</table>
VETCH, in botany, the English name for Vicia sativa, also known as tare, a leguminous annual herb with trailing or climbing stems, compound leaves with five or six pairs of leaflets, reddish-purple flowers borne singly or in pairs in the leaf-axis, and a silky pod containing four to ten smooth seeds. The wild form, sometimes regarded as a distinct species, V. angustifolia, is common in dry soils. There are two races of the cultivated vetch, winter and spring vetches: the former, a hardy form, capable of enduring frost, has smoother, more cylindrical pods with smaller seeds than the summer variety, and gives less bulk of stem and leaves. The spring vetch is a more delicate plant and grows more rapidly and luxuriantly than the winter variety.

The name vetch is applied to other species of the genus Vicia. Vicia orobus, bitter vetch, and V. sylvatica, wood vetch, are British plants. Another British plant, Hippocrepis, is known as horseshoe vetch from the fact of its pod breaking into several horseshoe-shaped joints. Anthyllis vulneraria is kidney-vetch, a herb with heads of usually yellow flowers, found on dry banks. Astragalus is another genus of Leguminosae, and is known as milk-vetch.

Vetches are a very valuable forage crop. Being indigenous to Britain, and not fastidious in regard to soil, they can be cultivated successfully under a great diversity of circumstances, and are well adapted for poor soils. By combining the winter and spring varieties, and making several sowings of each in its season at intervals of two or three weeks, it is practicable to have them fit for use from May till October, and thus to carry out a system of soiline by means of vetches alone. But it is usually more expedient to use them in combination with grass and clover, beginning with the first cutting of the latter in May, taking the winter vetches in June, recurring to the Italian ryegrass or clover as the second cutting is ready, and afterwards bringing the spring vetches into use. Each crop can thus be used when in its best state for cattle food, and so as gratefully to vary their dietary.

Winter Vetches.—There is no botanical difference between winter and spring vetches, and the seeds being identical in appearance, caution is required in purchasing seed to get it of the right sort. Seed grown in England is found the most suitable for sowing in Scotland, as it vegetates more quickly, and produces a more vigorous plant than that which is home-grown. As the great inducement to cultivate this crop is the obtaining of a supply of nutritious green food which shall be ready for use about the 1st of May, so as to fill up the gap which is apt to occur between the root crops of the previous autumn and the ordinary summer food, whether for grazing or soiline, it is of the utmost importance to treat it in such a way that it may be ready for use by the time mentioned. To secure this, winter tares should be sown in August if possible, but always as soon as the land can be cleared of the preceding crop. They may yield a good crop though sown in October, but in this case will probably be very little in advance of early-sown spring vetches, and possess little, if any, advantage over them in any respect. The land on which they are sown should be dry and well sheltered, clean and in good heart, and be further enriched by farmyard manure. Not less than $3$ bushels of seed per acre should be sown, to which some think it beneficial to add half a bushel of wheat. Rye is frequently used for this purpose, but it gets reedy in the stems, and is rejected by the stock. Winter beans are better than either. The land having been ploughed rather deeply, and well harrowed, it is found advantageous to deposit the seed in rows, either by a drilling-machine or by ribbing. The latter is the best practice, and the ribs should be at least a foot apart and rather deep, that the roots may be well developed before top-growth takes place. As soon in spring as the state of the land and weather admits of it, the crop should be hoed betwixt the drills, a top-dressing at the rate of 40 bushels of soot or 2 cwt. of guano per acre applied by sowing broadcast, and the roller then used for the double purpose of smoothing the surface so as to admit of the free use of the scythe and of pressing down the plants which may have been loosened by frost. It is thus by early sowing, thick sowing and liberal manuring that this crop is to be forced to an early and abundant maturity. May and June are the months in which winter vetches are used to advantage. A second growth will be produced from the roots if the crop is allowed to stand; but it is much better practice to plough up the land as the crop is
cleared, and to sow turnips upon it. After a full crop of vetches, land is usually in a good state for a succeeding crop. When the whole process has been well managed, the gross amount of cattle food yielded by a crop of winter vetches, and the turnip crop by which it is followed up, in the same summer, will be found considerably to exceed what could be obtained from the fullest crop of turnips alone, grown on similar soil, and with the same quantity of manure. It is useless to sow this crop where game abounds.

Spring vetches, if sown about the 1st of March, will be ready for use by the 1st of July, when the winter vetches are just cleared off. To obtain the full benefit of this crop, the land on which it is sown must be clean, and to keep it so a much fuller allowance of seed is required than is usually given in Scotland. When the crop is as thick as it should be, the tendrils intertwine, and the ground is covered by a solid mass of herbage, under which no weed can live. To secure this, not less than 4 bushels of seed per acre should be used if sown broadcast, or 3 bushels if in drills. The latter plan, if followed by hoeing, is certainly the best; for if the weeds are kept in check until the crop is fairly established, they have no chance of getting up afterwards. With a thin crop of vetches, on the other hand, the land is so certain to get foul, that they should at once be ploughed down, and something else put in their place. As vetches are in the best state for use when the seeds begin to form in the pods, reached with head and neck, in the same winter, will be found by the end of February, or as early in March as the season admits, and continuing till May. The usual practice in Scotland has been to sow vetches on part of the oat break, once ploughed from lea. Sometimes this does very well, but a far better plan is to omit sowing clover and grass seeds on part of the land occupied by wheat or barley after a crop of turnips, and having ploughed that portion in the autumn to occupy it with vetches, putting them instead of * seeds for one revolution of the course.

When vetches are grown on poor soils, the most profitable way of using them is by folding sheep upon them, a practice very suitable also for clays, upon which a root crop cannot safely be consumed in this way. A different course must, however, be adopted from that followed when turnips are so disposed of. When sheep are turned in upon a piece of tares, a large portion of the food is trodden down and wasted. Cutting the vetches and putting them into racks does not much mend the matter, as much is still pulled out and wasted, and the manure unequally distributed over the land. To avoid those evils, hurdles with vertical spars, between which the sheep can reach with head and neck, are set close, and the best choice is to set them close up to the growing crop along a considerable stretch, and shifted forward as the sheep eat up what is within their reach. This requires the constant attention of the shepherd, but the labour is repaid by the saving of the food, which being always fresh and clean, does the sheep more good. A modification of this plan is to use the same kind of hurdles, but instead of shifting them as just described, to mow a swathe parallel to them, and fork this forward within reach of the sheep as required, repeating this as often during the day as is found necessary, and at night move the sheep close up to the growing crop, so that they may lie for the next twenty-four hours on the space which has yielded food for the past day. During the night they have such pickings as have been left on the recently mown space and so much of the growing crop as they can get at through the spars. There is less labour by this last mode than the other, and having practised it for many years, we know that it answers well. This folding upon vetches is suitable either for finishing off for market sheep that are in forward condition, or for recently weaned lambs, which, after five or six weeks’ folding on this clean, nutritious herbage, are found to take in more readily to eat turnips and to thrive better upon them, than if they had been kept upon the pastures all the autumn. Sheep folded upon vetches must have water always at command, otherwise they will not prosper.

As spring-sown vetches are in perfection at the season when pastures usually get dry and scanty, a common practice is to cart them on to grass land and spread them out in wisps, to be eaten by the sheep or cattle. It is, however, much better either to have them eaten by sheep where they grow, or to cart them to the horridly to the homestead.

**VETERAN**

old, tried, experienced, particularly used of a soldier who has seen much service. The Latin *Veteranus* (vetus, old), as applied to a soldier, had, beside its general application in opposition to *itro*, recruit, a specific technical meaning in the Roman army. Under the republic the full term of service with the legion was twenty years; those who served this period and gained their discharge (*missio*) were termed *emeriti*. If they chose to remain in service with the legion, they were then called *veterani*. Sometimes a special invitation was issued to the *emeriti* to rejoin; they were then styled *vexillarii*.

The base of Lat. *Vetus* meant a year, as seen in the Gr. *Ero* (for *Ero*) and Sanskrit *vatas*; from the same base comes *vitulus*, a calf, properly a yearling; *vetelius*, a young calf, whereas O. Fr. *veel*, modern *veau*, English “veal,” the flesh of the calf. The Teutonic cognate of *vitulus* is probably seen in Goth. *wihcrus*, lamb, English “weather,” a castrated ram.

**VETERINARY SCIENCE**

(Lat. *Veterinaris*, an adjective meaning “connected with beasts of burden and draught,” from *veterinus*, “pertaining to yearlings,” and *vitulus*, “a calf”), the science, generally, that deals with the conformation and structure of the domesticated animals, especially the horse; their physiology and special racial characteristics; their breeding, feeding and general hygienic management; their pathology, and the preventive and curative, medical and surgical, treatment of the diseases and injuries to which they are exposed; their amelioration and improvement; their relations to the earth as well as to mankind with regard to communicable maladies; and the supply of food and other products derived from them for the use of mankind. In this article it is only necessary to deal mainly with veterinary science in its relation with medicine, as other aspects are treated under the headings for the particular animals, &c.

In the present edition of the *Encyclopaedia Britannica* the various anatomical articles (see *Anatomy* for a list of these) are based on the comparative method, and the anatomy of the lower animals is dealt with there and in the separate articles on the animals.

**History.**

There is evidence that the Egyptians practiced veterinary medicine and surgery in very remote times; but it is not until we turn to the Greeks that we obtain any very definite information with regard to the state of veterinary as well as human medicine in antiquity. The writings of Hippocrates (460-377 B.C.) afford evidence of excellent investigations in comparative pathology. Diocles of Carystus, who was nearly a contemporary, was one of the first to occupy himself with anatomy, which he studied in animals. Aristotle, too, wrote on physiology and comparative anatomy, and on the maladies of animals, while many other Greek writers on veterinary medicine are cited or copied from by Varro, Columella and Galen. And we must not overlook Mago of Carthage (300 B.C.), whose work in twenty-eight books was translated into Greek and was largely used by Varro and Columella.

---

1 Regarding the origin of the word “veterinary,” the following occurs in D’Arboval’s *Dictionnaire de médecine et de chirurgie vétérinaires*, edited by Zundel (1877), iii. 814: “Les mots *veterinaria* et *veterinarum* étaient employés par les Romains pour désigner: le premier, la médecine des bêtes de somme; le second, pour indiquer celui qui la pratiquait; le mot *veterinae* indiquait les bêtes de somme, et était la contraction de *veterinae*, du verbe *vetera*, porter, tirer, trainer. L’étymologie réelle du mot *vétérinaire*, en l’horizon du mot *veterinarus* des Romains, remonte d’après Lenger encore plus ancienne; elle viendrait du celtique, d’où le mot serait passé chez les Romains; cet auteur fait venir le mot de ree, bétail (d’où l’allemand *Vieh*), livres, être malade (d’où l’allemand *Zehren*, consommation), *weis* ou *artis*, artiste, médecins (d’où l’allemand *Arzt*)."
Until after the conquest of Greece the Romans do not appear to have known much of veterinary medicine. Varro (116–28 B.C.) among the Romans. may be considered the first Roman writer who deals with animal medicine in a scientific spirit in his De Re Rustica, a work which was not published in its present form until 1535. Celsus is supposed to have written on animal medicine, and Columella (1st century) is credited with having utilized those remarks. In De Re Rustica, however, whilst reflecting the ignorance and superstition of his day as is shown by the presence of such subjects as charms and incantations, Celsus, if he actually wrote the book, was the first to make serious and systematic research into the diseases of domestic animals. In the book, he has established the form and sequence which went on to be adopted by all subsequent writers on veterinary medicine. De Re Rustica, one of the best works of its class of ancient times; it treat not only of medicine and surgery, but also of sanitary measures for the suppression of contagious diseases. From the 3rd century to the 16th century, perhaps more than any other period, books were written on animal medicine by both authors from the ranks of regular practitioners, especially in the service of the Roman armies (mulomedici, veterinarii). Perhaps the most renowned veterinarian of the Roman empire was Apsyrus of Bithynia, who in 132 assumed the protection of Constantine against the Sar- mantians in his professional capacity, and seems to have enjoyed a high and well-deserved reputation in his time. He was a keen observer; he distinguished and described a number of diseases which were badly defined by his predecessors, recognized the contagious nature of glanders, farcy and anthrax, and prescribed isolation for their suppression; he also made observations on accidents and diseases of horses' limbs, and waged war against certain absurd empirical practices then prevailing in the treatment of disease, indicating rational methods, some of which are still successfully employed in veterinary therapeutics, for the treatment of wounds and burns, for the prevention of tetanus, for the treatment of prolapsus vaginae, hot baths for tetaus, &c.

Not less eminent was Hierocles, the successor of Apsyrus, whose writings he largely compiled, but which, however, were not published till 1666. His treatises included, in addition to the treatment of disease, a great deal of information on the hygiene and training of horses. Pelagonius, again, was a writer of empirical tendency, and his treatise of disease in general was most irrational. Publius Vegetius (not to be confounded with Flaminius Flaccus, who wrote the De Re Rustica) was perhaps the most popular author of the end of the 5th century, though less distin- guished than Apsyrus, to whom and to Pelagonius he was a great extent indebted in the previous school. His De Re Rustica or Veterinaria, it appears to have been more of a horse-dealer than a veterinary practitioner, and knew next to nothing of anatomy, which seems to have been but little cultivated at that period. He was, however, a great believer in the efficacy of disease by demons; nevertheless, he gives some interesting observations de- rived from his travels. He had also a good idea of aerial infection, recognized the utility of disinfectants, and describes some operations not at all unlike those which are discovered in the patho- logical operations of the 19th century. Two centuries later, during the 7th century, the Byzantine school appears to have been very much in vogue. From this line of thought we may mention that of Sollecsyl, Veritable parfart marchsal (1664), which passed through many editions, was translated into several languages, and was borrowed from for more than a century by different writers. From this time forward, until the 19th century or even later, the history of veterinary science is but a recital of names.

The 19th century the anatomy of the domesticated animals, formerly almost entirely neglected, began to receive attention. A work on comparative anatomy by Volcher Koyter was issued at Nuremberg in 1773; about the same time a writer in Germany named Copho (died 1774) published a work in which he composed many original remarks on the lymphatic vessels; and Jehan Hervard in France produced in 1594 his rather incomplete Hippo- crates Veterinarius, which was to obtain its popularity for a century and a half, was that of Carlo Ruini, a senator of Bologna, published in 1598 in that city, and entitled Dell' Anatomia e dell' Infermità dei Cavallo, e suoi Remedii. In England, about the 17th century, the long tendency towards the improvement of the horse was accompanied by the increase of medicine and surgery, especially as regards the horse. This was more notable in the writings of the 18th century, among which may be mentioned Gibson's Fortier's New Guide (1719), Method of Dicing Horses (1721) and (best of all) his New Treatise on the Diseases of Horses, besides Braken's, Burdon's, Bridge's and Bartlett's treatments. Veterinary anatomy was greatly advanced by the Anatomy of 1719, by Foure (1683) of Snape, later to Charles II., illustrated with copperplates, and by the still more complete and original work of Stubbs, the Anatomy of the Horse (1766), which completely marked the beginning of a new era in veterinary science.

The French veterinary school had its origin much earlier than the English. In 1764, a New Treatise of Veterinary Science was published at Lyons; but it was not till 1768 that the Lyon school was formally founded by the establishment of the Veterinary Faculty of the University. Though this date is far from being a date of great initiative in this direction. Buffon had recommended the formation of veterinary schools, but his recommendations were not attended to. Claude Bourgelt, a Frenchman, who had lived at Lyons and had had the advantage of a complete and thorough veterinary education, became, through his influence with Bertin, prime minister under Louis XV., was the first to induce the government to establish a veterinary school and school of equitation at Lyons, in 1761. This school is still directed from France. veterinary schools have been founded in nearly every European country, except Great Britain and Greece, mostly on a munificent scale. Probably all the European veterinary schools have been influenced by the English schools, and many have made the study of veterinary science, and to the profound and varied knowledge, made him most useful to France during the period of the revolution. It is chiefly to him that it is indebted for the celebrated Rambouillet flock of Merino sheep, for the conservation of the Tulleries and Versailles parks, and for the creation of the fine experimental agricultural establish- ment organized in the ancient domain of Sceaux. The Afford school specially became the nursery of veterinary science, and the source whence all similar institutions obtained their first teachers and guidance. A second veterinary school was founded in 1825 at Toulouse; and these three schools have produced thousands of students who have gone about the world, and in every country, and have employed their knowledge in the service of the poor and in preventing disease in their masters and farriers into England; and it is recorded that Henry VIII. brought over two of these men who had been trained by the French veterinary schools were founded in nearly every European country, except Great Britain and Greece, mostly on a munificent scale. Probably all the European veterinary schools have been influenced by the English schools, and many have made the study of veterinary science, and to the profound and varied knowledge.
school was established at Constantinople, and in 1861 the government founded a school at Belgrade. The veterinary schools of Berlin, Hanover and Vienna have been raised to the position of universities.

In 1790 St Bel (whose real name was Vial, St Bel being a village near Lyons, or the family's paternal estate), after studying at the Lyons school and teaching both at Allfort and Lyons, came to England and published proposals for founding a school of veterinary surgery at Edinburgh. At last, in 1822, the Veterinary College was established as a department of the University, to take charge of a department of veterinary surgery it had formed. The professors and students in the department of comparative pathology and surgery, and encouragement, were continued to the time of Dick's death in 1866. During the long period in which he presided over the school considerable progress was made in diffusing a sound knowledge of the subject of veterinary medicine among its students. The college, whose annual examination, which gave certificates of proficiency under the auspices of the Highland and Agricultural Society, was composed of several parts, was divided into independent examining boards, headed by Syme, Lizzars, Ballingall, Simpson and Knox. By his will Dick vested the college in the lord provost and town council of Edinburgh as trustees, and left a large portion of the fortune he had made to the college.

In 1900 another veterinary school was established in Edinburgh by John Gangee, and the Veterinary College, Glasgow, was founded in 1863 by collaboration of the veterinary surgeons of Scotland. In 1865 Sir John Gangee's school was discontinued in 1865; and William Williams founded the Veterinary College, Edinburgh. This school was transferred in 1900 to the university, Liverpool. In 1900 a veterinary school was founded in Dublin.

In 1844 the Royal College of Veterinary Surgeons (to be hereinafter distinguished from the Royal Veterinary College) obtained its charter of incorporation. The functions of this body were until 1894 limited almost entirely to examining students taught in the veterinary schools, and bestowing diplomas of membership on those who successfully passed the examinations conducted by the boards with practical as well as theoretical work, as the competition established was of a rather deteriorating nature. After the death of Dick in 1866, the dualism in veterinary licensing was suppressed and the Royal College of Veterinary Surgeons assumed the rights of the one portal of entry into the profession, and the veterinary students of England, Ireland and Scotland must satisfy the examiners appointed by the Royal College of Veterinary Surgeons before they can obtain their diploma.

Before beginning their professional studies students of veterinary medicine must pass an examination in general education equivalent to that of a medical student. The minimum period of study necessary to that of any course of study in veterinary medicine is four years. It is a condition of admission to the Royal College of Veterinary Surgeons that every student must study the anatomy and physiology of the domesticated animals, the pathology and bacteriology of the diseases to which these animals are subject, and the medical treatment of those diseases. They must also be taught the principles of veterinary legislation, and learn to know the results of disease as seen post mortem or in the slaughter-horse.

In 1851 an act of parliament was obtained protecting the title of veterinary surgeon in Scotland from any person other than one who had obtained a diploma of the Royal College of Veterinary Surgeons. The title of veterinary surgeon is constituted a "corporation," with a small number of non-commissioned officers and men under their command and specially trained by them.

In 1907 the Army Veterinary Corps consisted of 167 officers and 220
In the Australian commonwealth there is only one veterinary school, which was established in Melbourne, Victoria, in 1888. The Public Health Departments of New South Wales, Western Australia, Tasmania and the other states employ qualified veterinary surgeons as inspectors of live stock, cowsheds, meat and dairy produce.

There is no veterinary school in New Zealand, but the Department of Agriculture has arranged to establish one at Wellington in connexion with the investigation laboratory and farm of the division of veterinary science at Wallaceville. The government employs about forty qualified veterinarians as inspectors of live stock, also in connection with dairies.

In Egypt a veterinary school with French teachers was founded in 1830 at Abu-Zabel, near Cairo, by Clor-Baye, a doctor of medicine. This school was discontinued in 1842. The Public Health Department of Egypt was established in 1901 and the government now has a new veterinary school for the instruction of natives. Ten qualified veterinary surgeons are employed in the sanitary service.

The Royal College of Agriculture at Pietermaritzburg (South Africa) has been established, and protective sera have been established at Grahamstown, Pretoria and Pietermaritzburg.

**Characteristics of Veterinary Medicine.**

Veterinary medicine has been far less exposed to the vagaries of theoretical doctrines and systems than human medicine. The explanation may perhaps be that the successful practice of this branch of medicine more clearly than in any other depends upon the careful observation of facts and the rational deduction from them. Special doctrines appear to be much less frequent among veterinarians, and in later times at least, to have been abandoned. The practical sentiment in regard to disease and its treatment has been a medical eclecticism, based on practical experience and anatomico-pathological investigation, rarely indeed on philosophical or abstract theories. In this way veterinary science has become pre-eminently a science of observation. At times indeed it has to some extent been influenced by the doctrines which have controlled the practice of human medicine—such as those of Broussais, Hahnemann, Brown, Rasi, Rademacher and others—and yet this has not been for long: experience of them when tested upon dumb unimaginative animals soon exposed their fallacies and compelled their discontinuance.

Of more moment than the cure of disease is its prevention, and this is now considered the most important object in connexion with veterinary science. More especially is this the case with those contagious disorders which depend for their existence and extension upon the presence of an infecting agent, and whose ravages for so many centuries are written largely in the history of civilization. Every advance made in human medicine affects the progress of veterinary science, and the invaluable investigations of Davaine, Pasteur, Chauveau, Lister and Koch have created the view recently put forward that “practice is as in the medicine of man. In “preventive medicine” the benefits derived from the application of the germ theory are now realized to be immense; and the sanitary police measures based on this knowledge, if carried rigorously into operation, must eventually lead to the extinction of animal plagues. Bacteriology has thrown much light on the nature, diagnosis and cure of disease both in man and animals, and it has developed the beneficial practice of aseptic and antisepctic surgery, enabling the practitioner to prevent exhausting suppuration and wounds, and by its attendant septic fever, to ensure the rapid healing of wounds and to undertake the more serious operations with greater confidence of a successful result.

The medicine of the lower animals differs from that of man in no particular so much, perhaps, as in the application it makes of utilitarian principles. The life of man is sacred; but in the case of animals, when there are doubts as to complete restoration to health or usefulness, pecuniary considerations generally decide against the adoption of remedial measures. This feature makes the medicine of domesticated animals brings very prominently before us the value of the old adage that “prevention is better than cure.” In Great Britain the value of
veterinary pathology in the relations it bears to human medicine, to the public health and wealth, as well as to agriculture, has not been sufficiently appreciated; and in consequence but little allowed has it continued in the British Empire, in which the practitioner of animal medicine has to contend. The rare instances in which animals can be seen by the veterinary surgeon in the earliest stages of disease, and when this would prove most amenable to medical treatment; delay, generally due to the inability of those who have the care of animals to perceive these early stages; the fact that animals cannot, except in a negative manner, tell their woes, describe their sensations or indicate what and where they suffer; the absence of those comforts and conveniences of the sick-room which cannot be called in to ameliorate their condition; the violence or stupper, as well as the attitude and structural peculiarities of the sick creatures, which only too frequently render favourable positions for recovery impossible; the slender means generally afforded for carrying out recommendations, together with the oftentimes intractable nature of their diseases; and the utilitarian inferences alluded to above—all these considerations, in the great majority of instances, militate against the adoption of curative treatment, or at least greatly increase its difficulties. But notwithstanding these difficulties, veterinary science has made greater strides since 1877 than at any previous period in its history. Every branch of veterinary knowledge has shared in this advance, but in none has the progress been so marked as in the domain of pathology, led by Nocard in France, Schütz and Kitt in Germany, Bang in Denmark, and McFadyean in England. Bacteriological research has discovered new diseases, has revolutionized the views formerly held regarding many others, and has pointed the way to new methods of prevention and cure. Tuberculosis, anthrax, black-quarter, glanders, strangles and tetanus furnish ready examples of the progress of knowledge concerning the nature and causation of diseases among animals, which has resulted from a greater acquaintance with their causes—including climatic changes, dietetic errors, peculiar condition of the tissues, heredity, exposure, close breeding, overcrowding and even spontaneous origin—have been proved beyond the possibility of doubt to be due to infection by specific bacteria or germs.

In the United Kingdom veterinary science has gained distinction by the eradication of contagious animal diseases. For many years prior to 1865, when a government veterinary department was formed, destructive plagues of animals had prevailed in this country. Every branch of veterinary knowledge has shared in this advance, and has rendered the cleverest and most effective assistance; and it may truly be said that the advances made in this direction have been so marked as to have raised the public health and wealth of the country to a state of perfect health, possibly greater than any in the history of the country. The disease was known, the cause was discovered, the means of prevention and cure were at once adopted, and the animal was saved from the ravages of the pest. The success of the movement has been so great that the pest is now almost entirely exterminated, and the animal is saved from the sufferings which it was subjected to in former times. The public are now aware of the importance of the disease, and its necessity for the protection of the public health and wealth.

The Board of Agriculture and Fisheries has an efficient staff of trained veterinary inspectors, who devote their whole time to the work in connexion with the scheduled diseases of animals, and are frequently employed to inquire into other diseases of an apparently contagious nature. The circumstances are of general importance to agriculturists.

Veterinary science can offer much assistance in the study and prevention of the diseases to which mankind are liable. Some grave maladies of the human species are certainly derived from animals, and others may yet be added to the list. In the training of the physician great benefit would be derived from the study of disease in animals—a fact which has been strangely overlooked in England, as those can testify who understand how closely the health of man may depend upon the health of the creatures with which he maintains a close subsistence from, and how much more advantageously mortified processes can be studied in animals than in our own species.

Although as yet few chairs of comparative pathology have been established in British universities, on the European continent such chairs are now looked upon as almost indispensable to every university. Bourgelat, towards the middle of the 18th century, in speaking of the veterinary schools he had been instrumental in founding, urged that "leurs portes soient sans cesse ouvertes à ceux qui, chargés par l'état de la rigoureuse expression of its diseased condition. From this point of view, the dumb animal, when it is ill, offers the same difficulties in diagnosis as does theailing infant or the comatose adult.

Of the other objects of veterinary science there is only one to which allusion need here be made: that is the perfectioning of the domestic animals in everything that is likely to make them more valuable to man. This is in an especial manner the province of this science, the knowledge of the anatomy, physiology and other matters connected with these animals by its students being essential for such improvement.

**Diseases of Domestic Animals.**

Considerations of space forbid a complete or detailed description of all the diseases, medical and surgical, to which the domesticated animals are liable. Separate articles are devoted to the principal plagues, or murrains, which affect animals—RINDERFEST, FOOT-AND-MOUTH DISEASE, PLEURO-PNEUMONIA, ASTHRAX, &c. Reference will be made here only to the more important other disorders of animals which are of a communicable nature.

**Diseases of the Horse.**

Every horseman should know something of the injuries, lamenesses and diseases to which the horse is liable. Unfortunately much can be done in this direction by book instruction; indeed, there is generally too much doctoring and too little nursing of sick animals. Even in slight and favourable cases of illness the horse is often regarded too zealously, and injudiciously medicated; the object to be always kept in view in the treatment of animal patients is to place them in those conditions which allow nature to
operate most freely in restoring health. This can best be rendered in the form of nursing, which sick animals greatly appreciate. How- ever, indifferent a horse may be to caressing or kind atten- tion, yet in good health the application of a warm soothing ointment, and when in pain will often apparently endeavour to attract notice and seek relief from those with whom he is familiar. Fresh air and cleanliness, quiet and comfort, should always be secured, if possible, for the horse. The stable should be free of flies or other insects, being careful to secure protection against draughts. If the weather is cold, and especially if the horse is suffering from inflammation of the air-passages, it may be necessary to keep oats, hay and barley, lucerne, carrots, parsnips, and an oz. of Linseed, a necessary indulgence; after which it is well to refresh the nostrils with a couple of oz. of a gentle oil in order to allay fever or inflammatory symptoms, while supporting the strength.

The following list comprises the usual laxative foods employed: green grass, green beet, carrots, turnips, parsnips, bran mash, linseed oil, and all kinds of bran, milk, or milk, should be used. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. The following list comprises the usual laxative foods employed: green grass, green beet, carrots, turnips, parsnips, bran mash, linseed oil, and all kinds of bran, milk, or milk, should be used. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. The following list comprises the usual laxative foods employed: green grass, green beet, carrots, turnips, parsnips, bran mash, linseed oil, and all kinds of bran, milk, or milk, should be used. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength.

A horse has lost its appetite, he should be tempted to eat by offering him such food as will be enticing to him. It should be given frequently and in small quantities, but should not be allowed to be disposed of. Boiled bran mash is a food that is suitable for some horses, and the quantity given should not be eaten out of the manger. Whether the animal be fed from a bucket or from a manger, any food that is left should be thrown away, and the remainder of the day. After a meal of bran is over, and the horse shows no signs of sickness a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. The following list comprises the usual laxative foods employed: green grass, green beet, carrots, turnips, parsnips, bran mash, linseed oil, and all kinds of bran, milk, or milk, should be used. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. The following list comprises the usual laxative foods employed: green grass, green beet, carrots, turnips, parsnips, bran mash, linseed oil, and all kinds of bran, milk, or milk, should be used. For a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength.
The epizootic diseases affecting the horse are not numerous, and may generally be considered as specific and infectious or contagious in their nature, circumstances of a favourable kind leading to their extension by propagation of the agent upon which they depend. In the absence of such dependence, the maladies, has been proved to be a micro-organism, and there can be little doubt that it is so for all of them.

Glanders (p. 24), or equina, one of the most serious maladies of the horse, is a disease of the respiratory system. A virulent agent of glanders appears to establish itself most easily in the horses kept in foul, crowded, badly ventilated stables, or among such as are over-worked, badly fed or debilitated. Glanders, however, are always due to contagion, and in no case can infection be contaminated by inhalation of the bacilli, by ingestion of the virus with food or water, or by inoculation of a wound of the skin or a mucous membrane. Carnivorous animals—lions, tigers, dogs and cats—have been infected through eating the flesh of glandered horses; and men attending diseased horses are liable to be infected, especially if they have sores on the exposed parts of their bodies. Though in man infection through wounds is the result of receiving the disease, the bacillus may also obtain access through the digestive organs, the lungs and mucous membranes of the eyes, nose and lips.

The definitions of the equine disease sometimes a distinction is made between glanders with nasal ulcers and other symptoms of respiratory disease, and glanders of the skin, or fancy, but there is no essential difference between them. Glanders and fancy are due to the same organisms, and the same methods of curing are applicable to both.

The glanders disease begins with a general fever with its accom- paniments, thirst, loss of appetite, hurried pulse and respiration, emaciation, languor and disinclination to move. Sometimes the legs or joints are swollen and the horse is stiff; but the characteristic symptoms are a greyish-yellow viscid discharge from one or both nostrils, a peculiar enlarged and nodulated condition of one or both submaxillary lymphatic glands, which though they may be painless vary from small pinpricks or pustules, running into deep, ragged-edged ulcers, and sometimes on the septum large patches of deep ulceration. The discharge from the nose adheres to the nostrils and upper lip, and the surrounding tissues are swollen, oedematous, and exceedingly tender and frequent snorting. The lymphatic vessels of the face are often involved and appear as painful subcutaneous "cords" passing across the cheek. These vessels sometimes present nodules which break and discharge a glutinous pus. As the disease progresses, the ulcer on the nose increase in number, enlarge or become confluent, extend in depth and sometimes completely perforate the septum. The nasal discharge, now more abundant, and if it is streaked with blood and offensive, the respiration is noisy or roaring, and there may be coughing with bleeding from the nose. Painful oedematous swellings appear on the muzzle, throat, between the eyes, or on the other side of the head, and may form on some of the swollen parts. Symptoms of congestion of the lungs, or pneumonia and pleurisy, with extreme prostration, diarrhoea and gasping respiration, precede death, which is due to acute exhaustion.

Chronic or latent glanders generally presents few definite symptoms. The suspected animal may have a discharge from the nose, or an enlarged submaxillary gland, or both, and small unbroken nodules may exist on the septum, but usually there is no visible ulceration of the nasal membrane. In some horses suspicion of glanders may be excited by lameness and sudden swelling of a joint, by profuse stalling, sluggishness, loss of condition and general unthriftiness, or by refusal of food, rise of temperature, swollen fetlock, with dry hacking cough, nasal catarrh and other symptoms of a common cold. In some cases, the nasal discharge continues, the submaxillary gland enlarges, and after an interval, ulcers appear in the nose or "fancy buds" form on a swollen leg. In occult glanders the horse may appear to be in good health and be able to perform ordinary work. In these cases the existence of glanders can only be discovered by resorting to inoculation or the mallein test.

In cutaneous glanders, or fancy, symptoms occur on the skin of a horse. In glanders of the eye, or on the body, where the lymphatics become inflamed and ulcerated. The limb is much swollen, and the animal moves with pain and difficulty. The lymphatic vessels appear as cords or "cordelettes," and along their course nodular swellings—the so-called "fancy buds." These small abscesses break and discharge a yellow, glutinous, blood-stained pus, leaving sores which heal very slowly; these sores are liable in cases of constipation and disturbance.

Medical treatment of glanders or fancy should not be attempted. The disease is dealt with under the Contagous Diseases (Animals) Acts. Horses which present suspicious symptoms, or those which have been in contact, or have stood in the same stall with glandered horses, should be isolated and tested with mallein. Animals which are found affected should immediately be destroyed, and their harness, clothing and the utensils employed with them thoroughly cleansed, all stables, exercise-pens and paddocks in which the horses have frequented should be disinfected. Forage left by glandered horses should be burned or fed to cattle.

Mallein, which is almost indispensable in the diagnosis of latent glanders, is a very useful part of the veterinary surgeon's armamentarium, and the first complete demonstration of its diagnostic value was given in 1891 by Kaling, also of Russia. Mallein, prepared for the diagnosis of glanders in animals, is the sterilized and filtered blood serum of horses; it does not contain even dead bacilli, but it has in solution certain substances which are added to the liquid by the bacilli during their development. Horses are inoculated in the gluteal muscles, subcutaneously injected in a glandered horse, mallein causes a marked rise of temperature and an extensive painful swelling at the seat of injection.

Epizootic lymphangitis is a contagious eruptive disease of the horse caused by the cryptococcus farcininosus, and characterized by nodular swellings and suppuration of the superficial lymphatics. Infection can be transmitted by similar or immediate contagion. The eruption usually appears on the limbs, but it may occur on the body or on the head and neck. The symptoms closely resemble those of cutaneous glanders, or fancy, but it can be diagnosed by microscopic examination of pus discharged from the sores, or by testing the horse with mallein. Glanders and epizootic lymphangitis may coexist in the same animal. It is a scheduled disease and must be destroyed.

Strangles is a specific contagious eruptive fever peculiar to horses, and is more especially incident to young animals. It is particularly characterized by inflammation and suppuration of the lymphatic glands, chiefly those between the branches of the lower jaw (submaxillary). Various causes have been ascribed for its production, such as change of young horses from field to stable, from grass to dry feeding, from idleness to hard work, irritation of teething, and change of locality and climate. But the sole cause is infection by the streptococcus. Lymphangitis and abscesses appear in the lymphatic glands, swellings form on the membrane, with discharge from the eyes and nose, and thirst are among the earliest symptoms. Then there is difficulty in swallowing, coincident with the development of swelling between the branches of the windpipe, or jaw, the membranes on the tonsils, palate, and in drinking to be returned through the mouth. The swelling is hot and tender, diffused, and uniformly rounded and smooth; at first it is hard, with soft, doughy margins; but later it becomes soft in the centre, where an abscess is forming, and soon "points" and bursts, giving exit to a quantity of pus. Relief is now experienced by the animal; the symptoms subside, and the recovery is certain. In some cases, it is so great or occurs so close to the larynx that the breathing is interfered with, and even rendered so difficult that suffocation is threatened. In other cases the disease assumes an irregular form, and the swelling, instead of being soft and friable, is hard or woody, and persists for a long time, or it may subside and abscesses form in various parts of the body, sometimes in vital organs, as the brain, lungs, liver, kidneys, &c., or in the bronchial or mesenteric glands, where they generally produce no symptom, save local inflammation. Not uncommon also accompanies the other symptoms. The malady may terminate in ten days or be protracted for months, sometimes terminating fatally from complications, even when the animal is well nursed and kept in a healthy stable.

Good nursing is the chief part of the treatment. The strength should be maintained by soft nutritious food, and the body kept warm and comfortable; the stable or loose-box must have plenty of fresh air and be kept clean. The swelling may be fomented with warm water or poultice. The poultice may be a little bag containing fresh and melted fat, or a bolus of hot moistened flannel. The swelling is hot to the tumefaction, being retained there by a square piece of calico, with holes for the ears and eyes, tied down the middle of the face and behind the ears. If the breathing is disturbed and noisy, the animal may be made to inhale steam from hot water in a bucket or from bran mash. If the breathing becomes very difficult, the windpipe must be opened and a tube inserted. Instead of the tube the arm is amputated, a little blistering ointment is spread over it, which is removed when healed. When the abscess points, it may be lanced, though sometimes it is better to allow it to break spontaneously.

Influenza. Contagious diseases are sometimes included, and in different invasions it may (and doubtless does) assume varying forms. It is a specific fever of a low or asthenic type, associated with inflammation of the mucous membranes.
Various other organisms at times has prevailed extensively over different parts of the world, more especially during the 18th and 19th centuries. Perhaps one of the most widespread outbreaks recorded for this malady is that which radiates from the district in which it first appears. The symptoms have been enumerated as follows: sudden attack, marked by extreme debility and stupor, with increased body-temperature, quick and weak pulse, and extreme weakness of the extremities; the eyelids swollen and half closed, eyes lustreless, and tears often flowing down the face. There is great disinclination to move; the bowels are infrequent of less body and the mucus is not easily audible; and the membrane lining the eyelids and nose assumes either a bright pink colour or a dull leaden hue. A white, yellowish- or greenish-coloured discharge flows from the nostrils. In a few days the fever and other symptoms subside and completely rapidly sets in. In unfavourable cases the fever increases, as well as the prostration, the breathing becomes labouring, the cough more painful and deep, and as aspersion and percussion indicate that the lungs are seriously involved, with perhaps the pleura or the heart.

Clots sometimes form in the latter organ, and quickly bring about a fatal termination. When the lungs do not suffer, the bowels may, and with the more complicated cases of fever, which is indistinguishable from the former, there is a loss of bodily strength, and the patient becomes torpid, tense and tender of the abdominal walls when pressed upon, manifestations of colic, great thirst, a coated tongue, yellowness of the membranes of nose and eye, high-coloured urine, constipation, etc. Sometimes the whole body is affected. Somatic swelling and tenderness takes place in the muscles and joints of the limbs, which may persist for a long time, often shifting from leg to leg. In the hands and feet, the shivering persists, while acute inflammation of the eyes supervenes, or even paralysis.

In this disease good nursing is the chief factor in the treatment. Comfortable, clean and airy stables or loose-boxes should be provided, and the bedding of the house, which is required to be clean and dry, for cleanliness is of the utmost importance. Air and damp, foul air and uncleanness, are as injurious to health and as antagonistic to recovery as in the case of mankind. In influenza it has been generally found that the less medicine the sick animal receives the more likely it is to recover. Nevertheless, in severe cases it may be necessary to adopt such medical measures as the following. For constipation administer emenata of warm water or give a dose of linseed or castor oil. To prevent fever take a dose of diuretics (as liquor of acetate of ammonia or spirit of nitrous ether), and, if there is cough or nervous excitement, anodynes (such as extract of belladonna). When the fever subsides and the prostration is great, it may be necessary to give stimulants (carbonate of ammonia, nitrous ether, aromatic ammonia) and tonics, both vegetable (gentian, quassia, calumba) and mineral (iron, copper, arsenic). Some veterinary surgeons administer large and frequent doses of quinine. The best results are obtained by the administration of the ingredients. It is advisable to make the mixture with the horses’ milk, and it is beneficial to give the mixture to the horses at night, as they never reject milk at this time.

Some of the counter-irritants, such as ammoniacal saltpetre, ammonia, turpentine, or oil of turpentine, solution of ammonia and olive oil. The food should be soft masses and gruel of oatmeal, with carrots and green food, and small and frequent quantities of scalded oats in addition when convalescence begins.

Dourine, maladie du coit, or covering disease of horses, or contagious malady caused by the Trypanosoma equiperdum, and characterized by specific lesions of the male and female reproductive systems. It is transmitted by insect vectors. It occurs in South America, Africa, and the United States. It is spread by flies and mosquitoes, which bite the horse and become infected. The flies then carry the disease to other horses. The disease is most common in the southern parts of the United States, especially in Texas, Florida, and Georgia. It is a complex disease that is transmitted by insects. It is spread by the bites of flies and mosquitoes, which carry the disease to other horses. The disease is most common in the southern parts of the United States.

Horse- pox.

The diseases of the bovine species are not so numerous as those of the horse, and the more acute contagious maladies are dealt with under RINDERFEST and other articles already mentioned.

Tuberculosis is a most formidable and widespread disease of cattle, and it is assuming larger proportions every year, in consequence of the absence of legislative measures for its suppression. It is a specific disease, contracted through cohabitation, and caused by the Bacillus tuberculosis, discovered by Koch in 1882, and consisting of a ball-like or oval bacillus, varying in size from a millet seed to immense masses weighing several pounds. The large diffused nodular growths are found principally in the chest and abdomen attached to the membranes lining these cavities.

The symptoms somewhat resemble those of contagious pleuropneumonia in its chronic form, though tubercles, sometimes in large numbers, are often found after death in the bodies of cattle, and there is no similar disease in sheep and goats. Tuberculosis of cattle is not always fatal when the animal is killed; they are sold in good condition. It occurs in the lungs, the liver, the spleen, the kidney, the lymph nodes, and the brain. The disease is transmitted by contact and by the milk of infected animals. The infection is usually acquired during the lifetime of the animal, and is not transmitted by the offspring. The disease is not transmissible to other species of animals.

In tuberculous cattle, there is a very pronounced acidity of the milk, and the milk contains more or less acid. The milk is also deficient in butterfat and milk solids.

Horse-ulcer.

Horses can develop ulcers, which are often associated with infections. Ulners can be caused by a variety of factors, including injuries, infections, and immunological responses.

Ulners can be found in the mouth, stomach, and intestines of horses. They can be caused by a variety of factors, including infections, injuries, and immunological responses. Ulners can be found in the mouth, stomach, and intestines of horses. They can be caused by a variety of factors, including infections, injuries, and immunological responses. Ulners can be found in the mouth, stomach, and intestines of horses. They can be caused by a variety of factors, including infections, injuries, and immunological responses.
non-tuberculous animals it has no appreciable action. Medical treatment is of little if any avail. Preventive measures are of the utmost importance. Animals proved free of tuberculous taint should alone be bred from, and those found diseased should be at once destroyed. If the milk is not used except as food the flesh should be well cooked, and the milk from tuberculous cows should be boiled or heated to a temperature of 155°F.

Black-quarter, is a contagious disease, which occurs in young stock from a few months to two years old, in various parts of the country, and generally in low-lying damp situations. It was first noticed in cattle in France, and by the late Count Gobineau and Thomas, who termed it symptomatic anthrax (Charbon symptomatique)—a misleading name for a disease which is perfectly distinct from anthrax. This disease is caused by a culture and natural infection takes place through small wounds of the legs and feet or other parts. At first it is a local disease affecting usually a hind quarter, though sometimes the characteristic swelling forms on the shoulders, neck, breast, loins or flank. The chief symptoms are sudden loss of appetite, accelerated pulse and respiration, high temperature, debility, lameness or stiffness, followed by the formation of a small, painful swelling which rapidly increases in extent, becomes emphysematous, and in the centre cold and painless. Incision of the tumour gives escape to a red, frothy, sour-smelling fluid. This disease runs its course very rapidly, and if not treated promptly disease, even a death takes place. Cases of this kind should be isolated from the herd and treated immediately. stages as that of cowpox. The mortality may extend from 10% in mild outbreaks to 90% or 95% in very virulent ones. Diseased animals should be isolated, and feed on nourishing foods, and gruels of oatmeal flour or linseed; acidulated water may be allowed. If there is sloughing of the skin or extensive sores, oxide of zinc ointment should be applied. But treatment should not be too stringent, for fresh succussion of the bladder and bowels are a serious feature of the disease, the strength should be maintained or restored until the fever has run its course. Light broth, heel mash, and milk should be given, and fresh succussion of the bladder, and a diet. Preparations of quinine, given from the commencement of the attack in a little wine, such as sherry, have proved very beneficial. Often a mild laxative is required. Complications should be treated and cases be reported. Medical treatment and manipulation should be adopted with regard to other dogs. Protective vaccines and antitoxin sera have been introduced by Lignieres, Copeman, Philatix and others, but their action is uncertain.

The so-called Struggles of Hydrophobia. It is known as hydrophobia (22.) or rabies is treated under that name.

Principal Parasites of Domestic Animals.

Perhaps the commonest worm infesting the horse is Ascaris equi. It is a common and prevalent parasite. It is found in all animals, and its eggs are permanent in the environment. They are oval or elongated and yellowish. Their number in the intestine may be many. The male is about 4 to 5 inches, the female about 12 to 15 inches. The female eats the male. The egg of the worm contains the larva, which is a single-celled animal, and is infective in the soil. The oval eggs are usually found in the manure.

The principal symptom of Ascaridiasis is the passage of the worms in the stool. Other symptoms are a dulling of appetite, colic, diarrhea, and constipation. The horse may lose his appetite, become dull, and wander. The stools may be offensive, and the horse may vomit. The worms may be found in the manure, and in the abomasum and intestines. The eggs are usually found in the manure, and may be found in the soil.

The best treatment is to give the horse a dose of pyrantel pamoate, which is a broad-spectrum anthelmintic. Other treatments include the use of ivermectin, a macrocyclic lactone anthelmintic, or a combination of both. It is important to follow the manufacturer's instructions for dosing and application.

The parasite is common in horses, and is usually found in the manure. It is not usually a serious problem, but it can cause significant discomfort to the horse. It is important to treat the parasite to prevent the spread of the disease to other horses and to maintain the health of the herd.

Other Parasites of Domestic Animals.

There are many other parasites that can affect horses, including the horse roundworm, the horse pinworm, and the horse bots. These parasites can cause a variety of symptoms, including loss of appetite, colic, diarrhea, and constipation. They can also cause weight loss, anemia, and weakness. Treatment for these parasites includes the use of anthelmintics, such as pyrantel pamoate, ivermectin, and moxidectin. It is important to follow the manufacturer's instructions for dosing and application.

The parasite is common in horses, and is usually found in the manure. It is not usually a serious problem, but it can cause significant discomfort to the horse. It is important to treat the parasite to prevent the spread of the disease to other horses and to maintain the health of the herd.

VETERINARY SCIENCE

colour. The bot remains in the stomach till the following spring, when it detaches itself, passes into the food and is discharged with the faeces. When various dots may cause symptoms of intestinal irritation, and is therefore the subject of much discussion. A common and effective remedy is a dose of carbolic sulphide given in a gelatin capsule, repeated in twelve hours, and followed twelve hours later by an aebolic salt.

Some parasites which infest cattle and sheep, and mention will only be made of Distomum hepaticum, or common fluke, which causes liver-rot or distomiasis, a very fatal disease of lambs and sheep under two years old. It is not uncommon in cattle, and may be carried to other pastures by sheep which have been driven through a fluke-infected country, and sheep allowed to graze along the same line. A thorough examination of the intestine must be made, and a full description of its anatomy and development see TREMATODES. Preventive treatment comprises the destruction of flukes and snails; avoidance of low-lying, wet pastures draining infested land, and top-dressing with salt, lime, sugar or water or soot; supplying sheep with pure drinking water; placing rock-salt in the fields, and providing extra food and a tonic lick consisting of salt, aniseed, ferrous sulphate, linseed and peat. In an advanced bronchitis of calves is caused by Strongylus ruminantium, or pointed-tailed strongyle, a thread-worm 1 to 3 in. long, and S. papillosus, a similar but smaller nematode; and S. vulgaris, a worm of coarse structure and 6 in. long. The male S. ruminantium is 1 in. long, and the female 2 to 4 in. long. They are white in colour and of the thickness of ordinary sewing cotton. The S. rufescens is thinner and shorter than S. ruminantium and vulgaris, and the point of the tail is not accurately known. When expelled and deposited in water or moist earth, the embryos may live for many months. Horses occur in spring and continue until autumn, when it may be most severe. In sheep the symptoms are coughing, at first strong, with long intervals, then weak and frequent, leaving the sheep distressed and wheezing; discharge from the nose, salivation, occasional retching with vomiting. In cattle, in the mouth and even in the throat, symptoms of anaemia and weakness. In calves the symptoms are similar but less acute. Various methods of cure have been tried. Remedies given by the mouth are seldom satisfactory. Good results have followed from the intramuscular injection of chloroform. Intra-tracheal injections of chloroform, iodine and ether, oil of turpentine, carbolic acid, and opium tincture, or chloroform, ether, cresote and olive oil. The system should be supported as much as good nourishing food as possible.

The principal parasites which infest the alimentary canal of cattle or sheep are strongyles and taeniae. The strongyles of the fourth stomach are S. contortu, or twisted wire-worm (male 10 to 20 mm., female 20 to 30 mm. long). S. cervicornis (female 10 to 13 mm.), S. cervicornis (female 10 to 12 mm.), S. gracilis (female 3 to 4 mm.), and an unnamed species (female 9 mm. long) discovered by Malamud. The contortu and cervicornis may be easily recognized, but the other parasites, owing to their small size or situation in the mucous membrane, may be overlooked in an ordinary post-mortem examination. It is observed, however, as the worm of this type that it lives on the blood which it absorbs from the mucous membrane, and, according to the state of repletion, its body may be red or white. The ova of this worm are found in the faeces of sheep and infected cattle. The ova hatch in a few days, and, according to Ransom, within a fortnight embryos one-thirtieth of an inch long may be found encased in a chitinoid investment, which protects them from the effects of excessive cold, heat or moisture. When the ground is damp and the temperature not too low, the embryos creep up the leaves of grasses and other plants, but when the temperature is below 40° F. they are inactive (Ransom). Sheep feeding on infected pasture gather the young worms and convey them to the fourth stomach, where they attain maturity in two or three weeks. In wet weather the embryos are washed into ponds and ditches, and cattle and sheep may swallow them when drinking. Strongyles cause loss of appetite, irritation and inflammation of the stomach and bowel, diarrhoea, anaemia, progressive emaciation, and, if not destroyed or expelled, a lingering death from extreme debility or even death. The state of the horse, and its condition on the degree of infestation. A change of pasture is always desirable, and as remedies a few doses of oil of turpentine in linseed oil, or a mixture of carbolic acid and ferrous sulphate, are useful. Venomous and common salt may be tried. The ox may be the bearer of three and the sheep of twelve species of taeniae, and of these the commonest is Moniezia (taenia) expansa, which is one of the longest tapeworm, being from 6 to 30 ft. in sheep and from 40 to 100 ft. in cattle. Its maximum breadth is ½ in.; it is found in the small intestine, and sometimes in sufficient numbers in lambs to obstruct the bowel. Infected animals are constantly spreading the rise segments over the pastures, from which the ova or embryos are gathered by the sheep. The symptoms are inappetence, dry harsh stool, weakness, anaemia and diarrhoea with segments of the worms in the faeces. Various drugs have been prescribed for the expulsion of the worms, but the only reliable mode of treatment is by treatment. The principal round-worms of the intestine of ruminants are Ascaris vitulorum, or calf ascarid, Strongylus filicollis, S. ventriculosus, Sclerostomum hypostomum, Ankylostomum cernuum and Tricho- ostrongylus whittackeri. Of these the ventriculosus is the most likely to cause severe symptoms in sheep. For a full account of the development of Cysticercus bovis, or beef mease, the larval form of Taenia saginata of the human subject, see TAPWORMS. Another bladder-worm, Cysticercus tenuis, or pork tapeworm, is found in pigs, the larvae developing in the intestines of pigs, cattle, goats and deer gid or stinku, a peculiar affection in the central nervous system characterized by congestion, compression of the brain, vertigo, inco-ordination, and other symptoms of cerebrospinal paralysis. This bladder-worm is the cystic form of Taenia coenurus of the dog. It is found in the cranial cavity, resting on the brain, within its substance or at its base, and sometimes in the spinal canal. The symptoms vary with the position and number of the larvae. When they are not or are not at all, appears unaccountably nervous or very dull, more or less blind and deaf, with glazed eye, dilated pupil, the head twisted or convulsed, and always occur in association with paralysis of other parts. When moving the sheep constantly tends to turn in the same direction. When the vesicle is deep-seated or within the cerebral lobe, the sheep carries the head low, brings the feet together and turns round and round like a blind animal. If the cyst exerts pressure at the base of the cerebellum, the sheep repeatedly falls and rolls over. In other cases the chief symptoms may be frequent falling, always on the same side, high trotting action with varying length of step, advancing by rearing and leaning the complete motor paralysis, and in spinal cases posterior paralysis with dragging of the hind limbs. Medicinal treatment is of no avail, but in all cases the sheep may be killed by treatment of the sow. Gid may be prevented by attendance to the treatment of dogs infested with the tapeworm. The helminthes of the pig, although not very detrimental to the animal, are quite injurious. The commonest are Taenia pisiformis, or pigs' round-worms, and the bladder-worm (see TAPWORMS). Echinococcus granulosus is also common and is harboured in the body of the female worm. When scars of trichinous flesh or infested rats have been ingested by the pig, the cysts enclosing the larval trichine are dissolved by the gastric juice in about eighteen hours, and the worms are found free in the intestine. In twenty-four to forty-eight hours later these larvae, having undergone certain transformations, become sexually mature; then they copulate and after a period of two months the larva (Echinococcus) female worm and immediately begin to penetrate the intestinal wall in order to pass into various voluntary muscles, where they becomeysticated. There are various methods of treating the sheep when the hard bodies are discovered in the body. Usually each larva is enveloped in a capsule, but two or even three larvae have been found in one infection. They have been known to live in their capsules for eighteen months to two years. The principal round-worms of the intestine of ruminants are Ascaris marginata (3 to 8 in. long), a variety of the ascarid (A. mystax) of the cat. It occurs in the intestine of sheep and of young dogs. The symptoms are emaciation, diarrhoea, failure, failure of milk, debility, the worms in mucus, colic and diarrhoea. The treatment comprises the administration of arsenic or colanthan in milk, followed by a dose of oil of tar. The most usual cause of the condition is ascarid oesophagus, which is harboured in the heart of the dog, and its larvae may be found in the blood, causing endocarditis, obstruction of the vessels, and fits, which often end in death. Spirotera sanguinolenta may be found in the dog and in the very young in calves. Of the round-worms which are harboured eight species of taeniae and five species of Bothriocephalus. Taenia serrata, about 3 ft. in length, is found in about 10% of
The vegetable parasitic or Dermatophytes, which cause line or ringworm in horses, cattle and sheep, belong to the distinct genera: Trichophyton, Microsporum, Eidamella, Achondria and Oospora. Ringworm of the horse is either a Tricho- phyton or Microsporum, produced by fungi of the genera Tricho- phyton mentagrophytes, T. flavum, t. equinum, t. verrucosum, or a Microsporosis caused by Microsporum audouinii. Ringworm of cattle is always a Trichophytosis, and due to T. mentagrophytes. In sheep and goats, T. mentagrophytes and T. cerevisiae, invade their elasticity and break off, leaving a greyish-yellow, bran-like crust of epidermic products, dried blood and sometimes pus. In sheep there is always a trichophytosis, consisting entirely of fungi, and have an odour like that of rancid butter. This fungus may affect any part of the skin, but occurs principally on the head, face, neck, back and hind quarters. It is very contagious, and it may be conformed from one species to another, and from animals to man. The affected parts should be carefully scraped and the crusts destroyed by burning; then the patches should be dressed with iodine tincture, solution of copper sulphate or carbolic acid, or with oil of tar.

BIBLIOGRAPHY.—Modern veterinary literature affords striking evidence of the progress made by the science; excellent text-books, and a great number of separate subjects belonging to it are numerous, and are published in every European language in regular periodical press, with marked ability and discrimination, records and distributes the ever-increasing knowledge. The substantial benefit derived from the knowledge of the animal is to be sought in the improvement and preventive medicine point to a still greater rate of progress. The schools in every way are better equipped, the education and training—general and technical—of students of veterinary medicine is being conducted in a thorough manner, and animal observation and investigation of disease have been greatly improved. Among the numerous modern works in English on the various branches of veterinary science, the following may be mentioned: McFadyean, Anatomy of the Horse: A Practical Guide (London, 1902); Chauveau, Comparative Anatomy of the Domesticated Animals (London, 1891); Cuyer, Artistic Anatomy of Animals (London, 1895); Jones, Veterinary Parasites (London, 1907); Jowett, Blood-Serum Therapy and Preventive Inoculation (London, 1906); Swithinbank and Newman, The Bacteriology of Milk (London, 1905); Fleming, Animal Plagues (London, 1882); McFadyean, Veterinary Parasites (London, 1901); Cuyer, The Castration (9th ed., London, 1902); Moussu and Dollar, Diseases of Cattle, Sheep, Goats and Swine (London, 1905); Reck, Common Eczema of the Horse (London, 1900); Sewell, Cali Tuberculosis (London, 1905); Smith, Rings and Ringworm (London, 1905); Hobbay, Surgical Diseases of the Dog and Cat (London, 1906); Hill, Management and Diseases of the Dog (London, 1905); Sewell, The Evolution of the Horse (London, 1904); MacNeice, The Barrier, Exterior of the Horse (London, 1904); Keats, Diseases of the Foot of the Horse (London, 1906); Roberge, The Foot of the Horse (London, 1894); Jensen, Milk Hygiene: A Treatise on the Modern Dairy Practice (London, 1902); Frohner, Modern Veterinary Pathology (London, 1905); Fleming, Human and Animal Variolae (London, 1881); Hunting, The Art of Horse- shoeing (London, 1905); McFadyean and Cuyer, Atlas of Veterinary Surgery (London, 1908); Dollar and Wheatley, Handbook of Horse-shoeing (London, 1904); Lungwitz, Text-Book of Horse-shoeing (London, 1904); Aze, The Horse: its Treatment in Health and Disease (9 vols., London, 1905); Hayes, The Points of the Horse (London, 1904); Robertson, Equine Medicine (London, 1883); Hayes, Horses on Board Ship (London, 1902); FitzWygram, Horses and Stables (London, 1901); Liautard, Lameness of Horses (London, 1888); Walley, Meat Inspection (2nd ed., London, 1901); Oster, Handbook of Meat Inspection (London, 1907); Courtenay, Practice of Veterinary Medicine and Surgery (London, 1902); Williams, Principles and Practice of Veterinary Medicine (London, 1907); J. Laing, Text-Book of Veterinary Medicine (5 vols., New York, 1906); Idologi, Dollar, Clinical Veterinary Medicine and Surgery (London, 1900); Scientific and Popular Veterinary and Zoological Literature (London, 1900); Steel, Diseases of the Ox (London, 1881); Leblanc, Diseases of the Mam- malians (London, 1906); De Deye, Barberine Obstetrics (London, 1901); Fleming, Veterinary Obstetrics (London, 1896); Dalrymple, Veterinary Obstetrics (London, 1898); Neumann, Parasites and Parasitic Diseases of the Domesticated Animals (London, 1898); McFadyean, Veterinary Pathology and Pathogenic Bacteria (London, 1903); Smith, Physiology of the Domestic Animals (London, 1889); Kitt, Comparative General Pathology (London, 1907); Friedberger and Hesse, Diseases of the Pig (London, 1905); Brown, Atlas of the Pig (London, 1900); Rushworth, Sheep and Goats (London, 1903); Fleming, Operative Veterinary Surgery (London, 1903); Williams, Principles and Practice of Veterinary Surgery (London, 1907); Gaskell, Veterinary Surgery (London, 1904); Fröhner, General Veterinary Surgery (New York, 1906); Merillat, Principles of Veterinary Surgery and Surgical Pathology (London, 1907); Cadiot and Almy, Surgical
VETO

(Lat. for “I forbid”), generally the right of preventing any act, or its actual prohibition; in public law, the constitutional right of the competent authority, or in republics of the whole people in their primary assembly, to protest against a legislative or administrative act, and to prevent wholly, or for the time being, the validation or execution of the same. It is generally stated that this right was called into existence in the Roman republic by the tribunica potestas, because by this authority decisions of the senate, and of the consuls and other magistrates, could be declared inoperative. Such a statement must, however, be qualified by reference to the facts that interdictio, interdictio militum were the expressions used, and, in general, that in ancient Rome every holder of a magistracy would check a misstep taken by a colleague in his equal in rank, by opposition and intervention. This was a consequence of the position that each of the colleagues possessed the whole power of the magistracy, and this right of intervention must have come into existence with the introduction of collegial authorities, i.e., with the commencement of the republic. In the Roman magistracy a twofold power must be distinguished: the positive management of the affairs of the state entrusted to each individual, and the power of restraining the acts of magistrates of equal or inferior rank by his protest. As the tribuni plebis possessed this latter negative competence to a great extent, it is obvious that the power of the tribunes in the constitution of the Roman republic was considerable.

In the former kingdom of Poland the precedent first set in 1652 was established by law as a constant right, that in the imperial diet a single deputy by his protest “Nie pozwalam,” i.e., “I do not permit it,” could invalidate the decision sanctioned by the other members. The king of France received the right of a suspensive veto at the commencement of the French Revolution, from the National Assembly sitting at Versailles in 1789, with regard to the decrees of the latter, which was only to be valid for the time being against the decisions coming to and during the following National Assembly, but for the period of the third session it was to lose its power if the Assembly persisted in its resolution. By this means it was endeavoured to diminish the odium of the measure; but, as is well known, the monarchy was soon afterwards entirely abolished. Similarly the Spanish Constitution of 1812 prescribed that the king might twice refuse his sanction to bills laid twice before him by two sessions of the cortes, but if the third session repeated the same he could no longer exercise the power of veto. The same was the case in the Norwegian Constitution of 1814.

In the French republic the president has no veto strictly so called, but he has a power somewhat resembling it. He can, when a bill has passed both Chambers, by a message to them, refer it back for further deliberation. The king or queen of England has the right to withhold sanction from a bill passed by both houses of parliament. This royal prerogative has not been exercised since 1692 and may now be considered obsolete. The governor of an English colony with a representative legislature has the power of veto against a bill passed by the legislative body of a colony by a following colonial assembly, but as a bill would be which had been rejected by the colonial council, or as a bill passed by the English houses of parliament would be if the crown were to exert the prerogative of refusing the royal assent. The governor may, however, without refusing his assent, reserve the bill for the consideration of the crown. In that case the bill does not come into force until it has either actually or constructively received the royal assent, which is in effect the assent of the English ministry, and therefore indirectly of the imperial parliament. Thus the colonial liberty of legislation is made legally reconcilable with imperial sovereignty, and conflicts between colonial and imperial laws are prevented.

The constitution of the United States of America contains in art. i., sect. 7, par. 2, the following order:—

“Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the president of the United States; if he approve, he shall sign it, if not, he shall return it with his objections to that house in which it shall have originated, who shall enter the objections at large on their journal and proceed to reconsider it. If, after such reconsideration, two-thirds of both houses shall agree to pass the bill, it shall become a law.”

In all states of the Union except one the governors, in the same manner or to a modified extent, possess the right of vetoing bills passed by the legislature. Here, therefore, we have a power which is exercised only in some states.

According to the constitution of the German empire of 1871, the imperial legislation is executed by the federal council and imperial diet; the emperor is not mentioned. In the federal council the simple majority of votes decides. But in the case of bills concerning the army, the navy and certain specially noted taxes, as well as in the case of decisions concerning the alteration of orders for the administration, and arrangements for the execution of the laws of customs and taxes, the proposal of the federal council is only accepted if the Prussian votes are on the side of the majority in favour of the same (art. vii., sect. 3). Finally, according to the constitution of the German empire of 1871, the federal council is therefore, in fact, as follows: it is not the German emperor, but the same monarch as king of Prussia, who has the right of veto against bills and decisions of the federal council, and therefore can prevent the passing of an imperial law. The superior power of the presidential vote obtains, it is true, its due influence only in one legislative body, but in reality it has the same effect as the veto of the head of the empire.

The Swiss federal constitution grants the president of the Confederation no superior position at all; neither he nor the council of ministers has the power of veto over the decisions of the federal assembly. But in some cantons, viz. St Gall (1831), Basel (1832) and Lucerne (1841), the veto was introduced as a right of the people. The citizens had the power to submit to a plebiscite laws which had been debated and accepted by the cantonal council (the legislative authority), and to reject the same. If this plebiscite was not demanded within a certain short specified time, the law came into force. But, if the voting took place, and if the number of persons voting against the law exceeded by one vote half the number of persons entitled to vote in the canton, the law was rejected. The absent voters were considered as having voted in favour of the law. An attempt to introduce the veto in Zurich in 1847 failed. Thurgau and Schaffhausen accepted it later. Meanwhile another arrangement has quite driven it out of the field. This is the so-called “referendum”—properly speaking, direct legislation by the people—which has been introduced into most of the Swiss cantons. Formerly in all cantons—with the exception of the small mountainous districts of Uri, Schwyz, Unterwalden, Zug, Glarus and Appenzell—it was not a pure democracy, but a representative constitution that prevailed; the great councillors or cantonal councillors periodically chosen by the people were the possessors of the sovereign power, and after deliberating twice passed the bills definitely. Now they have only to discuss the bills, which
are printed and sent to all voters with an explanatory message; then the people on a certain day vote for the acceptance or rejection of the law by writing "yes" or "no" on a printed voting paper. The summary of the votes is published two days after the election, and the government is then bound to submit the legislation to the people for confirmation. Some cantons important financial resolutions involving large state expenses are also submitted to the decision of the people. In the revised federal constitution of 1874, under certain conditions which have no further interest for us at present, a facultative referendum or initiative (i.e., the possibility of demanding a plebiscite under exceptional circumstances) was introduced for federal laws. Since that period it has often been employed and has operated like a veto. It is evident that by the compulsory referendum in the cantons the mere veto is rendered superfluous.

In examining the question as to what position the veto occupies in the federal constitution, we must separate quite different conceptions which are comprised under the same name.

1. The veto may be a mere right of intervention on the part of a magistrate against the order of another official, or an act of an authority of equal or inferior rank. This was the case in ancient Rome. To this class belong also those cases in which, as in the French republic, the president makes his "no" valid against decisions of the general council or the president of the council of the state. The exercise of such a right of intervention and the veto is not confined to bills, but refers particularly to administrative measures. It affords a guarantee of the necessity of an act.

2. The veto may be a safety-valve against precipitate decisions, and so a preventive measure. This task is fulfilled by the suspensive veto of the president of the president of the United States. Similarly, this duty is also assigned to the president of the United States in the case of the executive, or the president of the state. The veto is neither an interference with the competence of an authority, nor a division of the legislative power among different factors, but simply a guarantee against too precipitate enactments of the executive or of an act on the part of the members of the communal councils. The use of the expression here is quite justifiable, and this veto is not confined to bills, but refers particularly to administrative measures. It affords a guarantee of the need of an act.

The veto is the negative side of the sanctioning of the laws, in other words, an act of sovereignty. It would not be in accordance with the nature of a constitutional monarchy to declare the monarch's consent to a law unnecessary, or make it a compulsory duty: the legislative power is divided between him and the chambers. The sovereign must therefore be perfectly at liberty to say "yes" or "no" in each single case according to his opinion. If he says the latter, we speak of it as a veto. The president is invested with this right of intervention and entirely to the holder of sovereign power—however he may be called—is self-evident. One chamber can also by protest prevent a bill of the other from coming into force. The "place of the temporal prince being in the hands of the people, when the time arrives to be removed, it is in itself the veto or non place." Where in pure democracies the people in their assembly have the right of veto or referendum, the exercise of it is the result of the sovereign rights of legislature. (For the question of the conflict between the two houses of England, see Representation.)

The peculiar power of veto possessed by the (Prussian) president of the federal council of Germany lies on the boundary between (2) and (3).

(A. V. O.)

VENETIUM [Vetter or Vetterl, often written, with the addition of the definite article, Vetterum], a lake of southern Sweden, 80 m. long, and 18 m. in extreme breadth. It has an area of 733 sq. m., and a drainage area of 2528 sq. m.; its maximum depth is 390 ft., and its elevation above sea-level 280 ft. It drains eastward by the Motala river to the Baltic. Its waters are of remarkable transparency and blueness, its shores picturesque and steep on the east side, where the Ömberg (863 ft.) rises abruptly, with furrowed flanks pierced by caves. The lake forms an important lake system. Its northern part is crossed from Karlsholm to Motala (W. E.) by the Olofsgatan railroad. From the southern end is the important manufacturing town of Jönköping, and 15 m. N. of it the picturesque island of Vising, with a ruined palace of the 17th century and a fine church. Vadstena, 8 m. S. of Motala, with a staple industry in lace, has a convent (now a hospital) of St. Bridget or Birgitta (1383), a beautiful monastic church (1392-1424) and a castle of King Gustavus Vasa. At Alvastra, 16 m. S. again, are ruins of a Cistercian monastery of the 17th century. Close to Motala are some of the largest mechanical workshops in Sweden, building war and merchant vessels, bridges, &c.

VENETIUM, or VETULONIUM (Etruscan Vetuluna), an ancient town of Etruria, Italy, the site of which is probably occupied by the modern village of Vetulonia, which up to 1883 bore the name of Colonna. It lies 1130 ft. above sea-level, about 10 m. N.W. of Grosseto, on the N.E. side of the hills which project from the flat Maremma and form the promontory of Castiglione. The place is little mentioned in ancient literature, though Silius Italicus tells us that it was hence that the Romans took their magisterial insignia (fasces, curule chair, purple toga and brazen truncheons), and it was undoubtedly one of the twelve cities of Etruria. Its site was not identified before 1882, and the identification has been denied in various works by C. Dott. dauili, who places it on the Poggio Castiglione near Massa Marittima, where scanty remains of buildings (possibly of city walls) have also been found. This site seems to agree better with the indications of medieval documents. But certainly an Etruscan city was situated on the hill of Colonna, where there are remains of city walls of massive limestone, in almost horizontal courses. The objects discovered in its extensive necropolis, which have been excavated, are now kept in the museums of Grosseto and Florence. The most important were surrounded by tumuli, which still form a prominent feature in the landscape. See G. Dennis, Cities and Cemeteries of Etruria (London, 1883), ii. 263; Notizie degli Scavi, passim; I. Falchi, Ricerche di Vetulonia (Prato, 1881), and other works, especially Vetulonia e la sua necropoli antichissima (Florence, 1894); C. Sordini, Vetulonia (Spoleto, 1894) and references.

VEUILLOT, LOUIS (1837-1893), French journalist and man of letters, was born of humble parents at Boyes (Loir-et) on the 11th of October 1813. When Louis Veillot was five years old his parents removed to Paris. After a very slight education he entered a lawyer's office, and was sent in 1830 to serve on a Rouen paper, and afterwards to Périgueux. He returned to Paris in 1837, and a year later visited Rome during Holy Week. There he embraced extravagant ultramontane sentiments, and was from that time an ardent champion of Catholicism. The results of his conversion appeared in Pèlerinage en Suisse (1839), Rome et Lorette (1841) and other works. In 1843 he entered the staff of the Univers religieux. His violent methods of journalism had already provoked more than one duel, and for his polemics against the university of Paris in the Univers he was imprisoned for a short time. In 1848 he became editor of the paper, which was suppressed in 1860, but revived in 1869, when Veillot recommended his ultramontane theories, and which brought about a second suppression of his journal in 1874. When his paper was suppressed Veillot occupied himself in writing violent pamphlets directed against the moderate Catholics, the Second Empire and the Italian government. His services to the papal see were fully recognized by Pius IX., on whom he wrote (1873) a monograph. He died on the 7th of March 1883.

Some of his scattered papers were collected in Mille anges religieux, historiques et littéraires (12 vols., 1859-75), and his Correspondance (6 vols., 1859-85) has which brings together, with Eugene Veillot, published (1904-14) a comprehensive and valuable life, Louis Veillot.

VEVEY [German Veits], a small town in the Swiss canton of Vaud and near the eastern extremity of the Lake of Geneva. It is by rail 12 m. S.E. of Lausanne or 38 m. N.W. of the Vernex-Montreux railway station, while it is well served by steamers plying over the Lake of Geneva. In 1900 it had a population of 1,465, of whom 137 were French Catholics. There French-speaking, with there were 8,777 Protesants to 3,424 Romanists and 56 Jews. It is the second town in point of population in the canton, coming next after Lausanne, though inferior to the "agglomeration" known as Montreux. It stands at the mouth of the Veveysse and commands fine views of the snowy mountains seen over the glassy surface of the lake. The whole of the surrounding
country is covered with vineyards, which (with the entertainment of foreign visitors) occupy the inhabitants. Every twenty years or so (last in 1889 and 1905) the Fête des Vigneronnies is held here by an ancient guild of vintners, and attracts much attention. Besides a railway line that joins the Montreux-Bernese Oberland line at Chamby (5 m. from Vevey and 1½ m. below Les Avants) there is a funicular railway from Vevey up the Mont Pèlerin (1555 ft.) to the north-west.

Vevey was a Roman settlement [Vivisus] and later formed part of the barony of Vaud, that was held by the counts and dukes of Savoy until 1536 when it was conquered by Bern. In 1798 it was freed from Bernese rule and became part of the canton du Léman (renamed canton de Vaud in 1803) of the Helvetic Republic.

VEXILLUM (Lat. dim. of velum, piece of cloth, sail, awning, or from vehere, vectum, to carry), the name for a small ensign consisting of a square cloth suspended from a cross-piece fixed to a spear. The vexillum was strictly the ensign of the maniples, and as signum was of the cohort, but the term came to be used for all standards or ensigns other than the eagle (aquila) of the legion (see Flago). Caesar (B.G. ii. 20) uses the phrase vexillum proponere of the red flag hoisted over the general's tent as a signal for the march or battle. The standard-bearer of the maniple was called vexillarius, and it is the very time of an ensign vexillum and vexillarius had gained a new significance. Tacitus uses these terms frequently both of a body of soldiers serving apart from the legion under a separate standard, and also with the addition of some word implying connexion with a legion of those soldiers who, after serving sixteen years with the legion, continued their service, under their own vexillum, with the legion. The term is also used for the scarlet wrapped round a bishop's pastoral staff (q.v.). Modern science has adopted the word for the web or vein of a feather of a bird and of the large uppermost flowers, such as the pea, whose corolla is shaped like a butterfly.

VEXIÎ, or Wexiô, a town and bishop's see of Sweden, capital of the district (län) of Kronoberg, 124 m. N.E. of Malmö by rail. Pop. (1900) 7365. It is pleasantly situated among low wooded hills at the north end of Lake Vexiô, and near the south end of Lake Helga. Its appearance is modern, for it was burnt in 1843. The cathedral of St Segrifard dates from about 1300, but has been restored, the last time in 1868. The Småland Museum has antiquarian and numismatic collections, a library and a building of Limousin stone. There are ironfoundries, a distillery and manufactories of hemp and paper. Ostraberg, the ancient seat of the Bishops of Vexiô, is in the middle of the town. Without the town, the poet Essaïs Tegnéér died in 1846, and he is buried in the town cemetery. On the shore of Lake Helga is the royal estate of Kronoberg, and on an island in the lake the ruins of a former castle of the same name.

VÉZELAY, a village of France, in the department of Yonne, 10 m. W.S.W. of Avallon by road. Its population, which was over 10,000 in the middle ages, was 524 in 1906. It is situated on the summit and slopes of a hill on the left bank of the Cure, and owes its renown to the Madeleine, one of the largest and most beautiful basilicas in France. The Madeleine dates from the 12th century and was skillfully restored by Viollet-le-Duc. It consists of a narthex, with nave and aisles; a triple nave, without triforium, entered from the narthex by three doorways; transepts; and a choir with triforium. The oldest portion of the church is the nave, constructed about 1125. Its groined vaulting is supported on wide, low, semicircular arches, and on piers and columns, the capitals of which are embellished with sculptures full of animation. The narthex was probably built about 1150. The central entrance, leading from it to the nave, is one of the most remarkable features of the church; it consists of two doorways, divided by a central pier supporting sculptured figures, and is surmounted by a tympanum carved with a representation of Christ bestowing the Holy Spirit upon His apostles. The choir and transepts are later in date than the rest of the church, which they surpass in height and grace of proportion. They resemble the eastern portion of the church of St Denis, and were doubtless built in place of a ROMANESQUE CHURCH damaged in a fire in 1165. A crypt beneath the choir is perhaps the relic of a previous Romanesque church which was destroyed by fire in 1120. The west façade of the Madeleine has three portals; that in the centre is divided by a pier and surmounted by a tympanum sculptured with a bas-relief of the Last Judgment. The upper portion of this front belongs to the 15th century. Only the lower portion of the northernmost of the two flanking towers is left, and of the two towers which formerly rose above the transept that to the north has disappeared. Of the other buildings of the abbey, there remains a chapter-house (13th century) adjoining the south transept. Most of the ramparts of the town, which have a circuit of over a mile, are still in existence. In particular the Porte Neuve, consisting of two massive, towers flanking a gateway, is in good preservation. There are several interesting old houses, among them one in which Theodore of Beza was born. Of the old parish church, built in the 17th century, the clock-tower alone is left. A mile and a half from Vézelay, in the village of St Père-sous-Vézelay, there is a remarkable Burgundian Gothic church, built by the monks of Vézelay in the 15th century. The west façade, flanked on the north by a fine tower, is richly decorated; its lower portion is formed of a projecting porch surmounted by pillars and colonnades. The choir was completed after 1430.

The history of Vézelay is bound up with its Benedictine abbey, which was founded in the 9th century under the influence of the abbey of Cluny. This dependence was soon shaken off by the younger monastery, and the acquisition of the relics of St Magdalene, soon after its foundation, began to attract crowds of pilgrims, whose presence enriched both the monks and the town which had grown up round the abbey and acknowledged its supremacy. At the beginning of the 12th century the exactions of the abbot Artaud, who required money to defray the expense of the reconstruction of the church, and the refusal of the monks to grant political independence to the citizens, resulted in an insurrection in which the abbey was burnt and the abbot murdered. During the next fifty years three similar revolts occurred, fanned by the counts of Nevers, who wished to acquire the suzerainty over Vézelay for themselves. The monks were, however, aided by the influence both of the Pope and of Louis VII., and the towns- men were unsuccessful on each occasion. During the 12th century Vézelay was the scene of the preaching of the second crusade in 1146, and of the assumption of the cross in 1190 by Richard of Cornwall and Philip of France. The result of the abbey began to diminish in 1280 when the Benedictines of St Maximin in Provence affirmed that the true body of St Magdalene had been discovered in their church; its decline was precipitated during the wars of religion of the 16th century, when Vézelay suffered great hardships.

VIANDEN, an ancient town in the grand duchy of Luxembourg, on the banks of the Our, close to the Prussian frontier. Pop. (1905) 2350. It possesses one of the oldest charters in Europe, granted early in the 14th century by Philip, count of Vianden, from whom the family of Nassau-Vianden sprung, and who was consequently the ancestor of William of Orange and Queen Wilhelmina of Holland. The semi-mythical foundress of this family was Bertha, "the White Lady" who figures in many German legends. The original name of Vianden was Weniensis or Vienna, and its probable derivation is from the Celtic Vien (rock). The extensive ruins of the ancient castle stand on an eminence of the little town, but the chapel which forms part of it was restored in 1849 by Prince Henry of the Netherlands. The size and importance of this castle in its prime may be guessed from the fact that the Knights' Hall could accommodate five hundred men-at-arms. A remarkable feature of the chapel is an hexagonal hole in the centre of the floor, opening upon a bare subterranean dungeon. This has been regarded as an instance of the "double chapel," but it seems to have been constructed by order of the crusader Count Frederick II. on the model of the Church of the Holy Sepulchre. In the neighbourhood of Vianden are other ruined castles, notably those of Stolzembourg and Falkenstein. The
VIANNA DO CASTELLO—VICAIRE

little town and its pleasant surroundings have been praised by many, among others by Victor Hugo, who resided here on several occasions. During his last visit he wrote his fine work "Luttain does not differ from time to time the office for the

VIANNA DO CASTELLO, a seaport and the capital of the district of Viana do Castelo, Portugal; at the mouth of the river Lima, which is here crossed by the iron bridge of the Oporto-Valença do Minho railway. Pop. (1900) 10,000. Viana do Castello has manufactures of lace and dairy produce. Its fisheries are important. Salmon and lampreys are exported, both fresh and preserved. The administrative district of Viana (C. Viana) is bounded on the north by the principal river of the province of Entre Minho e Douro (p. 243). Pop. (1901) 215,267; area, 857 sq. m.

VIAREGGIO, a maritime town and sea-bathing resort of Tuscan Italy, in the province of Lucca, on the Mediterranean, 13 m. N.W. of Pisa by rail, 7 ft. above sea-level. Pop. (1906) 14,863 (town); 21,557 (commune). Being sheltered by dense pine-woods on the north, and its malaria having been banished by drainage, it is frequented as a winter resort, and in summer by some thousands for its sea-bathing. In 1740 the population was only 300, and in 1841, 6549. The body of Vianede emigrated on 17 November 1529, and the Romans the Vandens by his death by drowning in 1822. The town possesses a school of navigation and a technical school, and carries on some shipbuilding.

VIATICUM (a Latin word meaning "provision for a journey"); Gr. ἑκτικόν, is often used by early Christian writers to denote the sacrament of the Eucharist, and is sometimes also applied to baptism. Ultimately it came to be employed in a restricted sense to denote the last communion given to the dying. The 13th chapter of the council of Nicaea is to the effect that "none, even of the lapsed, shall be deprived of the last and most necessary viaticum (oblation)" and that the bishop, or rather the priest, is to give the obligation to all who desire to partake of the Eucharist on the point of death. The same principle still rules the canon law, it being of course understood that penitential discipline, which in ordinary circumstances would have been due for their offence, is to be undergone by lapsed persons who have thus received the viaticum, in the event of recovery. In extreme cases it is lawful to administer the viaticum to persons not fasting, and the same person may receive it frequently if his illness be prolonged. The ritual to be observed in its administration is that of the Eucharist and the last communion of the sick, except in the words of the formula, which is "acipe, carissime frater (carissima soror), viaticum corporis nostri Jesu Christi, quod te custodiat ab hoste maligno, protegit te, et perducat te ad vitam aeternam. Amen." Afterwards the priest raises his fingers in a little water, which the communicant drinks. The viaticum is given before extreme unction, a renewal of the medial practice due to the importance of receiving the Eucharist while the mind is still clear. In the early centuries the sick, like those in health, generally received both kinds, though there are instances of the viaticum being given under one form only, sometimes the bread and sometimes, where swallowing was difficult, the wine. In times of persecution laymen occasionally carried the viaticum to the sick, a practice that persisted into the 9th century, and deacons continued to do so even after the Council of Nicaea (near Lyons) in 900 restricted the function to priests.

VIBORG, a town of Denmark, capital of the amt (county) of its name, lying in the bleak midland district of Jutland, though the immediate situation, on the small Viborg lake, is picturesque. Pop. (1901) 6823. It has a station on the railway running east and west between Langevæn and Yembr. The most notable building is the cathedral (1130-1169, restored 1864-1876). The Black Friars' church is of the 13th century, and the museum possesses specimens of the Stone, Bronze and Iron Ages, also medieval antiquities. The Borgevold Park borders the lake on the site of a former castle. The industries embrace distilleries, iron foundries and manufactures of cloth. The country to the south attains to a certain degree of beauty near Lake Hald, where the ground is slightly elevated.

VIBORG (Finnish Viljuri), capital of a province of the same name in Finland, is situated at the head of the Bay of Viborg in the Gulf of Finland, at the mouth of the Saima Canal and on the railway which connects St Petersburg with Helsingfors. Population of the town (1904) 24,672, of the province 458,269. The Saima Canal (37 m. long), a fine engineering work, connects with the sea Lake Saima—the principal lake of Finland, 240 ft. above sea-level—and a series of others, including Puruvesi, Orivesi, Höytänen and Kallavesi, all of which are navigated by steamers, as far north as Isalimi in 63° N. lat. Viborg is thus the seaport of Karelia and eastern Savolaks, with the towns of the lakes Turku and Pori (1004), St Petersburg (3933), Myslivt (2687), Kuospio (13,510) and Isalimi, with their numerous saw-mills and iron-works. Viborg stands most picturesquely on the glaciated and dome-shaped granite hills surrounding the bay, which is protected at its entrance by the naval station of Bjørkø and at its head by several forts. The castle of Viborg, built in 1293 by Marshal Torkel Knutson, was the first centre for the spread of Christianity in Karelia, and for establishing the power of Sweden; it is now used as a prison. Its lofty and elegant tower has fallen into decay. The court-house (1839), the town-house, the gymnasium (1841; with an excellent library), and the market are in the modern part, which extends to the city. There are also a lyceum and two higher schools for girls, a school of navigation and several primary schools, both public and private, a literary and an agricultural society, and several benevolent institutions. There are foundries, machine works and saw-mills, and a considerable export of timber and wood products. The coasting trade is also considerable.

The environs are most picturesque and are visited by many tourists in the summer. The park of Monrepos (Old Viborg), in a bay dotted with dome-shaped islands, is specially attractive. The scenery of the Saima Canal and of the Finnish lakes with the grand Æ of Pungaharju; the Imatra rapids, by which the Vuoksen discharges the water of Lake Saima into Lake Ladoga, with the castle of Kexholm at its mouth; Serdobol and Valamo monastery on Lake Ladoga—all visited from Viborg—attract many tourists from St Petersburg as well as from other parts of Finland.

VIURNUM, in medicine, the dried bark of the black haw or Viburnum prunifolium, grown in India and North America. The black haw contains viburnin and valerianic, tannic, gallic, citric and malic acids. The British Pharmacopoeial preparation is the Extractum Viburni prunifolii; the United States preparation is the fluid extract prepared from the Viburnum opulus. The physiological action of viburnin is to lower the blood pressure. In overdose it depresses the motor functions of the spinal cord and so produces loss of reflex and paralysis. Therapeutically the drug is used as an anti-spasmodic in dysmenorrhoea and in menorrhagia.

VICAIRE, LOUIS GABRIEL CHARLES (1848-1900), French poet, was born at Belfort on the 25th of January 1848. He spent a part of the campaign of 1870, and then settled in Paris to practise at the bar, which, however, he soon abandoned for literature. His work was twice "crowned" by the Académie, and in 1892 he received the cross of the Legion of Honour. Born in the Vosges, and a Parisian by adoption, Vicaire remained all his life an enthusiastic lover of the country to which his family belonged—La Bresse—spending much of his time at Ambérieu. His freshest and best work is his Émaux bressans (1884), a volume of poems full of the gaiety and spirit of the old French chansons. Other volumes followed: Le Livre de la patrie, L'Heure enchantée (1890), À la bonne franquette (1892), Au bois joli (1894) and Le Clos des fées (1896). At the famous Parnassian building with Jules Truffer two short pieces for the stage, Fleurs d'oîr (1890) and La Force du mari refusé (1895); also the Miracle de Saint Nicolas (1888). With his friend Henri Beaulieu he produced a parody of the Decadents entitled Les Délivresances and signed Adoré Floupette. His fame rests on his Émaux bressans and on his Rabelaisian drinking songs; the religious and fairy poems.
VICAR

(Vicars APOSTOLIC, substitute), a title, more especially ecclesiastical, describing various officials acting in some special way for the administration of the Church. Vicars Apostolic were never used for Bishops, but the name Vicar was often applied to an under-slave kept by another as part of his private property. The vicarius was an important official in the reorganized empire of Diocletian. It remained as a title of secular officials in the middle ages, being applied to persons appointed by the Roman emperor to judge cases in distant parts of the empire, or to wield power in certain districts, or, in the absence of the emperor, over the whole empire. The prefects of the city at Rome were called Vicarii Romae. In the early middle ages the term was applied to representatives of a count administering justice for him in the country or small towns and dealing with unimportant cases, levying taxes, &c. Monasteries and religious houses often employed a vicar to answer to their feudal lords for those of their lands which did not pass into mortmain.

The title of "vicar of Jesus Christ," borne by the popes, was introduced as their special designation during the 8th century, in place of the older style of "vicar of St Peter" (or vicarius principis apostolorum). In the early Church other bishops commonly described themselves as vicars of Christ (Du Cange gives an example as late as the 9th century from the capitularies of Charles the Bald); but there is no proof of their case, or indeed in that of "vicar of St Peter," given to the popes, that it was part of their formal style. The assumption of the style "vicar of Christ" by the popes coincided with a tendency on the part of the Roman chancery to insist on placing the pontiff's name before that of emperors and kings and to refuse to other bishops the right to address him as "brother" (Mas Latrie, 5, "Sabinien," p. 1047). It was not till the 13th century that the alternative style "vicar of St Peter" was definitely forbidden, this prohibition thus coinciding with the extreme claims of the pope to rule the world as the immediate "vicar of God" (see INNOCENT III).

All bishops were looked upon as in some sort vicars of the pope, but the title vicarius sedis apostolici came especially to be applied as an alternative to legatus sedis apostolicae to describe papal legates to whom in certain places the pope delegated a portion of his authority. Pope Benedict XIV, tells us in his treatise De synodo dioecesana that the pope often names vicars-apostolic for the government of a particular diocese because the episcopal see is vacant or, being filled, the titular bishop cannot fulfil his functions. The Roman Catholic Church in England was governed by vicars-apostolic for the greater part of the 8th century, when Pius IX re-established the hierarchy. Vicars-apostolic at the present day are nearly always titular bishops taking their titles from places not acknowledging allegiance to the Roman Catholic Church. The title is generally given by the pope to bishops sent on Eastern missions.

A neighbouring bishop was sometimes appointed by the pope vicar of a church which happened to be without a pastor. A special vicar was appointed by the pope to superintend the spiritual affairs of Rome and its suburbs, to visit its churches, monasteries, &c., and to correct abuses. It became early a custom for the prebendaries and canons of a cathedral to employ "priest-vicars" or "vicars-choral" as their substitutes when it was their turn as hebdomedary to sing High Mass and conduct divine office. In the English Church these priest-vicars remain in the cathedrals of the old foundations as beneficed clergy on the foundation; in the cathedrals of the new foundation they are paid by the chapters. "Lay vicars" also were and are employed to sing those parts of the office which can be sung by laymen.

In the early Church the assistant bishops (chorespiscopi) were sometimes described as vicarii episcoporum. The employment of such vicars was by no means general in the early Church, but towards the 13th century it became very general for a bishop to employ a vicar-general, often to curb the growing authority of the archdeacons. In the middle ages there was not a very clear distinction drawn between the vicar and the official of the bishop. When the voluntary and contentious jurisdiction came to be distinguished, the former fell generally to the vicars, the latter to the officials. In the style of the Roman chancery, official documents are addressed to the bishops or their vicars for dioceses beyond the Alps, but for French dioceses to the bishops or their officials. The institution of vicar-general to help the bishop is now general in the Catholic Church, but it is not certain that a bishop is obliged to have such an official. He may have two. Such a vicar possesses an ordinary and not a delegated jurisdiction, which he exercises like the bishop. He cannot, however, exercise functions which concern the episcopal order, or confer benefices without express and particular commission. In the Anglican Church a vicar-general is employed by the archbishop of Canterbury and some other bishops to assist in such matters as ecclesiastical visitations. In the Roman Catholic Church bishops sometimes appoint lesser vicars to exercise a more limited authority over a limited district. They are called "vicars-forane" or rural deans. They are entrusted especially with the surveillance of the parish priests and other priests of their districts, and with matters of ecclesiastical discipline. They are charged especially with the care of sick priests and in case of death with the celebration of their funerals and the charge of their vacant parishes. In canon law priests doing work in place of the parish priest are called vicars. Thus in France the curé or head priest in a parish church is assisted by several vicars.

Formerly, and especially in England, many churches were appropriated to monasteries or colleges of canons, whose custom it was to appoint one of their own body to perform divine service in such churches, but in the 13th century such corporations were obliged to appoint permanent paid vicars who were called perpetui vicarii. Hence in England the distinction between rectors, who draw both the greater and lesser tithes, and vicars, who are attached to parishes of which the greater tithes, formerly held by monasteries, are now drawn by lay rectors. (See APPROPRIATION.)

Favre (Niort, 1883, &c.); Migne, Encyclopædia Theologica, series i. vol. 10 (Droit Canon.); Comte de Mas Latrie, Trésor de chronologie (Paris, 1889); and Sir R. J. Phillimore, Ecclesiastical Law of the Church of England (2nd ed. 1895). (E. O'N.)

VICE. (1) (Through Fr. from Lat. vitium), a fault, blemish, more specifically a moral fault, hence depravity, sin, or a particular form of depravity. In the medieval morality plays a special character who acted as an attendant on the devil was styled the Vice," but sometimes took the name of specific vices, such as Envy, Pride, Iniquity and the like. He was usually dressed in the garb that is identified with that of the domestic fool or jester, and was armed with a wooden sword or dagger. (2) (M.E. vyse, vise or eye; Fr. vis; Lat. vitis, a vine, or byrony, i.e. something that twists or winds), a portable or fixed tool or appliance which holds or grips an object while it is being worked; a special form of clamp. The tool consists essentially of movable jaws, either joined by a hinge or moving on slides, and the closing motion is applied by a screw, whence the name, as of something which turns or winds, or by a lever, ratchet, &c. (see TOOLS). (3) (Lat. vicar, in place of, abl. sing. vicarius, not found in the nom.), a term chiefly used as a prefix, in combination with names of office-holders, indicating a position subordinate or alternative to the chief office-holder, especially one who takes second rank or acts in default of his superior, e.g. vice-chairman, vice-admiral, &c.

VICE-CHANCELLOR, the deputy of a chancellor (q.v.). In the English legal system vice-chancellors in equity were formerly important officials. The first vice-chancellor was appointed in 1813 in order to lighten the work of the lord chancellor and the master of the rolls, who were at that time the sole judges in equity. Two additional vice-chancellors were appointed in 1841. The vice-chancellors sat separately from the lord chancellor and the lords justices, to whom there was an appeal from their decisions. By the Judicature Act 1873
VICENTE
they became judges of the High Court of Justice, retaining their
titles, but it was enacted that on the death or retirement of any
"
one his successor was to be styled
judge." Vice-chancellor
Sir J. Bacon (1798-1895) was the last to hold the office, resigning
in 1886.

Vice-chancellor is also the title given to the judge of the duchy
For the vice-chancellor of a university,
court of Lancaster.

CHANCELLOR.
VICENTE, GIL (1470-1540), the father of the Portuguese
drama, was born at Guimaraes, but came to Lisbon in boyhood
and studied jurisprudence at the university without taking a
degree. In 1493 we find him acting as master of rhetoric to the
duke of Beja, afterwards King Manoel, a post which gave him
admission to the court; and the Cancioneiro Geral contains some
early lyrics of his which show that he took part in the famous
seroes do paco.
The birth of King John III. furnished the
occasion for his first dramatic essay
The Neatherd's Monologue,
which he recited on the night of the 7th-8th June 1502 in the
queen's chamber in the presence of King Manoel and his court.
It was written in Spanish out of compliment to the queen, a
daughter of Ferdinand and Isabella, and because that language
was then the fashionable medium with the higher classes. This
manger-hymn, which was a novelty in Portugal, so pleased the
king's mother, the infanta D. Beatriz, that she desired Gil
Vicente to repeat it the following Christmas, but he composed
instead the CastUian Pastoral Auto, a more developed piece in
see

run for. more than one night. The Auto of the Sybil Cassandra
(produced at the monastery of Euxobregas at Christmas 1503),
the Auto of St Martin (played in the church at Caldas on the
feast of Corpus Christi 1504), and a mystery play, the Auto of
the Four Seasons, all belong, like their predecessors, to the
religious drama, but in 1505 Gil Vicente wrote a comedy of real

clever farce depicting an amorous poor squire and his ill-paid
servants, and opens a rich portrait-gallery in which the dramatist
includes every type of Portuguese society, depicting the failings of each with the freedom of a Rabelais. The next three
years saw no new play, but in 1506 Gil Vicente delivered before
the court at Almeirim a sermon in verse on the theme Non volo,

which he protested against the intolerance
just as in 1531 he interfered to prevent a
massacre of the " New Christians " at Santarem. The Auto
of the Soul, a Catholic prototype of Goethe's Faust, containing
some beautiful lyrics, appeared in 1508, and in 1509 the Auto
da India, a farce which has the eastern enterprise of his countrymen for background, while the Auto da Fama (1516) and the
Exhortation to War (1513) are inspired by the achievements
that made Portugal a world-power. If the farce of The Old Man
of the Garden (1514) breathes the influence and spirit of the

The Comedy of the Arms of Ihs City of
Coimbra (1527) has a considerable antiquarian interest, and the
facetious Ship of Love is full of quaint imagery, while the lengthy
Auto of the Fair (1527), with its twenty-two characters, may
be described as at once an indictment of the society of the time
from the standpoint of a practical Christian and a telling appeal
for the reform of the church. In an oft-quoted passage, Rome
personified comes to the booth of Mercury and Time, and offers
"
her indulgences, saying,
Sell me the peace of heaven, since I
have power here below "; but Mercury refuses, declaring that
Rome absolves the whole world and never thinks of her own
sins. The play concludes with a dance and hymn to the Blessed

festa for the Conde de Vimioso (1535), and dramatizing the
romances of chivalry in D. Duardos and Amadis de Gaula, Gil
Vicente ended his dramatic career in 1536 with a mirthful

comedy, The Garden of Deceptions. He spent the evening of
life in preparing his works for the press at the instance of King
John III., and died in 1540, his wife Branca Bezerra having
predeceased him. Four children were bom of their union, and
among them Paula Vicente attained distinction as a member
of the group of cultured women who formed a sort of female
academy presided over by the infanta D. Maria.

The

forty-four pieces comprising the theatre of Gil Vicente

fall

from the point of view of language into three groups: (i) those in
Portuguese only, numbering fourteen; (2) those in Spanish only,
numbering eleven; and (3) the bilingual, being the remainder,
nineteen in all. They are also from their nature divisible as follows
a. Works of a religious character or of devotion.
Most of these
are a development of the mystery or miracle play of the middle
ages; and they may be subdivided into (i) Biblical pieces; (2) pieces
founded on incidents in the life of a saint and .(3) religious allegories.
In this department Gil Vicente reaches his highest poetical nights,
and the Auto of the Soul is a triumph of elevation of idea and feeling
allied to beauty of expression,
b. Aristocratic works, or tragicomedies, the composition of which was the result of his contact
with the court these," though often more spectacular than strictly
dramatic, are remarkable for opulence of invention and sweetness
of versification,
c. The popular theatre, or comedies and farces.
Gil Vicente's plays contain some evidence of his knowledge and
appreciation of French poetry e.e. The Beira Judge wears a general
likeness to the products of the Oercs de la Basocne, and his Testament of Maria Parda is reminiscent of the better-known work of

Most of the plays are written in the national
Francois Villon.
redondilha verse, and are preceded by initial rubrics stating the
date when, the place where, in whose presence, and on what occasion
each was first performed, and these make up the annals of the first
thirty-four years of the Portuguese drama. Most of them were put
on the stage at the different royal pala_ces; some, however, were
played in hospitals, and, it is said, even in churches, though this is
doubtful; those of which the subjects are liturgical at the great
festivals of Christmas, Epiphany and Maundy Thursday, others on
the happening of some event of importance to the royal family or
the nation. Many of the plays contain songs, either written and
set to music by the author, or collected by him from popular sources,
while at the close the characters leave the stage singing and dancing,
as was the custom in the medieval comedjes.
Though so large a proportion of his pieces are' in Spanish, they
are all eminently national in idea, texture and subject. No other
Portuguese writer reflects so faithfully the language, types, customs
and colour of his age as Gil Vicente, and the rudest of his dramas
are full of genuine comic feeling. If they never attain to perfect


VICENZA

art, they possess the supreme gift of life. None of them are, strictly speaking, historical, and he never attempted to write a tragedy. Hints sometimes, he would permute the products of the classical theatre as did Sà de Miranda and Ferreira, but though he remained faithful to the Old or Spanish school in form, yet he had imbibed the critical spirit and the wit of the age, without its culture or erudition. Endowed by nature with acute observation and considerable powers of analysis, Gil Vicente possessed a felicity of phrase and an unmatched knowledge of popular superstitions and superstition. To the above, he was a moralist, his fire and ridicule as his main weapons; but if his invective is often stinging it is rarely bitter, while more than one incident in his career shows that he pitted his heart against an impartial judgment, and his balanced outlook on life. If he owed his early success to Juan de Encina, he repaid the debt by showing a better way to the dramatists of the neighbouring country, so that he may truly be termed the founder of the Portuguese drama. Vega and Calderon. Much of his fame abroad is due to his position as an innovator, and, as Dr Garnett truly remarked, “One little corner of Europe alone possessed in the early 16th century a drama at once living, indigenous and admirable as literature.”

Gil Vicente perhaps lacks psychological depth, but he possesses a breadth of mental vision and a critical acumen unknown in any national dramatist. In his attitude to religion he appears the spokesman of the better men of his age and country. A convinced but liberal-minded Catholic, he has no sympathy with attacks on the unity of the Church, but he cries out for a reform of morals, privileges, and clerical arrogance. He repels the attack on his clergy, and opens the bitter things of the popes and their court. He strove to take a middle course at a time when moderation was still possible, though, had he lived a few years longer, in the reign of religious intolerance, the innovation, however small, in the field of religious toleration would have made him comprehend his exiles, or not a worse fate. He is a great dramatist in embryo, who, if he had lived later, we might have witnessed this liberating and expression, might with added culture have surpassed Calderon and taken his place as the Latin and Catholic rival of Shakespeare.

Some of the plays were printed in Gil Vicente’s lifetime, but the first collected edition, which included his letters, was published after his death by his son Luiz (Lisbon, 1662), with a dedication to King Sebastian. A second edition appeared in 1586, with various omissions and alterations made at the instance of the Inquisition. A critical edition of the text in 3 vols. came out at Hamburg (1834), with a glossary and introductory essay on Vicente’s life and writings, and a poor reprint of this edition is dated Lisbon 1852. He has never found a translator, doubtless because of the difficulty of rendering his form and explaining his wealth of topographical allusions.

(E. Fr.)

VICENZA, a town and episcopal see of Venetia, Italy, capital of the province of Vicenza, 42 m. W. of Venice by rail, 131 ft. above sea-level. Pop. (1901) 32,200 (town): 47,585 (commune). It lies at the northern base of the Monti Berici, on the lower flank of the Oderzo. It was named after the town of Vicenza, which it encloses. It was surrounded by 13th-century walls, once about 3 m. in circumference, but these are now in great part demolished. Though many of the streets are narrow and irregular, the town has a number of fine buildings, many of them the work of Andrea Palladio.

The best of these is the town hall, otherwise known as the basilica, one of the finest works of the Renaissance period, of which Palladio himself said that it might stand comparison with any similar work of antiquity. It is especially noteworthy owing to the difficulty of the task the architect had to accomplish in embalming the dead of the Palazzo della Ragione, a Gothic building of the latter half of the 13th century, which the colonnades of the basilica entirely enclose. It was begun in 1349, but not finished till 1614, long after his death. He also designed many of the fine palaces which give Vicenza its individuality; only two of them, the Barbarano and Chierici palaces (the latter containing the picture gallery), have two orders of architecture, the rest having a heavy rustic basis with only one order above it. Many palaces, however, have been wrongly attributed to him which are really the work of Scarpagnino and other masters. The buildings of the Palazzo della Ragione were ordered by Rocco Olimpico was begun by him, but only finished after his death; it is a remarkable attempt to construct a theatre in the ancient style, and the stage, with the representation of streets ascending at the back, is curious. The cathedral, which is Italian Gothic, dating mainly from the 13th century, consists of a nave with eight chapels on each side, and a very high Renaissance domed choir; it contains examples of the Montagnas and of Lorenzo da Venezia. The churches of S. Lorenzo (1280–1344) and S. Corona (1260–1300), both of brick, are better examples of the works of the great Giovanni Serpentini, and perhaps some of the works of art—s. latter a very fine “Baptism of Christ,” by Giovanni Bellini. In S. Stefano is an imposing altar-piece by Palma Vecchio. The church of SS. Felice e Fortunato was restored in A.D. 975, but has been much altered, and was transformed in 1613. The portal is of 1154, and the Lombardesque square brick tower of 1160. Under it a mosaic pavement with the names of the donors, belonging to the original church of the Lombard period (?), was discovered in 1895 (see F. Berchet, III. Relazione dell’Ufficio Regionale per la conservazione dei monumenti del Veneto, Venice, 1895, p. 111). None of the churches of Vicenza is the work of Palladio. Of the Palladian villas in the neighbourhood, La Rotonda, or Villa Palladiana, 1½ m. S.E., deserves special mention. It is a square building with Ionic colonnades and a central dome, like an ancient temple, but curiously unlike a Roman villa. Vicenza also contains some interesting remains of the Gothic period besides the churches mentioned—the lofty tower of the town hall (1174–1311–1446; the Piazza contains two columns of the Venetian period, with S. Theodore and the Lion of S. Mark on them) and several palaces in the Venetian style. Among these, the especially noteworthy are the beautiful Casa Longo (1553–1568), and Casa Gritti (1570–1580). The Casa Oderzo, from 1481, but still half Gothic, prettily decorated. Some of these earlier houses had painted façades. The fine picture of “Christ bearing the Cross” (wrongly ascribed to Giorgione), according to Burchardt once in the Palazzo Loschi, is now in the Gardner collection at Boston, U.S.A. The most important manufacture is that of silk, which employs a large proportion of the inhabitants. Great numbers of mulberry trees are grown in the neighbourhood. Woollen and linen cloth, leather, earthenware, paper, and articles in gold and silver are also made in Vicenza, and a considerable trade in these articles, as well as in cotton and wine, is carried on.

Vicenza is the ancient Vicellia, an ancient town of Venetia. It was of less importance than its neighbours Verona and Padua, and we hear little of it in history. It no doubt acquired Roman citizenship in 49 B.C., and became a municipium; and is mentioned two years later apropos of a dispute between the citizens and their slaves. Remains of a theatre and of a late mosaic pavement with hunting scenes have been found, three of the bridges across the Bacchiglione and Retrone are of Roman origin, and arches of the aqueduct exist outside the city. A road diverged here to Ostergium (Oderzo) from the main road between Verona and Patavium (Padua): see T. Mommsen in Corp. Inscriptionum Latinarum. (Berlin, 1883), p. 304. It suffered severely in the invasion of Attila, by whom it was laid waste, and in subsequent incursions. It was for some time during the middle ages an independent republic, but was subdued by the Venetians in 1405. Towards the end of the 15th century it became the seat of a school of painting strongly influenced by Mantegna, of which the principal representatives were, besides Bartolomeo Montagna, its founder, Giovanni Serpentini and Giovanni Buonconsiglio. Good altar-pieces by the former exist in S. Bartolommeo, S. Corona, and the cathedral, and several pictures also in the picture gallery; while his son Benedetto had greater merits as an engraver than as a painter. Some works by both of the last two exist at Vicenza—the best is a Pietà in tempera in the gallery by Buonconsiglio, by whom is also a good Madonna at S. Rocco. Andrea Palladio (1518–1580) was a native of Vicenza, as was also a contemporary, Vincenzo Scanozzi (1522–1616), who was largely dependent on him, but is better known for his work on architecture (Architettura universale, 1615). Palladio inaugurated a school of followers who continued to erect similar buildings in Vicenza even down to the French Revolution.

See G. Pettinà, Vicenza (Bergamo, 1905).
VICEROY—VICKSBURG

VICEROY (from O. Fr. viceroy, mod. viceroi, i.e. Lat. vice, in place of, and rey or roi, king), the governor of a kingdom or colony to whom is delegated by his sovereign the power to exercise regal authority in his name. The lord-lieutenant of Ireland and the governor-general of India are frequently referred to as viceroys. The title has no official recognition in British government.

VICH, a city of north-eastern Spain, in the province of Barcelona, on the river Guadià, a small right-hand tributary of the Ter, and on the Granollers-Ripoll railway. Pop. (1900) 11,628. Vich is an ancient episcopal city, with narrow, ill-paved streets and many curious old houses irregularly built on the slope of a hill, which rises above one of the side valleys of the Ter basin. The cathedral, founded about 1490 and built chiefly in the 14th century, was to some extent modernized in 1869. The Gothic cloisters (1340) are remarkable for the beautiful tracery in their windows, and there is a fine altar of sculptured marble. Some valuable manuscripts are preserved in the library of the chapter-house, and the museum contains an interesting archaeological collection, besides statuary, pictures, &c. The city is locally celebrated for the manufacture of sausages; other industries include tanning and the weaving of linen and woolen fabrics.

Vich, the Ausa of the ancient geographers, was the chief town of the Ausetani; in the middle ages it was called Ausaona and Vicas Ausonensis, hence Vie de Osona, and simply Vich. It was the scene of the meeting of the deputies of Osona, a province of the kingdom of Aragon, and was sometimes known as the town of El Aragon. Vich is situated on the right bank of the Allier, 33 m. S. by E. of Moulins by rail. Pop. (1906) 14,520. Vichy owes its importance to its mineral waters, which were well known in the time of the Romans. They afterwards lost their celebrity and did not regain it till the 17th century, in the latter half of which they were visited and written of by Madame de Sévigné. Within the town or in its immediate vicinity there are between thirty and forty springs, twelve of which are state property, four of these having been tapped by boring. The waters of those which are open to the public are vinegarous, alkaline, and very cold; those which are the most celebrated and frequented are the Grande Grille, L'Hôpital, the Célestins, and Lardy. The most copious of all, the Puits Carré, is reserved for the baths. All these, whether cold or hot (maximum temperature, 113° F.), are largely charged with bicarbonate of soda; some also are chalybeate and tonic. The waters, which are limpid, have an alkaline taste and emit a slight odour of sulphuretted hydrogen. They are recommended in cases of stomachic and liver complaint, also for diabetes, gravel and gout. Large quantities are bottled and exported. A luxurious bathing establishment, the property of the state, was opened in 1903. In addition to this, Vichy has the hydropathic establishments of Lardy, Larbaud and L'Hôpital, and a large military hospital, founded in 1843. A fine casino and two public baths contribute to its attraction. The promenade commands a splendid view of the mountains of Auvergne. Cuisset, about 1 m. distant, has similar mineral waters and a bathing establishment.

VICKSBURG, a city and the county-seat of Warren county, Mississippi, U.S.A., on the Mississippi and Yazoo rivers, 1 m. by rail W. of Jackson, and 236 m. N. by W. of New Orleans. Pop. (1860) 13,373; (1900) 14,834, of whom 8,147 were negroes, (1910 census) 70,814, being the second largest city in Mississippi. It is served by the Alabama & Vicksburg, the Vicksburg, Shreveport & Pacific, and the Yazoo & Mississippi Valley railways, and by steamboat lines. It is built among the Walnut Hills, which rise about 260 ft. above the river. Among the principal buildings and institutions are the court-house, standing on one of the highest hills, a fine Federal building, the city hall, a state charity hospital, an infirmary, a sanatorium, a public library, the medical college of the University of Mississippi, All Saints' Episcopal College (Protestant Episcopal, 1809) for girls, Saint Francis Xavier's Academy, and Saint Aloysius College (Roman Catholic). The Civil War battle-ground has been converted into a beautiful National Military Park, containing 283 acres and containing numerous markers, memorials and monuments, including one (1910) to Lieut.-General Stephen Dill Lee, who was superintendent of the Military Park from 1899 until his death in 1908. On the bluffs just beyond the northern limits of the city and adjoining the Military Park is the Vicksburg National Cemetery, in which are the graves of 16,892 Federal soldiers (12,769 unknown). The principal industry of Vicksburg is the construction and repair of rolling stock for steam railways. It has also a dry dock and cotton compresses; and among its manufactures are cottonseed oil and cake, hardwood lumber, furniture, boxes and basketry. In 1905 the factory products were valued at $1,887,924. The city has a large trade in long-staple cotton grown in the surrounding country. It is a port of entry but has practically no foreign trade.

The French built Fort St Peter near the site of Vicksburg early in the 18th century, and on the 2nd of January 1730 its garrison was murdered by the Yazoo Indians. As early as 1763 the Spanish erected Fort Nogales, and in 1798 this was taken by some United States troops and renamed Fort McHenry. The first permanent settlement in the vicinity was made about 1811 by Rev. Newell (or Newt) Vicks (d. 1849), a Methodist preacher. In accordance with his will a town was laid out in 1824, and Vicksburg was incorporated as a town in 1825, and was chartered as a city in 1836. The campaigns of which it was the centre in 1862 and 1863 are described below. Vicksburg was the home of Sergeant Smith Prentiss from 1832 to 1845.

Campaign of 1862–63.—Vicksburg is historically famous as being the centre of interest of one of the most important campaigns of the Civil War. The command of the Mississippi, which would imply the severance of the Confederacy into two halves, and also the reopening of free commercial navigation from St Louis to the sea, was one of the principal objects of the Western Union armies from the time that they began their southward advance from Illinois, Missouri and Kentucky in February 1862. A series of victories in the spring and summer carried them as far as the line Memphib-Corinth, but in the autumn they came to a standstill and were called upon by the Confederate authorities of the Southern army to join. These armies were accompanied by a flotilla of thinly armed but powerful gunboats which had been built on the upper Mississippi in the autumn of 1861, and had co-operated with the army at Port Donelson, Shiloh and Island No. 10, besides winning a victory on the river at Memphis.

At the same time a squadron of sea-going vessels under Flag-officer Farragut had forced the defences of New Orleans (q.v.) and, accompanied by a very small military force, had steamed up the great river. On reaching Vicksburg the heavy vessels again forced their way past the batteries, but both at Vicksburg and at Port Hudson they had to deal, no longer with low-sited fortifications, but with inconspicuous earthworks on bluffs far above the river-level, and they failed to make any impression. Farragut then returned to New Orleans. From Helena to Port Hudson the Confederates maintained complete control of the Mississippi, the improvised fortresses of Vicksburg, Port Hudson and Arkansas Post (near the mouth of Arkansas river) being the framework of the defence. It was to be the task of Grant's army around Corinth and the flotilla at Memphis to break up this system of defences, and, by joining hands with Farragut and clearing the whole course of the Mississippi, to cut the Confederacy in half.

The long and painful operations by which this was achieved grouped themselves into four episodes: (a) the Grenada expedition
of Grant's force, (b) the river column under McClean and Sherman, (c) the operations in the bayous, and (d) the final "overland" campaign from Grand Gulf. The country in which these operations took place divides itself sharply into two zones, the upland east of the river, upon which it looks down from high bluffs, and the levels west of it, which are a maze of bayous, backwaters and side channels, the intervening land being kept dry near the river itself by artificial banks (levees) but elsewhere swampy. At Vicksburg, it is important to observe, the bluffs trend away from the Mississippi to follow the course of the Yazoo, rejoining the great river at Memphis. Thus there are two obvious lines of advance for the Northern army, on the upland (Memphis and Grand Junction on Grenada-Jackson), and downstream through the bayou country (Memphis-Helena-Vicksburg). The main army of the defenders, who were commanded by Lieut.-General J. C. Pemberton, between Vicksburg and Jackson and Grenada, could front either north against an advance by Grenada or west along the bluffs above and below Vicksburg.

The first advance was made at the end of November 1862 by two columns from Grand Junction and Memphis on Grenada. The Confederates in the field, greatly outnumbered, fell back without fighting. But Grant's line of supply was one long single-line, ill-equipped railway through Grand Junction to Columbus, and the opposing cavalry under Van Dorn swept round his flank and, by destroying one of his principal magazines (at Holly Springs), without further effort compelled the abandonment of the advance. Meantime one of Grant's subordinates, McClean, was intriguing to be appointed to command an expedition by the river-line, and Grant meeting half-way an evil which he felt himself unable to prevent, had sent Sherman with the flotilla and some 30,000 men to attack Vicksburg from the water-side, while he himself should deal with the Confederate field army on the high ground. But the scheme broke down completely when Van Dorn cut Grant's line of supply, and the Confederate army was free to turn on Sherman. The latter, ignorant of Grant's retreat, attacked the Yazoo bluffs above Vicksburg (battle of Chickasaw Bayou) on December 29th; but a large portion of Pemberton's field army had arrived to help the Vicksburg garrison, and the Federals were easily repulsed with a loss of 2000 men. McClean now appeared and took the command out of Sherman's hands, informing him at the same time of Grant's retreat. Sherman thereupon proposed, before attempting fresh operations against Vicksburg, to clear the country behind them by destroying the Confederate garrison at Arkansas Post. This expedition was completely successful: at a cost of about 1000 men the fort and its 5000 defenders were captured on the 11th of January 1863. McClean, elated at his victory, would have continued to ascend the Arkansas, but such an eccentric operation would have been profitless if not dangerous, and Grant, authorized by the general-in-chief, Halleck, peremptorily ordered McClean back to the Mississippi.

Retreating from the upland, Grant sailed down the river and joined McClean and Sherman at Milliken's Bend at the beginning of February, and, superseding the resentful McClean, assumed command of the three corps (XIII., McClean; XV., Sherman; XVII., McPherson) available. He had already imagined the daring solution of his most difficult problem which he afterwards put into execution, but for the present he tried a series of less risky expedients to reach the high ground beyond Pemberton's flanks, without indeed much confidence in their success, yet desirous in these unhealthy flats of keeping up the spirits of his army by active work, and of avoiding, at a crisis in the fortunes of the war, any appearance of discouragement. Three such attempts were made in all, with the co-operation of the flotilla under Captain David D. Porter. First, Grant endeavoured to cut a canal across the bend of the Mississippi at Vicksburg, hoping thus to isolate the fortress, to gain a water connection with the lower river, and to land an army on the bluffs beyond Pemberton's left flank. This was unsuccessful. Next he tried to make a practicable channel from the Mississippi to the upper Yazoo, and so to turn Pemberton's right, but the Confederates, warned in time, constructed a fort at the point where Grant's advance emerged from the bayou. Lastly, an advance through a maze of creeks (Steele's Bayou expedition), towards the middle Yazoo and Haines's Bluff, encountered the enemy, not on the bluffs, but in the low-lying woods and islands, and these so harassed and delayed the progress of the expedition that Grant recalled it. Shortly afterwards Grant determined on the manoeuvre in rear of Vicksburg which established his reputation. The troops marched overland from Milliken's Bend to New Carthage, and on the 16th of April Porter's gunboat flotilla and the transports ran past the Vicksburg batteries. All this, which involved careful arrangement and hard work, was done by the 24th of April. General Banks, with a Union army from New Orleans, was now advancing up the river to invest Port Hudson, and by way of diverting attention from the Mississippi, a cavalry brigade under Benjamin Grierson rode from La Grange to Baton Rouge (600 m. in 16 days), destroying railways and magazines and cutting the telegraph
wires en route. Sherman's XV. corps, too, made vigorous demonstrations at Haines's Bluff, and in the confusion and uncertainty Pemberton was at a loss.

On the 30th of April McClernand and the XIII. corps crossed the Mississippi 6 m. below Grand Gulf, followed by McPherson. The nearest Confederate brigades, attempting to oppose the advance at Port Gibson, were driven back. Grant had now deliberately placed himself in the middle of the enemy, and abandoned all idea of covering Sturgis. Several barges carrying his supplies from Milliken's Bend to New Carthage, his long line of supply curving round the enemy's flank was very exposed. But his resolute purpose outweighed all text-book strategy. Having crossed the Mississippi, he collected wheeled transport for five days' rations, and on Sherman's arrival cut loose from his base altogether (May 27th). Free to move, he aimed north from the Big Black river, so as to interpose between the Confederate forces at Vicksburg and those at Jackson. A fight took place at Raymond on the 12th of May, and Jackson was captured just in time to forestall the arrival of reinforcements for Pemberton under General Joseph E. Johnston. The latter, being in supreme command of the Confederates, ordered Pemberton to come out of Vicksburg and attack Grant. But Pemberton did not so until it was too late. On May 16th Grant, with all his forces well in hand, defeated him at the battle of Champion Hill with a loss of nearly 4000 men, and sharply pursuing him drove him into Vicksburg. By the 19th of May Vicksburg and Pemberton's army in it was invested by land and water. Grant promptly assaulted his works, but was repulsed with loss (May 19th); the assault was repeated on the 22nd of May with the same result, and Grant found himself compelled to resort to a blockade.

Reinforcements were hurried up from all quarters, Johnston's force (east of Jackson), was held off by a covering corps under Blair (afterwards under Sherman), and though another unsuccessful assault was made on the 25th of June, resistance was almost at an end. On the 4th of July, the day after, far away in Pennsylvania, the great battle of Gettysburg had closed with Lee's defeat, the garrison of Vicksburg, 37,000 strong, surrendered.

VICO, GIOVANNI BATTISTA (1668-1744), Italian jurist and philosopher, was born at Naples on the 23rd of June 1668. At the university he made rapid progress, especially in jurisprudence, though preferring the study of history, literature, and science, and philosophy. Being appointed tutor to the nephews of the bishop of Ischia, G. B. Rocca, he accompanied them to the castle of Vatolla, near Cilento, in the province of Salerno. There he passed nine studious years, chiefly devoted to classical reading, Plato and Tacitus being his favourite authors, because “the former described the ideal man, and the latter man as he really is.” On his return to Naples he found himself out of touch with the prevailing Cartesianism, and lived quietly until in 1697 he gained the professorship of rhetoric at the university, with a scanty stipend of 100 scudi. On this he supported a growing family and gave himself to untiring study. Two authors exercised a weighty influence on his mind—Francis Bacon and Grotius. He was no follower of their ideas, indeed often opposed to them; but he derived from Bacon an increasing stimulus towards the investigation of certain great problems of history and philosophy, while Grotius proved valuable in his study of philosophic jurisprudence. In 1708 he published his De ratione studiorum, in 1710 De antiquissima Italorum sapientia, in 1720 De universali juris uno principio et uno uno, and in 1721 De constantia jurisprudentis. Of these works, one was prefaced at Rome for him as a candidate for the university chair of jurisprudence, but, as he had no personal or family influence was not elected. With calm courage he returned to his poverty and his favourite studies, and in 1725 published the first edition of the work that forms the basis of his renown, Princìpi d' una scienza nuova. In 1730 he produced a second edition of the Scienza nuova, so much altered in style and with so many substantial additions that it was practically a new work. In 1735 Charles III. of Naples marked his recognition of Vico's merits by appointing him historiographer-royal, with a yearly stipend of 100 ducats. Soon after his mind began to give way, but during frequent intervals of lucidity he made new corrections in his great work, of which a third edition appeared in 1744, prefaced by a letter of dedication to Cardinal Troiano Acquaviva. He died on the 20th of January of the same year. Fate seems to have conspired against him from the last. A fierce quarrel arose over his burial between the brotherhood to which he had belonged, and the university professors, who desired to escort his corpse to the grave. Finally the canons of the cathedral, together with the professors, buried the body in the church of the Gerolimini.

Vico has been generally described as a solitary soul, out of harmony with the rest of his age. It is easy to see the proximity of his views to an almost closer inquiry into the social conditions of Vico's time, and of the studies then flourishing, shows him to have been thoroughly in touch with them.

Owing to the historical past of Naples, and its social and economic condition at the end of the 17th century, the only study that really flourished there was that of law; and this soon penetrated from the courts to the university, and was raised to the level of a science. A great school of jurisprudence was thus formed, including many men of vast learning and great ability, although little known outside their immediate surroundings. Three men, however, obtained a place of position. By the condition of their universities, based on the Papal kingdom, based on a study of its laws and institutions and of its legal conflicts between the state and the court of Rome, Pietro Giannone was the initiator of what has been since known as civil jurisprudence, Giovanni Vico, the Son of Naples, who was especially distinguished for its accuracy and elegance. Vico raised the problem to a higher plane, by tracing the origin of law in the human mind and explaining the historical changes of the one by those of the other. Thus he made the original of glory of civilization, those ideas which constitute the modern historical-mechanic method. This problem he proceeded to develop in various works, until in his old age he arrived at his more complete, vision, which may be formulated as follows: If the principle of justice and law be one, eternal and immutable, why should there be so many different codes of legislation? These differences are not caused by difference of race, but only by a different construction of the laws of different people, even in that of the Romans. This problem is touched upon in his Orations or Inaugural Addresses (Orazioni o Protestazioni) and in his Minor Works (Scrilli minori). Finally he applied himself to a discussion in his in his Universal Law (Diritto universale), which is divided into two books. The first of these, De uno et universi juris principi e fine uno, was subdivided into two parts; so like wise was the second, with the respective titles of De constantia philologiae and De constantia jurisprudentis.

The following is the general idea derived from these researches. Vico held God to be the ruler of the world of nations, but ruling, as He rules nature, not directly but only through the free action of human beings; and of these, only a small portion is to be considered as miracles, but as He rules nature, by means of natural laws. If, therefore, the physicist seeks to discover the laws of nature by study of natural phenomena, so the philosopher should seek the change in human society, the construction of the human mind, and participates in its changes. This sentiment of justice is at first confused, uncertain and almost instinctive—is, as it were, a divine and religious inspiration instilled by Heaven into the primitive tribes of the earth. It is an unconfused, universal sentiment, not the personal, conscious and rational sentiment of the superior few. Hence the law to which it gives birth is enwrapped in religious forms which are likewise visible and palpable, inasmuch as primitive laws are of abstract, philosophical ideas. This law is not the individual work of any philosophical legislator, for no man was, or could be, a legislator at that time. It is first displayed in nature, in the natural law governing the primitive human community, and the names of leading legislators, which we so often find recorded in the history of primitive peoples, are symbols and myths, merely serving to mark an historic period or epoch by some definite and significative commitment of natural law. As a number of tribes, were then distinguished by personal names only. The first obscure and confused conception of law gradually becomes clearer and better defined. Its visible and religious form is then given to it, which turn and slowly replaced by the rational manifestation of the philosophic principles of law that gains the victory in the final stage of development, designated by Vico as that of civil and political law. This threefold development of the human mind, and participation in its changes. This is the origin of that fullness in the apparent difference between them, all have a common foundation, source and purpose. The human and civil
philosophic law of the third period is assuredly very different in form from the primitive law; but in substance it is, as it were, the abstractive reflection of the substance of justice and the same principles which were vaguely felt in primitive times. Hence one development of law may be easily transformed into another. Many men have already been assuredly a law for all nations and a natural law based on a general and unchanging principle of human nature, and therefore obligatory upon all. But Vico was able to discover a single and enduring principle (De universi juris uno principio et fine uno). On these grounds it has been sought to establish a close relation between Vico and Grotius. The latter clearly distinguished between an original or natural law, and a law deduced in advance, especially in so far as this conception is distinguished from the origin of society, and therefore of law. Grotius holds that its origin was not divine, but human, and neither collective, spontaneous nor unconscious, but personal, rational and conscious. He believed, moreover, that the origin of a law is best traced to the first principles of the natural order and the immutableparallel lines. But Vico maintained that the one was continually progressing towards the other, positive law showing an increasing tendency to draw nearer to natural and rational law. Hence the conception that law is of necessity a spontaneous birth, not the creation of any individual legislator; and hence the idea that it necessarily proceeds by a natural and logical process of evolution constituting its history. Vico may have derived from Grotius the idea of natural law; but his discovery of the historic evolution of law was first suggested to him by his study of Roman law. He saw that the history of Roman jurisprudence was a continuous process of discoveries, which could be said to be a development of the laws of the XIlI. Tables towards a wider, more general and more humane jus gentium. Having once derived this conception from Roman history, he appears to have applied it to the idea that the positive law of all nations, throughout history, is a continuous advance, keeping pace with the progress of civilization, towards the philosophic and natural law founded on the principles of human nature.

As already stated, the Scienza nuova appeared in three different editions. The third may be disregarded; but the first and second editions are almost distinct works. In the former the author sets forth the analytical process by which the laws he discovered were deduced from facts. In the second he not only enlarges his matter and gives multiplied applications of his ideas, but also follows the line of least resistance in the development of the laws he discovered and then proving them by the facts to which they are applied. In this edition the fragmentary and jerky arrangement, the intricate style, and a peculiar and often purely conventional terminology, seriously checked the diffusion of the work, which accordingly was little studied in Italy and remained almost unknown to the rest of Europe. Its fundamental idea consists in that which Vico, in his peculiar terminology, styles "poetic wisdom" (sapientia poetica) and "occult wisdom" (sapientia reposita), and in the historical process by which the one is merged in the other. He frequently declares that this discovery was the result of his poetic wisdom. Vico was the first thinker who asked, Why have we a science of nature, but no science of history? Because our glance can easily be turned outwards and surveyed the exterior world; but it is far harder to open our eye into the impenetrable depths of the spirit. All our errors in explaining the origin of human society arise from our obstinacy in believing that primitive man was entirely similar to civilized man, while civilized man, and all that he has developed by the lengthy process of ancient historic evolution, must be learnt from ourselves, transport ourselves back to other times, and become children again in order to comprehend the infancy of the human race. As in children, imagination and the senses prevail in those men of the past. They had no abstract ideas; in their minds all was concrete, visible and tangible. All the phenomena, forces and laws of nature, together with mental conceptions, were alike personified. To suppose that all mythical stories are fables invented by the philosophers is to write history backwards and confound the instinctive, impersonal, poetic wisdom of the savage mind, that the civilized race, as it were, has been educated and civilized by the poetic wisdom of their own day. But how can we explain the formation of this poetic wisdom, which, albeit the work of ignorant men, has so deep and intrinsic a philosophic value? The only possible reply is that already given when treating of the origin of law. Providence has instilled into the heart of man a sentiment of justice and goodness, of beauty and of truth, that is manifested differently at different times. The law truth within us, constituting the inner life of the individual, is subjected by philosophers because they are not sufficiently convinced of the facts of history into assured reality. For Vico psychology and history were the two poles of the new world he discovered. After having found a "natural law" and a "poetic wisdom," as he said of all, knowledge, he adds that a great truth is continually flashed on us and proved to us by history, namely, "that this world of nations is the work of man, and its explanation therefore only to be found in the psychology of men. The poetical or mythical poetic emanation of the human conscience, is almost the product of divine inspiration. From this, by the aid of civilization, reason and philosophy, there is gradually developed the civil, occult wisdom. The continual, slow and laborious progress from the one to the other is that which really constitutes history, and man begins to be civilized by the poetic wisdom of the primitive possessor of all that in poetical wisdom remained impersonal, unconscious, that came, as it were, from without by divine afflatus. The education of primitive peoples is no less mythological than their history, since they could only conceive of it by means of myths. On these lines he interprets the whole history of primitive Rome. One book was the history of its origin and elevation, the second the history of its decline and fall, the third is the history of its discovery of the True Homer." Why all the cities of Greece dispute the honour of being his birthplace is because the "Iliad" and the "Odyssey" have been, as Vico says, a faithful history of the total true creation of the Greek people which is in every city of Greece. And because the primitive peoples are unconscious and self-ignorant Homer is represented as being blind. In all parts of history in which an immediate knowledge of the events has been lost, he does not scruple to have invented a method, and arrives at safer conclusions. This is the case in Roman history, especially in such portions as related to the history of law. Here he sometimes attains, even in details, to divinations of the truth afterwards confirmed by new documents and later research. The aristocratic origin of Rome, the struggle between the patricians and the plebeians, the laws of the XII. Tables, not, as tradition have it, imported from Greece, but the natural and spontaneous product of ancient Roman customs, and many other similar theories were discovered by Vico, and expounded with his usual originality, though not always without blunders and exaggerations.

