience salt tastes best at the tip, and acid tastes at the sides of the tongue. When we consider that there are three kinds of papillae on the surface of the tongue, one would expect to meet with different degrees of sensitiveness to different tastes, even while we admit that the papillae may also have to do with sensations of touch and of temperature. By experimenting with fine capillary tubes containing sapid substances, observations have been made with individual papillae. Some are found to be sensitive to many tastes, others to two or three, others to only one, while others are insensitive to taste altogether. Again, it has been found that a mixture of sapid substances, say of quinine and sugar, may taste sweet when applied to one papilla and bitter when applied to another. The inference must be that there are special terminal organs for different tastes. Assuming that there are different kinds of taste-cells, it might be possible to paralyse some without affecting others, and thus different sensations of taste might be discriminated. This has been done by the use of the leaves of a common Indian plant, Gymnema sylvestre. When some of this plant are chewed, it has been found that bitters and sweets are paralysed (Taste of quinine, nor sugar giving rise to sensation), while acids and salines are unaffected. Again, certain strengths of decoctions of the leaves appear to paralyse sweets sooner than bitters. These observations show the existence of different taste-cells for sweets, bitters, acids and salines; and it is clear that the region of the tongue most richly supplied with taste-cells sensitive to sweets will respond best to sweet substances, while another region, supplied by taste-cells sensitive to bitters, will respond best to bitter and salts. In like manner the argument may be applied to other tastes. Suppose, again, a set of taste-cells sensitive to bitter substances: it is conceivable that in whatever way these were irritated, a bitter taste would result. If so, a substance which, applied to one part of the tongue, would cause a sweet sensation, might cause a bitter if applied to a part of the tongue richly supplied with taste-cells sensitive to bitters. This may explain why sulphate of magnesium excites at the root of the tongue a bitter taste, while applied to the tip it causes a sweet or an acid taste. Saccharine, a peculiar taste derivative, in like manner is sweet to the tip and bitter to the back of the tongue. It may be found that if the sweet and bitter taste-cells are paralysed by Gymnema, electrical irritation of the tip by a weak interrupted current does not give rise to an acid taste mixed with sweet, as it usually does, but to sensations somewhat different, which may be described as metallic or salt or acid. This experiment indicates that the action of the interrupted current on the terminal organ is analogous to the action of sweet or bitter substances (Shore). No direct observations of importance have yet been made on single circumvallate papillae. Further observations on the fungiform papillae, the taste buds, and areas of the surface of the tongue having neither papillae nor taste buds, may still, when stimulated by sapid substances, give rise to tastes. Taste is often associated with smell (g.a.). giving rise to a sensation of flavour, and we are frequently in the habit of confounding the one sensation with the other. Chloroform excites taste alone, whilst garlic, asafoetida and vanilla excite only smell. This is illustrated by the familiar experiment of blindfolding a person and touching the tongue successively with slices of an apple and of an onion.

In these circumstances the one cannot be distinguished from the other when the other is absent. When the other is present, a sensation of acidity at the anode (+pole) and of alkalinity at the katode (−pole). This is in all probability due to electrolysis, the decomposition products exciting the taste-bodies. Rapidly interrupted currents fail to excite the sense.

Disease of the tongue causing unnatural dryness may interfere with taste. Substances circulating in the blood may give rise to subjective sensations of taste. Thus santonine, morphia and biliary products (as in jaundice) usually cause a bitter sensation, whilst the sufferer from diabetes is distressed by a persistent sweetish taste. The insane frequently have subjective tastes, which are real to the patient, and frequently cause much distress. In such cases, the sensation is excited by changes in the taste-centres of the brain. Increase in the sense of taste is called hyperguesia, diminution of it hypoguesia, and
its entire loss of *agriculture*. Rare cases occur where there is a subjective taste not associated with insanity nor with the circulation of any known sweetish matters in the blood, possibly caused by irritation of the gustatory nerves or by changes in the nerve centres.

For the anatomy of the organs of taste, see the articles *Mouth and Tongue* (J. G. M.).

**TATA—TATARS**

Pacey, merchant and philanthropist, was born at Nosari, in the state of Baroda, in 1839, and went as a boy to Bombay, where he was educated at the Elphinstone College. In 1858 he entered his father's office, and began a commercial career of the highest eminence, beginning with cotton mills at Bombay and also at Nagpur, and ending with the formation of a company to work the iron ores of the Central Province and the modern blast furnaces. One of his best-known achievements was the lowering of the freights on Indian goods to China and Japan, as the result of a long struggle with the Nippon Yusen Kaisha Co. He also introduced a silk industry after Japanese methods into Mysore, and built the Taj Mahal hotel in Bombay. But his greatest benefaction is the endowment of a research institute at Bangalore. He died at Nauheim, in Germany, on the 19th of May 1904.

**TATAR PAZARJIK, or Tatar Bazaarlik**, a town of Bulgaria in Eastern Rumelia; on the river Maritsa, and on the Sofia-Constantinople railway, 74 m. E.S.E. of Sofia, and 23 m. N.W. of Philippopolis (Pop. 9068) (77). Situated at the junction of several roads, Tatar Pazarjik began to acquire commercial importance in the 15th century. Rice, millet and tobacco are largely cultivated in the surrounding lowlands, and there is some trade in coconuts and wool.

**TATARS** (the common form Tartars is less correct), a name given to nearly three million inhabitants of the Russian empire, chiefly Moslem and of Turkish origin. The majority—in European Russia—are remnants of the Mongol invasion of the 13th century (see Moslem). Among these are, however, two distinct elements, a more numerous Turkish population of the Ural-Altaic region, mixed with some extent with Finns and Samoyedic tribes, as also with Mongols. The name is derived from that of the Ta-ta Mongols, who in the 5th century inhabited the north-eastern Gobi, and, after subjugation in the 7th century by the Khitans, migrated southward, there founding the Mongol empire under Jenghiz Khan (q.v.). Under the leadership of his grandson (Batu) they moved westwards, driving with them many tribes of the Turkic Ural-Altaic and other tribes, which, as their eastern neighbours, were, and still are, a mixture of Mongolian blood, but belong to the Turkish branch of the Ural-Altaic stock, necessitating the conclusion that only Batu, his warriors, and a limited number of his followers were Mongols, while the great bulk of the 15th century invaders were Turks. On the Volga they mingled with remnants of the old Bulgarian empire, and elsewhere with Finnish tribes, as well as with remnants of the ancient Italian and Greek colonies in Crimea and Caucasians in Caucasus. The name of Tatars, or Tartars, given to the invaders, was afterwards extended so as to include different stems of the same Turkish branch in Siberia, and even the bulk of the inhabitants of the high plateau of Asia and its N.W. slopes, described under the general name of Tartary. This last name has almost disappeared from geographical literature, but the name Tatars, in the above limited sense, remains in full use.

The present Tatars of the Russian empire form three large groupings: those of East, or Russian and Poland, those of Caucasus, and those of Siberia. The differentiation of the separate stems included under the name is still far from completion. The following subdivisions, however, may be regarded as established. (1) The Kazakh Tatars, descendants of the Kipchaks settled on the Volga in the 13th century, where they mingled with survivors of the old Bulgarians and partly with Finnish tribes. They number about half a million in the government of Kazakh, about 100,000 in each of the governments of Ural, Simbirsa and Saratov, 300,000 in Vyatka, Saratov, Tambov, Penza, Nizhniy-Novgorod,Perm and Orenburg; some 15,000 belong to the same stem as migrated to Ryazan, or have been settled as prisoners in the 16th and 17th centuries in Lithuania (Vilna, Grodno and Podolia); and there are some 2000 in St Petersburg, where they pursue the callings of coachmen and waiters in restaurants. In Poland they constitute the larger part of the population of various localities. The Tatars speak a pure Turkish dialect; they are middle-sized, broad-shouldered and strong, and mostly have black eyes, a straight-nosed and scanty cheek bones. They are Moslems, except in the three classes and is a waning institution. Excellent agriculturists and gardeners, very laborious, and having a good reputation for honesty, they live on the best terms with their Russian peasant neighbours, especially in the Volga basin. They also are agriculturists and gardeners; while some 12,000 Koundrovsk Tatars still continue the nomadic life of their ancestors. (2) The Crimean Tatars, who are related to the 14th century, have preserved the name of their leader, Nagasi. During the 15th, 16th and 17th centuries they constituted a rich empire, which prospered until it fell under Turkish rule, when it had to suffer much from the wars fought-tenders and Turkish. Although most of its service of the peninsula. The war of 1853 and the laws of 1860-63 and 1874 caused an exodus of the Crimean Tatars; they abandoned their admirably irrigated fields and gardens and moved to Turkey, so that the number of their remains in the Crimea is about 100,000, mixed with Greeks and Italians, are well known for their skill in gardening, their honesty and their laborious habits, as well as for their fine features and especially for their quickness of wit. The Tatars in the Crimea closely resemble those of Caucasus, while those of the steppes—the Nagasi—are decided of a mixed origin from Turks and Mongols. The Tatars of Caucasian, who inhabit the upper Kuthan, the steppes of the Kuma and the Kura, and the Aras, number about 3,500,000. Of these (4) the Nagasi on the Kuma show traces of an intimate mixture with Kalmucks. They are nomads, supporting them by cattle-breeding and fishing; few are agriculturists or cattle-breeding. (5) The Karachais (18,500) in the upper valleys about Elburz live by agriculture. (6) The mountain Tatars (about 850,000), divided into many tribes and of an origin still undetermined, scattered throughout the provinces of Kildari, Tiflis, Kutais, Daghestan, and partly also of Batum. They are certainly of a mixed origin, and present a variety of ethnological types, all the more so as all who are neither Armenians nor Circassians, nor belong to any distinct Caucasian tribes, are often called Tatars. As a rule they are well built and little behind their Caucasian brethren. They are celebrated for their excellence as gardeners, agriculturists, cattle-breeding, and as fishermen; they are on very good terms both with their Sunnite and with their Russian neighbours. Polygamy is rare with them, and their women go out to work. The Siberian Tatars are estimated (1895) at 80,000 of Turkic stock, and about 40,000 of mixed Finnish stock. They occupy three distinct regions—a strip running west to east from Tobolsk to Tomsk, the Altai and its spurs, and South Yeniensis. They are included in the agricultural population of the region north of the Altai reached some degree of culture between the 4th and the 8th centuries, but were subdued and enslaved by the Mongols. They are difficult to classify, for they are the result of a recent mixed race, the Mongol-Tatars, who are more or less in process of being assimilated by the Russians, but the following subdivisions may be accepted provisionally. (1) The Bokhara Tatars, who take their name from one of their stems (Barama), number about 50,000 in the government of Tobolsk and about 5000 in Tomsk. After a strenuous resistance to Russian conquest, and much suffering at a later period from Kirghiz and Kalmuck raids, they now live by agriculture, either in separate villages or along with Russians. (6) The Cholm or Chulyen Tatars on the Cholm and the rivers Yus speak a Turkish language with many Mongol and Yakut words, and are more like Mongols than Turks. In the 14th century they lived on the Volga and the Kazanka, but now are rapidly becoming fused with Russians. (6) The Abakan or Minusinsk Tatars occupied the steppes on the Abakan and Yus in the 17th century, after the withdrawal of the Kirghizes, and remained a pure Turko-Mongol mixture with Kalbaits (whom Castaño considers as partly of Ostiak and partly Samoyedic origin) and Beltars—also of Finnish origin. Their language is also mixed. They are known under the names of Kalmucks, and are the Turkish stem of the Minusinsk Tatars, Kalbaits, and Kizil or Red Tatars. Formerly Shamanists, they now are, nominally at least, adherents of the Greek Orthodox Church, and support themselves mainly by herding of cattle. (7) The Soviet. They have 8000 and live with Turks the Uryankhes of north-west Mongolia, who are of Turkish origin but follow Buddhism, and the Karagasses, also of Turkish
TATE, SIR H.—TATE, R.

origin and much like the Kirghizes, but reduced now to a few hundreds, are akin to the above. (10) The Tatars of the northern slopes of the Altai (nearly 20,000 in number) are of Finnish origin. They comprise some 20,000 of Kumandistles, the Lebedi, the Cherniyakha, the Black-Forests and the Shors (11,000), descendants of the Kuznets or Iron-Smith Tatars. They are chiefly hunters, passionately loving their tajga, or wild forests, and have nothing in common with the racial organization of the Kazans; they live partly also on cedar-nuts and honey collected in the forests. Their dress is that of their former rulers, the Kalmucks, and their language contains many Mongol words. (11) The Altai Tatars, who live up in the Mountain Altai (12,000), to whom this name has been given by mistake, and who have nothing in common with the Kalmucks except their dress and mode of life, speak a Turkish dialect, and (6) the Teletuch of Tatar, as they are usually named, is a mainly nomadic or warlike nation who have migrated from the mountains to the lowlands, where they now live along with Russian peasants. Although Turkistan and Central Asia were formerly known as independent Tartary, it is not now usual to call the Sarts, Kirghiz and other inhabitants of those countries Tatars, nor is the name usually given to the Yakuts of Eastern Siberia.

It is evident from the above that the name Tatars was originally applied to both the Turkish and Mongol tribes which invaded Europe six centuries ago, and gradually extended to the Turkish tribes mixed with Mongol or Finnish blood in Siberia. It is used at present, in the books of the Ural-Altaians, to the Ural-Altaians, who, also those of the Russian historians Soloviev, Kostomarow, Bestuzhev-Ryumin, Schapov, and Illovaysky, the former of whom has published a Resume des travaux et des publications of the Russian Geographical Society and its branches; the Russian Etnographicheskiy Sbornik; The Istoria of the Moscow society of the amateurs of natural science; the works of the Russian ethnographical congresses; Kostrov's researches on the Siberian Tatars in the memoirs of the geographical branch of the Russian society; Radlov's Reise durch den Altai, Aus Siberien; "Picturesque Russia" (Zhininskaya Rosiya); Semenov's and Potanin's "Supplements" to Ritter's Asien; Harkavi's report on the Tatars at the congress at Kazan; Hartakhi's "Hist. of Crimean Tatars," in Vjetnik Evrope, 1866 and 1867; "Katchkin Tatars," in Istoria Rus. Acad. s. d.; and V. Volodarsky's article on Volodarsky and the Tatars will be found in the Revue orientale pour les Etudes d'Asie, and in the publications of the university of Kazan. See also E. H. Parker, A Thousand Years of the Tatars, 1895 (chiefly a summary of those of Sir Paul), A. Fish and Tatar to Skrine and Ross, Heart of Asia (1895).

TATE, SIR HENRY, Bart. (1819-1890), English merchant and founder of the National Gallery of British Art, was born at Chorley, Lancashire, in 1819. His father, a minister of religion, put him into business in Liverpool. He became a prosperous sugar-broker, and about 1874 removed to London, where he was afterwards one of his firm's leading members. He was at first merely a regular buyer of pictures, for which he built a large private gallery in his house at Streatham. Gradually his gallery came to contain one of the best private collections of modern painting in England, and the owner naturally began to consider what should be done with it after his death. It had always been his intention to leave it to the nation, but in the way of carrying out this generous desire there stood several obstacles. The National Gallery could not have accepted more than a selection from Tate's pictures, which were not all up to the standard of Trafalgar Square; and even when he offered to build a new gallery for them, it was found difficult to secure a suitable site. What Tate offered was to spend £20,000 upon a building if the government would provide the ground; and in 1892 this offer was accepted. A new gallery, controlled by the Trustees of the National Gallery, was built on the site of Millbank Prison. The gallery was opened on 21 July 1897, and a large addition to it was completed just before the donor died. It contained sixty-five pictures presented by him; nearly all the English pictures from the National Gallery painted within the previous eighty years; the pictures purchased by the Royal Academy under the Chantrey Bequest, of which he had previously bought a set in South Kensington Museum; and seventeen large works given under a will by Mr G. F. Watts, R.A. Mr Tate was created a baronet in the year after the Tate Gallery had been opened. He died at Streatham on the 5th of December 1890.

TATE, JAMES (1771-1843), English classical scholar and schoolmaster, was born at Richmond in Yorkshire on the 11th of June 1771. He was educated at Richmond school and Sidney Sussex College, Cambridge (fellow, 1795). From 1796 to 1833 he held the headmastership of his old school, being then a fellow of Trinity College, Cambridge, and a fellow of Pembroke College, Cambridge, and was appointed headmaster of the University Grammar School, Edinburgh. He died on the 2nd of September 1843. The work by which he is chiefly known is his Horatius Restituitus (1832).

TATE, NAHUM (1652-1715), English poet laureate and playwright, was born in Dublin in 1652. He was the son of Faithful Teate (as the name was spelt), who wrote a quain poem on the Trinity entitled Ter Tria. Nahum Tate was educated at Trinity College, Dublin, graduating B.A. in 1672. He published a volume of poems in London in 1677, and became a regular writer for the stage. Bruius of Alba, or The Enchanted Lover (1678), a tragedy dealing with Dido and Aeneas, and The Loyed General (1680), were followed by a series of adaptations from Elizabethan dramas. In Shakespeare's Richard II. he altered the names of the personages, and changed the text so that every scene, to use his own words, was "full of respect to Majesty and the dignity of courts"; but in spite of these precautions The Sicilian Usurper (1681) was suppressed on the third representation on account of a possible political interpretation. King Lear (1687) was fitted with a happy ending in a marriage between Cordelia and Edgar; and Coriolanus became the Ingratitude of a Commonwealth (1682). From appointed critic he at last returned to his metrical work (1685); from Chapman and Marston's Eastward Ho! he derived the Cuckold's Haven (1683); from John Webster's White Devil he took Injured Love, or The Cruel Husband (pr. 1707); and the As Sir Cockayne's Treapolinn suppord a Prince he imitated in Devil and no Duke (1683). Tate's name is chiefly connected with these adapted versions of other men's plays and with the famous New Version of the Psalms of David (1696), in which he collaborated with Nicholas Brady. A supplement was licensed in 1703. Some of these hymns, notably "While Shepherds watched," and "As pants the hart," rise above the general dull level, and are said to be Tate's work.

Tate was commissioned by Dryden to write the Second Part of Abolse and Achitophel. The portraits of Elkanah Settle and Thomas Shadwell, however, are attributed to Dryden, who probably also put the finishing touches to the poem. Of his numerous poems the most original is Parace, a poem on Tea (1700). In spite of his consistent Toryism, he succeeded Shadwell as poet laureate in 1692. He died within the precincts of the Mint, Southwark, where he had taken refuge from his creditors, on the 12th of August 1715.

TATE, RALPH (1840-1901), British geologist, was born at Alnwick in Northumberland in 1840. He was a nephew of George Tate (1805-1871), naturalist and archæologist, an active member of the Berwickshire Naturalists' Club. He was educated at the Cheltenham Training College and at the Royal School of Mines, and in 1861 he was appointed teacher of natural science at the Philosophical Institution in Belfast. He there studied botany, and published his Flora Balfinesis (1863); and he also investigated the Cretaceous and Liassic rocks of Antrim,
TATIAN—TATIAN

bringing his results before the Geological Society of London. In 1864 he was appointed assistant in the museum of that society. In 1867 he went on an exploring expedition to Nicaragua and Venezuela. In 1871 he was appointed to the mining school established by the Cleveland ironmasters first at Darlington and then at Redcar. Here he made a special study of the Lias and its fossils, in conjunction with the Rev. J. F. Blake, and in 1883 published an important work, *The Yorkshire Lias* (1876), in which the life-history of the strata was first worked out in detail. In 1875 Tate was appointed professor of natural science in the university of Adelaide, South Australia. He now gave special attention to the recent and tertiary mollusca of Australia. He was the chief founder of the Royal Society of South Australia, and was in 1893 president of the Australian Association for the Advancement of Science. He died at Adelaide on the 20th of September 1901.

TATI, a district of British South Africa forming, geographically, the S.W. corner of Matabeleland, but attached administratively to the BechuanaLand Protectorate. Area about 2500 sq. m. The railway from Cape Town to Bulawayo crosses the territory with a station at Francistown, the principal settlement. Francistown stands 3254 ft. above the sea and is 126 m. S.W. of Bulawayo by rail. The town of Tati, on the river of that name, is 18 m. S.E. of Shashi river railway station.

Tati owes its importance to the presence of gold, first discovered by the German traveler, Karl Mauch, in 1864. Mining began in 1868, but it was not until 1895 that work on a large scale was undertaken, and it has been frequently interrupted since that date. The chief mine is the Monarch, situated by the railway. A concession to work the gold-mines, and for other purposes, was obtained in 1887 by Mr S. H. Edwards from Lobengula, the Matabele chief, and the mining rights are vested in a company, thereafter formed, called the Tati Concessions Company. (See BechuanaLand and Rhodesia.)

TATIAN (2nd cent. A.D.), Christian apologist, missionary and heretic. Such knowledge as we have of his life is derived from (1) his *Sorites Ad Graecos* (mentioned in *Or. 42*); (2) Ireneaus, *Ad. Haereses*, i. 28, 1; (3) Rhodon, quoted in Eusebius's *His. Eccl.* v. 13, 1; (4) Clement of Alexandria, *Strom.* i. 11, 17; (5) Eusebius, *Chronicon anno* a.D. 171; (6) Epiphanius, *Panarion*, i. 3, 46.

Convenient collections of these passages may be found in E. Schwartz's *Tatiani Oratio ad Graecos, Texte und Untersuchungen*, iv. 1, pp. 51-55; and in A. Harnack's *Geschichte der altchristlichen Littératur*, i. pp. 485-96. From these data the following outline of his life can be reconstructed. He was a Syrian1 (Clem. Alex. and Epiphanius) born in Mesopotamia (Or. 41) and educated in Greek, in which he became proficient (Or. i. 42). He was initiated into the Mysteries, though into which is not stated (Or. 28), but after this became acquainted with the Old Testament, and was converted to Christianity. He then went to Rome, where he was a hearer of Justin, and together with the latter incurred the enmity of a certain philosopher Crescens. As this fact is mentioned both in Justin's *Apology* and in Tatian's *Oratio ad Graecos*, and the *Apology* can be dated with fair security about A.D. 152 (see Justin Martyr), the conversion of Tatian must have been before the death of Justin, which occurred about 163 or 165, according to Eusebius's *Chronicon* in 173. Among his pupils were Rhodon, and perhaps Apelles (see Victorinus Reat. schol. 44, in *Ep. Hieronymi ad Asteriun*, ep. 124) and Clement of Alexandria (*Strom.* i. 1, 11). He made a missionary journey to the East and worked in Cilicia and Pisidia, using the Syrian Antioch as the centre of his efforts (Epiphanius).

According to Epiphanius, Tatian went to the East after the death of Justin (c. 163), and then became heretical, and Eusebius states that he was recognized as heretical in 173. Zahn (*Forschungen zur Geschichte des Kanons*, i.) and most writers accept this as in the main correct; it is generally thought that his heresy was recognized in Rome, and it is suggested that this was the reason why he returned to the East. The statement in Epiphanius is capable of being interpreted in this sense, and whereas Tatian was always regarded as heretical in the East, he seems to have been respected in the East.

This fact, however, does more than support the suggestion that Tatian's heresy was recognized before he left Rome: it throws some doubt on the theory that after being turned out of the Church in Rome he worked as a missionary in the East without being suspected. Harnack (Texte und Untersuchungen, i. 1, pp. 196 ff.) once suggested that the missionary work in the East belongs to an earlier period, and that Tatian left Rome and returned to it between his first arrival and the death of Justin Martyr. But in his *Chronologie*, i. pp. 284 ff., he has withdrawn this, and it is probably too hypothetical; it is, however, the only serious effort to deal with the difficulty, which if not insoluble is at least unsolved.

The Heresy of Tatian.—As in the case of most heresies, we have only the partisan statements of opponents. Everything is therefore open to some doubt, but the following points seem fairly certain. The heresy which Tatian either founded or adopted was that of the Encratites. Their main doctrines were the evil nature of matter, an absolute forbidding of marriage, abstinence from wine and perhaps from meat. It would also seem that Tatian believed in the existence of aeons, and the doctrine is in fact based on the Books of Peter and excerpts from them. This doctrine is referred to by Hippolytus in *Refugium S. Spiritus* (C. Alex., *Strom.*, iii. 10, 80): (5) *πῶς ἀγαθοῦ* τῶν ἑλληνίδων τῷ ἀρχαίῳ (mentioned in Or. 40 as a book which Tatian intended to write, but there is no evidence that he carried his plan into effect; (6) *Πρὸς τῷ καθί τοῦ Σωτῆρα καταρρημένον* (Clem. Alex., *Strom.*, iii. 10, 80): (7) *The Dilestassor*; (8) a recession of the Pauline epistles (Eus. *Hist. Eccl.*, iv. 29) says that he was accused of producing a *μεταφράσεως* of the epistles so as to smooth the grammar, and in Justin's presence to St Paul's Epistle to Titus 3:5 is stated that he rejected some of the epistles, but not that to Titus. Of these books only two—the Dilestassor and the πρὸς τοὺς Ἑλληνίδων—are extant.

The Λόγος πρὸς τοὺς Ἑλληνίδων (Oratio ad Graecos) belongs to Tatian's Catholic period. He has the double purpose in view of exposing the weakness of the pagan view of the universe and of refuting the Christian position. It is to this that he seems to have made use of an already existent book, perhaps the Γονήν Θεοῦ of Onoeamus of Gadara, a Syrian who wrote in the time of Hadrian. This same source seems to have been used by Hippolytus Felix and Tertullian, and Eusebius in his *Præp. Evan.*, v. 19, quotes some other fragments of the work of Onoeamus.

The main argument employed is an exposition of the contradictions between the mysteries and immorality of Greek mythology. A special attack is made on the doctrine of Fate or Necessity. Tatian insists that man is a free agent: that his sins and the consequent evils in the world are the result of free choice, and that the same free agents are now responsible for the same consequences. His positive explanation of the universe is rather difficult to follow. He lays great stress on the Logos doctrine; all good is to be found in union with the Logos; all evil is in matter or in separation from the Logos. The material origin of evil in the world seems to be the choice of the latter rather than of the former; and redemption consists in the reverse process. But the choice of evil was not made only by man but by angels, who by their evil choice became the demons, that is, the gods of the heathen world. Both men and angels will be judged at the end of the world, when the good will receive again the immortality which was lost through their wickedness, and the wicked will receive the further loss of immortality (πάναν διὰ γυμνασμοῦ εἰς δαίμονες). Tatian does not deny the stories of the Greek mythology—indeed he protests against attempts to allegorize it—but he insists that these stories are the mistakes of the early interpreters of the Logos doctrine. The truth of his views he rests, rather strangely, on the argument that Moses, the writer of the Pentateuch, lived long before Homer, whom he regards as the earliest Greek religious writer, and to prove this he quotes a series of synchronisms, which were made use of by
The Tatra Mountains, or the High Tatra, the highest group in the central Carpathians, and the central group of the whole Carpathian system. They extend between the rivers Waag, Arva, Dunajec and Poprad, and form a sharply defined and isolated group, rising abruptly like a gigantic wall to an altitude of over 800 ft. in the midst of a high plateau situated 2600 ft. above sea-level. The Tatra Mountains extend through the Hungarian counties of Liptó and Szépes, and with them also the outcrops of the Tatra Mountains of Galicia, and have a length of 40 m. and a width varying between 9 and 5 m. The mean altitude is between 6000 and 7500 ft. The principal peaks are:—the Franz-Josef or Gerlsford (Hung. Gerlachfalvi-CsúcS, 8337 ft.), the highest in the Carpathian system; the Lomnitz (Lomnitz-CsúcS, 8642 ft.); the Eisthal (Jégvolgyi-CsúcS, 8630 ft.); the Tatraspitz or Hohe Visoka (8415 ft.); the Kesmark (8266 ft.); the Meeragenspitze (Tengerszem-CsucS, 8210 ft.); the Schlagenthof (Szláld-CsúcS, 8309 ft.); and the Kriváh (8190 ft.). The principal valleys, which lie at an altitude of 2600 to 3250 ft. above sea-level, and present some of the wildest scenery are: the Kohlbach Valley, the Felka Valley, the Valley of Mengsdorf, the Javorina Valley, the Kotlina Valley, in which is the stalactite cavern of Béla, and the Bielka Valley. One of the characteristics of the Tatra are the numerous mountain lakes (112 in number), called by the people "eyes of the sea." The largest of them are the Lake of Csorba, in the southern part of the group, which has an area of 50 acres; the Grosser Fischsee in the Bielka Valley; and the Wielki Staw, with an area of 85 acres, the largest of the Five Polish Lakes, which lie in the Roztoka Valley. These are many summer resorts in the Tatra Mountains, the most frequented being Tatrafüred (German, Schmack), three small villages situated at an altitude of 3250 ft., at the foot of the Schlagenthof peak; and the environs of the Lake of Csorba, which is called the "Pearl of the Tatra."

TATTA, or THATO, an ancient town of British India, in the Sind province of Bombay, 7 m. from the right bank of the main channel of the Indus and 13 m. from a station on the North-Western railway: pop. (1901) 10,783. Tatta was the capital of the Samma dynasty in Lower Sind in the 16th century, and long continued to be the centre of trade in the country, to which it sometimes gave its name in early European travels. An English factory was established here in 1758, but withdrawn after a few years. There are two old mosques, decorated with the coloured tiles characteristic of Sind.

TATTERSALL'S, the London horse auction mart, founded in 1766 by Richard Tattersall (1724-1795), who had been stud groom to the second duke of Kingston. The first premises occupied were near Hyde Park Corner, in what was then the outskirts of London. Two "Subscription rooms" were reserved for members of the Jockey Club, and they became the rendezvous for sporting and betting men, and those of the fanciers. Dispersal sales conducted by "Old Tatt" were those of the duke of Kingston's stud in 1774 and of the stud of the Prince of Wales (afterwards George IV.) in 1786. The prince often visited Richard Tattersall, and was joint proprietor with him of the Morning Post for several years. He was succeeded by his son, Edmund Tattersall (1758-1810), who extended the business of the firm to France. The third of the dynasty, Richard Tattersall (1785-1859), the eldest of Edmund's three sons, became head of the firm at his father's death. He had his grandfather's ability and tact, and was the intimate of the best sporting men of his time. Another Richard Tattersall (1812-1870), son of the last, then took command of the business. His great-grandfather's 99-year lease having expired, he moved the business to Knightsbridge. Richard was followed by his cousin, Edmund Tattersall (1816-1898), and he by his eldest son, Edmund Somerville Tattersall (b. 1863).

A son of the second Richard Tattersall, George Tattersall (1817-1849), was a well-known sporting artist. In 1836 he compiled a guide to The Lakes of England, illustrated with forty-three beautiful line drawings, and he showed skill as an architect by building the Tattersall stud stables at Willesden. His experience in this and similar undertakings led him to publish Sporting Architecture (1841). In the same year, under the pseudonym "Wildrake," he published Cracks of the Day, describing and illustrating sixty-five race-horses. He also contributed illustrations to the Hunting Reminiscences of Nimrod (Charles J. Apperley), the Book of Sports (1843), and the New Sporting Almanack.

TATTINALL, JOSIAH (1795-1871), American naval officer, was born at Savannah, and was educated in England. He entered the United States navy in 1812, and was actively employed till the beginning of the Civil War. He may be said to have gained a world-wide reputation by his use of the phrase "blood is thicker than water " to justify his intervention on behalf of the British squadron engaged in the operations against the Peiho Forts. Tattinall's flagship the Teyovva had grounded shortly before, and had been helped off by the British squadron. He was in the Peiho river when the unsuccessful attack of the 25th of June 1859 was made. Tattinall not only brought the Teyovva under fire, but lent the aid of his boats to land detachments to turn the Chinese defences. When the Civil War began he took the side of the Confederacy. He was put in command of its naval forces when Franklin Buchanan resigned after he was wounded in the action with the Federal squadron in Hampton Roads. The Confederate States were never able to form a sea-going squadron, and Tattinall had no chance to do more than make a struggle with insufficient resources on its rivers. He died on the 14th of June 1871.

TATTOO, a signal given by beat of drum and call of bugle at nightfall for soldiers to go to quarters when in garrison or to tents when in the field. The earlier word is taptoe or tapfeo, and was borrowed from Du. tapteo; the phrase de tapote sloan, to close the taps, and the parallel Ger. Zapfenstreich, literally "tap-stroke" (ZaOp, a tap of a cask), shows that it meant originally a signal that the "taps" or public-houses were closed for the night.

TATTOOING (Tahitian, latu, from ta, mark), the practice of decorating the skin, by cutting or puncturing, with various patterns into which a colouring matter is introduced. Though the word is Polynesian, the custom appears to have been almost universal, but tends to disappear before the spread of civilization. The prohibition to the Jews (Lev. xix. 28) under the Mosaic Law to "print any marks" upon themselves is believed to have reference to tattooing, which is still common in Arabia. The North and South American Indians, the Chinese, Japanese, Burmese, all tattoo. The origin of the custom is disputed. It was probably at first for purely ornamental purposes and with the idea of attracting the opposite sex. The discovery in the caves of Western Europe of hollowed stones which had been apparently used for grinding up ochre and other coloured clays is thought evidence that prehistoric man painted himself, and tattooing for decorative reasons may easily date back to the cave-dwellers. The modern savage paints himself as a protection against cold, against the bites of insects or the sun's rays, and most of all to give himself a ferocious appearance in battle, as Caesar relates of the ancient Britons. Any of these motives may have shared in originating tattooing. Subsequently the practice assumed religious and social significance, varying with the country and according to the age at which it was.
performed. Thus in Polynesia it is begun in or about the twelfth year, and becomes thus a mark of puberty; while among the Arabs and the Kabyles of Algeria infants are tattooed by their mothers for simple ornament or as a means of recognising them. The American Indians bore from their initiation to puberty the mark of the personal or tribal totem, which at once represented the religious side of their life, and served the practical purpose of enabling them to be known by friendly tribes. Among the Australians tattooing served as a mark of adoption into the family or tribe, the distinctive emblem or kobong being scarred on the thighs.

Tattooing is regarded, too, as a mark of courage. A Kaffir who has been a successful warrior has the privilege of making a long incision in his thigh, which is rubbed with clinders until sufficiently discoloured. Elsewhere tattooing is a sign of mourning, deep and numerous cuts being made on face, breast and limbs. Among the Fijians and Eskimos the untattooed were regarded as risking their happiness in the future world. Some of the most remarkable examples of tattooing are those to be found among the Laos, whose stomachs, thighs, legs and breasts are often completely covered with fantastic animal figures like those on Buddhist monuments.

The rudest form of tattooing is that practised especially by the Australians and some tribes of negroes. It consists in cutting gashes, arranged in patterns, on the skin and filling the wounds with clay so as to form raised scars. This tattooing by scarring as compared with the more common mode of prick- ing is, as a general rule, confined to the blacks. The tattooed races have no special idea of the use of tattooed parts of the body, whether arms, face or limbs. It is simply a mark of distinction marking the different classes of the society.

In Polynesia the art of tattooing reached its highest perfection. In the Marquesas group of islands, for example, the men were tattooed all over, even to the fingers and toes and crown of the head, and as each operation took from three to six months, beginning at virility, a man must have been nearly thirty before his body was completely covered. In New Zealand the face was the part most tattooed, and Maori heads so decorated were at one time in much request for European museums, but they are now no longer obtainable in the colony. In Japan, where it became a high art, tattooing was never used to any extent. In Polynesia the art of tattooing is still carried on, but it is used for ornamental purposes only, and is done by women.

Under the influence of civilization tattooing is losing its ethnological interest and has become an element of eccentrcity, with the result that it is not confined to the lower and often criminal classes of the great cities. Among the eight hundred convict French soldiers Lacassagne found 40 per cent. tattooed. In the British army till 1879 the letters D. and B. C. for Deserted and Bad Character were tattooed with needles and Indian ink; and tattooing has often been used to identify criminals and slaves.

See Lacassagne, Les Tatouages (Paris, 1881); General Rolyer, Moko ou Maori Tattooing (1896).

TAUCHNITZ, the name of a family of German printers and publishers. Karl Christoph Traugott Tauchnitz (1761-1836), born at Grossbardau near Gramma, Saxony, established a printing business in Leipzig in 1796 and a publishing house in 1798. He specialized on the publication of dictionaries, Bibles and stereotyped editions of the Greek and Roman classics. The business was carried on by his son, Karl Christian Philipp Tauchnitz (1798-1884), until 1865, when the business was sold out to O. Holtze. He left large sums to the city of Leipzig for philanthropic purposes. Christian Bernhard, Freiherr von Tauchnitz (1815-1895), the founder of the existing firm of Bernhard Tauchnitz, was the nephew of the first-mentioned. His printing house was established at Leipzig. In 1832 he published an edition of the works of British and American Authors, so familiar to travellers on the continent of Europe, was begun in 1841. In 1890 the collection numbered over 4000 volumes. In 1868 he began the Collection of German Authors, followed in 1886 by the Students' Tauchnitz editions. In 1860 he was ennobled with the title of Freiherr (Baron), and in 1877 was made a life member of the Saxon Upper Chamber. From 1866 to 1895 he was British Consul-General for the kingdom and duchies of Saxony. He was succeeded in the business by his son, Christian Karl Bernhard, Freiherr von Tauchnitz.

TAULANTIL, in ancient geography, an Illyrian people in the neighbourhood of Epidamnus (Thuc. i. 24). They were originally powerful and independent, under their own kings. One of these was Glaucias, who fought against Alexander the Great, and placed Pyrrhus, the infant king of Epirus, whom he had refused to surrender to Cassander, upon the throne (Plutarch, Pyrrhus, 3). Later the Taulantii fell under the sway of the kings of Illyria, and when the Romans were carrying on war against the Illyrian queen, Teuta, they were unimportant.

Tauler, Johann (1300-1358), was born about the year 1300 in Strassburg, and was educated at the Dominican convent in that city, where Meister Eckhart, who greatly influenced him, was professor of theology (1312-1320) in the monastery school. From Strassburg he went to the Dominican college of Cologne, and perhaps to St James's College, Paris, ultimately returning to Strassburg. In 1324 Strassburg with other cities was placed under a papal interdict. Legend says that Tauler nevertheless continued to perform religious services for the people, but though there may be a germ of historical truth in this story, it is probably due to the desire of the 16th-century Reformers to enrol the famous preachers of the middle ages among their forerunners. In 1338-1339 Tauler was in Basel, then the headquarters of the "Friends of God" (see MYSTICISM), and was brought into intimate relations with the members of that pious mystical fellowship. Strassburg, however, remained his headquarters. The Black Death came to that city in 1348, and it is said that, when the city was deserted by all who could leave it, Tauler remained at his post, encouraging by sermons and personal visitations his terror-stricken fellow-citizens. He continued with the same success to publish works, especially with Margaretha Ebner, and the fame of his preaching and other work in Strassburg, had made him known throughout a wide circle. He died on the 16th of June 1361.

The well-known story of Tauler's conversion and discipline by "the Friend of God from the Oberland" (see NICHAULS OF BASEL) cannot be regarded as historical. Tauler's sermons are among the noblest in the German language. They are not so emotional as Suso's, nor so speculative as Eckhart's, but they are intensely practical, and touch on all sides the deeper problems of the middle ages.

Tauler's sermons were printed first at Leipzig in 1348, and reprinted with additions from Eckhart and others at Basel (1522) and at Cologne (1543). There is a modern edition by Julius Hammerber (Frankfort, 1864), and R. H. Hutton published Tauler's Sermons for Festivals under the title of The Inner Way, Sein Denk, Das Buch von gesieltlicher Armuth (Strassburg, 1877); Carl Schmidt, Johann Tauler von Strassburg (Hamburg, 1841); S. Wink- vonka, Tauler's Lyric Poems (1885); A. Vonk, Hours with the Mystics, 3rd ed., vol. i. pp. 214-307; Preger's Gesch. der deutschen Mystik im Mittelalter, vol. iii.; W. R. Inge, Christian Mysticism; R. M. Jones, Studies in Mystical Religion (1909).

TAUNG-GYI, the headquarters of the superintendent and political officer, situated in S. Rangoon State. It is situated in 96° 58' E. and 20° 47' N., at an altitude of about 5000 ft., in a depressed plateau on the crest of the Sintaun hills. It is in
TAUNTON, BARON—TAUNTON

the state of Yangwhee, 105 m. from Thazi railway station on the Rangoon-Mandalay railway, with which it is connected by a road of Early English work in the north, and there were only a few Taungthu huts on the site. There were in 1906 upwards of a thousand houses, many of them substantially built of brick. Since 1906 the southern Shan States have been garrisoned by military police, whose headquarters are in Taunggyi. The station is to a considerable extent a commercial depot for the country behind, and there are many universal supply shops of most nationalities (except British)—Austrian, Chinese and Indian. The five-day bazaar is the trading place of the natives of the country. A special quarter contains the temporary residences of the chief's people, and the goods, and the bazaar is for their sale, but the foreign商业 culture has met with considerable success.

The average shade maximum temperature is 84°; the minimum 30°.

TAUNTON, HENRY LABOUCHERE, BARON (1798-1869), English politician, came of a French Huguenot family, which, on leaving France, settled in Holland. His father, Peter Caesar Labouclère, merchant, was a partner in the wealthy Amsterdam banking firm of Hope & Company; 1 he went to live in England, and married a daughter of Sir Francis Baring. Henry was his elder son, while a younger son, John, was the father of the Duke of Sutherland, Lord Chief Justice of Scotland, and proprietor of Truth, Henry Labouclère (b. 1831). He was educated at Winchester and Christ Church, Oxford, and entered the House of Commons as a Whig in 1826. From 1830 to 1838 he sat for Taunton, Somerset. After filling various minor offices, he became president of the Board of Trade in 1839-41; and in 1846 he was chief secretary for Ireland. In 1847-52 he was again president of the Board of Trade, and from 1855 to 1858 secretary of state for the colonies. In 1859 he was created Baron Taunton, but on his death, on the 13th of July 1869, the title became extinct.

TAUNTON, a municipal and parliamentary borough and market town of Somersetshire, England, on the river Tone, 163 m. W. by S. of London by the Great Western railway. Pop. (1901) 21,087. Standing in the beautiful valley of Taunton Dene, the town is chiefly built on the south side of the river. Its three main streets, broad and regular, converge upon a triangular space called the Parade, where there is a market cross. The parish church of St. Mary Magdalen is one of the finest and largest Perpendicular churches in England. Remnants of Norman work are preserved in the chancel arch, and the east window of the church, dating from the time of the Britanniawere in a window in the north aisle and transept. The tower, noteworthy for its union of elaborate ornament and lightness of effect, exceeds 150 ft. in height. There are double aisles on each side of the nave, and the whole interior is admirable in its harmony of design and colour. Little is left of an Austin priory established in the reign of Henry I. by William Giffard, bishop of Winchester, who also built the castle, now a museum for prehistoric, Roman and medieval antiquities. Taunton castle, though largely rebuilt in 1496, embodies the remains of a very early fortress, while its walls and a deep ditch date from the 12th century, its towers and gatehouses from the 13th or 14th. At the Restoration it was dismantled and its moat filled in. Among the schools is a grammar school founded in 1522 by Richard Fox, bishop of Winchester. There are also public gardens, assembly rooms, almshouses, a town hall, market hall, a hospital founded in 1819 to commemorate the jubilee of George III., and a shire hall containing a series of marble busts representing, among other Somerset worthies, Admiral Blake, John Locke the philosopher, the Puritan leader Pym, Bishop Ken, and Speke the African explorer. The local industries are silk, linen and glove manufactures, iron and brass founding, Coaching, cabinetmaking, malting and brewing; while Taunton Dene is famous as a rich agricultural district.

1 The Amsterdam Hopes were descended from Henry Hope, son of a Scottish merchant, and younger brother of Sir Thomas Hope (d. 1646), the famous Scottish lord-advocate, ancestor of the earls of Hopetoun (marquis of Linlithgow, etc.). Among his descendants was Thomas Hope (1770-1834), father of J. B. B. Beresford-Hope (1820-1887), politician and author. The parliamentary borough of Taunton returns one member. The town is governed by a mayor, six aldermen and eighteen councillors. Area, 3,933 acres.

There was perhaps the Romano-British village near the suburb of Holway, and Taunton (Tantun, Tontone, Tauntone) was a place of considerable importance in Saxon times. King Ine threw up an earthen castle here about 700, and a monastery was founded before 904. The bishops of Winchester owned the manor, and obtained the first charter for their "men of Taunton" from King Edward in 904, freeing them from all royal and county tribute. At some time before the Domesday Survey Taunton had become a borough with very considerable privileges, governed by a portreeve appointed by the bishops. It did not obtain a charter, however, until that of 1677, which was renewed in 1677. The corporation existed until 1792, when the charter lapsed owing to vacancies in the number of the corporate body, and Taunton was not reincorporated until 1877. Parliamentary representation began in 1299, and two members were returned until 1885. A fair on the 7th of July was held under a charter of 1256, and there are now two fairs yearly, on the 17th of June and the 7th of July. The Saturday market, for the sale of corn, cattle and provisions, dates from before the Conquest. There is also a smaller market on Wednesday. The market, which was celebrated for the sale of woollen cloth called "Tauntons" made in the town. On the decline of the west of England woollen industry, silk-weaving was introduced at the end of the 18th century.

See Victoria County History, Somerset; Toynbee's History of Taunton, edited by James Savage (1830).

TAUNTON, a city and one of the county-seats of Bristol county, Massachusetts, U.S.A., at the head of ocean navigation on the Taunton river, 17 m. above its mouth, about 35 m. S. of Boston, and about 14 m. N. of Fall River. Pop. (1890) 25,448; (1900) 31,156, of whom 940 were foreign-born, 1844 being Irish, 2,966 French-Canadians, 1,144 English, and 804 English Canadians; (1910, U.S. census) 34,759. Taunton is served by the New York, New Haven & Hartford railroad (Old Colony Branch) and by interurban electric railways connecting with Fall River, New Bedford, Providence and Boston. The channel of the Taunton river has been deepened and widened by the Federal government, and in 1910 vessels of 11 ft. draft could reach the city at high water (mean range of tide at Taunton, 3-4 ft.). Within the corporate limits of the city, which has a land area of 44-25 sq. m., there are six villages—Dobewell, Britanniawall, Oakland, Whitinton, East Taunton, and the Weir. Taunton Green, a rectangular stretch of land fringed with lofty elms, the "common" of the New England town, about which is the business portion of the modern city, is 1 m. from the Weir, the port of the city.

The city contains interesting specimens of colonial or early 19th-century architecture. Among the modern public buildings are the handsome granite County Court House (1895), facing the Green, the Public Library building (given by Andrew Carnegie), the registry building, the county gaol, the city hall, the post office, an old ladies' home, an emergency hospital, the Morton Hospital, occupied from 1869 to 1885 by the residence of Governor Marcus Morton, and the Y.M.C.A. building. The Bristol County Law Library and Old Colony Historical Society (incorporated in 1853 and organized in 1854) possess valuable collections of books, and the latter has a collection of portraits and antiquities. Bristol Academy (1792; non-sectarian) is a well-known preparatory school, and there is also a commercial school—the Bristol County Business College. At Norton (pop. in 1910, 2544), directly N. of Taunton, and formerly within its boundaries, is Wheaton Seminary (1834) for girls. Among social clubs are the Winthrop Club, the Bristol Club, the Taunton Boat Club, the Yacht Club, and the Country Club. A good water-supply, owned by the city, is obtained from neighbouring lakes and ponds, along the shores of which are many summer cottages. Taunton was one of the first cities in the United States to own and operate its own electric lighting plant, which it acquired from a private corporation in 1897. Its industrial importance
began with the establishment of ironworks in 1569; the plant then opened continued in active operation for about 225 years. Brick-making and shipbuilding were two of the early industries; the latter, formerly very important, has now been abandoned. The manufactures to-day are extensive and varied. The aggregate value of the factory product in 1905 was $13,644,586, an increase of 18.2 per cent. over that of 1900. Of this amount the value of the cotton manufactured was $6,141,596, or 45 per cent. of the whole. Herring fisheries give occupation during a part of the year to a considerable number of workmen. Taunton has a prosperous fishing trade, and, large shipping interests, the coast trade being particularly important.

Taunton was founded in 1638, when the territory was purchased from Massasoit by settlers from the Massachusetts Bay Colony, and became the frontier town of Plymouth Colony. Myles Standish was engaged on the original survey. But there had been earlier settlers in the region—at "Tecticurt" (Titicut), which later became part of Taunton. The settlement at Taunton was at first known as Cohannet, but the present name—from Taunton, Somerset, England, the home of many of the settlers in the early days—was probably adopted in 1651. In 1671 it was the scene of a meeting between Gov. Thomas Prince and King Philip, at which a treaty was drawn up. During King Philip's War, Taunton was a base of operations for Plymouth Colony troops under Gov. Josiah Winslow. In 1686 Taunton was one of the towns which refused to comply with Sir Edmund Andros's demands for a tax levy. For some years Thomas Coram, the philanthropist and founder of the London Foundling Hospital, was engaged in the shipbuilding industry here. In 1774, after the passage of the Boston Port Bill, the people of Taunton showed their sympathy for Boston by raising on the Green a red flag on which were inscribed the words "Liberty and Union." The leader of the patriotic party at this time was Robert Tread Paine, to whose memory a bronze statue has been erected. During Shays's rebellion the Taunton court-house was twice besieged by insurgents, who were each time dispersed through the resolute action and firmness of Gen. David Cobb, one of the judges. The event is commemorated by a tablet on Taunton Green. In Berkeley, which until 1735 was a part of Dighton (Taunton South Purchase, separated from Taunton in 1712), is the famous Dighton Rock, with inscriptions long erroneously supposed to have been made by Norse discoverers of America, but now known to be the work of Indians. Taunton was chartered as a city in 1864. In 1909 a new city charter was adopted, under which, the mayor and nine councilmen (elected at large) are the only city officers elected at any city election; candidates for these offices are nominated by petition; the mayor appoints, subject to the approval of the council, a chief of police and a city solicitor. See S. H. Emery, History of Taunton from its Settlement to the Present Time (Syracuse, N.Y., 1893); D. H. Hurd, History of Bristol County (Philadelphia, 1883); Quarter Millennium Celebration (Taunton, 1889).

TAUNUS, a wooded mountain range of Germany in the Prussian province of Hesse-Nassau and the grand-duchy of Hesse-Darmstadt. It lies between the Rhine and the Main on the S. and the Lahn on the N., and stretches some 55 m. E. and W. Its southern slopes stand 5 to 10 m. back from the Main, but leave only a very narrow strip of low ground alongside the Rhine, and from Bingen downwards they overhang it with precipitous cliffs, many of which are crowned with picturesque ruins. It has an average elevation of 1500 ft. The loftiest peaks occur in the cast, where the imposing cluster of Grosser Feldberg (2885 ft.), Kleiner Feldberg (2714 ft.) and Altkönig (2618 ft.) dominate the Wetterau and the valley of the Main. Above the Rheingau, or the slopes which stretch down to the Rhine between Biebrich and Bingen, the altitude averages 1300 to 1700 ft. The geological core of the system consists of primitive argillaceous schists, capped by quartzite and broken through in places by basalt. On the northern side, which sinks on the whole gently towards the Lahn, the greywacke formation attains a considerable development. The hills are almost everywhere well wooded, the predominant trees being firs and beeches. The lower slopes are, wherever possible, planted with vineyards, orchards and chestnut and almond groves. The vineyards of the Rheingau are specially famous, and yield brands of wine—e.g. Johannisberger, Steinberger, Rüdesheimer, Marcobrunner, Hochheimer, Raunchtaler, Assmannshäuser, and others—which enjoy the highest reputation amongst the vintages of Germany. The Taunus is also famous for the number and efficacy of its mineral springs, which annually attract thousands of invalids. The numerous districts of Homburg, Em's Schlangenbad, Schwallbach, Soden and Nauheim, while the waters of Selters and other springs are exported in large quantity. The sheltered position and warm climate have led also to the establishment of the health resorts of Falkenstein (1873) and Schmitthen, and of tourist centres at Königstein, Cronberg and Ober Urel.

Above Falkenstein stand the ruins of the ancestral castle of Kuno, the powerful archbishop of Trier; above Königstein are the ancient ramparts of the Inner Rhine fortified, of the outer Rhine or the old Limes of Roman times. All the way from above the Rhine to the Main, the road of Roman communication with the Rhine and the Moselle below the Rhine, the coast highway and the frontier-line, the road of the great Roman conquest. Here are the road of the siren Lurlei or Lorelei; the old castles of Stahleck and Pfalz, which belonged to the Counts Palatine of the Rhine; and the ruins of the Cistercian and Benedictine monasteries at Friedrichshof, at the foot of the Feldberg and Altkönig, immediately north of Kronberg, was built in 1897-99 by the widowized empress Frederick, and is the place where she died in 1901. The railway station, lying 20 m. short of the Feldberg in the direction of Coarshausen, lies at the foot of the range, that from Frankfort to Cassel the eastern side, while the line from Wiesbaden and Hochst to Limburg intersects it from south to north.

Johannes de Trèves, Recherches sur l'histoire du Taunus (published by Grossmann, Wiesbaden, 1887); Sievers, Zur Kenntnis des Taunus (Stuttgart, 1891), and the Taunus Club's Guide (4th ed. Frankfort-on-Main, 1905). For the Taunus see L. Jacobii, Das Römerbastei Saalburg (a vol., Homburg, 1897); also a small guide by the same author (3rd ed. Homburg, 1907).

TAUPO, a township of East Taupo county, New Zealand, in the south-west of the Hot Spring district of North Island. It attracts many visitors as a health resort and on account of the magnificent scenery and remarkable volcanic phenomena of the surrounding district. It lies on the north-east shore of Lake Taupo, the largest lake in the island, having an extreme length of 26 m. and a shore-line, not counting minor indentations, about 150 m., and lying 1200 ft. above sea-level. The river Waikato, which reaches the west coast not far from Manukau Harbour near Auckland, here leaves the lake. The district abounds in geysers, springs, mud volcanoes and other phenomena; some of the waters have petrifying powers, and some of the springs are vividly coloured. On the road running N.E. to Rotorua (56 m.) are the resorts of Weirakiri (7 m.) and Ateamuri (31 m.). Lake Taupo is finely situated, hills rising over 2000 ft. immediately from the shores, while the mountains of Tongariro, Ngauruhoe, an active volcano, and Ruapehu, a snow-clad peak, back the view to the south and mark the limit of the great volcanic line which extends 100 m. north-westward.
to White Island in the Bay of Plenty. The upper Waikato enters the lake from the south near Tokaanu, where there is another collection of springs, &c. The river forms several fine falls and rapids below the lake.

TAURELLUS, NICOLAIUS (1547–1609), German philosopher and theologian, was born at Mompelgard. He read theology at Tübingen and medicine at Basel, where he lectured on physical science. He subsequently became professor of medicine at Aitdorf, to which centre he was drawn by the career of Peter. He attacked the dominant Aristotelianism of the time, and endeavoured to construct a philosophy which should harmonize faith and knowledge, and bridge over the chasm made by the first Renaissance writers who followed Pomponazzi. Scholasticism he condemned on account of its unquestioning submission to Aristotle. Taurellus maintained the necessity of going back to Christianity itself, as at once the superstructure and the justification of philosophy.

His chief works were Philosophiae Triumphius (1573); Synopsis Metaphysicæ Aristotelis (1596); De Rerum Aeternitate (1604); and a treatise written in criticism of Caesalpinus entitled Caeasaræ Alpes (1597). See Schmid-Schwarzenburg, Nicolaius Taurellus (1860 and 1864).

TAURI, the earliest known inhabitants of the mountainous south coast of the Crimea (Herodotus iv. 103). Nothing is certain as to their affinities. They probably represent an old population perhaps connected with some Caucasus stock; in spite of the resemblance of the name Taurisci they are not likely to be Celts. They were famous in the ancient world for their maiden goddess, identified by the Greeks with Artemis Tauropolos or Iphigienia, whom the goddess was said to have horded to her shrine at the moment when she was to have been sacrificed at Aulis. Orestes sought her sister, and almost fell a victim to the Tauric custom of sacrificing to the maiden shipwrecked strangers, a real custom which was the ground of the whole myth. His adventures were the subject of many by Euripides and Goethe. Towards the end of the 2nd century B.C. we find the Tauri dependent allies of the Scythian king Scillus, who from their harbour of Symbolon Portus or Paladium (Balaklava) harassed Chersonese (q.v.). Their later history is unknown.

TAURIDA, government of southern Russia, including the peninsula of Crimea and a tract of mainland situated between the lower Dnieper and the coasts of the Black Sea and the Sea of Azov. It is bounded by these two seas on the S., while it has on the N. the governments of Kherson and Ekaterinoslav. The area is 24,532 sq. m., of which 9704 sq. m. belong to the Crimea. The continental part consists of a gently undulating steppe (from sea-level up to 400 ft. in the north-east) of black earth, with only a few patches of saline clay on the shores of the Sivash or Potrid Sea, and sand along the lower Dnieper. The government is drained by the Dnieper, which flows along the frontier for 180 m., and by two minor streams, the Molochnaya and Berda. Many small lakes and ponds occur in the north, as well as on the Kinburn peninsula, at the mouth of the Dnieper, where salt is made. There are no forests. The climate is continental, and resembles that of central Crimea and Kherson. The population in 1866 was estimated at 1,634,700. The continental portion, although less mixed than that of the peninsula, consists of Great and Little Russians, who constitute 83 per cent. of the whole, Germans (54 per cent.), Bulgarians (2-8 per cent.), Jews (3-6 per cent.), and Armenians. The chief occupation of the people is agriculture, and every available patch of land has been brought under the plough. In 1900 no less than 43 per cent. of its area was under cereal crops alone. The principal crops are rye, wheat, oats, barley and potatoes. Tobacco is also grown, and over 32,000 acres are under vineyards, while gardens extend to some 15,500 acres in Crimea. Live-stock breeding is extensively engaged in. Salt is the only mineral raised, but the iron industry, and especially the manufacture of agricultural machinery (e.g. at Berdyansk), has greatly developed. The export trade is considerable, the chief ports being Sevastopol, Eupatoria, Theodosia, and Yalta on the Black Sea, and Azov and Berdyansk on the Sea of Azov. The fisheries along the coast are active. Manufactures are insignificant, but there is a brisk export trade in grain, salt, fish, wool and tallow. The government is divided into eight districts, the chief towns of which are Simferopol, capital of the government, Eupatoria and Theodosia, in Crimea, and Aleshki, Berdyansk, Melitopol, Perekop and Yalta on the continent.

TAURINI, an ancient Ligurian people, although the name may be of Celtic origin, who occupied the upper valley of the Padus (Po) in the centre of the modern Piedmont. In 218 B.C. they were attacked by Hannibal, with whose friends the Insurbes they had a long-standing feud, and their chief town (Taurasia) was captured after a three days' siege (Polybius iii. 60, 8). As a people they are rarely mentioned in history. It is not known when they definitely became subject to the Romans, nor when the colony of (Julia) Augusta Taurinorum (Torino, Turin) was founded in their territory (probably by Augustus after the battle of Actium). Both Livy (v. 34) and Strabo (iv. p. 209) speak of the Taurini as including one of the passes of the Alps, which points to a wider use of the name in earlier times.

TAUROBOLIUM, the sacrifice of a bull, usually in connection with the worship of the Great Mother of the Gods, though not limited to it. Of oriental origin, its first known performance in Italy occurred in a.d. 134, at Puteoli, in honour of Venus Cælestis. Prudentius describes it in Peristephanon (x, 1066 ff.): the priest of the Mother, clad in a toga worn cinctori Gabinio, with golden crown and fillets on his head, takes his place in a trench covered by a platform of planks pierced with fine holes, on which a bull, magnificent with flowers and gold, is slain. The blood rains through the platform on to the priest below, who receives it on his face, and even on his tongue and palate, and after the baptism presents himself before his fellow-worshippers purified and regenerated, and receives their salutations and reverence.

The taurobolium in the 2nd and 3rd centuries was usually performed as a measure for the welfare of the Emperor, Empire, or community, its date frequently being the 24th of March, the Dies Sanguinis of the festival of the Great Mother and Attis. In the late 3rd and the 4th centuries its usual motive was the purification or regeneration of an individual, who was spoken of as renatus in aeternum, born for eternity, in consequence of the ceremony (Corp. Insuc. Lat. vi. 510–512). When its efficacy was not eternal, its effect was considered to endure for twenty years. It was also performed as the fulfillment of a vow, or by command of the goddess herself, and the privilege was limited to no sex nor class. The place of its performance at Rome was near the site of St Peter’s, in the excavations of which several altars and inscriptions commemorating taurobolia were discovered.

The taurobolium was probably a sacred drama symbolizing the relations of the Mother and Attis (q.v.). The descent of the priest into the sacrificial foss symbolized the death of Attis, the withering of the vegetation of Mother Earth; his bath of blood and emergence the restoration of Attis, the rebirth of vegetation. The ceremony may be the spiritualized descent of the primitive oriental practice of drinking or being baptized in the blood of an animal, based upon a belief that the strength of brute creation could be acquired by contact with the sublunary being of the Deity. In spite of the phrase renatus in aeternum, there is no reason to suppose that the ceremony was in any way borrowed from Christianity.

No. 2, 1901. (G. SN.)
TAURUS—TAUVENIER

TAURUS ("the Bull"), in astronomy, the second sign of the zodiac (q.v.), denoted by the symbol Τ. It is also a constellation of very great antiquity, the Pleiades and Hyades, two star clusters, being possibly referred to in the Old Testament; Aldebaran, a star in this constellation, is mentioned by Hesiod and Homer. Ptolemy catalogued 44 stars, Tycho Brahe 43, Hevelius 51. The Greeks fabled this constellation to be the bull which bore Europa across the seas to Crete, and was afterwards raised to the heavens by Jupiter. A Tauri, or Aldebaran, is a brilliant star of a reddish colour and magnitude 1·2; this star is the principal object of the group named the Hyades, named after the seven daughters of Atlas and Aethra—Abaris, Coronis, Eudora, Pasithoe, Plexaris, Pytho and Tycho—fabled by the Greeks to have been transformed into stars by Jupiter for threatening the death of their brother Hyas. Another star group in this constellation is the Pleiades. The Algonquian name of this constellation is a "Oldgo" variable, varying in magnitude from 3·4 to 4·2. Nebula M.1 Tauri is a famous "crab" nebula, so named by Lord Rosse from its clawlike protuberances; it is the first of the series of nebula on the enumeration of Messier.

TAUSEN, HANS (1494—1561), the protagonist of the Danish Reformation, was born at Birkende in Funen in 1494. The quick-witted peasant lad ran away from the plough at an early age, finally settling down as a friar in the Johannite cloister of Antvorskov. In 1516 he was transferred to Viborg, which he left for Tauris in 1518. At Tauris he was teaching there for a time and also at Copenhagen, he was again sent abroad by his prior, visiting, among other places, the newly founded university of Leyden and making the acquaintance of the Dutch humanists. He was already a good linguist, understanding both Latin and Hebrew. Subsequently he translated the books of Moses from the original. In May 1523 Tausen went to Wittenberg, where he studied for a year and a half, when he was recalled to Antvorskov. In consequence of his professed attachment to the doctrines of Luther he was forced to leave his diaconate as a punishment; transferred, in the spring of 1525, to the Grey Friars' cloister at Viborg in Jutland, where he preached from his prison to the people assembled outside, till his prior, whom he won over to his views, permitted him to use the pulpit of the priory church. At Viborg the seed sown by Tausen fell upon good soil. Several young men in the town had studied at Wittenberg, and the burghers, in their Lutheran zeal, had already expelled their youthful bishop JörgenFriis. Tausen's preaching was so revolutionary that he no longer felt safe among the Franciscans, so he boldly transferred his monastic bond of place and under the protection of the burgomaster of Viborg. At first he preached in the parish church of St John, but this soon growing too small for him he addressed the people in the market-place from the church tower. When the Franciscans refused to allow him to preach in their large church, the mob broke in by force. A compromise was at last arranged, whereby the friars were to preach in the forenoon and Tausen in the afternoon. The bishop, very naturally averse to these high-handed proceedings, sent armed men to the church to arrest Tausen, but the burghers, who had brought their weapons with them, drove them "the bishop's swains away." In October 1526 King Frederick I., during his visit to Aalborg, took Hans Tausen under his protection, appointed him one of his chaplains, and charged him to continue for a time "to preach the holy Gospel" to the citizens of Viborg, who were to be responsible for his safety, thus identifying himself with the new doctrines in direct contravention of the plain letter of his coronath oath. Tausen found a diligent fellow-worker in Jörgen Viborg, better known as Sadolin, whose sister, Dorothea, he married, to the great scandal of the Catholics. He was indeed the first Danish priest who took unto himself a wife. He was also the first of the reformers who used Danish instead of Latin in the church services, the "Even song" he introduced at Viborg being of great beauty. Tausen was certainly the most practically gifted of all the new native teachers. But he was stronger as a preacher and an agitator than as a writer, the pamphlets which he now issued from the press of his colleague the ex-priest Hans Vingaard, who settled down at Viborg as a printer, being little more than adaptations of Luther's opuscula. He continued to preach in the Grey Friars' church, while Sadolin, whom he had "consecrated" a priest, officiated at the church of the Dominicans, who had already fled from the town. The stouter-hearted Franciscans only yielded to violence persistently applied by the soldiers whom their opponents quartered upon them. In 1526 Tausen's "mission" at Viborg came to an end. King Frederick now recommended him to Copenhagen to preach heresy at the church of St Nicholas, but here he found an able and intrepid opponent in Bishop Rönne. Serious disturbances thereupon ensued; and the Protestants, getting the worst of the argument, silenced their gainsayers by insulting the bishops and priests in the streets and profaning and devastating the Catholic churches. A Herredag, or Assembly of Nobles, was held at Copenhagen on the 2nd of July 1530, ostensibly to mediate between the two conflicting confessions, but the king, from policy, and the nobility, from covetousness of the estates of the prelates, made no attempt to prevent the excesses of the Protestant rabble, openly encouraged by Tausen. On the other hand, the preachers failed to obtain the repeal of the Odense recess of 1527 which had subjected them to the spiritual jurisdiction of the prelates. On the death of King Frederick, Tausen, at the instance of Rönne, was in 1533, after a trial of blasphemy and condemned to expelusion from the diocese of Sjælland, whereupon the mob rose in arms against the bishop, who would have been murdered but for the courageous intervention of Tausen, who conducted him home in safety. The noble-minded Rönne thereupon, from gratitude, permitted Tausen to preach in all his churches on condition that he moderated his tone. On the final triumph of the Reformation Tausen was appointed bishop of Ribe (1542), an office he held with great zeal and fidelity for twenty years.

TAUSIG, FRANK WILLIAM (1859—1910), American economist, was born at St Louis, Missouri, on the 28th of December 1859. He was educated in his native city and at Harvard University, where he became professor of political economy in 1892. He has made a particular study of finance, and has written Tariff History of the United States (1888); The Silver Situation in the United States (1892); Wages and Capital (1896). He was for some time editor of the American Quarterly Journal of Economics.

TAUSOEUES, JEMIMA, BARONESS VON (1807—1893), British novelist, was born at Sea View, Co. Donegal, on the 23rd of October 1807, her maiden name being Montgomery. In 1838 she married the Baron von Tausopoulos of Marquartstein (1803—1883), chamberlain to the king of Bavaria, and in Bavaria she passed most of the rest of her life. She was the author of several novels, written in English, describing South German life, manners and history. The Initials (1850), Quix (1857), and At Odds (1863) are the best known of these. She died on the 12th of November 1893.

TAVASTEHS, a province of Finland, bounded by the provinces of Nyland, Viborg, Vasa and St Michel. Pop. (1904) 317,326. The province is largely unproductive, much of the surface being composed of hills and lakes, but in favourable districts agriculture is successfully pursued, and there is a school of agriculture and an institute of forestry.

TAVERN, the old name for an inn, a public house where liquor is sold and food is supplied to travellers. It is, however, now usually applied to a small ale-house where liquor only is supplied. The word comes through Fr. from Lat. taberna, a booth, shop, inn. It is usually connected with the root seen in "tabernum," board, whence Eng. "table," and thus meant originally a hut or both made of planks or boards of wood.

TAUVENIER, JEAN BAPTISTE (1606—1689), French traveller and pioneering of trade with India, was born in 1605 at Paris, where his father Gabriel and uncle Melchior, Protestants from Antwerp, pursued the profession of geographers and engravers. The conversations he heard in his father's
house inspired Tavernier with an early desire to travel, and in his sixteenth year he had already visited England, the Low Countries and Germany, and seen something of war with the imperialist Colonel Hans Brenner, whom he met at Nuremberg. Four and a half years in the household of Brenner's uncle, the viceroy of Hungary (1624-29), and a brief connexion in 1629 with the duke of Rethel and his father the duke of Nevers, prince of Mantua, gave him the habit of courts, which was invaluable to him in later years; and at the defence of Mantua in 1629, and in Germany in the following year with Colonel Walter Butler (afterwards noted in the death of Wallenstein), he gained some military experience. When he left Butler to view the diet of Ratisbon in 1630, he had seen Italy, Switzerland, Germany, Poland and Hungary, as well as France, England and the Low Countries, and spoke the principal languages of these countries. He was now eager to visit the East; and at Ratisbon he found the opportunity to join two French fathers, M. de Chapes and M. de St Liebou, who had received a mission to the Levant. In their company he reached Constantinople early in 1631, where he spent eleven months, and then proceeded by Tokat, Erzerum and Erivan to Persia. His farthest point in his first journey was Ispahan; he returned by Bagdad, Aleppo, Alexandria, Malta and Italy, and was again in Paris in 1633. Of the next five years of his life nothing is known with certainty, but it was probably during this period that he became controller of the household of the duke of Orleans. In September 1638 he began a second journey (1638-43) by Aleppo to Persia, and thence to India as far as Agra and Golconda. His visit to the court of the Great Mogul and to the diamond mines was connected with the plans realized more fully in his later voyages, in which Tavernier travelled as a merchant of the highest rank, trading in costly jewels and other precious wares, and finding his chief customers among the greatest princes of the East. The second journey was followed by four others. In his third (1643-49) he went as far as Java and returned by the Cape; but his relations with the Dutch proved not wholly satisfactory, and a long lawsuit on his return yielded but imperfect redress. In his last three journeys (1651-55, 1657-62, 1664-68) he did not proceed beyond India. The details of these voyages are often obscure; but they completed an extraordinary knowledge of the routes of overland Eastern trade, and brought the now famous merchant into close contact with the greatest Oriental potentates. They also secured for him a large fortune and great reputation at home. He was presented to Louis XIV., "in whose service he had travelled sixty thousand leagues by land," received letters of nobility (on the 16th of February 1669), and in the following year purchased the barony of Aubonne, near Geneva. In 1662 he had married Madeleine Goise, daughter of a Parisian jeweller.

Thus settled in ease and affluence, Tavernier occupied himself, as it would seem at the desire of the king, in publishing the account of his journeys. He had neither the equipment nor the tastes of a scientific traveller, but in all that referred to commerce his knowledge was vast and could not fail to be of much public service. He set to work therefore with the aid of Samuel Chappuiez, a French Protestant littérateur, and produced a Nouvelle Relation de l'Intérieur du Sträly du Grand Seigneur (4to, Paris, 1675), based on two visits to Constantinople in his first and sixth journeys. This was followed by Le Six Voyages de J. B. Tavernier (2 vols. 4to, Paris, 1676) and by a supplementary Recueil de Plusieurs Récitons (4to, Paris, 1679), in which he was assisted by a certain La Chapelle. This last contains an account of Japan, gathered from merchants and others, and one of Tongking, derived from the observations of his brother Daniel, who had shared his second voyage and settled at Batavia; it contained also a violent attack on the agents of the Dutch East India Company, at whose homes Tavernier had suffered more than one wrong. This attack was elaborately answered in Dutch by H. van Quellernburgh (Vindicia Batavis, Amst., 1684), but made more noise because Arnaud drew from it some material unfavourable to Protestantism for his Apologie pour les Catholiques (1681), and so brought on the traveller a ferocious onslaught in Jurieu's Esprit de M. Arnauld (1684). Tavernier made no reply to Jurieu; he was in fact engaged in weightier matters, for in 1684 he travelled to Berlin at the invitation of the Great Elector, who commissioned him to organize an Eastern trading company—a project never realized. The closing years of Tavernier's life are obscure; the time was not favourable for a Protestant, and it has even been supposed that he passed some time in the Bastille. What is certain is that he left Paris for Switzerland in 1687, that in 1689 he passed through Copenhagen on his way to Russia through Moscovy, and that in the same year he died at Moscow. It appears that he had still business relations in the East, and that the neglect of these by his nephew, to whom they were intrusted, had determined the indefatigable old man to a fresh journey.

Tavernier's travels, though often reprinted and translated, have two defects: the author uses other men's material without distinguishing it from his own observations; and the narrative is much confused by his plan of desiring the chronological order and giving instead notes from various journeys about certain routes. The latter defect, it is true, while it embarrasses the biographer, is hardly a blemish in view of the object of the writer, who sought mainly to furnish a guide to other merchants. A careful attempt to disentangle the thread of a life still in many parts obscure has been made by Charles Joret, Jean Baptiste Tavernier d'apres des Documents Inédits et des Observations, 4to, Paris, 1886, where the literature of the subject is fully given.

See also an English translation of Tavernier's account of his travels so far as relating to India, by V. Balf, 2 vols. (1889).

TAVIRA, a seaport of southern Portugal, in the district of Faro (formerly the province of Algarve); at the mouth of the river Seca, 21 m. E.N.E. of Faro. Pop. (1900) 12,175. The harbour is protected by two forts, and the public buildings contain a Moorish citadel, a ruinous monastery, and a nunnery founded by King Emanuel (1495-1521). Tavira has sardine and tunny fisheries, and carries on a considerable coasting trade. Excellent fruit is grown in the neighbourhood.

TAVISTOCK, a market town in the Tavistock parliamentary division of Devonshire, England, in the valley of the Tavy, on the western border of Dartmoor; 161 m. N. of Plymouth, on the Great Western and the London and South Western railways. Pop. of urban district (1901), 4728. There are some remains (including a portion in the square, now used as a public library) of the magnificent abbey of St Mary and St Robert, founded in 1060, destroyed by the Danes in 997 it was restored, and among its famous abbots were Lyving, friend of Canute, and Aldred, who crowned Harold II. and William, and died archbishop of York. The abbey church was rebuilt in 1285, and the greater part of the abbey in 1457-58. The church; of St Eustachius dates from 1318, and possesses a lofty tower supported on four open arches. Within are monuments to the Glanville and Bourchier families, besides some good stained glass, one window being the work of William Morris. Kelly College, near the town, was founded by Admiral Benedictus Marwood Kelly, and opened in 1877 for the education of his descendants, and the orphan sons of naval officers. Mines of copper, manganese, lead, silver and tin are in the neighbourhood, and the town possesses a considerable trade in cattle and corn, and industries in brewing and iron-founding. The mining industry generally has declined, but there is a trade in arsenic, extracted from the copper ore.

The early history of Tavistock (Tavi stove) centres round the abbey of St Rumon. Both town and abbey were sacked by the Danes in 997, but were shortly afterwards rebuilt, and the latter at the time of the Conquest ranked as the wealthiest house in Devon, including the hundred and manor of Tavistock among its possessions. Tavistock was governed from before the Conquest by a portreeve, who in the 14th century was assisted by a select council of burgesses, styled in 1660 "The Masters of the Toune and Parish of Tavistock." It returned two members to parliament as a borough from 1295 until deprived of one member by the act of 1857, and finally disfranchised
by that of 1885, but no charter of corporation was granted until 1683, when Charles II. instituted a governing body of a mayor, twelve aldermen and twelve assistants; with a recorder, deputy recorder, common clerk and two sergeants-at-mace. A market on Friday and a three days' fair at the feast of St Rumon were granted by Henry I. in 1102, the monks of Tavistock; and in 1552 two fairs on April 23 and November 28 were granted by Edward VI. to the earl of Bedford, then lord of the manor. In the 17th century great quantities of cloth were sold at the Friday market, and four fairs were held at the feasts of St Michael, the Epiphany, St Mark, and the Decollation of St John the Baptist. The charter of Charles II. instituted a Tuesday market and fairs on the Thursday after Whitsunday and at the feast of St Swithin. In 1822 the old fairs were abolished in favour of six fairs on the second Wednesdays in May, July, September, October, November and December. The Friday market is still held. Tavistock was one of the four stannary towns appointed by charter of Edward I., at which tin was stamped and weighed, and monthly courts were held for the regulation of mining affairs. It was also the site of one of the earliest printing-presses, and copies of the stannary laws and of a translation of Boethius issued from the Tavistock press in the reign of Henry VIII. are preserved in Exeter College library. The decay of the woollen industry at Tavistock was attributed by the inhabitants in 1641 to the dread of the Turks at sea and of popish plots at home. The tin-mining industry has much declined. The Royalist troops were quartered here in 1643 after the defeat of the Parliamentary forces at Bradock Down.

See Victoria County History, Devonshire; A. J. Kempe, Notices of Tavistock and its Abbey (London, 1830); R. N. Worth, Calendar of Tavistock Parish Records (Plymouth, 1887).

TAVOY, a town and district in the Tenasserim division of Lower Burma. The town is on the left bank of the river of the same name, 30 m. from the sea. Pop. (1901) 22,371. It carries on a considerable coastwise trade with other ports of Burma, and with the Straits Settlements. The chief industry is silk-weaving, but there are also rice and timber mills. The district has an area of 5308 sq. m. It lies between Siam and the Bay of Bengal, enclosed by mountains on three sides, viz., the main chain of the Bilkutang on the east, rising in places to 5000 feet, which, with its densely wooded spurs, forms an almost impassable barrier between British and Siamese territory; the Nwahlabo in the centre, which takes its name from its loftiest peak (5000 ft.); and a third range, under the name of Thinmaw, between the Nwahlabo and the sea-coast. The chief rivers are the Tenasserim and Tavoy, which is formed by the junction of two streams which unite near Met-ta; for the greater part of its course it is dangerous to navigation. The Tavoy is navigable for vessels of any burden. It is interspersed with many islands, and with its numerous smaller tributaries affords easy and rapid communication. The climate is on the whole pleasant. The annual rainfall averages 228 inches. Pop. (1901) 109,979, showing an increase of 16 per cent. in the decade. The staple crop is rice. Forests cover an area of nearly 5000 sq. m., of which 960 sq. m. are "canalised." Tavoy, with the rest of Tenasserim, was handed over to the British at the end of the first Burmese war in 1824. A revolt broke out in 1829, headed by the former governor, who was at once quelled, and since the district has remained undisturbed.

TAWDRY, an adjective used to characterize cheap finery, and especially things which imitate in a cheap way that which is rich or costly, or adornments of which the freshness and elegance have worn off. The word is first used in combination in the phrase "tawdry lace," a shortened form or corruption of St Audrey's or St Awdrey's lace. St Audrey was St Etheldreda, who founded Ely cathedral, and it is generally accepted that tawdry-laces or tawdries were necklaces bought at St Audrey's Fair on the 17th of October. Nares (Glossary to the Works of English Authors, 1850) gives as an alternative the story that the saint died of a swelling in the throat, which she took as a judgment for having worn fine necklaces in her youth.

TAXATION (from "tax," derived, through the French, from Late Latin, to appraise, which again is connected with the same root as tangerie, to touch), that part of the revenue of a state which is obtained by compulsory dues and charges upon its subjects. The state may have revenue from property of its own. In past times one of the principal sources of the revenue of the sovereign was in fact property of some sort, of which the crown lands in Great Britain, still administered by the government, are a remnant. In other countries, even at the present time, there is a large public domain yielding revenue. Local authorities also largely own property from which a revenue is obtained. But as a rule, and in spite of what has often been the practice in the past, and of exceptions which may still exist in some countries, a government obtains the money required for its expenses by means of taxation. Some of the apparent exceptions, moreover, appear to be only exceptions in name. It is contended, for instance, that the revenue from land obtained by the government of India is in reality of the nature of a land rent—a species of property owned by the government. But the fact of a government levying so general a charge may be held ipso facto to convert the charge into a tax, having much the same economic effects and consequences as a tax. When, moreover, a state receives a revenue from property, some of the economic consequences may be the same as if it received the money by means of a tax. In both cases there is absorption and administration by the state of so much of the income of the community, and it may be a question whether the private ownership of the property would not be more expedient both for the state and its subjects than state ownership is, in spite of the apparent advantage to all concerned in the state getting so much of its income without the complication of a tax.

The Four Kinds of Taxes.—In the economic development of states taxes have come to be grouped in different ways, according to variations in the method of levying them or the means of enforcing compulsion or other differences. One of the most usual divisions is into direct and indirect taxes. Taxes are distinguished as direct, because they are charged directly upon the tax-payer from whose income they are supposed to be taken. Indirect taxes are those where it is recognized from the beginning that the individual who pays in the first instance usually passes on the charge to some one else, who may again pass it on until it finally reaches the subject who bears the brunt. A tax, a direct charge upon all incomes above a certain limit, is the principal type in the United Kingdom of a direct tax. In France there is a group of taxes known by that name—a land tax, a personal and furniture tax, a door and window tax, and a trade licence tax. In the United States there are mainly assessments of the capital value of property, always for state and local purposes only, and not for the central government. Among the indirect taxes the most important are excise and customs duties upon articles of general consumption, the principal articles almost everywhere being tobacco, beer and tobacco, sugar, tea, coffee and tea, and also among the articles commonly selected. In essential character there is no difference between excise and customs duties, except that excise duties are levied upon articles of home production, and customs upon articles imported from abroad, or brought into one part of a country or empire from another part; but excise duties on the whole are considered more likely to interfere with trade, in consequence of the necessity of supervising the production of the articles affected. Next in importance to excise and customs we have duties levied by means of stamps upon documents or by charges at the time of registering deeds to which registration is necessary for the purpose of being valid. The charge in one case upon the article at a certain stage of its production, and in the other upon a transaction, is supposed to be passed on by the first payer to others. With these have been usually classed in the United Kingdom...
certain licence taxes upon traders, although such licences in France are reckoned direct taxes.

This division into direct and indirect is, however, far from logical. To take first the direct taxes. The income tax itself is not, in all cases, really paid to the state directly by the person out of whose income it comes. It is paid, in the first instance, in the case of land or houses, by the occupier, and where the occupier is a tenant it is recovered by him from the owner. In the case of joint-stock companies the company pays the state, and deducts the amount from the individual owners of stocks and shares. Thus the distinction between direct and indirect is drawn in receiving the rent of crown lands, and with similar economic incidents and consequences. Thus the direct taxes so called may frequently be no more direct than any others.

As regards indirect taxes, again, there appear to be some cases at least where it is by no means certain that the charge is passed on; stamp duties, for instance, especially where moderate in amount, may have the effect of diminishing pro tanto the profits in business of the person paying them, or the income which he enjoys. Where they are heavy, as, for instance, with the French registration duties on the transfer of property, there appears to be little doubt that they constitute a deduction from the price which a seller receives, and thus they are direct enough. Sometimes also, when a charge upon a commodity is not such a figure as to be easily divisible among the ordinary units of retail consumption, so that it can be passed on to a consumer of the articles in the form of an increased price, it may remain fixed upon those who first pay it, at least for a time. This is supposed to have actually happened with the increase of the beer duty in the British budget of 1894 by 6d. per barrel—a sum which would not when divided by the pint amount to an increase in the cost of living as the tax fell.

When the malt tax, a tax upon milling grain, was imposed in Italy many years ago, it was found that no corresponding increase took place in the price of flour and bread. The trade fell into the hands of the millers on a large scale, who paid the tax out of their increased profits from larger business, while the smaller millers were crushed out; so that this was manifestly the case of a tax, so called indirect, where the whole burden really fell on those who paid the charge in the first instance, and who in theory were supposed to pass it on to others. Even in the case of indirect taxes there, are important exceptions to the rule that they are indirect.

The division of taxes into direct and indirect is thus based on no real intrinsic difference. It is a classification for convenience's sake, adopted upon a rough observation of conspicuous, or apparently conspicuous, differences in the mode of levying taxes, and nothing more. The division, nevertheless, cannot be passed over without mention, as it is not only a common one in economic writing, but it figures largely in budget statements, financial accounts, and finance ministers' speeches—especially in the United Kingdom and France. In the United Kingdom the distinction has been made familiar by free-trade discussions. Direct taxation in the shape of income tax was substituted for indirect taxation previously levied, in order to relieve trade from the shackles of duties and charges which had become all-embracing. In France the direct taxes above referred to are described officially as direct, having been originally, there is little doubt, the main sources of government income; and there is equally an official designation of certain heads of revenue as "contributions et taxes indirectes." Recently in budget debates in

England there has been much comparison of the amounts yielded at different times by direct and indirect taxes respectively.

Other general classifications of taxes have also been attempted, as, for instance, taxes upon real property, and taxes upon personal property, and so on. Classification is indeed only too easy. Applying a characteristic common to some taxes, we can make a group of them, and set them against a group of all the other taxes lumped together. Such classifications are, however, uninstructional, and it has been found practically necessary in financial writing to take the principal taxes by their general grouping as that of import or stamp duties, and then describe their nature, cost, and incidence. In this way each country has a grouping of its own, though there is a common likeness, and the experience and practice of one country assist the financial study of another. As Adam Smith remarks, there is nothing in which governments have been so ready to learn of one another as in the matter of new taxes.

Descriptions of Taxes.—Following the practice of authors on finance, we may give a short account of the principal taxes in the United Kingdom, with references in passing to points of interest in the taxation of the United States, and of other countries. See, however, also the article on ENGLISH FINANCE.

The income tax (q.v.) for many years has been the most prominent, and latterly it has been the most productive, single tax. Its technical name is the property and income tax, but it is essentially a charge upon all incomes or profits, whether arising from property, or from the remuneration of personal services, or from annuities, income being applied with the widest possible meaning. As originally instituted in April 1798, during the great war with France, under the name of a "triplicate assessment," it was rather a consolidation of various assessed taxes levied upon the luxuries of the rich and upon property, than a wholly new tax. In December of the same year this impost was repealed, and a true income tax of 10 per cent. established on all incomes over £60, with abatements between £50 and £200. It was intended as a temporary tax for war purposes only, and was repealed in 1802, but was reimposed when the war recommenced in 1803, with the limit of abatement reduced to £50. So odious was it that parliament in 1815, when the war came to an end, ordered the destruction of the documents relating to it. Its efficiency as an instrument of revenue or restraint, with the taxes or excise as to its revival in 1842, when Sir Robert Peel inaugurated his great free-trade reform and swept away duties on exports, duties on imported raw material, and other imposts hampering the trade of the country. The intention again was that the tax should be temporary, but although the free-trade work was practically completed in the early 'sixties, and Mr Gladstone went so far as to dissolve parliament in 1874 with a promise that he would abolish the tax if his party were returned to power, it has become a permanent impost. The reasons are that with the tax at a low rate it has been found much less intolerable than during the Napoleonic War, when it was at the rate of 10 per cent., while the pressure of the tax has also been greatly mitigated by placing very high the minimum income subject to it, and giving abatements upon the lower taxable incomes. These expedients have since been carried much farther. The tax, if kept at a low rate, undoubtedly fulfils a useful function as a revenue reserve for emergencies, on account of the ease with which it can be put up and down without disturbing trade. But in recent years, by rising to the rate of 1s. 2d. per £, it has been felt more heavily, and at this height is decidedly less elastic. As regards this tax at least there is no question of its "directness" in a sense, as it is so contrived that it can hardly be passed on by those who are struck at, though they are not always the same as those who pay in the first instance, as has already been pointed out. There have been great complaints also of injustice by the possessors of temporary and precarious incomes, who have to pay the same rate of tax as the owners of permanent incomes from property, although these complaints have been diminished to some small extent by the raising of
TAXATION

the minimum limit of the income assessed and the increase of the principle of abatements.

The varieties of income charged being very great, and special claims for consideration having been set up at different times, the result has been the formation of an income tax code, defining the methods and rules for assessing the different classes of profits and income, and prescribing the way in which abatements and exemptions are to be obtained. A leading peculiarity is that special inquiry into the aggregate of individual incomes. Although it is called a direct tax, the method of levy, as far as property is concerned, is upon the profits at their source, and not as they are distributed among the receivers. The question of the amount of individual incomes only comes before the authorities when claims for exemption and abatement are made. The character of the tax is accordingly much less odious than it would be if an account of individual incomes were invariably demanded, as was the case in the United States during the Civil War, when an income tax existed for a short time.

Other taxes grouped with the income tax by the authorities are house duty and land tax, but they are unimportant by comparison. The house duty replaced a window tax and other charges which were formerly not unimportant, especially in the interval between 1815 and 1843, when there was no income tax. It is a charge upon the occupiers of houses, mainly dwelling-houses, according to the amount of rent, the rate upon dwelling-houses ranging from 3d. to 9d. in the £, and the yield being about £150,000 per annum. The charge is probably much the same as that of the income tax itself, though there are curious questions as to the ultimate incidence as between owners and occupiers of houses. The land tax is quite unimportant, being an ancient tax upon an old assessment which has long become obsolete, and it interests economists most of all by the illustration it furnishes of what may be called a rent-charge tax—a tax, that is, which has been so long in existence and so fixed in its basis that it becomes in reality a charge upon the property, and not a direct burden upon the person who pays it, as the income tax is upon the person who pays it or for whom it is paid. In 1897 the basis of the tax was varied, but not in any way to affect the principle just stated.

The next great group of taxes is that of the excise (q.v.) and customs duties upon commodities. Excise duties are charges upon commodities produced at home on their way to the consumer, and customs duties in the United Kingdom are charges upon commodities brought into the country from abroad; and they are of essentially the same nature. Not only so, but excise duties and customs duties are in some cases suffering greatly to each other, like articles being produced and home and imported from abroad, so that for the sake of the revenue they have both to be taxed alike. Of this in the British system spirits are the best instance.

Export duties, it may be observed, are not important in systems of taxation generally, as there are few articles where the charge will not really fall on the wages of labour and profits of capital within the country imposing them; but opium grown in India is a well-known exception, and in the West Indies export duties on principal articles of production, in spite of their incidence, have been found a convenient source of revenue.

The list of commodities selected for taxation in the English fiscal system, under Free Trade, is very small. Few countries have so short a list of import duties, but this is in consequence of their design to give protection, which raises totally different questions from those of revenue.

The next large group of taxes is that of the stamp duties (q.v.). The principal items are those derived from a stamp of 1d. upon each cheque or receipt for money paid, and from a variety of charges on deeds and other instruments, and principally on the price paid for the transfer of real property and of stocks and shares, and on mortgages. Included are various charges on foreign bonds to bearer, to compensate for the advantage they have in escaping the transfer duty on deeds, through their passing on sale or mortgage from hand to hand. The essence of the compulsion in the case of stamp duties is the invalidity of the documents in courts of law unless the stamp is affixed, besides liability to penalties for not affixing the proper stamps. As things go in matters of taxation, English stamp duties are low. In France, besides the stamp duties, there are charges on the transfer of real property amounting to about 6 per cent. on the official registration of the transfer which is necessary to make it effective.

We come next, in dealing with taxation, to a group of charges about which the question has been raised as to whether they are, properly speaking, taxes or not. These are the post office charges, and the charges for telegraph service, including telephones. In the classification of the revenue in English budgets and in official returns these charges are deliberately separated from the above sources of the revenue described as taxes, and charge, with "revenues derived from other sources." The correctness of this procedure is questionable. According to old usage, the post office was made a state monopoly for the express purpose of levying taxation by means of it. In France the postage on letters is still called the taxe des lettres. There is no doubt also, that when postage on letters is charged at the rate of 1d. each, where the cost of collection and delivery, as in the metropolis, is perhaps not more than a tenth of a penny, it is difficult to distinguish the levy from that of any other tax. The excuse, as a rule, may hold good, that the postal charge is only a reasonable one for service rendered, so that the net derived is probably much the same as that of the tax itself, though there be curious questions as to the ultimate incidence as between owners and occupiers of houses.

Another source of revenue in British imperial finance is that from fees in courts of justice, patent stamps and the like, which is usually classified, like the income of the post office, as revenue derived from other sources than taxes. The amount is not large, though unfortunately the charge is not accurately known, to the fees being treated in many cases as extra receipts, and deducted from the expenditure of the departments by which they are received, so that this part of the national expenditure is not shown in the accounts at all. The proceeding appears to be quite incorrect, whatever excuse there may be for treating revenue like that of the post office as non-tax revenue. Fees levied on proceedings in courts of justice are not only taxes, but taxes of the worst sort. They received the special condemnation of Jeremy Bentham. It is a blot on British finance, therefore, that this part of the taxation is treated as if it were not taxation at all, and largely concealed from view in the way described.

Lastly, all, we have to notice among the imperial taxes the estate (q.v.) or death duties, as they are called—the charges made by government on the transfer of property from the dead to the living. These have been considerably increased in amount. Various interesting questions arise regarding them. Logically they are apparently taxes upon the dead, as they limit the area of bequest, but they are felt by the living who receive the estate as if the burden of taxation fell on them. Practically, when a stranger receives the residue of a business man, the proper way of viewing the tax would appear to be that it is a share of property claimed by the state against a
stranger who has no right in the matter except that which the state gives him, so that it is hardly a tax at all, as the word is usually understood; but when the estate is received by the near relatives of the deceased who were subsisting upon it even before his death, it is undoubtedly felt as a tax by them, and operates as a tax. It is even at times a very burdensome tax, falling upon a family when its sources of income are otherwise diminished, while it has the demerit of striking a small number annually instead of being diffused equally. Duties also raise the question as to how they are to be taxed upon capital. They are, in fact, the same even at the lowest rates of 1 to 4 per cent. upon the capital charged, and they have to be paid at such times as to cause their being paid out of capital and not out of income, so that their tendency is to diminish the capital available for productive enterprises.

Local Taxation.—Besides the above revenue from taxation for imperial purposes, large amounts are raised for local purposes. The local authorities derive a large income from private property, and from monopolies such as water, gas, electric light, telephones and tramway service, which they carry on, and on which the only real property, which is mainly real and cannot be moved away, can be assessed and made to pay. The owners of real property, however, continually urge that they are unfairly treated, and that other property should be rated. Next there has been misconception, arising from the same cause, in the constant attempt to charge the occupier of lands and houses with rates, although the real effect of the rates must be, as a rule, to diminish the value of the property affected like an old-established land tax, so that rates, properly speaking, do not fall upon either owner or occupier. It would be hard, however, to persuade the mass of occupiers in England that they do not pay the rates, so that the expedient of dividing the rates between owner and occupier, though it cannot affect their real incidence to a substantial extent, constantly finds favour. The confusion has been further increased of late years by attempts, as far as towns are concerned, to find a new subject of taxation in what are called rate values, as if rates themselves were not in reality an appropriation by the state of a portion of the whole value of the property, subject to which all the other interests exist. It would be impossible here even to state all the questions that have arisen about rates; but the essential confusion caused by the neglect of practical men to study the actual history of taxation, as it may be called, must be obvious to every student. The frank recognition that local income taxes are impossible, and that taxation on property for local purposes can only be applied to real property, where it becomes, usually or frequently, in the nature of a rent-charge, would have saved the legislature and the public an infinity of laborious discussion. Other taxes for local purposes comprise dues and tolls, such as harbour dues, where the money is required for such a definite purpose as a harbour, maintained at the expense of the traffic accommodated. Here again the question arises as to whether the tax is a mere compulsory charge or payment for a service rendered. Among these tolls may perhaps be included some charges in the nature of octroi dues, imposed on commodities entering a town, but not to a great extent. Such dues, in the nature of customs, are very common in continental cities, and yield large revenue to the local authorities, although they have been very generally, if not quite universally, abolished in the United Kingdom. They have been regarded with much dislike by most economists, and some dues of the kind which existed in London, viz., dues on coal and wine imported, and metage dues on grain, were much imposed until their final abolition in recent years. When of moderate account, however, dues of this sort appear no more objectionable than harbour dues already mentioned, or any other moderate charges on transactions. If of large amount and very numerous, they hamper trade, as all taxation tends to do, but that is no reason for condemning them specially when the choice lies between them and other forms of taxation.

In addition, we have to notice certain taxes which up to 1910-11 were levied by the British government and distributed to the local authorities, just as in France the government levies certain direct taxes, or centimes additionnels, added to its own direct taxes for the benefit of the local authorities. These taxes were additional beer and spirit dues (customs and excise), excise licences, and share of probate and estate duty. The remarks already made on the corresponding taxes levied for imperial purposes of course apply to these. Exceptionally, it may be added, as regards the licence taxes, which occupy quite an inferior place in the British system of taxation for imperial purposes, that the question whether some of them are not really direct in their incidence on the first person charged may also be raised, although they are classed with indirect taxes. Many of the licences are those of brewers, distillers and publicans, and others in trade, and are paid out of the general profits of the business, so that they can hardly be passed on to the consumers, while other licences are for shooting, for employing carriages and men-servants, and for similar objects, where the charge on the payer is direct. This may be the place to mention that in other countries, as in France, the licence duties on traders are considerably more general than in the United Kingdom, and are levied on an elaborate scale, according to the size of population of the town where the business is carried on, and the rent paid for the premises. They take the place, to some extent, of the income tax, and are usually classed with the direct taxes.

The peculiarity of taxes which are levied by the imperial authority and distributed among the local authorities for disbursement deserves notice. There must be a general cause for such an arrangement when we find it to have been in existence in France and other countries, and to have been introduced into the United Kingdom. And this cause no doubt is the need of the local authorities, and the difficulty of letting them have taxes of their own to levy which do not interfere with the imperial monopoly. The arrangement is obviously objectionable on the score of its conducing to local extravagance, as local authorities are not likely to be so economical with money that comes to them from the outside, as it were, as they would be with money directly taken from their own pockets. Local authorities receive other subventions and aids from the central government besides the proceeds of these taxes, so that their appropriation for local needs is related to a large question which belongs, however, to the general subject of local government, and is much too large a subject to be here. Incidence of Taxation.—In describing the principal taxes which are employed in the United Kingdom to provide for the national expenditure, observations have necessarily been made upon the incidence, probable or assumed, upon the taxpayer, and on the question how far they may fall equally on the whole community without any special incidence being traceable. The incidence of taxation is, however, a special subject for discussion, and is connected with various large
issues, such as that of Free Trade, which are of deep interest to economic students.

The starting-point of discussions as to incidence of taxation is a classical passage in Adam Smith's Wealth of Nations (book v, chap. ii.), where he lays down the following maxims with regard to taxes in general: 1. the subject of which has to be brought to bear on the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. 2. the tax which each individual is bound to pay ought to be certain and not arbitrary. 3. Every tax ought to be levied at the time or in the manner in which it is most likely to be convenient for the contributor to pay it. [Adam Smith specially praises indirect taxes on commodities under this head, because the consumer "pays them by little and little as he buys the goods," and "it must be his own fault if he ever suffers any considerable inconveniency from such taxes."]

4. Every tax ought to be so contrived as both to take out and keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state. [This last passage is specially directed against taxes which are expensive to collect, or discourage trade, or offer temptation to smuggling, or subject people to frequent visits of the tax-gatherers.] These maxims have commanded universal assent, as they are obviously the common sense of the subject. Nevertheless, however, that while general maxims are easy, the application presents difficulties, and since Adam Smith wrote, and especially in modern times, new questions of some interest have been raised. Adam Smith does not go minutely into the incidence of taxation. Taxes in his view must come out of rent, or profit, or the wages of labour; and he observes that every tax which falls finally upon one only of the sorts of revenue "is necessarily unequal in so far as it does not affect the other two," and in examining different taxes he disregards as inadequate this sort of a priori observation "to that inequality which is occasioned by a particular tax falling unequally upon that particular sort of private revenue which is affected by it." Recent discussion, however, has gone rather to the point which Adam Smith neglected, that of inequality generally, not merely as between different sorts of income, but as between individuals and classes.

The whole burden of taxation, it is maintained, should fall equally upon classes and individuals as far as possible, and, if necessary, taxes falling equally upon special sources of private revenue should be balanced against each other in order to obtain the desired result. Along with this view none of the state ought to the question whether the burden of taxation should not be progressive—the proportion of the sum taken by the state from the tax-payers increasing with the wealth of the individual, because ability to pay taxes is assumed to be not in proportion to, but to increase with the size of, the income.

What opinion should be held regarding this modern view as to equality in taxation, which differs so widely from anything countenanced by Adam Smith, though his language is echoed in it? The answer must be that, however sound, the view is impracticable and indeed inclines me to the belief that the heavy proportion of the taxes in almost every system of taxation, and at any rate in the British system, where the exact incidence is in no way traceable, or where there is no sort of general agreement as to the incidence. The whole of the British revenue from post office and telegraph service, and the whole of the stamp revenue, are derived from charges whose exact incidence cannot be traced. We have seen, indeed, that doubt is even felt as to whether post office and telegraph charges can be treated as taxes at all. Again, the death duties are in a distinct category; these duties fall each year not on a particular class of the community, or a particular kind of property, but on a few individuals only, who are in some cases treated severely, while others may have no cause of complaint. In the course of fifty years, it may be said, the balance will be rectified, and the whole class to which the individuals belong, and the property they own, will be visited in turn, so that this taxation should be credited to them in an account of the incidence of taxes generally; but fifty years is altogether too long a period for such adjustments to be made. Thus a very large proportion of the total revenue of many, and although the rate of duty is the same, the definition of income seems imperfect, so that many pay on a much larger assessment of income than seems fair in comparison with other incomes of nominally the same amount, but really of much greater value when all deductions from the gross sum are fairly reckoned. If all who pay income tax are lumped together and contrasted with those who do not pay, then there is a false division to begin with, and there is so far no means of establishing equality or inequality. As regards indirect taxes, there is so little difficulty in ascertaining the relative consumption of different classes, for the simple reason that in the same class so called the habits of consumption differ widely. It is only by a wide extension of the term "working man," for instance, that a class which includes a steady mechanic earning 30s. to £2 a week, who is frequently a total abaster, and a labourer of inferior capacity and character earning 15s. to 20s. a week, and who is not a total abaster, can be spoken of as one, and credit given to the one class for so much taxation on spirits, beer, tobacco, wine, tea and sugar. There are at least geographical differences of kind; on the other hand, the consumption by the income tax paying classes of customs and excise articles must vary indefinitely amongst themselves, according to personal habits, size of families, and even their geographical distribution. A further difficulty is furnished by a question as to whether the employer of domestic servants who gives them their board does or does not bear the burden of the duties on the articles which they consume, and which he buys for their use. Theoretically the burden falls on them as consumers. They would have more real wages, it is said, if the price of the articles they consume was not raised by them; but practically most employers are convinced that they pay the taxes for their servants. To establish, therefore, any fair account of the incidence of indirect taxes on different classes of the community, real classes being distinguished, and not mere rough grouping into so-called classes of units who are altogether heterogeneous, is probably beyond the skill of man.

All this is evident on a view of imperial taxation alone. In studying equality, moreover, local taxation must be brought into view, with even more impracticable differences of opinion which arise in local geographical differences of kind. Even when hunting is the only tax, the moment rates are brought into question it is seen at once how impossible it would be to establish equality among tax-payers, when owners on one side and occupiers on the other claim that they each bear the burden of the same taxes, and economists favour the opinion that much of the burden is in the nature of a rent-charg on the property, and in any case is equally diffused over the whole community.

Adam Smith was thus not altogether badly advised in not carrying his investigations into the equality of taxation farther than he did. There was another reason for his so doing in the heavy-handedness of the burden of taxation at the time he wrote; governments exacting as much as they could, and being only desirous of finding the easiest means of doing so. It is the very lightness of taxation in recent years which has suggested the possibility of comparing the relative burdens of different
classes, which would have seemed quite hopeless with a high taxation and an immense variety of high taxes. The conclusion that with good taxes long established the burden of taxation tends to become equal over the whole community was certainly not ill founded in the circumstances of former times, and may be accepted as true even in the present day.

As to progressive taxation based on the assumption that equality requires a larger proportionate charge upon a big income than on one of a smaller amount, the practical application of the principle, if true, would be impossible. A great deal more would need to be known than is now known about the effect of taxes on different classes, and the aggregate amount of different incomes, before such a task could be undertaken. If there is a greater proportionate charge already on the larger incomes, nothing more need be done, and we cannot know that there is not.

As to the justice of such a progressive tax, there is a common opinion in its favour among economists, at least to the extent of exempting a certain minimum of subsistence from taxation; but the present writer, after accepting this view in early life on the authority of Mill, must now express the greatest doubt. The ideal is equality, and no measure of a minimum of subsistence can really be devised.

Of course there may be single taxes which are progressive in form, such as the licence tax in France, or the income tax in Great Britain, where progress is established by abatements, or the death duties, where progress by scale is very common. But such progression may arise in a different way and on different principles from those proposed in defence of a general system of progressive taxation. It may be expedient for balancing taxation and roughly redressing palpable inequalities, and may be adopted for that purpose and no other.

Statistical inquiries as to the incidence of taxation of the particular taxes, though ideal or even approximate equality of a palpable arithmetical kind is practically unattainable by governments, are not altogether to be put aside. The information thus obtainable may be useful as far as it goes, indicating the directions in which the burden of taxation may press, and forming a guide of some utility when changes of taxation are contemplated. Calculations, for instance, as to what people at the lower levels of the income tax must pay because they happen to be struck by every sort of tax as no other class is, and calculations as to the freedom from taxation of large numbers of consumers whose incomes are not sufficient to living enable them to escape the tax-gatherer as the class to which they belong cannot generally do, may help a finance minister in the selection of taxes to be repealed or reduced or to be newly imposed. With every effort after equality he must fail to satisfy all, but friction may be diminished and the work of carrying on government quietly and steadily facilitated.

Taxes and Free Trade.—Taxation ought not to interfere with trade if possible, and the object of Adam Smith’s maxim, as we have seen, was largely to erect sign-posts warning finance ministers against the kind of taxes likely to taxation trade.

There has been much discussion, however, on free trade since Adam Smith’s time, and the far-reaching nature of his warnings is not yet even generally understood. There will probably be general agreement as to the wisdom of avoiding taxes which are uncertain and arbitrary, or which involve frequent visits of the tax-gatherer; but so far from there being a general assent in all countries to his maxims as to the expediency of avoiding taxation, which takes more from the tax-payer than what comes into the hands of the government, this is the very characteristic of duties deliberately imposed by most governments for the purpose of interfering with trade, and frequently called for even in the United Kingdom with a similar object.

In a question of taxation, however, for the purpose of meeting the expenses of the government, all such duties must be ruled out. Taxes, as instruments for advancing the prosperity of a country, are things unknown to the study of “taxation” in the proper sense of the word. The only proper object of taxation is to meet the expenses of the state, and when taxes are used primarily or mainly for some other object they can only be justified by political and economic reasons of a different order from anything that has been under discussion.

On this ground, in an account of taxation proper, one might avoid discussing altogether the question of irregular or illegitimate taxation. But the subject is of too much popular interest, perhaps, to be passed over altogether. Generally, then, it may be affirmed that taxation in its essential nature cannot be thought of as a good instrument for promoting trade and the advancement of a country. So far as it operates at all, it operates by diverting trade from the channels in which it would naturally flow into other channels, and this diversion reduces the industry, so far as it goes, must involve loss. People are induced to do things they would otherwise leave alone, or to leave alone what they would otherwise do, because money is given to them out of the pockets of the tax-payers to make it worth their while to do so; but there is palpably loss and not profit in the proceeding. It is urged that in time industries are set up that would not otherwise have existed, and population thereby attracted, this being especially the argument for protective duties in new countries; but even so, there is loss to set against the final gain, if any, and we invoke if the cost account in which a balance of loss and gain is attempted. The presumption is that on balance there is loss. In new countries especially the diversion of industry from its natural development cannot but be mischievous, wrong manufactures and industries being set up at the expense of the whole community, instead of those manufactures and industries which would be most profitable.

There is more to be said for the political argument which induced Adam Smith to favour navigation laws, giving a preference to national shipping in national waters, and for a similar political argument in favour of duties on agricultural produce imported into the country, on the ground, as regards navigation, that the prosperity of the shipping industry in particular was essential to the safety of the country, and on the ground, as regards duties on agricultural produce, that the maintenance of a larger rural population and of a larger agricultural production than would exist under natural conditions of perfect free trade was essential to the welfare of the state and even to its very existence in the possible event of a temporary defeat at sea and a partial blockade of the coasts. This is not the place to discuss such political problems, but there is no question of free trade, history and practice, to the community of any such taxation is frankly acknowledged.

Sir John A. Macdonald, the great protectionist prime minister of Canada, in a conversation with the present writer in 1882, avowed without hesitation that protectionist taxation in Canada was indefensible on economic grounds, and he defended it exclusively for political reasons. Politically one might differ from him, but economists as such must either be silent when political reasons are alleged for taxes that are against fundamental maxims, or must be content to point out the cost of the taxes in order that the communities concerned may decide whether an object in view is obtainable by means of the taxation, and is worth the price.

A great deal has been said as to taxes termed “counter-vailing duties,” which are called for in order to defend free trade itself against the protectionist bounties of foreign governments. Such duties are obviously taxes outside the limits to be considered in a question of taxation proper. They are to be imposed for other purposes than revenue. As to the claim for them that they will restore free trade conditions by nullifying the foreign bounties which have caused a disturbance of trade, this is really in the nature of a political reason. A country which is so devoted to free trade that it not only practises free trade itself but endeavours to convert others by nullifying their protectionist measures as far as it can, even with immediate loss to itself, departs from the guidance of self-interest so far; but its political action may be justifiable in the long run by other considerations. It seems right to point out, however, that countervailing duties, which are really differential duties of a special kind, are not the good expedient they are supposed to be for nullifying foreign bounties; that
experience of differential duties in former times is altogether against them; and that they cannot be enforced without certificates of origin and other causes of harassment and confusion in the conduct of trade.

The extent of the interference with trade, in regard to particular taxes, is also a matter of importance. A particular tax is not necessarily to be condemned because it takes a little more out of the pockets of the people than what the government receives. Such a defect is a ground for consideration in weighing a particular tax against others, but it is only one inconvenience among many incidental to all taxes.

Some English applications of free trade theory in recent times in the matter of import duties have been pedantic—the abolition of the shilling corn duty in 1860 by Robert Lowe (Lord Sherbrooke) being typical of this pedantry, though it is not the only instance. No doubt, in theory, this duty, being levied on the import only and not on the home production of corn, took from the tax-payer a shilling on every quarter of grain produced at home which did not go into the exchequer. Per contra the tax was wholly unfelt, a shilling a quarter only affecting an average family of four persons to the extent of three shillings per annum, or about three farthings a week, while it was paid little by little, as Adam Smith explains with regard to indirect taxes in general. The amount yielded, moreover, was considerable, being equal to a penny on the income tax, which it is desirable to maintain as a reserve of taxation. When we balance advantages and disadvantages, therefore, the repeal of the corn duty and similar measures would appear to have been sacrifices of revenue without adequate reason.

Rates of Taxation.—Apart from the merits or demerits of particular taxes or groups of taxes, and the questions as to inequality, injury to trade, and the like already discussed, the aggregate of taxation, or rather revenue, of a state may be considered in the most general way, having regard to the proportion of the total state revenue accounted for by each individual, and the return made by the state therefor. Here there are the greatest variations. At one time, for instance, during the great wars at the beginning of the 19th century, it was calculated that the British government expenditure, and the corresponding revenue, mostly raised by taxation, were each equal to about one-third of the aggregate of individual incomes—that is, as £60,000,000 to about £270,000,000. Proportions even higher have not been unknown in history, and it is probable that in Russia, India, Egypt, and in other countries at this moment, the proportion may amount to one-fourth or one-fifth. On the other hand, some years ago in the United Kingdom, before the high expenditure on army and navy began, and before the South African war of 1890–1892, it was probable that with an outlay of less than £1,000,000 by the central government, the proportion of this outlay to the aggregate income of the people was not higher than one-fourteenth. At the beginning of 1902, when the South African war was closing, the normal peace expenditure, even reckoned at £1,60,000,000, did not exceed one-tenth, while even peace and war expenditure together in 1901, taking them as close on £200,000,000, did not exceed one-eighth. These varying proportions, however, mean different things economically, and it is of obvious interest that, besides questions as to particular taxes, the broad effect of the whole burden of taxation should also be discussed.