The greatest part of his ideas on poetical wisdom were derived from Greece. Nearly all the rest, more especially the transition from poetical wisdom to rational or historic wisdom, as he afterwards sent on account of his poetry was of great importance, I have already described. Vico formulated his idea, he made it more general in order to apply it to the history of all nations. From the savage state, through the terror that gives birth to religions, through the creation of the state by man, the origin of the divine, and from the dead, men approach civilization with the aid of poetic wisdom, and pass through three periods—the divine, heroic and human, in which they have three forms of government, language, literature, jurisprudence and civilization. The primary government is aristocratic. Patrician tyranny rouses the populace to revolt, and then democratic equality is established under a republic. After the exhaustion of that type of government, when society corrupts, declines into barbarism, and again emerging from it, traces the same course. This is the law of cycles, constituting that which is designated by Vico as the "eternal ideal history, or rather course of humanity, invariably followed by all nations." It must not be held to imply that one nation imitates the course pursued by another, nor that the points of resemblance between them are transmitted by tradition from one to the other, but merely that all are subject to one law, inasmuch as this is based on the human nature common to all alike. Thus, while on the one hand the various cycles traced and retraced by all nations are similar and parallel, on the other hand, the differences of history, different from Roman history, they become converted in the Scienza nuova into a bed of Procrustes, to which the history of all nations has to be fitted by force. And wherever Vico's historical knowledge was used he was led into increased error by this artificial and artificial effort.

It has been justly observed by many that this continuous cyclical movement entirely excludes the progress of humanity towards a better condition. It is often said that Vico's history is circular without being identical, and that, if one might differ from another, the idea of progress was not necessarily excluded by the law of cycles. Vico undoubtedly considered the poetical wisdom of the Middle Ages to be different from that of the Greeks and Romans, and Christianity to be very superior to the pagan religion. But he never investigated the question whether, since there is a law of progressive evolution in the history of different nations, separately examined, there may not likewise be another law ruling the general history of these nations, every one of which must have represented4 the general fragments of the human mind, and therefore could not, for instance, although the Scienza nuova cannot be said absolutely to deny the law of progress, it must be allowed that Vico not only failed to solve the problem but even shrank from attacking it.

Vico founded no school, and tuesday during his lifetime and for a while after his death he had many admirers both in Naples and the northern cities, his fame and name were soon obscured, especially as the Kantian system dominated the world of thought. At the close of his life the tendency of the time was characteristically Milan called attention to the merits of his great countryman, and his reinstatement was completed by Michelet, who in 1827 translated the Scienza nuova into French. With this work, Vico's writings suffer through their author's not having followed a regular course of studies, and his style is very involved. He was a deeply religious man, but his exposition of Jewish origins from the first is of considerable importance. It is very likely that Vico's ideas were due to the conditions of his age, which preceded the dawn of Semitic investigation and regarded the Old Testament and the Hebrew religion as sui generis.
VICTOR—VICTOR, SEXTUS AURELIUS

VICTOR, a deacon in the popes and two antipopes.

VICTOR I. was bishop of Rome from about 190 to 198. He submitted to the opinion of the episcopate in the various parts of Christendom the divergence between the Easter usage of Rome and that of the bishops of Asia. The bishops, particularly St Irenaeus of Lyons, declared themselves in favour of the usage of Rome, but refused to associate themselves with the excommunication pronounced by Victor against their Asiatic colleagues. At Rome Victor excommunicated Theodotus of Byzantium on account of his doctrine as to the person of Christ. St Jerome attributes to Victor some episcopula in Latin, which are believed to be recognized in certain apocryphal treatises of St Cyprian.

VICTOR II., the successor of Leo IX., was consecrated in St Peter's, Rome, on the 13th of April 1055. He was a Swabian baron, Count Hartwig von Calw, and his own baptismal name was Gebhard. At the instance of Gebhard, bishop of Regensburg, uncle of the emperor Henry III., he had been appointed while still a young man to the see of Eichstätt; in this position his great talents soon enabled him to render important services to Henry, whose chief adviser he ultimately became. His nomination to the papacy by Henry, at Mainz, in September, and his consecration at Hildesbröd, whose policy doubtless was to detach from the imperial interest one of its ablest supporters. In June 1055 Victor met the emperor at Florence, and held a council, which anew condemned clerical marriages, simony and the alienation of the estates of the church. In the following year he was summoned to Germany to the side of the emperor, and was with him when he died at Botfeld in the Harz on the 4th of October 1056. As guardian of Henry's infant son, and adviser of the empress Agnes, Victor now wielded enormous influence. He began with much tact the maintenance of peace throughout the empire and for strengthening the papacy against the aggressions of the barons. He died shortly after his return to Italy, at Arezzo, on the 28th of July 1057. His successor was Stephen IX. (Frederick of Lorraine).

VICTOR III. (Dauferius Epifani), pope from the 24th of May 1086 to the 10th of September 1087, was the successor of Gregory VII. He was a son of Landolfo V., prince of Benevento, and was born in 1027. After studying in various monasteries he became provost of St Benedict at Capua, and in 1055 obtained permission from Victor II. to enter the cloister at Monte Cassino, changing his name to Desiderius. He succeeded Stephen IX. as abbot in 1057, and his rule marks the golden age of that celebrated monastery; he promoted literary activity, and established an important school of mosaic. Desiderius was created cardinal priest of Sta Cecilia by Nicholas II. in 1059, and as papal vicar in south Italy conducted frequent negotiations between the Normans and the pope. Among the four men suggested by Gregory VII. on his death-bed as most worthy to succeed him was Desiderius, who was chosen by the cardinals because of his great learning, and his connection with the Normans and his diplomatic ability. The abbot, however, declined the papal crown, and the year 1085 passed without an election. The cardinals at length proclaimed him pope against his will on the 24th of May 1086, but he was driven from Rome by imperialists before his consecration was complete, and, laying aside the papal insignia at Terracina, he retired to his beloved monastery. As vicar of the Holy See he convened a synod at Capua on the 7th of March 1087, resumed the papal insignia on the 21st of March, and received tardy consecration at Rome on the 9th of May. Owing to the presence of the antipope, Clement III. (Guibert of Ravenna), who had powerful partisans, his stay at Rome was brief. He sent an army to Tunis, which defeated the Saracens and compelled the sultan to pay tribute to the papal see. In August 1087 he held a synod at Benevento, which renewed the excommunication of Guibert; banned Archbishop Hugo of Lyons and the Bishop of Marseilles as schismatics; and confirmed the prohibition of lay investiture. Falling ill at the synod, Vicar returned to Monte Cassino, where he died on the 16th of September 1087. He was buried at the monastery and is accounted a saint by the Benedictine order. His successor was Urban II.

VICTOR III., while abbot of Monte Cassino contributed personally to the literary activity of the monastery. He wrote Dialogi de miraculis S. Benedicti, which, along with his Epistolae, are in J. P. Migne, Patrol. Lat. vol. 149, and an account of the miracles of Leo IX. (Acta Sanctorum, 19th of April). The chief sources for his life are the 'Chronica monasterii Cassinensia,' in the Mon. Germ. hist. Script. vii., and the Vitae in J. P. Migne, Patrel. Lat. vol. 149, and in J. M. Watterich, Pontif. Roman. Viri.

VICTOR IV. was a title taken by two antipopes. (1) Gregorio Conti, cardinal priest of Santi Dodici Apostoli, was chosen by a party opposed to Innocent II. in succession to the antipope Anacletus II., on the 15th of March 1136, but through the influence of Bernard of Clairvaux he was induced to make his submission on the 29th of May. (2) Octavian, Count of Tusculum, the cardinal deacon of St Nicola in carcere Tulliano, the Ghibelline antipope, was elected at Rome on the 7th of September 1159, in opposition to Alexander III., and supported by the emperor Frederick Barbarossa. Consecrated at Farfa on the 4th of October, Victor was the first of the series of antipopes supported by Frederick against Alexander III. Though the excommunication of Frederick by Alexander in March 1160 made only a slight impression in Germany, this pope was nevertheless able to gain the support of the rest of western Europe, because since the days of Hildebrand the position of the pope and the maintenance of the church in the south had been greatly increased so greatly that the kings of France and of England could not view with indifference a revival of such imperial control of the papacy as had been exercised by the emperor Henry III. He died at Lucera on the 20th of April 1164 and was succeeded by the antipope Paschal III. (1164-1168).

See M. Meyer, Die Wahl Alexanders III. und Vatik III. 1150 (Göttingen, 1871); and A. Hauck, Kirchengeschichte Deutschlands, Band iv. (C. H. H.A.)

VICTOR, GAUS JULIUS (4th cent. a.d.), Roman writer on rhetoric, possibly of Gallic origin. His extant manual (in C. Halm's Rhetores Latini Minores, 1863) is of some importance as facilitating the textual criticism of Quintilian, whom he closely follows in many places.

VICTOR, SEXTUS AURELIUS, prefect of Pannonia about 360 (Amm. Marc. xxi. 10), possibly the same as the consul (jointly with Valentinian) in 373 and as the prefect of the city who is mentioned in an inscription of the time of Theodosius. Four small historical works have been ascribed to him on more or less doubtful grounds—(1) Origine Gentis Romanae, (2) De Viribus Ilustribus Romae, (3) De Caesaribus, (4) De Vita et Moribus Imperatorum Romanorum exspecta ex Libris Sex. Aur. Victorii. The four have generally been published together under the name Historia Romana, but the fourth piece is a réchoufe of the third. The first edition was first printed at Naples about 1472, in 40, under the name of Pliny (the younger), and the fourth at Strassburg in 1505.

The first edition was four that of A. Schottius (Svo, Antwerp, 1579). The most recent edition of De Caesaribus is by F. Pichlmayr (Munich, 1892).
VICTOR AMDEDES II—VICTOR EMMANUEL II.

VICTOR AMDEDES II. (1666–1732), duke of Savoy and first king of Sardinia, was the son of Duke Charles Emmanuel II, and Jeanne de Savoie-Nemours. Born at Turin, he lost his father in 1675, and spent his youth under the regency of his mother, known as “Madame Reale” (madame royale), an able but ambitious and overbearing woman. He assumed the reins of government at the age of sixteen, and married Princess Anne, daughter of Philip of Orleans and Henrietta of England, and niece of Louis XIV., king of France. That sovereign was determined to dominate the young duke of Savoy, who, from the first, presented the monarch’s insolent bearing. In 1683 Victor was forced by Louis to persecute his Waldensian subjects, because they had given shelter to the French Huguenot refugees after the revocation of the edict of Nantes. With the unwelcome help of a French army under Marshal Catinat, he invaded the Waldensian valleys, and after a difficult campaign, characterized by great cruelty, he subjugated them. Nevertheless, he became more anxious than ever to emancipate himself from French thraldom, and his first sign of independence was his visit to France in 1685, where he conferred on political affairs with Prince Eugene of Savoy and other personages, without consulting Louis. About this time the duke plunged into a whirl of dissipation, and chose the beautiful but unscrupulous Contessa di Verrua as his mistress, neglecting his faithful and devoted wife. Louis having discovered Victor’s intrigues with the emperor, tried to precipitate hostilities by demanding his participation in a second expedition against the Waldensians. The duke unwillingly complied, but when the French entered Piedmont and demanded the cession of the fortresses of Turin and Verrua, he refused, and while still professing to negotiate with Louis, joined the league of Austria, Spain and Venice. War was declared in 1690, but at the battle of Staffarda (18th of August 1691), Victor, in spite of his great courage and skill, was defeated by the French under Catinat. Other reverses followed, but the attack on Cuneo was heroically repulsed by the citizens. The war dragged on with varying success, until the severe defeat of the allies at Marsiglia and their selfish neglect of Victor’s interests induced him to open negotiations with France once more. Louis agreed to restore most of the fortresses he had captured and to make other concessions; a treaty was signed in 1696, and Victor appointed generalissimo of the Franco-Piedmontese forces in Italy operating against the imperialists. By the treaty of Ryswick (1697) a general peace was concluded. On the outbreak of the war of the Spanish Succession in 1700 the duke was again on the French side, but the insolence of Louis and of Philip V. of Spain towards him induced him, at the end of the two years for which he had bound himself to them, to go over to the imperialists (1704). At first the French were successful and captured several Piedmontese fortresses, but after besieging Turin, which was skilfully defended by the duke, for several months, they were completely defeated by Victor and Prince Eugene of Savoy (1706), and eventually driven out of the other towns they had captured. By the peace of Utrecht (1713) the Powers conferred the kingdom of Sicily on Victor Amdeus, whose government proved efficient and at first popular. But after a brief stay in the island he returned to Piedmont and left his new possessions to a viceroy, which caused much discontent among the Sicilians; and when the Quadruple Alliance decreed in 1718 that Sicily should be restored to Spain, Victor was unable to offer any opposition, and had to content himself with receiving Spaniard’s in exchange.

The last years of Victor Amdeus’s life were saddened by domestic troubles. In 1715 his eldest son died, and in 1728 he lost his queen. After her death, much against the advice of his remaining son and heir, Carlino (afterwards Charles Emmanuel III.), he married the Contessa di San Sebastiano, whom he created Marchesa di Spigno, abdicated the crown and retired to Chambery to end his days (1730). But his second wife, an ambitious intrigante, soon tired of her quiet life, and induced him to return to power and once again become king of Savoy. This led to a quarrel with his son, who with quite unnecessary harshness, partly due to his minister the Marquis d’Ormea, arrested his father and confined him at Rivoli and later at Moncalieri; there Victor, overwhelmed with sorrow, died on the 31st of October 1732.

Victor Amdeus, although accused not without reason of bad faith in his diplomatic dealings and of cruelty, was undoubtedly a great soldier and a still greater administrator. He not only won for his country a high place in the council of nations, but he doubled its revenues and increased its prosperity and industries, and he also emphasized its character as an Italian state. His indulgence to his wife and his harshness towards his son Carlino are blameworthy on a splendid career, less than more than expiated these faults by his tragic end.

See D. Carutti, Storia del Regno di Vittorio Amdeus II. (Turin, 1866); and E. Parri, Vittorio Amdeus II. ed Eugenio di Savoia (Milan, 1888). The Marchesa Vitelleschi’s work, Il Romance di Sardigna (Leipzig, 1905), is based on original authorities, and is the most complete monograph on the subject.

VICTOR EMMANUEL II. (1820–1878), king of Sardinia and first king of Italy, was born at Turin on the 14th of March 1820, and was the son of Charles Emmanuel III. of Savoy-Carignano, who became king of Sardinia in 1832. Brought up in the bigoted and chilling atmosphere of the Piedmontese court, he received a rigid military and religious training, but little intellectual education. In 1842 he was married to Adelaide, daughter of the Austrian Archduke Rainer, as the king desired at that time to improve his relations with Austria. The young couple led a somewhat dreary life, hid behind court etiquette, which Victor Emmanuel hated. He played no part in politics during his father’s lifetime, but took an active interest in military matters. When the war with Austria broke out in 1848, he was delighted at the prospect of distinguishing himself, and was given the command of a division. At Goito he was slightly wounded and displayed great bravery, and after Custozza defended the rearguard to the last (25th of July 1848). In the campaign of March 1849 he commanded the same division. After the disastrous defeat at Novara on the 23rd of March, Charles Albert, having rejected the peace terms offered by the Austrian field-marshal Radetzky, abdicated in favour of his son, and withdrew to a monastery in Portugal, where he died a few months later. Victor Emmanuel repaired to Radetzky’s camp, where he was received with every sign of respect, and the field-marshal offered not only to waive the claim that Austria should occupy a part of Piedmont, but to give him an extension of territory, provided he revoked the constitution and substituted the old blue Piedmontese flag for the Italian tricolour, which signified too much of revolution. But although the young king had not yet sworn to observe the charter, and in any case the other Italian princes had all violated their constitutional promises, he rejected the offer. Consequently he had to face to the temporary Austrian occupation of the territory comprised within the Po, the Sesia and the Ticino, and of half the citadel of Alessandria, to disband his Lombard, Polish and Hungarian volunteers, and to withdraw his fleet from the Adriatic; but he secured an amnesty for all the Lombards compromised in the recent revolution, having even threatened to go to war again if it were not granted. It was the maintenance of the constitution in the face of the overwhelming tide of reaction that established his position as the champion of Italian freedom and earned him the sobriquet of Re Galantuomo (the honest king). But the task entrusted to him was a most difficult one: the army disorganized, the treasury empty, the people despondent if not actively disloyal, and he himself reviled, misunderstood, and, like his father, accused of treachery. Parliament having rejected the peace treaty, the king dissolved the assembly; in the famous proclamation from Moncalieri he appealed to the people’s loyalty, and the new Chamber ratified the treaty (9th of January 1850). This same year, Cavour (q.v.) was appointed minister of agriculture in D’Azeglio’s cabinet, and in 1852, after the fall of the new government, he became a post which with brief interruptions he held until his death.

In having Cavour as his chief adviser Victor Emmanuel was
most fortunate, and but for that statesman's astounding diplomatic genius the liberation of Italy would have been impossible. The years from 1829 to 1859 were devoted to restoring the shattered finances of Sardinia, reorganizing the army and modernizing the antiquated institutions of the kingdom. Among other reforms the abolition of the *foro ecclesiastico* (privileged ecclesiastical courts) — brought down a storm of hostility from the Church both on the king and on Cavour, but the new law was supported by the Italian clergy. When the Crimean War broke out, the king strongly supported Cavour in the proposal that Piedmont should join France and England against Russia so as to secure a place in the councils of the great Powers and establish a claim on them for eventual assistance in Italian affairs (1854). The following year Victor Emmanuel was stricken with a threefold family misfortune; for his mother, the Queen Dowager Maria Teresa, his wife, Queen Adelaide, and his brother Ferdinand, duke of Genoa, died within a few weeks of each other. The clerical party were now at a low point, while Garibaldi's movements were judged on the king for what they deemed his sacrilegious policy. At the end of 1855, while the allied troops were still in the East, Victor Emmanuel visited Paris and London, where he was warmly welcomed by the emperor Napoleon III. and Queen Victoria, as well as by the peoples of the two countries.

Victor Emmanuel's object now was the expulsion of the Austrians from Italy and the expansion of Piedmont into a North Italian kingdom, but he did not regard the idea of Italian unity as coming within the sphere of practical politics for the time being, although a movement to that end was already beginning to gain ground. He was in communication with the conspirators, especially with La Farina, the leader of the *Societá Nazionale*, an association the object of which was to unite Italy under the king of Sardinia, and he even communicated with Mazzini and the republicans, both in Italy and abroad, whenever he thought that they could help in the expulsion of the Austrians from Italy. In 1859 Cavour's diplomacy succeeded in drawing Napoleon III. into an alliance against Austria, although the king had to agree to the cession of Savoy and possibly of Nice and to the marriage of his daughter Clothilde to Prince Napoleon. These conditions were judged on the king for what they deemed his sacrifice of principle. At the end of 1859, while the allied troops were still in the East, Victor Emmanuel visited Paris and London, where he was warmly welcomed by the emperor Napoleon III. and Queen Victoria, as well as by the peoples of the two countries.

Victor Emmanuel's object now was the expulsion of the Austrians from Italy and the expansion of Piedmont into a North Italian kingdom, but he did not regard the idea of Italian unity as coming within the sphere of practical politics for the time being, although a movement to that end was already beginning to gain ground. He was in communication with the conspirators, especially with La Farina, the leader of the *Societá Nazionale*, an association the object of which was to unite Italy under the king of Sardinia, and he even communicated with Mazzini and the republicans, both in Italy and abroad, whenever he thought that they could help in the expulsion of the Austrians from Italy. These conditions were judged on the king for what they deemed his sacrifice of principle. At the end of 1859, while the allied troops were still in the East, Victor Emmanuel visited Paris and London, where he was warmly welcomed by the emperor Napoleon III. and Queen Victoria, as well as by the peoples of the two countries.

The Roman question yet remained unsolved, for Napoleon, although he had assisted Piedmont in 1859 and had reluctantly consented to the annexation of the central and southern provinces of the Papal States, would not permit Rome to be occupied, and maintained a French garrison there to protect the pope. When war with Prussia appeared imminent he tried to obtain Italian assistance, and Victor Emmanuel was very anxious to fly to the assistance of the man who had helped him to expel the Austrians from Italy, but he could not do so unless Napoleon gave him a free hand in Rome. This the emperor would not do until it was too late. Even after the first French defeats the chivalrous king, in spite of the advice of his more prudent counsellors, wished to go to the rescue, and asked Thiers, the French representative who was imperialism for help, if with 100,000 Italian troops France could be saved, but Thiers could give no such undertaking and Italy remained neutral. On the 20th of September 1870, the French troops having been withdrawn, the Italian army entered Rome, and on the 2nd of July 1871 Victor Emmanuel made his solemn entry into the Eternal City, which then became the capital of Italy.

The pope refused to recognize the new kingdom even before the occupation of Rome, and the latter event rendered relations between church and state for many years extremely delicate. The king himself was anxious to be reconciled with the Vatican, but the pope, or rather his entourage, rejected all overtures, and the two sovereigns dwelt side by side in Rome until death without ever meeting. Victor Emmanuel devoted himself to his duties as a constitutional king with great conscientiousness, but he took more interest in foreign than in domestic politics and contributed not a little to improving Italy's international position. In 1873 he visited the emperor Francis Joseph at Vienna and the emperor William at Berlin. He received an enthusiastic welcome in both capitals, but the visit to Vienna was never returned in Rome, for Francis Joseph as a Catholic sovereign feared to offend the pope, a circumstance...
which served to embitter Austro-Italian relations. On the 9th of January 1879, VICTOR Emmanuel died of fever in Rome, and was buried in the Pantheon. He was succeeded by his son Humbert.

Bluff, hearty, good-natured and simple in his habits, yet he always had a high idea of his own kingly dignity, and his really statesmanlike qualities often surprised foreign diplomats, who were deceived by his homely exterior. As a soldier he was very brave, but he did not show great qualities as a military leader in the campaign of 1866. He was a keen sportsman, and would spend many days at a time pursuing chamois or steinbock in the Alpine fastnesses of Piedmont with nothing but bread and cheese to eat. He always used the dialect of Piedmont when conversing with natives of that country, and he had a vast fund of humorous anecdotes and proverbs with which to illustrate his arguments. He had a great weakness for female society, and kept several mistresses; one of them, the beautiful Rosa Vercellone, he created Countess Mirafiori e Fontanafreda and married morganatically in 1869; she bore him one son.

VICTOR EMMANUEL III. (1869— ), king of Italy, son of King Humbert I. and Queen Margherita of Savoy, was born at Naples on the 11th of November 1869. Carefully educated by his mother and under the direction of Colonel Osio, he obtained a thorough knowledge of his native language, and was taught horsemanship and military exercises. Entering the army at an early age he passed through the various grades and, soon after attaining his majority, was appointed to the command of the Florence Army Corps. During frequent journeys to Germany he enlarged his military experience, and upon his appointment to the command of the Naples Army Corps in 1890 displayed sound military and administrative capacity. A keen huntsman, and passionately fond of the sea, he extended his yachting and hunting excursions as far east as Syria and as far north as Spitberg. As representative of King Humbert he attended the coronation of Tsar Nicholas II. in 1896, the Victorian Jubilee celebrations of 1897, and the festivities connected with the coming of age of the German crown prince in 1900. The prince's intellectual and artistic leanings were well known; in particular, he has made a magnificent collection of historic Italian coins, on which subject he became a recognized authority. At the time of the assassination of his father, King Humbert (the 29th of July 1900), he was returning from a yachting cruise in the eastern Mediterranean. Landing at Reggio di Calabria he hastened to Monza, where he conducted with firmness and tact the preparations for the burial of King Humbert and for his own formal accession, which took place on the 9th and 11th of August 1900. On the 24th of October 1896 he married Princess Elena of Montenegro, who, on the 1st of June 1901, bore him a daughter named Yolanda Margherita, on the 19th of November 1902 a second daughter named Mafalda, and on the 15th of September 1904 a son, Prince Humbert.

VICTORIA [ALEXANDRINA VICTORIA], Queen of the United Kingdom of Great Britain and Ireland, Empress of India (1819-1901), only child of Edward, Duke of Kent, fourth son of King George III., and of Princess Victoria Mary Louisa of Saxe-Coburg-Gotha (widow of Prince Emich Karl of Leiningen, by whom she already had two children), was born at Kensington Palace on the 24th of May 1819. The duke and duchess of Kent had been living at Amorbach, in Franconia, owing to their straitened circumstances, but they returned to London on purpose that their child should be born in England. In 1817 the death of Princess Charlotte (only child of the prince regent, afterwards George IV., and wife of Prince Leopold of Saxe-Coburg-Gotha, afterwards king of the Belgians), had left the ultimate succession to the throne of England, in the younger generation, so uncertain that the three unmarried sons of George III., the dukes of Clarence (afterwards William IV.), Kent and Cambridge, all married in the following year, the two elder on the same day. All three had children, but the duke of Clarence's two baby daughters died in infancy, in 1819 and 1821; and the duke of Cambridge's son George, born on the 26th of March 1819, was only two months old when the birth of the duke of Kent's daughter put her before him in the succession. The Duke of Kent, as to what name the child should bear was not settled until after bickerings. The duke of Kent wished her to be christened Elizabeth, and the prince regent wanted Georgiana, while the tsar Alexander I., who had promised to stand sponsor, stipulated for Alexandrina. The baptism was performed in a drawing-room of Kensington Palace on the 24th of June by Dr Manners Sutton, archbishop of Canterbury. The prince regent, who was present, named the child Alexandrina; then, being requested by the duke of Kent to give a second name, he said, rather abruptly, "Let her be called Victoria, after her mother, but this name must come after the other."* Six weeks after her christening the princess was vaccinated, this being the first occasion on which a member of the royal family underwent the operation.

In January 1820 the duke of Kent died, five days before his brother succeeded to the throne as George IV. The widowed duchess of Kent was now a woman of thirty-four, handsome, homely, a German at heart, and with little liking for English ways. But she was a woman of experience, and shrewd; and fortunately she had a safe and affectionate adviser in her brother, Prince Leopold of Coburg, afterwards (1831) king of the Belgians, who as the husband of the late Princess Charlotte, became a prospective prince consort of England. His former doctor and private secretary, Baron Stockmar (q.v.), a man of encyclopaedic information and remarkable judgment, who had given special attention to the problems of a sovereign's position in England, was afterwards to play an important rôle in Queen Victoria's life; and Leopold himself took a fatherly interest in the young princess's education, and contributed some thousands of pounds annually to the duchess of Kent's income. Prince Leopold still lived at this time at Claremont, where Princess Charlotte had died, and this became the duchess of Kent's occasional English home; but she was much addicted to travelling, and spent several months every year in visits to watering-places. It was said at court that she liked the demonstrative homage of crowds; but she had good reason to fear lest her child should be taken away from her to be educated according to the views of George IV. Between the king and his sister-in-law there was little love, and when the death of the duke of Clarence's second infant daughter Elizabeth in 1821 made it pretty certain that Princess Victoria would eventually become queen, the duchess felt that the king might possibly obtain the support of his ministers if he insisted that the future sovereign should be brought up under masters and mistresses designated by himself. The little princess could not have received a better education than that which was given her under Prince Leopold's direction. Her uncle considered that she ought to be kept as long as possible from the knowledge of her position, which might raise a large growth of pride or vanity in her and make her unmanageable; so Victoria was twelve years old before she knew that she was to wear a crown. Until she became queen she never slept a night away from her mother's room, and she was not allowed to converse with any grown-up person herself, tutor or servant without the duchess of Kent or the Baroness Lehzen, her private governess, being present. Louise Lehzen, a native of Coburg, had come to England as governess to the Princess Feodora of Leiningen, the duchess of Kent's daughter

*The question of her name, as that of one who was to be queen, remained even up to her accession to the throne a much-debated one. In August 1831, in a discussion in parliament upon a grant of £250,000 to the Duke of Kent and his wife, Mr Herries asked what title it was intended to give to Elizabeth as "more accordant to the feelings of the people"; and the idea of a change seems to have been powerfully supported. In 1830 William IV. approved of a proposal to change it to Charlotte; but, to the princess's own delight, it was given up.
by her first husband, and she became teacher to the Princess Victoria when the latter was five years old. George IV. in 1827 made her a baroness of Hanover, and she continued as lady-in-attendance after the death of Northumberland was appointed official governess in 1830, but actually performed the functions first of governess and then of private secretary till 1842, when she left the court and returned to Germany, where she died in 1870. The Rev. George Davys, afterwards bishop of Peterborough, taught the princess Latin; Mr. J. B. Sale, musician, Mr. Westall, history; and Mr. Thomas Steward, the writing master of Westminster School, instructed her in penmanship.

In 1830 George IV. died, and the duke of York (George III.'s second son) having died childless in 1827, the duke of Clarence became king as William IV. Princess Victoria now became the direct heir to the throne. William IV. cherished affectionate feelings towards his niece; unfortunately he took offence at the duchess of Kent for declining to let her child come and live at his court for several months in each year, and through the whole of his reign there was strife between the two; and Prince Leopold was no longer in England to act as peacemaker.

In the early hours of the 20th of June 1837, William IV. died. His thoughts had dwelt often on his niece, and he repeatedly said that he was sure she would be "a good woman and a good queen. It will touch every sailor's heart to have a girl queen to fight for. They'll be tattooing her face on their arms, and I'll be bound they'll all think she was christened after Nelson's ship." Dr. Howley, archbishop of Canterbury, and the marquis of Conyngham, bearing the news of the king's death, started in a hansom with four horses to Kensington Palace, which they reached at five o'clock. Their servants rang, knocked and thumped, and when at last admittance was gained, the primate and the marquis were shown into a lower room and there left to wait. Presently a maid appeared and said that the Princess Victoria was "in a sweet sleep and could not be disturbed." Dr. Howley, who was nothing if not pompous, answered that he had come on state business, to which everything, even sleep, must give place. The princess was accordingly roused, and quickly came downstairs in a dressing-gown, her fair hair flowing loose over her shoulders. Her own account of this interview, written the same day in her journal (Letters, i. p. 97), shows her to have been quite prepared.

The privy council assembled at Kensington in the morning; and the usual oaths were administered to the queen by Lord Chancellor Cottenham, after which all present did homage. There was a touching incident when the queen's uncles, the dukes of Cumberland and Sussex, two old men, came forward to perform their obeisance. The queen blushed, and descending from her throne, kissed them both, without allowing them to kneel. By the death of William IV., the duke of Cumberland had become King Ernest of Hanover, and immediately after the ceremony he made haste to reach his kingdom. Had Queen Victoria died without issue, this prince, who was arrogant, ill-tempered and rash, would have become king of Great Britain; and, as nothing but mischief could have resulted from this, the young queen's life became very precious in the sight of her people. She, of course, retained the late king's ministers in their offices, and it was under Lord Melbourne's direction that the privy council drew up their declaration to the kingdom. This document described the queen as Alexandra Victoria, and all the peers who subscribed the roll in the House of Lords on the 20th of June swore allegiance to her under those names. It was not till the following day that the sovereign's style was altered to Victoria simply, and this necessitated the issuing of a new declaration and a re-signing of the peers' roll. The public proclamation of the queen took place on the 21st at St. James's Palace with great pomp.

The queen opened her first parliament in person, and in a well-written speech, which she read with much feeling, adverted to her youth and to the necessity which existed for her being guided by her friends and advisers. With both the opposite sides of the House, which had voted loyal addresses, the question of the Civil List was considered, and a week or two later a message was brought to parliament requesting an increase of the grant formerly made to the duchess of Kent. Government recommended an addition of £30,000 a year, which was voted, and before the close of the year a Civil List Bill was passed, settling £385,000 a year on the queen.

The duchess of Kent and her brothers, King Leopold and the duke of Saxe-Coburg-Gotha, had always hoped to arrange that the queen should marry her cousin, Albert (q.v.) of Saxe-Coburg-Gotha, and the prince himself had been made acquainted with this plan from his earliest years. In 1836 Prince Albert, who was born in the same year as his future wife, had come on a visit to England with his father and with his brother, Prince Ernest, and his handsome face, gentle disposition and playful humour had produced a favourable impression on the princess. The duchess of Kent had communicated her projects to Lord Melbourne, and they were known to many other statesmen, and to persons in society; but the gossip of drawing-rooms during the years 1837-38 continually represented that the young queen had fallen in love with Prince This or Lord That, and the more important of the bolder hangers on post-chaises waiting outside Kensington Gardens in the night, private marriages and so forth.

The coronation took place on the 28th of June 1838. No more touching ceremony of the kind had ever been performed in Westminster Abbey. Anne was a middle-aged married woman at the time of her coronation; she waddled and wheezed, and made no majestic appearance upon her throne. Mary was odious to her Protestant subjects, Elizabeth to those of the unformed religion, and both these queens succeeded to the crown in times of general sadness; but the young queen, for all her grace and her beauty, was resplendent and the land was peaceful and prosperous when she began to reign over it. The cost of George IV.'s coronation amounted to £240,000; that of William IV. had amounted to £50,000 only; and in asking £70,000 the government had judged that things could be done with suitable luxury, but without waste. The traditional banquet in Westminster Hall, with the throwing down of the glove by the king's champion in armour, had been dispensed with at the coronation of William IV., and it was resolved not to revive it. But it was arranged that the sovereign's procession to the abbey through the streets should be more magnificent than on previous occasions; and it drew to London 400,000 country visitors. Three ambassadors for different reasons became objects of great interest on the occasion. Marshal Soult, Wellington's old foe, received a hearty popular welcome as a military hero; Prince Esterhazy, who represented Austria, dazzled society by his Magyar uniform, which was encrusted all over, even to the boots, with pearls and diamonds; while the Turkish ambassador, Sarim Effendi, caused much diversion by his bewilderment. He was so wonder-struck that he could not walk to his place, but stood as if he had lost his senses, and kept muttering, "All this for a woman!"

Within a year the court was brought into sudden disfavour with the country by two events of unequal importance, but both exciting. The first was the case of Lady Flora Hastings. In February 1839 this young lady, a daughter of the marquis of Hastings, and a maid of honour to the duchess of Kent, was accused by certain ladies of the bedchamber of immoral conduct. The charge having been laid before Lord Melbourne, he communicated it to Sir James Clark, the queen's physician, and the result was that Lady Flora was subjected to the indignity of a medical examination by Dr. Clark, while it cleared her character, seriously affected her health. In fact, she died in the following July, and it was then discovered that the physical appearances which first provoked suspicion against her had been due to enlargement of the liver. The queen's conduct towards Lady Flora was kind and sisterly from the beginning to the end of this painful business; but the scandal was made public through some indignant letters which the marchioness of Hastings addressed to Lord Melbourne praying for the punishment of her daughter's traducers, and the general opinion was that Lady Flora had been grossly treated at the instigation of some private court enemies. While the agitation about the affair was yet unappeased, the political
crisis known as the "Bedchamber Plot." The Whig ministry had introduced a bill suspending the Constitution of Jamaica because the Assembly in that colony had refused to adopt the Prisons Act passed by the Imperial Legislature. Sir Robert Peel moved an amendment, which, on a division (6th May), was defeated by a majority of five only in a house of 383, and ministers thereupon resigned. The duke of Wellington was first sent for, but he advised that the task of forming an administration should be entrusted to Sir Robert Peel. Sir Robert was ready to form a cabinet in which the duke of Wellington, Lords Lyndhurst, Abercrombie, and Stanley, and Sir James Graham would have served; but he stipulated that the ministers of the new government should be Whigs. The Whig administration should be removed, and to this the queen would not consent. On the 10th of May she wrote curtly that the course proposed by Sir Robert Peel was contrary to usage and repugnant to her feelings; the Tory leader then had to inform the House of Commons that, having failed to obtain the proof which he desired of her majesty's confidence, it was impossible for him to accept office. The ladies of the bedchamber were so unpopular in consequence of their behaviour to Lady Flora Hastings that the public took alarm at the notion that the queen had fallen into the hands of an intriguing coterie; and Lord Melbourne, who was accused of wishing to rule on the strength of court favour, resumed office with diminished prestige. The Tories thus felt aggrieved; and the Chartists were so prompt to make political capital out of the affair that large numbers were added to their ranks. On the 14th of June Mr Attwood, M.P. for Birmingham, presented to the House of Commons a Chartist petition alleged to have been signed by 1,286,000 people. It was a cylinder of parchment of about the diameter of a coach-wheel, and was literally rolled up on the floor of the house. On the day after this curious document had furnished both amusement and uneasiness to the Commons a document revealing itself as Sophia Elizabeth Guelph Sins, made application at the Mansion House for advice and assistance to prove herself the lawful child of George IV. and Mrs Fitzherbert; and this incident, trumpery as it was, added fuel to the disflame then raging. Going in state to Ascot the queen was hissed by some ladies as her carriage drove on to the course, and two peers, one of them a Tory duchess, were openly accused of this unseemly act. Meanwhile some monster Chartist demonstrations were being organized, and they commenced on the 4th of July. At Birmingham. It was an untoward coincidence that Lady Flora Hastings died on the 5th of July, for though she repeated on her deathbed, and wished it to be published, that the queen had taken no part whatever in the proceedings which had shortened her life, it was remarked that the ladies who were believed to have persecuted her still retained the sovereign's favour. The riots at Birmingham lasted ten days, and had to be put down by armed force. They were followed by others at Newcastle, Manchester, Bolton, Chester and Macclesfield.

The queen's marriage.

These troubous events had the effect of hastening the queen's marriage. Lord Melbourne ascertained that the queen's dispositions towards her cousin, Prince Albert, were unchanged, and he advised King Leopold, through M. Van der Weyer, the Belgian minister, that the prince should come to England and press his suit. The prince arrived with his brother on a visit to Windsor on the 10th of October 1839. On the 12th the queen wrote to King Leopold: "Albert's beauty is most striking, and he is so amiable and unaffected—in short, very fascinating." On the 15th all was settled; and the queen wrote to her uncle, "I love him more than I can express." The public in the queen's public visits was enthusiastically received. But the royal lovers still had some parliamentary mortifications to undergo. The government proposed that Prince Albert should receive an annuity of £50,000, but an amendment of Colonel Sibthorp—a politician of no great repute—for making the annuity £20,000 was carried against ministers by 262 votes to 158, the Tories and Radicals going into the same lobby, and many ministerialists taking no part in the division. Prince Albert had not been described, in the queen's declaration to the privy council, as a Protestant prince; and Lord Palmerston was obliged to ask Baron Stockmar for assurance that Prince Albert did not belong to any sect of Protestants whose rules might prevent him from taking the Sacrament according to the ritual of the English Church. He got an answer couched in somewhat ironical terms to the effect that Protestantism owed its existence in a measure to the house of Saxon, from which the prince descended, seeing that this house and that of the landgrave of Hesse had stood quite alone against Europe in upholding Luther and his cause. Even after this certain High Churchmen held that a Lutheran was a 'dissenter,' and that the prince should be asked to subscribe to the Thirty-Nine Articles. The queen was particularly concerned by the question of the prince's future status as an Englishman. It was impracticable for him to receive the title of king consort; but the queen naturally desired that her husband should be placed by act of parliament in a position which would secure to him precedence, not only in England, but in foreign courts. Lord Melbourne sought to effect this by a clause introduced in a naturalization bill; but he found himself obliged to drop the clause, and to leave the queen to confer what precedence she pleased by every day. Whether she was in London or at Windsor, difficulty, for the queen could only confer precedence within her own realms, whereas an act of parliament bestowing the title of prince consort would have made the prince's right to rank above all royal imperial highnesses quite clear, and would have left no room for such disputes as afterwards occurred when foreign princes chose to treat Prince Albert as having mere courtesy rank in his wife's kingdom. The result of these political difficulties was to make the queen more than ever disgusted with the Tories. But there was no other flaw in the happiness of the marriage, which was solemnized on the 10th of February 1840. At the Chapel Royal, St James's. It is interesting to note that the queen was dressed entirely in articles of British manufacture. Her dress was of Spitalfields silk; her veil of Hentcon lace; her ribbons came from Coventry; even her gloves had been made in London of English kid—a novel thing in days when the French had a monopoly in the finer kinds of gloves.

From the time of the queen's marriage the crown played an increasingly active part in the affairs of state. Previously, ministers had tried to spare the queen all disagreeable and fatiguing details. Lord Melbourne saw her every day, whether she was in London or at Windsor, and he used to explain all current business in a benevolent, chatty manner, which offered a pleasant contrast to the style of his two principal colleagues, Lord John Russell and Lord Palmerston. A statesman of firmer mould than Lord Melbourne would hardly have succeeded so well as he did in making rough places smooth for Prince Albert. Lord John Russell and Lord Palmerston were naturally jealous of the prince's interference—and of King Leopold's and Baron Stockmar's—in state affairs; but Lord Melbourne took the common-sense view that a husband will control his wife whether people wish it or not. Ably advised by his private secretary, George Anson, and by Stockmar, the prince thus soon took the de facto place of the sovereign's private secretary, though he had no official status as such; and his system of classifying and annotating the queen's papers and letters resulted in the preservation of what the editors of the Letters of Queen Victoria (1907) describe as "probably the most extraordinary collection of state documents in the world"—those up to 1861 being contained in between 300 and 600 bound volumes at Windsor. To confer on Prince Albert the honor of an audience at Windsor that he could make his way gradually into public favour by his own tact, was the advice which Lord Melbourne gave; and the prince acted upon it so well, avoiding every appearance of intrusion, and treating men of all parties and degrees with urbanity, that within five months of his marriage he obtained a signal mark of the public confidence. In expectation of the queen becoming a mother, a bill was passed through parliament providing for the appointment of Prince Albert as sole regent in case the
queen, after giving birth to a child, died before her son or daughter came of age.

The Regency Bill had been hurried on in consequence of the attempt of a crank boy, Edward Oxford, to take the queen's

Attempts on the queen's life.

On 16th June 1840, the queen and Prince Albert were driving up Constitution Hill in an open carriage, when Oxford fired two pistols, the bullets from which flew, it was said, close by the prince's head. He was arrested on the spot, and when his lodgings were searched a quantity of powder and shot was found, with the rules of a secret society, called "Young England," whose members were pledged to meet, "carrying swords and pistols and wearing mask plates." These discoveries raise the surprise that Oxford was the tool of a widespread characterist conspiracy, or, as the Irish pretended, a conspiracy of Orangemen to set the duke of Cumberland on the throne; and while these delusions were fresh, they threw well-disposed persons into a paroxysm of loyalty. Even the London street dogs, as Sydney Smith said, joined with O'Connor in barking "God save the Queen." Oxford seems to have been crying for notoriety; but it may be doubted whether the jury who tried him did right to pronounce his acquittal on the ground of insanity. He feigned madness at his trial, but during the forty years of his subsequent confinement at Bedlam, he talked like a rational being, as on the queen was at length released and sent to Ireland, where he earned his living there as a house painter, and used to declare that he had never been mad at all. His acquittal was to be deprecated as establishing a dangerous precedent in regard to outrages on the sovereign. It was always Prince Albert's opinion that if Oxford had been hanged the attempt of Francis on the queen in 1842 and of Bean in the same year would never have been perpetrated. After the attempt of Bean—who was a hunchback, really insane—parliament passed a bill empowering judges to order whipping as a punishment for those who murder the queen; but somehow this act was never enforced. In 1850 a half-pay officer, named Pate, assaulted the queen by striking her with a stick, and crushing her bonnet. He was sentenced to seven years' transportation; but the judge, Baron Alderson, excused him the flogging. In 1869 an Irish lad, O'Connor, was sentenced to eighteen months' imprisonment and a whipping for presenting a pistol at the queen, with a petition, in St James's Park; but this time it was the queen herself who privately remitted the corporal punishment, and she even pushed clemency to the length of sending her aggressor to Australia at her own expense. The shooting of Hoadley, a private on the queen's household, was closed up in 1852 by Maclean, who fired a pistol at her majesty as she was leaving the Great Western Railway station at Windsor. He, like Bean, was a genuine madman, and was relegated to Broadmoor.

The birth of the princess royal, on the 21st of November 1840, removing the unpopular King Ernest of Hanover from the position of heir-presumptive to the British crown, was a subject of loud congratulations to the people. A curious scare was occasioned at Buckingham Palace, when the little princess was a fortnight old, by the discovery of a boy named Jokes concealed under a bed in the royal nursery. Jones had a mania for palace-breaking. Three times he effected a clandestine entry into the queen's residence, and twice he managed to spend several days there. By day he concealed himself in cupboards or under furniture, and by night he groped his way into the royal kitchen to eat whatever he could find. After his third capture, in March 1841, he coolly boasted that he had lain under a sofa, and listened to a private conversation between the queen and Prince Albert. This third time he was not punished, but sent to sea, and turned out very well. The incident strengthened Prince Albert's hands in trying to carry out sundry domestic reforms which were being stoutly resisted by vested interests. The royal residences and grounds were let be under the control of four different officials—the lord chamberlain, the lord steward, the master of the horse, and the commissioners of woods and forests. Baron Stockmar, describing the confusion fostered by this state of things, said—

"The lord steward finds the fuel and lays the fire; the lord chamberlain lights it. The lord chamberlain provides the lamps; the lord steward must clean, trim, and light them. The lord chamberlain's duties are at an end, but the outer parts must be attended to by the office of woods and forests, so that windows remain dirty unless the two departments can come to an understanding." It took Prince Albert four years of firmness and diplomacy before in 1845 he was able to bring the queen's home under the efficient control of a master of the household.

At the general election of 1841 the Whigs returned in a minority of seventy-six, and Lord Melbourne was defeated on the Address and resigned. The queen was affected to tears at parting with him; but the crisis had been fully expected and prepared for by confidential communications between Mr Anson and Sir Robert Peel, who now became prime minister (see Letters of Queen Victoria, i. 341 et seq.). The hold difficulty as to the appointments to the royal household was tactfully removed, and Tory appointments were made, which were agreeable both to the queen and to Peel. The only temporary embarrassment was the queen's continued private correspondence with Lord Melbourne, which led Stockmar to remonstrate with him; but Melbourne used his influence sensibly; moreover, he gradually dropped out of politics, and the queen got used to his not being indispensable. On Prince Albert's position the change had a marked effect, for in the absence of Melbourne the queen relied more particularly on his advice, and his indiscretion recognized the prince's unusual charm and capacity. One of the Tory premier's first acts was to propose that a royal commission should be appointed to consider the best means for promoting art and science in the kingdom, and he nominated Prince Albert as president. The International Exhibition of 1851, the creation of the Museum and Science and Art Department at South Kensington, the founding of art schools and picture galleries all over the country, the spread of musical taste and the fostering of technical education may be attributed, more or less directly, to the commission of distinguished men which began its labours under Prince Albert's auspices. The queen's second child, the prince of Wales (see Edward VII.), was born on the 9th of November 1841; and this event "filled the measure of the queen's domestic happiness," as she said in her speech from the throne at the opening of the session of 1842. It is unnecessary from this point onwards to go seriatim through the domestic history of the reign, which is given in the article ENGLISH HISTORY. At this time there was much political unrest at home, and serious difficulties abroad. As regards internal politics, it may be remarked that the queen and Prince Albert were relieved by the accession of the leader of the Protectionist party, adopted Free Trade and repealed the Corn Laws, for it closed a dangerous agitation which gave them much anxiety. When the country was in distress, the queen felt a womanly repugnance for festivities; and yet it was undesirable that the court should incur the reproach of living meanly to save money. There was a conversation between the queen and Sir Robert Peel on this subject in the early days of the Tory administration, and the queen talked of reducing her establishment in order that she might give away larger sums in charities. I am afraid the people would only say that your majesty was returning them change for their pounds in halfpence," answered Peel. "Your majesty is not perhaps aware that the most unpopular person in the parish is the relieving officer, and if the queen were to constitute herself a relieving officer for all the parishes in the kingdom she would find her money go a very little way, and she would provoke more grumbling than thanks." Peel added that a sovereign must do all things in order, not seeking praise for doing one particular thing well, but striving to be an example in all respects, even in dinner-giving.

Meanwhile the year 1842 was marked by splendid fêtets in honour of the king of Prussia, who held the prince of Wales at the font. In the spring there was a fancy-dress ball at Buckingham Palace, which remained memorable owing to the offence
which it gave in France. Prince Albert was costumed as
Edward III., the queen as Queen Philippa, and all the gentle-
men of the court as knights of Poitiers. The French chose to
view this as an unfriendly demonstration, and there was some
talk of getting up a counter-ball in Paris, the duke of Orleans
to figure as William the Conqueror. In June the queen took
her first railway journey, travelling from Windsor to Paddington
on the Great Western line. The master of the horse,
whose business it was to provide for the queen's
ordinary journeys by road, was much put out by this
innovation. He marched into the station several
minutes before the engine inspector had examined
a steed; but greater merriment was occasioned
by the queen's coachman, who insisted that, as a matter of form,
he ought to make-believe to drive the engine. After some
dispute, he was told that he might climb on to the pilot engine
which was to precede the royal train; but his scarlet livery,
white gloves and wig suffered so much from soot and sparks
that he made no more fuss about his rights in after trips. The
motion of the train was found to be so pleasant that the queen
readily trusted herself to the railway for a longer journey a few
weeks later, when she was to pay an official visit to Dublin. A report by Sir John
Clark led to the queen's visiting
Balmoral in 1848, and to the purchase of the Balmoral estate in
1852, and the queen's diary of her journeys in Scotland shows
what constant enjoyment she derived from her Highland home.
Seven years before this the estate of Osborne had been
purchased in the Isle of Wight, in order that the queen might have
a home of her own. Windsor she considered too stately, and
the Pavillon at Brighton too uncomfortable. The first stone
of Osborne House was laid in 1845, and the royal family entered
into possession in September 1847. In August 1848 Queen Victoria and Prince Albert paid a visit to
King Louis Philippe at the chateau d'Eu. They sailed from
Southampton for Tréport in a yacht, and, as it
happened to be raining hard when they embarked, the
loyal members of the Southampton Corporation remem-
brered Raleigh, and spread their robes on the ground
for the queen to walk over. In 1844 Louis Philippe
returned the visit by coming to Windsor. It was the first
visit ever paid by a king of France to a sovereign of England,
and Louis Philippe was much pleased at receiving the Order
of the Garter, and especially that he belonged to the
"Club" of European sovereigns until he received this
decoration. As the father of King Leopold of Belgium's
consort, the queen was much interested in his visit, which
went off with great success and goodwill. The tsar Nicholas
had visited Windsor earlier that year, in which also Prince Alfred,
who was to marry the tsar's grand-daughter, was born.
In 1846 the affair of the "Spanish marriages" seriously
troubled the relations between the United Kingdom and France. Louis Philippe and Guisa had planned the marriage
of the duke of Montpensier with the infanta Luisa of Spain,
younger sister of Queen Isabelia, who, it was thought at
the time, was not likely ever to have children. The intrigue
was therefore one for placing a son of the French king on the
Spanish throne. (See Spain, History.) As to Queen Victoria's
intervention on this question and on others, these words,
written by W. E. Gladstone in 1875, may be quoted:

"Although the admirable arrangements of the Constitution have
now shielded the sovereign from personal responsibility, they have
left ample scope for the exercise of direct and personal influence
in the whole work of government. ... The sovereign as compared
with her ministers has, because she is the sovereign, the advantage
of long experience, wide survey, elevated position and entire
disconnection from the bias of party. Further, personal and domestic
relations with the ruling families abroad give openings in delicate
cases for saying more, and saying it at once more gently and more
efficiently. This should also be studied to the end of formal and
rude contacts of government. We know with how much
truth, fulness and decision, and with how much tact and delicacy,
the queen, aided by Prince Albert, took a principal part on behalf
of the nation in the painful question of the Spanish marriages."

The year 1848, which shook so many continental thrones,
"She requires—

1. That he will distinctly state what he proposes in a given case, in order that the queen may know as distinctly to what she has committed him.

2. Having given her sanction to a measure, that it be not arbitrarily altered or modified by the minister. Such an act she must regard as failing in sincerity to the crown, and justly to be visited with the displeasure of her constitutional right of dismissing that minister. She expects to be kept informed of what passes between him and the foreign ministers, before important decisions are taken, based upon the instructions upon the advice which she dispaches in that good time, and to have the drafts for her approval sent her in sufficient time to make herself acquainted with their contents before they must be sent off. The queen thinks it best that Lord John Russell should show this letter to Lord Palmerston."

Lord Palmerston took a copy of this letter, and promised to attend to its direction. But the queen thoroughly distrusted him, and in October 1851 his proposed reception of Kossuth nearly led to a crisis. Then finally she discovered (December 13) at the time of the coup d'état, that he had, of his own initiative, given assurances of approval to Count Walewski, whose war she was not in accord with the views of the cabinet and with the neutrality which had been enjoined by the queen. This was too much even for Lord John Russell, and after a short and decisive correspondence Lord Palmerston resigned the seals of office.

The death of the duke of Wellington in 1852 deeply affected the queen. The duke had acquired a position above parties, and was the trusted adviser of all statesmen and of the court in emergencies. The queen sadly needed such a councillor, for Prince Albert's position was one full of difficulty, and party malignity was continually putting up spurious reports, and imputing to him advice which he did not give. During the Crimean War agitation offence was taken at his having attended a debate in the House of Commons, the Tories declaring that he had gone down to overawe the house in favour of Peel's measures. After Palmerston's enforced resignation, there was a new and more absurd hubbub. A climax was reached when the difficulties with Russia arose which led to the Crimean War; the prince was accused by the peace party of wanting war, and by the war party of plotting surrender; and it came to be publicly rumoured that the queen's husband had been found conspiring against the state, and had been committed to the Tower. Some said that the queen had been arrested too, and the prince wrote to Stockmar: "Thousands of people surrounded the Tower to see the queen and me brought to it." This gave infinite pain to the queen, and at length she wrote to Lord Aberdeen on the subject. Eventually, on 31st January 1854, Lord John Russell took occasion to deny most emphatically that Prince Albert interfered unduly with foreign affairs, and in both houses the statesmen of the two parties delivered feeling panegyrics of the prince, asserting at the same time his entire constitutional right to give private advice to the sovereign on matters of state. From this time it may be said that Prince Albert's position was established on a secure footing. He had declined (1850) to accept the post of commander-in-chief at the duke of Wellington's suggestion, and he always refused to let himself be placed in any situation which would have modified over so slightly his proper relations with the queen. The queen was very anxious that he should receive the title of "King Consort," and that the crown should be jointly borne as it was by William III. and Mary; but he himself never spoke a word for this arrangement. It was only to please her that he consented to take the title of Prince Consort (by letters patent of June 25, 1857), and he only did this when it was manifest that statesmen of all parties approved the change.

For the queen and royal family the Crimean War was a very busy and exciting one. Her majesty personally superintended the committees of ladies who organized relief for the wounded; she helped Florence Nightingale in raising bands of trained nurses; she visited the crippled soldiers in the hospitals, and it was through her resolute complaints of the utter insufficiency of the hospital accommodation that Netley Hospital was built. The distribution of medals to the soldiers and the institution of the Victoria Cross (February 1857) as a reward for individual instances of merit and valour must also be noted among the incidents which occupied the queen's time and thoughts.

In 1855 the emperor and empress of the French visited the queen at Windsor Castle, and the same year her majesty and the prince consort paid a visit to Paris.

The queen's family life was most happy. At Balmoral and Windsor the court lived in virtual privacy; and the queen and consort saw much of their children. The less entries in the queen's diaries testify to the anxious affection with which the progress of each little member of the household was watched. Two more children had been born to the royal pair, Prince Leopold (duke of Albany) on the 7th of April 1853, and on the 14th of April 1857 their last child, the princess Beatrice (Princess Henry of Battenberg), bringing the royal family up to nine—four sons and five daughters. Less than a year after Princess Beatrice's birth the princess royal was married to Prince Frederick William of Prussia, and Edward crowned emperor. The next marriage after the princess royal's was that of the princess Alice to Prince Louis (afterwards grand duke) of Hesse-Darmstadt in 1862. In 1863 the prince of Wales married the princess Alexandra of Denmark. In 1866 the princess Helena became the wife of Prince Christian of Schleswig-Holstein. In 1871 the princess Louise was wedded to the marquis of Lorne, eldest son of the duke of Argyll. In 1874 Prince Alfred, duke of Edinburgh, married Princess Marie Alexandrovna, only daughter of the tsar Alexander II. The duke of Connaught married in 1879 the princess Louise of Prussia, daughter of the soldier-prince Frederick Charles. In 1882 Prince Leopold, duke of Albany, wedded the princess Helen of Waldecc-Pyrmont. Finally came the marriage of Princess Beatrice in 1883 with Prince Henry of Battenberg.

On the occasion of the coming of age of the queen's sons and the marriages of her daughters parliament made provision. The prince of Wales, in addition to the revenues of the duchy of Cornwall, had £40,000 a year, the princess £10,000, and an addition of £6,000 a year for their children was granted by parliament in 1883. The princess royal received a dowry of £40,000 and £500 a year for life, the younger daughters £200 a year, and £600 a year each. The dukes of Edinburgh, Connaught and Albany were each voted an income of £15,000, and £10,000 on marrying.

The dispute with the United States concerning the "Trent" affair of 1861 will always be memorable for the part played in its settlement by the queen and the prince consort. In 1861 the accession of Abraham Lincoln to the presidency of the United States of America caused the Southern States of the Union to revolt, and the war began. During November the British West India steamer "Trent" was boarded by a vessel of the Federal Navy, the "San Jacinto," and Messrs Slidell and Mason, commissioners for the Confederate States, who were on their way to England, were seized. The British government were on the point of demanding reparation for this act in a peremptory manner which could hardly have meant anything but war, but Prince Albert insisted on revising Lord Russell's despatch in a way which gave the American government an opportunity to concede the surrender of the prisoners without humiliation. The memorandum from the queen on this point was the prince consort's last political draft. He was the last to ask for the queen's life which nothing could ever fill. She built at Frogmore a magnificent mausoleum where she might be buried with him.

Never again during her reign did the queen live in London, and Buckingham Palace was only used for occasional visits of a few days.
At the time of the prince consort's death the prince of Wales was in his twenty-first year. He had spent several terms at each of the two universities of Oxford and Cambridge, and he had already travelled much, having visited most of Europe, Egypt and the United States.

Marriage of the prince of Wales.

His marriage was solemnized at Windsor on the roth of March 1863. The queen witnessed the wedding from the private pew or box of St George's Chapel, Windsor, but she wore the deep mourning which she was never wholly to put off to the end of her life, and she took no part in the festivities of the wedding.

In foreign imperial affairs, and in the adjustment of serious parliamentary difficulties, the queen's dynastic influence abroad and her position as above party at home, together with the respect due to her character, good sense and experience, still remained a powerful element in the British polity, as was shown on more than one occasion. In 1866 the Austro-Prussian War broke out, and many short-sighted people were tempted to side with France when, in 1867, Napoleon III. sought to obtain a "moral compensation" by laying a claim to the duchy of Luxembourg. A conference met in London, and the difficulty was settled by neutralizing the duchy and ordering the evacuation of the普鲁士 troops who kept garrison there. But this solution, which averted an imminent war, was only arrived at through Queen Victoria's personal intercession. In the words of a French writer—

"The queen wrote both to the king of Prussia and to the emperor Napoleon. Her letter to the emperor, pervaded with the highest sentiments of respect and devotion to the crown of which the sovereign is the head, and to the person of the monarch, particularly since the death of Prince Albert, seems to have made a deep impression on the sovereign who, amid the struggles of politics, had never completely repudiated the philanthropic theories of his youth. Also, on the battlefield of Solferino, covered with the dead and wounded, was seized with an unspeakable horror of war."

Moreover, Disraeli's two premierships (1868, 1874-80) did a good deal to give new encouragement to a right idea of the constitutional function of the crown. Disraeli thought that the queen ought to be a power in the state. His notion of duty—once a loyal and chivalrous one—was that he was obliged to give the queen the best of his advice, but that the final decision in any course lay with her, and that once she had decided, he was bound, whatever the queen might be his own opinion, to stand up for her decision in public. The queen, not unnaturally, came to trust Disraeli implicitly, and she frequently showed her friendship for him. At his death she paid an exceptional tribute to his "dear and honoured memory" from his "grateful and affectionate sovereign and friend." To something like this position Lord Salisbury after 1866 succeeded. A somewhat different conception of the sovereign's functions was that of Gladstone, the great rival, Gladstone, who, though his respect for the person and office of the sovereign was unbounded, not only expected all people, the queen included, to agree with him when he changed his mind, but to become suddenly enthusiastic about his new ideas. The queen consequently never felt safe with him. Nor did she like his manner—he spoke to her (she is believed to have said) as if she were a public meeting. The queen was opposed to the Disestablishment of the Irish Church (1869)—the question which brought Gladstone to be premier—and though she disdained with good grace, Gladstone was fretful and astonished because she would not pretend to give a hearty assent to the measure. Through her secretary, General Grey, the queen pointed out that she had not concealed from Gladstone "how deeply she deplored" his having felt himself under the necessity of raising the question, and how apprehensive she was of the possible consequences of the measure; but, when a general election had pronounced on the principle, when the bill had been carried through the House of Commons by unrivalling majorities, she did not see what good could be gained by rejecting it in the Lords. Later, when through the skilful diplomacy of the prince the Lords had passed the second reading by a small but sufficient majority (179 to 146), and after amendments had been adopted, the queen herself wrote—

"The queen... is very sensible of the prudence and, at the same time, the anxiety for the welfare of the Irish Establishment which the archbishop has manifested during the course of the debate, and she will repeat to the House of Lords the amendments which have been adopted at his suggestion to a settlement of the question; but to effect this, concessions, the queen believes, will have to be made on both sides. The queen must say that she cannot view with anything but alarm possible consequences of a partition on the Irish Church, and she would ask the archbishop seriously to consider, in case the concessions to which the government may agree should not go so far as he may himself wish, whether the possible result of the settlement for a session may not be likely to result in worse rather than in better terms for the Church. The queen trusts, therefore, that the archbishop will himself consider, and far as he can, possible consequences of other solutions, any concessions that may be offered by the House of Commons in the most conciliatory spirit."

The correspondence of which this letter forms a part is one of the few published witnesses to the queen's careful and active interest in home politics during the latter half of her reign; but it is enough to prove how wise, how moderate, and how steeped in the spirit of the Constitution she was. Another instance is that of the County Franchise and Redistribution Bills of 1884--5. There, again, a conflict between the two houses was imminent, and the queen's wish for a settlement had considerable weight in bringing about the curious but effective conference of the two parties, of which the first suggestion, it is believed, was due to Lord Randolph Churchill.

In 1876 a bill was introduced into parliament for conferring on the queen the title of "Empress of India." It met opposition, an opinion which proved true, and the title was repudiated simply to shun the title of the sovereign, whether Indian or not. The title was intended to impress the idea of British suzerainty forcibly upon the minds of the native princes, and upon the population of Hindustan. The prince of Wales's voyage to India in the winter of 1875--6 had brought the heir to the throne into personal relationship with the great Indian vassals of the British crown, and it was felt that a further demonstration of the queen's interest in her magnificent dependency would confirm their loyalty.

The queen's private life during the decade 1870--80 was one of quiet, broken only by one great sorrow when the Princess Alice died in 1878. In 1869 her majesty had started in authorship by publishing The Early Days of the Prince Consort, compiled by General Grey; in 1869 she gave to the world her interesting and simply written diary entitled Leaves from the Journal of Our Life in the Highlands, and in 1874 appeared the first volume of The Life and Letters of the Prince Consort (2nd vol. in 1880), edited by Sir Theodore Martin. A second instalment of the Highland journal appeared in 1883. These literary occupations solaced the hours of a life which was spent in privation. Amongst all the years, 1870, which in which the queen was always accompanied by her youngest daughter, the Princess Beatrice, brought a little variety into the home-life, and aided much in keeping up the good health which the queen enjoyed almost uninterrupted. So far as public ceremonies were concerned, the prince and princess of Wales were now coming forward more and more to represent the royal family. People noticed meanwhile that the queen had taken a great affection for her Scottish man-servant, John Brown, who had been in her service since 1849; she made him her constant personal attendant, and looked on him more as a friend than as servant. When he died in 1882 the queen's grief was intense.

From 1880 onwards Ireland almost monopolized the field of domestic politics. The queen was privately opposed to Gladstone's Home Rule policy; but she observed in public a constitutional reticence on the subject. In the year, however, of the Crimes Act 1887, an event took place which was of more intimate personal concern to the queen, and of more attractive import to the country and the empire at large. June 9th was the fiftieth anniversary of another age of a1037, the coronation of Queen Victoria. On the following day, for the second time in English history, a great Jubilee celebration was held to commemorate so happy an event. The country threw
itself into the celebration with uncheckt enthusiasm; in large
sums of money, and everywhere subscribed; in every city,
town and village something was done both in the way
of rejoicing and in the way of establishing some permanent
memorial of the event. In London the day itself was kept by
a solemn service in Westminster Abbey, to which the queen
went in state, surrounded by the most brilliant, royal, and
princely escort that had ever accompanied a British sovereign,
and cheered on her way by the applause of hundreds of thousands
of her subjects. The queen had already paid a memorable visit
to the East End, when she opened the People's Palace on the
14th of May. On the 3rd of July she reviewed troops at Buckingham
Palace, and afterwards the funeral train for Queen Victoria passed
the residence of the Duke of Edinburgh. On the 4th of July she laid the foundation stone of the Imperial
Institute, the building at Kensington to which, at the instance
of the Prince of Wales, it had been determined to devote
the large sum of money collected as a Jubilee offering, and
which was opened by the queen in 1893. On the 9th of July the
queen reviewed 60,000 men at Aldershot; and, last and chief
of all, on the 23rd of July, one of the most brilliant days of
a brilliant summer, she reviewed the fleet at Spithead.
The year 1888 witnessed two events which greatly affected
European Blarney, from the beginning, vehemently opposed this mar-
riage, on the ground that for reasons of state policy it would
never do for a daughter of the German emperor to marry
a prince who was personally disliked by the tsar. This affair
caused no little agitation in royal circles, but in the end state
reasons were allowed to prevail and the chancellor had his
way.
The queen had borne so well the fatigue of the Jubilee that
during the succeeding years she was encouraged to make some-
what more frequent appearances among her subjects.
In May 1888 she attended a performance of Sir Arthur
Sullivan's Golden Legend at the Albert Hall, and in August she
visited Glasgow to open the magnificent new municipal buildings,
remaining for a couple of nights at Blythswood, the seat of Sir Archibald Campbell. Early in 1889 she received at Windsor
a special embassy, which was the beginning of a memorable
chapter of English history; two Matabele chiefs were sent by
King Lobengula to present his respects to the "great White
Queen," as to whose very existence, it was said, he had up
till that time been sceptical. Soon afterwards her majesty
was received by the crowned heads of Europe. On the 28th
afternoon of May, the queen paid a memorable visit which she paid to the queen-regent of Spain at San Sebastian,
the only visit that an English reigning sovereign had ever
paid to the Peninsula.
The relations between the court and the country formed
matter in 1889 for a somewhat sharp discussion in parliament
and in the press. A royal message was brought by Mr W. H.
Smith on the end of July, expressing, on the one hand, the
queen's desire to provide for Prince Albert Victor of Wales, and,

on the other, informing the house of the intended marriage
of the prince of Wales's daughter, the Princess Louise, to the
earl (afterwards duke) of Fife. 'On the proposal of
Mr Smith, seconded by Gladstone, a select committee
was appointed to consider these messages and to
grant to the house to as the existing practice and as
the principles to be adopted for the future. The evidence laid before the committee explained to the
country for the first time the actual state of the royal income,
and on the proposal of Gladstone, amending the proposal of
the government, it was proposed to grant a fixed addition of
£30,000 to the King, and a grant of £50,000 a year to the Duke of Edinburgh.
By the 4th of March the emperor William I. died at Berlin. He was
succeeded by his son, the emperor Frederick III.,
regarded with special affection in England as the husband
of the princess royal. But at the time he was suffering
from a malignant disease of the throat, and he died on the
15th of June, being succeeded by his eldest son, the emperor
William II., the grandson of the queen. Meanwhile Queen
Victoria spent some weeks at Florence at the Villa Palmieri,
and returned home by Darmstadt and Berlin. In spite of the
ilness of the emperor Frederick a certain number of court
festivities were held in her honour, and she had long con-
versations with Prince Bismarck, who was deeply impressed
by her majesty's personality. Just before, the prince
who was still chancellor, had taken a very strong line with regard
to a royal marriage in which the queen was keenly interested—
the proposal that Prince Alexander of Battenberg, lately ruler
of Bulgaria, and brother of the queen's son-in-law, Prince Henry,
should marry Princess Victoria, the eldest daughter of the
emperor Frederick, Prince Bismarck, who had been anti-
Battenberg, from the beginning, vehemently opposed this mar-
riage, on the ground that for reasons of state policy it would
never do for a daughter of the German emperor to marry
a prince who was personally disliked by the tsar. This affair
caused no little agitation in royal circles, but in the end state
reasons were allowed to prevail and the chancellor had his
way.
The queen had borne so well the fatigue of the Jubilee that
during the succeeding years she was encouraged to make some-
what more frequent appearances among her subjects.
In May 1888 she attended a performance of Sir Arthur
Sullivan's Golden Legend at the Albert Hall, and in August she
visited Glasgow to open the magnificent new municipal buildings,
remaining for a couple of nights at Blythswood, the seat of Sir Archibald Campbell. Early in 1889 she received at Windsor
a special embassy, which was the beginning of a memorable
chapter of English history; two Matabele chiefs were sent by
King Lobengula to present his respects to the "great White
Queen," as to whose very existence, it was said, he had up
till that time been sceptical. Soon afterwards her majesty
was received by the crowned heads of Europe. On the 28th
afternoon of May, the queen paid a memorable visit which she paid to the queen-regent of Spain at San Sebastian,
the only visit that an English reigning sovereign had ever
paid to the Peninsula.
The relations between the court and the country formed
matter in 1889 for a somewhat sharp discussion in parliament
and in the press. A royal message was brought by Mr W. H.
Smith on the end of July, expressing, on the one hand, the
queen's desire to provide for Prince Albert Victor of Wales, and,
had helped her in the management of her most private affairs and had acted as an intermediary between her and her ministers with singular ability and success. His successor was Sir Arthur Bigge. The following year, 1896, was marked by a visit which touched the queen even more nearly and more personally. At his own urgent request Prince Henry of Battenberg, the queen's son-in-law, was permitted to join the Ashanti expedition, and early in January the prince was struck down with fever. He was brought to the coast and put on board her majesty's ship "Blonde," where, on the 20th, he died.

In September 1896 the queen's reign had reached a point at which it exceeded in length that of any other English sovereign; but by her special request all public celebrations of the fact were deferred until the following June, which marked the completion of sixty years from her accession. As the time drew on it was obvious that the celebrations of this Diamond Jubilee, as it was popularly called, would exceed in magnificence those of the Jubilee of 1887. Mr Chamberlain, the secretary for the colonies, induced his colleagues to seize the opportunity of making the jubilee a festival of the British empire. Accordingly, the prime ministers of all the self-governing colonies, with their families, were invited to come to London as the guests of the country. Prince Henry of Battenberg and drafts of the troops from every British colony and dependency were brought home for the same purpose. The procession was, in the strictest sense of the term, unique. Here was a display, not only of Englishmen, Scotchmen, Irishmen, Welshmen, but of Mounted Rifles from Victoria and New South Wales, from the Cape and from Natal, and from the Dominion of Canada. Here were Husars from the Niger and the Gold Coast, coloured men from the West India regiments, zaptiehs from Cyprus, Chínamen from Hong Kong, and Dyaks—now civilized, now uncivilized—contingents from the Natives of India. Here, most brilliant sight of all, were the Imperial Service troops sent by the native princes of India; while the detachments of Sikhs who marched earlier in the procession received their full meed of admiration and applause. Altogether the queen was in her carriage for more than four hours, in itself an extraordinary physical feat for a woman of seventy-eight. Her own feelings were shown by the simple but significant message she sent to her people throughout the world: "From my heart I thank my beloved people. May God bless them!"

The illuminations in London and in the great provincial towns were magnificent, and all the hills from Ben Nevis to the South Downs were crowned with bonfires. The queen herself held a great review at Aldershot; but a much more significant display was the review by the prince of Wales of the fleet at Spithead on Saturday, the 26th of June. No less than 165 vessels of all classes were drawn up in four lines, extending altogether to a length of 30 m.

The two years that followed the Diamond Jubilee were, as regards the queen, comparatively uneventful. Her health remained good, and her visit to Cimiez in the spring of 1898 was as enjoyable and as beneficial as before. In May 1899, after another visit to the Riviera, the queen performed what proved to be her last ceremonial function in London: she proceeded in "semi-state" to South Kensington, and laid the foundation stone of the new buildings completing the Museum —henceforth to be called the Victoria and Albert Museum—which had been planned more than forty years before by the prince consort.

Griefs and anxieties encompassed the queen during the last year of her life. But if the South African War proved more serious than had been anticipated, it did more to weld the empire together than years of peaceful progress might have accomplished. The queen's frequent messages of thanks and greeting to her colonies and to the troops sent by them, and her reception of the latter at Windsor, gave evidence of the heartfelt joy with which she saw the sons of the empire giving their lives for the defence of its integrity; and the satisfaction which she showed in the Federation of the Australian colonies was no less keen. The reverses of the first part of the Boer campaign, together with the loss of some of her officers and soldiers, caused no small part of that "great strain" of which the Court Circular spoke in the ominous words which first told the country that she was seriously ill. But the queen faced the new situation with her usual courage, devotion and strength of will. She reviewed the departing regiments; she entertained the wives and children of the Windsor soldiers who had gone to the war; she showed by frequent messages her watchful interest in the course of the campaign and in the efforts which were being made throughout the whole empire; and her Christmas gift of a box of chocolate to every soldier in South Africa was a touching proof of her sympathy and interest. She relinquished her annual holiday on the Riviera, feeling that at such a time she ought not to leave her country. Entirely on her own initiative, and moved by admiration for the fine achievements of "her brave Irish" during the war, the queen announced her intention of paying a long visit to Dublin; and there, accordingly, she went for the month of April 1900, staying in the Viceregal Lodge, receiving many of the leaders of Irish society, inspecting some 50,000 school children from all parts of Ireland, and taking many a drive amid the charming scenery of the neighbourhood of Dublin. She went even further than this attempt to conciliate Irish feeling, and to show her recognition of the gallantry of the Irish soldiers she issued an order for them to wear the shamrock on St Patrick's Day, and for a new regiment of Irish Guards to be constituted.

In the previous November the queen had had the pleasure of receiving, on a private visit, her grandson, the German Emperor, who came accompanied by the empress and by two of their sons. This visit cheered the queen, and the successes of the army which followed the arrival of Lord Roberts in Africa renewed for her the keen interest she had always shown in the war, which she worked hard to bring to a successful close. The queen, however, was very seriously ill. Moreover, just at the end of the year a loss which greatly shocked and grieved the queen was experienced in the sudden death, at Windsor Castle, of the Dowager Lady Churchill, one of her oldest and most intimate friends. These losses told upon the queen at her advanced age. Throughout her life she had enjoyed excellent health, and even in the last few years the only marks of age were rheumatic stiffness of the joints, which prevented walking, and a diminished power of eyesight. In the autumn of 1900, however, her health began definitely to fail, and though arrangements were made for another holiday in the South, it was plain that her strength was seriously affected. Still she continued the ordinary routine of her duties and occupations. Before Christmas she made her usual journey to Osborne, and there on the 2nd of January she received Lord Roberts on his return from South Africa and handed to him the insignia of the Garter. A fortnight later she commanded a second visit from the field-marshal; she continued to transact business, and until a week before her death she still took her daily drive. A sudden loss of power then supervened, and on Friday evening, the 18th of January, the Court Circular published an authoritative announcement of her illness. On Tuesday, the 22nd of January 1901, she died.

Queen Victoria was a ruler of a new type. When she ascended the throne the popular faith in kings and queens was on the decline. She revived that faith; she consolidated her throne; she not only captivated the affections of the multitude, but...
won the respect of thoughtful men; and all this she achieved by methods which to her predecessors would have seemed impracticable—methods which it required no less shrewdness to discover than force of character and honesty of heart to adopt steadfastly. Whist all who approached the queen bore witness to her candour and reasonableness in relation to her ministers, all likewise proclaimed how anxiously she considered advice that was submitted to her before letting herself be persuaded that she must accept it for the good of her people.

Though richly endowed with saving common sense, the queen was not specially remarkable for high development of any specialized intellectual force. Her whole life, public and private, was an abiding lesson in the paramount importance of character. John Bright said of her that what specially struck him was her absolute truthfulness. The extent of her family connexions, and the correspondence she maintained with foreign sovereigns, together with the confidence inspired by her personal character, often enabled her to smooth the rugged places of international relations; and she gradually became in later years the link between all parts of a democratic empire, the citizens of which felt a passionate loyalty for their venerable queen.

By her long reign and unblemished record her name had become associated inseparably with British institutions and imperial solidarity. Her own life was by choice, and as far as her position would admit, one of almost austere simplicity and homeliness; and her subjects were proud of a royalty which involved none of the mischiefs of caprice or ostentation, but set an example alike of motherly sympathy and of queenly dignity. She was mourned at her death not by her own country only, nor even by all English-speaking people, but by the whole world. The funeral in London on the 1st and 2nd of February, including first the passage of the coffin from the Isle of Wight to Gosport between lines of warships, and secondly a military procession from London to Windsor, was a memorable solemnity; the greatest of English sovereigns, whose name would in history mark an age, had gone to her rest.

There is a good bibliographical note at the end of Mr Sidney Lee's article in the National Dictionary of Biography. See also the Letters of Queen Victoria (1907), and the obituary published by The Times, from which some passages have been borrowed above. (H. C. L.)

**VICTORIA (or VITTORIA), TOMMASO LUDOVICO DA** (c. 1540-c. 1613), Spanish musical composer, was born at Avila (unless, as Haberl conjectures, his title of Presbyter Abulensis refers not to his birthplace but to his parish priest, so that his name would indicate that he was born at Vittoria). In 1573 he was appointed as Maestro di Cappella to the Collegium Germanicum at Rome, where he had probably been trained. Victoria left Rome in 1586, being then appointed vice-master of the Royal Chapel at Madrid, a post which he held until 1603. In 1603 he composed for the funeral of the empress Maria the greatest requiem of the Golden Age, which is his last known work, though in 1613 a contemporary speaks of him as still living. He was not ostensibly Palestrina's pupil; but Palestrina had the main influence upon his art, and the personal relations between the two were as intimate as were the artistic. The work begun by Morales and perfected by Palestrina left no stumbling-blocks in Victoria's path and he was able from the outset to express the purity of his ideals of religious music without having to sift the good from the bad in that Flemish tradition which had engrossed him. Palaestrina, while he enlarged his style, never crossed Victoria's first publication in 1572 to his last requiem (the Officium Defunctorum of 1603) there is practically no change of style, all being pure church music of unsurpassing loftiness and showing no inequality except in concentration of thought. Like his countryman and predecessor Morales, he wrote no secular music; yet he differs from Morales, perhaps more than can be accounted for by his later date, in that his devotional spirit is impulsive rather than ascetic. His work is the crown of Spanish music: music which has been regarded as not constituting a special school, since it absorbed itself so thoroughly in the Rome of Palestrina. Yet, as has been aptly pointed out in the admirable article "Vittoria" in Grove's Dictionary of Music and Musicians, Roman music owes so much to that Spanish school which produced Guerrero, Morales and Victoria, that it might fairly be called the Hispano-Roman school. In spite of the comparative smallness of Victoria's output as compared with that of many of his contemporaries, there is no mistaking his claim to rank with Palestrina and Orlando di Lasso in the triad of supreme 16th-century masters. In any extensive anthology of liturgical polyphony such as the Musica Divina of Frotske, his work stands out as impressively as Palestrina's and Lasso's; and the style, in spite of a resemblance to Palestrina which amounts to imitation, is as individual as only a successful imitator of Palestrina can be. That is to say, Victoria's individuality is strong enough to assert itself by the very act of following Palestrina's path. When he is below his best his style does not become cabbard or harsh, but over-faceted and too high never falling in euphony. If he seldom displays an elaborate technique it is not because he conceals it, or lacks it. His mastery is unfailing, but his methods are those of direct emotional effect; and the intellectual qualities that strengthen and deepen this emotion are themselves innate and not sought out. The emotion is reasonable and lofty, not because he has trained himself to think correctly, but because he does not know that any one can think otherwise.

His works fill eight volumes in the complete edition of Messrs Breitkopf and Härtel.

**VICTORIA, a British colonial state, occupying the southeastern corner of Australia. Its western boundary is in 140° 58' E.; on the east it runs out to a point at Cape Howe, in 150° E. long., being thus rudely triangular in shape; the river Murray constitutes nearly the whole of the northern boundary, its most northerly point being in 34° S. lat.; the southern boundary is the coast-line of the Southern Ocean and of Bass Strait; the most southerly point is Wilson's Promontory in 39° S. lat. The greatest length east and west is about 480 m.; the greatest width, in the west, is about 250 m. The area is officially stated to be 57,854 sq. m.

The coast may be estimated at about 800 m. It begins about the 141st meridian with bold but not lofty sandstone cliffs, worn into deep caves and capped by grassy undulations, which extend inland to pleasant park-like lands. Cape Bridgewater and Nelson form a peninsula of forest lands, broken by patches of meadow. To the east of Cape Nelson lies the moderately sheltered inlet of Portland Bay, consisting of a sweep of sandy beach flanked by bold granite rocks. Then comes a long unbroken stretch of high cliffs, which, owing to inserting currents, have been the scene of many calamitous wrecks. Cape Otway is the termination of a wild mountain range that here abuts on the coast. Its brown cliffs rise vertically from the water; and the steep slopes above are covered with dense forests of exceedingly tall timber and tree-ferns. Eastwards from this cape the line of cliffs gradually diminishes in height to about 20 to 40 ft. at the entrance to Port Phillip. Next comes Port Phillip Bay, at the head of which stands the city of Melbourne. When the tide recedes from this bay through the narrow entrance it often encounters a strong current just outside; the broken and somewhat dangerous sea thus caused is called "the Rip." East of Port Phillip Bay the coast consists for 15 m. of a line of sandhanks; but at Cape Schanck they suddenly become high and bold. East of this comes Western Port, a deep inlet more than half occupied by French Island and Phillip Island. Its shores are flat and uninteresting, in some parts swampy. The bay is shallow and of little use for navigation. The coast continues rocky round Cape Liptrap. Wilson's Promontory is a great rounded mass of granite hills, with wild and striking scenery, tree-fern gullies and gigantic gum-trees, connected with the mainland by a narrow sandy isthmus. At its extremity lie a multitude of rocky islets, with steep granite edges. North of this cape, and
opening to the east, lies Corner Inlet, which is dry at low water. The coast now continues low to the extremity of the colony. The slight bend northward forms a sort of bay called the Ninety Mile Beach, but it really exceeds that length. It is an unbroken line of sandy shore, backed by low sandhills, on which grows a sparse dwarf vegetation. Behind these hills comes a succession of lakes, surrounded by excellent land, and beyond these rise the soft blue outlines of the mountain masses of the interior. The shores on the extreme east are somewhat higher, and occasionally rise in bold points. They terminate in Cape Howe, off which lies Gabo Island, of small extent but containing an important lighthouse and signalling station.

The western half of Victoria is level or slightly undulating, and as a rule tame in its scenery, exhibiting only thinly timbered grassy lands, with all the appearance of open parks. The north-west corner of the colony, equally flat, is dry and sometimes sandy, and frequently bare of vegetation, though in one part some seven or eight millions of acres are covered with the dense brushwood known as "mallee scrub." This wide western plain is slightly broken in two places. In the south the wild ranges of Cape Otway are covered over a considerable area with richly luxurious but almost impassable forests. This district has been reserved as a state forest and its coast forms a favourite holiday resort, the scenery being very attractive. The middle of the plain is crossed by a thin line of mountains, known as the Australian Pyrenees, at the western extremity of which there are several irregularly placed transverse ranges, the chief being the Grampians, the Victoria Range and the Sierra Range. Their highest point is Mount William (3600 feet). The eastern half of the colony is wholly different. Though there is plenty of level land, it occurs in small patches, and chiefly in the south, in Gippsland, which extends from Corner Inlet to Cape Howe. But a great part of this eastern half is occupied with the complicated mass of ranges known collectively as the Australian Alps. The whole forms a plateau averaging from 1000 to 2000 ft. high, with many smaller table-lands ranging from 3000 to 5000 ft. in height. The highest peak, Bogong, is 6908 ft. in altitude. The ranges are so densely covered with vegetation that it is extremely difficult to penetrate them. About fifteen peaks over 5000 ft. in height have been measured. Along the ranges grow the giant trees for which Victoria is famous. The narrow valleys and gullies contain exquisite scenery, the rocky streams being overshadowed by groves of graceful tree-ferns, from amid whose waving fronds rise the tall smooth stems of the white gums. Over ten millions of acres are thus covered with forest-clad mountains which in due time will become a very valuable asset of the state. The Australian Alps are connected with the Pyrenees by a long ridge called the Dividing Range (1500 to 3000 ft. high).

Victoria is fairly well watered, but its streams are generally too small to admit of navigation. This, however, is not the case with the Murray river (q.v.). The Murray for a distance of 670 m. (or 1250 m. if its various windings be followed) forms the boundary between New South Wales and Victoria; it receives a number of tributaries from the Victorian side. The Mitta Mitta, which rises in the heart of the Australian Alps, is 150 m. long. The Otways, rising among the same mountains, is slightly shorter. The Goulburn (340 m.) flows almost entirely through well-watered agricultural country; and is deep enough to be used in its lower part for navigation. The valley of this river is a fertile grain-producing district. The Campaspe (150 m.), has too little volume of water to be of use for navigation; its valley is also agricultural, and along its banks there lie a close succession of thriving townships. The Loddon (over 200 m.) rises in the Pyrenees. The upper part flows through a plain, to the right agricultural and to the left auriferous, containing nearly forty thriving towns, including Bendigo (formerly named Sandhurst) and Castlemaine. In the lower part of the valley the soil is also fertile, but the rainfall is small. To the west of the Loddon is the Avoca river with a length of 149 m.; it is of slight volume, and though it flows towards the Murray it loses itself in marshes and salt lagoons before reaching that river.

The rivers which flow southwards into the ocean are numerous. The Snowy river rises in New South Wales, and in Victoria flows entirely through wild and almost wholly unoccupied territory.
The Tambo (120 m. long), which rises in the heart of the Australian Alps, crosses the Gippsland plains and falls into Lake King, one of the Gippsland lakes; into the same lake falls the Mitchell river, rising in the eastern Alps, and, after a short distance, the Latrobe empties itself into Lake Wellington after a course of 135 m.; it rises at Mount Bav Bav. The Yarra river, flowing into the Lake Wannambool near Melbourne, is in a deep valley from the ranges, it follows a sinuous course through the undulating plains called the "Yarra Flats," which are wholly enclosed by hills, on whose slopes are some of the best vineyards of Australia, yet the flat is but 150 feet above sea level. Between Bayswater and Southcote are magnificent but well-wooded banks, and finally reaches Port Phillip Bay below Melbourne. Owing to its many windings its course through that city and suburbs, of which there are 20 miles, formerly available for vessels drawing 16 ft., has now been deepened so as to be available for vessels drawing 20 ft. The Barwon, farther west, is a river of considerable length but little value. The Victorian waterways are administered by the Hopkins and Glenelg (280 m.) both water the splendid pastoral lands of the west, the lower course of the former passing through the fertile district of Warrnambool, well known throughout Australia as a potato-growing region.

In the west there are Lakes Corangamite and Colac, due north of Cape Otway. The former is intensely salt; the latter is fresh, having an outlet for its waters. "Lakes Tyrrell and Hindmarsh lie in the plains of the north-west. In summer they are dried up, and in winter are again formed by the waters of rivers that have no outlet. In the east are the Gippsland lakes, formed by the waters of the rivers of that district dammed by the sandhills of the Ninety Mile Beach. They are connected with Bass Strait by a narrow and shifting channel through a shallow bar; the government of Victoria has done a great deal of late years to deepen the water making it suitable for larger ships. Upper Lake Wellington; a narrow passage leads into Lake Victoria, which is joined to a wider expanse called Lake King. These are all fresh water lakes and are visited by tourists, being readily accessible from Melbourne.

Geology.—Victoria includes a more varied and complete geological history than any other area of equal size in Australia. Its geological foundation consists of a band of Archean and Lower Palaeozoic rocks which form the backbone of the state, and sedimentary rocks in this foundation have been thrown into folds, of which the axes trend approximately north and south. The Lower Palaeozoic rocks, which are above the Archean, form the Victoria, which occupy the whole width of the state at its eastern end, extending from the New South Wales border on the north to the shore of the Southern Ocean on the south. These Highlands constitute the whole of the mountainous country of Gippsland and the north-eastern districts. They become narrower to the west, and finally, beyond the old plateau of Dunias, disappear beneath the recent loams of the plains along the Southern Australian border. Palaeozoic and Mesozoic rocks include the surface of some Upper Palaeozoic rocks, which occur in belts running north and south, and have been preserved by infolding or faulting; such rocks belong to the two upper divisions of the Lower Palaeozoic rocks, the Mountain Sandstones to the north-east of Melbourne; the belt of Devonian and Lower Carboniferous rocks that extends across eastern Victoria, through Mount Wellington to Mansfield; and finally the Great Coal Measures, the belt of Upper Palaeozoic and Lower Palaeozoic rocks, which extend along the Victoria and inhabited by the volcanic rocks of the Kainozoic age. The Kainozoic age of the north-eastern part of Victoria. They were originally described as metamorphosed Silurian rocks, but must be of Archean age. They form the southern part of the Victoria district and forms the old framework upon which the geology of Victoria has been built up. They are known as the Heathcotean series. The rocks consist of phyllites, schists and amphibolites; while their most characteristic feature is the occurrence of great masses of quartz veins and drifters. Volcanic agglomerates occur in the series at the typical locality of Heathcote. The Heathcotean rocks form the Cobinsabbine Range, which runs for 40 m. northward and southward. In the next series the quartz veins occur in the eastern foot of the Grampian Range, and at Dookie, and on the southern coast in Warrata Bay; they have been proved by bores under Russell, and they appear to have parts of the Gippsland coalfields. The Cambrian rocks have so far only been definitely proved near Mansfield. Mr. A. M. Howitt has there collected some fragmentary remains of Olenellus and worm tubes of the Cambrian genus Salterella. These beds at Mansfield contain phosphorus. The Ordovician system is well developed. It consists of slates and quartzites; and some schists around the granites of the western districts. The Ordovician is very well developed in the Grampians and the Hanging Rock area. The Ordovician is a rich graptolite fauna, and they have been classified into the following divisions:

Upper Ordovician
Darwilli Series
Castlemaine Series
Lower Ordovician
Berrigan Series
Lancefield Series

The Ordovician beds are best developed in a band running north-west and south-east across Victoria, of which the eastern boundary passes through Melbourne. This Ordovician band begins on the south with the block forming the plateau of Albury, and it extends across the North-Western Plains. This outlier is bounded to the north by the depression of Port Phillip and the basalt plains west of Melbourne. It reappears north of the Victoria, whence it extends along the Highlands, past Ballarat, with southern outers as far as Steiglitz. It forms the whole of the Ballarat Plateau, and is continued northward through the goldfields of Castlemaine, Bendigo and the Pyrenees, till it passes into the Northern Plains. The Upper Ordovician rocks have been collected in the Yarra goldfields; in the Pyrenees, and in the Grampians; in the Hanging Rock district; and in the Mount Eliza area.

The silurian system consists of two divisions: the lower or Melbournian, and the upper or Yerington. Both consist in the main of quartzites, sandstones, and shales. The upper series includes lentitic masses of limestones at Lilydale; and the limestone of the Thomson river. The limestones are rich in typical Silurian corals and bryozoa, and the shales and sandstones contain brachiopods and trilobites.

The Devonian rocks belong to the Lodefields of the Upper Yarra, Woods Point, Wahtalla and Rushworth, while the limestones are worked for lime at Lilydale and Wahtara. The moraine system includes the representatives of the lower, middle and upper series. The Lower Devonian includes the purporyries and their associated igneous rocks, along the valley of the Snowy river. They represent the remains of an old chain of volcanoes which once extended north and south across Victoria. The Middle Devonian is mainly formed of marine sandstone, and limestones in eastern Gippsland. It is best developed in the valleys of the Mitchell, the Tambo and the Snowy rivers. The Upper Devonian rocks are mainly sandstone, shale and conglomerate. At the close of Middle Devonian times there were intense crustal disturbances, and the granite massifs, which formed the primitive masses of the Victoria plateau, were emplaced. The Carboniferous system begins with the Avon river sandstone, containing Lepidoladenum, and the red sandstones, with Lower Carboniferous fish, collected by Mr Geo. Sweet near Mansfield. The Upper Carboniferous rocks, belonging to the Gippslandian system, include the characteristic rocks of Gippsland, and some in the Mount Wellington district belong to the same period. The Upper Carboniferous includes the famous glacial deposits and boulder clay, by which the occurrence of a Carboniferous glaciation in the Southern Hemisphere was first demonstrated. These beds occur at Heathcote, Bendigo, the Loddon Valley, southern Gippsland and the North-Eastern district. The bed consists of a lower clay band containing iron-boulders covered by a surface gravel, and sometimes rest upon rock-surface, and some lake deposits, similar to those laid down in glacial lakes. The glacial beds are overlain by sandstones containing Gangamopteris, the typical Carboniferous flora, and the beds rest on a series of the Greta or Lower Coal Measures of New South Wales. The Mesozoic rock is represented only by Jurassic rocks, which form the mountains of southern Gippsland and include the coalfields. The rocks contain fossil land plants, occasional fish remains and the clam of a dinosaur, &c. The coal is of excellent quality. The mudstone, which form the main bulk of this series, are largely composed of volcanic debris, which decomposes to a fertile soil. These rocks trend south-westward along the Bass Range, which reaches Western Port. They skirt the Mornington Peninsula, underlie part of Port Phillip and the Bass Strait, its width, and are exposed in the Barrabool Hills to the south-west of Geelong; thence they extend into the Otway Ranges, which are wholly built of these rocks and contain some coal seams. Farther west they disappear, and they are arrested in the Warrnambool district. They are exposed again in the Portland Peninsula, and rise again to form the Wannon Hills, to the south of Dunias. The Kainozoic beds include three main series: lacustrine, marine and volcanic. The main lacustrine series is probably of Oligocene.
age, and is important from its thick beds of brown coal, which are
thickest in the Great Valley of Victoria in southern Gippsland. A
cliff face on the banks of the Latrobe, near Morwell, shows 90 ft.
of it, and a bore near Morwell is recorded as having passed through
89 ft. of it. It is the greatest development of coal in the world, and
almost indestructible when used as piles for piers or wharves.
Smaller species of eucalyptus form the common "bush." Mela-
thus, Gomphocarpus, and others produce handsome fall foliage
on the banks of rivers in the summer, and in the lowlands of the
coasts, where they grow densely on the sand-hills, forming "flattree"
scrub. Eucalyptus dumosa is a species which grows only 6 to 12 ft.
high, but with a straight stem; the trees grow so close together
in many localities that they form a black "bush." Eucalyptus globulus
is extensive in the colony as a timber, being popularly known as
"blue gum" because of the beautiful blue color of the sap. It has
a maximum height of 90 ft. and 3 ft. in diameter in old trees, and
a half million acres of the Wimmera district are covered with
this "mallee scrub," as it is called. Recent legislation has made
the removal of artificial mallee scrub illegal, and the whole of it has been
taken under control for pastoral use.

VICTORIA (AUSTRALIA)

The Kainozoic marine rocks occur at intervals along the southern
coast and in the valleys opening from it. The most important horizon
is apparently of Miocene age. The rocks occur at intervals in eastern
Victoria, but the southern basalt and up to near the coast of the river
westward to Alberton. At the time of the deposition of these
beds Wilson's Promontory probably extended south-eastward and
to the east, and the beds there are folded and sometimes faulted.
They extend up the old valley of Port Phillip as far as Keilor to the
north of Melbourne, and are widely distributed under the volcanic
rocks in some places. They are exposed on the banks of the volcanic
cauldrons, and have been found by mining operations
under the volcanic rocks of the Ballarat plateau near Piffield.
The Miocene sea extended up the Glenelg valley, round the western
border of the Dundas Highlands, and spread over the Lower Murray
Basin into New South Wales; its farthest south-eastern limit was
in a valley at Stawell. Some marine deposits occur at the
Lakes Entrance in eastern Gippsland, and in the valley of the
Glenelg.

The volcanic series begins with a line of great dacite domes
including the geburite-dacite of Macedon, which is associated with
alopecurus and the true melampsorids. The boundary at which this
rocks was followed by that of sheets of basalt of several different ages,
and the intrusion of some trachyte dykes. The oldest basalt is
associated with the Oligocene lake deposits; and fragments of the
last described period occur in sheets below the basalts. The
contain in the Highlands of eastern Victoria. The gravel rivers below
the lavas have been worked for gold, and land plants discovered in
the workings. At Fliedner, near the highest development of the volcanic rocks are
a series of confluent sheets of basalt, forming the Western Plains,
which occupy over 10,000 sq. m. of south-western Victoria.
These lavas were extruded over the red sandstones and conglomerates
as well as the volcanic rocks, and the rocks of the Western Plains
have a drainage system with the sea, for the basin is a large
railway of 166 m. from Melbourne to Warrnambool. The volcanic
craters built up by later eruptions are well preserved: such are Mount
Elephant, a simple breached cone; Mount Noorat, with a
broad flat base; and Mount Warrenheip, near Ballarat, a single cone with the crater
breached to the north-west. Mount Frankland, standing on the
Ordivician rocks north of Daylesford, is a volcanic cone breached
up to the south-east. In addition to the volcanic craters, there are
numerous volcanic cauldrons formed by subsidence, such as Bulleen-
merri and Gnomok near Camperdown, Keilambete near Terang, and
Towong near Gippsland. These cauldrons are associated with Miocene
limestones.

The Pleistocene, or perhaps Upper Oligocene, deposits of most
importance in Victoria are the beds of Pleistocene glacier, which
are known as Dipothodon and Palochoestes, which have been found near Geelong,
Castlemaine, Lake Kolongulak, &c.; at the last locality Dipothodon
and Palochoestes have been reported to be the same as those in the diugo.
There is no trace in these deposits of the existence of man, and J. W.
Gregory has asserted the striking absence of evidence of man's residence in Victoria, except for a very limited period.
There is no convincing evidence of Pleistocene glacial deposits in Victoria.

of the many records, the only one that can still be regarded as at all probable is that regarding Mount Bogong.

The chief literature on the geology of Victoria is to be found in the
maps and publications of the Geological Survey—a branch of
the Mines Department. A map of the State, on the scale of eight
inches to the mile, was issued in 1902. The Survey has published numerous maps, charts, and memoirs.

The geology is described in the Reports, Bulletins and
Memorials of the Survey, and in the Quarterly Reports of the Mining
Registrars. Statistics of the mining industry are stated in the Annual
Reports of the Secretary of the Department of Mines. A resume
of the summary of the geology of Victoria, by R. Murray, issued by the
Mines Department in 1887 and 1895. Numerous papers on the
geochemistry of the State are contained in the Trans. R. Soc. Victoria,
and on its mining geology in the Transactions of the Austral.

The physical geography has been described by J. W.
Gregory in the Geography of Victoria (1903).

Victoria's mountains belong to the Myrrum group, being
largely composed of igneous or gum trees. There are several
hundred species, the most notable being Eucalyptus amygdalina, a
tree with white bloom, smooth, as a marble column, and without
branches for 10 ft. The leaves of the gum trees are 2 by 1.5 ft. when seen in groves, for these have all the appearance of lofty,
pillared cathedrals. These trees are among the tallest in the world,
average in some districts about 300 ft. The longest ever measured
was found prostrate on the Back Spur: it measured
470 ft. in length; it was 81 ft. in girth near the root. Eucalyptus
globulus or blue gum has broad green leaves, which yield the
eucalyptus oil of the pharmacopoeia. Eucalyptus rostrata is
extensively used in the colony as a timber, being popularly known as
"red gum" because of the color of the sap. It is 70 ft. high, and
has a diameter of 3 ft. in large trees. The largest tree ever measured
in Victoria was 100 ft. high, and 4 ft. in diameter. The largest
of the Myrrum group is the Eucalyptus amygdalina, which
is found in the highlands of northern Victoria. It has a
maximum height of 200 ft. and a diameter of 6 ft. in large trees.

The climate of Victoria is characterized by a large number
of snowstorms, which fall in the winter months. The temperature
falls to 0° below zero in the coldest months. The average annual
rainfall is 10 inches, and the average snowfall is 20 inches.

The population of Victoria in 1901 was 3,712,371, the proportion
of the sexes being nearly equal.

In 1860 the population numbered 537,873, in 1870,
The number of illegitimate births during 1859 was 1689, which gives a proportion of 5-61 to every 100 births registered. The death-rate has greatly improved. Arranged in quinquennial periods the death-rates were:

<table>

The marriages in 1905 numbered 8774, which represents a rate of 7-74 per 1000 persons. This was the highest number reached during a period of fourteen years, and was 54 per more than in 1904 and 1169 per more than in 1903. In the five years 1871-75 the marriage-rate stood at 6-30 per 1000; in 1876-80, 6-02; in 1881-85, 7-77; in 1886-90, 9-13; in 1891-95, 6-86.

Outside Melbourne and suburbs, the most important towns are Ballarat (49,648), Bendigo (43,666), Geelong (26,642), Castlemaine (8013), Warrnambool (6000), Maryborough (5000) and Stawell (380).

Religion.—The Church of England, as disclosed at the census of 1901, had 432,704 adherents; the Roman Catholic Church came next with 263,710; the Presbyterians had 190,725; Wesleyans and Methodists, 180,272; Congregationalists, 17,141; Baptists, 32,648; Lutherans, 13,035; Jews, 5907; and the Salvation Army, whose Australian headquarters are in Melbourne, 8930.

Education.—In 1905 Melbourne and its suburbs had 1149 schools, in which there were 210,200 children enrolled, the teachers numbering 4689. There were also 771 private schools with 2289 teachers and a net enrolment of 14,014 children; the majority of them being connected with one or other of the principal religious denominations. The total cost of primary instruction in 1905 was £675,228, being 11s. 2d. per head of population and 54,145, 4d. per head of scholars in average attendance. Melbourne University was its high position as a teaching body. In 1905 the number of matriculants was 493 and the graduates 118.

Crime is decreasing. In 1905 the number of persons brought before the magistrates was 44,345. Drunkenness accounted for 4,858, which represents 11-92 per 1000 of the population; in 1901 the proportion was 14-43. Charges against the person numbered 1932, and against property 4032.

Administration.—As one of the six states of the Commonwealth, Victoria returns six senators and twenty-three representatives to the federal parliament. The local legislative authority is vested in a parliament of two chambers, both elective —the Legislative Council, composed of thirty-five members, and the Legislative Assembly, composed of sixty-eight members. One-half of the members of the Council retire every three years. The members of the Assembly are elected by universal suffrage for the term of three years, but the chamber can be dissolved at any time by the Governor in council. Members of the Assembly are paid £300 a year.

The whole of Victoria in 1905 was under the control of municipalities, with the exception of about 500 sq. m. in the mountainous park of Wonnangatta, and 64 sq. m. in French Island. The number of municipalities in that year was 206; they comprised 11 cities, 11 towns, 36 boroughs and 46 shires.

Finance.—The public revenue in 1905 showed an increase on that of the three previous years, being £7,515,142, equal to 5s. 4s. 2d. per head of population; the expenditure amounted to £7,343,742, which showed a slight increase and was equal to 5s. 1d. 4d. per inhabitant. The public debt of Australia in 1860 was £4,621,282; in 1885, £5,260,391; in 1890, £6,515,195; in 1895, £6,712,512; and in 1901, £7,722,397. The chief sources of revenue of 1905 were as follows:—

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customs and Excise</td>
<td>£2,017,378</td>

</tr>
</tbody>
</table>

The capital value of properties as returned by the municipalities in 1905 was £210,920,714, and the annual value £11,743,270. In comparison with 1865 there were 104 millions and £8,099,000, and in 1860—203 millions and £13,734,000; the year last mentioned marked the highest point of inflation in land values, and during the following years there was a vast reduction, both in capital and in annual values. The lowest point was reached in 1895; since that time improvement has taken place, and there is every evidence that this improvement will continue. The revenues of municipalities are collected partly from rates, but the main body is largely supplemented by fees and licences, and contributions for services rendered, including government endowments and special grants, which in 1905 amounted to £60,572, the revenues of the municipalities in the city of Melbourne being £4,663,123; the city of Melbourne, £1,273,855; 1895, £1,036,720; 1900, £1,036,497; 1905, £1,341,252. In addition to the municipalities there are other local bodies charged with levy rates; their rates and their revenues in 1905 were:—

Productions and Industry—Minerals.—About 25,400 persons find employment in the goldfields, and the quantity of gold won in 1905 was 810,600 oz., valued at £1,773,744, a decrease of 16,007 oz. as compared with 1904. The dividends paid by gold-mining companies in 1905 amounted to £434,431, which, although about the average of recent years, showed a decline of £168,666 as compared with the distribution in 1904. The total value of gold won from the first discovery in 1851 was £723,356,500. No other metallic minerals are systematically worked, although many valuable deposits are known to exist. Brown coal, or lignite, is worked extensively, and is used largely for industrial heating purposes, but is too low in calory for the mineral for ordinary fuel purposes, but without much success. Black coal is now being raised in increasingly large quantities. The principal coalfield is the O'Connell, the Coal Creek Project, the Jaffa project and the Jumbunna project, all in the Wallan and Wendouricia-land district. The production of coal in 1905 was 155,185 tons, valued at £29,060; £4100 worth of silver and £11,135 worth of tin were raised; the value of other minerals produced was £93,392, making a total mineral production (exclusive of gold) of £187,711.

Agriculture.—Judged by the area under tillage, Victoria ranks first amongst the states of the Australian group. The area under crop in 1905 was 4,266,577 acres, compared with 2,116,000 acres in 1901 and 1,435,000 acres in 1881. Wheat-growing claims the chief attention, 2,079,517 acres being under that cereal in 1905. The area under wheat is extended to other states as follows:—

<table>
<thead>

The average yield per acre in 1905 was 11-31 bushels; the average of the seven years 1899 to 1905 was 11-31 bushels; the average of the ten years 1900 to 1905 were the highest ever obtained. The yield of oats was 23-18 bushels per acre, of barley 22-95, and of potatoes 2-58 tons. Great progress has been made in the cultivation of the grape vine, and wine now produces more than one-third of the wine made in Australia.

Live Stock.—The number of sheep in 1905 was 11,445,115. The quality of the sheep is steadily improving. Systematic attention is being brought to the breed, and careful observations show that between 1861 and 1871 the average weight of wool per sheep increased about one-third; between 1871 and 1881 about one pound was added to the weight.
per fleece, and there has been a further improvement in the 1899 to the year 1891. The following were the number of sheep and pigs in 1899: 1847; 1951; 1891, 12,928,000; 1901, 10,841,790. The horses numbered 385,513, the swine 273,582, and the horned cattle 1,737,690; of these last, 693,000 were females. By 1891, 6,499,505 tons of cheese, valued at £14,134; 1842, 18,000, had been produced. The value of cheese and butter has had a good deal of fluctuation in the amount of employment afforded by the factories, as the following figures show: hand worked, 1885, 29,477; 1890, 66,693; 1893, 39,473; 1895, 45,609; 1900, 64,207; 1905, 80,735. Of the hands laborers employed in the cheese factories in 1895, 12,496 females and 4,297,350 lb of bacon and hams.

The following is a statement showing the value of the state in 1895, andホーキングの数字を示しています。工場で雇用を支えるために、以下の数字を示しています。手作業、1885年、29,477人、1890年、66,693人、1893年、39,473人、1895年、45,609人、1900年、64,207人、1905年、80,735人。1895年、12,496人の女性労働者と4,297,350人の豚肉とハムが雇われました。

4.2 VICTORIA (AUSTRALIA)

Australasia

Van of number 1824 Swan steady light 293,241; 13,026,426; labourers 1842, 362,735. The value of these was returned at £3,193,919, and the value of butter £7,717,236. The majority of the establishments were small; those employing 50 to 100 hands in 1905 were 161, and upwards of 100 hands, 124.

Commerce—Excluding the coastal trade, the tonnage of vessels entering Victorian ports in 1904 was 5,896,003, or about 34 tons per inhabitant. The imports in the same year were valued at £22,337,886, and the exports at £22,758,828. These figures represent £18, 8s. 5d. and £18, 15s. 6d. per inhabitant respectively. The domestic produce exported was valued at £14,276,661; in 1891 the value was £13,026,426; and in 1891, £12,496,347. The comparatively small increase over the period named is due mainly to the large fall in prices of the staple articles of local production. There has, however, been a steady trade in the export of wool, flax, and hides from the colony. The government has been active in promoting the export trade, and the wool industry has greatly increased in value. The wool industry is said to have supplied 3,582,266, 3,582,266, and 3,582,266 wool in the years 1895, 1905, and 1905 respectively.

Defence.—The Commonwealth defence forces in Victoria numbered about 5,700 men, 1,300 being partially paid militia and 1,000 unpaid volunteers. In 1899, 18,400 of the force were belonging to rifle clubs. Besides these there are 200 naval volunteers, capable of being employed either as a light artillery force, or on board war vessels. The total expenditure in 1905 for purposes of defence in the state was £201,572.

Railways.—The railways have a total length of 3,544 m., and the cost of their construction and equipment up to the 30th of June 1905 was £4,259,857; this sum was obtained by raising loans, mortgage, and the proceeds of the general revenues of the state. In 1905 the gross railway earnings were £3,828,266; and the net earnings were £1,222,279; so that the net earnings were £1,599,878, which sum represents 3.50% on the capital cost.

History.—The first discovery of Victoria was Captain Cook, in command of H.M.S. “Endeavour,” who sighted Cape Evard, about half-way between Cape Howe and the mouth of the Snowy River, on the 19th of April 1770, a few days prior to his arrival at Botany Bay. The first persons to land in Victoria were the supercargo and a portion of the crew of the merchant ship “Sydney Cove,” which was wrecked at the Furneaux Islands in Bass Strait on the 6th of February 1797. In the same year, Mr Bass, a surgeon in the navy, discovered the strait which bears his name and separates Victoria from Tasmania. Liet. Grant in the “Lady Nelson” surveyed the south coast in 1802, and in 1801 Port Phillip was for the first time entered by Liet. Murray. In 1802 that harbour was surveyed by Captain Flinders, and in the same year Mr Grimes, the surveyor-general of New South Wales, explored the country in the neighbourhood of the present site of Melbourne. In 1804 Liet.-Col. Collins, who had been sent from England, formed a penal settlement on the shores of Port Phillip, but after remaining a little more than three months near Indented Head, he removed his party to Van Diemen Land. Victoria was visited in 1824 by two sheep farmers named Hume and Hovell, who rode overland from Lake George, New South Wales, to the shores of Corio Bay. In 1826 a convict establishment was attempted by the government of New South Wales at Port Phillip. In 1826 the first cattle were landed on Flinders Island, but it was abandoned shortly afterwards. In 1834 Messrs Edward and Francis Henty, who had taken part in the original expedition to Swan river, West Australia, and afterwards migrated to Van Diemen Land, crossed Bass Strait, established a small whaling station at Portland Bay, and formed sheep and cattle stations on the river Wannon and Wando rivulet, near the site of the present towns of Merino, Casterton and Coleraine. In 1835 a number of stock owners in Van Diemen Land purchased through Batman from the aborigines a tract of 700,000 acres on the shores of Port Phillip. The sale was repudiated by the British government, which regarded all unoccupied land in any part of Australia as the property of the crown, and did not recognize the title of the aborigines. Batman, however, remained at Port Phillip, and commenced farming within the boundaries of the present city of Melbourne. He was followed by John Pascoe Fawkes and other settlers from Van Diemen Land, who occupied the fertile plains of the new territory. In 1836 Captain Lonsdale was sent to Melbourne by the government of New South Wales to act as resident magistrate in Port Phillip. The first census taken in 1838 showed that the population was 351, of whom 108 were males and 243 females. In 1839 Mr Latrobe was appointed superintending officer of Port Phillip, and a resident judge was nominated for Melbourne, with jurisdiction over the territory which now forms the state of Victoria. The years 1840 and 1841 were periods of depression owing to the decline in the value of all descriptions of live stock, for which the first settlers had paid high prices; but there was a steady immigration from Great Britain of men with means, attracted by the profits of sheep-farming, and of labourers and artisans who obtained free passages under the provisions of the Wakefield system. In the summer of 1840, the sale and occupation of crown lands were expedited upon the introduction of workers. The whole district was occupied by sheep and cattle graziers, and in 1841 the population had increased to 11,738. Melbourne was incorporated as a town in 1842, and was raised to the dignity of a city in 1847. At that same year the first Anglican was ordained, and in 1848 the first Roman Catholic bishop. The third census (taken in 1846) showed a population of 34,870.

The elective element was introduced into the Legislative Council of New South Wales in 1842, in the proportion of twenty-four members to twelve nominated by the crown, and the district of Port Phillip, including Melbourne, returned six members. But the colonists were not satisfied with government
from and by Sydney; an agitation in favour of separation commenced, and in 1837 Victoria was formed into a separate colony with an Executive Council appointed by the crown, and a Legislative Council, partly elective and partly nominated, on the same lines as that of New South Wales. The population at that date was 77,435. Gold was discovered a few weeks after the colony had entered upon its separate existence, and a large number of persons were attracted to the mines, first from the neighbouring colonies—some of which, such as South Australia, Van Diemen’s Land and West Australia, were almost denuded of able-bodied men and women—and subsequently from Europe and America. The difficulties with which the local government had to contend, the task of maintaining law and order was fairly grappled with; the foundations of a liberal system of primary, secondary and university education were laid; roads, bridges and telegraphs were constructed, and Melbourne was provided with an excellent supply of water.

Local self-government was introduced in 1853, and the Legislature found time to discuss a new Constitution, which not only eliminated the nominee element from the Legislative Council, but made the executive government responsible to the people. The administration of the gold-fields was not popular with the miners, who demanded at first to be charged for permission to mine for gold, and at there being no representation for the gold-fields in the local Legislature. The discontent culminated, at Ballarat in December 1854, in riots in which there was a considerable loss of life both amongst the miners and the troops. Eventually, an export duty on gold was substituted for the licence fee, but every miner had to take out a right which enabled him to occupy a limited area of land for mining, and also for residence. The census taken in 1854 showed a population of 236,778. The new Constitution was proclaimed in 1855, and the old Legislative Council was gazetted as the first responsible ministry. It held office for about sixteen months, and was succeeded by an administration formed from the popular party. Several changes were made in the direction of democratizing the government, and vote by ballot, manhood suffrage and the abolition of the property qualification followed each other in rapid succession. To several of these changes there was strenuous opposition, not so much in the Assembly which represented the manhood, as in the Council in which the property of the colony was supreme. The crown land was often occupied by squatting adventurers... the term is locally squatters,” who held them under a licence renewable annually at a low rental. These licences were very valuable, and the goodwill of a grazing farm or “run” commanded a high price. Persons who desired to acquire freeholds for the purpose of tillage could only do so by purchasing the land at auction, and the local squatters, unwilling to be deprived of any portion of a valuable property, were generally willing to pay a price per acre with which no person of small means desirous of embarking upon agricultural pursuits could compete. The result was that although the population had increased in 1861 to 540,322, the area of land under crop had not grown proportionately, and Victoria was dependent upon the neighbouring colonies and even more distant countries for a considerable portion of its food. A series of Land Acts was passed, the first in 1860, with the view of encouraging a class of small freeholders. The principle underlying all these laws was that residence by landowners on their farms, and their cultivation, were more important to the state than the sum realized by the sale of the land. The policy was only partially successful, and by a number of ingenious evasions a large proportion of the best land in the colony passed into the possession of the original squatters. But instead of the proportion was purchased by small farmers to convert Victoria into a great agricultural country, and to enable it to export large quantities of farm and dairy produce.

The greater portion of the revenue was raised by the taxation through the customs of a small number of products, such as spirits, tobacco, wine, tea, coffee, &c. But an agitation arose in favour of such an adjustment of the import duties as would protect the manufactures which at that time were being com- menced. A determined opposition to this policy was made by a large minority in the Assembly, and by a large majority in the Council, but by degrees the democratic party triumphed. The victory was not gained without a number of political crises which shook the whole fabric of society to its foundations. The Assembly tackled the tariff to the Appropriation Bill, and the Council threw out both. The result was that there was no legal means of paying either the civil servants or the contractors, and the government had recourse to an ingenious though questionable system by which advances were made by a bank which was recouped through the crown’s own property. The government was in trouble; but by the privileges of its position for its payment without any recourse to parliament. Similar opposition was made by the Council to payment of members, and to a grant made to Lady Darling, the wife of Governor Sir Charles Darling, who had been recalled by the secretary of state on the charge of having shown partiality to the democratic party. Indeed on one occasion the dispute between the government and the Council was so violent that the former dismissed all the police, magistrates, county court judges and other high officials, on the ground that no provision had been made by the Council, which had thrown out the Appropriation Bill, for the payment of the ministerial establishments. Notwithstanding these political struggles, the population of the colony steadily increased, and the Legislature found time to pass some measures which affected the social life and the commercial position of the colonies. State aid to religion was abolished, and divorce was made comparatively easy. A system of free, compulsory and secular primary education was introduced. The import duties were increased and the transfer of land was simplified. In 1880 a fortnightly mail service via Suez between England and Melbourne was introduced, and in 1886 the International Exhibition was held. Victoria was opened. In the following year the census showed a population of 862,346, of whom 452,083 were males and 410,263 females. During the same year the lengthy dispute between the two houses of parliament, which had caused so much inconvenience, so many heartburnings and so many political crises, was brought to an end by the passage of an act which reduced the qualifications for members and the election of the Legislative Council, shortened the tenure of their seats, increased the number of provinces to fourteen and the number of members to forty-two. In 1883 a coalition government, in which the Liberal or protectionist and the Conservative or free-trade party were represented, took office, and with some changes remained in power for seven years. During this political truce several important changes were made in the Constitution. An act for giving greater facilities for divorce was passed, and with some difficulty obtained the royal assent. The Victorian railways were handed over to the control of three commissioners, who to a considerable extent were made independent of the government, and the civil service was placed under the supervision of an independent board. In 1887 the representatives of Victoria met those of the other British colonies and of the United Kingdom in London, under the presidency of Lord Knutsford, in order to discuss the questions of defence, postal and telegraphic communication, and the contribution of Australia to the Imperial navy. In 1888 a weekly mail service was established via Suez by the steamer of the P. & O. and the Orient Companies, and the second Victorian International Exhibition was opened. In 1890 all the Australian colonies, including New South Wales and New Zealand, sent representatives to a conference at Melbourne, at which resolutions were passed in favour of the establishment of a National Australian Convention empowered to consider and report upon an adequate scheme for the Federal Constitution. This Convention met in Sydney in 1891 and took the first step towards federation (see AUSTRALIA).

In 1891 the coalition government resigned and a Liberal administration was formed. An act passed in that year placed the railways again under the control of the government. Measures of a democratic and collectivist tendency have since obtained the assent of the Legislature.1 The franchise of...
property-holders not resident in an electorate was abolished and the principle of "one man one vote" was established. Acts have been passed sanctioning Old Age Pensions; prohibiting shops, except those selling perishable goods, from keeping them more than eight hours, compelling the proprietors to give their assistants one half-holiday every six days; preventing persons from working more than forty-eight hours a week; and appointing for each trade a tribunal composed of an equal number of employers and employed to fix a minimum wage. (See Australia.)

Victoria enjoyed a large measure of prosperity during the later 'eighties and earlier 'nineties, and its financial prosperity enabled the government to expend large sums in extending railway communication to almost every locality and to commence a system of irrigation. The soil of Victoria is on the whole more fertile than in any other colony on the mainland of Australia, and in no portion of the continent is there any locality equal in fertility to the western district and some parts of Gippsland. The rainfall is more equable than in any portion of Australia, but the northern and north-western districts, which are the most remote from the sea and the Dividing Range, are subject to droughts, which, although not so severe or so frequent as in the interior of the continent, are sufficiently disastrous in their effects. The results of the expenditure upon irrigation have been more successful than was hoped. Victoria has no mountains covered with snow, which in Italy and South America supply with water the rivers at the season of the year when the land needs irrigation, and it was necessary to construct large and expensive reservoirs. The cost of water is therefore greater than the ordinary agriculturist who grows grain or breeds and fattens stock can afford to pay, although the price may not be too high for orchardists and vine-growers. In 1892 the prosperity of the colony was checked by a great strike which for some months affected production, but speculation in land continued for a time longer, especially in Melbourne, which at that time contained nearly half the population, 900,000 out of a total of 1,140,105. There does not seem to have been any other reasons for this increase in land values, for there was no immigration, and the value of every description of produce had fallen—except that the working classes were prosperous and well paid, and that the purchase of small allotments in the suburbs was a popular mode of investment. In 1893 there was a collapse. The value of land declined enormously, hundreds of persons believed to be wealthy were ruined, and there was a financial panic which caused the suspension of all the banks, with the exception of the Australasian, the Union of Australia, and the New South Wales. Most of them resumed payment, but three went into liquidation. It was some years before the normal condition of prosperity was restored, but the great resources of the colony and the energy of its people discovered new markets, and new products for them, and enabled them materially to increase the export trade.

Victoria, a city and port of Brazil, capital of the state of Espírito Santo, on the W. side of an island at the head of the Bay of Espírito Santo, 270 m. N.E. of Rio de Janeiro, in lat. 20° 18' S., long. 40° 20' W. Pop. (1902, estimated) 9000. The city occupies the beach and talus at the base of a high, wooded mountain. The principal streets follow the water-line, rising in terraces from the shore, and are crossed by narrow, steep, roughly paved streets. The buildings are old and of the colonial type. The governor's residence is an old convent, with its church at one side. The entrance to the bay is rather tortuous and difficult, but is sufficiently deep for the largest vessels that are defended by five small forts. The harbour is not large, but is safe and deep, being almost shut in by hills. A large quay, pier, warehouses, &c., facilitate the handling of cargoes, which were previously transported to and from the anchorage by lighters. Victoria is a port of call for coasting steamers and a shipping port in the coffee trade. The other exports are sugar, rice and mandioca (manioc) to home ports.

Victoria was founded in 1535 by Vasco Fernandu Coutinho, on the S. side and nearer the entrance to the bay, and received the name of Espírito Santo. The old site is still occupied, and is known as Villa Velha (Old Town). The name of Victoria was adopted in 1558 in commemoration of a crushing defeat inflicted by Fernando da Sa on the allied tribes of the Aimorés, Tapinlinguins and Goitacazes in that year. It was attacked (1592) by the freebooter Cavendish, who was repelled by one of the forts at the entrance to the bay.

Victoria, the capital of British Columbia and the principal city of Vancouver Island, in the S.E. corner of which it is finely situated (48° 25' 26" N., 123° 22' 24" W.), on a small arm of the sea, its harbour, however, only admitting vessels drawing 18 ft. Pop. (1906) about 25,000. It is the oldest city in the province. It has fine streets, handsome villas and public buildings, government offices and churches. The high school is affiliated with McGill University, in Montreal. Victoria is connected with the mainland by cable, and is a favourite tourist resort for the whole west coast of North America. Till 1858 Victoria was a post of the Hudson's Bay Company. The city was incorporated in 1862, and according to the census of 1886 the population was 14,000, including Chinese and Indians, spread over an area of 4 sq. m. Until the redistribution of the fleet in 1905, the headquarters of the British Pacific squadron was at Esquimalt, a fine harbour about 3 m. W. of Victoria. This harbour, though spacious, is not much used by merchant vessels. It is provided with a large dry-dock and is defended by fortifications of a modern type.

Victoria Falls, the greatest waterfall in the world, forming the most remarkable feature of the river Zambesi, Central Africa. The falls are about midway in the course of the Zambesi in 15° 31' S., 25° 41' E. For a considerable distance above the falls the river flows over a level sheet of basalt, its valley bounded by low and distant sandstone hills. Its clear blue waters are dotted with numerous tree-clad islands. These islands increase in number as the river, without quickening its current, approaches the falls, whose nearness is indicated only by a veil of spray. At the spot where the Zambesi is at its widest—over 1860 yds.—it falls abruptly over the edge of an almost vertical chasm with a roar as of continuous thunder,
sends up vast columns of vapour. Hence the native name Mubi-oo-tunywa, "Smoke does sound there." The chasm extends the whole breadth of the river and is more than twice the depth of Niagara, varying from 250 ft. at the right bank to 450 ft. of the river's centre. On the Niagara the water does not fall into an open basin but is arrested at a distance of from 80 to 240 ft. by the opposite wall of the chasm. Both walls are of the same height, so that the falls appear to be formed by a huge crack in the bed of the river. The only outlet is a narrow channel cut in the barrier wall at a point about three-fifths from the western end of the chasm, and through this gorge, not more than 100 ft. wide, the whole volume of the river pours for 130 yds. before emerging into an enormous zigzag trough (the Grand Cañon) which conducts the river past the basalt plateau. The tremendous pressure with which the water is subjected in the confinement of the chasm causes the perpetual columns of mist which rise over the precipice.

The fall is broken by islands on the lip of the precipice into four parts. Close to the right bank is a sloping cataract 36 yds. wide, called the Leaping Water, then beyond Boaruka Island, about 300 yds. wide, is the Main Fall, 473 yds. broad, and divided by Livingstone Island from the Rainbow Fall 535 yds. wide. At both these falls the rock is sharp cut and the river maintains its level to the edge of the precipice. At the left bank of the chasm is the Eastern Cataract, a main channel, 1000 yds. broad, from the Leaping Water. From opposite the western end of the falls to Danger Point, which overlooks the entrance of the gorge, the escarpment of the chasm is covered with great trees known as the Rain Forest; looking across the gorge the eastern part of the wall (the Knife Edge) is less densely wooded.

At the end of the gorge the river has hollowed out a deep pool, named the Boiling Pot. It is some 500 ft. across; its surface, smooth at low water, is at flood-time troubled by slow, enormous swirls and heavy boilings. Thence the channel turns sharply westward, beginning the great zigzag mentioned. The course is not so long, but the rock is not so lofty. The perpendicular walls are over 400 ft. high, the level of the escarpment being that of the lip of the falls. A little below the Boiling Pot, and almost at right angles to the falls, the cañon is spanned by a bridge (completed in April 1903) which forms a link in the Cairo to Entebbe railway. This bridge, 650 ft. long, with a main arch of 500 ft. span, is slightly below the top of the gorge. The height from low-water level to the rails is 240 ft.

The volume of water borne over the falls varies greatly, the level of the river in flood being as much as 60 ft. between the full flood of April and the end of the season October-November. When the river is high the water rolls over the main falls in one great unbroken expanse; at low water (when alone it is possible to look into the grey depths of the great chasm) the falls are broken by crevices in the rock into numerous cascades. The falls are in the territory of Rhodesia. They were discovered by David Livingstone on the 17th of November 1855, and by him named after Queen Victoria of England. Livingstone approached them from above and gained his first view of the falls from the island on its lip now named after him. In 1865 Dr. John H. Traill made a careful investigation of the falls, but, until the opening of the railway from Bulawayo (1905) they were rarely visited. The main in the vicinity of the falls is preserved by the Rhodesian government as a public park.

VICTORIA NYANZA, the largest lake in Africa and chief reservoir of the Nile, lying between 0° 20' N. to 3° S. and 31° 49' to 34° 52' E. Among the fresh-water lakes of the world it occupies fourth place in size by its area, which is 26,000,000 sq. m., being nearly the size of Scotland. In shape it is an irregular quadrilateral, but its shores, save on the west, are deeply indented. Its greatest length, taking into account the principal gulfs, N. to S. is 250 m., its greatest breadth 200 m. Its coast-line exceeds 2000 m. It fills a depression in the central part of the great plateau which stretches between the western (Albertine) and eastern rift-valleys (see Africa, § 1), and has an elevation of about 3720 ft. above the sea. Its greatest ascertained depth is some 270 ft., which compares with something like 2000 ft. on the Abyssinian shore. On Nyanza Victoria Nyanza is remarkable for the severe and sudden storms which sweep across it, rendering navigation dangerous. It contains many groups of islands, the major being near the coast-line. The lake is full of reefs, many just below the surface of the water, which is clear and very fresh. It is abundantly stocked with fish. Geological research shows that the land surrounding the lake consists of gneiss, quartz and schistose rocks, covered, in the higher regions, with marl and red clay, and in the valleys with a rich black loam.