The important points in this connexion appear to be: (1) Very large appropriations can be made by the state from the revenue of its subjects without permanent injury. The common country suffers, but the land and fixed capital remain, and when the high Government expenditure ceases individuals at once have the benefit, subject to possible disturbance at the moment of transition, when many persons employed by the state return to private employment. (2) A state which in ordinary times appropriates one-tenth or some less proportion of aggregate individual incomes is much stronger relatively than a state absorbing one-fourth, one-third, or even a higher proportion. It has much larger resources, which would be available if time were given to develop them. (3) When the proportion becomes one-tenth or less it is doubtful whether the state can do best for its subjects by making the proportion still lower, that is, by abandoning one tax after another, or even a greater or smaller advantage would not be gained by using the revenue for wise purposes under the direction of the state, such as great works of sanitation, or water supply, or public defence. In other words, when taxes are very moderate and the revenue appropriated by the state is a small part only of the aggregate of individual incomes, it seems possible that individuals in a rich country may waste individually resources which the state could apply to very profitable purposes. The state, for instance, could perhaps more usefully engage in some great works, such as establishing reservoirs of water for the use of towns. The great plan of drainage under one of the channels between Ireland and Great Britain, or a sea-cause across Scotland between the Clyde and the Forth, or purchasing land from Irish landlords and transferring it to tenants, than allow money to fructify or not fructify, as the case may be, in the pockets of individuals. Probably there are no works more beneficial to a community in the long run than those like a tunnel between Ireland and Great Britain, which open an entirely new means of communication of strategic as well as commercial value, but are not likely to pay the individual entrepreneur within it.

Authorities.—See also, for taxation and taxes in different countries, the separate articles on the finance under the heading of each country; and the articles on Free Trade, Protection and Tariffs. The following short list of authors may be useful to the student: Adam Smith, a wealth of nations; Ricardo's Principles of Taxation; Mill, Principles of Political Economy; Bastable, Public Finance; E. A. Seligman, Shifting and Incidence of Taxation (2nd ed., 1899); Garnier, Traité de Finances; Cohn, System der National-Oekonomie; Wagner, Finanzwissenschaft; Roscher, System der Finanzwissenschaft. (R. Gs.)

TAXIDERMY, the art of preserving the integument, together with the scales, feathers or fur, of animals. Little is known of the beginnings of the practice of the "stuffing" or "setting up" of animals for ornament or for scientific purposes; and it is highly probable, from what we gather from old works of travel or natural history, that the art is not more than some three hundred years old. It was practised in England towards the end of the 17th century, as is proved by the Sloane collection, which in 1725 formed the nucleus of the collection of natural history now preserved in the Sloane room at the University of Kensington. It was not until the middle of the last century that any one devoted to the principles of the then little understood art was published in France, R. A. F. Réaumur's treatise (1749) being probably the first. This was followed at intervals by others in France and Germany, until the beginning of the 19th century, when the English began to move in the matter, and several works were published, notably those by E. Donovan, W. Swainson, Capt. Thomas Brown and others. These works, however, are long since inadequate; and at the Great Exhibition of 1851, the Germans and French taught British taxidermists the rudiments of scientific treatment of natural objects. The demands of sportsmen for the due preservation of their trophies, and the requirements of the great museums in every civilized country, have rapidly transformed a crude handicraft into an elaborate art, and the finest modern results, as produced by a private firm like Rowland Ward in England, or the expert staff of the American Museum of Natural History in New York, leave almost nothing to be desired. The rapidly recurring editions of Rowland Ward's handsome Guide to the art of collecting and preserving various species of birds, by John Rowley's little manual Supplies a guide to the beginner, and the expert specializes in the particular branch of the art which he prefers.

4 The Art of Taxidermy (New York, 1898).
more detail as to what may be done in the workshop; Montague Browne's elaborate treatise remains a standard work, whilst William T. Hornaday has supplied a very full account of the excellent American methods which he has done so much to develop.

The first principle governing the art is that, after the specimen has been procured, in as fresh and clean a state as may be, it should have the skin stripped from the body in such a manner as not to disturb the scales if a fish or a reptile, the feathers of a bird, the hair of a mammal. To do this correctly requires a small stock of tools, as well as a great amount of patience and perseverance. The appliances comprise several sharp knives (some pointed and some oilstone), a pair of scissors, a pair of pilers, a pair of nippers or "cutting-pliers," some tow, a wadding, needles and thread, also a "stuffing-iron," some crooked awls, a pair of fine long flat-nosed pilers, and a camel-hair brush. "The preservative compound is often the original (Bécouër's) arsenical soap," made by cutting up and boiling 2 lb. of white soap, to which 12 oz. of salt of tartar and 4 oz. of a mixture, when intimately glued, should be well worked into this mixture, when nearly cold, 2 lb. of powdered arsenic and 5 oz. of camphor (the latter previously triturated in a mortar with spirits of wine) are added. The mixture is put away in small jars or pots for use. Like all arsenical preparations, this is exceedingly dangerous in the hands of unskilled persons, often causing shortness of breath, sores, brittleness of the nails and other symptoms; and, as arsenic is really no protection against the attacks of insects, an efficient substitute has been invented by Browne, composed of 1 lb. of white curd soap and 3 lb. of whiting, triturated together, to which is added, whilst hot, 2 oz. of chloride of lime and, when cold, 1 oz. of tincture of musk. This mixture is perfectly safe to use when cold (although when hot the fumes should not be inhaled, owing to the chlorine given off), and is spoken of as doing its work efficiently. Solutions of corrosive sublimate, often recommended, are, even if efficient, dangerous in the extreme. Powders consisting of tannin, pepper, camphor, and burnt alum are sometimes used for "making skins," but they dry them too rapidly for the purposes of "mounting." Mammals are best preserved by a mixture of 1 lb of burnt alum to 4 lb. of salt-petre; this, when intimately glued, should be well worked into the skin. Fishes and reptiles, when not cast and modelled, are best preserved in rectified spirits of wine; but this, when economy is desired, can be replaced by "Müller's solution" (bichromate of potash 2 oz., sulphate of soda 1 oz., distilled water 3 pints) or by a nearly saturated solution of chloric of zinc. The cleaning of feathers and furs is performed by rubbing them lightly with wadding soaked in benzoline, afterwards dusting on plaster of Paris, which is beaten out, when dry, with a bunch of feathers.

The preparation and mounting of bird specimens, the objects most usually selected by the amateur, are performed in the following manner. The specimen to be operated upon should have its nostrils and throat closed by plugs of cotton-wool or tow; both wing-bones should be intimately glued to the body, and the head laid upon a table on its back; and, as birds—especially white-breasted ones—should seldom, if ever, be opened on the breast, an incision should be made in the skin under the wing on the side most damaged, from which the thigh protrudes. When push-pinning gently this is cut through at its junction with the body, when the knife is gently used to separate the skin from this, the wing-bone is seen on the open side. This is then cut through by scissors, and by careful manipulation the skin is further freed from the back and breast until the neck can be cut off. The other side now remains to be dealt with; from this the wing is cut by travelling downwards, the remaining leg is cut away, and very careful skinning over the stomach and upon the lower back brings the operator to the tail, which is cut off, leaving a small portion of the bone (the coccyx) in the skin. The body now falls off, and nothing remains in the breast but the neck and head. To skin these out completely without unduly stretching the integument, is a task trying to the patience, but it can be accomplished by gradually working the skin away from the back of the head forward, taking care to avoid cutting the eyes or the eyelids, but by cautious management, to cut the membranous skin over those parts, so that the eyes are easily extracted from the orbits without bursting. The skin should be carefully manipulated, since every movement round the neck, when with neck attached, should be cut off, the brains extracted, all the flesh cleared from the skull and from the bones of the wings, legs and tail; the skin is then turned over to the right side, and turned into its proper position. When "skins" only are to be made for the cabinet, it is sufficient to fill the head and neck with choped tow, the body with a false one made of tow, tightly packed to give the skeleton a natural position. When the skin is to be fitted over the body of the stomach, and to place a band of paper tightly pinned around the body over the breast and wings, and allow it to remain in a warm position, free from dust, for several days or weeks, according to the size of the specimen, the body must be pinned on the head, sex, locality and date, and put away with insect powder around it.

When, however, the specimen is to be mounted, the operation is considerably more difficult. First, a skull is made, with a false bone of tightly wrapped tow is made upon a wire pointed at its upper end. This is inserted through the incision under the wing, the pointed end going up the neck and through the skull to the outside. When the imitation body rests within the skin, pointed wires are thrust through the soles of the feet, up the skin of the back of the legs, and are finally clenched in the bounding edges of the skin of the under surface, and also clenched through into the body. A stand or perch is provided, and the bird, being fixed upon this, is, after the eyes have been inserted, arranged in the most natural attitude of the specimen. When thus mounted, the imitation body is cut off, and the skin and feathers are dusted and dressed, if necessary, when the specimen is to be kept in a cold place indefinitely.

Mammals are cut along the stomach from nearly the middle to the breast, and are skinned by working out the hind legs first, cutting them off under the skin at the junction of the femur with the trunk, and carefully removing them off the lower back and front until the tail is reached, the flesh and bones of which are pulled out of the skin, leaving the operator free to follow on up the back until the last under portion is reached. This is then dressed as like manner. The neck and head are skinned out down to the inner edges of the lips and nose, great care being exercised not to cut the outer portions of the ears, the eyelids, the nose or the lips. The ears are then cleaned off, and the brain and eyes extracted. The skull should adhere to the skin by the inner edges of the lips. All the flesh should be trimmed from the bones of the legs. The head, being shaped, where the flesh was removed, by tow and clay, is returned into the skin. A long wire of sufficient strength is tightly bound with tow, making a long, narrow body, through which wires are thrust by the skin of the soles of the feet. The wires and bones being wrapped with tow and clay into the skin, the points of the wires are pushed through the tow body and clenched. They and the body are then bent into the desired position, and modelled up by the addition of more tow and clay, until the contours of the natural body are imitated, when the stomach is sewn up. A board is provided upon which to fix the specimen, artificial eyes are inserted, the lips, nose and eyelids fixed by means of pins or "needle-points," and the specimen is then placed in a warm atmosphere.

Reptiles, when small, have their skin removed by cutting away the attachment of the skin to the cervical vertebrae, and by turning the "pectoral" (the mesial) into the "pectoral" (the lateral) position. When large, they are cut along their median line, and treated in the same manner as mammals.

Fishes, after being covered on their best side with paper or magazine, are cut along the lateral line from neck to tail, the gills to the gills, and are skinned out by removing "cutlets," as large as is possible without cutting the skin, which, indeed, should be kept damp during work. After being cured with a preservative, they are fixed with sawdust or dry plaster of Paris, sewn up, turned over on a board, the fins pinned out, and the mouth adjusted, and, when perfectly dry, the plaster may be shaken out.

The new school of taxidermists, with new methods, whose aim is to combine "knowledge of anatomy and modelling with taxidermic technique, has now come to the front, all processes of "stuffing" have been discarded in favour of modelling. Within the limits of an article like the present it is impossible to do more than indicate the methods in general. In the case of mammals, after the skin has been completely removed, even to the toes, a copy is made of the body, posed as in life, and from this an accurate representation of the skin is made. The model is then covered with skin, which is dipped, and moulded to follow every depression and prominence, the manikin, before having the skin put on it, frequently being covered completely with a thin layer of clay; the study is then suffered to dry; and, models having been made, in the case of large animals, of the 

1 Artistic and Scientific Taxidermy and Modelling (London, 1896).  
mucous membrane of the jaws, palate, tongue and lips, these are truly reproduced in a plastic material. The ordinary glass eyes are discarded, and hollow globes, specially made, are hand-painted from nature, and are fixed in the head so as to convey the exact expression which the pose of the body demands. Birds, if of any size, can be modelled in like manner, and fishes are treated by a somewhat identical process, being finally coloured as a "still life" painting.

To give a life-like representation, attention is also paid to artistic "mounting." By this is meant the surrounding of specimens with appropriate accessories, and it is well exemplified by the work shown in the natural history museum at South Kensington, where, for example, birds are arranged as in a state.

The great American museums have extended a similar method to the mounting of even large mammals, whilst they have made bird groups naturally still more life-like by panoramic backgrounds and top and side lighting of the cases. (M. B.)

TAY, the longest river in Scotland. From its source in Ben Lui (7300 ft.), a mountain on the borders of Perthshire and Argyllshire, it pursues a mainly north-easterly direction to Logierait, where it curls to the south by east as far as Dunkeld; there its course turns to the south-east to the mouth of the Isla, where it bends towards the south by west to the vicinity of Scone. From this point it makes a sharp descent to the south by east beyond the county town, when, at the point where the river turns south-east to near Nethy Bridge, Broughty Ferry and Ardeer, it again faces the north-east as far as Breughty Ferry, whence it flows straight eastwards into the North Sea, off Breadalbane in Forfarshire, after a total run of 117 miles. During the first 11 miles it is known as the Fillan and discharges into Loch Dochart. From the lake it emerges as the Dochart (13 m.), which enters Loch Tay at Killin. Flowing through the loch for 143 m., it issues at Kenmore under its proper name of Tay. From hence to the sea its course measures 781 m., from which we may deduct 25 m. as the length of the Firth of Tay (which begins at Cairn pier Ferry), leaving 353 m. as the length of the stream between Kenmore and the mouth of the Earn. Its principal affluents on the right are the Braan, Almond and Earn, and on the left the Lyon, Tummel and Isla. Along with its tributaries, therefore, it drains all Perthshire and portions of Forfarshire and Argyllshire, having a catchment basin of 2400 sq. m. In many parts the current is impetuous, and in flood has occasionally wrought much havoc, certain of the inundations being historically important. Its mean discharge of water every minute is estimated to amount to 273,000 cubic ft., a larger output than that of any other stream in the United Kingdom, and would make Dundee at all stages of the tide, and the estuary is navigable to Newburgh by vessels of 500 tons, and as far as Perth by ships of 200 tons. The navigation, however, is seriously obstructed by shifting sandbanks. The estuary varies in width from 1/2 m. at Cairn pier Ferry to fully 3 m. at its mouth. The principal points on the river are Crianlarich on the Fillan (with stations on the West Highland and Callander to Oban railways), Luib and Killin on the Dochart, Kenmore, Aberfeldy, Dunkeld, Birnam, Stanley, Scone, Perth and, on the north shore of the river, below the mouth of the Almond, Kenmore, and on the south shore, Newburgh, Newport and Tayport. It is bridged at Kenmore, Aberfeldy, Logierait, Dunkeld, Caputh and Perth (3). The first railway viaduct across the firth at Dundee was nearly two miles long and had been in use for some eighteen months from the date of its opening in 1877. During the night of the 28th of December 1879, however, while a great gale was at the height of its fury, the passing of a train over the central section gave purchase to the tempest and that portion of the structure was blown down along with the train and the unfortunate travellers. Some 75 to 90 persons are supposed to have perished. The second bridges of somewhat lower height, 2 m. and 73 yds. in length, was erected 60 ft. higher up stream and opened in 1887. The Tay is famous for salmon, the annual catch in the river and estuary being the most valuable in Scotland. There is a hatchery at Hormonfield, close to Luncarty station, 4 m. N. of Perth, for the artificial breeding of salmon, the fish being liberated from the ponds about the age of three years. In respect of riparian scenery the Tay as a whole is the most beautiful river in Scotland, the stretch between Logierait and Cargill, particularly the reaches above and below Dunkeld, being universally admired.

TAY, Loch, the largest lake in Perthshire, Scotland. It is situated about the middle of the county and has a flattened ogee form, with a general trend from N.E. to S.W. It is 134 m. long from Killin at the head to Kenmore at the foot, from 1/2 m. to fully 1 m. wide. The maximum depth is 508 ft., the mean depth 200 ft. The lake lies 355 ft. above the sea, covers an area of 6530 acres, or over 10 sq. m., and has a drainage basin of 232 sq. m., including the overflow from Lochs Dochart and Tushaill. It receives at Killin the rivulet Lochy and 1/2 m. rises near the left bank. There are piers at Killin, Ardeonaig, Lawers, Fernan and Kenmore, at which the steamers call during the tourist season; ferries at Ardeonaig and Lawers; and a coaching road on the left shore and a somewhat longer and more hilly road on the right. At the foot of the lake is an island containing the ruins of the priory which was founded in 1121 by Alexander I. in memory of his wife Sibylia, daughter of Henry I. She was buried here. Loch Tay enjoys great repute for its salmon-fishing.

As for the towns, a town of the province of Tayabas, Luzon, Philippine Islands, 8 m. N. of Lucena, the capital. Pop. of the municipality (1903) 147,740. Tayabas is picturesquely situated on the slopes of the extinct volcano Banájao, and commands a magnificent view of the surrounding country, which is extremely fertile, and is planted in rice and coco-nuts. Its climate, although cool, is very unhealthy, malignant malarial fevers causing a high death-rate. It has a church and convent of large size and massive construction. During the revolt of 1896 a Spanish garrison occupying these buildings withstood a siege of fifty-eight days. Thereafter the garrison was forced to surrender by lack of food. Tagalog and Bicol are the languages spoken. Until 1901 Tayabas was the capital of the province.

TAYGETUS (Tαγέτος or Tαγύτος, mod. St Elias or Pente-daktylon), the highest mountain ridge in the Peloponnese, separating Laconia from Messenia. Height 7000 ft. The highest point is H. Elias; here horses are said to have been sacrificed to Helios.

TAYLOR, ANN (1782-1880), afterwards Mrs. Gilbert, and TAYLOR, JANE (1783-1824), English writers for children, were daughters of Isaac Taylor (1750-1826), were born in London on the 30th of January 1782 and the 23rd of September 1783 respectively. In 1786 the Taylors went to live at Lavenham in Suffolk, and ten years later removed to Colchester. Jane was a lively and entertaining child, and composed plays and poems at a very early age. Their father and mother held advanced views on education, and under their guidance the girls were instructed not only in their father's art of engraving, but in the principles of fortification. Their poems were written in short intervals in the round of each day's occupations. Ann was the older, and wrote for herself to the point of Duenna. She then offered a riddle to a puzzle in the Minor's Pocket Book for 1799, and Jane made her first appearance in print in the same periodical with "The Beggar Boy." The publishers then wrote to Isaac Taylor asking for more verses for children from his family, and the result was Original Poems for Infant Minds (2 vols., 1804-5), by "several young persons," of whom Ann and Jane were the largest contributors. The book had an immediate and lasting success. It went through numerous editions, and was translated into German, Dutch and Russian. The elder Jane Taylor wrote directly for children, and viewed events and morals from the nursery standpoint. They had many imitators, but few serious rivals in their own kind, except perhaps Mrs Elizabeth Turner. They followed up this success with Rhymes for the Nursery (1806), Hymns for Infant Minds (1808, and ed. 1810), a less-known collection, Signor Topsy.
TURRY'S Wonderful Magic Lantern; or, The World Turned Upside Down (1810), and Original Hymns for Sunday School (1812). In 1813 Ann married a Congregational minister, the Rev. Josiah Gilbert, and Jane went to live at Ilfracombe with her brother Isaac. In 1816 Jane returned to Ongar, where the family had been settled for some years, and died there on the 13th of April 1824. Mrs Gilbert died at Nottingham on the 20th of December 1866. Both sisters wrote after their separation, but none of their later works had the same marked interest and shallowed much more than her sister, notably in the Contributions of Q. O. (2 vols., 1824), and in Display, A Tale for Young People (1873); but, though she was generally supposed to be the chief writer of the two, some of the most famous pieces in their joint works, such as "I thank the goodness and the grace," "Meddlesome Matty," "The Notorious Glutton," &c., are by Ann.

The best edition of the Poetical Works of the sisters is that of 1877. There is an excellent edition (1905) of the Original Poems and Others, by Ann and Jane Taylor and Adelaide O'Keeffe, edited by E. V. Lucas, with illustrations by F. D. Bedford.

Abundant information about Ann and Jane Taylor is to be found in: Autobiography and Other Memorials of Mrs Gilbert (2 vols., 1879), edited by her son Josiah Gilbert; Isaac Taylor, Memoirs . . . of Jane Taylor (2 vols., 1879), and the collection by the same editor entitled The Family Pen: Memorials . . . of the Taylor Family of Ongar, vol. ii. (1867).

TAYLOR, BAYARD (1825-1878), American author, was born at Kennett Square in Chester county, Pennsylvania, on the 11th of January 1825. The son of a well-to-do farmer, he received his early instruction in an academy at West Chester, and later at Unionville. At the age of seventeen, he began to practice law in West Chester. A little volume, published at Philadelphia in 1844 under the title Ximenia, or the Battle of the Sierra Morena, and other Poems, brought its author a little cash; and indirectly it did him better service as the means of his introduction to The New York Tribune. With the money thus obtained, and with an advance made to him on account of some journalistic work to be done in Europe, "J. B. Taylor" (as he had up to this time signed himself, though he bore no other Christian name than Bayard) set sail for the East. The young poet spent a happy time in roaming through certain districts of England, France, Germany and Italy; that he was a born traveller is evident from the fact that this pedestrian tour of almost two years cost him only £100. The graphic accounts which he sent from Europe to The New York Tribune, The Saturday Evening Post, and The United States Gazette were so highly appreciated that on Taylor's return to America he was advised to throw his articles into book form. In 1846, accordingly, appeared his Views Afoot, or Europe seen with Knapsack and Staff (2 vols., New York). This pleasant book had considerable popularity, and its author now found himself a recognized man of letters; moreover, Horace Greeley, then editor of the Tribune, placed Taylor on the Tribune staff (1846) thus securing him a certain if a moderate income. His next journey, made when the gold-fever was at its height, was to California, as correspondent for the Tribune; from this expedition he returned by way of Mexico, and, seeing his opportunity, published (2 vols., New York, 1850) a highly successful book of travels, entitled El Dorado; or, Adventures in the Path of Empire. Ten thousand copies were said to have been sold in America, and thirty thousand in Great Britain, within a fortnight from the date of issue. Bayard Taylor always considered himself nearer than his elder sister to the line of the "old-time" literature of his country; and that in 1851 he found himself on the banks of the Nile. He ascended as far as 12° 30' N., and stored his memory with countless sights and delights, to many of which he afterwards gave expression in metrical form. From England, towards the end of 1852, he sailed for Calcutta, proceeding thence to China, where he joined the expedition of Commodore Perry to Japan. The results of these journeys (besides his poetical memorials) were A Journey to Central Africa; or, Life and Landscapes from Egypt to the Negro Kingdoms of the White Nile (New York, 1854); The Lands of the Saracen; or, Pictures of Palestine, Asia Minor, Sicily and Spain (1854); and A Visit to India, China and Japan in the Year 1853 (1855). On his return (December 20, 1853) from these various journeys he entered, with marked success, upon the career of a public lecturer, delivering addresses in every town of importance from Maine to Wisconsin. About two years' experience of this lucrative profession, he again started on his travels, on this occasion for northern Europe, his special object being the study of Swedish life, language and literature. The most noteworthy result was his "Swedish Letters" to the Tribune were also republished, under the title Northern Travel: Summer and Winter Pictures (London, 1857). His first wife, May Agnew, died (1856) within a year of her marriage, and in October 1857 he married Maria Hansen, the daughter of Peter Hansen, the German astronomer. The ensuing winter was spent in Greece. In 1859 Taylor once more traversed the whole extent of the western American gold region, the primary cause of the journey lying in an invitation to lecture at San Francisco. About three years later he entered the diplomatic service as secretary of legation at St Petersburg, and the following year (1863) became chargé d'affaires at the Russian capital. In 1864 he returned to the United States and resumed his active literary labours, and it was at this period that Hannah Thurston (New York, 1863), the first of his four novels, was published. This book had a moderate success, but neither in it nor in its successors did Bayard Taylor betray any special talent as a novelist. In 1874 he went to Iceland, to report for the Tribune the one thousandth anniversary of the first settlement there. In 1876 he was accredited United States minister at Berlin. Notwithstanding the restless passion for travel which had always possessed him, Bayard Taylor was (when not actually en route) sedentary in his habits, especially in the later years of his life. His death occurred on the 19th of December, only a few months after his arrival in Berlin.

Taylor's most ambitious productions in poetry—his Masque of the Gods (Boston, 1872), Prince Deukaiinos; a lyrical drama (Boston, 1878), The Picture of St John (Boston, 1866), Lars; a Pastoral of Norway (Boston, 1873), and The Prophet; a tragedy (Boston, 1874)—are marred by a ceaseless effort to overstrain his power. But he will be remembered by his poetic and excellent translation of Fausi (2 vols., Boston, 1870-71) in the original metres. Taylor fell, in all truth, "the torment and the ecstasy of verse"; but, as a critical friend has written of him, "his nature was so ardent, so full-blooded, that slight and common sensations intoxicated him, and he estimated their value, and his power to transmit it to others, beyond the true value of the sensation and the power. He began to compose, a distinct lyrical faculty: so keen indeed was his ear that he became too insistently haunted by the music of ordinary words; but still it remained to him a constant and firm note of his own. His best short poems are "The Metempsychosis of the Pine" and the well-known Bedouin love-song. In his critical essays Bayard Taylor had himself in no inconsiderable degree been the writer of the first, and been indelibly associated with "that poetic insight which is the vital spirit of criticism." The most valuable of these prose dissertations are the Studies in German Literature (New York, 1879). Collected editions of his Poetical Works and his Dramatic Works were published at Boston, 1888; his Life and Letters (Boston, 2 vols., 1884) were edited by his wife and Horace E. Scudder.

See also Albert H. Smyth, Bayard Taylor (Boston, 1896), in the "American Men of Letters" series; and W. D. Howells's Literary Friends and Acquaintances (1900).

TAYLOR, BROOK (1865-1931), English mathematician, was the son of John Taylor, of Bifrons House, Kent, by Olivia, daughter of Sir Nicholas Tempest, Bart., of Dutham, and was born at Edmonton in London on 26th August 1865. He was educated at his father's College, Cambridge, as a fellow-commoner in 1701, and took degrees of LL.B. and LL.D. respectively in 1700 and 1714. Having studied mathematics under John Machin and John Keill, he obtained in 1708 a remarkable solution of the problem of the "centre of oscillation," which, however, remaining unpublished until May 1714 (Phil. Trans., vol. xxvii. p. 11), his claim to priority was unjustly disputed by John Bernoulli. Taylor's Methodus Incrementorum Directa et Inversa (London, 1715) added a new branch to the higher mathematics, now designated the "calculation of finite differences." Among other ingenious applications, he used it to determine
TAYLOR, Sir Henry

the form of movement of a vibrating string, by him first successfully reduced to mechanical principles. The same work contained the celebrated formula known as "Taylor's theorem" (see INFINITESIMAL CALCULUS), the importance of which remained unrecognized until 1772, when J. L. Lagrange realized its powers and termed it "le principal fondement du calcul différentiel."

In his essay on Linear Perspective (London, 1715) Taylor set forth the true principles of the art in an original and more general form than any of his predecessors; but the work suffered from the brevity and obscurity which affected most of his writings, and needed the elucidation bestowed on it in the treatises of Joshua Kirby (1754) and Daniel Fournier (1761).

Taylor was elected a fellow of the Royal Society early in 1712, sat in the same year on the committee for adjudicating the claims of Sir Isaac Newton and Gottfried Wilhelm Leibnitz, and acted as secretary to the society from the 13th of January 1714 to the 21st of October 1718. From 1715 his studies took a philosophical and religious bent. He corresponded, in that year, with the Comte de Montmort on the subject of Nicolas Malebranche's tenets; and unfinished treatises, "On the Jewish Sacrifices" and "On the Lawfulness of Eating Blood," written on his return from Aix-la-Chapelle in 1719, were afterwards found among his papers. His marriage in 1721 with Miss Brydges of Wallington, Surrey, led to an estrangement from his father, a person of somewhat morose temper, which terminated in 1723 after the death of the lady in giving birth to a son. The ensuing two years were spent by him with his family at Birfons, and in 1725 he married, with the paternal approbation, Sabetta, daughter of Mr. Sawbridge of Olanthig, Kent, who, by a strange fatality, died also in childbed in 1730; in this case, however, the infant, a daughter, survived. Taylor's fragile health gave way; he fell into a decline, died on the 29th of December 1731, at Somerset House, and was buried at St. Ann's, Soho. By his father's death in 1720 he had inherited the Birfons estate. As a mathematician, he was the only Englishman after Sir Isaac Newton and Roger Cotes capable of holding his own with the Bernoullis; but a great part of the effect of his demonstrations was lost through his failure to express his ideas fully and clearly.

A posthumous work entitled Contemplatio Philosophica was printed for private circulation in 1753 by his grandson, Sir William Young, Bart., prefixed by a life of the author, and with an appendix containing extracts from his letters. Several short papers by him were published in Phil. Trans., vols. xxvii. to xxxii., including accounts of some interesting experiments in magnetism and capillary attraction. He issued in 1719 an improved version of his work on perspective with the title of Principles of Linear Perspective, revised by Colson in 1749, and printed again, with portrait and life of the author, in 1811. A French translation appeared in 1753 at Lyons. Taylor's paper (Methodus Incrementorum, p. 168) the first satisfactory investigation of astronomical refraction.

TAYLOR, Sir Henry (1800–1886). English poet and political official, was born on the 18th of October 1800, at Bishop-Middleham, Durham, where his ancestors had been small landowners for some generations. His mother died while he was yet an infant, and he was chiefly educated by his father, a man of studious tastes, who, finding him less quick than his two elder brothers, allowed him to enter the navy as a midshipman. Finding the life uncongenial, he only remained eight months at sea, and after obtaining his discharge was appointed to a clerkship in the storekeeper's office. He had scarcely entered upon his duties when he was attacked by typhus fever, which laid low both his brothers, then living with him in London. In three or four years more his office was abolished while he was on duty in the West Indies. On his return he found his father happily married to a lady whose interest and sympathy proved of priceless value to him. Through her he became acquainted with her cousin, Isabella Ferwick, the neighbour and intimate friend of Wordsworth, who introduced him to Wordsworth and Southey. Under these influences he lost his early admiration for Byron, whose school, whatever its merits, he at least was in no way calculated to adorn, and his intellectual powers developed rapidly. In October 1822 he published an article on Moore's Irish Melodies in the Quarterly Review. In another year he went to London to seek his fortune as a man of letters, and meet with rapid success, though not precisely in this capacity. He became editor of the London Magazine, to which he had already contributed, and in January 1824 obtained, through the influence of Sir Henry Holland, a good appointment in the Colonial Office. He was immediately entrusted with the preparation of confidential state papers, and his opinion soon exercised an important influence on the decisions of the secretary of state. He visited Wordsworth and Southey, travelled on the Continent with the latter, and, at a certain time, mainly through his friend and official colleague, the Hon. Hyde Villiers, became intimate with a very different set, the younger followers of Bentham, without, however, adopting their opinions—"young men," he afterwards reminded Stuart Mill, "who every one said would be ruined by their independence, but who ended by obtaining all their hearts' desires, except one who fell by the way." The reference is to Hyde Villiers, who died prematurely. Taylor actively promoted the emancipation of the slaves in 1833, and became an intimate ally of Sir James Stephen, then counsel to the Colonial Office, afterwards under-secretary, by whom his Act of Emancipation was sombrely framed. His duties at the Colonial Office were soon afterwards lightened by the appointment of James Spedding, with whom he began a friendship that lasted till the end of his life.

His first drama, Isaac Comenius, Elizabethan in tone, and giving a lively picture of the Byzantine court and people, was published anonymously in 1828. Though highly praised by Southey, it made little impression on the public. Philip van Artevelde, an elaborate poetic drama, the subject of which had been recommended to him by Southey, was begun in 1828, published in 1839, and, aided by a large subscription from Lockhart's pen in the Quarterly, achieved extraordinary success. Its great superiority to Taylor's other works may be explained by its being to a great extent the vehicle of his own ideas and feelings. Artevelde's early love experiences reproduce and transfigure his own. Edwin the Fair (1842) was less warmly received; but his character of Dunstan, the ecclesiastical statesman, is a fine psychological study, and the play is full of historical interest. Meanwhile he had married (1839) Theodosia Spring-Rice, the daughter of his former chief Lord Montagle, whom he met at St. James's, and, with Sir James Stephen, had taken a leading part in the abolition of negro slaves. His friend John Stuart India, painted in 1832.

The State Poems, a volume of essays suggested by his official position, had been published in 1836, and about the same time he had written in the Quarterly the friendly notices of Wordsworth and Southey which did much to dispel the conventional prejudices of the day, and which were published in 1849 under the somewhat misleading title of Notes from Books. In 1847 he was offered the under-secretaryship of state for the colonies, which he declined. Notes from Life and The Eve of Conquest appeared in this year; and an experiment in romantic comedy, The Virgin Ideal, with admirable comment from Wordsworth, was published in 1849. A Sicilian Summer, was published in 1850. "The pleasantest play I had written," says the author; "and I never could tell why people would not be pleased with it." His last dramatic work was St. Clement's Eve, published in 1862. In 1869 he was made K.C.M.G. He retired from the Colonial Office in 1872, though continuing to be consulted by government. His last days were spent at Bournemouth in the enjoyment of universal respect; and the public, to whom he had hitherto been an almost impersonal existence, became familiarized with his picturesqueness of appearance in old age, as represented in the photographs of his friend Julius de la Motte Cameron. He died on the 27th of March 1886. His Autobiography, published a year before his death, while sinning a
little by the egotism pardonable in a poet and the garrulity
natural to a veteran, is in the main a pleasing and faithful
picture of an aspiring youth, an active maturity, and a happy
and honoured old age.

Taylor's Artevelde cannot fail to impress those who read it
as the work of a poet of considerable distinction; but, perhaps
for the very reason that he was so prominent as a state official,
he has not been accepted by the world as more than a very
accomplished man of letters. His lyrical work is in general
laboriously artificial, but he produced two well-known songs—
"Quoth the crow: neither maiden nor wife" and "If I had the
wings of a dove."

Taylor's Autobiography (2 vols. 1885) should be supplemented by his
Correspondence (1888), edited by Edward Dowden. His Works
were collected in five volumes in 1877-78.

TAYLOR, ISAAC (1785-1865), English author, son of Isaac
Taylor (1759-1829), engraver and author, was born at Laven-
ham, Suffolk, on the 17th of August 1878. He was trained by
his father to be an engraver, but early adopted literature as a
profession. From 1834, the year of his marriage, he lived a
busy but uneventful life at Stanford Rivers, near Ongar, Essex,
where he died on the 28th of June 1865. His attention was
drawn to the study of the fathers of the church through
reading the works of Sulpicius Severus, which he had picked up
at a bookstall. He published a History of the Transmission
of Ancient Books to Modern Times (1827), a study in biblical
criticism, and some other works, but he attracted little notice
until, in 1829, he published anonymously a book bearing upon
the religious and political problems of the day, entitled The
Natural History of Enthusiasm, which speedily ran through
eight or nine editions. Fanaticism (1833), Spiritual Despotism
(1835), Saturday Evening (1832), and The Physical Theory of
Ancient Life (1836), all commanded a large circulation. In
his Ancient Christianity (1839-46), a series of dissertations in
reply to the "Tracts for the Times," Taylor maintained that
the Christian church of the 4th century should not be regarded
as embodying the doctrine and practice of the apostles because
it was then already corrupted by contact with pagan superstition.
The book met with great opposition, but Taylor did not follow up the
controversy.

Among his other works may be mentioned biographies of Ignatius
Loyola (1845) and John Wesley (1851); a volume entitled The
Discoveries of the Arab Geographers (1851); and a course of lectures on The Spirit
of Hebrew Poetry (1861).

TAYLOR, ISAAC (1829-1901), English philologist, eldest son of the
preceding, was born at Stanford Rivers, 2nd May 1829. He was educated at Trinity College, Cambridge, and took the
mathematical tripos in 1853. His interests, however, were
linguistic rather than mathematical, and his earliest publication
was a translation from the German of W. A. Becker's Charicles.
Though of Nonconformist stock, Isaac Taylor joined the Church
of England, and in 1857 was ordained to a country curacy. In
1860 he published The Liturgy of the Dissenters, an appeal for
the revision of the Book of Common Prayer "on Protestant
lines," "as expedient for the material interests of the Church,
and as an act of plain justice to the Dissenters." His studies
in local etymology bore fruit in Words and Places in Etymological
Illustration of History, Ethnology and Geography (1864). Be-
tween 1865 and 1869, when he was in charge of a Bethnal
Green parish, his philological studies were laid aside, and he
published only The Burden of the Poor and The Family Pen, a
record of the literary work of his own family, the Taylors of
Ongar. In 1869 he became incumbent of a church at Twicken-
ham, and used his comparative leisure to produce his Etruscan
Researches (1874), in which he contended for the Ugrian
origin of the Etruscan language. In 1875 he was presented
to the rectory of Settrington, Yorkshire, and began his systematic
researches into the origin of the alphabet. His Greeks and Goths;
a Study on the Runes (1879), in which he suggested that the
runes were of Greek origin, led to a good deal of controversy.
His most important work is The Alphabet, an Account of the
Origin and Development of Letters (1883; new and revised
dition 1890). Taylor points out that alphabetical changes are the
result of evolution taking place in accordance with fixed
laws. "Epigraphy and palaeography may claim, no less than
philology or biology, to be ranked among the inductive
sciences." He was largely indebted to the Egyptian researches of
Rougé, which it has since become necessary to reconsider in
the light of discoveries in Crete. In 1885 Taylor became canon
of York, and two years later dean. His paper on the Origin of
the Aryans, read at the British Association in 1887, was after-
wards expanded into a book. In the following winter he visited
Egypt, and his letters from there, collected under the title
Egyptian Notes, aroused considerable controversy from the extremely favourable view he took of the Mahommedan religion. For the last few years of his life
Dean Taylor suffered from ill health, and was laid aside from
active work for some time before his death in October 1901.

TAYLOR, GEORGE (1613-1667), English divine and author, was
baptized at Cambridge on the 15th of August 1613. His
father, Nathaniel, though a barber, was a man of some educa-
tion, for Jeremy was "solely grounded in grammar and mathe-
matics." The tradition that he was descended from the Settrington Taylor, who lived in Yorkshire, is now no more.

Taylor was a pupil of Thomas Lovering, at the newly founded Perse grammar
school. Lovering is first mentioned as master in 1619, so that
Taylor probably spent seven years at the school before he was
entered at Gonville and Caius College as a sizar in 1626,1 eighteen
months after Milton had entered Christ's. And while George
Herbert was public orator and Edmund Waller and Thomas
Fulle were undergraduates of the university. He was elected
a Perse scholar in 1628, and fellow of his college in 1633, but
the best evidence of his diligence as a student is the enormous
learning of which he showed so easy a command in after years.
In 1633, although still below the canonical age, he took holy
orders, and, accepting the invitation of Thomas Risden, a
former fellow-student, to supply his place for a short time as
lecturer in St Paul's, he at once attracted attention by his eloquence and by his handsome face. Archbishop Laud sent
for Taylor to preach before him at Lambeth, and took the
professor under his own chaplain, who was no more than
his fellowship at Cambridge before 1636, but he spent, appa-
rently, much of his time in London, for Laud desired that his
"mighty parts should be afforded better opportunities of study
and improvement than a course of constant preaching would
allow of." In November 1635 he had been nominated by
Laud to a fellowship at All Souls, Oxford, where, says Wood
(Athen. Oxon., Ed. Bliss, ill. 781), love and admiration still
waited on him. He seems, however, to have spent little time
there. He became chaplain to his patron the archbishop, and
chaplain to visitors from Charles I. At Oxford William Chilling-
worth was then busy with his great work, The Religion of Pro-
testants, and it is possible that by intercourse with him Taylor's
mind may have been turned towards the liberal movement of
his age. After two years in Oxford, he was presented, in March
1638, by Juxon, bishop of London, to the rectory of Uppingham,
in Rutlandshire. In the next year he married Phoebe Langs-
dale, by whom he had six children, the eldest of whom died
at Uppingham in 1642. In the autumn of the same year he
was appointed to preach in St Mary's on the anniversary
of the Gunpowder Plot, and apparently used the occasion to
clear himself of a suspicion, which, however, haunted him through
life, of a secret leaning to the Romish communion. This
suspicion seems to have arisen chiefly from his intimacy with
Christopher Davenport, better known as Francis a Sancta
Clara, a learned Franciscan friar who became chaplain to Queen

1An obviously erroneous entry in the Admission Book states that he had been at school under Mr. Lovering for ten years, and
was in his fifteenth year. Admissions to Gonville and Caius College
(ed. J. Venn, 1887).
Henrietta; but it may have been strengthened by his known connexion with Laud, as well as by his ascetic habits. More serious consequences followed his attachment to the Royalist cause. The author of *The Sacred Order and Offices of Episcopacy or Episcopal Assay against the Arrians and Aethapli New and Old* (1642), could scarcely hope to retain his parish, which was not, however, sequenated until 1646. Taylor probably accompanied the king to Oxford. In 1643 he was presented to the rectory of Overstone, Northamptonshire, by Charles I. There he would be in close connexion with his friend and patron Spencer Compton, 2nd Earl of Northampton.

During the next fifteen years Taylor's movements are not easily traced. He seems to have been in London during the last weeks of Charles I., from whom he is said to have received his watch and some jewels which had ornamented the ebony case in which he kept his Bible. He was then taken prisoner with other Royalists while besieging Cadigan castle on the 4th of February 1645. In 1646 he is found in partnership with two other deprived clergymen, keeping a school at Newton Hall, in the parish of Llanvihangel-Aberbtythych, Carmarthenshire. Here he became private chaplain to Richard Vaughan, 2nd Earl of Carbery (1600–1680), whose hospitable mansion, Golden Grove, is immortalized in the title of Taylor's still popular manual of devotion, and whose first wife was a constant friend of Taylor. The second Lady Carbery was the original of the "Lady" in Milton's *Comus*. Mrs Taylor had died early in 1651. His second wife, Joanna Bridges, said to have very doubtful authority to have been a natural daughter of Charles I. She owned a good estate, though probably impoverished by Parliamentary exactions, at Mandinam, in Carmarthenshire.

From time to time Jeremy Taylor appears in London in the company of his friend Evelyn, in whose diary and correspondence his name repeatedly occurs. He was three times imprisoned: in 1654–5 for an injudicious preface to his *Golden Grove*; again in Chepstow castle, from May to October 1655, on what charge does not appear; and a third time in the Tower in 1657–8, on account of the indiscretion of his publisher, Richard Royston, who had adorned his "Collection of Offices" with a print representing Christ in the attitude of prayer.

Much of his best work was produced at Golden Grove. In 1646 appeared his famous plea for toleration, *Thologia E'lektivai*, *A Discourse of the Liberty of Prophecying*. In 1649 he published the complete edition of his *Apology for authorized and set forms of Liturgy against the Pretence of the Spirit*, as well as *Great Exemplars of the Holy Art of Prayer* (1650), a book which was inspired, its author tells us, by his earlier intercourse with the Earl of Northampton. Then followed in rapid succession the *Twenty-seven Sermons* (1651), "for the summer half-year," and the *Twenty-five* (1653), "for the winter half-year," *The Rule and Exercises of Holy Living* (1650), *The Rule and Exercises of Holy Dying* (1651), a controversial treatise on *The Real Presence* (1654), the *Golden Grove*; or *A Manuale of daily prayers and laneties* (1655), and the *Unum Necessarium* (1655), which by its Pelagianism gave great offence. *The Discourse of the Name and Things of God* is a manual of Christian practice, which has retained its place with devout readers. The scope of the work is described on the title-page. It deals with "the means and instruments of obtaining every virtue, and the remedies against every vice, and considerations serving to the resisting all temptations, together with prayers containing the whole Duty of a Christian." *Holy Dying* was perhaps even more popular. A very charming piece of work of a lighter kind was inspired by a question from his friend, Mrs Katherine Phillips (the "matchless Orinda"), asking "How far is a dear and perfect friendship authorized by the principles of Christianity?" In answer to this he dedicated to the "most ingenious and excellent Mrs Katherine Phillips" his *Discourse of the Nature, Offices and Measures of Friendship* (1657). *His Doctor Dubitantium, or the Rule of Conscience . . .* (1660) was intended to be the standard manual of casuistry and ethics for the Christian people.

He probably left Wales in 1657, and his immediate connexion with Golden Grove seems to have ceased two years earlier. In 1658, he was offered a lectureship in Lisburn, Ireland, by Edward Conway, second Viscount Conway. At first he declined a post in which the duty was to be shared with a Presbyterian, or, as he expressed it, "where a Presbyterian and myself shall be like Castor and Pollux, the one up and the other down," and to which also a very meagre salary was attached. He was, however, induced to take it, and found in his patron's mansion at Portmore, on Lough Neagh, a congenial retreat.

At the Restoration, instead of being recalled to England, he probably expected to be given certain privileges, he was appointed to the see of Down and Connor, to which was shortly added the small adjacent diocese of Dromore. He was also made a member of the Irish privy council and vice-chancellor of the university of Dublin. None of these honours were sincere. Of the university he writes, "I found all things in a perfect disorder . . . a heap of men and boys, but no body of a college, no one member, either fellow or scholar, having any legal title to his place, but thrust in by tyranny or chance." Accordingly he set himself vigorously to the task of framing and enforcing regulations for the admission and conduct of students and for the discipline of the university, and also of establishing lectureships. His episcopal labours were still more arduous. There were, at the date of the Restoration, about seventy Presbyterian ministers in the north of Ireland, and most of these were from the west of Scotland, and were imbued with the dislike of Episcopacy which distinguished the Covenanting party. No wonder that Taylor, writing to the duke of Ormonde shortly after his consecration, should have said, "I perceive myself thrown into a place of torment." His letters perhaps somewhat exaggerate the danger in which he lived, but there is no doubt that his authority was resisted and his overtures rejected. His writings also were ransacked for matter of accusation against him, "a committee of Scotch spiders being appointed to see if they can gather or make poison out of them." Here, then, was Taylor's opportunity for exemplifying the wise toleration he had in other days inculcated, but the new bishop had nothing to offer the Presbyterian clergy but the bare alternative—submission to episcopal ordination and jurisdiction or deprivation. Consequently, in his first visitation, he declared thirty-six churches vacant; and of these forcible possession was taken by the clergy. At the same time many of the gentry were won by his unbridled charity and devotedness as well as by his eloquence. With the Roman Catholic element of the population he was less successful. Ignorant of the English language, and firmly attached to their ancestral forms of worship, they were yet compelled to attend a service they considered profane, conducted in a language they could not understand. As Heber says, "No part of the administration of Ireland by the English crown has been more extraordinary and more unfortunate than the system pursued for the introduction of the Reformed religion. At the Instance of the Irish bishops Taylor took his book *Discourse of the Name and Things of God* (in two parts, 1664 and 1667), but, as he himself seemed partly conscious, he might have more effectually gained his end by adopting the methods of Ussher and Bedell, and inducing his clergy to acquire the Irish tongue. The troubles of his episcopate no doubt shortened his life. Nor were domestic sorrows wanting in these later years. In 1661 he married, at Lisburn, Edward, the only surviving son of his second marriage. His eldest son, an officer in the army, was killed in a duel; and his second son, Charles, intended for the church, left Trinity College and became companion and secretary to the duke of Buckingham, at whose house he died. The day after his son's funeral Taylor caught fever from a patient whom he visited, and, after a ten days' illness, he died at Lisburn on the 13th of August 1667, in the fifty-fifth year of his age. He was buried at Lisburn in a monument richly ornamented, with the following inscription:

1 See an angry letter by Brian Duppa, bishop of Salisbury, on the subject (Eden i. xliii.).
his life and the seventh of his episcopate, and was buried in the cathedral of Dromore. Taylor's fame has been maintained by the popularity of his sermons and devotional writings rather than by his influence as a theologian or his importance as an ecclesiastic. His mind was neither scientific nor speculative, and he was attracted rather to questions of casuistry than to the problems of pure theology. His wide reading and capacious memory enabled him to quote extensively from his religious reading, and supplied him with material for building up a completely designed and enduring edifice of systematized truth. Indeed, he had very limited faith in the human mind as an instrument of truth. "Theology," he says, "is rather a divine life than a divine knowledge." His great plea for toleration is based on the impossibility of exciting theology into a demonst proper home. It is one possible all should be of one mind. And what is impossible to be done is not necessary it should be done." Differences of opinion there must be; but "heresy is not an error of the understanding but an error of the will." He would submit all minor questions to the reason of the individual member, but he set certain limits to toleration, excluding "whatever is against the foundation of faith, or contrary to good life and the laws of obedience, or destructive to human society, and the public and just interests of bodies politic." Peace, he thought, might be made "if men would not call all opinions heresy." The nature of fundamental articles. Of the propositions of sectarian theologians he said that confidence was the first, and the second, and the third part. Of a genuine poetic temperament, fervid and mobile in feeling, and of a prolific fancy, he had also the sense and wit that come of varied contact with men. All his gifts were made available for influencing other men by his easy command of a style rarely matched in dignity and colour. With all the majesty and stately elaboration and musical rhythm of Milton's finest prose, Taylor's style is relieved and brightened by an astonishing variety of felicitous illustrations, ranging from the most dignified and elaborated his sermons especially abound in quotations and allusions, which have the air of spontaneously suggesting themselves, but which must sometimes have baffled his hearers. This seeming pedantry is, however, atoned for by the clear practical aim of his sermons, the noble ideal he keeps before his hearers, and the skill with which he handles spiritual experience and urges incentives to virtue.

The whole works of... Jeremy Taylor with a life of the author and a critical examination of his writings was published by Bishop Robert Anderson, who revised the text. Page Eden (1847-54). His most popular works, The Liberty of Prophesying, Holy Living, and Holy Dying have been often reprinted. The Poems and Verse-translations of Jeremy Taylor were edited by Dr. A. B. Grosart in vols. of the Miscellaneous of the Fuller Worthies Library (1870). The first biographer of Jeremy Taylor was his friend and successor, George Rust, who preached a funeral sermon (in 1662) which remains a valuable document. His life has been written by John Wheeldon (1703), H. K. Bonney (1815), T. S. Hughes (1831), R. H. Willmott (1847), George L. Duyckinck (New York, 1860). The chief authority is still Eden's revision of Bishop Heber's memoir, which includes much valuable correspondence. See also E. W. Gosse's Jeremy Taylor (1904) in the English Men of Letters series. A bibliography of works dealing with the subject is included in the article by the Rev. Alexander Grosart in the Victoria National Biography. S. T. Coleridge was a diligent student and a warm admirer of Jeremy Taylor, whom he regarded as one of the great masters of English style. A series of comments by Coleridge are collected in his Literary Remains (1858, vol. iii. pp. 263-390).

TAYLOR, JOHN (1580-1653), English pamphleteer, commonly called the “Water-Poet,” was born at Gloucester on the 24th of August 1580. His father was a small officer to John, who served (1596) in Essex's fleet, and was present at Flodden in 1519 and at the siege of Cadiz. On his return to England he became a Thames waterman, and was at one time collector of the perquisites exacted by the lieutenant of the Tower. He was an expert in the art of self-advertisement, and achieved notoriety by a series of eccentric journeys. With a companion as feather-brained as himself he journeyed from London to Queenborough in a paper boat, with two stockfish tied to canes for oars. The Pennyles Pilgrimage, or the Moneyless Perambulation of John Taylor ... how he traveled on foot from London to Edinborough in Scotland ... 1618, contains the account of a journey perhaps suggested by Ben Jonson's celebrated undertaking, though Taylor emphatically denies any intention of burlesque. He went as far as Aberdeen. At Leith he met Jonson, who good-naturedly gave him twenty-two shillings to drink his health in England. Other travels undertaken for a wager were a journey to Prague, where he is said to have been entertained (1620) by the queen of Bohemia, and those described respectively in A very merry, wherry ferry voyage, or Yorke for my money, and A New Discovery by sea with a Wherry from London to Salisbury (1623). At the outbreak of the civil war Taylor began to keep a public-house at Oxford, but when his friends the Royalists were obliged to surrender the city he returned to London, where he set up a similar business at the sign of “The Crown” in Phoenix Alley, Long Acre. At the time of the king's execution he changed his sign to the Mourning Crown, but the authorities objected, and he substituted his own portrait. He was buried in the churchyard of St Martin's-in-the-Fields on the 3rd of December 1653.

Taylor gave himself the title of “the king's water-poet and the most famous water-man.” He was not a poet, though he could string rhymes together on occasion. His style lay in a coarse, rough and ready wit, a talent for narrative, and a considerable command of repartee, which made him a dangerous enemy. Thomas Coryate, the author of the Crudities, was one of his favourite butts, and he roused Taylor's special anger because he persuaded the authorities to have burnt one of Taylor's pamphlets directed against him. This was Laugh and be Fat (1617?), a parody of the Odeonchan Banquet.

Sixty-three of Taylor's works appeared in one volume in 1630. This was reprinted by the Spenser Society in 1868-9, being followed by other tracts not included in the collection (1870-8). Some of his more amusing productions were edited (1872) by Charles Hindle in The Works of John Taylor. They provide some very entertaining reading, but in spite of the legend on one of his title-pages, “Lastly that (which is Rare in a Traveller) all is true,” it is permissible to exercise some mental reservations in accepting Mr. Hindle's conclusions. The other tracts of Taylor's in his Miscellaneous of the Fuller Worthies Library (1870).

TAYLOR, JOHN (1704-1766), English classical scholar, was born at Shrewsbury on the 22nd of June 1704. His father was a barber, and, by the generosity of one of his customers, the son, having received his early education at the grammar school of his native town, was sent to St John's College, Cambridge. In 1732 he was appointed librarian, in 1734 registrar of the university. Somewhat late in life he took orders, became rector of Lawford in Essex in 1751, and canon of St Paul's in 1757. He died in London on the 4th of April 1766. Taylor is best known for his editions of some of the Greek orators, chiefly valuable for the notes on Attic law, e.g. Lysias (1730); Demosthenes Contra Leptinum (1741) and Contra Midimius (1743, with Lycurgus Contra Leocratem), intended as specimens of a proposed edition, in five volumes, of the orations of Demosthenes, Aeschines, Dinarchus and Demades, of which only vols. ii. and iii. were published. Taylor also published (under the title of Marmor Sandyscum) a commentary on the inscription on an ancient marble brought from Greece by Lord Sandwich, containing particulars of the receipts and expenditure of the Athenian magistrates appointed to celebrate the festival of Apollo at Delos in 574 B.C. His Elements of Civil Law (1755) also deserves notice. It was deeply attacked by Wharton in his Divine Legation, professedly owing to a difference of opinion in regard to the persecution of the early Christians, in reality because Taylor had spoken disparagingly of his scholarship.
TAYLOR, JOSEPH—TAYLOR, ROWLAND

TAYLOR, JOSEPH (c. 1586-c. 1653), English actor, is mentioned in the folio Shakespeare of 1623 as one of the twenty-six who took principal parts in all of these plays. There is a legend that he was trained by Shakespeare to play Hamlet, and that he succeeded Burbage in this and other parts. Certain it is that in many of Beaumont and Fletcher's plays he played a leading rôle, and he is one of the ten actors who signed the dedication of the first folio of these dramatists (1647).

TAYLOR, MICHAEL ANGELO (1757-1834), English politician, was a son of Sir Robert Taylor (1714-1748), the architect, and was educated at Corpus Christi College, Oxford, becoming a barrister at Lincoln's Inn in 1774. He entered the House of Commons as member for Poole in 1784, and, with the exception of a short period of imprisonment (1789) for incurring the displeasure of parliament until 1834, although not as the representative of the same constituency. In parliament Taylor showed himself anxious to curtail the delays in the Court of Chancery, and to improve the lighting and paving of the London streets; and he was largely instrumental in bringing about the abolition of the pillory. At first a supporter of the younger Pitt, he soon veered round to the side of Fox and the Whigs, favoured parliamentary reform, and was a personal friend of the regent, afterwards George IV. He was on the committee which managed the affairs of the East India Company. He was made a privy councillor in 1831; and died in London on the 16th of July 1834. Taylor is chiefly known in connexion with the Metropolitan Paving Act of 1817, which is still referred to as "Michael AngeloTaylor's Act." Often called "Chicken Taylor" because of his reference to himself as a "mere chicken in the law," he is described by Sir Spencer Walpole as "a pompous barrister, with a little body and a loud voice." Taylor's father, Sir Robert, was the founder of the Taylorian Institution at Oxford.

TAYLOR, NATHANIEL WILLIAM (1786-1859), American Congregational theologian, was born in New Milford, Connecticut, on the 23rd of June 1786, grandson of Nathaniel Taylor (1722-1800), pastor at New Milford. He graduated at Yale College in 1807, studied theology under Timothy Dwight, and in 1812 became pastor of the First Church of New Haven. From 1822 until his death in New Haven on the 10th of March 1859 he was Dwight professor of didactic theology at Yale. He was the last notable representative of the New England School, in which his predecessors were the younger Edwars, John Smalley (1734-1820) and Nathaniel Emmens. In the Yale College, with influence, he had been one of his predecessors, Bennet Tyler (1783-1858), founded in East Windsor a Theological Institute to offset Taylor's teaching at Yale.

Taylorism, sometimes called the "New Haven" theology, was an attempt to defend Calvinism from Armenian attacks, and the defence itself was an attack of Armenianism and Pelagianism by A. A. Hodge of Princeton and Leonard Woods of Andover. Taylor's theology was distinctively infra-lapsarian; it disagreed with Samuel Hopkins and Emmens in rejecting the theory of "divine efficiency and in arguing that man can choose the right "even if he won't"—distinguishing Edwards between natural ability and moral inability; it distinguished sensibility or susceptibility as something different from will or understanding, without moral qualities, to which the appeal for right choice may be made; and it made self-love (a term borrowed from Dugald Stewart, connecting the innocent love of happiness and distinct from selfishness) the particular feeling appealed to by the inductiveness of the law and grace.

He wrote Practical Sermons (1858; edited by Noah Porter); Lectures on the Moral Government of God (2 vols., 1859), and Essays and Lectures upon Select Topics in Revealed Theology (1859), all published posthumously.

TAYLOR, PHILIP MEADOWS (1808-1876), Anglo-Indian administrator and novelist, was born at Liverpool on the 25th of September 1808. At the age of fourteen he was sent to England to become a clerk to a Bombay merchant. On his arrival the house was in financial difficulties, and he was glad to accept in 1824 a commission in the service of his highness the nizam, to which service he remained devotedly attached throughout his long career. He was speedily transferred from military duty to a civil appointment, and in this capacity he acquired a knowledge of the languages and the people of Southern India which has seldom been equalled. He studied the laws, the geology, the antiquities of the country; he was alternately judge, engineer, artist, and man of letters, for on his return to India in 1849 on furlough he published the first of his Indian novels, Confessions of a Thug, in which he reproduced, with singular vivacity and truth, the scenes which he had heard described by the chief actors in them. This book was followed by a series of tales, Tipoo Sultan (1840), Tara (1843), Ralph Darnell (1845), Seeta (1872), and A Noble Queen (1878), all illustrating periods of Indian history and society, and giving a prominent place to the native character, for which the Indian institutions and traditions he had a great regard and respect. Returning to India he acted from 1849 to 1853 as Indian correspondent for the Times. He also wrote a Student's Manual of the History of India (1879). About 1859, Meadows Taylor was appointed by the nizam's government to administer, during a long minority, the principality of the young raja of Shorapore. He succeeded without any European assistance in raising this small territory to a high degree of prosperity, and such was his influence with the natives that on the occurrence of the mutiny in Bengal he held his ground without military support. Colonel Taylor, whose merits were now recognized and acknowledged by the British government of India—although he had not been in the service of the company—was subsequently appointed to the deputy commissionership of the Western ceded districts, where he succeeded in establishing a new assessment of revenues at once more equitable to the cultivators and more productive to the government. By indefatigable perseverance he had raised himself from the condition of a half-educated lad, without patronage, and without even the support of the Company, to the successful government of some of the most important provinces of India, 36,000 square miles in extent and with a population of more than five millions. On his retirement from service in 1860 he was made a C.S.I. and given a pension. Taylor died at Mentone on the 17th of May 1876. See Meadows Taylor's The Story of My Life (1877).

TAYLOR, ROWLAND (d. 1555), English Protestant martyr, was born at Rothbury, Northumberland; he took minor orders at Norwich in 1528 and graduated LL.B. at Cambridge in 1530 and LL.D. in 1534. Adopting reformed views he was made chaplain by Cranmer in 1540 and presented to the living of Hadleigh, Suffolk, in 1544. In Whitsun week, 1547, he preached a "notable sermon," at St Paul's Cross, and was given the third stall in Rochester cathedral. In 1549 he was placed on a commission to examine Anabaptists, and in 1551 he was appointed Vicar of Hadleigh and Bishop Ridley, select preacher at Canterbury, and a commissioner for the reform of the canon law; in 1552 Coverdale made him archdeacon of Exeter. Apparently he advocated the cause of Lady Jane Grey, for on the 25th of July 1553, only six days after Mary's proclamation as queen, he was committed to the custody of the sheriff of Essex. He was released not long afterwards, and with the support of his parishioners offered strenuous resistance to the restoration of the Mass. He was consequently imprisoned in the King's Bench prison on the 26th of March 1554. The sturdy protestation of Taylor, and his flock, who seem to have caused various commotions, marked him out for the special hatred of Mary's government; and he was one of the first to suffer when in January 1555 parliament had once more given the clerical courts liberty of jurisdiction. He was sentenced on the 22nd, excommunicated on the 29th, degraded by Bonner on the 4th of February, and burnt on the 9th at Aldham Common near Hadleigh. His blameless character had made a great impression on his age, and he was commemorated in many popular ballads. He was regarded as the ideal of a Protestant parish priest; he was married and had nine children. The alleged descent of Jeremy Taylor from him has not been proved. See Thomas Quinton Stow's Memoirs of Rowland Taylor (1833); Dict. of Nat. Biog. iv. 463-4, and authorities there cited. (A. F. P.)
TAYLOR, THOMAS (1758–1832), English writer, generally called "the Platonist," was born in London on the 15th of May 1758, and lived there till his death on the 1st of November 1832. He was sent to St Paul's school, but was soon removed to Sheerness, where he spent several years with a relative who was engaged in the dockyard. He then began to study for the dissenting ministry, but an ignorant marriage and pecuniary difficulties compelled him to abandon the idea. He became a schoolmaster, a clerk in Lubbock's banking-house, and from 1796–1806 was assistant secretary to the society for the encouragement of arts, manufactures and commerce, which post he resigned to devote himself to the study of philosophy. He had the good fortune to obtain the patronage of the duke of Norfolk and of a Mr Meredith, a retired tradesman of literary tastes, who assisted him to publish several of his works. These mainly consisted of translations of the whole or part of the writings of Aristotle, Plato, Plotinus, Proclus, Pausanias, Porphyry, Ocellus Lucanus, and the Orphic hymns. His efforts were unavailing—almost contemptuously—received, but, in spite of defects of scholarship and lack of critical faculty, due recognition must be awarded to the indomitable industry with which he early convulsed his mind. He refers to the "Western Plctho" in Isaac Disraeli's "Curiosities of Literature" and in his novel "Varrius," and as "England's gentle priest" in Mathias's "Pursuit of Literature."

TAYLOR, TOM (1817–1880), English dramatist and editor of Punch, was born at Bishop Wearmouth, near Sunderland, on the 19th of October 1817. After attending school there and studying for two sessions at Glasgow University, he in 1837 entered Trinity College, Cambridge, of which he became a fellow. Subsequently he held for two years the professorship of English literature at University College, London. He was known already for early dramatic pieces, and in 1840 he published "The Modern Plutarch" and "The World of the Ancients" in his novel "Varrius," and as "England's gentle priest" in Mathias's "Pursuit of Literature."

TAYLOR, WILLIAM (1765–1836), English man of letters, served in the Navy in that city on the 7th of November 1765. He belonged to the Unitarian community, and went to a school kept at Palgrave, Suffolk, by Rochemont Barbauld, husband of Anna Letitia Barbauld, where Frank Syens (1763–1817) was among his schoolmates. He travelled on the Continent for some years to perfect himself in foreign languages. William Taylor and his father were both in sympathy with the French Revolution, and belonged to a "revolution society" at Norwich. In 1791 the disturbed condition of affairs induced the elder Taylor to wind up his business and return to Norwich. He devoted himself to literature. He was an enthusiastic German poet, and did great service to English literature by translations of Bürger's Lenore (1790, printed 1796), of Lessing's Nathan the Wise (1790, printed 1805), of Goethe's Iphigenia in Tauris (1790, printed 1793), and of four of Wieland's Dialogues of the Gods (1795). He was a prolific writer of review articles, in which his knowledge of foreign literature served as a useful standard of criticism. Much of this material was made use of in his most important work, his "Historic Survey of German Poetry" (3 vols., 1829–30). He also edited the works of his friend Sayers in a memoir (1823). He died at Norwich on the 5th of March 1836.

TAYLOR, ZACHARY (1784–1850), twelfth president of the United States, was born in Orange county, Virginia, on the 24th of September 1784. During the following year his father, Colonel Richard Taylor, a veteran of the War of Independence, migrated to Kentucky, settling near Louisville, and thereafter played an important part in the wars and politics of his adopted state. The boyhood and youth of Zachary Taylor were thus passed in the midst of the stirring frontier scenes of early Kentucky, and from this experience he acquired the hardihood and resoluteness that characterized his later life, although he inevitably lacked the advantages of a thorough education. In May 1823 he was commissioned as first lieutenant in the 7th United States Infantry, and for the next few years was employed in routine duties. Early in 1812 he was made captain, and during the ensuing hostilities with Great Britain distinguished himself by his gallant defence against the Indians of Fort Harrison, a stockade in central Indiana. For this he was breveted major, and in May 1814 received a regular major's commission, but being reduced at the conclusion of the war to the rank of captain, temporarily left the service. In May 1816 he was reinstated as major, and in 1819 was promoted to be a lieutenant-colonel; and in the routine discharge of his duties he was stationed at various posts on the western frontier. In 1832, as colonel, he took part in the Black Hawk War, and was the officer to whom Black Hawk surrendered; later he occasionally acted as Indian agent along the upper Mississippi.

In 1836 Taylor was ordered from Wisconsin to take command against the Seminoles in Florida. On the 25th of December 1837, after a difficult campaign, he inflicted a severe defeat upon the Indians at the battle of Okeechobee, and for this was breveted brigadier-general. Then followed four years of haraasing service in the Florida Territory. In May 1842 he assumed command of the First Department of the army, with headquarters at Fort Jefferson, Louisiana.

While at New Orleans in 1843, Taylor received orders from President Polk to march his troops into Texas, as soon as that state should accept the terms of annexation proposed by the Joint Resolution of Congress of March 2, 1845. Later in June Polk, who assumed that the Rio Grande rather than the Nueces was the south-western boundary of Texas, ordered him to take up a position at the mouth of the Sabine, or at some other
point best suited for an advance to the former river. By the middle of August Taylor had selected a position at Corpus Christi, on the west bank of the Nueces and within the disputed territory, and here he remained until the following spring. Upon the definite refusal of the Mexican government under Paredes to resume with the United States the diplomatic relations broken off by the annexation of Texas, Taylor was ordered to advance to the Rio Grande for the purpose of anticipating any hostile incursion from Mexico. He himself favoured such a movement if the United States was to maintain its claim as regards the boundary. In obedience to his instructions he left Corpus Christi on the 12th of March 1846, fortified Point Isabel as a base of supplies, and took up his position on the disputed river, opposite the Mexican town of Matamoros. Here he began to construct Fort Texas, afterwards called Fort Brown, upon the present site of Brownsville. The commander of the Mexican Army of the North, Ampudia, immediately summoned him to retire behind the Nueces under the threat of interpreting his advance as an invasion of Mexican territory. Taylor not only disregarded this summons, but within the following week proceeded to blockade the Rio Grande. Hostilities were then unavoidable, and the first passage at arms occurred on the 24th of April 1846, when a large force of Mexicans on the east bank of the Rio Grande ambushed and captured a small party of American dragoons under Captain Seth B. Thornton (1814—1847). The news of this event led President Polk, on the 13th of May, to recommend a formal declaration of war on the ground that it existed "by the act of Mexico herself," for that power "has passed the boundary of the United States, has invaded our territory and shed American blood upon American soil." This statement was incorporated in the bill declaring war, and although severely criticized during the Senate debate, passed both houses of Congress by overwhelming majorities.

Meanwhile Taylor had strengthened his base of supplies at Point Isabel, where he was reinforced by militia from Texas and Louisiana, and during the return march from this post he was fiercely attacked at Palo Alto (about 8 m. N.E. of Brownsville, Texas) on May 8th, by the Mexicans under Arista. The latter was easily driven from the field, but on the following day threatened Taylor's advance in a much stronger position, Resaca de la Palma (about 4 m. N. of Brownsville). A brilliant charge by the dragoons under Captain May decided this contest, which Taylor followed up by a pursuit of the Mexican general to the Rio Grande. After relieving Fort Brown, which had been besieged since the 3rd of May, Taylor himself crossed the river, and on the 18th of May, Matamoros, from which Arista had already retreated to Monterrey.

As it was the intention of the administration to wage war for the purpose merely of bringing Mexico to negotiate, Taylor did not immediately advance southward from the Rio Grande. When, however, Mexico persisted in her refusal to treat, Polk decided to conquer her northern provinces. Taylor formed a new base of operations at Camargo, farther up the river, and from this point, in August began an advance towards Monterrey, the capital of Nuevo León. After hard fighting he occupied this city in the latter part of September. See Map Section II. The truce with which he followed up this success was unacceptable to the administration, and upon receiving notice to resume hostilities, he occupied Saltillo, the capital of Coahuila, and Victoria, the capital of Tamaulipas, thus completing the conquest of the north-eastern states of Mexico. By this time Taylor had been reinforced by some 3000 troops which had marched under Gen. John E. Wool from San Antonio directly towards Chihuahua, but which had been deflected at Monclova to be known as "army of occupation." During the war he was brevetted major-general (May 18, 1846), and Congress thrice passed votes of thanks and ordered the presentation of commemorative gold medals. President Polk distrusted Taylor because of his supposed Whig views, and now began to express his dissatisfaction with the general's failure to take full advantage of his victories and his hesitancy to suggest a plan for the future conduct of the war. Taylor was unwilling to lead his own army farther into the desert interior of Mexico and remained non-committal upon the projected attempt from Vera Cruz. When Polk finally determined upon the latter campaign, he selected Gen. Winfield Scott, although the latter was personally unacquainted to himself, as its leader, and despite Taylor's protests detached most of his experienced troops to join Scott's command. Meanwhile through the connivance of the American authorities, Santa Anna returned from his Cuban exile, and, as the newly elected Mexican president, disregarding his pledges to aid Polk in bringing about a satisfactory peace, prepared to wage a more effective war against the American invaders. Learning of the weakened condition of Taylor's force he made a sudden advance to the northward, with some 20,000 troops, and on the 22nd of February 1847 encountered Taylor with one-fourth that number at Buena Vista, a few miles beyond Saltillo. The all-day battle in the narrow mountain pass was the most stubbornly contested of the whole war, and the brilliant victory of Taylor over such odds made "Old Rough and Ready," as he was called by his troops, the hero of the hour. With this encounter the serious work of his "army of occupation" ended, although he was later joined by Gen. Alexander W. Doniphan's troops, who had marched from New Mexico rio Chihuahua. Taylor's brilliant victory, won when he was so greatly handicapped by Polk, emphasized the popular discontent which that president's policy had already generated and suggested that the Whig leaders were more disposed to listen. The general, however, had passed his mature years wholly in military service and had never voted, much less strongly allied himself, with any political party. Nevertheless when Taylor meetings became the fashion and newspapers began to advocate his nomination, party lines threatened to disappear despite the frantic efforts of the old-time chiefs of the two leading organizations to stem the tide against the popular favourite. The Democratic party with its more efficient machinery prevented a stampede of its rank and file, but the Whigs were less successful. Within a month after his victory over Santa Anna a Whig convention in Iowa nominated him for the presidency, and public meetings in Kentucky, Ohio, Virginia, Pennsylvania and elsewhere quickly took similar action, in many cases without regard to party lines. Taylor first adopted a course of discouraging these suggestions and emphasized his non-partisan attitude, but later gave way to the pressure, and issued a statement that proved satisfactory to the majority of the Whig politicians. Yet it required four ballots in the national convention to overcome the reluctance of Webster's, Clay's and Scott's followers and secure the party designation for Taylor. The success of these last leaders was more or less counterbalanced, however, by the split of the New York Democrats over the slavery question, which assured Taylor of the vote of that state. His residence in Louisiana, his ownership of a large plantation with its slaves, and his family connexion with Jefferson Davis (who had married his daughter), rendered him more acceptable to many of the Southern Democrats than their party candidate, Lewis Cass, an advocate of "squatter sovereignty" and the representative of the democracy of the free North-West. As a result Taylor carried eight states to the Whigs were less successful. Within a month the Whigs were less successful. Within a month after states the conditions were exactly reversed. He received a majority of electoral votes on each side of the Mason and Dixon line and was confirmed in his preconceived opinion that he was to be the president of the whole people. Both parties had attempted to avoid the burning slavery issue,—the Whigs by adopting no platform whatever and the Democrats by trusting to the well-known views of their candidate, but the political leaders in Congress could not escape the many definite questions presented by the possession of the territory newly acquired from Mexico. The Wilmot Proviso and the bill to organize the territory of Oregon had already aroused both sections and had given occasion for Webster and Calhoun to state their respective views upon the constitutional questions involved. The three weeks' contest over the election of a
speaker in the House of Representatives, in December 1849, emphasized the sectional passions already engendered. Under the circumstances the first message from President Taylor was awaited with great interest. While advising Congress to "abstain from the introduction of those exciting topics of sectional character which have hitherto produced painful apprehensions in the public mind," he favoured the admission of California as a free state, and counselled the legislators to avoid "disturbances of people of different sentiments in the slavery question. As he had already encouraged California to form the state government it desired, and later took a strong position against the efforts of Texas to possess itself of part of New Mexico, it was apparent that he was less inclined to favour the radical pro-slavery programme than his previous career had seemed to promise. This was still further emphasized by his marked friendship for William H. Seward and his contemptuous reference to the territorial portion of Clay's compromise measures as the Omnibus Bill." This situation militated greatly against that leader's cherished policy, and led him to a bitter criticism of the president on the floor of the Senate. Such was the situation when the president, early in July 1850, was stricken by the disease to which he succumbed on the 9th. His remains were temporarily interred at Washington, but afterwards removed to the family cemetery near Louisville.

The only son that survived him, Richard Taylor (1820-1879), popularly known as "General Dick," graduated at Yale in 1845, entered the Confederate army at the beginning of the Civil War, was commanding officer in Louisiana, and under Kirby Smith helped to subdue the wild and unruly portion of the Confederacy, after the fall of Vicksburg. He won the victory of Sabine Cross Roads over the Union expedition under Gen. N. P. Banks on the 8th of April 1864. He finally surrendered to Gen. E. R. S. Canby on the 4th of May 1865. He wrote Destruction and Reconstruction (1879).

H. Montgomery's Life (Auburn, 1893) and John Frost's Life (New York and Philadelphia, 1847) are almost wholly devoted to President Taylor's military career, and are excessively laudatory in character. A better biography is that (New York, 1892) by Maj.-Gen. O. O. Howard, in the "Great Commanders" series. There is much material about Taylor in the general histories of M. Master, Von Holst, and Rhodes.

TAYLOR, a town in Williamson county, Texas, U.S.A., about 33 m. N.E. of Austin. Pop. (1890) 2584; (1900) 4213 (1260 negroes); (1910) 5314. It is served by the International & Great Northern and the Missouri, Kansas & Texas railways. It is in a region especially devoted to the growing of cotton and grain and to poultry raising, and an annual county fair is held here. In the city are machine and car shops of the International & Great Northern railway, and cotton-compresses, and there are manufactures of cotton-seed oil, &c. Taylor, named in honour of Gen. Zachary Taylor, was founded in 1876, and was incorporated in 1882.

TAYPORT, a police burgh of Fife-shire, Scotland. Pop. (1901) 3325. It is situated on the Firth of Tay, here about 1 m. wide, opposite to Broughty Ferry, with which there is communication by means of a ferry, 53 m. N. of Leuchars Junction by the North British railway. Its older name alternative of Ferry Port on Craig has reference both to its uses and its site. Its industries include manufactures of linen and jute, spinning mills, engineering works, timber-yard and salmon fishery. In other respects it is a residential quarter for Dundee. A mile S.W. is the ancient site of the Burgh of Tayport, which belonged to Archb. Sharp (1613-1679), of whose mansion there are still some traces. Two miles and a half W. by S. is the police burgh of Newport (pop. 2860), with stations at Easter and Wester Newport, on the North British Railway Company's loop line from Leuchars Junction to Wornet. It lies on the Firth of Tay opposite to Dundee, with which there is communication by means of a ferry, as well as by rail via the Tay Bridge. Even to a greater extent than has Tayport, it has practically become a suburb of Dundee. Its small harbour was designed by Telford. Two and a quarter miles S.W. of Wornet, the nearest railway station, close to the southern terminus of the Tay Bridge, is the village of Balmerino (Gaelic, "Town on the seashore"). Its once considerable shipping trade has declined, but some fishery is still carried on. In 1227 Eremenzarde, widow of William the Lion, and her son Alexander II. founded a Cistercian Abbey here, but in 1604 the Abbey estates were converted into a temporal lordship in favour of James Elphinstone, created Lord Balmerino.

TAY, the Roman name of the city of Ctesiphon, which was given to the town of the province of Panassagian, Lycon, the site of the ancient town of Ctesiphon, situated near the river Tchernaiev, the capital. Pop. (1905) 19,400. The river furnishes water for irrigating the low fields in the vicinity. The town's inhabitants are farmers, and rice is the principal crop. Panassagian and Ilocano are the languages spoken.

TASSA (Ital., cf. Fr. lasse, Ger. Tasse, cup; all from Persian tas, goblet), a word generally adopted by archaeologists and connoisseurs for a type of drinking vessel. It is a shallow saucer-like dish either mounted on a stem and foot or on a foot alone.

TCHERNAIEV, MIKHAIL GREGORIOVICH (1828-1908), Russian general, the Russia of a noble family, was born 24th of October 1828. Educated at the Nicholas Staff College, he entered the army in 1847, and distinguished himself in the Crimean war and in the Caucasus. After serving as divisional chief of the staff in Poland, he went to Orenburg in 1858 as assistant to the commander of the line of the Syr-Darya, and the following year commanded an expedition to support the Kirghiz tribes on the borders of the Sea of Aral against the Khivans. He did duty on the staff of the army of the Caucasus for a time, and returned to Orenburg as chief of the staff. In 1864, having reached the rank of major-general, he made his famous march with 1000 men across the steppes of Turkestan to Chimbent in Khokand, to meet another Russian column from Semipalatinsk, in Siberia, in conjunction with which he successfully stormed Chimbent, and then unsuccessfully attacked Tashkent, 80 miles farther south. Wintering at Chimbent, he captured Tashkent the following year. This was contrary to his instructions, and although he was received in St Petersburg with enthusiasm, and presented with a sword of honour by the emperor, he was not again employed in the military service, and retired from it in July 1874. He bought, and edited with great success, the Russkii list in Slavonic interests, devoting himself to the Panslavic idea. In the summer of 1876 he was appointed commander-in-chief of the Servian army, but on entering Turkey was driven back by Osman Pasha, who followed him into Servia, defeating him at Zayechar and Yavor in July, and the campaign in Servia proved disastrous. He rashly proclaimed Milan king of Servia in September, and in October Aleksinats and Deligrad were in the hands of the Turks, and the road open to Belgrade. An armistice was concluded, and Tchernaiev resigned his command. In 1877 he visited Austria in connexion with his propaganda, but was expelled, and confined for a time in France. In 1879 he organized a Bulgarian rising, but was arrested at Adrianople and sent back to Russia. He succeeded Kaufmann (q.v.) as governor of Turkestan in 1882, but his aggressive policy led to his recall two years later, when he was appointed a member of the council of war at St Petersburg. In 1886 his opposition to the Central Asian Military railway caused him to lose his seat in the council. He died on the 16th of August 1898, at his country seat in the province of Mogilev.

The publications include: Voyage scientifique dans l'Altai oriental et les parties adjacentes de la frontière de Chine (with atlas, 1845); Atlas Miniere; description physique, statistique et archéologique de cette contrée (4 vols. with 3 atlases, 1853-60); Le Boisphore et Constantinople (1864, another ed. 1877); Considerations géologiques sur les îles Centrales (1870); and Espagne, Algérie et Tunisie (1886).
TEA (Chinese cha, Amoy dialect íè), the name given to the leaves of the tea bush (see below) prepared by decoction as a beverage. The term is by analogy also used for an infusion or decoction of other leaves, e.g., camomile tea; and similarly for the afternoon meal at which tea is served.

Historical.—The early history of tea as a beverage is mainly traditional. The lack of accurate knowledge regarding the past of the Chinese Empire may possibly some day be supplied, as European scholars become more able to explore the unvisited stores in the great Chinese libraries, or as Chinese students rank-sack the records of their country for the facts of earlier periods. It may then be learnt who made the first cup of tea, who planted the earliest bushes, and how the primitive methods of manufacture were evolved. In the absence of first-hand knowledge on the subject is mingled with much that is obviously mythical and with gleanings from the casual references of travellers and authors.

According to Chinese legend, the virtues of tea were discovered by the Emperor Chinnung, 2737 B.C., to whom all agricultural and medicinal knowledge is traced. It is doubtfully referred to in the book of ancient poems edited by Confucius, all of which are previous in date to 550 B.C. A tradition exists in China that a knowledge of tea travelled eastward to and in China, having been introduced 543 A.D. by Bodhidharma, an ascetic who came from India a few years. The name of the plant is little known, but that legend is also mixed with supernatural details. But it is quite certain, from the historical narrative of Lo Yu, who lived in the Tang dynasty (618-906 A.D.), that tea was already used as a beverage in the 6th century, and that during the 8th century its use had become so common that a tax was levied on its consumption in the 14th year of Tih Tsung (793). The use of tea in China in the middle of the 9th century is known from Arab sources (Reinaud, Relation des Voyages, 1845, p. 40). From China a knowledge of tea was carried into Japan, and thence to the rest of the eastern world. Tea was first introduced into Japan by Nakahara Taniemon, in the 10th century, and was planted in the southern island of Kusshiu, whence the cultivation spread northwards till it reached the high limit of 30° N.

It is somewhat curious that although many of the products of China were known and used in Europe at much earlier times, no reference to tea has yet been traced in European literature prior to 1588. No mention of it is made by Marco Polo, and no knowledge of the substance appears to have reached Europe till after the establishment of intercourse between Portugal and China in 1517. The Portuguese, however, did very little, but that legend is also mixed with supernatural details. But it is quite certain, from the historical narrative of Lo Yu, who lived in the Tang dynasty (618-906 A.D.), that tea was already used as a beverage in the 6th century, and that during the 8th century its use had become so common that a tax was levied on its consumption in the 14th year of Tih Tsung (793). The use of tea in China in the middle of the 9th century is known from Arab sources (Reinaud, Relation des Voyages, 1845, p. 40). From China a knowledge of tea was carried into Japan, and thence to the rest of the eastern world. Tea was first introduced into Japan by Nakahara Taniemon, in the 10th century, and was planted in the southern island of Kusshiu, whence the cultivation spread northwards till it reached the high limit of 30° N.

It was not till the middle of the century that the English began to use tea, and they also received their supplies from Java till in 1668 they were driven out of the island by the Dutch. At first the price of tea in England ranged from 50 to 100 per lb. In the Mercator Politicus, No. 435, of September 1658, the following advertisement occurs:—"That excellent and by all Physic-men approved China Drink called by the Chineans Tcha, by other nations Tea, is sold at the Taltans Head, a coffe-house in Sweetings Rents, by the Royal Exchange, London." Thomas Garway, the first English tea dealer, and founder of the well-known coffee-house, "Garraways," in a curious broadsheet, An Exact Description of the Growth, Quality and Virtues of the Leaf Tea, issued in 1659 or 1660, writes, "In respect of its scarceness and dearness, it hath been only used as a regalia in high treatments and entertainments, and presents made thereof to princes and grandees." In that year he purchased a quantity of the rare and much-prized commodity, and offered it to the public, in the leaf, at fixed prices varying from 40s. the lb, according to quality, and also in the infusion, "made according to the directions of the most knowing merchants and travellers into those eastern countries." In 1660 an Act of the first parliament of the Restoration imposed a tax on "every gallon of chocolate, sherbet and tea, made and sold, to be paid by the maker thereof, eightpence." (12 Car. II. c. 23.)

Pepys's often-quoted mention of the fact that on the 25th September 1666, "I did send for a cup of tea, a China drink, of which I never had drunk before," proves the novelty of tea in England. In 1667 the Honourable East India Company presented the king with 2 lb and 2 oz. of "thee," which cost 40s. per lb, and two years afterwards with another parcel containing 22½ lb, for which the directors paid 50s. per lb. Both parcels appear to have been purchased on the Continent. Not until 1677 is the Company recorded to have taken any steps for the importation of tea. The order then given to their agents was for "tea of the best kind to the amount of 100 dollars." But their instructions were considerably exceeded, for the quantity imported in 1678 was 4715 lb, a quantity which seems to have glutted the market for a time. The Company also imported tea from India, and in February 1684, the directors wrote thus to Madras:—"In regard thee is grown to a commodity here, and we have occasion to make presents therein to our great friends at court, we would have you to send us yearly five or six canisters of the very best and freshest thee." Until the Revolution no duty was laid on tea other than that levied on the infusion as sold in the coffee-houses. By 1 William and Mary, c. 6, a duty of 5s. per lb and 5 per cent. on the value was imposed. For several years the quantities imported were very small, and consisted exclusively of "Best Sencha," which was a sort of the finest sort. The introduction of tea to England was at Amoy, the teas previously obtained by the Company's factors having been purchased in Madras and Surat, wither it was brought by Chinese junks after the expulsion of the British from Java. During the closing years of the century the amount brought over seems to have been, on the average, about 20,000 lb a year. The instructions of 1700 directed the supercargoes to send home 300 tubs of the finer green teas and 80 tubs of bohea. In 1703 orders were given for "75,000 lb Singlo (green), 15,000 lb imperial, and 20,000 lb best to goos", at the average price of tea at this period was 16s. per lb.

As the 18th century progressed the demand for tea in England rapidly increased, and by the close of the century the rate of consumption exceeded an average of 2 lb per person per annum, a rate in excess of that of to-day of all people except those of Mongol and Anglo-Saxon origin. The business being a monopoly of the East India Company, and a very profitable one, the company at an early stage of its development endeavoured to ascertain whether tea could not be grown within its own dominions. Difficulties with China doubtless showed the advisability of having an independent source of supply. In 1718 Sir Joseph Banks, at the request of the directors, drew up a memoir on the cultivation of economic plants in Bengal, in which he gave special prominence to tea, pointing out the regions most favourable for its cultivation. About the year 1820 Mr David Scott, the first commissioner of Assam, sent to Calcutta from Kuch Behar and Rangpur—the very districts indicated by Sir Joseph Banks as favourable for tea-growing—certain leaves, with a statement that they were said to belong to the wild tea-plant. The leaves were submitted to Dr Wallis, government botanist at Calcutta, who pronounced them to belong to a species of Camellia, and no result followed on Mr Scott's communication. The leaves ultimately came into the herbarium of the Linnean Society of London, and have authoritatively been pronounced to belong to the indigenous Assam tea-plant. Dr Wallis's attribution of this and other specimens subsequently sent in to the genus Camellia, although scientifically defensible, unfortunately
diverted attention from the significance of the discovery. It was not till 1834 that, overcome by the insistence of Captain Francis Jenkins, who maintained and proved that, called by the name Camellia or not, the leaves belonged to a tea-plant, Dr Wallich admitted "the fact of the genuine tea-plant being a native of our territories in Upper Assam as incontrovertibly proved." In the meantime a committee had been formed by Lord William Bentinck, the governor-general, for the introduction of tea culture into India, and an official had already been sent to the tea districts of China to procure seed and skilled Chinese workmen to conduct operations in the Himalayan regions. The discovery and reports of Captain Jenkins led to the investigation of the capacities of Assam as a tea-growing country, and in 1834 an Act was passed by the East India Company resolved to institute an experimental establishment in Assam for cultivating and manufacturing tea, leaving the industry to be developed by private enterprise should its practicality be demonstrated.

In 1834 the monopoly of the East India Company was abolished and an era of rapid progress in the new industry began. In 1836 there was sent to London 1 lb of tea made from indigenous leaves; in 1837 2 lb of Assam tea were sent; in 1838 the quantity sent was 12 small boxes, and 95 boxes reached London in 1839. In 1840, 1841, and 1842, tea was offered at public auction in Calcutta early the following year, 35 packages, chiefly green-teas, stated to have been manufactured by a chief of the Singpho tribe aided by the government establishment. In the same auction catalogue were included 95 packages, "the produce of the Government Tea Plantation in Assam," many of which bore the Chubwa mark, one well known to this day. This auction is most interesting as being the first of British-grown tea, and it included about 6000 lb. It is of interest also for the reference to the Singpho tribe, who are even now in small numbers in the same district, where the tea produced in a primitive manner tea plucked from the indigenous trees growing in their jungles.

In January 1840 the Assam Company was formed to take over the early tea gardens of the East India Company, and this, the premier company, is still in existence, having produced up to 1907 no less than 117,000,000 lb of tea and paid in dividends £1,650,000 or 730 per cent. on capital. It is no longer the first company in extent of yield, as the Consolidated Tea and Lands Company produced in 1907 about 15,000,000 lb of tea, besides other products. The introduction of Chinese seeds and Chinese methods was a mistake, and there seems little reason to doubt that, in clearing jungle for tea planting, fine indigenous tea was frequently destroyed unwittingly in order to plant the inferior China variety. The period of unlearning the Chinese methods, and replacing the Chinese plants, had to be lived through. Vicissitudes of over-production and inflation came to interfere with an even course of success, but the industry developed and has increased enormously. From its point of origin in Assam, it has gradually spread to other districts with varying commercial success. The aggregate total of capital of the tea-producing companies in India and Ceylon now amounts to about £23,500,000.

The Dutch were rather earlier than the English in attempting to establish tea growing in their eastern possessions. A beginning was made in Java in 1826, but probably because of the even more marked influence of Chinese methods and Chinese plant, the progress was slow and the results indifferent. Of late years, however, by the introduction of fine Assam seed and the adoption of methods similar to those in use in India, a marked improvement has taken place, and there seems little reason to doubt that, with the very rich soil and abundant cheap labour that the island of Java possesses, the relative progress there may be greater in future than in any other producing land.

Somewhere about 1860 the practical commercial growing of tea was introduced into the island of Formosa. The methods of cultivation and manufacture followed there differ in many ways from those of the other large producing countries, but the industry has been fairly successful throughout its history. Attempts were repeatedly made to introduce tea culture in Ceylon, under both Dutch and British authority. No permanent success was attained till after 1836, when the disastrous effects of the coffee-leaf disease forced planters to give serious attention to tea. Since that period the tea industry has developed with marvellous rapidity, and now takes first rank in the commerce of the island.

Several plantations have been successfully put out both by the Russian government and private enterprise in the Caucasus, but it is doubtful whether they could exist long but for the high rate of duty on tea entering Russia from foreign countries. Natal has now about 3000 acres under tea giving a fairly large yield, and plantations are being established higher up on the slopes of the Drakensberg. The Cape Province is about 600 miles from the tea-growing region in Natal, and it is doubtless the desire to produce a tea of the quality most highly esteemed outside of Southern Africa, where it benefits to the extent of 4d. per pound of protection in the tariff. A small plantation exists in South Carolina under circumstances not conducive to financial success on a large scale of production. Attempts at tea growing have been made in the West Indies, Brazil, Australia, Nyassaland, Mauritius, the Straits Settlements, Johore, Fiji and at San Miguel in the Azores without marked success. In addition to favourable conditions of soil and climate, abundant cheap labour is an absolute necessity if satisfactory commercial results are to be obtained.

Botany.—The tea bush or tree is a member of the natural order Theaceae and is closely allied to the well-known ornamental shrub the camellia. As cultivated in China it is an evergreen shrub growing to a height of from 3 to 5 ft. The stem is bushy, with numerous and very leafy branches; the leaves are alternate, leathery in texture, elliptical, obtusely serrated, strongly veined and placed on short channelled footstems. The flowers are white, axillary and slightly fragrant,—often two or three together on separate pedicels. The calyx is small, smooth and divided into five oblong sepals. The corolla has from five to nine petals, cohering at the base. The stamens are short, numerous and inserted at the base of the corolla; the anthers are large and yellow, and the long style ends in three branches. The fruit is a woody capsule of three cells, each containing one large nearly spherical seed, which consists mainly of two large hemispherical cotyledons.

As is commonly the case with plants which have been long under cultivation, there has been some doubt as to specific distinctions among the varieties of tea. The plant was originally described by Linnaeus as one species, Thea sinensis. Later Bentinck established two species, viz. Thea Bohea and Thea viridis, and it was erroneously assumed that the former was the source of black teas, while Thea viridis was held to yield the green varieties. In 1843, however, Mr Robert Fortune found that, although the two varieties of the plant existed in different parts of China, black and green tea were produced from the leaves of the same plant by varying the manufacturing processes.

SIR GEORGE WATT (Journal of the Royal Agricultural Society, vol. xxxii.) describes with ample illustrations the recognized varieties, placing all of them under Camellia Thea, with the following subdivision:

A. Variety Viridis—races

1. Assam Indigenus.
2. Lushai.
4. Manipur.
5. Burma and Shan.

B. " Bohea.
C. " Stricta.
D. " Laxifoliax.

Of the foregoing, the teas of commerce are derived almost entirely from the varieties Viridis and Bohea. The Assam Indigenus, in its two sub-races of Singlo and Bazalona, and the Manipur, originally found wild in the jungles of the native state of that name, have, with various intercrossings and crossings, been used to cover the greatest areas of all the more modern planting in India, Ceylon and Java. The great size
of leaf when fully developed (4 to 9 ins. in length and 2 to 3½ in breadth) has made them in demand because of the heavy yields. From the variety Bohea, or from hybrids of descent from it, came the China teas of former days and the earlier plantings in India grown from imported China stock. The leaves of this variety are generally, roughly speaking, about half the size of those of the Assam Indigenous and Manipur sorts. The bush is in every way smaller than the Assam types. The latter is a tree attaining in its natural conditions, or where allowed to grow unpruned in a seed garden, a height of from 30 to 40 ft. and prospering in the midst of dense moist jungle and in shady sheltered situations.

The Bohea variety is hardy, and capable of thriving under many different conditions of climate and situation, while the indigenous plant is tender and difficult of cultivation, requiring for its success a close, hot, moist and equable climate. In minute structure it presents highly characteristic appearances.

The under side of the young leaf is densely covered with fine one-celled thick-walled hairs, about 1 mm. in length and 0.15 mm. in thickness. These hairs entirely disappear with increasing age. The structure of the epidermis of the under side of the leaf, with its contorted cells, is represented (×160) in fig. 3.

A further characteristic feature of the cellular structure of the tea-leaf is the abundance, especially in grown leaves, of large, branching, thick-walled, smooth cells (idioblasts), which, although they occur in other leaves, are not found in such as are likely to be confounded with or substituted for tea. The minute structure of the leaf in section is illustrated in fig. 4.

Constant controversy has existed as to what is the actual original home of the tea-plant, and probably no one has given to the subject more careful study than Professor Andreas Krassnow, of Kharkoff University. By order of the Russian government, he visited each of the great tea-growing countries, and the results of his observations were published in a book entitled *On the Tea-producing Districts of Asia*. He holds the opinion that the tea-plant is indigenous, not to Assam only, but to the whole monsoon region of eastern Asia, where he found it growing wild as far north as the islands of southern Japan. He considers that the tea-plant had, from the remotest times, two distinct varieties, the Assam and Chinese, as he thinks that the period of known cultivation has been too short to produce the differences that exist between them.

Chemistry.—What may be termed the chemistry of production, viz., that relating to soils, manures, manufacturing processes, &c., has of recent years received great attention from the scientific experts appointed in India and Ceylon to assist and guide the tea planters. The chemistry of the completed teas of commerce does not appear to have been subjected to adequate scientific study. There cannot be said to be any standard or recognized analysis. Many such have been made, and they may be found in chemical text-books of high authority, but they are defective because of the lack of commercial knowledge in association with the chemical skill. More attention seems to have been given to the matter in the United States of America and in Germany and Russia than in England, but the infinite variety of samples known to the commercial expert, and the impossibility of standardizing those in such a manner as to make readily recognizable what the chemist has treated, renders most of the recorded analyses of uncertain value.

There seems to be no relationship between the commercial value and the analysis, the arbitrary personal methods of the expert tea-taster being controlled by factors that chemistry does not appear to deal with. One reason may be that analyses are generally made of tea liquors produced by distilled water, which is the very worst possible from the point of view of the commercial expert or in domestic usage.

The principal chemical constituents of tea of practical interest are: caffeine, tannin and essential oil, on which depend respectively the physiological effects, the strength and the flavour. The commercial value appears to depend on the essential oil and aroma, not on the amount of caffeine, tannin or extract.

The following is suggested as a typical analysis of an average sample of black tea:—

Also a trace (1 to 2 per cent.) of boheic acid, a vegetable acid peculiar to tea. The amount of tannin found in green teas appears to be
about half as much again as in black, and the former always yield less moisture, doubtless because of the harder fibre produced by the methods of manufacture followed by the different commercial uses. A large percentage of moisture found in any sample would indicate improper condition. At the stage of final firing, tea is supposed to be dry, not completely as is possible, and it is then sealed up to exclude air entirely. However, most liable to absorb moisture upon subsequent exposure. Caffeine (formerly known as theine) is the alkaloid of tea, and is identical with that of coffee, guarana, mate, and other closely related plants of the theobromaceous family. A large quantity of cocoa, and also to uric acid. In large quantities it is a poison, but in smaller quantities it acts as a stimulant. It exists in greater percentage in Indian and Ceylon teas than in those from Java, and is lowest in China and Japanese. Taxation is a hindrance and astringent substance, and in large quantities impairs digestion. Prolonged infusion increases the amount extracted. The essential oil of tea is of a characterless colour; it is lighter than water and possesses the distinctive odor of tea. Extracts made from it yield to 40 per cent. and is of guide to quality. Ash averages 5-7 per cent., about half of which is soluble in water. About 8 per cent. of it is proof of adulteration.

Commercial.—There is probably no article of large consumption the commerce in which has been so revolutionized during a single generation. In 1877, except to the initiated, tea meant China tea. India and Java were producing a little, but practically none only in Great Britain and Holland. Formosa and Japan were beginning to attract attention in America, but China supplied the world, and already supplied the market in the London market. Days of sailing ships from China had not entirely passed, and the steamers of the period were built for rapidity of transit to London. The Australasian colonies got their supplies direct, and part of the Russian tea was bought for the Russian public. By 1897, however, the greatly increased production in India and Ceylon, with the willingness of many nations to drink this tea, in preference to those of China, had left her to Russia as a customer of a customer. Nearly half her exportation of tea to the Russian markets is the return via Ceylon to India, showing that country too turned in the direction of using the stronger varieties. China and Japan have hitherto been regarded as the chief producers of tea, and the reputed large domestic consumption of those Mongolian peoples has led to assumptions of vast internal productions. There exist absolutely no data, and it is doubtful whether such a country can ever be gathered, for forming trustworthy estimates. In both of those countries tea is grown principally in a retail manner, and much of it simply for family consumption. The country cultivator has, as a rule, only a small area—perhaps a corner of his farm or garden—planted with tea, the produce of which is roughly sun-dried and cured in a primitive manner. Any surplus not needed for the family is sold in its sun-dried state to the collector, who takes it to the Hong, where it is fired, blended and packed for exportation. Excluding therefore from the description, the quantities produced for internal consumption in China and Japan (that from the former alone has been estimated at a total of 24,000,000 lb. in 1877), the following are the acreages for the years 1908:

The quantities exported only are 276,601,000

The quantity from China includes about 16,000,000 lb. imported from India, Ceylon and Java, and worked up with China tea into bricks and tablets.

The modern developments of production and consumption have rendered the subject of China tea one of subordinate interest, except to students of commercial evolution. In several of the earlier editions of this work it was necessary to enlarge the headings, with many interesting pictorial illustrations of the processes of production. The conservative tendencies of Japan are most suitable to develop the old methods of extensive cultivation based on scientific manipulation of the crops by machinery in place of hand labour. Conclusively, their export trade has been for many years a diminishing thing in the eyes of the experienced grower. In China above, only 81,000,000 lb. were the ordinary black tea known to the English consumer (collectively described in the United States of America and Canada as English Breakfast Tea '). Out of that total, Great Britain consumed only about 5,000,000 lb., against a consumption of 126,000,000 lb. of China tea in the United States of America. This was chiefly to the United States of America, to Central Asia, and North Africa. The remainder, 88,000,000 lb. is brick and tablet tea sent entirely to Asiatic and European Russia, and to Java, Ceylon and the other islands in the territories of the Chinese empire. The use of brick tea is somewhat uncommon in western Europe. It does not arise from the necessity of reducing bulk to a minimum for conveyance by canals and rivers, but rather from the desire to separate the preparation of the tea in its requisite form has, however, largely left Chinese hands. The Russians have themselves established several important factories at Hankow, which is the chief seat of this industry, and to which plants are imported from China; large quantities are exported from India, Ceylon and Java. There are freely used in the preparation of small tablets, compressed to such a condition of hardness as to be portable, and are passed round as currency in certain districts of Russia. Of a somewhat different nature is the brick tea prepared chiefly at Ya-chou in the province of Ssu-chuan for overland transit to Tibet, to investigate the commerce in which Mr James Hutchison, M.A., was sent in 1906 as a special commissioner for the Indian Tea Cess Committee. This tea is mostly prepared from exceedingly rough leaf, including even bush prunings, which would only be plucked and used in the interior. The brick process was initiated, but worked out, in Ceylon. It is "panned," rolled, fermented and divided into various classes or qualities. It is then steamed and placed in a moulding frame, and forced to the required shape of brick wanted. The bricks are wrapped in paper bearing handwriting and the writing in Tibetan. For transit they are packed twelve together in hides sewn up while moist, which contract to a strong tight bundle and thus prevent the setting of the tea. The back of the coals for great distances across very high passes into Tibet, and the trade is estimated at an average of 19,000,000 lb. per year. About 9,000,000 is a subsidy from the emperor of China to the Tibetan monasteries.

The Japanese production is almost entirely green tea for North American use. It is prepared in two distinctive classes named by the first process to which they are submitted, viz., basket-fired, i.e. dried over a hot stove in a basket, and pan-fired, i.e. in machine-made pans. The industry is a declining one, because of change in the American taste, and the area under cultivation has diminished by nearly 20 per cent. in the ten years since 1896. The mulberry leaf for the most profitable silk trade has taken its place. The export production of Formosa is limited to a particular class of tea termed Formosa Oolong, practically all produced in the island of Taiwan. It is scarcely known in England save by experts. The Tea Cess Committees of India and Ceylon have been two powerful agencies for the improvement of the products. As the planting, productive and manufacturing processes of India may be taken to be generally representative of the trade.

The methods described hereafter are those generally followed in India and Ceylon in the manner of the most modern application.
but variations must take place according to district and elevation.

Propagation is from seed only. The seed is rather larger than that of the black mustard, and is perfectly spherical in shape. When ripe (about the month of November) the seeds are placed a few inches apart in carefully prepared nursery beds, which are then kept covered. During the first week or ten days after sowing, the third and fourth flushes are carefully removed. The seedlings should then be 6 in. to 8 in. high and ready to plant out in the fields. These are prepared by cutting down and building up the bushes, and afterwards hoed so as to form parallel rows running both ways. The intervals of planting vary, but 4 ft. by 4 ft. is a very common distance. In 15 ins. to 18 ins. deep, are dug for each plant, and refilled loosely—then the plants are carefully placed so as to admit of the shading being

interplanting of nitrogen-producing growths has been done with a view to enriching the soil, most notably clover.

Planted out.

In the early days an attempt was made to copy the Chinese methods, and the various processes were manual. Now, from the plucking stage onwards, almost everything is done by machinery. Seventy per cent. of the bushes are plucked every 7 to 10 days, and, as a rule, in India the opening bud and two leaves below it are plucked. To take more than this would be considered necessary. Besides, in the immature, the longest rarely being more than an inch in length. The lower leaves on the young shoots are too old and hard to manufacture into tea. The plucking is done by women and girls, who use a curved pruning knife, the blades of which the tea is touched by hand. The plucking season continues in some districts of India till December. As they are plucked, the leaves are spread out in baskets, and twice daily the pluckings are heaped up in sieves, which results in the leaves becoming firm and at the same time overcome any excess of moisture. The leaves are then dried in the sun, or are dried in sheds or in the shade. When the leaves are dry, they are either packed in bundles or separated, and sent, per train or steamer, to the factories. The leaves are then laid out in the manufacture, or a sort of drying

Various species of Ceylon and Assam, are raised in the northern plains of India. It was estimated that the whole crop of tea in 1900 was 250,000,000 lb., of which 230,000,000 lb. were manufactured, the balance being consumed in India.

The manufacture of tea consists of two operations—drying and fermenting. The leaves, having been plucked, undergo two processes—drying and fermentation. The leaf is first dried by the sun, or in ovens, and is then ready for rolling. On a successful outing the amount of the tea or enzyme is dependent. The object of rolling is to crush the leaves and to break their cells so as to liberate the juices. The leaves are passed repeatedly through a machine driven by steam or other power giving a rotary motion, the operation occupying about 40 to 60 minutes. The next process is familiarly termed fermentation, but is really an oxidation of the leaves. Should the leaf be subjected to heat and steam, or other process, before fermentation, it is said to have been withered, and some other processes applied, but in India very little green tea is manufactured. Many people still cherish the antiquated belief that the black and dark are formed and enhanced in the manufacture of the tea-plant, which is quite a mistake, the difference being merely one of preparation. After being rolled, the leaves are spread out in layers of 1 to 2 ins. thick in a cool house, and left under undergoing a second action, during which the leaves are checked after from 2 to 3 hours, according to climatic conditions. A further brief rolling to close up the open leaves is followed by the first firing, which is effected by subjecting the leaves to the gradual action of hot air up to a temperature of 250° F. Various processes of the same kind are in use, but the most popular is to place the leaves on the wires of a machine in a high temperature for about 9 hours, which will mature the leaf. When this point of the manufacture the leaf has been in the stalk, the leaves and bud being unseparated. They are now broken apart and sorted by mechanical sifters into the various grades or qualities, which are described as Orange Pekoe, Broken Pekoe, Tchins and Souchong, each of which names represents approximately the leaf-bud and the three lower leaves. In addition to these four classes, out of each are sifted all the broken elements of leaf broken in the process of manufacture, which are termed Broken Orange Pekoe, &c. These broken grades are frequently objected to by the consumer, under the impression that they are inferior in quality, but in the opinion of many experts—indeed the more broken grades are esteemed by those who enjoy the tea upon infusion. Upon completion of the sifting, the tea is again fired, and while warm it is packed tightly into lead-lined chests, and the leaf covers completely soldered over it, so that it may be kept practically air-tight.

The machinery in use is very varied in character, and it has been evolved principally by practical planters of a mechanical turn. It is not necessary to keep an engineer, but it is usual to have a sort of foreman who will direct the running of the plant, and who can be trained without any particular qualifications. The machinery is generally simple in character, and it is not unusual for a large estate, or a group of estates, to have one member of the European staff who is a qualified engineer. The motive power is generally a steam engine, but the greater economy and facility of oil engines have led to their fairly widespread adoption. Where water power is available, turbines of a variety of types are in use. The machine to be driven are air fans, rollers, roll-breakers, sifters, cutters and packers, and there are besides numerous types of driers or destackers. The names associated with the most successful and widely used machines are those of the Messrs. Jackson (makers, Marshalls of Gainsborough) and Davy (makers, Thos. & Davy, of Newhall). The production of the empty boxes for packing, called chests or half-chests, is in itself a large industry. The heavy old-fashioned country-made packages are rapidly being replaced by light-tared boxes made from several thicknesses of paper. The tea is then pressed tightly together, most of which come from Russia.

A production temporarily in excess of the world's demand of several years ago, led to the offering of bonuses for the production of tea in India. In 1908 the Ceylon government offered £3 per cwt. for the weight of the best quality of tea.
the ferment or enzyme, and renders it possible to conserve the tea in what is really nearer its natural form than the black tea that is so well known to the consumer.

Tea Consumption.—The following table gives particulars relative to the principal consuming countries, from which it will be seen that Great Britain and its English-speaking dependencies are the great consumers:

The countries of smaller consumption absorbed about 25,000,000 lb, but there is a considerable excess in the returns of production over those of consumption. This arises partly from the latter relating in certain instances to an earlier period, and partly from the fact that much of the yield of 1906 was float or underspatched at the close of that year.

The following table gives the approximate rates of duty per English lb during 1907 in places not referred to above:—

The rate per head of population within the United Kingdom has not increased much during recent years, and in the Australasian colonies it has apparently fallen greatly as compared with recorded averages of 12 lb per head in Victoria and 9 lb in New South Wales in 1884. The modern statistics of the commonwealth may have accurately kept, and there may be less waste in use, but it is not supposed that there is any diminution in the free use of the beverage which has always characterized the anti-podean colonist. One important factor in keeping down the amount per person is the substitution in use, which for a generation has been in progress, of the stronger teas of India and Ceylon for the old-fashioned weaker produce of China. The progressive increase in the consumption of tea in Great Britain and Ireland during 50 years from 1836 to 1886 is shown in the table below. The dotted line represents the average monthly consumption in each year; the fluctuations in price of good sound China congou are traced by the black line; and the years in which reduced customs duty came into operation are indicated along the base. From 1860 onwards, the amount of Indian tea entered for home consumption is shown in monthly average by a black column. This column brings out the remarkable fact that the Indian tea alone consumed in 1886 equaled the consumption of all kinds in 1860, and was double the quantity of all kinds in 1836. The table, however, shows merely the general development of con-

**FIG. 5.**

---

The table below shows the gradual and almost total displacement of China tea by that grown in the English dependencies. In both, the price fluctuations and fiscal changes are shown that their effect upon consumption may be judged. The prices below are the annual averages for all Indian teas sold in the London public auction market during the years stated. Lowness of price has not been the only factor in increasing the rate of consumption. The lean years and the fat years of the general labour market always tell, and the low range
prices for sugar during recent times has undoubtedly assisted in increasing the amount available for expenditure on tea. In Russia tea costs more to the consumer than in any country where modern transit by railway and steamer exists. The reason is the enormous proportion of the retail selling price which is exacted by the government by way of duty. But in return the government, with a paternal care for its people, makes absolutely certain that the tea reaches their hands as pure and unadulterated as when it first entered the country. Russian tea has always had a high reputation — largely sentimental, however. The quantity taken by the country is very large, but when spread over the enormous population the rate of consumption per person is not great. The extreme poverty of the great body of the people and the high price doubtless explain this. The method of use differs much from that followed in England. The samovar, or urn for boiling the water, is always in much evidence. Tea that makes a dark, strong liquor is preferred — not that such tea is more possible; quantity of tea-colored water may be drained from the teapot by refilling it over and over again from the samovar. The tea is generally drunk from glasses and while very hot, with a liberal addition of sugar and a flavouring of lemon. The method of use is probably a more healthy one than that followed in many parts of the United Kingdom, where strong infusions of powerful teas are indulged in too frequently.