Shores and Islands.—The shores of the lake present varied aspects. They are covered with no land forest, but with the Bedrooms, among the southern part, backed by precipices of 300 or more ft. high, behind which rise down to the height of the cliffs. Going north, the hills give way to papyrus and tamba swamps, which mark the delta of the Nyanza. The most remarkable of these are the two great islands of the nyanza they rise some 500 ft. above the water. This western island is connected by a causeway, and has an entrance to a lake at a short distance inland. The northern coast of the lake is very deeply indented and is marked throughout its length by rocky headlands jutting into the waters. This high land is very narrow, and contains some 200 miles of islands which extend far out into the nyanza. The two groups of islands which lie to the east of the main coast are the Kagera islands, the largest and most important of the lake are the Kagera islands, the largest and most important of the lake, lying in the extreme east of the lake. The island on the northern shore is Musi-oa-tunya, a place of great beauty, and celebrated for the Grand Falls, a beautiful waterfall, 270 yds. high, which falls into a great chasm. The island on the southern shore is Lake Mwiwanganu, the island near the head of the lake on the southern coast is Lake Mpwanganu.

VICTORIA NYANZA (1857) for the story of the discovery of the falls, and the Popular Account of Dr Livingstone's Expedition to the Zambezi and Its Tributaries 1858-1864 (London, 1894) for a fuller description of the falls and a theory as to their origin. How I crossed Africa, by Major Serpa Pinto (English trans., London, 1881), contains a graphic account of the visit paid to the falls by the Portuguese explorer. In the Geographical Journal for January 1905 is an article by A. J. C. Molnyneux on "The Physical History of the Victoria Falls." The article is illustrated by excellent photographs and gives a bibliography. Consult also The Gorge and Basin of the Zambesi below the Victoria Falls, by W. G. Lambugh in the Geog. Jour. (1906), vol. xxxi. (F. R. C.)

1 The altitude see Geog. Jour., March 1907 and July 1908.
2 To prevent the spread of sleeping sickness the inhabitants were removed to the mainland (1909).
affluents, which has its rise in the hill country east of Lake Kivu, and enters the west side of the nyanza just north of 1° S., is described in the first place. It is one of the longest and most remote of the Nile's most important affluents. The other rivers entering Victoria Nyanza from the west are the Katonga and Ruizi, both north of the Kagera. The Katonga rises in the plateau east of the Dweru branch of Albert Edward Nyanza, and after a considerable fall, it reaches the Nyanza in a swamp at its N.W. corner. The Ruizi (180 m.) is a deep, wide and swift stream with sinuous course flowing in part through great gorges and in part through the Elgin valley. Along the length of the district and reaches the nyanza a little north of the Kagera. Between the Katonga and the Nile outlet, the rivers which rise close to the lake drain away northward, the watershed being the lake shore and the Nyanza. The speed of the water, which considerables reach the lake, is over a rocky bed in a south-westerly direction, emptying into the lake south of Berkeley Bay. On the east side the Mara Dabagh enters the lake between 1° and 2° S. It is next to the Kagera, the largest of the lake tributaries. All the rivers mentioned are perennial, and most of them bring down a considerable volume of water, even in the dry season. On the S., S.E. and S.W. shores a number of short rivers drain into the lake. They traverse a treeless and arid region, have but an intermittent flow, and are of little importance in the hydrography of the district. The only outlet of the lake is the Nile (q.v.).

**Lake Albert and Lake Leed.**—The very important part played by the Victoria Nyanza in the Nile system has led to careful study of its drainage basin and rainfall and the perplexing variations in the level of the lake. The area drained by the lake covers, with the islands and the shore and the Nyanza, 13,500 square miles. The shore consists of lofty mountains, and a considerable portion is somewhat arid tableland. According to the calculations of Sir William Garstina the rainfall over the whole area averages 50 in. a year. Allowing that as much as 25% of this amount enters the lake, this is equivalent to a total of 3,750,000,000 cubic. metres in a year. Measurements at the Ripon Falls show that 18,000,000,000, or some 13% of this amount is held up by the lake, and that the difference has been made for the annual rise and fall of the lake-level it is apparent that by far the greater part of the water which enters the nyanza is lost by evaporation; in fact, that the amount drawn off by evaporation is almost in part the cause of the unusual oscillation of the water surface. Rain falls more or less in every month, but is heaviest during March, April, May and again in September, October and November. The level of the lake is chiefly affected by the annual rains and generally reaches its maximum in July. The annual rise and fall is on an average from 1 to 3 ft., but between November 1900 and June 1901 a difference of 42 in. was recorded. Considerable speculation was caused by the fact that whereas in 1878-79 the lake-level was high, from 1888 to 1898 the level was falling, and that after a few years (1892-98) of higher level there was, from 1896 to 1902, again a gradual falling. In 1902 everything was in such a state of contraction that William Garstina for deficiency of rain. Any secular sinking of the lake in common with the lakes of Central Africa generally must be so gradual as to have no practical importance. It must also be remembered that part of what is supposed to be the change in the nyanza the wind exercises an influence on the level, tending to pile up the water at different parts of the lake. The winds may also be the cause of the daily variation of level, which on Speke Gulf has been found to reach 20 in.; but this may also partly be the character of a "seiche." Currents setting towards the north or north-west have been observed in various parts of the lake.

**Discovery and Exploration.**—The quest for the Nile sources led to the discovery of the lake by J. H. Speke in 1856, and it was by C. J. Grant and E. S. M'Gowan in 1858. In 1862 Speke and his companion, J. A. Grant, partially explored the N.W. shore, leaving the lake at the Nile outlet. Great differences of opinion exist as to its size until its circumnavigation in 1874 by H. M. Stanley, which proved it to be of vast extent. The invitation sent by King Mtesa of Uganda through Stanley to the Christian missionaries led to the despatch from England in 1876 of the Rev. C. T. Wilson, to whom we owe our first detailed knowledge of the nyanza. Mr Wilson and Lieut. Shergold Smith, R.N., made, in 1877, the first voyage across the nyanza. In 1879, after an expedition of two months, members of the Church Missionary Society, who were the same year murdered on Ukerewe Island. In 1889 Stanley further explored the lake, discovering Emin Pasha Gulf, the entrance to which is masked by several islands. In 1890 the ownership of the lake was divided by Great Britain and Germany, and the first degree of south latitude being taken as the boundary line. The southern portion, which fell to Germany, was visited and described by scientists of that nation whose objects, however, were not primarily geographic. At the instance of the British Foreign Office a survey of the southern shores of the lake was carried out in 1899-1900 by Commander B. Whitehouse, R.N., commander of the steamer E. Lugard, and afterwards taken over by the British government, made her first trip on the lake. In 1903, the year in which the railway from Mombasa to the lake was completed, a steamer of 60 tons burden was launched at Port Florence. Since that date trade has considerably increased.

See NILE AND UGANDA and the British Blue-book Egypt No. 2 (1904) which is a Report by Sir Wm. Garstina upon the Basin of the Uganda. This report contains considerable information upon the Victoria Nyanza, summarizes the information of previous travellers, whose works are quoted. In 1908 the British Admiralty published a chart of the lake (scale 4 in. to the mile), and in September, the surveys of the lake, which include: C. T. Wilson, Uganda and the Soudan (London, 1882); Sir F. D. Lugard, The Rise of Our East African Empire (London, 1893); Forrest, Whitehouse's, Mut Emin Pasha, &c. (Berlin, 1881); Paul Kollmann, The Victoria Nyanza (English translation; London, 1889); E. G. Ravenstein, The Lake-level of the Victoria Nyanza, Geographical Journal, October 1901; Sir H. N. Johnston, The Uganda Protectorate (London, 1902). In most of these publications the description of the lake occupy but a small part. (W. E. G.; F. R. C.)

**VICTORINUS, GAUSIUS MARIUS (4th century a.d.), Roman grammarian, rhetorician and neo-Platonic philosopher, an African by birth (whence his surname Afer), lived during the reign of Constantius II. He taught rhetoric at Rome (one of his pupils being Jerome), and in his old age became a convert to Christianity. His conversion is said to have greatly influenced that of Augustine. When Julian published an edict forbidding Christians to lecture on polite literature, Victorinus closed his school. A statue was erected in his honour as a teacher in the Forum Traj anus.

His translations of platonic writers are lost, but the treatise De Definitionibus (ed. T. Stangl In Pauliana et Mario-Victorinae, Munich, 1881) is preserved. The Nyseus's (Theophrastus) translations and commentaries are preserved. (pp. 44-24) much of the work of his contemporaries was formerly attributed. His manual of prosody, in four books, taken almost literally from the works of Apollonius, is extant (H. Kii, Grammatici Latini, vti.). It is doubtful whether he is the author of certain other extant treatises attributed to him on metrical and grammatical subjects, which will be found in Keil. His commentary on Cicero's De Inventione (in Halm's Rhetores Latinorum VII.), is the most valuable and in itself needed in commentary. His extant theological writings, which will be found in J. F. Migne, Cursus Patrologiae Latinae, viii., include commentaries on Galatians, Ephesians and Philippians, De Trinitate contra Arians, and Instruktum de abicatione (a Declaratio haereticorum, a quo prophetae in prophetae, and inются in the original text as "The evening and the Morning were one day." The genuineness of the last two is doubtful. Some Christian poems under the name of Victorinus are probably not genuine. See G. Geiger, C. Marius Victorinus Afer, ein neuplatonischer Philosoph (Metten, 1888); G. Koffmann, De Mario Victorino philosopho Christiano (Breslau, 1886); R. Schmidt, Marius Victorinus Rhetor und seine Biographien an Augustus und Konstantin in Dictionary of Christian Biography, iv.; M. Schanz, Geschichte der römischen Literatur, iv. 1 (1904); Teuffel, Hist. of Roman Literature (Eng. tr., 1900), 408.

**VICTOR-PERRIN, CLAUDE, DUKE OF BELLUNO (1764-1814), marshal of France, born in La Marche (Vosges) on the 15th December, 1764. In 1783 he entered the army as a private soldier, and after ten years' service he received his discharge and settled at Valence. Soon afterwards he joined the local volunteers, and distinguishing himself in the war on the Alpine frontier, in less than a year he had risen to the
command of a battalion. For his bravery at the siege of Toulon in 1793 he was raised to the rank of general of brigade. He afterwards served for some time with the army of the Eastern Pyrenees, and in the Italian campaign of 1796-97 he so acquitted himself at Mondevi, Roveredo and Mantua that he was promoted to be general of division. After commanding for some time the troops in the department of La Vendée, he was again employed in Italy, where he did good service against the papal troops, and he took a very important part in the battle of Marengo. In 1802 he was governor of the colony of Louisiana for a short time, in 1803 he commanded the Batavian army, and afterwards he acted for eighteen months (1805-6) as French plenipotentiary at Copenhagen. On the outbreak of hostilities with Prussia he joined the V. army corps (Marshal Lannes) as chief of the general staff. He distinguished himself at Saalfeld and Jena, and at Friedland he commanded the 1. corps in such a manner that Napoleon gave him the marshal-ate. After the peace of Tilsit he became governor of Berlin, and in 1808 he was created duke of Belluno. In the same year he was sent to Spain, where he took a prominent part in the Peninsular War (especially at Espinosa, Talavera, Barrosa and Cadiz), until his appointment in 1812 to a corps command in the invasion of Russia. Here his most important service was in protecting the retreating army at the crossing of the Beresina. He took an active part in the wars of 1812-14, till in February of the latter year he had the misfortune to arrive too late at Montereau-sur-Yonne. The result was a scene of violent recrimination and in the extremity of his commands he transferred his command to Gérard. Thus wounded in his amour-propre, Victor now transferred his allegiance to the Bourbon dynasty, and in December 1814 received from Louis XVIII. the command of the second military division. In 1815 he accompanied the king to Ghent, and on the second restoration he was made a peer of France. He was also president of a commission which inquired into the conduct of the officers during the Hundred Days, and dismissed Napoleon’s sympathizers. In 1821 he was appointed war minister and held this office for two years. In 1823 he was major-general of the royal guard, and after the revolution of that year he retired altogether into private life. His death took place at Paris on the 1st of March 1841.

His papers for the period 1793-1800 have been published (Paris, 1846).

**VICTUAL**, food, provisions, most commonly in the plural, "victuals." The word and its pronunciation came into English from the O. Fr. *vitaile*. The modern French and English spelling are due to a pedantic approximation to the Latin original, *victualia*, a neuter plural substantive formed from *victual*, *victus*, nourishment, provisions (hence, to live). The most familiar use of the term is in "licensed victualler," to which the Licensing Act 1872 (§ 27) has applied the wide significance of any person selling any intoxicating liquor under a licence from a justice of the peace. Properly a "victualling house" is one where persons are provided with food and drink but not lodging, and is thus distinct from an inn, which also provides the last.

**VICUGNÁ**, one of the two wild living South American representatives of the camel-tribe, a *Camelidae* (see *Vulpes*). From its relatives the *Vicugna Vicugna* (Lama vicugna) differs by its inferior stature, more slender build and shorter head, as well as by the absence of bare patches or calllosities on the hind limbs. The general colour of the woolly coat is orange-red. Vicugás live in herds on the bleak and elevated parts of the mountain range bordering the region of perpetual snow, amidst rocks and precipices, occurring in various parts of Peru, in the southern part of Ecuador, and as far south as the middle of Bolivia. The wool is extremely delicate and soft, and highly valued for the purposes of weaving, but the quantity which each animal produces is not great.

**VIDA, MARCO GIROLAMO** (c. 1489-1566), Italian scholar and Latin poet, was born at Cremona shortly before the year 1490. He received the name of Marchantio in baptism, but changed this to Marco Girolamo when he entered the order of the Canonici Regolari Lateranensi. During his early manhood he acquired considerable fame by the composition of two didactic poems in the Latin tongue, on the Game of Chess (*Scacciaeh Ludus*) and on the Silkworm (*Bombyce*). This reputation induced him to seek the papal court in Rome, which was rapidly becoming the headquarters of polite learning, the place where students might expect advancement through their literary talents. Vida reached Rome in the last years of the pontificate of Julius II. Leo X., on succeeding to the papal chair (1513), treated him with marked favour, bestowed on him the priory of St Sylvester at Frascati, and had him compose a heroic Latin poem on the life of Christ. Such was the origin of the *Christiad*, Vida’s most celebrated, if not his best, performance. It did not, however, see the light in Leo’s lifetime. Between the years 1520 and 1527 Vida produced the second of his masterpieces in Latin hexameters, a didactic poem on the *Art of Poetry* (see Baldi’s edition, Würzburg, 1851). Clement VII. raised him to the rank of apostolic protonotary, and in 1532 conferred on him the bishopric of Alba. It is probable that he took up his residence in this town soon after the death of Clement; and here he spent the greater portion of his remaining years. Vida attended the council of Trent, where he enjoyed the society of Cardinals Cervini, Pole and Del Monte, together with his friend the poet Flaminio. A record of their conversations may be studied in Vida’s Latin dialogue *De Rophoeboc*. Among the writings which should be mentioned are three eloquent orations in defence of Cremona against Pavia, composed upon the occasion of some dispute as to precedence between those two cities. Vida died at Alba on the 27th of September 1566.

See the *Life* by Lancetti (Milan, 1840).

**VIDAME** (Lat. *vice-dominus*), a French feudal title. The vidame was originally, like the avoué (*advocatus*), an official chosen by the bishop of the diocese, with the consent of the count (see *Advocate*). Unlike the advocate, however, the *vice-dominus* was at the outset an ecclesiastical and not a layman. Among the many titles which were originally combined with it (e.g., papal *titular* bishop, and later, “vicar-general”) he was given the right to keep the baptism, the domestic administration, and the curia, and to exercise the temporalities of the asylum which he was called to guard. In the 12th century he began to be known as the “vice-dominus” (i.e. vicar-general) of the bishop, a title which was made hereditary in the 13th century, and which he usually held in conjunction with some temporal rights. It was the vicar-general who was in effect the first ecclesiastical governor of the territory under the control of his bishop, and who was responsible for the temporal welfare of the see. He had the right to make and lift sentences, and to represent the bishop in all temporal matters. The vicar-general also had the right to summon the people to church, and to act as a military governor of the territories under his jurisdiction. The vicar-general was often the most powerful man in the diocese, and he was able to exercise great influence over the local government. The title of vicar-general was hereditary, and it was often passed from father to son. The vicar-general was usually the father of the bishop, or the brother of the bishop. The vicar-general was usually a nobleman, and he was often a prominent figure in the local government. He was often a powerful magnate, and he was able to exercise great influence over the local government.
their private seigneuries. Thus the vidame de Picquigny was the representative of the bishop of Amiens, the vidame de Gerberoy of the bishop of Beauvais. In many sees there were no vidames, their function being exercised by viscounts or châtelains. With the growth of the central power and of that of the municipalities the vidames gradually lost all importance, and the title became merely honorary.

VIDIN (formerly written WIDIN or WIDDIN), a fortified river-port and the capital of a department in the extreme N.E. of Bulgaria; on the right bank of the river Danube, near the Servian frontier and 151 m. W.N.W. of Sofia. Pop. (1906) 16,168, including about 3000 Turks and 1500 Spanish Jews—descendants of the refugees who fled hither from the Inquisition in the 16th century. Vidin is an episcopal see and the headquarters of a brigade; it was formerly a strong fort, of no great importance, and was rendered difficult to besiege by the surrounding marshes, formed where the Topolovitza and other streams join the Danube. A steam ferry connects it with Calafat, on the Rumanian bank of the Danube, and there is a branch railway to Medzdra, on the main line Sofia-Plevna. The city consists of three divisions—the modern suburbs extending beside the Danube, the citadel and the old town, still surrounded by walls, though only four of its nine towers remain standing. The old town, containing several mosques and synagogues and a bazaar, preserves its oriental appearance; the citadel is used as a military magazine. There are a modern cathedral, a school of viticulture and a high school, besides an ancient clock-tower and the palace (Konak) formerly occupied by the Turkish pashas. Vidin exports cereals and fruit, and is locally celebrated for its gold and silver filigree. It has important fisheries and manufactures of spirits, beer and tobacco.

Vidin stands on the site of the Roman town of Bononia in Moesia Superior, not to be confounded with the Pannonian Bononia, which stood higher up the Danube to the north of Sirrium. Its name figures conspicuously in the military annals of medieval and recent times; and it is specially memorable for the overthrow of the Turks by the imperial forces in 1689 and for the crushing defeat of the hospodar Michael Sustos by Pasvan Oglu in 1801. It was again the scene of stirring events during the Russo-Turkish Wars of 1854-55 and 1877-78, and successfully resisted the assaults of the Servians in the Servo-Bulgarian War of 1886-87.

VIDOQC, FRANÇOIS EUGÈNE (1775-1857), French detective, was born at Arras in 1775 (or possibly 1773). After an adventurous youth he joined the French army, where he rose to be lieutenant. At Lille he was imprisoned as the result of a quarrel with a brother officer, and while in gaol became involved, possibly innocently, in the forgery of an order for the release of another prisoner. He was sentenced to eight years’ hard labour, and sent to the galleys at Brest, whence he escaped twice but was recaptured. For the third time he succeeded in getting free, and lived for some time in the company of thieves and other criminals in Paris and elsewhere, making a careful study of their methods. He then offered his services as a spy to the Paris police (1809). The offer was accepted, on condition that he should extend his knowledge of the criminal classes by himself serving a further term in prison in Paris, and subsequently Vidoqc was made chief of the reorganized detective department of the Paris police, with a body of ex-convicts under his immediate command. In this capacity Vidoqc was extremely successful, for he possessed unbounded energy and a real genius for hunting down criminals. In 1827, having saved a considerable sum of money, he retired from his post and started a paper-mill, the work-people in which were drawn entirely from ex-convicts. The venture, however, was a failure, and in 1835 Vidoqc re-entered the police service and was employed mainly in political work, though given no special office. Anxious to get back to his old detective post he himself foolishly organized a daring theft. The authorities were unable to trace the thieves, who at the proper moment were “discovered” by Vidoqc. His real part in the matter became known, however, and he was dismissed from service. He subsequently started a private inquiry agency, which was indifferently successful, and was finally suppressed. Vidoqc died in great poverty in 1857. Several volumes have been published under his name, including Mémoires (1828), and in 1858 appeared in three volumes The True Adventures of Vidoqc (1858). It is, however, extremely doubtful whether he wrote any of them.

See Charles Ledru, La Vie, la mort et les derniers moments de Vidoqc (Paris, 1857).

VIDYASAGAR, ISWAR CHANDRA (1820-1881), writer and social reformer of Bengal, was born at Bisrigha in the Midnapur district in 1820, of a Kulim Brahman family. He was removed to Calcutta at the age of nine, was admitted into the Sanskrit College, and carried on his studies in the midst of privations and extreme poverty. In 1839 he obtained the title of Vidyasagar (to the education department was now unbonded). He simplified the method of learning Sanskrit, and thus helped a knowledge of that ancient tongue among his countrymen. He was consulted in all educational matters by Sir Frederick Halliday, the first lieutenant-governor of Bengal. And when the great scheme of education under Sir Charles Wood’s despatch of 1854 was inaugurated in India, Iswar Chandra established numerous aided schools under that scheme in the most advanced districts of Bengal. In 1858 he resigned his appointment under government, and shortly afterwards became manager of the Metropolitan Institution, a private college at Calcutta. But a greater task than literary work or educational reforms claimed his attention. He had discovered that the ancient Hindu scriptures did not enjoin perpetual widowhood, and in 1855 he startled the Hindu world by his work on the Remarriage of Hindu Widows. Such a work, from a learned and presumably orthodox Brahman, caused the greatest excitement, but Iswar Chandra remained unmoved amidst a storm of indignation. Associating himself with the most influential men of the day, like Prosonno Kumar Tagore and Ram Gopal Ghosh, he appealed to the British government to declare that the sons of remarried Hindu widows should be considered legitimate in law. The British government responded; the act was passed in 1856, and some years after Iswar Chandra’s own son was married to a widow. In the last years of his life Iswar Chandra wrote works against Hindu polygamy. He was as well known for his charity and wide philanthropy as for his educational and social reforms. His large income, derived from the sale of school-books, was devoted almost entirely to the succour of the needy; hundreds of young men owed their education to him; hundreds of widows depended on him for their daily bread. The Indian government made him a Companion of the Indian Empire in 1886. He died on the 29th of July 1881. (R. C. D.)
VIEIRA

VIEIRA, ANTONIO (1608-1697), Portuguese Jesuit and writer, the "prince of Catholic pulpit-orators of his time," was born in Lisbon on the 6th of February 1608. Accompanying his parents to Brazil in 1615 he received his education at the Jesuit college at Bahia. He entered the Jesuit novitiate in 1625, and two years later pronounced his first vows, the age of eighteen, he was teaching rhetoric, and a little later dogmatic theology, at the college of Olinda, besides writing the "annual letters" of the province. In 1635 he received the priesthood. He soon began to distinguish himself as an orator, and the three patriotic sermons he delivered at Bahia (1638-40) are remarkable for their imaginative power and dignity of language. The sermon for the success of the arms of Portugal against Holland was considered by the Abbé Raynal to be "perhaps the most extraordinary discourse ever heard from a Christian pulpit." When the revolution of 1640 placed John IV, on the throne of Portugal, Brazil gave him its allegiance, and Vieira was chosen to accompany the vicerey's son to Lisbon to congratulate the new king. His talents and aptitude for affairs impressed John IV, so favourably that he appointed him royal preacher, gave him free access to the palace and constantly consulted him on the business of the state. Possessed of great political sagacity and knowledge of the lessons of history, Vieira used the pulpit as a tribune from which he propounded measures for improving the general and particularly the economic condition of Portugal. His pen was as busy as his voice. In 1647 he was in Sweden, and during the 1680s he passed away. After his death he was declared a martyr, and his veneration added to his celebrity. His "Papel Forte" was adopted by the College of Cardinals, and a memorial of his oratory and teaching, "Clavis Prophetarum" he had endeavoured to prove the truth of his dreams from passages of Scripture. As he refused to submit, the Inquisition kept him in prison from October 1665 to 1675, and finally imposed a sentence which prohibited him from teaching, writing or preaching. It was a heavy blow for the Company, and though Vieira recovered his freedom and much of his prestige shortly afterwards on the accession of King Pedro II., it was determined that he should go to Rome to procure the revision of the sentence, which still hung over him though the penalties had been removed. During a six years' residence in the Eternal City Vieira won his greatest triumphs. Pope Clement X. invited him to preach before the College of Cardinals, and he became confessor to Queen Marguerite of France, and a member of her literary academy. At the request of the pope he drew up a report of two hundred pages on the Inquisition in Portugal, with the result that after a judicial inquiry Pope Innocent XI. suspended it for five years (1676-81). Ultimately Vieira returned to Portugal with a papal bull exempting him from the jurisdiction of the grand inquisitor, and in January 1681 he embarked for Brazil. He resided in Bahia and occupied himself in revising his sermons for publication, and in 1687 he became superior of the province. He also acted as President of the College of Cardinals, and in 1687 he was appointed perpetual commissioner of the Congregation of the Propaganda Fide. In 1690 he was appointed Titular Bishop of Ambra, and in 1692 he was appointed Delegate to the Council of Cardinals. He died in 1697, and his remains were translated to the Jesuit church in Lisbon. His works form perhaps the greatest monument of Portuguese prose. Two hundred discourses exist to prove his fecundity, while his versatility is shown by the fact that he could treat the same subject differently on half a dozen occasions. His letters, simple and conversational in style, have a deep historical and political interest, and form documents of the first value for the history of the period. As a man, Vieira would have made a noble figure if he had not been so great an egotist and so clever a courtier, and the readiness with which he sustained his faults and enemies for various causes at the Inquisition with calm warmth argues a certain lack of sincerity. His name, however, is identified with great causes, justice to the Jews and humanity to the Indians, and the fact that he was in advance of his age led to many of his troubles, while his disinterestedness in money matters is deserving of all praise.

Principal works: Sermôes (Sermons) (15 vols., Lisbon, 1679-1749); there are many subsequent editions, but none complete; translations exist in Spanish, Italian, German and French, which have gone through several editions. Historia do Futuro (Lisbon, 1716; 2nd ed., ibid., 1755); this and the Quinco Imperio and the Clavis Prophetarum seem to be in essence one and the same book in different redactions. Cartas (Letters) (3 vols., Lisbon, 1735-46). Noticias recebidas do modo de proceder a Inquisição de Portugal com os seus processos (Lisbon, 1821). The Arie de Partar, published under Vieira's name in many editions is now known not
VIÉLE-GRIFFIN, VIENA

RICHARD NITIEZ.—André de Barros, *Vida (Lisbon, 1746)—a panegyric by a member of the same society: D. Francisco Alexandre Lobo, bishop of Viseu, "Historical and Critical Discourse," *Obras (Lisbon, 1849), vol. ii.—a valuable study; João Francisco Lisboa, *Vida* de Vieira—he is best to Vieira, but may be assumed to have written the next best treatise.*

A bibliography of Vieira was also published in Lisbon, 1854-58. There are unpublished MSS. of his in the British Museum in London, and in the Bibliothèque Nationale in Paris. A bibliography of Vieira will be found in Sommervogel, *Bibliothèque de la compagnie de Jésus*, viii. 653-89.

VIELE-GRIFFIN, FRANCIS (1864– ), French poet, was born at Norfolk, Virginia, U.S.A., on the 26th of May 1864. He was educated in France, dividing his time between Paris and Tournai. His volumes include *Cueilte d'avril* (1885); *Les Cygnes* (1887; new series, 1892); *La Chevauchée d'Yaldiz* (1893); *Swanhilde*, a dramatic poem (1894); *Lus Veneris* (1899); a volume of transcriptions in France was an oval, which, with its modifications remained in favour until the gourd-flute of the violinists, and the Italian lyra, assumed itself as the finest type, from which also the violin was directly evolved. (K. S. VIEYEN, JOSEPH MARIE (1716-1809), French painter, was born at Montpellier on the 18th of June 1716. Protected by Comte de Caylus, he entered at an early age the studio of Natoire, and obtained the grand prix in 1745. He used his time at Rome in applying to the study of nature and the development of his own powers all that he gleaned from the masterpieces around him; but his tendencies were so foreign to the reigning taste that on his return to Paris he owed his admission to the academy for his picture " Daedalus and Icarus" (Louvre) solely to the indignant protests of Boucher. When in 1776, at the height of his established reputation, he became director of the school of France at Rome, he took David with him amongst his pupils. After his return, five years later, his fortunes were wrecked by the Revolution; but he undauntedly set to work, and at the age of eighty (1796) carried off the prize in an open government competition. Bonaparte acknowledged his merit by making him a senator. He died at Paris on the 27th of March 1809, leaving behind him several brilliant pupils, amongst whom were Vincent, Regnault, Suève, Ménageot, Taillasson and others of high merit; nor should the name of his wife, Marie Thérèse Reboul (1728-1805), herself a member of the academy, be omitted from this list. Their son, Marie Joseph, born in 1761, also distinguished himself as a painter.

VIENA (Ger. Wien; Lat. Vindobona), the capital of the Austrian empire, the largest city in the Austro-Hungarian monarchy, and the fourth city in Europe as regards population. It is situated on the right bank of the Danube, at the base of the Wiener Wald, and at the beginning of the great plain which separates the Alps from the Carpathians. This plain is continued on the opposite bank of the Danube by the valley of the March, which constitutes the easiest access to the north. Thus Vienna forms a junction of natural ways from south to north, and from west to east. It also lies on the frontier which separates from one another three races, the German, the Slavonic and the Hungarian.

Curiously enough, Vienna has for a long time turned its back, so to speak, on the magnificent waterway of the Danube, the navigation of which is barrierless, and has been built about 13 m. away from the main stream. Only an arm of the river, the Danube Canal, so called because it was regulated and widened in 1598, passes through the city, dividing it into two unequal parts. It is true that the river forms at this point several arms, and the adjoining districts were subjected to periodical inundations, while navigation was by no means easy here. But in 1870 works for the regulation of the river were started with the object of making it quite safe for navigation, and of avoiding the dangers of inundation. By these magnificent works of regulation the bed was brought nearer to the town, and the new channel has an average width of 15 m. Only the Danube Canal flows the small stream, called Wien, now arched over almost in its entirety. Vienna extends along the right bank of the Danube from the historic and legendary Kahlenberg to the point where the Danube Canal rejoins the main stream, being surrounded on the other side by a considerable stretch of land which is rather rural than suburban in character. Vienna is officially divided into twenty-one districts or Bezirke. Until 1892 it contained only ten of the present districts; in that year nine outlying districts were incorporated with the town; in 1900 Brigitteau was created out of part of the old district of Leopoldstadt, and in 1905 the Floridsdorf district was made up by the incorporation of the following former suburbs: Aspern-an-der-Dornau, Donaufeld, Floridsdorf, Gross Jeldersdorf, Hirschstetten, Jedelesee, Klagran, Leopoldau, Lobau-Insel and Stadlau. By the incorporation of the suburbs in 1892, the area of Vienna was more than trebled, namely, from 213 sq. m. to 69 sq. m.; while a new increase of about one-fifth of its total area was added by the incorporation of 1902. A feature of the new city is the unusually large proportion of woods and arable land within its bounds. These form nearly 60% of its total area, private gardens, parks and open spaces occupying a further 15%. While from the standpoint of population it takes the fourth place among European capitals, Vienna covers about three times as much ground as Berlin, which occupies the third place. But the bulk of its inhabitants being packed into a comparatively small portion of this area, the working classes suffer greatly from overcrowding, and all sections of the community from high rents.

The inner city, or Vienna proper, was formerly separated from the other districts by a circle of fortifications, consisting of a rampart, fosse and glacis. These, however, were removed in 1858-60, and the place of the glacis has been taken by a magnificent boulevard, the Ring-Strasse, 2 m. in length, and about 150 ft. in average width. Another series of works, consisting of a rampart and fosse, were constructed in 1704 to surround the whole city at that time, i.e. the first ten districts of modern Vienna. This second girdle of fortifications was known as the Lines (Linien), and a second wide boulevard (Gürtel-Strasse) follows their course round the city. This second or outer girdle of fortifications formed the boundary
between the city and the outlying suburbs, but was removed in 1892, when the incorporation of the suburbs took place.

The inner town, which lies almost exactly in the centre of the others, is still, unlike the older parts of most European towns, the most aristocratic quarter, containing the palaces of the emperors and of the nobility. The government residences, many of the embassies and legations, the opera house and the principal hotels. Leopoldstadt, which together with Brigittenau are the only districts on the left bank of the Danube Canal, is the chief commercial quarter, and is inhabited to a great extent by Jews. Mariahilf, Neubau and Margareten are the chief seats of manufacturing industry. Landstrasse may be described as the district of officialism; here too are the British and German embassies. Alsergrund, with the enormous general hospital, the military hospital and the municipal asylum for the insane, is the medical quarter.

Near the centre of the inner city, most of the streets in which are narrow and irregular, is the cathedral of St Stephen, the most important medieval building in Vienna, dating in its present form mainly from the 14th and 15th centuries, but incorporating a few fragments of the original 12th-century edifice. Among its most striking features are the fine and lofty tower (450 ft.), rebuilt in 1860-64; the extensive catacombs, in which the emperors were formerly interred; the sarcophagus (1533) of Frederick III; the tombs of Prince Eugene of Savoy; thirty-eight marble altars; and the fine groined ceiling. A little to the south of the cathedral is the Hofburg, the imperial residences, a huge complex of buildings of various epochs and in various styles, enclosing several courtyards. The oldest part of the present edifice dates from the 13th century, and extensive additions have been made since 1887. In addition to private rooms and state apartments, the Hofburg contains a library of about 800,000 volumes, 7000 incunabula and 24,000 MSS., including the celebrated "Papyrus Rainer"; the imperial treasury, containing the family treasures of the house of Habsburg-Lorraine, and other important collections.

In the old town are two of the largest of the Hoff, extensive blocks of buildings belonging to the great abbeys of Austria, which are common throughout Vienna. These are the Schottenhof (once belonging to the "Scoti," or Irish Benedictines) and the Mollerhof, adjoining the open space called the Freiung, each forming a little town of itself. As in most continental towns, the custom of living in flats is prevalent in Vienna, where few except the richer nobles occupy an entire house. Of late the so-called "Zinnspaläste" ("tenement palaces") have been built on a magnificent scale, often profusely adorned without and within, and with a scale of decoration unparalleled in European art.

The Ring-Strasse ranks as one of the most imposing achievements of modern street architecture. Opposite the Hofburg, the main body of which is separated from the Ring-Strasse by the Hofgarten and Volksgarten, rise the handsomest monument of the empress Maria Theresa (erected 1771) and the imperial museums of art and natural history, two extensive Renaissance edifices with rich prismatic (erected 1870-82), matching each other in every particular and grouping finely with the new part of the palace. Hans Makart's painted dome in the natural history museum is the largest pictorial canvas in the world. Adjoining the museums to the west is the palace of justice (1881), and this is closely followed by the houses of parliament (1883), in which the Grecian style has been successfully adapted to modern requirements. Beyond the houses of parliament stands the new Rathaus, an immense and 1869-83) decorated Gothic building, erected in 1873-83. It was designed by Friedrich Schmidt (1825-1891), who may be described as the chief exponent of the modern Gothic tendency as T. Hansen and G. Semper, the creators respectively of the parliament house and the museums, are the leaders of the Classical and Renaissance styles which are so strongly represented in Viennese architecture. Opposite the Rathaus, on the inner side of the Ring, is the new court theatre, another specimen of Semper's Renaissance work, finished in 1889. To the north stands the new building of the university, a Renaissance edifice by H. von Ferstel, erected in 1873-84 and rivalling the Rathaus in magnificence, and separated from the Ring by a garden, stands the votive church in Alsergrund, completed in 1879, and erected to commemorate the emperor's escape from assassination in 1853, one of the most elaborate and successful of modern Gothic churches (Ferstel). The other important buildings of the Ring-Strasse include the magnificent opera house, built 1861-69, by E. Van der Nüll (1812-1868) and A. von Sicardsburg (1823-1868), the sumptuous interior of which was modelled after the Cercle de la Ville de Paris; the academy of art, built in 1872-76; the exchange, built in 1873-77, by Hans Makart; the Austrian museum of art and industry, an Italian Renaissance building erected by Ferstel in 1868-71. On the north side the Ring-Strasse gives place to the spacious Franz Josef's quay, flanking the Danube Canal. The municipal districts outside the Ring also contain numerous handsome modern buildings. Vienna possesses both in the inner city and the outlying districts numerous squares adorned with artistic monuments. One of the finest squares in the world for the beauty of the buildings which encircle it is the Rathausplatz, adjoining the Ring-Strasse.

Vienna is the intellectual as well as the material capital of Austria—emphatically so in regard to the German part of the empire. Its university, established in 1365, is now attended by nearly 6000 students, and the medical faculty enjoys a world-wide reputation. Its scientific institutions are headed by the academy of science. The academy of art was founded in 1707.

Museums.—In the imperial art-history museum are stored the extensive art-collections of the Austrian imperial family, which were formerly in the Hofburg, in the Belvedere, and in other places. It contains a rich collection of ancient, Gothic, Renaissance, and modern antiquities; of coins and medals, and of industrial art. The last contains valuable specimens of the industrial art of the middle ages and of the Renaissance period in gold, silver, bronze, glass, enamel, ivory, and wood. The famous salt-cellar (salerio) of Benvenuto Cellini, executed in 1539-43 for Francis I. of France, is here. Then comes the collection of weapons and armor, including the famous Ambros collection of swords, which is perhaps the finest in the world, but it is unsuited for its specimens of Rubens. Dürer and the Venetian masters. Next come the imperial treasury at the Hofburg, already mentioned; the famous collection of drawings and engravings, known as the "atelier," formerly in the palace of Adolph Frederick, which contains over 200,000 engravings and 16,000 drawings; the picture gallery of the academy of art; the collection of the Austrian museum of art and industry; the historical museum of the city of Vienna; and the military museum at the arsenal.
Besides, there are in Vienna a number of private picture galleries of great importance. The largest is that belonging to Prince Liechtenstein, containing about 5,000 paintings, and containing in important works by Rubens and Van Dyck; the picture gallery of Count Harrach, with over 400 paintings, possessing numerous examples of the later Italian and French schools; that of Count Coburg, the distance of which from the center of the city is about 110 miles. The imperial natural history museum contains a mineralogical, geological and zoological section, as well as a prehistoric and ethnographical collection.

Parks, etc.—The Prater, a vast expanse (2000 acres) of wood and park on the east side of the city, between the Danube and the Danube Canal, is greatly frequented by all classes. The exhibition building was held in this park in 1873 and several of the pavilions, including the large rotunda, have been left standing. Other parks are the Hofgarten, the Volksgarten and the Town Park, all adjoining the Ringstrasse; the Augarten in the Leopoldstadt, the Belvedere Park in the Landstrasse, the Esterhazy Park in Mariahilf, and the Türkenschranz Park in Döbling. Among the most popular resorts are the parks and gardens belonging to the imperial châteaux of Schönbrunn and Laxenburg.

Government and Administration.—Vienna is the residence of the emperor of Austria, the seat of the Austrian ministers, of the Reichsrat and of the Diet of Lower Austria. It is also the seat of the common ministries for the Austro-Hungarian monarchy, of the foreign ambassadors and general consuls and the like. Vienna is the First City, with Budapest, of the Austrian and Hungarian delegations. It contains also the highest judicial, financial, military and administrative official authorities of Austria, and is the see of a Roman Catholic archbishop. Vienna enjoys autonomy for communal affairs, but is under the control of the governor and the Diet of Lower Austria, while the election of the chief burgomaster requires the sanction of the sovereign, advised by the prime minister. The municipal council is composed of 158 members elected for a period of six years. The long struggle between the municipality and the Austrian ministry arising out of the refusal to sanction the election (1854) of Dr. Luger, the anti-Semitic leader and champion, recalls in some respects the Wilkes incident in London. In this instance the ultimate success of the corporation greatly strengthened the Obscurantist and reactionary element throughout Austria.

The cost of the transformation of Vienna, which has been in progress since 1858, cannot be said to have fallen heavily on the population. Great part of the burden has been borne throughout the city through the "Fund for the Improvement of the Suburbs," the ground formerly occupied by the fortifications and glacia. The subsequent regulation of the former suburbs has to a large extent covered its own expenses through the acquisition by the town of the open grounds of the suburbs, the sidewalk of which was made usable, and notwithstanding the extra burdens assumed on the incorporation of the suburbs, the equilibrium of the communal budget was maintained up to the fall of the Liberal administration. In spite of short-sighted parsimony in the matter of schools, &c., and increased resources through the allocation to the municipality of a certain percentage of new state and provincial taxation, their anti-Semitic successors have been unable to avoid a deficit, and have been obliged to increase the rates. But the direct damage done in this and other ways would seem to be less than that produced by the mistrust they inspired for a time among the property holders. The general paralyzing influence of the anti-Magyar attitude has driven away a certain amount of Hungarian custom, and has helped to increase the political difficulties of the cis-Leithan government.

Vienna is situated at an altitude of 550 ft. above the level of the sea, and possesses a healthy climate. The mean annual temperature is 48°-6°F., and the range between January and July is about 40°F. The climate is rather changeable, and rapid falls of temperature are not uncommon. Violent storms occur in spring and autumn, and the rainfall, including snow, amounts to 39 inches yearly. The drinking water of any European capital. The water is brought by an aqueduct direct from the Alps, viz. from the Schneeberg, a distance of nearly 60 m. to the south-west. These magnificent waterworks were opened in 1873, and their sanitary influence was soon felt, in the almost complete disappearance of typhoid fever, which had numerous victims before.

Great enlargements, by tapping new sources of supply, were made in 1891–93, while since 1902 works have been in progress for bringing a new supply of pure water from the region of the Black Forest. The most important improvement was the improvement carried out in the drainage system, and the regulation of the river Wien. This river, which, at certain times, in particular after heavy rains, the side of an immense bed, was occasionally converted into a formidable and destructive torrent. Now half the bed of the river has been walled over for the metropolitan railway, while the other half has been improved. It is estimated that the term has been arched over. A beginning was thus made for a new and magnificent avenue in the neighbourhood of the Ringstrasse.

Population.—In 1800 the population of the old districts was 231,950; in 1820, 336,870; in 1837, 476,222 (with or with suburbs, 587,235); in 1869, 607,514 (with suburbs, 842,951); in 1880, 704,750 (with suburbs, 1,090,119); in 1890, town and suburbs, 1,394,548; and in 1900, 1,662,260, including the garrison of 26,029 men. Owing to the peculiarities of its situation, the population of Vienna is of a very transitional and heterogeneous character. Its permanent population (some 43.5% are born in the city) is recruited from all parts of Austria, and indeed of the entire monarchy. The German element is, of course, the most numerous, but there are also a great number of Hungarians, Czechs and other Slavs.

Previous to the loss of the Italian provinces, a considerable proportion came from Italy (30,000 in 1859), including artists, members of the learned professions and artisans who left their mark on the various buildings and streets. In addition were about 2500 (chiefly navies and masons), in addition to some 1400 Austrian subjects of that nationality. At present the largest and most important contributions to the population of Vienna come from the Czech provinces of Bohemia and Moravia, next in importance being those from Lower Austria and Styria. This steady and increasing influx of Czechs is gradually infusing a large proportion of Slav blood in what Bismarck (1864) described as the Germanish which makes up a Slav empire. Formerly the Czech labourers, artisans and domestic servants who came to Vienna were somewhat ashamed of their mother-tongue, and are now very much in evidence of their origin as speedily as possible. The revival of the nationality agitation has produced a marked change in this respect. The Czech immigrants, attracted to Vienna as to other German towns by the growth of industry, are now too numerous for easy absorption, which is further retarded by their national organization, and the provision of separate institutions, churches, schools (thus far private) and places of resort. The consequence is that they take a pride in their own race, and in their honor of their own language, which threatens to develop into a new source of discord. In 1900 the population included 1,386,115 persons of German nationality, 21,476 of Ital. nationality, 28,712 Jews, 27,579 Ruthenians, 1,329 Slovenes, 2,71 Serbo-Croatians, and 1368 Italians, all Austrian subjects. To these should be added 133,144 Hungarians, 21,733 natives of Germany (3762 less than in 1890), 2595 natives of Italy, 1276 natives of Poland, 1775 Swedes, 1273 Danes and 1173 French, while the population 1,461,891 were Roman Catholics, the Jews coming next in order with 146,926. Protestants of the Augsburg and Helvetic Confessions numbered 54,364; members of the Church of England, 490; Old Catholics, 975; members of the Greek Orthodox Church, 3674; Greek Catholics, 2521; and Mahomedans, 889.

As a general rule, the Viennese are gay, pleasure-loving and genial. The Viennese women are justly celebrated for their beauty and elegance; and dressing as a fine art is cultivated here with almost as great success as in Paris. As a rule, the Viennese are passionately fond of dancing; and the city of Strauss, J. F. K. Lanner (1801–1843) and J. Gungl (1810–1889) gives name to a school "of waltz and other dance music. Opera, especially in its lighter form, flourishes, and the actors of Klagenfurt maintain a reputation of no mean order. Its chief place in the history of art Vienna owes to its musicians, among whom are counted Haydn, Mozart, Beethoven and Schubert. The Viennese school of painting is of modern origin; but some of its members, for instance, Hans Makart (1840–1884), have acquired a European reputation.

Trade.—Vienna is the most important commercial and industrial centre of Austria. For a long time the Austrian government, by failing to keep the Danube in a proper state for navigation, let slip the opportunity of making the city the great Danubian
metropolis which its geographical position entitles it to be. But during the last quarter of the 19th century active steps were taken to improve the situation. The conversion of the entire Danube Canal into a harbour, the construction of the navigable channel Danube-March-Oder—all gave a new impetus to the trade of Vienna. The construction of the Triest Railway and the new and shorter railway line constructed between it and Vienna also contribute to the same effect. Vienna carries on an extensive trade in corn, flour, cocoa, wine, sugar, and a large variety of manufactured articles. Besides the Danube it is served by an extensive net of railways, which radiate from here to every part of the empire.

The staple productions are machinery, railway engines and carriages, steel, tin and bronze wares, pottery, beer, and civil and military clothing, opthalmic instruments, and artistic products generally. Its articles of clothing, silk goods and millinery also enjoy a great reputation for the taste with which they are manufactured. Books, artistic publications, paper and beer are amongst the other principal products. The building trade and its allied trades are also active.

History.—For several centuries Vienna filled an important rôle as the most advanced bulwark of Western civilization and Christianity against the Turks, for during the whole of the middle ages Hungary practically retained its Asiatic character. The story of Vienna begins in the earliest years of the Christian era, with the seizure of the Celtic settlement of Vindobona by the Romans, who changed its name to Vindobona, and established a fortified camp here to command the Danube and protect the northern frontier of the empire. The fortress grew in importance, and was afterward raised to a citadel. Marcus Aurelius died in 180. On the decline of the Roman empire Vindobona became the prey of successive barbarian invaders. Attila and his Huns were among the temporary occupants of the place (5th century), and in the following century it came into the possession of the Avars, after which its name disappears from history until towards the close of the 8th century, when Charlemagne expelled the Avars and made the district between the Enns and the Wiener Wald the boundary of his empire. In the time of Otho II. (976) this "East Mark" (Ostmark, Oesterreich, Austria) was granted in feoff to the Babenbergers, and in the reign of Frederick Barbarossa (1150) it was advanced to the rank of a duchy. There is no certain record that the site of Vindobona was occupied at the time of the formation of the Ostmark, though many considerations make it probable. It is not likely that the Avars, living in their "ring" encampments, destroyed the Roman municipium; and Becs, the Hungarian name for Vienna to this day, is susceptible of a Slavonic interpretation only, and would seem to indicate that the site had been occupied in Slavonic times. The frequency with which "Wien" and "Wulz" in the oldest extant version of the "Nibelungenlied" points in the same direction, passing over a doubtful mention of "Vwieni" in the annals of 1390, we find the "civitas" of Vienna mentioned in a document of 1330, and in 1350 it became the capital and residence of Duke Heinrich Jasomirgott. In 1377 Vienna received a charter of freedom from Frederick II., confirmed in 1247. In the time of the crusades Vienna increased so rapidly, in consequence of the traffic that flowed through it, that in the days of Ottacar II. of Bohemia (1235-70), the successor of the Babenbergers, it had attained the dimensions of the present inner town. A new era of power and greatness began when it became, in 1365, the capital of the Habsburg dynasty, after the defeat of Ottacar by Rudolph of Habsburg. From this time on it has shared the fortunes of the house of Austria. In 1477 Vienna was besieged unsuccessfully by the Hungarians, and in 1485 it was taken by Matthias Corvinus. Of more importance were the two sieges by the Turks (1529 and 1569), when the city was saved on the first occasion by the gallant defence of Count Nicholas von Salm (1459-1530), and on the second by Rüdiger von Starhemberg (1568-1701), who held out until the arrival of the Poles and Germans under John Sobieski of Poland. The severity of war, however, were destroyed on both occasions. In 1805, and again in 1809, Vienna was for a short time occupied by the French. In 1814-15 it was the meeting-place of the congress which settled the political affairs of Europe after the overthrow of Napoleon. In 1848 the city was for a time in the hands of the revolutionary party; but it was bombarded by the imperial forces and compelled to surrender on 30th October of the same year. Vienna was not occupied by the Prussians in the war of 1866, but the invaders marched to within sight of its towers. In 1873 a great international exhibition was held here.

While Berlin and Budapest have made the most rapid progress of all European cities, having multiplied their population by nine in the period 1800-90, Vienna—even including the extensive annexations of 1862—only increased sevenfold. Many causes conspired to this end, but most of them date from the years 1859, 1866 and 1867. The combined effect of these successive blows, aggravated by the long period of decentralizing policy from Taaffe to Badeni, is still felt in the Kaiserscht. The gaiety of Vienna had for centuries depended on the brilliancy of its court, recruited from all parts of Europe, including the nobility of the whole empire, and on its musical, light-hearted and contented population. Even before it fell from its high estate as the social centre of the German-speaking world, it had suffered severely by the crushing defeats of 1859 and the consequent exodus of the Austrian nobles. These were held responsible for the misfortunes of the army, and to escape the atmosphere of popular odium retired to their country seats and the provincial capitals. They have never since made Vienna their home to the same extent as before. The change thus begun was confirmed by the exclusion of Austria from the German Confederation, the suppression of her Constitutional tradition, which gave an immense impetus to the two rival capitals. Thus within eight years the range of territory from which Vienna drew its former throngs of wealthy pleasure-seeking visitors and more or less permanent inhabitants—Italian, German and Hungarian—was enormously restricted. Since then Vienna has benefited largely by the enlightened efforts of its citizens and the exceptional opportunities afforded by the removal of the fortifications. But a decline of its importance, similar to that within the larger sphere which it influenced prior to 1870, has continued uninterruptedly within the Habsburg dominions up to the present day. Its commercial classes constantly complain of the increasing competition of the provinces, and of the progressive industrial emancipation of Hungary. The efforts of the Hungarians to complete their social and economic, no less than their political, emancipation from Austria and Vienna have been unremittingly pursued. The formal recognition of Budapest as a royal residence and capital in 1892, and the appointment of independent Hungarian court functionaries in November 1893, mark new stages in its progress. It would be longer correct to speak of Vienna as capital of the dual monarchy. It merely shares that distinction with Budapest.

VIENNA, CONGRESS OF (1814-1815). The fall of Napoleon was only achieved by the creation of a special alliance between Great Britain, Austria, Russia and Prussia. By the Treaty of Chaumont of March 10, 1814, these four powers bound themselves together in a bond which was not to be dissolved when peace was concluded. When Napoleon had been beaten, France conceded to these allies by a secret article of the first Treaty of Paris of May 30, 1814, the disposition of all countries which Napoleon's fall had freed from French suzerainty. This stupendous task was reserved for a general congress, and it was agreed to meet at Vienna. The visit of the allied sovereigns to England and the pressing engagements of the emperor Alexander and Lord Castlereagh delayed the congress until the
autumn, when all Europe sent its representatives to accept the hospitality of the impoverished but magnificent Austrian court.

Metternich, though he had not yet completely established his position, acted as chief Austrian representative, and he was naturally in his capacity as host the president of the congress. Friedrich v. Gentz acted as secretary both to him and the congress and did much of the routine work. Alexander of Russia directed his own diplomacy, and round him he had gathered a brilliant circle of counselors but not control their master’s desires. Of these the chief were foreigners, according to the traditions of Russian diplomacy. Capo d’Istria, Nesselrode, Stein, Pozzo di Borgo were perhaps the best men in Europe to manage the Russian policy, while Czartoriski represented at the imperial court the hope of Polish nationality. Frederick William III. of Prussia was a weaker character and, as will be seen, his policy was largely determined by his ally. Prince von Hardenberg, who by no means shared all the views of his master but was incapacitated by his growing infirmities, was first Prussian plenipotentiary, and assistant to the great Baron von Humboldt. Great Britain was represented by Lord Castlereagh, and under him were the British diplomats who had been attached to the foreign armies since 1813, Clancarty, Stewart and Cathcart. Castlereagh brought with him decided views, which however were not altogether those of his cabinet, and his position was weakened by the fact that Great Britain was still at war with the United States, and that public opinion at home cared for little but the abolition of the slave trade. When parliamentary duties called Castlereagh home in February 1815, the duke of Wellington filled his place with adequate dignity and statesmanship until the war broke out.

France sent Prince Talleyrand to conduct her difficult affairs. No other man was so well fitted for the task of maintaining the interests of a defeated country. His rare diplomatic skill and supreme intellectual endowments were to enable him to play a deciding part in the coming congress. All the minor powers of Europe were represented, for all felt that their interests were at stake in the coming settlement. Gathered there also were a host of publicists, secretaries and courtiers, and never before had Europe witnessed such a collection of rank and talent. From the first the foreign ministers, and all the observers impressed with its wealth and variety, nor did the statesmen disdain to use the dining-table or the ballroom as the instruments of their diplomacy.

All Europe awaited with eager expectation the results of so great an assembly. The fate of Poland and Saxony hung in the balance; Germany awaited an entirely new reorganization; Italy was again ready for dismemberment; rumours went that even the pope and the sultan might be largely affected. Some were who hoped that so great an opportunity would not be lost, but that the statesmen would initiate such measures of international disarmament as would perpetuate the blessings of that peace which Europe was again enjoying after twenty years of warfare.

It was not long, however, before the allies displayed their intention of keeping the management of affairs entirely in their own hands. At an informal meeting on the 22nd of September the four great powers agreed that all subjects of general interest were to be settled by a committee consisting of Austria, Russia, Prussia and Great Britain together with France and Spain. At the same time, however, it was decided by a secret protocol that the four powers should first settle among themselves the distribution of the conquered territories, and that France and Spain should only be consulted when their final decision was announced.

This was the situation which Talleyrand had to face when he arrived on the 24th of September. His first step when he was admitted to the European committee, which was in the plans of the allies to act so colourless a part, was to ignore the position of the Four and to assert that only the congress as a whole could give the committee full powers. This was not without meaning an almost indefinite delay, for how was it possible to decide the exact rights of all the different states to a voice in affairs? After some heated discussion a compromise was arrived at. The opening of the congress was postponed, and Sweden and Portugal were added to the European committee, but the Four still persisted in the informal meetings which were to decide the important questions. Meanwhile separate committees were formed for the discussion of special problems. Thus a special committee was appointed consisting of the five German powers to discuss the constitution which was to replace the Holy Roman Empire, and others for minor questions. Talleyrand had, however, already shaken the position of the allies. He had posed as the defender of the public rights of Europe and won to his side the smaller powers and much of the public opinion of Europe, while the allies were beginning to be regarded more in the light of rapacious conquerors than as disinterested defenders of the liberties of Europe.

Had the Four remained united in their views they would still have been irresistible. But they were gradually dividing into the two great parties upon the Saxon Polish question. Alexander, exaggerating the part he had played in the final struggle, and with some vague ideas of nationality in his brain, demanded that the whole of Poland should be added to the Russian dominions. Austria was to be compensated in Italy, while Prussia was to receive the whole of Saxony, whose unfortunate monarch had been the most faithful of Napoleon’s vassals.

It was Castlereagh that led the opposition to these almost peremptory demands of Alexander. A true disciple of Pitt, he came to the congress with an overwhelming distrust of the growing power of Russia, which was only second to his hatred of revolutionary France. He considered that the equilibrium of Europe would be irrevocably upset if the Russian boundaries were to be pushed into the heart of Germany. Thus while willing, even anxious that Prussia should receive Saxony, in order that she might be strong to meet the danger from the East, he was prepared to go to any lengths to resist the claims of Russia. For Austria Saxony was really of more vital interest than Poland, but Castlereagh, despite a vigorous resistance from a section of the Austrian court, was able to win Metternich over to his views. He hoped to gain Prussia also to his side, and urged Alexander to retire from the position he had so uncompromisingly laid down. With the Prussian statesmen he had some success, but he could make no impression on Frederick William. Alexander used to the utmost that influence over the mind of the Prussian monarch which he had been preparing since the beginning of 1813. Against Castlereagh he entered the lists personally, and memorandum after memorandum was exchanged. Despite the warning letters of the British cabinet which, dismayed at the long continuance of the American War, counselled caution on a question in which England had no immediate interest, Castlereagh yielded no inch of his ground. But Metternich wavered on the question of Saxony, and December saw the allies hopelessly at difference. It seemed by no means unlikely that the armies which had conquered Napoleon would soon be engaged in conflict with one another.

It was Talleyrand’s opportunity. As Castlereagh and Metternich began to regard the position as hopeless they began to look upon him as a possible ally. Talleyrand had constantly defended the rights of France’s old ally Saxony in the name of the principle which his master Louis XVIII. represented. His passionate appeal on behalf of “legitimacy” was particularly adapted to the necessities of the situation. Alexander was driven into transports of rage by this championship of the ancien régime by one who had been a servant of its bitterest foe. But Castlereagh saw that war could only be avoided if one party was made stronger than the other. The reluctant consent of the British cabinet was obtained and Talleyrand was approached as an equal. He came boldly to the front in the middle of December as the champion of Saxony; and as Prussia was still obstinate, Metternich and Castlereagh demanded the admission of France to the secret council. This was refused, and on the 3rd of January
VIENNE

1813 a secret treaty of defensive alliance was signed between France, Austria and Great Britain. For some time affairs hung in the balance, but Alexander could not mistake the tone of his opponents. Gradually a compromise was arranged, and by the end of the month all danger was past. Eventually Austria and Prussia retained most of their Polish dominions, and the latter power only received about two-fifths of Saxony. The rest of Poland was incorporated as a separate kingdom in the Russian dominions with a promise of a constitution of its own. Talleyrand had rescued France from its humilitating position, not so much as an equal by the side of the allies. Henceforward he made no effort for the rights of the whole congress.

Meanwhile other affairs had been progressing more harmoniously under the direction of special committees, which included representatives of the powers specially interested. Switzerland was given a constitution which led it in the direction of its later federalism. In Italy Austria retained her hold on Lombardy and Venetia, Genoa was assigned to the kingdom of Sardinia, while Parma went to Marie Louise, the legitimate heir, Carlo Ludovico, having to content with the reversion after her death, the congress meanwhile assigning Lucca to him as a duchy, the claims of the young Napoleon to succeed his mother in Parma were only destroyed by the efforts of France and England. The other petty monarchies were restored, and Murat's rash attempt, after Napoleon's return from Elba, to make himself king of united Italy, gave back Naples to the Bourbons, an event which would have been brought about in any case in the course of the next few years (see Murat, Joachim). Holland was, confirmed in the possession of Belgium and Luxemburg, Limburg and Liège were added to her dominions. Sweden, who had sacrificed Finland to Russia, obtained Norway.

German affairs, however, proved too complicated for complete solution. It was difficult enough to decide the claims of the states in the scramble for territory. Eventually, however, by methods of compromise, this was adjusted fairly satisfactorily. The greater states gained largely, especially Prussia, who was given large acquisitions of territory on the Rhine, partly as a compensation for her disappointment in the matter of Saxony, partly that she might act as a bulwark against France. Some disputes between Baden and Bavaria remained unsettled, and many questions about the future federal constitution of the greater part of Germany, which had been hurriedly patched together under the influence of the news of Napoleon's return, had to be postponed for further discussion, and were not settled until the Final Act agreed upon by the conference of German statesmen at Vienna in 1821.

Other more general objects, such as the free navigation of international rivers and the regulation of the rights of precedence among diplomatists (see DIPLOMACY), were managed with much address. Castlereagh's great efforts were rewarded by a declaration that the slave trade was to be abolished, though each power was left free to fix such a date as was most convenient to itself. The Final Act, embodying all the separate treaties, was signed on the 9th of June 1815, a few days before the battle of Waterloo.

Before the work of the congress was completed Napoleon was again at Paris, and the closing stages were hurried and ill-considered. One negotiation of supreme importance was cut short for this reason. Castlereagh had left Vienna with the hope that the powers would solemnly guarantee their territorial settlement and promise to make collective war on whoever dared to disturb it. This guarantee was to include the Ottoman dominions, in whose interests, indeed, it had been brought forward. Alexander made no objection provided that the Porte would submit all outstanding claims to arbitration. The distance of Constantinople from Vienna and the obstinacy of the sultan would probably have prevented a settlement, but the return of Napoleon rendered all such proposals almost absurd, and the scheme was dropped.

Thus the congress of Vienna failed to institute any new system for securing the stability of the European polity, nor did it recognize those new forces of liberty and nationality which had really caused Napoleon's downfall. Following the tradition of all preceding congresses, it was mainly a scramble for territory and power. Territories were distributed among the powers with no consideration for the feelings of their inhabitants, and in general the right of the strongest prevailed. For this reason it has often met with a condemnation that has perhaps been unmerited. It is true that the map of Europe shows to-day but little trace of its influence; but much of its work was determined by conditions of which the statesmen had little control. Europe was not ready for the recognition of nationality and liberalism. What it wanted most of all was peace, and by establishing something like a territorial equilibrium the congress did much to win that breathing space which was the cardinal need of all.

Bibliography.—The treaties and acts of the congress may be consulted in J. L. Klüber, Actes des Viennais Congress (9 vols.); Comte d’Angeberg, Le Congrès de Vienne (4 vols.); British and Foreign State Papers, vols. ii., gives some of the documents in English, and the Final Act is found in many collections. For the diplomacy, Wellington’s Supplementary Despatches, vols. ix. and x., Castlereagh’s Letters and Despatches, vols. x. and xi., Talleyrand’s Mémoires, vols. ii. and iii., the works of Gentz (see Gentz, F. Von) and the Mémoirs of Hardenberg and Cantorovsky are very useful. Other records include the Journals of Ministers and the correspondence of Maître and Gagen. The comte A. de La Garde-Chambons, Souvenirs du congrès de Vienne (ed. with introduction and note by Comte Fleury, Paris, 1901), gives an interesting picture of the event in its personal aspect. Special side-light is given by many historians both of the Napoleonic era and of the 19th century, include chapters on the congress; Sorel, L’Europe et la Révolution française, vol. viii., and the various volumes of Stauder, Geschichte der Neuesten Zeit give much information. In English the best account is that by Dr A. W. Ward in chs. xix. and xxi. of vol. ix. of the Cambridge Modern History (1906), which gives also a fairly complete bibliography, pp. 867-875. There is also a list of authorities in Lavisse and Rambaud’s Histoire Générale, vol. x.

VIENNE, a river of central France, a left-hand tributary of the Loire, watered the departments of Corrèze, Haute-Vienne, Charente, Vienne and Indre-et-Loire. Length, 210 m.; area of basin, 8286 sq. m. Rising on the plateau of Millevaches 14 m. N.W. of Ussel (department of Corrèze) at a height of 2780 ft., the Vienne flows westward, between the highlands of Limousin on the south and the plateau of Gentoux and the Thiou, meeting their merged waters at Niort, where its banks is Limoges (Haute-Vienne), below its confluence with the Taurion: in this part of its course the river supplies motive power to paper-mills and other factories. The river next reaches St Junien, below which it turns abruptly northwards to Confolens (Charente). Flowing through a picturesque and now wider valley, and passing in its course the churches and châteaux of Chauvigny, the river proceeds to the confluence of the Clain just above Châtellerault. Below that town it receives the Creuse (rising on the plateau of Millevaches and reaching the Vienne after a course of 179 m.), and turns north-west, uniting with the Loire below the historic town of Chinon. There is little river-traffic on the Vienne, and that only below its confluence with the Creuse (30 m.).

VIENNE, a department of west-central France, formed in 1790 out of Poitou (four-fifths of its present area), Touraine (one-seventh) and Berry, and bounded by Deux-Sèvres on the W., Charente on the S., Haute-Vienne on the S.E., Indre on the E., Indre-et-Loire on the N.E. and N., and Maine-et-Loire on the N.W. Pop. (1906) 333,621. Area, 2719 sq. m. The river Vienne, which gives the department its name, rises on the frontier between the Creuse (subtributary of the Garonne) and the Loire, and for some distance flows from west to north. The general slope of the department is in the same direction, the highest point (764 ft.) being in the south-east and the lowest (115 ft.) at the junction of the Vienne and the Creuse. In the south the Charente, on the north-west the Dive, and in the west some streams belonging to the basin of the Sèvre-Niortaise drain small portions of the department. The average temperature is 54° F. The prevailing winds are from the south-west and west. The annual rainfall is 22 in.
VIENNE—VIENNE, COUNCIL OF

Wheat, oats and barley are the principal cereals cultivated, other important crops being lucerne, sainfoin, clover, mangold-watsonia and potatoes. The vineyards and the olive-orchards give rise to a good wine. The district of Poitiers grows good red wine, and the white wine of Triou-Moutiers near Loudun is well known. The breeding of live stock in all its branches is fairly active. Poitou is famous for its sheep and the breed of the pink turkey. The department is highly esteemed. Oak, ash, alder and birch are the principal forest trees, and among the fruit trees are the chestnut, walnut and almond. For the making of bricks the most important industrial establishments are the national arms manufactory at Châtellerault and the cutlery works near that town. In other parts of the department are wool-spinning mills, hemp-spinning mills, manufactories of sashes and ribbons, and the great goat-hides tanneries and potteries, paper-works, breweries, distilleries, lime-kilns and numerous flour-mills. Corn, wine, brandy, vegetables, fruit, chestnuts, fodder, cattle, stone, cutlery, arms and dressed hides are exported. In addition to the abbeys, castles, market towns, and village farms, the department is peppered with numerous other industrial establishments (paper mills, iron foundries, brick works, refining furnaces, &c.).

Vienne was originally the capital of the Allobroges, and became a Roman colony about 47 B.C. under Caesar, who embellished and fortified it. A little later these colonists were expelled by the Allobroges; the exiles then founded the colony of Lyons (Lugdunum). It was not till the days of Augustus and Tiberius that Vienne regained all its former privileges as a Roman colony. Later it became the capital of the Provence kingdom, as well as the empress was proclaimed emperor here, and for a few years from that day onwards Vienne was the capital of a short-lived provincial empire. It is said to have been converted to Christianity by Crescens, the disciple of St Paul. Certainly there were Christians here in 177, as in the Greek letter (preserved to us by Eusebius) addressed at that date by the churches of Vienne and Lyons to those of Asia and Phrygia mention is made of the "deacon of Vienne. The first bishop certainly known is Verus, who was present at the Council of Arles in 314. About 450 Vienne became an archbishopric, and it has remained so till 1596, when the see was suppressed. The archbishops disputed with those of Lyons the title of "Primate of All the Gauls." Vienne was conquered by the Burgundians in 438, and in 534 was taken by the Franks. Sacked in 558 by the Lombards and in 737 by the Saracens, the government of the district was given by Charles the Bald in 862 to a certain Count Boso, who in 879 was proclaimed king of Provence, and was buried on his death in 887 in the cathedral church of St Maurice. Vienne then continued to form part of the kingdom of Provence or Arles till 1552 it reverted to the Holy Roman Empire. The sovereignty of that kingdom, as well as the emperors was proclaimed in the 13th century (in particular Frederick Barbarossa in 1153), recognized the rights of the archbishops as the rulers (in the name of the emperor) of Vienne. But the growing power of the counts of Albon, later Dauphins of the neighbouring county of the Viennois, was the cause of many disputes between them and the archbishops. In 1349 the reigning, Dauphin sold his Dauphiné to France, but the town of Vienne was not included in this sale, and the archbishops did not give up their rights over it to France till 1449, when it first became French. In 1511-12 the fifteenth General Council was held at Vienne, when Charles V. abolished the order of the Knights Templar. Vienne was sacked in 1562 by the Protestants under the banner of the Adrets, and was held for the Ligue 1569-95, when it was taken in the name of Henri IV. by Montmorency. The fortifications were demolished between 1589 and 1656. In 1790 the archbishopric was abolished, the title "Primate of All the Gauls" being attributed to the archbishops of Lyons. Among famous natives of Vienne may be mentioned St Julian (3rd century) and Nicholas Chorier (1612-1662), the historian of the Dauphiné, who under Louis IV. (Troyes, 1697). See A. Allmer et A. de Terrebasse, Inscriptions antiques du moyen âge de Vienne en Dauphiné (6 vols., Vienne, 1875-76); Ch. Charvet, Fastes de la ville de Vienne (Vienne, 1869); E. Chevalier, Collection des Cartulaires Dauphinois, in vol. i. (Vienne, 1869); A. Charvet, Le Sacre de Charles Ier (3 vols., 1847-51); Nicholas Chorier, Recherches sur les antiquités de la ville de Vienne (Vienne, 1668); E. A. Freeman, Article in the Saturday Review for Feb. 6, 1875; F. Raymond, Le Guide Viennois (Troyes, 1897).
the presidency of Pope Clement V. The transference of the Curia from Rome to Avignon (1309) had brought the papacy under the influence of the French crown; and this position Philip the Fair of France now endeavoured to utilize by demanding from the pope the dissolution of the powerful and wealthy order of the Temple, together with the introduction of a trial for heresy against the late Pope Boniface VIII. To evade the second claim, Clement gave way on the first. Legal trials and acts of violence against the Templars had begun as early as the year 1307 (see Templars); and the principal object of the council was to secure a definite decision on the question of their continuance or abolition. In the committee appointed for preliminary consultation, one section was for the immediate condemnation of the order, and declined to allow it any opportunity of defence, on the ground that it was now superfluous and simply a source of strife. The majority of the members, however, regarded the case as non-proven, and demanded that the order should be heard on its own behalf; while at the same time they held that its dissolution was unjustifiable. Under pressure from the king, who was himself present in Vienne, the pope determined that, as the order gave occasion for scandal but could not be condemned as heretical by a judicial sentence (de jure), it should be abolished per medium provisionis seu ordinationis apostolicae; in other words, by an administrative ruling based on considerations of the general welfare. To this procedure the council agreed, and on the 22nd of March the order of the Temple was suppressed by the bull Vox clamantis; while further decisions as to the treatment of the order and its possessions followed later.

The discussions announced in the opening speech, regarding measures for the reformation of the Church and the protection of her liberties, took place; and a part of the Constitutions found in the Clementinum, published in 1317 by John XXII., were probably enacted by the council. Still it is impossible to say with certainty what decrees were actually passed at Vienne. Additional decisions were necessitated by the violent disputes which raged within the Franciscan order as to the observance of the rules of St Francis of Assisi, and by the multitude of subordinate questions arising from this. Resolutions were also adopted on the Beguines and their mode of life (see Beguines), the control of the hospitals, the institution of instructors in Hebrew, Arabic, and Chaldaic at the universities, and on numerous details of ecclesiastical discipline and law.

See Mans, Collectio Conciliorum, vol. xxv.; Hefele, Concilien-

VIERGE, DANIEL (1831-1904), Spanish painter and draughtsman, was born in Madrid in 1831. He went to Paris in 1867 to seek his fortune, fired by the vivid energy of his national temperament. He became attached to the Monde illustré in 1870, just before the Franco-Prussian War broke out, and, like other artists in the paper, came under the powerful influence of Edmond Morin, the first newspaper draughtsman in France who sought to impart to drawings for journals the character of a work of art. Vierge's earlier drawings, therefore, partake greatly of Morin's style; such are, "The Shooting in the Rue de la Paix," "The Place d'Armes at Versailles," "The Loan," "The Great School-Fête of Lyons," "Anniversary of the Fight of Aydes" and "Souvenir of Coulommiers." Vierge lost no time in proving the extraordinary vigour and power of his art. Apart from the contribution of his own original work, he was required to etch several of his drawings for the wood, for the engraver, the sketches sent in by artist-corre-
spondents, such as Luc Olivier Merson in Rome and Samuel Urrabietta (Vierge's brother) in Spain. From 1871 to 1878 his individuality became more and more pronounced, and he produced, among his best-known drawings, "Christmas in Spain," "The Republican Meeting in Trafalgar Square," "Attack on a Train in Andalusia," "Feast of St Rosalia in Palermo," "In the Jardin d'Acclimatation," "The Burning of the Library of the Encrical," 1873, "Grasshoppers in Algiers," "Brigandage in Sicily," "Night Fête in Constantinople," "Pride of the Civil War in Spain," "Marriage of the King of Spain" and "The Bull Fight." About this time he illustrated with remarkable dash and skill Victor Hugo's Anne de Boholino, the 1867 work of the same name (see Boholino, 1867). His "1813" (Hugues, 1877) and Les Misérables (1883). His masterpiece of illustration is Michelet's History of France (1876), consisting of 26 volumes containing 1000 drawings. In 1879 he was drawing for La Vie moderne, and then proceeded to illustrate Pablo de Segovia. While engaged upon this work he was attacked by paralysis in the right arm, but with characteristic energy and courage he set himself to acquire the necessary skill in drawing with the left, and calmly proceeded with the illus-
trations to the book. In 1891 he illustrated L'Espagnole, by Bergerat, and in 1895 Le Cabaret des trois versus ("The Last of the Abencerrages"), and in the following year a compre-
prehensive exhibition of his work (including the illustrations to Don Quixote) at the Art Nouveau Gallery, also in Paris. In 1898 Vierge contributed to L'Image, a magazine devoted to the encouragement of engraving upon wood; and two years later, at the International Exhibition at Paris, he was awarded a grand prix. In 1902 he exhibited at the New Salon a scene from the Franco-Prussian War. He died at Boulouge-sur-
Seine in May 1904.

See Roger Marx, L'Image (1898); Béraldi, La Gravure au 19e siècle.

VIERSEN, a town of Germany, in the Prussian Rhine pro-
vince, 11 m. by rail S.W. from Crefeld, and at the junction of lines to München-Gladbach, Venlo, &c. Pop. (1905) 27,577. It has an evangelical and four Roman Catholic churches, among the latter the handsome parish church dating from the 15th century, and various educational establishments. Viersen is one of the chief seats in the lower Rhine country for the manufacture of velvets, silks (especially umbrella covers) and plush.

VIERZON, a town of central France, in the department of Cher, 20 m. N.W. of Bourges by rail. The Cher and the Yèvre unite at the foot of the hill on which lie Vierzon-Ville (pop. (1906) town, 11,312) and Vierzon-Village (pop. town, 2026; commune, 9710); Vierzon-Bourgeois (pop. town, 1482) is on the left bank of the Cher. The town has a port on the canal of Berry and is an important junction on the Orléans railway; there are several large manufactories for the production of agricultural machines, also foundries, porcelain, brick and tile works and glass works. A technical school of mechanics and a branch of the Bank of France are among the institutions of the town.

VIETA (or ViET), FRANCOIS, SEIGNEUR DE LA BIGHTRE (1540-1603), more generally known as Franciscus Vieta, French mathematician, was born in 1540 at Fontenay-le-Comte, in Poitou. According to F. Ritter, Vieta was brought up as a Catholic, and died in the same creed; but there can be no doubt that he belonged to the Huguenots for several years. On the completion of his studies in law at Poitiers Vieta began his career as an advocate in his native town. This he left about 1567, and somewhat later we find him at Rennes as a councillor of the parliament of Brittany. The religious troubles drove him thence, and Rohan, the well-known chief of the Huguenots, took him under his special protection. He recom-

mended him in 1580 and "made up the best of me," as the terms of his recommendations were. He became valued both at St. Trojans, and Catherine, Countsess of

1 Boletino Boncompagni (Rome, 1868), vol. i. p. 227, n. 1.
We know of one important service rendered by Vieta as a royal officer. While at Tours he discovered the key to a Spanish cipher, consisting of more than 500 characters, and thenceforward all the despatches in that language fell into the hands of the French could be easily read. His fame now rests, however, entirely upon his achievements in mathematics. Being a man of wealth, he printed at his own expense the books in which he published various branches of this science, and communicated them to scholars in all parts of the country of Europe. An evidence of the good use he made of his means, as well as of the kindliness of his character, is furnished by the fact that he entertained as a guest for a whole month a scientific adversary, Adrian van Roomen, and then paid the expenses of his journey home. Vieta's writings thus became very quickly known; but, when Francis van Schooten issued a general edition of his works in 1646, he failed to make a complete collection, although probably nothing of very great value has perished.

The form of Vieta's writings is their weak side. He indulged freely in flourishes; and in devising technical terms derived from the Greek he seems to have aimed at making them as unintelligible as possible. Nor did he add, in some of his works, the key to his cipher, and even his proposal to denote unknown quantities by the vowels A, E, I, O, U, Y—the consonants B, C, K, &c., being reserved for general knowledge—has not been followed up. In this denotation he followed, perhaps, some older contemporaries, and designated the points in geometrical figures by vowels, making use of consonants, B, S, T, &c., only when these were exhausted. Vieta is well known for his notation of algebra, which, the sign of equality—a want which is the more striking because Robert Recorde had made use of our present symbol for this purpose since 1557, and Xylander had employed vertical parallel lines since 1575. On the other hand, Vieta was well skilled in most modern artifices, aiming at a simplification of equations by the substitution of new quantities having a certain connexion with the primitive unknown quantities. Another of his works, Recensio consonarum effectionum geometricarum, bears a stamp not less modern, being what we now call an algebraic geometry—in other words, a collection of precepts how to construct algebraic expressions with the use of rule and compasses. These were, however, not general, and therefore of the greatest didactic importance, the principle of homogeneity, first enunciated by Vieta, was so far in advance of his times that most readers seem to have passed it over without attending to its importance. That point of view had been long foreseen by the Greek authors of the classic age; but of later mathematicians only Hero, Diophantus, &c., ventured to regard lines and surfaces as mere numbers which could be joined to give a new number, their sum. It may be that the study of maps, the withering of the works of Diophantus, prompted him to lay it down as a principle that quantities occurring in an equation ought to be homogeneous, all of them lines, or surfaces, or solids, or supersolids—an equation between mere numbers being inadmissible. During the three centuries that have elapsed between Vieta's day and our own several changes of opinion have taken place on this subject, till the principle has at last proved so far victorious that modern mathematicians like to make homogeneous such equations as are not so from the beginning, in order to get values of a symmetrical shape. Of course, it is never done so far as the theory is concerned, as undoubtedly the merit cannot be denied him of having indirectly suggested the thought. Nor are his writings lacking in actual inventions. He conceived methods for the general resolution of equations of the second, third and fourth degrees different from those of Ferro and Ferrari, with which, however, it is difficult to believe him to have been unacquainted. He devised an approximate numerical solution of equations of the sixth, and third degrees, wherein Leonardo of Pisa must have preceded him. His method of obtaining the roots of an equation is completely lost. He knew the connexion existing between the positive roots of an equation (which, by the way, were alone thought of in those days of the rood), and the denominator of the unknown quantity. He found out the formula for deriving the sine of a multiple angle, knowing that of the single angle with due regard to the periodicity of sines. This formula must have been known to A. de la Hire (1600-1673), because he is said to have given it as a problem to all mathematicians an equation of the 45th degree, which, being recognized by Vieta as depending on the equation between sin ϕ and sin 4ϕ/5, was resolved by him at once, all the twenty-three positive roots of which the said equation was capable being given at the same time (see TRIGONOMETRY). Such was the first encounter of the two scholars. A second took place when Vieta pointed to Apollonius's problem of taction as not yet mastered, which, when communicated by van Schooten at Flanders in 1646, lastly he gave an infinite product for the number π (see CIRCLE, SQUAREING OF). Vieta's collected works were issued under the title of Opera Mathematica by van Schooten in 1657.
MARIE ANTOINETTE, of whom she painted over twenty portraits between 1779 and 1789. A portrait of the artist is in the hall of the painters at the Uffizi, and another at the National Gallery. The Louvre owns two portraits of Mme Lebrun and her daughter, besides five other portraits and an allegorical composition.

A full account of her eventful life is given in the artist's Souvenirs, and in K. Pillet's Mme Vigée-Le Brun (Paris, 1896). The artist's autobiography has been translated by Lionel Strachey, Memoirs of Mme Vigée-Lebrun (New York, 1902), fully illustrated.

VIGEVANO, a town and episcopal see of Lombardy, Italy, in the province of Pavia, on the right bank of the Ticino, 24 m. by road or 15 m. by rail from Milan. It is a large town, 5,930 ft. above sea-level. Pop. (1911) 33,563. It was (commenced new) in 1885.

It is a medieval walled town, with an arcaded market-place, a cathedral, the Gothic church of St. Francesco, and a castle of the Sforza family, dating from the 14th century and adorned with a loggia by Bramante and a tower intimating that of Filarete in the Castello Sforzesco at Milan. It is a place of some importance in the silk trade and also produces excellent macaroni. There is a steam tramway to Novara.

VIGFUSSON, GUDBRAND (1828-1886), the foremost Icelandic scholar of the 19th century, was born a good and old Icelandic Breiðuvogur (with the following) in the parish of Flateyar-bok (town); (last in 1858), and made short tours in Norway and South Germany with friends. In 1866, after some months in London, he settled down in Oxford, which he made his home for the rest of his life, only quitting it for visits to the great Scandinavian libraries or to London (to work during two or three long vacations with his fellow-labourer, F. Y. Powell), or for short trips to places such as the Isle of Man, the Orkneys and Shetlands, the old moutstead of the West Saxons at Downtown, the Roman station of York, the burial-place of Bishop Brynjulf's ill-fated son at Yarmlund, and the Orbis Professed Reader in Scandinavian at the university of Oxford (a post created for him) from 1884 till his death. He was a Jubilee Doctor of Upsala, 1877, and received the Danish order of the Dannebrog in 1885. Vigfusson died of cancer on the 31st of January 1889, and was buried in St Sepulchre's Cemetery, Oxford, on the 3rd of February. He was an excellent judge of literature, reading most European languages well and being acquainted with the classics. His memory was remarkable, and if the whole of the Eddic poems had been lost, he could have written them down from memory. He spoke English well and idiomatically, but with a strong Icelandic accent. He wrote a beautiful, distinctive and clear hand, in spite of the thousands of lines of MS. copying he had done in his early life.

By his Tórnadl (written between October 1854 and April 1855) he laid the foundations for the chronology of Icelandic history, in a series of conclusions that have not been displaced (save by his own additions and corrections), and that justly earned the praise of Jacob Grimm. His editions of Icelandic classics (1858-68), Biskupa Sógr, Bodad Saga, Forn Sógr (with Möbius), Eyvypatugga Saga and Sandmannaga Saga furnish the most complete Icelandic scholarchip, and can only fitly be compared to the Rolls Series editions of chronicles by Dr Stubbs for the interest and value of their prefaces and texts. Seven years of constant and severe toil (1866-73) were given to the Oxford Icelandic-English Dictionary, incomparable in the best guide to classic Icelandic, and a monumental example of single-handed work. His later series of editions (1874-85) included Orvar-Olaf's Saga, the great and complex mass of Icelandic historical saga, such as Skáldsögur, and the Poeticum Boreale, in which he edited the whole body of classic Scandinavian poetry.

As an introduction to the Sturlunga, he wrote a complete though concise history of the classic Northern literature and its sources. In the introduction to the Corpus, he laid the foundations of a critical history of the Eddic poetry and Court poetry of the North in a series of brilliant, original and well-supported theories that are gradually being accepted everywhere, who were at first inclined to reject them. His little Icelandic Prose Reader (with F. York Powell) (1879) furnishes the English student with a pleasant and trustworthy path to a sound knowledge of the language.

The Corpus of Icelandic Epistles (1886) give good examples of the range of his historic work, while his Appendix on Icelandic currency to Sir G. W. Desant's Burnett Nyali is a model of unfussful investigato into an intricate and somewhat important subject. As a writer in his own tongue he at once gained a high position by his excellent and delightful Relations of Travel in Norway and South Germany. In English, as his "Visit to Grim " and his " Iceland, the North." His life is mainly a record of well-directed and efficient labour in Denmark and Oxford.

VIGIL (Lat. vigilia, " watch "), in the Christian Church, the eve of a festival. The use of the word is, however, late, the vigiliae (pernoctationes, πανεκδόσεις) having originally been the services, consisting of prayers, hymns, processions and sometimes the eucharist, celebrated on the preceding night in preparation for the feast. The oldest of the vigil is that of Easter Vigil. The Pentecost Vigil is of much later than Easter Vigil, the eucharist was especially associated, and baptism with that of Pentecost (see Whit-Sunday). The abuses connected with nocturnal vigils led to their being attacked, especially by Vigilantius of Barcelona (c. 400), against whom Jerome fulminated in this as in other matters. The custom, however, increased, vigils being instituted for the other festivals, including those of saints.

In the middle ages the nocturnal vigilia were, except in the monasteries, gradually discontinued, matins and vespers on the preceding day, with fasting, taking their place. In the Roman Catholic Church the Vigil is now celebrated on the morning of the day preceding the festival, except at Christmas, when a midnight mass is celebrated, and on Easter Eve. These vigils are further distinguished as privileged and unprivileged. The former (except that of the Epiphany) have special offices; in the latter the vigil is merely commemorated.

The Church of England has reverted to early custom so far as only " Easter Even " is distinguished by a special collect, gospel and epistle. The other vigils are recognized in the calendar (including those of the saints) and the rubric directs that for each collect appropriate, as, for instance, the Vigil of the Vigil or Eve, shall be said at the Evening Service next after the main service.

VIGILANCE COMMITTEE, in the United States, a self-constituted judicial body, occasionally organized in the western frontier districts for the protection of life and property. The first committee of prominence bearing the name was organized in San Francisco in June 1851, when the crimes of desperadoes who had immigrated to the gold-fields were rapidly increasing in numbers and it was said that there were venal judges, packed juries and false witnesses. At first this committee was composed of about 200 members; afterwards it was much larger. The general committee was governed by an executive committee and the city was policed by sub-committees. Within about thirty days four desperadoes were arrested, tried by the executive committee and hanged, and about thirty others were banished. Satisfied with the result, the committee then quietly adjourned, but it was revived five years later. Similar committees were common in other parts of California and in the mining districts of Idaho and Montana. That in Montana exterminated in 1863-64 a band of outlawed organized under Henry Plummer, the sheriff of Montana City; twenty-four of the laws were hunged within a few months. Committees or societies of somewhat the same nature were formed in the Southern states during the Reconstruction period (1865-72) to protect white families from negroes and " carpet-baggers," and besides these there were the Ku-Klux-Klan (q.v.) and its branches; the Knights of the White Camelia, the Pale Faces, and the Invisible Empire of the South, the principal object of which was to control the negroes by striking them with terror.

1 The 35th council of the council of Elvira (305) forbids women to attend them.
VIGILANTIOUS (fl. c. 400), the presbyter, celebrated as the author of a work, no longer extant, against superstitious practices, which called forth one of the most violent and scurrilous of Jerome's polemical treatises, was born about 370 at Calagurris in Aquitania (the modern Cazères or perhaps Saint Bertrand-de-Comminges) in the department of Haute-Garonne, where his father kept a "statio" or inn on the great Roman road from Aquitania to Spain. While still a youth his talent became known to Sulpicius Severus, who had estates in that neighbourhood, and in 395 Sulpicius, who probably baptized him, sent him with letters to Paulinus of Nola, where he met with a friendly reception. On his return to Severus in Gaul he was ordained; and, having soon afterwards inherited means through the death of his father, he set out for Palestine, where he was received with great respect by Jerome at Bethlehem. The stay of Vigilantius lasted for some time but, as he was almost inevitably, he was dragged into the dispute then raging about Origen, in which he did not see fit wholly to adopt Jerome's attitude. On his return to the West he was the bearer of a letter from Jerome to Paulinus, and at various places where he stopped on the way he appears to have expressed himself about Jerome in a manner that when reported gave great offence to that father, and provoked him to write a reply (Ep. 61). Vigilantius now settled for some time in Gaul, and is said by one authority (Gennadius) to have afterwards held a charge in the diocese of Barcelona, but, some years after his return from the East, Vigilantius wrote his celebrated work against superstitious practices, in which he argued against the veneration of the martyrs, so common, the sending of alms to Jerusalem, the rejection of earthly goods and the attribution of special virtue to the unmarried state, especially in the case of the clergy. He thus covers a wider range than Jovinian, whom he surpasses also in intensity. He was especially indignant at the way in which spiritual worship was being ousted by the adoration of saints and their relics. All that is known of his work is through Jerome's treatise Contra Vigilantium, or, as that controversialist would seem to prefer saying, "Contra Dormitantium." Notwithstanding Jerome's exceedingly unfavourable opinion, there is no reason to believe that the tract of Vigilantius was exceptionally illiterate, or that the views it advocated were exceedingly "heretical." Soon, however, the great influence of Jerome in the Western Church caused its leaders to espouse all his quarrels, and Vigilantius gradually came to be ranked in popular opinion among heretics, though his influence long remained potent both in France and Spain, as is proved by the polemical tract of Faustus of Rhegim (d. c. 490).

VIGLIUS, pope from 537 to 555, succeeded Silvester and was followed by Pelagius I. He was ordained by order of Belisarius while Silvester was still alive; his elevation was due to Theodora, who, by an appeal at once to his ambition and, it is said, to his covetousness, had induced him to promise to disallow the council of Chalcedon, in connexion with the "three chapters" controversy. When, however, the time came for the fulfilment of his bargain, Viglius declined to give his assent to the condemnation of that council involved in the imperial edict against the three chapters, and for this act of disobedience he was peremptorily summoned to Constantinople, which he reached in 547. Shortly after his arrival there he issued a document known to history as his Judicatum (548), in which he condemned indeed the three chapters, but expressly disavowed any intentions thereby to disparage the council of Chalcedon. After a good deal of trimming (for he desired to stand well with his own clergy, who were strongly orthodox, as well as with the court), he prepared another document, the Constitutum ad Imperatorem, which was laid before the imperial court by the legates in person, and to his condemnation by the majority of that body, some say even to his banishment. Ultimately, however, he was induced to assent to and confirm the decrees of the council, and was allowed after an enforced absence of seven years to set out for Rome. He died, however, at Syracuse, before he reached his destination, on the 7th of June 555.

VIGINTEXVIRI, in Roman history, the collective name given in republican times to "twenty-six" magistrates of inferior rank. They were divided into six boards, two of which were abolished by Augustus. Their number was thereby reduced to twenty and their name altered among others ("the twenty "). They were originally nominated by the higher magistrates, but subsequently elected in a body at a single sitting of the comitia tributa; under the empire they were chosen by the senate. The following are the names of the six boards: (1) Tresviri capita]es (see Tresviri); (2) Tresviri moneta]es; (3) Quatuorviri viis in urbe purgandis, who had the care of the streets and roads inside the city; (4) Duoviri viis extra urmem purgandis (see Duoviri), abolished by Augustus; (5) Decemviri s]litibus judicandis (see Decemviri); (6) Quatuor praefecti Curiam Comenii, abolished by Augustus. The members of the last-named board were appointed by the praetor urbanus of Rome to administer justice in ten Campanian towns (list in Mommsen), and received their name from the two most important of these. They were subsequently elected by the people under the title of quatuorviri jure dicundo, but the date is not known. See Mommsen, Römisches Staatsrecht, ii. (1887), p. 592.
opposed the duke's scheme of extorti on, and sought to induce Philip himself to visit the Low Countries. His health was now impaired and his work was nearly over. Having suffered a short imprisonment with the other members of the state council in 1576, he died at Brussels on the 5th of May 1577, and was buried in the abbey of St. Bavon.

Viglius was an advocate of peace and moderation, and as such could not expect support or sympathy from men engaged in a life-and-death struggle for liberty, or from their relentless enemies. He was undoubtedly avaricious, and accumulated great wealth, part of which he left to found a hospital in his native place, Zwichem, and college at the university of Louvain. He married a rich lady, Jacqueline Dambart, but had no children.

He wrote a Tagebuch des Schmalıdlischen Demokrakrieges, edited by A. von Druffel (Munich, 1887), and some of his lectures were published under the title Commentarii in decem Institutionum Vitae et operis historicae in the Analecta Belgica of C. P. Huyven van Pappenrecht (the Hague, 1742). See L. P. Gachard, Correspondance de Philippe II. sur les affaires des Pays-Bas (Brussels, 1848-79); and Correspondance de Marquart de Amschelauff, duchesse de Parme, avec Philippe II. (Brussels, 1867-81); and E. Poulet, Correspondance de cardinal de Granvelle (Brussels, 1877-81).

Vigne, Paul de (1843-1901), Belgian sculptor, was born at Ghent. He was trained by his father, a statuary, and began by exhibiting his "Fra Angelico da Fiesole" at the Ghent Salon in 1868. In 1872 he exhibited at the Brussels Salon a marble statue, "Heliotrepe" (Ghent Gallery), and in 1875, at Brussels, "Beatrice" and "Domenica." He was employed by the government to execute caryatides for the conservatoire at Brussels. In 1876 at the Antwerp Salon he had busts of E. Baudrier and W. Wilson, which were afterwards placed in the communal museum at Brussels. During 1882 he lived in Paris, where he produced the marble statue "Immortality" (Brussels Gallery), and "The Crowning of Art," a bronze group on the façade of the Palais des Beaux-Arts at Brussels. His monument to the popular heroes, Jean Breydel and Pierre de Coninck, was unveiled at Bruges in 1887. At his death he left unfinished his principal work, the Ansopch monument, which was erected at Brussels under the direction of the architect Janlet with the co-operation of various sculptors. Among other notable works by De Vigne may be mentioned "Volumia" (1875); "Poverella" (1878); a bronze bust of "Psyche" (Brussels Gallery), of which there is an ivory replica; the marble statue of Marnix de Ste Aldegonde in the Square du Sablon, Brussels; the Metdepenningen monument in the cemetery at Ghent; and the monument to Canon de Hacene at Courtrai.

See E. L. Detage, Les Artistes Belges contemporains (Brussels), and O. G. Destre, The Renaissance of Sculpture in Belgium (London, 1895).

Vignette (Fr. for "little vine"), in architecture, a running ornament, representing, as its name imports, a little vine, with branches, leaves and grapes. It is common in the Tudor period, and runs or roses in a large hollow or crosset. It is also called tracery. From the transference of the term to book-illustration resulted the sense of a small picture, vanishing gradually at the edge.

Vigny, Alfred de (1797-1863), French poet, was born at Loches (Indre-et-Loire) on the 27th of March 1797. Sainte-Beuve, in the rather ill-natured essay which he devoted to Vigny after his death, expresses a doubt whether the title of count which the poet bore was well authenticated, and hints that no very ancient proofs of the nobility of the family were forthcoming; but it is certain that in the 18th century persons of the name occupied positions which were not open to any but men of noble birth. For generations the ancestors of Alfred de Vigny had been soldiers, and he himself joined the army, with a commission in the Household Troops, at the age of sixteen. But the Revolutionary and Napoleonic wars were over, and after twelve years of life in barracks he retired, preserving, however, a very high estimate of the duties and career of the soldier. While still serving he had made his mark, if as yet unrecognized, by the publication in 1822 of a volume of poems, and in 1826 by another, together with the famous prose romance of Cinq-Mars. Sainte-Beuve asserts that the poet anticipated some of his most remarkable work. This may or may not be the case; he certainly could not ante-date the publication. And it so happens that some of his most celebrated pieces—Éloa, Dolorida, Moïse—appeared (1822-23) before the work of younger members of the Romantic school whose productions strongly resemble these poems. Nor is this originality limited to the poem, which is in "the first of their kind in France, in which philosophic thought is clothed in epic or dramatic form." Indeed this claim is disputable in itself, and has misled not a few of Vigny's recent critics. It is in poetic, not philosophic, quality, that his idiosyncrasy and preciosity are most remarkable. It is quite certain that the other Alfred—Alfred de Musset—felt the influence of his elder namesake, and an impartial critic might discern no insignificant marks of the same effect in the work of Hugo himself. Even Lamartine, considerably Vigny's elder and his predecessor in poetry, seems rather to have been guided by Vigny than by him. No one can read Dolorida or Le Cor without seeing that the author had little to learn from any of his French contemporaries and much to teach them. At the same time Vigny, from whatever cause, hardly made any further public appearance in poetry proper during the more than thirty years of his life, and his entire poems, including posthumous fragments, form but one small pocket volume. Cinq-Mars, which at least equalled the poems in popularity, will hardly stand the judgment of posterity so well. It had in its favor the immense vogue of the novels of Walter Scott, on which it was evidently modelled, the advantages of an exquisite style, and the taste of the day for the romance as opposed to the novel of analysis. It therefore gained a great name both in France and abroad. But any one who has read it critically must acknowledge it to be disappointing. The action is said to be dramatic; if it be so, it can only be said that this proves very conclusively that the action of drama and the action of the novel are two quite different things. To the reader who knows Scott or Dumas the story is singularly uninteresting (far less so than in the original story), the characters want life; and the book generally stagnates.

Its author, though always as a kind of outsider (the phrase constantly applied to him in French literary essays and histories being that he shut himself up in a tour d'ivoire), attempted more or less to the Romantic movement of 1830 and the years immediately preceding and following it, and was stimulated by this movement both to drama and to novel-writing. In the year before the revolution of July he produced at the Théâtre Français a translation, or rather paraphrase, of Othello, and an original piece, La Marche d'Ancre. In 1832 he published the curious book Stello, containing studies of unlucky youthful poets—Gilbert, Chatterton, Chénier—and in 1835 he brought out his drama of Chatterton, which, by the hero's suicide, shocked French taste even after five years of Romantic education, but had a considerable success. The same year saw the publication of Servitude et grandeurs militaires, a singular collection of sketches rather than a connected work in which Vigny's military experience, his idea of the soldier's duties, and his rather poetical views of history were all worked in. The subjects of Chatterton and Othello naturally suggest a certain familiarity with English, and in fact Alfred de Vigny knew English well, lived in England for some time and married in 1828 an Englishwoman, Lydia Bunbury. His father-in-law was, according to French gossip, so conspicuous an example of insular eccentricity that he never could remember his son-in-law's name or anything about him, except that he was a poet. By this fact, and the kindness of casual Frenchmen who went through the list of the chief living poets of their country, he was sometimes able to discover his daughter's husband's designation. In 1845 Alfred de
VIGNY was elected to the Academy, but made no compromise in his "discourse of reception," which was unlinchingly Romantic. Still, he produced nothing save a few scraps; and, beyond the work already enumerated, little has to be added except his Journal d'un poète and the poems called Les Destinées, edited, with a few fragments, by Louis Ratisbonne after his death. Among his dramatic work, however, should be mentioned *Quite pour la peur* and an adaptation of the *Merchant of Venice* called *Shylock*. *Les Destinées* excited no great admiration in France, but they are among some of the rarest poems of a rarest kind, such as the magnificent speech of Nature in "La Maison du berger" and the remarkable poem entitled "La Colère de Samson." Vigny died at Paris on the 17th of September 1863.

His later life was almost wholly uneventful, and for the most part, as has been said, spent in retirement. His reputation, however, is perfectly secure. It may, and probably will, rest only on his small volume of poems, though it will not be lessened, as far as qualified literary criticism is concerned, should the reader proceed to the amount of the work. The whole of his non-dramatic verse does not amount to two lines; it may be a good deal less. But the range of subject is comparatively wide, and extraordinary felicity of execution, not merely in language, but in thought, is evident throughout. Vigny, as may be seen in the speech of Nature referred to, had the sentiment of uniting with French plenitude of attainment without grandiosity, by means of an almost classical precision and gravity of form. The defect of volubility, of never leaving off, which may be traced in the early work of Hugo, is in him, and he is equally free from the looseness and disorderliness of form which are sometimes blemishes in Musset, and from the effeminacy of Lamartine, while once more his nobility of thought and pleasantness of fibre are unexampled. The whole work of Vigny is thought to rest on the technically perfect work of Théophile Gautier. The dramatic work is, perhaps, less likely to interest English than French readers, the local colour of *Chatillerion* being entirely false, the sentiment conventional in the extreme, and the real paths of the story exchanged for a commonplace devotion on the poet's part to his host's wife. In the same way, the finest passages of *Ohellos* similar to those of Vigny's verse. In his remaining works the defect of skill in managing the plot and characters of prose fiction, which has been noticed in *Cinq-Mars*, reappears, together (in the case of the *Journal d'un poète* and elsewhere) with signs of the fastidious and slightly affected manner by which Vigny was himself, like his hero, seen, not so well as a man. In his poems proper none of these faults appears, and he is seen wholly at his best. It should be said that of his posthumous work not a little had previously appeared piecemeal in the *Revue des deux mondes*, to which he was an occasional contributor.

The prettiest of the complete editions of his works (of which there are several) is to be found in what is called the *Petite bibliothèque Charpentier*. For the general arrival of himself and his works to the world, Recently there has been a revival of interest as shown by anthologies: M. Pâloéologue's "Alfred de Vigny" in the *Grands écrivains français* (1891); L. Dorison's *Alfred de Vigny, poète-philosophe* (1897); L. A. Négri's *Alfred de Vigny, poète philosophe* (1895); E. Dupuy's *La Jeunesse des Romantiques* (1903); and E. Lauvriere's *Alfred de Vigny* (Paris, 1910). But in most of these rather excessive attention has been paid to the "philosophy" of a pessimistic kind which succeeded Vigny's early Christian Romanticism. This, though not unworthy, is separable from his real poetical quality, and concentration on it rather obscures the latter, which is of the rarest kind. It should be added that an interesting sidelight has been thrown on Vigny by the publication (1905) of his Fragments inédits sur F. et T. Corneille. (G. S.)

VIKING, a seaport and naval station of north-western Spain, in the province of Pontevedra; on Vigo Bay (Ría de Vigo) and on a branch of the railway from Tuy to Corunna. Pop. (1900) 23,295. Vigo Bay, one of the finest of the Galician fjords, extends inland for 10 m., and is sheltered by low mountains and by the islands (Islas de Cies, ancient Insulae Siccæ) at its mouth. The town is built on the south-eastern shore, and occupies a hilly site dominated by two obsolete forts. The older streets are steep, narrow and tortuous, but there is also a large modern quarter. Vigo owes its importance to its deep and spacious harbour, and to its fisheries. It is a port of call for many lines trading between Western Europe and South America. Shipbuilding is carried on, and large quantities of fish are canned for export. In 1909, 2041 ships of 2,710,601 tons (t, 1,765,564 h.p.) entered, and 2,481,752 £ worth of the imports in that year, including tin and tinplate, copper, machinery, cement, sulphate of copper and foodstuffs, were valued at £481,752; the exports, including sardines, mineral waters and eggs, were valued at £554,834. The town contains flour, paper and sawmills, sugar and petroleum refineries, tanneries, distilleries and soap works; it has also a large agricultural trade and is visited in summer for sea-bathing. Vigo was attacked by Sir Francis Drake in 1585 and 1589. In 1702 a combined British and Dutch fleet under Sir George Rooke and the duke of Ormonde destroyed a Franco-Spanish fleet in the bay, and captured treasure to the value of about £5,000; numerous attempts have been made to recover the larger quantity of treasure which was supposed, on doubtful evidence, to have been sunk during the battle. In 1716 Vigo was captured by the British under Viscount Cobham.

VÍJAYANAGAR, or BIJANAGAR ("the city of victory"), an ancient Hindu kingdom and ruined city of southern India. The kingdom lasted from about 1336 to 1656, forming during all that period a bulwark against Mahomedan invasion from the north. Its foundation, and even great part of its history, is obscure; but its power and wealth are attested by more than one European traveller, and also by the character of the existing ruins. At the beginning of the 14th century Mahomedan raiders had effectually destroyed every Hindu principality throughout southern India, but did not attempt to occupy the country permanently. In this state of desolation Hindu nationality rose again under two brothers, named Harihara and Bukka, of whom little more can be said than that they were Kanarese by race. Hence their kingdom was afterwards known as the Carnatic. At its widest extent, it stretched across the peninsula from sea to sea, from Masulipatnam to Madras, and even included the provinces of the south acknowledged its supremacy. The site of the capital was chosen, with strategic skill, on the right bank of the river Tungabhadra, which here runs through a rocky gorge. Within thirty years the Hindu Rayas of Vijayanagar were able to hold their own against the Bahmani sultans, who had now established their independence of Delhi in the Deccan proper. Warfare with the Mahomedans across the border in the Raichargur doab was carried on almost unceasingly, and with varying result. Two, or possibly three, different dynasties are believed to have occupied the throne of Vijayanagar as time went on; and its final downfall may be described to the domestic dissensions thus produced. This occurred in 1565, when the confederate sultans of Bijapur, Ahmednagar and Golconda, who had divided amongst themselves the Bahmani dominions, overwhelmed the Vijayanagar army in the plain of Talikota, and sacked the defenceless city. The Raya fled south to Penukonda, and later to Chandragiri, where one of his descendants granted to the English the site of Fort St George or Madras. The city has ever since remained a wilderness of immense ruins, which are now owned by the British government.

VIKING. The word "Viking," in the sense in which it is used to-day, is derived from the Icelandic (Old Norse) *Vikinger* (m.), signifying simply a sea-rover or pirate. There is also in Icelandic the allied word *vik*ing (I.), a predatory voyage. As a loan-word *vik*ing occurs in A.S. poetry (*vecing* or *væcing*), e.g., in *Widsith*, *Byroth*, *Exodus*. During the Saga Age (900-1050), in the beginning of Norse literature, *vik*ing is not as a rule used to designate any class of men. Almost every young Icelandic of sufficient substance made a very large number of young Norsemen, made one or more viking expeditions. We read of such a one that he went "a-viking" (*fara i viking*, *vera i viking*, or very often *fara, &c.*, *vestan i viking*). The procedure was almost a recognized part of education, and was analogous to the grand tour made by our great-grandfathers in the 18th century. But the use of *vik*ing in a more generic sense is still to be found in the Saga Age. If the designation of this or that personage as *núskil vikings* or *rvuðu vikings* (red vikings) be not reckoned an instance of such use, we have at all events in the name of a small quasi-nationality, the Jómsvíkingar, settled at Jómsborg on the Baltic (in modern Pomerania).
to whom a saga is dedicated: who possessed rather peculiar institutions evidently the relic of what is now called the Viking Age, that preceded the Saga Age by a century. Another instance of such more generic use occurs in the following typical passage from the Landnámabók (Sturlabók), where it is mentioned that Harald Fairhair harried the Vikings of the Scottish isles—that famous harrying which led to most of the settlement of Iceland and the birth of Icelandic literature:

"Haraldr en harfari herjaði vestr am hafi... Hann lagði "undir sig allar Sudreyjar... En er hann for vestann sogust "iðvölkum... Shoar skötur ok rennað víslu" (Landn., ed. Jónsson, 1906, p. 135).

It is in this more generic sense that the word "viking" is now generally employed. Historians of the north have distinguished as the "Viking Age" (Vikingerlidi) the time when the Scandinavian folk first by their widespread piracies bought themselves forcibly into the notice of all the Christian peoples of western Europe. We cannot to-day determine the exact homes or provenance of these freebooters, who were a terror alike to the Frankish empire, to England and to Ireland and the so-called Viking Age only came into the present when they were anchored in some Christian harbour, and who were called now Normau, now Dociu, now Danes, now Lockannoch; which last, the Irish, gave them the name for them, though etymologically "men of the lakes or bays," might as well be translated "Norsemen," seeing that Lechann was the Irish for Norway. The exact etymology of vikings itself is not certain; for we do not know whether vik is used in a general sense (bay, harbour) in this connexion, or in a particular sense as the Vik, the Skagerrack and Christiania Fjord. The reason for using "viking" in a more generic sense than is warranted by the actual employment of the word in Old Norse literature rests on the fact that we have no other word by which to designate the early Scandinavian pirates of the 9th and beginning of the 10th century. We cannot tell for the most part whether they came from Denmark or Norway, so that we cannot give them a national name. "Normanner" is used by some Scandinavian writers (as by Steenstrup in his classical work Normannierne). But "Normans" has for us quite different associations. And even those who have preferred not generally to use the word "vikings" to designate the pirates and invaders, have adhered to the term "Viking Age" for the period when they were more active (cf. Munkholm, Det Nordiske Folks Historie, Deel I. Bd. i. p. 336; Steenstrup and others, Danmarks Rigeis Historie, bk. ii. &c.). At the same time, the significance which the word "viking" has had in our language is due in part to a false etymology, connecting the word with "king"; the effect of which still remains in the customary pronunciation vi-king instead of vik-ing, now so much embedded in the language that it is a pedantry to try and change it.

We may fairly reckon the "Viking Age" to lie between the date of the first recorded appearance of a northern pirate fleet (A.D. 750) and the settlement of the Normans in Normandy by the treaty of St Clair-sur-Epte, A.D. 911 or 912. For a few years previous to that date our chief authority for the history of the pirates and raids in the Frankish empire fails us:2 we know that the Norsemen had a few years before that date been driven in great numbers out of Ireland; and England had been in a sense pacified through the concession of a great part of the island to the invaders by the peace of Wedmore, A.D. 878. Although, outside the information we get from Christian chroniclers, this age is for the people of the north one of complete obscurity; it is evident that the Viking Age corresponds with some universal disturbance or unrest among the Scandinavian nations, strictly analogous to the unrest among more southern Teutonic nations which many centuries before had heralded the break-up of the Roman empire, an epoch known as that of the Folk-wanderings (Völkerwander-ungen). We judge this because we can dimly see that the

1 W. Vogel gives the former date; 912 is that more commonly accepted.
2 The Annates Vedastini.

impulse which was driving part of the Norse and Danish peoples to piracies in the west was also driving the Swedes and perhaps a portion of the Danes to eastward invasion, which resulted in the establishment of a Scandinavian kingdom (Garðarki) in what is now Russia, with its capital first at Novgorod, afterwards at Kiev.3 This was, in fact, the germ of the Russian empire. If we could know the Viking Age from the other, the Scandinavian side, it would doubtless present far more interest than in the form in which the Christian chroniclers present it. But from knowledge of this sort we are almost wholly cut off. We have to content ourselves with what is for the greater part of this age a mere catalogue of embarkations and plunderings along all the coasts of western Europe without distinctive characteristics.

The Viking Raids.—The detail of these raids is quite beyond the compass of the present article, and a summary or synopsis must suffice. For all record which we have, the Viking Age was inaugurated in A.D. 793 by the appearance in England of the Danelaw coast of three pirate ships "from Haerethalond" (Hordeland or Hardyssel in Denmark or Höröland in Norway), which are said in the Anglo-Saxon Chronicle to be "the first ships of the Danish men" who sought the land of England. They killed the port-reeve, took some booty and sailed away. Other pirates appeared in 793 on a different coast, Northumbria, attacked a monastery on Lindisfarne (Holy Island), slaying and capturing the monks; the following year they attacked and burnt Jarrow; after that they were caught in a storm, and all perished by shipwreck or at the hands of the countrymen. In 795 a fleet appeared off Glamorganshire. They attacked Man in 798 and Iona in 802. But after this date for many centuries of generations the chief scene of viking exploits was Ireland, and probably the western coasts and islands of Scotland.

The usual course of procedure among the northern adventurers remains the same to whatever land they may direct their attacks, or during whatever years of the 9th century these attacks may fall. They begin by more or less desultory raids, in the course of which they seize upon some island, which they generally use as an arsenal or point d'appui for attacks on the mainland. At first the raids are made in the summer; the first wittinger in any new scene of plunder forms an epoch so picturesque of the country or region of litigation on the literature. In the last part of the 9th century, the chief scene of viking exploits was Ireland, and probably the western coasts and islands of Scotland.

This brief sketch may be taken as the prototype of viking invasion of any region of western Christendom which was the object of their continuous attacks. Of such regions we may distinguish five. The first, simultaneously with the attacks on Ireland came others, probably also from Norway, on the western regions (coasts and islands) of Scotland. Plunderings of Iona are mentioned in A.D. 802, 806. In the course of a generation almost all the monastic communities in western Scotland had been destroyed. But details of these viking plunderings are wanting. On the continent there were three distinct regions of attack. First the mouth of the Scheldt. There the Danes very early settled on the island of Walcheren, which had in fact been given by the emperor Louis the Pious in 806 to a vassal of his, a native of Walcheren, named Harald. After the partition of the territory of Charlemagne's empire among the sons of Louis the Pious, Walcheren and the Scheldt-mouth fell within the possessions of the emperor Lothair, and in the region subsequently distinguished as Lotharingia. From this centre, the Scheldt, the viking raids extended on either side; sometimes eastward as far as the Rhine, and so into Germany proper, the territory assigned to Louis the German; at other times westward to the Somme, and thus into the territory of Charles the Bald, the future kingdom of France. In the event, toward the end of the 9th century all Frisia between Walcheren and the German Ocean seems to have become the permanent possession of the invaders. In like fashion was it with the next district, that of the Seine, only that here no important island served the pirates for their first arsenal and winter quarters. The serious attacks of the pirates in any part of the empire distant from their own lands begin about the time of the battle of Fontenoy between Louis' sons (A.D. 841). The first wintering of the vikings in the Seine territory (A.D. 850) was in "Givoldi fossa," the tomb of one Givolus, not far from their later centre, but not across the Seine. Their first attack on Paris was in A.D. 845: a much more important but unsuccessful one took place in A.D. 853-87, unsuccessful that is so far as the city itself was concerned; but the invaders received an indemnity for raising the siege and leave to pass beyond Paris into Burgundy. The settlement of Danes under Rollo or Rolf on the lower Seine, i.e. in Normandy, dates from the treaty of St Clair-sur-Epte, A.D. 912 (or 911).

The third region is the mouth of the Loire. Here the island point d'appui was Noirmoutier, an island with an abbey at the Loire-mouth. At the Loire-mouth was more often ravaged than that of the lower Loire, so rich in abbeys—St Martin of Tours, Marmoutiers, St Benedict, &c. But the country ceded to the vikings under Hastig at the Loire mouth was insignificant and not in permanent occupation.

Near the end of the 9th century, however, the plundering expeditions which emanated from these three sources became so incessant and so widespread that we can signalize no part of west France as free from them, at the same time that the vikings wrought immense mischief in the Rhine country and in Burgundy. The defences of west France seem quite to have broken down, as did the Irish when Turgesius took "Con's half," or when in A.D. 853 Olaf the White became over-king of Ireland. Unfortunately at this point our best authority ceases; and we cannot well explain the changes which brought about the Christianization of the Normans and their settlement in Normandy as vassals, though recalcitrant ones, of the West Frankish kings.

For the viking attacks in the 5th (or 6th) territory, our own country, the course of events is much clearer. As a part of English history it is, however, sufficiently known, and the briefest summary thereof must suffice. That will show how in its general features it follows the normal course. The first appearance of the vikings in England we saw was in A.D. 789. The first serious attacks do not begin till 838. The island of Sheppey, however, was attacked in 835, and in the following year the vikings entrenched themselves there. The first wintering of the pirates in England was on the contiguous island of Thanet in A.D. 830. The breakdown of the English defences in all parts of the country save Wessex dates from 868; in Wessex that occurs in 875-88. But the position, is suddenly recovered by Alfred in 878, by the battle of Athelney, as suddenly though not so unaccountably as it was later in West Francia. As Rollo was to die in 912, the Danish leader Guthorn received baptism, taking the name of Aethelthorn, and settled in his assigned territory, East Anglia, according to the terms of the peace of Wedmore. But the forces which Alfred defeated at Athelney repulsed but half of the viking army in England at the time. The other half under Halfdan (Ragnar Lodbrog's son?) had never troubled itself about Wessex, but had gone down the coast of England, to the island of Sheppey, and thence conquered Kent, as well as East Anglia, in 870.

The six territories which we have signalized—Ireland, Western Scotland, England, the three in West Francia which merge into each other by the end of the 9th century—do not comprise the whole field of viking raids or attempted invasion. For farther still to the east they twice sailed up the Elbe (A.D. 851, 856) and burnt Hamburg. Southwards they plundered far up the Garonne, and in the north of Spain; and one fleet of them sailed all round Spain, plundering, but attempting in vain to establish themselves in this Arab caliphate. They plundered on the West African coast, and at last got as far as the mouth of the Rhine, in the north of Germany. What we found in the case of the Irish raids, that at first they are quite anonymous, but that presently the names of the captains of the expeditions emerge, is likewise the case in all other lands. In Ireland, besides the important and successful Turgesius, we read of a Saxulf who early met his death, as well as of Ivar (Ingvar), famous also in England and called the son of Ragnar Lodbrog, and of Osli, Ivar's comrade; finally (the vikings in Ireland being mostly of Norse descent) of the well-known Olaf the White, who became king of all the Scandinavian races in Ireland, from about 920-930, and was the most successful and most most of the invaders. Later the name of Ragnar (probably Ragnar Lodbrog) appears, along with Weland, Hastig and one of the sons of Ragnor, Björn. Farther to the east we meet the names of Runik, Godfried and Siegfried. In the eastern region the viking leaders seem to have been closely connected with one of the Danish royal families, the kings of Jutland. The practical though short-lived conquest of England begins under Ivar, Ubbe and Halftán, reputed sons of Ragnar, and is completed by the last of the three in conjunction with Hrefn, who we read, in the 870's, about 879. What we should expect, that larger acquaintance gives to the Christian chroniclers more knowledge of their enemy. Precisely the same process in a converse sense develops the casual raids of early times into a scheme of conquest. For at the outset the Christian world was wholly strange to these northmen. We have, it has been said, hardly any means of viewing these raids from the other side. But one small point of light is so suggestive that it may be cited here. The mythical saga of Ragnar Lodbrog is undoubtedly concerned with the Viking Age, though it is impossible now to identify most of the expeditions attributed to this northern hero, stories of conquest in Sweden, in Finland, in Russia and in England, which belong to quite a different age from this one. In the Christian chronicles the name of Ragnar is associated with an attack on Paris in A.D. 845, when the adventurers were (through the interposition of St Germain, say the Christians) suddenly enveloped in darkness—in a thick fog—and fell before the arms of the defenders. In Saxo Grammaticus' account of Ragnar Lodbrog, this event seems to be reflected in the story of an expedition of Ragnar's to Bjarmaland (or Perm) in Russia. For Bjarmaland, though it is, of course, a local habitation, is also in Norse tradition a wholly mythical and mythological place, more or less identical with the underworld (Niflhel, mist-hell). So it appears in the history given by Saxo Grammaticus of the voyage to Bjarmaland of one "Gorm the old." It "looks like a vaporous cloud" and is full of tricks and illusions of sense. We see then that in virtue of some quite historical misfortune to the viking invaders,
connected with a mist and with a great sickness which invaded the army, the place they have come to (in reality Paris) is in Scandinavian tradition identified with the mythical Bjarmaland; and later, in the history of Saxo Grammaticus, it is identified with the geographical Bjarmaland or Perm. (Saxo Grammat., Hist. Dan., p. 452, Gyldenfasing (Edda Snorra); Acta SS. 18th May and 11th Oct.; Steenstrup, Normannerei, p. 97 seq.; Keesey, The Vikings in Western Christendom, pp. 162, 560.)

No example could better than this bring home to us the strangeness of the Christian world to the first adventurers from the North. They came as the vikings, applied a name which gradually extended the sphere of their ambition. The expedition which we have made mention of took place almost in the middle of the 9th century, and exactly fifty years after the effective opening of the Viking Age. But after this date events developed rapidly. It was fourteen years later (in A.D. 899) that Ragnar's son Björn Ironside and Hasting made their great expedition round Spain to the Mediterranean. In 865 or 866 came to England what we know as the Army, or the Great Army, whose first attacks were in the north of England. Five kings are mentioned and their ravages are given in various parts of England, and many more besides. Their course was not unchequered; but it was only in Wessex that they met with any effective resistance, and the victory of Ashdown (871) put no end to their advance; for, as we know, Alfred himself had at last to wander a fugitive in the fastnesses of Selwood Forest. Much was retrieved by the victory of Aethandune; yet even after the peace of Wedmore as large a part of the land lay under the power of the Danes as of the English.

It is from this time that we discern two distinct tendencies in the viking people. While one section is content to settle down and receive territory at the hands of the Christian rulers—whether or without homage, another section still adheres to a life of mere adventure and of plunder. A large portion of the Great Army refused to be bound by the peace of Wedmore, made some further attempts on England which were frustrated by Alfred's powerful new-built fleet, and then sailed to the continent and spread devastation far and wide. We see them under command of two Danish "kings," Godfried and Siegfried, first in the country of the Rhine-mouth or the Lower Schelct; afterwards dividing their forces and, while some devastate far into Germany, others extend their ravages on every side, in invasion France down to the Loire. The whole of these vast countries, Northern Francia, with part of Burgundy, and the Rhineland, seem to lie as much at their mercy as England had done before Aethandune, or Ireland before the death of Turgesius. But in every country alike the wave of viking conquest now begins to recede. The settlement of Normandy was the only permanent outcome of the Viking Age in France. In England under Edward the Elder and Aethelhaid, Mercia recovered a great portion of what had been ceded to the Danes. In Ireland a great expulsion of the invaders took place in the beginning of the 10th century. Eventually the Norsemen in Ireland entertained themselves with a small number of colonies, strictly confined in territory around certain seaports which they themselves had created: Dublin, Waterford and Wexford; though as the whole of Ireland was divided into petty kingdoms, it might easily happen that the Norse king in Ireland rose to the position—not much more than nominal—of over-king (Ardr) for the whole land.

Character of the Vikings.—Severe, therefore, as were the viking raids in Europe, and great as was the suffering they inflicted—on account of which a special prayer, _A foreuse Normannorum libera nos_, was inserted in some of the litanies of the West—if they had been pirates and nothing more their place in history would be an insignificant one. If they had been no more than what the Illyrian pirates had been in the early history of Rome, or than the Arabian corsairs were at this time in southern Europe, the disappearance of the evil would have been quickly followed by its oblivion. But even at the outset the vikings were more than isolated bands of freebooters. As we have seen, the viking outbreak was probably part of a national movement. We know that at the same time that some Scandinavian folk were harking all the western lands, others were founding Garðaríki (Russia) in the east; others were pressing still farther south till they came in contact with the eastern empire in Constantinople, which the northern folk knew as Mikilliðr (Mikklegard); so that when Hasting and Björn had sailed to Luna in the gulf of Genoa the northern folk had almost put a girdle round the Christian world. There is every evidence that the vikings were not a mere lawless folk—that is, in their internal relations—but that a system of laws was in existence among them, which may have been more or less of the nature of custom than of positive enactments. The approach to it now preserved is probably the code of laws attributed to the mythic king Froði (the Wise) and preserved in the pages of Saxo Grammaticus. It contains provisions for the partition of booty, punishments for theft, desertion and treachery. But some of the clauses securing a comparative liberty for women appear less characteristic of the Viking Age (cf. Alexander Bugge, _Vikingerne_, vol. i. p. 49). Women, indeed, did not take part in their first expeditions. In the constitution of the Jomborg state and again in that of the eastern Vaerings (Saxo's body of the East the new Empire) we see a constitution which looks like the foretaste of that of the Templars or the Teutonic Knights. Steenstrup thinks the code cited by Saxo may be identical with the laws which Rollo promulgated for his Norman subjects. In any case, they fall more near the Viking period than any other northern table of laws. A certain republicanism was professed by these adventurers. "We have no king," one body answered to some Frankish delegates. We do read frequently of kings in the accounts of their hosts; but their power may not have extended beyond the leadership of the expedition; they may have been kings ad hoc. On the other hand, the whole purpose of the northern tradition (Teutonic and Scandinavian tradition alike) forbids us to suppose that any would be elected to that office who was not of noble or princely blood. They were not entirely unlettered; for the use of runes dates back considerably earlier than the Viking Age. But these were used almost exclusively for lapidary inscriptions. What we can alone describe as a literature, first the early Eddic verse, next the habit of narrating sagas: these things the Norsemen learned probably from their Celtic subjects, partly in Ireland, partly in the western islands of Scotland, in the service of the Earl the new Empire. But there we see a constitution which looks like the foretaste of that of the Templars or the Teutonic Knights. Steenstrup thinks the code cited by Saxo may be identical with the laws which Rollo promulgated for his Norman subjects. In any case, they fall more near the Viking period than any other northern table of laws. A certain republicanism was professed by these adventurers. "We have no king," one body answered to some Frankish delegates. We do read frequently of kings in the accounts of their hosts; but their power may not have extended beyond the leadership of the expedition; they may have been kings ad hoc. What we can alone describe as a literature, first the early Eddic verse, next the habit of narrating sagas: these things the Norsemen learned probably from their Celtic subjects, partly in Ireland, partly in the western islands of Scotland, in the service of the Earl the new Empire. Nevertheless, some of the Eddic songs do seem to give the very form and pressure of the viking period.

In certain material possessions—those, in fact, belonging to their trade, which was war and naval adventure—these viking folk were ahead of the Christian nations: in shipbuilding, for example. There is certainly a historical connexion between the ships which the tribes on the Baltic possessed in the days of Taetus and the viking ships (Keary, _The Vikings in Western Europe_, pp. 105-9): a fact which would lead us to believe that the art of shipbuilding had been better preserved there than elsewhere in northern Europe. Merchant vessels must of course have plied between England and France or Frisia. But it is certain that even Charlemagne possessed no adequate navy, though a late chronicler tells us how he thought of building one. His descendants never carried out his designs. Nor was any English king before Alfred stirred up to undertake the same task. And yet the Romans, when threatened by the Carthaginian power, built in one year a fleet capable of holding its own against the, till then, greatest maritime nation in the world. The viking ships had a character apart. They may have owed their origin to the Roman canals; they did without doubt owe their sails to them. Equally certain it is that this special type of shipbuilding was developed in the Baltic, if not before.
VIKRAMADITYA—VIлас

the time of Tacitus, long before the dawn of the Viking Age. Their structure is adapted to short voyages in a sea wellsted with harbours, not exposed to the most violent storms or most dangerous tides. To the last, judging by the specimens of Scandinavian boats which have come down to us, they must have been not very seaworthy; they were shallow, narrow in the beam, pointed at both ends, and so eminently suitable for manoeuvring (with oars) in creeks and bays. The viking ship had but one large and heavy square sail. When a naval battle was in progress, it would depend for its manoeuvring on the rowers. The accounts of naval battles in the sagas show us, too, that this was the case. The rowers in each vessel, instead of being sons of seafarers, were led, probably, by soldiers, not slaves as in the Roman and Carthaginian galley, would yet need to be supplemented by a contingent of fighting men, marines, in addition to their crew. Naturally the shipbuilding developed: so that vessels in the viking time would be much smaller than in the Saga Age. In saga literature we read of craft (of "long ships") with 20 to 30 benches of rowers, which would mean 40 to 60 oars. There exist at the museum in Christiania the remains of two boats which were found in the neighbourhood: one, the Göktäsk ship, is in very tolerable preservation. It belongs probably to the 11th century, and bears the same inscription on the prow which is to be seen on the Viking ships on the Lofoten. It is not probable that the largest viking ships had more than 10 oars a side. As these ships must often, against a contrary wind, have had to row both day and night, it seems reasonable to imagine the crew divided into three shifts (as they call them in mining districts), which would give double the number of men available to fight on any occasion as to row.1 Thus a 20-oared vessel would carry 60 men. But some 40 men per ship seems, for this period, nearer the average. In 896, toward the end of our age, it is incidentally mentioned in one poem, that these boats had 200 rowers, an average of 40 per ship. Elsewhere about the same time we read of 12,000 men carried in 250 ships, an average of 48.

The round and painted shields of the warriors hung outside along the bulwarks: the vessel was steered by an oar at the right side (as whaling boats are to-day), the steerboard or starboard side. Prow and stern rose high; and the former was carved most often into the likeness of a snake's or a dragon's head: so generally that "dragon" or "worm" (snake) became synonymous with a war-ship. The warriors were well armed. The byrnie or mail-shirt is often mentioned in Eddic songs: so are the jarl, the great(IM414) axe, the bow and arrows and the sword. The Danes were specially renowned for their axes; but about the sword the most of northern poetry and mythology clings. An immense joy in battle breathes through the earliest Norse literature, which has scarce its like in any other literature; and we know that the language recognized a peculiar battle fury, a veritable madness by which certain were seized and which went by the name of "berserk's way" (berserksgang).2 The courage of the vikings was proof against anything, even as a rule against superstitious terrors. "We cannot easily realize how all-embracing that courage was. A trained soldier is often afraid at sea, a trained sailor lost if he has not the protecting sense of his own ship beneath him. The viking ventured upon unknown waters in ships very ill-fitted for their work. He had all the spirit of adventure of a Drake or a Hawkins, all the trained valour of reliance upon his comrades that mark a soldierly fighting a militia ("The Vikings in Western Christendom, p. 143). He was unfortunately hardly less marked for cruelty and faithlessness. Livy's words, "inhumana crudelitas, perfidia plus quam Punic," might, it is to be feared, have been applied as justly to the vikings as to any people of western Europe. It is also true, however, that they showed a great capacity for government and a taste for peace for peaceful organization. Normandy was the best-governed part of France in the 11th century; and the Danes in East Anglia and the Five Burghs were in many respects a model to their Saxon neighbours (Steenstrup, op. cit. iv. ch. 2). Of all European lands England is without doubt that on which the Viking Age has left most impression: in the number of original settlers after 878; in the way which these prepared for Canute's conquest; and finally in that which she absorbed from the conquering Normans. England's gain was France's loss: had the Normans turned their attention in the other direction, they might likely have conquered all Gaul in a generation. The Danes were a sea people and saved that country from the intermittent anarchy from which it suffered from the 11th till the middle of the 15th century.