The United States of America and the great colonial dependencies follow generally the English way of using the beverage. France, considering that it is England’s nearest neighbour, has a remarkably small tea consumption: 0.06 lb per person per annum, or about 1/34th only of the English rate. The increase in consumption there has been so small that it probably arises mainly from the increasing number of English and English-colonial visitors that spend portions of each year in the country.

Germany, and the Germanic peoples, take slightly more per person, but the statistics are rather indefinite. Holland, in Europe, comes next to England, and uses principally the product of her dependencies Java. The other nations of Europe are very small consumers. Some of the peoples of eastern Europe take their tea with an admixture of rum. In Morocco and generally throughout North Africa there is a considerable demand for green tea, which is drunk hot out of glasses, the liquor being almost saturated with sugar and strongly flavoured with mint.

In China and Japan tea is generally drunk without any other qualifying or flavouring addition. Exceedingly delicate teas can therefore be used unimpaired. In Japan the ceremony of serving tea is one of the better classes, been raised to a high art, which the girls have to study at school for protracted periods.

In Mongolia and other parts of Central Asia tea is made into a kind of soup, somewhat on the lines of the following written regarding tea in "Thibet by Dr. Oldham." Writing of the Tibetan he states: "As a beverage he drinks, all day long, cupsful of hot buttered tea, which is really a soup or broth made by boiling tea-leaves with rancid butter and rolls of rice (Chuk), and adding a little salt, and straining—a decoction which was invariably nasty to our taste, though no doubt it is wholesome; for it is not merely a stimulating hot drink in the cold, but overcomes the danger of sickness from drinking too much water in a country where the least water supply is dangerous polluted."

**Geography of Tea.**—The successful commercial production of tea on a large scale is confined to a strictly limited area enclosed by about 40° of latitude (5° S. to 35° N.) and about 73° of longitude (109° E. to 100° E.), and adding a little salt, and straining—a decoction which was invariably nasty to our taste, though no doubt it is wholesome; for it is not merely a stimulating hot drink in the cold, but overcomes the danger of sickness from drinking too much water in a country where the least water supply is dangerous polluted.

1. The samovar, or urn for boiling the water, is always in much evidence. Tea that makes a dark, strong liquor is preferred — not that such tea is more possible; quantity of tea-colored water may be drained from the teapot by refilling it over and over again from the samovar. The tea is generally drunk from glasses and while very hot, with a liberal addition of sugar and a flavouring of lemon. The method of use is probably a more healthy one than that followed in many parts of the United Kingdom, where strong infusions of powerful teas are indulged in too frequently.

2. The United States of America and the great colonial dependencies follow generally the English way of using the beverage. France, considering that it is England’s nearest neighbour, has a remarkably small tea consumption: 0.06 lb per person per annum, or about 1/34th only of the English rate. The increase in consumption there has been so small that it probably arises mainly from the increasing number of English and English-colonial visitors that spend portions of each year in the country.

3. Germany, and the Germanic peoples, take slightly more per person, but the statistics are rather indefinite. Holland, in Europe, comes next to England, and uses principally the product of her dependencies Java. The other nations of Europe are very small consumers. Some of the peoples of eastern Europe take their tea with an admixture of rum. In Morocco and generally throughout North Africa there is a considerable demand for green tea, which is drunk hot out of glasses, the liquor being almost saturated with sugar and strongly flavoured with mint.

4. In China and Japan tea is generally drunk without any other qualifying or flavouring addition. Exceedingly delicate teas can therefore be used unimpaired. In Japan the ceremony of serving tea is one of the better classes, been raised to a high art, which the girls have to study at school for protracted periods.

5. In Mongolia and other parts of Central Asia tea is made into a kind of soup, somewhat on the lines of the following written regarding tea in "Thibet by Dr. Oldham." **TEA-CADDY—TEAK** 483

Tea Adulteration.—In the earlier days of the tea trade, adulteration, especially prior to importation, was frequent, because the prices obtainable made it remunerative. Now, intentional adulteration is far less general, although the places of production the price obtainable is so low that any possible adulterant would be too costly to collect. Most countries have a close check upon this at the time of importation, and the checking is especially strict in British India, to analysis all samples of a doubtful character. Impure teas are not permitted to pass into consumption, but the quantity condemned after analysis as unfit for use in the year 1906 was 41 packages, out of a total of $175,000,000 lb.

Effect on Health.—The effect of the use of tea upon health has been much discussed. In the days when China green teas were much used, tea-grocers told the public that tea was a serious, because of the objectionable facing materials so often used. In the modern days of machine-made black tea, produced under British supervision, both the tea-taster and the ordinary consumer has to be on his guard against the product which has been carefully cooked and used in moderation, should be harmless to all normal human beings. There has been constant controversy as to whether China tea is better than that of other growths, but the verdict first of all of Great Britain, and subsequently of all the other large consuming countries, has relegated the produce of the Celestial Empire to a very subordinate position. A limited section of connoisseurs, on brick tea, Formosa tea, and other sorts, some of which are prepared for the Teacess Committees of India and Ceylon; *Journals of the Royal Asiatic Society, Journal of the Society of Arts, Geographic Journal of India and Ceylon, China in London,* and the like, with practical planting details, see *Tea: its Cultivation and Manufacture,* by David Crole (1897), with a full bibliography; also Rutherford's *Planter's Handbook.* For scientific aspects see *Chemistry and Agriculture of Tea,* by M. Kelway Bamber (1893). (J. M.G.)

**TEA-CADDY,** a box, jar, canister or other receptacle for tea. The word is believed to be derived from *catty,* the Chinese pound, equal to about a pound and a third avoirdupois.

The earliest examples that came to Europe were of Chinese porcelain, and approximated in shape to the ginger-jar. They had lids or stoppers likewise of china, and were often frequently blue and white. The English kilns at first imitated them, but speedily devised forms and ornament of their own, and there was hardly a ceramic factory in the country which did not compete for the supply of the new fashion. But tea-caddies were not for long confined to procelain or faience. They were presently made in a great variety of materials, and in an equal variety of shapes. Wood, pewter, tortoise-shell, brass, copper and even silver were employed, but in the end the material most frequently used was wood, and there still survive vast numbers of them, made in Japan for the European market. The woods used are wood and other choice timbers, often mounted in brass and delicately inlaid, with knobs of ivory, ebony or silver. Although many examples were made in Holland, principally of the earthenware of Delft, the finer varieties enamelled, enriched with ciphers, and emblazoned with heraldry, the tea-caddy was a typically English product. As the use of the jar waned and that of the box increased, the provision for different receptacles for green and black tea was abandoned, and the wooden caddy, with a lid and a lock, was made with two and often three divisions, the centre portion being reserved for sugar. Chippen-dale's caddies in Louis Quinze fashion were delightful, with their claw and ball feet and exquisite finish. On the whole the mahogany or rosewood caddy of the latter part of the 18th and the early years of the 19th century was, from the artistic point of view, the most elegant and satisfying. The wood was rich and well-marked, the inlay simple and delicate, the form graceful and unobtrusive. Even when it took the shape of a miniature sarcophagus, imitated from the massive wine- box of the Empire period, with little claw feet and brass rings, it was a decidedly pleasing object. The larger specimens were known as tea-chests. As tea grew cheaper it became less important that it should be kept constantly under the mistress's eye, and the tea-caddy gradually fell into desuetude. It has, however, never gone entirely out of use, though handsome examples are now most commonly regarded as ornaments or preserved in collections.

**TEACH** [Thatch or Thatch]. EDWARD (d. 1718), English pirate, popularly known as Blackbeard, is believed to have been born at Great Harwood in Yorkshire. He is said to have gone out to the West Indies during the war of the Spanish Succession of 1701-13, then spent some years in privateering, and after the declaration of peace (1713) to have turned pirate, but he is not actually heard of in this capacity till the end of 1716. The following year he captured a large French merchantman, rechristened her "Queen Anne's Revenge," and converted her into a warship of forty guns. His robberies and outrages in the Spanish main, the West Indies, and on the coasts of Carolina and Virginia, quickly earned him an infamous notoriety. He made his winter quarters in a convenient inlet in North Carolina, the governor of which colony was not above sharing in the profits of his crimes, but the governor of Virginia at last dispatched two sloops, manned from the British warships on the station, to cut him out. On the 22nd of November 1718 Lieutenant Maynard, commanding the attacking forces, boarded Teach's sloop, after a sharp fight, and himself shot the pirate dead. Teach seems to have been an ignorant ruffian. His personal appearance was remarkable. His nickname was due to his habit of tying up the ends of his long and bushy black beard with ribbon and curling them back over his ears. Johnson in *General History of the Pyrates* has his name as Teach, but according to the official records it was really Thatch or Teach.

**TEAK,** the most valuable of all known timbers. For use in tropical countries it has no equal, and for certain purposes it is preferable to other woods in temperate climates also. Its price is higher than that of any other timber, except mahogany. Great efforts have been made to find substitutes, but no timber has been brought to market in sufficient quantities combining the many valuable qualities which teak possesses.

The first good figure and description of the tree was given by Rheed, the best modern picture being that given by Brandis. The younger Linnaeus called it *Teckoa grandis.* It is a large deciduous tree, of the natural order Verbenaceae, with a tall, straight but often buttressed stem, a spreading crown, and the branchlets four-sided with large quadrangular pith. It is a native of the Indian peninsula, Burma and Siam, and is also found in the Philippine Islands, in Java and elsewhere in the Malay Archipelago. In India proper its northern limit is 24° 40' on the west side of the Aravalli Hills, and in the centre, near Jhansi, in 25° 30' N. lat. In Burma it extends to 20° 50' N. lat. From the wood of the teak, known in the English language as *Sarawak* teak, a large proportion of the teak produced in British India is exported to the United States of America. The wood is known as *Sarawak* teak, and the town of Sarawak on the Persian Gulf was entirely built of it. Saj is the name in Arabic and Persian; and in Hindi, Mahtrati and the other modern languages derived from Sanskrit the tree is called by that name. The tree itself is occasionally planted in Portugal, adopting this, called it *teke, teca,* whence the English name.

The rate in the London market since 1860 has fluctuated between 7½ and 8½ per load of 50 cab. ft.

1 The Sanskrit name of teak is *saka,* and it is certain that in India teak has been known and used largely for considerably more than 2000 years. A large number of the oldest and most important buildings in India are constructed of teak, and the town of Saraf on the Persian Gulf was entirely built of it. Saj is the name in Arabic and Persian; and in Hindi, Mahtrati and the other modern languages derived from Sanskrit the tree is called by that name. The tree itself is occasionally planted in Portugal, adopting this, called it *teke, teca,* whence the English name.

2 Forest Flora of North-West and Central India, Ill. t. 44.
TEAK

TEAK to near Myitkyina, in lat. 25° 30'. In Bengal or Assam it is not indigenous, but plantations have been formed in Assam as far as the 27th parallel. In the Punjab it is grown in gardens to the 32nd.

Teak requires a dry tropical climate, and the most important forests are found in those districts of India where, during the summer months, heavy rains are brought by the south-west monsoon, the winter months being nearly rainless. In the interior of the Indian peninsula, where the mean annual rain fall is less than 30 in., teak is more scarce, and it thrives best with a mean annual fall of more than 50 in. The mean annual temperature which suits it best lies between 75° and 81° Fahr. Near the coast the tree is absent, and inland the most valuable forests are on low hills up to 3000 ft. It grows on a great variety of soils, but there is one indispensable condition—perfect drainage or a dry subsoil. On level ground, with deep alluvial soil, teak does not always form regularly shaped stems, probably because the subsoil drainage is imperfect.

During the dry season the tree is leafless; in hot localities they do not fall in January, but in moist places the tree remains green till March. At the end of the dry season, when the first monsoon rains fall, the fresh foliage comes out. The leaves, which stand opposite, or only whorled in very young specimens, are from 1 to 2 ft. in length and from 6 to 12 in. in breadth. On coppice shoots the leaves are much larger, and not rarely from 2 to 3 ft. long. In shape they somewhat resemble those of the tobacco plant, but their substance is hard and the surface rough. The small white flowers are very numerous, on large erect cross-branched panicles, which terminate the branches. They appear during the rains, generally in July and August, and the seed ripens in the succeeding January and February. On the east side of the Indian peninsula, the teak flowers during the rains in October and November. In Java the plantations are leafless in September, while during March and April, after the rains have commenced, they are clothed with foliage and the flowers open. During the rainy season the tree is readily recognized at a considerable distance by the whitish flower panicles, which overtop the green foliage, and during the dry season the feathery seed-bearing panicles distinguish it from its associates.

The small oily seeds are enclosed in a hard, brown, cross-branched nut, which is surrounded by a thick covering, consisting of a dense felt of matted hairs. The fruit thus formed is further enclosed in the enlarged membranous calyx, in appearance like an irregularly plaited or crumpled bladder. The tree seeds freely every year, but its spread by means of self-sown seed is impeded by the forest fires of the dry season, which in India generally occur in March and April, after the seeds have ripened and have partly fallen. Of the seeds which escape, numbers are washed down the hills by the first heavy rains of the monsoon, while these collect in the valleys, and it is here that groups of seedlings and young trees are frequently found. A portion of the seed remains on the tree; this falls gradually after the rains have commenced, and thus escapes the fires of the hot season. The germination of the seed is slow and uncertain; a large amount of moisture is needed to saturate the sappy covering; many seeds do not germinate until the second or third year, and many do not germinate at all. Where the teak tree is associated with dense clumps of bamboo, natural reproduction is almost absent, except when the bamboo flowers and dies, and even then, if the dry bamboo and the resultant bamboo seedlings are not burnt, such young teak as may germinate are likely to be smothered at once.

The bark of the stem is about half an inch thick, grey or brownish grey, the sapwood white; the heartwood of the green tree has a pleasant and strong aromatic fragrance and a beautiful golden-yellow colour, which on seasoning soon darkens into brown, mottled with darker streaks. The timber retains its aromatic fragrance to a great age. On a transverse section the wood is marked by large pores, which are more numerous and larger in the spring wood, or the inner belt of each annual ring, while they are less numerous and smaller in the autumn wood or outer belt. In this manner the growth of each successive year is marked in the wood, and the age of a tree may be determined by counting the annual rings.

The principal value of teak timber for use in warm countries is its extraordinary durability. In India and in Burma beams of the wood in good preservation are often found in buildings several centuries old, and instances are known of teak beams having lasted more than a thousand years. Being one of the most durable of Indian timbers, teak has always been used for buildings, particularly for temples, and in India it has been the chief timber employed for shipbuilding. When iron commenced to be extensively used for the last-named purpose, it was supposed that the demand for teak would decrease. This, however, was not the case, for the wood was for long very largely used in shipbuilding, and though its employment in war-vessels has diminished, it is still in very great demand for "liners" and similar ships. It is also used for furni-
ture, for door and window frames, for the construction of railway carriages, and for many other purposes. White ants eat the sap-
wood, but rarely attack the heartwood of teak. It is not, however,

proof against the borings of the teredo, from whose attacks the teak piles of the warwhes in the Rangoon river have to be protected by a sheathing of metal.

Once seasoned, teak timber does not split, crack, shrink, or alter its shape. In these qualities it is superior to most timbers. In contact with iron, neither the iron nor the teak suffers, and in this respect it is far superior to oak. It is not very hard, is easily worked, and takes a beautiful polish. It has great elasticity and strength, and is not very heavy. The average weight of perfectly seasoned wood fluctuates between 38 and 40 lb per cub. ft. Its weight, therefore, is a little less than that of English oak. Green teak timber, however, is heavier than water, so that,
TEAK

485

unless thoroughly seasoned, the wood cannot be floated. In Burma, the trees are often used when cut for the ground, from 7 to 16 ft. Larger girths, up to 25 ft, are not uncommon.

The teak tree does not usually form pure forests. It is associated with bamboos and with a great variety of other trees, which have little effect on its economic value. Hence in the plantations established in Burma the object has been to raise forests of teak mixed with bamboos and other trees.

The coast of the teak timber produced in India is used in the country. The produce of the forests of Travancore, Cochin, the Madras presidency, Coorg, Mysore, Bombay, Berar and the Central Provinces is all so consumed. Formerly there was a considerable export from the ports of Moulmein, Rangoon and Mysore to the other teak-producing countries, Java, however, there have been exports from Saigon; and since 1882 Bangkok has sent considerable quantities to Europe. But the Burma coast is the chief source of supply at present. Rangoon was for a long time an important place for shipbuilding, teak being the chief timber used: between 1786 and 1825 111 European vessels were built at Rangoon, aggregating 35,000 tons. At the same time timber was exported, and when the timber began to come down from more distant forests, and in 1841 one-fourth of the supply was brought from the Attarans.

The increase in the export of timber from the Burma ports was slow at first, but has gone on rapidly since Rangoon became a British port. Since that time the timber brought to the Burma ports has come from the following sources: (1) from the forests in the British coast provinces, Pegu and Tenasserim; (2) from the forests of the former Portuguese kingdom, Cochin and the Malabar; (3) from the Sitang and Irrawaddy rivers; (4) from the forests in the Shan states formerly tributary to Burma, from the Karenni country, and from western Siam, whence it is floated to Moulmein by the Salwin river.

The following table shows the figures of the imports and exports of British India for the years 1901-2 to 1905-6:

Nearly the whole of the imports came from Siam, and of the exports four-fifths were from Burma. The balance of the imports consisted of timber from Java, that of the exports of supplies sent from peninsular ports. Two-thirds of the exports went to theRangoon presidency, the remaining third being ordinarily Germany, Ceylon and Australia. The recent great increase in the general teakwood trade is evidenced by the fact that the imports increased in six years from 17,842 tons in 1901-2 to 61,482 in 1905-6.

In British India, including Burma, a large portion of the teak-producing tracts have since 1856 been placed under conservancy management with the object of preventing overcutting and maintaining the forests. This is the object of the working plans referred to. The area of teak forest

1 It has been erroneously stated that the tree in Burma is tapped for its oil before felling.
available in India and Burma is considerable, and every endeavour is made to conserve it and increase its production. Similar measures have taken in Siam under the advice of officers borrowed from British India; and in the teak-producing native states in the peninsula the necessity for careful management is now well understood. The teak plantations in Java had come into bearing by 1908 and it was expected that the teak area in the Philippine Islands would be similarly developed.

(De Beers: J. S. Ca.)

TEAL (O.E. tele), a variety of duck, whose name is of uncertain origin, but doubtlessly cognate with the Dutch Tailing (formerly Tailen and Taling), and this apparently with the Scandinavian Ateling-And (Brunnich, Ornithol. Bow. 1838), and the Dutch possibly, or the Latin Atelis, to be found in many old records, though this last word (however it be spelt) is generally used in conjunction with teal, as if to mean a different kind of bird; and commentators have shown a marvellous iniquitude in surmising what that bird was.

The Teal is the Anas crecca of Linnaeus, Nettion crecca of modern ornithology, and the smallest of the European Anatidae, as well as one of the most abundant and highly esteemed for the table. It breeds in many parts of the British isles, and is present on the shores of some of the largest lakes, such as those formed by the Wild Duck, A. bosca; but there is no doubt that by far the greater number of those that are taken in decoys, or are shot, during the autumn and winter are of foreign origin. While the female presents the usual inconspicuous mottled plumage of the same sex in most species of Anatidae, the male is one of the handsomest of his kind. His deep chestnut head and throat are diversified on either side by a line of buff, which, springing from the neck, runs upward to the eye, in front of which it forms a fork, one prong passing backward above and the other below, enclosing a dark glossy-green patch, and both losing themselves in the elongated feathers of the hind-head and nape. The back and sides of the body appear to be grey, an effect produced by delicate transverse pencilling of black on a dull white ground. The outer lanceolate scapulars have one-half of their webs pure white, forming a conspicuous stripe along the side of the back. The breast is of a pale salmon or peach-blossom colour, each feather in front bearing a roundish dark spot, but these spots lessen in number and size lower down, and the warm tint passes into white on the belly. The tail coverts above and below are velvety black, but those at the sides are always chested by the Wild Duck, A. bosca: and these peculiarities to a great extent are the causes to which the Teal is so frequently and so appropriately applied.

The teal inhabits almost the whole of Europe and Asia, from Iceland to Japan,—in winter visiting Northern Africa and India. It occasionally occurs on the western shores of the Atlantic; but its place in North America is taken by its representative, A. carolinensis, the male of which is easily to be recognized by the absence of the upper buff line on the side of the head and of the white scapular stripe, while he presents a whitish crescentic bar on the sides of the lower neck just in front of the wings.

Species more or less allied to these two are found in most other parts of the world, and among such species are some (for instance, the N. gigolofrons of the Australian region) in which the male wears the same inconspicuous plumage as the female. But the determination of the birds which should be technically considered "Teals," and belong to the genus Netton, as distinguished from other groups of Anatidae is a task not yet successfully attempted, and much confusion has been caused by associating with them such species as the Garganey (q.v.) and its allies of the group Querquedula. Others again have not yet been discriminated from the Wigeons (q.v.), the Pintail-Ducks, D. Dailla, or even from the typical form of Anas (see Duck), into each of which genera the Teals seem to pass without any great break. In ordinary talk "Teal" seems to stand for any Duck-like bird of small size, and in that sense the word is often applied to the members of the genus Nettopus, though some systematists will have it that they are properly Geese. In the same loose sense the word is often applied to the two most beautiful of the family Anatidae, belonging to the genus Anas (commonly misspelt, Azas)—the Carolina Duck of North America, A. spona (not to be confounded with the above-named Anas carolinensis, and Netton carolinensis), and the Mandarin-Duck of China, A. gulericulata. Hardly less showy than these are the two species of the subgenus Emetta,—the Falcated Duck, E. falcata, and the Baikal Teal, E. formosa,—both from Eastern Asia, but occasionally appearing in Europe. Some British authors have referred to the latter of these well-marked species certain Ducks that from time to time occur, but they are doubtless hybrids, though the secret of their parentage may be unknown; and in this way a so-called Bimaculated Duck, Anas bimaculata, was for many years erroneously admitted as a natural species to the British list, but of late this has been properly discarded.

(AN.)

TEANO (anc. Teanum Sidicinum), a town of Campania, Italy, in the province of Caserta, 21 m. N.W. of that town on the main line from Rome to Naples, forming conjointly with Calvi an episcopal see. Pop. (1901) 6607 (town); 15,505 (commune). It stands at the S.E. foot of an extinct volcano, Rocca Monfina (3297 ft.), 643 ft. above sea-level. The cathedral dates from 1350, but has many columns obtained from the ruins of the ancient town. There is a feudal castle built by count Hugo of Sessa in the 11th century. Below the town on the S.E. is the old church of S. Paride.

The ancient Teanum Sidicinum (there is a Teanum Apulum, q.v., in Apulia) was the capital of the Oscan tribe of the Sidicini which drove the Aurunci from Rocca Monfina. They probably submitted to Rome in 334 B.C. and their troops were grouped with those of Campania in the Roman army. Thus the garrison of Regium, which in 280 attacked the citizens, consisted of one cohort of Sidicini and two of Campanians. Like Caes, Teanum continued to have the right of coinage, and, like Sessa and Calvi, remained faithful to Rome in both the Hannibalic and the Social wars. Its position gave it some military importance, and it was apparently made a colony by Claudius, not by Augustus. Strabo speaks of it as the most important town on the Via Latina, and only coming after Capua among the towns in the interior of Campania. It lay on the Via Latina, here joined by a branch road from Sessa, of which remains still exist, and which continued E. to Alliae. Remains of a theatre and an amphitheatre still exist, and some extensive baths, containing several statues, and some Roman dwellings, both some way below the modern town, were excavated in 1908. The church of S. Maria in Campo, 334 ft. above sea-level, representing the visit of the three kings to Bethlehem was found in 1907 (V. Spinaazzola in Notizie degli Scavi, 1907, 607; E. Gabrici, ibid., 1908, 309).

TEANUM APULUM, an ancient town of Apulia, Italy, on the road between Larinum and Spicuntm, 18 m. E. of the former, at the crossing of the Fortore near the modern village of S. Paolo di Civitate. It was called Teate in earlier times, as appears from its numerous coins, which have Oscan legends. It submitted to Rome in 316 B.C., being then the chief town of Apulia. It was afterwards known as Teanum Apulum, and was a municiplum. Some ruins and an old bridge over the Fortore still exist.

TEA-POY (Hindustani ñpdy), a small table, supported upon a tripod, or even upon four legs, for holding a tea-service or an urn. The word was also sometimes applied to a large porcelain or earthenware tea-caddy, and more frequently to the small bottles, often of Battersea enamel, which fitted into receptacles in the caddy and actually contained the tea.

TEAR, a drop of the liquid secretion of the lachrymal gland, commonly produced in a certain quantity and flowing through the nasal duct without notice, but, when stimulated by an allied smell, emotion or artificial excitation, increasing so that it flows over the eyelids and runs down the cheeks and is the visible result of crying or weeping (see Eye). The O.E. ñær, taer, is represented in other Teutonic languages by Dan. taar; Swed. lår; Goth. lagr, &c. The O.H. G. was zahar; the mod. Ger. Zähre was formed from the M.H. G. plural Zahere. The common word in Ger. Thräne, cf. Du. troon, is closely allied. The original root is seen in Gr. ñapox, Lat. lacrima, lacruma, for dracona, whence Fr. larme, and It., Sp., and Port. lagrima.
The generally accepted Indo-Germ. root is dak-, to bite, cf. Gr. ὀξέω, and Skt. dać, to bite, tears being "biting" or "bitter" things. The Du. troon, in the sense of tear-drop, was particularly applied to the blubber of whales reduced to oil by boiling, whence has come the tautological English "train-oil," often identified with the lubricant for the wheels of railway trains. For the so-called "tear-vessels," which are properly small vases containing unguents, see LACRYMATORY.

"Tear" (O.E. tere), to pull apart violently, to rend, is, of course, a distinct word; it is cognate with Gr. ἀκραίω, to flay, pull off, and the root is seen in Gr. ὀξύς, skin, whence "dermatology," "epidermis," &c.

TEASEL. Wild teasel is a common plant of the English copse, hedges, with a tall, stout, rigid, prickly stem, bearing large spreading opposite leaves, the middle one of which is oblong and conspicuous. The round heads, the purplish flowers in which are subtended by very long, narrow, stiff, upright bracts. The plant is known botanically as Dipsacus sylvestris. Fullcrum's teasel, D. Fullorum, in which the bracts are hooked, is probably a cultivated form of the wild species; the dry heads are used to comb up the nap on cloth. The genus Dipsacus gives its name to the family Dipsacaceae, to which also belongs the Scabions (Scabiosa), represented in Britain by several species.

TEATRE MARRUCINORUM [mod. Chieti, q.v.], the chief town of the Marrucini, the whole of whose territory was placed under its municipal jurisdiction by the Romans, and called "Social War." It was thus a town of some importance. Under the church of Ss. Pietro e Paolo and the adjoining houses are extensive substructures (opus reticulatum and brickwork) of the 1st century A.D., belonging to a building erected by M. Vectius Marcellus (probably mentioned by Pliny, H.N., II, 190) and Helvidia Priscilla. There are also remains of large reservoirs and of a theatre.

TEBESSA (the Roman Theveste), a town of Algeria in the department of Constantine, 145 m. S.E. of Bona by rail and 12 m. W. of the Tunisian frontier, on a plateau 2090 ft. above the sea. Pop. (1906) 5723. The modern town, which is within the walls of the Byzantine citadel, boasts nothing of interest save a church built out of the ancient ruins. The Byzantine walls, pierced by three gates, are in tolerable preservation. They are strengthened by numerous square towers. One of the gates is formed by the quadrifilar arch of Carcalla, a rare form of construction. The arch, erected about A.D. 212, is in good preservation. A pair of monolithic columns, disengaged, flank each façade. An inscription on the frieze gives the history of its construction; it was built by two brothers and a condition of inheriting the property of a third brother. The most important ruins are those of the great basilica. This building, one of the finest Roman monuments in Algeria, bears evidence of having been built at various epochs; the earlier portions probably date from not later than the beginning of the 2nd century A.D. The basilica was partially destroyed by the Berbers in the 5th century, and was rebuilt in A.D. 535 by the Byzantine general Solomon, who surrounded it with a wall about 25 feet high, still standing. The main building, consisting of a nave with apsidal end and two aisles, was approached through a peristyle, which was surrounded by two colonnades, the columns of which supported a roof. The building was completed by the emperor Justinian, and though several parts of the basilica have fallen, but the bases of all are in their original positions. A quadrifoil chapel on the east side of the basilica is a Byzantine addition. The tessellated pavement which covers the basilica proper is in almost perfect condition. It is kept covered, for purposes of preservation, by a layer of earth. Next the basilica (and within the same enclosing walls) are the ruins of the forum, converted into a monastery in the 4th or 5th century, and regarded by Sir R. Lambert Playfair as the oldest known example of the monasteria clericorum. The whole of the basilica and its dependencies have been cleared and are kept in order by the Service des Monuments historiques, the principal work being accomplished by Héron de Villefosse. Noteworthy among the buildings within the ancient citadel is a small tetrastyle temple, variously ascribed to Jupiter and Minerva, the portico supported by six monolithic columns of cippolino, four being in front. After the French occupation in 1842, the building was used successively as a soap factory, a prison, a canteen, a parish church, and, finally, as a museum. The monastery was founded towards the close of the 1st century A.D. In the succeeding centuries it was an important Carthaginian "great house." In the 5th century, under Vandal dominion, it declined in importance. Refounded by the Byzantines in the 6th century, the city disappeared from history at the time of the Arab conquest of the country in the 7th century. In the 16th century the Turks placed a small garrison of janissaries in the place, but Tebessa continued to be but a small village until the establishment of French rule.

Nine miles from Tebessa are the extensive phosphate quarries of Jebel Dyr, where is also an interesting megalithic village.

TECHNICAL EDUCATION. The term now generally adopted to designate the special training of persons in the arts and sciences that underlie the practice of some trade or profession, is called "technical education." Schools in which this training is provided are known as technical schools. In its widest sense, technical education embraces all kinds of instruction that have direct reference to the career a person is following or preparing to follow; but it is usual and convenient to restrict the term to the special training which helps to qualify a person to engage in some branch of productive industry, and the instruction so provided is generally known as "technical instruction." This specialized education may consist of the explanation of the processes concerned in production, or of instruction in art or science in its relation to industry, but it may also include the acquisition of the manual skill which production necessitates.

The terms "technical" and "technological" (Gr. τεχνη, art or craft) as applied to education, arose from the necessity of finding words to indicate the special training which was needed in consequence of the altered conditions of production during the 19th century. Whilst the changed conditions of production, consequent mainly on the application of steam power to machinery, demanded a special training for those who were to be engaged in productive industry, the prevalent system of education was not adapted to the requirements of these persons, and schools were wanted in which the necessary instruction could be obtained. Other circumstances resulting mainly from the application of steam power to machinery, production and rendered technical education necessary. Production on a large scale led to a great extension of the principle of the division of labour, in consequence of which it was found economical to keep a man constantly engaged at the same kind of work, since the more he practised it the quicker and more skilful he became. Thus employed, the workman learned little or nothing of the process of the manufacture at which he assisted, or of other departments of the work than the particular one in which he was engaged, and his only opportunity of acquiring such knowledge was outside the workshop or factory in a technical school. The employment of skilled labour, which was an essential part of the principle to other industries than those in which machinery is largely employed. There are many trades in which manual skill is as necessary now as ever, but in these the methods of instruction prevailing under the old system of apprenticeship are now almost obsolete.

In many industries, including trades in which machinery is not as yet extensively employed, production on a large scale has increased the demand for unskilled labour, numbers of hands being required to prepare the work to be finished by a few skilled artisans. Rapidity of execution is attained by keeping a workman at the same work, which after a time he proceeds to mechanically and continues to do until some machine is invented to take his place. In most trades, as formerly practised, the master...
employed a few apprentices who assisted him in his work, and who learnt from him to understand the details of their craft, so that, when the term of their apprenticeship was over, they were competent to practise as journeymen. But now the master frequently has neither time nor opportunity to instruct young lads, and the old relation of master and apprentice is changed into that of manufacturer and workman. In consequence of these altered relations between employer and employed, there has arisen an acknowledged want of properly trained workmen in a number of trades in which skilful hand work is still needed; and in these trades a demand has arisen for technical schools, or some other system of the training of the unskilled labourer by direct apprenticeship, as a means of suitably training workmen and foremen. The ever-increasing competition in production has led to the employment, in many trades, of children to do work of a mechanical kind requiring little skill; but, whilst thus employed, these young people have little opportunity of learning those parts of their trade in which skill and special knowledge are needed; and when they are grown up, and seek higher wages, they are dismissed to make room for other children. Numbers of young people are thus thrown upon the labour market, swelling the unskilled numbers of the unemployed. We are competent to do nothing more than children's work, and to earn children's wages, and who know no trade to which they can apply their hands. To remedy this, by creating some substitute for the old apprenticeship, is one of the objects of a system of technical education; though in suitable trades an independent movement for reviving apprenticeship (q.v.) under improved conditions has also made some way.

A complete system of technical education should provide the necessary instruction for the different classes of persons engaged in productive industry. It is usual to divide these persons into three classes:—(1) workmen or journeymen; (2) foremen or overseers; (3) managers or masters.

The industries in which they are employed may be grouped under four heads:—(1) those involving the use of extensive machinery, such as iron and steel manufacture, machine-making, the textile industries, and some of the chemical trades; (2) those which mainly require the use of hand tools, as cabinet-making, brick-work, plumbing, and tailoring; (3) those depending on artistic skill, as woodwork, metal-working, enamelling, decorative work, and industrial designing generally; (4) agriculture in all its branches, and forestry. These industries will be referred to as manufactures, handicrafts, art industries and agriculture. The foregoing classification comprises groups which necessarily, to some extent, overlap one another. Every factory contains a carpenter’s and smith’s shop, and handi- craftsman of group (2) are required in every manufacturing concern. Whilst the industries in which hand labour is exclusively employed are becoming fewer and fewer, there are many trades which, owing to the frequent invention of labour-saving appliances, are passing gradually from the class of handicrafts to that of manufactures. In these trades, of which watch- and clock-making and boot- and shoe-making may be taken as examples, there is still a demand for goods largely if not entirely produced by hand work. In such trades, owing to the absence of facilities for instruction in the ordinary shops, there is a want of skilled hand labour which there is an increasing difficulty in satisfying, and to supply this want technical schools of different kinds have been established. Then, again, there are many branches of manufacturing industry which greatly depend for their success upon the designer’s art, and it is necessary that the industrial designer should possess a knowledge of the processes of the manufacture in which his designs will be utilized, as well as of the properties and capabilities of the material to which they will be applied. Indeed, it is the possession of this knowledge which mainly distinguishes the industrial designer from the ordinary artist. To determine the best training for such designers is one of the problems of technical education. There are many trades, too, in which the handicraftsman and the designer should be united. This is the case in such industries as silversmith’s and goldsmith’s work. In these and other trades the true artisan is the artist and handicraftsman combined.

In order to reconcile some of the different views which are held as to the objects of technical education, it is necessary to keep in mind the broad distinction, above referred to, between the conditions of production on a large scale, as in those industries in which goods are manufactured by the use of extensive labour-saving machinery, and in those trades in which hand work still prevails, and which are frequently engaged in to and from countries, where the objects of opinion regarding the objects of technical education is due to the difference of standpoint from which the problem is regarded. The volume of the trade and commerce of Britain depends mainly on the progress of its manufacturing industries. It is these which chiefly affect the exports and imports. The aim of manufacturers is to produce cheaper and better goods than can be produced by other manufacturers at home or abroad; and technical education is valuable to them, in so far as it enables them to do so. It also helps to widen the area of productive industry, and to encourage varieties of activity which the existing system of free trade and free competition tends to all but to restrict. On the other hand, the artisan engaged in hand industries looks to technical education for self-improvement, and for the means of acquiring that general knowledge of the principles and practice of his trade, which he is unable to obtain in the commercial shop. Hence the artisan and the manufacturer approach the consideration of the question from different sides. To the spinner or weaver who almost exclusively employs women to tend his machinery, or to the manufacturing chemist whose workpeople are little more than labourers employed in carrying to and from materials, knowing little or nothing of the scientific principles underlying the complicated processes in which they are engaged, the technical education of the workpeople may seem to be a matter of little moment. What such manufacturers require are the services of a few skilled engineers, artistic designers or scientific chemists. From the manufacturer’s point of view, therefore, technical instruction is not so much needed for the hands he employs in his work as for the heads that direct it. But in trades in which machinery plays a subsidiary part, technical teaching supplies the place of that instruction which, in former times, the master gave to his apprentices, and the competition tended to make them attend technical classes with a view to acquiring that knowledge of the theory and practice of his trade, on the acquisition of which his individual success greatly depends. In the former class of industries, technical education is needed mainly for the training of managers; in the latter, for the training of workmen. Hence has arisen a double cry,—for the teaching of art and of the higher branches of science, with a view to their application to manufacturing industry, and for the specialized instruction in drawing, and in the scientific facts which help to explain the processes and methods connected with the practice of different crafts and trades. This double cry has led to the establishment of technical universities and of trade schools.

Owing to the conditions under which manufacturing industry is now carried on, it is difficult to select competent foremen from the rank and file of the workmen. The ordinary hands gain a very limited and circumscribed acquaintance with the details of the manufacture in which they are engaged, and have little opportunity of acquiring that general knowledge of various departments of work, and of the structure and uses of the machinery employed, which is essential to the foreman or overseer. It is in evening technical classes that this supplementary instruction, which it is the workman’s interest to acquire and the master’s to encourage, can be obtained; and it is from the more intelligent workmen who attend these classes that masters and employers will select as foremen those students who are found to possess the essential qualifications. The history of invention shows how frequently important improvements in machinery
are made by the workman or minder in charge of it, and adds weight to the arguments already adduced for giving technical instruction to persons of all grades employed in manufacturing industry. To these advantages of technical education, as affecting the workmen themselves as well as the progress of the industry in which they are engaged, must be added the general improvement in the character of the work produced, resulting from the superior and better-trained intelligence of those who have had the benefit of such instruction.

It will be seen from the foregoing that a complete system of technical education must make provision for the training of those who are to be occupied as journeymen or foremen in different branches of trade or industry, and also for those who aim at becoming managers or masters or heads of manufacturing firms, scientific advisers or professional engineers. As technical education necessarily implies specialized teaching, the curriculum and methods of instruction adopted in the elementary and secondary schools, where students receive their preliminary training, are matters closely related to any scheme of technical instruction, and the trend of public opinion in favour of amending the general instruction given in those schools with the specialized teaching of the technical institutions. Indeed, it is daily becoming more difficult to draw any hard-and-fast line between professional and general education. It is now universally recognized that the foundations of technical instruction must be laid in the elementary and the secondary schools, and many of the changes which have been made in the organization of those schools had their origin in the requirements of technical institutions.

A short survey of the methods adopted in different countries to provide the specialized teaching applicable to different pursuits, and of its relation to the general school system of those countries, will serve as a fitting introduction to the consideration of the legislative and other changes which have gradually been made in the British school system with a view to modern industrial conditions. The study of foreign systems of education is serviceable as showing the relation of such systems to the industrial needs of each country and to the genius and character of the people. In the organization of technical education in England, full advantage has been taken of foreign experience, although much attention has been given to amending the general foreign methods. Detailed information as to what has been done abroad is found in the published reports of the several English commissions which have been appointed to inquire into the subject, and in the valuable series of special reports issued from the Board of Education. From these reports which show how varied have been the attempts to adapt school training to modern industrial requirements, certain general principles may be inferred, which are equally applicable to the conditions under which the trade and commerce of different countries is now carried on.

These general principles may be briefly enunciated as follows:

1. The education of all persons who may expect to be occupied in some form of productive industry may be considered as consisting of two parts, (a) general, (b) special.

2. The general education is the preliminary training provided in elementary and secondary schools, and the curriculum of those schools should be varied so as to have some reference to the future pursuits of the pupils.

3. The specific or supplementary instruction should be adapted to the requirements of different grades and classes of workers, and to different trades or occupations as practised in different localities.

A complete system of technical education would afford facilities of training adapted to every kind and grade of industry; but, owing to the complexity of the subject, such a system is nowhere to be found. In every country the scheme of education and method of instruction have varied from time to time, as the conditions regulating trade and industry have changed. But recently in all civilized countries, the effort has been made to provide a general and specialized education adapted to different pursuits for each of these great classes of workers: (1) operatives, (2) foremen and overseers, (3) masters and managers.

1. Workmen.—Many attempts have been made to provide a substitute for apprenticeship, but hitherto with no great success. We have, therefore, to consider, as connected with the workpeople in manufacturing industries, and (2) those engaged in handicraft industries. The education of all classes of workpeople begins in the public elementary schools; and, in view of the future occupation of these children, it may be taken that the general technical instruction should be practical, and should include drawing and elementary science. It should indeed be closely associated with manual training, connecting workpeople with workshops in various branches of trade in urban and rural schools respectively, and in instruction of the domestic arts in the case of girls. The lessons in drawing and in elementary science should form part of the manual training, and the school should be so arranged that all the subjects of instruction should be grouped together as parts of an organized system. The desired diversity should be found in the different kinds and grades of manual work. Reading, writing and arithmetic would be taught incidentally in close connexion with the practical exercises. In nearly every country of Europe, and in the United States, the trend of education is in this direction. Swedish handicraft instruction is generally included in the curriculum of elementary schools. Rudimentary science is also taught in nearly all the primary schools of Europe. Modelling is taught both boys and girls in many Continental schools; and in Sweden ‘'loyd’’ (Sw. , manual dexterity, cf. Eng. 'sleight') is a system of manual training, in which simple and useful articles, especially of wood, are constructed with the fewest possible tools, is taught with considerable success in both France and Sweden.

In Germany and Switzerland, there exists an excellent system of evening continuation schools, known as Fortbildungs- or Ergänzungs- schulen, in which every child who leaves school before fourteen, and of those who leave at that age, is continued. In all these schools drawing is taught with special reference to local industries. In England great progress has been made in recent years in developing evening classes; but the pupils’ elementary instruction is continued with a view to the specialized teaching provided in the technical school. The teaching in these continuation schools is generally varied according as the pupil is occupied in trade or office work, and the practice is becoming general of requiring him to pass a qualifying examination to secure admission to classes in technology. It will be seen, therefore, that the training of most workpeople, and of nearly all those who are engaged in manufacturing industry, consists of:—(1) primary teaching in elementary schools; (2) practice in the factory or shop, supplemented by further elementary teaching in evening classes; (3) technical examination. In all the principal towns throughout Europe evening classes have been established for teaching drawing, painting and designing, and the elements of science in their application to special industries. Their conduct, however, has not been always uniform; they are supported in some cases by the local governments and in others by the corresponding schools in England. The classes are usually supported by the municipalities, by the chambers of commerce, by industrial associations, or by funds contributed by some cases by the fees of the pupils. They receive little or no support from the state. They are well attended by workpeople of all grades, who are encouraged by their employers to profit by these opportunities of instruction. In England evening technical instruction is more systematically organized than in any other country. It is under the general direction of the Board of Education, of the City, and Guilds of London Institute.

The Board of Education prescribe the conditions under which grants are paid to schools providing technical instruction. In former years these grants were paid on the results of the examination of individual students; but this method ofappraisal being found insufficient, the system of state aid has been almost entirely abandoned. The Board still hold annual examinations in science and art and in certain branches of applied science; but the more specialized examinations in technical instruction are annually held by the City and Guilds of London Institute, through its department of technology. These latter examinations are utilized by the Board, and the certificates granted for the results are recognized by the employers of apprentices. The technical schools in which these classes are held are under the direct control of the local educational authorities, and are largely supported by grants from local rates, and in recent years by means of contributions from the local authorities, with a view to encouraging greater variety of instruction and further adaptation of the teaching to local needs. The Board continue, however, to indicate the range of subjects to be taught for each class of workpeople, and the City and Guilds of London Institute issues each year a programme containing suggested courses of training in nearly a hundred trade subjects.

XXVI. 16 a
In the evening classes in science, art, and technology, which have been established throughout the United Kingdom, the workman or foreman in the artisanal industries has been enabled to benefit by payment of a very small fee, of studying art in all its branches, science theoretically and practically, and the technology of any particular industry. Provided his early education enables him to take advantage of the classes, the technical evening system has already supplanted temporary instruction in the United Kingdom. It is suggested enabling workmen, whilst earning wages at an early age, to acquire manual skill by continuous practice, and at the same time to gain a knowledge of the principles of science connected with their trade, and the economy of the processes of the manufacture in which they are engaged.

For those engaged in handicraft trades this evening instruction is of the highest value on other workmen, the latter as a substitute for the shop. In such a school the pupils have the advantage of being taught their trade systematically and lend them to the practical men and women engaged. Such an artificial system of production, the pupil is less likely to acquire excellence of workmanship and smartness of habit than in the mercantile shop, under the strain of severe competition. Moreover, sending an able and practical men and women to look at them as a substitute for apprenticeship. By sending into the labour market, however, a few highly trained workmen, who are absorbed in various works, and exert a beneficial influence on other workmen, they become the leaders and the leaders of the shops serve a double purpose. Schools of this kind have been tried with more or less success in different countries. In France there is the well-known École des Arts et Métiers, which has the object of practical education, and similar schools have been established in other parts of France. For many years a society of Christian Brethren has directed a large school situated in the Rue Vaugirard, Paris, in which different trades are taught. The system combines many of the advantages of shop work and school work, and it depends financially for its success upon the religious spirit which actuates its promoters and supporters. The Ariane school, near Dublin, is conducted on similar lines, and a number of similar schools are established in other parts of France. In Austria, particularly in the rural districts, there are numerous day schools for the training of carpenters, joiners, turners, cabinetmakers, workers in stone and marble, in silver, gold, brass, &c. In Germany, Germany, and Holland, and schools very similar in character have been organized to a limited extent in England. The demand that called them into existence in other parts of Europe and America is likely to be felt in the United Kingdom in the future. The difficulty of securing apprentices in a commercial shop systematic training in handicraft has led to the establishment of a few trade schools which receive children from the elementary school about the age of fifteen for a three years' course of instruction. In such schools the time is about equally divided between ordinary school subjects and the practice of some handicraft, such as cabinet-making, upholstery, waist-coat-making, millinery. Parents are encouraged to allow their children to receive this further education by the offer of free teaching and maintenance grants. Such schools, however, must be regarded as educational experiments, to be superseded if not improved. A system by which the trade can secure organized instruction in the craft which they are engaged. Any system of technical education, however, should be sufficiently elastic to permit of such experiments and of the introduction of types of instruction to meet special and temporary needs. It is only in certain cases that apprenticeship schools can be said to answer satisfactorily the purpose for which they have been established. Where a new industry, especially one employing at least a few hundred skilled workmen, industries need to be revived; where machinery is superseding hand work, and, owing to the demands for ordinary hands, there is a valuable demand for older hands, the workmen; where the requirements for the various special hands in the trade are different, and that general knowledge of their work, and to acquire that general knowledge of their work, and to exhibit those special aptitudes, which may qualify them for the position of special workmen. The type of a technical education is, though, limited to the middle class and to the working classes, although having some bias towards the future career of the pupil, is disciplinary in character, and consists of the subjects of primary instruction further pursued,—of drawing, modelling, science, arithmetic, &c.,—as far as they have practical application, according to local requirements, the technology of the staple industries forming in many cases part of the instruction. Such
schools, under varied forms, have been established in most European countries, some of the best examples of them being found in Paris, London, Berlin, Rouen, and in other towns of France. One of the oldest of these schools is the Collège Royal at Paris, which was founded in 1280 by a bequest from Major-General Martin, who had fought against the English under Tippoo Sahib. In this school instruction is given in the arts of stonecutting, mining, and higher elementary schools of France, instruction is given in drawing, modelling, chemistry, mechanics and physics, in the working of wood and iron, and in German and English in addition to the subjects given in the common schools. The technical education given to some of the pupils, and the instruction generally is of a very practical character. The students visit factories under the guidance of men of practical experience in their full appreciation of the work of the future. The school hours are from seven till eleven in the morning and from one till seven in the afternoon. The boys from this school rapidly obtain places in the commercial and industrial houses, and in the various branches of the great state. A large number obtain high positions. A very similar school, on more modern lines, has been established at Reims, and is accommodated in a building especially adapted to the purpose. In this school instruction is directed towards the staple industries of the district, namely, weaving, dyeing and engineering. There are many other similar schools in France, the object of which is to give the children of the merchant and industrial classes an education, as to qualify them for higher posts in industrial works. The cost of this higher education seldom exceeds 5 per annum. In Bavaria there is a type of school called 'Industrie-Schule', which serves very well for the training of engineers and industrial chemists, who are trained to higher intermediate posts, and desire to enter upon commercial work at an earlier age than students attending a university or technical college. The instruction in these Industrie-Schulen is largely practical, but is also attended with some amount of literary and linguistic training. Some of the students proceed to the technical university, but the majority find posts as foremen or overseers soon after completing their courses of instruction. In the United States technical instruction is nearly all branches of technology. Other schools in Germany are less complete, but most of them have one or more departments which are specially organized with a view to the highest grade of technical instruction. Both the universities and in the technical high schools facilities for scientific research are provided, and the students are encouraged to undertake original investigations. The technical high schools are now placed in the same educational platform as the universities and have the power to confer the degree of Doctor of Engineering on students fulfilling the required conditions.

In France, the institutions in which the highest technical instruction is obtained are the Polytechnic schools, which are usually founded in the capital. There are a large number of provincial colleges such as the Ecole Centrale at Lyons, the Ecole des Mines at St Etienne and the Ecole des Mines de Dijon. The Ecole Centrale at Paris, which is the highest technical school and has been in existence since 1803, has a great reputation, and was founded in 1843 at a cost of about £50,000. It is situated in what was a suburb of Berlin, and is generally known as the Charlottenburg Institution. It includes departments for the higher degree of masters in civil and military engineering, the theory of structures, and the science of iron and steel. The educational departments of the Ecole Centrale are well provided with workshops and laboratories, and are on a high technical level. The school, by having a large number of professors attached to it, is able to give the highest degree of instruction in all the branches of technology. There are nearly all branches of technology. Other schools in Germany are less complete, but most of them have one or more departments which are specially organized with a view to the highest grade of technical instruction. Both the universities and in the technical high schools facilities for scientific research are provided, and the students are encouraged to undertake original investigations. The technical high schools are now placed in the same educational platform as the universities and have the power to confer the degree of Doctor of Engineering on students fulfilling the required conditions.

In Switzerland the federal polytechnic at Zurich is in many ways superior to the Ecole Centrale at Paris. It was founded in 1854 and is the highest technical school and has been in existence since 1854, having a great reputation, and was founded in 1843 at a cost of about £50,000. It is situated in what was a suburb of Berlin, and is generally known as the Charlottenburg Institution. TECHNICAL EDUCATION

of managers in engineering and industrial works—are found in the United States. From the opening of a school, the student may go at once into business; or he may proceed to a college, with a four years' course of general instruction; or he may enter a professional or technical school. In higher education which adapts itself to the desire of students of all classes to obtain it, in many cases at considerable individual sacrifice, and by the value which masters and employers attach to a college-trained youth, is partly due to the large proportion of practice instead of theory at these schools. The schools are of two general types, the ordinary and technical high school.

Higher technical training in United States

To the foundation and maintenance of these schools wealthy citizens have given or bequeathed enormous sums of money, and they further endow the system of the college, the college system, by which there was set up the Morrill Act of 1862 to give assistance to institutions providing instruction in agriculture and the mechanical arts. Several colleges whose work was mainly literary took advantage of this act to endow institutions and technical high schools in order to secure the income to be obtained by compliance with its provisions.

Without entering into great detail, it may be said that the schools providing advanced technical instruction may be grouped under three headings: (1) those which are free from state or federal control and are maintained from funds arising out of endowments and students' fees, such as the Massachusetts Institute of Technology and Boston University; (2) those supported by the federal government, which are under the control of the federal government, as those which are equal in public control, such as Columbia University, New York, and the Sidney College of Mechanical Arts, Cornell University, and member of the state, such as the universities of Illinois and Michigan.

Contributions from private sources towards the establishment and equipment of these institutions are far in excess of those in any other part of the world. Between the years 1890 and 1901 these contributions amounted to about $23,000,000.

The American universities, with which the technical institutions are in many cases closely associated, differ from those in the United Kingdom in their examinations for degrees. In this respect they have adopted the practice of the German and other continental universities. The examinations are almost uniformly conducted by the teachers. The external examiner is practically unknown. This system allows considerable freedom to the teacher, and is said by some of his best and most eminent professors to be one of the most efficient methods of training many of the states, particularly in the east, even the matriculation, or entrance examination, being superseded by a system known as the "accrediting" system of the secondary of high or schools, where the students receive their general education. According to this system, the schools are inspected by the professors of the university, and those in which the equipment, the courses of instruction, and the method of teaching are found to be satisfactory, are included in a list of "accredited" or approved schools, and the pupils of such schools, who produce a certificate of having satisfactorily attended the prescribed course of study, are admitted to the university without further examination. This is the system that it brings the professors of the university into direct relationship with the schools in which the students receive their preliminary training, and closely connects the instruction provided in the school with the higher orders of specialized teaching of the university.

The widespread appreciation of the advantages of the higher education among all classes of the American people, and the general recognition by manufacturers, engineers, and employers of labour, of the value to them, in their own work, of the services of college-trained men, has largely helped to increase the number of students who reach the universities and technical high schools and to encourage in every state the foundation of schools for advanced professional training.

The institutions in which the highest technical instruction is provided are largely devoted to the preparation of engineers in all its branches, including mining engineering, and of chemistry in its application to manufacturing industry; besides schools of agriculture and forestry and schools of design.

One of these, the Massachusetts Institute of Technology at Boston is the most typical. It was founded in 1859 with a view to supplying a need in the education of men trained in the general training of other institutions. In 1861 an act was passed incorporating a body of persons for the purpose, inter alia, of aiding in the advancement of science in its application to the arts, agriculture, and health, and establishing a school of science, with the power to conduct the instruction of its students, and to confer degree certificates on them in such of the liberal arts, sciences, and practical arts as the school may prescribe. The character of the instruction is such as to provide for technical courses as well as general courses of instruction. This was the first of the systems of technical education in the United States. In 1859 the school was established for the purpose of providing the highest grade of engineering education. In this respect it compared more nearly than any other institution with the highest schools of Europe. The School of Mines, connected with the Royal College of Science, was a similar institution, providing the highest teaching for mining engineers. In Birmingham, Leeds and Sheffield, schools of applied science were established under the names respectively of the Mason College, the Yorkshire College of Science, and Firth College, which gradually developed into technical colleges to which a literary side has been added. The first of these colleges was the Owens College, Manchester, which combined the curriculum of a university with that of a technical high school. Its school of applied chemistry was, for many years, of the most flourishing kind in the United Kingdom. A similar school was founded in Liverpool as a university college, and the Yorkshire College of Science similarly widened its curriculum. To this college, a technical school, including a department for dyeing and design, was added in 1855, and in 1864 another was added in the area of over twenty-five acres, contains blocks of buildings devoted to the teaching of mining and engineering, and at Shefield there is a special school dealing with the metallurgy of iron and steel.

The University of Manchester soon after its incorporation entered into arrangements with the municipal school of technology in that city, which took the first steps to provide the students of the well-equipped buildings of the municipal school, the largest institution of the kind in Great Britain. It was publicly opened in the year 1892. In these new universities ample provision is made for the instruction of students in advanced technical courses, and the laboratories provided for this purpose are well equipped with machinery and apparatus, and compare favorably with some of the most recently erected in Germany. Schools for mining engineers have been established at the universities of Saxon Switzerland and the universities of Saxon Switzerland and the universities of Saxon Switzerland and the universities of Saxon Switzerland. They have been provided for the students of the universities of Saxon Switzerland and the universities of Saxon Switzerland. In Saxon Switzerland, technical instruction forms part of the ordinary university courses in which degrees are granted.

Some other colleges outside London, besides those named, which participate in the government grant, also give high technical training. The most notable, giving higher grade instruction of a technical character,
are University College, Bristol; Armstrong College, Newcastle-on-Tyne; and the university colleges at Nottingham, Reading and Southampton.

The University of Cambridge has a school of engineering with well-endowed scholarships for the study of pure and applied sciences. The universities of Edinburgh and Glasgow recognized at an early date, as part of a university course, the teaching of science in its application to engineering; and at University College, Dublin, in 1853, the foundation of the department of spinning and weaving, more particularly with reference to the manufacture of jute and linen.

In London, the Middlesex College and King's College fulfilled for many years the function of a university and technical high school. Soon after the reorganization of the University of London in 1901, by which that institution was changed from an educational into a university corporation, the Middlesex College and King's College, which were named in the charter as schools of the university, transferred their funds, buildings, &c., to the University of London. King's College, which was founded in 1829, and the Middlesex College, which was originally founded as a technical school in connexion with the People's Palace at Mile End, was admitted in 1907 as a school of the university, and under the statutes of the university certain teachers in the Polytechnic institutes became university teachers, and their students were admitted to graduation as internal students. Most of the students so admitted graduated in the faculty of engineering. For several years it was apparent that the work of the City Guilds Central College and that of the Royal College of Science and School of Mines overlapped to some extent, and that the teaching in each separate institution was incomplete and needed to be supplemented. A report of a joint committee was accordingly appointed by the president of the Board of Education in the year 1904 to consider the working of the government College of Science and the School of Mines and their relation to other institutions. In this report a recommendation was published in 1906, a charter of incorporation was granted in 1907 to a new institution under the name of the Imperial College of Science and Technology, in which the teaching given in the three schools would be co-ordinated under a new governing body, consisting of members appointed by the Crown, the Board of Education, the City and Guilds of London Institute, the University of London and the principal engineering societies, with power to negotiate with the university for the transfer to the new institution of the engineering departments of University College and of King's College. The Exhibition Commissioners of 1851 agreed to grant unoccupied sites of about 9 acres to King's College for the extension of, and the building of new departments to, the existing colleges, and large annual endowments were promised by the government and the London County Council in addition to sums of money from private sources. The new Imperial College of Science and Technology began teaching in 1888, by charter a school of the university, and is intended to provide the highest instruction in engineering and applied science, with facilities for advanced research work. The scheme was intended, when complete, to supply the metropolis with a technical school of the highest grade, similar to some extent to the well-known institutions in Berlin (Charlottenburg) and Massachusetts, but adapted to the special industrial needs of the British empire.

Legislative enactments.—The state organization of technical education in the United Kingdom is mainly the result of enactments passed in and after the year 1850. Before that date, however, as early as 1877, the Livery Companies of London, with a view to fulfilling the purposes for which by charter they were originally incorporated, began to consider how best they could initiate a national scheme of technical education, for which they could not act under the changed conditions under which British industries were conducted, a strong demand had arisen. They consulted leading manufacturers and some of the best-known scientific authorities, and in 1880 an association was formed of the City corporation and some of the wealthier City companies under the name of the City and Guilds of London Institute for the advancement of technical education. The scheme of the institute was to establish a central institution at South Kensington, somewhat on the lines of the high schools of Germany, and one or more technical schools of intermediate grade in London, and to encourage, by means of grants, money and by examination certificates technical classes and trade schools in different parts of the United Kingdom. In March 1888, an organizing director and secretary was appointed to develop and give effect to the scheme. As indicating the importance of the movement King Edward VII., then prince of Wales, accepted the office of president of the institute, which thus led the way to the establishment, under the direction of the government and under the control of local authorities, of a national system of technical education. The successive steps by which the system was evolved, and how it was gradually incorporated into the general scheme of education, are matters of interest in the history of education. A definition of "technical instruction" applicable to the varied teaching of the United Kingdom was, in the first instance, fixed by act of parliament. The term included instruction in science, art, and technology, and also in manual training; and by "technology" was understood the practical application of different kinds of knowledge to a particular trade, or industry, or occupation.

The progress of technical education was very much helped by the formation of the "National Association for the Promotion of Technical Education," which was inaugurated at a meeting held on the 1st of July 1887 and dissolved when its objects had been fulfilled, in June 1907, after twenty years of useful work. The general objects of the association were to promote and watch legislation, to spread information, and to discuss and assist in giving effect to the recommendations of royal commissions appointed to inquire into educational methods and organizations. To this activity the educational department of the then In England had been largely due. The first legislative effort to give effect to the recommendations of the Royal Commission on Technical Instruction, whose report was published in 1884, was a bill introduced into parliament in July 1887. The purpose of this bill was to enable school boards and local authorities to provide out of the rates technical schools, or to contribute to their support. A special provision of the bill was that a poll might be demanded by fifty ratepayers before any action could be taken under the powers it conferred. Technical instruction was also defined as to include subjects aided or sanctioned by the Science and Art Department. The bill was read a second time on 9th of August 1887, but never reached the committee stage. In the following March a new bill was introduced on behalf of the "National Association." It empowered school boards to provide technical instruction in schools under their management, and to contribute to the maintenance of higher technical institutes. The definition of technical instruction was widened so as to include the use of tools, commercial subjects, modern languages, and any subjects sanctioned jointly by the Education Department at Whitehall and the Science and Art Department. South Kensington, which at that time were practically separate government departments. The bill gave very extensive powers to school boards. It was withdrawn without a second reading, in view of the avowed intention of the government to deal with the subject. On the 17th of May 1888 the government bill was introduced. It contained several new features which pointed in the direction of subsequent legislation. Whilst school boards were again empowered to provide technical instruction in their own schools, they were also required, under certain conditions, to aid in the supply of technical and manual training in voluntary schools. At the same time the local control of secondary technical instruction was placed in the hands of a separate authority, viz., the "authority empowered to carry out the Public Libraries Acts," Additional rates, limited in each case to 1d. in the £, might be levied. The bill bristled with difficulties. It aimed at placing the voluntary schools, as regards technical instruction, under the control of school boards, but set up a new authority for the control of technical instruction higher than elementary. There was a growing belief, however, that school boards were not the most suitable bodies for the direction or control of technical education. This belief arose from the difficulty of devising means for securing equal advantages to both classes of elementary schools, and from the general unwillingness to extend school board authority beyond the limits of elementary instruction.

No reference was made to technical education in the Queen's Speech in opening the parliamentary session of 1889, but the
subject had been fully discussed during the recess. The difficulties in the way of legislation on the lines previously attempted were considerable, and it was recognized that separate and distinct measures would have to be adopted for providing technical instruction in elementary schools and in schools of a higher grade. During the year 1889 three bills were introduced by private members. Two only of these bills were considered: the one dealing with elementary education, and enabling school boards to give technical teaching in schools under their management; the other enabling local authorities to establish or contribute to technical schools and classes. The former bill was fully discussed, but in the absence of any practical settlement of the voluntary school difficulty the government withdrew its support, and the bill was dropped. About this time the passing of another legislative measure helped very considerably towards the solution of the difficulty. The Local Government bill, which became law in 1888, enacted that “a council shall be established in every administrative county . . . and be entrusted with the management of the administrative and financial business of that county.” A number of new representative bodies known as county councils were thus created, with powers similar in character to those possessed by the local boards of education, and all business previously conducted by the county municipal bodies for educational purposes the necessity of entrusting technical instruction to school boards was avoided; and, accordingly, on the 24th of July 1889, the government introduced into the House of Commons a bill conferring upon county and county borough councils, and also upon urban sanitary authorities, the power to levy a rate not exceeding 1d. in the £ for the purpose of promoting technical and manual instruction in their district. This bill met with serious opposition from school board authorities and their friends, who resented the limitations it imposed on their educational aspirations; but the government was resolved to pass it, and after much obstruction it became law on the 16th of August 1889, having passed through all its stages in the House of Lords in a single sitting. The bill marked an epoch in the history of education, being the first legislative enactment dealing with technical instruction in England.

The act (Technical Instruction Act, 1888) provided that:

The expression “technical instruction,” shall mean instruction in the principles of science and art applicable to industries, and in the practice of the various branches of industry and art, in the local industries or employment. It shall not include teaching the practice of any trade or industry or employment, but, save as aforesaid, shall include instruction in the principles of science and art with respect to which grants are for the time being made by the Department of Science and Art, and any other form of instruction (including modern languages and commercial and agricultural subjects), which may for the time being be sanctioned by that department by a minute laid before parliament, and made on the representation of a local authority that such a form of instruction is required by the circumstances of its district.

Although at first received with no great favour, the act proved useful, and is important as representing the outcome of a number of abortive attempts at legislation, occupying three years, and intended to give practical effect to some of the recommendations of the Royal Commission of 1884. The act definitely settled the question as to the local authority for technical instruction, and decided it against the school board. It contained no provision, however, for the supply of technical instruction to children in a separate voluntary or board schools, and even expressly excluded from any share in its benefits all scholars receiving instruction in the obligatory or standard subjects. A way was soon found, however, of providing for technical instruction in elementary schools without any fresh act of parliament, and the difficulty of reconciling the interests of voluntary and board schools, which had impeded previous attempts at legislation, was thus avoided.

Early in 1886 the School Board for London, finding that it was unable to expend on technical instruction any part of the school board rate, applied to the City and Guilds of London Institute for financial help. The application was favourably received, and in the following year a joint-committee was formed, consisting of representatives of the Board, of the Institute and of the Drapers’ Company. With the funds supplied by the Company and the Institute the committee were enabled to try some interesting educational experiments. Six centres for workshop instruction were equipped, and children were received into the classes from voluntary and board school. A scheme was devised for grading the work of the institutions, the prominence the disciplinary character of the teaching, and of distinguishing it from the rule-of-thumb methods adopted in the workshop of commerce; and the experience of foreign schools, especially those in France, was utilized. The fears of trade unions lest the action of the school board would have the effect of increasing the number of trade carpenters were minimized, and the real value of manual training as a part of general education was for the first time illustrated. The experiment proved so successful that H.M. inspectors reported most favourably on the usefulness of the teaching, and on the value of the instruction in improving the general intelligence of the pupils, and particularly in rendering them more skilful and observant. Indeed, it was found that their progress in ordinary school studies was quickened by the practical training of the shop. As the result of these experiments the “use of tools” was recognized in the government code of 1890 as a subject of school instruction on which grants were to be paid, and towards the cost of which the school board rate was applicable. Later, following further experiments by the joint-committee, laundry-work and housewifery were included in the curriculum, and the problem of introducing so-called technical teaching into elementary schools was solved without any special legislation. Since 1890 manual training has formed a part of the elementary school system. The instruction includes the use of wood-working and metal-working tools, but stops short of teaching any particular trade, and is thus differentiated from the teaching given in the municipal schools of Paris. The new code also provided for a more rational system of object-lessons and of rudimentary science teaching, encouraging practical exercises and experiments to be worked by the pupils themselves. The joint-committee having completed its work, ceased to exist in 1900.

The act of 1889 and the code of 1890 enabled local authorities and school boards to provide out of the rates technical instruction for the working classes. The rate available under the act was limited to one penny in the pound, and very gradually, and with some hesitation, certain local authorities put the act in force. The motive power required for promoting technical instruction, other than that in elementary schools, was, however, still wanting, and might have remained so for some time longer if it had not been for the accident that in the following year, during the discussion in parliament of the question of compensation relating to public-houses, the residue of the beer and spirit duty was found to be unappropriated, and was allocated to county and county borough councils and made available for the purposes of technical education. The Local Taxation (Customs and Excise) Act, which became law on the 18th of August 1890, was “an act for the distribution and application of certain duties of customs and excise,” and it provided that the residue of the English share of these duties should be distributed between county and county borough funds, and made applicable “for the purposes of technical education within the meaning of the Technical Instruction Act, 1888.” By the express terms of this act this disposition of the residue, which then amounted to £743,000 for England and Wales, was revocable by parliament, and the allocation of the fund to education was left to the discretion of the local authorities. The grant accordingly was not generally regarded as permanent, and local
authorities hesitated to commit themselves to any definite educational schemes. Indeed, it was seriously doubted whether such a measure was likely to be made a permanent annual contribution from the state to the purposes of technical education. But gradually small sums were provisionally voted in aid of existing schools; and when the then Chancellor of the Exchequer declared that, if the "whisky" money (as it was commonly called) were found to be well and carefully expended, no future Chancellor would be able to divert it to any other purpose, local authorities began to consider how the money that had fallen into their hands might be best employed to meet local educational needs. Special committees were accordingly formed, consisting in many cases not only of members of the county or town council, but also of persons versed in educational matters, to whom the preparation of schemes of instruction suitable to the several districts was referred. The committees so constituted, known as technical instruction committees, were established in different parts of the country, and to these bodies was delegated, subject to periodic reports to the council, the responsibility of dealing with the moneys at their disposal. The technical instruction committees proceeded in nearly all cases to elect as secretary a gentleman of scholarly attainments and educational experience, capable of setting on foot and in- terpreting the organization of schools and classes in accordance with the terms of the act and the special requirements of the districts. As a result of the acts of 1889 and 1890 local educational authorities altogether distinct from school boards came into existence, each with an organizing secretary acting as educational officer for the district. The creation of these educational authorities, with functions, however, limited to technical instruction, marks the most important step in the organization of education since the establishment of school boards.

By special minutes of the School and Art Department, new subjects were from time to time included under the term "technical," and the definition of technical education was gradually widened. Among the subjects first added to the list were those included in the "programme of technological examinations" of the City and Guilds of London Institute, and the teaching of technology, as distinct from science, was thus for the first time officially recognized and aided by grants from public funds. Later, commercial subjects and modern languages, the theory and practice of agriculture, and the arts and crafts underlying various cottage industries were accepted as branches of technical instruction; and whilst, on the one hand, the definition was so widened as to include nearly all that is comprised in the curriculum of a secondary school, the teaching of certain technological subjects approached so near to trade teaching that the provision excluding "the practice of any trade or industry or employment" from the teaching sanctioned by the act appeared likely to be overlooked. Practical instruction in engineering, weaving, printing, photography, plumbing, carpentry, brickwork, book-binding and other subjects was encouraged by the City and Guilds Institute, acting as a central authority for education of a distinctly technological character; but notwithstanding the continued increase in the number of practical classes in different branches of technology, the teaching of technology as distinct from that of science and art received at this time no direct support by means of grants in aid from the state. Under the new conditions, however, of assessing the government grant, introduced into the Directory of 1901-02, instruction in technology received some form of recognition.

The county of London remained for some time behind other counties in utilizing the provisions to the Technical Instruction Schemes for London. Act of 1889, by devoting to educational purposes the funds placed at its disposal by the Local Taxation (Customs and Excise) Act, 1890. The funds applicable to London, which in the first instance amounted to about £165,000, but soon reached a total of about £200,000, were wholly employed for a period of two years in relief of the rates. The wants of London were not at first understood; and it was thought that sufficient funds for educational purposes might be obtained from other sources. A scheme for the utilization of a fairly large income arising from the City parochial charities had been under the consideration of the Charity Commissioners. It was first published in 1888, and, after some discussion and modification, was sanctioned by parliament. According to that scheme a capital sum of about £50,000, supplemented by a like amount obtained from the City companies and other sources, was made available for the building of technical and recreative institutions for the poorer classes of the working population of London, similar to the Polytechnic in Regent Street and the People's Palace in Mile End. The scheme created a central governing body for the general supervision and control of such institutions, and placed its disposal an income of about £50,000 available for educational purposes, which, with the falling-in of leases, was certain to increase. Provision for the endowment of eight polytechnics and of other educational institutions was made in the scheme, and the Goldsmith's Company undertook to erect and maintain from its corporate funds a ninth, which has since been presented by the Company to the University of London, and under the name of the Goldsmiths' College is used mainly as a school for the training of teachers. Since then other similar but somewhat smaller schemes have been established.

Before the erection of these new institutions was completed it was ascertained that the annual income at the disposal of the trustees for the purposes of maintenance and equipment was altogether inadequate; and a committee of inquiry having been appointed by the London County Council, an exhaustive report on the educational needs of the metropolis was prepared, which led to the formation of a Technical Education Board for London, consisting of members of the County Council, who formed the majority of the board, and also of representatives of the City Parochial Trustees, of the City and Guilds Institute, of the School Board, and of other bodies; and to the board so constituted the council entrusted the spending of the funds available under the Local Taxation Act, 1890. The board held its first meeting on the 28th of April 1893, but ceased to have a separate existence in 1903 on the passing of the London Education Bill. During those eleven years the board, with the assistance of its organizing secretary, succeeded in arranging a comprehensive and varied scheme of scholarships, which, among other benefits, enabled children from the elementary schools to continue their education in technical instruction in the larger cities, in the intermediate technical schools, and in the higher technical institutes and universities. It supplemented by large grants the income of the polytechnic institutions; it established or assisted in establishing new trade schools; it provided laboratories, and aided in the teaching of practical science in a large number of secondary schools; it encouraged the teaching of modern languages and commercial subjects; it assisted in founding a school of economics, which has become a constituent part of the new University of London, and utilized in nearly all instances with the best possible results the large and increasing income allocated by the County Council to technical education.

The close connexion between technical and secondary education was clearly indicated in the comprehensive definition of the former term given in the act. But it soon became manifest that no great progress could be expected in technical education unless further provision were made for secondary education, and unless some improvement could be effected in the methods adopted in secondary schools. The cry of Mr. Arnold for the better organization of secondary education had, so far, met with no adequate response. There was still an insufficient supply of secondary schools, and a complete absence of advice or control by any central authority. The urgency of this subject was recognized by the National Association for the Promotion of Technical Education, which at a meeting held in July 1889 resolved to alter its title by the addition of the words "and Secondary," after Technical.

This revolt against the widespread conviction that technical and secondary education are of necessity closely associated, and that future efforts should be directed towards the improvement and organization of secondary education and the union of different grants of technical education under a single government department. That the Technical
Instruction Act would need to be followed by a Secondary Edu-
cation Act. This was generally recognized. According, after much dis-
cussion, the government in the year 1896 introduced into parliament a
comprehensive measure dealing with education as a whole and
embodied the principal recommendations of the Royal
Commission of 1892. The bill was well received, and, if the
government had persevered with it, would have passed into law,
and the question would have been settled for a generation. It
was withdrawn before the Easter Recess of 1896, an opportunity
of the 1903-1904 session of the House of Commons to
be taken to affect the ratepayers, and although in 1903 an act was passed for the extension of
education in London, the Board of Education had undertaken
the preparation of a scheme prepared by the London County Council which vested the
control of education in the hands of a committee consist-
ing exclusively of members of the council with the

teaching of technology and helped to promote a better system of instruction in Irish schools.

The work was successfully commenced under the direction of the newly constituted Department of Agriculture and Technical Instruction, consisting of an Agricultural Board, a Board of Technical Instruction, a Council of Agriculture, and a Consultative Committee of Education. The department had an endowment of £166,000 a year, which was distributed among the several branches. It took over the duties of several other administrative bodies, and the grant for the instruction of agriculture in Ireland, as an additional and necessary contribution to the development of agriculture in the country. Thanks to its activities and the unimpeachable honesty with which public money was administered, the department was able to carry on the work of the State Education Board, which was done in an manner in Ireland as defined by the Technical Education Act of 1889, previously administered from South Kensington, was transferred to the new department. Among the industries for which the department is now occupied in organizing courses of instruction are engineering, textiles (particularly linen manufac-

The municipal school of technology at Belfast, opened in 1907, is an institution similar in many respects to those of Manchester and Birmingham, and providing technical instruction in connexion with a great variety of industries. There is also a large school at Dublin, and schools have been established in Cork, Limerick and elsewhere.

Results of Experience.—Experience has helped to establish certain principles as applicable to technical education. It is now generally admitted that whilst the age at which the ordinary school training should cease, and technical or professional education should commence, must vary for different classes of workers, the teaching special to any industry or employment should supplement, and not form part of, general education. The subjects entering into the school curriculum may be, and in certain cases should be, selected with reference to their applicability to certain callings, but they should be so taught as to become instrumental in the formation of mental habits and in the development of character, the mere knowledge and skill acquired being of secondary importance. In the teach-
ing of science there has been a marked change in method. Formerly the usefulness of the knowledge to be derived from the study of nature gave to physical science its chief claim to a place in the school curriculum, but it is now held that the real value of the study consists in the opportunities it affords of exercising the pupil in accurate observation, and of developing resourcefulness and powers of independent thought and reason-
ing. Whilst the opinion in favour of postponing as long as circumstances permit all specialized instruction has been lent to this tendency, there is also a growing tendency, not only in England but also on the Continent and in the United States, to associate technical teaching more closely with work-
shop practice. The professional or trade teaching, which is supplementary to primary or secondary education, is more practical and less easily distinguishable by the ordinary ob-
server from the training of the factory or workshop. This tendency is shown in all grades of technical education. The technical institutes established in London and in the large English manufacturing towns, attended mainly by evening students, are more closely connected with the development of character, the mere knowledge and skill for the teaching of applied science, but also with tools and machines for the teaching of technology; and some of the departments of these schools are equipped so as to resemble a small factory. This is the case in the departments devoted to the teaching of mechanical and electrical engineer-
ing, weaving, and spinning, watch- and clock-making, boot and shoe manufacture, and the different branches of the building and printing trades.

So far, however, no attempt has been made, except in very special cases, to teach the practice of any special trade. The teaching of technology is distinctly different. In all the technical institutes of London, and in most of those of other towns, none but persons actually engaged in the industry, the technology of which they are desirous of studying, are admitted to the workshop classes. The instruction given in such classes is very different as regards method, and also in its aims and objects, from the training of apprentices in the factory or trade shop. The tools and appliances are the same, but they are used rather as a help to the teachers in illustrating principles than as a means of training for technological practice. This is essentially different from the instruction of men in the strict sense of the term. The position of these higher-grade schools in the general educational scheme was the subject of an important action (Rex v. Cockerton, 1901) in which it was
decided by the law courts that the school boards were unable to apply the rates to the support of such schools. They were accordingly withdrawn from the sphere of elementary education, and have since been treated as schools of a secondary type. The judgment on appeal was conclusive, that the school board rates could be employed only for the provision of elementary education for children, whether in the day or evening, and this decision paved the way for the dissolution of school boards, and to the transfer of their duties and functions to the county and borough councils under the Act of 1902.

As regards secondary schools proper, in their relation to technical education, it is important that the curriculum of such schools should be sufficiently varied to afford a sound liberal and preparatory training for the different branches of professional work. It is generally admitted that at least three types or departments of schools are needed—(a) the classical, (b) the mathematical, and (c) the modern language type; and that each of these divisions should contain sub-departments. The first of these varieties would be available for the general training of students wishing to enter the legal, theological or literary professions; the second for those preparing for scientific, medical or agricultural pursuits; and the third would be found best fitted as a preparation for a commercial calling. These schools would correspond to some extent to the three kinds of secondary schools found in Germany, and would be available for students preparing to enter one or other of the faculties of a modern university. The organization of different types of secondary schools, and the curriculum appropriate to each, are matters which continue to occupy the attention of educational experts. In accordance with the regulations for secondary schools issued by the Board of Education in 1907, substantial grants were made to secondary schools which conformed to certain conditions as regards local control and undenominational religious instruction, or the directive influence of the board as regards curriculum and management over all such schools was strengthened. At the same time, manual training and domestic science were made essential parts of the curriculum in boys' and girls' schools respectively.

The demand for technical education, which originally led to the formation of the City and Guilds of London Institute, directed attention to the methods of teaching science, drawing and other subjects, and to the necessity of including science, manufacture and various agricultural pursuits; and the third would be found best fitted as a preparation for a commercial calling. These schools would correspond to some extent to the three kinds of secondary schools found in Germany, and would be available for students preparing to enter one or other of the faculties of a modern university. The organization of different types of secondary schools, and the curriculum appropriate to each, are matters which continue to occupy the attention of educational experts. In accordance with the regulations for secondary schools issued by the Board of Education in 1907, substantial grants were made to secondary schools which conformed to certain conditions as regards local control and undenominational religious instruction, or the directive influence of the board as regards curriculum and management over all such schools was strengthened. At the same time, manual training and domestic science were made essential parts of the curriculum in boys' and girls' schools respectively. The methods of science teaching have been greatly improved. Experimental work has become essential, and methods of investigation and research have been applied to the teaching of a number of subjects to which formerly they would have seemed inapplicable. A close connexion has thus been established between the workshop and the classroom, and practical instruction is now regarded as a necessary part of general education both elementary and secondary, and as no less disciplinary than the merely literary and oral teaching which it has partly superseded. This change in the school curriculum and in the methods of instruction has narrowed the true significance of the term "technical" as applied to education. By the term "technical" as commonly used is now understood "technological" or "professional," and whilst technical instruction may supplement either primary or secondary education, it is necessarily distinct from either.

The conviction has been steadily gaining ground that success in manufacturing industry, in the higher walks of commerce, and in every pursuit requiring technical knowledge, depends very largely upon the thoroughness and completeness with which those who are charged with the control of the different kinds of work in which the army of operatives are engaged. Intelligent and highly skilled workers are indispensable; but unless they are properly directed by efficient and expert officers they can effect but little. It is undoubtedly due to the careful training of the masters and leaders of industry that the Germans have achieved so large a measure of success in different technical pursuits. The recognition of this fact is slowly but surely influencing educational thought and action in Great Britain; but Germany is still ahead in the facilities afforded for higher education, and in the advantage taken of the facilities that exist. The number of students in her universities and technical high schools is still in excess of those receiving a similar training in Great Britain. The establishment, however, of local universities and the schemes for the award of scholarships adopted by local education authorities, will tend year by year to lessen this disparity. Meanwhile, Germany has relaxed none of her former efforts, but is steadily occupied in the enlargement and improvement of educational institutions. New schools have been erected wherever and for whatever purpose they are needed, equipped with every modern appliance for scientific investigation and research. Each professional career has its corresponding high school or university department. The economy of a wise and liberal expenditure on higher education is a recognized fact in German statecraft.

For those who are intended to occupy the highest posts in industrial life, a sound secondary education, supplemented by appropriate university training, is the best preparation. It is only in the university or tertiary grade of educational training that specialized or technological training for the higher industrial posts should commence. At this stage of education, general and professional teaching are more closely associated, and the names of the faculties of the new universities in the United Kingdom will in future indicate the several branches of professional work to which the different courses of university study are intended to lead. Of late there has been a marked development of distinctly technical instruction in connexion with the colleges of university rank. The error of restricting university studies to a certain limited range of subjects, which led in Germany to the establishment of technical high schools as institutions distinct from the universities, has been avoided. Engineering, in the broadest sense of the term, has been recognized as a branch of university education of the same order as medicine or law. Laboratories and workshops have for many years formed part of the equipment of the principal university colleges. In the statutes of the university a separate faculty is assigned to engineering, and part of the work of the polytechnic institutes is correlated with that of the reconstituted university. A survey of the field of education and research has been applied to the teaching of a number of subjects to which formerly they would have seemed inapplicable. A close connexion has thus been established between the workshop and the classroom, and practical instruction is now regarded as a necessary part of general education both elementary and secondary, and as no less disciplinary than the merely literary and oral teaching which it has partly superseded. This change in the school curriculum and in the methods of instruction has narrowed the true significance of the term "technical" as applied to education. By the term "technical" as commonly used is now understood "technological" or "professional," and whilst technical instruction may supplement either primary or secondary education, it is necessarily distinct from either.

The conviction has been steadily gaining ground that success in manufacturing industry, in the higher walks of commerce, and in every pursuit requiring technical knowledge, depends very largely upon the thoroughness and completeness with which those who are charged with the control of the different kinds of work in which the army of operatives are engaged. Intelligent and highly skilled workers are indispensable; but unless they are properly directed by efficient and expert officers they can effect but little. It is undoubtedly due to the careful training of the masters and leaders of industry that the Germans have achieved so large a measure of success in different technical pursuits. TECK, a ducal castle in the kingdom of Württemberg, immediately to the N. of the Swabian Jura and S. of the town of Kirchheim, crowning a ridge (2544 ft.) of the same name. It was destroyed in the Peasants' War (1525).

The duchy of Teck was acquired early in the 11th century by Berthold, count of Zähringen, whose great-grandson Albert, accordingly wallaced himself duke of Teck and general both by the ancient and composite descent, to Württemberg. The title, which had lapsed with the extinction of the Zähringen line in 1439, was revived in 1495 by the German King Maximilian I., who bestowed it upon the dukes of Württemberg. The dignity was renounced by Duke Frederick William Charles upon his elevation to the rank of king in 1806. In 1863 the title "prince of Teck" was conferred by King William I. of Württemberg upon the children of Duke Alexander of Württemberg
TECUCI—TEETH

TECUMSEH, TECUMTHA, or TECUMTI (c. 1768–1813), American Shawnee chief, was probably born in the old Shawnee village of Piqua, near the site of Springfield, Ohio, between 1768 and 1780. While still a youth he took part in attacks on settlers passing down the Ohio and in widely extended hunting expeditions or predatory forays to the west and south; and he served in the Indian wars preceding the Treaty of Greenville in 1795. About 1800 his eloquence and his self-control made him a leader in conferences between the Indians and whites. After 1805 the Indians of the Northwest were aroused by a series of cessions of their territory and by the prospect of war between Great Britain and the United States. This presented to Tecumseh and to his brother Tenskwatawa (i.e. the Open Door), popularly called “the Prophet,” the opportunity to put into operation a scheme which followed the ambitious dream of Pontiac. With some scattered Shawnee clans as a nucleus, the brothers proceeded to organize, first near Greenville, Ohio, and later on the White and Tippecanoe rivers in Indiana, “the Prophet’s town,” which was based on a sort of communism and was apparently devoted to peace, industry and sobriety, their actual plan was to combine all of the Indians from Canada to Florida in a great democratic confederacy to resist the encroachment of the whites. Tribal organizations were to be disregarded, but all warriors were to be represented at periodical assemblages where matters of interest to all Indians were to be definitely decided. The twofold influence that was to dominate this league was the eloquence and political ingenuity of Tecumseh and the superstitious reverence aroused by “the Prophet.” This programme alarmed the whites along the north-western border. In the course of the next three years Governor William Henry Harrison of Indiana held interviews with each of the brothers, and during one of these, at Vincennes in 1810, the respective leaders narrowly avoided a hostile encounter. Nevertheless “the Prophet” and Tecumseh reiterated their determination to remain at peace with the United States if the Indians were unmolested in their territory, and if all cessions beyond the Ohio were given up by the whites. The treaty of Fort Wayne in 1809, which called for the cession to the whites of some three million acres of land in central Indiana, was a direct challenge to this programme, and when, during Tecumseh’s absence in the South, Harrison made a hostile move against “the Prophet’s” town, the latter ventured to meet him, but was defeated on the 17th of November 1811 in the famous battle of Tippecanoe, which broke the personal influence of “the Prophet” and largely destroyed the confedera-
yacy built up by Tecumseh. Tecumseh still professed to be friendly toward the United States, probably because his British advisers were not ready to open hostilities, but a series of border outrages indicated that the fatal moment could not long be postponed. When, in June 1812, war broke out Tecumseh joined the British, was commissioned a brigadier-
genral in the British army, and participated in the skirmishes which preceded General William Hull’s surrender at Detroit. He took an active part in the sieges of Fort Meigs, where he displayed his usual clemency toward his prisoners. After the battle of Put-in-Bay, when Colonel Henry Proctor began to withdraw to Malden, Tecumseh bitterly reproached him for his cowardice and finally forced him to join battle with Harrison on the Thames, the 5th of October 1813. In this battle Tecumseh was killed, as is generally supposed by Colonel Richard M. Johnson of Kentucky, although this has never been fully substantiated. Like Pontiac, whom he doubtless imitated consciously, he had a wonderful eloquence and a power of organization rare among the Indians. His brother, “the Prophet,” remained with a small band of Shawnees and died west of the Mississippi in 1834.

See Benjamin Drake, The Life of Tecumseh and of his Brother the Prophet, 2 vols. (1841); and Homer J. Webster, Harrison’s Administration of Indiana Territory (Indianapolis, 1907).

TEDDINGTON, an urban district in the Uxbridge parliamentary division of Middlesex, England, close to the Thames, 13 m. W.W.S. of St Paul’s Cathedral, London, on the London and South-Western railway. Pop. (1901) 14,037. The district is residential and the town is a resort of visitors both to the river and to Bushy Park, which lies immediately south (see HAMPTON). The National Physical Laboratory, for making scientific investigations of industrial importance, and for mechanical testing, was opened in Bushy House in 1902.

TEES, a river of England, rising on the eastward slope of Cow Green Fell in the county of Durham, and running westward, past the scene of the battle 85 m. in length to the North Sea. In the earliest part of its course it forms the boundary between the counties of Westmorland and Durham. The head of the valley, of which the upper portion is known as Teesdale, is not without desolate grandeur, the hills, exceeding 2500 ft. in height at some points, consisting of bleak moorland. A succession of falls or rapids, where the river traverses a hard series of black basaltic rocks, is known as Cauldon Snout; and from a point immediately below this to its mouth the Tees forms the boundary between Durham and Yorkshire almost without a break. Thedale becomes bolder below Cauldon Snout, and trees appear, contrasting with the broken rocks where the water dashes over High Force, one of the finest falls in England. The scenery becomes gentler but more picturesque as the river descends past Middleton-in-Teesdale (Durham), the terminus of a branch of the North-Eastern railway from Darlington. In this locality lead and ironstone are worked. The ancient town of Barnard Castle, Eggleston Abbey, and Rokeby Hall, well known through Sir Walter Scott’s poem, are passed; and then the valley opens and the Tees escapes the throng of hills to outcrop on the rich plain east and south of Darlington. The eastern side of the valley hitherto has been generally E.S.E., but it now turns N.E. and, nearing the sea, becomes an important commercial waterway, having on its banks the ports of Stockton-on-Tees, Thornaby-on-Tees and Middlesbrough, and forming an outlet for the rich ironworking district of Cleveland in the North Riding of Yorkshire. It is also navigable for barges up to High Worsall, 11 m. above Stockton. For the last five miles the course, below Middlesbrough, is estuarine. The drainage area is 708 sq. m. No important tributary is received.

TEETH (O.E. teō; plural of tooth, O.E. teō), The modified papillae or elevations of the mucous membrane of the mouth, impregnated with lime salts. Each tooth has a biting part or crown covered by enamel, a neck where the gum surrounds it, and one or more roots or fangs fitting into sockets (alveoli) in the jaw bone. For surgery of the teeth see DENTISTRY.

There are thirty-two permanent teeth in man, sixteen in the upper and sixteen in the lower jaw; they are also arranged in symmetrical sets of eight teeth on each side. The two teeth on each side of the mid-line in front are “incisors” and have chisel-shaped crowns. The incisors are followed by the “canines” or central incisor of the lower jaw, which are broader than any of the others, consequently it bites against the central and lateral incisors of the lower jaw, and the same way of exact adaptation continues throughout the series, so that every tooth in the upper jaw except the last molar bites against its corresponding tooth of the lower jaw and the tooth behind that.
Next to the incisors comes the "canine tooth," the crown of which is somewhat peg-shaped, while behind this are the two "premolars" or "bicuspids," whose crowns are flattened from before backward and bear two cusps, the larger of which is somewhat more prominent than the other. They are readily distinguished from the canines by being placed farther apart from each other and from the incisors. As a rule there is a single root, though sometimes in the upper premolars it is double.

The three "molars" are placed behind the premolars, and the upper and lower sets can be easily distinguished because the upper have three roots while the lower have only two. Of the three roots which the upper molars bear two are lateral or external and one mesial (see fig. 2), so that it is easy to tell the outer from the inner side of an upper molar. The front can, as a rule, be identified by the fact that the roots are generally bent a little backward at their tips, and this applies to other teeth than the upper molars. In the lower jaw, owing to the two fangs being anteroposterior, it is not possible to tell the lateral from the mesial surface of the molars by them, although the backward inclination of their tips shows the front from the back. When it is remembered that the upper teeth overlap the lower externally it is reasonable to expect that the lower molars would show some rounding due to wearing away of the edge of the crown on the outer side, and this is the case.

The grinding surface of the crowns of the upper molars shows three or four cusps, while on that of the lower four or five are found.

Of the three molars the first is the largest, and the third, or wisdom tooth, the smallest, while the upper wisdom tooth is smaller than the lower.

The "milk teeth" or temporary dentition of the child are only twenty teeth, ten in each jaw and five in each segment. They are two incisors, one canine, and two so-called molars. These molars occupy the position which the permanent premolars later on take, and it is held by many that the adult molars really belong to the milk dentition, although they cannot appear until the jaw has grown backward sufficiently far to make room for them. The temporary teeth differ from the permanent in their smaller size, their whiter colour, the greater constriction of their necks, and in the fact that the roots of the molars are widely splayed.

The dates at which the milk teeth are cut are very variable. The lower central incisors come first between the sixth and seventh month, or even later; then, after a few months, come the central and lateral upper incisors; again a few months' rest and the lower lateral incisors appear, followed closely by the first molars. After another rest of four or five months come the canines, the eruption of which is a slow process, while by about the end of the second year the second molars have appeared, and the milk dentition is complete. It will be seen from the above that the milk teeth are cut in batches with resting intervals between.

As C. S. Tome's points out, we do not know what causes the eruption of the teeth; the growth of the roots is not of itself enough to account for it. It is possible, however, that blood-pressure may be the determining cause. The first permanent tooth to be cut is the first molar, and this happens during or soon after the sixth year. It does not displace any of the milk teeth, but comes down behind the second milk molar. During the seventh year the central milk incisors fall out and their place is taken by the permanent ones; the shed teeth are mere shells of the crown, all the root having been absorbed, though not, as might be thought, owing to direct pressure of the succeeding tooth.

The lateral incisors succeed their milk predecessors at about eight years old, the first premolar takes the place of the first temporary molar about nine, the second premolar that of the second temporary molar about ten, the canine about eleven, while the second molar comes down behind the first about twelve, and so is known as the "twelve-year-old tooth." The third molar, or wisdom tooth, usually appears between eighteen and twenty, but may be much later, indeed it is sometimes never cut at all, and when it is, it often does not come down to a level with the other teeth. It is believed that man is gradually undergoing a suppression of his last molar teeth, which, if the process continue, will lead to our successors having a different dental formula from our own. It is interesting to notice that in some of the lower races of mankind the last molar tooth is nearly as large as those in front of it, and this is the case in the anthropoid apes. A. Keith and D. Braden Kyle have pointed out that the second and third molar teeth are successively formed in the posterior wall of the maxillaty antrum.
and their crowns look backward. It is owing to the gradual growth backward of this antrum and the maxilla that they are rotated round a quarter of a circle and so at last look downward (see A. Keith, British Journal of Dental Science, vol. xiv., June 16, 1902).

Extra teeth are occasionally met with in the incisor, premolar and molar regions; their significance will be better realized after the embryology and comparative anatomy of the subject have been sketched.

**HISTOLOGY.**

If a section be made vertically through a tooth all the exposed part or crown is seen to be covered with enamel, which, microscopically, is composed of a number of fine hexagonal prisms arranged at right angles to the surface of the tooth, and formed chiefly of calcium phosphate with small amounts of calcium carbonate, magnesium phosphate and calcium fluoride, but containing practically no organic matter. The enamel rests on the “dentine,” of which hard yet elastic substance by far the greater part of the tooth is composed. It is made of the same salts as the enamel, but contains in addition a good deal of organic matter and forms a structureless mass through which the fine “dental tubes” run from the pulp cavity to the periphery.

Surrounded by the dentine is the “pulp cavity,” which is filled by the pulp pulp, a highly vascular and nervous mass of branched connective tissue cells, which, in a young tooth, has a layer of epithelial cells, the “odontoblasts,” lying close against the wall of the cavity and forming new dentine. Slender processes (“Tomes’s fibris”) project from these cells into the dental tubules, and are probably sensory. A nerve and artery enter the apex of the root of the tooth, but it is not understood how the nerve ends.

Surrounding the dentine where it is not covered by enamel is the “cement” or “crusta petrosa,” a thin layer of bone which is only separated from the bony socket by the alveolar periosteum.

**EMBRYOLOGY.**

The lip is marked off from the rest of the mouth region by a “lip groove,” which, in the case of the lower jaw, grows obliquely downward and backward, and the mass of ectodermal cells bounding it penetrates for some distance into the surrounding mesoderm below the bottom of the groove. This is known as the ‘tooth band.’

On the under surface of this oblique tooth band (still taking the lower jaw), and close to its edge, appear ten thickening, below each of which, the mesodermal layer, the dental papilla, “appears, the moulds the thickening into a cap for itself—the ‘enamel organ.’ The superficial cells of the dental papilla become the ‘odontoblasts’ and manufacture the dentine, while those cells of the cap (enamel organ) which are on its inner surface and therefore nearest the dental papilla are called ‘ameloblasts,’ and form the enamel. The cutting or grinding part of the tooth is first formed, and the crown gradually closes round the papilla, so that at last the root is formed, the central part of the papilla remains as the pulp cavity surrounded by dentine except at the apex of the root. The roots, however, are formed slowly, and as a rule are not complete until some time after the tooth is cut. The dental cavity following the developing tooth becomes condensed into a fibrous bag which is called the tooth-sac, and round this the lower jaw grows to form the alveolus. The crista petrosa which covers the tooth, is developed from the tooth-sac. It will be realized that, of the various structures which make up a tooth, the enamel is derived from the ectoderm, while the dentine, pulp and crista petrosa, or cement are mesodermal.

So far only the milk dentition of the lower jaw has been accounted for.

Returning to the tooth band, it was noticed that the enamel organs were formed not at the extreme edge but a little way from it. From the extreme edge, which, it will be remembered, points inward toward the tongue, the permanent tooth germs are derived, and it is therefore clear that the permanent teeth must come up on the lingual side of their milk predecessors.

**COMPARATIVE ANATOMY.**

The details of the teeth vary so greatly in different animals and groups of animals, and, on account of their being the most durable tissues of the body, are so important for classificatory purposes, that they are dealt with freely in the various zoological articles. All that can be done here is to give a broad general survey of the subject, taking the details of man’s dentition, already set forth, as a point of departure.

In some fishes the teeth are continuous over the edges of the jaws with the scales on the surface of the body, and there is no doubt that teeth should be regarded as modified scales which have migrated into the mouth.

In the Cyclostomata (lampreys and hags) the teeth are horn-like, but beneath them there are papillae of the mesoderm covered with ectoderm which resemble the dental papilla and enamel organs although no calcification occurs except in Bdellostoma. In the Elasmo-branchii (cartilaginous fishes) the teeth are arranged in several rows, and as those of the front row fall out the hinder row take their place; sometimes they are triangular and very sharp as in the sharks, sometimes flattened and arranged themselves for crushing as in rays. These teeth only represent the crowns of man’s teeth, and they are not embedded in sockets except in the case of the teeth in the jaw of the saw-fish (Pristis); moreover the dentine of which they are largely composed resembles bone and fills up the whole pulp cavity. From its structure it is known as osteodentine.

In the Teleostomi (teleostean and ganoid fishes) there is great variability; sometimes, as in the sturgeon, there are no teeth at all, while at others every bone bounding the mouth, including the branchial arches, bears teeth. As an example of a very full tooth armature the pike’s mouth and pharynx may be instanced. Both in the pike and the hake hinged teeth occur; these bend backward during the passage of prey down the throat, but are re-erected by elastic ligaments. As a rule, the dentine of the Teleostomi of the variety already described as osteodentine, but sometimes, as in the hake, it is vascular and is known as vasodentine.

In the Amphibia teeth are not so numerous as in the fishes, though still, they are present in the jaws, though the teeth are very constant. The toad is edentulous, while the frog has no teeth in the lower jaw. An extinct order of tailed amphibians, the Stegocephali, are often called labyrintodonts or condylodonts, but in the case, of both in which the enamel is cellular, the teeth of which are largely composed resembles bone and fills up the whole pulp cavity. From its structure it is known as osteodentine.
to do so, to let any prey which had once entered its mouth escape. The poisonous snakes have a special poison fang in the maxilla of each side; these have a deep groove or canal running down them which transmits the poison from the poison gland. In the colubrid snakes, the fangs are elongated and fixed to the palate by a great number of ligaments and muscles, but in the viperine, such as our own adder and the rattlesnake, there is a mechanism by which the tooth is only erected when the jaws are opened for striking. At other times the teeth lie flat in the gums.

In the lizards or Lacertilia the teeth usually consist of a series of pegs in the upper and lower jaw, each resembling the one in front of it in place and in shape. The chisel-shapes are impossible, as their bases to the bone, but at others, as in the iguana, they are fused by their sides to a ridge of bone which forms a low wall on their lateral surface. In the former case the dition is spoken of as "homodont," but in the latter as "pleurodont.

In the Crocodilia the teeth are fitted into definite sockets as in mammals and are not ankylosed with the jaws. This arrangement is spoken of as "heterodonto.

In all these lower vertebrates, then, the teeth are similar or nearly similar in character; at least they are not divided into incisor, canine, premolar and molar regions. Their dition is therefore known as "homodont." Another characteristic is that in almost all of them there is an arrangement for a continuous succession of teeth, so that when one is lost another from behind takes its place, and to this arrangement the term "polyphyodont" is applied. With a few exceptions a homodont dition is also polyphyodont.

In the Mammalia the different groups of teeth (incisor, canine, &c.) already noticed in man are found, and these animals are characterized, with some exceptions, by having a "heterodont" as opposed to the "homodont" dition. In the dog, for instance, the succession of teeth is reduced to a "diphyodont" dition, which means that only one pair of teeth is replaced in the mandible.

In the marsupials the reduction of the succession is carried still further, for there is only one premolar in each segment of the jaw is replaced, while in the toothed whales there is no succession at all. When one set has to do duty throughout life the succeeding is called the "metaphyodont." There is a good deal of discussion as to how the complex back teeth of mammals with their numerous cusps were derived from the simple conical teeth which are generally assumed, though not by all, to have been the primitive arrangement. One simple way of accounting for the change is by the concrescence theory, namely that several conical homodont teeth have fused and so formed a single multibuccal toothen; but, although this process may be partly true, it does not account for all the facts at our disposal. Another theory, which is more favoured at the present time, is known as the "tribute," and is largely based on the researches of E. D. Coe and H. F. Osborn, two American palæontologists. According to this theory a simple peg-like, or, as it is called, "hapolodont," tooth develops two additional smaller pegs or cones, one in front and one behind the original main cone, possibly owing to the irritation of the teeth against which it bites. This is known as the "triconodont stage, and it is found in some of the oldest extinct mammals. As a later adaptation it is found that the two small cones, the interior of which is called the "paracone" and the posterior the "metacone," become external to the original "protocone" in the upper jaw and internal in the lower.

The surface of the tooth has now a triangular shape with a cone as its acme, and this is the "tribute" tooth which is of very common occurrence among the ancestral mammals. Other cusps may be developed later, and so the quadricuspid and quinquecuspid molar teeth of man and other mammals are accounted for. This theory, although in a brief outline it sounds feasible enough, has really many points of difficulty, and those who are interested in the subject will find a fuller account in C. S. Tomes' Dental Anatomy and Palæontology, and in W. L. Clark's Morphology and Anthropology (Cambridge, 1901), in which references to the original literature, which is now very voluminous, are given. Marett Tima (J. Anat. and Phys., vol. xxxvi, p. 131) suggests that the evolution of the mammalian teeth is to be explained partly by the tribute and partly by the concrescence theory.

It is impossible, in the space assigned, to give even a brief review of mammalian odontology, but it may clear the ground for the special zoological articles if an attempt is made to define what is meant by the different classes of teeth.

Incisor teeth are those which in the upper jaw have their sockets in the premaxillary-maxillary suture, provided it be not far behind it; it is almost always the first of the premaxillary series, speaking accurately, which is elongated and sharply pointed. As its name implies it is well marked in dogs and other Carnivora, but is found in many other orders. It is the principal offensive and defensive weapon of many mammals, and is greatly developed in some of the ungulates which are without horns, e.g., the musk deer. The tusks of the walrus and wild boar are canines.

In many of the Insectivora, especially the mole, the canine is very hard to identify, as in these animals an incisor or a premolar may take on caniform characters, or there may be no tooth at all with these characters.

The premolar teeth are those in the maxillary bone which are preceded by milk teeth. This definition, of course, includes the canine as a modified premolar, and so it should no doubt be considered, though, if it is desired to keep it distinct, "behind the canine" must be added.

Unfortunately for an accurate definition the first premolar behind the canine is not always preceded by another tooth, and so it becomes an unsettled question whether, in these cases, the tooth is really a premolar tooth or a permanent one which has had no predecessor; it is probable, however, that the latter is the right interpretation.

The molar teeth are those, behind the premolars, which are not preceded by temporary teeth. As was pointed out, in man's dition they are probably teeth of the first or milk dition which appear late.

In front of the premolar teeth, and between them and the canine, if it be present, or the incisors, if it be absent, there is often a space called the "diastema." It is best marked in the orders of Rodentia and Ungulata, and in the horse is familiar as the place where the bit lies.

In recording the teeth of any particular mammal it saves time and space if a dental formula be used. This simply means setting down the number of each kind of tooth in one side and lower jaw, and in their order from before backwards. Thus man's formula would be, incisors 2\(\frac{3}{3}\), canines 1\(\frac{1}{1}\), premolars 2\(\frac{2}{2}\), molars 3\(\frac{2}{1}\). This is condensed into 2.1.3.2.

Some other types of dental formulae are—

- Carnivora (old world monkeys) 2.1.3.2
- Platyrhine (new world monkeys) 2.1.3.3
- Marmosets 2.1.3.3
- Most lemurs 2.1.2.3
- Insectivorous bats (full series) 3.1.3.3
- (The upper incisors and both premolars may be reduced by one)
- Frugivorous bats 2.1.3.3
- (The molars may be reduced)
- Insectivora (teeth variable and somewhat uncertain) 3.1.3.3
- Hedgehog 2.1.2.3
- Mole 3.1.4.3
- (Five different dental formulae have been assigned to this animal)

Carnivora—

- Cat family (Felidae) 3.1.3.1
- Dog family (Canidae) 3.1.4.2
- Bear family (Ursidae) 3.1.4.3
- Civet family (Vivirridae) 3.1.4.2
- Raccoon family (Procyonidae) 3.1.4.2
- Hyaena family (Hyaenidae) 3.1.4.3
- Weasel family (Mustelidae) 3.1.4.3
- Eared seal family (Otariidae) 3.1.4.1 or 2
- Seal family (Phocidae) 3.1.4.1
- Walrus family (Trichechidae), adult 3.1.3.0
- In a young animal (probably) 3.1.3.2
In this animal there are no premolars, but the milk molars (d.m) and true molars gradually replace one another from before backward throughout life, so that there are never more than two back teeth in each segment of the jaw at any one time.

Rodents—

Typical rodents (Simplicidentata) 1.0 (0-1).3 1.0 (0-1).3

Hares and rabbits (Duplicidentata) 2.0.3.3 1.0.2.3

Cetacea.—In the living toothed whales (Odontoceti) the dentition is homodont and may be as great as 50. There is every reason to believe, however, that they are derived from heterodont ancestors. In the whalebone whales (Mystacoceti) the teeth are replaced by the whalebone in the adult, but in the embryo slightly calcified teeth are present which are afterwards absorbed.

The homodont dentition of the whales is a retrograde process, and is therefore not comparable to the homodont dentition of the vertebrates below mammals.

Sirenia.—The dentition is monophyodont. The manatee has i. 2 c. 0 back teeth 11.

In the Edentata the ant-eaters (Myrmecophagidae) and pangolins (Manidae) are toothless, though the latter have toothed foot gums. The aard varks (Orycteropodidae) are somewhat heterodont, while the armadillos (Dasyopodidae) and sloths (Bradypodidae) have a homodont dentition, which, like that of the whales, is retrogressive.

In the giant armadillo (Priodon gigas) the formula is 25. 25

This animal therefore has a hundred teeth. In none of the Edentata are the teeth covered with enamel.

In the Marsupialia the typical formula is 3.1.4.3; 3.1.4.3. They are divided into diprotodont, in which there are not more than 2 incisors, often 3 as in kangaroos, and polyprotodont, in which the incisors are more than 2 as in the Tasmanian devil (Thylacinus) and Tasmanian devil (Sarcophilus). The marsupial teeth are often regarded as all milk teeth, yet the order is not really monophyodont because the germs of the permanent teeth are formed and aborted. Modern research, however, casts grave doubt on the accuracy of this view.

In the Monotremata the Echidna or spiny ant-eater is quite edentulous, while the duck-mole (Ornithorhinchus) has functional molar teeth in youth, though in the adult these are lost, and their place is taken by horny plates.

Reviewing the various tooth formulae of mammals the following is usually regarded as typical:—

| Ungulata — | 2.1.4.3 |
| Hippiopotamus | | 2.1.4.3 |
| Pig family (Suidae) | | 3.1.4.3 |
| Camel | | 1.1.3.3 |
| Chevrotain (Tragulidae) | | 3.1.2.3 |
| Deer family (Cervidae) | | 0.0 (or 1).3.3 |
| Hollow-horned ruminants (Bovidae) | | 3.1.3.3 |

This, it will be noticed, is the formula of the pig, and it is also that of almost all the Eocene Ungulata. Although the majority of mammals are diphyodont, or, in other words, the working teeth belong to two dentitions, evidences have lately been submitted of vestiges of two other series, one on the labial side of the milk teeth and one on the lingual side of the permanent series. If these are substantially there would be four dentitions—(1) premilk; (2) milk; (3) permanent; (4) post-permanent. The theory, though it bridges over the gap between the polyphyodont lower vertebrates and the apparently diphyodont mammals, is not by any means established. As the teeth are of such importance in the classification of animals, it will save continually repeated explanations in other articles if some of the chief terms by which they are described are recapitulated and briefly defined here.

1. Acrodont, a tooth which is anchylosed by its base to the summit of a pariet on the jaw.

2. Bilophodont, a molar tooth having two transverse ridges on its grinding surface, as in the tapi.

3. Brachydont, a low-crowned molar tooth—the opposite of hypsodont.

4. Bunodont, a tooth bearing conical cusps.

5. Diphyodont, having two series of teeth (milk and permanent).

6. Diprotodont, a marsupial with not more than 2 incisors, often only one on each side of the mandible.

7. Haploidont, a tooth having a simple conical crown with a single root.

8. Heterodont, a dentition in which the teeth are not all alike, chiefly characteristic of the Mammalia.

9. Homodont, a dentition in which the teeth are all alike as in many of the lower vertebrates and some mammals.

10. Hypsodont, a high-crowned molar tooth, such as that of the horse,—the opposite to brachydont.

11. Lophodont, a transversely ridged molar tooth; cf. bilopho-dont.

12. Monophyodont, having only one dentition (cf. diphy- and polyphyodont).

13. Multituberculate, a tooth, the crown of which bears numerous conical cusps; held by some to be the primitive condition of the mammalian teeth.

14. Pleurodont, a tooth anchored to the inner side of a parapet on the jaw.

15. Polybunodont, a synonym for multituberculate.

16. Polyphycodont, having an endless succession of teeth, as in most vertebrates below the mammals.

17. Polyprotodont, a marsupial having an incisor formula of more than 3. 3.

18. Protodont, a stage met with in fossil mammals which is an advance on the haploidont tooth in that two small cusps are added to the main cone.

19. Secodont, a back tooth adapted to cutting as in many of the Carnivora.

20. Selenedont, a molar tooth with crescentic ridges on its grinding surface as in most ruminants.

21. Thecodont, a tooth embedded in a socket or alveolus, as in mammals.

22. Triquodont, a fossil stage in advance of the protodont. There are three well-marked cones in an antero-posterior line.

23. Tritubercular, a fossil stage succeeding the triquodont. The main cone extends over the lower teeth and internal in the common form of back tooth in fossil forms and one which gives its name to the "tritubercular theory." (F. G. P.)