Sources of Viking History.—These are, as has been said, almost exclusively the chronicles of the lands visited by the vikings. For Ireland we have, as on the whole our best authority, the Annales Ulyonenses (C. O'Conor, Scr. Rev. Hibern. iv.), supplemented by the Annales of the Four Masters (ed. O'Donovan) and the Chronicum Scotorum (ed. Hennelly). Finally, The War of the Gaedhil with the Gaill (ed. Todd); Three Fragments of Irish History (O'Donovan); W. W. Skeene, C. H. F. Voelkle (ed. 1877), Beschreibung der hist. Chronik, Annales Lindisfarneenses (in Pertz, Monumenta, vol. viii.); Simeon of Durham, Historia Domnului Ecclesiae. For the Frankish empire the chief sources of our information are The Annales Regni Francorum (C. Pertz, vol. i.), The Annales Breviores Francorum (Pertz, vol. ii.) and the Annales Notitia (Vincent), for the northern and eastern regions, and the Annales Fuldenses (which begin with Pipan of Hereford as down to A.D. 900; Pertz, vol. i.) for Germany. Toward the end of the 9th century the Annales Vedastini (Pertz, vol. i. and ii.) are almost the exclusive authority for the western raids. In the historians of Normandy, especially in Dudo of St Quentin, much incidental matter may be found.

References to the Viking Age in a general way are to be found in a number of biographies especially histories of the Scandinavian countries, of which Munch's Det Norske Folkets Historie (1852, &c.) is the most distinguished: J. J. A. Worsaae has written Minder om de Danske og Nord-Mændene i England, Skotland og Irland (1863), an antiquarian rather than an historical study; G. B. Depping, L'Histoire des expéditions maritimes des Normands (1843), a not very critical work, and E. Mabile, Les Invasions Normandes dans la Loire "(Ecole des chartes bibl., t. 30, 1886). A complete work under either of these is W. Vogel's Die Normannen und das Frankische Reich (1906). It does not, however, break any fresh ground. J. C. H. Steenstrup's Normannernes (1876–82), in four volumes, is not without excellent material; series historians is the best work and value; C. F. Kreasy, The Vikings in Western Europe (1891) is a history of the viking raids on all the western lands, but ends A.D. 888. Vincent, Scandinavias Invasions des Normands (1851), which appeared first in French, is indispensable. See also the earlier work of Vincent, and J. S. M. Forberg, La Norvegie aux Temps des Vikings (1913). The history of the vikings on the east side of the vikings, or, one should rather say, of the earliest Scandinavian folk. (C. F. K.)

VIKRAMADITYA, a legendary Hindu king of Ujsain, who is supposed to have given his name to the Vikram Samvat, the era which is used all over northern India, except in Bengal, and at whose court the "nine gems " of Sanskrit literature are also supposed to have flourished. The Vikram era is reckoned from the vernal equinox of the year 57 B.C., but there is no evidence that that date corresponds with any event in the life of any actual king. As a matter of fact, all dates in this era down to the 13th century never use the word Vikram, but that of Malava instead, that being the tribe that gives its name to Malwa. The name Vikramaditya simply means "sun of power," and was adopted by several Hindu kings, of whom Chandragupta II. (Chandragupta Vikramaditya), who ascended the throne of the Guptas about A.D. 375, approaches most nearly to the legend.

See Alexander Cunningham, Book of Indian Eras (1883); and Vincent Smith, Early Indian History (1876).

VIлас, William Freeman (1840–1908), American political leader and lawyer, was born in Chelsea, Vermont, on the 9th of July 1840. His father, Levi B. Vилас, a lawyer and Democratic politician, emigrated in 1853 to Madison, Wisconsin. William graduated at the university of Wisconsin in 1858, and at the Albany (New York) Law School in 1860, and began to practise law in Madison with his father. In 1862 he recruited and became captain of Company A of the Twenty-Third Wisconsin
Volunteers, of which he was made lieutenant-colonel in 1863, and which he commanded in the siege of Vicksburg. In August 1863 he resigned his commission and resumed his law practice. He was professor of law in the university of Wisconsin in 1868-85, and again in 1889-92, and in 1875-78 was a member of the commission which revised the statutes of Wisconsin. From 1876 to 1886 he was a member of the National Democratic Committee, and virtually the leader of his party in his state; he was a delegate to the National Democratic Conventions of 1876, 1880 and 1884, and was permanent chairman of the last. In 1885 he was a member of the state Assembly. He was postmaster-general in President Grover Cleveland's cabinet from March 1885 until January 1888, and was then secretary of the interior until March 1889. From 1891 until 1897 he was a member of the United States Senate, in which, during President Cleveland's second term, he was recognized as the chief defender of the Administration, and he was especially active in securing the repeal of the silver-purchase clause of the Sherman Act. He was a delegate to the Democratic National Convention of 1896, but withdrew after the adoption of the free-silver plank. He then became one of the chief organizers of the National (or Gold) Democratic party, attended the convention at Indianapolis, and was chairman of its committee on resolutions. In 1881-85 and in 1893-95 he was a regent of the university of Wisconsin; and he was a member (1887-1905) of the commission which had charge of the erection of the State Historical Library at Madison. From 1886-88 he was one of the commissioners for the construction of the new state capital. He died at Madison on the 27th of August 1908.

With E. E. Bryant he edited vols. i. to xx., except vol. v., of the Reports of the Wisconsin Supreme Court.

VILL, the Anglicized form of the word villa, used in Latin documents to translate the Anglo-Saxon tun, township, "the unit of the constitutional machinery, the simplest form of social organization" (Stubbs, Const. Hist. § 39). The word did not always and at all times have this meaning in Latin-English documents, but "vill" and "township" were ultimately, in English law, treated as convertible terms for describing a village community, and they remained in use in legal nomenclature until the ecclesiastical parishes were converted into areas for civil administration under the Poor Law Acts. This technical sense is derived from the late Latin use of villa for vicus, a village. Thus Fleta (vi. c. 51), writing in the time of Edward I., distinguishes the villa, as a collection of habitations and their appurtenances, from the manors, a single house, nulli vicino, and the manor, which may embrace one or more villas. In classical Latin villa had meant "country-house," "farm," "villa" (see VILLA); but the word was probably an abbreviation of vicula, diminutive of vicus, and in the sense of vicus it is used by Apuleius in the 2nd century. Later it even displaced civitas, for city; thus Rutilius Namatanius in his Itinerares speaks of villa ingentis, oppida para; whence the French ville (see Du Cange, Glossarium lat. s.v. Villa). In the Frankish empire villa was also used of the royal and imperial palaces or seats with their appurtenances. In the sense of a small collection of habitations the word came into general use in England in the French form "village." From villa, too, were derived villein and villagium (?villae). (See also VILLAGE COMMUNITIES).

VILLA, the Latin word (diminutive of vicus, a village) for a country-house. This term, which in England is usually given to a small country-house detached or semi-detached in the vicinity of a large town, is being gradually superseded by such expressions as "country" or "suburban house," "bungalow," &c., but in Italy it is still retained as in Roman times and means a summer residence, sometimes being of great extent. References to the villa are constantly made by Roman writers, and it is said to have possessed no less than seven villas, the oldest of which was near Arpinum, which he inherited. Pliny the younger had three or four, of which the example near Laurentum is the best known from his descriptions.

There is too wide a divergence in the various conjectural restorations to make them of much value, but the remains of the villa of Hadrian at Tivoli, which covered an area over seven miles long and in which reproductions were made of all the most celebrated buildings he had seen during his travels, those in Greece seeming to have had the most attraction for him, and the villas of the 16th century on similar sites, such as the Villa d'Este near Tivoli, enable one to form some idea of the exceptional beauty of the positions selected and of the splendour of the structures which enriched them. According to Pliny, there were two kinds of villas, the villa urbana, which was a country seat, and the villa rustica, the farm-house, occupied by the servants who had charge generally of the estate. The Villa Boscoreale near Pompeii, which was excavated in 1803-94, was an example of the villa rustica, in which the principal room was the kitchen, with the bakery and stables beyond and room for the wine presses, oil presses, hand mill, &c. The villas near Rome were all built on hilly sites, so that the laying out of the ground in terraces formed a very important element in their design, and this forms the chief attraction of the Italian villas of the 16th century, among which the following are the best known: the Villa Madama, the design of which, attributed to Raphael, was carried out by Giulio Romano in 1520; the Villa Medici (1540); the Villa Alhani, near the Porta Salaria; the Borghese; the Doria Pamphili (1650); the Villa di Papa Giulio (1550), designed by Vignola; the Aldobrandini (1593); the Falconieri and the Montdragon villas. The terraces, fountains, and cascades, in which the terraces and staircases are of great importance. In the proximity of other towns in Italy there are numerous villas, of which the example best known is that of the Villa Rotunda or Capra near Vicenza, which was copied by Lord Burlington in his house at Chiswick.

The Italian villas of the 16th and 17th century, like those of Roman times, included not only the country residence, but the whole of the other buildings on the estate, such as bridges, casinos, pavilions, small temples, rectangular or circular, which were utilized as summer-houses, and these seem to have had a certain influence in England, which may account for the numerous examples in the large parks in England of similar erections, as also the laying out of terraces, grottos and formal gardens. In France the same influence was felt, and at Fontainebleau, Versailles, Meudon and other royal palaces, the celebrated Le Nôtre transformed the parks surrounding them and introduced the cascades, which in Italy are so important a feature, as at St Cloud near Paris. (R. P. S.)

VILLACH, a town in Carinthia, Austria, 24 m. W. of Klagenfurt by rail. Pop. (1900) 9690. It is situated on the Drave, near its confluence with the Gall, in a broad fertile basin at the foot of the Dobratsch or Villach Alp (9107 ft.). The parish church is an interesting Gothic edifice of the 15th century. The principal industry of Villach consists in the fabrication of various lead wares, and is mostly dependent on the lead mines of Bleiberg, which is situated about 9 m. to the west. This village (pop. 3435) is one of the richest lead-mining centres in Europe. The ores found here comprise silver-free galena, sulphate of zinc and calamine. The mines were already worked during the middle ages. Warmbad Villach, a watering-place with hot sulphur baths and Mittelwald, a favourite summer resort, whence the ascent of the Dobratsch can be made, are in the neighbourhood of Villach. Some of the prettiest Carinthian lakes are to be found near Villach, as the Ossiacher-see, on whose southern shore stands the ruined castle of Landskron, dating from the middle of the 16th century, the Wörther-see and the small but lovely Faaker-see.

Villach is an old town, which was given by Heinrich II. to the bishopric of Bamberg in 1007. During the middle ages it was an important centre of commerce between Germany and Italy. With the advent of new trade routes at the beginning of modern times the town lost its importance, and in 1745 the citizens nearly decided to emigrate en masse. Its trade revived during the French occupation of 1809-13, and it
continued to improve during the 19th century. The Turks were defeated here in 1492 by Maximilian I, and an engagement between the Austrians and the French took place here on the 21st of August 1813.

VILLA DEL PILAR, a city of Paraguay, 104 m. S. by E. of Asuncion, on the left bank of the navigable river Paraguay, which receives the Bermejo from the right immediately opposite. Pop. (1910) about 10,000. Villa del Pilar is a thriving modern city, containing barracks, law courts, a national college, several schools and a branch of the Agricultural Bank. It has a fine harbour, and is one of the principal centres in the republic for the exportation of oranges.

VILLAFRANCA DI VERONA, a town of Venetia, Italy, in the province of Verona, 11 m. S.S.W. of Verona, on the railway to Mantua, 174 ft. above sea-level. Pop. (1901) 5037 (town); 9635 (commune). It has considerable silk industries. Here preliminaries of peace were signed between Napoleon III. and the Austrians in 1859 after the battle of Sorrellino. Five miles to the N. is Custoza, where the Italians were defeated by the Austrians in 1848 and 1866. Villafraanca is a common place name in Italy.

VILLAGE COMMUNITIES. The study of village communities has become one of the fundamental methods of discussing the ancient history of institutions. It would be out of the question here to range over the whole field of human society in search for communal arrangements of rural life. It will be sufficient to confine the present inquiry to the varieties presented by nations of Aryan race, because greater importance is to be attached to these nations than to other branches of humankind, although this view might also be reasonably urged, but principally because the Aryan race in its history has gone through all sorts of experiences, and the data gathered from its historical life can be tolerably well ascertained. Should the road be sufficiently cleared in this particular direction, it will not be difficult to connect the results with similar researches in other racial surroundings.

The best way seems to be to select some typical examples, chiefly from the domain of Celtic, Slavonic and Germanic social history, and to try to interpret them in regard to the general conditions in which communal institutions originate, grow and decay. As the principal problem will consist in ascertaining how far land was held in common instead of being held, as is usual at present, by individuals, it is advisable to look out for instances in which this element of holding in common is very clearly expressed. We ought to get, as it were, acclimated to the mental atmosphere of such social arrangements in order to counteract a very natural but most pernicious bent prompting one to apply to the modern ideas of welfare, etc. of our modern views and habitual notions. A certain acquaintance with the structure of Celtic society, more especially the society of ancient Wales, is likely to make it clear from the outset to what extent the husbandry and law of an Aryan race may depend on institutions in which the individual factor is greatly reduced, while the union of kinsmen and then of neighbours plays a most decisive part.

F. Seebohm has called our attention to the interesting studies of Welsh tracts of country made in the 14th century, soon after these regulations were the hands of English lords. It is one of the merits of these studies published by him and his commentary on them are very illuminating, but further study of the documents themselves discloses many important details and helps to correct some theories propounded on the subject. Let us take up a concrete and simple case, e.g. the description of Astret Canon, a trev or township (villata) of the honour of Denbigh, surveyed in 1334. In the time of the native Welsh princes it was occupied entirely by a kindred (progenities) of free tribesmen descended from a certain Canon, the son of Lawaurgh. The kindred was subdivided into four gavells or bodies of joint-tenants. On the half-gavell of Monnow, an Canon, e.g. thereof no less than sixteen coparceners, of whom eight possess houses. The peculiarity of this system of land tenure consists in the fact that all the tenants of these gavells derive their position on the land from the occupation of the township by their kindred, and have to trace their rights to shares in the original unit. Although the village of Astret Canon was occupied under the survey by something like fifty-four male tenants; the majority of whom were settled in houses of their own, it continued to form a unit as well in regard to the payment of tumpound, that is, of the direct land tax and other services and payments, but also in respect of the possession and usage of the soil. On the other hand, moveable property is owned in severalty. Services have to be apportioned among the members of the kindreds according to the number of heads of cattle owned by them. From the description of another township—Pireyon—we may gather another important feature of this tribal tenure. The population of this village also clustered in gavells, and we hear that these gavells ought to be considered as equal shares in respect of the arable, the wood and the waste of the township. If the shares were reduced into acres there would have fallen to each of the eight gavells of Pireyon ninety-one acres, one rood and a half and six perches of arable and woodland, and fifty-three and one-third of an acre and half a rood of waste land. But as a matter of fact the land was not divided in such a way, and the rights of the tenants of the gavell were realized not through the appropriation of definite acres, but as proportionate opportunities in regard to tillage and as to usages in pasture, wood and waste. Pastoral habits must have greatly contributed to give the system of landholding its peculiar character. It was not necessary, it would have been even absurd, for the upholders of the area in which the herds of cows and the flocks of sheep and goats were grazing. Still Welsh rural life in the 14th century had already a definite though subordinate agricultural aspect, and it is important to notice that individual appropriation had as yet made very slight progress in it.

We do not notice any systematic equalization between members of the tribal communities of the trevs. In fact, both differences in the ownership of cattle and differences of tribal standing, established by complex reckonings of pedigree and of social rank, led to marked inequalities. But there was also the notion of birthright, and we find in the laws that every free tribesman considered himself entitled to claim from his kindred grazing facilities and five erws for tillage. Such a claim could be made unconditionally only at a time when there was a superabundance of land to dispose of. In the 14th century, to which our typical descriptions refer, this state of things had ceased to be universal. Although great tracts of Welsh land were undoubtedly still in a state of wilderness, the soil in more conveniently situated regions was beginning to be scarcer, and considerable pressure of population was already felt, with a consequent transition from pastoral pursuits to agriculture. The tract appropriated to the township of Astret Canon, for instance, contained only 574 acres of land of all kinds. In this case there was hardly room for the customary five erws per head of grown-up males besides commons. And yet although the population lived on a small pittance, the system of tribal tenure was not abandoned.

Although there are no rearrangements or redvission within the tribe as a whole, inside every gavell, representing more narrow circles of kinship, already divided into households (kindreds), i.e. into sets of cousins, the shares were shifted and readjusted according to one of two systems. In one case, that of the trevgyr or joint-account village, every man receives "as much as another yet not of equal value"—which means, of course, that the members of such communities were provided with equal allotments, but left to make the best of them, each according to chance and ability. This practice of reallocation was, however, restricted in the 14th century to taeg trevs, to villages occupied by half-free settlers. The free tribesmen, the priadetii of Wales, held by daddenth and reallotted share within the trev on the coming of each new generation or, conversely, on the going out, the dying out, of each older generation. In other words: at the demise of the last of the grandfathers in a gavell, all the fathers took
VILLAGE COMMUNITIES

equal rank and claimed equal shares, although formerly some of the portions had been distributed equally only between the grandparents or their offspring (stirps). The right to claim redivision held good only within the circle of second cousins. Members of the kindred who stood further than that from each other, that is, third cousins, were not entitled to reallocation on the strength of dademhut.

Another fact which is brought out with complete evidence by the Welsh Surveys is that the tenure is ascribed to communities of kinsmen and not to chiefs or headmen. The latter certainly existed and had exerted a powerful influence on the disposal of common land as well as on government and justice. But in the view of 14th-century surveys each township is owned not by this or the other elder, but by numerous bodies of coparceners. The gavell of Owen Gogh, for instance, contained twenty-six coparceners. In this way there is a clear attribution of rights of communal ownership, if we like to use the term, and not merely of rights of maintenance. Nor is there any warrant for a construction of these arrangements on a supposed patriarchal system.

Let us now compare this description of Celtic tribal tenure with Slavonic institutions. The most striking modern examples of tribal communities settled on a territorial basis are presented by the history of the Southern Slavs in the Balkan Peninsula and in Austria, of Slovenes, Croats, Serbs and Bulgarians, but it is easy to trace customs of the same kind in the memories of Western Slavs conquered by Germans, of the Poles and of the different subdivisions of the Russians. A good clue to the subject is provided by a proverb which says that a man by himself is bound to be a martyr. One might almost suggest that these popular customs illustrate the Aristotelian conception of the single man seeking the "autarkela," a complete and self-sufficient existence in the society of his fellow-men, and arriving at the stage of the tribal village, the țieșs, which is also a čapse, as described in the famous introductory chapter of the Greek philosopher's Politics. The Slavs of the mountainous regions of the Balkans and of the Alps in their stubborn struggle with nature and with human enemies have clustered and still cluster to some extent (e.g. in Montenegro) in closely united and widely spreading brotherhoods (bratstvo) and tribes (plemena). Some of these brotherhoods derive their names from a real or supposed common ancestor, and are composed of relatives as well as of affiliated strangers. They number sometimes hundreds of members, 1 as guns, as the fighting males are characteristically called. Such are—the Vukotiči, Kovaceviči, as one might say in Old English—the Vukotings or Kovachevings, of Montenegro. The dwellings, fields, and pasturages of these brotherhoods or kindreds are scattered over the country, and it is not always possible to trace them in compact divisions on the map. But there was the closest union in war, revenge, funeral rites, marriage arrangements, provision for the poor and for those who stand in need of special help, as, for instance, in case of fires, inundations and the like. And corresponding to this union there existed a strong feeling of unity in regard to property, especially property in land. Although ownership was divided among the different families, a kind of superior or eminent domain stretched over the whole of the bratstvo, and was expressed in the participation in common in pasture and wood, in the right to control alienations of land and to exercise preemption. If any of the members of the brotherhood wanted to get rid of his share he had to apply first to his next of kin within the family and then to the further kinmen of the bratstvo.

As the Welsh kindred (progenies) were subdivided into gavells formed of extended family communities, even so the Bosnian, Montenegrin, Servian, Slovene tribes fell into house communities, Kucka, Zadručni, which were built up on the principle of keeping blood-relatives and their property together as long as possible. They consisted generally of some 15 to 20 grown-up persons, some 6 or 7 first and second cousins with their wives and children, living in a hamlet around the central house of the domaćin, the house leader. In some instances the number of coparceners increased to 50 or even to 70. The members of the united house community, which in fact was a small village or hamlet, joined in meals and work. Their rights in the undivided household of the hamlet were apportioned according to the pedigree, i.e. this apportionment took account first of the stirps or extant descendants of former scions of the family, so that, say, the offspring of each of two grandparents who had been brothers were considered as equal sharers although the stirps, the stock, of one was represented only by one person, while the stirps of the other had grown to consist of two uncles and of three nephews or all alive. There was no resettlement of shares, as in the case of Wales, but the life of the house community while it existed unbroken led to work in common, the contributions to which are regulated by common consent and supervised by the leader. Grounds, houses, implements of agriculture (ploughs, oxen, carts) and of viticulture—vats, presses, the making of brandy, &c., are considered to be common capital and ought not to be sold unless by common consent. Divisions were not prohibited. Naturally a family had to divide sooner or later, and the shares have to be made real, to be converted into fields and vineyards. But this was an event which marks, as it were, the close of the regular existence of one union and the birth of similar unions derived from it. As a rule, the kula kept together as long as it could, because co-operation was needed and isolation dangerous—for economic considerations as well as for the sake of defence.

Attention, however, should be called more particularly to the parallel phenomena in the social history of the Russians, where the conditions seem to stand out in specially strong contrast with those prevailing among the mountain Slavs of the Balkans and of the Alps. In the enormous extent of Russia we have to reckon with widely different geographical and racial areas, among other, with the Steppe settlements of the so-called Little Russians in the Ukraine and the forest settlements of the Great Russians in the north. In spite of great divergencies the economic history of all these branches of Slavonic stock gravitates towards one main type, viz. towards the making of brandy, and towards rural unions of kinsmen, on the basis of enlarged households. In the south the typical village settlement is the dvorite, the big court or hamlet consisting of some four to eight related families holding together; in the north it is the petite, the big oven, a hamlet of somewhat smaller size in which three to five families are closely united for purposes of common husbandry.

It is interesting to notice that even the break-up of the joint household does not lead to an entire severance of the ties between its members. They mostly continue in another form, viz. in the shape of an open-field system with intermixture of stips, and also in rotation of crops, against over pasturage of wood, sometimes shifting allotments as regards meadows. There is, e.g. an act of division between six brothers from the north of Russia of the year 1640. They agree to divide bread and salt, house and liberties, money, cloth and stores of all kinds and to settle apart. As to arable, Shamila is to take the upper strip in the field by the settlement, and next to him Trtjak, then Maxim, then Zvitala, then Shesto, then Luke. In the big harvest furlong likewise, and in the small likewise, and by the meadow likewise and so on through all the furlongs. In that in case and in innumerable other cases of the separate kind the open-field system with its inconvenient intermixture of plots and limited power of every husbandman to manage his land appears as a direct continuation of the joint tribal households.

Another fact to be noticed is the tendency to form artificial associations on the pattern of the prevailing unions of kinsmen. People who have no blood-relations to appeal to for clearing the waste, for providing the necessary capital in the way of cattle and plough implements, for raising and fitting out buildings, join in order to carry on these economic undertakings, and also to help each other against enemies and aggressors. The members of these voluntary associations,
which at once call to mind German, Norse and English gilds, are called "siabri," "sklandik," and the gilds themselves "spôlkie," in south Russia. In a district of the Ukraina called the "Ratensky Sharostov" there were no fewer than 278 such gilds interchanging with these kindreds. The organization of all these unions could in no way be called patriarchal. Even in cases when there is a definite elder or headman (bol'shoy), he was only the first among equals and exercised only a limited authority over his fellows: all the important decisions had to be taken by the council of the community.

In Great Russia, in the districts gathered under the sway of the Moscow tsars, the basis of the household community and of the rural settlements which sprang from it was modified in another direction. The entire agricultural population was subjected to strict supervision and coercive measures for purposes of military organization and taxation. Society was drilled into uniformity and service on the principle that every man has to serve the tsar, the upper class in war and civil administration, the lower class by agricultural labour. A consequence of the heavy burden laid on the land and of the growth of a landed aristocracy somewhat resembling the gentry and the noblesse of the West was a change in the management of land allotments. They became as much a badge of service and a basis for fiscal requirements as a means of livelihood. The result was the practice of realtiments according to the strength and needs of different families. The shifting of arable (peredal) was in this case reapportionment of rights, but a consequence of the correspondence between rights and obligations. But although this admeasurement of claims appears as a comparatively recent growth of the system, the fundamental solidarity between kinsmen or neighbourly associates grouped into villages was in no way an invention of the tsars or of their officials: it was rooted in traditional customs and naturally suggested by the practices of joint households. When these households become crowded in certain areas, open-field systems arise; when they are burdened with public and private service their close co-operation produces occasional or periodical redivisions of the soil between the shareholders.

Let us now pass to village communities in Teutonic countries, including England. A convenient starting-point is afforded by the social and economic conditions of the southern part of Jutland.

Now the Saxon or Ditmarschen portion of this region gives us an opportunity of observing the effects of an extended and highly systematized tribal organization on Germanic soil. Though the name of the district is a reminiscence of one of the Swiss cantons, lasted until the time of the Reformation. We find the Ditmarschen organized in the 13th, as they had been in the 10th century, in a number of large kindreds, partly composed of relatives by blood and partly of "cousins" who had joined them. The membership of these kindreds is based on agnatic ties—that is, on relationship through males—or on affiliation as a substitute for such agnatic kinship. The families or households are grouped into brother-hoods, and these again into clans or "Schlachten" (Geschlechter), corresponding to Roman gentes. Some of them could put as many as 500 warriors in the field. They took their names from ancestors and chieftains: the Wollersmannen, Hennemannen, Jerremannen, &c.—that is, the men of Woll, the men of Henne, the men of Jerre. In spite of these personal names the organization of the clans was by no means a monarchical one: it was based on the participation of the full-grown fighting men in the government of each clan and on a council of co-opted elders at the head of the entire federation. We need not repeat here what has already been stated about the mutual support which such clans afforded to their members in war and peace, in judicial and in economic matters.

Let us notice the influence of this tribal organization on husbandry and property. The regular economic arrangement was an open-field one based on a three-field and similar systems. The furlongs were divided into intermixed strips with com-

pulsory rotation on the usual pattern. And it is interesting to notice that in these economic surroundings indivisible holdings corresponding to the organic units required for efficient agriculture arose of themselves. In spite of the equal right of all coheirs to an estate, this estate does not get divided according to their numbers, but the unification of holdings else falls into such fractions, halves or fourths, which will enable the farming to be carried on successfully, without mischievous interruption and disruption. Gradually the people settled down into the custom of united succession for agrarian units. The Hufe or Hof, the virgate, as might have been said in England, goes mostly to the eldest son, but also sometimes to the youngest, while the brothers of the heir either remain in the same household with him, generally unmarried, or leave the house after having settled with the heir, who takes charge of the holding, as to an indemnity for their relinquished claims. This indemnity is not equivalent to the market price, but is fixed, in case of dispute or doubt, by an award of impartial and expert neighbours, who have to consider not only the claims of interested persons but also the economic quality and strength of the holding. In other words, the heir has to pay so much as the estate can conveniently provide without being wrecked by the outlay.

This evidence is of decisive importance in regard to the formation of unified holdings; we are on entirely free soil, with no vestige whatever of move towards the unification of holdings by a transfer by the lord, and yet the Hufe, the normal holding, comes to the fore as a result of the economic situation, on the strength of considerations drawn from the efficiency of the farming. This "Anerben" system is widely spread all through Germany. The question whether the eldest or the youngest succeeds is a subordinate one. Anyhow, manorial authority is not necessary to produce the limitation of the rights of succession to land and the creation of the system of holdings, although this has been often asserted, and one of the arguments for a servile origin of village communities turns on a supposed incompatibility between unified succession and the equal rights of free coheirs.

We need not speak at any length about other parts of Germany, as space does not permit of a description of the innumerable combinations of communal and individual elements in German law, the various shapes of manorial and political institutions with which the influence of blood relationship, gild and neighbourly union had to struggle.

But we must point out some facts from the range of Scandinavian customs. In the mountainous districts of Norway we find the whole of the open fields is divided into the hands of the men of the woods. The Hufe or Hof, or freehold estates, from which supernumerary heirs are removed on receiving some indemnity, and which are protected from alienation into strange hands by the privilege of pre-emption exercised by relatives of the seller. Equally suggestive are some facts on the Danish side of the Straits, viz. the arrangements of the "bol" which correspond to the "böl" of England and to the Hufen of Germany. Here again we have to do with normal holdings independent of the number of coheirs, but dependent on the requirements of agriculture—on the plough and oxen, on certain constant relations between the arable of an estate and its outlying commons, meadows and woods. The bol does not stand by itself like the Norwegian gaard, but is fitted into a very close union with neighbouring bôls of the same kind. Practices of coration, of open-field intermixture, of compulsory rotation of lot-meadows, of stinting the commons, arise of themselves in the villages of Sweden. Laws compiled in the 13th century but based on even more ancient customs give us most interesting and definite information as to Scandinavian practices of allotment.

We catch a glimpse, to begin with, of a method of dividing
fields which was considered archaic even in those early times. The Swedish laws use the expression "forniskift," which means ancient mode of allotment, and another term corresponding to it is "hamarskift," which may possibly be con-

nected with throwing the hammer in order to mark the boundary of land occupied by a man’s strength. The two principal features of forn or hamar skift are the irregularity of the resulting shapes of plots and the temporary character of their occupation. The first observation may be substantiated by a description like that of Laasby in Jutland: “These lands are to that scattered and intermixed by the joint owners that it cannot be said for certain what or (how much) they are.”

Swedish commoners, on the other hand, speak expressly of practices of shifting arable and meadows periodically; sometimes year by year.

Now the uncertainty of these practices based on occupation became in process of time a most inconvenient feature of the situation and evidently led to constant wrangling as to rights and boundaries. The description of Laasby which I have just quoted ends with the significant remark: “They should be compelled to make allotment by the cord.” This making of allotments by the cord is the process of regrading, from reb, the surveyor’s cord, and the juridical procedure necessary to make a solskift”—because it was a division following the course of the sun.

The two fundamental positions from which this form of allotment proceeds are: (1) that the whole area of the village is common land (faellesjord), which has to be allotted to the single householders; (2) that the partition should result in the creation of equal holdings of normal size (bøls). In some cases we can actually recognize the effect of these allotments by ancient solskift in the 18th century, at a time when the Danish enclosure acts produced a second general revolution in land tenure.

The oldest twelve inhabitants, elected as sworn arbitrators for effecting the allotment, begin their work by throwing together into one mass all the grounds owned by the members of the community, including dwellings and farm-buildings, with the exception of some privileged plots. There is a close correspondence between the sites of houses and the shares in the field. The first operation of the surveyors consists in marking out a village green for the night-rest and pasture of the cattle employed in the tillage (jord), and to assign sites to the houses of the coparceners with orchards appendant to them (tøft); every household was entitled to as much as his neighbour. From the tofts they proceeded to the fields on the customary notion that the toft is the mother of the field. The fields are disposed into furlongs and shots, as they were called in England, and divided among the members of the village with the strictest possible equality. This is effected by assigning to every householder a strip in every one of the furlongs constituting the arable of the village. Meadows were often treated as lot-meadows in the same way as in England. According to the account of a solicitude executed in 1533 (Oester Højsteds), every otting the eighth part of a boll, corresponding to the English oxgang or bovate, got a toft of 40 rods in length and 6 in breadth. One of the coparceners received, however, 8 rods because his land was worse than that of his neighbours. Of the arable there were allotted to each otting two rods’ breadth for the plough in each furlong and appendant commons “in damp and in dry”—in meadow and pasture. After such a “solskift” the peasants held their tenements in undisturbed ownership, but the eminent demesne of the village was recognized and a revision of the allotment was called forth. Many revisions did actually take place, and in such cases all rights and claims were apportioned according to the standard of the original shares. Needless to say that these shares were subjected to all the usual limitations of champion farming.

After having said so much about different types of village communities which occur in Europe it will be easier to analyse the incidents of English land tenure which disclose the work-

of similar conceptions and arrangements. Features which have been very prominent in the case of the Welsh, Slavs, Germans or Scandinavians recur in the English instances sometimes with equal force and at other times in a mitigated shape.

There are some vestiges of the purely tribal form of community on English soil. Many of the place-names of early Saxon and Anglo-Saxon settlements are derived from personal names with the suffix ing, as designations like Oakington, the town of the Hockings.

True, it is just possible to explain some of these place-names as pointing to settlements belonging to some great man and therefore taking their designation from him with the adjunct of an ing indicating possession. But the group of words in question falls in exactly with the common patronyms of Saxon and German families and kindreds, and therein it is most probable, as Kemble supposed, that we have to do in most of these instances with tribal and family settlements, although the mere fact of belonging to a great landowner or a monastery may have been at the root of some cases.

A very noticeable consequence of tribal habits in regard to landownership is presented by the difficulties which stood in the way of alienation of land by the occupiers of it. The Old English legal system did not originally admit of any alienation in folkland, land held by folkright, or, in other words, of the landholding owned in the modified form of the tribal law of the people. Such land could not be bequeathed out of the kinred and could not be sold without the consent of the kinsmen. Such complete disabilities could not be upheld indefinitely, however, in a growing and progressive community, and we find the ancient folkright assailed from different points of view. The Church insists on the right of individual possessors to give away land for the sake of their souls; the kings grant exemption from folkright and constitute privileged estates held by hook and following in the main the rules of individualized Roman law; the grants of private persons to make provision for daughters and to deal with land as with other commodities produces con-

stant collisions with the customary tribal views. Already, by the end of the Saxon period transfer and alienation of land make their way everywhere, and the Norman conquest brings these features to a head by substituting the notion of tenure—that is, of an estate burdened with service to a superior—for the ancient notion of tribal folkland.

But although the tribal basis of communal arrangements was shaken and removed in England in comparatively early times, it had influenced the practices of rural husbandry and landholding and in the modified form of the village community it survived right through the feudal period, leaving characteristic and material traces of its existence down to the present day.

To begin with, the open-field system with intermixture of strips and common rights in pasture and wood has been the prevailing system in England for more than a thousand years. Under the name of champion farming it existed everywhere in the country until the Inclosure Acts of the 18th and 19th centuries put an end to it; it may be found in operation even now in some of its features in backward districts. It would have been absurd to build up these practices of compulsory rotation of crops, of a temporary relapse of plots into common pasture between harvest and ploughing time, of the interdependence of thrifty and negligent husbandmen in respect of weeds and times of cultivation, &c., from the point of view of individual appropriation. On the other hand, it was the natural system for the apportionment of claims to the shareholders of an organic and perpetual joint-stock company.

Practices of shifting arable are seldom reported in English evidence. There are some traces of periodical redivisions of arable land in Northumberland: under the name of reign system such practices seem to have been not uncommon in the outer fields, the non-manured portions of townships in Scotland, both among the Saxon inhabitants of the lowlands and the Celtic population of the highlands. The joining of small tenants for the purpose of coartation, for the formation of the big,
heavy ploughs, drawn by eight oxen, also produced sometimes the shifting in the possession of strips between the coparceners of the undertaking. But, as a rule, the arable was held in severalty by the different members of the township.

On the other hand, meadows were constantly owned by entire townships and distributed between the tenements entitled to shares from year to year either by lot or according to a definite order. These practices are in full vigour in some places even at the present day. Any person living in Oxford may witness the distribution by lot on Lammas day (rat of August) of the Lammas meadows. That is, the meadows inclosed for the sake of raising hay-grass in the village of Yarmouth, some three miles to the north of Oxford.

Let us, however, return for a moment to the arable. Although held in severalty by different owners it was subjected to all sorts of interference on the part of the village union as represented in later ages by the manorial court framing by-laws and settling the course of cultivation. It might also happen that in consequence of encroachments, disputes and general uncertainty as to possession and boundaries, the whole distribution of the strips of arable in the various fields had to be given over and regulated anew. In an interesting case reported from a Cartulary of Dunstable in Bedfordshire, all the possessions of the villagers in a place called Segenhoe were thrown together in the 12th century and redivided according to an award of experts chosen by a meeting of the villagers from among the oldest and wisest inhabitants.

Exactly as in the Danish examples quoted before, the strips were apportioned, not to the single owners, but to the normal holdings, the hides, and the actual owners had to take them in proportion to their several rights in the hides. This point is very important. It gives the English village community its peculiar stamp. It is a community not between single members or casual households, but between determined holdings constructed on a proportional scale. Although there was no provision for the admeasurement and equalization of the claims of Smith and of Brown, each hide or ploughland of a township took as much as every other hide, each virgate or yardland as every other yardland, each bovate or oxgang as every other oxgang. Now the proportions themselves, although varying in respect of the number of acres included in each of these units, were constant in their relation to each other. The yardland was almost everywhere one-fourth of the hide or ploughland, and corresponded to the share of two oxen in an eight-oxen plough; the oxgang was reckoned at one-half of the yardland, and corresponded to the share of one ox in the same unit of work. The constant repetition of these fractions and units proves that we have to do in this case with phenomena arising not from artificial devices but from the very nature of the case. Nor can there be a doubt that both the unit and the fractions were produced by the application to land of the chief factor of working strength in agrarian husbandry, the power of the ploughteam for tillage.

The natural composition of the holdings has its counterpart, as in Schleswig-Holstein and as in the rest of Germany, in the customs of united succession. The English peasantry worked out customary rules of primogeniture or of so-called Borough English or claim of the youngest to the land held by his father. The German examples adduced in the beginning of this article teach us that the device is not suggested primarily by the interest of the landlord. Unified succession takes the place of the equal rights of sons, because it is the better method for preserving the economic efficiency of the household and of the tenement corresponding to it. There are exceptions, the most notorious being that of Kentish gavelkind, but in agricultural districts the holding remains undivided as long as possible, and if it gets divided, the division follows the lines not of the casual number of coheirs, but of the organic elements of the ploughlands. Fourths and eighths arise in connexion with natural fractions of the ploughteam of eight oxen.

One more feature of the situation remains to be noticed, and it is the one which is still before our eyes in all parts of the country, that is, the commons which have survived the wholesale process of inclosure. They were an integral part of the ancient village community from the first, not only because the whole ground of a township could not be taken up by arable and meadows, at a time when population was scanty, but because there existed the most intimate connexion between the agricultural and pastoral part of husbandry in the time of the open-field system. Pasture was not treated as a commodity by itself but was mostly considered as an adjunct, as appendant to the arable, and so was the use of woods and of turf. This feature is clearly brought out, e.g. in an Elizabethan case reported by Coke-Tyringham's case. The problem of admeasurement of pasture was regulated in the same way as that of the apportionment of arable strips, by a reference to the proportional holdings, the hides, yardlands and oxgangs of the township, and the only question to be decided was how many heads of cattle and how many sheep each hide and yardland had the right to send to the common pasturage grounds.

When in course of time the open-field system and the tenure of arable according to holdings were given up, the right of freeholders and owners of the old manors in which the ancient townships were, as it were, encased, still held good, but it became much more difficult to estimate and to apportion such rights.

In connexion with the individualistic policy of inclosure the old writ of admeasurement of commons was abolished in 1837 (3 & 4 Will. IV.). The ordinary expedient is to make out how much commongable cattle could be kept by the tenements claiming commons through the winter. It is very characteristic and important that in the leading modern case on sufficiency of commons—in Robertson v. Hartopp—it was admitted by the Court of Exchequer that authority has to be construed as a right of turning out a certain number of beasts on the common, quite apart from the number which had been actually turned out at any given time. Now a vested right has to be construed from the point of view of the time when it came into existence. The standards used to estimate such rights ought not to be drawn from modern practice, which might help to dispense altogether with commons of pasture by stable feeding, substitutes for grass, &c., but ought to correspond to the ordinary usages established at a time when the open-field system was in full vigour. The legal view stands thus in front, but we cannot conceal from ourselves that the inroads achieved by individual appropriation it is by no means certain that the reference to the rights and rules of a previous period will continue to be recognized. However this may be, in the present commons we have certainly a system which draws its roots from customs, as to the origin of which legal memory does not run.

We may, in conclusion, summarize very briefly the principal results of our inquiry as to the history of European village communities. It seems that they may be stated under the following heads: (1) Primitive stages of civilization disclose in human society a strong tendency towards mutual support in economic matters as well as for the sake of defence. (2) The most natural form assumed by such unions for defence and co-operation is that of kinship. (3) In epochs of pastoral husbandry and of the beginnings of agricultural land is mainly owned by tribes, kindreds and enlarged households, while individuals enjoy only rights of usage and possession. (4) In course of time unions of neighbours are substituted for unions of kinsmen. (5) In Germanic societies the community of the township rests on the foundation of efficient holdings—each hide, each yardland, each oxgang—kept together as far as possible by rules of united or single succession. (6) The open-field system, which prevailed in the whole of Northern Europe for nearly a thousand years, was closely dependent on the customs of tribal and neighbourly unions. (7) Even now the treatment of commons represents the last manifestations of ancient communal arrangements, and it can only be reasonably and justly interpreted by reference to the law and practice of former times.

VILLALBA, a town of north-western Spain, in the province of Lugo; on the left bank of the river Ladra, one of the head-streams of the Miño, and at the junction of the main roads from Ferrol and Mondoñedo to the city of Lugo. Pop. (1900) 13,572. Villalba is the chief town of the district watered by the Ladra. Tamboga and other small streams—a fertile plateau, 1,500 ft. above sea-level. Cloth and pottery are manufactured, and there is some trade in grain and live stock. The nearest railway station is Otero, 15 m. by E. on the Lugo-Corunna line.

VILLAMENDIANA, COUNT DE (1582-1623), Spanish poet, was born at Lisbon towards the end of 1582. His father, a distinguished diplomatist, upon whom the dignity of count was conferred in 1603, entrusted the education of the brilliant boy (Juan de Tassí y Peralta) to Luis TrUbaldos de Toledo, the future editor of Mendoza's Guerres de Granado, and to Bartolomé Jimenez Patón, who subsequently dedicated Mercurius Trismegistus to his pupil. On leaving Salamanca the young man married in 1604, and succeeded to the title on the death of his father in 1607; he was prominent in The responsibility of the capital, acquired a bad reputation as a gambler, was forbidden to attend court, and resided in Italy from 1611 to 1617. On his return to Spain, he soon proved himself a fearless, pungent satirist. Such public men as Lema, Rodrigo Calderón and Jorge de Tobar wrought beneath his murderous invective; the foibles of humble private persons were exposed to public ridicule in verses furiously passed from hand to hand. So great was the resentment caused by these envenomed attacks that Villamediana was once more ordered to withdraw from court in 1618. He returned on the death of Philip III. and was appointed gentleman in waiting to Philip IV.'s young wife, Isabel de Bourbon, daughter of Henri IV. Secure in his position, he scattered his scathing epigrams in profusion; but his ostentatious attentions to the queen supplied his countless foes with a weapon which was destined to destroy him. A fire broke out while his masque, La Gloria de Nigua, was being acted before the court on the 15th of May 1622, and Villamediana carried the queen to a place of safety. Suspicion deepened; Villamediana neglected a significant warning that his life was in peril, and on the 21st of August 1622 he was murdered as he stepped from his coach. For the murder of his father, his death was divided between Philip IV. and Olivares; the actual assassin was either Alonso Mateo or Ignacio Mendez; and naturally the crime remained unpunished.

Villamediana's works, first published at Saragossa in 1629, contain not only the nervous, blighting verses which made him widely feared and hated, but a number of more serious poems embodying the most exaggerated conceits of gongorism. But, when even adopting the perverse conventions of the hour, he remains a poet of high distinction, and his satirical verses, more especially those on the morose, are written with a cold, concentrated song which has never been surpassed.

Villanelle, a form of verse, originally loose in construction, but since the 16th century bound in exact limits of an arbitrary kind. The word is ultimately derived from the Latin villanella, a country house or farm, through the Italian villano, a peasant or farm hand, and a villanelle was primarily a round song taken up by men on a farm. The Spaniards called such a song a villancio or villancete or a villancico, and a man who improvised villanelles was a villanciquero. The villanelle was a pastoral poem made to accompany a rustic dance, and from the first it was needed to contain a regular system of repeated lines. The old French villanelles, however, were irregular in form. One of the most celebrated, the "Rosette, pour un peu d'absence" of Philippe Desportes (1545-1665), is a sort of ballade, and those contained in the Astrée d'Urfé, 1610, are scarcely less unlike the villanelles of modern times. It appears, indeed, to have been an accident that the special and rigorously defined form of the villanelle was invented. In the posthumous poems of Jean Passerat (1534-1602), which were printed in 1606, several villanelles were discovered, in which the lines of one couplet were repeated, and the regular system of repeated lines. One of these became, and has remained, so deservedly popular, that it has given its exact character to the subsequent history of the villanelle. This famous poem runs as follows—

"Je perdu ma tourterelle; Est-ce point celle que j'ai? Je veux aller après elle."

Tu regrettes ta femelle? Hélas! aussi fais-je moi: J'ai perdu ma tourterelle.

Si ton amour est fidèle, Aussi est feme ma. Je veux aller après elle.

Je ta plante se renouvelle? Toujours plaindre je me dois: J'ai perdu ma tourterelle."
This exquisite lyric has continued to be the type of its class, and the villanelle, therefore, for the last three hundred years has been a poem, written in tercets, on two rhymes, the first and the third line being repeated alternatively in each tercet. It is usual to confine the villanelle to five tercets, but that is not essential; it must, however, close with a quatrains, the last two lines of which are the first and third line of the original tercet. The villanelle was extremely admired by the French poets of the Parnasse, and one of them, Théodore de Banville, compared it to a ribband of silver and gold traversed by a thread of rose-colour. Boulmier, who was the first to point out that Passerat was the inventor of the definite villanelle, published collections of these poems in 1878 and 1879, and was preparing another when he died in 1881. When, in 1877, so many of the early French forms of verse were introduced, or reintroduced, into English literature, the villanelle attracted a great deal of attention; it was simultaneously cultivated by W. E. Henley, Austin Dobson, Lang and Gosse. Henley wrote a large number, and he described the form itself in a specimen beginning:

"A dainty thing's the Villanelle,
Sly, musical, a jewel in rhyme,
It serves its purpose passing well."

It has since then been very frequently used by English and American poets. There are several excellent examples in English of humorous villanelles, especially those by Austin Dobson and by Henley.

There are several accounts of the beginning of the villanelle, and one of them is that it was introduced by Dante through a villanelle, which he wrote in his Inferno.

### VILLANI, JOVANNI (c. 1275-1348)

**Italian chronicler,** was the son of Villano di Stoldo, and was born at Florence in the second half of the 13th century; the precise year is unknown. He was of good burgher extraction, and, following the traditions of his family, applied himself to commerce. During the early years of the 14th century he travelled in Italy, France and the Netherlands. In the latter, he made many and things with the sagacity which he was to continue in the history of Florence. He was not afraid of the man of business, and the historian. Before leaving Florence, or rather in the interval between one journey and another, he had at least taken some part in that troubled period of civil contentions which Dino Compagni has described and which swept Dante Alighieri into banishment. In 1302 Villani saw Charles, count of Valois, ruining his country under the false name of peacemaker, and was witness of all the misery which immediately followed. Somewhat later he left Italy, and in September 1304 he visited Flanders. It is not well ascertained when he returned to his native city. He was certainly living there shortly after the emperor Henry VII visited Italy in 1312, and probably he had been there for some time before. While still continuing to occupy himself with commerce, he now began to take a prominent part in public affairs. In 1316 and 1317 he was one of the priors, and shared in the crafty tactics whereby Pisa and Lucca were induced to conclude a peace with Florence, to which they were previously averse. In 1317 he also had charge of the mint, and during his administration of this office he collected its earlier records and had a register made of all the coins struck in Florence. In 1321 he was again chosen prior; of the Florentines having just then undertaken the rebuilding of the city walls, he and some other citizens were deputed to look after the work. They were afterwards accused of having diverted the public money to private ends, but Villani clearly established his innocence. He was next sent with the army against Castruccio Castracani, lord of Lucca, and was present at its defeat at Altopascio. In 1328 a terrible famine visited many provinces of Italy, including Tuscany, and Villani was appointed to guard Florence from the worst effects of that distressing period. He has left a record of what was done in a chapter of his Chronicle, which shows the economic wisdom in which the medieval Florentines were often greatly in advance of their age. In 1339, some time after the death of Castruccio, some rich Florentine merchants, and among them Villani, treated for the acquisition of a mine by Florence for 80,000 florins, offering to supply the larger part of that sum out of their own private means; but the negotiations fell through, owing to the discords and jealousies then existing in the government (Chron. x. 143). The following year Villani superintended the making of Andrea Pisano's bronze doors for the baptistery. In the same year he watched over the raising of the campanile of the Badia, erected by Egidio and Giovanni Orsini (Chron. x. 177). In 1341 the acquisition of Lucca was again attempted, this time with Martino della Scala, for 250,000 florins. Villani was sent as a hostage to Ferrara, where he remained for some months. He was present in Florence during the unhappy period that elapsed between the entry of Walter of Brienne, duke of Athens, and his expulsion by the Florentines (1342-43). Involved through no fault of his own in the failure of the commercial company of the Bonaccorsi, which in its turn had been drawn into the failure of the company of the Bardl, Villani, towards the end of his life, suffered much privation and for some time was in prison. In 1348 he fell a victim to the plague described by Boccaccio.

The idea of writing the Chronicle was suggested to Villani under the following circumstances: "In the year of Christ 1300 Pope Boniface VIII. made in honour of Christ's nativity a special and generous donation. And it was resolved that, in that blessed pilgrimage in the holy city of Rome, seeing her great and ancient remains, and reading the histories and great deeds of the Romans as written by Virgil, Sallust, Lucan, Livy, Valerius, Paulus Orosius and other masters of history who wrote the exploits of the great and small, of the Romans and also of strangers, in the whole world... considering that our city of Florence, the daughter and offspring of Rome, is on the increase and destined to do great things, as Rome is to the Venerable Hereditary House of St. Louis, in this volume and new chronicle all the facts and beginnings of the city of Florence, in as far as it has been possible to me to collect and discover them, and to follow the doings of the Florentines at length... and so in the year 1300, on my return from Rome, I began to compile this book, in honour of God and of the blessed John, and in praise of our city of Florence." Villani's work, written and probably first begun in 1300, is a great work, and makes itself felt in all the historical literature of Italy, just as the history of Florence, the moment it emerges from the humble and uncertain origin assigned to it, rises to a height of influence and science into a rich and powerful life of thought and action. Nothing but scarcity of materials and records had preceded Villani's work, which rests in part on them.

The Gesta Florentinorum of Sanzalone, starting from these vague origins, was next to be brought down to 1325, at the union of Fiesole with Florence. The Cronica de Origine Civitatis seems to be a compilation, made by various hands and at various times, in which the different legends regarding the city's origin have been gradually collected. The Annali Florentini Primis (1110-1173) and the Annales Florentini Secundi (1107-1247), together with a list of the consuls and podestas from 1197 to 1267, and another chronicle, formerly attributed, but apparently without good reason, to Brunetto Latini, complete the series of ancient Florentine records. To these must, however, be added a certain quantity of facts which were to be found in various manuscripts, peculiarly and quoted by the author, so that the study under the general name of Gesta Florentinorum. Another work, formerly reckoned among the sources of Villani, is the Chronicle of the Popes (1300-1342); it is a grave doubts are now entertained as to its authenticity, and may be held that at any rate the records of the period, posterior to Villani's time, of old records from which several chroniclers may have drawn, either without citing them at all or only doing so in a vague manner.

The Historie Fiorentine, or Cronica universale, of Villani begins with Biblical times and comes down to 1348. The universality of the subject, especially in the times near Villani's own, while it offers various views to the historian and makes up the nescience of his mind, makes one also feel that the book was inspired within the walls of the universal city. Whereas Dino Compagni's Chronicle is within itself more of a period of time and place, this of Villani is a general chronicle extending over the whole of Europe. Dino Compagni feels and lives in the facts of his history; Villani looks at them and relates them calmly and fairly, with a serenity which makes him seem an outsider, even when he is mixed up in them. While very important for Italian history in the 14th century, this work is the cornerstone of the
early medieval history of Florence. Of contemporary events Villani has a very exact knowledge. Having been a sharer in the public affairs and in the intellectual and economic life of his native city, and having lived in Europe, he tells us what he saw with the vividness natural to a clear mind accustomed to business and to the observation of mankind. He was Guelph, but without passion; and his book is much more taken up with an in-depth description of persons and property conditions. He is really a chronicler, not an historian, and has but little method in his narrative, often reporting the things which occurred long ago just as he heard them. Even so, however, he falls into some inaccuracy; but such defects as he has are largely compensated for by his valuable qualities. He was for half a century eyewitness of his history, and he provides abundant information on the custom and costume of the time, commerce and arts; and among the chronicles throughout Europe he is perhaps unequalled for the value of the statistical data he has preserved. As a writer Villani is clear and acute; and, though his prose has not the force and colouring of Compagni's, it has the advantage of greater simplicity, so that, taking his work as a whole, he may be regarded as the greatest chronicler who has written in Italian. The many difficulties connected with the publication of this important text have hitherto prevented the preparation of a perfect edition. However, the Chronica has been printed by L. A. Marutari in tome xiii. of the Rerum Italicarum Scriptores (Milan, 1771) and has been edited by L. Meurer and F. G. Drexler (Florence, 1844). Among other editions is one published at Trieste in 1857 and another at Turin in 1879. Selections have been translated into English by R. E. Selle (1906). More will be continued by two other members of his family. 

1. Matteo Villani, his brother, of whom nothing is known save that he was twice married and that he died of the plague in Florence in 1348. In the early 14th century, his work, though inferior to Giovanni's, is nevertheless very valuable. A more prolix writer than his brother and a less acute observer, Matteo is well informed in his facts, and for the years of which he writes is one of the most important sources of Italian history. 

2. Filippo Villani, the son of Matteo, flourished in the end of the 15th and the beginning of the 16th century. In his continuation which goes down to 1501, though showing great literature, he is very inferior to an author to his predecessor. His most valuable work was a collection of lives of illustrious Florentines. Twice, in 1401 and 1404, he was chosen to explain in public the Disputations of his uncle. See P. Schefler-Bolchorst, Florentiner Studien (Leipzig, 1874); G. Gervinus, "Geschichte der Florentinischen Historiographie" in his Historische Schriften (1833); U. Balzani, Le cronache Italiane nel medio evo (Milan, 1884); A. Gasparry, Geschichte der italienischen Literatur (Berlin, 1885); O. Knoll, Beiträge zur italienischen Historiographie im 14. Jahrhundert (Göttingen 1876), and O. Hartwig, "G. Villani und die Leggenda di Messer Gianni di Procida" in Band xxv. of H. von Sybel's Historische Zeitschrift. (U. B.)

VILLANOVA, the name given to an ancient cemetery in the neighbourhood of Bologna, Italy, and generally applied by archaeologists to all the remains of that period, and to the discovery thereof in a large number of the characteristic remains of the earliest Iron Age of Italy. The antiquities of this culture are widely spread over upper Italy and differ essentially from those of the previous epoch known as Terramara, and they have been described by some as following at a considerable interval, for they show a great advance in metal work. The chief cemeteries of the Villanova period are at Bologna, Este, Villanovo, Golasecca, Trezzo, Rivoli and Oppiano. As there can be no doubt that the Terramara culture was that of the aboriginal Ligurians (see, however, Terramara), so the Villanova is that of the Umbrians, who, according to the historians, were masters of all northern Italy, as far as the Alps at the time of the Etruscan conquest (c. 1000 B.C.). They contain cist-graves, the bottoms, sides and tops being formed of flat unheated stones, though sometimes there are only bottom and top slabs: the dead were burnt, and the remains are usually in the earth grave, being a rule but one ossuary; sometimes the vessel is covered with a stone or two inverted, sometimes the urns are deposited in the ground without any protection. The vases are often hand-made and adorned with incised linear ornament, though in later times the bones were often placed in bronze urns or buckets. Though iron is steadily making its way into use, flat, flanged, and socketed and looped celts of bronze are found in considerable numbers. Brooches of many kinds, ranging from the most primitive safety-pin fashioned out of a common bronze pin (such as those found in the Bronze Age settlement at Peschiera on Lake Maggiore), through many varieties, are in universal use. Representations of the human figure are practically unknown, but models of animals of a rude and primitive kind are very common, probably being votive offerings. These are closely parallel to the bronze figures found at Olympia, where human figures were likewise rare. All these objects are decorated in repoussé with geometric designs. The culture of the Villanova period is part of the Etruscan civilization, though the contents of the Hallstatt (p.e.) graves differ considerably from those from the antiquities of the ordinary Villanova period, there is no breach of continuity between Hallstatt and Villanova, for the types of Vadena, Este, Golasecca and Villanova are found in the Hallstatt culture. The connexion between the north and the south of the Alps is never interrupted. The chief difference lies in the fact that the Celts of the Danubian region made greater advances in the development of weapons and defensive armour than their kindred in northern Italy. The Po and Danube regions alike are characterized by bronze buckets, cists, girdles and the like, wrought in repoussé with small geometric designs; but the introduction of iron into Italy is considerably posterior to its development in the Hallstatt area.

VILLANUEVA DE LA SERENA, a town of western Spain, in the province of Badajoz, near the left bank of the river Guadiana, and on the Madrid-Badajoz railway. Pop. (1900) 13,480. Villanueva is a clean and thriving place, with good modern public buildings—town hall, churches, convenant schools. It is the chief town of an undulating plain, La Serena, locally celebrated for red wine and melons. Grain and hemp are also cultivated, and live stock extensively reared in the neighbourhood.

VILLANUEVA Y GELTRU, a seaport of north-eastern Spain, in the province of Barcelona; on the Barcelona-Tarragona section of the coast railway. Pop. (1900) 11,850. Villanueva is a busy modern town, with manufactures of cotton, woollen and linen goods, and of paper. It has also iron foundries and an important agri-motor traffic and markets from the inland and deep anchorage; it is a lifeboat station and the headquarters of a large fishing fleet. The coasting trade is also considerable. Villanueva has a museum, founded by the Catalan poet, historian and diplomat, Vittorio Balaguer (1824-1901), which contains collections of Roman, Egyptian and prehistoric antiquities, besides paintings, engravings, sculptures, coins and a large library, including many valuable MSS.

VILLARD, HENRY (1835-1900), American journalist and financier, was born in Speyer, Rhenish Bavaria, on the 10th of April 1835. His baptismal name was Ferdinand Heinrich Gustav Hilgard. His parents removed to Zweibrücken in 1839, and in 1856 his father, Gustav Leonhard Hilgard (d.1867), became a justice of the Supreme Court of Bavaria, at Munich. Henry was educated at the gymnasium of Zweibrücken, at the French semi-military academy in Phalsburg in 1849-50, at the gymnasium of Speyer in 1850-51, and at the universities of Munich and Würzburg in 1852-53; and in 1853, having had a disagreement with his father, emigrated—without his parents' knowledge—to the United States. He was at this time a member of the American Board of Foreign Missions. He landed in New York in 1854, and from thence went westward. In 1856 he went in turn at Cincinnati, Belleville (Illinois), Racine (Wis.) and Chicago, engaged in various employments, and in 1856 formed a project, which came to nothing, for establishing a colony of "free soil" Germans in Kansas. In 1856-57 he was editor, and for part of the time proprietor, of the Racine (Wis.) Volksblatt, in which he advocated the election of John C. Frémont (Republican). Thereafter he was associated (in 1857) with the Staats-Zeitung, Frank Leslie's and the Tribune, of New York, and with the Cincinnati Commercial
in 1859-60; was correspondent of the New York Herald in 1861 and of the New York Tribune (with the Army of the Potomac) in 1862-63, and in 1864 was at the front as the representative of a news agency established by him in that year at Washington. In 1865 he became Washington correspondent of the Chicago Tribune, and in 1866 was the correspondent of the paper in the Prusso-Austrian War. He began to take an interest in railway financing in 1871, was elected president of the Oregon & California railroad and of the Oregon Steamship Company in 1876, was receiver of the Kansas Pacific railway in 1876-78, organized the Oregon Railway & Navigation Company in 1876, the Oregon Improvement Company in 1880, and the Oregon & Transcontinental Company in 1881, becoming in that year president of the Northern Pacific railway, which was completed under his management, and of which he remained president until 1883. In 1889 he again became connected with the Northern Pacific, and in 1890 was chosen chairman of its finance committee. He was actively identified with the financing of other Western railway projects until 1893. In 1881 he acquired the New York Evening Post and the Nation. In 1883 he paid the debt of the state university of Oregon, and gave to the institution $50,000, and he also gave to the town of Zwillbrücken, the home of his boyhood, an orphan asylum (1891). He died on the 12th of November 1900.

VILLA REAL, the capital of the district of Villa Real, Portugal; 10 m. N. of the river Douro and 47 m. by road E.N.E. of Oporto. Pop. (1900) 5716. The town has a large transit trade in wine, mineral waters and live stock, especially pigs. The administrative district of Villa Real corresponds with the western part of the ancient province of Traz os Montes (q.v.). Pop. (1900) 242,196; area, 1620 sq. m. There are alkaline waters and baths at Vidago (near Chaves) and at Pedras Salgadas (near Villa Pouca d’Aguilar). The district adjacent to the Douro is known as the Paia do vino, or “wine country”; here are the vineyards from which “port” wine is mostly made.

VILLARET DE JOYUSE, LOUIS THOMAS (1750-1812), French admiral, was born at Auch, of a noble family of Languedoc. He was originally destined for the church, but served for some time in the royal guard, which he had to leave at the age of sixteen after killing one of his comrades in a duel. He then entered the navy, and in 1773 was lieutenant on the “Atlante” in Indian waters. In 1778 he distinguished himself at the siege of Pondicherry and was promoted captain. He afterwards served under Suffren, took part in the battle of Cuddalore, and in 1782 was taken prisoner after a fierce encounter with an English vessel. He was released in 1783, and, unlike the majority of naval officers, did not emigrate during the Revolution. In 1791 he was in command of the “Prudente” in the waters of San Domingo, and in 1794 was appointed rear-admiral and assisted the Conventional, St André, in the reorganization of the fleet. Villaret was in command of the French fleet at the battle of the First of June. He was appointed a member of the Council of the Ancients in 1796, and was sentenced to deportation in the following year on account of his royalist sympathies. He escaped arrest, however, and until the Consulate lived in obscurity at Oléron. In 1801 he commanded the squadron which transported the French army to San Domingo, and the following year was made captain-general of Martinique, which he surrendered to the English in 1809 after a brave defence. In 1811, after some hesitation on the part of Napoleon, Villaret was rewarded for his services with the command of a military division and the post of governor-general of Venice. He died at Venice.

VILLARI, PASQUALE (1827-1906), Italian historian and statesman, was born at Naples on the 9th of October 1827. He studied together with Luigi la Vista under Francesco de Sanctis. He was implicated in the riots of the 15th of May 1848 at Naples, against the Bourbon government, and had to take refuge in Florence. There he devoted himself to teaching and historical research in the public libraries, and in 1859 he published the first volume of his Storia di Girolamo Savonarola e de’ suoi tempi, in consequence of which he was appointed professor of history at Pisa. A second volume appeared in 1861, and the work, which soon came to be recognized as an Italian classic, was translated into various foreign languages. It has been praised by many of the greatest historians, among whom were Niccolò Machiavelli and i suoi tempi (1787-88). In the meanwhile Villari had left Pisa and was transferred to the chair of philosophy of history at the Institute of Studi Superiori in Florence, and he was also appointed a member of the council of education (1862). He served as a juror at the international exhibition of that year in London, and contributed an important monograph on education in England and Scotland. In 1869 he was appointed under-secretary of state for education, and shortly afterwards was elected member of parliament, a position which he held for several years. In 1884 he was nominated senator, and in 1891-92 he was minister of education in the Marchese di Rudini’s first cabinet. In 1893-94 he collected a number of essays on Florentine history, originally published in the Nuova Antologia, under the title of I primi due secoli della storia di Firenze, and in 1901 he produced Le Imasioni barbariche in Italia, a popular account in one volume of the events following the dissolution of the Roman empire. All these works have been translated into English by the historian’s wife, Linda White Villari. Another side of Villari’s activity was his interest in the political and social problems of the day; and although never identified with any political party, his speeches and writings have always commanded critical public attention.

Among his other literary works may be mentioned: Saggi Critici (1865); Arte, Storia, e Filosofia (Florence, 1884); Scritti vari (Bologna, 1893); another volume of Saggi Critici (Bologna, 1896); and a volume of Discusioni erudite e d’interesse (Bologna, 1905), containing his speeches as president of the Dante Alighieri Society. His most important political and social essays are collected in his Lettere Meridionali ed altri scritti sulla questione sociale in Italia (Turin, 1885), and Scritti sulla questione sociale in Italia (Florence, 1902). The Lettere Meridionali (originally published in the newspaper L’Opinione in 1875) produced a deep impression, as they were the first exposure of the real conditions of southern Italy. A selection of Villari’s essays, translated by his wife, has been published in England (1907).

See also Francesco Baldasseroni, Pasquale Villari (Florence, 1907).

VILLA RICA, the largest city in the interior of Paraguay, on the railway from Asuncion (70 m. N.W.) to Encarnacion. Pop. (1910) about 25,000. Situated in a rich agricultural region watered by the upper Paraguay, with finely timbered and extended alluvial plain. It is the centre of an important trade in tobacco and yerba maté. It is to a great extent modern, and contains some fine buildings, including a national college, a church, many schools, and a branch of the Agricultural Bank.

VILLARREAL, a town of eastern Spain, in the province of Castellon de la Plana; 4 m. from the Mediterranean Sea, near the right bank of the river Milares, and on the Barcelona-Valencia railway. Pop. (1900) 16,668. Villarreal has a station on the light railway between Ondara and the seaports of Castellon de la Plana and Burriana. Under Moorish rule and up to the expulsion of the Moriscos in 1609, it was the headquarters of a flourishing trade, and in modern times its industries have revived. Palm-groves, churches with blue-tiled cupolas, and houses with flat roofs and view-turrets (miradores) to some extent preserve the Moorish character of the town. There are extensive orange-groves, watered by the irrigation canal of Castellon, which is a good example of Moorish engineering skill. The local industries include manufacturers of paper, woolen goods and spirits.

VILLAREGRANGE, MARQUIS DE, Duc de Villars and Viscount de Melun (1653-1734), marshal of France, one of the greatest generals of French history, was born at Moulins on the 8th of May 1653, and entered the army through the corps of pages in 1671. He
served in the light cavalry in the Dutch wars, and distinguished himself by his daring and resourcefulness. But in spite of a long record of excellent service under Turrene, Condé and Luxembourg, and of his aristocratic birth, his promotion was but slow, for he had incurred the enmity of the powerful Louvois, and although he had been proprietary colonel (mestre de camp) of a cavalry regiment since 1674, thirteen years elapsed before he was made a maréchal de camp. In the interval between the Dutch wars and the formation of the League of Augsburg, Villars, who combined with his military gifts the tact and subtlety of the diplomatist, was employed in an unofficial mission to the court of Bavaria, and there became the constant companion of the Elector; and when war broke out between the Turks and fought at Mohacs. He returned to France in 1690 and was given a command in the cavalry of the Flanders, but towards the end of the Grand Alliance War he went to Vienna as ambassador. His part in the next war (see Spanish Succession War), beginning with Friedlingen (1702) and Hochstadt (1703) and ending with Denain (1712), has made him immortal. For Friedlingen he received the marshalate, and for the pacification of the insurgent Cévennes the Saint-Esprit order and the title of duke. Friedlingen and Hochstadt were barren victories, and the campaign of 1703 was a disaster both to the state and to himself. Villars’s glory thus begins with the year 1709 when France, apparently helpless, was roused to a great effort of self-defence by the exorbitant demands of the Coalition. In that year he was called to command the main army opposing Eugène and Marlborough on the northern frontier. During the famine of the winter he shared the soldiers’ miserable rations. When the campaign opened the old Marshal Boufflers volunteered to serve under him, and after the terrible battle of Malplaquet (9 Sept), in which he was gravely wounded, he was able to tell the king: “If it please God to give your majesty another such victory, they are ruined.” Two more campaigns passed without a battle and with scarcely any advance on the part of the invaders, but at last Marlborough manœuvred Villars out of the famous Ne plus ultra lines, and the power of the defence seemed to be broken. But Louis made a last effort, the English contingent and its great leader were withdrawn from the enemy’s camp, and Villars, though still suffering from his Malplaquet wounds, outmanœuvred and decisively defeated Eugene in the battle of Denain. This victory saved France, though the war dragged on several years. In 1711, on the Rhône, where Villars took Lamastre, he led the stormers at Frejus and negotiated the peace of Rastatt with Prince Eugene.

He played a conspicuous part in the politics of the Regency period as the principal opponent of Cardinal Dubois, and only the memories of Montmorency’s rebellion prevented his being made constable of France. He took the field for the last time in the War of the Polish Succession (1734), with the title “marshal-general of the king’s armies,” that Turenne alone had held before him. But he was now over eighty years of age, and the war was more diplomatic than earnest, and after opening the campaign with all the fire and restless energy of his youth he died at Turin on the 17th of June 1734.

Villars’s memoirs show us a “fanfaron plein d’honneur,” as Voltaire calls him. He was indeed boastful, with the gallant habit of his native province, and also covetous of honours and wealth. But he was an honourable man of high courage, moral and physical, and a soldier who stands above all his contemporaries and successors in the 18th century, on the same height as Marlborough and Frederick.

The memoirs, part of which was published in 1734 and afterwards several times printed in France, were written in the 1690s and first appeared in the 1740s, but were finally completed by the Marquis de Vogué in 1884-92.

VILLAVICIOSA—VILLEGAS, a seaport of northern Spain, in the province of Oviedo; on the Rio de Villavicisoa, an estuary formed by the small river Villavicisoa which here enters the Bay of Biscay. Pop. (1900) 20,995. The town is the headquarters of a large fishery, and has some coasting trade. Its exports are chiefly agricultural produce. Villavicisoa suffers from the competition of the neighbouring ports of Gijón and Avilés, and from the lack of railway communication. It is connected by good roads with St. (13 m.) and Infusual (14 m.) on the Oviedo-Infesto railway.

Villefranche-de-Rouergue, a town of France, capital of an arrondissement in the department of Aveyron, 36 m. W. of Rodez by road. Pop. (1906) town, 6397; commune, 3352. Villefranche, which has a station on the Orleans railway, lies amongst the hills on the right bank of the Aveyron at its junction with the Alzou. One of the three bridges that cross the river belongs to the 13th century, and the straight, narrow streets are full of gabled houses of the 13th and 14th centuries. One of the principal thoroughfares passes beneath the porch of Notre-Dame de la Vigeant, which was built between 1560 and 1581, the massive tower which surmounts its porch being of late Gothic architecture. The remarkable woodwork in the choir dates from the 15th century. A Carthusian monastery overlooking the town from the left bank of the Aveyron derives much interest from the completeness and fine preservation of its buildings, which date from the 15th century. They include a fine refectory and two cloisters, the smaller of which is a masterpiece of the late Gothic style. The manufacture of leather, animal-traps, hosiery, bell-founding, hemp-spinning, &c., are carried on. Quarries of phosphates and minerals of argentiferous lead are worked in the Villefranche district. Villefranche, founded about 1252, owes its name to the numerous immunities granted by its founder Alphonse, count of Toulouse (d. 1271), and in 1348 it was so flourishing that sumptuary laws were passed. Soon afterwards the town fell into the hands of Edward, the Black Prince, but was the first place in Guienne to rise against the English. New privileges were granted to the town by King Charles V., but these were taken away by Louis XI. In 1588 the inhabitants repulsed the forces of the League, and afterwards murdered a governor sent by Henry IV. The town was ravaged by plague in 1463, 1528 and 1628, and in 1643 a revolt, excited by the exactions of the intendants, was cruelly repressed.

Villegas, Esteban Manuel de (1589-1669), Spanish poet, was born at Matute (Logroño) on the 8th of February 1589, matriculated at Salamanca on the 20th of November 1610, and challenged attention by the mingled arrogance and accomplishment of Las Eréticas (1617), a collection of clever translations from Horace and Anacreon, and of original poems, the charm of which was marred by the writer’s petulant vanity. Married young, but unmarried in 1626 or earlier, Villegas practised law at Nájera till 1659, when he was charged with expressing unorthodox views on the subject of free will; he was exiled for four years to Santa María de Ribareondoa, but was allowed to return for three months to Nájera in March 1660. It seems probable that the rest of the sentence was remitted, for the report of the local inquisition lays stress on Villegas’s simple piety, on the extravagance of his attire.
ridiculous in a man of his age, and on the eccentricity of his general conduct and conversation, so marked as to suggest "a kind of mania or lesion of the imagination." In his version of Boetius (1665), Villegas showed that he had profited by his experience, for he made no attempt to translate the last book (in which the problem of free will is discussed), and reprinted the Latin text without comment. He died at Nájera on the 3rd of September 1669. His tragedy El Hipólito, imitated from Euripides, and a series of critical dissertations entitled Varrae Philosophiae, finished in 1650, are unpublished; and "a book of satires," found among his papers by the inquisitors, was consigned to the flames.

**Villehardouin, Geoffroy de** (c. 1160-c. 1213), the first vernacular historian of France, and perhaps of modern Europe, who possesses literary merit, is rather supposed than known to have been born at the château from which he took his name, near Troyes, in Champagne, about the year 1160. Not merely his literary and historical importance, but almost all that is known about him, comes from his chronicle of the fourth crusade, or *Conquête de Constantinople.* Nothing is positively known of his ancestry, for the supposed (originating with Du Cange) that a certain William, marshal of Champagne between 1198 and 1213, was the brother of a certain William who was Villehardouin himself, however, undoubtedly held this digressively, and certain minute and perhaps not very trustworthy indications, chiefly of an heraldic character, have led his most recent biographers to lay it down that he was not born earlier than 1158 or later than 1164. He introduces himself to us with a certain abruptness, merely specifying his own name as one of a list of knights of Champagne who with their count, Thibault, took the cross at a tournament held at Escury-sur-Asne in Advent 1199, the crusade in contemplation having been started by the preaching of Pulk de Neulhy, who was commissioned thereto by Pope Innocent III. The next year six deputies, two appointed by each of the three allied counts of Flanders, Champagne and Blois, were despatched to Venice to negotiate for ships. Of these deputies Villehardouin was one and Quesnes de Bethune, the poet, another. They concluded a bargain with the seignior for transport and provisions at a fixed price. Villehardouin had hardly returned when Thibault fell sick and died; but this did not prevent, though it somewhat delayed, the enterprise of the crusaders. The management of that enterprise, however, was a difficult one, and cost Villehardouin another embassy into Italy, and the bustle that followed in the breaking the treaty with the Venetians by embarking at other ports and employing other convoy. He was only in part successful, and there was great difficulty in raising the charter-money among those who had actually assembled (in 1202) at Venice, the sum collected falling short of the stipulated amount. It is necessary to remember this when the somewhat erratic and irregular character of the operations which followed is judged. The defence that the crusaders were bound to pay their passage-money to the Holy Land, in one form or other, to the Venetians, is perhaps a weak one in any case for the attack on two Christian cities, Zara and Constantinople; it becomes weaker still when it is found that the expedition never went or attempted to go to the Holy Land at all. But the desire to discharge obligations incurred is no doubt respectable in itself, and Villehardouin, as one of the actual negotiators of the bargain, must have felt it with peculiar strength.

The crusaders set sail at last, and Zara, which the Venetians coveted, was taken without much trouble. The question then arose whether the host should go next. Villehardouin does not tell us very satisfactorily how he took it himself in the debates on the question of interfering or not in the dispute between the empire of the East—debates in which the chief ecclesiastics present strongly protested against the diversion of the enterprise from its proper goal. It is quite clear, however, that the marshall of Champagne, who was one of the leaders and inner counsellors of the expedition throughout, sympathized with the majority, and it is fair to point out that the temptation of chivalrous adventure was probably as great as that of gain.

He narrates spirited enough the discussions and decisions in the winter camp of Zara and Corfu, but is evidently much more interested in the case when the voyage was again resumed, and, after a fair passage round Greece, the crusaders at last saw before them the great city of Constantinople which they had it in mind to attack. When the assault was decided upon, Villehardouin himself was in the fifth "battle," the leader of which was Mathieu de Montmorency. But, though his account of the siege is full of personal touches, and contains one reference to the number of witnesses whose testimony he took for a certain wonderful fact, he does not tell us anything of his own prowess.

After the flight of the usurper Alexius, and when the blind Isaac was in the ascendant, the claims of the Greeks were defended by a detachment taken by the Greeks from prison and placed on the throne, Villehardouin, with Montmorency and two Venetians, formed the embassy sent to arrange terms. He was again similarly distinguished when it became necessary to remanstrate with Alexius, the blind man's son and virtual successor, on the non-keeping of the terms. Indeed Villehardouin's talents as a diplomatist seem to have been held in very high esteem, for later, when the Latin empire had become a fact, he was charged with the delicate business of mediating between the emperor Baldwin and Boniface of Tyre, in 1199, in which task he had at least partial success. He was also appointed by the king of France, in the year 1203, to the very important mission of "Romanie"—a term very vaguely used, but apparently signifying the mainland of the Balkan Peninsula, while his nephew and namesake, afterwards prince of Achaia, took a great part in the Latin conquest of Peloponnesus. Villehardouin himself before long received an important command against the Bulgarians. He was left to maintain the siege of Adrianople when Baldwin advanced to attack the relieving force, and with Dandolo had much to do in saving the defeated crusaders from utter destruction, and conducting the retreat, in which he conducted the royal baggage, and brought his troops in safety to the sea of Rodosto, and thence to the capital. As he occupied the post of honour in this disaster, so he had that (the command of the vanguard) in the expedition which the regent Henry made shortly afterwards to revenge his brother Baldwin's defeat and capture. And, when Henry had succeeded to the crown on the announcement of Baldwin's death, it was Villehardouin who fetched home his bride Agnes of Montferrat, and shortly afterwards commanded under him in a naval battle with the ships of Theodore Lascaris at the fortress of Chios. When the Lascaris turned his sails to the west, joined with Lascaris, Villehardouin received the ief of Messinopoli (supposed to be Mosynopolis, a little inland from the modern Gulf of Lagos, and not far from the ancient Abdera) from Boniface of Montferrat, with the record of whose death the chronicle abruptly closes.

In the foregoing account only those particulars which bear directly on Villehardouin himself have been detailed; but the chronicle is as far as possible from being an autobiography, and the displays of the writer's personality, numerous as they are, are quite involuntary, and consist merely in his way of handling the subject, not in the references (as brief as his functions as chronicler will admit) to his own proceedings. The chronicle of Villehardouin is justly held to be the very best specimen of the spirit of chivalry—not the designedly exalted and poetized chivalry of the romances, not the self-conscious and deliberate chivalry of the 14th century, but the more spontaneous type of chivalry which brought about the crusades, stimulated the vast literary development of the 12th and 13th centuries, and sent knights-errant, principally though not wholly of French blood, to establish principalities and kingdoms throughout Europe and the nearer East. On the whole, no doubt, it is the more masculine and practical side of this enthusiastic state of mind which Villehardouin shows. No woman makes any but a negative appearance in the pages. In reference to this it must of course be remembered that he was certainly a man past middle life when the events occurred, and perhaps a man approaching old age when he set out upon his "Romanie." Despite the character of the book, there, exhibiting the impression which the beauty of sea and land, the splendour of Constantinople, the magnitude of the effete but still imposing Greek power, made on him, there is not only an entire absence of dilution of such subjects as a modern would have dilated on (that was to be expected), but an absence likewise of the elaborate and painful description of detail in which contemporary
trouvères would have indulged. It is curious, for instance, to compare the scanty references to the material marvels of Constantinople, which are very much out of place, with the very rich and varied accounts given by Villehardouin, and elsewhere, to be found in his other contemporaries, the later chanson de geste writers and the earlier embroiderers of the Arthurian romances and romans d' aventures. And if the contrast is more striking in comparison with Villehardouin, he does not, and not impossibly borrow from, these very writers in many points of style and phraseology. The brief chapters of his work have been justly compared to the laisses or fórcules of the chansons and the viguets or d'aventurcs, and of the subject each, in the absence of any attempt to run on the narrative, in the stock forms, and in the poetical rather than prosaic word-order of the sentences. Unlike his half-century ago, when this artifice (it is here forced from any charge of bastardy by the freshness and vigour which pervade it) adds not a little to the charm of the book. Its succession of word pictures, conventional, yet vigorous as the illuminations of a medieval manuscript, and in their very conventionality free from all thought of literary presentation, must charm all readers. The sober lists of names with which it opens: the account of the embassy, so business-like in its estimates of costs and terms, and suddenly breaking into a fervent description of how the six deputies, "prostrating themselves on the earth and weeping warm tears, begged the doge and people of Venice to have pity on the story of a happy man," followed by a short account of Thibault of Champagne, raising himself from a sickbed in his joy at the successful return of his ambassadors, "leva suet cheuaveta, et ilai co grant domanges, car il a veintu e il fauille grant nesioin"; these are next to beovers. Then the history relapses into the business vein and tells of the debates which took place as to the best means of carrying on the war after the count's decease, the rendezvous at Venice, the plausible suggestion of the Venetians that the balance due to them should be made up by a joint attack on their enemy, the king of Hungary. Villehardouin does not in the least conceal, in fact, that the policy proposed by the Venetians as "his own, and for his own part he seems to think of little or nothing but the reparation due to the republic, which had so long been of break the peace, on the part of members of a joint association, and perhaps of the unkinliness of not taking up an adventure whenever it presents itself. For here again the restoration of the unfortunate Prince of Venice, the plausibility of Villehardouin the man, and the imprudence of Villehardouin the author, are at the same time an excuse for what has been already said, to repeat that Villehardouin's book, brief as it is, in reality one of the capital books of literature, not merely for its merit, but also for its use. The mode of utilitarian and propagandist embodiment in contemporary literature of the sentiments which determined the action of a great and important period of history. There are but very few books which have satisfied so completely Villehardouin's object of bringing to light the history of every other contemporary record of the crusades perished, we should still be able by aid of this to understand and realize what the mental attitude of crusaders, of Teutonic knights, and the rest, and without this we should lack the earliest, the most undeniably genuine, and the most characteristic of all such records. The very inconsistency with which Villehardouin is chargeable, the absence of compunction with which he relates the changing of a sacred religion into something by no means unlike a mere filibustering raid on the great scale, add a charm to the book. For religious as it is, it is entirely free from the very slightest touch of hypocrisy, and this makes it an artful composition, a fact which, no less than the plain description of the crusades, gestis Dei per Francos, was evidently to Villehardouin a plain matter-of-fact description, and it no more occurred to him to doubt the divine favour being extended to the expeditions against Saracen and Turks.

The person of Villehardouin reappears for us once, but once only, in the chronicle of his contemporarv, Henri de Valenciennes. There is a great gap in style, though none in subject, between the truly poetical prose of the first historian of the fifth crusade and the Latin empire and the awkward mannerism (so awkward that it has been taken to represent a 'disthyme' or 'chiasm') and chronicle-like form of the Bayonnaise. But although at the great length at which Villehardouin appears on this one occasion shows us the restraint which he must have exercised in the passages which deal with himself in his own work. He again led the vanguard in the emperor Henry's expedition against Burilas the Bulgarian, and he is represented by the Valenciennes scribe as encouraging his sovereign to the attack in a long speech. Then he disappears altogether, with the exception of some brief and chiefly diplomatic mentions. Du Cange discovered the name of Villehardouin, and it was for some time thought that certain properties were devised to the churches of Notre Dame de Fossey and Notre Dame de Troyes, with the reservation of life interests to his daughters Alix and Damarones, and his sisters Emmeline and Haye, all of whom appear to have embraced a monastic life. A letter addressed from the East to Blanche of Champagne is cited, and a papal record of 1212 styles him still "marshal of Romans." The next year this title passed to his son Erard; and 1213 is accordingly given as the date of his death, which, as there is no record or hint of his having returned to France, may be supposed to have taken place at Messinepolo, where also he must have written the Conquête.

The book appears to have been known in the ages immediately succeeding his own; and, though there is no contemporary manuscript in existence, there are some half-dozen which appear to date from the end of the 13th or the course of the 14th century, at least appears to be a copy made from his own work in that spirit of unintelligent faithfulness which is much more valuable to posterity than more pragmatical editing. The first printed edition of the book, by Biornis and Villeneuva, the latter a Vignoles, the other a Raphin, 1585, is dedicated to the seignory of Venice (Villehardouin, it should be said, has been accused of a rather unfair predilection for the Venetians), and speaks of either of a part or the whole of the memoirs as "an experiment in primitive literature," as nothing appears to have been known. A better edition, founded on a Netherlandish MS., appeared at Lyons in 1601. But both these were corrected and annotated by Dom Brial, the new edition of Du Cange in 1776, wherein that learned writer employed all his knowledge, never since equalled, of the subject, but added a translation, or rather paraphrase, into modern French which is scarcely worthy either of himself or his author. Dom Brial gave a new edition from different MS. sources in 1823, and the book figures with different degrees of dependence on Du Cange and Brial in the collections of Petiot, Buchon, and Michaud and Poujoulat. All these, however, were supplanted for the French text of the Chronicles of Nativity of Wally (1782 and 1874), in which the text is critically edited from all the available MSS. and a new translation added, while there is a still later and rather handling one by E. Bouchet (2 vols., Paris, 1891), which, however, rests mainly on N. de Wally for text. The charm of Villehardouin can escape no reader; but few readers will fail to derive some additional pleasure from the two essays which Sainte- Beuve devoted to him, reprinted in the ninth volume of the Correspondans du luins. See also A. Debidoir, Les Chroniqueurs (1888). There are English translations by T. Smith (1829), and (more literally) by F. T. Marzials (Everyman's Library, 1908). (G. S.)

VILLELÉ, JEAN BAPTISTE GUILLAUME MAURICE SÉRAPHIN, COMTE DE (1777–1858): French statesman, born in Nîmes, Gard, on April 1777 and educated for the navy. He joined the 'Bayonnaise' at Brest in July 1788 and served in the West and East Indies. Arrested in the Isle of Bourbon under the Terror, he was set free by the revolution of Thermidor (July 1794). He acquired some property in the island, and married in 1799 the daughter of a great proprietor, M. Deshashyres de Richemont, whose estates he had managed. His apprenticeship to politics was served in the Colonial Assembly of Bourbon, where he fought successfully to preserve the colony from the consequences of perpetual interference from the autarchy of France, and to prevent local discontent from appealing to the English for protection. The arrival of General Decaen, sent out by Bonaparte in 1802, restored security to the island, and five years later Villé, who had now realized a large fortune, returned to France. He was mayor of his commune, and a member of the council of the Haute-Garonne under the Empire. At the restoration of 1814 he at once declared for royalist principles. He was mayor of Toulouse in 1814–15 and deputy for the Haute-Garonne in the 'Chambre introuvable' of 1815. Villé, who before the promulgation of the charter had written, in the géral de constitution opposing it, as too democratic in character, naturally took his place on the extreme right with the ultra-royalists. In the new Chamber of 1816 Villé found his party in a minority, but his personal authority nevertheless increased. He was looked on by the
ministerialists as the least unreasonable of his party, and by the "ultras" as the safest of their leaders. Under the electoral law of 1817 the Abbé Grégoire, who was popularly supposed to have voted for the death of Louis XVI in the Convention, was admitted to the Chamber of Deputies. The Conservative party gained strength from the alarm raised by this incident and which resulted from the shock caused by the assassination of the duc de Berri. The duc de Richelieu was compelled to admit to the cabinet two of the chiefs of the Left, Villele and Corbière. Villele resigned within a year, but on the fall of Richelieu at the end of 1821 he became the real chief of the new cabinet, in which he was minister of finance. Although not himself a courtier, he was backed at court by Sostènes de la Rochefoucauld and Madame du Cayla, and in 1822 Louis XVIII. gave him the title of count and made him formally prime minister. He immediately proceeded to muzzle opposition by stringent press laws, and the discovery of minor liberal conspiracies afforded an excuse for further repression. Forced against his will into interference in Spain by Mathieu de Montmorency and Chateaubriand, he contrived to reap some credit for the monarchy from the successful campaign of 1823. Meanwhile he had consolidated the royal power by persuading Louis XVIII. to swamp the liberal majority in the upper house by the nomination of twenty-seven new peers; he availed himself of the temporary popularity of the monarchy after the Spanish campaign to summon a new Chamber of Deputies. This new and obedient legislature, to which only nineteen deputies were hostile to Villele, was empowered to make way for the short-lived ministry of Martignac.

The new ministry made Villele's removal to the upper house a condition of taking office, and he took no further part in public affairs. At the time of his death, on the 13th of March 1854, he had advanced as far as 1816 with his memoirs, which were completed from his correspondence by his family as Mémoires et correspondance du comte de Villele (Paris, 5 vols., 1879–90).

VILLENAA, ABEL FRANCOIS (1790–1867), French politician and man of letters, was born in Paris on the 9th of June 1790. He was educated at the lycée Louis-le-Grand, and became assistant master at the lycée Charlemagne, and subsequently at the École Normale. In 1812 he gained a prize from the Academy with an éloge on Montaigne. Under the restoration he was appointed, first, assistant professor of modern history, and then professor of French eloquence at the Sorbonne. Here he delivered a series of literary lectures which had an extraordinary effect on his younger contemporaries. Villenain had the great advantage of coming just before the Romantic movement, of having a wide and catholic love of literature without being an extremist. All, or almost all, the clever young men of the brilliant generation of 1830 passed under his influence; and, while he pleased the Romanticists by his frank appreciation of the beauties of English, German, Italian and Spanish poetry, he had not the least inclination to decry the classics—either the classics proper of Greece and Rome or the so-called classics of France. In 1850 he published a book on Cromwell, and two years later he was elected to the Academy. Villemain was appointed by the restoration government "chef de l'imprimerie et de la librairie," a post involving a kind of irregular censorship of the press, and afterwards to the office of master of requests. Before the revolution of July he had been deprived of his office for his liberal tendencies, and had been elected deputy for Évreux. Under Louis Philippe he received a peerage in 1834. He was a member of the council of public instruction, and was twice minister of that department, and he also became secretary of the Academy. During the whole of the July monarchy he was thus one of the chief dispensers of literary patronage in France, but in his later years his reputation declined. He died in Paris on the 8th of May 1867.

Villemain's chief work is his Cours de la littérature française (5 vols., 1828–29). Among his other works are: Tableau de la littérature du moyen âge (2 vols., 1846); Tableau de la littérature au XVIIe siècle (4 vols., 1846); Souvenirs de correspondance (Cr. Paris, 1856); Histoire de Grégoire VII. (2 vols., 1873; Eng. trans., 1874). Among notices on Villemain may be cited that of Louis de Loménie (1841), E. Mirecourt (1858), J. L. Dubrit (1873). See also Sainte-Beuve, Travaux (vol. iii.), and Coursiers du lundis (vol. xi. Notes et pensées).
10th century in Llano’s Mocas and in Hartzenbusch’s play La Redoma encantada.

(V. F.-K.)

VILLENA, a town of eastern Spain, in the province of Alicante; on the right bank of the river Vinalapo, and at the junction of railways from Valencia, Alicante, Albacete and Yecla. Pop. (1900) 14,099. Villena is a labyrinth of winding alleys, which contain some interesting examples of Moorish domestic architecture. It is dominated by a large and picturesque Moorish castle. The surrounding hills are covered with vines, and to the east there is an extensive salt lagoon. Silk, linen, flour, wine, and brandy are the chief industries, and the increased population is due to the climate.

VILLENAGE (Villainage, Villanage, Villenage), a medieval term (from villa, villanus), pointing to serfdom, a condition of men intermediate between freedom and slavery. It occurs in France as well as in England, and was certainly imported into English speech through the medium of Norman French. The earliest instances of its use are to be found in the Latin and French versions of English documents in the 11th and 12th centuries (cf. Domesday Book; Liebermann, Glossary to the Gesetze der Angelsachsen, s.v. villanus, vilain). The history of the word and of the condition is especially instructive in English usage.

The materials for the formation of the villein class were already in existence in the Anglo-Saxon period. On the one hand, the Saxon coeors (tewhyndemen), although considered as including the typical freemen in the earlier laws (Ethelberht, Hlothhere and Edric, Ine), gradually became differentiated through the action of political and economic causes, and many of them had to recognize the patronage of magnates or to seek livelihood as tenants on the estates of the latter. These coeors, sitting on galol-land, were, though personally free, considered as a lower order of men, and rapidly gradually into more or less oppressive subjection in respect of the great landowners. It is characteristic in this connexion that the West Saxon laws do not make any distinction between coeors and laets or half-freemen as the Kentish laws had done: this means that the half-free people were, if not Welshmen, reckoned as members of the coeor class. Another remarkable indication of the decay of the coeor’s estate is afforded by the fact that in the treaties with the Danes the twyhynde coeors are equated with the Danish leyseings or freedmen. It does not mean, of course, that their condition was practically the same, but in any case the fact testifies to the gulf which had come to separate the two principal subdivisions of the free class—the coeor and the thane. The Latin version of the Rectitudines Singularum Personarum, a document compiled probably in the 11th century, not long before the Conquest, renders geneat (a peasant tenant of a superior kind performing lighter services than the gebur, as he was burdened with heavy week-work) by villanus; but the gebur came to be also considered as a villanus according to Anglo-Norman terminology. The group designated as geburs in Anglo-Saxon charters, though distinguished from mere slaves (thowe baerde-barbaerde, Kemble, Cod. Dipl. 1079), undoubtedly included many freedmen who in point of services and economic subjection were not very much above the slaves. Both coeors and geburs disappear as separate classes, and it is clear that the greater part of them must have passed into the rank of villeins.

The terminology of the Domesday Inquest we find the villeins as the most numerous element of the English population. Out of about 240,000 households enumerated in Domesday 100,000 are marked as belonging to villeins. They are rustics performing, as a rule, work services for their lords. But not all the inhabitants of the villages were designated by that name. Villeins are opposed to socmen and freemen on one hand, to bordarii, cottagers and slaves on the other. The distinction in regard to the first two of these groups was evidently derived from their greater freedom, although the difference is only one in degree and not in kind. In fact, the villein is assumed to be a person free by birth, but holding land of which he cannot dispose freely. The distinction as against bordarii and cottagers is based on the size of the holding: the villeins are holders of regular shares in the village—that is, of the virgates, bovates or half-hides which constitute the principal subdivisions in the fields and contribute to form the ploughteams—whereas the bordarii hold smaller plots of some 5 acres, more or less, and colararii are connected with mere cottages and crofts. Thus the terminology of Domesday takes note of two kinds of differences in the status of rustics: a legal one in connexion with the right to dispose of property in land, and an economic one reflecting the opposition between the holders of shares in the fields and the holders of auxiliary tenements. The feature of personal serfdom is also noticeable, but it provides a system developed for the convenience of the owner of small holding only about 25,000 are enumerated in Domesday Book. The contrast between this exceptionally situated class and the rest of the population shows that personal slavery was rapidly disappearing in England about the time of the Conquest. It is also to be noticed that the Domesday Survey constantly mentions the terra villanorum as opposed to the demesne in the estates or manors of the time, and that the land of the rustics is taxed separately for the geld, so that the distinction between the property of the lord and that of the peasant dependent on him is clearly marked and had a good deal of practical importance.

The Domesday Survey puts before us the state of England as it was at the very beginning of the Norman and at the close of the Saxon period. The development of feudal society, of centralizing kingship and ultimately of a system of common law, brought about great changes which all hang on the fundamental fact that the kings, while increasing the power of the state in other respects, surrendered it completely as regards the relations between the peasants and their lords. The protection of the assizes was tendered in civil matters to free tenants and refused to villeins. The royal courts refused to entertain suits of villeins against their lords, although there was a good deal of vacillation before this position was definitely taken up. Bracton still speaks in his treatise of the possibility for the courts to interfere against intolerable cruelty on the part of the lord involving the destruction of the villein’s waynage, that is, of his ploughteam, and in the Notebook of Bracton there are a couple of cases which prove that 13th-century judges occasionally allowed themselves to entertain actions by persons holding in villenage against their lords. Gradually, however, the exception of villenage became firmly settled. As the historical and practical position was developing on these lines, the lawyers who fashioned English common law in the 12th and 13th centuries did not hesitate to apply to it the teaching of Roman law on slavery. Bracton fits his definition of villenage into the Romanesque scheme of Azo’s Summa of the Institutes, and the judges of the royal courts made sweeping inferences from this general position. To begin with, the relation between the villein and his lord was regarded as a personal and not a praelial one. Everyone born of villein stock belonged to his master and was bound to undertake any service which might be imposed on him by the master’s or the steward’s command. The distinction between villeins in gross and villeins regardant, of which much is made by modern writers, was suggested by modes of pleading and does not make its appearance in the Year-Books before the 15th century. Secondly, all independent proprietary rights were denied to the villein as against his lord, and the legal rule “quicquid servo acquiritur domino acquiritur” was extended to villeins. The fact that a great number of these serfs had been enjoying protection as free coeors in former ages made itself felt, however, in three directions. (1) In criminal matters the villein was treated by the King’s Court irrespectively of any consideration as to his debased condition. More especially the police association, organized for the keeping of the peace and the presentation of criminals—the frankpledge groups were formed of all “worthy of were and wite,” villeins as well as freemen. (2) Politically the villeins were not eliminated from the body of citizens: they had to pay taxes, to serve in great emergencies in the militia, to serve on inquests, &c., and although there was a tendency to place them on a lower footing in all these respects yet the fact of their being lesser members of the commonwealth did not remove the fundamental
VILLENAGE

qualification of citizenship. (3) Even in civil matters villeins were deemed free as regards third persons. They could sue and be sued in their own name, and although they were able to call in their lords as defendants when proceeded against, there was nothing in law to prevent them from appearing in their own right. The state even afforded them protection against extreme cruelty on the part of their masters in respect of life and limb, but in laying down this rule English lawyers were able to follow the precedents set by late Roman jurisprudence, especially by measures of Hadrian, Antonine and Constantine the Great.

There was one exception to this harsh treatment of villeins, namely, the rustic tenancy in manors of ancient demesne, that is, in estates which had belonged to the crown before the Conquest, had a standing-ground even against their lords as regards the tenure of their plots and the fixity of their services. Technically this right was limited to the inhabitants of manors entered in the Domesday Survey as terra regis of Edward the Confessor. On the other hand the doctrine became effective if the manors in question had been granted by later kings to subjects, because if they remained in the hand of the king the only remedy against ejectment and exactation lay in petitioning for redress without any definite right to the latter. If, however, the two conditions mentioned were forthcoming, villeins, or, as they were technically called, villein socmen of ancient demesne manors, could resist any attempt of their lords to encroach on their rights by depriving them of their holdings or increasing the amount of their customary services. Their remedy was to apply for a new writ of right in the first case and for a writ of monstrare in the second. These writs entitled them to appear as plaintiffs against the lord in his own manorial court and, eventually, to have the question at issue examined by way of appeal, on a writ of error, or by reservation on some legal points in the upper courts of the king. A number of cases arising from these privileges of the men of ancient demesne are published in the Notebook of Bracton and in the Abbreviatio placi torum. This exceptional procedure does not simply go back to the rule that persons who had been tenants of the king ought not to have their condition altered for the worse in consequence of a royal grant. If this were the only doctrine applicable in the case there would be no reason why similar protection should be denied to all those who held under grantees of manors escheated after the Conquest. A material point for the application of the privilege consists in the fact that ancient demesne has to be proved from the time before the Conquest, and this shows clearly that the theory was partly derived from the recognition of tenant right in villeins of the Anglo-Saxon period who, as we have said above, were mostly serfs, that is, freeborn men.

In view of the great difference in the legal position of the free man and of the villein in feudal common law, it became very important to define the exact nature of the conditions on which the status of a villein depended. The legal theory as to these conditions was somewhat complex, because it had to take account of certain practical considerations and of a rather abrupt transition from a previous state of things based on different premises. Of course, persons born from villein parents in lawful wedlock were villeins, but as to the condition of illegitimate children there was a good deal of hesitation. There was a tendency to apply the rule that a bastard follows the mother, especially in the case of the servile mother. In the case of mixed marriages, the condition of the child is determined by the free or villein condition of the tenement in which it was born. This notion of the influence of the tenement is well adapted to feudal notions and makes itself felt again in the case of the pursuit of a fugitive villein. He can be seized without further formalities if he is caught in his "nest," that is, in his native place. If not, the lord can follow him in fresh pursuit for four days; once these days past, the fugitive is provisional only in possession of his liberty, and the lord has to bring an action de nativo habiendo and has to assume the burden of proof. So much as to the proof of villenage by birth or previous condition. But there were numbers of cases when the discussion as to servile status turned not on these formal points but on an examination of the services performed by the person claimed as a villein or challenged as holding in villenage. In both cases the courts had often recourse to proof derived not from direct testimony but from indirect indications as to the kind of services that had been performed by the supposed villein; certain services, especially the payment of merchandise or the fine for marrying a daughter—were considered to be the badge of serfdom. Another service, the performance of which established a presumption as to villenage, was compulsory service as a reeve. The courts also tried to draw a distinction from the amount and regularity of agricultural services to which a tenant was subjected. Bracton speaks of the contrast between the irregular services of a serer, "who could not know in the evening what he would have to do in the morning," and services agreed upon and definite in their amount. The customary arrangements of the work of villeins, however, render this contrast rather fictitious. The obligations of downright villeins became to that degree settled and regular that one of the ordinary designations of the class was cas tamartii. Therefore in most cases there were no arbitrary exactions to go by, except perhaps one or the other tallage imposed at the will of the lord. The original distinction seems to have been made not between arbitrary and agreed but between occasional services and regular agricultural work-week. While the occasional services, even when agricultural, in no way established a presumption of villenage, and many sermen, freemen and holders by serjeantry submitted to them agricultural work-week was primarily considered as a trait of villenage and must have played an important part in the process of classification of early Norman society. The villein was in this sense emphatically the man holding "by the fork and the flail."

This point brings us to consider the matter-of-fact conditions of the villeins during the feudal period, especially in the 12th, 13th and 14th centuries. As is shown by the Hundred Rolls, the Domesday of St Paul, the Surveys of St Peter, Glastonbury Abbey, Ramsey Abbey and countless other records of the same kind, the customary conditions of villenage did not tally by any means with the identification between villenage and slavery suggested by the jurists. It is true that in nomenclature the word "serf" is not infrequently used (e.g. in the Hundred Rolls) where villani might have been mentioned, and the feminine nief (nativa) appears as the regular parallel of villanum, but in the descriptions of usages and services we find that the power of the lord loses its discretionary character and is in every respect moderated by custom. As personal dependents of the lord native villeins were liable to be sold, and we have actual sales recorded: Glastonbury Abbey e.g. sells a certain Philipp Hardynge for 20 shillings. But such transfers of human chattels occur seldom, and there is nothing during the English feudal period corresponding to the brisk trade in men characteristic of the ancient world. Merchet was regarded, as has been stated already, as a badge of serfdom in so far as it was said to imply a "buying of one's own blood" (serus de sanguine suo emendo). The explanation is even more characteristic than the custom itself, because fines on marriage may be levied and were actually levied from people of different condition, from the free man as well as from the serf. Still the tendency to treat merchet as a distinctive feature of serfdom has to be noted, and we find that the custom spread for this very reason in consequence of the encroachments of powerful lords: in the Hundred Rolls it is applied indiscriminately to the whole rustic population of certain hundreds in a way which can hardly be explained unless by artificial extension. Iterol, the surrender of the best horse or ox, is also considered as the common incident of villein tenure, although, of course, its very name proves its intimate connexion with the outfit of soldiers (here-goatu).

Economically the institution of villenage was bound up
with the manorial organization—that is, with the fact that the country was divided into a number of districts in which central home farms were cultivated by the help of work supplied by villein households.

The most important of villein services is the week-work performed by the peasantry. Every virger or holder of a bovate has to send a labourer to do work on the lord's farm for some days in the week. Three days is indeed the most common standard for service of this kind, though four or even five occur sometimes, as well as two. It must be borne in mind in the case of heavy tasks, such as four or five days' week-work, that only one labourer from the whole holding is meant, while generally there were several men living on every holding—otherwise the service of five days would be impossible to perform. In the course of these three days, or whatever the number was, many requirements of the demesne had to be met. The principal of these was ploughing the fields belonging to the lord, and for such ploughing the peasant had not only to appear personally as a labourer, but to bring his oxen and plough, or rather to join with his oxen and plough in the work imposed on the village: the height, costliness, and time of a team of eight oxen, when every day by several peasants contributing their beasts and implements towards its composition. In the same way the villagers had to go through the work of harrowing with their harrows, and of removing the harvest in their vans and carts. Carriages duties in carts and on horseback were also apportioned according to the time they took as a part of the week-work. Then came innumerable varieties of manual work for the erection and keeping up of hedges, the preservation of dykes, canals and ditches, the threshing and garnering of corn, the tending and shearing of sheep and so forth. All this hand-work was reckoned according to customary standards as day-work and week-work. But besides all these services into which the regular week-work of the peasantry was differentiated, stood some additional duties. The ploughing for the lord, for instance, was not only imposed in the shape of a certain number of days in the week, but took sometimes the shape of a certain number of acres which the village had to plough and to sow for the lord irrespectively of the time employed on it. This was sometimes termed gafolærði. Exceedingly burdensome services were required in the seasons when farming processes are, as it were, at their height, in the seasons of ending and reaping, when the work usual is of special value and the working power of the farm hands is strained to the utmost. At that time it was the custom to call up the whole able-bodied population of the manor, with the exception of the housewives for two, three or more days of mowing and reaping on the lord's fields; to these boon-works the peasantry was asked or invited by special summons, and their value was so far appreciated that the villagers were usually treated to meals in cases where they were again and again called off from their own fields to the demesne. The liberaity of the lord actually went so far, in exceptionally hard straits, that some ale was served to the labourers to keep them in good humour.

In the 14th century this social arrangement, based primarily on natural economy and on the feudal disruption of society, began to give way. The gradual spread of intercourse rendered unnecessary the natural husbandry of former times which sought to produce a complete set of goods in every separate locality. Instead of acting as a little world by itself for the raising of corn, the breeding of cattle, the gathering of wool, the weaving of linen and common cloths, the fabrication of necessary implements of all kinds, the local group began to buy some of these goods and to sell some others, renouncing isolation and making its destiny dependent on commercial intercourse. Instead of requiring from its population all kinds of work and reducing its ordinary occupations to a hard-and-fast routine meeting in a slow and unskilled manner all possible contingencies, the local group began to move, to call in workmen from abroad for tasks of a special nature, and to send its own workmen to look out for profitable employment in other places. Instead of managing the land by the constant repetition of the same processes, by a customary immobility of tenure and service, by communalistic restrictions on private enterprise and will, local society began to try improvements, to escape from the bounds of champion farming. Instead of producing and collecting goods for immediate consumption, local society came more and more into the habit of exchanging corn, cattle, cloth, for money, and of laying money by as a means of getting all sorts of exchangeable goods, when required. In a word, the time of commercial, contractual, cash intercourse was coming fast. What was exceptional and local in time and place came to obtain general recognition in the course of the 14th and 15th centuries, and, for this very reason, assumed a very different aspect.

A similar transformation took place in regard to government. The local monarchy of the manorial lords was fast giving way to a central power which maintained its laws, the circuits of its judges, the fiscal claims of its exchequer, the police interference of its civil officers all through the country, and, by prevailing over the fringes of manorial lords, gave shape to a vast dominion of legal equality and legal protection, in which the forces of commercial exchange, of contract, of social intercourse, of house and welcome-sphere of or free tenures. In truth, the processes, the economic and the political one, worked so much together that it is hardly possible to say which influenced the other more, which was the cause and which the effect. Government grew strong because it could draw on a society which was going ahead in enterprise and well-being; social intercourse progressed because it could depend on a strong government to safeguard it.

If we now turn to the actual stages by which this momentous passage from the manorial to the commercial arrangement was achieved, we have to notice first of all a rapid development of contractual relations. We know that in feudal law there ran a standing contrast between tenure by custom—villein tenure—and tenure by contract—free tenure. While the manorial system was in full force this contrast led to a classification of holdings and affected the whole position of people on the land. Still, even at that time it might happen that a freeholder owned some land in villegaigne by the side of his free tenement, and that a villein held some land freely by agreement with his lord or with a third person. But these cases, though by no means infrequent, were still exceptional. As a rule people used land as holdings, and those were rigidly and completely of or free tenures. The interesting point to be noticed is that, without any formal break, leasing land for life and for term of years is seen to be rapidly spreading from the end of the 13th century, and numberless small tenancies are created in the 14th century which break up the disposition of the holdings. From the close of the 13th century downwards countless transactions on the basis of leases for terms of years occur between the peasants themselves, any suitably kept set of 14th-century court rolls containing entries in which such and such a villein is said to appear in the halfmote and to surrender for the use of another person a piece of land belonging to the holding. The number of years and the conditions of payment are specified. Thus, behind the screen of the normal shares a number of small tenancies arise which run their economic concerns independently from the cumbersome arrangements of tenure and service, and, needless to add, all these tenancies are burdened with money rents.

Another series of momentous changes took place in the arrangement of services. Even the manorial system admitted the buying off for money of particular dues in kind and of specific performance of work. A villein might be allowed to bring a penny instead of bringing a chicken or to pay a rent instead of appearing with his oxen three times a week on the lord's fields. Such rents were called mal or mail in contrast with the gafol, ancient rents which had been imposed independently, apart from any buying off of customary services. There were even whole bodies of peasants called Molsmen, because they had bought off work from the lord by settling with him on the basis of money rents. As time went on these practices of commutation became more and more frequent. There were, for both sides, many advantages in arranging their mutual
relations on this basis. The lord, instead of clumsy work, got clear money, a much-coveted means of satisfying needs and wishes of any kind—instead of cumbrous performances which did not come always at the proper moment, were carried out in a heartened manner, yielded no immediate results, and did not admit of convenient rearrangement. The peasant got rid of a burdensome drudgery which not only took up his time and means in an unprofitable manner, but placed him under thorough control and the arbitrary discipline of stewards or reeves and gave occasion to all sorts of fines and extortions.

With the growth of intercourse and security money became more frequent and the number of such transactions increased in proportion. But it must be kept in mind that the conversion of services into rents went on very gradually, as a series of private agreements, and that it would be very wrong to suppose, as some scholars have done, that it had led to a general commutation by the middle or even the end of the 14th century. The 14th century was marked by violent fluctuations in the demand and supply of labour, and particularly the tremendous loss in population occasioned in the middle of this century by the Black Death called forth a most serious crisis. No wonder that many lords clung very tenaciously to customary services, and ecclesiastical institutions seem to have been especially backward in going over to the system of money rents. There is evidence to show, for instance, that the manors of the abbey of Ramsey were managed on the system of enforced labour right down to the middle of the 15th century, and, of course, survivals of these customs in the shape of scattered services lived on much longer. A second drawback from the point of view of the landlords was called forth by the fact that commutation for fixed rents gradually lessened the value of the exactions to which they were entitled. Money not only became less scarce but it became cheaper, so that the couple of pence for which a day of manual work was bought off in the beginning of the 13th century did not fetch more than half of their former value at its end. As quit rents were customary and not rack rents, the successors of those who had redeemed their services were gaining the whole surplus in the value of goods and labour as against money, while the successors of those who had committed their right to claim services for certain sums in money lost all the corresponding difference. These inevitable consequences came to be perceived in course of time and occasioned a backward tendency towards services in kind which could not prevail against the general movement from natural economy to money dealings, but was strong enough to produce social friction and grave disturbances.

The economic crisis of the 14th century has its complement in the legal crisis of the 15th. At that time the courts of law begin to do away with the denial of protection to villeins which, as we have seen, constituted the legal basis of villeneue. This is effected by the recognition of copyhold tenure (see Copyhold). It is a fact of first-rate magnitude that in the 17th century customary relations on one hand, the power of government on the other, ripened, as it were, to that extent that the judges of the king began to take cognizance of the relations of the peasants to their lords. The first cases which occur in this sense are still treated not as a matter of common law, but as a manifestation of equity. As doubtful questions of trust, of wardship, of testamentary succession, they were taken up not in the strict course of justice, but as matters in which redress was sorely needed and had to be brought by the exceptional power of the court of chancery. But this interference of 15th-century chancellors paved the way towards one of the greatest revolutions in the law; without formally enfranchising villeins and villeneue tenants they created a legal basis for it in the law of the realm: in the formula of copyhold—tenement held at a rent of the lord and by the consent of the manors—the first part lost its significance and the second prevailed, in direct right contrast with former times when, on the contrary, the second part had no legal value and the first expressed the view of the courts. One may almost be tempted to say that these obscure decisions rendered unnecessary in England the work achieved with such a flourish of trumpets in France by the emancipating decree of the 4th of August 1789.

The personal condition of villeneue did not, however, disappear at once with the rise of copyhold. It lingered through the 16th century and appears exceptionally even in the 17th. During the emancipation movements for personal enfranchisement are often noticed at that very time. But these were only survivals of an arrangement which has been destroyed in its essence by a complete change of economic and political conditions.

command in November. On the 17th of January 1805 he left Toulon for the first time, but was driven back by a squall which damaged some of his awkwardly handled ships. On the 3rd of March he was out again, and this time he headed Nelson by some weeks on a cruise to the West Indies. But Villeneuve's success so far had not removed his fears. Though on taking up his command he had issued an order of the day in which he spoke boldly enough of the purpose of his cruise, and his determination to adhere to it, he was racked by fears of what might happen to the force entrusted to his care. For the details of the campaign see Trafalgar. In so far as the biography of Villeneuve is concerned, his behaviour during these trying months cannot escape condemnation. He had undertaken to carry out a plan of which he did not approve. Since he had not declined the task altogether, it was clearly his duty to execute his orders at all hazards. If he was defeated, as he almost certainly would have been, he could have left the responsibility for the disaster to rest on the shoulders of Napoleon who assigned him the task. But Villeneuve could not free himself from the conviction that it was his business to save his fleet even if the issue were hopeless. When he returned to Europe and fought his confused action with Sir R. Calder off Ferrol on the 22nd of July 1805, he first hesitated, and then, in spite of vehement orders to come on, turned south to Cadiz. Napoleon's habit of suggesting alternative courses to his lieutenants gave him a vague appearance of excuse for making for that port. But it was one which only a very weak man would have availed himself of, for all his instructions ought to have been read subject to the standing injunction to come on to the Channel—and in turning south to Cadiz, he was going in the opposite direction. His decision to leave Cadiz and give battle in October 1805, which led directly to the battle of Trafalgar, cannot be justified even on his own principles. He foresaw defeat to be inevitable, and yet he went out solely because he learnt from the Minister of Marine that another officer had been sent to supersede him. In fact he ran to meet the very destruction he had tried to avoid. No worse fate would have befallen him in the Channel than came upon him at Trafalgar, but it might have been incurred in a manly attempt to obey his orders. It was provoked in a spasm of wounded vanity. At Trafalgar he showed personal courage, but the helpless incapacity of the allies to manoeuvre gave him no opportunity to influence the course of the battle. He was taken as a prisoner to England, but was soon released. Shortly after landing in France he committed suicide in an inn at Rennes, on the 22nd of April 1806. Among the other improbable crimes attributed to Napoleon by the fear and hatred of Europe, was the murder of Villeneuve, but there is not the faintest reason to doubt that the admiral died by his own hand.

The correspondence of Napoleon contains many references to Villeneuve. Accounts of the naval operations in which he was concerned will be found in James's Naval History. Trouble, in his Batailles navales de la France, vol. iii., publishes several of his letters and orders of the day.

(D. H.)

VILLENEUVE-LES-AVIGNON—VILLEROI

Villeveneville-les-Avignon, a town of south-eastern France, in the department of Gard on the right bank of the Rhone opposite Avignon, with which it is connected by a suspension bridge. Pop. (1906) 2582. Villeneuve preserves many remains of its medieval importance. The church of Notre Dame, dating from the 14th century, contains a rich marble altar and remarkable pictures. The hospice, once a Franciscan convent, part of which is now a museum of pictures and antiquities, has a chapel in which is the fine tomb of Innocent VI. (d. 1362). The church and other remains of the Carthusian monastery of Val-de-Bénédicton, founded in 1356 by Innocent VI., are now used for habitation and other secular purposes. A gateway and a rotunda, built as shelter for a fountain, both dating from about 1670, are of architectural note. On the Mont Andao, a hill to the north-east of the town, stands the Fort of St André (14th century), which is entered by an imposing fortified gateway and contains a Romanesque chapel and remains of the abbey of St André. The other buildings of interest include several old mansions once belonging to cardinals and nobles, and a tower, the Tour de Philippe le Bel, built in the 14th century, which guarded the western extremity of the Pont St Bénézet (see AVIGNON).

In the 6th century the Benedictine abbey of St André was founded on Mount Andao, and the village which grew up round it took its name. In the 13th century the monks, acting in concert with the crown, established a bastide, or "new town," which came to be called Villeneuve. The town was the resort of the French cardinals during the sojourn of the popes at Avignon, and its importance, due largely to its numerous religious establishments, did not decline till the Revolution.

Villeveneville-sur-Lot, a town of south-western France, capital of an arrondissement in the department of Lot-et-Garonne, 22 m. N. by E. of Agen on a branch line of the Orleans railway. Pop. (1906) town, 6978; commune, 13,540. Villeneuve is divided into two unequal portions by the river Lot, which here runs between high banks. The chief quarter stands on the right bank and is united to the quarter on the left bank by a bridge of the 13th century, the principal arch of which, constructed to the order of Louis VI. in the time of Leguizamon, has a span of 118 ft. and a height of 59 ft. On the left bank portions of the 13th century ramparts, altered and surmounted by machicolations in the 15th century, remain, and high square towers rise above the gates to the north-east and south-west, known respectively as the Porte de Paris and Porte de Pujois. On the right bank boulevards have for the most part taken the place of the ramparts. Arcades of the 13th century surround the Place La Fayette, and old houses of the 13th, 14th and 15th centuries are to be seen in various parts of the town. The church of St Etiennne is in late Gothic style. On the left bank of the Lot, 2 m. S.S.W. of Villeneuve, are the 13th-century walls of Pujois. The buildings of the ancient abbey of Eysses, about a mile to the N.E., which are mainly of the 17th century, serve as a departmental prison and penitentiary establishment. The principal hospital, the hospice St Cyr, is a handsome building standing in beautiful gardens. Villeneuve has a sub-prefecture, tribunals of first instance and of commerce and communal colleges for both sexes. It is an important agricultural centre and has a very large trade in plums (prunes d'ente) and in the produce of the market gardens which surround it, as well as in cattle, horses and wine. The preparation of preserved plums and the tinning of peas and beans occupy many hands; there are also manufactories of boots and shoes and tin boxes. The important mill of Gajac stands on the bank of the Lot a little above the town.

Villeneuve was founded in 1254 by Alphonse, count of Poitiers, brother of Louis IX., on the site of the town of Gajac, which had been deserted during the Albigensian crusade.

Villeroi, François de Neuvville, Duc de (1644-1730), French soldier, came of a noble family which had risen into prominence in the reign of Charles IX. His father Nicolas de Villeroi, Marquis de Villeroi, marshal of France (1598-1705), created a duke by Louis XIV., was the young king's governor, and the boy was thus brought up in close relations with Louis. An intimate of the king, a finished courtier and leader of society and a man of great personal gallantry, Villeroi was marked out for advancement in the army, which he loved, but which had always a juster appreciation of his incapacity than Louis. In 1693, without having exercised any really important and responsible command, he was made a marshal. In 1695, when Louis XIV. died, he obtained the command of the army in Flanders, and William III. found him a far more compliant opponent than the "little hunchback." In 1701 he was sent to Italy to supersede Catinat and was soon beaten by the inferior army of Eugene of Chiari (see Spanish Succession War). In the winter of 1701 he was made prisoner at the surprise of Cremona, and the wits of the army made at his expense the famous rhyme:

"Par la faveur de Bellone, et par un bonheur sans égal,
Nous avons conservé Crémone—et perdu notre général."

In the following years he was pitted against Marlborough in
the Low Countries. Marlborough's own difficulties with the Dutch and other allied commissioners, rather than Villeroi's own skill, put off the inevitable disaster for some years, but in 1706 the duke attacked him and thoroughly defeated him at Ramillies (q.v.). Louis consigned his old friend with the remark, "At our age, one is no longer lucky," but superseded him in the command, and henceforward Villeroi lived the life of a courtier, much busied with intrigues but retaining to the end the friendship of his master. He died on the 18th of July 1782.

VILLERS LA VILLE, a town of Belgium in the province of Brabant, 2 m. E. of Quatre Bras, with a station on the direct line from Louvain to Charleroi. Pop. (1904) 1166. It is chiefly interesting on account of the fine ruins of the Cistercian abbey of Villers founded in 1147 and destroyed by the French republicans in 1795. In the ruined church attached to the abbey are still to be seen the tombstones of several dukes of Brabant of the 13th and 14th centuries.

VILLETTE, CHARLES, MARQUIS DE (1736-1793), French writer and politician, was born in Paris on the 4th of December 1736, the son of a financier who left him a large fortune and the title of marquis. After taking part in the Seven Years' War, young Villette returned in 1765 to Paris, where he made many enemies by his insufferable manners. But he succeeded in gaining the intimacy of Voltaire, who had known his mother and who wished to make a poet of him. The old philosopher even went so far as to call his protégé the French Tibullus. In 1777, on Voltaire's advice, Villette married Mademoiselle de Varicourt, but the marriage was unhappy, and his wife was subsequently adopted by Voltaire's niece, Madame Denis. During the Revolution Villette publicly burned his letters of nobility, wrote revolutionary articles in the *Chronique de Paris*, and was elected deputy to the Convention by the department of Seine-et-Oise. He had the courage to censure the September massacres and to vote for the imprisonment only, and not for the death, of Louis XVI. He died in Paris on the 7th of July 1793.

In 1784 he published his *Oeuvres*, which are of little value, and in 1792 his articles in the *Chronique de Paris* appeared in book form under the title *Leçons choisies sur les principaux événements de la Révolution*.

VILLIERS, CHARLES PELHAM (1802-1898), English statesman, son of George Villiers, grandson of the 1st earl of Clarendon of the second (Villiers) creation, and brother of the 4th earl (q.v.), was born in London on the 3rd of January 1802, and educated at St John's College, Cambridge. He read for the bar at Lincoln's Inn, and became an associate of the Benthamites and "philosophical radicals" of the day. He was an assistant commissioner to the Poor Law Commission (1834), and in 1835 was made by the master of the Rolls, whose secretary he had been, a chancery examiner of witnesses, holding this office till 1852. In 1835 he was elected M.P. for Wolverhampton, and retained his seat till his death. He was the pioneer of the free-trade movement, and became prominent with Cobden and Bright as one of its chief supporters, being indefatigable in pressing the need for free trade on the House of Commons, by resolution and by petition. After free trade triumphed in 1846 his importance in politics became rather historical than actual, especially as he advanced to a venerable old age; but he was president of the Poor Law Board, with a seat in the Cabinet, from 1855 to 1856, and did other useful work in the Liberal reforms of the time. Like Bright, he parted from Mr Gladstone on Home Rule for Ireland. He attended parliament for the last time in 1895, and died on the 16th of January 1898.

VILLIERS DE L'ISLE-ADAM, PHILIPPE AUGUSTE MATHIAS, COMTE DE (1838-1889), French poet, was born at St Brieuc in Brittany and baptized on the 28th of November 1838. He may be said to have inaugurated the Symbolist movement in French literature, and *Azeb*, the play on which he was engaged during so much of his life, though it was only published after his death, is the typical Symbolist drama. He began with a volume of *Premières Poésies* (1856-58). This was followed by a wild romance of the supernatural, *Ixis* (1862), and by two plays in prose, *Élén* (1866) and *Morgane* (1866). *La Révolte*, a play in which Ibsen's *Doll's House* seems to be anticipated, was represented at the Vaudeville in 1870; *Contes cruels*, his finest volume of short stories, in 1883, and a new series in 1886; *Le Nouveau Monde*, a drama in five acts, in 1880; *L'Éve future*, an amazing piece of buffoonery satirizing the pretensions of science, in 1886; *Tribunal Bouhomot* in 1887; *Le Secret de l'échauffard* in 1888; *Azel* in 1890. He died in Paris, 12th August 1892.

VILLETTE, the beach of Saint-Jean-de-Cień, on the 19th of August 1899. Villette has left behind him a legend probably not more fantastic than the truth. Sharing many of the opinions of Don Quixote, he shared also Don Quixote's life. He was the descendant of a Grand Master of the Knights of Malta, famous in history, and his pride as an aristocrat and as an idealist were equal. He hated mediocrity, science, progress, the present age, money and "serious" people. In one division of his work he attacked all the things which he hated with a savage irony; in another division of his work he discovered at least some glimpses of the ideal world. He remains a remarkable work and a challenge.

He improvised out of an abundant genius, but the greater part of his work was no more than improvisation. He was accustomed to talk his stories before he wrote them. Sometimes he talked them instead of writing them. But he has left, at all events, the *Contes cruels*, in which may be found every classic quality of the French conte, together with many of the qualities of Edgar Allan Poe and Ernst Hoffmann; and the drama of *Azel*, in which the stage takes a new splendour and a new subtility of meaning. Villiers's influence on the younger French writers was considerable. It was always an exaltation. No one in his time followed a literary ideal more romantically.

(A. S. W.)

VILLINGEN, a town of Germany in the grand duchy of Baden, pleasantly situated amid well-wooded hills, 52 m. by rail N. of Schaffhausen. Pop. (1905) 9828. It is in part still surrounded by walls, with ancient gate towers. It is the chief seat of the watch-making industry of the Black Forest. It also produces musical-boxes, glass and silk, and has a Gothic church of the 13th century and another of the 11th, a 13th-century town hall, with a museum of antiquities, and music, technical and agricultural schools.

VILLOISON, JEAN BAPTISTE GASPARD D'ANSESSE (or DANNSE) DE (1752-1800), French classical scholar, was born at Corbeil-sur-Seine on the 5th of March 1750 (or 1755; authorities differ). He belonged to a noble family (De Ansson) of Spanish origin, and took his surname from a village in the neighbourhood. In 1773 he published the Homeric Lexicon of Apollonius from a MS. in the abbey of Saint Germain des Prés. In 1778 appeared his edition of Longus's *Daphnis and Chloe*. In 1781 he went to Venice, where he spent three years in examining the library, his expenses being paid by the French government. His chief discovery was a 10th-century MS. of the *Iliad*, with ancient scholia and marginal notes, indicating supposititious, corrupt or transposed verses. After leaving Venice, he accepted the invitation of the duke of Saxe-Weimar to his court. Some of the fruits of his researches in the library of the palace were collected into a volume *Epistolae Vinarienses*, (1778), dedicated to his royal hosts. Hoping to find a treasure similar to the Venetian Homer in Greece, he returned to Paris to prepare for a journey to the East. He visited Constantinople, Smyrna, the Greek islands, and Mount Athos, but the results did not come up to his expectation. In 1786 he returned, and in 1786 brought out the Codex Venetus of Homer, which created a sensation in the learned world. When the revolution came out, being banished from Paris, he lived in retirement at Orléans, occupying himself chiefly with the transcription of the notes.
in the library of the brothers Valois (Valesius). On the restoration of order, having returned to Paris, he accepted the professorship of modern Greek established by the government, and held it until it was transferred to the Collège de France as the professorship of the ancient and modern Greek languages. He died soon after his appointment, on the 25th of April 1805.

Another work of some importance, *Anecdota Graeca* (1781), from the Paris and Venice libraries, contains the *Ionia* (violet garden) of the *empress Eudocia, and several fragments of Lambichus, Porphyry, Procopius of Gaza, Choricius and the Greek grammarians. Materials for an exhaustive work contemplated by him on ancient and modern Greece are preserved in the royal library of Paris.

See J. Dacier, *Notice historique sur la vie et les ouvrages de Villon* (1806); Chardon de la Rochette, *Mélanges de critique et de philologie*, iii. (1812); and especially the article by his friend and pupil E. Guettremer in *Nouvelle biographie générale*, xiii., based upon private information.

**Villon, François** (1431–1463), French poet (whose real surname is a matter of much dispute, so that he is also called De Montcorbejard and Des Loges and by other names, though in literature Villon is the sole term used), was born in 1431, and, as it seems, certainly at Paris. The singular poems called *Teatrofe* and the other, more or less, have only certain work, are largely autobiographical, though of course not fully trustworthy. But his frequent collisions with the law have left more certain records, which have of late been ransacked with extraordinary care by students, especially by M. Longnon. It appears that he was born of poor folk, that his father died in his youth, but that his mother, for whom he wrote one of his most famous *ballades*, was alive when her son was thirty years old. The very name Villon was stated, and that by no mean authority, the president Claude Fauchet, to be merely a common nickname, and not a proper signifying "cheesemonger" or "railroad"; but this seems to be a mistake. It is, however, certain that Villon was a person of loose life, and that he continued, long after there was any excuse for it in his years, the reckless way of living common among the wilder youth of the university of Paris. He appears to have derived his surname from a friend and benefactor named Guillaume de Villon, chaplain in the collegiate church of Saint-Benoît-le-Bestourné, and a professor of canon law, who took Villon into his house. The poet became a student in arts, no doubt early, perhaps at about twelve years of age, and took the degree of bachelor in 1450, and that of master in 1455. Between this year and 1455 nothing positive is known of him, except that nothing was known against him. Attempts have been made, in the usual fashion of conjectural biography, to fill up the gap with what a young graduate of Bohemian tendencies would, could, or might have done; but they are mainly futile.