**TEETOTALISM—TEETOTUM**

TEETOTALISM, the practice of total abstinence from all intoxicating liquors, hence that form of the temperance movement of which the basis is the "pledge" to abstain from all intoxicating liquors (see Temperance). There seems no doubt that the word, whatever its actual origin, is a strengthened form of "total," probably influenced by "teetotum" (q.v.). According to the Century Dictionary, the secretary of a New York temperance society introduced a total abstinence pledge among its members, who were thus divided into those who had taken the old pledge, the O.P.'s, to abstain from spirituous liquors, and the T.'s, who had taken the new or total pledge. The English version, taken from the account by Joseph Livesey in the *Staunch Teetotaler*, January 1867, is that one Richard Turner, a Preston artisan and popular temperance speaker, declared at a meeting about 1833, that "nothing but teet-teetotal would do." This repetition of the initial letter does not appear to have been due to hisammering but to have been a mere emphasis on the word. The expression seems to have obtained instant recognition and popularity. Both versions are apparently authentic, and there seems no reason to suppose that they are not independent.

**TEETOTUM**, a form of top, used in various games of chance; the body is of polygonal shape, marked with letters or numbers, which decide the result of the game, according to the side which
TEGEA—TEGETTHOFF, BARON

remains uppermost on the fall of the top after spinning. Strutt, who was born in 1749, mentions (Sports and Pastimes) the teetotum as used in games when he was a boy. It seems that in its earliest form it was used as a game of chance, when the player throws the top to the right or left as it will fall. In the form of the teetotum, which was thrown from the right hand and caught by the left, it was used as a game of chance, when the player takes one from the pool, D. (Lat. depone, put down), when a fine has to be paid, N. (Lat. nihil, nothing), and T. (Lat. totum), when the whole pool is taken. Other accounts give such letters as P.N.D. (dimidium, half), or H. and T. or other combinations of letters.

TEGEA, an ancient Greek city of Arcadia, situated on a plateau which is enclosed by Mt. Parthenium and Maenalus on E. and W., and by two transverse ranges which separate it from the plateau of Orchomenus and the Eurotas. The Tegean territory occupied the southern part of this space; the northern half, surrounded by projecting spurs from the parallel ranges, belonged to Mantinea. The entire plain was well adapted for pasture and corn-growing, but was liable to floods owing to the lack of free outlets for its water-courses. Hence the regulation of the zereutha or subterranean conduits which drained away the overflow southward was a matter of vital importance both to Tegea and to Mantinea, and a cause of frequent quarrels. By its vicinity to the water-sheds of the Eurotas and Alpheus, and its command over the main route from Argos to Arcadia and the Isthmus, Tegea likewise was brought into conflict with Sparta.

Tegea was one of the most ancient cities of Peloponnese; tradition ascribed its concentration (synoecism) out of eight or nine primitive cantons to a mythical king Aleus. From the fact that several Cretan towns passed for colonies of Tegea, it may be inferred that this city had oversea connexions in prehistoric days. The prominence which legend assigns to its king Echemus in opposing the Heraclid invasion shows that it was one of the chief Peloponnesian communities in the pre-Dorian epoch. For several centuries it was supposed as a rival of Sparta against the expanding power of Sparta; though ultimately subdued about 550 B.C., it was allowed to retain its independence and its Arcadian nationality. During the Persian invasion the Tegeans displayed a readiness unusual among Peloponnesian cities; in the battle of Plataea they were the first to enter the enemy's camp. A few years later they headed an Arcadian and Argive league against Sparta, but by the loss of two pitched battles (Tegea and Dipasa) they were induced to resume their former loyalty (about 468-467). In 425 they broke out into open war with Sparta. In 423 Sparta, under the command of Argos and the Isthmian League, invaded the plain, and Tegea and its allies submitted to Sparta and Athens, the Tegeans stood firmly by Sparta's side: in the decisive battle of Mantinea (418) their troops had a large share in the overthrow of the coalition. During the early 4th century before Christ Tegea continued to support Sparta against the Mantineians and other malcontents. After the battle of Leuctra the philo-Laconian party was expelled with Mantineian help. Tegea henceforth took an active part in the revival of the Arcadian League and the prosecution of the war in alliance with Thebes against Sparta (371-362), and the ultimate detection of Mantinea confirmed it in its federalist tendencies. The foundation of the new federal capital Megalopolis threw Tegea somewhat into the shade. It showed itself hostile to the Macedonians, and in 266 joined the Chremonidean League against Antigonus Gonatas. To the incorporation of Mantinea into the Achaean League (233) Tegea replied by allying itself with the Aetolians, who in turn made it over to Cleomenes III. of Sparta (228). From the latter it was transferred by Antigonus Doson to the Achaeans (222); in 218 it was again occupied by the Spartans but reconquered in 207 by the Achaean general Philomel Lampon. In August 207 B.C. the Tegeans were the only important town of Arcadia, but its history throughout the Roman and Byzantine periods is obscure; it ceased to exist as a Greek city after the Gothic invasion of 395. During the Frankish occupation its place was taken by the fortress of Nikli. At the time of the Turkish conquest (1458) Nikli had been superseded by a fair-sized town called Mouchli, which in turn disappeared when the new city of Tripolitsa was founded about 3 m. N.W. The site is now occupied by the small village of Piali.

Archaeology.—The temple of Athena Alea at Tegea is described by Pausanias as excelling all others in the Peloponnese both in size and in beauty of construction. The original temple was said to have been built by Aeis, the founder of Sparta, and was called "the temple which was superseded by a larger one which was destroyed by fire in 395 B.C. The rebuilding was entrusted to Scopas, the great sculptor; and it is probable that he not only acted as architect, but also provided the sculptural groups which ornamented the pediments. Like the temple at Phigalia, it combined the forms of all three orders—Doric, Ionic and Corinthian. Pausanias asserts that the outer order was Ionic; but excavations have proved that it was Doric. The pedimental groups of the temple represented at the front, the hunt of the Calydonian boar, and, at the back, the battle of Achilles and Telephus. Both subjects were intimately associated with the temple, for Atalanta had dedicated in it the face and tusks of the boar, which had been awarded to her as the first to wound it; and Telephus was the son of Heracles and the priestess Auge. Two heads of heroes and that of the boar were found before 1880; later excavation, in 1883, showed the plan of the temple, which had six columns at front and back, and thirteen at the sides. In 1900 the French school at Athens recovered more fragments of sculpture, including a head of Heracles and the torso and possibly the head of Atalanta, these last two of Parian marble. The other heads are badly damaged, owing to the fact that the white marble from Doliana, of which they are made, does not resist damp. But they still show in the intensity of their expression the power of expressing the will for which Scopas was famous beyond all other ancient sculptors. See GREEK ART, fig. 63.

TEGERNSEE, a lake of Germany, in the province of Upper Bavaria, situated in a beautiful mountain country, 235 ft. above the sea, 34 m. S. from Munich by rail to Gmund, a village with a station on the north shore. The lake is 4 m. long, averages 1.7 m. broad, and is about 235 ft. deep. Its waters discharge through the Mangfall into the Inn. The southern part is enviroined by high and well-wooded hills, while on the northern side, where it debouches on the plain, the banks are flat and less attractive. Prosperous villages and handsome villas stud its shores, and it is one of the most frequented summer resorts in the vicinity of Munich.

The village of Tegernsee, 1744, on the east bank, has a parish church dating from the 15th century, a ducal castle which was formerly a Benedictine monastery, and a hospital, founded in connexion with the large ophthalmic practice of the late Duke Charles Theodore of Bavaria.

See Freyberg, Aktenthe Geschichte von Tegernsee (Munich, 1882); Hack, Tegernsee (Munich, 1888); Breu, Der Tegernsee, iumalogische Studien (Munich, 1906).

TEGETTHOFF, WILHELM VON, BARON. (1827-1871), Austrian admiral, son of Lieutenant-Colonel Karl von Tegetthoff, was born at Marburg, in Styria, on the 23rd of December 1827. After passing through the naval college at Venice, he first served afloat in 1845, and in 1848 was made an ensign. In 1849 he was present at the blockade of Venice, resulting in its surrender. In 1852 he was promoted to be a lieutenant, and during the Crimean war was employed on a sort of police
TEGGIANO—TEGNÉR

505
duty at the Sulina mouth of the Danube, which brought him to the favourable notice of the Archduke Maximilian, who in 1834 had been appointed head of the navy with the style of rear-admiral. After some time in a semi-official scientific expedition in Egypt, Arabia, and the Red Sea down to the island of Socotra, Tegnér was promoted to the rank of captain of the third class, and in 1838 he commanded the corvette "Erzherzog Friedrich" on the coast of Morocco, then in a very disturbed state. The corvette returned to Trieste on the imminence of the war with France; but during 1839 the French fleet commanded the Adriatic in vastly superior force, against which the Austrians were powerless. After the peace Tegetthoff made a voyage to Brazil as aide-de-camp to Maximilian, and in 1860-63 commanded a large frigate in the Levant during the disturbances in Syria, and on the coast of Greece in 1862, and subsequently the Adriatic fleet. Towards the end of 1863 he was sent to the North Sea as commodore in command of two frigates, with which, together with three small Prussian gunboats, he fought an action with the Danish squadron, and though without any decisive success, succeeded in raising the blockade of the mouths of the Elbe and Weser.

The Austrian emperor answered Tegetthoff's telegraphic despatch by another promoting him to be rear-admiral, and conferring on him the Order of the Iron Crown. In 1865 he commanded a small squadron in the Mediterranean, and in the war of 1866 was placed in command of the whole effective force of the Austrian navy. With all his efforts this was markedly inferior to the Italian force opposed to it, and when the two fleets met off Lissa on the 20th of July, the decisive victory of the Austrians was entirely due to the personal superiority of Tegetthoff and the officers whom he in great measure had trained. In numbers, in ships, and in armament the Italians were much the more powerful, but they had neither a capable chief nor efficient officers. Tegetthoff was immediately promoted, by telegraph, to the rank of vice-admiral, and among the many decorations conferred on him was one from his former commander, the unfortunate Maximilian, at this time emperor of Mexico, whose body was in the following year brought home by Tegetthoff. In March 1868 he was appointed head of the naval section of the War Office and commander-in-chief of the navy, which offices he held till his death at Vienna, after a very short illness, on the 7th of April 1871—in the words of the semi-official notice—"zu früh für Österreich."

(J. K. L.)

TEGGIANO (anc. Teggiunum, formerly called Diano), a town in Campania, Italy, in the province of Salerno, 45 m. S.E. of that town. Pop. (1901) 5005. It is situated 3200 ft. above sea-level on an isolated eminence above the upper part of the valley of the Negro (anc. Tavagia), to which it gives the name of Val di Diano. It represents the ancient Teggiunum a municipal town of Lucania, made into a colony by Nero, of which the ruins can be traced at the foot of the hill, with an ancient Roman bridge. An Olympic inscription in Greek letters has been found here (cf. W. Corssen in Ephemeris Epigraphica, ii. 153). It possesses a castle, several churches of some interest, and three conventual buildings. In 1497 it was strong enough to resist, under Antonio Sanseverino of Salerno, the siege undertaken by Frederick of Aragon. (T. A.)

TEGNÉR, ESAIAS (1752—1846). Swedish writer, was born on the 13th of November 1782, at Kyrkrud in Värmland. His father was a pastor, and his grandparents on both sides were peasants. His father, whose name had been Esaias Lucasson, took the surname of Tegnerus—altered by his fifth son, the poet, to Tegnér—from the hamlet of Tegnöy in Småland, where he was born. In 1792 Tegnerus died. In 1799 Esaias Tegnér, hitherto educated in the country, entered the university of Lund, where he graduated in philosophy in 1802, and continued as tutor until 1810, when he was elected Greek lecturer. In 1806 he married Anna Maria Gustava Myhrman, to whom he was never attached since his earliest youth. In 1812 he was named professor of history and finance at Lund until 1824, when he was made bishop of Vexiö. At Vexiö he remained until his death, twenty-two years later. Tegnér's early poems have little merit. He was comparatively slow in development. His first great success was a dithyrambic war-song for the army of 1808, which stirred every Swedish heart. In 1811 his patriotic poem Skrä i his great prize of the Stockholm Senate, and made him famous. In the same year he founded in Stockholm the Gothic League (Gotiska församlingen), a sort of club of young and patriotic men, of whom Tegnér quickly became the chief. The club published a magazine, entitled Iduna, in which it printed a great deal of excellent poetry, and ventilated its views, particularly as regards the study of old Icelandic literature and history. Tegnér, Geijer, Afzelius, and Nicander became the most famous members of the Gothic League. Of the very numerous poems written by Tegnér in the little room at Lund which is now open to visitors as the Tegnér museum, the majority are short, and even occasional. He celebrated Song to the Sun dates from 1817. He completed three poems of a more ambitious character, on which his fame chiefly rests. Of these, two, the romance of Axel (1822) and the delicately-chiselled idyl of Nattvardsbarnen ("The First Communion," 1820), translated by Longfellow, take a secondary place in comparison with Tegnér's masterpiece, of world-wide fame. In 1820 he published in Iduna certain fragments of an epic or cycle of epical pieces, on which he was then working, Frikjöfads saga or the Story of Frithiof. In 1822 he published five more cantos, and in 1825 the entire poem. Before it was completed it was famous throughout Europe; the astute Goethe took upon himself to commend to his countrymen this "alte, kräftige, ehrgeizige, barbarische Dichtart," and desired Amalie von Imhoff to translate it into German. This romantic paraphrase of an ancient saga was composed in twenty-four cantos, all differing in verse form, modelled somewhat, it is only fair to say, on an earlier Danish masterpiece, the Helge of Ohlenschläger. Frikjöfads saga is the best known of all Swedish productions; it is said to have been translated twenty-two times into English, twenty times into German, and once at least into every European language. It is far from satisfying the demands of more recent antiquarian research, but it still is allowed to give the freshest existing impression, in imaginative form, of life in early Scandinavia. In later years Tegnér began, but left unfinished, two important epic poems, Gerda and Kronbruden. The period of the publication of Frikjöfads saga (1825) was the critical epoch of his career. It made him one of the most famous poets in Europe; it transferred him from his study in Lund to the bishop's palace in Vexiö; it marked the first breakdown of his health, which had hitherto been excellent; and it witnessed a singular moral crisis in the inner history of the poet. For a long time without words, much about which little is known. Tegnér was at this time passionately in love with a certain beautiful Euphrosyne Palm, the wife of a town councillor in Lund, and this unfortunate passion, while it inspired much of his finest poetry, turned the poet's blood to gall. From this time forward the heartlessness of woman is one of Tegnér's principal themes. It is a remarkable sign of the condition of Sweden at that time that a man not in holy orders, and so little in possession of the religious temperament as Tegnér, should be offered and should accept a bishop's crosier. He did not hesitate in accepting it: it was a great honour; he was poor; and he was anxious to get away from Lund. No sooner, however, had he begun to study for his new duties than he began to regret the step he had taken. It was nevertheless too late to go back, and Tegnér made a respectable bishop as long as his health lasted. But he became moody and melancholy; as early as 1833 he complained of fiery heats in his brain, and in 1840, during a visit to Stockholm, he suddenly became insane. He was sent to an asylum in Schleswig, and early in 1841 he was cured, and able to return to Vexiö. It was during his convalescence in Schleswig that he composed Kronbruden. He wrote no more of importance; in 1843 he had a stroke of apoplexy, and on the 2nd of November 1846 he died in Vexiö. From 1810 he had been a member of the Swedish
TEGUCIGALPA—TEHERAN

Academy, where he was succeeded by his biographer and best imitator Böttiger.

See Böttiger, Teckning af Tegners Løjfæ; Georg Brandes, Essais Tegné; Thonmander, Tank och Løjen. (E. G.)

TEGUCIGALPA, the capital of Honduras and of the department of Tegucigalpa; situated 3200 ft. above sea-level, on the river Choluteca, and at the head of a railway to the port of San Lorenzo on Fonseca Bay. Pop. (1905) about 35,000. Tegucigalpa is the largest and finest city in the republic. The majority of its houses are of one storey, built round a central court; the windows are usually unglazed but protected by iron bars which project into the narrow cobble-paved streets. The focus of civic life is near the central park, in which stands a bronze equestrian statue of Francisco Morazán (1792–1842), the Honduran statesman and soldier. Fronting the park is a domed cathedral, one of the largest and most ornate churches in Honduras. Other noteworthy buildings are the government offices, university, school of industry and art, national printing works, and law courts. A lofty ten-arched bridge over the Choluteca connects the city with its principal suburb, Concepción or Comayagua. Tegucigalpa became capital of Honduras, a status it had previously shared with Comayagua, in 1880. During the 18th century the neighbourhood was famous for its gold, silver and marble, but in modern times the mines and quarries have greatly declined in value, and farming is the chief local industry. In 1907 Tegucigalpa was occupied by the Nicaraguan invaders.

TEGULA, the Latin term for the convex covering tile of a roof, as distinguished from the imbre, the concave tile (see TILES).

TEHERAN (more properly TEHRAN), a province of Persia, with capital of the same name (which is also the capital of the Persian empire). It pays a yearly revenue of about £100,000, and comprises the districts of Saujbulag, Shahriar, Feshaviyeh, Shimiran, Kasran and Veramin. The first three, situated north-west, west and south of the city of Teheran, are very fertile, and supply the capital with grain, grapes and melons. Shimiran, the district north of the city, and on the slopes of the Elburb (rising to an elevation of 12,600 ft.) has 63 villages (one, Tajrish, the seat of the governor, with a population of over 2000), which are much frequented during the summer months by the inhabitants of the city seeking relief from the great heat. One of the villages, Gulhek or Gulahke, but correctly Kulheh (with a guttural k, and meaning a small, reedy mere), situated 800 ft. above the city of Teheran and 63 m. from it, was given in feef to the British government by Fath Ali Shah about 1830 for the summer quarters of the British legation. Zergendeh, a village adjoining Gulhek, is held in a similar manner by the Russian government, and the Russian legation stays there during the summer. Kasran is a hilly district north-east of Teheran, with numerous coal mines (inferior coal of the Jurassic period) and streams abounding with salmon trout. The Veramin district, south-east of Teheran city, has 123 villages, and supplies the city and surrounding districts with wheat, barley and rice. It is watered by the Jajrud river, and is considered one of the most fertile districts of Persia.

TEHERAN, the capital of Persia and of the province of the same name, 70 m. S. of the southern shore of the Caspian Sea. It is situated on an immense gravel deposit which slopes down from the foot of the Elburb mountain (rising to an altitude of 12,600 ft.) 8 or 9 m. N. of the city, and extends for 16 m. to near Shah-abad-Azim, 53 m. S. of it. Teheran was formerly a kind of polygon about 4 m. in circumference, with a mud wall and towers, a dry ditch and six gates, but in 1869 Nasr-ud-din Shah decided upon enlarging the city; the old wall and towers were demolished, the ditch was filled up and used for building sites, and an enceinte consisting of a ditch and 58 unequal bastions according to Vauban's first system was constructed and completed in 1874. The city then took the form of an octagonal pentagon, and its circumference (a line through the salient angles of the bastions) measures 19,596 metres, or 1218 m. The area within the bastions is about 72 sq. m. There are twelve gates, which are closed from two hours after sunset to an hour before sunrise. According to observations taken in 1895 by British officers in connexion with determining the longitude of Madras, the longitude of Teheran (pillar at the north-western corner of the British legation grounds) is 51° 25′ 3-8″ E. The latitude of the old telegraph office, which was situated almost due S., is 35° 41′ 6-83″ N., and its elevation 3810 ft. The northern gates of the city, however, are 282 ft. above the level of the International Mercantile Marine, and little has been done in general outward appearance from other cities of the country, though in recent years (since the above-mentioned extension) many broad and straight streets and a number of buildings of western architecture, shops with show windows, electric lamps, cafes, &c., have been introduced. "We are in a city which was born and nurtured in the East, but is beginning to clothe itself at a West-End tailor's" (Curzon). Most of the innovations are to be seen only in the northern part of the town where the Europeans and many wealthy Persians have settled. The ark or citadel, situated nearly in the centre of the town, contains the shah's palace and a number of modern buildings of respectable appearance, for instance the foreign office, the war office, customs, telegraph station, arsenal, &c. Immediately north of the ark are the Maidan Tupkhaneh (Artillery Square), 270 yds. by 120, and the great Maidan i Mash (Maidan of drill), the military parade ground, 550 yds. by 350. South of the ark are the bazaars, the central arcade and caravanserai built c. 1850 by the prime minister Mirza Taki Khan, commonly known as the amir, and beyond them, as well as on the east and west, are the quarters of the old town, with narrow, crooked and mostly unsanitary and unclean streets. Teheran has 65 m. of tramways (single lines) and is connected with Shah-abad-Azim by a single line of railway of one-metre gauge and 53 m. long (the only railway in Persia). Water is freely supplied to the town by means of about thirty underground canals (kanats), led from the slope of the northern hills and running 5 to 10 m. at considerable depths below the surface. The water supply would be ample for the requirements of the population if it could be regularly and equally distributed; but the supply in the months of October and November is only about one-half of that during March, and much water is lost through open ditches and by leakage. The distribution therefore is irregular: in winter and early spring, when the gardens require very little water from the canals, the supply is too great, and in summer it is too little. It has been calculated that the mean water supply amounts to the enormous quantity of 921,000 gallons per hour all the year round, but that, after deducting the quantity wasted in distribution, irrigation of gardens, filling tanks and baths, watering streets, &c., there remain forty-two gallons per head daily during the month of April, seventeen during July, August and September, and ten during October and November. Even the last quantity would suffice if evenly distributed, but as most of the canals are private property and independent of government or municipal control, the distribution is unequal, and it frequently happens that when some parts of the city have water in abundance others have hardly any. Teheran has many mosques, all of recent date, the finest being the one called Masjed i Sipahsalar, built by Mirza Husain Khan Sipahsalar Azam, who was prime minister for ten years until 1884. It is situated in the new part of the city and adjoining it is the Baharistan palace, once the residence of a cabin or apartments, the last occupied by the national assembly. Another notable mosque is the Masjed i Shah, completed c. 1840. There are also many colleges and schools, some of them with European teachers, including the " German School" (1907) with a yearly subsidy of £2500 from the shah. Before Nasr-ud-din's first voyage to Europe in 1873 only four western states had legations and consulates at Teheran; now twelve states are represented.

The present population of Teheran is about 280,000, including 120,000 Europeans, 4000 Jews, the same number of Armenians, 200 Zoroastrians, and a garrison of 3000 to 4000. The climate is considered unhealthy, particularly in the summer and early
TEHRI—TEIGNMOUTH, 1ST BARON

507

autumn, when typhoid,ague and other fevers are prevalent, but something in the way of sanitation has been effected and there is a distinct improvement. The author of the Zinat el mojalis, writing in 1596, states that cholera frequently visited the city, and, the north being shut off by high mountains, the air was hot and evil-smelling and the water unwholesome. In fact the climate was so bad that even the Angel of Death ran away from it. The mean yearly temperature calculated from observations taken for a number of years ending 1902 was 62-6° F., the highest temperature observed was 111°, the lowest 3°, giving a difference of 108° between extremes. The hottest month is July, with a mean of 85-2°, the coldest January, with a mean of 34-25°. The mean annual rainfall during a period of 15 years ending 31 December 1907, was 10 ins.

In the Jehanshah i Safawni, a Persian history written in the 13th century, the name of the town is written Tir'an, while other works have the name as it is now written, viz. Tehran. The latter spelling is due to Arabic influence, old Persian names being frequently Arabicized and sometimes becoming unrecognizable. Two villages in the neighbourhood of Isfahan appear as Tir'an in old documents, while in modern revenue accounts and lists they are written Tehran. The Mujem el Budan, a geographical dictionary written in 1224, describes Tehran as a village 4 m. distant from Rai (Rahges). Pietro della Valle, who passed a night (June 6-7, 1618) at Tehran, writes "Taherm" (perhaps thinking it to be a plural of taher, "the pure "); and Sir Thomas Herbert, who visited it on 14th June 1615, calls it Tehran and states that it contained 3,000 houses built of sun-dried bricks and had its water supply from a little river which flowed through it in two branches. Almost the whole of the city was destroyed by the Afghans in 1723, and Tehran did not regain any importance until the close of the century when Agha Mahommed Khan, the founder of the Kajar dynasty, made it his capital and residence. Dr Olivier, who visited Tehran in 1796, says, "In spite of Agha Mohammed Khan's efforts to induce people to settle and merchants and manufacturers to establish themselves there, the population of Tehran does not amount to 15,000 souls, including 1 garrison of 3,000."

(A. H.-S.)

TEHRI, a native state in Northern India, in political sub-division to the United Provinces: area, 4,000 sq. m.; population (1901) 268,885; estimated revenue, £28,000. It lies entirely amid the Himalayas, containing ranges from 20,000 to 25,000 ft. above sea-level, and also the sources of both the Ganges and the Jumna, with the places of pilgrimage associated with them. The forests, which have been leased to the British government, are very valuable, yielding several kinds of pine, oak and cedar. The crops are rice, small millets, potatoes and a little sugar. Tahri chowk, whose title is raja, is descended from a Rajput family which formerly ruled over all Garhwal. The existing state was acquired by the British after the war with Nepal in 1816. The town of Tehri, on the river Bhagirathi (as the Ganges is here called) has a pop. (1901) of 3,387.

TEHUANTEPEC (from tehuani-tepec—"jaguar-hill"), the town which gives its name to the isthmus, gulf and railway, stands on the Tehuantepec river about 15 m. from its mouth and 13 m. by rail from Salina Cruz. Pop. (1904, estimated) 10,000. It is a typical struggling frontier town, occupying the slope of a hill on the Pacific side of the divide, with a beautiful view of the river valley and the distant sierras to the N. The streets are little more than crooked paths up the hillside, and the habitations are for the most part thatched, mud-walled huts. The population of the town and of the surrounding district is composed almost wholly of Indians of the great Zapoteca family. The Tehuanas of Tehuantepec are noted for the beauty and graceful carriage of their women, who are reputed to be the finest-looking among the native races of Mexico. The women are the traders in Tehuantepec and do little manual work—a result, apparently, of the influence of beauty. The local industries include the making of "caña," a cane spirit, and the weaving of cotton fabrics, dyed with the juice of a marine shell-fish (Purpura patula) found on the neighbouring coast. Indigo was formerly grown in the vicinity and cochineal gathered for export, but both of these industries have declined.

TEHUANTEPEC, an isthmus of Mexico lying between the Gulfs of Campeche (Campeachy) and Tehuantepec, with the states of Tabasco and Chiapas on the E., and Vera Cruz and Oaxaca on the W. It includes that part of Mexico lying between the 94th and 96th meridians of W. longitude, or the south-eastern parts of Vera Cruz and Oaxaca, with perhaps small districts of Chiapas and Tabasco. It is 125 m. across at its narrowest part from gulf to gulf, or 120 m. to the head of Laguna Superior on the Pacific coast. The Sierra Madre breaks down at this point into a broad, plateau-like ridge, whose elevation, at the highest point reached by the Tehuan-tepec railway (Chivela Pass) is 735 ft. The northern side of the isthmus is swampy and densely covered with jungle, which has been a greater obstacle to railway construction than the grades in crossing the sierra. The whole region is hot and malarial, except the open elevations where the winds from the Pacific render it comparatively cool and healthful. The annual rainfall on the Atlantic or northern slope is 136 in. (Enoch) and the maximum temperature about 95° in the shade. The Pacific slope has a light rainfall and dryer climate.

Since the days of Cortés, the Tehuantepec isthmus has been considered a favourable route, first for an interoceanic canal, and then for an interoceanic railway. Its proximity to the ports of international trade gives it some advantage over the Panama route, which is counterbalanced by the narrower width of the latter. When the great cost of a canal across the isthmus compelled engineers and capitalists to give it up as impracticable, James B. Eads proposed to construct a quadruple track ship-railway, and the scheme received serious attention for some time. Then came projects for an ordinary railway, and several concessions were granted by the Mexican government for this purpose from 1857 to 1882. In the last-named year the Mexican government resolved to undertake the enterprise on its own account, and entered into contracts with a prominent Mexican contractor for the work. In 1888 this contract was rescinded, after 67 m. of road had been completed. The next contract was fruitless through the death of the contractor, and the third failed to complete the work within the sum specified (£2,700,000). This was in 1893, and 37 m. remained to be built. A fourth contract resulted in the completion of the line from coast to coast in 1894, when it was found that the terminal ports were deficient in facilities and the road too light for heavy traffic. The government then opened into a contract with the London firm of contractors of S. Pearson & Son, Ltd., who had constructed the drainage works of the valley of Mexico and the new port works of Vera Cruz, to rebuild the line and construct terminal ports at Coatzacoalcos, on the Gulf coast, and Salina Cruz, on the Pacific side. The work was done for account of the Mexican government. Work began on the 16th of December 1899, and was finished to a point where its formal opening for traffic was possible in January 1907.

The railway is 192 m. long, with a branch of 18 m. between Julle and San Juan Evangelista. The minimum depth at low water in both ports is 33 ft., and an extensive system of quays and railway tracks at both terminals affords ample facilities for the expedient handling of heavy cargoes. The general offices, shops, hospital, &c., are located at Rincon Antonio, at the entrance to the Chivela Pass, where the temperature is cool and healthful conditions prevail. At Santa Lucrecia, 100 m. from Salina Cruz, connexion is made with the Vera Cruz & Pacific railway (a government line), 213 m. to Cordova and 311 m. to Mexico city.

TEHUELCHE, CHUELCHE, or HUILICHIE ("Southern People"), the generic name given by the whites of Argentina to the Indian tribes speaking Patagonian or Tehuelche tongue. SOUTH, JOHN SHORE, 1ST BARON (1751-1834), governor-general of India, was born on the 8th of October 1751, the son of Thomas Shore, a supercargo in the service of the
East India Company. He was educated at Harrow, and went out to India as a writer in the Bengal Civil Service in 1760. He became a member of the Supreme Council (1787–89), in which capacity he assisted Lord Cornwallis in introducing many reforms, but did not approve his permanent settlement of Bengal. On the retirement of Cornwallis, he was appointed governor-general (1793–98), adopting a policy of non-interference, but deposed Wazir Ali, for whom he substituted Saadat Ali as nawab of Oudh. His term of office was also signalized by a mutiny of the officers of the Indian army, which he met with concessions. He was created a baronet in 1792, and Baron Teignmouth in the peerage of Ireland in 1798. On his retirement from India he was appointed member of the board of control (1807–28), and was for many years president of the British and Foreign Bible Society. He died on the 14th of February 1834.

See Memoirs of Lord Teignmouth, by his son (1843).

**TEIGNMOUTH**, a seaport and market town in the Ashburton parliamentary division of Devonshire, England, at the mouth of the river Teign, on the English Channel, 15 m. S. by E. of Exeter, by the Great Western railway. Pop. of urban district (1901) 8,566. Two parishes, East and West Teignmouth, form the town. It lies partly on a peninsula between the river and the sea, partly on the wooded uplands which enclose the valley and rise gradually to the high moors beneath Heytor. The Den, or Dene, forms a promenade along the sea-front, with a small lighthouse a short way out. St. Michael's church at the old East Teignmouth was rebuilt in 1824 in Decorated style, but retains a Norman doorway and other ancient portions; of St James', in West Teignmouth, the south porch and tower are Norman. There are a theological college for Redemptorists, and a Bene-dictine convent, dedicated to St Scholastica. The entrance to the harbour has been improved by dredging, and the two quays accommodate vessels drawing 13 ft. at neap tides. Pipeclay and china clay, from Kingsteignton, are shipped for the Staffordshire potteries, while coal and general goods are imported. Pithead, herring, whiting and mackerel are taken, and salmon in the Teign. Malting, brewing and boatbuilding are also carried on. East Teignmouth was formerly called Teignmouth Regis, and West Teignmouth, Teignmouth Episcopi.

Teignmouth (Teinemue, Tengenue) possessed a church of St Michael as early as 1044, when what is now East Teignmouth was granted by Edward the Confessor to Leofric, bishop of Exeter, and an allusion to salters in the grant proves the existence of the salt industry at that date. Teignmouth is not mentioned in the Domesday Survey, but in 1276 what is now West Teignmouth appears as a mesne borough held by the dean and chapter of Exeter; what is now East Teignmouth continuing with the bishop, who was accused in that year of holding in his manor a market which should be held in the borough. The bishop's manor was alienated in 1550 to Sir Andrew Dudley, but West Teignmouth remained with the dean and chapter until early in the 19th century. In the middle ages Teignmouth was a flourishing port, able to furnish 7 ships and 120 mariners to the Calais expedition of 1347, and depending chiefly on the fishing and salt industries. In the early part of the 17th century the town had fallen into decay, but had again recovered, and in 1744 could contribute twenty vessels to the Newfoundland shipping trade. The borough was never represented in parliament, nor incorporated by charter. The Saturday market, which was held up to the 19th century, is mentioned in 1220, and was confirmed by royal charter in 1525, together with a fair at Michaelmas. Teignmouth was burned by French pirates in 1340, and was again devastated by the French on the 26th of June 1690.

See Victoria County History, Devonshire; The Teignmouth Guide and Complete Handbook to the Town and Neighbourhood (Teignmouth, 1875).

**TEIRESIAS**, in Greek legend, a famous Theban seer, son of Eueres and Charicio. He was a descendant of Udeaen, one of the men who had sprung up from the serpent's teeth sown by Cadmus. He was blind from his seventh year, for which various causes were alleged. Some said that the gods had blinded him because he had revealed to men what they ought not to know. Others said that Athena (or Artemis) blinded him because he had seen her naked in the bath; when his mother prayed Athena to restore his sight, the goddess, being unable to do so, purged his ears so that he could understand the speech of birds, and gave him a staff wherewith to guide his steps (ApolloDorus iii. 6). According to Sostratus, author of an elegiac poem called Teiresias, he was originally a girl, but had been changed into a boy by Apollo at the age of seven; after undergoing several more transformations from one sex to the other, she (for the final sex was feminine) was turned into a mouse and her lover Arachnus into a wasp (Eustathius on Odyssey, p. 1665). Teiresias' grave was at the Tphilus spring; but there was a cenotaph of him at Thebes, and also in later times his "tombstone": for place for was ting omens from birds, was pointed out (Pausanias ix 16; Sophocles, Antigone, 999). He had an oracle at Orchomenus, but during a plague it became silent and remained so in Plutarch's time (De Defectu Oraculorum, 44). According to Homer (Od. x. 492, xi. 90), Teiresias was the only person in the world of the dead whom Proserpine allowed to retain his memory and intellect unimpaired, and Circe sends Odyssey and to consult him concerning his return home. He figured in the great paintings by Polygnotus in the Lesche at Delphi.

**TEISSERENC DE BORT, PIERRE EDMOND** (1814–1892), French writer and politician, was born at Châteauroux on the 17th of September 1814, and entered the civil service after the completion of his education at the École Polytechnique. He was a railway expert, becoming secretary-general of the Railway Commission established in 1842, government commissioner to the authorized railway companies, administrator of the Lyons-Mediterranean railway, and commissioner to examine foreign railways. In 1846 he was returned to the Chamber of Deputies for Hérald, but the revolution of 1848 drove him into private life, from which he only emerged after the downfall of the Empire, when in February 1871 he was returned to the National Assembly. He supported the government of Thiers and was minister of agriculture and commerce in 1872–73. He sat in the Left Centre, and steadily supported republican principles. He entered the Senate in 1876, and was minister of agriculture in the Dufaure-Ricard cabinet of that year, retaining his portfolio in the Jules Simon ministry which fell on the 16th of May 1877. In 1878, when he joined the new Dufaure cabinet, he opened the Paris exhibition of agriculture and manufactures, the original suggestion of which had been made by him during his Jules Simon ministry. In 1879 he was sent as ambassador to Vienna, where he next year recalled on the score of health. Two years later he re-entered the Senate, where he did good service to the cause of "Republican Defence" during the Boulangist agitation. He died in Paris on the 29th of July 1892. His works consist of discussions of railway policy from the technical and economic side.

**TELANONES** (Gr. τέλαμον, supporter, from τλήνω, to bear), in architecture the term used by the Romans as equivalent to Atlantes (the Greek term) for male figures employed to carry arches and cornices. The best-known examples are those in the tepidarium and in the baths of Pompeii, which consist of small figures in terra-cotta, 2 ft. high, placed between niches and carrying a cornice.

**TELANG, KASHINATH TRIMBAK** (1850–1893), Indian judge and oriental scholar, was born at Bombay on the 30th of August 1850. By profession an advocate of the high court, he also took a vigorous part in literary, social, municipal and political work, as well as in the affairs of the university of Bombay, over which he presided as vice-chancellor from 1892 till his death. At the age of five Telang was sent to the Amarnachand Wadi vernacular school, and in 1859 entered the high school in Bombay which bears the name of Mounstuart Elphinstone. Here he came under the influence of Narayan Mahadev Purmanand, a teacher of fine intellect and force of character, afterwards one of Telang's most intimate friends.
TELAV—TELEGONY

From this school he passed to the Elphinstone College, of which he became a fellow, and after taking the degree of M.A. and LL.B., decided to follow the example of Bal Mangesh Wagle, the first Indian admitted by the judges to practise on the original side of the high court, a position more like the status of a barrister than a vakil or pleader. He passed the examination and was enrolled in 1872. His learning and other gifts soon brought him into the good graces of the English-speaking elements, and he completed command of the English language, and his intimacy with Sanskrit enabled him to study and quote the Hindu law-books with an ease not readily attained by European counsel. Telang, finding his career assured, declined an offer of official employment. But in 1889 he accepted a seat on the high court bench, where his judgments are recognized as authoritative, especially on the Hindu law. He was syndic of the university from 1883, and vice-chancellor from 1893 till his death. In that year also he was elected president of the local branch of the Royal Asiatic Society. These two offices had never been held by a native of India before. The decoration of C.I.E. conferred on him in 1882 was a recognition of his services as a member of a mixed commission appointed by the government to deal with the educational system of the whole of India. He was nominated to the local legislative council in 1884, but declined a similar position on the viceroy's council. Along with P.M. Metha, he was the originator of the Bombay Presidency Association. When a student he had won the Bhugwandas scholarship in Sanskrit, and in this language his later studies were profound. His English was brought into English prose and verse by a hard word; and he criticized Professor Weber's hypothesis that the story of the Ramayana was influenced by the Homeric epics. While devoted to the sacred classics of the Hindus, Telang did not neglect his own vernacular, Mahārāṭā literature being enriched by his translation of Lessing's Nathan the Wise, and an essay on Social Compromise. He died at Bombay on the 1st of September 1893.

TELAV, a town of Russian Transcaucasia, in the government of Tiflis, 63 m. N.E. of the town of Tiflis, on the river Alazar and at an altitude of 2450 ft. Pop. (1897) 11,810, chiefly Jews. Tiflis (9000). Telav is a very old town, founded in 803, and until 1797 it was the capital of Kakhetia, and has ruins of old forts. In the neighbourhood are the Ikalto monastery (6th century), the Shunaty monastery (16th century), and the originally 10th century Alaverdi church, visited by many pilgrims. Wine is exported.

TELEGONY (Gr. τελέγον, far, and ὑστα, offspring), the name now given to the hypothesis that offspring sometimes inherit characters from a previous mate of their dam. Until recent years the supposed inheritance of characters acquired by a dam from one or more of her male progenitors, and usually by virtue of breeding only back and forth, has been considered by physiologists, “infection of the germ,” or simply “infection.” The doctrine of “infection,” like the somewhat allied doctrine of “maternal impressions,” seems to be alike ancient and widespread. Evidence of the antiquity of the belief in “maternal impressions” we have in Jacob placing peeled rods before Laban's cattle to induce them to bring forth “ring-straked speckled and spotted” offspring; evidence of the antiquity of the “infection” doctrine we have, according to some writers, in the practice amongst the Israelites of requiring the childless Ishmael to give up his deceased husband's brother, that he might “raise up seed to his brother.” Whatever may have been the views of stockowners in the remote past, it is certain that during the middle ages the belief in “infection” was common amongst breeders, and that during the last two centuries it met with the general approval of naturalists, English breeders being especially satisfied of the fact that the offspring frequently inherited some of their characters from a former mate of the dam, while both English and Continental naturalists (apparently without putting the assertions of breeders to the test of experiment) accounted for the transmission of some of the characteristics of the dam having been directly or indirectly “infected” by a former mate. It is noteworthy that L. Agassiz, C. Darwin, W. B. Carpenter, and G. J. Romanes were all more or less firm believers in the doctrine of infection, and that a few years ago, with the exception of Professor A. Weismann, all the leading biologists had either subscribed to the telegony doctrine or admitted that “infection of the germ” was well within the bounds of possibilities. Even Professor Weismann did not deny the possibility of the offspring throwing back to a previous mate. The trouble seems to have been, “may be justifiable, I am not sure,” and founded on fact,” but he was careful to add that “only the confirmation of the theory by methodical investigation, in this case by experiment, could raise telegony to the rank of a fact.” In assuming this attitude Professor Weismann decidedly differed from Herbert Spencer, who some years ago mentioned that he had evidence “enough to prove the fact of a previous sire asserting his influence on a subsequent progeny.”

The importance of determining whether there is such a thing as telegony is sufficiently evident. If a mare or other female animal is liable to be “infected” by her first or by subsequent mates, telegony will rank as a cause of variation, and breeders will be justified in believing (1) that pure-bred females are liable to be “corrupted” when mated with sires of a different breed; and (2) that inferior or cross-bred females, if first mated with a high-class sire, will thereafter produce superior offspring, however inferior or cross-bred her subsequent mates. If, on the other hand, “infection of the germ” is impossible, telegony will not count as a factor in variation, and breeders will no longer be either justified in regarding mares and other female animals as liable to be “infected” by their mates, or benefited by first having offspring to a high-class, or it may be more vigorous, mate. Though, according to breeders, evidence of telegony has been found in nearly all the different kinds of domestic mammals and birds, most stress has been laid on instances of “infection” in the horse and dog families.

Telegony in the Horse Family.—Beecher at the end of the 17th century pointed out that “when a mare has had a mule by an ass and afterwards a foal by a horse, there are evident marks on the foal of the mother having retained some ideas of her former paramour, the ass.” That mares used in mule breeding are liable to be infected is still widely believed, but irrefragable evidence of the influence of the ass persisting, as Agassiz assumed, is conspicuous by its absence. Darwin says, “It is worth notice that farmers in south Brazil are convinced that mares which have once borne mules when subsequently put to horses are extremely liable to produce colts striped like a mule” (Animals and Plants, vol. i. p. 436). Baron de Parana, on the other hand, says, “I have many relatives and friends who have large establishments for the rearing of mules, where they obtain from 40 to 1000 mules in a year. In these cases the offspring are liable to be infected; but I have never before heard of any case in which this has been actually observed.”

The prevalence of the belief in telegony at the present day is largely due to a case of supposed infection reported to the Royal Society in 1820 by Lord Morton. A chestnut mare, after having a hybrid by a quagga, produced a black Arabian horse three foals showing a number of stripes—in one more stripes were present than in the quagga hybrid. The more, however, the case so intimately associated with that of the quagga. The peculiarity of telegony is the evidence it affords in favour of “infection.” Stripes are frequently seen in high-caste Arab horses, and cross-bred colts out of Arab mares sometimes present far more distinct bars across the legs and other zebra-like markings than characterized the subsequent offspring of Lord Morton's seven-eighths Arabian mare. In the absence of control experiments there is therefore no reason for assuming Lord Morton's chestnut mare would have produced less striped offspring had she been mated with the black Arabian before giving birth to a quagga hybrid. To account for the stripes of the Arabian breeders, it is only necessary to assume that in the cross-bred chestnut mare there lay latent the characteristics of the Kattiavar or other
Indian breeds, in which stripes commonly occur. Darwin and others having regarded Lord Morton's mare as affording very strong evidence in support of the infection hypothesis, it was considered some years ago desirable to repeat Lord Morton's experiment as accurately as possible. The quagga having become extinct, a number of mares were put to a richly striped Burchell zebra, and subsequently mated with Arab, thoroughbred and cross-bred sires. Other mares were used for control experiments. Thirty mares put to a Burchell zebra produced seventeen hybrids, and subsequently twenty pure-bred foals. The mares used for control experiments produced ten pure-bred foals. Unlike Lord Morton's quagga hybrids, all the zebra hybrids were richly, and sometimes very distinctly, striped, some of them having far more stripes than their zebra parent. Of the subsequent foals, three out of Highland mares presented indistinct markings at birth. But as equally distinct markings occurred on two pure-bred Highland foals out of mares which had never seen a zebra, it was impossible to ascribe the stripes on the foals born after zebra hybrids to infection of their respective dams. Further, the subsequent foals afforded no evidence of infection, either in the mane, tail, hoofs or disposition. Of the pure-bred foals, i.e. the foals by pure-bred sires out of mares which had never been mated with a zebra, two were striped at birth and one acquired stripes later—they were revealed as the foal's coat was shed. Moreover, while the faint markings on the foals born after hybrids compared with the foals' coat, the stripes on the three pure-bred colts persisted. One of the consequently striped colts, a bay, was out of a black Shetland mare by a black Shetland sire, one was by a dun Norwegian pony out of a roan-coloured Arab mare, while the third was by a Norwegian pony out of a half-bred bay Arab mare. It has been asserted by believers in teleology that evidence of infection may appear in the second though not present in the first generation. By way of testing this assumption, a bay filly, the half-sister of a richly striped hybrid, was put to a cross-bred Highland pony, and a Highland mare, while nursing her hybrid foal, was put to a colt the half-brother of a hybrid. The result was two fillies which in no single point either suggest a zebra or a zebra hybrid. Similar results having been obtained with horses and asses, there is no escape from the conclusion that the teleology tradition is not confirmed by such methodical investigations as were suggested some years ago by Professor Weismann (see Cossar Ewart, The Pennycuik Experiments, 1899).

Telegony in Dogs.—Breeders of dogs are, if possible, more thoroughly convinced of the fact of telegony than breeders of horses. Nevertheless, Sir Everett Millais, a recognized authority, has been led to the conclusion by his own experience, during which he made all sorts of experiments, he had never seen a case of telegony. Recent experiments support Millais's conclusion. Two of the purest breeds at the present day are the Scottish deerhound and the Dalmatian (spotted carriage-dog). A deerhound after having seven pups to a Dalmatian was put to a dog of her own breed. The result was five pups, which have grown into handsome hounds without the remotest suggestion of the previous Dalmatian mate of their dam. A similar result was obtained with a deerhound fathered by a mongrel. Many cross-bred experiments on telegony are made annually with dogs. Two such experiments may be mentioned. A black-brindled Scottish terrier belonging to a famous breed had first a litter of pups to a curly-haired liver-and-white cocker-spaniel. The pups were spaniel-like in build, and of a brown-and-white colour. Subsequently this terrier had pups to a black-brindled terrier. All the pure-bred pups were typical terriers, and evidence of their dam having escaped infection is the fact that three of them proved noted prize-winners. The subject of the second undesigned experiment was a half-bred fox-terrier. In this case the first sire was a white Pomeranian and the second a thoroughbred Irish terrier. Having had ample opportunity of being "corrupted," the fox-terrier was mated with a prize dog of her own strain. The result was three pups, all in make and markings pure terriers, and one of the three was regarded as an unusually good specimen of the breed.

Experiments with cats, rabbits, mice, with sheep and cattle, with fowls and pigeons, like the experiments with horses and dogs, fail to afford any evidence that offspring inherit any of their characters from previous mates of the dam; i.e. they entirely fail to prove that a female animal is liable to be so influenced by her first mate that, however subsequently mated, the offspring will either in structure or disposition give some hint of the previous mate. In considering telegony it should perhaps be mentioned that some breeders not only believe the dam is liable to be "infected" by the sire, but also that the sire may acquire some of the characteristics of his mates. This belief seems to be especially prevalent amongst breeders of cattle; but how, for example, a long-horned Highland bull, used for crossing with black hornless Galloway cows, could subsequently get Galloway-like calves out of pure Highland heifers it is impossible to imagine.

In conclusion, it may be pointed out that it was only natural for breeders and physiologists in bygone days to account for some of their results by the "infection" hypothesis. Even now we know surprisingly little about the causes of variation, and not many years ago it was frequently asserted that there was no such thing as reversion or throwing back to an ancestor. But even were the laws of heredity and variation better understood, the fact remains that we know little of the origin of the majority of our domestic animals. On the other hand, from the experiments of Mendel and others we now know that cross-bred animals and plants may present all the characters of one of their pure-bred parents, and we also know that the offspring of what are regarded as pure-bred parents sometimes revert to remote, it may be quite different, ancestors. The better we understand the laws of heredity and variation, and the more we learn of the history of the germ cells, the less need will there be to seek for explanations from teleology and other like doctrines.

**TELEGRAPH** (Gr. τῆλε, far, and γράφω, to write), the name given to an apparatus for the transmission of intelligence to a distance. Etymologically the word implies that the messages are written, but its earliest use was of appliances that depended on visual signals, such as the semaphore or optical telegraph of Claude Chappe. The word is still sometimes employed in this sense, as of the ship's telegraph, by means of which orders are mechanically transmitted from the navigating bridge to the engine room, but when used without qualification it usually denotes telegraphic apparatus worked by electricity, whether the signals that express the words of the message are visual, auditory or written.

Land and Submarine Telegraphy will be considered in Part I., with a section on the commercial aspects. In Part II. Wireless Telegraphy is dealt with.

**PART I.—LAND AND SUBMARINE TELEGRAPHY**

**Historical Sketch.**—Although the history of practical electric telegraphy does not date much further back than the middle of the 19th century, the idea of using electricity for telegraphic purposes is much older. It was suggested again and again as each new discovery in electricity and magnetism seemed to render it more feasible. Thus the discovery of Stephen Gray and of Granville Wheeler that the electrical influence of a charged Leyden jar may be conveyed to a distance by means of an insulated wire gave rise to various proposals, of which perhaps the earliest was that in an anonymous letter to the Scots Magazine (vol. xv. p. 73, 1753), in which the use of as many insulated conductors as there are letters in the alphabet was suggested. Each wire was to be used for the transmission of one letter only, and the message was to be sent by charging the proper wires in succession, and received by observing the

TELEGRAPH

movements of small pieces of paper marked with the letters of the alphabet and placed under the ends of the wires. A very interesting modification was also proposed in the same letter, viz. to attach to the end of each wire a small light ball which, when actuated by the galvanic current, would strike the adjacent bell and strike it. Some twenty years later G. L. Le Sage proposed a similar method, in which each conductor was to be attached to a pitball electrometer. An important advance on this was proposed in 1797 by Lomond, who used only one line of wire and an alphabet of motions. Besides these we have in the same period the spark telegraph of Reiser, of Don Silva, and of Cavallo, the pitball telegraph of Francis Ronalds (a model of which is in the collection of telegraph apparatus in the Victoria and Albert Museum), and several others. The application of this to telegraphic purposes was suggested by Laplace and taken up by Ampere, and afterwards by Triboulet and by Schilling, whose work forms the foundation of much of modern telegraphy. Faraday's discovery of the induced current produced by passing a magnet through a helix of wire forming part of a closed circuit was held of in the telegraph of Gauss and Weber, and this application was at the request of Gauss taken up by Steinheil, who brought it to considerable perfection. Steinheil communicated to the German Academy of Sciences in September 1837 an account of his telegraph, which had been constructed about the middle of the preceding year. The currents were produced by a magneto-electric machine resembling that of Clarke. The receiving apparatus consisted of a multiplier, in the centre of which were pivoted one or two magnetic needles, which either indicated the message by the movement of an index or by striking two bells of different tone, or recorded it by making ink dots on a ribbon of paper.

Steinheil appears to have been anticipated in the matter of a recording telegraph by Morse of America, who in 1827 constructed a galvanometer; this within a few years was so perfected that with some modification in detail it has been largely used ever since (see below). In 1836, to whom the idea appears to have been suggested by Schilling's method, invented a telegraph in which an alphabet was worked out by the single and combined movement of three needles. Subsequently, in conjunction with Wheatstone, he introduced another form, in which five vertical index needles, each worked by a separate multiplier, were made to point out the letters on a dial. Two needles (for some letters, one only) were acted upon at the same time, and the letter at the point of intersection of the direction of the index was read. This telegraph required six wires, and was shortly afterwards displaced by the single-needle system, still to a large extent used on railway and other less important circuits. The single-needle instrument is a vertical needle galvanoscope worked by a battery and reversing handle, or two "tapper" keys, the motions to right and left of one end of the index corresponding to the dashes and dots of the Morse alphabet. To increase the speed of working, two single-needle instruments were sometimes used in the action of a double-needle telegraph. This system required two line wires, and, although a remarkably serviceable apparatus and in use for many years, is no longer employed. Similar instruments to the single and double needle apparatus of Cooke and Wheatstone were about the same time invented by the Rev. H. Highton and his brother Edward Highton, and were used for a considerable time on some of the railway lines in England. Another series of instruments, introduced by Cooke and Wheatstone in 1830, and generally known as "Wheatstone's step-by-step letter-showing" or "ABC instruments," were worked out of the great ingenuity of detail by Wheatstone in Great Britain and by Bréguet and others in France. The Wheatstone instrument in the form devised by Stroh is still largely used in the British Postal Telegraph Department. Wheatstone also described and to some extent worked out an interesting modification of his step-by-step instrument, the object of which was to produce a letter-printing telegraph. But it never came into use; some years later, however, an instrument embodying the same principle, although differing greatly in mechanical detail, was brought into use by Royal Telephone, and was very successfully worked on some of the American telegraph lines till 1860, after which it was gradually displaced by other forms. Various modifications of the instrument are still employed for stock telegraph purposes.

Construction of Telegraph Circuits.—The first requisite for electro-telegraphic communication between two localities is an insulated conductor extending from one to the other. This, with proper apparatus for originating electric currents at one end and for discovering the effects produced by one of them at the other end, constitutes an electric telegraph. Faraday's term "electro," literally "a way (δρος) for electricity to travel," might be well applied to designate the insulated conductor along which the electric messenger is despatched. It is, however, more commonly and familiarly called "the wire" or "the line." The apparatus for generating the electric action at one end is commonly called the transmitting apparatus or instrument, or the sending apparatus or instrument, or sometimes the transmitter or sender. The apparatus used at the other end of the line to render the effects of this action perceptible to the eye or ear, is called the receiving apparatus or instrument.

In the aerial or ground system of land telegraphs the use of copper wire has become very general. The advantage of the high conducting power which copper possesses is of especial value in moist climates (like that of the United Kingdom), since the effect of leakage over the surface of the damp insulators is much less noticeable when the conducting power of the wire is high than when it is low, especially when the line is a long one. Copper is not yet universally employed, price being the governing factor in its employment; moreover, the conducting quality of copper makes it less suited to telegraphic purposes than silver or gold. The use of copper as a telegraphic conductor has of late years been very greatly improved.

In the British Postal Telegraph system five sizes of iron wire are in general use, weighing respectively 200, 400, 450, 600 and 800 lb per statute mile, and having electrical resistances (at 60° F.) of 26.64, 13.32, 11.84, 8.88 and 6.66 standard ohms per statute mile respectively. The sizes of copper wire employed have weights of 100, 150, 200 and 400 lb per statute mile, and have electrical resistances (at 60° F.) of 8.782, 5.955, 4.391 and 2.195 standard ohms respectively. Copper wire weighing 600 and 800 lb per mile has also been used to some extent. The copper is "hard drawn," and has a breaking strain as high as 28 tons per sq. in.; the last strain required for the iron wire is about 2½ tons. The particulars sizes and descriptions of wires used are dependent upon the character of the "circuits" the longer and more important circuits requiring the heavier wire. The lines are carried on poles, at a sufficient height above the ground, by means of insulators. These vary in form, but essentially they consist of a stem of porcelain, coarse earthenware, glass or other non-conducting substance, protected by an insulating roof or screen. The form in general use on the British postal lines is the "Cordeaux screw," but the "Varley double cup" is still employed, especially by the railway companies.