On the 5th of June 1455 the first important incident of his life that is known occurred. Being in the company of a priest named Giles and a girl named Isabeau, he met, in the rue Saint-Jacques, a certain Breton, Jean le Hardi, a master of arts, who was with a priest, Philippe Chermoyre or Sermoine or Sermaise. A scuffle ensued; daggers were drawn; and Sermaise, who was accused of having threatened and attacked Villon and drawn the first blood, not only received a dagger-thrust in return, but a blow from a stone which struck him down. Sermaise died of his wounds. Villon fled, and was sentenced to banishment—a sentence which was remitted in January 1456, the formal pardon being extant, strangely enough, in two different documents, in one of which the culprit is described as "Francois des Loges, autrement dit Villon," in the other, "Francois de Villes." He was also said to have described himself to the barber-surgeon who dressed his wounds as Michel Mouton is less surprising, and hardly needs an addition to the list of his aliases. It should, however, he said that the documents relative to this affair confirm the date of his birth, by representing him as twenty-six years old or thereabouts. By the end of 1456 he was again in trouble. In his first broil "la femme Isabeau" is only generally named, and it is impossible to say whether she had anything to do with the quarrel. In the second, Catherine de Vauclées, of whom we hear not a little in the poems, is the declared cause of a scuffle in which Villon was so severely beaten that, to escape ridicule, he fled to Angers, where he had an uncle who was a monk. It was before leaving Paris that he composed what is now known as the *Petit testament*, of which we shall speak presently with the rest of his poems, and which, it should be said, shows little or no such mark of profound bitterness and regret for wasted life as does its in every sense greater successor the *Grand testament*. Indeed, Villon's serious troubles were only beginning, for he, like the other innocent accused, was sentenced to banishment and he did not attempt to return to Paris. In fact for four years he was a wanderer; and he may have been, as each of his friends Regnier de Montigny and Colin des Caux was certainly a member of a wandering thieves' gang. It is certain that at one time (in 1457), and probable that at more times than one, he was in correspondence with Charles d'Orléans, and it is likely that he resided, at any rate for some period, at that prince's court at Blois. He had also something to do with another prince of the blood, Jean of Bourbon, and traces are found of him in Poitou, in Dauphiné, &c. But at his next certain appearance he is again in trouble. For it is said that he had spent the summer of 1457 in the bishop's prison (bishops were fatal to Villon) of Meung. His crime is not known, but is supposed to have been church-robbery; and his enemy, or at least judge, was Thibault d'Aussigny, who held the see of Orleans. Villon owed his release to a general gaol-delivery at the accession of Louis XI., and became a free man again on the 2nd of October.

It was now that he wrote the *Grand testament*, the work which has immortalized him. Although he was only thirty at the date (1461) of this composition (which is unmistakable, because given in the book itself), there seems to be no kind of aspiration or ambition in it, even any hankering after the old. Nothing appears to be left him but regret; his very spirit has been worn out by excesses or sufferings or both. Even his good intentions must have been feeble, for in the autumn of 1462 we find him once more living in the cloisters of Saint-Benoît, and in November he was in the Châtelet for theft. In default of evidence the old charge of the college of Navarre was revived, and even a royal pardon did not bar the demand for restitution. Bail was, however, accepted, but Villon fell promptly into a street quarrel, was arrested, and it is said that he had spent the summer of 1462 in banishment by the parlement on the 5th of January 1463. The actual event is unknown: but from this time he disappears from history. Rabelais indeed tells two stories about him which have almost necessarily been dated later. One is a countryside anecdote of a trick supposed to have been played by the poet in his old age at Saint Maixent in Poitou, whither he had retired. The other, a coarse but pointed jest at the expense of England, is told as having been addressed by Villon to King Edward V. during an exile in that country. Now, even if King Edward V. were not evidently out of the question, a passage of the story refers to the well-known scholar and man of science, Thomas Linacre, as court physician to the king, and makes Villon mention him, whereas Linacre was only a young scholar, not merely at the time of Edward V.'s supposed murder, but at the extreme date (1489) which can be assigned to Villon's life. For in this year the first edition of the poet's work appeared, obviously not published by himself,
and with no sign in it of his having lived later than the date (1461) of the Grand Testament. It would be easy to dismiss these Rabelaisian mentions of Villon as mere humorous inventions, if it were not that the author of Pantagruel was born almost soon enough to have actually seen Villon if he had lived to anything that could be called old age, that he almost certainly must have known men who had known Villon, and that the poet undoubtedly spent much time in Rabelais's own country on the banks of the lower Loire.

The obscurity, the unapprehension, and the evil reputation of Villon's life was due chiefly to the mingling of events to which the events of that life have been subjected, and the result of which has been summed up here. But his poetical work, scanty as the certainly genuine part of it is, of such extraordinary quality and of such incongruous mixture, constitutes, up to the eight-line stanzas of eight-syllabled verse, varied in the case of the Grand Testament by the insertion of ballades and rondelues of a very great beauty, is an interesting example of formal poetry and way of verse from the same kind for more than a century past. What really distinguishes Villon is the intense critical quality of his poetical feeling and expression, and what is perhaps arrogantly called the realism of his image and thought. Medieval poetry, with rare exceptions, and, with exceptions not quite so rare, classical poetry, are distinguished by their lack of what is now called the personal note. In Villon this note sounds, struck with singular force and skill. Again, the simple joy of living which distinguishes both periods—the medieval, despite a common opinion, scarcely less than the ancient—has disappeared. Even the riot and the gallantry of Villon have less of the charm with which the Elizabethan poets and playwrights encountered it, as a joy of remembrance than sense of their vanity. This sense of vanity, indeed, not of the merely religious, but of the purely mundane and even half-pagan kind, is Villon's most prominent characteristic. It imparts to his narrative, despite its burlesque facettes, all through; it is the very keynote of his most famous and beautiful piece, the Ballade des dames du temps jadis, with its refrain, "Mais oû sont les nôgres d'ant'un?" as well as of his most dashing piece of realisation, the other ballade of La Croix Margot, with its burden of hopeless entanglement in shameless vice. It is nowhere more clearly sounded than in the piece which ranks with these two at the head of Villon's work, Le Jargon de la Bûcheronnière. The poem is, once young and beautiful, now old and withered, laments her lost charms. So it is almost throughout his poems, including the grim Ballade des pendus, and hardly excluding the very beautiful Barcarolle, with its delightful mixture of old French innocence and sly wit. It is in the profound melancholy which the dominance of this note has thrown over Villon's work, and in the suitableness of that melancholy to the temper of his contemporaries and of his power and charm have consisted, though it is difficult to conceive any time at which his poetical merit could be ignored. His certainly genuine poems consist of the two Testaments with their codices (the latter containing the Ballade des pendus, and more properly Epitaphe en forme de ballade, and some other pieces of a similarly grim humour), a few miscellaneous poems, chiefly ballades, and an extraordinary collection (called Le Jargon ou joliette) of pieces, the greater part of which is entirely invented and fantastical, if, which may perhaps be doubted, it ever was otherwise. Besides these, several poems of no inconsiderable interest are usually placed with Villon, though they are the certain work of another hand, not his. The chief are Les Reques Franches, a curious series of verse stories of cheating tavern-keepers, &c., having some resemblance to those told by George Peele, but of a broader and coarser humour. These, though in many cases "the essence of the broader tale-kind, are not much later than his time, and evidence to reputation if not to fact. Another of these poems is the extremely amusing monologue of the Franc Archeryhand which has the newness of the recently trained archers or regularly trained and paid soldiery, who were extremely unpopular in France, is made to expose his own poltroonery. The third most important piece of this kind is the Dialogues de M. l'Amoureux et de son jeune page et la Saloperie de Fauteuil, a sort of between two penniless speckthinds, which is not without merit. These poems, however, were never attributed to Villon or printed with his works till far into the 16th century. The first edition of the first of these poems, La Croix Margot, though some have held one or more than one undated copy to be still earlier. Between the first, whenever it was, and 1542 there were very numerous editions, the most famous being that (1553) of Clément Marot, one of whose most honourable distinctions is the care he took of his poetical predecessors. The Plaidé movement and the classicising of the grand siècle put Villon rather out of place, and he was again neglected, till the last years of the reign of Charles IX., when he attracted the attention of students of old French like De Lachâtre, Bernard de la Monnoye and Prosper Marchand. The first critical edition in the modern sense—that is, to say, an edition of the poems in a modern language and with commentaries—was that of Abbé H. R. Prompsuit in 1832. The next was that of the "Bibliothèque Jacob" (F. Lacroix) in the Bibliothèque Estiverniere (Paris, 1854). The long-suppressed and long-forgotten edition of Rabelais is that of Auguste Longnon (1802). This contains copies of the documents on which the story of Villon's life is based, and a bibliography. The late M. Marcel Schwob discovered new documents relating to the poet, which have been published, and it is believed that he was not dead as he is said to have been. His poems were posthumously published in 1605. See also A. Campaux, F. Villon, sa vie et ses œuvres (1859); A. Longnon, Étude biographique (1877); M. Pierre, Les ballades de Villon (1852); and an edition of Le Jargon with a preface into ordinary French. (G. S.)

VILONA, or WILNO, a Lithuanian government of West Russia, having the Polish name of Suwałki on the W., Kovno and Vitebsk on the N., and Minsk and Grodno on the E. and S. Area, 16,176 sq. m.; pop. (1906 estimate) 1,866,500. Villna lies on the broad marshy swelling, dotted with lakes, which separates Poland from the province of East Prussia and stretches E.N.E. towards the Valdai Plateau.

Its highest parts are a little more than 1000 ft. above sea-level. Over 40 per cent. of the land is cultivated. The chief crops are rye, potatoes, and hemp, and there is a good deal of forest. The valleys of the Niemen and the S. Divna. It is chiefly built up of Lower Tertiary deposits, but in the north Devonian sandstones appear on the surface. The Tertiary deposits consist of Eocene clay, slates, sandstones, limestones and chalk, with gypsum, and are partly of marine and partly of terrane origin. The whole is overlain with thick layers of Glacial boulder clay and post-Glacial deposits, containing remains of the mammath and other extinct mammals. Interesting discoveries of Nolithic implements, especially of polished stone, and of implements belonging to the Bronze Age and the early years of the Christian epoch, have been made. The church is of the same kind as the Bakhchisarai, in Asia Minor, and is partly of brick, and partly of stone, and scarcely passable except when frozen, as well as wet meadow-land, occupy a large area in the centre of the government. The Niemen, which flows along the southern and western borders for about 140 miles, is in this respect by its tributary the Villna, which flows west for more than 200 m. through the central parts of Vilna, receiving many afluents on its course. Among the tributaries of the central, is the Berezina, which acted as rear-guard during Napoleon's retreat in 1812; it flows in a marshy valley in the south-east. The S. Divna for 50 m. of its course separates Vilna from Vitebsk. The climate of the government is only slightly tempered by its proximity to the Baltic Sea (January, 21°8' July, 64°8'; the average temperature at the town of Vilna is only 43°5. But in winter the thermometer descends very low, a minimum of 35° having been observed. The forest and della are inter-medium between those of Poland and middle Russia.

The government is divided into seven districts, the chief towns of which are Vilna, Vileik, Disna, Lida, Oshmany, Zventzyany and Kryven-stro. The next district is the chief government of the same name, 436 m. S.W. of St. Petersburg, at the intersection of the railways from St. Petersburg to Warsaw and from Libau to the mouth of the Don. Pop. (1883) 93,760; (1900) 162,633. With its suburbs Antokol, Lukishki, Pogulanka and Sareczye, it stands on and around a knot of hills (2450 ft.) at the confluence of the Vileika with the Vitly. Its streets are in part narrow and not very clean; but Vilna is an old town, rich in historical associations. Its imperial palace, and the cathedral of St Stanislaus (1357, restored 1801), containing the silver sarcophagus of St Casimir and the tomb of Prince Witoff, are fine buildings. There is a second cathedral, that of St Nicholas, built in 1556-1604; also several churches dating
from the 14th to the 16th centuries. The Ostra Brama chapel contains an image of the Virgin greatly venerated by Orthodox Greeks and Roman Catholics alike. The museum of antiquities has valuable historical collections. The ancient castle of the Jagellones is now a mass of ruins. The old university, founded in 1578, was restored (1803) by Alexander I., but has been closed since 1832 for political reasons; the only departments which remain in activity are the astronomical observatory and a medical academy. Vilna is an archiepiscopal see of the Orthodox Greek Church and an episcopal see of the Roman Catholic Church, and the headquarters of the Lithuanian province of the III. army corps. The city possesses a botanical garden and a public library, and is adorned with statues to Catherine II. (1903), the poet Pushkin and Count M. Muraviev (1898). It is an important centre for trade in timber and grain, which are exported; and has theological seminaries, both Orthodox Greek and Roman Catholic, a military school, a normal school for teachers and professional schools. It is the seat of many scientific societies (geographical, medical and archæological), and has a good antiquarian museum and a public library.

Firstly the territory of Vilna has been occupied by the Lithuanians since the 10th century, and probably much earlier; their chief fortified town, Vilna, is first mentioned in 1128. A temple to the god Perkunas stood on one of its hills till 1387, when it was destroyed by Prince Jagiello, after his baptism. After 1393, when Gedymin, prince of Lithuania, abandoned Troki, Vilna became the capital of Lithuania. The formerly independent principalities of Minsk and Lidy, as well as the territory of Disna, which belonged to the Polotsk principality, were annexed by the Lithuanian princes, and from that time Vilna, which was fortified by a stone wall, became the chief city of the Lithuanian state. It was united with Poland when its prince, Casimir IV., was elected (1447) to the Polish throne. The plague of 1588, a fire in 1610 and still more the wars between Russia and Poland, which began in the 17th century, checked its further growth. The Russians took Vilna in 1655, and in the following year it was ceded to Russia. The Swedes captured it in 1702 and in 1706. The Russians again took possession of it in 1788; and it was finally annexed to Russia in 1795, after the partition of Poland. Its Polish inhabitants took an active part in the risings of 1831 and 1863, for which they were severely punished by the Russian government.

VILVORDE, a town of Belgium in the province of Brabant, 9 m. N. of Brussels and on the Sene. Pop. (1904) 14,418. The old castle of Vilvorde, which often gave shelter to the dukes of Brabant in their days of trouble, is now used as a prison. The younger Teniers lived and died at a farm outside Vilvorde, and is buried in the parish church of Dry Torch.

VINCENNES, a town of northern France, in the department of Seine, on a wooded plateau 14 m. E. of the fortifications of Paris, with which it is connected by rail and tram. Pop. (1906) town, 29,791; commune, 34,185. Its celebrated castle, situated to the south of the town and on the northern border of the Bois de Vincennes, was formerly a royal residence, begun by Louis VII. in 1164, and more than once rebuilt. It was frequently visited by Louis IX., who held informal tribunals in the neighbouring wood, a pyramid marking the spot where the oak under which he administered justice is said to have stood. The chapel, an imitation of the Sainte Chapelle at Paris, was begun by Charles V. in 1379, continued by Charles VI. and Francis I., consecrated in 1552 and restored in modern times. In the sanctuary is the magnificent tapestry representing the coronation of the Duke of Englen, who was shot in the castle moat in 1804. Louis XI. made the castle a state prison in which Henry of Navarre, the great Condé, Mirabeau and other distinguished persons were afterwards confined. Under Napoleon I. the castle became a magazine of war-material. Louis XVIII. added an armory, and under Louis Philippe numerous case-mates and a new fort to the east of the donjon were constructed. The place now serves as a fort, arsenal and barracks. It forms a rectangle 417 yds. long by 245 yds. wide. The enclosing wall was originally flanked by nine towers, which were cut down to its level between 1808 and 1811, and now serve as bastions. The donjon is a square tower, 170 ft. high, with turrets at the corners. The Bois de Vincennes, which covers about 2,300 acres and stretches to the right bank of the Marne, contains a race-course, a military training-ground, a school of military explosives (pyrotechnic), several artificial lakes, an artillery polygon and other military establishments, an experimental farm, the redoubts of Gravelle and La Faisanderie and the normal school of military gymnastics. The wood, which now forms the second empire of the same lines as the Bois de Boulogne. On its south border is the asylum of Vincennes, founded in 1835 for the benefit of convalescents from the hospitals. In the town there is a statue of General Daumesnil, celebrated for his defense of the castle against the allies in 1814 and 1815. Vincennes has a school of military administration and carries on horticulture and the manufacture of ironware of various kinds, rubber goods, chemicals, perfumery, mineral waters, etc.

VINCENNES, a city and the county-seat of Knox county, Indiana, U.S.A., in the S.W. part, on the E. bank of the Wabash river, in the S.W. corner of the S.W. quadrant of section 29,793 (1890) 8835; (1900) 10,249, of whom 736 were foreign-born; (1910 census) 14,895. It is served by the Baltimore & Ohio South-Western, the Cleveland, Cincinnati, Chicago & St Louis, the Evansville & Terre Haute, and the Vandalia railways. Extensive levees, 15 m. in length, prevent the overflow of the Wabash river, which for nine months in the year is navigable from this point to the Ohio. The city is level and well drained, and has a good water-supply system. In Vincennes are a Roman Catholic cathedral, erected in 1839, opposite the Methodist church, West, occupying the site of a church built early in the 18th century; Vincennes University (1866), the oldest educational institution in the state, which in 1910 had 14 instructors and 236 students; St Rose Female Academy, and a public library. Coal, natural gas and oil are found near Vincennes. The city is a manufacturing and railway centre, and ships grain, pork and neat cattle. The total value of the factory products in 1905 was $3,172,799. Vincennes was the first permanent settlement in Indiana. On its site François Margrane, Sieur de Vincennes, established a French military post about 1731, and a permanent settlement was made about the fort in 1735. After the fall of Quebec this place remained under French sovereignty until 1777, when it was occupied by a British garrison. In 1778 an agent of George Rogers Clark took possession of the fort on behalf of Virginia, but it was soon afterwards again occupied by the British, who called it Fort Sackville and held it until February 1779, when it was besieged and was captured (on the 25th of February) by George Rogers Clark, and passed finally under American jurisdiction. The site of the fort is marked by a granite shaft erected in 1905 by the Daughters of the Revolution. Vincennes was the capital of Indiana Territory from 1800 to 1813, and was the meeting-place in 1805 of the first General Assembly of Indiana Territory. In 1839 it was incorporated as a borough, and it became a city in 1856.

See J. Law, The Colonial History of Vincennes (Vincennes, 1858); W. H. Smith, "Vincennes, the Key to the North-West," in L. P. Powell's Historic States of the Western States (New York, 1901); "The Capture of Vincennes by George Rogers Clark," Old South Leaflets, No. 43 (Boston, n.d.); also chap. ii. of J. P. Dunn's Indiana (Boston, 1892).

VINCENT (or VINCENTUS), ST, deacon and martyr, whose festival is celebrated on the 22nd of January. In several early MSS. St Vincent is styled the "Apostle of Spains" and the "Apostle of the Moors." These accounts of the saint are due to the fact that he died a martyr, and refers to Acts which were read in the church. It is doubtful whether the Acts that have come down to us (Acta Sanctorum, January, ii. 304-307) are those referred to by St Augustine, since it is not certain that they are a contemporary document. According to this account, Vincent was born of noble parents in Spain, and was educated by Valerius, bishop of Saragossa, who ordained him to the diaconate. Under the persecution of Diocletian, Vincent was arrested and taken to Valencia. Having stood firm in his profession before Diacuanus,
the governor, he was subjected to excruciating tortures and thrown into prison, where angels visited him, lighting his dungeon with celestial light and relieving his sufferings. His warders, having seen these wonders through the chinks of the wall, forthwith became Christians. He was afterwards brought out and laid upon a soft mattress in order that he might regain sufficient strength for new torments; but, while Dacianus was meditating punishment, the saint gently breathed his last. The tyrant exposed his body to wild beasts, but a raven made a nest in his breast and preserved him in the sea, but was cast up on the shore, recovered by a pious woman and buried outside Valentine. Prudentius devoted one of his hymns (Peristephe, v.) to St Vincent, and St Augustine attests that in his lifetime the festival of the saint was celebrated throughout the Christian world (Serm. 276, n. 4).

VINCENT OF BEAUVS, or VINCENTUS BREVACENSES (c. 1570-c. 1634), the encyclopaedist of the middle ages, was probably a native of Beauvais. 1 The exact dates of his birth and death are unknown. A tolerably old tradition, preserved by Louis a Valloleti (c. 1413), gives the latter as 1624, 2 but Tholomaeus de Luca, Vincent's younger contemporary (d. 1321), seems to reckon him as living during the pontificate of Gregory X (1271-76). If we assume 1264 as the year of his death, the immense volume of his works forbids us to think he could have been born much later than 1190. Very little is known of his career. A plausible conjecture makes him enter the house of the Dominicans at Paris between 1215 and 1220, from which place a second correspondence carries him to the Dominican monastery founded at Beauvais in 1228-29. There is no evidence to show that the Vincent who was sub-pror of this foundation in 1246 is the encyclopaedist; nor indeed is it likely that a man of such abnormally studious habits could have found time to attend to the daily business routine of a monastic establishment. It is certain, however, that he at one time held the post of "reader" at the monastery of Royaumont (Mons Regalis), not far from Paris, on the Oise, founded by St Louis between 1223 and 1235. St Louis read the books that he compiled, and supplied the funds for procuring copies of such authors as he required for his com-

1 He is sometimes styled Vincentius Burgundus; but, according to M. Dauzou, this appellation cannot be traced back further than the first half of the 15th century.

2 Apparently confirmed by the few enigmatical lines preserved by Échard from his epitaph—

"Perturb iste necem post annos mile ducentos, Seneaiga decem sex habe, sex mili retenens,"
VINCENT, G.—VINCENT DE PAUL, ST

The last book (xvi.) of the Speculum Doctrinale is a summary of the Speculum Naturale, so the Speculum Historiale may be regarded as the expansion of the last book of the same work. It consists of thirty books, divided into 267 chapters. The first chapter deals with the mysteries of God and the angels, and then passes on to the works of the six days and the creation of man. It includes dissertations on the various views of ancient arts and writers, and affords a detailed history of the world to the sojourn in Egypt. The next eleven books (ii.—xi.) conduct us through sacred and secular history down to the triumph of Christianity under Constantine. Then the great paroxysm of the Church is described, and the letters xvi.; and book xvi., gives an account of Daniel's nine kingdoms, in which account Vincent differs from his professed authority, Sigebert of Gembloux, by reckoning England as the fourth instead of the fifth. In the chapters devoted to the origins of Britain he relies on the Brutus legend, but cannot carry his catalogue of British or English kings further than 735, where he honestly confesses that his authorities fail him. Seven more books bring us to the

VINCENT, GEORGE (1796-1832), English landscape and marine painter, was born at Norwich in June 1796. He studied art under "Old" Crome, and at the age of fifteen began to contribute to the Norwich exhibition. From 1814 till 1823 he exhibited occasionally at the Royal Academy, and also in the Water-Colour Exhibition and the British Institution. In 1819 he removed from Norwich to London, and he was a contributor to the Suffolk Street gallery from its foundation in 1824 till 1830. He received great and increasing encouragement, and his works became slight and hastily executed. Finally he dropped out of sight, and he is believed to have died about 1837.

His most important work, a "View of Greenwich Hospital," was shown in the International Exhibition of 1852. His "London from the Surrey Side of Waterloo Bridge" is also a fine work.

VINCENT, MARY ANN (1818-1887), American actress, was born in Portsmouth, England, on the 18th of September 1818, the daughter of an Irishman named Farlin. Left an orphan at an early age, she turned to the stage, making her first appearance in 1834 as Lucy in The Forester, at Cowes, Isle of Wight. The next year she married J. R. Vincent (d. 1850), an actor with whom she toured England and Ireland for several years. In 1846 Mrs J. R. Vincent went to America to join the stock company of the old National theatre in Boston. Here she became a great favourite. No actress in America, except Mrs Gilbert, has ever been such a "dear old lady" to so wide a circle of constant admirers. She died in Boston on the 4th of September 1857. Her memory is honoured by the Vincent Memorial Hospital, founded in that city in 1859 by popular subscription, and formally opened on the 6th of April 1897, by Bishop Phillips Brooks, of the church of the Institution, and the poet, who became afterwards Cardinal de Bérulle, who was then founding the congregation of the French Oratory. At Bérulle's instance he became curate of Cîteaux near Paris (1611); but this charge he soon exchanged for the post of tutor to the count of Joigny at Folleville, in the diocese of Amiens, where his success in dealing with the spiritual needs of the peasants led to the "missions" with which his name is associated. In 1617 he accepted the curacy of Châtillon-lès-Dombes (or sur-Chalâonne), and here he received from the countess of Joigny the breaks, by which he was enabled to found his first "confrérie de charité," an association of women who ministered to the poor and the sick. In 1619 Louis XIII. made him royal almoner of the galleys. Among the works of benevolence with which his name is associated are the establishment of a hospital for galleys slaves at Marseilles, the institution of two establishments for foundlings at Paris, and the organization of the "Filles de la Charité," to supplement the work of the confréries, whose members were mainly married women with domestic duties. He died at Paris on the 27th of September 1660, and was buried in the church of St Lazare. He was beatified by Benedict XIII. in 1729, and canonized by Clement XII. in 1737, his festival (duplex) being observed on the 19th of July. The Society of St Vincent de Paul was founded by Frederic Ozanam and others in 1833, in reply to a charge brought by some free-thinking contemporaries that the church no longer had the strength to inaugurate a practical enterprise. In a variety of ways it does a great deal of social service similar

to that of gilds of help. Its administration has always been in the hands of laymen, and it works through local "conferences" or branches, the general council having been suspended because it declined to accept a cardinal as its official head.

VINCENT OF LERINS, ST, or VINCENTIS LERINSENSI (d. c. A.D. 450), an ecclesiastical writer of the Western Church of whose personal history hardly anything is known, except that he was a native of Gaul, possibly brother of St Loup, bishop of Troyes, that he became a monk and priest at Lerinum, and that he died in or about 450. Lerinum (Lerins, off Cannes) had been made by Honoratus, afterwards bishop of Arles, the seat of a monastic community which produced a number of eminent churchmen, among them Hilary of Arles. The school did not produce an extensive literature, but it played an important part in resisting an exaggerated Augustinianism by reasserting the freedom of the will and the continued existence of the divine image in human nature after the fall. As regards Vincent he himself tells us that only after long and sad experience of worldly turmoil did he betake himself to the haven of a religious life. In 434, three years after the council of Ephesus, he wrote the Commonitorium adversus profanos omnium haereticorum novitales, in which he ultimately sits at Augustine's doctrine of grace and predestination. In it he displays the "three " which distinguish Catholic truth from heresy, and (cap. 2) lays down and applies the famous threefold test of orthodoxy—quod ubique, quod semper, quod ab omnibus creditum est. It is very striking that in his appeal to tradition Vincent assigns no part to the bishops as such—apart from the council; he appeals to the ancient "teachers," not to any apostolic succession. His "semi-Pelagian" opposition to Augustine is dealt with by Prosper of Aquitania in his Pro Augustini doctrina responsiones ad capitula objectionum Vincentiorum. It explains why the Commonitorium has reached us only in a mutilated form.

The Commonitorium has been edited by Baluze (Paris, 1663, 1669 and 1684) and by Klüpfel (Vienna, 1800). It also occurs in vol. I. of Migne's Patroli. Ser. Lat. (1846). A full summary is given in A. Harnack's History of Dogma, iii. 230 ff. See also F. H. Stanton, Place of Authority in Religion, pp. 167 ff.; A. Cooper-Marston, The School of Lerins (Rochester, 1905).

VINCENzo FERRER, ST (1355-1419), Spanish Dominican preacher, was born of respectable parentage at Valencia on the 23rd of January 1355. In February 1374 he took the Dominican habit, and after spending some years in teaching, and in completing his theological studies, he was licensed to preach. He graduated as doctor of theology at Lerida in 1374, and his sermons in the cathedral of Valencia from 1385 onwards soon became famous. Cardinal Peter de Luna took him with him to Paris in 1391; and on his own election to the pontificate as antipope Benedict XIII. made Ferrer his confessor and master of the sacred palace. Finding, however, the ecclesiastical atmosphere of Avignon an uncongenial one, he in 1397 resumed his work as a preacher, and Spain, France, Italy, Germany and Great Britain and Ireland were successively visited by him; and in every case numerous conversions were the result of his eloquence, which is described as having been singularly powerful and moving. In 1412 he was delegated by his native city to take part in the election of a successor to the vacant crown of Aragon; and in 1416 he received a special invitation to attend the council of Constance, where he supported the cause of the Florentines (cf.). He died at Vannes on the 5th of April 1419, and was canonized by Calixtus III. in 1455, his festival (duplex) being observed on the 5th of April.

See A. Sorbetti, Il trattato di S. Vincenzo Ferrer intorno al Grande Scisma d'Occidente (Bologna, 1906).

VINCI, LEONARDO (1650-1730), Italian musical composer, was born at Strongoli in Calabria in 1650 and educated at Naples under Gaetano Greco in the Conservatorio dei Poveri di Gesù Cristo. He became known first by his comic operas in Neapolitan dialect in 1719; he also composed many serious operas. He was received into the Congregation of the Rosary at Formiello in 1728 and died by poisoning in 1730, not 1739, as is generally stated. His comic operas, of which Le Zite in Galera (1722) is the best, are full of life and spirit; in his serious operas, of which Didone Abbandonata (Rome, 1728) and Artaserse (Rome, 1730) are the most notable, have an incisive vigour and directness of dramatic expression deservedly praised by Burney. The well-known air "Vo solcando," from Artaserse, is a good example of his style.

VINDELCIA, in ancient geography, a country bounded on the S. by Raetia, on the N. by the Danube and the Vallum Maris at Aquincum (Buda), on the E. by the river Danube, and on the territory of the Helvetii. It thus corresponded to the N.E. portion of Switzerland, the S.E. of Baden, and the S. of Württemberg and Bavaria. Together with the neighbouring tribes it was subjugated by Tiberius in 15 B.C. and towards the end of the 1st century A.D. was made part of Raetia (q.v.). Its chief town was Augusta Vindelicorum (Augsburg). Its inhabitants were probably of Celtic origin (cf. the recurrence of Vind- in other Celtic names—Vindobona, Vindonissa); some authorities, however, regard them as German. According to Dio Cassius (liv. 22) they were an agricultural people, and later (e.g. Isidorus, Origines, i. 4), describe the country as very fertile.

VINDHYA, a range of mountains in Central India. It forms a well-marked, though not quite continuous, chain across India, separating the Ganges basin from the Deccan. Starting on the west in Gujurat, the Vindhyas cross Malwa and the central portions of India, until their easternmost spurs abut on the valley of the Ganges at Rajmahal. They thus roughly form the northern side of the triangle, of which the other two sides are the Eastern and Western Ghats. They have an elevation of 1,500 E. and 300 ft. crossing 200 it. Geologically they give their name to the "Vindhyan formation," one of the recognized rock systems of India. In legendary tradition they formed the demarcating line between the Madya-desha or middle land of the Sanskrit invaders and the non-Aryan Deccan, and they are still largely inhabited by aboriginal races such as the Bhils.

VINE. The grape-vine, botanically Vitis, is a genus of about thirty species, widespread in the north temperate zone, but richest in species in North America. The best known and cultivated species is the old-world grape-vine, Vitis vinifera; a variety of this, silvestris, occurs wild in the Mediterranean region, spreading eastwards towards the Caucasus and northwards into western Germany, and may be regarded as the parent of the cultivated vine. It is of interest to note that grape-stones have been found with mummies in Egyptian tombs of not later age than 3000 years. The seeds have the characteristics of those of V. vinifera, but show some very slight variations from the type of seed now prevalent. Among the Greeks in the time of Homer wine was in general use. The cultivation of the vine must also have been introduced into Italy at a very early period. In Virgil's time the varieties in cultivation seem to have been exceedingly numerous; and the varied methods of training and culture now in use in Italy are in many cases identical with those described by Columella and other Roman writers. Grape-stones have been found among the remains of Swiss and Italian lake dwellings of the Bronze period, and others in tufaceous volcanic deposits near Montpellier, not long before the historic era.

The old-world species is also extensively cultivated in California, but the greatest extent of the vine in the United States has been developed from native species, chiefly V. Labrusca and V. aestivalis and their hybrids with V. vinifera. Some of the American varieties have been introduced into France and other countries infested with Phyloxera, to serve as stocks on which to graft the better kinds of European vines, because their roots, though perhaps equally subject to the attacks of the insects, do not suffer so much injury from them as the European species.
The vine requires a high summer temperature and a pro-
longed period in which to ripen its fruit. Where these are
forthcoming, it can be profitably cultivated, even though
the winter temperature be very low. Thirhatchel mentions
that at Erivan in Russian Armenia the mean winter tempera-
ture is 71° C. and finds the cultivated vine fit, usually harvest-
ing itself at the mean temperature of January is 41° C. and
the minimum — 25° C., and yet at both places the vine is grown with success. In the
Alps it is profitably cultivated up to an altitude of 1870 ft.,
and in the north of Piedmont as high as 3180 ft. At the present
time the limit of profitable cultivation in Europe passes
from Brittany, lat. 47° 30', to beyond the Rhine by Liége and
through Thuringia to Silesia in lat. 51° 55'. In former
centuries vines were cultivated to the north of this region, as,
for instance, in Holland, in Belgium largely, and in England,
where they might still be grown. Experimentations have been
made in this direction near Cardiff in South Wales. The
yield is satisfactory, and the wine made, the variety known as
Gamay noir, is described as being like still champagne. In
the middle ages, owing to various causes, the better vines
of France and Germany could not be obtained in England
except at prohibitive prices; but when this state of things
ceased, and foreign wine could be imported, the English con-
sumers would no longer tolerate the inferior productions of
their own vineyards. It is also probable that the English
mixed sugar or honey with the wine and thus supplied artificially
the sweetness which the English sun denied. It is a curious
fact that at the present day much or even most of the wine
of finest quality is made at or near to the northern limits of
possible cultivation with profit. This circumstance is probably
explained by the greater care and attention bestowed both
on the cultivation of the vine and on the manufacture of the
wine in northern countries than in those where the climate
is more propitious. The relative inferiority of the wines made
at the Cape of Good Hope and in Australia is partly due to
variations of climate, the vine not having been so widely
adapted and cultivated as partly to the deficient skill of the
manufacturers. That such inferiority may be expected to
disappear is suggested by the success of vine-culture in Madeira
and the Canary Islands.

The development of other species of Vitis, such as the curious
succulent species of the Soudan and other parts of equatorial
Africa, or the numerous kinds in India and Cochin China, is
of course possible under suitable conditions; but it is obvious
that an extremely long period must elapse before they can
successfully compete with the product of many centuries.
[See also generally the article Wijn. For currants and
raisins, both produced by varieties of the grape-vine, see the
respective articles.]

Apart from their economic value, vines are often cultivated for
purely ornamental purposes, owing to the elegance of their
foliage, the rich coloration they assume, the shade they afford,
and their hardihood.

Vines have woody climbing stems, with alternate, entire or
palmately lobed leaves, provided at the base with small stipules.
Opposite some of these leaves spring a tendril, by aid of which the
plant climbs. There are numerous transitional states between the
ordinary form of tendril and the inflorescence. The flowers are
small, green and fragrant, and are arranged in dense clusters. Each
has a small calyx in the form of a shallow rim, sometimes five-lobed
or toothed; five petals, which cohere by their tips and form a cap
or hood, which is pushed off when the stamens are ripe; and
five free stamens, placed opposite the petals and springing from a
common ovary. Each bears a two-celled anther. The anomalous
position of the stamens in front of the petals is explained by the abortion or non-development of the ovary which indicates the fact that the ovary, as seen on the hypogynous disk encircling the ovary. The ovary
bears a sessile stigma and is more or less completely two-celled,
with two erect ovules in each cell. This ripens into the berry and seed. The cultivated vine has usually hermaphrodite
flowers; but as it occurs in a wild state, or as an escape from
cultivation, the flowers manifest a tendency towards unisexualit-
y that is, one plant bears flowers with stamens only, or only the
rudiments of the pistil, while on another plant the flowers are
bisexual. Exclusively female flowers without stamens do not appear
to have been observed. Seedling plants from the cultivated vines
often produce unisexual flowers, thus reverting to the feral type.
Perhaps the explanation of the fact that some of the cultivated
varieties are, as gardeners say, "bad setters,"—i.e. do not ripen their
fruit owing to imperfect fertilization,—is to be sought in this natural
tendency to dioecism.

The conformation of the vine stem has elicited a vast amount of
explanatory comment. The most generally accepted explanation
is the "symphalix" one. According to this, the shoot of the vine is a
"symphalix," consisting of a number of "podia" placed one over
the other in longitudinal series. Each podium consists of a portion of
the stem bearing one or more leaves, each with an axillary bud or
buds, and terminating in a tendril or an inflorescence. In V. Lab-
rata there is a tendril opposite to each leaf, so that the podium
bears only a single leaf. In other species there is a definite arrange-
ment of the leaves, some with and others without tendrils opposite
to them, the numerical order remaining constant or nearly so.
These arrangements have doubtless some reference to climatic
phenomena, continuity of growth being arrested by cold and pro-
duced by warmth. In any case, it is obvious that these facts might
be turned to practical ends in cultivation. A vine, for instance,
that produces bunches of grapes at each joint is preferable to one in
which there are several barren joints, as a larger quantity can be
grown within a smaller area. The practice of pruning or "stopping"
consciously or unconsciously, regulated by the mode of growth.
The tendril or inflorescence, according to the views above explained,
though in reality terminal, is bent to one side; hence it appears to
be lateral and opposite to the leaf. While the tendril is thus
diverted from its original direct course, the axillary bud of the leaf
opposite the tendril begins a new podium, by lengthening into a
shoot which assumes the direction the tendril had prior to its
deflexion. This new podium, now in a direct line with its predecessor,
produces leaves and ends in its turn in a tendril or inflorescence.
A third podium succeeds the second, and so on. Other authorities
explain the formation of the tendril and its anomalous position
opposite to a leaf by supposing that the end of the stem bilaterally
during growth, one division forming the shoot, the other the tendril
or inflorescence. It is not possible within the limits at our command
to specify the facts and arguments by which these theories are
respectively supported. Practically the tendrils assist the plant
in its native state to scramble over rocks or trees. As in the
case of similar formations generally, they are endowed with a
sensitivity to touch which enables them to grasp and coil
themselves round any suitable object which comes in their way,
and thus to support the plant. The seeds or grape-stones are
somewhat club-shaped, with a narrow neck-like portion beneath,
which expands into a rounded and thickened portion above. On
the inner or central side of the seed is a ridge bounded on either side
by a shallow groove. This ridge indicates the point of union of the
rachis, or seed-stalk with the seed; it serves to distinguish the
varieties of V. vinifera from those of other species. In endeavouring
to trace the filiation and affinities of the vine, the characters afforded
by the seed are specially valuable, because they have not been
wittingly interfered with by human agency. Characters derived
from the size, colour or flavour of the berry are of less value for
long-rod, the short-rod and the spur systems, and good crops have been obtained by each of them. It is admitted that larger bunches are generally obtained by the long-rod than by the spur system. The principal technique of this mode of pruning is to train in at considerable length, according to their strength, shoots of the last year's growth for producing shoots to bear fruit in the present; these rods are afterwards cut away and replaced by young shoots trained up during the preceding summer, and these in their turn cut out in the following autumn after bearing, and replaced by shoots of that summer's growth. By the short-rod system, short instead of long rods are retained; they are dealt with in a similar manner. The spur system has, however, become the most general. In this case the vines are usually planted so that one can be trained up under each rafter, or up the middle of the sash, the latter method being preferable if there is plenty of room for the foliage to expand; the lateral shoots, which will push out after the topping, must be again topped above their first or second joints. If the bunches are too numerous they must be thinned before the flowers expand, and the berries also must be properly thinned out and regulated as soon as they are well set, care being taken to avoid overcrowding, that the bunches be not made too thin and loose.

The cultivation of vines in pots is very commonly practised with good results, and pot-vines are very useful for forcing the earliest crop, the plants should be raised from eyes, and grown as strong as possible in the way already noticed, in rich turfy loam mixed with about one-third of horse dung and a little bone dust. The temperature should be gradually increased from 60° to 80°, or 90° by sun heat, and a bottom heat a few degrees higher must be maintained during their growth. As the roots require more room, the plants should be shifted from 3-inch pots into those of 6, 12 or 15 in. in diameter, in any of which larger sizes they may be rooted in the following season, but, to be successful in this, the young rod produced must be thoroughly matured after it has reached its limit of growth. The periodical thorough cleansing of the vine stems and every part of the house is of the utmost importance. The number of varieties of grapes possessing some merit is considerable, but a very few of them will be found sufficient to supply all the wants of the cultivator. For general purposes nothing approaches the Black Hamburgh (including Frankenthal) in merit. "Fungoid Diseases.—The most destructive form of fungoid disease
The attack, has whither finely dredged planting brown caused the to boil thr Charbon identical. In f England, 1848 had the or evaporated. shoots Europe, solutions (Phoma is to spots, side the America America, are shoots one disease iron characteristic in those bursts, disease bear in the centre the vineyard from the leaves, twigs and unripe grapes. On the upper side of the leaf, where it is first visible, it forms pale green irregular spots, which become darker in colour. On the under side the leaf these patches are white and are composed of the spore-bearing hyphae. The leaf ultimately becomes dried up and brittle. The grapes which are attacked cease to grow, turn brown or white, and ultimately dry up and fall off. This disease has been successfully treated with a spray of copper sulphate and lime, or sulphate of iron; solutions of these salts prevent the conidia from germinating.

Anthracnose is the name usually given to a disease formerly known as "charbon," "pech" or "brenner." This disease is caused by the parasitism of Sphaecoma ampelinum, one of the Pyrenomycetous fungi (fig. 4). The fungus assails all the green parts of the vine, and injures the leaves and young shoots as much as does the grape itself. The first sign of its presence is the appearance of a minute spot, which is greyish in the centre, with a brown border. This spot increases in size; in the stalks it assumes an oval shape, with its long axis parallel to the stalk, whilst in the leaves and grapes it is more or less circular in outline. The centre of the spots on the grapes becomes darker as the disease advances, and a red line appears dividing the dark brown border into an outer and an inner rim and giving a very characteristic appearance to the diseased plant. The surrounding tissue enlarges, so that the spots appear as if sunk in depressions, and bear a considerable resemblance to hailstone wounds. Later the spots on the leaves often drop out. The berries do not shrivel up as those do that are affected by the black rot. The mycelium of Sphaecoma grows just beneath the cuticle of the vine through which it soon breaks, forming a number of minute hyphae which bear conidia. These are minute, oval, colourless spores, which serve to spread the disease over the vineyard and from place to place. The complete life-history of this form is at present unknown; and it is not known as to where the fungus passes the winter, and in what form, would probably afford some useful indications as to the method that should be adopted to combat the disease. Anthracnose has been known in Europe for many years, but has only been observed in America since 1841, whether it was probably imported from the old world. As a preventive to its attacks the copper sulphate sprays and a solution (50%) of iron sulphate have been found very useful, as well as care in planting on well-drained soil that does not lie too low, the disease seldom appearing in dry, well-exposed vineyards. A great deal of confusion still exists with regard to this disease. A similar disease which of late has frequently been found in England, and which is ascribed to the fungus Gloeosporium ampelophagum, is very similar to it. In their mode of attack, in the symptoms they produce, and in the result upon the grapes and the vine the two fungi are so much alike that for practical purposes they may be regarded as identical. Nansen recommends that the shoots should be dredged with flowers of sulphur at intervals of ten days, while the disease continues to spread, a small quantity of quicklime in a finely powdered con-

whole grape. The latter for a time retains its plumpness, but on the appearance of little black pustules, which first occur on the part primarily affected, the grape begins to shrivel. This continues until the grape is reduced to a black hard mass, with the folds of skin pressed close against the seed. The dried masses from grape to grape, so that, as a rule many of the grapes in a bunch are destroyed. The hyphae of the mycelium of this fungus are septate, with numerous short branches. The pustules on the surface of these bunches of grapes, are supplied with spores, in such numbers, that if fungus passes the winter in the withered grapes which fall to the ground, and on these the mature form of the fungus (fig. 5, 2 and 3) is produced, hence every care should be taken to collect these and burn them. The use of the copper solutions mentioned above may also be recommended as a preventive.

Among the other fungi which infest the vine may be mentioned Physalospora, which, &c., Whilst the latter is perfectly harmless, it seems to be to the plants and burn them. Isolation of the diseased areas by means of trenches has also been practised.

VINEGAR, a dilute solution of impure acetic acid, prepared by the acetic fermentation of alcohol or of substances which yield alcohol or ethylic distillations (analogous is produced solely by acetic fermentation, wood vinegar being only employed in certain arts. Ordinary vinegar has been known from the earliest times, and its power of combining with or dissolving mineral substances caused the alchemists to investigate its preparation and properties. They failed however, to obtain pure acetic acid, although by distillation they prepared more concentrated solutions (spirits Veneris). In 1607 Stahl showed that vinegar could be concentrated by freezing out part of the water, and, better, in 1702, by neutralizing the acid with an alkali and distilling the salt with oil of vitriol. A notable improvement was made in 1789 by Löwitz, who showed that the dilute acid could be concentrated by repeatedly passing it over charcoal powder, and by cooling he obtained a crystalline substance named in 1777 by Durande, "glacial acetic acid."

The presence of an acid substance in the products of the dry distillation of wood wasters (analogous processes were proposed at about the same time by Wagemann in Germany and by Ham in England), and the older of "spirit" process.

In the "quick" process advantage is taken of the fact that the fermentation proceeds more quickly when a large surface of the liquid is exposed to air. Any alcoholic liquid can be treated. The apparatus consists essentially of a vat divided into three portions: the lowest, which is separated from the one above by a grid or false bottom, serves for the collection of the vinegar; the central portion, which is by far the largest, is the chamber wherein the fermentation is effected, and it is separated from the topmost section by a perforated with holes and drilled through which the liquid issuing from the base escapes. The central chamber is filled with material of large surface. The commonest are beech-wood shavings, which, before use, must be carefully freed from all extractives by washing and steaming, then dried and finally sourd by immersion in hot vinegar for twenty-four hours. The fermentedwort, prepared in various ways and of varying composition, or wine, is warmed to about 35° C. and then fed into the fermentation apparatus. The ratio of the liquor to the vine is increased, and the fermentation which ensues maintains the temperature at about 47° and draws a current of air upwards through the shavings, which after a time become covered with the so-called mould of yeast or hyphae. This forms a kind of sponge, which is completely converted into acetic acid, but stronger liquors require to be passed through the vat three or four times. Some of the alcohol (and consequently some acetic acid) is carried away by the air and some is converted into other volatile products by the factories by leading the air over or into water, whereby the alcohol and aldehyde are recovered. The same is effected in Singer's apparatus, besides to a certain extent the wood.

For making wine-vinegar by the slow process, full-bodied wines about one year old and containing 10% of alcohol (this amount being obtained, when necessary, by blending) are preferred; and they are then placed in casks, which may be made of oak, chestnut, or beech, and filled with boiling strong vinegar and allowed to stand for eight days. Nine pints of the wine are now added every day until the cask is two-thirds full, and the mixture is allowed to stand for fourteen days. After this interval from the casks are opened, the capes are drawn off, and more wine added. The working temperature is about 25°. The progress of the operation is shown by the white (from the alcohol) which forms on the surface. If in a day if it be reddish, more wine must be added. In certain parts of France, Holland, and of the Rhine district a different procedure is adopted. Two casks, fitted with false bottoms on which are placed wine cuttings, are taken; one cask is completely filled with the wine, whilst the other is only half filled. The acetic fermentation proceeds more rapidly in the second cask, and after twenty-four hours the contents of the two are mixed, and the process repeated. The product is settled in casks containing birch wood, and after fourteen days it is put upon the market.

In preparing malt vinegar, an infusion of malt is prepared by extracting it with water, and the liquor is finally boiled to the boiling-point. After cooling the extracts are fermented with yeast, and the product kept for some months before acetalization. This step can be effected by the quick process as described above, or by the slow process. In the latter the liquid at 25° is transferred to barrels lying on their sides and the fermentation allowed to proceed. When the process is complete the product is filtered through raps in a fine tun. This is a cask fitted with a false bottom in which are placed spent tanner's wood, shavings, or, better, the pressed stalks and skins of grapes and raisins from wine manufacture. Householder vinegar is made in upright casks; after the first four or five months, the process is repeated a third and fourth cask. Malt vinegar is sold in four strengths designated 18, 20, 22, 24, the last being "proof" vinegar, containing 6% of acetic acid and having a specific gravity of 1.075. Here the vinegar is diluted with water, and the mixture then converted into acetic acid by the process of acetylation, using calcium carbonate, which are neutralized by one fluid ounce of the vinegar.

Several other vinegars are made. Crystal vinegar is ordinary vinegar coloring by treatment with sawings or charred wood; Ac vinegar is prepared from strong sour pale ale; it has a tendency to purify. Glucose or sugar vinegar is made by first fermenting amylaceous substances to alcohol, and then acetyling the alcohol. Compound table vinegars are made by digesting ordinary vinegar with condiments such as pepper, garlic, capers, &c.; whilst aromatic vinegars popularly used in vineagrettes on account of their refreshing, stimulating properties. There is a great variety of vinegar with plants, perfumes and aromatic substances. Medicinal vinegars are prepared either by digestion or distillation of vinegar with various drugs. Vinegar, however, is not now much used in medicine, although it can be taken, under certain circumstances, in order to reduce obesity.

Wood vinegar is not used in cooking, as it lacks those substances which render ordinary vinegar palatable. It is largely manufactured for use as a fixative and for use as an antiseptic and wood preserving. (See ACETIC ACID.)

VINELAND, a borough of Cumberland county, New Jersey, U.S.A., in the southern part of the state, about 34 m. S. of Philadelphia and about 115 m. S.W. of New York. Pop. (1890) 3822; (1900) 4370, including 590 foreign-born; (1902 state census) 4593; (1910) 3282. Area, 1 sq. m. It is served by the Central of New Jersey and the West Jersey & Seashore railways, and by electric railway to Millville and Bridgeton. Vineland is situated at an altitude of 90-118 ft. above the sea, on a
VINER—VINGT-ET-UN

generally level or slightly undulating plain, and has unusually broad, straight and well-shaded streets. The borough maintains a public library, a public park of 40 acres, artesian waterworks, a sewerage system and an electric lighting plant. It is the seat of the New Jersey Training School for Feeble-Minded Girls and Boys (1888), the State Home for Disabled Soldiers, Sailors, Marines and their Wives. The Vineland Historical and Antiquarian Society (organized in 1864) has a library (8,000 volumes in 1909) housed in the Society's building, and it maintains a free lecture course. Saloons for the sale of intoxicating liquors have never been allowed in Vineland. The surrounding country is largely devoted to the growing of small fruits, grapes, peaches, pears and apples, and the raising of sweet potatoes; and within the borough are manufactured unfermented grape juice wine, boots and shoes, clothing, carpets, rugs, chenille curtains, pearl buttons, flint-glass tubes and bottles, and iron castings.

Vineland was founded in 1861 by Charles K. Landis (1835–1900), who conceived the idea of creating a settlement in the almost uninhabited "Pines" of Southern New Jersey; and after purchasing a large tract he laid out a village with small farms adjoining. The settlers, largely from New England and the Middle States, received the land at moderate prices on agreeing to make certain stipulated improvements. The township of Landis (pop. in 1910, 6,435), named in honour of its founder, was incorporated in 1864, having formerly been a part of Millville; from it Vineland was separated and was incorporated as a borough in 1880.

See The Founder's Own Story of the Founding of Vineland (Vineland, 1903), a pamphlet published by the Vineland Historical and Antiquarian Society.

VINER, SIR ROBERT (1631–1688), lord mayor of London, was born in Warwick, but migrated in early life to London, where he was apprenticed to his uncle, Sir Thomas Viner (1558–1663), a goldsmith, who was lord mayor of London in 1653–54, and who was created a baronet in 1661. Soon Robert became a partner in his kinsman's business, and in 1666 an alderman of the city of London; in 1665 he was made a knight, and in the following year a baronet. He was sheriff during the year of the great fire in London, and was chosen lord mayor in 1674. Combining like his uncle the business of a banker with that of a goldsmith, Viner was brought much into contact with Charles II. and with the court. The king attended his mayoral banquet, and the lord mayor erected an equestrian statue in his honour on a spot now covered by the Mansion House. He had been appointed the king's goldsmith in 1661, Sir Robert was one of those who lent large sums of money for the expenses of the state and the extravagances of the court; over £40,000 was owing to him when the national exchequer suspended payment in 1672, and he was reduced to the necessity of compounding with his creditors. He obtained from the state an annuity of £25,000. Viner died at Windsor on the 2nd of September 1688.

See Viner: a Family History, published anonymously (1885).

VINET, ALEXANDRE RODOLPHE (1797–1847), French critic and theologian, of Swiss birth, was born near Lausanne on the 17th of June 1797. He was educated for the Protestant ministry, being ordained in 1819, when already teacher of the French language and literature in the gymnasium at Basel; and during the whole of his life he was as much a critic as a theologian. His literary criticism brought him into contact with Sainte-Beuve, for whom he procured an invitation to lecture at Lausanne, which led to his famous work on Port-Royal. Vinet's Chrestomathie française (1830), his Études sur la littérature française au XIXème siècle (1849–51), and his Histoire de la littérature française au XVIIIème siècle, together with two volumes of Passes et Passeurs de la Révolution, et XVIème siècles, Histoire de la prédestination parmi les Réformés de France, and other kindred works, gave evidence of a wide knowledge of literature, a sober and acute literary judgment and a distinguished faculty of appreciation. He adjusted his theories to the work under review, and condemned nothing so long as it was good work according to the writer's own standard. His criticism had the singular advantage of being in some sort foreign, without the disadvantage which attaches in French eyes to all criticism of things French written in a foreign language. As theologian he gave a fresh impulse to Protestant theology, especially in French-speaking lands, but also in England and elsewhere. Lord Acton clasped him with Rothe. He built all on conscience, as that wherein man stands in direct personal relation with God as moral sovereign, and the seat of a moral individuality which nothing can rightly infringe. Hence he advocated complete freedom of religious belief, and to this end the formal separation of church and state (Mémoire en faveur de la liberté des cultes (1829), Essai sur la conscience (1839), Essai sur la manifestation des convictions religieuses (1842). Accordingly, when in 1845 the civil power in the canton of Vaud interfered with the church's autonomy, he led a secession which took the name of L'Église libre. But already from 1831, when he published his Discours sur quelques sujets religieux (Nouveaux discours, 1841), he had begun to exert a liberalizing and deepening influence on religious thought far beyond his own canton, by bringing traditional doctrine to the test of a living personal experience (see also FROMMEL, GASTON). In this he resembled F. W. Robertson, as also in the change which he introduced into pupil style and in the permanence of his influence. Vinet died on the 4th of May 1847 at Claren's (Vaud, Switzerland). Considerable part of his works was not printed till after his death.

His life was written in 1875 by Eugène Rambert, who re-edited the Chrestomathie in 1876. See also L. M. Lane, Life and Writings of A. Vinet (1869); L. Molines, Étude sur Alexandre Vinet (Paris, 1890); V. Rossel, Histoire de la litté. française hors de France (Lausanne, 1895); V. Rivet, Études sur les origines de la pensée religieuse de Vinet (Paris, 1896); A. Schumann, Alex. Vinet (1907). A uniform edition of his works was begun in 1906, see Revue de théologie et philosophie (Lausanne, 1908, et seq.).

J. V. B.
similar cards may put his stake on each and draw on them separately, receiving or paying according as he stands successfully or overdraws, but the two cards must be similar, i.e., he cannot set play with both a knife and a queen; or a ten, though their values are equal for the purpose of counting. A natural drawn in this way, however, only counts as 21, and does not turn out the dealer. Similarly a player may draw on three cards, or even four, should they be dealt him. A player who overdraws on one of such cards must declare and pay immediately, even though he stands on another. After a hand is played, the “pone” (Latin for “behind”)—the player on the dealer’s right—collects and shuffles the cards played, the dealer dealing from the remainder of the pack, till it is exhausted, when he takes the cards the pone holds, after the pone has cut them. It is a great advantage to deal, as the dealer receives from all who have already withdrawn, even if he overdraws himself.

French Vingt-et-un, or vingt-et-un with variations, is played by any number of persons. The first deal is played as in the ordinary game. In the second (“Imaginary Ten”) each player is supposed to hold a ten on and receives one card from the dealer, face downwards; he is then considered to hold a ten-card plus the one dealt, and stands or draws, receives or pays, as in the ordinary game. If he receives an ace he holds a natural. In the third deal ("Blind Vingt-et-un") each player receives two cards, and draws or stands without looking at either. The fourth deal is “Sympathy and Antipathy,” each player staking, and declaring which of the two he does not wish then drawing—or dealing to himself, if they are of the same colour, it is “sympathy”; if of different colours, “antipathy.” At the fourth deal (Rouge-et-noir), each player, having received three cards, bets that the majority will be either black or red, as he chooses. In “Self and Company” every one stakes but the dealer, who then sets out two cards, face upwards, one for himself and one for the players. If the two cards are pairs, the dealer wins; if not, he deals one of the cards exposed is paired, paying or receiving according as that card belongs to himself or the “company.” The seventh deal is “Paying the difference.” Each player receives two cards, face upwards. The dealer pays or receives a stake for the difference in value between the cards. The dealer then draws and deals another card, and the second player the ace counts as one. The eighth deal is “Clock.” The stakes are pooled. The dealer draws the cards out, face upwards, calling “one” for the first, “two” for the second, and so on, the knife being 11, queen 12, and king 13. If any of the cards dealt correspond to the number called, the dealer takes the pool; if none correspond, he forfeits that amount. At the end of this (the eighth) deal, the next player deals.

VINITA—VINLAND

VINITA, a city and the county-seat of Craig county, Oklahoma, U.S.A., in the N.E. part of the state, about 135 m.E.N.E. of Guthrie. Pop. (1900) 2339; (1907) 3157, including 624 Indians, (1910) 2339; (1910) 1939. The county is rich in iron ore, and in 1908 the Missouri, Kansas & Texas and the St Louis & San Francisco railways. In the city are the Sacred Heart Institute (Roman Catholic), and a hospital for masons. Vinita is situated in an agricultural and stock-raising region, and lead, zinc, oil and natural gas are found in the vicinity; the city’s water supply is obtained from artesian wells. Bricks are manufactured. The first settlement was made here in 1870 and Vinita was chartered as a city in 1885.

VINLAND (Old Norse, Vinland, i.e. Vineland or Vineland), so named by the early settlers on the eastern coast of North America, visited and named by the Norsemen in the beginning of the 11th century. The word first appeared in print in Adam of Bremen’s Description Insularum Aquilonis, an appendix to his Gesta Hammaburgensis Ecclesiae Pontificum, published by Lichtenberg in 1855. In pursuit of historical study, Adam visited the Danish court during the reign of the well-informed monarch Swen Estridsson (1047-1076), and writes that the king “spoke of an island (or country) in that ocean discovered by many, which is called Vinland, because of the wild grapes [litre] that grow there, that fruit is very good, but that green grows there abundantly [fruges ibi non seminates abundare] is not a fabulous fancy, but is based on trustworthy accounts of the Danes.” This passage offers important corroborative of the Icelandic accounts of the Vinland voyages, and is, furthermore, interesting “as the only un-doubted reference to Vinland in a medieval book written beyond the limits of the Scandinavian world” (Fiske). Adam’s information concerning Vinland did not, however, impress his medieval readers, as he placed the new land somewhere in the Arctic regions: “All those regions which are beyond are filled with unimportant ice and boundless glooms.” These words show the futility of ascribing to Adam’s account Columbus’s knowledge of lands in the West, as many overzealous advocates of the Norse discoveries have done. The importance of the information, meagre as it is, lies in the fact that Adam received from the lips of kinsmen of the explorers (as the Danes in a sense were) certain characteristic facts (the finding of grapes and unsown grain) that support the general reliability of the Icelandic sagas which tell of the Vinland voyages (in which these same facts are prominent), but which were not put into writing by the Norsemen until later—just how much later it is not possible to determine. The fact that the Irish the sagas concerning Vinland are not contemporaneous written records has caused them to be viewed by many with suspicion; hence such a significant allusion as that by Adam of Bremen is not to be overlooked. To the student of the Norse sources, Adam’s reference is not so important, as the internal evidence of the sagas is such as to give easy credence to them as records of exploration in regions previously unknown to civilization. The contact with savages would alone prove that.
the years 1305 and 1334, the date of his death, and probably during the period 1310-20. It is No. 544 of the Arne-
Magnaean collection in Copenhagen. Another manuscript
that tells the same story, with only verbal variations, is found in No. 557 of the same collection. This manuscript was made
later than Hauk’s, probably in the early part of the 15th century,
but it is not a copy of Hauk’s. Both were made independently
from earlier manuscripts. The story as found in these two
manuscripts has been pronounced by competent critics, espe-
cially Professor Gustav Storm of the university of Christiania,
as the best and the most trustworthy record.

The other saga, which by chance came to be looked upon as
the chief reservoir of facts concerning the Vinland voyages,
was found in a large Icelandic work known as the Flatey Book,
and was used for example by a man who lived on Flat Island
(Flatey), on the north-western coast of Iceland. This collection of
sagas, completed in about 1380, is “the most extensive and most
perfect of Icelandic manuscripts,” and was sent to Denmark in
1662 as a gift to the king. It was evidently the general ex-
cellence of this collection that gave the version of the Vinland
story that it contained precedence, in the works of early inves-
tigators, over the Vinland story of Hauk’s Book. (Reeves’s
Finding of Vinland contains fine photographs of all the vellum
pages of this manuscript, and those from the Vinland story are
commonly many leaves behind the others, which shows that the
improvisers, whereby it may be seen that the same kind of
folk had been there as which inhabited Vinland, and
whom the men of Greenland (i.e. the explorers) called the
“skraelings” (i.e. inferior people). From this allusion one
cannot but think that so keen and alert a writer as Ari had given
some attention to Vinland in the lost work. But of this there
is no other proof. We are left to affirm, on account of definite
references in various sagas and annals to Leif Ericsson and the
discovery of Vinland, that the saga as preserved in Hauk’s Book
(as also in No. 557) rested on a strong verbal tradition which
was early put into writing by a competent hand. Dr Finnur
Jonsson of Copenhagen says: “The classic form of the saga
and its vivid and excellent tradition surely carry it back to about
1200.” This conservative opinion does not preclude the possi-
bility, or even probability, that written accounts of the Vinland
voyages existed before this date. Vigfusson, in speaking of the
goals in general, says: “We believe that when once the first saga
was written down, the others were in quick succession committed
to parchment, some still keeping their form through a succession
of copies, other changes and modifications. That which was not written
down quickly, in due time, was lost and forgotten, forever.

The fact that there are discrepancies between the two ver-
sions as they appear in the Hauk’s Book and in the Flatey Book
does not justify the overthrow of both as historical evidence.
The general truth of the tradition is strengthened by the fact
that it has come down from two independent sources. One
of them must be the better, however, and this is the province
of competent scholars to determine. The best modern scholar
ships a premature elimination of the Hyperion version, as it tends
and best-established facts of Scandinavian history, and
is based on a more plausible account. In accordance with this
decision, Biarni Heriulfsson’s adventure should be
eliminated, the priority of discovery given to Leif Ericsson, and the
honour of being the first European colonists on the American continent
awarded to Thorfinn Karlsefni and his followers. This
was evidently the only real attempt at colonization, despite the
numerous contentions to the contrary. Under date of 1121
the Icelandic annals say: “Bishop Eric of Greenland went in search
of Vinland.” Nothing further is recorded. The fact that his
successor as bishop was appointed in 1123 would seem to indicate
that the Greenlanders had information that the site had perished.
The only important phase of the Vinland voyages that has not
been definitely settled is the identifications of the regions visited
by Leif and Thorfinn. The Danish antiquarian Rafn, in his
monumental Antiquitates Americanae, published in 1837, and
much discussed in America at that time, held for Rhode Island
as Leif’s landfall and the locality of Thorfinn’s colony. Pro-
fessor E. N. Horsford, in a number of monographs (unfortunately
spent the winter of 1006-7 there, whereupon he settled
in Iceland. From him and Gudrid a number of prominent
ecclesiastics claimed descent, and also Hauk Eldrsson.
The Vinland story was doubtless a cherished family possession,
and was put into writing, when writing sagas, instead of telling
them, came into fashion. And here it is important to remember
that before the age of writing in Iceland there was a saga-telling
age, a most remarkable period of intellectual activity, by the aid
of which the deeds and events of the seething life of the heroic
age was carried over into the age of writing. “Among the
medieval literatures of Europe, that of Iceland is unrivalled in
the profusion of detail with which the facts of ordinary life are
recorded, and the chronicles of which the life of the thousands
of numberless real persons stand out from the historic back-
ground.” (Origines Islandicae). Icelandic literary history says
that Ari the Learning (born in 1067) was “the first man in this
land who wrote in the Norse tongue history relating to times
ancient and modern.” Among his works is the Book of
Settlements, “a work of thorough and painstaking research
unequaled in medieval literature” (Fiske). His work The
Book of Icelanders is unfortunately lost, but an abridgment
of it, Libellus Islandorum, made by Ari himself, contains
the following references to Vinland. It tells that the colonists in
Greenland, who found “the coast and lands of Vinland,...
of no historical or scientific value), fixed upon the vicinity of Boston, where now stand a Leif Ericson statue and Horsford's Norumbega Tower as testimonials to the Norse explorers. But in 1887 Professor Storm announced his conviction that the lands visited by the Norsemen in the early part of the 11th century were Labrador, Newfoundland and Nova Scotia. And a careful reading of the Hawk's Book narrative seems to show that the numerous details of the saga fit Nova Scotia remarkably well, and much better than any other part of the continent. This view has in recent years been quite generally accepted by Archaeologists in the U. S. and by the English. John Fiske, botanist of Harvard University, published a paper in Rhodora, vol. 12, No. 134, in which he contends that it is most probable that the 'vinber' of the sagas were not 'grapes,' but 'wine-berries,' also known as the mountain or rock cranberries. The 'self-sown wheat' of the sagas he identifies as strand wheat, instead of Indian corn, or wild rice, and the mőur trees as the canoe birch. He thinks the natives were Eskimos, or Americans, as stoutly maintained by John Fiske. Professor Fernald concludes his paper by saying that: 'The mass of evidence which the writer has in hand and which will be ready for publication, makes it clear that, if we read the sagas in the light of what we know of the abundant occurrence north of the St. Lawrence of the 'vinber' ('Vaccinium Viitis-Idaea or possibly Ribes iriste, R. prostratum, or R. lacustre'), 'hveitl' (Elymus arenarius), and 'mőur' (Bétula alba, i.e. B. poplyfera of many botanists), the discrepancies in geography, ethnology and zoology, which have been so troublesome in the past, will disappear; other features, usually considered obscure, will become luminous; and the older and less distorted sagas, at least in their main incidents, will become vivid records of actual, geographic exploration.'

It is possible that Professor Fernald may show conclusively that Leif's landfall was north of the St. Lawrence. That the 'vinber' were mountain cranberries would explain the fact, mentioned in the Flatey Book saga, that Leif filled his after-boat with 'vinber' in the spring, which is possible with the cranberries, as they are most palatable after having lain under the snow for the winter. But Thorfinn Karlsen found no abundance of 'vinber,' in fact one of his followers composed some verses to express his disappointment on this score. "Vines" were found only in the southernmost part of Vinland by Karlsen. It is to be noted that the word "vines" is more prominent in the Hawk's Book narrative than the word "vinber." At present it does not seem likely that Professor Fernald's argument will seriously affect Professor Storm's contention that Thorfinn's colony was in Nova Scotia. At any rate, the incontrovertible facts of the Vinland voyages are that Leif and Thorfinn were historical characters, that they visited, in the early part of the 11th century, some part of the American continent south-west of Greenland, that they found natives whose hostility prevented the founding of a permanent settlement, and that the sagas telling of these things are, on the whole, trustworthy descriptions of actual experience.

Bibliography.—The bibliography of this subject is large, but adequate documents, accounts and discussions may be found in the following modern works: Gustav Storm, Studies on the Vinland Voyages (Copenhagen, 1889); Arthur M. Reeves, The Finding of Wineland, the Good (London, 1890 and 1893); John Fiske, The Discovery of America, vol. 1, (Boston, 1892); Juel Diesendurff, Norse Discoveries in America, in Bulletins of the American Geographical Society, vol. xxxiii. (New York, 1901); Guidbrand Vigfusson and F. Yorke Powell, Origines Islandicae (Oxford, 1905); and Julius E.从严治党, 1903, (New York, 1906), the first volume of Original Narratives of Early English History.

J. E. O.)

VINOGRADOFF, PAUL (1854- ), Anglo-Russian jurist, was born at Koatsma in Russia. He became professor of history in the university of Moscow, but his zeal for the spread of education brought him into conflict with the authorities, and consequently he was obliged to leave Russia. Having settled in England, Vinogradoff brought a powerful and original mind to bear upon the social and economic conditions of early England, a subject which he had already begun to study in Moscow. His Villainage in England (1892) is perhaps the most important book written on the peasantry of the feudal age and the village community in England; it can only be compared for value with F. W. Maitland's Domeday Book and Beyond. In masterly fashion Vinogradoff here shows that the villain of Norman times was the direct descendant of the Anglo-Saxon freeman, and that the typical Anglo-Saxon settlement was a free community, not a manor, the position of the freeman having steadily deteriorated in the centuries that followed the Norman Conquest. The status of the villain and the conditions of the manor in the 12th and 13th centuries are set forth with a legal precision and a wealth of detail which shows its author, not only as a very capable historian, but also as a brilliant and learned jurist. Almost equally valuable was Vinogradoff's essay on "Folklund" in vol. viii. of the English Historical Review (1893), which proved for the first time the real nature of this kind of land. Vinogradoff followed up his Villainage in England with The Growth of the Manor (1902) and English Society in the 12th Century (1906), works on the lines in his own view were done in 1903. He was appointed Professor of jurisprudence in the university of Oxford, and subsequently he became a fellow of the British Academy. He received honorary degrees from the principal universities, was made a member of several foreign academies and was appointed honorary professor of history at Moscow.

VINOY, JOSEPH (1863-1886), French soldier, was originally intended for the Church, but, after some years at a seminary, he decided upon a military career, and entered the army in 1883. When he was a sergeant in the 14th line infantry, he took part in the Algerian expedition of 1880. He won his commission at the capture of Algiers, and during the subsequent campaigns he rose by good service to the rank of colonel. He returned to France in 1890, and in the Crimean War served under Canrobert as general of brigade. For his brilliant conduct at the Malakoff he was promoted general of division, and he led a division of Nié's corps in the campaign of Solferino. Retired on account of age in 1895, he was recalled to active service on the outbreak of the war of 1870, and after the early reverses was put at the head of the XIII. army corps, which, fortunately for France, did not arrive at the front in time to take part in the catastrophic battle of Sedan. By a skilful retreat he brought his corps intact to Paris on September 7th. Vinoy during the siege commanded the III. army operating on the south side of the capital and took part in all the actions in that quarter. On Trochu's resignation he was appointed to the supreme command, in which capacity he had to negotiate the surrender. During the commune he held important commands in the army of Versailles, and occupied the burning Tuileries and the Louvre on May 23rd. He was in the same year made grand chancellor of the Legion of Honour.

Vinoy wrote several memoirs on the war of 1870-71: Opérations de l'Armée pendant le siège de Paris (1872), L'Armistice et la communion (1872), L'Armée française (1873).

VINT, a Russian card-game. It is generally considered as the immediate ancestor of Bridge (q.v.). Vint means in Russian "screw," and is given to the game because the four players, each in turn, propose, bid and overbid each other until one, having bid higher than the others care to follow, makes the trump, his rás-bás becoming his partner. It has many points of resemblance to Bridge. The cards have the same rank; the score of tricks is entered under the line, and points for slams, penalties and honours above the line; while the value of the different suits is the same as in Bridge: spades, clubs, diamonds, hearts and "no trumps." In a "no trump" declaration aces only count as honours; in a suit declaration both the aces and the five next highest cards. During the progress of the bidding and declaring, opportunity is taken by the players to indicate by their calls their strength in the various suits and the high cards they hold, so that, when the playing begins, the position of the best cards and the strength of the different hands can often be fairly accurately estimated.
VINTON—VIOLET

The leads are subject to much the same rules as those in Bridge.

See The Laws and Principles of Vint, edited by Frank W. Hadden (London, 1889). See also Frederick Porter's American portrait painter, born at Bangor, Maine, on the 20th of January 1846. He was a pupil of Duvencen, of William M. Hunt in Boston, of Léon Bonnat and Jean Paul Laurens in Paris, and of the Royal Academy of Munich. In 1891 he was elected a full member of the National Academy of Design, New York.

VIOLA, a generic term for the bowed precursors of the violin (q.v.), but in England more specially applied to those immediate predecessors of the violin which are distinguished in Italy and Germany as the Gambe family. The chief characteristics of the viola were a flat back, sloping shoulders, "c"-shaped sound-holes, and a short finger-board with frets. All these features were changed or modified in the violin, the back becoming delicately arched, the shoulders reverting to the rounded outline of the guitar or troubadour fiddle, the shape of the sound-holes changing from "c" to "f," and the finger-board being carried considerably nearer the bridge. The viola, of which the origin may be traced to the 13th and 14th centuries German Minnesinger fiddle, characterized also by sloping shoulders, can hardly be said to have evolved into the violin.

The latter was derived from the guitar-fiddle through the Italian lyre or viol-lyra family, distinguished as da braccio and da gamba, and having early in the 17th century the outline and "f" sound-holes of the violin. The viol family consisted of treble, alto, tenor and bass instruments, being further differentiated as da braccio or da gamba according to the position in which they were held against the arm or between the knees. The favourite viol da gamba, or division viol, frequently had a man or a woman's head instead of the scroll finish to the peg-box, and in the more fine viola and sympathetic strings tuned an octave higher than the strings in the bridge. The viola were very popular in England in the 16th and 17th centuries, holding their own for a long time after the introduction of the louder-toned violin; they are fully described and figured in the musical works of the period, and more especially in Christoph Siemens's Distinction Viol (1667), Thomas Maca's Musick's Monument (1676) and John Playford's Introduction to the Skill of Musick (K. S.).

VIOLA [Fr. viole, Ger. Bratsche, Ital. viola, alto], the tenor member of the violin family. The construction of the viola is the same, but on a larger scale, as that of the violin (q.v.). The instrument is pitched a perfect fifth below the violin.

VIOLET. The violas comprise a large botanical genus (Viola)—in which more than 200 species have been described—found principally in temperate or mountain regions of the northern hemisphere; they also occur in mountainous districts of South America and South and Tropical Africa, while a few are found in Australasia. The species are mostly low-growing herbs with alternate leaves provided with large leafy stipules (fig. 1). The flowers, which are solitary, or rarely in pairs, at the end of slender axillary flower-stalks, are very irregular in form, with five sepals prolonged at the base, and five petals, the lowest one larger than the others and with a spur, in which collects the honey secreted by the spurs of the two adjoining stamens. The five anthers are remarkable for the coloured processes which extend beyond the anther cells and form a sort of cone around the style (fig. 2). The ovary is superior and one-celled, with three parietal placentas and numerous ovules; it bears a single style, which ends in a dilated or hood-like stigma (fig. 3). The fruit is a capsule bursting loculicidally, i.e. through the centre of each of the three valves. By the contraction of the valves the small smooth seeds, which form a row down the centre, are shot out to some little distance from the parent plant. The irregular construction of the flower is connected with fertilization by insect agency. To reach the honey in the spur of the flower, the insect must thrust its proboscis into the flower close under the globular head of the stigma. This lies in the anterior part of a groove fringed with hairs on the inferior petal. The anthers shed their pollen into this groove, either of themselves or when the pistil is shaken by the insertion of the bee's proboscis. The proboscis, passing down this groove to the spur, becomes dusted with pollen; as it is drawn back, it presses up the lip-like valve of the stigma so that no pollen can enter the stigmatic chamber; but as it enters the next flower it leaves some pollen on the upper surface of the valve, and thus cross-fertilization is effected. In the sweet violet, V. odorata and other species, inconspicuous permanently closed or "cleistogamic" flowers (fig. 4) occur of a greenish colour, so that they offer no attractions to insect visitors and their form is correspondingly regular. The anthers are so situated that the pollen on escaping comes into contact with the stigma; in such flowers self-fertilization is compulsory and very effectual, as seeds in profusion are produced.

Several species of Viola are native to Great Britain. Viola canina (fig. 5) is the dog violet, many forms or subspecies of which are recognized; V. odorata, sweet violet, is highly prized for its fragrance, and in cultivation numerous varieties have originated. The Neapolitan or Parma violet (var. pallida canina) is a form with very sweet-scented, double, pale lavender flowers; var. sulphurea has shining deep green leaves and lemon-yellow flowers, deeper yellow in the centre, and with a pale-violet spur. Sweet violets like a rich, fairly heavy soil, with a north or north-west aspect if possible;
VIOLIN

They are readily increased by dividing the crowns after flowering. Other species known in gardens are: V. alata, flowers yellow or violet with yellow eye; V. bifora, a pretty little species 3-4 in. high with small yellow flowers, the large petal being streaked with black; V. calcarata, flowers light blue or white, or yellow in var. flava; V. cornuta, flowers pale blue—there are a few good varieties of this, including one with white flowers; V. cucculata, a free-flowering American species with violet-blue or purple flowers; V. Mouyaya, a native of Algeria, with large violet or yellow flowers; V. pedata, the bird's-foot violet, with pedately divided leaves and usually bright blue flowers; V. rothomagensis, a native of western Europe, with flowers bright blue striped with black, and sometimes called the Rouen violet; and V. suavis, a native of Asia Minor, the Russian violet, with pale blue sweet-scented flowers. The garden pansies or heartseases are derivatives from V. tricolor, a cornfield weed, or V. alata, a native of the Alpfa mountains. (See Pansy.) "Bedding violas," which differ from pansies in some slight technical details, have been raised from V. cornuta and V. lutea by crossing with the show pansies. The application of an infusion of violet leaves was at one time believed to have the power of reducing the size of cancerous growths, but its use is now discredited.

VIOLIN, a musical instrument consisting essentially of a resonant box of peculiar form, over which four strings of different thicknesses are stretched across a bridge standing on the box, in such a way that the tension of the strings can be adjusted by means of revolving pegs to which they are severally attached at one end. The strings are tuned, by means of the pegs, in fifths, from the second or A string, which is tuned to a fundamental note of about 445 vibrations per second at the modern normal pitch: thus giving $\text{C}^\text{4}$ as the fourth open notes. To produce other notes of the scale the length of the strings is varied by stopping them with the fingers on a finger-board, attached to a "neck" at the end of which is the "head" in which the pegs are inserted. The strings are set in vibration by drawing across them a bow, the bowing with horse-hair, which is rosin to increase adhesion.

The characteristic features which, in combination, distinguish the violin (including in that family name its larger brethren the viola and the violoncello) from other stringed instruments are: the restriction of the strings to four, and their tuning in fifths; the peculiar form of the body, or resonating chamber, especially the fully moulded back as well as front, or belly; the shallow sides or "ribs" bent into characteristic curves; the acute angles of the corners where the curves of the ends and middle "bouts" or waist ribs meet; and the position and shape of the sound-holes, cut in the belly. By a gradual process of development in all these particulars the modern violin was evolved from earlier bowed instruments, and attained its highest perfection at the hands of the great Italian makers in the 16th, 17th and early 18th centuries, since which time, although many experiments have been made, no material improvement has been effected upon the form and mode of construction then adopted.

The body, or sounding-box, of the violin is built up of two arched plates of thin wood, the belly and the back, united by side pieces or ribs to form a shallow box. The body is cut from soft elastic woods: the belly, over which is projects, but is much thinner than the back, is made of a close-grained wood, generally sycamore or maple. Both back and belly are carved to their model from the solid, but for utilitarian reasons are generally made by cutting up and piecing together long longitudinal sections; while the sides or ribs, of very thin sycamore or maple, usually in six sections, are bent on a mould, by the aid of heat, to the required form. Into the corners are glued corner-blocks of soft wood, which help to retain the ribs in their sharply curved form, and materially strengthen the whole structure. Into the angle of the joints between the sides and the back and belly are glued thin lining strips, bent to the mould, giving a bearing surface for the transverse line dividing the surface into two approximately equal areas, that is, about 1 1/2 in. below the middle, the lower end of the body being wider than the upper part or shoulders; whereby a greater length is rendered available for the vibrating portion of the strings.

The neck, made of maple, is glued and now always mortised into the block at the upper end of the body,1 bearing against a small semicircular projection of the back, and is inclined at such an angle that the finger-board, when glued on to its upper surface, may lie in the same plane as the belly, over which it projects, but at such an inclination that the height of the bridge as to allow the strings to be stretched nearly parallel to, and at a convenient distance above, its own surface.

The bridge, cut out of maple, in the peculiar form devised by Stradivarius in the 17th century, and popularly known as the "Strad," is about 8 1/2 in. long, and cut from, is in the violin about 1 1/4 in. high by 1 1/4 in. wide, and tapers in thickness from about 1 in. at the base to 1/4 in. at the crown; but the dimensions of the body increased member vary for different instruments according to the arch of the belly, the strength of the wood and other considerations. It is placed on the belly exactly midway between the sound-holes and in such a position as to stand on a transverse line dividing the surface into two approximately equal areas, that is, about 1 1/2 in. below the middle, the lower end of the body being wider than the upper part or shoulders; whereby a greater length is rendered available for the vibrating portion of the string.

A short distance behind the right foot of the bridge, the sound-post, a rod of soft pine about 1 in. thick, is fixed inside the body in contact with it on the belly, and serves directly to convey the vibrations to the back. The pressure of the other foot of the bridge, where the tension of the fourth string is far less than that of the first string, is partly sustained by the bass-bar—a strip of wood tapering from the middle to both ends, which is glued underneath the belly and extends to within rather less than 2 in. of the ends of the instrument. This fitting not only serves to strengthen the belly mechanically, but exerts a profound effect upon the vibrations of that plate.

The fixed structure is completed by the head, which surmounts the neck and consists primarily of a narrow box into the sides of which are inserted the pegs round which the free ends of the strings are wound. The body is divided by a solid nut, by which it is fixed, and held in position which in the hands of the Italian makers followed the traditional pattern of a scroll, or volute, offering the skilled craftsmen infinite scope for boldness and freedom in its execution; but sometimes, especially in the English instruments, it was carved in the form of an animal’s head, usually a lion’s.

The strings, fastened at one end to an ebony tail-piece or tongue, which is itself attached to the tail-board of the instrument, pass over the bridge, along the finger board and over the nut (a dwarf bridge forming the termination of the finger-board) to the pegs. The effective vibrating portion of the strings is accordingly the bridge and nut between the mouth of the bow and the bridge. This bridge and the nut of the fine violin, which now only come into use when the strings are set for the open notes, were introduced by Stradivarius in the 17th century, and he afterwards replaced the previously used finger-hole bridge.

1 Up to about the year 1800 the old Italian makers, including Stradivarius (in his earlier instruments), usually strengthened the attachment of the neck by driving nails, frequently three and sometimes four, through the top block into the base of the neck, which was not mortised into the block.
VIOLIN

103

in an ordinary full-sized violin about 13 in. The portion of the strings to which the bow is applied lies over the space measuring about 21 in., between the bridge and the free end of the fingerboard. The strings are manufactured from so-called catgut, made from the intestines of certain animals, and are cemented to the first or D string from .026 to .046 in. more or less. The necessary weight is given to the string of lowest pitch, G, without unduly sacrificing its elasticity, by winding a thin gut string with fine wire around it. The other strings are so wound that the thickness at the first third or D string from .026 to .046 in. more or less.

An ornamental feature characteristic of nearly all violins is the purfling, a very thin slip of wood with margins of ebony or (rarely) whalbone, inlaid in thin strips close to the edge of both plates, and following the entire outline of the instrument. In some instruments, especially of the Brescian school, a double line of purfling was inserted.

The number of pieces of wood of which the violin is composed amounts to about 70, varying, as the plates are made in one piece or two pieces, and with the number of sections in which the ribs are put together. Of this number 57 pieces are built into the permanent structure, while 13 may be described as fittings. The whole of the permanent structure is cemented together with glue alone, and it is a striking testimony to the mechanical conditions satisfied by the design, that the instrument built of such slender material with wood, without deformation the considerable stresses applied to it. It is worthy of remark that after the lapse of so many years, since it attained perfect musical efficiency, no essential adjustment of the sound-constituents can alter the instrument. No play of fancy has grafted anything beyond quite minor ornamentation on a work of art distinguished by its simplicity of pure outline and proportion.

The violin was a principal dimensions of a very fine specimen of Stradivari's work, which has been preserved in perfect condition since the latter end of the 17th century:

| Length of body | = 14 in. full. |
| Width across top | = 3 3/8 in., bare. |
| Width across bottom | = 3 1/2 in. |
| Height of sides (top) | = 1 7/16 in. |
| Height of sides (bottom) | = 1 3/4 in. |

The belly is in one piece, somewhat a little in width at the lower part, and the ribs are composed of the greatest makers, and is cut from very handsome wood; the ribs are of the same wood, while the belly is formed of two pieces of soft pine of rather fine and beautifully even grain. The strings are cut with perfect precision, exhibit much grace and freedom of design. The scroll, which is a characteristic of the maker's style and beautifully modelled, harmonizes admirably with the general modelling of the instrument. The model is flatter than in violins of the earlier period, and the design bold, while displaying all Stradivari's microscopic perfection of workmanship. The whole is coated with a very fine orange-red-brown varnish, untouched since it left the maker's hand in 1720, and the only respects in which the instrument has been altered since that date are in the fitting of the longer neck and stronger base-bar necessitated by the increased compass and raised pitch of modern violinists.

The measurements given above are the same as those of a well-known Stradivari of later date (1714).

The acoustics of the violin are extremely complex, and notwithstanding many investigations by men of science, and the enunciation of some plausible hypotheses with regard to the cause of the musical instrument, remain as a whole obscure. So far as the elementary principles which govern its action are concerned, the violin follows familiar laws (see Sound). The different notes of the scale are produced by vibrating strings differing in weight and tension, and varying in length under the hand of the player. The vibrations of the strings are conveyed through the bridge to the body of the instrument, which fulfils the common function of a resonator in reinforcing the notes initiated by the strings. So far first principles carry us at once. But when we endeavour to detail in detail the causes of the peculiar character that of the violin family, the great range and variety in that character obtained in different instruments, the extent to which those qualities can be controlled by the bow of the player, and the mode in which they are influenced by minute variations in almost every component part of the instrument, we find ourselves faced by a series of problems which have so far defied any but very partial solution.

The distinctive quality of the musical tones of the violin is produced by the simple vibrations of the strings, and generally by the simple vibrations of the strings, and generally by the simple vibrations of the strings.

The characteristic tone and its control by the player are undoubtedly conditioned in the first place by the peculiar path of the vibrating string under the action of the bow. This takes the form of a symmetrical oscillation, but of a succession of alternating bound and free movements, as the string adheres to the bow according to the pressure applied and, releasing itself by its elastic property.

The lightness of the material of which the strings are made conduces to the production of very high upper partial tones which give brilliancy of sound, while the low elasticity of the gut causes them to be quickly damped, thus softening the ultimate quality of the note.

In order that the resonating body of the instrument may fulfill its highest purpose in reinforcing the complex vibrations set up by the bow, it is essential that the sound-holes, formed in the belly, which, as already shown, respond sensitively to the selective impulses communicated to them. It is the attainment of this perfect selective responsiveness which marks the construction of the best instruments. Many factors contribute to this result. The thickness of the plates in different parts of their areas, the size and form of the interior of the body, the size and shape of the sound-holes through which the vibrations of the contained air are communicated to the external air, and which also influence the nodal points in the belly, according to the number of fibres of the wood cut across, varying with the angle at which the sound-holes cross the grain of the wood. Their position in relation to the width of the central vibrating portion of the belly under the bridge.

All these important factors are influenced by the quality and elasticity of the wood employed.

It has been thought by many speculations have been advanced with regard to the superiority in tone of the old Italian instruments over those of modern construction. This superiority has sometimes been disputed, and, judging from the many examples of second-rate instruments which have survived from the 17th and 18th centuries, it is certain that antiquity alone does not confer upon violins the merits which have frequently been claimed for it. More recently, we compare the comparative, for really the specimens of the Italian school which have survived in good condition, with the best examples of modern construction in which the proportions of the older masterpieces have been faithfully followed, and to which the most careful craftsmanship of the wealthiest masters has been devoted, it cannot be denied that the former possess a superiority in the quality of their tone which the musical ear immediately recognizes. After taking into account the practical identity in dimensions and construction between the classic and the modern of the best models, the conclusion suggests itself that the difference must be attributed to the nature of the materials used, or to the method of their employment, as influenced by local conditions and practice. The argument, not inadvisedly, that the modern makers of Italy had special local sources of supply, zealously guarded, for wood with exceptional acoustical properties, can hardly be sustained.

Undoubtedly, the exceptional qualities of the superior specimens of sound and handsome wood; but there is evidence that some of the finest wood they used was imported from across the Adriatic. The many courses of trials conducted with them, in all probability, largely one of expense. There is good reason to suppose that a far larger choice of equally good material is accessible to modern makers.

The varnish, which has the completed instrument is coated. This was an item in the manufacture which received most careful attention at the hands of the great makers, and much importance has been attached to the superiority of their varnish over that used in more recent times—so much so that its composition has been attributed to secret processes known only to themselves. The probability is that they were able to exercise more personal selection of the materials used than has been generally practised by makers dependent upon commercial products under modern conditions, and the general result has been analogous to that seen in the pigments employed by modern painters as compared with those of the old masters, who were able to achieve perfect purity in their ingredients. But that the Italian makers individually or collectively attempted, or were able, to preserve as a secret the composition of the varnish they used is unlikely. Although the exhibit of the varnish in the conservatories, was in a wide range of their period and locality, to justify the assumption that the general composition of the finest varnish ever used by makers will be found in any one of the earliest or later, this industry so flourishing as that of violin-making in the 17th and early 18th centuries. The excellence of an instrument in respect of its varnish depended on the quality of the constituent materials, on the processes in which they were put together, and on the method of their application. The most enduring and perfect varnish used for violins is an oil varnish, and the best results therefore are obtained by the oil varnish, which is produced for the drying process. In this respect there can be no doubt that the southern climate placed the makers whose work lies in higher latitudes at a disadvantage. In a letter to Galilei in 1638 concerning a violin he had ordered from Cremona, the writer states that
"It cannot be brought to perfection without the strong heat of the sun"; and all recorded experience indicates the great importance of slow drying of the varnish under suitable conditions. Stradivari himself wrote to account for the delivery of an instrument bearing the words "belonging to the Sun". By this time, the absence of the sun, whether by natural means or by artificial means such as that employed by Huggins, had long been observed to cause deterioration, but especially to its action, when supplied under favourable conditions to wood at a ripe stage of seasoning (when that process has proceeded far enough, but not so far as to allow the fibres to be damaged by soaking in liquids or gases), and in preserving its elasticity. This being so, successful varnishing will be seen to be an operation of great delicacy, and one in which the old masters found full scope for their skill and large experience. The effects of the natural qualities of the wood, and the final cost, texture and gradual absorption into the pores of the wood under favourable conditions of drying, are great and far-reaching, as is proved in the survival through two centuries of the great qualities of the specimens most fittingly treated in this respect.

After the early part of the 18th century the use of the fine oil varnish employed by the great makers was gradually abandoned, concurrently with the decline of the instrument maker-art in Italy. Except in the hands of the fast-diminishing band of craftsmen trained in the old traditions, its place was taken by the newer spirit varnishishes which, with their quick-drying qualities and ease of application, satisfied the changing needs of the applications of the new instruments of the period following the death of Stradivari; and before the end of the century these inferior varnishes had quite superseded the old.

Having regard to all these considerations it is not unreasonable to conclude that the varnish of the old instruments contributed probably the most important single element of their superiority in sound. Hence, modern copyists and restorers work in mind that the instrument makers of the 17th and 18th centuries carried on a great and flourishing and a highly developed craft; and that their best creations owe their distinct largely to causes similar to those which produced the great art works of the same period. The violin makers had a lifelong training in their craft. The productions of the famous among them were eagerly sought after by connoisseurs. Entertainments in various parts were treated to true amateurs of music, and vied with one another to secure the masterpieces of Brescia and Cremona. In such circumstances the trained judgment and wide experience of the craftsmen were naturally in the possession of the instrument makers of those ages, and was an additional factor in the making of instruments of high excellence in his work: the choice of sound and handsome wood; the perfection of design and workmanship; the composition of his varnish, and the utmost care and skill in applying it under the best conditions; and, not least important, time for deliberate and thoughtful production. The masterpieces of that period were not constructed upon any exact or scientific system, but were the productions of a tradition, and were the result of the skill and experience of the violin makers of those ages, in the art of sound-making, and in those simple systems for the adjustment of the factors to the production of the best results; but data obtained by experiments with test specimens of regular shape do not carry us very far when applied to so complex and irregular a structure as the violin. The vibrating plates of the violin are neither symmetrical nor uniform in dimensions. They are not free plates, but are fixed round the whole edge of a very irregular outline; and these conditions, taken together with their unsymmetrical arched form, held under pressure by the tension of the strings, establish a state of complex stresses under vibration which have so far escaped analysis.

Their vibratory characteristics are more clearly seen in the acceleration or deceleration factors of the instrument, such as the bass-bar, already described, the reaction of the sound-post, and the different pressures by the two feet of the bridge, that it is impossible to figure closely the vibrations of any given area of the instrument. It is certainly very remarkable that so precise a pattern of irregular form should have been arrived at empirically, and should have survived as the standard, apparently for all time. Not only is the arch of the plate and its length, but its total area, its oblong shape, all commonly noticed, the upper bouts, especially in violins of the Cremona school, are slightly shallower than the lower; so that the two feet of the bridge are not placed so close together as back, but the two plates converge in the direction of the head. Probably the most successful attempts at analysing the vibrations of the violin have been those made by Sir William Huggins, by means of the contact microphone, and more recently with the radiographs, by Sir William Huggins, namely, that the strings, when agitated by the bow, vibrate in a plane oblique to the vertical axis of the bridge; the vibrations may be accordingly resolved into two orthogonal components, one of which, say the horizontal, is directed toward the bridge, the other vertical—that is, in a direction favourable for setting the belly into vibration across its lines of support.

It is advantageous to maintain simplicity in direction of those vibrations communicated to the body, and therefore to eliminate the belly is close to the foot of the bridge, under the fourth string while that of least vibration is exactly over the top of the sound-post. The back, which is strongly agitated, also has its least vibration where the sound-post rests upon it. With the sound-post partially removed the back is clearly set into oscillation, while the vibration of the back was very feeble, and the tone became very poor; supporting the view that in the complete instrument the influence of the bridge is most important in attaining that tone. The pressure on that point in the belly normally in contact with the top of the sound-post partially restored the proper character though not the power of the tone; indicating the importance of the bridge in maintaining the tone of the violin, and that it largely determines the normal vibration of the belly. Modifications of the material of which the sound-post was made produced a profound effect upon the quality, but comparatively small effect upon the power of the tone. In general it is found that the effective part of the instrument is the region below the bridge, and is the most important factor in producing the tone of the violin, and of the action of the wood under vibration. Many violins, especially old and inferior ones, fail to resonate clearly and fully to particulars, the sounds produced being commonly harsh and dry, but the violin in all cases will give a more or less clear tone, and possibly always, associated with special parts in the body of the instrument; for, if pressure be applied at these spots, the resonance of the respective notes is improved. This observation suggests that the region concerned has been cut, or has become disproportionately thin in relation to the normal thickness of the plate; and, when stimulated by the appropriate note, the sound is produced with uniformity and force when the violin is played. The vibration of the plate as a whole; this interfering vibration being damped by local pressure. These defects are said to develop with age and constant use, and to be minimized by the use of thin strings or lower strings; but the natural decrease in the thickness of the plate which tends to support the hypothesis of thin regions in the plate, which might be expected to respond more truly to the vibrations of lighter, than to those of heavier strings. Detailed investigations of these phenomena on the lines of the experiments already referred to may have valuable results. Another well-known characteristic of the violin is that a new instrument, or one that has been newly varnished," says Stradivari, "vibrates irregularly, but becomes more regular as it is made up, and as it is freely played, the proper vibrations of the plate as a whole; this interfering vibration being damped by local pressure. Experiments made to test the effect of prolonged transverse vibrations upon strips of suitable wood have shown that such treatments both weaken and stiffen the wood, and that the weakening of a normal degree of rigidity after a period of rest. No conclusive interpretation of these experiments has yet been offered; but they indicate the probability of modifications of the internal viscosity of the instrument, by particular changes under the influence of continued vibratory movement.

The function of the bridge, as above mentioned, is to communicate the vibrations of the strings to the resonating body of the violin. This communication is made mainly, though not entirely, through the left foot of the bridge, which, under the comparatively low tension of the G string rests with light pressure upon the belly, which at that point has accordingly greater freedom of movement than under the other foot, in proximity to which the sound-post, extending from back to belly, maintains that region of the plate in a state of relative rigidity which influences the proper resonance of the string. The view, however, maintained by some writers that the right foot of the bridge communicates no vibrations directly to the belly is inaccurate. The main object of placing the sound-post some distance behind, instead of directly beneath the bridge, is to allow the belly under that foot to vibrate with some freedom. This has been proved by the destructive effect produced upon the tone by fixing the sound-post immediately under the foot of the bridge. The form into which the bridge is fretted after the pattern devised by Stradivari has given rise to some speculation; but the justification of the form is not based so much as it is on the interference of Sir William Huggins, namely, that the strings, when agitated by the bow, vibrate in a plane oblique to the vertical axis of the bridge; the vibrations may be accordingly resolved into two orthogonal components, one of which, say the horizontal, is directed toward the bridge, the other vertical—that is, in a direction favourable for setting the belly into vibration across its lines of support.

It is advantageous to maintain simplicity in direction of those vibrations communicated to the body, and therefore to eliminate
the transverse vibrations before they reach the belly. This is accomplished by a certain lateral elasticity of the bridge itself, attained by under-cutting the sides so as to allow the upper half of the bridge to oscillate or rock from side to side upon its central support, thus setting into vibration this oscillation absorbing the transverse vibrations above mentioned.

The function of the sound-post is on the one hand mechanical, and on the other acoustical. It serves the purpose of sustaining the greater share of the pressure of the strings, not so much to save the belly from yielding under that pressure, as to enable it to vibrate more freely in its several parts than it could do, if unsupported, under the influence which would be set up in its substance by that pressure. The chosen position of the post, allowing some freedom of vibration under the bridge, ensures the belly's proper vibrations being directly set up before the impulses are transmitted to the back. Amongst the ground-plan of bridges generally being, as already shown, its principal function. The post also by its contact with both vibrating plates is, as already shown, a governing factor in determining the nodal division of their surfaces, and its position therefore influences fundamentally the related states of vibration of the two plates of the instrument, and the compound oscillations set up in the contained body of air. This is an important element in determining the tone character of the instrument.

The immediate ancestors of the violins were the viols, which were the principal bowed instruments in use from the end of the 15th to the end of the 17th century, during the latter part of which period they were gradually supplanted by the violin. As the viol was held in the same manner until towards the later part of the 18th century, when the general adoption of the larger pattern of violoncello drove the viol from the field it had occupied so long. The sole survivor of the viol type of instrument, although not itself an original member of the family, is the double bass of the modern orchestra, which retains many of the characteristic features of the viol, notably the flat back, with an oblique slope at the shoulders, the high bridge and deep ribs. Excluding the marine trumpet or bowed monochord, we find in Europe no trace of any large bowed instruments before the appearance of the viol, and thence until the latter part of the 18th century, when the general adoption of the larger pattern of violoncello drove the viol from the field it had occupied so long. The violin was made in three main kinds—descant, tenor and bass—answering to the cantus, medius and bassus of vocal music. Each of these three kinds admitted of some variation in dimensions, especially the bass, of which three distinct sizes ultimately came to be made—(1) the largest, called the concert bass viol; (2) the division or solo bass viol, usually known by its Italian name of viola da gamba; and (3) the lyra or tablature bass viol. The normal tuning of the viols, as laid down in the earliest books, was adapted from the lute to the bass viol, and repeated in higher and lower forms. The invention of the violin, and its development as an instrument, was thus simply that of transposing the viol in several octaves, and continuing the above plan of tuning.

The earliest use of the viol was to double the parts of vocal concerted music; they were next employed in special compositions for the viol trio written in the same compass. Many such works in the form of "fantasies" or "fancies," and preludes with suites in dance form, by the masters of the end of the 16th and 17th centuries, exist in manuscript; a set by Orlando Gibbons, which are especially valuable, has been published by the English Musical Antiquarian Society. Later, the viols, especially the bass, were employed as solo instruments, the methods of composition and execution being based on those of the lute. Most lute music is in fact equally adapted for the bass viol, and vice versa. In the 17th century, when the violin was coming into general use, constructive innovations began which resulted in the abandonment of the trio of pure six-stringed violins. Instruments which show these innovations are the quinto and the viola d'amore. The first-mentioned is of a type intermediate between the violin and the viol. In the case of the descant and tenor viol the lowest string, which was probably found to be of little use, was abandoned, and the pressure on the bass side of the belly thus considerably lightened. The five strings were then spread out, as it were, to the compass of the six, so as to retain the fundamental principle of the outer strings being two octaves apart. This was effected by tuning the lower half of the instrument in fifths, as in the violin, and the upper half in fourths. This innovation altered the tuning of the treble and tenor viols, thus—One half of the instrument was therefore tuned like a violin, the other half as in a violin, the middle string forming the division. The tenor viol thus improved was called in France the quinte, and the treble corresponding to it the quinton. From the numerous specimens which survive it must have been a popular instrument, as it is undoubtedly a substantially excellent one. The
relief in the bass, and the additional pressure caused by the higher tuning in the treble, gave it greater brilliancy, without destroying the pure, ready and sympathetic tone which characterizes the viol. While the tendency in the case of the dispont and tenor was to lighten and brighten them, the reverse process took place in that of the bass. The richer and more sonorous tones of the viola da gamba were extended downwards by the addition of a string tuned to double bass A. Marais, a French virtuoso, is usually credited with this improvement; and it was extended compass is recognized in the classical viola da gamba writings of Sebastian Bach and De Caix d'Hérelle.

The result, however, was not universally satisfactory, for Abel used the six-stringed instrument; and the seven strings never came into general use in England, where the viola da gamba was more generally employed and survived longer than elsewhere.

The chief defect of the viol was its weakness of tone; this the makers thought to remedy in two ways: first by additional strings in unisons, fifths and octaves; and secondly by sympathetic strings of fine steel wire, laid under the fingerboard as close as possible to the belly, and sounding in sympathy with the notes played on the sound strings. The upper sympathetic strings were attached to ivory pegs driven into the bottom block, and, passing through the lower part of the bridge, or over a very low bridge of their own, were stretched to pitch either by means of additional pegs or by wrist pins driven into the sides of the head, and tuned with a key. Originally six, seven or eight wire strings were used, tuned to the diatonic scale of the piece to be performed. Later on a chromatic set of twelve was employed, and occasionally viols were made with twenty-four wire strings, two for each semitone in the scale. This system of reinforcement was applied to all the various sizes of viols in use during that period.

The improvements which resulted in the production of the viol on proceeded on different lines. They consisted in increasing the resonance of the body of the instrument, by making it lighter and more symmetrical, and by stringing it more lightly. These changes transformed the body of the viol into that of the violin, and the transformation was completed by rejecting the lute tuning with its many strings, and tuning the instrument by fifths, as the fiddle had been tuned. The tenor viol appears to have been the first instrument in which the change was made, and thus the viol or viola, as they probably claimed to be the father of the modern violin family.

Violas were used in church music before the modern violin period, and violins as we know them were at first called "Piccoli Violini," to distinguish them from the earlier and larger instruments.

A tenor viol of date 1500 is still extant, bearing in general outline the typical features of the violin, as distinct from the viol family. This instrument was exhibited in 1872 in the Loan Exhibition of Musical Instruments at South Kensington with the label "Pietro Zanure, Brescia, 1509." From existing specimens we know that a bass violin, precursor of the violoncello, with a tuning an octave below the tenor, appeared shortly after that instrument. A double bass violin, tuned a fourth below the violoncello and usually known as the "basso da camera," completed the set of instruments in violin shape; but from the difficulty attending its manipulation it never came into general use. The celebrated double bass viol, named Hancock, who dispensed with the highest or E string, is still remembered for his performances on this unusual instrument.

The tenor and violoncello are made on the same general model and principles as the violin, but with modifications. Both are, relatively to their pitch, made in smaller proportions than the violin, because, if they were constructed to dimensions having the same relation to pitch and tension of strings as the violin, they would not only have an overpowering tone but would be unmanageable from their size. These relatively diminished dimensions, both in the size of the instrument and in the thickness of the wood and strings, give to the tenor and violoncello a graver and more sympathetic tone. To some extent the reduced size is compensated by giving them a greater proportional height in the ribs and bridge; an increase hardly perceptible in the tenor, but very noticeable in the violoncello. To lighten the tension and thus allow greater freedom of vibration to the belly on the bass side, as with the lowest string of the violin, the two lowest of the tenor and violoncello are made of thin gut, covered with fine metal wire; thus providing the necessary weight without inconvenient thickness. If the tension of the lowest string, or the two lowest strings, be increased, not only will they be elevated in pitch, but the violin will produce a more powerful tone; if the bass string be lowered, the contrary will take place. By adapting the music to this altered tuning (scordatura) some novel effects are produced. The following are the principal scordature which have been occasionally employed by various players:

The violoncello is less amenable to the scordatura than the violin; the only classical instance is the tuning employed by Bach in his fifth sonata, which consists in lowering the first string by a tone.

The early Italian school is chiefly represented by the Brescian makers, Gaspar da Salò, Giovanni Paolo Maggini, Gavita Rodiani and Zanetto Peregrino. It is, however, somewhat misleading to denite it the Brescian school, for its characteristics are shared by the earliest makers of Cremona and Venice. To eyes familiar with the geometrical curves of the later Cremona school, most of the violins of these makers have a rude and uncouth appearance. The height of the model varies; the pattern is attenuated; the f-holes share the general rudeness of design, and are set high in the pattern. Andreas Amati of Cremona, the eldest maker of that name, effected some improvements on this primitive model; but the violin owes most to his sons, Antonio and Geronimo, who were partners. They introduced the substantial improvements which developed the Brescian violin into the modern instrument. These improvements were in their inception probably of an artistic rather than a scientific nature. Painting and inlaying had long been employed in the decoration of stringed instruments; but the brothers Amati were the first who applied to the violin the fundamental law of decorative art, that the decorative and constructive elements should be blended in their conception; in other words, the construction should be itself decorative and the decoration itself constructive. Nicholas Amati (1596-1654), son of Geronimo, made some slight improvements in the model, and his pupil Antonio Stradivari (1644-1737) finally settled the typical Cremona pattern, which has been generally followed; for the majority of violins since made, whether by good or bad makers, are copies of Stradivari. Besides the last-named, the following makers worked generally on the Amati model—Cappa, Gobetti, the Grancino family, Andrea Guarneri and his son Giuseppe, the Ruggeri family and Serafin of Venice. The Bergonzi family, Alessandro Gagliano, the earlier members of the Guarini family, and Panormo were either pupils or followers of Stradivari. But excepting Carlo Bergonzi and Stradivari's two sons, Omobono and Francesco, there is no evidence of
any having actually worked with or for him. Landolfi, Storioni, and Carlo Giuseppe Testore, a pupil of Giovanni Grancino, leaned to the model of Giuseppe Guarneri del Gesù. Some resemblances, especially in the matter of the varnish, are traceable between the works of makers who lived con-temporaneously in the same town, e.g. in Naples, Milan and Venice. A high model was adopted by Jacob Stainer of Absam, near Hall in Tirol, whose well-known pattern was chiefly followed by the makers of England, Tirol and Germany, down to the middle of the 18th century. It therefore hard fell into the hands of the Stainton family of Cremona. The school of Stainer is represented by Albani, Hornsteiner, the Klotz family (who made large numbers of instruments excellent in their kind), Schorn of Salzburg and Withalm of Nuremberg, and the others. The English makers may be divided into three successive groups: (1) an antique English school, having a character of its own (Rayman, Urquhart, Pamphilon, Barak Norman, Duke, of Oxford, &c.); (2) imitators of Stainer, at the head of whom stands Peter Wamsley (Smith, Barrett, Cross, Hill, Airton, Norris, &c.), who in the schools of this type sustained to the English school a position in general, in the name of which the making of violins was carried out by the hands of skilled players. (3) The early French makers have little merit or interest (Boquay, Gaviniès, Pierray, Guerzan, &c.), but the later copyists of the Cremona models (Lupot, Alric, Chanot the elder, Nicholas, Pique, Silvestre, Vuillaume, &c.) produced admirable instruments, some of which rank next in merit to the first-rate makers of Cremona.

The general form of the violin, as finally developed under the hands of the leading makers, resolved itself into two main types, the high and the flat models, of which the latter, on the lines of which ultimately adopted by Stradivari, has survived as the most efficient pattern for all modern instruments. The distinction is one of degree, the difference of actual measure of the arching and curve of the cases amounting to little more than a quarter of an inch in the convexity of the belly above the top line of the ribs; but the difference in character of tone of the two types is, in the main, well marked. Speaking generally, the tone of the high-built instrument is less powerful and sweeter, and it speaks more readily, but responds less completely to gradations of tone under the action of the bow than the flat type, which yields a tone of greater carrying power, and at the same time is more powerful and susceptible to more sudden variation of tone, according to the player, and with a peculiar penetrating quality lacking in the highly arched model. These differences in tone probably depend largely on the method of cutting the arch of the violin box than on the incidental effects of cutting the wood to the higher or lower arch; for it would seem that the best results in tone have been attained in instruments with a fairly constant volume of cavity, and with the arch the highest and the slightly in proportion to the height of arch in the best examples of the different models. The differences of tone between the high and the flat violin may, indeed, be ascribed to a difference in the thickness and flexibility of the cases, and to the difference in the character of the sound-holes. The high-built instrument is more flexible; it of course has a more sensitive and elastic quality in relation to the more suitable thickness, in order to withstand the pressure of the bridge, a resistance which the higher arch renders possible with a stiffer and more brittle material; and the effect of these qualities upon tone must be taken into account in estimating the tone characters of the two types of instrument.

Broadly speaking, the higher-arched type found favour with the earlier makers up to the end of the Amati period. Stainer in Tirol inclined more to the high arch, but worked also in London, where he probably had a model after which he worked, but as he have developed on independent lines, the tradition that he here is in the sense of Amati being no longer tenable. The flattened arch is the arch of evolution of the plain violin, and the immediate influence of the Amati and developed on his own incomparable lines a somewhat larger and more powerful instrument, adapted to the requirements of the increasing class of solo players.

The violins as a distinctive family of instruments cannot be fully discussed without reference to the bow (g.v.) as an essential adjunct, on account of the very important part taken by the bow in determining, as already mentioned, the peculiar form of the vibrations of the string, and in controlling, in the hand of a skilled player, the subtle gradations of tone produced from the instrument. The evolution of the modern bow has taken place almost entirely since the violin attained its final form, and has followed, more completely perhaps than the instrument itself, the development of violin music and the requirements of the player. It reached its highest perfection at the hands of the celebrated Fétis, at the Congress of Paris (1855), where he is represented as a model for all succeeding makers, even more exclusively than the violins of Stradivari controlled the pattern of later instruments; and at the present time Tourte bows are valued beyond any others.

For more than 250 years the violin and its larger brethren have held the leading position among musical instruments. For they have been written some of the most inspired works of the great musicians. Famous composers, such as Tartini, Corelli, Spohr and Viotti have been great violinists, and by their compositions of a generation are as much as by their talents as virtuosi, have largely developed the capacity of the violin as a vehicle of profound musical expression. To the listener the violin speaks with an intensity, a sympathy, and evokes a thrill of the senses such as no other instrument can produce. For the player it seems to respond to every pulse of his emotions.

VIOLET, PAUL MARIE (1840– ), French historian, was born at Tours on the 24th of October 1840. After serving his native city as secretary and archivist, he became archivist to the national archives in Paris in 1866, and later librarian to the faculty of law. In 1890 he was appointed professor of law at the University of Paris. His work, a history of the history of law and institutions, on this subject he published two valuable and scholarly books—Droit public: Histoire des institutions politiques et administratives de la France (1890–98), and Précis de l'histoire du droit français (1880).

VIOLET-LE-DUC, EUGÈNE EMANUEL (1814–1879), French architect and writer on archaeology, was born in Paris on the 21st of January 1814. He was a pupil of Achille Leclère, and in 1836–37 spent a year studying Greek and Roman architecture in Sicily and Rome. His chief interest was, however, in the art of the Gothic period, and, like Sir Gilbert Scott in England, he was employed to "restore" some of the chief medieval buildings of France, his earliest works being the abbey church of Vézelay, various churches at Poissy, St Michel at Carcassonne, the church of Semur in Côte-d'Or, and the fine Gothic town halls of Saint-Antonin and Narbonne, all carried out between 1840 and 1850. From 1845 to 1856 he was occupied on the restoration of Notre Dame in Paris in conjunction with Lassus,1 and also with that of the abbey of St Denis. In 1840 he began the restoration of the fortifications of Carcassonne and of Amiens cathedral; and in later years he was employed to restore many other important buildings. He was an intimate friend of Napoleon III., and during the siege of Paris (1871) gave valuable help as an engineer to the beleaguered army. He held many important offices, both artistic and political, and was for many years inspector-general of the ancient buildings throughout a large part of France. His last work was the general scheme 1 He published in 1867–69 a fine work showing his not very successful coloured decoration applied to the chapels of Notre Dame.
VIOLONCELLO

for the Paris exhibition buildings in 1878. He died on the 17th of September 1879 at Lausanne.

As a designer Viollet-le-Duc occupied only a secondary place; but as a writer on medieval architecture and the kindred arts he takes the highest rank. His two great dictionaries are the standard works in their class, and are most beautifully illustrated with very skilful drawings by his own hand. Viollet-le-Duc was a man of the most varied and brilliant abilities, endowed with a power of work which has seldom been equalled. He was at once an artist, a man of science, a learned archaeologist and a scholar. The map in his Le Massif du Mont Blanc, showing the rock contours and the glaciers of Mont Blanc, is a model of its kind, which combines great artistic beauty with the accuracy of the most skilful engineer. His strong poetical fancy enabled him to reconstruct the life and buildings of the middle ages in the most vivid way.

His principal literary works were the Dictionnaire de l'architecture française du XI. au XVI. siècle (1854-68); Dictionnaire du mobilier français (1859-75); L'Architecture militaire au moyen âge (1854); Entretiens sur l'architecture (1865-72); Cités et ruines américaines (1865); Mémoire sur la défense de Paris (1871); Habitations modernes (1874-77); Histoire d'une maison (1873); Histoire d'une maison (1875); Le Massif du Mont Blanc (1876); L'Art russe (1877); Histoire d'un hôtel-de-ville et d'une cathédrale (1878); La Décoration appliquée aux édifices (1879); as well as many minor works dealing with separate buildings.

VIOLONCELLO (Fr. violoncelle, Ger. Violoncell, Ital. violoncello), the bass member of the violin family. Although the word violoncello is a diminutive, signifying "small violone," or double bass, the instrument is really a bass violin, formed on a different model from the violone, which has the sloping shoulders and flat back of the violin family, whereas those of the violoncello are rounded as in the violin. The construction of the violoncello is therefore the same as that of the violin (q.v.) but on a much larger scale. It is either held, on account of its size, between the performer's knees, or rests on the floor supported on a foot or spike.

VIONVILLE, a village of Lorraine, between Metz and the French frontier, celebrated as the scene of the battle of Vionville (Rezonville or Mars-la-Tour), fought on the 16th of August 1870 between the French and the Germans (see METZ and France: The Battle of Vionville).

VIOTTI, GIOVANNI BATTISTA (1753-1824), Italian violinist and musical composer, was born at Fontanetto in the province of Turin on the 23rd of May 1753. He learned the rudiments of music from his father, a blacksmith who played the horn; and in 1764 Giovannini taught him the violin for a year. Two years later he was placed at the cost of the prince de la Cisterne under the violinist G. Pugnani at Turin, where he became violinist in the court chapel. In 1780 Viotti, having already made himself a name, travelled through Germany and Poland to Russia, where the empress Catherine honoured him with marks of extraordinary favour. He next appeared in London, in company with Pugnani, and at once achieved a brilliant and lasting reputation. In 1782 he was equally successful in Paris. Two years later he was appointed leader of the prince de Soubise's private orchestra; and in 1785 he undertook the direction of the opera, raising the performances, with Cherubini's assistance, to a very high level. He had also started an Italian opera in co-operation with the barber Léonard, which was opened in 1789 in the Tuileries, being subsequently amalgamated with the Théâtre de la Foire St. Germain in 1793 and finally merged in the new Théâtre Feydeau in 1791. In 1791 the Revolution compelled Viotti to fly to London, where he took part in the Hanover Square concerts; but being suspected to be an agent of the Revolutionary Committee in Paris he was compelled to retire for a time to the neighbourhood of Hamburg, which he subsequently quitted, although the date of his departure, often given as 1795, does not seem probable. It is possible that he was already in 1794 in London, where he took shares in a wine business, and he resided almost uninterruptedly there until 1819, when he once more settled in Paris, resumed the direction of the opera, and retired in 1822 with a pension. He died in London on the 10th (or 3rd) of March 1824.

Viotti's playing was distinguished by an extreme purity of style, a magnificent tone, and an inexhaustible variety of poetical and imaginative expression. Among his works are 20 violin concertos, a series of symphonies concertantes for two violins, 45 duos, 18 trios and 21 quartets, and a great number of sonatas, nocturnos and other instrumental works. His school was worthily perpetuated by his pupil Rode.

VIPER. The vipers constitute a family of Old-World poisonous snakes, with a pair of poisonous fangs in the maxillary bones, which are short and movable. The main anatomical features are described in the article SNAKES. In the present article only the Viperinae, namely those without an external pit between the eye and the nose, are described. Pit vipers, or Crotalinae, are treated under SNAKES, and those which are possessed of a rattle under RATTLENAKE. The true vipers comprise about nine genera with some forty species, which can be distinguished as follows:

Causus in Africa, and Asemophis fœae in Burma, are the only vipers which have the head covered with large symmetrical shields, while in the other genera the head shields are broken up into small shields, or into still more numerous scales. C. rhombodus, common from the Gambia to the Cape.

Atractaspis, small burrowing vipers in Africa, without post-frontal bones.

Echis and Atheris have only one row of subcaudal shields. E. carinata, scarcely exceeding 20 in. in length, is very poisonous and easily overlooked on account of its light brown coloration, with pale spots and delicate markings on the keels of the scales of the back. It is a desert type, having the lateral scales strongly keeled and directed downwards, by means of which it shuffles itself into the sand; by folding itself and rubbing the scales together it produces a rustling sound. It ranges from India, where it is known as the "Krait," called "Kuppur" in Sind, through North Africa. This desert type is replaced farther south in Africa, where vegetation flourishes, by the closely allied genus Atheris, which, however, possesses a prehensile tail and vivid coloration and has assumed truly arboreal habits.

Cerastes is another desert form, but is restricted to Africa; the arrangement of the scales of the sides of the body is similar to that of

VIOLONCELLO—VIPER

![Image](image-url)

**Fig. 1.**—Echis carinata. The "Krait" of India.
Echis, but it has two rows of subcaudals. *C. cornutus*, the "horned viper" of North Africa, from Algeria to Palestine, has a large horny spike above each eye. This, the "Efa" of the Arabs, buries itself in the sand, with only the eyes, nostrils and the horns appearing above the surface. It attains a length of 2 ft. *C. vipera* is hornless.

*Bitis* s. *Echidna s. Clothe* has two rows of shields on the underside of the very short tail; the thick head is much depressed, like the body. The nasal shields are separated from the rostral by small scales, otherwise much resembling the genus *Vipera*. *B. arietans*, the "puff-adder" of nearly the whole of Africa, an ugly, very dangerous brute growing to a length of 4 or 5 ft. *B. naricorns*, the West African nose-horned viper, has a pair of erectile scales on the nose. Scarcely smaller and less bulky than the puff-adder and just as poisonous, it is yet very handsomely marked with a series of large pale, dark-edged spots and oblique crosses on a purplish or reddish brown ground. Especially handsome are the young, which at birth are as much as 1 ft. in length. On one occasion one of these snakes, after giving birth to twenty-one young (which bit and killed mice within five minutes of being born), became very ill-tempered, and when two adult males were placed in her cage she bit one with such violence as to break off one of her fangs, which she left, about three-quarters of an inch in length, sticking which are hunted after sunset. They cannot climb and they avoid going into water. The pairing takes place from March to May and the young are born about four months later. During the pairing, and for hibernation, they often collect in considerable numbers. Whilst most snakes readily take proper food in captivity, these vipers prefer starving themselves to death, a feat which they accomplish within six to nine months according to conditions. As a rule their bite is not fatal to man, but the consequences are often serious and protracted. For treatment see SNAKES.

*V. aspis* is the more southern and western continental European viper; it is slightly snub-nosed, and this feature is still more pronounced in *V. latastei* of Spain and Portugal. In *V. ammodytes* of south-eastern Europe the raised portion is produced into a soft, scaly appendage.

*V. russelli*, the "Daboia," is one of the most poisonous snakes of India, Ceylon, Java, Burma and Siam. It is pale brown with three longitudinal series of black, light-edged rings which sometimes encircle reddish spots. It grows to a length of about 5 ft.

(V. F. G.)

**VIRBIUS**, an old Italian divinity, associated with the worship of Diana at Aricia (see DIANA). Under Greek influence, he was identified with Hippolytus (q.v.), who after he had been trampled to death by the horses of Poseidon was restored to life by Asclepius and removed by Artemis to the grove at Aricia, where horses were not allowed to enter. Virbius was the oldest priest of Diana, the first "king of the grove" (Rex Nemorensis). He is said to have established the rule that any candidate for the office should meet and slay in single combat its holder at the time, who always went about armed with a drawn sword in anticipation of the struggle. Candidates had further to be fugitives (probably slaves), and as a preliminary had to break off a bough from a specified tree. By the eponymous nymph Aricia, Virbius had a son of the same name, who fought on the side of the Rutulian Turnus against Aeneas. J. G. Frazer formerly held Virbius to be a wood and tree spirit, to whom horses, in which form tree spirits were often represented, were offered in sacrifice. His identification with Hippolytus and the manner of the latter's death would explain the exclusion of horses from his grove. This spirit might easily be confounded with the sun, whose power was supposed to be stored up in the warmth-giving tree. Sauer (in Roscher's *Lexikon*) also identifies...
Hippolytus with the "health-giving sun," and Virchow with a healing god akin to Asclepius. Frazer's latest view is that he is the old cult associate of Diana of Aricia (to whom he is related as Attis to Cybele or Adonis to Venus), the mythical predecessor or archetype of the kings of the grove. This grove was probably an oak grove, and the oak being sacred to Jupiter, the king of the grove (and consequently Virchow) was a local form of Jupiter. A. B. Cook suggests that he may be the god of the stream of Nemi.

VIRCHOW, RUDOLF (1821-1902), German pathologist and politician, was born on the 13th of October 1821 at Schivelbein, in Pomerania, where his father was a small farmer and shopkeeper. As a boy he attended the Volkschule of his native village, and at the age of seventeen, having passed through the gymnasium of Köslin, went to Berlin to study medicine. He took his doctor's degree in 1843, and almost immediately received an appointment as assistant-surgeon at the Charité Hospital, becoming pro-rector three years later. In 1847 he began to act as Privatdocent in the university, and founded with Reinhardt the Archiv für pathologische Anatomie und Physiologie, which, after his collaborator's death in 1857, he carried on alone, and in 1848 he went as a Privatdozent at the University of Breslau to investigate an outbreak of typhus in upper Silesia. About the same time, having shown too open sympathy with the revolutionary or reforming tendencies of 1848, he was for political reasons obliged to leave Berlin and retire to the seclusion of Würzburg, the medical school of which profited enormously by his labours as professor of pathological anatomy, and secured a wide extension of its reputation. In 1856 he was recalled to Berlin as ordinary professor of pathological anatomy in the university, and as director of the Pathological Institute formed to centre for research whence has flowed a constant stream of original work on the nature and processes of disease. On the 14th of October 1901 his eightieth birthday was celebrated in Berlin amid a brilliant gathering of men of science, part of the ceremonies taking place in the new Pathological Museum, near the Charité, which owes its existence mainly to his energy and powers of organization. On that occasion all Europe united to do him honour, many learned societies sent delegates to express their congratulations, the king of Italy gave him his own portrait on a gold medallion, and among the numerous addresses he received was one from Wilhelm II, in which he expressed the opportunity of presenting him with the Grand Gold Medal for Science.

In the early part of 1902 he slipped from a tramcar in Berlin, and fractured his thigh; from this injury he never really recovered, and his death occurred in Berlin on the 5th of September 1902.

Wide as were Virchow's studies, and successful as he was in all, yet the foremost place must be given to his achievements in pathological investigation. He may, in fact, be called the father of modern pathology, for his view, that every animal is constituted by a sum of vital units, each of which manifests the characteristics of life, has almost uniformly dominated the theory of disease—since the middle of the 19th century, when it was enunciated. The beginnings of his doctrine of cellular pathology date from the earliest period in his career. When, towards the end of his student-days in Berlin, he was acting as clinical assistant in the eye department of the Berlin Hospital, he noticed that in keratitis and corneal wounds healing took place without the appearance of plastic exudation. This observation led him to further work, and he succeeded in showing that in vascular organs the presence of cells in inflammatory exudates is not the result of exudation but of multiplication of pre-existing cells. Eventually he was able to prove that, the biological doctrine of omnis cellula e cellula applies to pathological processes as well as to those of normal growth, and in his famous book on Cellular-pathologie, published at Berlin in 1858, he established what Lord Lister described as the "true and fertile doctrine that every morbid structure consists of cells which have been derived from pre-existing cells as a progeny." But in addition to bringing forward a fundamental and philosophical view of morbid processes, which probably contributed more than any other single cause to vindicate for pathology the place which he claimed for it among the biological sciences, Virchow made many contributions to histology and morbid anatomy and to the study of particular diseases. The classification into epithelial organs, connective tissues, and the more specialized muscle and nerve, was largely due to him; and he proved the presence of neuroglia in the brain and spinal cord, discovered crystalline haematoxilin, and made out the structure of the umbilical cord. Medical science further owes to him the classification of new growths on a natural histological basis, the elucidation of leucæmia, glioma and lardaceous tumours, and detailed investigations into many diseases—tuberculosis, pyaemia, diphtheria, leprosy, typhus, &c. Among the books he published on pathological and medical subjects may be mentioned Vorlesungen über Pathologie, the first volume of which was the Cellular-pathologie (1858), and the remaining three Die Krankhaften Geschwülste (1865-67); Handbuch der speziellen Pathologie und Therapie (3 vols., 1854-62), in collaboration with other German surgeons; Gesammelte Abhandlungen zur wissenschaftlichen Medizin (1856); Vier Reden über Leben und Kranksein (1861); Untersuchungen über die Entwicklung des Schädelgründes (1857); Lehre von den Trichinen (1865); Ueber das Hunger-Thyphus (1869); and Gesammelte Abhandlungen aus dem Gebiete der öffentlichen Medizin und der Seuchenlehre (1879). In England his pathological work won general recognition. The Royal Society awarded him the Copley medal in 1892, and selected him as Cronian lecturer in the following year, his subject being the position of pathology among the biological sciences; and in 1898 he delivered the second Hussey memorial lecture at Charing Cross Hospital.

Another science which Virchow cultivated with conspicuous success was anthropology, which he did much to put on a sound critical basis. At the meeting of the Naturforscher-versammlung at Innsbruck in 1860, he was one of the founders of the German Anthropological Society, of which he became president in the following year; and from 1860 onwards he presided over the Berlin Anthropological Society, also acting as editor of its proceedings in the Zeitschrift für Ethnologie. In ethnology he published a volume of essays on the physical anthropology of the Germans, with special reference to the Frisians; and at his instance a census, which yielded remarkable results, was carried out among school children throughout Germany, to determine the relative distribution of blondes and brunettes. His archæological work included the investigation of lake dwellings and other prehistoric structures; he went with Schlickeimann to Troy in 1879, fruits of the expedition being two books, Zur Landeskunde der Troas (1880) and Alt-trojanische Gräber und Schädel (1882); in 1881 he visited the Caucasus, and on his return published Das Gräberfeld von Koban im Lande der Osseten; and in 1888 he accompanied Schlickeimann to Egypt, Nubia and the Peloponnesse. As a politician Virchow had an active career. In 1862 he was elected a member of the Prussian Lower House. Professing to be a liberal mind, he was leader of the Fortschrittpartei, and the expression Kulturkampf had, it is believed, its origin in one of his electoral manifestoes. For many years he was chairman of the finance committee, and in that capacity may be looked upon as a chief founder of the constitutional Prussian Budget system. In 1886 he entered the Reichstag as representative of a Berlin constituency, but was ousted in 1893 by a Social Democrat. In the Reichstag he became the leader of the Opposition, and a vigorous antagonist to Bismarck. In the local and municipal politics of Berlin again he took a leading part, and as a member of the municipal council was largely responsible for the transformation which came over the city in the last thirty years of the 19th century. That it has become one of the healthiest cities in the world from being one of the unhealthiest is
attributable in great measure to his insistence on the necessity of sanitary reform, and it was his unceasing efforts that secured for its inhabitants the drainage system, the sewage farms and the good water-supply, the benefits of which are reflected in the decreased death-rate they now enjoy. In respect of hospitals and the treatment of the sick his energy and knowledge were of enormous advantage to the city, both in cases of peace and of war, and the enviable accommodation for medical treatment possessed by Berlin is a standing tribute to his name, which will be perpetuated in one of the largest hospitals of the city.

Of his writings on social and political questions may be mentioned Die Erziehung des Weibes (1865); Über die nationale Entwicklung und Bedeutung der Naturwissenschaften (1865); Die Aufgaben der Naturwissenschaften und der menschlichen Lebensdeutschlands (1871); Die Freiheit der Wissenschaft im modernen Staat (1877), in which he opposed the idea of Haeckel—that the principles of evolution should be taught in elementary schools—on the ground that they were not as yet proved, and that it was mischievous to teach a hypothesis which still remained in the speculative stage.

See Becher (Berlin, 1894) and Pagel (Leipzig, 1906); Rudolf Vircow als Pathologe by Marchand (München, 1902); Rudolf Vircow als Arzt by Eustein (Stuttgart, 1903); Gedächtnissrede auf R. Vircow (Berlin, 1903); and Briefe Vircow an seine Eltern 1839–1854, by Marie Rabl (Leipzig, 1907). A bibliography of his works was published at Berlin in 1901.

VIRE, a town of north-western France, capital of an arrondissement in the department of Calvados, 47 m. S.W. of Caen by rail. Pop. (1863) 5228. Vire stands on an eminence skirted on three sides by the Vire and crowned by the remains of a 12th-century château. The church of Notre Dame (13th to 15th century), and the picturesque Tour de l’Horloge (13th century), beneath which runs the chief street, are the principal buildings. A library and a small museum with good collections of porcelain, pictures and curiosities, are installed in the town hall (17th and 18th centuries). In the public garden there is a statue of Marshal Jacques Goyon, comte de Maintenon (1592–1679); and the native poets C. J. L. Chénédollé and P. L. R. Castel are represented, the former by a marble bust, the latter by a bronze statue. Vire grew up around a castle built in the 12th century by Henry I. of England, and in the middle ages was one of the important strongholds of Normandy. South-west of the town is the gorge called Vaux-de-Vire, in which was situated the mill of Olivier Basselin (15th century), the fuller and reputed author of the satiric songs, hence known as “vaudevilles” (see Basselin, Olivier).

VIRELAY, the title applied to more than one fixed form of verse, from the French verer, to turn or veer. The history and exact character of the virelay are more obscure than those of any other of the old French forms. It is possible that it is connected with the Provençal ley. Historians of poetry have agreed in stating that it is a modification of the medieval lai, but it is curious that no example of the lai is forthcoming, except the following, which was first printed by the Père Mourgues in his Traité de la Poésie:—

"Sur l’appui du monde
Que faut-il qu’on fonde
D’esprit?
Cette mer profonde
Et débris féconds
Fait voir
Calme au matin l’onde
Et l’orage y gronde
Le Soir."

But this appears to be, not a complete poem, but a fragment of a virelay, which proceeds by shifting or "veering" the two rhymes to an extent limited only by the poet’s ingenuity. This is the Old Virelay (virelai ancien), of which examples have been rare in recent literature. There is, however, a New Virelay (virelai nouveau), the newness of which is merely relative, since it was used by Alain Chartier in the 15th century. In French the old and popular verses beginning—

"Adieu vous dy triste Lyre,
C’est trop apprêter à rire,"

form a perfect example of the New Virelay, and in English we have at least one admirable specimen in Mr Austin Dobson’s "July"—

"Good-bye to the Town! good-bye! Hurrah! for the sea and the sky!"

The New Virelay is entirely written on two rhymes, and begins with two lines which are destined to form recurrent refrains throughout the whole course of the poem, and, reversed in order, to close it with a couplet. The virelay is a vaguer and less vegetable form of verse than the sonnet, the ballad or the villanelle, and is of less importance than these in the history of prosody.

VIRGIL (Publius Vergilius Maro), the great Roman poet, was born on the 15th of October in the year 70 B.C., on a farm on the banks of the Minucio, in the district of Andes, not far from the town of Mantua. In the region north of the Po a race of more imaginative susceptibility than the people of Latium formed part of the Latin-speaking population. It was favourable to his development as a national poet that he was born and educated during the interval of comparative calm between the first and second civil wars, and that he belonged to a generation which, as the result of the social war, first enjoyed the sense of an Italian nationality. Yet it was only after Virgil had grown to manhood that the province to which he belonged obtained the full rights of Roman citizenship. It is remarkable that the two poets whose imagination could have been most powerfully possessed by the spell of Rome—Ennius and Virgil—were born outside the pale of Roman citizenship.

The scenery familiar to his childhood, which he recalls with affection both in the Eclogues and the Georgics, was that of the green banks and slow windings of the Minucio and the rich pastures in its neighbourhood. Like his friend and contemporary Horace, he sprang from the class of yeomen, whose state he pronounces the happiest allotted to man and most conducive to virtue and piety. Virgil, as well as Horace, was fortunate in having a father who, though probably uneducated himself, discerned his genius and spared no pains in giving it the best culture then obtainable in the world. At the age of twelve he was taken for his education to Cremona, and from an expression in one of the minor poems attributed to him, about the authenticity of which there cannot be any reasonable doubt, it may be inferred that his father accompanied him. Afterwards he removed to Milan, where he continued engaged in study till he went to Rome two years later. The time of his removal to Rome must have nearly coincided with the publication of the poem of Lucretius and of the collected poems of Catullus.

After studying rhetoric he began the study of philosophy under Siron the Epicurean. One of the minor poems written about this time in the scacron metre tells of his delight at the immediate prospect of entering on the study of philosophy, and of the first stirrings of that enthusiasm for philosophical investigation which haunted him through the whole of his life. At the end of the poem, the real master-passion of his life, the charm of the Muses, reasserts itself (Cauleption v.).

"By knowledge of him is derived allusions in the Eclogues, and belongs to a period nine or ten years later. Of what happened to him in the interval, during which the first civil war took place and Julius Caesar was assassinated, we have no indication from ancient testimony or from his own writings. In 42 B.C., the year of the battle of Philippi, we find him "cultivating his woodland Muse" under the protection of Asinius Pollio, governor of the district north of the Po. In the following year the famous confiscations of land for the benefit of the soldiers of the triumvirs took place. Of the impression produced on Virgil by these confiscations, and of their effect on his fortunes, we have a vivid record in the first and ninth eclogues. Mantua, in consequence of its vicinity to Cremona, which had been faithful to the cause of the republic, was involved in this calamity; and Virgil's father was
driven from his farm. By the influence of his powerful friends, and by personal application to the young Octavian, Virgil obtained the restitution of his land. In the meantime he had taken his uncle Vettius, with him to the small country house of his old teacher Siron (Calataeption x.).

Soon afterwards he heard of his living in Rome, enjoying, in addition to the patronage of Pollio, the favour of Maecenas, intimate with Varius, who was at first regarded as the rising poet of the new era, and later on with Horace. His friendship with Gallus, for whom he indicates a warmer affection and more enthusiastic admiration than for any one else, was formed before his second residence in Rome, in the Cisalpine province, with which Gallus also was connected both by birth and office. These Moscathian "eclogues," commenced in his native district, were finished and published in Rome, probably in 37 B.C. Soon afterwards he withdrew from habitual residence in Rome, and lived chiefly in Campania, either at Naples or in the neighbourhood of Nola. He was one of the companions of Horace in the famous journey to Brundisium; and it seems not unlikely that, some time before 23 B.C., he made the voyage to Athens which forms the subject of the third ode of the first book of the Odes of Horace.

The seven years from 37 to 30 B.C., were devoted to the composition of the Georgics. In the following year he read the poem to Augustus, on his return from Asia. The remaining years of his life were spent on the composition of the Aeneid. In 19 B.C., after the Aeneid was finished but not finally corrected, he set out for Athens, intending to pass three years in Greece and Asia and to devote that time to perfecting the poem. At Athens he met Augustus, and was persuade to return with him to Italy. While visiting Megara under a burning sun, he was seized with illness, and, as he continued his voyage without interruption, he grew rapidly worse, and died on the 21st of September, in his fifty-fifth year, a few days after landing at Brundisium. Let his last illness he called for the cases containing his manuscripts, with the intention of burning the Aeneid. He had previously left directions in his will that his literary executors, Varius and Tucca, should publish nothing of his which had not already been given to the world by himself. This pathetic desire that the work to which he had given so much care, and of which such great expectations were formed, should not survive him has been used as an argument to prove his own dissatisfaction with the poem. A passage from a letter of his to Augustus, in which he speaks, like the prophet, of the worshippers of the sun, his latest wish that the taking of the work had been a mistake. This dissatisfaction with his work may be ascribed to his passion for perfection of workmanship, which death prevented him from attaining. The command of Augustus overrode the poet's wish and rescued the poem.

Virgil was buried at Naples, where his tomb was long regarded with religious veneration. Horace is our most direct witness of the affection which he inspired among his contemporaries. The qualities by which he gained their love were, according to his testimony, candor—sincerity of nature and goodness of heart—and pietas—the union of deep affection for kindred, friends and country with a spirit of reverence. The statement of his biographer, that he was known in Naples by the name "Parthenias," is a testimony to the exceptional purity of his life in an age of licence. The seclusion of his life and his devotion to his art touched the imagination of his countrymen as the finer qualities of his nature touched the heart of his friends. It had been, from the time of Cicero,1 the ambition of the men of finest culture and most original genius in Rome to produce a national literature which might rival that of Greece; and the feeling that at last a poet was about to appear which would equal or surpass the greatest among all the works of Greek genius found a voice in the lines of Propertius—

"Cedit Romani scriptores, silvis erudi Græri;
Nequid quid majus nascitur iliaede."

The feeling of his countrymen and contemporaries seems justified by the personal impression which he produces on modern readers—an impression of sanctity, as of one who habitually lived in a higher and serener sphere than that of this world. The veneration in which his name was held during the long interval between the overthrow of Western civilization and the revival of letters affords testimony of the depth of the impression which he made on the heart and imagination of the ancient world. The traditional belief in his pre-eminence and the formality of the imperial age, that he is the absolute unison, in modern times. By the scholars and men of letters of the 16th, 17th and 18th centuries it was never seriously questioned. During the first half of the 19th century his right to be ranked among the great poets of the world was disputed by some German and English critics.

The effect of this was a juster estimate of Virgil's relative position among the poets of the world. It may still be a matter of individual opinion whether Lucretius himself was not a more powerful and original poetical force, whether he does not speak more directly to the Catullus and more profoundly than any of them. But it can hardly be questioned, on a survey of Roman literature, as a continuous expression of the national mind, from the age of Naevius to the age of Claudian, that the position of Virgil is central and commanding, while that of Lucretius is in a great measure isolated. If we could imagine the place of Virgil in Roman literature vacant, it would be much the same as if we imagined the place of Dante vacant in modern Italian, and that of Goethe in German literature. The serious efforts of the early Roman literature—the efforts of the older epic and tragic poetry—found their fulfillment in him. The revelation of the deeper sensibility and the life of Nature, first made to Lucretius, was able to charm the Roman mind, only after it had passed into the mind of Virgil.

Virgil is the only complete representative of the deepest sentiment and highest mood of his countrymen and of his time. In his pastoral and didactic poems he gives a living voice to the whole charm of Italy, in the Aeneid to the whole glory of Rome. He was in the maturity of his powers at the most critical epoch of the national life, one of the most critical epochs in the history of the world. Keeping aloof from the trivial daily life of his contemporaries, he was sustained, like Homer, by the deeper currents of emotion in the sphere of government, religion, morals and human feeling which were then changing the world; and in uttering the enthusiasm of the hour, and all the new sensibilities that were stirring in his own heart and imagination, he had, in the words of Sainte-Beuve, "divined at a decisive hour of the world what the future would love." He was also by universal acknowledgment the greatest literary artist whom Rome produced. Virgil had a more catholic sympathy with the whole range of Greek poetry, from Homer and Hesiod to Theocritus and the Alexandrians, than any one else at any period of Roman literature. The effort of the preceding generation to attain to beauty of form and finish of artistic execution found in him, at the most susceptible period of his life, a ready recipient of its influence. The rude dialect of Latium had been moulded into a powerful and harmonious organ of literary expression by a long series of orators; the Latin hexameter, first shaped by Ennius to meet the wants of his own spirit and of his high argument, had been smoothed and polished by Lucretius, and still more perfected by the finer ear and more careful industry of the Catullus and his circle; but neither had yet attained their final development. It was left for Virgil to bring both diction and rhythm to as high a pitch of artistic perfection as has been attained in any literature. This great work was accomplished by the steady devotion of his genius to his appointed task. For the first half of his life he prepared himself to be the poet of his time and country with a high ambition and unresting industry. The second half of his career

---

1 Cf. Tusc. Disc. ii. 2: "Quamobrem horto meus qui lucere id possunt, ut hujus quoque generis laudem jam languent! Græcæ eripiant," &c. These words apply specially to philosophical literature, but other passages in the same and in other works imply that Cicero thought that the Romans had equal aptitudes for other departments of literature: and the practice of the Augustan poets in each appropriating to himself a special province of Greek literary art seems to indicate the same ambition.
was a religious consecration of all his powers of heart, mind and spirit to his high office.

Virgil's fame as a poet rests on the three acknowledged works of his early and mature manhood—the pastoral poems or Eclogues, the Georgics and the Aeneid—all written in that hexameter verse which Terence was later to condemn.

"The stateliest measure moulded by the lips of man."

The pastoral poems or Eclogues—a word denoting short selected pieces—were composed between the years 42 and 37 B.C., when Virgil was serving as military scribe in the review of the veterans. Three books thus composed, with the revisions and additions that have been ascribed to him, have been preserved. By his invitation to the "Sicelides Musae" and "Arethusa," and by many other indications, he avows the purpose of a revival of Homer's pastoral scenes. Virgil, however, was not content merely with simplicity; he felt the need of subtlety in the description of the beauty of Italian scenes which Theocritus had expressed for the beauty of Sicily. There were precedents for the second, third and fifth; and, along with the seventh, are the most purely Theocritean in character. The first and ninth, which probably were next in order, are much more Italian in sentiment, are much more an expression of the poet's own feelings, and have a much more direct reference both to his own circumstances and the circumstances of the time. The first is a true poetical reflection of the distress and confusion which arose out of the new distribution of lands, and blends the poet's own deep love of his home, and of the sights and sounds familiar to him from childhood, with his Italian susceptibility to the beauty of nature. The ninth is immediately connected in art with the first, and is a faithful imitation of the dignified and majestic style of Virgil's countryman, Pollio, who in 48 B.C. had been named by Julius Caesar to describe the site of Virgil's farm, at the point where the range of hills which accompany the river for some distance from the foot of the Lago di Garda sinks into the plain about 14 or 15 m. above the water. This description is treated by Virgil as if he were governor of the Cisalpine district. Its theme is the creation of the world (according to the Epicurean cosmogony), and the oldest tales of nature and of the gods. Of the eighth book, which is the last that was closely associated with the name of Virgil's earliest protector, Pollio, the fourth celebrates the consulship of his patron in 40 B.C., and also the prospective birth of a child, though it was disputed in antiquity, and still is disputed, who was meant by this child whose birth was to be coincident with the advent of the new era, and who, after filling the other great offices of state, was to "rule with his father's virtues the world at peace."

The main purpose of the poem, however, it was to express its author's view of the rural affections of the world for a new era of peace and happiness, of which the treaty of Brundisium seemed to hold out some definite hopes. There is no trace in this poem of Theocritean influence. The ideas are derived partly from Greek representations of the Golden Age, and partly, it is supposed, from the later Sibylline prophecies, circulated after the burning in the time of Sulla of the old Sibylline books, and possibly tinged with Jewish ideas. Some of the phraseology of the poem led to a belief in the Christian church that Virgil had been an unconscious instrument of inspired prophecy. The date of the eighth is fixed by a reference to the campaign of Pollio against Drusus, who was killed in 39 B.C. It is from the sixth book of Theocritus, but brings before us, with Italian associations, two love tales of homely Italian life. The tenth reproduces the Daphnis of Theocritus, and is a dirge over the bards of his own time. Of the other poems, the second and eighth, of which love is the burden, it is to the romantic and fantastic melancholy which the passion assumes in certain natures that Virgil gives a voice.

There is no important work in Latin literature, with the exception of the comedy of Terence, so imitative as the Eclogues. But they are not, like the comedies of Terence, purely exotic as well as imitative. They are rather composite, partly Greek and partly Italian, and, as a vehicle for the expression of feeling, hold an undefined place between the objectivity of the Greek idyll and the subjectivity of the Latin elegy. For the most part, they express the loves and sorrows of a child, and the tender and all-sentiment inspired by the charm of human relationships. Virgil's susceptibility to the beauty of nature appears in the truth with which his work suggests the charm of Italy—the fresh life of an Italian spring and summer; the quickness of the pastures and orchards of his native district. The representative character of the poems is enhanced by the fidelity and grace with which he has expressed the Italian peasant's love of his home and all things associated with it. The supreme charm of the diction and rhythm is universally recognized. The power of varied harmony is as conspicuous in Virgil's earliest poems as in the mature and more elaborate work of his old age. The lucidity, clearness, harmony of language, without sacrifice of the fulness, strength and majesty of its tones, acquired a more tender grace and more liquid flow from the "molle atque faciem"—which the Muses of country life borrowed.

1 In the Georgics Virgil attempts to combine science with the pastoral fancies which filled its place in older times.

links and formulas, such as "principio," "nunc age," etc., but uses them more sparingly, so as to make the logical mechanism of the poem as transparent as possible. It has little of the charm of a personal address. All his topics admit of being vitalized by attributing to natural processes the vivacity of human relationships and sensibility, and he has evolved a harmony between the joy which his studies, a science and mythology. There is uniformity of chastened excellence in the diction and versification of the Georgics, contrasting with the imaginative force of isolated expressions and the majesty of isolated lines. The method of evoking via the senses, however, is more apparent in the older poet; the artistic perfection of Virgil is even more conspicuous in the Georgics than in the Eclogues or the Bucolics.

The principal episodes of the poem, in which the true dignity and human interest of the subject are brought out, occur in the first and second books. Other shorter episodes add variety to the different themes. These episodes are not detached or isolated ornaments, but give a higher unity to the poem, and are the main ground of its permanent hold upon the world. There is indeed one marked exception to this rule. The long episode with which the whole poem ends—the tale of the shepherd Aristaeus, with which is connected the more poetical fable of Orpheus and Eurydice—has only the slightest connexion with the general ideas and sentiment of the poem, and is altogether at variance with the realism and the Italian feeling which pervade it. But we are distinctly told that the original conclusion had contained the praises of Gallas, the friend of Virgil's youth, who, about the time when the poem was written, was fighting the war against Cleopatra, and had in consequence been made the first governor of the new province of Egypt. Such a conclusion might well have been kept with the main purpose of the poem. The fall of Gallas is an episode of the earlier Egyptian administration, and his death in 26 B.C., the poet, according to the story, in obedience to the command of the emperor, substituted for this encomium the beautiful but irrelevant fable of Orpheus and Eurydice, in which he first displayed the narrative skill, the pathos and the magical power of making the mystery of the unseen world present to the imagination which characterize the Aeneid.

The cardinal episodes of the poem, as it now stands, are the passages in bk. i. from line 464 to the end, and in bk. ii. from 136 to 176 and from 505 to the end. The introduction, according to the signs of the weather, recounts the omens which accompanied the death of Julius Caesar, and shows how the misery of Italy and the neglected state of the fields are the punishment for the great sin of the previous generation. In the second of these passages the true keynote of the poem is struck in the invocation in Italy—

"Salve, magna parent frugum, Saturnia tellus,\nMater dei et patriæ!"

The thought of the beauties of the land, of the abundance and variety of its products, of its ancient cities and mighty works of man, its brave and hardy races, the great men who had fought for her in old times, and of him, the greatest among her sons, who was then about to be born, is the second as against the first, which inspires the poet, and gives dignity to the trivial details of farm life. But a still higher and more catholic interest is given to the subject of the gods, worship of whom pervades all Latin poetry—that from line 458, "O fortunatus minium," to the end. The subject is there glorified by its connexion not only with the national well-being but with the highest and purest beauty of man. The old delight in the labours and productivity blends with the new delight in the beauty of nature, and is associated with that purity and happiness of family life which was an Italian ideal, and with the poetry of those religious beliefs and observances which were the bond of the people for the period. The ideal of Italian art, which from Greek originals, Virgil makes the Greek mind tributary to his national design. The Georgics, the poem of the land, is essentially Italian as the Odyssey, the poem of the sea, is essentially Greek. It is addressed, as is presented to us as she is revealed in the soft luxuriance of Italian landscape, not in the clearly defined forms of Greek scenery. The poem shows the Italian susceptibility to the beauty of the earth, the dignity and sobriety of the Italian imagination, the firm and enquiring will of all Romans, and the manliness, while it is essentially Italian in its religious and ethical feeling.

Recent work which yet remained for Virgil to accomplish was the addition of a great Roman epic to literature. This had been the earliest effort of the national imagination, when it first departed from the mere imitative reproduction of Greek originals. It was the genius of Rome before the time of Virgil had been the Annalen of Ennius. This had been supplemented by various historical poems but had never been superseded. It satisfied the national pride and ambition, but it could not satisfy the newly developed sense of art; and the expansion of the national life since the days of Ennius, and the progress of the sciences, had given new fields for the exercise of art, a science and mythology. There is uniformity of chastened excellence in the diction and versification of the Georgics, contrasting with the imaginative force of isolated expressions and the majesty of isolated lines. The method of evoking via the senses, however, is more apparent in the older poet; the artistic perfection of Virgil is even more conspicuous in the Georgics than in the Eclogues or the Bucolics.

The Aeneid is thus at once the epic of the national life under its new conditions and an epic of human character. The true keynote of the poem is struck in the line with which the proem closes—

"Tantae mollis erat Romanam condere gentem."

The idea which underlies the whole action of the poem is that of the great part played by Rome in the history of the world, that part being from of old determined by divine decree, and carried out through the virtue of her sons. The idea of universal empire is maintained throughout the poem, as a dominant idea, the unbroken continuity of the national life is intimately associated. The reverence for old customs and for the traditions of the past was a large element in the national sentiment, and has a prominent place in the Aeneid. So too has the feeling of local attachment and of the power of local association over the imagination. The poem is also characteristically Roman in the religious belief and observance which it embodies. Besides all the conventional machinery of the old Olympic gods there is the Roman apprehension of a great inscrutable power, manifesting itself by arbitrary signs, exacting jealous certain observances, working out its own secret purposes through the medium of men. The poem is thus a religious as well as a national epic, and this explains the large part played in the development of the action by special revelation, omens, prophecies, ceremonial usages and ceremonies, which in the epic lay before the reader and disposed them to that of divine purpose carried out regardless of human feeling, in other parts of the poem, and especially in that passage of the dithyramb of dedicating the real and the imaginary, the mercy on individual destiny, the agency of fate seems to yield to that of a spiritual dispensation, awarding to men their portions according to their actions.

The Idealization of Augustus is no expression of servile adulation. It is through the promiscence assigned to him that the poem is truly representative of the critical epoch in human affairs at which it was written. The cardinal fact of that epoch was the establishment of a new order of society, a new idea of the world and the world as it is, the result of the downfall of the Roman world. Virgil shows the imaginative significance of that fact by revealing the emperor as chosen from of old in the counsels of the gods, a man who was, as he was, the descendant of gods and of heroes of old poetic renown; as one, moreover, who, in the actual work done by him, as victor in a great decisive battle between the forces of the Western and the Eastern empires, and as the organizer of the empire, had rendered better service to mankind than any one of the heroes who in an older time had been raised for their great deeds to the company of the gods. This idealizing interpretation of the imperial idea of Rome is the basis of the greatness of the Aeneid as a representative poem. It is on this representative character and on the correlation of its art machinery with the art machinery of the Aeneid that rank as one of the great poems of the world mainly rests. The inferiority of the poem to the Iliad and the Odyssey as a direct representation of human life is so unquestionable that we are in
and character. In the first place it should be remarked that the action is chosen not only as suited to embody the idea of Rome, but as having a peculiar nobleness and dignity of its own. It brings before us the spectacle of the destruction of the city of greatest name in the ancient world. The idea is vividly realized, and the western seas, in which Rome had encountered its most powerful antagonist in her long struggle for supremacy, and that of the first rush of its passage through the icy stream of life and creation, is familiar, yet full of great memories and associations—Troy and its neighbourhood, the seas and islands of Greece, the coasts of Epirus, familiar to all travellers between Italy and Greece, and the sites of the Greek city-states and the Tiber, and all the country within sight of Rome. The personages of the action are prominent in poetry and legend, or by their association with the natural movements and sentiments of man—Aeneas and Anchises, Dido, Acestes, Evander, Turnus. The action itself is developed in a series of scenes in which war and sea-adventure. The passion of love is a powerful addition to the older sources of interest. The Aeneid, as a poem, is the result of many stages of development; of the present and the remote past, some image of the old romance of Greece; it creates the romance of "that Italy for which Camilla the virgin, Euryalus, and Turnus and Nisus died of wounds." It might be said of the manner of life represented in the Aeneid, that it is no more true to any actual condition of human society than represented in that of the Ægees. But may not the same be said of the actual condition of an age, of the state of society and of civilization? The life represented in the Odysseus Tyrannus in King Lear is not the life of the Periclan nor of the Elizabethan age, nor is it conceivable as the real life of a prehistoric age. The truth and value of art lies in the effort to take the highest perfection, to the highest perfection, which the Latin tongue was capable. The rhythm and diction of the Latin verse are no more solid, no more vivid instrument. The note of his supremacy among all the poetic and moral arts is written in the structure of the language and in the meaning of language which touches the deepest and most secret springs of emotion. He touches especially for the emotions of religion and of yearning for a higher spiritual life, and the sense of nobleness in human affairs, in great institutions, and great natures; the sense of the sanctity of human affections, of the imaginative sense exercised by the past, of the mystery of the unseen world. This is the first of the powers of the Latin words that have over some of the deepest and greatest natures in all ages. (W.Y.S. & T.R.G.)

BIBLIOGRAPHY

Appendix Vergiliana.—Under this collective name there are current several poems of some little length and some groups of shorter pieces, all attributed to Virgil in antiquity. Virgil wrote a poem called Æneid, but not the Culex, but not the Culex, nor the lost, nor that of the later, and the Aeneid, the poem of the Ægees, the spell of the luxurious and the opulent; others may say, to the partial energy of the Ægees, and some of them have a peculiar beauty from the poet with which the deaths of some of the Ægees is done.

But the adverse criticisms of the Æneid are chiefly based on Virgil's supposed failure in the crucial test of the creation of character. It is a point less often pronounced to be the "lous Aeneas." Is Aeneas a worthy and ideal hero of a great poem of action? Not, certainly, according to the ideals realized in Achilles and Odysseus, nor according to the modern ideal of heroism, Virgil writes, who is wont to superimpose and Beethoven's ode to a burning planet. Yet that there was in his own imagination a chord responsive to the chivalrous emotion of a later time is seen in the love and pathos of the Æneas and Camilla. But he felt that the deepest need of his time was military glory, but peace, reconciliation, the restoration of law, order and piety.

In Roman human poetry has added to the great gallery of men and women, created by the imaginative art of different times and peoples, the ideal of a true queen and a true woman. In the poetry in which she is the heroine the most passionate human interest is completely realized, and it is a great truth issue in which a noble and generous nature is sacrificed to no purpose of the gods. But that Virgil really sympathized with the creation of his imagination appears, not only in the sympathy which he has thrown into his delineations of Pallas, Lausus and Camilla. But he felt that the deepest need of his time was military glory, but peace, reconciliation, the restoration of law, order and piety.

Even those who have been sensible to the representative and to the human interest of the Æneid are generally recognized as an artistic excellence of the poem. This is conspicuous both in the conception of the action and the arrangement of its successive stages and in the workmanship of details. Each of the first eight books has a large and distinct sphere of interest, and each contrive to contribute to the impression of the work as a whole. In the first book we have the storm, the prophecy of Jove and the building of Carthage; in the second the destruction of Troy; in the third the Aeneid and the flight of Dido; in the fourth the tragedy of Dido; in the fifth the rest in the Sicilian bay, at the foot of Mount Eryx; in the sixth the revelation of the spiritual natures, the vision of the Trojan and the Greek, in the seventh and eighth the vision of Hector, and the Trojan at the end of the poem.

The Æneid is generally thought to be the four last books; nor is it possible to feel that culminating sympathy with the final combat between Aeneas and Turnus. Yet a personal interest is awakened in the adventures and fate of Pallas, Lausus and Camilla. Virgil may himself have become weary of the succession of battle-scenes—"eadem horrida bella"—which the requirements of epic poetry called upon him to portray. There is not only a less varied interest, there is greater inequality of workmanship in the latter books, owing, to the fact that they had not received their author's final revision. Yet there are more than there are. The pathos and beauty. Virgil brought out the two great instruments of varied and continuous harmony and of a rich, chastened and varied style. "Yet the names of the Ægus are larger and more varied instrument. The note of his supremacy among all the poetic and moral arts is written in the structure of the language and in the meaning of language which touches the deepest and most secret springs of emotion. He touches especially for the emotions of reverence and of yearning for a higher spiritual life, and the sense of nobleness in human affairs, in great institutions, and great natures; the sense of the sanctity of human affections, of the imaginative sense exercised by the past, of the mystery of the unseen world. This is the first of the powers of the Latin words that have over some of the deepest and greatest natures in all ages. (W.Y.S. & T.R.G.)

Manuscripts.—Gellius (Notae Atticae, ix. 14, 7) tells us of people who had inspected idagographum liber Vergilii, but this has of course lost. It was later than the Culex, but not the Culex, now extant, though it passed for half a century after his death. The Aenaeis, the Ciris and the Cupa are clearly not Virgil's. The Mortemus is said to have been translated by him from a Greek poem by his teacher Parthenius, it is an exquisite piece of work, familiar perhaps to English readers in Cowper's translation. The case of the Aenaeis (carat Aenaeis) is peculiar. Two of these little poems (icio indus and Villula) and the Cupa, are generally attributed to the Aenaeis, and the last, with very little to go upon, but generally rejecting them. The whole are printed in the large editions of Virgil. For English readers the last three of insignificant works have had over some of the deepest and greatest natures in all ages.

Ancient Commentators.—Commentaries on Virgil began to be written at a very early date. Suetonius, V. Verg. 44, mentions an ancient commentator of Carthage, who wrote Virgil's "thefts" and "faults," besides eight "volumina" of Q. Octavius Avitus. The "Schedae Berolinenses," perhaps of the 4th century. The "Schedae Sangallenses." The "Schedae seriptae Vernerones" the last three of insignificant works have had over some of the deepest and greatest natures in all ages.

Respondet curis, aquaeque Syracusae amorem.

**Editions.**—The editions of Virgil are innumerable; Heyne (1795, 1802, 1805, 1822, 1827, 1849) in Germany; Benoist (1876) in France, and Conington (completed by Nettleship, and edited by Haverfield) in England, are perhaps the most important. Earlier editions in English have been produced by Page, Sidgwick and Papillon. Conington’s work, however, is without question the best in English.

The *Virgil Legend.*

Virgil’s great popularity in the middle ages is to be partly explained by the fact that he is to a certain extent recognized by the Church. He was supposed to have prophesied the coming of Christ in the fourth Eclogue, and by some divines the Aeneid was held to be an allegory of salvation. Virgil’s popularity was greatly enhanced by Dante when he chose him from among all the sages of antiquity to be his guide in the *Divina Commedia*. Ancient poets and philosophers were commonly transformed by medieval writers into necromancers; and Virgil and Aristotle became popularly famous, not for poetry and science, but for their supposed knowledge of the black art. Naples appears to have been the home of the popular legend of Virgil, which represented him as the special protector of the city, but was probably never quite independent of learned tradition.

One of the earliest references to the magical skill of Virgil occurs in a letter of the imperial chancellor Conrad of Querfurt (1194). 1

1 The Irish apostle to Carinthia, St Virgilus, bishop of Salzburg (d. 784), who held original views on the subject of antipodes, may have been the real eponym of the legend.

reproduced by Arnold of Lübeck in the continuation of the *Chronica Slavorum* of Helmold. John of Salisbury alludes to the brazen fly fibricated by Virgil, *Héloïsite* (d. 1227) speaks of similar marvels. Da Vincis (1482) refers to Virgil’s fires and to Virgil as the guide of Gervase of Tilbury, in his *Oiga Imperialis* (1212), and Alexander of Neckam (d. 1217), in *De Naturis Rerum*, have reproduced these traditions, with modifications. Perhaps the most curious and least over look this accessory to his repertory. The *Roman de Clémédes* of Adénès li rois (12th century) and the *Image du Monde* of Gauthier de Metz (1324) contain numerous references to the applications of Virgil’s *Eclogues* to the practice of medicine and to the services of pilgrims. Receives that he from the wise Virgil a quantity of valuable receipts. He plays a considerable part in the popular folk-tale *The Seven Legends* (13th century). The *Cité des Fées* (1570) is a popular guidebook for pilgrims, the *Mirabilia Romae*. He is to be found in John Gower’s *Confessor Amantis* and in John Lydgate’s *Bochas*. A Spanish romance, *Virgilius*, is included by E. de la Madeleine in the *Tesoro de Historias* (1558) of Hita (d. c. 1560), also wrote a poem on the subject. Many of the tales of magic throughout Europe were referred to Virgil, and gradually developed into a completely new life, strangely different from that of the real hero. They were collected in French under the title of *Les Fais Merveilleux de Virgile* (c. 1499), a quarto chapbook of ten pages, which became extremely popular, and was shortly, with numerous less additions, in various editions in English version, beginning “This is reasonable to wryght the mervelus dede done by Virgilius,” was printed about 1520. We are told that Virgil beguiled the devil at a very early age, in the same manner as Dante. Virgil is also said to have been the Nighth to re-enter Solomon’s casket. Another reproduction of a widely spread tale was that of the lady who kept Virgil suspended in a basket. To revenge the affront the magician extinguished all the lights and lights in the town, and feasting the lady out over the city, and burning the lady to an ordeal highly offensive to her modesty. Virgil made for the emperor a castle in which he could see and hear everything done or said in Rome, an ever-blooming orchard, such as the tributary princes which gave warning of treason or rebellion, and a lamp to supply light to the city. He abducted the son’s daughter, and built for her the city of Naples upon a secure foundation of truth. He had performed many extraordinary things, he knew that his time was come. In order to escape the common lot he placed all his treasures in a castle defended by images unceasingly moving. They were studded, on the ceiling, (in a vast book), 

**Virgil, Polydore**

(C. 1470-1556). English historian, of Italian extraction, otherwise known as P. V. Castellanesis, was a kinman of Cardinal Hadrian Castellensis, a native of Castro in Eturia. His father’s name is said to have been George Virgil; his great-grandfather, Anthony Virgil, “a man well skilled in medicine and astrology,” had professed philosophy at Paris, as did Polydore’s own brother and protégé John Matthew Virgil, at Pavia, in 1517. A third brother was a London merchant in 1511. Polydore was born at Urbino, is said to have been educated at Bologna, and was probably in the service of Giuda Ubaldino, an envoy of the pope. Polydore first consultation of his father work, *Liber Proserbiurn* (April 1498), he styles himself this prince’s client. Polydore’s second book, *De Inventoribus Rerum*, is dedicated to Guido’s tutor,
Ludovico Odaxius, from Urbino, in August 1499. After being chamberlain to Alexander VI. he came to England in 1501 as deputy collector of Peter's pence for the cardinal. As such he was in London near the end of April, 1504. He made his return to Urbino in October 1504. It was at Henry VII's instance that he commenced his Historia Anglica—a work which, though seemingly begun as early as 1502, was not completed till August 1533, the date of its dedication to Henry VIII., nor published till 1534. In May 1514 he and his patron the cardinal are found supporting Wolsey's claims to the cardinalship, but he had lost the great minister's favour before the year was out. A rash letter, reflecting severely on Henry VII. and Wolsey, was intercepted early in 1515, after which Polydore was cast into prison. He was exiled from Italy in December (May and April). He was not without some powerful supporters, as both Catherine de' Medici and Leo X. wrote to the king on his behalf. From his prison he sent an abject and almost blasphemous letter to the offended minister, begging that the fast approaching Christmas—a time which witnessed the restitution of a world—might see his pardon also. He was set at liberty before Christmas 1515, though he never regained his collectorship. In 1525 he published the first edition of Gildas, dedicating the book to the king of England. Next year appeared his Liber de Prodigis, dedicated (in Latin) to Ludovicus Francesco Maria, duke of Urbino. Somewhere about 1538 he left England, and remained in Italy for some time. Ill-health, he tells us, forbade him on his return to continue his custom of making daily notes on contemporary events. About the end of 1551 he went home to Urbino, where he appears to have died in 1555. He had been naturalized an Englishman in October 1510, and had held several clerical appointments in England. In 1538 he was appointed archdeacon of Wells, and in 1533 prebendary of Osgate in St Paul's cathedral, both of which offices he held after his return to Urbino.

The first edition of the Historia Anglica (twenty-six books) was printed at Basel in 1534; the twenty-seventh book, dealing with the reign of Henry VIII. down to the birth of Edward VI. (October 1536), was added to the third edition of 1555. Polydore claims to have been very careful in collecting materials for this work, and takes credit for using foreign historians as well as English; for which reason, he remarks, the English, Scotch and French will find several things reported in his pages far differently from the way in which they are laid down by historians in his native tongue. In his search for information he applied to James IV. of Scotland for a list of the Scottish kings and their annals; but not even his friendship for Grotius enabled him to obtain from him the secret of his learned family of books. Polydore is accused of being a pope's proxy, and thus called forth Leland's Defensio Galliædis et Assertor Incomparabilitis Artarum. This doubting instinct led to his being accused of many offences against learning, such as that of burning caricatures of MSS. lest his errors should be discovered, of purloining books from libraries and shipping them off by the vesselful to Rome. As a matter of fact, it is of course mainly from the time of Henry VI., where our contemporary records begin to fail so sadly, that Polydore's work is useful. He must have been personally acquainted with many men whose memories could carry them back to the beginning of the Wars of the Roses. Dr Brewer speaks somewhat hastily of Henry VII. and his courtiers as the authors of the History of his birth alone, and indeed his spite against Wolsey is evident; but it is impossible to read his social and geographical accounts of England and Scotland without recognizing the book as a work which deserved so many interesting details. Polydore's Adagia (Venice, 1498-1500) was a collection of Latin proverbs ever printed; it preceded Erasmus's by two years, and the slight misunderstanding that arose for the moment out of rival claims gave place to a sincere friendship. A second series of Biblical proverbs (555 in number) was dedicated to Wolsey's follower, Richard Pace, and is preceded by an interesting letter (July 1510), which gives the names of many of Polydore's English friends, and reveals how the cardinal led the life of a rich and Turin. The De Inventoribus, treating of the origin of all things whether ecclesiastical or lay (Paris, 1499), originally consisted of three books. The second book was written for Erasmus, and exceedingly popular, and was early translated into French (1521), German (1537), English (1546) and Spanish (1551). All editions, however, except those following the text sanctioned by Gregory XIII. in 1576, are on the Index Expurgatories. The De Prodigis also achieved a great popularity, and was soon translated into Italian (1543), English (1546) and Spanish (1550). This treatise takes the form of a Latin dialogue between Polydore and his Cambridge friend Robert Ridley. It takes place in the air, at Polydore's country house near London. Polydore's duty is to state the problems and supply the historical illustrations; his friend's task is to explain, rationalize and depreciate as best he can. Here, as in the Historia Anglica, it is plain that the writer plumes himself specially on the excellence of his Latin, which in Sir Henry Ellis's opinion is purer than that of any of his contemporaries.

**VIRGINAL, or PAIR OF VIRGINALS,** a name applied in England, and also recognized on the continent of Europe, to the spinet, and more especially to the small pentagonal and to the rectangular models. The word virginal, bestowed because it was pre-eminently the instrument for girls, denotes a spinet which is narrow enough to be played with a quill string only, plucked by means of a quill attached to a jack.1 The fine instrument in the Victoria and Albert Museum, known as Queen Elizabeth's virginal, is an Italian pentagonal spinet, elaborately emblazoned with the coat of arms of the queen, and having a compass of just over four octaves. King Henry VIII. and his daughters, Queen Mary and Queen Elizabeth, were all accomplished performers on the virginal. (K.S.)

**VIRGINIA, or VIRGINAL, in Roman legendary history, daughter of L. Virginius, a plebeian centurion. Her beauty attracted the notice and love of Lucetia, wife of Quintus, a tribune of the army. According to Plutarch, the latter took hissed to be a slave, and the property of Marcus. Virginus thereupon stabbed her to the heart in the presence of Appius and the people. The story, connecting the history of Roman liberty with the martyrdom of a woman) are nothing but late elaborations of legends connected with the cults of Areto.

**VIRGINIA, one of the more N. of the S.E. Atlantic states of the United States of America, lying between latitudes 36° 30' and 39° 30' N., and longitude 75° 15' and 83° 40' W. It is bounded on the N.W. by Kentucky and West Virginia, the boundary line being nominally a parallel of latitude, but actually a more irregular line. Virginia has an area of 42,637 sq. m., of which 2362 sq. m. are water surface, including land-locked bays and harbours, rivers and Lake Drummond. The state has a length of about 440 m. E. and W., measured along its S. boundary; and an extreme breadth N. and S. of about 200 m.

**Physical Features.**—Virginia is crossed from N. to S. or N.E. to S.W. by four distinct physiographic provinces. The easternmost is the Coastal Plain Province, and forms a part of the great Coastal Plain bordering the S.E. United States from New-York Harbour to South Carolina. This plain occupies about 11,000 sq. m. of the state, and is known as "Tidewater Virginia." After the plain had been raised above sea-level to a higher elevation than it now occupies, it was much dissected by streams and then depressed, leaving large areas of sedimentary strata. Such is the origin of the branching bays or "drowned river valleys," among which may be noted the lower Potomac, Rappahannock, York and James rivers. Chesapeake Bay itself is the drowned lower course of the Susquehanna river, to which the other streams mentioned were

---

1 The mechanism is described under PIANOFORTE and SPINET.
The coastal plain of Virginia is covered with pine forests which merge westward with the hard woods of the Piedmont Belt, where oaks formerly prevailed, but where a second growth of pine now constitutes part of the forest. Even on the Coastal Plain the pines are by no means in the minority; but they are not popular while that portion of these provinces lying in the S.W. part of the state, where the red pine, the black walnut, besides oak and cherry. On the Coastal Plain the cypress grows in the Dismal Swamp, river birch along the streams, and sweet gum and black gum in swampy woods. Other characteristic plants of the Coastal Plain are the cranberry, wild rice, wild yam, wax myrtle, wistaria, trumpet flower, passion flower, holly and white alder. Many of these species spread into the Piedmont Belt. The piedmont province which is characterized by the mountains. The blackberry, black raspberry, huckleberry, blueberry, wild ginger and gingeng are widely distributed.

In Virginia, the climate is generally free from extremes of heat and cold. In the Coastal Plain the temperature is quite stable from day to day, as a result of the equalizing effect of the numerous bays which indent this province. The mean winter temperature is 38°-40°, the mean summer temperature 77°-78°. Killing frosts do not occur before the middle of October, nor later than the last part of April. In the Piedmont Province temperature conditions are naturally less stable, owing to the distance from the sea and the greater inequality of surface topography. In autumn and winter sudden temperature changes are experienced, though not frequently. The mean winter temperature for the state is 31°; mean annual, 58°-60°.

Marshy soils are found along the lowest portions of the Coastal Plain, and are exceedingly productive wherever reclaimed by draining, as in portions of the Dismal Swamp. Other portions of the tidal portions of the land afford more valuable soils, sandy loams overlying sandy clays. On the higher elevations the soil is light and sandy, and such areas remain relatively unproductive. The crystalline rocks of the Piedmont area are covered with residual deposits consisting of glacial till, which is mostly a mixture of sands and gravels, with some clay. The most characteristic types of surface topography is likewise found. The mean winter temperature for this section is 33°; mean summer temperature, 71°-73°; mean annual, 53°-54°.

The forests of Virginia consist of pines, oaks, and hardwoods. The woods are very productive of hardwoods, especially pine and oak.

**Agriculture.**—Tobacco was an important crop in the earlier hisotry of the colony, and Virginia continued to be the leading tobacco-producing state of the Union (reporting in 1850 28.4% of the total crop) until after the Civil War, which, with the division of Virginia into two states, practically ended Virginia’s monopoly of the lead; and in 1900 the crop of North Carolina also was larger. The state’s production of tobacco in 1909 was 120,125,000 lb., valued at $2,121,210,000.

The production of Indian corn in 1909 was 47,328,000 bus., valued at $35,023,000; of wheat, 8,845,000 bus., valued at $10,173,000; of oats, 3,860,000 bus., valued at $2,082,000; of rye, 3,350,000 bus., valued at $200,000; and of feed, $5,520,000. The hay harvest in 1909 was valued at $287,000; the hay crop was valued at $8,060,000 (606,000 tons). The amount of the cotton crop in 1909 was 189,500 bales.

The value of horses in 1910 was $34,561,000 (323,000 head); of mules, $7,020,000 (54,000 head); of neat cattle, $20,343,000 (875,000 head); of swine, $5,031,000 (774,000 head); of sheep, $1,750,000 (245,000 head). A valuable product is Virginia tobacco.
discontinued about the middle of the 19th century. The most important coalfields of the state lie in the Appalachian regions in the S.W. part of the state, though there are also rich deposits in the counties of Henrico, Chesterfield and Rockingham, and in parts of Fauquier, Madison, and Albemarle. In the average year, the anthracite produced was about 1,423,500 its average yearly value was $75,650,450. In the S.E. counties, the famous Pocahontas coal, which produces one of the most valuable grades of coking and steam coal to be found in the United States. There are remarkably rich deposits of iron ore in the Alleghany and Greenbrier river regions, which have been worked for iron by slabs. The rock containing the iron ore of the state is procured, are lined with brown hematite. Iron mining—perhaps the first in the New World—was begun in Virginia in 1619 when theElizabethan gentlemen in the valley of Falling Creek, a tributary of the James river, a colony of about 175 iron workers from Warwickshire, Staffordshire and Sussex, who had obtained a charter for mining purposes under royal warrant of John Berkeley of Gloucester, England, when on March 22nd of 1619 the entire colony, consisting of a girl and a boy, were massacred by the Indians. The first blast-furnace in the colony seems to have been owned by Governor Spotswood, and was built and operated at the head of the Rappahannock river about 1715 by a colony of German Protestants. Immediately after the War the iron industry had been driven from its cradle by the war, and it remained for many years to come a minor industry. The industry waned rapidly toward the middle of the 19th century, but was renewed upon the discovery of the high-grade ores in the S.W. part of the state and the development of railway facilities, and the iron industry of the United States began to be shiped to England. Between 1885 and 1891 the average annual production was about 15,000 tons, the greatest output—

The production of pyrite, which is found in Louisa county and is used for the manufacture of sulphuric acid employed in the treatment of many mineral products, affords a manufactory of superphosphates from phosphate rock, Virginia took first rank in 1902 with an output valued at $501,642, or 64.7% of the total yield of this mineral in the United States; and this rank was maintained in 1908, when the product was 116,340 long tons, valued at $4,356,525. Limestone is found not only in the region west of the Blue Ridge, and has been quarried extensively, the product, used chiefly for flux, being valued in 1908 at $445,885.

The most important state in 1908 in the production of soapstone, nearly the whole product being taken from a long narrow belt running north-east from Nelson county into Albemarle county. The soapstone was shipped from 1836 on, but in 1908, 90% of it had been shipped to England. Between 1885 and 1891 the average annual production was about 15,000 tons, the greatest output—

The value of mineral waters produced in 1908 was $207,115. The state's most important mineral is coal, produced in the Appalachian chain of mountains; in 1908, 46 were reported, making the state third among the states of the United States in number of springs, and of these several have been in high medical repute. At 18 of these resorts are situated, some of which have at times had considerable social value. White Sulphur Springs, in Greenbrier county, impregnated with sulphur, with therapeutic application in jaundice, dyspepsia, &c.; Alleghany Springs, in Montgomery county, calcareous and earthy, purgative and diuretic; Rawley Springs in Rockingham county, Sweet Chalybeate Springs in Alleghany county, and Rockbridge Alum Springs in Rockbridge county, are noted for their therapeutic qualities. The Shenandoah Valley is noted for its healing properties, and the thermal springs, Healing Springs (88° F.) and Hot Springs (110° F.), both in Bath county are noted medicinal springs.

Minerals produced in 1908 included 37,997 tons of iron ore, 3,032,925 tons of anthracite, 8,780,487 tons of bituminous coal, 1,810,698 tons of limestone, salt and sandstone, and among those found but not produced in 1902 in commercial quantities may be mentioned alunite, alum, arsenic, bismuth, carbonite, felspar, kaolin, marble, pitch, pyrites, and zinc. Several of these were mined in the western and southwestern part of the state. Barytes is mined near Lynchburg; the value of the output in 1907 was $55,075. It was not mined in 1902.

Manufactures.—Virginia's manufacturing establishments increased very rapidly in number and in the value of their products during the last two decades of the 19th century. The number of all factories established increased from 5710 in 1880 to 8548 in 1900; the capital invested from $26,965,966 to $103,070,386; the number of wage-earners from 40,184 to 72,702, the total wages from $7,425,261 to $22,445,720, and the value of products from $5,770,952 to $13,172,910. The number of factories1 increased from 3180 in 1890 to 3180 in 1905, the capital invested from $29,209,589 to $47,708,285, the total wages from $20,269,026 to $27,943,048, and the value of products from $108,644,150 to $148,856,525. The manufacture of tobacco was the most important industry; the value of its products in 1905 was $16,768,204. Since 1819 there has been a rapid development in textile manufacture, for which the water power of the Piedmont region is used. A peculiar industry is found in the manufacture of fire-proof cloth, or fire-damp, for use in coal mines. Transportation and Commerce.—Four large railway systems practically originate in the state and radiate to the S. and W. Virginia, the Southern railway, with its main line traversing the state in the shape of a greater or less semicircle through Alexandria, Charlottesville, Lynchburg and Danville to the North Carolina line, with connections to Richmond and a line to Norfolk on the east; the Atlantic Coast line with its main line running S. from Richmond and Norfolk; the Seaboard Air Line, having its main lines also running to the S. from Richmond and Norfolk; the Norfolk & Western crossing the state from east to west in the southern part with Norfolk its eastern terminus, passing through Lynchburg and leaving the state at the south-western corner at Bristol, and the Chesapeake & Ohio crossing the state from west to east farther north than the Norfolk & Western from Newport News to Wheeling through the cities of Harrisonburg and West Virginia line. Of more recent construction is the Virginia railway, a project of H. H. Rogers, opened for traffic in 1905, which connects the railroad between Charles Town and Broad Run on the Oxtongue river, with those of the Norfolk & Western and the Chesapeake & Ohio. The Virginia railroad (Richmond, Fredericksburg & Potomac and Washington Southern railways) operated jointly by the Southern, Atlantic Coast line, Western & Atlantic and Baltimore & Ohio railways. In 1890 there were 34 m. of railway in Virginia; in 1880, 1839 m., and in 1890 it had nearly doubled, having increased to 3,359.54 m., a gain coincident with the growing interest on the part of the state in the development of the Shenandoah Valley. The railroad mileage in 1900 was 3,789.56, and in January 1909 it was 4,348.53.

Hampton Roads at the mouth of the James river, which forms the head of navigation for the largest coastwise vessels, is the chief port of Virginia, while the capital is connected by railroads with all points on the Atlantic coast and with the Pacific States. Newport News, affords one of the best anchorages of the Atlantic coast. It gives shelter not only to vessels plying to its adjoining ports but serves as a harbour of refuge for shipping bound up or down the Atlantic coast, and is frequently used for the assembling of naval fleets. There is a large foreign trade and a regular steamship line to Boston, Providence, New York, Philadelphia and Savannah from the Virginia ports. There is also a large output of tobacco, and there are good railroad facilities for the export of all other products. The mouth of the James river is a large natural harbor, and is afforded with abundant room for the standing of large vessels. The Virginia coast has a number of fine harbors for steamers. The climate of Virginia is healthful; the state has a vast extent of navigable waters, and the Virginia coast has a number of fine harbors for steamers.

Population.—The population of Virginia in 1890 was 1,655,680; in 1900, 1,854,184; and in 1910, 2,611,612. Of the total population in 1900, 1,173,787 were native whites, 19,461 were foreign-born, 660,722 (or 35.7% of the total population) were negroes, 354 were Indians, 243 were Chinese and 10 were Japanese. The state was first among the states and Territories in the number of persons engaged in manufacturing. The capital decreased in the ratio of negroes to the total population in the decade from 1890 to 1900, the percentage of the total population in 1890 being 38%.

Of the inhabitants born in the United States 53,235 were natives of North Carolina, 12,504 were natives of Maryland, and 10,273 were natives of Pennsylvania. Of the foreign-born 4904 were 1 Statistics for 1890 represent the value of all manufactures; those for 1900 (from this point) and 1905 show values under the factory system, including none for manufacturers.

2 According to previous censuses the population was as follows: (1700), 274,610; (1800), 880,200; (1810), 974,600; (1820), 1,055,366; (1830), 1,121,405; (1840), 1,293,797; (1850), 1,421,661; (1860), 1,996,319; (1870), 1,255,153; (1880), 1,512,865.
VIRGINIA

Germans, 3534, were natives of Ireland and 3425 of England. Of the total population 52,264 were of foreign parentage (i.e. either one or both parents). He (American-born) and 9759 were of German birth. 8235 of Irish and 4702 of English parentage, both on the father's and on the mother's side. Out of the total of 793,546 members of religious denominations in 1906, more than half, 415,987, were Lutherans. The Methodists numbered 200,771 and were of German extraction. 39,628 Presbyterians, 28,700 Roman Catholics, 28,487 Protestant Episcopalians, 26,248 Disciples of Christ, and 15,010 Lutherans. Veterans of the Revolutionary War were veterans in number. The principal cities of the state are: Richmond (the capital), Norfolk, Petersburg, Roanoke, Newport News, Lynchburg, Portsmouth and Danville.

Government.—Virginia has had six state constitutions: the first was adopted in 1776, the second in 1820, the third in 1851, the fourth in 1864, the fifth in 1869, and the sixth, the present, in 1902. Amendments to the present constitution may be proposed in either house of the General Assembly, and if they pass both houses of that and the succeeding General Assembly by a majority of the members elected to each house and are subsequently approved by a majority of the people who vote on the question at the next general election they become a part of the constitution. A majority of the members in each house of the General Assembly may at any time propose a convention to revise the constitution and, if at the next succeeding election a majority of the people voting on the question approve, the General Assembly must provide for the election of delegates. To be entitled to vote one must be a male citizen of the United States and twenty-one years of age; have resided in the state for five years, and in the city, or town for one year, and of the election precinct for thirty days next preceding the election; have paid, at least six months before the election, all state poll taxes assessed against him for three years next preceding the election, unless he is a veteran of the Civil War; and have registered after the adoption of the constitution (1902). For registration prior to 1904 one of four additional qualifications was required: service in the army or navy of the United States, of the Confederate States, or of some state of the United States or of the Confederate States; direct descendent from one who served; ownership of property upon which state taxes amounting to at least one dollar were paid in the preceding year; or ability to read the constitution or at least to show an understanding of it. And to qualify for registration after 1904 one must have paid all state poll taxes assessed against him for the three years immediately preceding his application, unless he is a veteran of the Civil War; and unless physically unable he must "make application in his own handwriting, without aid, suggestion or memorandum, in the presence of the registrar of voters, stating therein his name, age, date and place of birth; residing the full time in the state the time next preceding, whether he has previously voted, and, if so, the state, county and precinct in which he voted last;" and must answer questions relating to his qualifications.

Executive.—The governor, lieutenant-governor, attorney-general, secretary of the commonwealth, treasurer, superintendent of public instruction and commissioner of agriculture are elected for a term of four years, every fourth year from 1905, and each new administration begins on the first Monday in February. The governor shall be at least thirty years of age, a resident of the state for five years next preceding his election; and, if of foreign birth, a citizen of the United States and of Virginia for fifteen years next preceding his election. The concurrence of the Senate, the usual power of vetoes legislative bills, and has authority to inspect the records of officers, or to employ accountants to do so, and to suspend, during a recess of the General Assembly, any executive officer at the seat of government except the lieutenant-governor; he must, however, report to the General Assembly at its next session the cause of any suspension and the Assembly determines whether the suspended officer shall be restored or removed.

Legislature.—The General Assembly consists of a Senate and a House of Delegates. The Constitution provides that the number of senators shall be more than one third but not more than three tenths and that the number of delegates shall not be more than one hundred nor less than ninety. Senators and delegates are elected by single districts (into which the state is apportioned once every ten years, according to population), the senators for a term of four years, the delegates for a term of two years. The only qualifications for senators and delegates are those required of an elector and residence in their districts; there are, however, a few disqualifications, such as a manifestation of incapacity, which are imposed by the Constitution.
property as if she were single, except that she cannot by her sole
and deprive her husband of his courtesy in her real estate. A widow
is entitled to a dower in one-third of the real estate of which her
husband was seized at any time during coverture. If the husband
die intestate, or if he have no surviving descendants, or if he
be a widower, she is entitled to so much of his personal estate as was acquired by him by virtue
of his marriage with her prior to the 4th of April 1877; if he leaves
a widow, she is entitled to a dower in one-third of the whole
estate of education; the widow is entitled to at least one-fifth of
the whole of his personal estate. The causes for an absolute divorce are adultery; impotency;
desertion for three years; a sentence to confinement in the peni-
tentiary; a conviction of an inebriate house; and a sentence to
a county penitentiary, or to a city, chosen biennially by the other members of the board. This
board enacts the duties of the superintendent of public instruc-
tion and decides appeals from his decisions; keeps the state divided
into school districts, comprising not less than one county or city
each; appoints quadrennially, with the concurrence of the Senate,
one superintendent for each school division and prescribes his
powers and duties; selects textbooks; provides for examination
and disciplinary action of the teachers and members of the
school board, consisting of the attorney for the Commonwealth,
the division superintendent and one member appointed by the
Board of Supervisors of each county, one member for each district, one member each year. The
division superintendent and the school trustees of the several districts constitute a county
school board. The elementary schools are maintained from the
revenue of the state, the Consolidation Literary fund, a portion of the state poll tax, a property tax not less
than one mill nor more than five mills on the dollar, and special
appropriations; county funds, consisting principally of a property
tax; and district funds, consisting principally of a property tax
and a dog tax. A law enacted in 1908 encourages the establish-
ment of departments of agriculture, domestic economy and manual
training. A law passed in 1880 provided for the education of the
blind by the creation of a Board of Trustees of the Virginia School
for the Blind. A law enacted in 1910 provides a fund for special aid from the
state to rural graded schools with at least two rooms. With state
aid normal training departments are maintained in several of the public schools, and each school in each
little college. All children between the ages of eight and twelve years are required to attend
a public school at least twelve weeks in a year (six weeks
consecutively) unless excused on account of weakness of mind or
body, unless the child can read and write and is attending a private
school, or unless the child lives more than two miles from the
nearest school and more than one mile from an established public
school. A law enacted in 1905, as amended in 1913, provided
for the establishment of a State School for Negroes. This school,
known as the A. L. Smith State School for Coloured Deaf and Blind Children (1908), at Newport
News, is under the charge of a Board of Directors, consisting
of the State Superintendent of Public Instruction and nine other
members appointed by the governor with the concurrence of the
Senate. This school is located in the city of Newport News, on the
right bank of the James River. The school is under the charge of
a Board of Directors, consisting of the State Superintendent of
Public Instruction and nine other members appointed by the governor with the concurrence of the
Senate. The school was founded in 1857 and opened in 1858. The College of William and
Mary, located in the city of Williamsburg, is a private institution, under the control of a Board of
Trustees, consisting of nine members, appointed by the governor with the concurrence of the
Senate, and is endowed with an annual fund of $10,000.

Charitable and Penal Institutions.—Virginia has four hospitals
for the insane: the Eastern State Hospital (1773), at Williams-
burg; the South-Western State Hospital (1867), at Marion; the
Western State Hospital, at Lynchburg; and the Central State Hospital (1860), at Petersburg.
For the care of the deaf and blind there is the Virginia School for the Deaf and Blind, one of the Schools of the State, at Richmond
School for Coloured Deaf and Blind Children (1908), at Newport
News, the State Penitentiary is at Richmond. The Prison
Association of Virginia with an Industrial School (1890) at Laurel
Station, the Negro Reformatory Association of Virginia with a Manual
School (1897) at Broadneck Farm, Hanover, and the Virginia
Home and Industrial School for white girls (1910) at
Lynches Station, are of justifiable expense; these are all owned and
controlled by self-perpetuating boards of trustees, but; are supported by the state, receiving an allowance per capita. For each state hospital for the insane there is a special board of directors consisting of
not less than nine and not more than fifteen members, elected by the
Senate; and the counties, with the concurrence of the Senate; and the
members of the Senate, every two years, and over them all is the com-
misioner of state hospitals for the insane, who is appointed by the
governor with the concurrence of the Senate for a term of four
years. Each of the members of the Board of Directors of the
State Hospital for Coloured Deaf and Blind Children (1908), at
Newport News, is entitled and has the same rights as the
other members appointed by the governor with the concurrence of the
Senate. The Virginia Military Institute, at Lexington, is governed by a board of visitors consisting of
not less than nine and not more than fifteen members, and the
other members appointed by the governor with the concurrence of
the Senate. The University of Virginia (a.), at Charlottesville,
was founded in 1817 and opened in 1825. The College of William
and Mary (a.), at Williamsburg, was founded in 1693 and opened
1906 and is likewise governed under a board appointed by the
Senate. Other institutions of higher learning which are not
under state control are: Washington and Lee University (non-
sectarian, 1749), at Lexington; Hampden-Sidney College (Presby-
terian, 1776), at Hampden-Sidney; Richmond College (Baptist,
1832), at Richmond; Randolph-Macon College (Methodist Episco-
pal, 1837), at Ashland; Hampden-Sidney College (Episcopal,
1838), at Emory; Roanoke College (Lutheran, 1853), at Salem;
Bridgewater College (German Baptist, 1879), at Bridg-
water; Fredericksburg College (Presbyterian, 1852), at Freder-
icksburg; and Virginia Christian College (Christian, 1903), at
Lynchburg.

Finance.—Revenue for state, county and municipal purposes is
developed principally from taxes on real estate, tangible personal
property, and intangible taxes in excess of $1000, wills and administrations,
deeds, seals, lawsuits, banks, trust and security companies, insurance companies, express companies, railway and canal corporations, sleeping-car, parlour-car and dining-car companies, telegraph and telephone companies, Indian reservations, all business transacted that year and taxes on various business and professional licences. The tax laws require that property shall be assessed at its full value by competent valuers, the revenue collected by the state and the receipts of the state are appropriated for the support of the government, and the state corporation commission, consisting of three members appointed by the governor with the concurrence of the General Assembly, is charged with the duty of collecting the taxes. The court of appeals is the supreme court of the state. It consists of seven judges, who are appointed by the governor, with the concurrence of the Senate, for terms of ten years, and the salaries of the judges are $4,600 a year. The state legislature is the supreme legislative body of the state, and consists of a Senate and a House of Representatives, each of which is elected for two years. The Senate consists of twenty-four members, and the House of Representatives consists of sixty members. The state is divided into twenty-three judicial districts, each of which is represented in the General Assembly by one senator and two representatives. The state is represented in the United States Senate by two senators, and in the House of Representatives by forty members. The state has a constitution, which was adopted in 1869, and was amended in 1913. The state has a capital, Richmond, and a chief city, Norfolk. The state has a population of 6,500,000. Virginia was the first permanent English settlement in North America. From 1587 to 1588 attempts had been made by Sir Walter Raleigh and others to establish colonies on the coast of what is now North Carolina. The only result was the naming of the country Virginia in honour of Queen Elizabeth. But glowing accounts were brought back by the early adventurers, and in 1606 an expedition was sent out by the London Company, which was chartered with rights of trade and settlement on the new found land. This expedition was commanded by Captain Christopher Newport (d. 1618), Sir Thomas Gates and Sir George Somers, the new authorities, reached Jamestown at last with 150 men, but finding things in such a deplorable state all agreed (June 10, 1606) to give up the effort to found a colony on the James and set sail for Newfound-land. At the mouth of the river they met Lord Delaware, however, who brought other colonists and plentiful supplies; and they returned, set up a trading post at what is now Hampton and undertook to bring the hostile natives to subjection. In 1611, 650 additional colonists landed, the James and Appomattox rivers were explored and "plantations" were established at Henrico and New Bern. In 1617 Virginia fell into the hands of a rigid Puritan, Captain Samuel Argall. The colonists were compelled on pain of death to accept the doctrine of the trinity, respect the authority of the Bible and attend church. This rigid regime was superseded in 1619 by a milder system under Sir George Yeardley (d. 1627). Twelve hundred new colonists arrived in 1619. At the same time negro slaves and many "indentured" servants were imported as labourers. At the beginning Virginia colonists had held their land and improvements in common. But in 1616 the land was parcelled out and the settlers were scattered along the shores of the James and Appomattox rivers many miles inland. Twenty thousand pounds of tobacco were exported in 1619. The community had now become self-supporting, and the year that witnessed these changes witnessed also the first representative assembly in North America, the Virginia House of Burgesses, a meeting of planters sent from the plantations to assist the governor in reforming and remaking the laws of the colony. In 1621 a constitution was granted whereby the London Company and the colonists were to have it. The colonies were to choose annually from their counties, towns, villages, and plantations delegates to the House of Burgesses. The popular assembly, like the English House of Commons, granted supplies and originated laws, and the governor and Council enjoyed the right of revision and veto as did the king and the House of Lords at home. The Council sat also as a supreme court to review the county courts. This system remained unchanged until the revolution of 1776. But in 1624 the king took the place and exercised the authority of the London Company. Before 1622 there was a population of more than 4000 in Virginia and the many tribes of Indians who were still the prop-rietors of the soil over a greater portion of the country naturally became jealous, and on the 22nd of March of that year fell upon the whites and slew 350 persons. Sickness and famine once again visited the colony, and the population was reduced by nearly one-half. These losses were repaired, however; the tobacco industry grew in importance, and the settlers built their cabins far in the interior of lowland Virginia. This rapid growth was scarcely retarded by a second Indian attack, in April 1641, which resulted in the death of about 350 settlers. By 1648 the population had reached 10,000, but was later reduced by the civil war. In 1662 the king took the place and exercised the authority of the London Company. But Sir William Berkeley had been the governor since 1644, and though he was loyal enough to the crown, it was without difficulty that his authority was overthrown in March 1652 and that of Cromwell proclaimed in its stead. Richard Bennett, a Puritan from Maryland, now ruled the province. Bennett and his Puritan successors, Edward Digges and Samuel Mathews, made no serious change in the administration of the colony except to extend greatly the elective franchise. But this policy was reversed in 1669, when Berkeley was restored to power. The reign of Berkeley was the beginning of a reaction which concentated authorithy, both in the House of Burgesses and in the Council, in the hands of the older families, and thus created a privileged class. The governor, supported by the great families, retained the same House of Burgesses for sixteen years lest a new one might not be submissive. The increasing mass of the population dwelt along the western border or on the less fertile ridges which make up the major part of the land in tide-water Virginia. These poorer people—who were not, however, "poor whites"—developed an abiding hostility towards the oligarchy. They desired a freer land-grant system, protection against the inroads of the Indians along the border, and frequent sessions of an assembly to be chosen by all the freeholders. But a new code of laws outlawed many of these people as dissenters, and in 1676 a burdensome tax was laid by the representative assembly. The Indians had again attacked the border farmers, and the governor had refused assistance, being willing, it was generally believed, that the border pop-ulation should suffer while he and his adherents enjoyed a lucrative fur trade with the Indians. Under these circum-stances, Nathaniel Bacon (1645–1676), whose grandfather was a cousin of Francis Bacon, took the cause of the borderers and severely punished the Indians at the battle of Bloody Run. But Berkeley meanwhile had outlawed Bacon, whose forces now marched on the capital demanding recognition as the authorized army of defense. This was refused, and civil war began, in which the governor was defeated and Jamestown was burned. But Bacon fell a victim to malaria and died in October in Gloucester county. Berkeley closed the conflict with wholesale executions and confiscations. Censured by the king, he sailed to England to make his defence, but died in London in 1677 without having seen Charles. Virginia
remained in the hands of the reactionary party and was governed by men whose primary purpose was to "make their fortunes" at the expense of the colonials. Even the accession of William and Mary scarcely affected the fortunes of the "fifth kingdom,"E though Middle Plantation, a hamlet not far from Jamestown, became Williamsburg and the capital of the province in 1619, and the clergy received a head, though not a bishop, in the person of James Blair (1656-1743), an able Scottish churchman, who as commissary of the bishop of London became a counterpoise to the arbitrary governors, and who as founder and head of the College of William and Mary (established at Williamsburg in 1693) did valiant service for Virginia. Under the stimulus of his presence, the colony, which had lagged behind as before, The powers and duties of the vestry were defined, the position of the parish priest was fixed and his salary was regularly provided for at the public expense, and pedagogues were brought over from Scotland. By 1700 the population of Virginia had reached 70,000, of whom 20,000 were negro slaves. The great majority of whites were small farmers whose condition was anything but desirable and who constantly encroached upon the Indian lands in the Rappahannock region or penetrated the forests south of the James, several thousand having reached North Carolina. Between the negroes and the whites the Negro revolutionized manry resistance and the whites were sometimes driven from their plantations by Negroes who held the upper hands in the struggle. Negro slavery grew so rapidly during the first half of the eighteenth century that the blacks outnumbered the whites in 1740. The master of slaves set the fashion. Handsome houses were built along the banks of the Tug hill rivers, and numerous slaves were employed. There was as great a social distance between the planters and their families on the one side and the masses of people in Virginia on the other as that which separated the nobles from the yeomanry in Europe; and there was still another chasm between the small farmers and the negroes. In 1716 an expedition of Governor Alexander Spotswood over the mountains advertised to the world the rich backcountry, now known as the Valley of Virginia; a migration thither from Pennsylvania and from Europe followed which resulted in the creation of new counties and proportionate representation in the Burgesses. They did not at first succeed, but when the Seven Years' War came on they proved their worth by fighting the battles of the community against the Indians and the French. When the war was over the prestige of the up-country had been greatly enhanced, and its people soon found eastern leaders in the persons of Richard Henry Lee and Patrick Henry. In 1763-1765 an investigation of the finances of the colony, forced by the up-country party, showed widespread corruption, and resulted in the collapse of the tide-water oligarchy, which had been in power since 1660. In the meantime the Presbyterians, who had been officially recognized in Virginia under the Toleration Act in 1699, and had been guaranteed religious autonomy in the Valley by Governor Gooch in 1738, had sent missionaries into the border counties of eastern Virginia. The Baptists about the same time entered the colony both from the north and the south and established scores of churches. The new denominations vigorously attacked the methods and
formation of a national government with adequate powers to supersede the lame confederacy. In 1787, under the presidency of Washington, the National Convention sat in Philadelphia, with the result that the present Federal Constitution was submitted to the states for ratification during 1787-1789. In Virginia the tide-water leaders urged adoption, while the upcountry men, following Henry, opposed; but after a long and a bitter struggle, in the summer of 1788 the new instrument was accepted, the low-country winning by a majority of ten votes, partly through the influence of James Madison. Thus the eastern men, who had reluctantly supported the War of Independence, now became the sponsors for the national government, and Washington was compelled to rely on the party of slavery, not only in Virginia but in the whole South, in order to administer the affairs of the nation.

In 1784, Virginia, after some hesitation, ceded to the Federal government the north-west territory, which it held under the charter of 1609; in 1792 another large strip of the territory of Virginia became an independent state under the name of Kentucky. But the people of these cessions, especially of Kentucky, were closely allied to the great up-country party of Virginia, and altogether they formed the basis of the Jeffersonian democracy, which from 1794 opposed the chief measures of the Washington administration, and which on the passage of the Alien and Sedition laws in 1798 precipitated the first great constitutional crisis in Federal politics by the adoption in the Kentucky and Virginia legislatures of the resolutions, known by the names of those states, strongly asserting the right and duty of the states to arrest the course of the national government whenever in their opinions that course had become unconstitutional. Jefferson was the author of the Kentucky resolutions, and his friend Madison prepared those passed by the Virginia Assembly. But these leaders restrained their followers sharply whenever the suggestion of secession was made, and the question of what was meant by arresting the course of Federal legislation was left in doubt. The election of 1800 rendered unnecessary all further agitation by putting Jefferson in the President's chair. The up-country party in Virginia, with their allies along the frontiers of the other states, were in power, and the radical of 1776 shaped the policy of the nation during the next twenty-five years. Virginia held the position of leadership in Congress, controlled the cabinet and supplied many justices of the Supreme Court.

Virginia played a leading rôle in the War of 1812, and up to 1835 her influence in the new Western and North-Western states was overwhelming. But the steady growth of slavery in the East and of a virile democracy in the West neutralized this influence and compelled the assembling of the constitutional convention of 1829, whose purpose was to revise the fundamental law in such a way as to give the more populous counties of the West their legitimate weight in the legislature. The result was failure, for the democracy of small farmers which would have taxed slavery out of existence was denied proportionate representation. The slave insurrection under Nat Turner (q.v.) in 1831 led to a second abortive effort, this time by the legislature, to fay with the fateful institution. The failure of these popular movements led to a sharp reaction in Virginia, as in the whole South, in favour of slavery. From 1835 to 1861 many leading Virginians defended slavery as a blessing and as part of a divinely established order.

In 1850 a third Convention undertook to amend the Constitution, and now that the West yielded its bitter hostility to slavery, representation was so arranged that the more populous section was enabled to control the House while the East still held the Senate; the election of judges was confined to the people; and the suffrage was broadened. Although the West was not pleased, the leaders of the slave-holding counties threatened secession.

In the national elections of 1860 Virginia returned a majority of unionist electors as against the secession candidates, Breckinridge and Lane, many of the large planters voting for the continuance of the Union, and many of the smaller slave-owners supporting the secessionists. The governor called an extra session of the legislature soon after the Federal election, and this in turn called a Convention to meet on the 13th of February 1861. The majority of this body consisted of Unionists, but the Convention passed the ordinance of secession when the Federal government (April 17) called upon the state to supply its quota of armed men to suppress "insurrection" in the lower Southern states. An alliance was made with the provisional government of the Confederate States, on April 25, without waiting for the vote of the people on the ordinance. The Convention rounded out 10,000 troops and appointed Colonel Robert E. Lee of the United States army as commander-in-chief. On the 23rd of May the people of the eastern counties almost unanimously voted approval of the acts of the Convention, and the western counties took steps to form the state of West Virginia (q.v.). Richmond soon became the capital of the Confederacy.

The Civil War was already begun, and Virginia was of necessity the battle-ground. Of the six great impacts made upon the Confederacy, four were upon Virginian soil: the first Manassas campaign (1861), the Peninsular battles (1862), second Manassas (1862), Fredericksburg, Chancellorsville (1862-63) and the great Wilderness-Petersburg series of attacks (1864-65). About 50,000 men were killed in Virginia, and probably 100,000 died of wounds and disease. The principal battles were: the first Manassas, or Bull Run (July 21, 1861); those around Richmond (June 26-July 2, 1862); second Manassas (August 29-30); Fredericksburg (December 12, 1862); Mechanicsville (May 2 and 3, 1863); the Wilderness (May 5 and 6); Spotsylvania (May 8); North Anna and Bethesda (May 23-26); Cold Harbor (June 3); the Wilderness (June 15, July 11 and November 1, 1864); and Five Forks (April 1) and Appomattox (April 9-10, 1865).

With the surrender of the Confederate army under General Lee to Grant at Appomattox the task of reconstruction began. President Lincoln offered a very liberal plan of re-establishing the civil authority over the counties east of the Alleghany mountains, and Governor Francis H. Pierpont set up in Richmond a government, based upon the Lincoln plan and supported by President Johnson, which continued till the 2nd of March 1867, when the famous reconstruction order converting the state into Military District No. 1 was issued. Governor John M. Schofield was put in charge, and under his authority a constitutional Convention was summoned which bestowed the suffrage upon the former slaves, who, led by a small group of whites, who had come into the state with the invading armies, ratified the 14th and 15th amendments to the Federal Constitution and governed the community until 1869. Then the secessionists and Union men of 1861 united and regained control. Virginia was readmitted to the Union on the 26th of January 1870. The Constitution of the reconstruction era was unchanged until 1902, when the present fundamental law was adopted.

In national elections the state has supported the Democratic party, except in 1860, when its vote was cast for John Bell, the candidate of the Constitutional Union party.

GovernoRS of VIRGINIA
Under the Company

Edward Maria Wingfield, President of the Council
John Ratcliffe, President of the Council 1609 (April to Sept.)
John Smith, 1607-1608
George Percy, 1608-1609
Thomas West, Lord Delaware, "Governor and Captain General" 1609-1610
George Percy, Deputy Governor 1610 (March to May)
Sir Thomas Dale, "High Marshal" and Deputy Governor 1611 (May to Aug.)
Sir Thomas Gates, Acting Governor 1611-1612
Sir Thomas Dale 1612-1616
George Yeardley, Lieutenant or Deputy Governor 1616-1617
Samuel Argall, Lieutenant or Deputy Governor 1617-1619
Nathaniel Powell, Acting Governor 1619-1621
Sir George Yeardley, Governor 1620-1621
Sir Francis Wyatt, 1621-1624
Under the Crown

Sir Francis Wyatt, Governor. 1624-1626
Sir George Yeardley. 1626-1627
Francis West (elected by "Council"). 1628-1629
John Pott. 1629-1635
Sir John Harvey, Governor. 1635-1639
Sir John Harvey, Governor. 1639-1641
Sir William Berkeley. 1641-1644
Richard Kemp (elected by Council). 1644-1645
Sir William Berkeley, Governor. 1645-1652

Under the Commonwealth

Richard Bennett (elected by General Assembly 1652-1655)
Edward Digges (elected by House of Burgesses 1655-1657)
Samuel Matthews (elected by House of Burgesses). 1657-1660
Sir William Berkeley, Governor. 1660-1667
Francis Morrison (or Morison), Deputy Governor. 1661-1662
Herbert Jeffreys, Lieutenant Governor. 1667-1678
Sir Henry Chicheley, Deputy Governor. 1678-1680
Thomas, Lord Culpepper, Governor. 1680-1683
Nicholas Spencer, President of the Council. 1683-1684
Francis, Lord Howard of Effingham, Lieutenant Governor. 1684-1687
Nathaniel Bacon, President of the Council. 1687-1690
Francis Nicholson, Lieutenant Governor. 1690-1692
Sir Edmund Andros, Governor. 1692-1698
Francis Nicholson, Lieutenant Governor. 1698-1704
George Hamilton Douglas, Earl of Orkney, Governor-in-chief. 1704-1737
Edward Nott, Lieutenant Governor. 1705-1706
Edmund Jenings, President of the Council. 1706-1710
Robert Hunter, Lieutenant Governor1. 1707
Alexander Spotswood, Lieutenant Governor. 1710-1722
Hugh Drysdale
Robert Carter, President of the Council. 1726-1727
William Gooch, Governor. 1727-1740
William Anne Keppel, Earl of Albemarle, Governor-in-chief1. 1737-1754
James Blair, President of the Council. 1740-1741
Sir William Gooch, Governor. 1741-1749
John Robinson, President of the Council. 1749 (June to Sept.)
Thomas Lee.
Lewis Burwell.
Robert Dinwiddie, Lieutenant Governor. 1751-1758
John Campbell, Earl of Loudon, Governor General of the American Colonies3. 1756-1759
John Blair, President of the Council. 1758 (Jan. to June)
Francis Fauquier, Lieutenant Governor. 1758-1759
Sir Jeffrey Amherst, Governor-in-chief1. 1763-1768
John Blair, President of the Council. 1768 (March to Oct.)
Norborne Berkeley, Baron de Botetourt, Governor. 1768-1770
William Nelson, President of the Council. 1770-1771
John Murray, Earl of Dunmore, Governor-in-chief. 1771-1775

State

Patrick Henry. 1776-1779
Thomas Jefferson. 1779-1801
Thomas Nelson, jun. 1781
Benjamin Harrison. 1781-1784
Patrick Henry. 1784-1786
Edmund Randolph. 1786-1788
Beverley Randolph. 1788-1791
Henry Lee.
Robert Brooke. 1791-1794
James Wood, Democratic-Republican. 1795-1799
James Monroe. 1799-1802
John Page.
William H. Cabell.
John Tyler, sen. 1808-1811
James Monroe.
George Wm. Smith (acting), Democratic Republican. 1811
Peyton Randolph (acting). 1811-1812
James Barbour, Anti Democratic. 1812-1814
Wilson Cary Nicholas, Republican. 1814-1816
James Patton Preston.
Thomas Mann Randolph.
James Pleasants.
John Tyler, State Rights Democrat. 1825-1827
William Branch Giles, Democrat. 1827-1830

1 Never in Virginia.

John Floyd, Democrat. 1830-1834
Littleton Waller Tazewell, Democrat. 1834-1836
Wyndham Robertson (acting), Democrat. 1836-1837
David Campbell, Whig. 1837-1838
Thomas W. Gilmer, Whig. 1839-1841
John M. Patton (acting), Whig. 1841
John Rutherford (acting), Whig. 1841-1842
John Munford Gregory (acting), Whig. 1842-1843
James McDowell, Whig. 1843-1846
William Smith, Democrat. 1846-1849
John Buchanan Floyd, Democrat. 1849-1852
Joseph Johnson, Whig. 1852-1854
Henry Alexander Wise. 1854-1860
John Letcher. 1860-1864
William Smith.
Francis H. Pierpont (provisional), Republican. 1865-1867
Henry Horatio Wells.
Gilbert Carlton Walker.
James Lawson Kemper, Conservative. 1874-1875
Frederick Wm. Mackey Holliday, "Debt Paying". 1875-1878
William Ewan Cameron, Readjuster. 1878-1882
Firthugh Lee, Democrat. 1886-1890
Philip W. McKinney, Democrat. 1890-1894
Charles Triplett O’Ferrall, Democrat. 1894-1898
James Hoge Tyler.
Andrew Jackson Montague.
Claude Augustus Swanson.
William Hodges Mann.

1898-1902
1902-1906
1906-1910
1910

VIRGINIA, UNIVERSITY OF, a state institution for higher education, situated at Charlottesville among the foot-hills of the Blue Ridge Mountains. Its buildings, arranged around...
a large rectangular lawn and erected from a plan prepared by Thomas Jefferson, are noted for their architectural effect. At the head of the lawn is the Rotunda, modelled after the Roman Pantheon and now containing the university library; and at the foot of the lawn are three modern recitation and laboratory buildings. On the sides are grouped buildings for each individual professor and dormitories for students. There are also a chapel, a gymnasium, a hospital, and on the summit of Mount Jefferson Hill, a mile south-west of the campus, is the M'Cormick Observatory. The university comprises twenty-six independent schools, but the courses of instruction given in these are so co-ordinated as to form six departments: two academic—the college and the department of graduate studies; and four professional—law, medicine, engineering, and agriculture. The institution owns 532 acres of land, has productive endowment funds amounting to $1,978,000, and receives from the state an annual appropriation of $80,000. It is governed by a rector, chosen by and from nine visitors, and a board of trustees, moral philosophy, chemistry, and medical jurisprudence, the state superintendent of public instruction and the president of the university; and the corporate name of the university is "The Rector and Visitors of the University of Virginia." In 1804 Edwin Anderson Alderman (b. 1861) was elected president. In 1910 the faculty and officers numbered 110, the students (men only) 803, and the number of volumes in the libraries 88,000.

The university traces its beginning to an act of the legislature in January 1812 for incorporating the "Trustees of Albemarle Academy," before the site of this proposed institution had been chosen, Thomas Jefferson was elected a trustee, and under his influence the legislature, in February 1816, authorized the establishment of Central College in lieu of Albemarle Academy. The corner-stone of Central College was laid in October 1817, and Jefferson, who was rector of its board of trustees, evolved a plan for its development into the university of Virginia. The legislature, thanks to the efforts of Joseph Carrington Cabell, a close personal friend of Jefferson, adopted the plan in 1818 and 1819, and seven independent schools—ancient languages, modern languages, mathematics, natural philosophy, moral philosophy, chemistry, and medical jurisprudence, opened to students in March 1825; a school of law was opened in 1826. In 1837 the School of Medicine became a department of three individual schools; and in 1850 the School of Law became a department of two schools. After the gift of $500,000 by Andrew Carnegie there were established in 1909 the Andrew Carnegie School of Engineering, the James Madison School of Law, the James Monroe School of International Law, the James Wilson School of Political Economy, the Edgar Allan Poe School of English and the Walter Reed School of Pathology.

Under Jefferson's plan only two degrees were granted: "Graduate," to any student who had completed the course of any one school; and "Doctor" to a graduate in more than one school who had shown powers of research. But in 1831 for the Doctor's degree the faculty substituted, following British custom, the degree of Master of Arts. The college now grants the degrees of "Bachelor of Arts," "Cultural Bachelor of Science," and "Vocational Bachelor of Science." The Department of Graduate Studies, the degrees of "Graduate in a School," "Master of Arts," "Master of Science," and "Doctor of Philosophy," the Department of Law, the degree of "Bachelor of Laws," the Department of Medicine, the degree of "Doctor of Medicine," the Department of Engineering, the degrees of "Civil Engineer," "Mechanical Engineer," "Electrical Engineer," "Mining Engineer," and "Chemical Engineer," and the Department of Agriculture, the degree of "Bachelor of Science in Agriculture."

See J. S. Patton, Jefferson, Cabell and the University of Virginia (New York, 1906).

**VIRGIN ISLANDS.** A group of small islands in the West Indies, about 100 in number, for the most part uninhabited. They extend E. from Puerto Rico, lying between 17° and 19° N. and 64° and 66° W., their total area being about 465 sq. m. The islands are mostly rocky, or sandy and barren, but such portions as are under cultivation yield sugar, maize, coffee, cotton and indigo. Guinea grass grows abundantly on the hillsides, affording excellent pastureage; the forests, though few, include the mahogany and other useful trees. The coasts abound with fish. The climate is more healthy than that of the other West Indian islands, and the heat is not so great. Some of the islands belong to the United States, some to Denmark and some to Great Britain. The United States' possessions (once dependencies of Puerto Rico, but ceded by Spain in 1898) have an area of about 150 sq. m. and include Culebra or Snake Island, and Vieques or Crab Island. The chief Danish islands are St Thomas (q.v.), St Croix (q.v.) and St John (q.v.), the total area being about 240 sq. m. Of the British portion of the group the principal are Tortola, Anguilla, Virgin Gorda, Jost van Dyke, Peter's Island and Salt Island, in all numbering 32, with an area of 58 sq. m. With the exception of the island of Sombrero they form one of the five presidencies in the colony of the Leeward Islands. The inhabitants are peasant proprietors, mainly engaged in raising cattle and in burning charcoal, but some are fishermen and boatmen. The chief town is Roadtown (pop. 400) at the head of a splendid harbour on the S. of Tortola, and what trade there is is mostly with St Thomas. Sombrero is maintained as a lighthouse by the British government. Population of the presidency, mostly negroes (1891) 4639; (1901) 4908.

The Virgin Islands were discovered by Columbus in his second voyage, in 1494, and named Las Virgenes, in honour of St Ursula and her companions. In 1666 the British established themselves on Tortola, which has ever since remained in their possession. In the 17th century the Virgin Islands were favourite resorts of the buccaneers. The Danish islands of St Thomas and St John were taken by the British in 1672 but restored in the following year. In 1807 they surrendered to the British, and continued in their hands till 1815, when they were again restored.

**VIRGiniUS RufUS, LuciUs.** A.D. 15-97. Roman patriot and soldier, three times consul (A.D. 63, 69, 97), was born near Comum, the birthplace of the two Plinys. When governor of upper Germany under Nero (68), after he had put down the revolt of Julius Vindex in Gaul, he was more than once urged by his troops to assume the supreme power; but he firmly refused, and further declared that he would recognize no one as emperor who had not been chosen by the senate. Gallus, on his accession, aware of the feelings of the German troops and uncertain as to the intentions of Virginius, induced him to accompany him to Rome. But Virginius, as always, remained loyal to the head of the state. After the death of Otho, the soldiers again offered the throne to Virginius, but he again refused it. Considering themselves slighted, they drew their swords upon him, and he only saved himself from their hands by making his escape through the back of the tent. But the soldiers never forgave the fact that Virginius insulted them by a military disturbance at Ticinium, one of Virginius's slaves was among them and charged with the design of murdering the emperor. Virginius was accused of being implicated in the conspiracy, and his death was loudly demanded by the soldiers. To his credit Vitellius refused to sacrifice so valuable a servant, on whose loyalty he could depend, to the vengeance of a capricious army. Virginius subsequently lived in retirement, chiefly in his villa at Abium, on the coast of Etruria, till his death in 97, in which year he held the consulship, together with the emperor Nerva. At the public burial with which he was honoured, the historian Tacitus (then consul) delivered the funeral oration. The younger Pliny, his neighbour and ward, has recorded the lines which Virginius had ordered to be engraved upon his tomb:

"Hic situs est Rufus, pulso qui Visidce quondam Imperium asseruit non sibi sed patriae." See Tacitus, Hist. i. ii.; Dio Cassius lxxii. 24-27, liv. 4. Iviii. 2; Pliny, Ep. ii. 1, vi. 10; Juvenal vii. 221, with his own note; L. Paul in Rheinisches Museum (1899), liv. pp. 602-30.

**VIRGO** ("the Virgin"), in astronomy, the sixth sign of the zodiac (q.v.), denoted by the symbol Υ. It is also a constellation mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.); Ptolemy catalogued 32 stars, Tycho Brahe 33.
VIRUÉS—VISCHE, FAMILY)

Hevelius's. The Greeks represented this constellation as a virgin, but different fables are current as to the identity of the maid. She is variously considered to be Justitia, daughter of Astraeus and Ancora, who lived before man sinned, and taught him his duty, and when the golden age ended she returned to heaven; according to Hesiod the virgin is the daughter of Jupiter and Themis; others make her to be Erigone, daughter of Icarus, or Parthene, daughter of Apollo. The most interesting stars of this constellation are: α Virginis, or Spica, a star of the first magnitude with a very faint companion; and γ Virginis, a binary star, having components of the third magnitude.

VIRUÉS, CHRISTOPH (1500–1555), Spanish diplomat, and soldier, was born at Valencia about the middle of the 16th century, joined the army, fought at Lepanto, and retired to his native place with the rank of captain shortly before 1586. The first-fruits of his leisure was El Monserrate (1587), a dull poem on a responsive subject which had the honour of being praised by Cervantes, and of being reprinted in 1601. Shortly afterwards Virués returned to Italy and issued a recast of his poem entitled El Monserrate Segundo (1602). His Obras Trágicas y líricas (1600) include five tragedies: La Gran Sembramis, La Cruel Casandra, Atila Juroso, La Infeliz Marcela and Elisa Díez. The date of his death is uncertain; but he is believed to have been alive as late as 1614. Virués belongs to the school of dramatists displaced by Lope de Vega, and his methods were out of fashion before his plays were printed; yet he is an interesting figure, chiefly because of the very extravagances which destroy the effect of his best scenes.

VISBY, or WISBY, the capital of the Swedish island and administrative district (län) of Gotland, in the Baltic Sea. Pop. (1900) 3876. It is the seat of a bishop, the port of the island, and a favourable watering-place. It is picturesquely situated on the west coast, 190 m. S. by E. of Stockholm by sea. The houses cluster beneath and above a cliff (klint) 100 ft. high, and the town is thoroughly medieval in appearance. The remains from its period of extraordinary prosperity from the 11th to the 14th century are of the highest interest. Its walls date from the end of the 13th century, replacing earlier fortifications, and enclose a space much larger than that now covered by the town. Massive towers rise at close intervals along them, and nearly forty are in good preservation. Between them are traces of barbicans. The cathedral church of St Mary dates from 1190–1225, but has been refaced and improved at various times; it has a great square tower at the west end and two graceful octagonal towers at the east, and contains numerous memorials of the 13th century. There are ten other churches, in part ruined, none of which is used for service. Among those of chief interest St Nicholas', of the early part of the 13th century, formerly belonged to a Dominican monastery. It retains two beautiful rose-windows in the west front. The church of the Holy Ghost (Helgeands-Kyrka) in a late Romanesque style (c. 1250) is a remarkable structure with a nave of two storeys. The Romanesque St Clement's has an ornate south portal, and the churches of St Dronem and St Lars, of the 14th century, are notable for their huge towers. St Catherine's, of the middle of the 13th century, is Gothic, with a pentagonal apse. It belonged to a Franciscan convent, of the buildings of which there are slight ruins. Among ancient remains in the vicinity may be mentioned Galgherget, the place of execution, with tall stone pillars still standing; and the remarkable stone labyrinth of Träbjerg. Modern buildings include the Gotland museum of antiquities, and the high school, with a museum and library. The artificial harbour, somewhat exposed, lies south of the town; but it has been filled up and covered with gardens. The town is the terminus of railways to north and south. It is the headquarters of the army division of Gotland troops, and there are some modern forts.

The name Visby is derived from the old Norse ve= (sanctuary) and by (town). This was no doubt a place of religious sacrifice in heathen times. At any rate it was a notable trading-place and emporium as early as the Stone Age, and continued to enjoy its importance as such through the Bronze and Iron Ages, as is proved, inter alia, by the large number of Arabic, Anglo-Saxon and other coins which have been found on the island. See Gotland and SEA LAWS.

VISCACHA, or Biscacha, a large South American burrowing rodent mammal belonging to the family Chinchillidae and commonly known as Lagostomus trichodactylus, although some writers prefer the name Viscacia. With the cheek-teeth formed of a number of parallel plates in the manner characteristic of the family, the viscachas is distinguished from the other members of that group by having only three hind toes; while it is also the heaviest-built and largest member of the group, with a short tail and short ears; the general colour of the latter being dark grey, with conspicuous black and white markings on the face. Viscachas inhabit the South American pampas between the Uruguay river and the Rio Negro in Patagonia, where they dwell in warrens covering from 100 to 200 sq. ft. and forming mounds penetrated by numerous burrows. The ground around the "viscachera" is cleared from vegetation, the refuse of which is heaped upon the mound. Anything the rodents may meet with on their journeys, such as thistle-stalks or bones, are also sometimes deposited in the vischera. Deep down in the burrows the viscachas, from which in frequented districts they seldom emerge till evening, unless to drink after a shower. Their chief food is grass and seeds, but they also consume roots. When alarmed, they rush to their burrows, and if these are disturbed utter a growling sound. A pair of prairie burrowing owls (Speotyto) are almost invariably inhabitants of a vischera (see Rodentia). (R. L.)*

VISCHER, the name of a family of Nuremberg sculptors, who contributed largely to the masterpieces of German art in the 15th and 16th centuries.

1. Hermann, the elder, came to Nuremberg as a worker in brass in 1453 and there became a "master" of his guild. There is only one work that can be ascribed to him with certainty, the baptismal font in the parish church of Wittenberg (1457). This is decorated with figures of the Apostles.

2. His son, Peter, the elder, was born about 1455 in Nuremberg, where he died on the 7th of January 1526. He became "master" in 1489, and in 1494 was summoned by the Elector Prince Philip of the Palatinate to Heidelberg. He soon returned, however, to Nuremberg, where he worked with his sons, and died in 1515. His works are: the tomb of Bishop Johannes IV., in the Breslau cathedral (1496); the tomb of Archbishop Ernest, in Magdeburg cathedral (1497); the shrine of Saint Sebald in the Sebaluskirche at Nuremberg, between 1508 and 1510; a large grille ordered by the Fugger brothers in Augsburg (lost); a relief of the "Crowning of the Blessed Virgin" in the Erfurt cathedral (a second example in the Wittenberg Schlosskirche, 1521); the tombstones for Margareta Tucherin in the Regensburg cathedral (1521), and for the Ebem family in the Agidienkirche at Nuremberg (1522); the epitaph for the cardinal Albrecht of Brandenburg in the collegiate church at Aschaffenburg (1522); the tomb of the electoral prince Frederick the Wise in the Schlosskirche at Wittenberg (1521); the epitaph of the duchess Helene of Mecklenburg in the cathedral at Schwerin. Besides these works there are a number of others ascribed to Peter the elder with less certainty. In technique few bronze sculptors have ever equalled him, but his designs are marred by an excess of mannered realism and a too exuberant fancy. His chief early work, the tomb of Archbishop Ernest in Magdeburg cathedral (1495), is adorned with fine statuettes of the Apostles under semi-Gothic canopies; it is purer in style than the magnificent shrine of St Sebald, a tall canopied bronze structure, crowded with reliefs and statuettes in the most lavish way. The general form of the shrine is Gothic, but the details are those of the 16th-century Italian Renaissance treated

1 This great work is really a canopied pedestal to support and enclose the shrine, not the shrine itself, which is a work of the 14th century, having the gabled form commonly used in the middle ages for metal reliquaries.
with much freedom and originality. Some of the statuettes of saints attached to the slender columns of the canopy are modelled with much grace and even dignity of form. A small portrait figure of Peter himself, introduced at one end of the base, is a marvel of clever realism: he has represented himself as a stout, bearded man, wearing a large leathern apron, and holding various tools of his trade. It is a remarkable example of the uncommercial spirit which animated the artists of that time, and of the evident delight which they took in their work. Dragons, grotesques and little figures of boys, mixed with graceful scroll foliage, crowd every possible part of the canopy and its shafts, designed in the most free and unconventional way and executed with an utter disregard of the time and labour which were lavished on them.

See R. Bauer, Peter Vischer und das alte Nürnberg (1886); C. Headlam, Peter Vischer (1901).

**VISCHER, FRIEDRICH THEODOR** (1807-1887), German writer on the philosophy of art, was born at Ludwigsburg on the 30th of June 1807, and was the son of a clergyman. He was educated at Tübingen, and began life in his father's profession. In 1835 he became Privatdozent in aesthetics and German literature at his old university, was advanced in 1837 to extraordinary professor, and in 1844 to full professor. In consequence, however, of his outspoken inaugural address, he was suspended for two years by the Württemberg government, and in his enforced leisure wrote the first two volumes of his *Aesthetik, oder Wissenschaft des Schönen* (1846), the fourth and last volume of which did not appear till 1857. Vischer threw himself heartily into the great German political movement of 1848-49, and shared the disappointment of patriotic democrats at its failure. In 1855 he became professor at Zürich. In 1866, his fame being now established, he was invited back to Germany with a professorship at Tübingen combined with a post at the Polytechnicum of Stuttgart. He died at Gmunden on the 14th of September 1887. His writings include literary essays, collected under the titles *Kritische Gänge und Altes und Neues*, poems, an excellent critical study of Goethe's Faust (1875), and a successful novel, *Auch Einer* (1878; 25th ed., 1904). Vischer was not an original thinker, and his monumental *Aesthetik*, in spite of industry and learning, has not the higher qualities of success. He attempts the hopeless task of explaining art by the Hegelian dialectic. Starting with the definition of beauty as "the idea in the form of limited appearance," he goes on to develop the various elements of art (the beautiful, sublime and comic), and the various forms of art (plastic art, music and poetry) by means of the Hegelian antitheses—form and content, objective and subjective, inner conflict and reconciliation. The shape of the work also is repellently Hegelian, consisting of short highly technical paragraphs containing the main argument, followed by detailed explanations printed in different type. Still, Vischer had a thorough knowledge of every branch of art except music, and much valuable material is buried in his volumes. In later life Vischer moved considerably away from Hegelianism, and adopted the conceptions of sensuous completeness and cosmic harmony as criteria of beauty; but he never found time to rewrite his great book. His own work as a literary artist is of high quality; vigorous, imaginative and thoughtful without academic technicality.

**VISCONTI** (family), the name of a celebrated Italian family which long ruled Milan; they claimed descent from King Desiderius, and in the 11th century possessed estates on Lake Como and Maggiore. A certain Ottone, who distinguished himself in the First Crusade, is mentioned in 1078 as viscount of Milan. The real basis for the family's dominion was laid, however, by another Ottone, a canon of Desio, appointed archbishop of Milan by Pope Urban IV. in 1262 through the influence of Cardinal Ubaldini. The Della Torre family, who then con-
trolled the city, opposed the appointment, and not until his victory at Desio in 1277 was Ottone able to take possession of his see. He imprisoned Napoleonelle Della Torre and five of his relatives in iron cages, and directed his later efforts towards the advancement of his nephew Matteo. He died on the 18th of August 1324 at Inverio, and set the seal of the Montefeltro, his brother, to give the Della Torre the title of "Duke." Matteo, born at Inverio on the 15th of August 1275, succeeded his uncle as political leader of Milan, and although an uprising of the Della Torre in 1302 compelled him to take refuge at Verona, his steadfast loyalty to the imperial cause in Italy earned him the gratitude of Henry VII, who restored him to Milan in 1310 and made him imperial vicar of Lombardy. He brought under his rule Piacenza, Tortona, Pavia, Bergamo, Vercelli, Cremona and Alessandria. An able general, he yet relied for his conquests more on diplomacy and bribery, and was esteemed as a model of the prudent Italian type (Puo). In 1326 he purchased in his Gibelline policy, and quarrelling with Pope John XXII., over an appointment to the archbishopric of Milan, he was excommunicated by the papal legate Bertrand du Puy in 1322. He at once abdicated in favour of his son Galeazzo, and died at Crescenzago on the 24th of June of the same year. He left besides Galeazzo several sons: Marco, Lucchino, Giovanni and Stefano. Galeazzo I. (1277-1328), who ruled at Milan from 1322 to 1328, met the Holy Army which the pope had sent against the Visconti at Vaprio on the Adda (1324), and was defeated. He died in 1328. His wife Beatrice, who married the Bavarian. In 1327 he was imprisoned by the emperor at Monza because he was thought guilty of making peace with the church, and was released only on the intercession of his friend Castruccio Castracane. By his wife Beatrice d'Este he had the son Azzo who succeeded him. His brother Marco commanded a band of Germans, conquered Pisa and Lucca and died in 1329. Azzo (1302-1339), who succeeded his father in 1328, bought the title of imperial vicar for 25,000 florins from the same Louis who had imprisoned Galeazzo I. He conducted a war with Emperor Louis the Strenuous, a revolt led by his cousin Lodrisio, reorganized the administration of his estates, built the octagonal tower of S. Gottardo, and was succeeded in turn by his uncles Lucchino and Giovanni. Lucchino made peace with the church in 1341, bought Parma from Obizzo d'Este and made Pisa dependent on Milan. Although he showed ability as general and governor, he was jealous and cruel, and was poisoned in 1349 by his wife Isabella Fieschi. Giovanni, brother of the preceding, archbishop of Milan and lord of the city from 1349 to 1354, was one of the most notable characters of his time. He befriended Petrarch, extended the Visconti sway over Bologna (1350), defeated Pope Clement VI., annexed Genoa (1353), and died on the 4th of October 1354 after having established the rule of his family over the whole of northern Italy except Fiesmont, Verona, Mantua, Ferrara and Venice. The Visconti from the time of Archbishop Giovanni were no longer mere rivals of the Della Torre or dependants on imperial caprice, but real sovereigns with a recognized power over Milan and the surrounding territory. The state was partitioned on the death of Giovanni among his brother Stefano's three sons, Matteo II., Galeazzo II. and Bernabo. Matteo II., who succeeded to Bologna, Lodri, Piacenza and Parma, abandoned himself to the most revolting immorality, and was assassinated in 1355 by direction of his brothers, who thenceforth governed the state jointly and with considerable ability. Galeazzo II., who held his court at Pavia, was handsome and distinguished, the patron of Petrarch, the founder of the university of Pavia and a gifted diplomat. He married his daughter Violante to the duke of Clarence, son of Edward III., of England, giving a dowry of 200,000 gold florins; and his son Gian Galeazzo to Isabella, daughter of King John of France. He died in 1378. Bernabo, who held his court at Milan, was involved in constant warfare, to defy the expenses of which he instituted very oppressive taxes. He fought Popes Innocent VI. and Urban V., who proclaimed a crusade against him. He fought the emperor Charles IV., who declared the forfeiture of his fief. He
endeavoured to exercise sole power in the state after the death of his brother, but his young nephew Gian Galeazzo plotted against him and put him to death (1383). Gian Galeazzo, the most powerful of the Visconti, became joint ruler of the Milanese territories with his brother, gaining full power in 1378 and sole ruler on the death of his uncle seven years later. He founded the cathedral of Milan, built the Certosa and the bridge across the Ticino at Pavia, improved the university of Pavia and established the library there, and restored the university at Piacenza. His bureaucratic government was excellent; he was an able and economical administrator, and was reputed to be one of the wealthiest princes of his time. He was ambitious to reduce all Italy under the sway of the Visconti. He conquered Verona in 1387, and in the following year, with the aid of the Venetians, took Padua. He plotted successfully against the rulers of Mantua and Ferrara, and now that the whole of Lombardy lay prostrate before him he turned his attention to Tuscany. In 1390 he bought Pisa and seized Sienna. The emperor Wenceslaus had already conferred on him the title of duke of Milan for 100,000 florins, reserving only Pisa, and refused to take arms against him. Gian Galeazzo took Perugia, Lucca and Bologna (1400–1), and was besieging Florence when he died of the plague (3rd of September 1402) at the age of fifty-five years. His sons, Giovanni Maria and Filippo Maria, were mere boys at the time of his death, and he bequeathed in the will the empire to the celebrated condottiere Facino Cane de Cesar; but most of Gian Galeazzo’s conquests were lost to his self-seeking generals. Giovanni Maria was proclaimed duke of Milan in 1402, displayed an insane cruelty, and was killed in 1412 by Ghibelline partisans. Filippo Maria, who became nominal ruler of Pavia in 1402, succeeded his brother as duke of Milan. Cruel and extremely sensitive about his personal ugliness, he nevertheless was a great politician, and by employing such powerful condottieri as Carmagnola, Piccinino and Francesc Sforza he managed to recover the Lombard portion of his father’s duchy. From his marriage with the unhappy widow of the above-mentioned Facino Cane he received a dowry of nearly half a million florins. He died in 1447, the last of the Visconti in direct male line, and was succeeded in the duchy, after the shortlived Ambrosian republic, by Francesc Sforza, who had married his daughter Bianca in 1441 (see Sforza). Valentina (1366–1405), a daughter of Gian Galeazzo and a sister of the preceding, married Louis of Orleans in 1387, and it was from her that Louis XII. of France derived his claim to the duchy of Milan. Galeazzo’s son was an illegitimate, and when the bishop of Milan died in 1404, Filippo became the titular prince and other towns but was deposed and beheaded (1407) by Charles VI. duke of Guena, under whose protection he had placed himself. Among the branches of the Visconti family were the counts of Saliceto, counts of Zagna, lords of Brignano, marquis of San Giorgio di Borgoratto, marquis of Involio and Marquis Della Motta. Other branches attained to some prominence in the local history of Bari and of Tarento. Tebaldo Visconti of Piacenza became Pope Gregory X. in 1271. Among the Visconti lords of Fontaneto was Gasparo, who died in 1355. archbishop of Milan. An Ignatius Visconti was secretary of the Jesuits (1752–55).

There is a contemporary history of the principal members of the family by Paolo Giovio, bishop of Nocera, which may be had in several editions. See J. Burckhardt, The Civilisation of the Renaissance in Italy, trans. by S. G. C. Middlemore (London, 1896); J. A. Symonds, Age of the Despot (New York, 1888); C. Magenta, I Visconti e gli Sforza nel Castello di Pavia (1883); A. Medin, I Visconti nella poesia contemporanea (Milan, 1891); F. Mugnier, "Les lettres de Visconti" in Memòires et documents de la société savantine d’histoire et d’archéologie, vol. x. of the second series (1896).
VISCOUNT—VISION

**VISCOUNT** (through O. Fr. viscomte, mod. vicomte, from Low Lat. vice-comes, cf. Portug. visconde, Ital. visconte), the title of the fourth rank of the European nobility. In the British peerage it intervenes between the dignities of earl and baron. The title is now purely one of honour, having long been dissociated from any special office or functions.

In the Carolingian epoch the *vice-comites*, or *missi comitis*, were the deputies or vicars of the counts, whose official powers they exercised by delegation, and from these the viscounts of the *ducal* order undoubtedly sprang. The viscounts became hereditary the same happened in the case of their lieutenants; e.g. in Narbonne, Nîmes and Alby the viscounts had, according to A. Molinier, acquired hereditary rights as early as the beginning of the 10th century. Viscountcies thus developed into actual fiefs, with their own jurisdiction, domain and seigniorial rights, and could be divided or even transmitted to females. Viscounts, however, continued for some time to have no more than the status of lieutenants, calling themselves either simply *vice-comites*, or adding to this title the name of the county from which they were powerful. It was not till the 12th century that the universal tendency to territorialize the feudal dominions affected the viscounties with the rest, and that the viscounts began to take the name of the most important of their patrimonial domains. Thus the viscounts of Poitiers called themselves viscounts of Thouars, and those of Toulouse viscounts of Bruniquel and Montelar. From this time the significance of the title was extremely varied. Some viscounts, notably in the duchy of Aquitaine and the county of Toulouse, of which the size made an effective centralized government impossible, were great barons, whose authority extended over whole provinces, and who disputed for power on equal terms with counts and dukes. Elsewhere, on the other hand, e.g. in the Île de France, Champagne, and a great part of Burgundy, the *vicomtes* continued to be half feudatories, half officials of the counts, with the same functions and rank in the feudal hierarchy as the châtelains; their powers were jealously limited and, with the organization of the system of *prévôts* and *baillis* in the 12th century, practically disappeared. In the royal domains especially, these petty feudatories could not maintain themselves against the growing power of the crown, and they were early assimilated to the *prévôts*; thus there is no record of a *vicomte* at Paris after 1027.

In Normandy, where from the first the central power had been strong, *vicomtes* appeared at a very early date as deputies of the counts (afterwards dukes) of the Normans: "They are both personal companions and hereditary nobles." When local Norman counts began in the 11th century, some of them had *vicomtes* under them, but the normal *vicomte* was still a deputy of the duke, and Henry I. largely replaced the hereditary holders of the *vicomte* by officials. "By the time of the Conqueror the judicial functions of the viscounts were fully recognized, and extended over the greater part of Normandy." Eventually almost the whole of Normandy was divided into administrative viscounties or bailiwicks by the end of the 12th century. When the Normans conquered England, they applied the term *viscount* or *vicomtes* to the sheriffs of the English system (see SHERRIFF), whose office, however, was quite distinct and was hardly affected by the Conquest.

Nearly four centuries later "viscount" was introduced as a peerage style into England, when his king was once more lord of Normandy. John, Lord Beaumont, K.G., who had been created count of Boulogne in 1346, was made Viscount Beaumont, February 12, 1440, and granted precedence over all barons, which was doubtless the reason for his creation. Within a year the feudal *vicomte* of Beaumont in Normandy was granted to him and the heirs male of his body on the ground that he traced his descent from that district. In 1446 Lord Bourchier, who held the Norman countship of Eu, was similarly made a viscount. The oldest viscountcy now on the roll is that of Hereford, created in 1550; but the Irish viscountcy of Gormanston is as old as 1478. The dignity was sparingly conferred in the peerage of England till recent times, when the number of viscountcies was increased by bestowing the dignity on retiring speakers (e.g. Viscounts Canterbury, Hampden, Peel, Selby) and ministers who accepted peerages (e.g. Viscounts Melville, Halifax, Knutsford, Llandaff, Cross, Ridley, Goschen, St Aldwyn, Morley of Blackburn, Wolverhampton).

A viscount is "Right Honourable," and is styled "My Lord." His wife, also, is "Right Honourable," is a "viscountess," and the children of the peer and daughters are "Honourable." The coronet first granted by James I. has on the golden circlet a row of fourteen small pearls set in contact, of which number in representations nine are shown. The scarlet parliamentary robe of a viscount has two and a half doublings of ermine.

**VISHNU** (Sanskrit, "the worker," from root *vish*, "to work"); a solar deity, in later Hindu mythology a god of the first importance, one of the supreme trinity with Brahma and Siva, but in the Rig Veda only a minor deity. In the Vedic scriptures his only anthropomorphic characteristics are the frequently mentioned strides that he takes, and his being a youth vast in body. His essential feature is the three strides (*vi-kram*) with which he traverses the universe. Two of these steps are visible to men, but the third or highest is beyond mortal sight. These steps are symbolic of the rising, culminating and setting of the sun, and of the division of the solar deity through the three divisions of the universe. To-day Vishnu is adored by the Vishnaut sects as the equal or even the superior of Brahma, and is styled the Preserver. He is represented with four arms, and black in colour; in one hand he holds a club and in the others a shell, a discus and a lotus respectively. He rides on the Garuda, half man and half bird, having the head, wings, beak and talons of an eagle, and human body and limbs, its face being white, its wings red and its body golden. In his character as preserver of men Vishnu has from time to time become incarnate to rid the world of some great evil (see also BRAHMANISM and HINDUISM).

**VISION** (from Lat. videre, to see), or SIGHT, the function, in physiology, of the organ known as the eye (q.v.). The sense of vision is excited by the influence of light on the retina, the special terminal organ connected with the optic nerve. By excitation of the retina, a change is induced in the optic nerve fibres, and is conveyed by these to the brain, the result being a luminous perception, or what we call a sensation of light or colour. If light were to act uniformly over the retina, there would be no image of the source of the light formed on that structure, and consequently there would be only a general consciousness of light, without reference to any particular object. One of the first conditions, therefore, of vision for useful purposes is the formation of an image on the retina. To effect this, just as in a photographic camera, refractive structures must be placed in front of the retina which will so bend luminous rays as to bring them to a focus on the retina, and thus produce an image. Throughout the animal kingdom various arrangements are found for this purpose; but they may be all referred to three types, namely—(1) eye-specks or eye-dots, met with in Medusae, Annelidae, &c.; (2) the compound eye, as found in insects and crustaceans; and (3) the simple eye, common to all vertebrates. The eye-specks may be regarded simply as expansions of optic nerve filaments, covered by a transparent membrane, but having no refractive media, so that the creature would have the consciousness of light only, or a simple luminous impression, by which it might distinguish light from darkness. The compound eye consists essentially of a series of transparent
cone-like bodies, arranged in a radiate manner against the inner surface of the cornea, with which their bases are united, while their apices are connected with the ends of the optic filaments. As each cone is separated from its neighbours, it admits only a ray of light parallel with its axis, and its apex represents only a portion of the image, which must be made up, like a mosaic-work, of as many parts as there are cones in the eye. When the cones are of considerable length, it is evident, from their form and direction, their apices being directed inwards, that the oblique rays emanating from a luminous surface will be cut off, and that only those rays proceeding along the axis of the cone will produce an effect. Thus distinctness or sharpness of definition will be secured. The size of the visual field will depend on the form of the eye, the outermost cones marking its limits. Consequently the size of the visual field will depend on the size of the segment of the sphere forming its surface. The eyes of many insects have a field of about half a sphere, so that the creature will see objects and behind it as well as those at the side. On the other hand, in many the eyes have scarcely any convexity, so that they must have a narrow field of vision. For anatomical details, and diseases of the eye, see Eye; the pathophysiological aspects of vision itself are treated at the end of this article.

1. Physical Causes of Vision

A luminous sensation may be excited by various modes of irritation of the retina or of the optic nerve. Pressure, cutting or electrical shocks may act as stimuli, but the normal excitation is the influence of light on the retina. From a physical point of view, light is a mode of movement occurring in a medium, termed the aether, which pervades all space; but the physiologist studies the operation of these movements on the sentient organism as resulting in consciousness of the particular kind which we term a luminous impression. Outside of the eye, light is produced with great accuracy; but the physiological effects depend upon such complex conditions as to make it impossible to state them in the same precise way. Thus, when we look at the spectrum, we are conscious of the sensations of red and violet, referable to its two extremities: the physicist states that red is produced by 392 billions of impulses on the retina per second, and that violet corresponds to 757 billions per second; but he has arrived at this information by inductive reasoning from facts which have not at present any physiological explanation. We cannot at present trace any connexion between the 392 billions of impulses on the retina per second and a sensation of red. Below the red and above the violet the ends of the spectrum there are vibrations which do not excite luminous sensations. In the first case, below the red, the effect as a sensation is heat; and above the violet the result is that of chemical activity. Thus the method of dispersion of light, as is followed in passing a ray through a prism, enables us to recognize these general facts: (1) rays below the red excite thermal impressions; (2) from the lower red up to the middle of the violet, the thermal rays become gradually weaker until they have no effect; (3) from the lower red to the extreme violet, they cause luminous impressions, which reach their greatest intensity in the yellow; and (4) from about the end of the yellow to far beyond the extreme violet, the rays have gradually a less and less luminous effect, but they have the power of exciting such chemical changes as are produced in photography. In general terms, therefore, the lower end of the spectrum may be called thermal, the middle luminous, and the upper actinic or chemical; but the three merge into and overlap one another. It may be observed that the number of vibrations in the extreme violet is not double that of the low red, so that the sensibility of the eye to vibrations of light does not range through an octave. The ultra-violet rays may act on the retina in certain conditions, as when they are reflected by a solution of sulphate of quinine, constituting the phenomenon of fluorescence. Far above the violet are the Röntgen radiations and probably others.

2. Optical Arrangements of the Eye

1. General.—When light traverses any homogeneous transparent medium, such as the air, it passes on in a straight course with a certain velocity; but if it meet with any other transparent body of a different density, part of it is reflected or returned to the first medium, whilst the remainder is propagated through the second medium in a different direction and with a different velocity. Thus we may account for the phenomena of reflection of light (q. v.) and of refraction (q. v.). Let ab, in fig. 1, be a plane surface of some transparent substance, say a sheet of glass; a ray, cd, perpendicular to the surface, will pass through without refraction; but an oblique ray, ef, will be sent in the direction eh. If the ray eh had passed from a dense into a rarer medium, then the direction would have been eg. It might also be shown that the sine of the angle of incidence always bears a certain ratio to the sine of the angle of refraction; this ratio is termed the index of refraction. Thus, if a ray pass from air into water, the sine of the angle of incidence is to the sine of the angle of refraction the ratio of 4:3, or $\frac{4}{3}$. Before a ray of light can reach the retina, it must pass through a number of transparent and refractive surfaces. The eye is a nearly spherical organ, formed of transparent parts situated behind each other, and surrounded by various membranous structures, the anterior part of which is also transparent. The transparent parts are,—(1) the cornea; (2) the aqueous humour, found in the anterior chamber of the eye; (3) the crystalline lens, formed by a transparent convex body, the anterior surface of which is less convex than the posterior; and (4) the vitreous humour, filling the posterior chamber of the eye. The ray must therefore traverse the cornea, aqueous humour, lens and vitreous humour. As the two surfaces of the cornea are parallel, the rays practically suffer no deviation in passing through that structure, but they are bent or refracted during their transmission through the other media.

From the optical point of view, the eye may be regarded as a dioptric system consisting of various refractive media. In such a system, as shown by K. F. Gauss, there are six cardinal points, which have a certain relation to each other. These are—

(1) Two focal points: every ray passing through the first focal point becomes, after its refraction, parallel to the axis, and every ray which before refraction is parallel to the axis passes after its refraction to the second focal point; (2) two principal points: every ray which passes through the first point before refraction passes after refraction through the second, and every ray which passes through any point of a plane elevated on a perpendicular axis from the first principal point (the first principal plane) passes through the corresponding point of an analogous plane raised upon the axis at the second principal point (the second principal plane); and (3) two nodal points, which correspond to the optical centres of the two principal planes just alluded to. The distance of the first principal point from the first focal point is called the first focal length, and the term posterior focal length is applied to the distance of the posterior focal point from the second principal point. Listing has given the following measurements in millimetres from the centre of the cornea for the cardinal points in an ideal eye:

| Anterior focal point | 12.836 |
| First nodal point    | 7.720 |
| Posterior focal point| 22.670 |
| Second nodal point   | 7.6398 |
| First principal point| 2.1745 |
| Anterior focal length| 15.0072 |
| Second principal point| 20.0746 |

A view of such an ideal eye is shown in fig. 2. The remaining measurements of such an eye are as follows:

Fig. 2.—Transverse Section of an Ideal or Schematique Eye.

A, summit of cornea; SC, sclerotic; S, Schlemm's canal; CH, choroid; I, iris; M, ciliary muscle; R, retina; N, optic nerve; HA, aqueous humour; L, crystalline lens, the anterior of the double lines on its face showing its form during accommodation; HV, vitreous humour; DN, internal rectus muscle; DE, external rectus; YY', principal optical axis; φφ, visual axis, making an angle of 9° with the optical axis; C, centre of the ocular globe. The cardinal points of Listing: H, H₁, pinpoint on the K₁K₂ nodal points; F₁F₂, principal focal points. The dioptric constants according to Giraud-Tuellin: H₁, principal points united; φφ, principal foci during the repose of accommodation; φφ', principal foci during the maximum of accommodation; E, fused nodal points.

Fig. 6.—Visual Angle.

When rays, reflected from an object or coming from a luminous point, are not brought to an accurate focus on the retina, the image is not distinct in consequence of the formation of circles of diffusion, the production of which will be rendered evident by fig. 4. From the point A luminous rays enter the eye in the form of a cone, the kind of which will depend on the pupil. Thus it may be circular, or oval, or even triangular. If the pencil is focused in front of the retina, as at d, or behind it as at f, or, in other words, if the retina, in place of being at F, be in the positions G or H, there will be a luminous circle or a luminous triangular space, and many elements of the retina will be affected. The size of these diffusion circles depends on the distance from the retina of the point where the rays are focused: the greater the distance, the more extended will be the diffusion circle. Its size will also be affected by the greater or less diameter of the pupil. Circles of diffusion may be studied by the following experiment, called the experiment of Scheiner—:

Let C be a lens, and DEF be screens placed behind it. Hold in front of the lens a card perforated by two holes A and B, and allow rays from a luminous point a to pass through these holes. The point a on the screen E will be the focus of the rays emanating from a; if a were removed farther from the lens, the focus would be on F, and if it were brought near to C, the focus would then be on D. The screens E and D show two images on the point a. If, then, we close the upper opening in AB, the upper image m on F and the lower image n on D disappear. Suppose now that the retina be substituted for the screens D and F, the contrary will take place, in consequence of the reversal of the retinal image.

If the eye be placed at φ, only one image will be seen; but if it be placed either in the plane of F or D, then two images will be seen, as at mm, or nn; consequently, in either of these planes there will be circles of diffusion and indistinctness, and only in the plane E will there be sharp definition of the image.

To understand the formation of an image on the retina, suppose a line drawn from each of its two extremities to the nodal point and continued onwards to the retina, as in fig. 6, where the visual angle is x. It is evident that its size will depend on the size of the object and the distance of the object from the eye. Thus, also, objects of different sizes, c, d, e in fig. 6, may be included in the same visual angle, as they are at different distances from the eye. The size of the retinal image may be calculated if we know the size of the object, its distance from the nodal point φ, and the distance of the nodal point from the posterior focus.

Let A be the size of the object, B its distance from the nodal point, and C the distance of φ from the retina, or 15 mm.; then the size of the retinal image is (A + 15)/B. The smallest visual angle in which two distinct points may be observed is 60 seconds; below this, the two sensations fuse into one; and the size of the retinal image
corresponding to this angle is \(0.04\) mm., nearly the diameter of a single retinal rod or cone. Two objects, therefore, included in a visual angle of less than 60 seconds, appear as one point. A small visual angle is in most eyes a condition of sharpness of definition. With a large angle, objects appear less sharply marked. Acuteness is determined by a few retinal elements, or even only one, being affected. A very minute image, if thrown on a single retinal element, is apparently sufficient to excite it. Thus it is possible to see a brilliant point in an angle even so small as \(\frac{1}{16}\) of a second, and a sharp eye can see a body the \(\frac{1}{1000}\)th of a line in diameter—that is, about the \(\frac{1}{1000}\)th part of an inch.

3. The Optical Defects of the Eye.—As an optical instrument, the eye is defective; but from habit, and want of attention, its defects are not appreciated, and consequently they have little or no influence on our sensations. These defects are chiefly of two kinds—(1) those due to the curvature of the refractive surfaces, and (2) those due to the dispersion of light by the refractive media.

(a) Aberration of Sphericity.—Suppose, as in fig. 7, M A K to be a refractive surface on which parallel rays from L to S impinge, it will be seen that those rays passing near the circumference are brought to a focus at \(F_1\), and those passing near the centre at \(F_2\)—intermediate rays being focused at N. Thus on the portion of the axis between \(F_1\) and \(F_2\) there will be a series of focal points, and the effect will be a blurred and bent image. In the eye this defect is to a large extent corrected by the following arrangements: (i) the iris cuts off the outer and more strongly refracted rays; (2) the curvature of the cornea is more ellipsoidal than spherical, and consequently those farthest from the axis are least deviated; (3) the anterior and posterior curvatures of the lens are such that the one corrects, to a certain extent, the action of the other; and (4) the structure of the lens is such that its power of refraction diminishes from the centre to the circumference, and consequently the rays farthest from the axis are less refracted.

(b) Astigmatism.—Another defect of the eye is due to different meridians having different degrees of curvature. This defect is known as astigmatism. It may be thus detected. Draw on a sheet of white paper a vertical and a horizontal line with ink, crossing at a right angle; at the point of distinct vision, it will be found impossible to see the lines with equal distinctness at the same time; to see the horizontal line distinctly the paper must be brought near the eye, and removed from it to see the vertical. In the cornea the vertical meridian has generally a shorter radius of curvature, and is consequently more refractive than the horizontal. The meridians of the lens may also vary; but, as a rule, the asymmetry of the cornea is greater than that of the lens. The optical explanation of the defect will be understood with the aid of fig. 8.

Thus, suppose the vertical meridian C A D to be more strongly curved than the horizontal F A E, the rays which fall on C A D will be brought to a focus G, and those falling on F A E at B. If we divide the pencil of rays at successive points, G, H, I, K, B, by a section perpendicular to A B, the various forms it would present at these points are seen in the figures underneath, so that if the eye were placed at G, it would see a horizontal line a a' at H, an ellipse with the long axis a a' parallel to A B; if at I, a circle; if at K, an ellipse, with the long axis, b c, at right angles to A B; and if at B, a vertical line b c. The degree of astigmatism is ascertained by measuring the difference of refraction in the two chief meridians; and the defect is corrected by the use of cylindrical glasses, the curvature of which, added to that of the minimum meridian, makes its focal length equal to that of the maximum meridian.

Fig. 8.—Diagram illustrating Astigmatism.

(c) Aberration of Refrangibility.—When a ray of white light traverses on a lens, the different rays composing it, being unequally refrangible, are dispersed: the violet rays (see fig. 9), the most refrangible, are brought to a focus at e, and the red rays, less refrangible, at d. If a screen were placed at e, a series of concentric coloured circles would be formed, the central being of a violet, and the circumference of a red colour. The reverse effect would be produced if the screen were placed at d. Imagine the retina in place of the screen in the two positions, the sensation would be those just mentioned. Under ordinary circumstances, the error of refrangibility due to the optical construction of the eye is not observed, as for vision at near distances the interval between the focal point of the red and violet rays is very small. If, however, we look at a candle flame through a bit of cobalt blue glass, which transmits only the red and blue rays, the flame may appear violet surrounded by blue, or blue surrounded by violet, according as we have accommodated the eye for different distances. Red surfaces always appear nearer than violet surfaces situated in the same plane, because the eye has to be accommodated more for the red than for the violet, and consequently we imagine them to be nearer. Again, if we contemplate red letters or designs on a violet ground the eye soon becomes fatigued, and the designs may appear to move.

(d) Defects due to Opacities, &c., in the Transparent Media.—When small opaque particles exist in the transparent media, they may cast their shadow on the retina so as to give rise to images which are projected outwards by the mind into space, and thus appear to exist outside of the body. Such phenomena are termed entoptic. They may be of two kinds: (1) extra- retinal, that is, due to opaque or semi-transparent bodies in any of the refractive structures anterior to the retina, and presenting the appearance of drops, striae, lines, twisted bodies, forms of grotesque shape, or minute black dots dancing before the eye; and (2) intra-retinal, due to opacities, &c., in the layers of the retina, in front of Jacob's membrane. The intra-retinal may be produced in a normal eye in various ways. (1) Throw a strong beam of light on the edge of the sclerotic, and a curious branched figure will be seen, which is an image of the retinal vessels. The construction of these images, usually called Purkinje's figures, will be understood from fig. 10. Thus, in the figure to the left, the rays passing through the sclerotic at \(b^*\), in the direction \(b^* c\), will throw a shadow of a vessel at \(c\) on the retina at \(b^*\). When the light moves from \(b^*\) to \(a^*\), the retinal shadow will move from \(b^*\) to \(b^*\), and the line in the field of vision will pass from \(B\) to \(A\).
It may be shown that the distance \( c' b' \) corresponds to the distance of the retinal vessels from the layer of rods and cones. If the light enter the cornea, as in the figure to the right, and if the light be moved, the image \( \ast \) will be displaced in the same direction as the light, if the movement is not exactly beyond the middle of the cornea, but in the opposite direction to the light when it is moved up and down. Thus, if \( a \) be moved to \( a' \), \( d \) will be moved to \( d' \), the shadow on the retina from \( c \) to \( c' \), and the image \( b \) to \( b' \). If, on the other hand, \( a \) be moved above the plane of the paper, \( d \) will move below, consequently \( c \) will move above, and \( b' \) will appear to sink. (2) The retinal vessels may also be seen by looking at a strong light through a minute aperture, in front of which a rapid to-and-fro movement is made. Such experiments prove that the sensitive part of the retina is its deepest and most external layer (Jacob's membrane).