The latter form consists (fig. 1) of two distinct cups (c, C), which are moulded and fired separately, and afterwards cemented together. The double cup gives greater security against loss of insulation due to wind, the metal cups, and are more easily cleaned by pouring hot water upon the surface insulation. An iron bolt (b) cemented into the centre of the inner cup is used for fixing the insulator to the pole or bracket.

\[ See \ Arthur \ Young, \ "Travels \ in \ France," \ page \ 3.\]
This form of insulator is still largely used and is a very serviceable pattern, though possessing the defect that the porcelain cup is not removable from the iron bolt on which it is mounted. The Cordeaux insulator (fig. 2) is made in one piece. A coarse screw-thread is formed in the upper part of the inner cup, and this screws on to the end of the iron bolt by which it is supported. Between a shoulder, $a$, in the iron bolt and a shoulder in the porcelain cup, $c$, is placed an indiarubber ring, which forms a yielding washer and enables the cup to be screwed firmly to the bolt, while preventing the abrasion of the porcelain against the iron. The advantage of the arrangement is that the cup can at any time be readily removed from the bolt. At the termination of a line a large insulator (fig. 3), mounted on a strong steel bolt having a broad base flange, is employed. Connexion is made into the office (or to the underground system, as is often the case) from the aerial wire by means of a copper conductor, insulated with gutta-percha, which passes through a "leading in" cup, whereby leakage is prevented between the wire and the pole. The insulators are planted on creosoted oak arms, 2½ in. sq. and varying in length from 24 to 48 ins., the 24 and 33 in. arms taking two, and the 48 in. four, insulators. The unequal lengths of the 24 and 33 in. arms are adopted for the purpose of allowing one wire to fall clear of that beneath it, in the case of an insulator breaking or the securing binder giving way. The poles are of red fir, creosoted, this method of preservation being the only one now used for this purpose in the United Kingdom. The number of poles varies from about 15 to 22 per m. of line; they are planted to a depth of from 2 to 4 ft. in the ground. For protection from lightning each pole has an "earth wire" running from the top, down to the base.

Gutta-percha-covered copper wires were formerly largely used for the purpose of underground lines, the copper conductor weighing 40 lb per statute mile, and the gutta-percha covering 50 lb (90 lb total). The introduction of "paper" cables, i.e., copper wires insulated with carefully dried paper of a special quality, has practically entirely superseded the use of wires insulated with gutta-percha. The paper cables consist of a number of wires, each enclosed in a loose covering of well-dried paper, and loosely laid up together with a slight spiral "lay" in a bundle, the whole being enclosed in a stout lead pipe. It is essential that the paper covering be loose, so as to ensure that each wire is enclosed in a coating not of paper only, but also of air; the wires in fact are really insulated from each other by the dry air. To ensure paper acting merely as a separator to prevent them from coming into contact. The great advantage of this air insulation is that the electrostatic capacity of the wires is low (about one-third of that which would be obtained with gutta-percha insulation), which is of the utmost importance for high-speed working or for long-distance telephonic communication. As many as 1200 wires are sometimes enclosed in one lead pipe.

Between London and Birmingham a paper cable 116 m long and consisting of 72 copper conductors, each weighing 150 lb per statute mile, was laid in 1900. The conductors are enclosed in a lead pipe, 2½ in. in outside diameter and 1 in. thick, which itself is enclosed in cast iron spiral-ended pipes, 3 in. in internal diameter, and buried 2 ft. below the surface of the roadway. At intervals of 2 m. "test pillars" are placed for the purpose of enabling possible faults to be accurately located. Each conductor has a resistance (at 60° F.) of 5.74 ohms per statute mile, and an average electrostatic capacity per mile between adjacent wires of 0.060 microfarad; or between wire and earth of 0.1 microfarad; the insulation resistance of each wire is about 5000 megohms per mile. The underground system of paper cables has been very largely extended. Cables between London, Glasgow, Dublin, Liverpool, Leeds, Bristol, Exeter and other important towns have been laid, and eventually telephonic communication between every important town in the United Kingdom will be rendered safe from interruptions caused by gales or snowstorms.

The one disadvantage of paper cables is the fact that any injury to the lead covering which allows moisture to penetrate causes telephonic interruption to the whole of the enclosed wires, whereas if the wires are each individually coated with gutta-percha, the presence of moisture can only affect those wires whose covering is defective. There is no reason for doubting, however, that, provided the lead covering remains intact, the paper insulation is imperishable; this is not the case with gutta-percha-covered cables.

In order to maintain a system of telegraph lines in good working condition, daily tests are essential. In the British Postal Telegraph Department all the most important wires are tested every morning between 7.30 and 7.45 A.M., in sections of about 200 miles. The method adopted consists in looping the wires in pairs between two testing offices, A and B (fig. 4); a current is sent from a battery, $E$, through one coil of a galvanometer, $g$, through a high resistance, $r$, through one of the wires, $1$, and thence back from office B (at which the wires are looped), through wire 2, through another high resistance, $r'$, through a second coil on the galvanometer, $g$, and thence to earth. If the looped lines are both in good condition and free from leakage, the current sent out on line 1 will be exactly equal to the current received back on line 2; and as these currents will have equal but opposite effects on the galvanometer needle, no deflection of the latter will be produced. If, however, there is leakage, the current received on the galvanometer will be less than the current sent out, and the result will be a deflection of the needle proportional to the amount of leakage.

The galvanometer being so adjusted that a current of definite strength through one of the coils gives a definite deflection of the needle, the amount of leakage expressed in terms of the insulation resistance of the wire is given by the formula:

$$ \text{Total insulation resistance of looped lines} = \frac{R(D/d - 1)}{}; $$

in which $R$ is the total resistance of the looped wires, including the resistance of the two coils of the galvanometer, of the battery, and of the two resistance coils $r$ and $r'$. (Inserted for the purpose of causing the leakage on the lines to have a maximum effect on the galvanometer deflections.) In practice the resistances $r$, $r'$ are...
of 10,000 ohms each. The deflection observed on the galvanometer when the lines are leaky is \( d \), while \( D \) is the deflection observed through only one coil of the galvanometer with all the other resistances in circuit; and assuming that no leakage exists on the lines, this deflection is calculated from the "constant" of the instrument, \( i.e. \), from the known deflection obtained with a definite current. For the purpose of avoiding calculation, tables are provided showing the values of the total insulation according to the formula, corresponding to various values of \( d \). If the insulation per mile, \( i.e. \), the amount of insulation multiplied by the mileage of the wire loop, is found to be less than 200,000 ohms, the wire is considered to be faulty. The climatic conditions in the British Islands are such that it is not possible to maintain, in unfavourable weather, a higher atmosphere than that named, which is the insulation obtained when all the insulators are in perfect condition and only the normal leakage, due to moisture, is present.

There are three kinds of primary batteries in general use in the British Postal Telegraph Department, viz., the Daniell, the bichromate, and the Leclanché. The Daniell type consists of a teak trough divided into five cells by slate partitions coated with marine glue. Each cell contains a zinc plate, immersed in a solution of zinc sulphate, and also a porous chamber containing crystals of copper sulphate and a copper plate. The electromotive force of each cell is 1.07 volts and the resistance 3 ohms. The Fuller bichromate battery consists of an outer jar containing a solution of bichromate of potash and sulphuric acid, in which a plate of hard carbon is immersed; in the jar there is also a porous pot containing dilute sulphuric acid and a small quantity (2 oz.) of mercury, in which stands a stout zinc rod. The electromotive force of each cell is 1.05 volts, and the resistance 4 ohms.

The Leclanché is of the ordinary type, and each cell has an electromotive force of 1.64 volts and a resistance of 3 to 5 ohms (according to the size of the complete cell, of which there are three sizes in use). Dry cells, \( i.e. \), cells containing no free liquid, but a chemical paste, are also largely employed; they have the advantage of great portability.

Primary batteries have, in the case of all large offices, been displaced by accumulators. The force of the set of accumulators provided is such as to give sufficient power for the longest circuit to be worked. The shorter circuits being brought up approximately to a level, as regards resistance, by the insertion of resistance coils in the circuit of the transmitting apparatus of each shorter line. A spare set of accumulators is provided for every group of instruments in case of the failure of the working set. For working "double current," two sets of accumulators are provided, one set to send the positive and the other set the negative currents; that is to say, when, for example, a double current Morse key is pressed down it sends, say, a positive current from one set, but when it is allowed to rise to its normal position then a negative current is sent out, and the resistance of the second set of accumulators is increased.

It is not possible to work double current from one set alone, as in this case, if one key of a group of instruments is up and another is down, the battery would be short-circuited and no current would flow to line. The size of the accumulators employed varies from a cell capable of an output of 8 ampere-hours, to a size giving 750 ampere-hours.

**Submarine Cables.**—A submarine cable (figs. 5-7), as usually manufactured, consists of a core, a in the centre of which is a strand of copper wires varying in weight for different cables between 70 and 650 lb to the nautical mile. The stranded form was suggested by W. Thomson (Lord Kelvin) at a meeting of the Philosophical Society of Glasgow in 1854, because its greater flexibility renders it less likely to damage the insulating envelope during the manipulation of the cable. The central conductor is covered with several continuous coatings of gutta-percha, the total weight of which varies between 70 and 650 lb to the mile. Theoretically for a given outside diameter of core the greatest speed of signalling through a cable is obtained when the diameter of the conductor is \( \frac{606}{t + 4} \), the diameter of the core, but this ratio makes the thickness of the gutta-percha covering insufficient for mechanical strength. Owing to the high price of gutta-percha the tendency, of recent years, has been to approximate more closely to the theoretical dimensions, and a thickness of insulating material which formerly would have been considered quite insufficient is now generally adopted with complete success. Of two transatlantic cables laid in 1854, the core of one consisted of 300 lb copper and 320 lb gutta-percha per mile, and that of the other of 650 lb copper and 500 lb gutta-percha; whereas for the similarly situated cable laid in 1866 the figures were 300 lb copper and 400 lb gutta-percha. The core is served with a thick coating of wet jute, yarn or hemp (\( h \)), forming a soft bed for the sheath, and, to secure immunity from the ravages of submarine boring animals, \( e.g. \), *Teredo navalis*, it has been found necessary, for depths not exceeding 300 fathoms, to protect the core with a thin layer of brass tape. The deep sea portion is sheathed with galvanized iron or steel wires (in the latter case offering a breaking strain of over 80 tons per sq. in., with an elongation of at least 5 per cent.), the separate wires being first covered with a firm coating of tape and Chatterton's compound (a mixture of gutta-percha, rosin and Stockholm tar). Sometimes the wires are covered with the compound alone, and the whole cable after being sheathed is finally covered with tinned tape. The weight of the iron sheath varies greatly according to the depth of the water, the nature of the sea bottom, the prevalence of currents, and so on. Fig. 5 shows the intermediate type again sheathed with a heavy armour to resist wear in the shallow water near shore. In many cases a still heavier type is used for the first mile or two from shore, and several intermediate types are often introduced, tapering gradually to the thin deep-water type.

The cost of the cable before laying depends on the dimensions of its core, the gutta-percha, which still forms the only trustworthy insulator known, constituting the principal item of the expense; for an Atlantic cable of the most approved construction the cost may be taken at \( £250 \) to \( £300 \) per nautical mile.

In manufacturing a cable (fig. 8) the copper strand is passed through a vessel \( A \) containing melted Chatterton's compound, then through the cylinder \( C \), in which a quantity of gutta-percha, purified by repeated washing in hot water, by mastication, and by filtering through wire-gauze filters, is kept warm by a steam-jacket. As the wire is pulled through, a coating of gutta-percha, the thickness of which is regulated by the die \( D \), is pressed out of the cylinder by applying the requisite pressure.
to the piston P. The newly coated wire is passed through a long trough T, containing cold water, until it is sufficiently cold to allow it to be safely wound on a bobbin B. This operation is repeated, the wire being passed through the troughs from the bobbin to the bottom of the trough, and from the bottom of the trough to the bobbin, at the same time carefully examined for air-holes or other flaws, all of which are eliminated. The coated wire is treated in the same way as the copper strand—the die D, or another of the same size, being placed at the back of the cylinder and a larger one substituted at the front. A second coating is then laid on, and after it passes through a similar process of examination a third coating is applied and so on until the requisite number of layers has been completed. The finished core clings rapidly to its electrical qualities at first, and is generally kept for a stated interval of time before being subjected to the specified tests. It is then placed in a tank of water and kept at a certain frictional resistance, say 50°F., until it has reached a sufficiently uniform temperature by means of water. When the core is thus hardened, it is placed in a tank in a vertical position, with the bottom of the tank at the level of the water-stranded core. The core is then immersed in water, and the temperature is raised to 65°F., and held at this temperature for a stated time. The core is then removed and allowed to cool to room temperature, and the resistance and its electrostatic capacity are then measured. These tests are in some cases repeated at a different temperature, say 50°F., for the purpose of obtaining at the same time greater certainty of the soundness of the core and the rate of variation of the conductor and core temperature. The test specimen of the core to a hydrometric pressure of four tons to the square inch and an electric pressure of 5000 volts from an alternating-current transformer has been adopted, by one manufacturer at least, to secure the detection of mixed faults which might develop themselves after submersion. Should these tests prove satisfactory the core is served with jute yarn, coated in water-tight tanks, and surrounded with salt water. The insulation is again tested, and if no fault is discovered the served core is passed through the sheathing machine and the iron sheath and the outer covering are laid on. As the cable is sheathed it is stored in large water-tight tanks and kept at a uniformly uniform temperature by means of water.

When the cable is to be laid it is transferred to a cable ship, provided with water-tight tanks similar to those used in the factory for storing it. The tanks are nearly cylindrical in form and have a truncated cone fixed in the center, as shown at C, Fig. 9. The cable is carefully coiled into the tanks in horizontal flanges, each of which is begun at the outside of the tank and coiled towards the centre. The different coils are prevented from adhering by a coating of white-wash, and the end of each nautical mile is carefully marked for future reference. After the cable has been again subjected to the proper electrical tests and found to be in perfect condition, the ship is taken to the place where the shore end is to be landed. A sufficient length of cable to reach the shore or the cable-house is paid overboard and coiled on a raft or rafts, or on the deck of a steam-launch, in order to be connected with the shore. The end is then taken into the testing room in the cable-house and the conductor connected with the testing instrument, and the electrical tests are continued. The ship is then put on the proper course and steams slowly ahead, paying out the cable over her stern. The cable must not be overstrained in the process of submersion, and must be paid out at the proper rate to give the requisite slack. This involves the introduction of machinery for measuring and controlling the speed at which it leaves the ship and for measuring the pull on the cable. The several parts of this apparatus are shown in Fig. 10. The lower end e of the cable in the tank T is taken to the testing room, so that continuous tests for electrical condition can be made. The upper end is passed over a guiding quadrant Q to a set of wheels or rollers on the drum R, from which it passes through the dip pulley D, and finally to the stern pulley, over which it passes into the sea. The wheels 1, 2, 3, ... are arranged so that 2, 4, 6, ... can be raised or lowered as to give the cable less or more hold as it passes between them, while 1, 3, 5, ... are furnished with brakes. The whole system provides the means of giving sufficient back-pull to the cable to make it grip the drum R, round which it passes several times to prevent slipping. On the same shaft with R is fixed a brake-wheel furnished with a powerful brake B, by the proper manipulation of which the speed of paying out is regulated, the pull on the cable being at the same time observed by means of D. The shaft of B can be readily put in gear with a powerful engine for the purpose of hauling back the cable should it be found necessary to do so. The length paid out and the rate of paying out are obtained approximately from the number of turns made by the drum P and its rate of turning. This is obtained by the mile marks, the known position of the joints, &c. The speed of the ship is obtained from the speed of the engines; it is more accurately obtained by one or other of the various forms of log, or it may be measured by paying out continuously a steel wire over a measuring wheel. The average speed is obtained by connecting together the various observations for the position of the ship. The difference between the speed of the ship and the rate of paying out gives the amount of slack. The amount of slack is thus regulated to be between one and three per cent., but some is always allowed, so that the cable may easily adapt itself to inequalities of the bottom and may be more readily lifted for repairs. But the mere paying out of sufficient slack is not a guarantee that the cable will always lie closely along the bottom or be free from spans. Whilst it is being paid out the portion between the surface of the water and the bottom of the sea lies along a straight line, the component of the weight at right angles to its length being balanced by the buoyancy of the cable in the water. The angle of the wire is given by the frictional resistance to sinking in the water. If, then, the speed of the ship be v, the rate of paying out u, the angle of immersion i, the depth of the water h, the weight per unit length of the cable w, the pull on the cable at the surface P, and A, B constants, we have:

$$P = h - w \left(\alpha - \cos \theta\right)$$

$$w \cos i = B \left(\sin \theta\right)$$

where \(\theta\) stands for "function." The factors \(A (u - \cos i)\) and \(B (\sin \theta)\) give the frictional resistance to sinking, per unit length of the cable, in the direction of the cable length respectively. It is evident from equation (9) that the angle of immersion depends solely on the speed of the ship; hence in laying a cable on an irregular bottom it is of great importance that the speed should be sufficiently low. This may be illustrated very simply as follows: suppose a a (Fig. 10) to be the surface of the sea, b c the bottom, and c c the straight line made by the cable; and suppose that H, which is the end of the cable, is passed over, the cable touches it at some point t before it touches the part immediately below t, and if the friction between the cable and the ground is sufficient the cable will either break or be left in a long span ready to break at some future time. It is important to observe that the risk is in no way obviated by the increasing slack paid out, except in so far as the amount of sliding which the strength of the cable is able to produce at the points of contact with the ground may thereby increased. The speed of the ship must therefore be so regulated that the friction of the cable against the ground is as great as the inclination of the steepest slope passed over. In ordinary circumstances the angle of immersion i varies between 1° and 2°.

The "slack indicator" of Messrs Siemens Brothers & Co. yields a continuous indication and record of the actual slack paid out. It consists of a long screw spindle, coupled by suitable gearing with the cable drum, and thus rotating at the speed of the outgoing cable; on this screw works a nut which forms the centre of a thin circular disk, the edge of which is pressed against the surface of a right circular cone, the line of contact, as the nut moves along the screw, being parallel to the axis of the latter. This cone is driven by gearing from the wire drum, so that the rate of rotation of the diaphragm of the outgoing wire, the direction of rotation being such as to cause the nut to travel towards the smaller end of the cone. If both...

---

by the disk, for any difference in speed between nut and screw will cause the nut to move along the screw until the diameter of the cone is reached which fulfills the condition of equality in speed. In fig. 11 the edge of the disk serves as the pointer and the scale gives the percentage of slack, or \((N-n)/n\). The wire being paid out without slack measures the actual distance and speed over the bottom will be found if the original fregure is being on land or the heaving in of cable will continue until the end comes on board. Another buoy is then lowered to mark this spot, and the cable on either side of the line is spliced for the purpose, as this is not the actual line of the cable. Grappling will be recommended so as to hook the cable near enough to the end to allow of its being hove to the surface. When this has been done an electrical test is made of the connexion, and, if found perfect, the cable is weighed down and the vessel is made fast and, if communication is found perfect with the shore, buoyed with sufficient chain and rope attached to allow of the cable being towed to the bottom. The ship now returns to the position of the buoys, and a proper length of cable is paid out, a mark being placed on it which gives the point of projection. As to cost, one transatlantic cable repair cost \(\$75,000\); the repair of the Aden-Bombay cable, broken in a depth of 190 fathoms, was effected with the expenditure of 176 miles of new cable, and this operation was completed in 11 years. The cost of a repair for the remainder of the time was interrupted by the monsoon; a repair of the Lisbon-Portsmouth cable, broken in the Bay of Biscay at a depth of 130 fathoms, was completed in 215 days, with an expenditure of 300 miles of cable. All interruptions are not so costly, for in shallower waters, with favourable conditions of weather, a repair may be only a matter of a few hours, and, if such waters are nearly always open, a large reserve fund must be laid aside for this purpose. As an ordinary instance, it has been stated that the cost of repairing the Direct United States cable up to 1900 from its submergence in 1858 averaged \(\$800\) per annum. All the cables, however, possess their own steamers, of sufficient dimensions and specially equipped for making ordinary repairs; but for exceptional cases, where a considerable quantity of new cable may have to be inserted, it is sometimes necessary to charter the services of one of the larger vessels owned by a cable-manufacturing company, at a certain sum per day, which may well reach \$200 to \$300. This fleet of cables now number ranging in size from vessels of 300 tons to 10,000 tons carrying capacity.

The life of a cable is usually considered to continue until it is no longer capable of being lifted for repair, but in some cases the duration and frequency of interruptions is so abnormally large as to render repair inadvisable and the public inconvenience, with the loss of revenue and cost of repairs, must together decide the question of either making very extensive renewals or even abandoning the whole cable. The order result in a rupture by so many circumstances determining the environment of the cable, that not even an approximate term of years has yet been authoritatively fixed. It is a well-ascertained fact that the insulator, gutta-percha, is, when kept under water, practically imperishable, so that it is only the original strength of the sheathing wires and the deterioration allowable in them which have to be considered. Cables have frequently been picked up after many years and the sheathing and other materials are in perfect condition. In this respect, while in other cases ends have been picked up which in the course of twelve years had been corroded to needle points, the result probably of metallic losses in the locality. A cable may also be repaired by removing the sheathing for several miles apart, to obtain more than a general idea as to the average depth along the route, while the nature of the constituents of the sea bed can only be revealed by a few small specimens brought up at isolated spots, though fortunately the globigerine ooze which covers the bottom at all the greater ocean depths forms an ideal bed for the cable. The experience gained in the earlier days of telegraphy, from 1850 to 1865, shows that 10 to 20 per cent. of the deep-sea cables within the first twelve years, placed the probable life of a cable as low as fifteen years, but the weeding out of unserviceable types of construction, and the general improvements in materials and technique, have so much increased the life, that an estimate, until now the limit may be safely placed at not less than forty years. In depths beyond the reach of wave motion, and apart from suspension across promontories, the most frequent cause of interruption is seismic or other shifting of the ocean bed, while in shallower waters and near the shore the dragging of anchors or
fishing trawls has been mostly responsible. Since by international agreement the willful damage of a cable has been constituted a criminal offence, and the cable companies have avoided crossing the fishing banks, or have adopted the wise policy at other the value of anchors lost on their cables, the number of such fractures has greatly diminished.

**Instruments for Land Telegraphy.**—At small country towns or villages, where the message traffic is light, the Wheatstone "A B C" instrument is used. In this apparatus electric currents are generated by turning a handle (placed in front of the instrument), which is geared, in the instrumentmost constant pattern, to Siemens shuttle armature placed between the two arms of a powerful horse shoe permanent magnet. When one of a series of keys (each corresponding to a letter) arranged round a pointer is depressed, the motion of the pointer, which is geared to the shuttle armature, is arrested on coming opposite that particular key, and the transmission of the currents to line is stopped, though the armature itself can continue to rotate. The depression of a second key causes the first key to be raised. The currents actuate a ratchet-wheel mechanism at the receiving station, where a small dial is moved on letter by letter. A noticeable feature in the modern A B C indicator, as well as in all modern forms of telegraph instruments, is the adoption of "induced" magnets in the moving portion of the apparatus. A small permanent magnet is always liable to become demagnetized, or have its polarity reversed by the action of lightning. This liability is overcome by making such movable parts as require to be magnetic of soft iron, and magnetizing them by the inducing action of a strong permanent magnet. Although formerly in very extensive employment, this instrument is dropping out of use and the "sounder" (and in many cases the telephone) is being used in its place.

At offices where the work is heavier than can be dealt with by the A B C apparatus, the "Single Needle" instrument has been very largely employed; it has the advantage of slight liability to derangement, and of requiring very little adjustment. A fairly skilled operator can signal with it at the rate of 20 words per minute. The needle (in the modern pattern) is of soft iron, and is kept magnetized inductively by the action of two permanent steel magnets. The coils are wound with copper wire (covered with silk), 10 mils in diameter, to a total resistance of 200 ohms. The actual current required to work the instrument is 3-3 milliamperes (equivalent approximately to the current given by 1 Daniell cell through 3,300 ohms), but in practice 10 milliamperes is allowed. A simple, but important, addition to enable the reader from the instrument to be affected by sound is shown in fig. 13; in this arrangement the needle strikes against small tubes formed of tin-plate. Although a most serviceable instrument and cheap as regards maintenance, the "single needle" has (except for use in telegraph purveying) been discarded in favour of the "sounder," to secure the advantage of using one general pattern of apparatus, as far as possible, and to avoid the necessity of two different types of instrument being learnt by the telegraphist.

The well-known code of signals (fig. 14) introduced by Morse is still employed in the United States and Canada, and the international code in vogue in Europe differs only slightly from it. The instruments used for land telegraphs on this system are of two types—"sounders," which indicate by sound, and "recorders," which record the signals.

Recorders vary in details of construction, but all have the same object, namely, to record the intervals during which the current is applied to the line. In the earlier forms of instrument the record was made by embossing lines on a ribbon of paper by means of a sharp stylus fixed on the end of a lever, which carried at its end the armature of an electromagnet. The form of Morse recorder almost universally used in Europe makes the record in ink, and hence is sometimes called the "ink writer." This method has the advantage of distinctness, and so is less trying to the eyes of the operators. Although the "ink writer" is still in use it is practically an obsolete instrument, and has been displaced by the "sounder.

Operators who used the recorder soon learned to read the message by the click of the armature against its stop, and as this left the hands and eyes free to write, reading by sound was usually preferred. Thus, when it is not necessary to keep a copy, a much simpler instrument may be employed and the message read by sound. The earliest successful form was "Bright's bell" sounder, which consisted of two bells of distinct tone or pitch, one of which was sounded when the current was sent in one direction and the other when it was reversed. This instrument was capable of giving very considerable speed, but it was more complicated than that now in use, which consists only of an electromagnet, with its armature lever arranged to stop against an anvil or screw in such a way as to give a distinct and somewhat loud sound. Dots and dashes are distinguished by the interval between the sounds of the instrument in precisely the same way as they are distinguished when reading from the recorder by sound. Fig. 15 shows the modern pattern of "sounder" as used by the British Post Office. The magnet is wound to a resistance of 40 ohms (or 900 ohms when worked from accumulators), and the instrument is worked with a current of 400 milliamperes (25 milliamperes with accumulators).

**Methods of Working Land Circuits.**—The arrangement on the "open-circuit" system for single-current working is shown in fig. 16, in which L1 represents the line, G a galvanometer, used simply to show that the currents are going to line when the message is being transmitted, K the transmitting key, B the battery, I the receiving instrument, and E the earth-plate. The complete circuit is from the plate E through the instrument I, the key K, and the galvanoscope G to the line L1, then through the corresponding instruments to the earth-plate E at the other end, and back through the earth to the plate E. The earth is always, except for some special reason used as a return, because it offers little resistance and saves the expense and the risk of failure of the return wire. The earth-plate E ought to be buried in moist earth or in water. In towns the water and gas pipe systems form excellent earth.
plates. It will be observed that the circuit is not in this case actually open; the meaning of the expression "open circuit" is "no battery to line." In normal circumstances the instruments at both ends are ready to receive, both ends of the line being to earth through the receiving instruments. A signal is sent by pressing the key K, and so changing the contact from a to b, and thus putting the battery to line. On circuits where the traffic is small it is usual to make one wire serve several stations. At an intermediate wayside station W, a "switch" S, consisting of three blocks of brass fixed to an iron base, is sometimes used (not in Great Britain). W may be made the terminal station of L by inserting plug 3, and of L2 by inserting plug 2, or the instruments may be cut out of circuit by inserting plug 1. In ordinary circumstances the messages from all stations are sent through one line, and thus the operator at any station may transmit, if the line is free, by manipulating his key.

The connexions for single-current working on the "closed-circuit" system are shown in fig. 17. There are three forms of a closed circuit, and the choice of which to adopt is determined precisely as in open circuit sending. This system is more expensive than the open-circuit system, as the battery is always at work; but it offers some advantages on circuits where there are a number of intermediate stations, as the circuit is under a constant electromotive force and has the same resistance no matter which station is sending or receiving. The arrangement at a wayside station is shown at W. When the circuit is long and contains a large number of stations, the sending battery is sometimes divided among them in order to give greater uniformity of current along the line. When only one battery is used the current may be considerably affected by the leakage to earth along the line. If long circuits were worked direct with ordinary instruments, high battery power would be required in order to send sufficient current to actuate the receiving apparatus; in such cases it is usual to employ a local battery to produce the signals, and close the local battery circuit by means of a circuit-closing apparatus called a relay, which is practically an electromagnetic instrument. In such a relay the armature is fixed to the armature of the magnet and which can be worked by a very weak current. The arrangement at a station worked by relay on the "single-current" system is shown in fig. 18, where L is the line wire, joined through the key K to one end of the coil of the relay magnet R, the other end of which is put to earth. When a current passes through R, the armature A is attracted and the local circuit is closed through the switch at b. The local battery B then sends a current through the instrument I and reveals the signal. In the form of relay indicated in the figure the armature is held against the stop o by a spring s.

"Single-current" working by means of a non-polarized relay (fig. 18), although general in America, is not adopted in England. In the latter country, when such working is resorted to, a "polarized relay" (fig. 19) is used, and on all important lines worked by ordinary single current, a "polarized relay" system is employed. In this the tongue of the relay is kept over to the spacing side by means of a current flowing in one direction, but on the depression of the signalling key the current is reversed, moving the relay tongue over to the marking side.

The Siemens polarized relay, shown in fig. 19, consists of an armature a, pivoted at one end a in a slot at one end N of a permanent magnet m, the other pole s of which is fixed to the yoke y of a horse-shoe electromagnet M. The armature is placed between the poles of the electromagnet and is magnetized by the magnet m. It will oscillate to the right or left under the action of the poles of the electromagnet M according as the current passes through M in one direction or the other. This form of relay is largely used in Great Britain; it has been entirely displaced by the form shown in fig. 20, which is the most modern pattern of relay used by the British Post Office, known as the "Post Office Standard Relay." In this instrument there are two soft iron tongues, n, s, fixed upon and at right angles to an axle a, which works on pivots at its ends. These tongues are magnetized by the induction of a strong horseshoe electromagnet, S, N, which is made in a curved shape for the sake of compactness. The tongue plays between the poles of two straight electromagnets. The coils of the electromagnets are differentially wound with silk-covered wire, 4 mils (= 0.002 inch) in diameter, to a total resistance of 400 ohms. This differential winding enables the instrument to be used for "duplex" working, but the connexions of the wires to the terminal screws are such that the relay can be used for ordinary single working. Although the relay is a "polarized" one, so that it can be used for "double-current" working, it is equally suitable for "single-current" purposes, as the tongue can be given a bias over to the "spacing" side, i.e. to

TELEGRAPH

[DUPLEX TELEGRAPH]

indicating whether a station is calling, in case the relay sticks or is out of adjustment. The key K (shown in general plan), when worked, sends reversed currents from the battery B. In cases where "universal battery" working, i.e., the working of several instruments from one set of batteries or accumulators, is adopted, the positive and negative currents have to be sent from independent batteries, as shown by fig. 22. The stop a of the key K is connected through a switch S with one pole of the battery B, and the stop b in the usual way with the other pole. Suppose the arm c of the switch S to be in contact with 2; then when the key is manipulated it sends alternately positive and negative currents into the line. If the positive is called the signalling current, the line will be charged positively each time a signal is sent; but as soon as the signal is completed a negative charge is communicated to the line, thus hastening the discharge and the return of the relay tongue to its insulated stop.

When a local instrument such as a sounder (fig. 15) is worked from a relay, the drying away of the magnetism in the iron cores of the electromagnet, when the relay tongue moves from the marking to the spacing side, i.e., when the local battery is cut off, sets up an induced current of high tension, which causes a spark to jump across the contact points of the relay, and by oxidizing them makes it necessary for them to be frequently cleaned. In order to avoid this sparking, every local instrument in the British Postal Telegraph Department has a "spark" coil connected across the terminals of the electromagnet. The spark coil has a resistance about ten times as great as that of the electromagnet it shunts, and the wire of which it is composed is double wound so as to have no retarding effect on the induced current, which circulates through the spark coil instead of jumping in the form of a spark across the contact points. The device is a most effectual one.

On long circuits worked by the Wheatstone fast-speed apparatus, and especially on those in which a submarine cable is included, it is found necessary to introduce "repeaters" half-way, in order to enable a high speed to be maintained. The speed at which a circuit can be worked depends upon what is known as the "KR" of the line, i.e., the product of the total capacity and the total resistance, both the capacity and the resistance having a retarding effect on the signals. By dividing a line into sections or "repeaters," the working speed will be dependent upon the KR of the longest half, and as both K and R are directly proportional to the length of the line, the KR product for the half of a circuit is but one quarter that of the whole length of the circuit, and the retardation is correspondingly small. Thus the speed on a line at which the repeater is situated exactly midway will be four times that of the line worked direct. Repeaters (or translators, as they are sometimes termed) are in Great Britain only used on fast-speed circuits; they are in no case found necessary on circuits worked by hand, or at "key speed" as it is called.

Duplex telegraphy consists in the simultaneous transmission of two messages, one in each direction, over the same wire. Duplex telegraphy. The solution of this problem was attempted by J. W. Gintel of Vienna in 1835 and in the following year by Frischen and by Siemens and Halske. Within a few years several methods had been proposed by different inventors, but none was at first very successful, not from any fault in the principle, but because the effect of electrostatic capacity of the line was left out of account in the early arrangements. The first to introduce a really good practical system of duplex telegraphy, in which this difficulty was sufficiently overcome for land line purposes, was J. B. Stearns of Boston (Mass.). In order that the line between two stations may be worked on the duplex system it is essential that the receiving instrument shall not be acted on by the outgoing currents, but shall respond to incoming currents. The two methods most commonly employed are the differential and bridge methods.

In fig. 23, representing the "differential" method, B is the sending battery, R a rheostat and C an adjustable condenser. Suppose the key to be depressed, then a current flows through one winding of the differential relay and through the other winding and rheostat to earth. Now if the values of the rheostat and condenser are adjusted so as to make the rise and fall of the outgoing current through both windings of the relay exactly equal, then no effect is produced on the armature of the relay, as the two currents neutralize each other's magnetizing effect.

Incoming currents pass from line through one coil of the relay, the key, and either the battery or battery resistance, according as whether the key is raised or depressed. The result is that the armature of the relay is attracted, and currents are sent through the sounder from the local battery, producing the signals from the distant station. When the key is in the middle position, that is, not making connexion with either the front or back contacts, the received currents pass through both coils of the relay and the rheostat; no interference is, however, felt from this extra resistance because, although the current is halved, it has double the effect on the relay, because it passes through two coils instead of one.

![Fig. 22.—Universal Battery Working.](image)

In the "bridge" method (fig. 24), instead of sending the currents through the two coils of a differentially wound relay or receiving instrument as in Frischen's method, two resistances a and b are inserted, and the receiving instrument is joined between P and Q. The currents thus divide at the point D, and it is clear that if the difference of potential between P and Q is unaffected by closing the sending key, then no change of current will take place in the instrument circuit. The relative potential of P and Q is not affected by the manipulation of the sending key if the resistance of a bears the same proportion to that of b as the resistance of the line does to that of the resistance R; hence that is the arrangement used. One very great advantage in this method is that the instrument used between P and Q may be of any ordinary form, i.e., relay, Hughes, siphon recorder, etc.

Most important cables, such as those of the Eastern Telegraph Company and the various Atlantic cables, are worked duplex on Mr. Head's plan. What may be called a mechanical method of duplexing a cable was described by Lord Kelvin in a patent taken out by him in 1858. In this, as in the ordinary methods, a differentially wound receiving instrument was used, one coil being connected with the cable and the other with the earth; but it differed from other methods in requiring no "artificial" or balancing cable. The compensation was to be obtained by working a slide resistance included in the circuit of the compensating coil, either by the sending key or by clockwork released by the key, so as to vary the resistance in that.
circuit according to any law which might be required to prevent the receiving instrument being affected by the outgoing current. Four years later Varley patented his artificial cable, which was the first near approach to a successful solution of the duplex problem on the submarine line. It was not, however, a sufficiently perfect representation of a laid cable to serve for duplexing cables of more than a few hundred miles in length. By a modification of the bridge method, applied with excellent results by Dr. Murchie for submarine work, condensers are substituted for $a$ and $b$, one being also placed in the circuit between $P$ and $Q$. In this case no current flows from the battery through the line or instruments, the whole action being inductive. As we have already stated, the distribution of the capacity along the resistance $R$ must in submarine cable work be made to correspond very accurately with the distribution of the capacity along the resistance of the cable. This is accomplished by Dr. Murchie in the following manner: In the manner of a sheet of paraffined paper is covered with a sheet of conducting substance, say tinfoil, and over the other side narrow strips of the same substance are arranged gridironwise to form a continuous circuit along the cable, the thickness of the strip conductor and the thickness of the paraffined paper are adjusted so that the relative resistance and capacity of this arrangement are the same as those of the cable with which it is intended to be used. A large number of such sheets are prepared and placed together, one over the other, the end of the strip of the first sheet being connected with the beginning of the strip of the second, and so on to the last sheet, by means of the strip conductor. In this manner, the resistance of the whole system of conducting sheets is in parallel with the resistance of the strip conductor along the cable, the capacity of this parallel circuit being equal to that of the strip conductor. Thus in a given case the parallel circuit with the resistance of the strip conductor increased $n$ times can be represented by a parallel circuit with the capacity of that conductor increased $n$ times. If one of these conductors is connected to the earth at one end and the other of them is connected to the earth at the other, and if the capacity of the strip conductor is connected to the earth at the other end, the whole arrangement will be of the same resistance as that of the cable under consideration, the capacity being, however, very much increased.

Quadruplex telegraphy consists in the simultaneous transmission of two messages from each end of the line. The only new problem introduced is the simultaneous transmission of two messages in the same direction; this is sometimes called "duplex transmission." The solution of this problem was attempted by Dr. F. B. Stark of Vienna in 1855, and during the next ten years it was worked on by Bosscha, Kramer, Maron, Schaak, Schroeder, Wartmann and others. The first to attain practical success was Edison, and his method with some modifications is still the one in most general use.

The arrangement is shown in fig. 25, and indicates the general principle of the transmitting apparatus. The telegraph key $K_1$ and the relay $R_1$ are for the former reverses the direction of the line current, the latter increases the strength of the transmitted current, by joining another battery when the key is depressed. $R_2$ and $R_3$ are relays for receiving the currents; the former is polarized and responds to reversals of current, while the latter is a tinfoil relay, $K_2$ being a tinfoil relay. $K_3$ is the increased current from $K_1$ irrespective of the direction of the current. This arrangement can be duplexed in the way already explained, by providing differential relays and arranging for the outgoing currents to divide differentially through the two relays at each end. The "multiplex" system devised by Patrick B. Delany (which was adopted to a limited extent in Great Britain, but has now been abandoned) was based on the principle of connecting the maximum number of instruments simultaneously on one wire. The general principle of the arrangement of the apparatus is shown by fig. 26. Arms $a$ and $b$, one at each station $A$ and $B$, are connected by means of a tinfoil relay, the latter being a relay in the metal segments, $1$, $2$, $3$, $4$, and $1'$, $2'$, $3'$, $4'$, at the two stations, so that when the arm $a$ is on segment $1$ at $A$, then $b$ is on segment $1'$ at $B$, and so on. At each station sets of telegraph apparatus are connected to these metal segments, so that when two relays are kept rotating the set connected to 1 becomes periodically connected to the set connected to 1', the set connected to 2 to the set connected to 2', and so on. In practice the number of segments actually employed is much greater than that shown in fig. 26, and the segments are arranged in a number of groups, as shown by fig. 27, all the segments being connected together, all the segments 2, all the segments 3, and all the segments 4. To each group is connected a set of apparatus; hence during a complete revolution of the arms a pair of instruments (at station $A$ and station $B$) will be in communication four times, and the intervals during which any particular set of instruments at the two stations are not in connection with each other become much smaller than in the case of fig. 26. In practice this subdivision of the segments is so far extended that the intervals of disconnection become extremely small, and each set of apparatus works as if it were alone connected to the line. As many as 162 segments in eight groups are practically used. The arm which moves round over the segments rotates at the rate of three revolutions per second, and is kept in motion by means of an iron toothed wheel, the rim of which is set in close contact with the poles of an electromagnet. Through this pole-magnet pass impulses of current regulated in frequency by a tuning-fork contact breaker; these impulses, acting on the teeth of the iron wheel, make the latter rotate and thus keep it in uniform rotation. If the rates of vibration of the two tuning-forks at the two stations could be maintained precisely the same, the two arms would rotate in synchronism, but as this uniform vibration cannot be exactly preserved for any length of time, a means is provided whereby the rate of vibration of either of the forks can be slowed down, so as to retard the rate of rotation of one or other of the arms, and of his effect is by means of "correcting" segments, of which there are six sets containing three each. Should the rotating arms fail to pass over these correcting segments at their synchronous positions, correcting currents pass to a relay which cuts off momentarily the current actuating the tuning-fork, thereby altering the rate of vibration of the latter until the arms once more run together uniformly. The actual number of sets of apparatus it was possible to work multiplex depended upon the length of the line, for if the latter were long, retardation effects modified the working conditions. Thus between London and Manchester only four sets of apparatus were worked, but between London and Birmingham, a shorter distance, six sets (the maximum for which the system is adapted) were used.

**Chemical Telegraphs.** A method of recording signals in the Morse code, formerly used to a considerable extent, was to use a chemically prepared ribbon of paper. Suppose, for instance, the paper. ribbon to be soaked in a solution of iodide of potassium and a light contact spring made to press continuously on its surface as it is pulled forward by the mechanism. Then, if a current is sent from the spring to the roller through the paper, a brown mark will be made by the spring due to the liberation of iodine. This was the principle of the chemical telegraph proposed by Bain in 1846. Several ingenious applications of his method were proposed and practically worked, as, for example, the copying telegraph of Bakewell and of Cros, by means of which a telegram may be transmitted in the sender's own handwriting; the pantelegraph of Caselli; the autographic telegraphs of Meyer, Lenoir, Sawyer and others; and the autographic typo-telegraph of Bonelli; all forms of the apparatus have, however, fallen into disuse.

**Automatic Telegraphs.** It was found impossible to make the Morse ink writer so sensitive that it could record signals sent over land lines of several hundred miles in length, if the speed of transmission was very much faster than that which could be effected by hand, and this led to the adoption of automatic methods of transmission. One was proposed by Bain as early as 1846, but it did not come into use. That now employed is, however, practically a development of his
TELEGRAPH

WHEATSTONE SYSTEM.

It consists in punching, by means of "a puncher," a series of holes in a strip of paper in such a way that, when the strip is sent through another instrument, called the "transmitter," the holes cause the circuit to be closed at the proper times and for the proper proportionate intervals for the message to be correctly printed by the receiving instrument or recorder.

The most successful apparatus of this kind is that devised by Wheatstone; others were devised by Siemens and Halske, Garnier, Humiston, Siemens, and Little.

In the Wheatstone automatic apparatus three levers are placed side by side, each acting on a set of small punches and on mechanism for feeding the paper forward a step after each operation of the levers. The punches are shown in fig. 28, and the levers are adjusted so that the left-hand one moves a, b, c and punches a row of holes across the paper (group 1 in the figure), the middle one moves b only and punches a centre hole (2 in the figure), while the right-hand one moves a, b, b, and punches four holes (3 and 4 in the figure). The whole of this operation represents a dot and a dash or the letter "a." The side rows of holes only are used for transmitting the message, the centre row being required for feeding forward the paper in the transmitter. The perforation of the paper when done by hand is usually performed by means of small mallets, but at the central telegraph office in London, and at other large offices, the keys are only used for opening air-valves, the actual punching being done by pneumatic pressure. In this way severe thicknesses of paper can be perforated at the same time, which is a great convenience for press work, since copies of the same message have often to be transmitted to several newspapers at the same time.

The mode of using the paper ribbon for the transmission of the message is illustrated in fig. 29. An electric beam B is rocked up and down rapidly by a train of mechanism, and moves the crank, and then a positive current is sent to the line, the effect of the current continuing during the time required for the paper to travel the space between two holes. Again, suppose groups 3 and 4 to be punched. Then there will be, as before, a half stroke of the beam M will not pass through, as there is no hole in the paper; but at the third half stroke it passes through and copper is put to the line. Thus for a dash the interval of time between two positive currents will be as the interval the paper takes to travel over twice the space between two successive holes. Hence for sending both a dot and a dash, reverse currents of short duration are sent through the line, but the interval of the reversal is three times as great for the dash as for the dot.

In the receiving instrument the electromagnet is constructed in practically similar fashion, and if pulled into any position by either current, remains in that position, whether the current continues to flow or not, until a reverse current is made to act on the magnet. For the dot the armature is deflected by the first current, the inking-wheel being brought into contact with the paper and after a short interval pulled back by the reverse current. In the case of the dash, the inking-wheel is brought into contact with the paper by the first current as before, and is pulled by the reverse current after three times the interval.

The armature acts on an inking disk on the principle described above, save only that the disk is supplied with ink from a groove in the inking-wheel, on which it rests. The inking-wheel is grooved at one edge in contact with ink in an inkwell. By this method of transmission the battery is always to the line for the same interval of time, and alternately with opposite poles, so that the correct electric currents are made to pass. This method is also used in telegraphy and telephony.

Although it is quite possible to obtain good signals at a rate corresponding to 600 letters per minute, in practice it is found that such a speed is not advisable, as it is difficult or impossible for even the most skilled operators properly to handle and transcribe from the "slip" on which the signals are recorded.

In Squier and Crehore's "Synchronograph" system "sine waves" of current, instead of sharp "makes and breaks," or sharp reversals, are employed for transmitting signals, the waves being produced by an alternating-current dynamo, and regulated in width and intensity of the paper by means of a Wheatstone automatic system. The arrangement has been found under certain conditions to give better results than those obtained with sharp reversals.

In the undulator apparatus, which is similar in general principle to the "siphon recorder" used in submarine telegraphy, a spring or falling weight moves a paper strip beneath one end of a line silver tube, the other end of which dips into a vessel containing ink. The siphon is supported on a vertical axle carrying two armatures which are acted upon by two electromagnets. It is in fact the electromagnet and spindle of a telegraph relay, with windings and core attached to and reversed, and the armatures are provided for closing or opening the air gap between the electromagnets and armatures, for raising or lowering the siphon, and for adjusting the point of the siphon to the centre or side of the paper. The reciprocating motion of the armatures is transmitted to a horizontal axis through which the siphon is attached, and by means of a rod, is transmitted to a peculum fixed in an undulating continuous line of ink, and are distinguished by the length of deviation from zero. The amplitude of the signals can be set in several positions by means of a control-magnet, or by altering the tension of the controlling springs or by altering the air gap between electromagnets and armatures. Up to 100 words per minute the signals are easily readable, but beyond that speed they are more difficult to translate, although experts can read them when received at 200 words per minute.

In the improved Pollak-Virag system the received signals are recorded in characters similar to ordinary hand-written, the operator acuates a treadle which actuates a train of mechanism which punches varying groups of holes, representing the different characters, in a paper strip about one inch wide. This strip is then carried across a light beam, and a diaphragm is arranged so that the perforated paper strip is conveyed to the two line wires of a metallic loop. One circuit is formed by the loop itself, and a second, quite independent, by the two wires in parallel, earthed at each end. At the receiving end there is an arrangement of diaphragms and glass lense to make these signals visible. The magnet employed is a moving-coil magnet, or by altering the tension of the controlling springs or by altering the air gap between electromagnets and armatures. Up to 100 words per minute the signals are easily readable, beyond that speed they are more difficult to translate, although experts can read them when received at 200 words per minute.
other, being very similar in appearance. The bromide paper is automatically passed through a developing bath, a fixing bath, and drying rollers. This operation occupies about twelve seconds, giving a speed of about five hundred miles per hour delivery. It is not a system likely to have general application.

Type Printing Telegraphs.—The first considerable improvement in type printing telegraphs was made by D. E. Hughes in 1853.

Hughes instrument.

The mechanism, one at each end of the line, are kept moving at the same speed. Each instrument is provided with a set of perforated tape upon which it is arranged to print the letters which communicate with a circular row of vertical pins. A horizontal arm fixed to a vertical shaft in gear with the mechanism sweeps over these pins at the rate of about two revolutions per second. While the arm is being lifted the horizontal arm will pass over it and in doing so will momentarily join the battery to the line. The current thus sent to the line may make short-circuit the electromagnet and cause the horizontal arm to close a local circuit by means of a relay. For simplicity we will suppose direct action. The current then passes through the coils of an electromagnet, which releases the printing mechanism. The electromagnet consists of two coils, each worked on a soft iron core fixed to the poles of a strong permanent horse-shoe magnet. The armature of the electromagnet is normally attracted by the effect of the permanent magnet, but it is furnished with two antagonistic springs to ensure that when the armature is in the position where it would be if a telephone or telegraph is provided, they are not quite able to release the armature. When a current comes in from line it passes through the electromagnet in such a manner that it releases a mechanism which causes the springs to be released, and hence the springs are able to release the armature, which rises smartly and in its turn releases the printing mechanism. Either a weight or a motor is used for making the movements of the mechanism.

In the operation of producing type by this instrument the type-wheel is carried round continuously by the mechanism to which it is attached by a friction disk and ratchet drive. An axle carrying four cams is normally at rest, but it is thrown into gear with the mechanism when the armature rises, makes one complete revolution, and comes to rest ready for the next signal. In its revolution one of its cams engages with the correct wheel and moves it, and moves it over to ensure that the second cam engages with the correct wheel and moves it; the second cam lifts the paper against the type-wheel and prints the letter; the third moves forward the paper tape one space to be ready for the printing stroke of the next signal; and the fourth cam operates on the cores of the electromagnet. This complete operation occupies about one-twelfth of a second. It is of course necessary that two instruments working together should have the same speed. This is obtained by causing one of them to send a signal every second, from one particular key, while the operator at the other station adjusts his speed until he receives the same signal after short-circuiting his electromagnet for ten revolutions. Both type-wheels are then set to zero by the lever provided for that purpose, and released by the current from the letter-blank key; then all subsequent signals will be recorded similarly at the sending and receiving stations. When the two instruments get out of phase, the sender is stopped by the receiver sending a few signals, after which both type-wheels are again set to zero and correspondence continued. This system of telegraphic printing is, therefore, capable of a very high speed, and avoiding the necessity for the rapidly acting electric escapement, which, however skilfully planned and executed, is always liable to failure when used of thirty words per minute or less in usage, can be perfect accuracy and certainty have been attained, and in actual practice it has proved to be decidedly superior to all previous type-printing telegraphs, not only in speed and accuracy, but in less liability to mechanical derangement from wear and tear than from accident. It involves many novel features; the receiving electromagnet is of peculiar construction and remarkable efficiency and the transmitting apparatus has a contrivance to prevent uninterrupted communication. Each letter is produced by the operation of two pairs of type-wheels, and the combination of letters is produced by the combination of the type-wheels. It is further provided with a system of correctors, by which it is possible to stop or alter any letter or words, and even to strike out any letter or words. It is further provided with a system of correctors, by which it is possible to stop or alter any letter or words, and even to strike out any letter or words.

In the Murray system the messages are first prepared in the form of perforations on paper, and are then transmitted by the perforator. The telegraphing machines equipped with typewriter keyboards are used for the preparation of the messages, two or three keyboards being employed at each end of the telegraph lines on which the Murray system is used. The messages in the form of perforated tape are then passed through an automatic transmitter, something like a Wheatstone transmitter, at a speed of about a minute. At the receiving station, electric mechanical mechanisms record the signals once more as perforations in a paper strip forming an exact replica of the transmitting tape. This received perforated tape is then used to control what is known as a Sturt or automatic typewriter. It is provided with a strip of tape perforations into letters and prints the messages in Roman type in page form. This printer is purely mechanical, and its speed is very high. An experimental printer constructed about the middle of 1908 by the British Post Office, operated successfully at the rate of 210 words (1260 letters) per minute. The usual working speed is from 100 to 120 words per minute. The Murray automatic system was designed specially for dealing with heavy traffic on long lines. As it uses the Baudot telegraph alphabet it has an advantage in theory over the Wheatstone using Morse alphabet in regard to the speed that can be obtained on a long telegraph line. The system is not regarded as suitable for short telegraph lines or moderate traffic, printing telegraphs of the multiplex principle being considered more or less realized in practice. The Murray automatic system is not regarded as suitable for short telegraph lines or moderate traffic, printing telegraphs of the multiplex principle being considered more or less realized in practice. The Murray automatic system is not regarded as suitable for short telegraph lines or moderate traffic, printing telegraphs of the multiplex principle being considered more or less realized in practice. The Murray automatic system is not regarded as suitable for short telegraph lines or moderate traffic, printing telegraphs of the multiplex principle being considered more or less realized in practice.

The Creed system is a development of the Morse-Wheatstone system, and provides a keyboard perforator which punches Morse letters or figures on a paper strip by depressing type-writer keys. The slips are passed through an ordinary Wheatstone transmitter and actuate Wheatstone receiving apparatus which in turn controls a  "Creed receiving perforator," the messages are reproduced thereon by means of perforations, which can be passed on to any other Wheatstone circuit or can be run through a "Creed printer," which is a pneumatic machine netting the several messages of identical perforations upon a tape which is gummed to the telegraph form. The speed of the receiving perforator ranges from 20 to 150 words per minute.

In the Rowland multiple method of telegraphic working, the transmitter consists of a mechanical keyboard provided with a series of levers, which effect certain combinations of positive and negative currents on the keyboard. These are transformed into sine currents over the line and operates a motor at the distant end of the line, both machines running in synchronism. At the receiving station there is provided with gearing which rotates four combining commutators and four type-wheels, which prints the letters on the band of paper. There are four transmitters and four receivers, which are operated independently by means of an adaptation of the multiplex system of working, and each circuit is provided with a number of segments set apart for its own use. Each transmitter is therefore able to
transmit a separate series of positive and negative currents in different combinations; these are distributed, by suitably arranged distributors and relays at the receiving end of the line, into their respective receivers. The combination of the currents causes a receiving instrument so to group the received combination of positive and negative currents that they operate polarized relays in the same manner as does the combination of the operation of the levers on the transmitter. Since each letter is represented by a specific combination of positive and negative currents, it is possible, by means of the combinations, to close a local circuit whenever the current causes it to be pressed against the periphery of the type-wheel at the time when the letter required is opposite. The paper is also caused to advance automatically for each letter, start a fresh line, and also to completely erase the last message.

Telegraph.—Instruments such as the telegraph and teletypewriter are apparatus for transmitting a facsimile of handwriting inscribed on a paper at one end of a line, the reproduction being made automatically at the other end of the line at the same time that the message is being written.

A successful apparatus for effecting this was devised by Cowper and was known as the writing telegraph. The telegraph is on a similar principle to the Cowper apparatus, the motion of the transcribing stylus being transferred to a system of levers into two component rectilinear motions, which are used to control and vary the currents in two distinct electrical circuits, of which the two are connected in series. A magnetic mechanism in the receiver, the two component motions are reproduced and by their combined action on a second system of levers the receiving pen is caused to duplicate the motions of the stylus. This motion is transmitted through the pencil to the roller so that the pencil serves to cut resistance in or out of the two line circuits which are connected to the rollers, and thus two independent variable resistances are obtained. These receiving resistances are placed in a strong electromagnet, excited by a local current, which has in its circuit two annular air gaps, across which the magnetic field is practically uniform and constant. In these annular spaces there are placed two light coils of fine copper wire, capable of being moved vertically, and connected in such a manner as to be traversed by the two variable line currents from the transmitter.

These coils are drawn down, by the magnetic action of the field on the light coils, into the annular spaces, against the pull of the springs, more or less strongly, according to the strengths of the two line currents. Each coil is attached to a shaft by a bell crank arrangement, and to these shafts there is secured a system of levers similar to that at the transmitter carrying the receiving pencil at the junction. The shafts are turned by the pull of the magnet upon the coils, and the motions of the transmitting pencil are thus reproduced.