4. Accommodation, or the Mechanism of Adjustment for Different Distances. — When a camera is placed in front of an object, it is necessary to focus accurately in order to obtain a clear and distinct image on the sensitive plate. This may be done by moving either the lens or the sensitive plate backwards or forwards so as to have the posterior focal point of the lens corresponding with the sensitive plate. For similar reasons, a mechanism of adjustment, or accommodation for different distances, is necessary in the human eye. In the normal eye, any number of parallel rays, coming from a great distance, are focused on the retina. Such an eye is termed emmetropic (fig. 11, A). Another form of eye (B) may be such that parallel rays are brought to a focus in front of the retina. This form of eye is myopic or short-sighted, inasmuch as, for distinct vision, the object must be brought near the eye, so as to catch the divergent rays, which are then focused on the retina. A third form is seen in C, where the focal point, for ordinary distances, is behind the retina, and consequently the object must be held far off, so as to allow only the less divergent or parallel rays to reach the eye. This kind of eye is called hypermetropic, or far-sighted. For ordinary distances, at which objects must be seen distinctly in everyday life, the fault of the myopic eye may be corrected by the use of convex and of the hypermetropic by convex glasses. In the first case, the concave glass will move the posterior focal point a little farther back, and in the second the convex glass will bring it farther forwards; in both cases, however, the glasses may be so adjusted, both as regards refractive index and radius of curvature, as to bring the rays to a focus on the retina, and consequently secure distinct vision.

From any point 65 metres distant, rays may be regarded as almost parallel, and the point will be seen without any effort of accommodation. This point, either at this distance or in infinity, is called the punctum remotum, or the most distant point seen without accommodation. In the myopic eye it is much nearer, and for the hypermetropic there is really no such point, and accommodation is always necessary. If an object were brought too close to the eye for the refractive media to focus it on the retina, circles of diffusion would be formed, with the result of causing indistinctness of vision, unless the eye possessed some power of adapting itself to different distances. That the eye has some such power of accommodation is proved by the fact that, if we attempt to look through the meshes of a net at a distant object, we cannot see both the meshes and the object with equal distinctness at the same time. Again, if we look continuously at very near objects, the eye speedily becomes fatigued. Beyond a distance of 65 metres, no accommodation is necessary; but within it, the condition of the eye must be adapted to the diminished distance until we reach a point near the eye which may be regarded as the limit of visibility for near objects. This point, called the punctum proximum, is usually 12 centimetres (or 4-8 inches) from the eye. The range of accommodation is thus from the punctum remotum to the punctum proximum.

The mechanism of accommodation has been much disputed, but there can be no doubt it is chiefly effected by a change in the curvature of the anterior surface of the crystalline lens. If we hold a lighted candle in front and a little to the side of an eye to be examined, three reflections may be seen in the eye, as represented in fig. 12. The first, \( a \), is erect, large and bright, from the anterior surface of the cornea; the second, \( b \), also erect, but dim, from the anterior surface of the crystalline lens; and the third, \( c \), inverted, and very dim, from the posterior surface of the lens of the eye. Thus the middle of the concave surface of the vitreous humour to which the convex surface of the lens is adapted. Suppose the three images to be in the position shown in the figure for distant vision, it will be found that the middle image \( b \) moves towards \( a \), on looking at a near object. The change is due to an alteration of the curvature of the lens, as shown in fig. 13. The changes occurring during accommodation are:

\[ \text{fig. 10. — Perkinje's Figures.} \]

In the eye to the right the illumination is through the sclerotic, and in the one to the left through the cornea.

\[ \text{fig. 11.} \]

A, Emmetropic or normal eye; B, Myopic or short-sighted eye; C, Hypermetropic or long-sighted eye.

\[ \text{fig. 12. — Reflected Images in the Eye.} \]

A, The lens during accommodation, showing its anterior surface advanced; B, The lens as for distant vision; C, Position of the ciliary muscle.

1. The curvature of the anterior surface of the crystalline lens increases, and may pass from 10 to 6 mm.; 2. The pupil contracts; and 3. The intracocular pressure increases in the posterior part of the eye. An explanation of the increased curvature of the anterior surface of the lens during accommodation has been thus given by H. von Helmholtz. In the normal condition, that is, for the emmetropic eye, the crystalline lens is flattened anteriorly by the pressure of the anterior layer of the capsule; during accommodation, the radiating fibres of the ciliary muscles pull the ciliary processes forward, thus relieving the tension of the anterior layer of the capsule, and the lens at once bulges forward by its elasticity.

By this mechanism the radius of curvature of the anterior
OPTICAL ARRANGEMENTS

VISION

surface of the lens, as the eye accommodates from the far to the near point, may shorten from 10 mm. to 6 mm. The ciliary muscle, however, contains two sets of fibres, the longitudinal or meridional, which run from before backwards, and the circular or equatorial (Müller's muscle), which run, as their name indicates, around the band of longitudinal fibres forming the muscle. Direct observation on the eye of an animal immediately after death, when the pupil is dilated, does actually cause a forward movement of the ciliary processes, and there can be little doubt that the explanation above given applies to man, probably most mammals, and to birds and most reptiles.

In birds, which are remarkable for acuteness of vision, the mechanism is somewhat peculiar. In them the fibres of the ciliary muscle have a strong attachment posteriorly, and when these contract they pull back the inner posterior layers of the cornea, and thus relax that part of the ciliary zone called the ligamentum pectinatum. In a state of rest this structure in the bird's eye is tense, but in accommodation it becomes relaxed. Thus by a somewhat different mechanism, in birds, accommodation consists in allowing the anterior surface of the lens to become more and more convex. In reptiles generally the mechanism resembles that of the bird; but it is said that in snakes and amphibia there is a movement forwards of the lens as a whole, so as to catch rays at a less divergent angle. When the eye is directed to a distant object, such as a star, the mechanism of accommodation is at rest in mammals, birds, reptiles and amphibia, but in fishes and cephalopods the eye at rest is normally adjusted for near vision. Consequently when we look at an object the pupil contracts, and a mechanism that carries the lens as a whole backwards. There is still some difficulty in explaining the action of the equatorial (circular) fibres. Some have found that the increased convexity of the anterior surface of the lens takes place only in the central portions of the lens, and that the circumferential part of the lens is actually flattened, presumably by the contraction of the equatorial fibres. Seeing, however, that the central part of the lens is the portion used in vision, as the pupil contracts during accommodation, a flattening of the margins of the lens can have no optical effect. Further, another explanation can be offered of the flattening. As mentioned in the bird, during accommodation the pupil contracts, and the pupillary edge of the iris, thinned out, spreads over the anterior surface of the capsule of the lens, which it actually touches, and this part of the iris, along with the more convex central part of the lens, bulges into the anterior chamber, and must thus displace some of the aqueous humour. To make room for this, however, the circumferential part of the iris, related to the ligamentum pectinatum, moves backwards very slightly, while the flattening of the circumferential part of the lens facilitates this movement.

Helmholtz succeeded in measuring with accuracy the sizes of these reflected images by means of an instrument termed an ophthalmometer, the construction of which is based on the following optical principles: When a luminous ray traverses a plate of glass having parallel sides, if it fall perpendicular to the plane of the plate, it will pass through without deviation; but if it fall obliquely on the plate (as shown in the left-hand diagram in fig. 14) it undergoes a lateral deviation, but in such a direction as to be that of the incident ray, so that to an eye placed behind the glass plate, at the lower A, the luminous point, upper A, would be in the direction of the prolonged emergent ray, and thus there would be an apparent lateral deviation of that amount of which would increase with the obliquity of the incident ray. If, instead of one plate, we take two plates of equal thickness, one placed above the other, two images will be seen, and by turning the one plate with reference to the other each may be displaced to one side. If the instrument consists of a small telescope (fig. 14) T, the axis of which coincides with the plane separating the two glass plates C C and B B, and at an object X Y, at a distance from the plates till we see two objects x y, x y touching each other, the size of the image X Y will be equal to the distance the one object is displaced to the one side and the other object to the other side. Having thus measured the amount of deviation, it is known that the size of the object reflecting the light and its distance from the eye, to calculate the radius of the curved surface (Appendix to M'Kenzie's "Outlines of Physiology, 1878"). The general result is that, in accommodation for near objects, the middle reflected image becomes smaller, and the radius of curvature of the anterior surface of the lens becomes shorter.

5. Absorption and Reflection of Luminous Rays from the Eye.

—When light enters the eye, it is partly absorbed by the black pigment of the choroid and partly reflected. The reflected rays are returned through the pupil, and, if situated in the same direction as the rays entering the eye, but uniting to form an image at the same point in space as the luminous object. The pupil of an eye appears black to an observer, because the eye of the observer does not receive any of those reflected rays. If, however, we strongly illuminate the retina, and hold a lens in front of the eye, so as to bring the reflected ray out, at a focus nearer the eye, then, a virtual and erect, or a real and reversed, image of the retina will be seen. Such is the principle of the ophthalmoscope, invented by Helmholtz in 1857. Eyes deficient in pigment, as in albinos, appear luminous, reflecting light of a red or pink colour; but if we place in front of such an eye a card perforated by a round hole of the diameter of the pupil, the card will appear quite dark, like the pupil of an ordinary eye. In many animals a portion of the fundus of the eyeball has no pigment, and presents an iridescent appearance. This is called a tapetum. It probably renders the eye more sensitive to light of feeble intensity.

6. Functions of the Iris.—The iris constitutes a diaphragm which regulates the amount of light entering the eyeball. The aperture in the centre, the pupil, may be dilated by contraction of a system of radiating fibres of involuntary muscle, or contracted by the action of another system of fibres, forming a ciliary muscle, situated at the margin of the pupil. The radiating fibres are controlled by the sympathetic, while those of the circular set are excited by the third cranial nerve. The variations in diameter of the pupil are determined by the greater or less intensity of the light acting on the retina. A strong light causes contraction of the pupil; with light of less intensity, the pupil will dilate. In the human being, a strong light acting on one eye will often cause contraction of the pupil, not only in the eye affected, but in the other eye. These facts indicate that the phenomenon is of the nature of a reflex action, in which the fibres of the optic nerve act as sensory. The chief is to a centre in the encephalon, whence influences emanate which affect the pupil. It has been ascertained that if the fibres of the optic nerve be affected in any way, contraction of the pupil follows. The centre is in the anterior pair of the corpora quadrigemina, as destruction of these bodies causes immobility of the pupil. On the other hand, the dilating fibres are derived from the sympathetic; and it has been shown that they come from the lower part of the cervical, and upper part of the dorsal, region of the cord. But the iris seems to be directly susceptible to the action of light. Thus the pupil of the eye of a dead animal contracts if kept in the dark for several hours, whereas, if the eye on the opposite side be covered, its pupil will remain widely dilated, as at the moment of death.

The pupil contracts under the influence—(1) of an increased intensity of light; (2) of the effort of accommodation for near objects; (3) of a strong convergence of the two eyes; and (4) of such active substances as nicotine, morphia and physostigmine; and it dilates under the influence—(1) of a diminished intensity of light; (2) of vision of distant objects; (3) of a strong excitation of any sensory nerve; (4) of dyspepsia; and (5) of such substances as atropine and hyoscyamine. The chief function of the iris is to so moderate the amount of light entering
the eye as to secure sharpness of definition of the retinal image. This it accomplishes by (1) diminishing the amount of light reflected from near objects, by cutting off the more divergent rays and admitting only those approaching a parallel direction, which, in a normal eye, are focused on the retina; and (2) preventing the error of spherical aberration by cutting off divergent rays which would otherwise impinge near the margins of the lens, and would thus be brought to a focus in front of the retina.

3. Specific Influence of Light on the Retina

The retina is the terminal organ of vision, and all the parts in front of it are optical arrangements for securing that an image will be accurately focused upon it. The natural stimulus of the retina is light. It is often said that it may be excited by mechanical and electrical stimuli; but such an observation really applies to the stimulation of the fibres of the optic nerve. It is well known that such stimuli applied to the optic nerve behind the eye produce always a luminous impression; but there is no proof that the retina, strictly speaking, is similarly affected. Pressure or electrical currents may act on the eyeball, but in doing so they not only affect the retina, consisting of its various layers and of Jacob's membrane, but also the fibres of the optic nerve. It is possible that the retina, by which is meant all the layers except those on its surface formed by the fibres of the optic nerve, is affected only by its specific kind of stimulus, light. This stimulus so affects the terminal apparatus as to set up actions which in turn stimulate the optic fibres. The next question naturally is—What is the specific action of light on the retina? A. F. Holmgren, and also J. Dewar and J. G. M'Kendrick, have shown that when light falls on the retina it excites a variation of the electrical current obtained from the eye by placing it on the cushions of a sensitive galvanometer. One electrode touches the vertex of the cornea and the other the back of the eyeball. The corneal vertex is positive to the back of the eye, or to the transverse section of the optic nerve. Consequently a current passes through the galvanometer from the cornea to the back. Then the impact of light causes an increase in the natural electrical current—during the continuance of light the current diminishes slowly and falls in amount even below what it was before the impact—and the withdrawal of light is followed by a rebound, or second increase, after which the current falls in strength, as if the eye suffered from fatigue.

It was also observed in this research that the amount of electrical variation produced by light of various intensities corresponded pretty closely to the results expressed by G. T. Fechner's law, which regulates the relation between the stimulus and the sensational effect in sensory impressions. This law is, that the sensational effect does not increase proportionally to the stimulus, but as the logarithm of the stimulus. Thus, supposing the stimulus to be 10, 100 or 1000 times increased, the sensational effect will not be 10, 100 or 1000 times, but only 1, 2 and 3 times greater.

Such electrical phenomena probably result either from thermal or chemical changes in the retina. Light produces chemical changes in the retina. If a frog be killed in the dark, and if its retina be exposed only to yellow rays, the retina has peculiar purple colour, which is at once destroyed by exposure to ordinary light. The purple matter apparently is decomposed by light. An image may actually be fixed on the retina by plunging the eye into a solution of alum immediately after death. Thus it would appear that light affects the purple-matter of the retina, and the result of this chemical change is to stimulate the optic filaments; if the action be arrested, we may have a picture on the retina, but if it be not arrested, the picture is evanescent; the purple-matter is used up, and new matter of a similar kind is formed to take its place. The retina might, therefore, be compared to a sensitive photographic plate having the sensitive matter quickly removed and replaced; and it is probable that the electrical expression of the chemical changes is what has been above described.

(a) Phosgenes.—Luminous impressions may also be produced by pressure on the eyeball. Such impressions, termed phosgenes, usually appear as a luminous centre surrounded by coloured or dark rings. Sometimes they seem to be small bright scintillations of various forms. Similar appearances may be observed at the moments of opening or of closing a strong electrical current transmitted through the eyeball.

(b) The Retina's Proper Light.—The visual field, even when the eyelids are closed in a dark room, is not absolutely dark. There is a sensation of faint luminosity which may at one moment be brighter than at another. This is often termed the proper light of the retina, and it indicates a molecular change, even in darkness.

(c) The Excitability of the Retina.—The retina is not equally excitable in all its parts. At the entrance of the optic nerve, as was shown by E. Mariotte in 1668, there is no sensibility to light. Hence, this part of the retina is called the blind spot. If we shut the left eye, fix the right eye on the cross seen in fig. 15, and move the book towards and away from the eye, a position will be found when the round spot disappears, that is when its image falls on the entrance of the optic nerve. There is also complete insensibility to colours at that spot. The diameter of the optic papilla is about 1.8 mm., giving an angle of 6°; this angle determines the apparent size of the blind spot in the visual field, and it is sufficiently large to cause a human figure to disappear at a distance of two metres.

The yellow spot in the centre of the retina is the most sensitive to light, and it is chiefly employed in direct vision. Thus, if we fix the eye on a word in the centre of this line, it is distinctly and sharply seen, but the words towards each end of the line are vague. If we wish to see each word distinctly, we "run the eye" along the line—that is, we bring each successive word on the yellow spot. This spot has a horizontal diameter of 2 mm., and a vertical diameter of -8 mm.; and it corresponds in the visual field to an angle of from 2 to 4°. The fossa in the spot, where there are no retinal elements except Jacob's membrane, consisting here entirely of cones (2000 in number), is the area of most acute sensibility. This fossa has a diameter of only 2 mm., which makes the angle ten times smaller. Thus the field of distinct vision is extremely limited, and at the same moment we see only a very small portion of the visual field. Images of external objects are brought successively on this minute sensitive area, and the different sensations seem to be fused together, so that we are conscious of the object as a whole.

Towards the anterior margin of the retina sensitiveness to light becomes diminished; but the diminution is not uniform, and it varies in different persons.

(d) Duration and Persistence of Retinal Impressions.—To excite the retina, a feeble stimulus must act for a certain time; when the retina is excited, the impression lasts after the cessation of the stimulus; but if the stimulus be strong, it may be of very short duration. Thus the duration of an electrical spark is extremely short, but the impression on the retina is so powerful, and remains so long, as to make the spark visible. If we rotate a disk having white and black sectors we see continuous dark bands. Even if we paint on the face of the disk a single large round red spot, and rotate rapidly, a continuous red band may be observed. Here the impressions of red on the same area of retina succeed each other so rapidly that before one disappears another is superadded, the result being a fusion of the successive impressions into a continuous sensation. This phenomenon is called the persistence of retinal impressions. An impression lasts on the retina from \( \frac{1}{8} \) to \( \frac{1}{6} \) of a second. The cinematograph owes its effects to persistence of retinal impressions.

(e) The Phenomena of Irradiation.—If we look at fig. 16, the white square in the black field appears to be larger than the black square in the white field, although both are of precisely
VISION

the same size. This is due to irradiation. The borders of clear surfaces advance in the visual field and encroach on obscure surfaces. Probably, even with the most exact accommodation, diffusion images form round the image of a white surface on a black ground, forming a kind of penumbra, thus causing it to appear larger than it really is.

(f) Intensity of Light required to excite the Retina.—Light must have a certain intensity to produce a luminous impression. It is impossible to fix the minimum intensity necessary, as the effect will depend, not only on the intensity of the stimulus, but on the degree of retinal excitability at the time. Thus, after the retina has been for some time in the dark, its excitability is increased; on the other hand, it is much diminished by fatigue. Aubert has stated that the minimum intensity is about 300 times less than that of the full moon. The sensibility of the eye to light is measured by the photometer.

(g) Consecutive Retinal Images.—Images which persist on the retina are either positive or negative. They are termed positive when the bright and obscure parts of the image are the same as the bright and obscure parts of the object; and negative when the bright parts of the object are dark in the image, and vice versa. Positive images are strong and sharply marked when an intense light has acted for not less than \( \frac{1}{2} \) of a second. If the excitation be continued much longer, a negative and not a positive image will be seen. If, when the positive image is still visible, we look on a very brilliantly illuminated surface, a negative image appears. Negative images are seen with greatest intensity after a strong light has acted for a considerable time. These phenomena may be best studied when the retina is very excitable, as in the morning after a sound sleep. On awakening, if we look steadily for an instant at the window and then close the eyes, a positive image of the window will appear; if we then gaze fixedly at the window for one or two minutes, close the eyes two or three times, and then look at a dark part of the room, a negative image will be seen floating before us. The positive image is due to excitation of the retina, and the negative to fatigue. If we fatigue a small yellow area of the retina with white light, and then allow a less intense light to fall on it, the green fatigued area responds feebly, and consequent upon the object, such as the window pane, appears to be dark.

4. Sensations of Colour

1. General Statement.—Colour (q.v.) is a special sensation excited by the action on the retina of rays of light of a definite wave-length. On the most likely hypothesis as to the physical nature of light, colour depends on the rate of vibration of the luminiferous aether, and white light is a compound of all the colours in definite proportion. When a surface reflects solar light into the eye without affecting this proportion, it is white, but if it absorbs all the light so as to reflect nothing, it appears to be black. If a body held between the eye and the sun transmits light unchanged, and is transparent, it is colourless, but if translucent it is white. If the medium transmits or reflects some rays and absorbs others, it is coloured. Thus, if a body absorbs all the rays of the spectrum but those which cause the sensation of green, we say the body is green in colour; but this green can only be perceived if the rays of light falling on the body contain rays having the special rate of vibration required for this special colour. For if the surface be illuminated by any other pure ray of the spectrum, say red, these red rays will be absorbed and the body will appear to be black. As a white surface reflects all the rays, in red light it will be seen to be red, and in a green light, green. Colour depends on the nature of the body and on the nature of the light falling on it, and a sensation of colour arises when the body reflects or transmits the special rays to the eye. If two rays of different rates of vibration, that is to say, of different colours, affect a surface of the retina at the same moment, the effects are fused together and we have the sensation of a third colour different from its cause. Thus, if red be removed from the solar spectrum, all the other colours combined cause a sensation of greenish yellow. Again red and violet give purple, and yellow and blue, white. Yellow and blue, however, only give white when pure spectral colours are mixed. It is well known that a mixture of yellow and blue pigments do not produce white, but green; but, as was explained by Helmholtz, this is because the blue pigment absorbs all the rays at the red end of the spectrum up to the green, while the yellow pigment absorbs all the rays at the violet end down to the green, and as the only rays reflected into the eye are the green rays, the substance appears green. Finally, if colours are painted on a disk in due proportions and in a proper order, the disk will, when quickly rotated, appear white, from the rapid fusion of colour effects.

When we examine a spectrum, we see a series of colours merging by insensible gradations the one into the other, thus—red, orange, yellow, green, blue and violet. These are termed simple colours. If two or more coloured rays of the spectrum act simultaneously on the same spot of the retina, they may give rise to sensations of mixed colours. These mixed colours are of two kinds: (r) those which do not correspond to any colour in the spectrum, such as purple and white, and (2) those which do exist in the spectrum. White may be produced by a mixture of two simple colours, which are then said to be complementary. Thus, red and greenish blue, orange and cyanic blue, yellow and indigo blue, and greenish yellow and violet all produce white. Purple is produced by a mixture of red and violet, or red and bluish violet. The following table by Helmholtz shows the compound colours produced by mixing other colours:

This table shows that if we mix two simple colours not so far separated in the spectrum as the complementary colours, the mixed colour contains more white as the interval between the colours employed is greater, and that if we mix two colours farther distant in the spectrum than the complementary colours, the mixture is whiter as the interval is smaller. By mixing more than two simple colours, no new colours are produced, but only different shades of colour.

2. Modes of Mixing Colour Sensations.—Various methods have been adopted for studying the effect of mixing colours.

(a) By Superposing Two Spectra.—This may be done in a simple way by having a slit in the form of the letter V (see fig. 17), of which the two portions \( ab \) and \( bc \) form a right angle; behind this slit is placed a vertical prism, and two spectra are obtained.
as seen in fig. 15, in which blue is the spectrum of the slit ab, and cef that of the slit cd; the coloured spectra are contained — in the triangle gcf, and, by arrangement, the effects of mixture of any two simple colours may be observed. 

(b) By Method of Reflection.—Place a red wafer on b, in fig. 19, and a blue wafer on d, and the sensation will be that of purple; and by using wafers of different colours, many experiments may thus be performed.

(c) By Rotating Disks which quickly superpose on the same Area of Retina the Impressions of Different Wave-lengths. — Such disks may be constructed of cardboard on which coloured sectors are painted, as shown in fig. 20, the arrangement of Sir Issac Newton. The angles of the sectors were thus given by:

With sectors of such a size, white will be produced on rotating the disk rapidly. This method has been carried out with great efficiency by the colour-top of J. Clerk-Maxwell. It is a flat top, on the surface of which disks of various colours may be placed. Dancer has added to it a method by which, even while the top is rotating rapidly and the sensation of a mixed colour is strongly perceived, the eye may be able to see the simple colours of which it is composed. This is done by placing on the handle of the top, a short distance above the coloured surface, a thin black disk, perforated by holes of various size and pattern, and weighted a little on one side. This disk vibrates to and fro rapidly, and breaks the continuity of the colour impression; and thus the constituent colours are readily seen.

3. The Geometric Representation of Colours.—Colours may be arranged in a linear series, as in the solar spectrum. Each point of the line corresponds to a determinate impression of colour; the line is not a straight line, as regards luminous effect, but is better represented by a curve, passing from the red to the violet. This curve might be represented as a circle in the circumference of which the various colours might be placed, in which case the complementary colours would be at the extremities of the same diameter. Sir Isaac Newton arranged the colours in the form of a triangle, as shown in fig. 21. If we place three of the spectral colours at three angles, thus—green, violet and red—the sides of the triangle include the intermediate colours of the spectrum, except purple.

The point S corresponds to white, consequently, from the intersection of the lines which join the complementary colours, straight lines from green to S, RS and VS represent the amount of green, red and violet necessary to form white; the same holds good for the complementary colours; for example, for blue and red, the line SR = the amount of blue, and the line SR = the amount of red required to form white. Again, any point, say M, on the surface of the triangle, will represent a mixed colour, the composition of which may be obtained by mixing the three fundamental colours in the proportions represented by the length of the lines M to green, M to yellow, and M to white.

The following list shows characteristic complementary colours, with their wave-lengths (A) in millions of a millimetre:

- Red, λ 650
- Orange, λ 608
- Gold-yellow, λ 574
- Yellow, λ 567
- Greenish yellow, λ 564
- Blue, λ 492
- Blue-green, λ 492
- Blue, λ 490
- Indigo-blue, λ 464
- Indigo, λ 462
- Violet, λ 457
- Yellow, λ 567

By combining colours at opposite ends of the spectrum, the effect of the intermediate colours may be produced; but the lowest and the highest, red and violet, cannot thus be formed. These are therefore fundamental or primary colours, colours that cannot be produced by the fusion of other colours. If now we add green, which has a rate of vibration about midway between red and violet, we obtain a sensation of white. Red, green and violet are therefore the three fundamental colours.

4. Physiological Characters of Colours.—Colour physiologically is a sensation, and it therefore does not depend only on the physical stimulus of light, but also on the part of the retina affected. The power of distinguishing colours is greatest when they fall on, or immediately around, the yellow spot, where the number of cones is greatest. In these regions more than two hundred different tints of colour may be distinguished. Outside of this area lies a middle zone, where fewer tints are perceived, mostly confined to shades of yellow and blue. If intense coloured stimuli are employed, colours may be perceived even to the margins of the periphery of the retina, but with weak stimuli coloured objects may seem to be black, or dark like shadows. In passing a colour from the periphery to the centre of the yellow spot, remarkable changes in hue may be observed. Orange is first grey, then yellow, and it only appears as orange when it enters the zone sensitive to red. Purple and bluish green are blue at the periphery, and only show the true tint in the central region. Four tints have been found which do not thus change: a red obtained by adding to the red of the spectrum a little blue (a purple), a yellow of 574-5, a green of 495 λ, and a blue of 477 λ.

The question now arises, How can we perceive differences in colour? We might suppose a molecular vibration to be set up in the nerve-endings synchronous with the undulations of the luminiferous aether, without any change in the chemical constitution of the sensory surface, and we might suppose that where various series of waves in the aether corresponding to different colours act together, these may be fused together, or to interfere so as to give rise to a vibration of modified form or rate that corresponded in some way to the sensation. Or, to adopt another line of thought, we might suppose that the effect of different rays (rays differing in frequency of vibration and in physiological effect) is to promote or retard chemical changes in the sensory surface, which again so affect the sensory nerves as to give rise to differing states in the nerves and the nerve centres, with differing concomitant sensations. The former of these thoughts is the foundation of the Young-Helmholtz theory, while the latter is applicable to the theory of E. Hering.
5. Theories of Colour-Percussion.—A theory widely accepted by physicists was first proposed by Thomas Young and afterwards elaborated by Helmholtz. It is based on the assumption that three kinds of nervous elements exist in the retina, the excitation of which gives respectively sensations of red, green and violet. These may be regarded as fundamental sensations. Homogenes or light excites all three, but with different intensities according to the length of the wave. Thus long waves will excite most strongly fibres sensitive to red, medium waves those sensitive to green, and short waves those sensitive to violet. The relative excitation of different fibres shows graphically the irritability of the three sets of fibres. Helmholtz thus applies the theory:

1. Red excites strongly the fibres sensitive to red and feebly the other two—sensation: Red.
2. Yellow excites moderately the fibres sensitive to red and green, and the violet—sensation: Yellow.
3. Green excites strongly the green, feebly the other two—sensation: Green.
4. Blue excites moderately the fibres sensitive to green and violet, and feebly the red—sensation: Blue.
5. Violet excites strongly the fibres sensitive to violet, and feebly the other two—sensation: Violet.
6. When the excitation is nearly equal for the three kinds of fibres, then the sensation is White.

The Young-Helmholtz theory explains the appearance of the consecutive coloured images. Suppose, for example, that we look at a red object for a considerable time; the retinal elements sensitive to red become fatigued. Then (1) if the eye be kept in darkness, the fibres affected by the red being fatigued do not act so as to give a sensation of red; the area of green and of violet have been excited, and this excitement is sufficient to give the sensation of pale greenish blue: (2) if the eye be fixed on a white surface, the red fibres, being fatigued, are not excited by the red rays contained in the white light; on the contrary, the green and violet fibres, lying directly opposite to the excited fibres, give rise to the consequence that we have an intense complementary image; (3) if we look at a bluish green, the complementary of red, the effect will be to excite still more strongly the green and violet fibres, and consequently to give a still more intense complementary image; (4) if we regard a red surface, the primitive colour, the red fibres are little affected in consequence of being fatigued, the green and violet fibres will be only feebly excited, and therefore only a very feeble complementary image will be seen; and (5) if we look at a surface of a different colour altogether, this colour may combine with that of the consecutive image, and produce a mixed colour; thus, on a yellow surface, we shall see an image of an orange colour.

Every colour has three qualities: (1) hue, or tint, such as red, green, violet; (2) degree of saturation, or purity, according to the amount of white mixed with the tint, as when we recognize a red or green as pale or deep; and (3) intensity, or luminosity, or brightness as when we designate the tint of a red rose as dark or bright. Two colours are identical when they agree as to these three qualities. Observation shows, however, that out of one hundred men ninety-six agree in identifying or in discriminating colours, while the remaining four show defective appreciation. These latter are called colour-blind. This defect is about ten times less frequent in women. Colour-blindness of this sort is an inital and incurable, and it is due to an unknown condition of the retina or nerve centres, or both, and must be distinguished from transient colour-blindness, sometimes caused by the excessive use of tobacco and by disease. When caused by tobacco, the sensation of blue is the last to disappear. Absolute inability to distinguish colour is rare, if it really exists; in some rare cases there is only one colour sensation; and in a few cases the colour-blind fails to distinguish blue from green, or there is insensibility to violet. Daltonism, or red-green blindness, as that disease is termed, is the commonest defect. Red appears to the red-blind person as a dark green or greenish yellow, yellow and orange as dirty green, and green and blue brighter than the green of the yellow and orange. To a green-blind person red appears as dark yellow, yellow is yellow, except a little lighter in shade than the red he calls dark yellow, and green is pale yellow.

According to the Young-Helmholtz theory, there are three fundamental sensations, red, green and violet, and the combination of which all other colours may be formed, and it is supposed that there exist in the retina three kinds of nerve elements, each of which is specially responsive to the stimulus of waves of a certain length. These elements are called red-blind, green-blind and blue-blind, the last being the commonest. If waves corresponding to pure red alone act on the retina, only the corresponding nerve element is excited, and so with green and violet. But if waves of different frequencies are mixed (corresponding to a mixture of colours), then the nerve elements will be set in action in proportion to the amount and intensity of the constituent excitants in the colour. The three elements are: 1. Red, 2. Green and 3. Violet.
gives white, while anabolism, in the dark, gives rise to the sensation of blackness. Thus blackness is a sensation as well as whiteness, and the members of each pair are antagonistic as well as complementary. In the red end of the spectrum the rays cause katabolism of the red-green substance, while they have no effect on the yellow-blue substance. Here the sensation is red. The shorter waves of the spectral yellow cause katabolism of the yellow-blue material, while anabolism of the red-green substance causes the sensation green. Here the sensation is green. Shorter waves of the blue of the spectrum cause anabolism of the yellow-blue material, and as their action on the red-green substance is neutral, the sensation is blue. The sensation is yellow at the blue end of the spectrum where katabolism of the red-green substance, and thus give violet by adding red to blue. The sensation orange is experienced when there is excess of katabolism, and greenish blue when there is excess of anabolism in both substances. Again, when all the rays of the spectrum fall on the retina, katabolism and anabolism in the red-green and yellow-blue matters are equal and neutralize each other, but katabolism is great in the white-black substance, and we call the sensation white. Lastly, when no light falls on the retina, anabolic changes are going on and there is the sensation of black.

Hunt's theory accounts satisfactorily for the formation of coloured after-images. Thus, if we suppose the retina to be stimulated by red light, katabolism takes place, and if the effect continues after withdrawal of the red stimulus, we have a positive after-image. Then applied to the retina anabolism according to the influence of nutrition, and the effect is assisted by the anabolic effect of shorter wave-lengths, with the result that the negative after-image, green, is perceived. Perhaps the distinctive feature of Hering's theory is that white is an end product not the secondary result of a mixture of primary sensations, as held by the Young-Helmholtz view. The greatest difficulty in the way of the acceptance of Hering's theory is with reference to the sensation of black. Black is held to be due to anabolic changes occurring in the white-black substance. Suppose that anabolism and katabolism of the white-black substance are in equilibrium, unaccompanied by stimulation of either the red-green or yellow-blue substance, we find that we have a sensation of darkness, but not one of intense blackness. This "darkness" has still a certain amount of luminosity, and it has been called "intrinsic light." In the human retina, sensations of black differing from this darkness may be readily experienced, as when we expose the retina to bright sunshine for a few moments and then close the eye. We then have a sensation of intense blackness, which soon, however, is succeeded by the darkness of the "intrinsic light." The various degrees of blackness, if it is truly a sensation, are small compared with the degrees in the intensity of whiteness. In the consideration of both theories changes in the composition of cerebromotor centres have not been taken into account, and of this we know next to nothing.

6. The Contrast of Colours.—If we look at a small white, grey or black object on a coloured ground, the object appears to have the colour complementary to the ground. Thus a circle of grey paper on a red ground appears to be of a greenish-blue colour, whilst on a blue ground it will appear pink. This effect is heightened if we place over the paper a thin sheet of tissue paper; but it disappears at once if we place a black ring or border round the grey paper. Again, if we place two complementary colours side by side, both appear to be increased in intensity. Various theories have been advanced to explain these facts. Helmholtz was of opinion that the phenomena observed are dependent on a change in the intensity of the sensory impressions; J. A. F. Plateau, on the other hand, attempted to explain them by the theory of consecutive images.

5. The Movements of the Eye
1. General Statement.—The globe of the eye has a centre of rotation, which is not exactly in the centre of the optic axis, but rather in the centre of the orbit. On account of this centre of rotation, of which there are three—an antero-posterior, a vertical and a transverse. In normal vision, the two eyes are always placed in such a manner as to be fixed on one point, called the fixed point or the point of regard. A line passing from the centre of rotation to the point of regard is called the line of regard. The two lines of regard form an angle at the point of regard, and the base is formed by a line passing from the one centre of rotation to the other. A plane passing through both lines of regard is called the plane of regard. With these definitions, we can now describe the movements of the eyeball, which are of three kinds: (1) First position. The head is erect, and the line of regard is directed towards the distant horizon. (2) Second position. This indicates all the movements round the transverse and horizontal axes. When the eye rotates round the first, the line of regard is displaced above or below, and makes with a line indicating its former position an angle termed by Helmholtz the angle of vertical displacement, or the ascensional angle; and when it rotates round the vertical axis, the line of regard is displaced from side to side, forming with the median plane of the eye an angle called the angle of lateral displacement. (3) Third order of positions. This includes all those which the globe may assume in performing a rotary movement along with lateral or vertical displacements. This movement of rotation is measured by the angle which the plane of regard makes with the transverse plane, an angle termed the angle of rotation or of torsion.

The two eyes move together as a system, so that we direct the two lines of regard to the same point in space.

The eyeball is moved by six muscles, which are described in the article Eye (Anatomy). The relative attachments and the axes of rotation are shown in fig. 23.

The term visual field is given to the area intercepted by the extreme visual lines which pass through the centre of the pupil, the amount of dilatation of which determines its size. It follows the movements of the eye, and is displaced with it. Each point in the visual field has a corresponding point on the retina, but the portion, as already explained, which secures our attention is that falling on the yellow spot.

2. Simple Vision with Two Eyes.—When we look at an object with both eyes, having the optic axes parallel, its image falls upon the two yellow spots, and it is seen as one object. If, however, we dispose one eyeball by pressing it with the finger, then the image in the displaced eye does not fall on the yellow spot, and we see two objects, one of them being less distinct than the other. It is not necessary, however, in order to see a single object with two eyes that the two images fall on the two yellow spots; an object is always single if its image fall on corresponding points in the two eyes.

The eye may rotate round three possible axes, a vertical, horizontal and antero-posterior. These movements are effected by the four straight muscles and two oblique. The four straight muscles arise from the back of the orbit, and pass forward to be inserted into the front part of the eyeball, or its equator, if we regard the anterior and posterior ends of the globes as the poles. The two obliques (one originating at the back of the orbit) come, as it were, from the nasal side—the one goes above the eyeball, the other below, while both are inserted into the eyeball on the temporal side, the superior oblique above and the inferior oblique below. The six muscles work in pairs. The internal and external recti turn the eye round the vertical axis,
VISION

so that the line of vision is directed to the right or left. The superior and inferior recti rotate the eye round the horizontal axis, and thus the line of vision is raised or lowered. The oblique muscles turn the eye round an axis passing through the centre of the eye to the back of the head, so that the superior oblique muscle lowers, while the inferior oblique raises, the visual line. It was also shown by Helmholtz that the oblique muscles sometimes cause a slight rotation of the eyeball round the visual axis itself. The point to which we are trying to get control of the will up to a certain point, but these are slighter movements that are altogether involuntary. Helmholtz studied these slighter movements by a method first suggested by F. C. Donders. By this method the apparent position of after-images produced by exhausting the retina, say with a red or green object, was compared with that of a line or fixed point gazed at with a new position of the eyeball. The ocular spectra soon vanish, but a quick observer can determine the coincidence of lines with the spectra. After producing an after-image with the head in the erect position, the head may be placed into any inclined position, and if the attention is then fixed on a diagram having vertical lines ruled upon it, it can easily be seen whether the after-image coincides with these lines. As the after-image must remain in the same position on the retina, it will be evident that if it coincides with the vertical lines there must have been a slight rotation of the eyeball. Such a coincidence always takes place, and thus it is proved that there is an involuntary rotation. This minute rotation enables us to judge more accurately of the position of external objects.

3. The horopter is the locus of those points of space which are seen at the same time when the eyes are simultaneous open. It may be conceived as simple, as a matter of fact it is generally a line of double curvature produced by the intersection of two hyperboloids, or, in other words, it is a twisted cubic curve formed by the intersection of two hyperboloids which have a common generator. The curves pass through the nodal point of both eyes. An infinite number of lines may be drawn from any point of the horopter, so that the point may be seen as a single point, and these lines lie on a cone of the second order, whose vertex is the point. When we gaze at the horizon, the horopter is really a horizontal plane passing through our feet. The horopter in this instance is the ground on which we stand. Experiments show that the forms and the distances of these objects which are situated in, or very nearly in, the horopter, are perceived with a greater degree of accuracy than the same forms and distances would be when not situated in the horopter" (M'Kendrick, Life of Helmholtz, 1899, p. 172 et seq.).

An object which is not found in the horopter, or, in other words, does not form an image on corresponding points of the retina, is seen double. When the eyelids are so acted upon by their muscles as to secure images on non-corresponding points, and consequently double vision, the condition is termed strabismus, or squinting, of which there are several varieties treated of in works on ophthalmic surgery. It is important to observe that in the fusion of double images we must assume, not only the correctness of the theory of corresponding points of the retina, but also that there are corresponding points in the brain, at the central ends of the optic fibres. Such fusion of images may occur without consciousness—at all events, it is possible to imagine that the cerebral effect (except as regards consciousness) would be the same when a single object was placed before the two eyes, in the proper position, whether the individual were conscious or not. On the other hand, as we are habitually conscious of a single image, there is a psychical tendency to fuse double images when they are not too dissimilar.

4. Binocular Perception of Colour.—This may be studied as follows. Take two No. 3 eye-pieces of a Hartnack's microscope, or two eye-pieces of the same optical value from any microscope, place one in front of each eye, direct them to a clear window in daylight, keep them parallel, and two luminous fields will be seen, one corresponding to each eye. Then converge the two eye-pieces, until the two luminous circles cross, and the central part, like a bi-convex lens, will appear clear and bright, while the outer segments will be much less intense, and may appear even of a dim grey colour. Here, evidently, the sensation is due to a fusion of impressions in the brain. With a similar arrangement, blue light may be admitted by the one eye-piece and red by the other; and on the convergence of the two, a resultant colour, purple, will be observed. This may be termed the binocular vision of colours. It is remarkable that by a mental effort this sensation of a compound colour may be decomposed into its constituents, so that one eye will again see blue and the other red.

6. THE PSYCHICAL RELATIONS OF VISUAL PERCEPTIONS

1. General Characters of Visual Perceptions.—All visual perceptions, if they last for a sufficient length of time, appear to be external to ourselves, erect, localized in a position in space and more or less continuous.

(a) Visual Sensations are referred to the Exterior.—This appears to be due, to a large extent, to habit. Those who have been born blind, on obtaining eyesight by an operation, have with great difficulty the localization of the external relations of objects. Again, phosgenes, when first produced, appear to be in the eye, but when conscious of them, by an effort of imagination, we may transport them into space, although they never appear very far off.

(b) Visual Sensations are referred to Erect Objects.—Although the images of objects are inverted on the retina we see them erect. The explanation of the effect is that we are conscious of that image on the retina, but of the luminous object from which the rays proceed, and we refer the sensation in the direction of these rays. Again, in running the eye over the object, say a tall pole, from base to apex, we are not conscious of the different images on the retina, but of the muscular movements necessary to bring the parts successively on the yellow spot.

(c) Visual Sensations are referred to a Position in Space.—The localization of a luminous point in space can only be determined by observing its relations to other luminous points with a given position of the head and of the eye. For instance, for the very dark room, if we look at a single luminous point, we cannot fix its exact position in space, but we may get some information of a vague character by moving the head or the eye. If, however, a second luminous point appears in the darkness, we can tell whether it is nearer or farther distant, above or below the first. So with regard to other luminous points we observe their reciprocal relations, and thus we localize a number of visual impressions. There are three principal directions in space: the transverse (breadth), the vertical (height) and the sagittal (depth). Luminous points may be localized either in the transverse or vertical directions. Here we have to do simply with localization on a surface. A number of points may be observed simultaneously (as when the eye is fixed) or successively (as when the eye moves). If the movement of the eye be made rapidly, the series of impressions from different points may be fused together, and we are conscious of a line, the direction of which is indicated chiefly by the muscular sensations felt in following it. The case is different as regards points in the sagittal direction.

We see only a single point of this line at a time; it may be a transverse series of retinal elements, A B, and each of these formed by a number of smaller elements, 1, 2, 3, 4, situated in the axis of each principal element; it may be, on the other hand, the transverse line a b situated in space and formed by a series of points in juxtaposition.
Each of these points will impress a retinal element, and the result will be the perception of a transverse line; but this will not be the same for the points $c$, $d$, $e$, $f$, $g$, situated in space in a linear series, in the sagittal direction; only one of those points, $e$, will impress the corresponding retinal element, and we can see only one point at a time in the line $eg$. By accommodating successively, however, for the various points at different and considerable distances along the line $eg$, we may excite retinal elements in rapid succession. Thus, partly by the fusion of the successive impressions on the retina, and partly from the muscular sensations caused by repeated accommodations and possibly of ocular movements, we obtain a notion of depth in space, even with the use of only one eye. It is, however, one of the chief effects of binocular vision to give precision to the notion of space in the sagittal direction.

(d) Visual Sensations are Continuous.—Suppose the image of a luminous line falls on the retina, it will appear as a line although it is placed on perhaps 300 cones or rods, each of which may be separately excited, so as to cause a distinct sensation. Again, on the same principle, the impression of a superficial surface may be regarded as a kind of mosaic, made up of individual portions corresponding to the rods or cones on which the image of the surface falls. But in both cases the sensation is continuous, so that we see a line or a surface. The individual images are fused together.

2. Notions derived from Visual Perceptions.—When we look at any object, we judge of its size, the direction of its surfaces (unless it be a point), its distance from the eye, its apparent movement or fixedness and its appearance of solidity.

(a) Apparent Size.—This, so far as regards a comparatively small object, depends on the size of the retinal image, as determined by the visual angle.

![Fig. 26.—Diagram to illustrate Illusions of Size and Distance.](image)

With a very large object, there is an appreciation of size from the muscular sensations derived from the movements of the eyeball as we "range" the eye over it. It is difficult to appreciate the distance separating two points between which there are other points, as contrasted with an apparently similar distance without intermediate points. For example, the distance $A$ to $B$ appears to be greater than from $B$ to $C$, in fig. 26.

(b) Direction.—As the retina is a curved surface, a long straight line, especially when seen from a distance, appears curved. In fig. 27 a curious illusion of direction, first shown by J. K. F. Zoellner, is depicted. If these lines be looked at somewhat obliquely, say from one corner, they will appear to converge or diverge, and the oblique lines, on each side of the vertical lines, will appear not to be exactly opposite each other. But the vertical lines are parallel, and the oblique lines are continuous across them. The effect is evidently due to an error of judgment, as it may be controlled by an intense effort, when the lines will be seen as they really are.

(c) Apparent Distance.—We judge of distance, as regards large objects at a great distance from the eye,—(1) from their apparent size, which depends on the dimensions of the visual angle, and (2) from the interposition of other objects between the eye and the distant object. Thus, at sea, we cannot form, without great experience, an accurate estimate of how many miles we are off the coast, and all know how difficult it is to estimate accurately the width of a river. But if objects be interposed between the eye and the distant object, say a few vessels at different distances at sea, or a boat in the river, then we have certain materials on which to form a judgment, the accuracy of which, however, even with these aids, will depend on experience. When we look at a near object, we judge of its distance chiefly by the sense of effort put forth in bringing the two lines of regard to converge upon it.

(d) The Movement of a Body.—If the eye be fixed, we judge of movement by successive portions of the retina being affected, and possibly also by a feeling of an absence of muscular contractions necessary to move the eyeballs. When the eye moves, so as to "follow" the object, there is a sense of muscular effort, which is increased when, in addition, we require to move the head.

(e) The Apparent Solidity of an Object.—If we look at an object, say a cube, first with the right eye and then with the left, it will be found that the two images of the object are somewhat different, as in fig. 28. If, then, by means of a stereoscope, or by holding a card between the two eyes, and causing a slight convergence of the eyes, the two images are brought upon corresponding points of the two retinæ, the image will at once be seen in relief.

7. Errors of Refraction and Accommodation and their Curative Treatment

The following is a classification of the diseases of vision, from a medical point of view (see also Eye: Diseases):

a. Errors of refraction: hyperopia, myopia, astigmatism, anisometropia, aphakia.
b. Errors of accommodation:
   (1) Loss of accommodation: (a) From advancing years (presbyopia), or from debility.
   (b) From paralysis (cycloplegia) due to—
      1. Drugs such as atropine.
      2. Systemic poisons: diptheria, influenza, syphilis, etc.
   (2) Spasm of accommodation.
   (3) Meridional asymmetrical accommodation by means of low errors of astigmatism are corrected, producing eye-strain.

Hyperopia or Hypermetropia (H.) (Far-sight; German = Uebersicht).—This is a condition of the refraction of the eye in which, with the eye at rest, parallel rays of light focus beyond the retina, which means that the image of a distant object is not in focus when it meets the retina, because the eye is too short antero-posteriorly. Most eyes at birth are hyperopic, but as the child grows the eye also grows; when, however, this does not take place, or does not take place sufficiently, normal development is thus arrested. There are other conditions that cause hyperopia, but this shortening of the antero-posterior axis is by far the commonest.

Hyperopia is corrected by convex glasses (fig. 29), and the measurement of the hyperopia is that convex glass which enables the hyperopic eye, at rest, to see distinctly objects at a distance. When the hyperopia is not too high it can also be corrected by the eye itself by means of the ciliary muscle (muscle of accommodation) which causes the crystalline lens to become more convex, and thus brings about the same result as placing a convex glass before the eye.

In young people when the error is not too high this work is done unconsciously, vision appears to be perfect, and it is only by placing the eye under the influence of atropine that
the defect is revealed. In the normal eye distant objects are focused on the retina without the use of the ciliary muscle.

![Fig. 29.—Showing Parallel Rays focused on the Retina of a Hyperopic Eye by means of a Convex Lens.]

which is only employed when looking at near objects; but the hyperope has to use this muscle all his waking hours for both near and distant vision, so that his eyes are never at rest. Fortunately he has some compensation for this extra work, for in most hyperopes the ciliary muscle becomes more or less hypertrophied; but even so, if near work is at all excessive, or if the defect is associated with astigmatism or anisometropia, symptoms of eye-strain will sooner or later show themselves (see Eye-strain, below).

In older people a very common symptom is blurring of the type while reading; the book has to be put down and the eyes rested for some minutes before reading can be resumed. This is due to the fatigued ciliary muscle giving way and becoming unable to focus.

As we advance in years we lose accommodation power (see Presbyopia, below), so that the time comes to every hyperope, if he live long enough, when he not only has to use glasses for reading (at an earlier period than the normal person), but he also finds that he is gradually losing his distant vision. This is very alarming to many; until it is explained that all that has happened is the loss of power to correct the defect, which defect, of course, has always existed, and which in future will have to be corrected by suitable glasses. The higher the hyperopia the sooner will these symptoms manifest themselves.

In quite young children, sometimes the earliest sign of the presence of hyperopia is a convergent strabismus (internal squint). As a rule, this squint is nothing more than an over-convergence brought about by over-accommodation in those who cannot dissociate their convergence and accommodation; if we remove the necessity for over-accommodation by correcting the defect with suitable glasses, the over-convergence disappears and the squint is cured.

The total hyperopia of the eye is divided into manifest hyperopia and latent hyperopia. Manifest hyperopia is expressed in amount by the strongest convex glass that allows clear distant vision when the eye is not under atropine. Latent hyperopia is the additional hyperopia which is revealed under atropine. With advancing years the latent hyperopia becomes more and more manifest, and between the ages of 45 and 50 the total hyperopia is entirely manifest.

In addition to the symptoms already described, a very common one among young hyperopes is spasm of the ciliary muscle. This cramp of the muscle causes distant objects to be very indistinct, improvement only taking place with a concave glass, and near work has to be approached very close to the eyes, thus giving a wrong idea that the child is suffering from myopia; by paralysing the ciliary muscle with atropine the spasm disappears and the true nature of the defect is revealed.

The treatment essentially consists in ascertaining the total hyperopia of the eye, and this can only be done satisfactorily, when latent hyperopia is present, by paralysing the accommodation, using atropine for these under 25, and homatropine for those between the ages of 25 and 35 or 40. Over 40 (and when the hyperopia is high, even at an earlier age) no cycloplegic is necessary—in fact it is in many cases dangerous, as an attack of glaucoma may be induced. (See Eye: Diseases.)

Having found the total hyperopia, we learn the amount of the latent hyperopia, and, roughly speaking, the convex glass required is equal to the whole of the manifest hyperopia added to, from one-third to a half, of the latent; but the treatment varies with the age of the individual and the amount of the hyperopia, and is too complicated to be detailed here.

Myopia (M.) (Short-sight).—Typical myopia is due to an elongation of the antero-posterior diameter of the eye, so that the retina is situated behind the principal focus, and only divergent rays of light from a near point (fig. 30), or parallel rays made divergent by a concave glass (fig. 31), can come to a focus on the retina. In other words, the far point of a myope is at a short distance in front of the eye, the distance being the measure of the myopia.

A myope can see distinctly at a distance when the eye is at rest (i.e. when accommodation is not being used), with that concave glass whose focal length is equal to the distance of the far point from the eye, and the converse is true; the measurement of myopia is that concave glass with which the myopic eye sees distinctly objects at a distance, and its focal length is equal to the distance of the myope's far point from the eye.

The Causes of Myopia.—Although myopia is hereditary, it is, with few exceptions, not congenital. We have seen that almost all eyes are hyperopic at birth. The Savage is rarely myopic; it is civilization that is responsible for it; the necessity for constantly adapting the eye for near objects means undue convergence. We find that myopia generally first shows itself at the age of 8 to 10, when school work begins in earnest—that is, when convergence is first used in excess—and there is no doubt that it is excessive convergence that is mostly responsible for the development of myopia. The over-used internal recti constantly pulling at the sclerotic tend to lengthen the antero-posterior diameter of the eye, and as this lengthening of the antero-posterior axis necessitates greater convergence still, a vicious circle is produced, and the myopia gradually increases. The hereditary character of myopia is explained by the existence in such eyes of an "anatomical predisposition" to myopia. The sclera is unusually thin, and consequently less able to resist the pull of the internal recti, and the relative position of the recti and the position of the optic nerve, both of which may be hereditary, may be factors in the production of this defect.

Anything which causes young subjects to approach their work too near the eyes may be the starting-point. Bad illumination, or the light coming from the wrong direction (for instance, in front), or defective vision produced by cornal nebule, or lamellar cataract, &c., all necessitate over-convergence in order to obtain clearer images, and myopia may be produced.
It is interesting to note that when the work is approached very near the eye, but convergence is not used, as in the case of watchmakers, who habitually use a strong convex glass in one eye, there is no special tendency to myopia.

Some of the more common symptoms of myopia are:

1. Vision near is always distinctly worse than vision far.
2. Near objects are seen distinctly, and the near point is much nearer than in the normal eye.
3. Acuteness of vision is often lowered, and especially this is the case in high myopia.
4. Myopes are often present, due to overuse of the muscles of convergence, and this may lead to (3) an additional or divergent squint.
5. Floating black specks are often complained of, these are generally muscae volitantes, but often, especially in high myopia, may be actual opacities floating in the vitreous.
6. Myopes often stope and become "round shouldered" from the extreme postures they take in order to see.

A small amount of myopia, if it is stationary, is in no sense a serious defect of the eye, the possessors of it are often quite unconscious of any deficiency in vision, and in fact brag that they have better vision than their fellows. The reason of this is that they learn in early life to recognize indistinct distant objects by the aid of other senses in a way that the ordinary individual can hardly understand, and in later life they can postpone the wearing of glasses for near work for many years, and sometimes until extreme old age. Unfortunately myopia is, as a rule, not stationary; it almost always tends to increase, and children who need glasses to see properly may suffer serious changes may occur in the eyes as to lower the visual acuity enormously and sometimes lead to total loss of vision.

The treatment of myopia is general and local.

General Treatment.—The most important part of this is the preventive treatment (phylaxis), especially in its application to children. All children who have one or both parents myopic are specially "marked down" for this defect, for they have probably inherited an anatomical predisposition. Bearing in mind that excessive convergence is the most potent cause of myopia, the most rigid discipline should be imposed to keep the child from close work. This room should be large, lofty and well ventilated, and have good-sized high windows on one wall, preferably on the north side. Each scholar should have an adjustable seat and desk so arranged that his head is upright and the work not too near his eyes. These desks should be arranged in rows so placed that the pupils sit with the light on their left. Schoolbooks must be clearly printed and the type should not be too small. The school work that needs close application of the eyes should be continued only for a short period at a time, the period alternating with other work which does not require the use of the eyes, such as mental arithmetic, blackboard exercises, recitation, etc. The teacher should teach more—that is, that they should explain and impart knowledge by demonstrations and simple lectures, and reduce as much as possible the time spent in "home preparations," which is usually work for the eyes and which, if it is prolonged, is harmful to the pupils. The teacher should not be too hasty, and patients, especially those who are mentally tired. Even in the nursery the greatest care should be taken. The little ones should be supplied with large toys, a large book, and the cards should be kept as large as possible. Picture books should be discouraged, and close work that entails undue convergence, such as sewing, threading beads, &c., ought to be forbidden. The nursery governess can teach the alphabet, small words and even simple arithmetic with the bricks. No child with a tendency to myopia, or with a myopic family history should be allowed to learn to write or draw until at least seven years old. The child's bed should be placed so as to allow the eye to look straight to the window, or the room, in the brighter weather. Work which entails close application for many hours a day, should be advised to regulate their work, if they are free to do so, by working for shorter periods and taking longer intervals of rest, they should be especially careful not to approach their work too near to the eyes and they should always work in good light.

Local Treatment.—This consists in correcting the eye with a correction that will bring objects into clear vision. The testing must be done when the eye is under atropine in all those under 25, and under homatropine between the ages of 25 and 35 or 40. Over 40 no cycloplegia is required. The physician himself, or his assistant, should examine each eye. Each eye, playing rough games the glasses should not be worn always. The wearing of glasses produces some alteration in the near work produces at first considerable rebellion in children, because they can see near work so much better without a glass. The object of enforcing this temporary use of glasses, and the subsequent use of accommodation done for the one eye only, is to be of use in the future, not only do we do this, but we also do away with the excess of convergence over accommodation, and lastly, make excessive convergence impossible, because, with the glasses on, the near work has to be held at a distance from the eyes. In other words, we have practically made the eyes normal, and it is only by doing this that we can prevent the increase of myopia. If adults who have never worn glasses (especially if the myopia is high) must have a weaker glass for near work. Each case must be treated on its own merits. So-called malignant myopia, which is high myopia with serious changes in the eye, must be treated in a special manner and with the greatest care.

Astigmatism.——The principal seat of astigmatism is the cornea, the curvature of one meridian being greater than that of the other. In regular astigmatism, which is the only form that can as a rule be treated by glasses, the meridians of greatest and least curvature are at right angles to each other, and the intermediate meridians pass by regular gradations from one to the other. Rays of light passing through such an astigmatic surface do not focus at one point, but form many points, with the result that the image is more or less indistinct according to the amount of the error. In uncorrected astigmatism a clock-face viewed at a distance of 4, 5, or by laying near and have figures distinct, and others (at right angles) indistinct; for instance, figures XI and V may appear quite black, while figures II and VIII are grey and indistinct. If one of the principal meridians be emmetropic the astigmatism is simple; if both be hyperopic, or if both be myopic, it is compound; and if one meridian be hyperopic and the other myopic, it is styled mixed astigmatism. Generally the vertical meridian or one near it is the most convex, and this is called direct astigmatism (astigmatism “according to the rule”). When the up and down, or the horizontal and vertical, of the convex, the term inverse astigmatism is used (astigmatism “against the rule”). When the meridians are oblique, that is, about 45°, it is called oblique astigmatism. Low degrees of astigmatism (of the cornea) are corrected by the ciliary muscle, producing an astigmatism of the crystalline lens, the opposite of that of the cornea, and so neutralizing the defect. This work is done unconsciously, vision is generally quite good and no suspicion is entertained of anything wrong until some symptom of eye-strain shows itself (see Eye-strain, below), and the detection of it is one of the most important duties of the oculist. The only certain method of detecting and consequently correcting a low error of astigmatism, in all below the age of 50, is by paralyzing the ciliary muscle with atropine or homatropine and thus preventing it from correcting the defect, and revealing the true refraction of the eye. Astigmatism is corrected by cylindrical glasses combined with spherical convex or concave glasses if hyperopic or myopic co-exist, and the correction must be worn always in the form of rigid pince-nez or spectacles.

Presbyopia (Old Sight).—A normal-sighted child at the age of 40 begins to notice a near point of accommodation 7 cms. from the eye, and as age advances this near point recedes gradually. At the age of 40 it has receded to 22 cms., in other words at this age the fine print cannot be read nearer to the eye than 22 cms. Between the ages of 45 and 50 the person who has apparently enjoyed good sight up till then, both for distance and near, finds that by artificial light he cannot read the newspaper unless he holds it some distance from the eyes, and he has to give up consulting "Bradshaw" because he cannot distinguish between 3's and 8's. Another symptom often complained of is the difficulties in reading small writing, the letters so that they be clear for reading, and the weasel rested between can be resumed. This loss of accommodation power is due to the gradual hardening of the crystalline lens from age, and convex glasses have to take its place, in order to make reading possible and comfortable. In hyperopia the presbyopic period is earlier, and in myopia it is later than normal (see above).

It is unwise for the presbyope to select the glasses for himself, as astigmatism or lenticulometria may be present and must, of course, be corrected; the eyes should be properly tested, and this testing should be repeated every two or three years, as not only does the old sight increase, but changes in the static refraction of the eyes are probably taking place. When an error of refraction exists with the presbyope, glasses for distance, as well as reading, have to be worn, and to avoid the trouble 1 See also § Astigmatism, above.
of constantly changing, the two should be combined as bi-focal glasses. The upper portion of the bi-focal corrects the distant, and the lower the near vision, and in the best form the division between the two is invisible. When properly fitted these bi-focals prove the greatest boon to the presbyope.

Anisometropia (Odd Sight) is a condition in which the refraction of the two eyes is different. There are three varieties. (1) Binocular vision exists. As a rule a very small difference is present, and the difference is generally in the astigmatism; consequently eye-strain is very commonly manifested, and the correction by suitable glasses is imperative. (2) The eyes are used alternately. For instance, one eye may be hyperopic or emmetropic, and the other myopic; in such a case the former will be used for distant and the latter for near vision, and although binocular or stereoscopic vision is lost, glasses may never be required and any attempt at a correction of the defect may be useless. However, if eye-strain is present, the attempt should be made. (3) One of the eyes is permanently excluded. When the difference between the eyes is great the most defective eye is little used and tends to become amblyopic (partially blind), if it is not so already. This condition is very common in squid, and the treatment in such cases consists in providing the defective eye with its correcting glass, completely covering up the good eye and practising for certain periods every day, and thus forcing the defective eye to work. This eye may never take its share in binocular vision, but it may become very useful in special cases; thus, for instance, a musician should correct the good eye in the improvement of the vision of the eye materially assists the treatment of the squint. When one eye is irre- medially lost, the other should be very carefully tested, and if any error exists it ought to be corrected and the glass worn always.

Aphakia is the absence of the crystalline lens through dis- location, or removal by operation, or injury. A strong convex glass has to be worn in front of such an eye in order to obtain clear vision even for distance, and a still stronger one for near vision; after cataract operation astigmatism is generally present, and the convex glass has to be combined with a cylinder; these glasses are best worn in the form of bi-focals (see Pres- byopia, above).

Eye-Strain.—Eye-strain is a symptom, or group of symptoms, produced by the correction, or attempt at correction, by the cyanide muscle of an error of refraction, or a want of balance between the external muscles of the eye (heterophria). Where gross errors exist either in the refraction or in the muscular equili- brium, the correction cannot be made, and consequently no attempt is made to correct the defect, and eye-strain is not produced. The smaller the error the more likely is the eye- strain to be present, and also, unfortunately, the more likely is it to be overlooked. It is important to recognize what may be the different manifestations of eye-strain. They may be grouped under three headings: (1) manifestations on the eye and lids, such as conjunctivitis, blepharitis, iritis, cyclitis, glaucoma and cataract. (2) Peripheral irritation: (a) with pain: head- aches and megrim; (b) without pain: epileptic attacks and choreiform movements of the facial muscles: vertigo, nausea, vomiting. (3) Nerve waste: nerve exhaustion, neurasthenia, brain-fag. This last form of eye-strain is as common as it is subtle, and is subtle because the sufferer never suspects the eyes to be at fault; all his waking hours he is unconsciously correcting a low degree of astigmatism, or anisometropia, or heterophoria, which means a constant nerve waste; and when he begins near work he starts with a big deficit, and further strain results.

Insomnia is a prominent symptom of eye-strain; this leads to depression, which in its turn may lead to the alcoholic or morphia habit. There is no form of functional nerve disorder that may not be caused by, or aggravated by, eye-strain.

The treatment of eye-strain consists in correcting all errors of refraction (as in and also, unfortunately, the more likely is it to be overlooked) and in wearing the correction always. A small amount of heterophoria will generally, in a short time, disappear when the error is corrected; if not, it must be corrected by prisms or decentring.

VISITATION (Lat. from visitare, frequentative form of visere, to look at, to go to see, visit, visere, to see), an act of visiting, or going to, a formal visit. The use of the word for an act of divine retributive justice, or generally of an occurrence of temporal import, such as a plague or famine, is due mainly to Biblical phraseology, as in “the day of visitation” (Isa. x. 3). For the duty of bishops of the Roman Church to visit periodically the tombs of the apostles Peter and Paul at Rome, the Visitation Limeumin Apostolorum, see Bishop. The specific application of the term is to a formal periodical visit paid by a superior authority to an institution or to a district for the purpose of investigation, examination or the like. There are three classes of such visitations: ecclesiastical, charitable and heraldic. Ecclesiastical visitations were originally the periodic journeys of personal inspection to ascertain the temporal and spiritual condition of each parish, form part of the functions of an archbishop, a bishop and an archdeaon. All charitable corpora- tions are at law subject to visitation; the functions of the “visitors” have been largely taken over by the Board of Charity Commissioners. Colleges at a university are regarded in law as charitable institutions, and each college has a “visitor” whose duty it is to represent the founder and see that his wishes are carried out. Heraldic visitations were perambulations made by a king-at-arms or other high heraldic officer with a warrant under the Great Seal to examine into pedigrees and claims to bear arms. The results of these visitations were certainly entered in “Visitation Books,” which are in the nature of official records; their admissibility as evidence, though claimed, is judicially questioned as containing merely experts’ statements from the families to whom they refer (D’Arcy de Knayth Perage Case, 1901). These heraldic visitations ceased about 1686.

In addition to these specific meanings may be mentioned the festival of the “Visit of Mary,” in commemoration of the visit of the Virgin to Elizabeth, mother of St John the Baptist, celebrated in the Roman, Greek and other churches on the 2nd of July, and the office of the English Church, the “Visit of the Sick,” ordered for the spiritual comfort and benefit of sick persons. For the international law relating to the right of belligerent vessels to “visit and search” neutral vessels in time of war, see SEARCH, RIGHT OF.

VISITING CARDS. The use of cards of personal identifica- tion for social purposes is generally supposed to have had its origin at the court of Louis XIV. of France, that centre of the etiquette of the 17th century. But there appears to be little doubt that, in a rougher and ruder form, this mark of intercourse dates from much earlier times, and that the Chinese, and possibly other Oriental nations also, had in bygone ages employed some other medium of communication on calling at the houses of absent friends. When and where visiting cards first came into vogue in Europe is a matter of some uncertainty. It is probable, how- ever, that they were first used in Germany—and as early as the 16th century. A German visiting card recently discovered in Venice bears this inscription: Johannes Westerholt Westphalus scribepat, Paviavi, 4 Martii 15 90. Concerning this, Professor Dr Kirnias (Dcheim, September 30th, 1905) remarks that the German students in Padua were wont, on quitting the university, to pay farewell calls at the houses of the professors, and, in the event of not finding them within, to leave their names on paper billets; and he adds that the custom must, until that time, have been unknown in Italy, for this card of the student Wester- holt was sent by Professor Giacomo Contarini on the 15th of January 1572 to Venice as a curiosity. Under the reign of Louis XIV, however, the fashion appears to have become firmly established in France. Small stripes of paper were at first employed for the purpose of the communication; but gradually they attained a more elaborate finish and execution. Ladies especially seem to have been the pioneers in this direction, and other ladies were not long in following the fashion. Thus adorned, taking the form of "hearts" and other amorous tokens of affection. Under Louis XV, the reign of exquisite extravagance
and refined taste, visiting cards were furnished with delicate engravings, frequently masterpieces of that art, showing some fanciful landscape, or a view of the town or place where the person resided. A further stage in the development of this custom was the autograph signature at the foot of the card beneath the engraved visiere. Engravings followed; and visièrs became a universal fashion in Europe towards the close of the 18th century. But though in almost every European country there are variations in the size and shape of the card and the way of describing the quality of the person whom it represents, the modern tendency is everywhere in favor of simplicity and the avoidance of ostentation.

A valuable collection of visiting cards is that of the Gabinetto della Stampe in Rome and the Museo Civico in Venice.

VISOKO (or Visoki), a town of Bosnia, on the river Bosna, 15 m. N.W. of Sarajevo by rail. Pop. (1895), about 5000. Visoko has a brisk trade in leather, carpets and tobacco.

Between the 13th and 16th centuries Visoko was only second to Jajce as a stronghold of the Bosnian rulers. There were fortified palaces at Sutijeka, and Bobovce, among the mountains on the north. Bobovce, which was nearly as well fortified as any previous assualts, was betrayed to the Turks in 1463; at Sutijeka there was a Franciscan monastery, founded in 1391, often razed by the Turks, and finally rebuilt in 1821. Just below Visoko lay the town of Podvisoko, called Sotto Visoki by the Ragusans, which was the chief mart of the country from 1348 to 1430.

VISOR (also spelled visor, visor, razor or visard), a term now used generally of the various forms of movable face-guards in the helmet of medieval and later times. It meant properly a mask for the face, and is an adaptation of the O.Fr. visiere, mod. visière, as is seen by the M.E. forms visor, visiere. It is thus to be referred to the Fr. vis, face, Lat. visum, from videre, to see. In this sense the word "visor" is modern, the movable guard for the upper part of the face being known as an "avantail" or "ventail," and that for the lower part a "beaver" (see HELMET).

VISTULA (Ger. Weichsel, Polish Wisła), one of the chief rivers of Europe, rising in Austria and flowing first through Russian and then through Prussian territory. Its source is in Austrian Silesia on the northern slopes of the West Beskid range of the Carpathian mountains.

The stream runs through a mountain valley, in a N.N.W. direction to Schwarzwater, where it leaves the mountains, turns E. and E.N.E., and forms the frontier of the Austro-German, Silesian region. At a distance of 19 sq. m. from Austrian territory (Galicia), it passes Cracow, and thereafter forms a long stretch of the frontier with Russia (Poland), bending gradually towards the north, until at Zawichost it runs due N. and enters Poland. From this point it runs through bigets and large plains which enter Poland, but leaves this near Jezcow, and flows as far as the junction with the Pilica in a broad valley between wooded bluffs. Crossing the Old Polish central plain, it passes through Warsaw, and at the junction of the Bug sweeps W. and N. to pass Plock and Olszawa (see further Poland for its course within this territory). It enters Prussia to m. above Thorn, turns N.E. on receiving the Brze, passes Gdansk and turns towards the north. From this point it flows off numerous branches and sweeps from side to side of a broad valley, having steep banks on the side upon which it impinges, and on the other being bordered by extensive flat lands. Near the point it forms a delta, dividing into two main arms, the left or western of which bears the name of Vistula, and flows directly to Danzig Bay, while the right is called the Nogat, and flows into the Frisches Haff. The enclosed deltaic tract is very fertile. Parts of it are known as Werder (cf. the English "islands" or "holms," in the Fens and other low-lying tracts of the east). In the lower part of the delta the Haff Canal leads from the main river to the Frisches Haff; there are also various natural channels in that direction, but the main river passes on towards the N.N.W., having a tendency to run parallel to the coast, and reaching Danzig Bay with a direct channel as an artificial structure. In 1846 the river broke a new channel into the bay, at a point between this cut and the old mouth at Neufahrwasser, on the night of the 1st-2nd of February 1840. The important seaport of Danzig, however, is on the old channel, and this channel is used by shipping, which enters it by a canal at Neufahrwasser. The Nogat, formerly inaccessible, had become so much deepened and broadened by natural means in the latter part of the 19th century that it acts as a waterway than the Vistula itself (i.e. the other main deltaic branch). In 1845-57 the outflow of the Nogat was stopped and an artificial channel was formed for it, so as to restore the proper head of water to the Vistula.

Shifting banks form a serious impediment to navigation, and these and floods (principally in spring and midsummer) necessitate careful works of regulation. The river is ice-bound at Warsaw, and passes through the material about the 10th of March. The navigation of the Vistula is considerable up to Cracow, and the river forms a very important highway of commerce in Poland (g.a.) and Prussia. For small craft it is navigable above Cracow to the Austro-German frontier, where the Freiwasser enters it. This river and the Pilica, Bzura, Brahe, Schwarzwater and Pire are the chief left-bank tributaries; on the right the Vistula receives the Skawa, Raba, Danajec, Wisoka and Sun before reaching Poland, the Wieprz and Bug in Poland, and the Drezwenz in Prussia. The Brahe and the Bromberg Canal give access from the Vistula to the Netze and so to the Oder. The river is rich in fish. Its area is about 650 sq. m., and its drainage area approaches 74,000 sq. m.

See H. Keller, Memel, Pregel- and Weichselstrom, Ihre Stromgebiete, &c., vols. iii. and iv. (Berlin, 1900).

VITALIANUS, bishop of Rome from 657 to 672, succeeded Eugenius I. and was followed by Adeodatus. In the monothelite controversy then raging he acted with cautious reserve, refraining at least from express condemnation of the Typus of Constans II. The chief episode in his uneventful pontificate was the visit of Constans to Rome; the pope received him "almost with religious honors," a deference which he required because he considered all the fires of the Empire, including the titles of the Pantheon—and sending them to Constantinople. Archbishop Theodore was sent to Canterbury by Vitalian.

VITEBSK, a government of western Russia, with the government of Pskov on the N., Smolensk on the E., Mogilev, Minsk and Vila on the S., and Courland and Livonia on the W., having an area of 16,978 sq. m. Except on its south-eastern and northern borders, where there are low hills, deeply eroded by the rivers, its surface is mostly flat, or slightly undulating, and more than a million acres are occupied by immense marshes, which are as many as 2500 small lakes. It is mainly built up of Devonian red sandstones and red clays, but the Carboniferous formations—both the Lower, characterized by layers of coal, and the Upper—crop out in the east. The whole is covered with Glacial and post-Glacial formations, in which remains of extinct mammals and stone implements are found in large quantities. There are numerous burial-mounds containing bones and iron implements and ornaments. The soil is for the most part unproductive. The W. Dvina rises not far from the northern-east angle of the government, and flows through it, or along its southern boundary, to the Baltic, i.e. for more than 430 m., it is navigable; and, through a tributary, the Ulyanka, it is connected with the Dnieper by the Berezina Canal. The Mezha and Kasplia, tributaries of the W. Dvina, are navigable in spring. The climate is relatively mild, the average yearly temperature at the city of Vitebsk being 40° F. (January 16°; July 64°) in 1895. The population was estimated at 1,740,700 in 1906. The government is divided into eleven districts, the chief towns of which are Vitebsk, Drissa, Dvinsk, formerly Deina- burg, Gorodok, Lepel, Lyutsyn, Nevel, Polotsk, Rzezhiasta, Sezhov and Velizhsk.

VITEBSK, a town of Russia, capital of the government of the same name, on both banks of the W. Dvina, and on the railway from Smolensk to Riga, 85 m. N.W. from the former. Pop. (1858) 54,676; (1867) 63,871. It is an old town, with decaying mansions of the nobility, and dirty Jewish quarters, half of its inhabitants being Jews. There are two cathedrals, founded in 1664 and 1777 respectively. The church of St Elia, a fine example of the Old Russian style of architecture, founded in 1643, was burned down in 1904. The manufactures are insignificant, and the poorer classes support themselves by gardening, boat-building and the flax trade, while the merchants carry on an active business with Riga in corn, flax, hemp, tobacco, sugar and timber.

Vitebsk (Dvibes, Vitibes and Vitebsk) is mentioned for the first time in 1021, when it belonged to the Polotsk principality. Eighty years later it became the chief town of a separate
principality, and so continued until 1320, when it came under the

dominion of the Lithuanians. In the 16th century it fell to

Poland. Under the privileges granted to the city by the

Polish sovereign it flourished, but it soon began to suffer from the

wars between Russia and Poland, during which it was

thrice taken by the Russians and burned. Russia annexed it

finally in 1772.

VITELLI, VITELLOZZO ( 1502), Italian condottiere.

Together with his father, Niccolò, tyrant of Città di Castello,

and his brothers, who were all soldiers of fortune, he instituted a

new type of infantryman, who were all soldiers of fortune, he instituted a

new type of infantryman, and armed himself with a sort of

Gothic open-arms, and also a corps of mounted infantry

armed with arquebuses. Vitellozzo took service with Florence

against Fisa, and later with the French in Apulia (1490) and

with the Orsini faction against Pope Alexander VI. In 1500

Vitellozzo and the Orsini made peace with the pope, and

the latter's son Cesare Borgia, being determined to crush the petty

tyrants of Romagna and consolidate papal power in that

province, took the condottieri into his service. Vitellozzo

distinguished himself in many engagements, and in 1501 he

advanced against Florence, moved as much by a desire to avenge

his brother Polon, who had been slain in the battle, as in the republic had

been suspected of treachery and put to death (1499), as by

Cesare's orders. In fact, while the latter was actually negoti-

ating with the republic, Vitelli seized Arezzo. Forced by

Borgia and the French, much against his will, to give up the city,

he began from that moment to nurture hostile feelings towards his master and to aspire to independent rule. He took part with the Orsini, Oliverotto da Fermo and other captains in the conspiracy of La Magione against the Borgia; but mutual distrust and the incapacity of the leaders before Cesare's

domination and the promise of French help, brought the plot to

naught, and Vitellozzo and other condottieri, hoping to ingratiate

themselves with Cesare once more, seized Senigallia in his name.

There they were defeated by him and arrested while their

troops were out of reach, and Vitello and Oliverotto were

stranged at that same night (31st of December 1501).

See vol. iii. of E. Ricotti's Storia della compagnie di ventura (Turin, 1843), in which Domenich's MS. Vita di Vitellozzo Vitelli is quoted; C. Yrlare, César Borgia (Paris, 1886); P. Villati, Life and Times of N. Machiavelli (English ed., London, 1892); see also under Alexander VI. and Cesare Borgia.

VITELLIUS, AULUS, Roman emperor from the 2nd

of January to the 2nd of December A.D. 69, was born on the

24th of September A.D. 15. He was the son of Lucius Vitel-

lius, who had been consul and governor of Syria under Tiberius.

Aulus was consul in 48, and (perhaps in 60-61) proconsul of Africa, in which capacity he is said to have acquired himself with credit. Under Galba, to the general astonishment, at the end of 68 he was chosen to command the army of Lower

Germany, and here he made himself popular with his subalterns and with the soldiers by outrageous prodigality and excessive

good nature, which soon proved fatal to order and discipline. Far from being ambitious or scheming, he was lazy and self-

indulgent, fond of eating and drinking, and owed his elevation to the throne to Caecina and Valens, commanders of two legions on the Rhine. Through these two men a military revolution was speedily accomplished, and early in 69 Vitellius was pro-

claimed emperor at Colonia Agrippinensis (Cologne), or, more

accurately, emperor of the armies of Upper and Lower Ger-

many. In fact, he was never acknowledged as emperor by the entire Roman world, though at Rome the senate accepted him and decreed to him the usual imperial honours. He

advanced into Italy at the head of a licentious and ruinously

soldiery, and Rome became the scene of riot and massacre,

gladiatorial shows and extravagant feasting. As soon as it

was known that the armies of the East, Dalmatia and Illyricum

had declared for Vespasian, Vitellius, deserted by many of his

adherents, would have resigned the title of emperor. It was

said that the terms of resignation had actually been agreed upon

with Primus, one of Vespasian's chief supporters, but the

praetorians refused to allow him to carry out the agreement,

and forced him to return to the palace, when he was on his way to
deposit the insignia of empire in the temple of Concord. On

the entrance of Vespasian's troops into Rome he was dragged

out of some miserable hiding-place, driven to the fatal Gemmalian
stairs, and there struck down. "Yet I was once your emperor," were the last and, as far as we know, the noblest words of

Vitellius. During his brief administration Vitellius showed

indications of a desire to govern wisely, but he was completely

under the control of Valens and Caecina, who for their own

ends encouraged him in a course of vicious excesses which threw

off the balance and brought about the downfall of the empire.

See Tacitus, Histories: Suetonius, Vitellius; Dio Cassius lxx.

Merivale, Hist. of the Romans under the Empire, chs. 56, 57;

H. Schiller, Geschichte der römischen Kaiserzeit, i. pt. 1; W. A. Spooner's ed. of the Histories of Tacitus (introduction); B. W. Henderson, Civil War and Rebellion in the Roman Empire, A.D. 69-70 (1908).

VITERBO, a city and episcopal see of the province of Rome, Italy, 54 m. by rail N.W. of Rome, 1073 ft. above sea-level.

Pop. (1901) 17,344 (town), 21,258 (community). It lies on the old high road between Florence and Rome, and besides the railway to Rome it has a branch line (25 m.) going N.E. to Atina, on the road to Florence. In Roman times the city was

picturesquely surrounded by luxuriant gardens, and enclosed by walls and towers, which date partly from the Lombard

period. The streets are paved with large lava blocks, of which the town is also built. It has many picturesque medieval
towers and other edifices (the Palazzo degli Alessandri is perhaps the most interesting), for which indeed it is one of the best towns in central Italy, and some elegant fountains; among the latter may be mentioned the Fontana Grande (1729, restored in 1742) and Fontana della Roca by Vignola (1566). The citadel (Rocca) itself, erected by Cardinal Albornoz in 1345, is now a barracks. The Palazzo Patrizi is a building of the early Renaissance in the Florentine style. The cathedral, a fine basilica, of the 12th (?) century, with columns and fantastic capitals of the period, originally flat-roofed and later vaulted, with 16th-century restorations, contains the tomb of Pope John XXI., and has a Gothic campanile in black and white stone. It is more probable that it was S. Silvestro (now Chiesa del Gesù) and not the cathedral that, in 1271, was the scene of the murder, on the steps of the high altar, during public worship, of Henry, son of Richard of Cornwall, by Guy de Montfort (see Dante, Purg. 9, 76). In part of the magnificent palace of Cardinal Adrian IV. (Nicholas Breakspear) compelled the emperor Frederick I. to hold his stirrup as his vassal. The old episcopal palace with a double loggia built on to it (recently restored to its original form) is a Gothic building of the 13th century, in which numerous concleses have been held. The church of S. Rosa exhibits the embalmed body of that saint, a native of Viterbo, who died in her eighteenth year, after

working various miracles and having distinguished herself by

her invectives against Frederick II. (1251), some ruins of whose

palace, destroyed after his death, exist. S. Francesco, a Gothic

church (before 1290), contains the fine Gothic tombs of Popes

Clement IV. and Adrian V., and has an external pulpit of the

15th century. The town also contains a few small Romanesque churches (S. Maria Nuova, S. Andrea, S. Giovanni in Zoccoli, S. Sisto, &c.) and several other Gothic churches. S. Maria della Cella is noteworthy among the former as having

one of the earliest campanili of any size in Italy (9th century).

The town hall, with a medieval tower and a 13th-century portico, contains some Etruscan sarcophagi from sites in the

neighbourhood, and a few good paintings. At one corner of the picturesque square in front of it is a Roman sarcophagus with a representation of the hunt of Meleager, with an inscription in honour of the fair Galiana, to whom it is said, a

Roman noble laid siege to Viterbo in 135. Close by is the

elegant Gothic façade of S. Maria della Salute, in white and

red marble with sculptures. The Gothic cloisters of S. Maria

della Verità just outside the town are strikingly beautiful. The church contains frescoes by Lorenzo da Viterbo (1460) and a

fine majolica pavement. A mile and a half to the north-east.
VITET—VITORIA

is the handsome early Renaissance pilgrimage church of the Madonna della Quercia; the façade adorned with three lunettes by Andrea della Robbia. The fine wooden roof of the interior is by Antonio da Sangallo the younger (1510–29). The adjoining monastery has a pleasing cloistered court. A mile and a quarter farther is the town of Bagnaia, with the Villa Lante, still belonging to the family of that name, with fine fountains and beautiful trees, ascribed to Vignola. The inhabitants of Viterbo are chiefly dependent on agriculture, hemp, specialty of the district, and tobacco and various grains are largely grown, as well as the olive and the vine. There are in the vicinity numerous mineral springs; the warm sulphur spring of Bollicame, about 2 m. off, is alluded to by Dante (Inf. xiv. 70).

Viterbo is by some identified with Surrina nova, which is only mentioned in inscriptions, while some place it at the sulphur springs, called the Bollicame, to the west of Viterbo on the line of the Via Cassia, where Roman remains exist. This might well be the site of the Roman town. Here the Via Cassia was joined by the Via Cirminia, passing east of the Litus Ciminius, while a road branched off to Ferentum. See E. Bornmann in Corp. Inscr. Lat. xi. (Berlin, 1888), p. 454; H. Nissen, Italiche Landeskunde (Berlin, 1902), ii. 343. The forgeries of the Dominican Annio da Viterbo (d. 1502) were directed to prove that Viterbo was the site of the Fanum Vultumnae (see, however, Montefiascone). There are no archaeological remains in Viterbo itself, except a few courses of masonry under the bridge which connects the cathedral with the city, near the cathedral, possibly the pier of an older bridge. But the site is not unreasonably considered to be ancient, and the name to be derived from Venus urbis; tombs, too, have been found in the neighbourhood, and it is not an unlikely assumption that here, as elsewhere, the medieval town occupies the Etruscan site. It was fortified by the Lombard king Desiderius (the decree ascribed to him, now in the municipal palace, has long been recognized as a forgery of Annio). It is the centre of the territory of the "patrimony of Peter," which the countess Matilda of Tuscany gave to the papal see in the 12th century; in the 13th century it became a favourite papal residence. Popes Urban IV. (1261), Gregory X. (1271), John XXII. (1276), Nicholas III. (1277) and Martin IV. (1281) were elected here, and it was at Viterbo that Alexander IV. (1261), Clement IV. (1268), Adrian V. (1276) and John XXII. (1277) died. (T. As.)

VITET, LUDOVIC (1802–1873), French dramatist and politician, was born in Paris on the 18th of October 1802. He was educated at the École Normale. His politics were liberal, and he was a member of the society "Aide-toi, le ciel t'aidera." On the triumph of liberal principles in 1830 Guizot created an office especially for Vitet, who became inspector-general of historical monuments. In 1834 he entered the Chamber of Deputies, and two years later was made a member of the Council of State. He was consistent in his monarchist principles, and abstained from taking any part in politics during the second empire. The disasters of 1870–71 reawakened Vitet's interest in public affairs, and he published in the Revue des deux mondes his optimistic "lettres sur le siège de Paris." He died in 1873.

Vitet was the author of some valuable works on the history of art, and his Monographie de l'Église Notre Dame de Neuvy (1845) especially did much to awaken popular interest in architecture. In the early days of the Romantic movement he wrote some vivid dramatic sketches of the time of the Leagie. They are: Les Bretonnages de Bretagne (1836), Le Bas de la Ligue (1827), and La Mort de Henri III. (1829), all three being published together in 1844 with the title of La Ligue. The best of these is the Bas de la Ligue, in which the murder of the duke of Guise is described in the most convincing manner.

VITORIA, an episcopal city of northern Spain, and capital of the province of Álava; on the Miranda de Ebro-Alsasu section of the Northern railways, among the southern outlets of the Ceniza ranges, and on the left bank of the river Zadorra, a left-hand tributary of the Ebro. Pop. (1900) 30,701. The city is built on a hill 1750 ft. high, and overlooks the plain of Álava. Its oldest part, the Campillo or Villa-Suso, occupies the top of the hill; some of the walls and towers by which it was formerly defended still remain. Below it is Vitoria Antigua, with narrow tortuous lanes; on the still lower level ground is the modern town, with wide streets, an arcaded market-place and shady promenades. The cathedral of Santa Maria in the Campillo dates from 1181, but has been considerably spoiled by later additions; the church of San Miguel also dates from the 12th century; it has an exceptionally beautiful altar, covered in wood by J. Velazquez and G. Hernandez, in the 16th century. The town hall and the palace of the provincial assembly contain some fine paintings and interesting relics connected with the history of Álava. Vitoria, from its favourable position on the main lines from Madrid to France and to the port of San Sebastian, is an important centre of trade in wine, wool, horses, mules and hardware; other industries are paper-making, carriage-building, cabinet-making, tanning and the manufacture of earthenware. There is a branch railway from Vitoria to Villarreal. The city is lighted by electricity; its trade and population have largely increased since 1875.

Vitoria was founded in 881 by Leovigild, king of the Visigoths; but its importance dates from the 10th century. In 1181 Sancho the Wise of Navarre granted it a charter and fortified it.

Battle of Vitoria.—For the operations which preceded the battle of Vitoria see PENINSULAR WAR. On June 21st, 1813, the French army in Spain (about 65,000 men with 150 guns), under King Joseph Bonaparte, held an extended position in the basin of Vitoria, south (with the exception of the extreme right) of the river Zadorra. The left rested on the heights of Puebla, north of the Puebla Pass, and Puebla de Arganzon, through which ran the Miranda-Vitoria-Bayonne road, Joseph's line of communication with France. Thence the line stretched to the ridge of Margarita, the troops so far being under General Gazan, with a second supporting line under D'Erlon between Arinez and Hermanand and a reserve behind Arinez. The right under Reille guarded the Bilbao-Vitoria road, occupying heights on the north bank of the Zadorra, and also the villages and bridges of Abechuco and Gamarra Mayor, as well as a ridge near Ariaia on the south bank.

There were no troops between Hermanand and Ariaia, except a mass of cavalry near Ali. The Zadorra, fordable in certain spots only, was spanned by bridges at Puebla de Arganzon, Nuancleres, Villolda, Tres Puentes, Mendoza, Abechuco and Gamarra Mayor, which French guns commanded; but, for some reason, none of these had been destroyed. The faults of the French position and their occupation of it were its extension; that it was in prolongation of and (on the right especially) very close to their line of retreat, so that if the right were driven back this line could be at once seized; that the centre was not strongly held; and that all bridges were left intact.

The Allies (nearly 80,000, with 90 guns), under Wellington, had moved from the river Bayas at daylight to attack Joseph, in four columns, the right being under Hill (20,000, including Morillos's Spaniards), the right centre and left centre under Wellington (30,000) and the left under Graham (20,000, including Longa's Spaniards). As the columns marched across the intersected country between the Bayas and Zadorra, extending from near Puebla de Arganzon to the Bilbao-Vitoria road, they kept touch with each other; and as they neared the Zadorra the battle opened all along the line soon after 10 a.m. Wellington's instructions to Graham were to undertake no manoeuvre which would separate his column from those on the right; but, with this proviso, to seize the Vitoria-Bayonne road if the enemy appeared definitely in retreat. Hill after a sharp contest gained the Puebla heights, too weakly held, and pushing through the pass carried the village of Subijana de Álava. The right centre column having reached Villolas, was waiting for Hill to gain further ground, when the bridge at Tres Puentes was observed to be destroyed and the column commanded from the south bank; and the French attention being now turned towards their flanks, it was surprised and rushed by Wellington with the
Light division, supported quickly by cavalry and other troops, who maintained themselves on the south bank. Joseph's centre was partially forced, while his left was hard pressed by Hill; and, fearing that Gazan and D'Erln might be cut off from Reille, he ordered them to withdraw to a ridge farther back, which they did, holding Arinex in front. Here there was no hard fighting; but, as Wellington had now passed three divisions, many guns and the cavalry (which, however, from the nature of the ground could be but little used) across the Zadorra, Margarita, Hermandad and Arinex soon fell to the Allies.

On the left, Graham, having turned the heights north of Zadorra with Longa's Spaniards, seized Gamarra Menor close to the Bayonne road. He also with heavy loss carried Gamarra Mayor and Abechuco, but the bridges south of these villages, though more than once taken, were always recaptured by Reille. At length, when a brigade from the Allied centre had been pushed up from Hermandad against Reille's flank, he withdrew from the obstinately defended bridges, and before this Gazan and D'Erln had also fallen back, fighting, to a third position on a ridge between Armentia and Ali west of Vitoria. Here, at about 6 p.m., they made a last stand, being compelled in the end to yield; and as Graham having now crossed the bridges was close to the Bayonne road, the main body of Joseph's army fled by a bad cross road towards Pampluna, abandoning artillery, vehicles and baggage (of which an enormous quantity was parked near Vitoria), Reille afterwards joining it through Betonia. The Allies then occupied Vitoria and pursued the French until nightfall. All Joseph's equipages, ammunition and stores, 143 guns, a million sterling in money, and various trophies fell into Wellington's hands, the French loss in men being nearly 7000, of that the Allies over 5000, of whom 1600 were Portuguese and Spaniards. This decisive victory practically freed Spain from French domination.

Vitrté, a town of north-western France, capital of an arrondissement in the department of Ille-et-Vilaine, situated on a hill rising from the left bank of the Vilaine, 24 m. E. of Rennes by rail. Pop. (1906) town, 7166; commune, 10,002. The town largely retains its feudal aspect. The ramparts on the north side and on the west, consisting of a machicolated wall with towers at intervals, are still standing. Only one gateway remains of the original castle, founded towards the end of the 11th century; the rest was rebuilt in the 14th and 15th centuries (the best period of Breton military architecture) and restored in recent times. It is now occupied by a prison, a museum of natural history and painting and the town library. The church of Notre-Dame, formerly a priory of the abbey of St Méline of Rennes, dates from the 15th and 16th centuries. An outside stone pulpit is a fine example of 16th-century sculpture. The church possesses a fine enamelled triptych of the 16th century. A tower of the 16th century is all that remains of the church of St Martin. The château de Les Rochers 3 m. from Vitré was the residence of Madame de Sévigné.

The town was formerly a Breton barony, and belonged in the 10th century to the younger branch of the counts of Rennes. In 1295 it passed to Guy IX., baron of Laval, on his marriage with the heiress, and afterwards successively belonged to the families of Rieux, Coligny and La Trémoille. The town was seized by Charles VIII. in 1488. Protestantism spread under the rule of the houses of Rieux and Coligny; Vitré became a Huguenot stronghold; and a Protestant church was established, which was not suppressed till the revocation of the edict of Nantes in 1685. Philip Emmanuel, duke of Mercour, the head of the members of the League in Brittany, besieged the town and forced it in 1515. The Marquis de Rogues, over which the barons of Vitré and of Léon alternately presided, met here several times.

Vitrified Forts, the name given to certain rude stone enclosures whose walls have been subjected in a greater or less degree to the action of fire. They are generally situated on hills offering strong defensive positions. Their form seems to have been determined by the contour of the flat summits which they enclose. The walls vary in size, a few being upwards of 12 ft. high, and are so broad that they present the appearance of ramparts. Weak parts of the defence are strengthened by double or triple walls, and occasionally vast lines of ramparts, composed of large blocks of unhewn and unvitrified stones, envelop the vitrified centre at some distance from it. No lime or cement has been found in any of these structures, all of them presenting the peculiarity of being more or less consolidated by the fusion of the rocks of which they are built. This fusion, which has been caused by the application of intense heat, is not equally complete in the various forts, or even in the walls of the same fort. In some cases the stones are only partially melted and calcined; in others their adjoining edges are fused so that they are firmly cemented together; in many instances pieces of rock are enveloped in a glassy enamelled coating which binds them into a uniform whole; and at times, though rarely, the entire length of the wall presents a solid mass of vitreous substance.

Since John Williams—one of the earliest of British geologists, and author of The Mineral Kingdom—first described these singular ruins in 1777, about fifty examples have been discovered in Scotland. The most remarkable are Dun Mac Uisneachain (Dun Macnoichan), the ancient Beregonium, about 50 m. N.N.E. of Oban; Tap o' Noth, in Aberdeenshire; Craig Phadraíc, or Phadrick, near Inverness; Dun Dhardhail (Dunjardill) in Glen Nevis; Knockfarriar, near Strathpeffer; Dun Creich, in Sutherland; Finhaven, near Aberlemno; Barryhill, in Perthshire; Laws, near Dundee; Dun Gall and Burnt Island, in Buteshire; Anwoth, in Kirkcudbright; and Cowdenknowes, in Berwickshire. Dun Mac Uisneachain is the largest in area, being 250 yds. long by 50 yds. broad. In the Tap o' Noth the walls are about 8 ft. high and between 20 and 30 ft. thick. In Dun Mac Uisneachain, Barryhill and Laws the remains of small rectangular dwellings have been found. For a long time it was supposed that these forts were peculiar to Scotland; but they are found also in Londonderry and Cavan, in Ireland; in Upper Lusatia, Bohemia, Silesia, Saxony and Thuringia; in the provinces of the Rhine, especially in the neighbourhood of the Nahe; in the Ucker Lake, in Brandenburg, where the walls are formed of burnt and smelted bricks; in Hungary; and in several places in France, such as Châteauvieux, Peran, La Courbe, Sainte Suzanne, Puy de Gaudy and Thauron. They have not been found in England or Wales.

In some continental forts the vitrified walls are supported by masses of unvitrified stone built up on each side. This,
in all probability, constituted an essential feature in the Scottish forts. Except on the hypothesis of buttresses of a similar kind, it is impossible to explain the vast quantities of loose stones which are found both inside and outside many of the vitrified walls.

The method by which the fusion of such extensive fortifications was produced has excited much conjecture. Williams maintains that the builders found out, either during the process of smelting bog-ore, or whilst offering sacrifices, the power of fire in vitrifying stone, and then they used this method to cement the stones upon the foundations. This theory has been keenly controverted, and it has been suggested that the vitrified summits were not forts but the craters of extinct volcanoes, an hypothesis long since abandoned; that they are not so much forts as vitrified sites, and that the vitreosity was produced by fires lighted during times of invasion, or in religious celebrations; and, lastly, that if they were forts they must originally have been built of wood and stone, and that their present appearance is due to their being set on fire by a besieging enemy. The theory of Williams has, with modifications, been accepted by various authorities. It is supported by the following facts:—

(1) The idea of strengthening walls by means of fire is not singular, or confined to a distinct race or area, as is proved by the burnt-earth enclosure of Azralan, in Wisconsin, and the vitrified substructures of the Mississippi valley. (2) Many of the Primary rocks, particularly the schists, gneisses and trapps, which contain large quantities of potash and soda, can be readily fused in the open air by means of wood fires—the alkali of the wood serving in some measure as a flux. (3) The walls are vitrily at the weakest points, the naturally inaccessible parts being unvitrified. (4) When the walls have been placed on materials practical advantages are gained, but there is the question of what materials were used. (5) The vitrified walls of the German forts are invariably formed from (local) rocks which could be easily acted upon by fire, whereas the outer ramparts, which are not vitrified, are built of large blocks. (6) Many of the continental forts are so constructed that the fire must have been applied internally, and at the time when the structure was being erected. (7) Daubréé, in an analysis which he made on vitrified materials taken from four French forts, and which he submitted to the Academy of Paris in February 1881, found the presence of natron in such great abundance that he inferred that sea-salt was used to facilitate fusion. (8) In Scandinavia, where there are hundreds of ordinary forts, and where for centuries a system of signal fires was enforced by law, no trace of vitrification has yet been detected.

A great antiquity has been assigned to vitrified forts, without sufficient proof. Articles of bronze and iron have been found in the Scottish forts, while in Puy de Gauzy a Roman tile has been discovered soldered to a piece of vitrified rock. In a few of the German forts Professor Virchow found some of the logs used as fuel in vitrifying the walls, and he concluded from the evenness of their cut surfaces that iron and not stone implements must have been used. These results indicate that these structures were possibly in use as late as the early centuries of the Christian era. It has been suggested that they were built as refuges against the Norsemen. Much in the situation and character of the forts favours this supposition. This is especially the case with reference to the Scottish forts. Here the vitrified summits are invariably so selected that they not only command what were the favourite landing-places of the vikings, but are the best natural defences against attacks made from the direction of the seacoast. In Saxony and Lusatia the forts are known as Schwenkburgen, and in the Highlands of Scotland as the fortresses of the Picts—designations which also seem to point to an origin dating back to the times of the vikings.

VITRULIUS, a name given to sulphuric acid and to certain sulphates. Oil of vitriol is concentrated sulphuric acid; blue or Roman vitriol is copper sulphate; green vitriol, ferrous sulphate (coppers); white vitriol, zinc sulphate; and vitriol of Mars is a basic iron sulphate.

VITRUVIUS (Marcus Vitruvius Pollio), Roman architect and engineer, author of a celebrated work on architecture. Nothing is known concerning him except what can be gathered from his own writings. Owing to the discovery of inscriptions relating to the Gods Vitruvia at Formiae in Campania (Moli di Gaete), it has been suggested that he was a native of that city, but this has been denied. He is considered connected with Verona on the strength of an existing arch of 16 feet 8 inches, supposed to have been built by him. It was found with the name of a later architect of the same family named “Lucius Vitruvius Cerdo, a freedman of Lucius.” From Vitruvius himself we learn that he was appointed, in the reign of Augustus, together with three others, a superintendent of balistes and other military engines, a post which, he says, he owed to the friendly influence of the emperor’s sister, probably Octavia (De Architectura, i. pref.). In another passage (v. 1) he describes a basilica and adjacent aedes Augusti, of which he was the architect. From viii. 3 it has been supposed that he had served in Africa in the time of Julius Caesar, probably as a military engineer, but the words hardly bear this interpretation. He speaks of himself as being low in stature, and at the time of his writing bowed down by age and ill-health (ii. pref.). He appears to have enjoyed no great reputation as an architect, and, with philosophic contentment, records that he possessed but little fortune. Though a great student of Greek philosophy and science, he was unpractised in literature, and his style is very involved and obscure. To a great extent the theoretical and historical parts of his work are compiled from earlier Greek authors, of whom he gives a list at i. 1 and viii. 3. The practical portions, on the contrary, are evidently the result of his own professional experience, and are written with much sagacity, and in a far clearer style than the more pedantic chapters, in which he gives the somewhat fanciful theories of the Greeks. Some sections of the latter, especially those on the connexion between music and architecture, the scale of harmonic proportions, and the Greek use of bronze vases to reverberate and strengthen the actors’ voices in the theatre, are now almost wholly unintelligible. Vitruvius’s name is mentioned by Pliny the Younger in his work on the aqueducts of Rome; and most of what Pliny says (Hist. Nat. xxxiv. 45–51) about methods of wall-painting, the preparation of the stucco surface, and other practical details in building is taken almost word for word from Vitruvius, especially from vi. 1, though without any acknowledgment of the source.

The treatise De Architectura Libri Decem is dedicated to Augustus. Lost for a long time, it was rediscovered in the 19th century at St Gall; the oldest existing MS. dates from the 10th century. From the early Renaissance down to a comparatively recent time the influence of this treatise has been remarkably great. Throughout the period of the classical revival
VITRY-LE-FRANÇOIS—VITTORIA

Vitruvius was the chief authority studied by architects, and in every point his precepts were accepted as final. In some cases a failure to understand his meaning led to curious results; for example, the medieval custom, not uncommon in England, of placing rows of earthenware jars under the floor of the stalls in church choirs, appears to have been an attempt to follow suggestions raised by Vitruvius as to the advantages of placing bronze vases round the auditorium of theatres. Bramante, Michelangelo, Palladio, Vignola, and other architects of the Renaissance carefully studied the works of Vitruvius, which through them has largely influenced the architecture of almost all European countries.

Bk. i. opens with a dedication to Augustus. C. i. is on the science of architecture generally, and the branches of knowledge with which the trained architect ought to be acquainted, viz. grammar, music, painting, sculpture, mathematics, and geometry; optics; c. 2 is on the general principles of architectural design; c. 3 on the considerations which determine a design, such as strength, utility, beauty; c. 4 on the nature of different sorts of ground for siting churches and buildings; c. 6 on aspects towards the north, south and other points; c. 7 on the proper situations of temples dedicated to the various deities.

Bk. ii. relates to materials (preface about Dinocrates, architect to Alexander). C. i. is on the earliest dwellings of man; c. 2 on systems of Thales, Heraclitus, Democritus, &c.; c. 3 on bricks, c. 4 on sand; c. 5 on lime; c. 6 on pozzolana; c. 7 on kinds of stones used, such as marble, sandstone, brick, marble, clay, red bricks, concrete and marble, and on the materials for stucco; c. 9 on timber, time for felling it, seasoning, &c.; and c. 10 on the fir trees of the Apenines.

Bk. iii. is a preface on ancient Greek writers. C. 1 is on symmetry and proportion; c. 2 on various forms of Greek temples, e.g. in antis, prostyle, peripteral, dipetal, hypaethral; c. 3 on the colonnades of various temples, e.g. the Corinthian, Ionic and Doric orders; c. 4 on the Doric order; c. 5 on the orders of ancient Roman temples; c. 6 on the Doric order; c. 7 on the order of Roman temples; c. 8 on the selection of sites for theatres according to acoustic principles; c. 9 on porticos and covered walks; c. 10 on the peristyles of various parts; c. 11 on palaestra, xysti and other Greek buildings for the exercise of athletes; c. 12 on harbours and quays.

Bk. iv. is on sites and planning, and the preface treats of various Greek writers. C. 1 is on selection of sites; c. 2 on the planning of buildings to suit different sites; c. 3 on private houses, their construction and styles, the names of the different apartments; c. 4 on foundations; c. 5 on buildings fitted for special positions; c. 6 on farms and country houses; c. 7 on Greek houses and the names of various parts; c. 8 on construction of tempi et decausticatores.

Bk. vii. mostly on methods of decoration, has a preface (as usual) on the opinions of ancient Greek writers, with lists of Greek sculptors, architects and writers on architecture, and of Roman architects. C. 1 is on the arrangement of pavements; c. 2 on the various kinds of pavement; c. 3 on mosaic floors; c. 2 is on white stucco for walls (opus apsidale, &c.); c. 3 on concrete vaults, gypsum mouldings, stucco prepared for painting; c. 4 on the designs of hollow walls; c. 5 on the decoration by various processes; c. 6 on methods and styles of wall painting, the debased taste of his time; c. 6 on fine stucco made of pounded marble—three coats to receive wall paintings; c. 7 on colours used for mural decoration; c. 8 on red lead (minium) and mercury, and how to use the latter to extract the gold from worn-out pieces of stuff or embroidery; c. 9 on the preparation of red lead and the method of encaustic painting with hot wax on artificial colours; c. 10 white lead and estrum, i.e. mercury and impurities of murex dye.

1 The excavations made in 1887 have shown that Vitruvius was right in describing the great temple of Olympian Zeus at Athens as being octastyle. The previously almost universal opinion that it was decaystyle had led to the needless theory that the passage containing this statement was corrupt.

2 Vitruvius names Cicero and Lucretius as post nostri memoriam nascendarum.

3 The architect being at that time also the contractor.
in the centre of a fertile district, with the largest wine trade in Sicily. Pop. (1901) 30,832 (town), 32,219 (commune).

**VITTORIO**, a town and episcopal residence of the province of Treviso, Venetia, Italy, 25 m. by rail N. of Treviso, 406 ft. above sea-level. Pop. (1901) 2977 (town), 19,133 (commune). It is a summer resort, with sulphur and saline springs (51°8' to 59° F.), and was formed in 1879 by the union of Ceneda (the episcopal see), and Malvaldo, the latter called the Città di Caos. Caos and the naval station of Pozzomaggio are a suburb of the town. It is a town and episcopal residence of the province of Treviso, Venetia, Italy, 25 m. by rail N. of Treviso, 406 ft. above sea-level. Pop. (1901) 2977 (town), 19,133 (commune). It is a summer resort, with sulphur and saline springs (51°8' to 59° F.), and was formed in 1879 by the union of Ceneda (the episcopal see), and Malvaldo, the latter called the Città di Caos. Caos and the naval station of Pozzomaggio are a suburb of the town.

**VITTORIO Lugo**, celebrated proselytism. In 1879 he was seized by the order of the Lateran and sent to Serravalle, a church with a fine altar-piece (1547) by Titian. It is a seat of the silkwork and weaving industries.

**VITUS, ST**, (German, Vitt; French, Guy). According to the legend, where he is associated with Modestus and Crescentia, by whom he was brought up at St Vitus suffered martyrdom at a very early age under the emperor Diocletian. Son of a Sicilian nobleman who was a worshipper of idols, Vitus was converted to the Christian faith without the knowledge of his father, was denounced by him and scourged, but resisted all attacks on his profession. Abandoned by an angel, he crossed the sea to Lucania and went to Rome, where he suffered martyrdom. His festival is celebrated on the 15th of June. The "Passion of St Vitus has no historical value, but his name occurs in the Martyrologium hieronymianum. In 836 the abbey of Corvey, in Saxony, received his relics, and became a very active centre of his cult. In the second half of the 9th century the monks of Corvey, according to Helmbold's *Chronica Slavorum*, evangelized the island of Rügen, where they built a church in honour of St Vitus. The island, however, was kept under the jurisdiction of the saint (whom they hounded as a god), returning to Christianity three centuries later. At Prague, too, there are some relics of the saint, who is the patron of Bohemia and also of Saxony, and one of the fourteen "protectors" (*Nothelfer*) of the church in Germany. Among the diseases against which St Vitus is invoked is chorea, also known as St Vitus's Dance.

**VITAL** (VITUS), GEOLEINO and *SORELLE DE* (fl. 1291–1313). Genoese explorers, connected with the first known expedition in 1291 of Iberia and the way from Europe to India. Ugolino, with his brother Guido or Vittore Vivaldo, was in command of this expedition of two galleys, which he had organized in conjunction with Tedisio Doria, and which left Genoa in May 1291 with the purpose of going to India "by the Ocean Sea" and bringing back useful things for trade. Planned primarily for commerce, the enterprise also aimed at proselytism. Two Franciscan friars accompanied Ugolino. The galleys were well armed and sailed down the Morocco coast to a place called Gozora (Cape Nun), in 28°47' N., after which nothing more was heard of them. Early in the next (14th) century, Soarele de Vivaldo, son of Ugolino, undertook a series of distant wanderings in search of his father, and even penetrated, it is said, to Magadozo on the Somali coast. In 1455 another Genoese seaman, Antcnuotto Uso di Mare, sailing with Cadamosto in the service of Prince Henry the Navigator of Portugal, claimed to have met, near the mouth of the Gambia, with the last descendant of the survivors of the Vivaldo expedition. The two galleys, he told, had sailed to the Sea of Guinea; in that sea one was stranded, but the other passed on to a place on the coast of Ethiopia-Mena or Amuann, near the Gion (Gambia, known as the Sea)—where the Genoese were seized and held in close captivity.

**VIVARINI**, the surname of a family of painters of Murano (Venice), who produced a great quantity of work in Venice and in Italy during the 15th century. The father of the family was a pupil of the school which is represented by Carpaccio and the Bellinis.

**ANTONIO VIVARINI** (Antonio of Murano) was probably the earliest of this family. He came from the school of Andrea da Murano, and his works show the influence of Gentile da Fabriano. The earliest known date of a picture of his, an altar-piece in the Venetian academy, is 1440; the latest, in the Lateran museum, 1454, but he appears to have been alive in 1470. He worked in company with a certain "Joannes de Alemania," who has been (with considerable doubt) regarded as a brother (Giovanni di Murano), but no trace of this painter exists of a date later than 1447. After 1447 Antonio painted either alone or in combination with his younger brother Bartolommeo. The works of Antonio are well drawn for their epoch, with a certain noticeable degree of softness, and with good flesh and other tints. Three of his principal paintings are the "Virgin Enthroned with the Four Doctors of the Church," the "Coronation of the Virgin," and "Sts Peter and Jerome." The first two (in which Giovanni co-operated) are in the Venetian academy, the third in the National Gallery, London. This gallery contains also specimens of the two under-named painters.

**BARTOLOMMEO VIVARINI** is known to have been active from 1450 to 1490. He learned oil-painting from Antonello da Messina, and is said to have produced, in 1473, the first oil picture done in Venice. This is in the church of S. Giovanni e Paolo—a large altar-piece in nine divisions, representing Augustine and other saints. Most of his works, however, including one in the National Gallery, are in tempera. His outline is always hard, and his colour good; the figures have much dignified and devout expression. As "vivarino" means in Italian a goldfinch, he sometimes drew a goldfinch as the signature of his picture.

**LUIGI or ALVISE VIVARINI**, born about 1446, painted in 1475 and on to 1502, when he died. It has sometimes been supposed that, besides the Luigi who was the latest of this pictorial family, there had also been another Luigi who was the earliest, this supposition being founded on the fact that one picture is signed with the name, with the date 1414. There is good ground, however, for considering this date to be a forgery of a later time. The works of Luigi show an advance on those of his predecessors, and some of them are productions of high quality. Columbus was inspired by one of his pictures to the *Scuola di S. Girolamo in Venice, representing the saint carrying a Donation, and some monks decamping in terror. The architecture and perspective in this work are superior. Other works by Luigi are in Treviso and in Milan. He painted some remarkable portraits.

*W. M. R.*

**VIVERO**, a town of north-western Spain, in the province of Lugo; on the Ria de Vivero, an estuary formed by the river Landrove, which here enters the Bay of Biscay. Pop. (1900) 12,843. Vivero is an old-fashioned and picturesque town, connected with the opposite bank of the estuary by a bridge of twelve arches and a causeway. Its fishing fleet, its coasting trade and the agricultural products of the fertile country are important. The only means of communication with the interior is by the road to Cabeceiras, for Lugo and Ferrol.

**VIVES, JUAN LUIS** (1492–1540), Spanish scholar, was born at Valencia on the 6th of March 1492. He studied at Paris from 1509 to 1512, and in 1519 was appointed professor of humanities at Louvain. At the instance of his friend Erasmus he prepared an elaborate commentary on Augustine's *De Civitate Dei*, which was published in 1522 with a dedication to Henry VIII. Soon afterwards he was invited to England, and is said to have acted as tutor to the princess Mary, for whose use he wrote *De ratione studii puellaris epistolae due*
VIVIAN, 1st BARON—VIVISECTION

(1533). While in England he resided at Corpus Christi College, Oxford, where he was made doctor of laws and lectured on philosophy. Having declared himself against the king's divorce from Catherine of Aragon, he lost the royal favour and was confined to his house for six weeks. On his release he withdrew to Bruges, where he ranked in the action of Guy of Burgundy, a copy of many activities, chiefly directed against the scholastic philosophy and the preponderant authority of Aristotle. The most important of his treatises is the De Causis corruptorum Artium, which has been ranked with Bacon's Organon. He died at Bruges on the 6th of May 1540.

VIVIAN, RICHARD HUSSEY VIVIAN, 1st BARON (1775—1842), British cavalry leader, came of a Cornish family. Educated at Harrow and Magdalen College, Oxford, Vivian entered the army in 1792. He became a captain in the 10th Hussars, G. in 1797 was transferred to the 7th Light Dragoons (now Hussars), and in Sir Ralph Abercromby's division was present at the battles of Bergen and Alkmaar (19th September to 6th October 1799). In 1800 he received his majority, and in 1804 he became lieu.-colonel of the 7th. In command of this regiment he sailed to join Baird at Corunna in 1805, and took part in Lord Pagel's cavalry fights at Sahagun and Benavente. During the retreat of Moore's army the 7th were constantly employed with the rearguard. Vivian was present at Corunna, and returned with the remainder of the army to England. It was not until late in 1813 that the 7th returned to the Peninsula, and Vivian (now colonel and A.D.C. to the prince regent) was soon taken away to command a cavalry brigade under Hill. With this corps he served throughout the fighting on the Nive (9th—13th December). At the beginning of 1814 he was transferred to a cavalry brigade of Beresford's corps, and took a marked part in the engagements at Pau and the battle of Orthes. In the advance on Toulouse Vivian brought a brilliant action at Crois d'Orade on the Ers (8th April), when he was very severely wounded. At the beginning of 1815 he was made K.C.B.; he had been a major-general for several months. In April Sir Hussey Vivian was appointed to command a brigade of Uxbridge's cavalry, and at Waterloo his regiments, with those of Vandeleur's brigade, made the final charge of the day between Hougoumont and La Haye Sainte, sweeping everything before them. This service was rewarded by the thanks of both houses of parliament, the K.C.H. and the orders of Maria Theresa and St Vladimir, from the emperors of Austria and Russia, and given the G.C.H. In 1815 he became master-general of the ordnance. In 1837 he received the G.C.B., and in 1841, being then M.P. for East Cornwall, was created Baron Vivian in the English peerage. A year later he died at Baden-Baden. He was twice married (first in 1804), and the title descended in the direct line to his natural son, Sir Robert John Hussey Vivian (1802—1887), who was a famous soldier in India, in who in 1857 was made K.C.B. and in 1871 G.C.B., having previously attained the rank of general.

VIVIANITE, a mineral consisting of hydrated iron phosphate Fe(PO₄)ₓ·8H₂O, crystallizing in the monoclinic system. The crystals possess a perfect cleavage parallel to the plane of symmetry and are usually bladed, in habit; they are soft (H=4), flexible and septic. The specific gravity is 2·6. When unaltered and containing no ferric oxide, the mineral is colourless, but on exposure to the light it very soon becomes of a characteristic indigo-blue colour. Crystals were first found in Cornwall near Truro, associated with pyrrhotite by J. G. Vivian, after whom the species was named by A. G. Werner in 1817. The mineral had, however, been earlier known as a blue powdery substance, called "blue iron-earth," met with in peat-bogs, in bog iron-ore, or with fossil bones and shells. (L. J. S.)

VIVISECTION, literally the cutting (sectio) of living (vivus) animals, a word which might be applied to all surgical operations whether practised upon the lower animals or on man. As conventionally used, however, it has exclusive reference to experiments upon the lower animals undertaken for the advance ment of medical sciences. There are a number of people who, calling themselves anti-vivisectionists, strongly object to these experiments on the lower animals; and it must be conceded that the humane reasons which they advance against it can only be set aside as "sentimental" if considerations of a wider humanity can show that the arguments of the anti-vivisectionists really run counter to human progress. The supporters of vivisection, properly considered, must not be confused with those who would make a barbarous use of this means of research. What is at stake here is the right to use it as a means to an end, and that is a purely technical question, unnecessary to result if the practice of vivisection were unrestricted; and the purpose of this article is to give some account of the method of experiments on animals as sanctioned by law in the United Kingdom, and to justify that method by setting forth the chief historical discoveries that have been made by the help of vivisection. Such experiments have for their object the advancement of the sciences of physiology and pathology. From the earliest periods experimental vivi sessions have occasionally been practised, but before the days of the anti-vivisectionists no result of fundamental importance could be drawn that required the sacrifice of a single animal. The introduction of anaesthetics has greatly extended the scope of the experimental method, because an animal can be kept unconscious and quiet, without even a quiver of a muscle, during prolonged operations. Further, the introduction of the antiseptic method has made it possible to subject all tissues and organs of the body to surgical interference, and this has also had the effect of increasing the possibilities of experimental research.

In 1906 a British Royal Commission was appointed to inquire into the whole subject under the chairmanship of Mr. A. J. Ram, K.C. The Commission sat from October 1906 to March 1908, and heard no fewer than 21,761 questions and answers. In view of attempts on the part of the anti-vivisectionists to misrepresent the nature of the evidence given before the Commission, in January 1908 the supporters of experiments on animals founded the Research Defence Society, under the presidency of Lord Cromer; by July 1910 this society had some 3,500 members. Its official address is 21, Ladbroke Square, London. (J. S.)

I. METHODS EMPLOYED.—The present act relating to experiments on animals was passed in 1876. At that time the majority of these experiments were physiological. There was, it may be fairly said, no such thing as bacteriology, no general following up of Pasteur's work. A few experiments were made in pathology, for instance in tubercle; and a few in surgery, in pharmacology, and in the action of poisons, especially snake venom. But the chief use of experiments on animals was for the advancement of physiology. The evidence given before the Royal Commission (1875) was almost entirely on physiological matters, on the discoveries of Harvey, Bell, Magendie and Claude Bernard, on the Handbook for the Physiological-Laboratory, and so forth. The act, therefore, was drafted with a view to physiology, without much concern for pathology, and without foreknowledge of bacteriology. At the time of writing (1910), 95% of the experiments are inoculations. Every experiment must be made in a registered place open to government inspection. But inoculation experiments are sometimes
VIVISECTION

permitted in non-registered places, for the immediate study of outbreaks of disease, or in circumstances which render it impracticable to use a registered place. Every experiment must be made under a licence; and every application for a licence must be recommended by the signatures of two out of a small body of expert authorities, or learned societies, or professors of certain universities and colleges.

The word "experiment" is not allowed to cover the use of more than one animal. Most experiments are made not under a licence alone, but under a licence plus one or more certificates, and the wording and working of these certificates must be clearly understood, because it is over them that the question arises as to the amount of pain inflicted by these experiments. Under the licence alone, the animal must be kept under anaesthetic during the whole of the experiment; and if no pain is likely to continue after the effect of the anaesthetic has ceased, or if any serious injury has been inflicted on the animal, it must be killed forthwith under the anaesthetic. Thus, under the licence alone, it is impossible to make an inoculation; for the experiment consists, not in the introduction of the needle under the skin, but in the observation of the results of the inoculation. A guinea-pig inoculated with tubercle cannot be kept under anaesthetic till the disease appears. The disease is the experiment, and it is therefore an experiment made without an anaesthetic, and not authorized by the licence alone. Again, under a licence alone, it is impossible to check out the thyroid treatment of myxoedema, or the facts of cerebral localization. For to remove the thyroid gland, or to remove a portion of the surface of the brain, is to inflict a serious injury on the animal. The operation is done under profound anaesthesia—it would be impracticable otherwise; the wound is treated and dressed by the antiseptic method—suppuration would invalidate the result. But a serious injury has been inflicted. Nevertheless, the animal must not be killed forthwith; the result must be watched. These and the like experiments cannot be made under the licence alone. For the licence is evidence of the removal of such disabilities as these, the act empowers the home secretary to allow certain certificates, to be held with the licence. They must be recommended by two signatures, and various restrictions are put upon them by the home secretary. On July 11, 1898, the home secretary was asked, in the House of Commons, what were the conditions and regulations attached by the Home Office to licences and certificates; and he answered—

The conditions are not always the same, but may vary according to the nature of the investigation. It is hardly possible, therefore, for me to state all the conditions attached to licences and certificates. The most important conditions, however (besides the limitations as to place, time and number of experiments), and the conditions most frequently imposed, are those as to reporting and the use of antisepsics. The latter condition is that the animals are to be treated with strict antiseptic precautions, and if these fail and pain results, they are to be killed immediately under anaesthetics. The reporting conditions are, briefly, that a written record, in a prescribed form, is to be kept of every experiment, and is to be open for examination by the inspector; that a report of all experiments is to be forwarded to the inspector; and that any published account of an experiment is to be transmitted to the secretary of state. Another condition requires the immediate destruction under anaesthetics of an animal in which severe pain has been induced, after the main result of the experiment has been obtained.

The home secretary attaches to licences and certificates such endorsements as he thinks fit. The bare text of the act, now thirty-four years old, is a very different thing from the administration of the act; and the present writer is in a position to say that the act is administered with great strictness, under a careful system of inquiry and reference.

The certificates are distinguished as A, B, C, E, EE and F. Certificate D, which permitted the testing, by experiments, of "former discoveries alleged to have been made," has fallen into disuse. Certificate C permits experiments to be made by way of illustration of experiments. They must be made under the provisions contained in the act as to the use of anaesthetics. Certificates E and EE permit experiments on dogs or cats; certificate F permits experiments on horses, asses or mules.

These certificates are linked with Certificate A or Certificate B. It is round these two certificates, A and B, that the controversy as to the pain caused by experiments on animals is maintained.

Certificate A permits experiments to be made without anaesthesia. It is worded as follows: "Whereas A, B, of [here insert address and name], is a practical and experimental man of science, and does propose, if duly authorized under the above-mentioned act, to perform on living animals certain experiments described below: We hereby certify that, in our opinion, inexperience in the animal operation of any such experiment may be prevented or counteracted by anaesthetics without necessarily frustrating the object of such experiment." All inoculations under the skin, all feeding experiments and the like are scheduled under this certificate. This certificate must be signed and sealed made under a licence alone. Though the only instrument used is a hypodermic needle, yet every inoculation is officially returned as an experiment, calculated to give pain, performed without an anaesthetic. It is for inoculations and the like experiments, and for them alone, and for nothing else, that Certificate A is allowed (or A linked with E or F). This want of a special certificate for inoculations, and this wresting of Certificate A for the purpose, have led to an erroneous belief that "cutting operations" are permitted by the act without an anaesthetic. But, as the home secretary said in parliament on March 15th, "Certificate A is never allowed except for inoculations and similar trivial operations, and in every case a condition is attached to prevent unnecessary pain." And again he wrote in 1896, Such special certificates are allowed with anaesthetic precautions, or with feeding and similar procedures involving no cutting. The animal has to be killed under anaesthetics if it be in pain, so soon as the result of the experiment is ascertained.

The licence, when granted, is in the name of the operator, and includes the name and address of any other persons acting as agents, or living in the same house, and who have been permitted. These licences, or the initial operation of an experiment. It is worded as follows:

Whereas A, B, of [here insert address and profession] has represented (i.e., twice, has been held under the above-mentioned act, to perform on living animals certain experiments described below, such animals being, during the whole of the initial operation of such experiments, under the influence of anaesthetics of sufficient power to prevent their feeling pain: We hereby certify that, in our opinion, the killing of the animal on which any such experiment is performed before it recovers from the influence of the anaesthetic administered to it would necessarily involve injury, or any other object, which the experiment of B (or linked with EE or F) is used for those experiment which consist in an operation plus subsequent observation of the animal. The section of a nerve, the removal of a secretary organ, the establishment of a fistula, the plastic surgery of the intestine, the sub-dural method of inoculation—these and the like experiments are made under this certificate. We may take, to illustrate the use of Certificate B, the operation of removing the thyroid gland of an animal, which for the operation plus subsequent observation of the animal. The removal of the thyroid gland was the initial operation; and this was performed under an anaesthetic, and with the antiseptic method. Then the animal was left under observation. If the experiment fails, the animal is killed alone, without the observation, but the two together. The purpose of this certificate is set forth in the inspector's report for 1909. "In the experiments performed under Certificate B, or linked to Certificate B with EE, experiments are performed under anaesthetics from the influence of which the animals are allowed to recover. The operations are required to be performed antiseptically, so that the heating of the wounds shall, as far as possible, take place without pain. If the antiseptic precautions fail, and suppuration occurs, the animal is required to be killed. It is generally essential for the success of these experiments that the wounds should heal cleanly, and the surrounding parts remain in a healthy condition. After the healing of the wounds the animals are not necessarily, or even generally, in pain, since experiments involving the removal of important organs, such as the thyroid gland, are performed without the production of pain. The section of a nerve in an experiment performed under Certificate B, or B linked with EE, a condition is attached to the licence requiring all operative procedures to be carried out under anaesthetics of sufficient power to prevent the animal feeling pain; and no observations or stimulations of a character to cause pain are allowed to be made without the animals being anaesthetized. In no case has a cutting operation more severe than a superficial vesication (the opening of a wound under the skin) been allowed to be performed without anaesthetics,"

From this brief account of the chief provisions of the act, we come to consider the general method of experiments on animals in the United Kingdom, and the question of the infliction of pain on them. The figures for a representative year may be given. The total number of licences in 1909, in England and Scotland, was 483; of whom 135 performed no experiments during the
The experiments performed under Certificate A (or A+F, or A+F) were mostly inoculations; but a few were feeding experiments, or the administration of various substances by the mouth or by inhalation, or the absorption of blood by puncture or by simple venesection. Inoculations into deep parts, involving a preliminary incision, are required to be performed under anaesthetics (Certificate B).

"It will be seen," says the report for 1900, "that the operative procedures in experiments performed under Certificate A, without anaesthetics, are only such as are attended by no considerable, if appreciable, pain. The certificate is, in fact, not required to cover these proceedings, but to allow of the subsequent course of the experiment."

The animals most used for inoculations are mice, rats, guinea-pigs and rabbits. It is not once in a thousand times that a dog or a cat is used for inoculation. The act of inoculation is not in itself painful. A small area of the skin is carefully shaved and cleansed, that it may be aseptic, the hypodermic needle is sterilized and the method of hypodermic injection or of vaccination is the same as it is in medical practice. "A guinea-pig that will rest quietly in your hands before you commence to inject it, will remain perfectly quiet during the introduction of the needle under the skin; and the moment it is returned to the cage it resumes its interrupted feeding. Arteries, veins and most of the parts of the viscera are without the sense of touch. We have actual proof of this in what takes place when a horse is bled for the purpose of obtaining curative serum. With a sharp lance a cut may be made in the skin so quickly and easily that the animal does nothing more than twitch the skin-muscle of the neck, or give his head a shake, while of the further proceeding of introducing a hollow needle into the vein, the animal takes not the slightest notice. Some horses, indeed, will stand perfectly quiet during the whole operation, munching a carrot, nibbling a wrap of hay, or playing with a button on the vest of the groom standing at its head." These sentences, written in the Medical Magazine (June 1868) by Dr. Sims Woodhead, Professor of Pathology at Cambridge, are sufficient evidence that inoculations and the like experiments are not painful at the time.

In a few instances cultures of micro-organisms have been made in the anterior chamber of the eye, by the introduction of a needle behind the cornea. This might be thought painful, but cocaine renders the surface of the eye wholly insensitive. Many operations of ophthalmic surgery are done under cocaine alone, and the anterior chamber of the eye is so far insensitive that a man may have blood or pus (κυπλωμα in it, and hardly be conscious of the fact. The results of inoculation are in some cases negative, in others positive; the positive results are, in the great majority of cases, not a local change, but a general infection which may end in recovery, or in death. The diseases thus induced may, in some cases, fairly be called painless—such as septicемia in a mouse, snake-venom in a rat, and malaria in a sparrow. Rabbits affected with rabies do not suffer in the same way as dogs and some other animals, but become subject to a painless kind of paralysis. It is probable that animals kept for inoculation purposes for a long time, less pain is given to the lot of a like number of animals in a state of nature or in subjection to work: they are well fed and sheltered, and escape the capa city of larger animals, the inevitable cruelties of sport, and the drudgery and sexual mutilation that man inflicts on the higher domestic animals.

The present writer has, of course, seen the mice that are used for the study of cancer (Imperial Cancer Research Fund), and the guinea-pigs that are used at the Lister Institute for the testing of the London milk-supply, lest the milk should convey tubercle. He did not see, among all the many animals, one that appeared to be suffering; save that a very few of the mice were incommoded, or, if the word be applicable to mice, distressed, by large tumours. Of the guinea-pigs that had been inoculated, not one seemed to be in any pain. A nodule of tubercle, or a tuberculous gland, is painless in us, and therefore cannot be painful in a guinea-pig. It is not denied that the study of some diseases (plague, tetanus) causes some pain to rats and rabbits; but this pain is hardly to be compared with the pain and horror of these diseases in man.

The experiments now to be described were performed under Certificate B. If it were lawful, under Certificate B, to make an incision under an anaesthetic, to call this "initial operation," and then, without an anaesthetic, to make painful experiments, through the incision, on the deeper structures, doubtless much pain might be inflicted under this certificate. But experiments of this kind can be, and are, made under the licence alone, the animal being kept under an anaesthetic all the time, and killed under it. "No experiments requiring anything of the nature of a surgical operation, or that would cause the infliction of an appreciable amount of pain, are allowed to be performed without an anaesthetic," (Inspector's Report, 1890). "The infliction of the antiseptic precautions are used; and if these fail, and pain continues after the anaesthetics have ceased to operate, the animal is immediately killed painlessly" (Letter from the Home Secretary, 1898).

Of experiments made under this certificate (which must be linked with Certificate EE for any experiment on a dog or a cat), three instances may be given here: an operation on the brain, a removal of part of the whole of a secreting gland, and the establishment of a fistula. It is to be noted that, for these and the like operations, profound anaesthesia and the strict observance of the antiseptic method are matters of absolute necessity for the success of the experiment: the operation could not be performed without anaesthesia; and the experiment would come to nothing if the wound suppurated. It is to be noted, also, that these operations are such as are performed in surgery for the saving of life or for the relief of pain.

As to operations on the brain, it must be remembered that the surface of the brain is not sensitive. Therefore the removal or destruction of a portion of the surface of the brain, or the division of some tract of central nervous tissue, though it might entail some loss of power or control, does not cause pain; a wound of the brain is painless. Tension within the cranial cavity, as in cases of cerebral tumour or cerebral abscess, may indeed cause great pain; and, if the aseptic method failed in an experiment, inflammation and tension would ensue: in that case the animal must be killed.

The removal of part or the whole of a secreting gland (e.g. the thyroid, the spleen, the kidney) is performed by the same methods, and with the same precautions, as in human surgery. Profound anaesthesia, and the use of a strict antiseptic procedure, are of absolute necessity. The skin over the part to be removed must be shaved and carefully cleansed for the operation; the instruments, sponges and ligatures must be sterile, not capable of infecting the wound; and when the operation is over, the wound must be carefully closed with sutures, and left to heal under a proper surgical dressing.

The establishment of a fistula, again, is an operation practised, as a matter of course, in large numbers of surgical cases. The stomach, the gall-bladder, the large intestine, are opened for the relief of obstruction, and kept open, either for a time or permanently, according to the nature of the case. Under anaesthesia, the organ that is to be opened is exposed through an incision made through the structures overlying it, and is secured in the wound by means of fine sutures. Then, when it has become adherent there, it is opened by an incision made into it; no anaesthetic is needed for this purpose, because these internal organs are so unlike the skin in sensitness that an incision is hardly felt: the patient may say that he "felt a prick," or he may be wholly unconscious that anything has been done. A
VIVISECTION

fistula thus established is not afterward painful, though there may be some discomfort now and again.

The classical instance is the case of Alexis St Martin, who was shot in the stomach in 1822, and recovered, but with a fistula. He let Dr Beaumont make experiments on him for nine years: "During the whole of these periods, from the spring of 1824 to the present time (1833), he has enjoyed general good health . . . active, alert and vigorous; exercising, eating and drinking years after and he now enjoys the most perfect health and constitutional soundness, with every function of the system in full force and vigour." (Beaumont, Experiments and Observations on the Gastric Juice, 1836).

We come now to the question, What anaesthetics are used in these experiments, and are they properly administered? The anaesthetics used are—(1) chloroform, ether, or a mixture containing chloroform and ether; (2) morphia, chloral, urethane. It is sometimes said that morphia is not an anaesthetic. That depends on the quantity given. Not a mouth passes in this country without somebody killing himself or herself with morphia or chloral. They die profoundly anaesthetized: they cannot be roused; even the pain of a strong electric shock is not enough to rouse them. So it is with animals. The doses given to them are enormous and produce complete insensibility. On this point the evidence given before the Royal Commission of 1906-8 by Mr Thane, Professors Brunton and Buxton, Professors Dixon, Dr Dudley Buxton and Professor Starling is absolutely conclusive. "As to the statements," says Sir Lauder Brunton, "that chloral and opium or morphia are not narcotics, and do not remove pain, there is no other word for it, it is simply a lie; you may as well say that chloroform does not remove pain. If you give any animal a sufficiently large dose of chloral or opium, you so completely abolish sensibility that there is nothing you can do that will awaken its sensibility. The animal is as senseless as a piece of board."

With regard to chloroform, ether and the A.C.E. mixture, it is absolutely certain, that animals can be kept, with these anaesthetics, profoundly unconscious for three or four or more hours. Nothing on this point is more worthy of consideration than the evidence in veterinary surgery, given before the Royal Commission by Mr Hobday, one of the very foremost veterinary surgeons in this country (Reports of Evidence, vol. iv. Q. 16284-16323). The opponents of all experiments on animals are apt to believe that dogs and cats must be bound and fastened on boards, and then have the anaesthetic given to them. That is not the case. They can be taken, as is given. In large doses chloroform abolishes the movement of the voluntary muscles, but also acts as an anaesthetic: in small doses it acts only on the voluntary muscles, i.e., on the ending of the motor nerves going to these muscles. For example, suppose that the object of the experiment is to observe and record the action of a nerve on the contraction of certain blood vessels. The nerve gives off some branches to muscles, and other branches to blood vessels. If the animal is anaesthetized, and the nerve stimulated, muscles and vessels will both contract; but, if curare be given, as well as an anaesthetic, the vessel alone will contract, without the muscles: for curare does not act on the muscles of the body. But, as a practical matter, curare is very hard to obtain, and is often impure, and is very seldom used. One of the inspectors said to the Royal Commission that he had once seen it used, fifteen years ago. Professor Schäfer said that he had not used it for years. And Sir Lauder Brunton said that he did not think he had used it all since the passing of the act in 1876. The fear that, in a case where curare was being used, the effect of the anaesthetic might "pass off," and the animal be left under curare alone, is not reasonable. The dosage and administration of anaesthetics is not usually done in the manner of a large percentage of chloroform vapour, it is of necessity under the influence of the chloroform; and the anaesthesia will gradually become not less but more profound. (See the evidence before the Royal Commission by Professor Langley and Professor Waller.)

It may be interesting to compare the pain, or death, or discomfort among 86,277 animals used for experiments in Great Britain in 1909, with the pain, or death, or discomfort of an equal number of the same kinds of animals, either in a state of nature, or kept for sport, or used for the service of human profit or amusement. But it would be outside the purpose of this article to describe the cruelties which are inseparable from sport, and from the killing of animals for food, and from fashion: neither is this the place to describe the millions of men and women who are employed in breeding and breeding animals and breeders. As one of the Royal Commissioners recently said, the farmyards, at certain times of the year, simply "seethe with vivisection." The number of animals wounded in sport, or in traps, cannot be guessed. Against this vast amount of suffering we have to put an estimate of the condition of 86,277 animals used for medical science. Ninety-five per cent. of them were used for inoculation. In many of these inoculations the result was negative: the animal did not take any disease, and thus did not suffer any pain. In many more, e.g., cancer in mice, tubercle in guinea-pigs, the pain or discomfort, if any, may fairly be called trivial or inconsiderable. It could hardly be said that these small animals suffer much more than an equal number of the same kind of animals kept in little cages to amuse children. There remain 3888 animals which were submitted to operation under an anaesthetic. In the greater number of these cases the animal was killed then and there under the anaesthetic, without recovering consciousness. In the remaining cases the animal was allowed to recover, and to be kept for observation; but no further observation of any kind, which could cause pain, was allowed to be made on it, and it was then killed under an anaesthetic. Many of these cases, thus allowed to recover after an operation, may fairly be compared to an equal number of domestic animals after one of the formal operations of veterinary surgery. These observations made under Certificat B form but a very small proportion of the total number of experiments on animals in the United Kingdom; and they have led, in recent years, to discoveries of the very utmost importance for human life and health.

II. SCIENTIFIC RESULTS.—We come now to consider the results of experiments on animals, but we must remember that not only we, but animals also, owe a great debt to them. Great epizootic diseases like anthrax, swine-fever, chicken cholera, silkworm disease, pleuro-pneumonia, glanders, Texas cattle fever, blackleg, tuberculosis in cattle, have killed yearly millions of animals, and have been brought under better control by these experiments. The advantages that have been obtained for man may be arranged under two heads—(A) Physiology, (B) Pathology, Bacteriology and Therapeutics.

A. PHYSIOLOGY

1. The Blood.—Galen (A.D. 131) confuted the doctrine of Erasistratus, that the arteries contained æræcig., the breath of life, proving
by experiment that they contain blood. "Ourselves, having

tied the exposed arteries above and below, opened them, and
showed that they were indeed full of blood." Real das Columbus
(1559), though he did not discover the general or "systematic"
circulation, was the first to observe that the blood was carried
to the head, the pulmonary circulation. "The blood is carried
through the pulmonary artery to the lung, and there is attenuated; thence,
mixed with air, it is carried through the pulmonary vein, in which a
left heart, the pulmonary vein, full of blood, which assuredly
it would not be if it were designed only for air and vapours....

Verily I pray you, O candid reader, study us of authority, but more
studious of that Rhinoceros of the human body, the pulmonary
vein full of blood, not air or fuligo, as these men call
it, God help them." Harvey's treatise De Muli Cordis et Sanguini
in Animalibus was published at Frankfurt in 1621. It begins thus:

"When by many dissections of living animals, as they came to
hand, Cumm multis vivorum dissectionibus, uti ad manum dabantur,
I first gave myself to observing how I might discover, with my own
eyes, and not from books, the workings of the system.
use and purpose of the movement of the heart in animals, forwith
I found the matter indeed and full of difficulty; so that I
began to think, with Fracastorius, that the movement of the heart
was not observed. At last, by the frequent disinfection and
diligence, by frequent examination of many and various
living animals, multa frequentet et varia animalia eva
intrinsecum,—I came to believe that I had succeeded, and had
evenged the negligence of previous observers. I had covered
what I desired, the movement and use of the heart and thearteries.
And from that time, not only to my friends but also in
public, I began to give these dissections, for which I did not fear to
set forth my opinion in this matter." Here, and
again at the end of the Preface, and again in the eighth chapter of the De Motu, he puts his experiments in the very foreground of
the discovery, thus churning the chyle from the veins:

1. Cause, quibus ad seribendum ancter permutus fuit. 2. Ex vivorum
dissectionibus, quibus fit cordis molis. 3. Artirarium motus qualis,
ex vivorum dissectionibus. 4. Motus cordis et auricularum
qualis, in hoc speciebus. He cites the sources—from anatomy and from
biochemistry; but it is certain, from his
own words, that he attributed his discovery, in a very great
measure, to experiments on animals. Malpighi (1661), professor of
medicine at Padua, who had discovered the mesentery of the live
frog, made out the capillary vessels. He writes to Borelli, professor of
mathematics at Pisa, that he has
failed in every attempt to discover them by injecting fluids into
the larger vessels, but has succeeded by examining the tissues with
the microscope: "Such is the divarication of these little vessels
coming off from the vein and the artery, that the order in which a
vein takes its origin on the artery is observed and the threads
woven from the offshoots of both veins" (De Pulmonibus, 1661).

Stephen Hales (1733), rector of Farrington and minister of
Teddington-on-Thames, in his "Researches into the Subjects of
Blood, Lacteals and Chyle" (1733), in which he "dissected the
mammary glands of a large cow," described many observations on the nature and processes of the blood; and, above
all, he discovered the facts of collateral circulation. These
facts were fresh in his mind when he first ventured, in December
1735, to tie the femoral artery in "Hunter's canal" for the
cause of aneurysm in the popliteal space. The experiment that gave
him his knowledge of the collateral circulation was made on one of
the deer in Richmond Park: he tied its external carotid artery, to
see what effect would be produced on the shedding of the antler.

Some days later he found that the circulation had returned in the
antler. He had the buck killed, and found that the artery had
been tied. "The blood was observed to run through the vessels
coming from it, between the heart and the ligature, were enlarged
and were in communication with others of its branches beyond the
ligature; and by this collateral circulation the flow of blood
to the antler was restored: the circulation must be considered is, as
in the hands of the heart by Hering (1849) and the
permanent tracing of the pressure in the vessels, was noted (1863). Finally
came the study of those more abstruse problems of the circulation
which the older physiologists had left alone—the intervention of the heart, the "heart-beat," the
blood pressure and secretion, the law of the heart-beat, and
the influence of gravitation. Professor Starling, in 1906, writes
as follows of this part of physiology: "Among the researches of
the early part of this century, it is the most important.
must take an important place, both for their physiological interest
and for the weighty influence they have exerted on our knowledge and
treatment of disorders of the vascular system, such as heart
disease. We have learned to measure accurately the work done
by the great heart-pump; and by studying the manner in which
this work is affected by different conditions, we are enabled to
increase or diminish it, according to the needs of the organ.
Experimental physiologists have shown us what is known as the
department of physiology—that which treats of muscle and
nerve—have thrown light on the wonderful processes of 'com-
This advance would have been absolutely impossible without
the knowledge gained by experiment" (Research Defence Society, May
1910).

The Lacteals.—The first experiment demonstrated the flow of chyle along the lacteals. The existence of
these minute vessels had been known even to Galen and Erasistratus, but they had made nothing of their knowledge. Achillis
Borelli, in his De Motu, had shown that the lacteal vessels
of the lymphatic system were distinct from these white threads, and ran a different course.
Brushed with this new fact, I was silent for a time, thinking of the bitter warfare of words among anatomists as to the
existence of a lymphatic system. But next day, Bartolomeo
Tiedmann, after experiments on a calf, which he had
himself by an experiment, I pierced one of the largest cords with a
scalpel, I hit the right point, and at once observed a white liquid
"flowing into the blood vessel." This was the first experiment in the course of an experiment on the heart, observed the
flow of chyle into the subclavian vein, and its identity with the chyle in the lacteals; and by further experiment found the thoracic duct and described the lymph glands.

I found these vessels (the thoracic duct) all along the dorsal
vermiform processes, and observed that they were supplied with
lymph, that is, with blood, from the organs of the abdomen, as, for
instance, like milk, flowing from the vena cava ascendens into the
pericardium, at the place where the right auricle had been....

3. The Gastric Juice.—Our knowledge about digestion dates
back to the end of the 17th century, when Valnesiier first
observed that the stomach of a dead animal contained a fluid
which acted on certain bodies immersed in it—"a kind of agua foris." In
1752 Réamur began his observations on this fluid, making
birds swallow fine fenestrated tubes containing grain or meat, or
living rabbits and observing the nature of the secretions.
It was clear that the stomach was the organ of
the process. At last, in 1817, Spallanzani was able to
digest in the absence of air. Then, in 1827, hand
were looked over by Vesalius, and all the great anatomists of the
earlier ages were not the last to make their contributions
and to make their discoveries. The number of their experiments, from which came not only the absolute proof of the existence of the gastric juice, but also the study of the transformation of starch into glucose. Thus the theory of digestion entered a new phase; it was finally recog-
nized, at least for certain substances, that digestion is not simply
dissolution, but a true chemical transformation ("Claude Bernard,
Physiologie opératoire, 1879). Beaumont's experiments on Alexis
St Martin (Garde Supére) were published in 1855. They were, of
course, based on the work of the physiologists: "I do not
make to originality in my opinions as respects the existence and opera-
tions of gastric juice, and I have no objection to this discovery
(with some modifications) taught by Spallanzani and many of the
most enlightened physiological writers" (Beauont's preface to
his book). Eberli, in 1834, showed how this knowledge of the
existence of the juices was derived from experiments on animals,
extracting the mucous membrane of the stomachs of animals after death:
hence came the invention of the various preparations of<pn>
are exercised, as it were, on a particular tract of the digestive system, at the bidding of another tract. Pavlov, recognizing the importance of keeping the animals under the most normal conditions that were compatible, divided his work into two different systems: one for the digestive in animals not anesthetized, yet free from pain or distress, made use of fistulae established at different points of the digestive canal, and was able to study the digestive juices at different levels. Galvani, on the other hand, was studying the nervous system in animals. The work of Pavlov has been further developed by Professor Starling's recent work on the chemical substances produced in the body, during the act of digestion, to promote digestion.

Galvani was interested in the discovery and destruction of sugar in the body was begun in 1843. His discovery of the glycogenic action of the liver was made by keeping dogs on a sugar diet, and observing the sugar in them during digestion, and testing the blood in the veins coming from the liver: "What was my surprise when I found a considerable quantity of sugar in the hepatic veins of the dog that had been fed with sugar!" In 1841, G. F. Heine and Sir Charles Bell, who lived in the time of George III., no great advance was made in our knowledge of the nervous system. The way of experiment, which had led Galen far ahead of his age, was neglected, and everything was overwhelmed by theory.

Finally, after many attempts—après beaucoup d'essais et plusieurs illusions que je fus obligé de rectifier par des idéalismes— I succeeded in showing, that in dogs fed on meat the blood passing through the portal vein (from the stomach) does not contain sugar before it reaches the liver; but when it leaves the liver and comes by the hepatic veins into the inferior vena cava, this same blood contains a quantity of pure sugar substance (glucose) (Newelle fonction du foie, Paris, 1853).

5. The Pancreas.—The 17th century was a time of very fanciful theories about the pancreas (Lindanus, Wharton, Bartholin), which was not long afterwards clarified by the Galvanicists. They had the wisdom to see that the pancreas must be estimated, not according to its position, but according to its structure, as that of the salivary gland. In 1843, Great Britain, France and Germany were experimenting, and de Graaf said: "I put my hand to the work; and though many times I dispaired of success, yet at last, by the blessing of God on my work and prayers, in the year 1843, I observed a way of attacking the pancreas. By the method of a fistula he collected and studied the secretion of the pancreas; and by further experiment he refined Bartholin's theory that the pancreas is a sort of appendix or "biliary vesicle" of the stomach. He then showed that he could no more discover the amylolytic action of the pancreatic secretion than Galvani could discover wireless telegraphy. Still, he did good results, and Claude Bernard, a year or two years later, brought to light South's method of the fistula. His observations, begun in 1846, received a prize from the French Academy in 1850. Sir Michael Foster says of them: "Valentin, it is true, had in 1844 not only inferred that the pancreatic juice had an action on starch, but confirmed his view by actual experiment with the juice expressed from the gland; and Eberle had suggested that the juice had some action on fat; but Bernard at one stroke made clear its threefold action, and applied it on the pancreatic juice, and by his other hand split up into fatty acids and glycerine, the neutral fats; he clearly proved that it had a powerful action on starch, converting it into sugar; and he laid down the principle that the metabolism of the protoplasm is not divided into two exclusive processes only, one the metabolism of carbo-hydrates, which are entirely digested, the result being the production of permanent diabetes. But if even a very small part of the gland is left within the body, the carbo-hydrate metabolism remains unaltered, and there is no diabetes. The small portion of the organ which has been allowed to remain (and which need not even be left in its proper place, but may be transplanted to other places) is still a powerful ferment, which go on between it and the blood generally, to prevent those serious consequences to the composition of the blood, and the general constitution of the body, which result from the complete removal of this most important part of the pancreas, in a cat or a dog, may cause fatal diabetes, is of importance, because the pancreas in some cases of diabetes in man is diseased; but, at present, experiments on animals have not led to any certain or specific cure of diabetes in man.

6. The Growth of Bone.—The experiments made by du Hamel (1739-1854) on the growth of bone by deposit from the peristem (the bone in the growing limb) and of the difference between the ligamentous and spongy bone, observed (1735) that the bones take up the slain of madder mixed with the food. Du Hamel studied the whole subject very carefully, and this led him to connect the formation of bone with the secretion of calciun, which is an important fact in all operations on the bones. As he puts it, in the title of one of his own memoirs, Les os croissent en grosseur par l'addition de couches osseuses qui tirent leur origine du peristème, comme le cœur ligneux des ânes d'augustטון found in the heart. By feeding pigs at one time with dryed food, at another with unded food, he obtained their bones in concentric layers alternately stained and unstained. His facts were confirmed by Bazan (1740) and Boerhaave, and 86 years later of the different species of animal in France, the reaction of the consumption of madder by Haver. Still, he brought men to study the whole subject of the growth of bones, in length as well as in thickness, and the whole modelling of the bones, in adult life, by deposit and absorption, Bleusten, and Beaugenn, published their observations in physiology and in surgery. Later, from the point of view of surgery, Syme (1837) and Stanley (1849) made experiments on the growth of bone, and on the exfoliation of dead bone; and, after them, Ollier and Peronneau showed us on this part of surgical practice has been of the very highest value.

7. The Nervous System.—A. The Nerve-Roots.—Through all the centuries, mankind has, as it were, lived in ignorance of the nervous system. Sir Charles Bell, who lived in the time of George III., no great advance was made in our knowledge of the nervous system. The way of experiment, which had led Galen far ahead of his age, was neglected, and everything was overwhelmed by theory.

The question of discovery of nerves not concern us here; we may take Sir Michael Foster's judgment, that Magendie brought exact and full proof of the truth which Bell had divined rather than demonstrated, that the anterior and posterior roots of spinal nerves have essentially different functions. This is a discovery of the physiological and nervous system. The date of Bell's work is 1811, An Idea of a New Anatomy of the Brain, submitted for the Examination of the Author's Friends. In it he says: Considering that the spinal nerves form a pair of fibres (Francis Galton) and that the functions of the nerves are derived from their connexions with the parts of the brain, I thought that I had an opportunity of putting my opinion to the test of its application, and of proving at the same time that nerves of different endowments (bodily force, nerves, nerve-trunk) and held together by the same sheath. On laying bare the roots of the spinal nerves I found that I could cut across the posterior fasciculus of nerves, which took the form of the spinal nerve, without convulsing the muscles of the back; but that on cutting the anterior fasciculus with the point of the knife, the muscles of the back were immediately convulsed. Such were my reasons for concluding that the cerebrum and cerebellum were parts distinct in function, and that every nerve possessing a double function obtained that by having a double root. I now saw the long investigation of the nerves made easy. The anterior root of the spinal nerve, and also the cause of that seeming intricacy in the connexions of nerves throughout their course, which were not double at their origins. His other work, on the cranial nerves, which are "not double at their origins" bore fruit at once in surgery. Sir John Erichsen says of it: "Up to the time that Sir Charles Bell made his experiments on the nerves of the face, it was the common custom of surgeons to divide the facial nerve for the relief of pains and for cutting. Sir Charles Bell brought out the value of these nerves by Sir Charles Bell to exercise, no influence over sensation, and its division consequent for the relief of pain was a useless operation."

B. The Reflex Nerves.—Redi, Le Gallois and others on the reflex movements of decapitated vipers, frogs, cels and butterflies were of no great use from the point of view of physiology; but they led toward the discovery that the spinal cord is a powerful organ, in the same manner as the cerebellum, in action independent of the higher cerebral centres. Marshall Hall (1832-1837) discovered, by his experiments, that reflex actions are the work of definite groups of cells, set at certain points or levels in the cord; he proved the segmental structure of the cord, the existence of nerve-centres in it, and thus foreshadowed the discovery of the like centres in the brain. In his earlier writings (1832-33) he saluted the principles of the doctrines of reflex action to the larynx, the pharynx and the sphincter muscles; later, in 1837, he demonstrated the course of nerve-impulses within the cord, from one level to another, and the effects of direct stimulation of the cord. Also, as he had said in 1832, the reflex character of the convulsions that occur in certain diseases.

C. The Medulla Oblongata and the Cerebellum.—Flourens, who was among the earliest students of the use of chloroform, is best known for his experiments on the respiratory centre and the cerebellum. He localized the cells in the medulla that govern the reflex movement of respiration. Afterward came the discovery of cardiac and other centres in the neighbourhood of the respiratory centre. He showed also that the cerebellum is concerned with the equilibration and co-ordination of the muscles; that an animal, a few days old, deprived of sensation and of power to move, on being placed in a glass bowl, was yet able to stand and to move forward, but when the cerebellum also was removed, lost all power of co-ordination (Branst). The experiments of the powerful influence of the cerebellum made by him and by others, it was found that the semicircular canals of the internal ears are the terminal organs of the sense of equilibration.

The Vaso-Motor Nerves.—Claude Bernard, studying the sympathetic nervous system, discovered the vaso-motor nerves that
control the calibre of the arteries. The question of priority between him and Brown Séquard need not be considered here. His first account of his work was communicated to the Société de Biologie in December 1857. The following account of it is from his Leçons de physiologie pathologique.

"Let me remind you how I was led to discover the vaso-motor nerves. Starting from the clinical observation, made long ago, that in paralysed limbs you find at one time an increase of cold and at another a general dilatation of all the blood-vessels. This contrast might be explained by supposing that, side by side with the general action of the nervous system, the sympathetic nerve might have the function of presiding over the production of heat; that is to say, that in the case where the paralysed limb was chilled, I supposed the sympathetic nerve to be paralysed, as well as the motor nerves; while in the paralysed limbs that were not chilled the sympathetic nerve had remained alive and was at work, as I supposed.

This was a theory, that is to say, an idea, leading me to make experiments; and for these experiments I must find a sympathetic nerve-trunk of sufficient size, going to some organ that was easy to observe; and must divide the trunk to see what would happen to the heat-supply of the organ. You know that the rabbit’s ear, and the cervical sympathetic of this animal, offered us the required conditions. So I divided this nerve; and, at once, the part of the ear next to the cut became warm, and the blood-vessels dilated; while the part of the ear next to the intact side was as cold as before. I also made similar observations upon the other limbs, the rectum, the urinary bladder, the heart, the intestines, and the stomach; and in every case the opposite results were obtained, one part of the organ becoming dilated, and the other cold and constricted.

It is almost impossible to exaggerate the importance of these labours of Bernard on the vaso-motor nerves, since it is almost impossible to exaggerate the influence which our knowledge of the vaso-motor system, springing as it does from Bernard's researches as to its fount and origin, has exerted, is exerting, and in widening measure will continue to exert, on all our physiological and clinical work, and on the practice and conduct of human life. There is hardly a physiological discussion of any width in which we do not sooner or later come on vaso-motor questions. (Foster, Life of Claude Bernard.)"

B. Pathology, Bacteriology and Therapeutics

1. Inflammation.—Pathology is so intimately associated with the work of the microscope that it is a new study, in comparison with physiology. In 1850 the microscope was not in general use. With it nor did microscopists have the means of their making fluids that are essential to modern histology. Bacteriology, again, is even younger than pathology. In 1875 it had hardly begun to exist. For example, in the evidence before the Royal Commission of 1875, one of the witnesses said, "I believe that they were beginning to get an idea of the nature of the bacillus." Anthrax was the first disease studied by the methods of bacteriology; and in his evidence concerning this disease Sir John Simon speaks of bacteriology as of a discovery wholly new and unexplored. Then, in 1881, came Koch's discovery of the bacillus of tuberculosis. But a great advance was made, in days before 1875, by the more general use of the microscope. Every change in the tissues during inflammation—the slowing of the blood stream in the capillary vessels, the escape of the leucocytes through their walls into the surrounding tissues, the stagnation of the blood in the affected part—all these phenomena are observed in situ, in the living body, with the microscope. The mesentry of the frog, the bat's wing, or the tadpole's tail, irritated by a drop of acid, or a crystal of salt, or a scratch with a needle. It is found how the leucocytes glide about through the blood vessels, and how the rhythmic contraction of veins, and Waller and Cohnheim observed the escape of the leucocytes, bacteriology, in the walls of the capillaries. From these simple experiments under the microscope arose all our present knowledge of the minute processes of inflammation. Later came the work of Metschnikoff and others, showing the importance of diapedesis in relation to the presence of bacteria in the tissues.

2. Neuronew and Wound-Infection.—Practically every case of suppuration, wound-infection or "blood-poisoning," all abscesses, boils, carbuncles, and all cases of puerperal fever, septicaemia, or pyaemia, are due to infection, either from without or from within the body, by various forms of micro-organisms. The same is true of every case of erysipelas, or cellulitis, or acute gangrene—short, of the whole multitude of "septic diseases. The work done on these micro-organisms has been the greatest triumph of medical science. The knowledge of the phases, antagonisms and preferences of each kind, their range of variation and of virulence, their products, and the influences on the nervous system, light, heat and chemical agents. The beginning of the greater work in Pasteur's laboratory was the vaccination of 1856. Pasteur's discovery that lactic fermentation was due to a special micro-organism, opened the way for modern surgery. That which had been accomplished in medicine and chemistry in the field of the phases, antagonisms and preferences of each kind, their range of variation and of virulence, their products, and the influences on the nervous system, light, heat and chemical agents. The beginning of the greater work in Pasteur's laboratory was the vaccination of 1856. Pasteur, in his first published work on the antiseptic treatment of compound fractures, he speaks about his discoveries. And that, which is perhaps the most important subject by the philosophic writing of M. Pasteur, who has demonstrated, by thoroughly convincing evidence, that it is not to its stomach that the air owes this property (of producing decomposition), but to minute particles suspended in it, which are the germs of various small forms of life long since revealed by the microscope, and regarded
as merely accidental concomitants of putrefaction; but now shown by Pasteur to be its essential cause. The present antiseptic method includes the Pasteur method. That is to say, the instruments and other accessories of an operation are "sterilized" by heat; and, where heat cannot be applied, as to the patient's skin and the surgeon's hands, antiseptics are used. Modern surgery is both antiseptic and aseptic.

3. *Anthrax.* — The bacillus of anthrax (charbon, malignant pustule, wool-sorfer's disease) was the first specific micro-organism discovered and cultivated. Davaine (1856) observed the *petits bédiones* in the blood of sheep and of the disease; and in 1863, when Pasteur's observations on lactic-acid fermentation were published, Davaine recognized that the *bédiones* were not blood broths, but certain bacteria. Koch, however, succeeded in cultivating the bacillus, and in reproducing the disease in animals by inoculation from these cultures. Pasteur's discovery of preventive inoculation of animals against the disease was communicated to the Agricultural Society of the Seine, and in May, 1863, he gave his public demonstration at Pouilly-le-Fort. Two months later, at the International Medical Congress in London, he spoke as follows of this discovery: "

La méthode que je viens de vous exposer pour obtenir des vaccins du charbon était à peine connue qu'elle passait dans la grande pratique pour prévenir l'affection charbonneuse. La France perd chaque année pour une valeur de plomb de millions de francs des charbons de fer. J'en ai calculé à 30 millions, m'a dit une des personnes autorisées de mon Ministère de l'Agriculture, mais des statistiques exactes font encore défaut. On m'a demandé de mettre à l'épreuve les résultats qui précèdent par une grande expérience publique, à Pouilly-le-Fort, près de Melun. . . . Je la résume en quelques mots; 50 moutons furent mis à ma disposition, nous en vaccinâmes 25, les 25 autres ne subirent aucune inoculation. Quinze jours après environ, les 50 moutons furent inoculés par le microbe charbonneux le plus puissant; tous les 25 vaccinés résistèrent; les 25 non-vaccinés moururent, tous charbonneux, en cinquante heures. Depuis lors, dans mon laboratoire, on peut subir un défaut de vaccin des animaux pour la charbonneuse. En quinze jours, nous avons vacciné dans les départements voisins de Paris près de 20,000 moutons et un grand nombre de boeufs; le vaccin de charbon.

The extent of this preventive vaccination may be judged from the fact that a single dose of the Sero-Therapeutic Institute of Milan, in a single year (1897–98) sent out 165,000 tubes of anti-charbon vaccine, enough to inoculate 33,750 sheep, 9,750 calves, 83,000 goats, and 30,000, a third of France, during the years 1882–93, more than three million sheep and nearly half a million head of cattle were inoculated. In the *Annales de l'Institut Pasteur,* March 1891, M. Chamberland published the results of these twelve years in a paper entitled "Résultats pratiques des vaccinations contre le charbon et le rouget en France." The mortality from charbon, before vaccination, was 10% among sheep and 5% among cattle, according to estimates made by veterinary surgeons all over the country. With vaccination, the whole loss of sheep was about 1%, for the loss of vaccinated cattle was still less; for the twelve years it was 0.34, or 0.4, depending on the annual reports sent to M. Chamberland by the veterinary surgeons represent not more than half of the work. A certain number of veterinary surgeons neglect to send in reports at the end of the year. The number of reports that come to us even tends to regress each year, so that many veterinary surgeons who perform vaccinations every year content themselves with writing. The results are always very good, it is useless to try and give them in detail, but in the year 1892, there was a 98% cure rate. We have every reason to believe, as a matter of fact, that those who send no reports are satisfied; for if anything goes wrong with the herds, they do not fail to let us know it at once by special letters.

For those of two years the loss of sheep and cattle

4. *Tuberculosis.*—Laennec, who in 1816 invented the stethoscope, recognized the fact that tuberculosis is a specific disease, not a simple degeneration of the numerous throat and lung tissues. Villemain, in 1868, communicated to the Académie des Sciences the fact that he had produced the disease in rabbits by inoculating them with tuberculous matter; he appeared to these inoculations, in voici the precautions—to show that the tubercle bacilli can be eaten that a raw potato, treated, introduced by Selvado, has been found of considerable value in cases of anthrax (malignant pustule) occurring in France.

**Vaccination against Charbon (France)**

**Vaccination against Rouget (France)**
of doctrines, Coehnheim reaffirmed the infectivity of the disease, and even made the proof of tubercle depend on inoculation alone: "everything is tuberculous that can produce tuberculous disease by inoculation in the tubercle bacilli is tuberculous that cannot do this." In 1881 Koch discovered the tubercle bacillus, and, in spite of the tragic failure of his tuberculin in 1890-91, a vast amount of practical advantage has already been acquired by the use of the bacillus as a basis of modern methods of surgery (a thorough and early surgical treatment of all primary tuberculous sores or deposits—the occlusion of tuberculous sinuses and the surgical prevention of the spread of the bacillus). It has helped us to make an early diagnosis, in obscure cases, by finding tubercle bacilli in the sputa, or in the discharges, or in a particle of the tissues. It has proved, past all reasonable doubt, that tuberculosis is communicable to man. Sacrificing numbered thousands of children, may arise from infection of the bowels by the milk of tuberculous cows. And it has helped to bring about the present rigorous control of the milk trade and the meat trade.

"...the new tuberculin," now that the use of the opsonic index has guided physicians to a better understanding of the tuberculin treated patients, has produced results in suitable cases. Moreover, tuberculin is used, because of the reaction that it causes in tuberculous animals, as a test for the detection of latent tuberculosis in cattle. An injection of one to two c.c. of tuberculin is made into the subcutaneous region of the skin of a number of healthy cows. If the reaction is positive, due to high temperature if the animal be tuberculous. If it be not, there is no rise of temperature, or only a very slight rise. For example, in a case of this kind, an injection of 1.5 c.c. of tuberculin was made on the 10th of May, at 1:00 p.m., 180 reacted to the test, 85 did not, 5 were "doubtful." Tuberculous disease was actually found in 175 out of the 180. Eber of Dresden used the test on 174 animals, of whom 136 reacted, 32 did not react and 6 were doubtful. Of the 136, 22 were slaughtered, and were all found to have tubercle; of the 32, 3 were slaughtered, and were found free. The opinion of Professor M'Fadyean, one of the highest authorities on the subject, is as follows: "I have most implicit faith in tuberculin as a test for tuberculosis when it is used contrary to the standing in their own premises and undisturbed. It is not reliable when used on animals in a market or slaughter-house. A consideration of the saving of thousands of animals in slaughter-houses after they had been conveyed there by rail, &c. Since that, using it on animals in their own premises, I have found that it is practically infallible. I have notes of one particular case where 25 animals in one dairy were tested, and afterwards all were killed. There was only one animal which did not react, and it was the only animal not found to be tuberculous when killed. This test has now been in regular use for many years in many countries, and it is accepted everywhere as of national importance.

5. Diphteria.—The Bacillus diphteriae (Klebs-Löffler bacillus) was discovered by Klein and Löffler in 1884. Behring and Kitasato, in 1890, succeeded in immunizing animals against the disease. The first cases treated with diphteria antitoxin were published in 1893 by Behring, Kölliker, and Noguchi, and successful results were obtained, but the work began in the latter part of 1894. Besides its curative use, the antitoxin has also been used as a preventive, to stop an outbreak of the disease in a hospital or institution or village, and with admirable success. (See DIPHTHERIA.)

6. Tetanus (lock-jaw).—Experiments on animals have taught us the true nature of this disease, and have led to the discovery of an antitoxin which has given fairly good results. We possess, moreover, a preventive treatment against the disease; though, unfortunately, the time of latency, when the antitoxin is most needed, cannot be recognized. The old, misleading doctrine that tetanus is an infectious disease is no longer tenable. Diphtheria obtained a place in the mind of mankind, and tetanus was regarded as an organism. It is now known that the disease is due to a microbic organism, (bacteria) living in the saliva of a rabbit, animal, introduced under the skin of animals, sometimes failed; and if they succeeded, the incubation period of the disease was thus induced. The rabbit, of course, had no salvars, but an emulsion of the brain or the spinal cord; because the central nervous system is the chief seat of the poison. But this emulsion, introduced under the skin, was also uncertain in action, and gave no further results. It is now known that the poison has a selective action on the nerve cells of the central nervous system, and a sort of natural affinity with them, it must be introduced directly into them, where it will have its proper environment; the emulsion must be put not under the skin, but under the dura mater (the membrane enveloping the brain). These subcutaneous inoculations were the turning-point of his work. By transplanting the poison through a series of rabbits, by subcutaneous inoculation of each rabbit with a minute quantity of nerve tissue from the rabbit that had died before it, he was able to intensify the poisoning, to shorten its period of incubation, and to fix this period at six days. Thus the rabbit gained a power of infecting other rabbits, and the virulence, viris fixa: the next rabbit inoculated would have the disease in six days, neither more nor less. By gradual drying, after death, of the cords of rabbit animals, he was able to attenuate the virulence obtained in the preceding experiments, and the rabbit, when died of rabbits slowly loses virulence by simple drying. A cord dried for four days is less virulent than a cord dried for three, and more virulent than a cord dried for five. A cord dried for a fortnight has lost all virulence; even a large dose of it will not produce the disease. By this method of drying, Pasteur was able to keep going one or more series of cords, of known and exactly graduated strengths, from which he could always draw the part ranging from absolute non-virulence through every shade of virulence.

As with fowl cholera and anthrax, so with rabbits: the poison, attenuated till it is innocuous, can yet confer immunity against a virulent dose of the same poison. A man bitten by a rabid animal has at least some weeks of repose before the disease can break out; and during that time of repose he can be immunized against the disease, while it is still dormant. He begins with a dose of poison attenuated past all power of doing harm, and advances day by day.

(See CHOLERA.)

11. Malta Fever (Mediterranean fever). The Microoccus Malte-

is discovered in 1887 by Sir David Bruce. The work of dis-

covering and preparing an immunizing serum was done at Netley

Hosp. In this fever, as in typhoid and some others, Widal's reac-
tious of great value: The diagnosis of Malta fever from typhoid is,
of course, a highly important practical matter. It is exceedingly
difficult in the early stages" (Manson). Even in a dilution of 1 in
1000, the blood of Malta fever can give the typical reaction with the
Widal's test; but in typhoid fever, the test is negative. The dento-

cial inoculation with Malta fever: one of three cases that have
 happened there. The case is reported in the British Medical

Journal, October 16, 1897: It appears that he had scratched
himself with the foreleg of a horse for the preparation of serum-protective against Malta fever; and his blood, when examined, had a typical reaction with the
Widal's test. Before the subsequent inoculation, he had been
sentenced to death, as a result of which the句子 has been
immunized for Malta fever for the last eight months, and is
immediately bled, and we are informed that the patient has
now had two injections, each of 30 cubic. cm. of the serum. He is
doing well, and it is hoped that the attack has been cut short.
About 30 cases of the fever, by April 1899, had been treated at Netley.
The Lancet, April 15, 1899, says that the treatment was "with
satisfactory results." The drug treatment failed, the antitoxin

treatment had been generally used. It has now been proved

that the usual source of infection with Malta fever is the drinking of the milk of infected goats; thus, by the public health authorities, the most terrible

has been prevented: and prevention is better than cure. In
1904 a commission was sent out to Malta by the Royal Society, at
the request of our government, to discover how the fever is conveyed
to man. They found that it is not conveyed by air, or by drinking-
water, or by pollution of sewage, or by contact; nor are its
carriers, like those of malaria, yellow fever and sleeping sickness,

infectious to others by the casual and thorough beating of
any one of them, even for one day, almost invariably got the
disease. On the 1st of July 1906, an official order was

issued forbidding the supply of goats' milk to our garrison. The year

after, when goats' milk was first obtained in Malta, up to the 1st of July, there were 123 cases. During the rest of the year,

including the three worst months for the fever, there were 40
cases; in 1907 there were 11 cases; in 1909 there were 5 cases;

1910, by latest accounts, none.

12. Epidemic Meningitis.—The history of the serum treatment of

epidemic meningitis affords an admirable example of the place

of experiments on animals in the advancement of medical practice. This form of meningitis is one of the worst ways in which a

man can die. Dr. Robb, who had charge of the Belfast fever hospitals
during the epidemic, calls it a "total collapse of the patient," and its

manifestations, and the most disastrous in its death-rate, of all the

epidemic diseases met with in English-speaking countries." Very

little is known as to the way in which it spreads, and the public

health authorities cannot prevent its sudden appearance in a town.

"Many of those attacked," says Dr. Robb, "died within a few
hours of the onset, and that after terrible suffering; while many of

those who survived the acute attack lingered on for weeks and

months, with great suffering, and lived only to die after months of

painful and wretched suffering."

By means of inoculation experiments, Dr. Flexner and Dr. Jobling,
of the Rockefeller Institute, proved that the disease is due to a

particular kind of germ, diplococcus intracellularis. They obtained

the disease from two soldiers suffering with meningitis, and when

they cultivated the germs all by themselves, in test tubes, apart

from all other kinds of germs; and they were able to reproduce

the disease in monkeys by injecting under the skin a minute

quantity of this pure culture of the germs. It may be worth noting

"Widal's reaction" for the early diagnosis of the disease—a matter

of the very highest practical importance. A drop of blood from

the finger of a patient suspected to be suffering from typhoid fever,
is diluted fifty or more times, that the perfect delicacy of the test

in this condition is ensured. A ready supply of this fluid containing living bacilli of typhoid, and a drop of this fluid is

observed under the microscope. The motility of the bacilli is

instantaneous or very quickly arrested, and in a few minutes the

bacilli clump, and the agglutinated bacilli are also visible to the

naked eye by the subsidence of the agglutination bacilli to the bottom of the containing vessel.

The amazing delicacy of Widal's test "is but a part of the wonder.

When Widal showed a bacillus, a fiftieth the living bacilli; and

cause clumping: it has even been obtained from an infant whose

mother had typhoid shortly before the child was born. A drop of

blood from the child was put by post to be tested a hundred miles away, and the answer telegraphed back.
that the disease in monkeys is less violent and less painful than it is in man. By the help of these experiments, Flexner and Jobling were able to prepare a serum for the treatment of the disease, in the same way as the serum is prepared which has been such a blessing to the world in cases of diphtheria. This serum for the treatment of epidemic meningitis was first used in the spring of 1907.

The contrast between cases without serum treatment and cases with serum treatment is very plain. We may first give the records before the use of the serum. Of 4000 cases in New York in 1904, 75% died; Baker reports from expressing the serum in 21 cases, 78.4% mortality; Chalmers reports from Glasgow (1907) 998 cases with 683 deaths, giving 68.4% mortality; Balfour reports in Belfast (1907) 633 cases with 493 deaths, giving 78.1% mortality; Kier reports that in the second graving aside meningitis there was 78% mortality; Robertson reports from Leith (1907) 62 cases with 74.4% mortality; Turnour reports from the Transvaal 200 cases with 74% mortality. Amongst patients treated in hospitals the death rate was lower. Of 202 cases in Barbiil Hospital, Glasgow, 79.2% died; of 108 cases in Edinburgh Fever Hospital, 80.5% died; of 275 cases in Belfast Fever Hospital, 72.3% died; and Dunn reports that in the Brien Children's Hospital, during the eight years 1899-1907, the mortality varied from 69% to 80%. Contrast with these results the cases treated with Flexner's and Jobling's Serum:

These figures speak for themselves. Similar results have been obtained with similar treatment in France and Germany. "From these figures," says Dr Robb, "it will be seen that the death-rate in cases not treated with serum averaged some 75%. This has been reduced to 15.6%, and in many instances much below that figure." "My own experience has been that of 275 cases under my care in hospital, before the use of the serum was commenced, 72.3% died; while of the 98 cases treated with serum 29.6% died. No selection of cases was made: every case sent into hospital since September 1907 has been treated in this way. No change in the severity of the attack was observed: in the three months immediately before the serum arrived, out of 45 cases came under treatment, of whom 37, or 82.4%, died; and in the first four months after we began its use in hospital 30 cases were treated, of whom 8 died, a mortality of 26.6%, while of the 31 cases which were not treated with the serum in the same period, but received ordinary medical treatment, the mortality was 80.3%. Great as this change in the death-rate has been, it is not more striking than the difference in the course run by the cases, or whereas it was common to have cases running on into weeks and even months, such cases are no longer met with" (R. D. S. pamphlet, 1909).

13. Malaria.—Laveran, in 1880, discovered the *Plasmodium malariae*, an amoeboid organism, in the blood of malarial patients. In 1894 Manson took, as a working theory of malaria, the old belief that the mosquito is the intermediate host of the parasite. In 1895 came MacCullum's observations on an allied organism, *H. ocellatum*. In 1897, after two years' work, Ross found bodies, pigmented like the *Plasmodium*, in the outer coat of the stomach of the grey or "daggle-winged" mosquito, after it had been fed on malarial blood. In February 1898 he started work in Calcutta: "Arriving there at a non-fever season, he took up the study of what may be called bird malaria." In birds, two parasites have become well known—(i) the *Plasmodium* of the birds, the flagellate forms, and both are closely allied to the *Plasmodium malariae*. Using grey mosquitoes and *Plasmodium*-infected birds, Ross showed by a large number of observations that it was only from these that the piggies pig, and that a grey mosquito could be got; therefore that this cell is derived from the *Plasmodium*, and is an evolutionary stage of that parasite. On the other side, these pigmented cells give rise to innumerable swarms of spiral-ended and flagellated "germiforms" and also of "rings of cells". These mosquito Ross found these rings in the glands of the proboscis. Finally, he completed the circle of development, by infecting healthy sparrow with the pigment cells, a process which would be hard to surpass Ross's work, and that done in India by Grassé. From the grey mosquito may be obtained the pretty "plume" from the grey and sparrow. This is an entirely different animal: the same symptoms, course, tissue-changes, mental and physical hebetude, the same alternations of the excretions, the temperature and the voice. In 1888 the Clinical Society of London...
published an exhaustive report, of 215 pages, on 113 cases of the disease, giving all historical, clinical, pathological, chemical and experimental facts; but out of 215 pages there is but half a page about treatment, of the useless old-fashioned sort. In 1890 Horsley published a paper on the thyroid gland from a newly killed animal should be transplanted beneath the skin in cases of myxoedema: 'The justification of this procedure rested on the remarkable experiments of Schiff and von Eisselberg. I only believe, however, Dr. Roper in April 1890 that the proposition had been forestalled in 1889 by Dr. Bircher in Aarau. Kocher had tried to do the same thing in 1883, but the graft was soon absorbed; but each of these grafts took again in five cases, and one greatly improved.' In 1891 Gascoyne published his Note on the Injurious Effect of Methyl Alcohol on the Thyroid Gland of a Sheep. Later, the gland was administered in food. And for a time the blood of these sheep, which may possess, because experiments on animals are necessary, the advantages of the administration of a substance for the advancement of medicine. Now, with little bottles of tabloid, men and women are restored to health who had become degenerate in the use of and disposed of. The same treatment has given back mental and bodily growth to countless cases of sporadic cretinism. Moreover, the action of the thyroid gland has been made known, in the fact of 'internal secretion' have been in part elucidated. [Claude Bernard, speaking of the thyroid thymus and the suprarenal capsules, said: 'We know absolutely nothing about the functions of these organs; we have not so much a right to use them, as we may possess, because experiences have told us nothing about them, and anatomy, left to itself, is absolutely silent on the subject.]' 18. The Action of Drugs.—Even in the 18th century medicine was beginning to acquire a magic quality, and the use of the stock-in-trade of long 1721 Pharmacopoeia contains substances that were the regular stock-in-trade of witchcraft. Long after 1721 neither clinical observations, nor physiology brought about a reasonable understanding of the action of drugs. It was the pharmacologists, more than the physicians, who worked the thing out.—Bichat, Magendie, Claude Bernard. Magendie's study of upe and strychnine, Bernard's study of curare and digitalis, revealed the selective action of drugs: the direct influence of strychnine on the central nerve-cells, of carare on the terminal filaments of motor nerves. The conclusions may be given how experiments on animals have elucidated the action of drugs: the list might be made: atonie, belladonna, chloride of calcium, cocaine, chloral, ergot, morphia, salicylic acid, strophantus, the chief diuretics, the chief diaphoretics—all these and more have been applied to good purpose by this method; but it must suffice to quote here (1) Sir Thomas Frazer's account of digitalis, and (2) Sir Thomas Lauder Brunton's account of nitre of amy-lit. '1. Digitalis was introduced as a remedy for dropsy; and on the applications which were made of it for the treatment of that disease, a slowing action upon the cardiac movements was observed, which led to the increasing of the reputation of a cardiac sedative. . . . It was not until the experiment was applied in the first instance by Claude Bernard, and subsequently by Dybzkowski, Pellikan, Meyer, Böhm and Schmiechen, that the effect of digitalis on the circulation was elucidated. It was shown that the effects upon the circulation were not in any exact sense sedative, but, on the contrary, stimulant and tonic, rendering the action of the heart more powerful, and increasing the force of the cardiac muscle. All indications to the contrary were thereby revolutionized, and at the same time rendered more exact; and the striking benefits which are now afforded by the use of the substance in most (cardiac) diseases were made available to humanity.' 2. In the spring of 1867 I had opportunities of constantly observing a patient who suffered from angina pectoris, and of obtaining from him numerous physiographic tracings of the skin during the attack and during the interval. These showed that during the attack the pulse became quicker, the blood-pressure rose and the arteries contracted, . . . it occurred to me that if it was possible to diminish the tension instead of increasing it the pain would be removed. I knew from unpublished experiments on animals by Dr A. Gamgee that nitre of amyl had this power, and I therefore tried it on the patient. My expectations were perfectly answered.
vegetation, amid which rise many tall forest trees, while the bamboo grows profusely in the valleys. The drainage on the east is carried by numerous streams direct to the sea, and that to the west flows into the Godavari through the Indravati or through the Sabari and Siller rivers. To the west of the range is situated the greater portion of the extensive zamindari of Jâipur, which is for the most part very hilly and jungly. In the extreme north a remarkable mass of hills, called the Nim- girls, rise to a height of 3000 ft. The plain along the Bay of Bengal is a vast sheet of cultivation, green with rice fields and groves of sugar-cane and tobacco. The climate is very variable, and gives rise to a great variety of climate in the district. Along the coast the air is soft and relaxing, the prevailing winds being south-easterly. The average annual rainfall at Vizagapatam exceeds 40 in. Pop. (1800) 2,933,650, showing an increase of 4.7% in the decade. The principal crops are rice, millets, pulses and oil-seeds, with some sugar-cane, cotton and tobacco. The coast portion of the district is traversed throughout by the East Coast railway, opened from Madras to Calcutta in 1904; and a line through the hills from Vizianagaram to Raipur in the Central Provinces has been sanctioned. The chief seaports are Birmilipatam and Vizianagaram.

On the dissolution of the Mogul empire Vizagapatam formed part of the territory known as the Northern Circars, which were ceded to the East India Company by treaties in 1705 and 1766. It was long before British authority was established over the hilly tract inland, inhabited by aboriginal tribes, and still administered under a peculiar system, which vests in the collector the powers of a political agent. This tract, forming more than two-thirds of the whole district, is known as the Agency.

See The Vizagapatam District Gazetteer (Madras, 1897).

**VIZETELLY, HENRY** (1820-1894), English publisher, was born in London on the 30th of July 1820, the son of a printer. He was early apprenticed as a wood engraver, and one of his first blocks was a portrait of "Old Parr." Encouraged by the success of the Illustrated London News, Vizetelly in 1843, with his brother James Thomas Vizetelly (1817-1897) and Andrew Spotiswoode (1757-1866), started the Pictorial Times, which was published successfully for several years. In 1853, in partnership with Boyne, he started a threepenny paper called the Illustrated Times, which four years later was merged in the Penny Illustrated Paper. In 1865 Vizetelly became Paris correspondent for the Illustrated London News. During the years he remained in Paris he published several books—Paris in Peril (1882), The Story of the Diamond Necklace (1887) and a free translation of Topin's Man in the Iron Mask. In 1872 he was transferred to Berlin; where he wrote Berlin under the New Empire (1879). In 1887 he established a publishing house in London, issuing numerous translations of French and Russian authors. In 1888 he was prosecuted for publishing a translation of Zola's La Terre, and was fined £100; and when he reissued Zola's works in 1889 he was again prosecuted, fined £200 and imprisoned for three months. In 1893 he wrote a volume of autobiographical reminiscence called Glances Back through Seventy Years, a graphic picture of literary Bohemia in Paris and London between 1840 and 1870. He died on the 1st of January 1894. His younger brother, Frank Vizetelly (1830-1889), was a clever artist and journalist; he went to Egypt as war correspondent for the Illustrated London News and was never heard of after the massacre of Hicks Pasha's army in Kordofan.

**VIZEU,** or VISEU, an episcopal city and the capital of the province of Vízela, of which it is the chief town, is situated at the terminus of the branch of the Figueira da Foz-Guarda railway, and on the Ribeira d'Asnos, a sub-tributary of the Mendoce. Pop. (1900) 8057. The cathedral, which was founded in the 12th century, contains pictures by the native artist Grão Vasco (16th century). The city stands near the ruins of the ancient Vacca, or Casa de Viriaio, a Roman military colony founded by Decius Brutus and captured by Viriathus (2nd century B.C.). The administrative district of Vizeu coincides with the central and northern parts of the ancient province of Beira (q.v.). Pop. (1900) 402,255; area, 1937 sq. m.

**VIZIADRUG,** VAYADURG or GHERIA, a port on the W. coast of India in Ratnagiri district, Bombay, 170 m. S. of Bombay city. Pop. (1901) 2339. It is one of the best harbours on the west coast, being without any bar, and may be entered in all weathers; even to large ships it affords safe shelter during the south-west monsoon. At the beginning of the 18th century the pirate chief Angria made Vizadirug the capital of a territory stretching for 150 m. along the coast and from 30 to 60 m. inland. The fort was taken by Admiral Watson and Capt. Sigismund in 1756.

**VIZIANAGRAM,** a town of British India, in the Vizagapatam district of Madras, 17 m. from the seaport of Birmilipatam, on the East Coast railway, 522 m. N.E. of Madras. Pop. (1901) 37,270. It has a small military cantonment. It contains the residence of a zamindar of the same name, who ranks as the first Hindu nobleman of Madras. His estate covers about 3000 sq. m., with a population of 900,000. The estimated income is £38,000, paying a permanent land revenue of £34,000. The town possesses many fine buildings, entirely supported by the raja. It has a college and two high schools.

The ruling family, which claims descent from a high official at the court of Golconda, established itself in Vizagapatam in the 17th century. In 1754 Vizianara Ram made an alliance with the French, but his son, on succeeding, fell out with them, captured Vizagapatam from them and ceded it to the British in 1758. The next rajah, another Vizianara, was entirely under the influence of his half-brother Sita Ram, whose power, however, became so great a menace that he was forced to retire in 1793. A period of decay now set in. The raja was incompetent, and his estate having been sequestrated for debt, revolted and was defeated and killed in 1794. The next raja, Narayana Babu, was no more successful, and his estate had been long under the management of the British government when he died in 1845. Vizianara Gajapati Raz, who succeeded him and took over full powers in 1852, was a man of ability, and received the titles of maharaja and K.C.S.I.; as also was his son, the maharaja Ananda Raz, G.C.I.E. He died in 1897, and was succeeded by Raja Pusapati Vizianara Gajapati Raz, during whose minority (till 1904) the estate was again under government administration.

**VIZIER,** more correctly VIZIR (Arabic Wazir), literally "burden-bearer" or "helper," originally the chief minister or representative of the Abbassid caliphs. The office of vizier, which spread from the Arabs to the Persians, Turks, Mongols, and other Oriental peoples, arose under the first Abbassid caliphs (see MAHOMMEDAN INSTITUTIONS, and CALIPHATE, C § 1) and took shape during its tenure by the Barmecides (q.v.). The vizier stood between sovereign and subjects, representing the former in all matters touching the latter. This withdrawal of the head of the state from direct contact with his people was unknown to the Omayyads, and was certainly an imitation of Persian usage; it has even been plausibly conjectured that the name is but the Arabic adaptation of a Persian title. In modern usage the term is used in the East generally for any important official under the sovereign.

**VIZZOLA TICINO,** a village of Lombardy, Italy, in the province of Milan, 6 m. W. of Gallarate and 31 m. N.W. of Milan, 725 ft. above sea-level. Pop. (1901) 469. It is situated on the Ticino, and is remarkable as having one of the largest electric works in Europe, worked by water-power from the Ticino brought by a canal 45 m. long, constructed in 1889-91 by the Società Lombarda per Distribuzione di Energia Elettrica, Gallarate, Sesto Calenle, Saronno and other neighbouring places are supplied from here with electricity.

**VLAARDINGEN,** a river port of Holland, in the province of South Holland, on the Maas, 6 m. by rail W. of Rotterdam. Pop. 17,000. A very old town and the seat of a former margraviate belonging to the counts of Holland, Vlaardingen is now chiefly important as the centre of the great herring and cod fisheries of the North Sea. Its only ornaments are the old market-place and the gardens formed by the purchase in 1825
of a seat called the Hof. The chief industries are those connected with the large fishing trade.

VLACHS. The Vlachs (Vlakh, Wallach) or Roman race constitutes a distinct division of the Latin family of peoples, widely disseminated throughout south-eastern Europe, both north and south of the Danube, and extending sporadically from the Russian river Bug to the Adriatic. The total numbers of the Vlachs may be estimated at 10,000,000 or 11,000,000. North of the Danube, 5,400,000 dwell in Rumania; 1,250,000 are settled in Transylvania, where they constitute a large majority of the population; and there are still others living in Transylvania, other Hungarian districts west and north of Transylvania. Close upon 1,000,000 inhabit Bessarabia and the adjoining parts of South Russia, and about 230,000 are in the Austrian province of Bukovina. South of the Danube, about 500,000 are scattered over northern Greece and European Turkey, under the name of Kutzto-Vlachs, Tzintzars or Aromani. In Servia this element is preponderant in the Timok valley, while in Istria it is represented by the Cici, at present largely Slavonized, as are now entirely the kindred Morlachs of Dalmatia. Since, however, it is quite impossible to retain one's identity over so wide an area, and in countries where politics and racial feeling are so closely connected, the figures given above can only be regarded as approximately accurate; and some writers place the total of the Vlachs as low as 9,000,000. It is noteworthy that the Rumanians north of the Danube continually gain ground at the expense of their neighbours; and even the long successful Greek propaganda among the Kutzto-Vlachs were checked after 1860 by the labours of Apostol Margaritis and other nationalists.

A detailed account of the physical, mental and moral characteristics of the Vlachs, their modern civilization and their historical development, will be found under the headings RUMANIA and MACEDONIA.

All divisions of the race prefer to style themselves Romani, Romeni, Rumeni or Aromani; and it is from the native pronunciation of this name that we have the equivalent expression Ruman, a word which must by no means be confined to that part of the Vlach race inhabiting the present kingdom of Rumania.

The name "Vlachs," applied to the Rumans by their neighbours but never adopted by themselves, appears under many allied forms, the Slavs saying Votli or Woloch, the Greeks Vlachoi, the Magyars Olók, and the Turks, at a later date, İbfık. In its origin identical with the English Welsh or Welsh, it represents a Slavonic adaptation of a generic term applied by the Teutonic races to all Roman provincials during the 4th and 5th centuries. The Slavs, at least in their principal extent, first knew the Roman empire through a Teutonic medium, and adopted their term Voloh from the Ostro-Gothic equivalent of the Anglo-Saxon Wealh. It thus finds its analogies in the German name for Italy—Welschland (Waltschland), in the Walloons of the Low Countries and the Wallgau of Tirol. An early instance of its application to the Roman population of the Eastern empire is found (c. 550–600) in the Traveller's Song, where, in a passage which in all probability connects itself with the early trade-route between the Baltic staple of Wollin and Byzantium, the gleemian speaks of Caesar's realm as Walaric, "Weilsy." In verse 140 he speaks of the Rwm-walas, and it is to be observed that Rum is one of the words by which the Vlachs of eastern Europe still know themselves.

The Vlachs claim to be a Latin race in the same sense as the Spaniards or Italians—in language and culture—and, in a smaller degree, by descent. Despite the long predominance of Greek, Slavonic and Turkish influence, there is no valid objection to this claim, which is now generally accepted by competent ethnologists. The language of the Vlachs is Latin in structure and to a great extent in vocabulary; their features and stature would not render them conspicuous as foreigners in south Italy; and that their ancestors were Roman provincials is attested not only by the names "Vlach" and "Ruman" but also by popular and literary tradition. In their customs and folk-lore both Latin and Slavonic traditions assert themselves. Of their Roman traditions the Trajan saga, the celebration of the Latin festivals of the Rosalia and Kalendae, the belief in the striga (witch), the names of the months and days of the week, may be taken as typical examples. Some Roman words connected with the Christian religion, like biserica (basilica)=church, bolea=boato, dumnicina=Sunday, prot (presbyter)=priest, point to a continuous tradition of the Illyrian church, though most of their ecclesiastical terms, like their liturgy and the sacred music, have been borrowed. In the 5th century the question of political organization the Slavonic element is also preponderant, though there are words like imperator=imperial, and dominus, which point to the old stock. Many words relating to kinship are also Latin, some, like vitricus (vitrice)=father-in-law, being alone preserved by this branch of the Romance family. But if the Latin descent of the Vlachs may be regarded as proven, it is far less easy to determine their place of origin and to trace their early migrations.

The centre of gravity of the Vlach or Roman race is at present undoubtedly the Danube in the almost circular territory between the Danube, the Carpathians and the Black Sea. Its original home.

In the 5th century, and corresponds roughly with the Roman province of Dacia, formed by Trajan in A.D. 106. From this circumstance the popular idea has arisen that the race itself represents the descendants of the Romanized population of Trajan's Dacia, which was assumed to have maintained an unbroken existence in Walachia, Transylvania and the neighbour provinces, beneath the domination of a succession of invaders. The Vlachs of Pindus, and the southern region generally, were, on this hypothesis, to be regarded as later immigrants from the lands north of the Danube. In 1871, E. R. Roesler published at Leipzig, in a collective form, a series of essays entitled Romanische Studien, in which he absolutely denied the claim of the Rumanian and Transylvanian Vlachs to be regarded as autochthonous Dacians. He laid stress on the statements of Vopscus and others as implying the total withdrawal of the Roman provincials from Trajan's Dacia by Aurelian, in A.D. 272, and on the non-mention by historians of a Latin population in the lands on the left bank of the lower Danube, during their successive occupation by Goths, Huns, and others. In 1408, D. Hasdeu, in his work Dr Regno Dalmatici et Croatae, published at Amsterdam, 1666.

The theory of the late immigration of the Rumans into their present abodes north of the Danube, as stated in its most extreme form by Roesler, commanded wide acceptance, and in Hungary it was politically utilized as a plea for refusing parity of treatment to a race of comparatively recent intruders. In Rumania itself Roesler's views were resented as an attack on Ruman nationality. Outside Rumania they found a determined opponent in Dr J. Jung, of Innsbruck, who upheld the continuity of the Roman provincial stock in Trajan's Dacia, disputing from historic analogies the total withdrawal of the provincials by Aurelian; and the reaction against Roesler was carried farther by J. L. Pöp, Professor A. D. Xenopol of Jassy, B. P. Hasdeu, D. Onciul and many other Rumanian writers, who maintain that, while their own race north of the Danube represents the original Daco-Roman population of this region, the Vlachs of Turkey and Greece are similarly descended from the Moeso-Roman and Illyro-Roman inhabitants of the provinces lying south of the river. On this theory the entire Vlach race occupies almost precisely the same territories to-day as in the 3rd century.
On the whole it may be said that the truth lies between the two extremes. Roesler is no doubt so far right that after 272, and throughout the early middle ages, the bulk of the Roman people lay south of the Danube. Plé's view that the population of the Roman provinces of Moesia and Illyria were Hellenized rather than Romanized, and that it is to Trajan's Dacia alone that we must look for the Roman source of the Vlachs is shown to be beside the mark, for we know of the Latinizing of the Balkan lands from inscriptions, martyrologies, Procopius's list of Justinian's Illyrian fortresses and other sources. This Roman element south of the Danube had further received a great increase at the expense of Trajan's colonial foundation to the north when Aurelian established his New Dacia on the Moesian side of the river. On the other hand, the analogy supplied by the withdrawal of the Roman provincials from Riparian Noricum tells against the assumption that the official withdrawal of the Roman colonists of Trajan's Dacia by Aurelian entailed the entire evacuation of the Carpathian regions by their Latin-speaking inhabitants. As on the upper Danube the continuity of the Roman population is attested by the Vici Romanisci of early medieval diplomas and by other traces of a Romanic race still represented by the Ladines of the Tirol, so it is reasonable to suppose a Latin-speaking population continued to exist in the formerly thickly colonized area embracing the present Transylvania and Little Walachia, with adjoining Carpathian regions. Even as late as Justinian's time (483–563), the official connexion with the old Dacian province was not wholly broken, as the Burgenland, inhabited by the barbarian chief-counts, with certain fortified posts on the left bank of the lower Danube.

We may therefore assume that the Latin race of eastern Europe never wholly lost touch of its former trans-Danubian strongholds. It was, however, on any showing greatly diminished there. The open country, the broad plains of what is now the Rumanian kingdom, and the Banat of Hungary were in barbarian occupation. The centre of gravity of the Roman or Romance element of Illyricum had now shifted south of the Danube. By the 6th century a large part of Thrace, Macedonia and even of Epirus had become Latin-speaking.

What had occurred in Trajan's Dacia in the 3rd century was consummated in the 6th and 7th throughout the greater part of the South-Illyrian provinces, and the Slavonic and Avar conquests severed the official connexion with eastern Rome. The Roman element was uprooted from its fixed seats, and swept hither and thither by the barbarian flood. Nomadism became an essential of independent existence, while large masses of homeless provincials were dragged as captives in the train of their conquerors, to be distributed in servile colonies. They were thus transported from their home in the Carpathian region, Slav, Avar and Bulgarian—to trans-Danubian and Pannonian regions. In the Acts of St Demetrius of Thessalonica (d. A.D. 306) we find an account of such a Roman colony, which, having been carried away from South-Illyrian cities by the Avar khagan (prince), and settled by him in the Sirmian district beyond the Save, revolted after seventy years of captivity, made their way once more across the Balkan passes, and finally settled as an independent community in the country inland from Salonica. Others, no doubt, thus transported northwards never returned. The earliest Hungarian historians who describe the Magyar invasion of the 9th century speak of the old inhabitants of the country as Romans, and of the country they occupied as Pecsa Romanorum; and the Russian Nestor, writing about 1100, makes the same invaders fight against Slavs and Vlachs in the Carpathian Mountains. So far from the first mention of the Vlachs north of the Danube occurring only in 1122, as Roesler asserts, it appears from a passage of Nicetas of Chonae that they were to be found already in 1164 as far afield as the borders of Galicia; and the date of a passage in the Nibelungenlied, which mentions the Vlachs, under the leader Rämunc, in association with the Poles, cannot well be later than 1200.

Nevertheless, throughout the early middle ages the bulk of the Ruman population lay south of the Danube. It was in the Balkan lands that the Ruman race and language took their characteristic mould. It is here that this new Illyrian Romance first rises into historic prominence. Already in the 6th century, as we learn from the place-names, such as Sceptecasas, Burgualtu, Clisura, &c., given by Procopius, the Ruman language was assuming, so far as its Latin elements were concerned, its typical form. In the somewhat later campaigns of Comentidus (587) and Priscus, against the Avars and Slavs, we find the Latin-speaking soldiery of the Eastern emperor making use of such Romance expressions as torna fratei (turn, brother!), or sculea (out of bed) applied to a watch (cf. Ruman a so culea = Italian coricarsi + ex-(s-) privative). Next we find this warlike Ruman population largely incorporated in the Bulgarian kingdom, and, if we are to judge from the names Faganus and Sabinus, already supplying it with rulers in the 9th century. The accordance of close contact during this period of the surviving Latin population with the Slavonic settlers of the peninsula impregnated the language with its large Slavonic ingredient. The presence of an important Latin element in Albanian, the frequent occurrence of Albanian words in Rumanian, and the remarkable retention by both languages of a suffix article, may perhaps imply that both alike took their characteristic shapes in the same region. The fact that these peculiarities are common to the Rumanats north of the Danube, whose language differs dialectically from that of their southern brothers, shows that it was this southern branch of the Bulgaro-ROMANOscian race that was exerting a dominating influence. Migrations, violent transplanta-tion, the intercourse which was kept up between the most outlying members of the race, in its very origin nomadic, at a later period actual colonization and the political influence of the Bulgaro-Vlachian empire, no doubt contributed to propa-gate these southern linguistic acquisitions throughout that northern area to which the Ruman race was destined almost imperceptibly to shift its centre of gravity.

Byzantium, which had ceased to be Roman, and had become Rumanic, renewed its acquaintance with the Latin inhabitants of the Illyric provinces of Illyricum through a Slavonic medium, and applied to them the name of Vlach, which the Slav himself had borrowed from the Goth. The first mention of Vlachs in a Byzantine source is about the year 976, when Cedrenus (ii. 439) relates the murder of the Bulgarian tsar Samuel's brother "by certain Vlach wayfarers," at a spot called the Fair Oaks, between Castoria and Prespa. From this period onwards the Ruman inhabitants of the Balkan peninsula are constantly mentioned by this name, and we find a series of political organiza-tions and territorial divisions connected with the name of Vlach. Thus the short survey of the history of the most of the important of these, outside the limits of Rumania itself,

1. The Bulgaro-Vlach Empire.—After the overthrow of the older Bulgarian tsardom by Basil Bulgaroktonos (976–1025), the Vlach population of Thrace, Haemus and the Moesian lands passed once more under Byzantine dominion; and in 1185 a heavy tax, levied in kind on the cattle of these warlike mountain shepherds, stirred the Vlachs to revolt against the emperor Isaac Angelus, and under the leader of his brothers, Altan, they found a new Bulgaro-Vlachian empire, which ended with Kaliman II. in 1257. The dominions of these half-Slavonic half-Roman emperors extended north of the Danube over a great deal of what is now Rumania, and even during the period that the Vlach population north of the river seems to have been most largely reinforced. The 13th-century French traveller Rubruquis speaks of all the country between Don and Danube as As'm land or Blakia.

2. Great Walachia (Me-Xajm, Vlahia).—It is from Anna Commena, in the second half of the 11th century, that we first hear of a Vlach settlement, the nucleus of which was the mountainous region of Transylvania. Benjamin ofсоntent is an interesting account of this Great Walachia, then completely independent. It embraced the southern and central ranges of Fındus, and extended over part of Macedonia, thus including the land in which the Branas, the ancestors of the Ban of St Demetrius had fixed their abode. After the Latin conquest of Constantinople in 1204, Great Walachia was included in the enlarged despotate of Epirus, but it soon reappears as an independent principality under its old name, which, after passing under the yoke
of the Serb emperor Dushan, was finally conquered by the Turks in 1392. Many of their old privileges were accorded to the inhabitants, and their taxes were limited to an annual tribute. Since the 15th century, the Morlachs have largely been<hl>Marched</hl>as bondsmen, and they are still represented by the flourishing Flinzstett settlements of the Krumlov and its neighbourhood (see Macedonia).

3. Little Walachia (Малая Болгария) was a name applied by Byzantine writers to the eastern element of the Rus inhabitants and their descendants, and with it may be included "Upper Walachia," or Архео-дакия. Its inhabitants are still represented by the Tzintzars of the Apsoamotpo and the Georgians of the Cape of the Heraclea.

4. The Morlachs (Мавровлаци) of the West.—These are already mentioned as Нигри Латини by the presbyter of Dioclea (c. 1150) in the old Dalmatian littoral and the mountains of what is now Montenegro, and of the region bordering on the Adriatic. Of course, they are represented by the settlements of the region mentioned above, which it is common to the eastern element of the Rus inhabitants and their descendants, and with it may be included "Upper Walachia," or Архео-дакия. Its inhabitants are still represented by the Tzintzars of the Apsoamotpo and the Georgians of the Cape of the Heraclea.

5. Basil (R-985 Constantinople, the ostasiarch of the Russian Church). Many of the Russian writers of the 14th and 15th centuries mentioned him, but his life is little known. He is represented in the Church of Moscow, and his shrine is located in the Architecture of the Russian Church. In the 14th century, the Mavrovlaci or Morlachs extended themselves towards the Caucasian borders, and a large part of the populations of the Dalmatian littoral is of this kind. The population of the Morlachs is formed by a people of Slavonic origin, which is known as the Mavrovlaci or Morlachs.

6. Ruman of Transylvania and Hungary.—As already stated, a large part of the Hungarian plains were, at the coming of the Magyars in the 9th century, known as Пеша Romannarum. At a later period privileged Ruman communities existed at Fogaras, where there was a Сеу Wlachorum, at Marmaros, Deva, Hateg, Hunyad and Lugos, and in the Banat they were seven Ruman districts. Two of the greatest figures in Hungarian history, the 15th-century rulers John Corvinus of Hunyad and his son King Matthias, were due to this element. For its later history see TRANSYLVANIA.

VLADIKAVKAZ.—VLADIMIR

VLADIKAVKAZ, a town and fortress of Russia in northern Caucasus, the capital of the province of Terek. Pop. (1900) 40,924. It stands on a plateau, at an altitude of 2343 ft., on both banks of the Terek, where that river issues from the Darial gorge. It is 434 m. by rail S.E. from Rostov-on-the-Don, and has regular communication with Tiflis (333 m.) by coach through the Darial Pass (Georgian military road) of the Caucasus. Moreover, a line of railway, running eastwards to the Caspian ports of Petrovsk and Baku, connects Vladikavkaz, or rather the station Beslan, 14 m. N. of it, with the Transcaucasian railway, i.e. with Tiflis, Poti and Batum. Russians, Armenians and Jews constitute the bulk of the population, which also contains the Ossetes, Chechens, Ingushes and others. There are distilleries and a number of smaller factories. The fort, around which the town has grown up, was built in 1784. The town is an episcopal see of the Orthodox Church.

VLADIMIR, ST. (c. 956-1015), grand duke of Kiev and of all Russia, was the youngest son of Svyatoslav I. and his mistress Malushka. In 970 he received Great Novgorod as his apanage. On the death of Svyatoslav in 972, a long civil war took place between his sons Yaropolk and Oleg, in which Vladimir was involved. From 977 to 984 he was in Scandinavia, collecting as many of the Viking warriors as he could to recover Novgorod, and on his return marched against Yaropolk. On his way to Kiev he sent ambassadors to Ragvald, prince of Polotsk, to sue for the hand of his daughter Ragnhild. The haughty princess refused to affiance herself to "the son of a bondswoman," but Vladimir attacked Polotsk, slew Ragvald, and took Ragnhild by force. Subsequently (980) he captured Kiev also, slew Yaropolk by treachery, and was proclaimed prince of all Russia. In 981 he conquered the Cherven cities, the modern Galicia; in 983 he subdued the heathen Yatvyaqs, and transferred their territories lay between an emilia and Poland; in 985 he led a fleet along the central rivers of Russia from Novgorod to the Bulgarians of the Kama, planting numerous fortresses and colonies on his way. At this time Vladimir was a thoroughgoing pagan. He increased the number of the trebischba, or heathen temples; offered up Christians (Theodore and Ivan, the proto-martyrs of the Russian Church) on his altars; had eight hundred concubines, besides numerous wives; and spent his whole leisure in feasting and hunting. He also formed a great council out of his boyars, and set his twelve sons over his subject peoples. In 987, as the result of a consultation with his boyars, Vladimir sent embassies to study the religions of the various neighbouring nations whose representatives had been urging him to embrace their respective faiths. The result is amusingly described by the chronicler Nestor. Of the Muscovian Bulgarians of the Volga the envoy reports "there is no gladness among them; only sorrow and a great stench; their religion is not a good one." In the temples of the Germans they saw "no beauty"; but at Constantinople, where the full festival ritual of the Orthodox Church was set in motion to impress them, they found their ideal. We no longer know whether they were in heaven or on earth, nor how much beauty, and we know not how to tell of it." If Vladimir was impressed by this account of his envoy, he was yet more so by the offer of the emperor Basil II. to give him his sister Anna in marriage. In 988 he was baptized at Kherson in the Crimea, taking the Christian name of Basil out of compliment to his imperial brother-in-law; the sacrament was followed by his marriage with the Roman princess. Returning to Kiev in triumph, he converted his people to the new faith with no apparent difficulty. Crypto-Christianity had been numerous in Kiev for some time before the public recognition of the Orthodox faith. The remainder of the reign of Vladimir was devoted to good works. He founded numerous churches, including the splendid Девятинський Sobor or "Cathedral of the Tithes" (959), established schools, protected the poor and introduced ecclesiastical courts. With his neighbours he lived at peace, with the incursions of the savage Petchenegs alone disturbing his tranquillity. His nephew Svyatopolk, son of his brother and victim Yaropolk, he married to the daughter of Boleslaus of Poland. He died at Berestova, near Kiev, while on his way to chastise the insolence of his son, Prince Yaroslav of Novgorod. The various parts of his dismembered body were distributed among his numerous sacred foundations and were venerated as relics. The university of Kiev has rightly been named after the man who both civilized and Christianized ancient Russia. His memory was also kept alive by innumerable folk ballads and legends. With him the Varangian period of Russian history ceases and the Christian period begins.

B.)

VLADIMIR, a government of middle Russia, bounded W. by the governments of Moscow and Tver, N. by Yaroslav and Kostroma, E. by Nizhny-Novgorod, S. by Tambov and Ryazan, with an area of 18,815 sq. m. It belongs to the eastern part of the central plateau of middle Russia, which has an average elevation of 800 to 950 ft., and is grooved by river valleys to a depth of
VLADIMIR—VLADIVOSTOK

300 ft. to 450 ft. below the general level, so that the country has a hilly appearance.

The great depression of the middle Volga and Oka extends into the east of the country. The Upper Carboniferous limestones, of which it is mostly built up, are overlain by Permian sandstones towards the east, and patches of Jurassic clays—denuded remnants of which form extensive dejectas in scattered patches on the surface. The whole is covered with a thick sheet of boulder clay, considered to be the bottom moraine of the North-European ice-sheet. In this region there are extensive lacustrine clays and sands. The geology, especially of the western parts, has been investigated by Professor Nikitin, who has ascertained that under the glacial and post-glacial deposits—the lower slaty beds containing both sandstone and clay—the Cretaceous and the upper Cretaceous deposits and deposits intermediate between the Cre-taceous and the Jurassic (Oka deposits). Upper Jurassic (Lias) and Upper Carboniferous deposits are also found, and at Gorbatov Permian marls.

The soil is for the most part sterile, save in the district of Yuryev, where are patches of black earth, which have occasioned a good deal of discussion among Russian geologists. Iron ore is widely diffused, and china clay and gypsum are met with in several places. Peat is of common occurrence. Forests cover extensive tracts in the south, which at least resembles that of Moscow, but is a little colder, and still more continental: the average yearly temperature at the city of Vladimir is 38° F. (January, 16°; July, 66°)

The Oka flows through the government for 85 m., and is navigable throughout. Of its tributaries, the Klyazma is navigable to Kovrov, and even to Vladimir in summer; and timber is floated on the Teza. Though that the Plesheevo or Pereyaslavsk (5 m. in length) has historical associations, Peter the Great was there in his boyhood his first experiences in navigation. The marshes extend to more than half a million acres.

Vladimir ranks third among the governments of European Russia for manufactures. It has some 500 large factories, which employ over 100,000 persons (one-third women); the principal establishment is cotton, linen and silk mills, dye-works, and rope, paper, cardboard, oil, chemical, machinery, glass and iron works, tanneries and distilleries. Wood, coal, petroleum and peat are all used as fuel.

A distinctive feature of Vladimir is the great variety of petty trades, the most important of which are those who still cultivate their allotments. While in some villages almost all the inhabitants leave their homes and travel all over Russia as carpenters, masons, iron-roof makers, or as peddlers or travelling merchants, other villages have come to depend almost entirely on one branch of manufacture. Nearly 30,000 carpenters leave Vladimir every year. Whole villages are engaged in painting sacred pictures or icons; and although the icons are sold a shilling the hundred, the aggregate trade is valued at £150,000 a year. The whole of Vladimir (and Suldal) pictures are sold all over Russia and the Balkan peninsula. In other villages some 1200 men are employed in making sickles, sickle-blades, knives, sledges and baskets, lapl (shoes made of lime-tree bark, which are worn in central Russia). Sledges produced by the million), wheels and sledges, sieves, combs, woolen stockings and gloves, sheep-skins and sheep-skin gloves, felt, toys, earthenware, and confectionaries are the specialties of other villages. In these petty trades Vladimir occupies the first place in Russia, the annual production being one-third of the total output for the whole country.

The movement of shipping on the Volga and its tributaries and sub-tributaries, the Oka, Klyazma and Teza, is considerable. The principal ports are Murom on the Volga and Kovrov and Vyazniki on the Klyazma. Timber, wood for fuel and manufactured goods are the chief exports. Numbers of Palaeolithic stone implements, intermingled with bones of the mammoth and the rhinoceros, and still greater numbers of Neolithic stone implements, have been found in this region, and there is a great number of burial-mounds belonging to the Bronze and Iron periods, and containing decorations in amber and gold; nearly 2000 such burial-mounds are scattered round Lake Plesheevo, 'the largest in Europe belonging to the pagan period and some to the early Christian. Coins from Arabia, Bokhara, Germany and Anglo-Saxon lands are found in great quantities.

(V. A. K. & J. T. Be.)

VLADIMIR, a town of Russia, capital of the government of the same name, in the Klyazma, to distinguish it from Vladimir in Volhynia. It is picturesquely situated on the Klyazma and Lybed, 118 m. by rail E.N.E. of Moscow. Pop. (1884) 18,420; (1900) 32,029. The city is an archiepiscopal see of the Orthodox Greek church. The Lybed divides it into two parts. Extensive cherry orchards occupy the surrounding slopes, and in each is a small watch-tower, with cords drawn in all directions to be shaken by the watch when birds alight. The Kremlin stands on a hill and contains two very old cathedrals—the Uspenskiy (1150; restored in 1891), where all the princes of Vladimir have been buried, and the Dmitrievskiy (1197; restored in 1834-1835). Several churches date from the 12th century, including one dedicated to the Birth of Christ, in which St Alexander Nevski was buried. The "Golden Gate"—a triumphal gate surmounted by a church—was built by the grand duke Andrei Bogolyubsky in 1198.

Vladimir was founded in the 12th century. It first comes into record in 1151, when Andrei Bogolyubsky secretly left Vysyagorod—the domain of his father in the principality of Kiev—and migrated to the newly settled land of Suzdal, where he became (1157) grand prince of the principalties of Vladimir, Suzdal and Rostov. In 1242 the principality was over-run by the Mongols under Batu Khan, and he and his successors asserted their suzerainty over it until 1328. During this period Vladimir became the chief town of the Russian settlements in the basin of the Oka, and it disputed the superiority with the new principality of Moscow, to which it finally succumbed in 1328.

In the 14th century it began to decay.

VLADIMIR—VLADIVOSTOK, a town of Russia, in the government of Volhynia, 39 m. N.N.E. of the town formerly on the frontier of Russia, Poland and Galicia meet and 300 m. W.N.W. of Kiev. Pop. (1885) 8752; (1897) 9695, three-fifths Jews. Though not mentioned in the annals before 988, Vladimir was probably in existence in the 9th century under the name of Ladimir. In the 10th century it was the capital of the principality of Volhynia. The Tatars and the Lithuanians destroyed it several times, but it always recovered, and only fell into decay in the 17th century. It was finally annexed to Russia after the first division of Poland (1772). The ruins in and near the town include remains of a church supposed to have been built by Vladimir, grand duke of Kiev, in the 10th-11th centuries, and of another built in 1160 by his descendant Mstislav. This latter was apparently very well built, and its length exceeded that of the temple of St Sophia at Kiev. The town contains a good archaeological museum.

VLADIVOSTOK, the chief Russian seaport and naval station on the Pacific Ocean, situated at the southern extremity (45° 7' N. and 130° 55' E.) of the Maritime Province, not far from the point where the government touches both Manchuria and Korea (Cho-son). It has been created by the Great Gulf, occupying the northern shore of one of its horn-like expansions, which the Russians have called the Golden Horn. The depth of the Eastern Bosphorus ranges from 13 to 20 fathoms, and that of the Golden Horn from 5 to 13, the latter affording a spacious harbour. The hills are covered with forests of oak, lime, birch, maple, cork, walnut, acacia, ash, aspen, poplar, elm, apple, pear and wild cherry, with a rich undergrowth of the most varied shrubs. Excellent timber is supplied by
oak and cedar forests not far off. The climate, however, is severe, as compared with that of corresponding latitudes in Europe. Though standing in almost the same parallel as Marseilles, Vladivostok has an average annual temperature of only 40°F., and, although the gulf itself never freezes, a thin ice-crust forms along the shores in December and remains until April. The town has several handsome buildings, a monument to Adm. the Novelsky (1867), a cathedral, a museum, an observatory, an Oriental institute (opened in 1890), professional schools, a naval hospital, mechanical and naval works, steam saw-mills and flour-mills. The drawback of Vladivostok is that it has not, and cannot have, a well-developed hinterland, despite the great efforts which have been made by the Russian government to supply the Usuri region (to the north of Vladivostok) with Russian settlers. The town of Vladivostok was founded in 1860-1861, and from 1865 to 1900 was a free port.

**VODENA** (Turk. and Bulg. *Voden*, anc. *Elesa*, q.v.), a city of European Turkey, in the vilayet of Salonica, western Macedonia; at the source of the small river Bitristra, which flows east and south into Lake Yenije, and on the railway from Salonica to Monastir. Pop. (1905) about 25,000, consisting of Turks, Slavs and Greeks. The town stands on a rocky height commanding views of Pindus and Olympus; the approaching slopes are richly wooded, and traversed by picturesque waterfalls, from which the name of Vodena (Slav. *voda*, water) is probably derived. Vodena is the see of a Greek archbishop, and possesses numerous churches and mosques, besides unimportant remains of Byzantine and Byzantine buildings. It has manufactures of cotton, tobacco and leather, and a large trade in wine, silk cocoons and red pepper.

**VODEISHANKAR, GOWRISHANKAR** (1805-1892), native minister of the state of Bhauanagar in Kathiawar, Bombay, was born on the 21st of August 1805, of a family of Nagar Brahmins. He rose from being a revenue officer to be state minister in 1847. His success in this capacity was such that on the death of the reigning chief, in 1850, he was appointed joint administrator in concert with a British official. The experiment was in every respect successful. Under the simple and economical forms used in native states, improvements suggested by British experience were introduced. The land revenue was based on a cash system, the fiscal and customs systems were remodelled and tree planting was encouraged. The town of Bhauanagar received the great boon of the Gowrishankar Waterworks, on which six lakhs of rupees were spent. The Bhauanagar state also warmly pressed for railway communication with the continent of India, and thus began a movement which has spread a network of railway lines over the peninsula of Kathiawar. The British government rewarded all these many services of Gowrishankar with the distinction of C.S.I. in 1897. He helped to establish the Rajkumar College at Rajkot, for the education of native princes, and also the Rajasthaniak Court, which, after settling innumerable disputes between the land-owning classes and the chiefs, has since been abolished. In 1879 Gowrishankar resigned office, and devoted himself to the study of the higher literature of that Vedanta philosophy which through his whole life had been to him a solace and a guide. In 1884 he wrote a work called *Svarapandasthan*, on the union of the soul with Deity, which led to a letter of warm congratulation from Max Muller, who also published a short biography of him. In 1887 he put on the robe of the *Sanyasi* or ascetic, the fourth stage, according to the Hindu Shastras, in the life of the twice-born man, and in this manner passed the remainder of his life, giving above ten hours each day to Vedantic studies and holy contemplation. He died, revered by all classes, in December 1892.

**VODKA**, *Vodka* or *Wodka*, the Russian national spirited beverage. Originally vodka was made almost entirely from rye, but the valley being to the extent of 15 to 20%, being used to effect saccharification (*see SPRITS*), but at the present day potatoes and maize are the staple raw materials from which this spirit is manufactured, and, as a rule, green rye malt is now used instead of barley. The distillation is conducted by means of live steam in a double still of the "patent" type. Vodka as manufactured contains from 90 to 96% of alcohol, but it is diluted, previous to retailing, to a strength of 40 to 40%. It is illegal to sell it with less than 40% of alcohol.

**VOTTIUS (Voir), GYSEBERTUS** (1588-1676), Dutch theologian, was born at Heusden, Holland. He studied at Leiden, and in 1611 became pastor of Blymen, whence in 1617 he returned to Heusden. In 1619 he played an influential part in the Synod of Dort, and in 1634 was made professor of theology and Oriental science at Utrecht. Three years later he became pastor of the Utrecht congregation. He was an advocate of the extreme form of Calvinism against the Arminians; but his personal influence was good, and the city of Utrecht perpetuated his memory by giving his name to the street in which he lived.

**VOGEL, EDUARD** (1820-1866), German traveller in Central Africa, was born at Krefeld on the 7th of March 1829. He studied mathematics and astronomy at Leipzig and Berlin, and in 1851 engaged in astronomical work in London. In 1853 he was chosen by the British government to take supplies to Heinrich Barth, then in the western Sudan; and Vogel met Barth at Kuka in Bornu (1854). During 1854 and 1855 he explored the countries round Lake Chad and the upper course of the Benue. On the 1st of December 1855 he left Kuka at the Nile Valley, and nothing further was heard of him. Several search expeditions were organized to ascertain his fate and to recover his papers; it was not until 1873 that Gustav Nachtigal on reaching Wadai learnt that Vogel had been murdered in that country in February 1856.

See *Erinnerungen an einen Verschollenen* (Leipzig, 1863), by Vogel's sister, E. Polko, and *Der Afrikanischer Eduard Vogel* (Hamburg, 1895).

**VÖGEL, SIR JULIUS** (1835-1899), British colonial statesman, son of Albert Leopold Vogel, was born in London on the 24th of February 1835; was educated at University College school, London; and emigrated to Victoria during the exciting years which followed the discovery of goldfields there. He became editor of a newspaper at Maryborough, stood for the Legislative Assembly and was defeated, and in 1861 left Victoria, carried in the mining rush to Otago, New Zealand, where much gold had just been found. Settling in Dunedin, he bought a half-share in the *Otago Daily Times*, and was soon its editor and a member of the Otago Provincial Council. He made his paper the most influential in the colony, and was returned to the House of Representatives. In 1866 he was head of the Otago Provincial Executive (by which he had made his mark in the New Zealand parliament), and was treasurer in the ministry of Sir William Fox. Without delay he brought forward a scheme for the construction of trunk railways and other public works, the purchase of land from the Maori tribes, and the introduction of immigrants, all to be done with money borrowed in London. At that time New Zealand hardly contained a quarter of a million of white settlers, was exhausted by the ten years' struggle with the Maori, not then ended, and was depressed by the low price of her staple product, wool, and the abatement of a gold-fever. Yet Vogel's sanguine, energetic appeals and remarkable gift of persuasion induced the House of Assembly to adopt a modified version of his scheme. For the next six years he was the most powerful man in the colony. Millions were borrowed, railways were pushed on, immigrants—state and voluntary—streamed in. Lasting peace was made with the Maori, a telegraph line laid to Australia, a steam mail service secured across the Pacific to San Francisco; a government life insurance office, and a public trust office, were established, both of which proved useful and were well-managed. During a visit to London on the colony's financial business, Vogel succeeded in arranging for the issue of colonial loans at the Bank of England, an arrangement afterwards confirmed by the imperial parliament. In 1875 he was knighted.
In 1874 Vogel, until that time a supporter of the Provincial system, decided to abolish it. In this, with the aid of Sir E. W. Stafford and Sir H. A. Atkinson, he succeeded. In the struggle, however, he broke with many of his old allies, and in 1876 suddenly quit New Zealand to take the post of agent-general in London. This he held until 1880, and while holding it negotiated a loan for five millions. Having become connected with certain public companies, and the New Zealand government objecting thereto, he had to resign his position. An attempt, too, which he made in 1880 to enter the House of Commons as a Conservative member for Penryn was unsuccessful. In 1884 he returned to New Zealand, was at once elected to parliament, and a year later was appointed to the Ministry of Finance by R. Stout. They held office for three years, but though Vogel showed some of his old financial skill, they were not years of prosperity for the colony, or triumph for the government. A deficit, a rejected scheme of taxation and a crushing defeat at the polls ended Vogel's career as a minister. After a few months of failure as leader of an outnumbered Opposition he gave up the contest, left New Zealand for the last time, and for the last eleven years of his life lived quietly near London. Throughout his life he had from time to time to struggle with debt. For many years he could not write, while an impulsive, speculative nature led him once and again into financial difficulties. The persistency with which he faced trouble and embarrassment, the hopefulness he showed under stress of ill fortune, the sympathy and pleasantness of manner which won him friends at all times, were elements in his curious and interesting character no less remarkable than the fertility and imaginative power of his busy brain.

Vogel was among the pioneers of Imperial Federation; he would have extended Great Britain's influence in the Pacific Ocean had he been allowed. He was the first minister to secure the second reading of a Women's Franchise Bill in search of the South Sea Islands and New Zealand. As long ago as 1874 he endeavoured to save the New Zealand forests from the reckless destruction by axe and fire which has since gone on. In 1880 a novel from his pen, Anno Domini 2000, was published, and reached a second edition. He died at East Molesey on the 13th of March 1890. His wife, who was the daughter of William Clayton, government architect, New Zealand, two sons and a daughter survived him. Another son had been killed in the Matabele War in South Africa. Vogel was buried in the Ashkenazi rite.

VOGHERA (Anc. Iria), a town of Lombardy, in the province of Pavia, and 19 m. by rail S.S.W. of that city, 305 ft. above sea-level, on the Staffora (a tributary of the Po). Pop. (1901) 14,453 (town); 20,442 (commune). The fortifications erected by the Visconti in the middle ages have given place to shady promenades. The large church of San Lorenzo dates from the 11th century, but was remodelled in the baroque style about the beginning of the 17th. The suppressed church of S. Ilario (Chiesa Rossa), so called from the red colour of the brick of which it is built, dates from the 10th century. The neighbourhood produces much silk, in which, as well as in corn and wine, an active trade is carried on. The ancient Iria took its name from the river on which it was situated. It was on the road from Placentia to Dertona, and was made a colony by Augustus (colonia Forum Iulium Iriensem).

VOGLER, GEORGE JOSEPH (1749-1814), usually known as Abbé or Abt (Abbot) Vogler, German organist and composer, was born at Freilach in Würzburg on the 10th of June 1749. His father, a violin maker, while educating him in the Jesuit college, encouraged his musical talent, which was so marked that at ten years old he could not only play the organ well, but had also acquired a fair command of the violin and some other instruments. In 1771 he went to Mannheim, where he composed a ballet for the elector Karl Theodor, who sent him to Bologna in 1774 to study under the Padre Martini. Dissatisfied with the method of that learned theorist, he studied for five months under Valotti at Padua, and afterwards proceeded to Rome, where, having been ordained priest, he was admitted to the famous academy of Arcadia, made a knight of the Golden Spur, and appointed protonotary and chamberlain to the pope.

On his return to Mannheim in 1755 Vogler was appointed court chaplain and second "maestro di cappella." He now established his first great music school. His pupils were devoted to him, but he made innumerable enemies, for the principles upon which he taught were opposed to those of all other teachers. He had invented a new system of fingering for the harpsichord, a new form of construction for the organ, and a new system of musical theory founded upon that of Valotti. Mozart condemned the fingering as "misérable," and many rumours to his discredit have survived to this day over Mazzi's shaft. In the project he had proposed change in the construction of the organ consisted in simplifying the mechanism, introducing free-reeds in place of ordinary reed-stops, and substituting unisonous stops for the great "mixtures" then in vogue. The theoretical system, though professedly based upon Valotti's principles, was to a great extent empirical. Nevertheless, in virtue of a certain substratum of truth which seems to have underlain his new theories, Vogler undoubtedly exercised a powerful influence over the progress of musical science, and numbered among his disciples some of the greatest geniuses of the after race.

In 1778 the elector removed his court to Munich. Vogler followed him thither in 1780, but, dissatisfied with the reception accorded to his dramatic compositions, soon quitted his post. He went to Paris, where after much hostility his new system was recognized as a continuation of that started by Rameau. His organ concerts in the church of St Sulpice attracted considerable attention. At the request of the queen, he composed the opera Le Patriote, which was produced before the court at Versailles. His travels were wide, and extended over Spain, Greece, Armenia, remote districts of Asia and Africa, and even to Grenada. In the period of the greatest prosperity of the after race he died in Paris on 10th July 1804. Vogler was an organist of great talent and就行了organist of great talent and upon whom he bestowed the title of "kapelmester," with the order of merit, the title of privy councillor, a salary of 3000 florins, a house, a table supplied from the duke's own kitchen, and other privileges, which determined him to bring his wanderings at last to a close.

At Darmstadt he opened his third and most famous music school, the chief ornaments of which were Gansbacher, Weber and Meyerbeer, whose affection for their old master was unbounded. One of Vogler's latest exploits was a journey to Frankfurt in 1810, to witness the production of Weber's Sylvia. He continued to work hard to the last, and died suddenly of apoplexy at Darmstadt on the 6th of May 1814. He was a

1 Robert Browning's poem 'Abt Vogler extemporizing on an instrument of his own invention' has made his name familiar to the literary public.
brilliant and accomplished performer, and an excellent if an eccentric teacher; but his own compositions have not survived.

VOGT, KARL CHRISTOPH (1827-1859). German naturalist and geologist, was born at Giessen on the 5th of July 1817. In 1847 he became professor of zoology at Giessen, and in 1852 professor of geology and afterwards also of zoology at Geneva, where he died on the 5th of May 1859. His earlier publications were on zoology; he dealt with the Amphibia (1839), Reptiles (1840), with Molusca and Crustacea (1843) and more generally with the Invertebrate fauna of the Mediterranean (1854).

His separate works include Im Gebirg und auf den Gletschern (1843); Physiologische Briefe (1845-46); Handbuch der Geologie (1860); and Lehrbuch der Geologie und Petrofunktion (2 vols., 1846-47; ed. 4, 1879). An English version of his Lectures on Man: his Place in Creation and in the History of the Earth was published by the Anthropological Society of London in 1864.

VOGTLAND, or Vogtland, a district of Germany, forming the S.W. corner of the kingdom of Saxony, and also embracing parts of the principality of Reuss and of the duchies of Saxe-Altenburg and Saxe-Weimar. It is bounded on the N. by the principalities of Reuss, in the S.E. by Bohemia, and on the S.W. and W. by Bavaria. Its character is generally mountainous, and geologically it belongs to the Erzgebirge range. It is extremely rich in mineral ores—silver, copper, lead and bismuth. The name denoted the country governed for the elephant (balleine, saved from the terrors of the French revolution by a privilege of safe conduct) and was, in the middle ages, known as terra advocatorum. The Vogtland was in with in the country in the 19th century, and the office shortly afterwards appears to have become hereditary in the princely line of Reuss. But this house was not in undivided possession, rival claims being raised from time to time; and after being during the middle ages a bone of contention between Bohemia, the burgvoges of Nuremberg and the Saxon house of Wettin, it passed gradually to the Wettins, falling by the division of 1485 to the Ernestine branch of the family. The elector Augustus I. made it one of his dominions.

VOUDE, EUGÈNE MELCHOR, COMTE DE (1848- ), French author, was born at Nice on the 25th of February 1848. In 1868 he was in the diplomatic service, being appointed successively attaché to the legations at Constantinople and Cairo and secretary at St. Petersburg. He resigned in 1882, and from 1893 to 1898 was deputy for Ardèche. His connexion with the Revue des deux mondes began in 1873 with his Voyage en Syrie et en Palestine, and subsequently he was a frequent contributor. He did much to awaken French interest in the intellectual life of other countries, especially of Russia, his sympathy with which was strengthened by his marriage in 1878 with a Russian lady, the sister of General Annenkow. De Voude was practically the first to draw French attention to Dostoievski and his successors. He became a member of the French Academy in 1888.

His works include: Histoires orientales (1879); Portraits du siècle (1883); Le Pils de Pierre le Grand (1884); Histoires d'heros (1885); Les Fables de la Fontaine (1886); Histoires littéraires (1892); Cœurs russes (1894); Devant le siècle (1896); Jean d'Arginen (1898); Le Rappel des ombres (1900); Le Maître de la mer (1903); Maxim Gorky (1905).

VOICE (Fr. voix, from Lat. vox), the sound produced by the vibrations of the vocal cords; two ligaments or bands of fibrous elastic tissue situated in the larynx. It is to be distinguished from speech, which is the production of articulate sounds intended to express ideas. Many of the lower animals have voice, but none has the power of speech in the sense in which man possesses that faculty. There may be speech without voice, as in whispering, whilst in singing a scale of musical tones we have voice without speech. (See Song; and for speech see Phonetics; also the articles on the various letters of the alphabet.)

1. Physiological Anatomy.—The organ of voice, the larynx, is situated in man in the upper and fore part of the neck, where it forms a well-known prominence in the middle line (see details under Respiratory System). It opens below into the trachea or windpipe, and above into the cavities of the pharynx, and it consists of a framework of cartilages, connected by elastic membranes or ligaments, two of which constitute the true vocal cords. These cartilages are movable on each other by the action of various muscles, which thus regulate the position and the tension of the vocal cords. The trachea conveys the blast of air from the lungs during expiration, and the whole apparatus may be compared to an acoustical contrivance in which the lungs represent the wind chest and the trachea the tube passing from the wind chest to the sounding body contained in the larynx. Such are the two tight bands of any elastic membrane, such as thin sheet india-rubber, stretched over the end of a wide glass tube so that the margins of the bands touched each other, and that a powerful blast of air is driven through the tube by a bellows. The pressure would so distort the margins of the membrane as to open the aperture and allow the air to escape; this would cause a fall of pressure, and the edges of the membrane would spring back by their elasticity to their former position; again the pressure would increase, and again the edges of the membrane would be distended, and those actions would be so quickly repeated as to cause the edges of the membrane to vibrate with sufficient rapidity to produce a musical tone, the pitch of which would depend on the number of vibrations executed in a second of time. In other words, there would be a rapid succession of puffs of air. The condensation and rarefaction of the air thus produced are the chief cause of the tone, as H. von Helmholtz has pointed out, and in this way the larynx resembles the siren in its mode of producing tone. It is evident also that the intensity or loudness of the tone would be determined by the amplitude of the vibrations of the margins of the membrane, and that its pitch would be affected by any arrangement effecting an increase or decrease of the tension of the margins of the membrane. The pitch might also be raised by the strength of the current of air, because the great amplitude of the vibrations would increase the mean tension of the elastic membrane.

With tones of medium pitch, the pressure of the air in the trachea is equal to that of a column of mercury of

(From Krause.)

2 FIG. 2.—Cartilages and Ligament of Larynx, seen from behind; half natural size. 1, epiglottis; 2, lesser cornu of hyoid bone; 3, greater cornu of hyoid; 4, lateral thyro-hyoid ligament; 5, cartilago triticea; 6, upper cornu of thyroid; 7, thyro-epiglottic liga-
mentation; 8, cartilage of Santorini; 9, arytenoid cartilage; 10, left lamina of thyroid; 11, muscular process of arytenoid cartilage; 12, inferior cornu of thyroid; 13, first ring of trachea; 14, posterior membraneous wall of trachea; 15, lamina of cricoid cartilage. (From Krause.)

160 mm.; with high pitch, 920 mm.; and with notes of very high pitch, 945 mm.; whilst in whispering it may fall as low
as that represented by 30 mm. of water. Such is a general
conception of the mechanism of voice.

The cartilages form the embryological framework of the larynx. They consist of three single pieces (the thyroid, the arytenoids, and of three pairs (two arytenoids, two cornicula laryngis or cartilages of Santorini, and two cornicula cartilagineae of Weis-
berg), see figs. 1 and 2. The epiglottis, the cornicula laryngis, the cuneiform cartilages of the aryten-
oids are composed of yellow or elastic fibro-cartilage, whilst the cartilage of all the others is of the hyaline variety, resembling more the cartilage of the ribs. Fig. 3 shows the cartilages bound together by ligaments, some of which are seen in figs. 1 and 2, whilst the remainder are represented in fig. 3. The ligaments specially concerned in the production of voice are the inferior thyro-
arytenoid ligaments, or true vocal cord; 9, thyroid cartilage; 10, superior thyro-arytenoid liga-
ment, or false vocal cord; 11, thyro-epiglottidinous muscle; 12, middle thyro-hyoid ligament; 13, hyo-epi-
glottid ligament; 14, body of hyoid bone; 15, smaller cornu of hyoid bone. (From Krause.)

The voice is represented in fig. 4, by the epiglottis, e, behind by

vocal cords the epiglottis is squamous. Patches of squamous
epithelium are also found in the ciliated tract above the glottis, on the under surface of the epiglottis, on the inner surface of the arytenoid cartilages, and on the free border of the upper or false
sides of the larynx, more especially in the epiglottis. In each laryngeal
pouch there are sixty to seventy such glands, surrounded by fat.

We are now in a position to understand the action of the muscles
of the larynx, which by visible movement forming the rima glottidis,
can be tightened or relaxed, and by which they can be approximated or
parted. Besides the cartilages—sterno-hyoid, omohyoid, sterno-thyroid and thyro-hyoid—which
move the larynx as a whole, there are several muscles which move the cartilages on each other. Some of
these are seen in fig. 5. These muscles are (a) the crico-thyroid, (b) the post-

arytenoid cartilages, (d) the thyro-arytenoid, (e) the aryteno-
tidal muscles, (f) the aryteno-

tenoid cartilage; 12, false vocal cord; 13, true vocal cord; 14, arytenoid cartil-
gage; 15, thyroid cartilage; 16, thyro-hyoid ligament. (From Triandos.)
and thus approximate the cords. (4) The arytenoids pass from the one arytenoid cartilage to the other, and in action these cartilages will be approximated and slightly depressed. (5) The aryteno-epi-glottidean muscles arise near the outer angles of the arytenoid; their fibres pass obliquely upwards, decussate and are inserted partly into

![Diagrams explaining the action of the muscles of the larynx.]

The dotted lines show the positions taken by the cartilages and the true vocal cords by the action of the muscles, and the arrows show the general direction in which the muscular fibres act. A, Action of crico-thyroid; 1, cricoid cartilage; 2, arytenoid cartilage; 3, thyroid cartilage; 4, true vocal cord; 5, thyroid cartilage, new position; 6, true vocal cord, new position. B, Action of arytenoid; 1, section of thyroid; 2, arytenoid; 3, posterior border of epiglottis; 4, true vocal cord; 5, direction of muscular fibres; 6, arytenoid, new position; 7, true vocal cord, new position. C, Action of lateral crico-arytenoid; same description as for A and B; 8, posterior border of epiglottis, new position; 9, arytenoid in new position. D, Action of posterior crico-arytenoid; same description. (From Beaunis and Bouchard.)

2. Physiology of Voice Production.—The vocal cords are tightened by the action of the crico-thyroid, or, as it might be more appropriately termed, the thyro-cricoid muscle. It stretches the thyro-arytenoid ligaments, the free edges of which, covered by mucous membrane, form the vocal cords. The adductors of the cords are the lateral crico-arytenoids, while the posterior crico-arytenoids are the abductors. The arytenoid muscle brings the cords together. Many of the fibres of the thyro-arytenoid are inserted obliquely into the sides of the cord, and in contraction they tighten the cord by pulling on the edge and making it curved instead of straight. Some such action is indicated by the elliptical shape of the rima glottidis in passing from the chest register to the middle register. Other fibres, however, running parallel with the cord may tend to relax it in certain circumstances. All the muscles except the thyro-cricoid (which is innervated by the superior laryngeal) receive nerve filaments from the inferior laryngeal branch of the vagus, the fibres being derived from the accessory roots. Both the adductor and adductor nerves come therefore from the inferior laryngeal. When an animal is deeply anaesthetised stimulation of the inferior laryngeal nerve causes abduction of the cord, but if the anaesthesia is slight, then we have adduction. The tonic contraction of the abductors is stronger than that of the adductors, so in a state of rest the glottis is slightly open. The centre of innervation is in the medulla oblongata, and this is dominated by a centre in the Rolandic region of the cerebral cortex.

The intensity or loudness of voice depends on the amplitude of the movement of the vocal cords. Pitch depends on the number of vibrations per second; and the length, size and degree of tension of the cords will determine the number of vibrations. The more tense the cords the higher the pitch, and the greater the length of the cords the lower will be the pitch. The range of the human voice is about three octaves—that is, from fa (87 vibrations per second) to sol (768 vibrations). In men, by the development of the larynx, the cords become more elongated than in women, in the ratio of 3 to 2, so that the male voice is of lower pitch and is usually stronger. At the age of puberty the larynx grows rapidly, and the voice of a boy "breaks" in consequence of the lengthening of the cords, generally falling an octave in pitch. A similar change, but very much less in amount, occurs at the same period in the female. At puberty in the female there is an increase of about one-third in the size of the glottis, but it is nearly doubled in the male, and the adult male larynx is about one-third greater than that of the female. In advanced life the upper notes of the register are gradually weakened and ultimately disappear, whilst the character of the voice also changes, owing to loss of elasticity caused by ossification, which first begins about middle life in the thyroid cartilage, then appears in the cricoid, and much later in the arytenoid. Eunuchs retain the voices of childhood; and by careful training it is possible in normal persons to arrest the development of the larynx so that an adult male can still sing the soprano parts sometimes used in cathedral choirs. The ranges of the different varieties of voice are shown in the following diagram, where the dotted lines give the range of certain remarkable voices, and the figures represent vibrations per second, taking the middle C of the piano as 256 vibrations per second.

A basso named Gaspar Forster passed from fa to la; the younger of the sisters Sessi had a contralto voice from do to fa; the voice of Catalani ranged three and a half octaves; a famous actor-singer, Farinelli, passed from la to re; Nilsson, in Il Flauto Magico, could take fa; and Mozart states that he heard in Parma in 1770 a singer, Lucrezia Ajugari, range from sol to do, which she gave purely, whilst she could execute trills on re. The latter is the most highly pitched voice referred to in musical literature, an octave and a half above the highest ordinary soprano. It will be observed that the lowest note of Gaspar Forster's voice is not much above the pitch at which
the perception of musical tone begins, and that from this note to the upper note of Lucrezia Ajugari there is a range of nearly six octaves, whilst the extreme range of ordinary voices, from the lowest bass to the highest soprano, is a little over three octaves. It is the first term of this set that, as the range of the ear for the perception of musical tone is from do to do, or from about 32 to 33,768 vibrations per second—eleven octaves.

3. The Voice Registers.—The voice has been divided by writers into three registers—the lower or chest, the middle, and the small or head register. In singing, the voice changes in volume and in quality in passing from one register into another. There is remarkable diversity of opinion as to what happens in the larynx in passing through the various registers. There has been much discussion as to the production of falsetto tones. Lehfeldt and Johannes Müller held that a weak blast of air caused only a portion of the cords, as regards length, to vibrate; M. J. Ortel noticed that when a falsetto tone is produced nodal lines are formed in the cords parallel to their edges, an observation supporting the first contention; M. Garcia was of opinion that as the voice rose in pitch into falsetto only the ligamentous edges of the cords vibrated; and W. R. E. Hodgkinson showed, by dusting finely powdered indigo into the larynx and observing the blue specks with the laryngoscope, that "... in the deeper note of the lower register, a margin extended from the thyroid cartilage in front to a point behind the junction of the ligamentous and cartilaginous portions of the cord." In singing falsetto tones these additional parts are not thrown into action. Some remarkable and instructive photographs obtained by French show that in proceeding from the lowest to the highest notes of the lower register the cords became lengthened by one-eighth of an inch in a contralto singer's larynx; the same singer, in passing into the middle register, showed a shortening of the cords by one-sixteenth of an inch, and another increase in length of from one-eighth to one-quarter of an inch, giving a much more rapidly pulsating tone in the production of falsetto tones.

4. Condition of the Larynx in the Various Registers.—In singing, one can readily observe that the tone may appear to come chiefly from the chest, from the throat, or from the head, or it may show the peculiar quality of tone termed falsetto. Authorities differ much in the nomenclature applied to these varieties of the voice. Thus the old Italian music masters spoke of the voce di petto, voce di gola and voce di testa. Madame Seiler describes five conditions, viz., the first series of tones of the chest register, the second series of tones of the chest register, the register of the false cord, the second series of tones of the false cord register, and the head register. French writers usually refer to two registers only, the chest and the head; whilst Behnke gives three registers for male voices (lower thick, upper thick and upper thin) and five for the voices of women and children (lower thick, upper thick, lower thin, upper thin and small). These distinctions are of more importance practically than as implying any marked physiological differences in the mechanism of the larynx during the production of the tones in the different registers. By means of the laryngoscope it is possible to see the rima glottidis in the cords in passing through all the range of the voice.

In 1807 Bozzini first showed that it was possible to see into the dark cavities of the body by illuminating them with a mirror, and in 1829 W. Babington first saw the glottis in this way. In 1834 Garcia investigated his own larynx and that of other singers, and three years later Türek, and especially J. N. Czernak, perfected the construction of the laryngoscope. In 1883 Lennox Brownie and Emil Behnke obtained photographs of the glottis in the living man. The laryngoscope is a small mirror, about the diameter of a pencil, fixed to the end of a long handle at an angle of 125° to 130°. This mirror is gently pressed towards the back of the throat, and if sufficient light is thrown into the mouth from a lamp, and if the eye of the observer be in the proper position, by aiming the small mirror it is not difficult to get a view of the glottis. The light from the lamp is reflected by the mirror down on the glottis; from this to the reflected back to the mirror, and then by the mirror it finally reflected to the eye of the observer. Usually the observer has in front of his eye a mirror by which a powerful beam of light can be thrown from a lamp into the mouth and throat. In the centre of the mirror there is a small hole through which the eye of the observer sees the image in the small mirror at the back of the throat. By placing a second plane mirror in front of the face, an observer can easily make the observation of his own vocal cords.

Suppose the picture of the larynx to be examined in the small mirror at the back of the throat, an image will be seen as in Fig. 4. During calm breathing, the glottis is lance-shaped, between the yellowish white cords. A deep inspiration causes the glottis to open widely, and in favourable circumstances one may look into the trachea. When a sound is to be made, the vocal cords are brought close together, either along their whole length, as in Fig. 7, or only along the ligamentous portion, the space between the arytenoids being still open, as in Fig. 8. Then when the sound begins the...
strengthened by the resonance of the air in the air-passages and in the pharyngeal and oral cavities. If mixed—that is, give a special character to the sound; and in the case of a vowel tone the pitch does not appear to depend on that of the fundamental tone but on the pitch of the resonance cavity, as adjusted for the sounding of any particular vowel. When vowels to pronunciation or singing a vowel the oral cavity must be adjusted to a certain form, and it is only when it has that form that the vowel can be sounded. The nature of vowel tones has been investigated by means of the phonograph by Flemming Jenkin and Ewing, L. Hermann, Pipping, Boeke, Lloyd, McKendrick and others. E. W. Scripture has worked with the gramophone. These observers may be ranged in two divisions—those who uphold the theory of relative as opposed to those who contend for the theory of fixed pitch. Assuming that a vowel is always a compound tone, composed of a fundamental and partials, those who uphold the relative pitch theory state that if the pitch of the fundamental is changed the pitch of the partials must undergo a relative change, while their opponents contend that whatever may be the pitch of the tone produced by the larynx, the pitch of the partials that gives quality or character to a vowel is always the same, or, in other words, vowel tones have a fixed pitch. Helmholtz held that all the partials in a vowel tone were harmonic to the fundamental tone, that is that their periods were simple multiples of the period of the fundamental tone. Hermann, however, has conclusively shown that many of the partials to pronunciation or singing are inharmonic to the fundamental. This practically upsets the theory of Helmholtz. The methods by which this problem can be investigated are mainly two. The pitch of the oral cavity for a given vowel may be experimentally determined, or an analysis may be made of the curve-forms of vowels on the wax cylinder of the phonograph or the disk of the gramophone. By such an analysis, according to Fourier's theorem, the curve may be resolved into the partials that take part in its formation, and the intensity of those partials may be thus determined. The observations of Donders, Helmholtz, König and others as to the partials of the resonating cavity have yielded the different results. Greater success has followed the attempts made by Hermann, Boeke, McKendrick, Lloyd and Marichelle to analyse the curves imprinted on the phonograph. (Examples of such phonograms are given by McKendrick in the article on "Vocal Sounds" in Schäfer's Physiologie, ii. 1228; see also PHONOGRAPH.)

The following is an instructive analysis by Boeke of the curves representing the tones of a cornet, and it illustrates the laws that govern the production of quality in such an instrument:

Note
1. 1 2 3 4 5 6 7 8 9 10 Partials.

C. F. C. Donders has given a third result, differing from each of the above; and there is little doubt that much will depend on the quality of tone peculiar to different nationalities. By means of Koenig's manometric flames with revolving mirror the varying quality of tone may be illustrated: with a pure tone, the teeth in the flame-picture are equal, like the serrations of a saw, whilst usually the tone is mixed with partials which show themselves by the unequal serrations. Thus quality of voice depends, not merely on the size, degree of elasticity and general mobility of the vocal cords, but also on the form of the resonating cavities above, and very slight differences in these may produce striking results.

6. Vowel Tones.—A vowel is a musical tone produced by the vibrations of the vocal cords. The tone produced by the vocal cords is a mixed one, composed of a fundamental and partials, and certain of the partials are strengthened by the resonance of the air in the air-passages and in the pharyngeal and oral cavities. In this respect the quality of the human voice depends on the same laws as those determining the quality or timbre of the tones produced by any musical instrument. The pitch of the note of a musical instrument, however, depends on the pitch of the first or fundamental tone, while the partials are added with greater or less intensity so as to
partials reinforced we obtain the pitch of the mean resonance. Lloyd applies this method to the foregoing figures as follows:—

\[
\begin{array}{cccc}
\text{Partials.} & \text{Reinforced.} & \text{Mean.} & \text{Pitch in Complete Vibration.} \\
\hline
\text{f} & \text{170-6 vibs.} & 4-6 & 4-96 & 846 \\
\text{c} & \text{350} & 3-4 & 3-39 & 886 \\
\text{g'} & \text{38-8 vibs.} & 2-4 & 2-82 & 1084 \\
\text{c} & \text{390} & 1-3 & 2-04 & 1307 \\
\end{array}
\]

This analysis shows: (1) that the man’s resonance rises slightly (half-semitone) in ascending seven semitones in the middle of his register; (2) that the boy’s resonance rises three semitones in ascending nine semitones in the upper half of his register; and (3) in the mid-register the boy’s resonance is to the man’s as 5:14. Thus, as we sing a vowel in an ascending scale the pitch of the oral cavity slightly changes, or, in other words, the pitch of the resonating cavity for a given vowel may be slightly altered.

It would appear that both theories are partially true; they are not mutually exclusive. The view of Donders that each vowel has an oral cavity of unchanged and fixed pitch is too exclusive, and, on the other hand, it cannot be denied that each vowel has a predominant partial or predominant partials which give it a definite character, and which must be produced by the oral cavity as a whole, or by the double resonance of portions of the cavity, as suggested by Lloyd. As we sing a vowel in an ascending scale the form of the resonance cavity may slightly change, but not sufficiently to alter the quality of the vowel. Thus we still detect the vowel tone. A singer almost instinctively chooses such vowels as best suit the resonating arrangements of his or her voice, and avoids vowels or vowel combinations which would lead to the production of notes of inferior quality.

**VOIRON,** a town of France in the department of the Isère. Pop. (1901) 13,625. It stands at a height of 950 ft., on the Morge (a tributary of the Isère). It is a manufacturing town, and contains numerous factories which produce a sort of cloth named after the town, and also silk-weaving factories (2000 looms, with an annual output of eight to nine million yards). There are also paper-making factories in the town. The fine church of St Bruno was built 1864–73 at the expense of the monks of the Grande Chartreuse. Voiron is the starting-point of the steam tramways to St Laurent du Pont, 12 m. (for the Grande Chartreuse), and to Charavines, 10 m. (for the Lac du Bourget). Long formed part of Savoy, but in 1355 it was exchanged (with the rest of the region between the Rhône and the Isère, watered by the Guiers Mort) by the count with France for Faucigny and Gex.

**VOISENON, CLAUDE HENRI DE Fuzée, ABIÉ DE (1768–75),** French dramatist and man of letters, was born at the château of Voisenon near Melun, on the 8th of July 1768. At the age of ten he addressed an epistle in verse to Voltaire, who asked the boy to visit him. From this introduction dated a friendship that lasted for fifty years. Voisenon made his début as a dramatist with *L’Heureuse réconciliation* in 1782, followed in 1759 by a three-act comedy *L’École du monde* at the Théâtre français. This was preceded by a verse prologue, *L’Ombre de Molière*, and a month later Voisenon produced a criticism on his own piece in *Le Retour de l’ombre de Molière*. A duel in which he was the aggressor inspired him with remorse, and he entered the priesthood, becoming vicar-general to the bishop of Boulogne. He received the abbey of Jardin, which made no demands on him. He became closely attached to Madame du Châtelet, the mistress of Voltaire (q.v.), and was intimate with the comte de Caylus and Mademoiselle Quinault Dufresne. He was not made witty but by no means edifying contributions to the *Beaunes de Saint-Jean*, the *Bais de Bois*, &c. In 1744 he produced the *Mariages assortis* and in 1746 his masterpiece, the *Coquette fixée*. He lived on terms of the closest intimacy with Charles Simon Favart and his wife. His pen was always at the service of any of his friends, and it was generally supposed, though on insufficient grounds, that he had a considerable share in Favart’s most successful operas. Voisenon had, strange to say, scurples all his life about the incongruity between his way of living and his profession, but he continued to write indelent stories for private distribution, and wrote verses in honour of Madame du Barry, as he had done for Madame de Pompadour. He was elected to the Academy in 1762. On the disgrace of his patron, the duc de Choiseul, he lost his pensions and honours, but soon recovered his position. He was intimate with the chancelor Maupou, and was suspected of writing on his behalf in defence of the abolition of the parliament. This and some other incidents brought him into general disgrace. Early in 1775 he retired to the château of Voisenon, where he died on the 22d of November of the same year.

**VOISIN, GEORGES complices were published by his executors, Madame de Turpin, in 1781.**

**VOITRE, VINCENT** (1596–1648), French poet, was the son of a rich merchant of Amiens. He was introduced by a school-fellow, the comte d’Avaux, to Gaston d’Orléans, and accompanied him to Brussels and Lorraine on diplomatic missions. Although a follower of Gaston, he won the favour of Richelieu, and was one of the earliest academicians. He also received appointments and pensions from Louis XIII. and Anne of Austria. He published nothing in book form, but his verses and his prose letters were the delight of the coteries, and were considered abou the best and admired work in honour of any contemporary. He had been early introduced to the Hôtel de Rambouillet, where he was the especial friend of Julie d’Angennes, who called him her “dwarf king.” His ingenuity in providing amusement for the younger members of the circle ensured his popularity, which was never seriously threatened except by Antoine Godeau, and this rivalry ceased when Richelieu appointed Godeau bishop of Grasse. When at the desire of the duc de Montausier nineteen poets contributed to the *Guirlande de Julie*, which was to decide the much-feted wedding of the Comte de Guise to take part. The quarrel between the Uranistes and the Jobelins arose over the respective merits of a sonnet of Voiture addressed to a certain Uranie, and of another composed by Isaac de Benserade, till then unknown, on the subject of Job. Another famous piece of his of the same kind, *La Belle Molineuse*, is less exquisite, but still very admirable, and Voiture stands in the highest rank of writers of *vers de société*. His prose letters are full of lively wit, and, in some cases, as in the letter on Richelieu’s policy (Letter LXXIV.), show considerable political penetration. He ranks with Jean de Balzac as the chief director of the reform in French prose which accompanied that of Malherbe in French verse. Voiture died at the outbreak of the Fronde, which killed the society to which he was accustomed, on the 26th of May 1648.

VOIVODE—VOLCANO

VOIVODE (also Vauvode, Vayvode, Wayvode, &c., Med. Gr. βοιώτος), a title in use among certain Slavonic peoples, meaning literally "leader of an army" (Sl. voj, host, army; voiditi, to lead), and so applied at various periods and in various eastern European countries to rulers, governors or officials of varying degree. It is best known as the title of the princes of Moldavia and Wallachia. In these states the title remained in use from the earliest times until 1638 in the case of the first state, and until 1716 in that of the second, when it gave way to EYBENE. During the period of Hungarian domination of Transylvania (1000-1526) it was governed by a voivode as an Hungarian province, the last voivode raising himself to the position of an independent prince. It was used, and used, in Germany in common, and advocated the greatest possible simplification of grammar and vocabulary. The divergence of views between the inventor and his colleagues became more and more marked; and after the third congress the breach between M. Schleyer and the Volapük Academy (founded at the second congress in 1887) became a definite one: the director of the Academy proposed a totally new scheme of grammar, and other members proposed others, although one of the objects of the foundation of the Academy was the presentation of the integrity of the language. A new director, Mr. Rosenberger of St Petersburg, was elected in 1885; and from this moment the Academy dissociated itself from Volapük.

VOLOKON, the first artificial language (see Universal Languages) that had any measure of practical success. First published in 1880, it was the work of J. M. Schleyer (b. 1839), a south-German priest. Volapük is not, like the earliest attempts of the kind, an a priori language, but is based mainly on English, the rest of the vocabulary being made up from Latin and the Romance languages. The borrowed words are reduced to a monosyllabic form and are often altered in a very arbitrary manner. Thus the name Volapük itself is made up of the two English words, world and speak, the first in the genitive, the three vowels, a, e, i, being used to express the three cases, genitive, dative and accusative respectively; the nominative is expressed by the bare root, and s is added to form the plural. The grammar of Volapük is therefore partly borrowed, like the vocabulary, partly original. Adjectives end in -ik. The persons of the verb are indicated by adding the pronouns of "I," or "thou," om "he," &c., plural obs "we," &c.; the tenses and the passive are indicated by prefixes, the moods by suffixes following the person-endings, many other inflections being used as well, so that the Volapük verb boasts of no less than 952,440 different forms. Although founded on English, Volapük is mainly German in structure. It gets rid of the German word-order and the irregularities of German grammar, but it is often impossible to understand a Volapük text without thinking in German. The following is a specimen of the language:

Lōb kemens valik volik loliik, patiko etis peukiwik, kels konfids Volapūks, a bale medis glekñik nesetanetan.

"I love all my fellow-creatures of the whole world, especially those cultivated (ones) who believe in Volapük as (being) one of the greatest means of nation-binding."

Here konfids governs the dative just as its German equivalent does, and "cultivated" is used in the sense of the German geistes.

The history of Volapük has an interest greater than that of the language itself. It has proved (1) that people in general are ready to adopt an artificial language, and (2) that an artificial language is easier to learn than any national language, and supplies an efficient means of communication between those who have no other language in common. Volapük had no special philological merits to recommend it; yet, after a few years' incubation in south Germany, it spread, first to France (about 1885) and then in a few years over the whole civilized world, so that in 1889, when the third Volapük congress met at Paris, there were 283 Volapük societies all over the world, and the total number of Volapük students was estimated at over a million. At this congress every one—even the waiters—spoke Volapük, and the permanent triumph of the language seemed certain. But the year of its zenith was the beginning of a decline even more rapid than its rise. It fell to pieces through dissensions in its own camp, the first cause of which was the opposition of the inventor to those of his disciples who aimed at making the language mainly an instrument of communication, and advocated the greatest possible simplification of grammar and vocabulary. The divergence of views between the inventor and his colleagues became more and more marked; and after the third congress the breach between M. Schleyer and the Volapük Academy (founded at the second congress in 1887) became a definite one: the director of the Academy proposed a totally new scheme of grammar, and other members proposed others, although one of the objects of the foundation of the Academy was the presentation of the integrity of the language. A new director, Mr. Rosenberger of St Petersburg, was elected in 1885; and from this moment the Academy dissociated itself from Volapük.

VOLCA, a Celtic people in the province of Gallia Narbonensis, who occupied the district between the Garumna (Garonne), Cerhenna mons (Cévennes), and the Rhodanus (or even farther to the east in earlier times), corresponding roughly to the old province of Languedoc. They were divided into two tribes, the Arecomici on the east and the Tectosages (whose territory included that of the Tolosates), on the west, separated by the river Ararius (Hérault) or a line between the Arauris and Orbis (Orbe). The Volcae were free and independent, had their own laws, and possessed the jus Latii. The chief town of the Tectosages was Tolosa (Toulouse); of the Arecomici, Nemausus (Nîmes); the capital of the province and residence of the governor was Narbo Martius (Narbonne). It was said that there was an earlier settlement of Volcae Tectosages near the Hercynia Silva in Germany; Tectosages was also the name of one of the three great communities of Gauls who invaded and settled in Asia Minor in the country called the Volcanic. The name seems to have been applied originally to Etna and some of the Lipari Islands, which were regarded as the seats of Hephaestus, a Greek divinity identified with Vulcan, the god of fire in Roman mythology. All the phenomena connected directly or indirectly with volcanic activity are comprised under the general designation of vulcanism or vulcanicity—words which are also written less familiarly as volcanism and volcanicity; whilst the study of the phenomena forms a department of natural knowledge known as vulcanology. Vulcanicity is the chief superficial expression of the earth's internal igneous activity.

It may happen that a volcano will remain for a long period in a state of moderate though variable activity, as illustrated by the normal condition of Stromboli, one of the Lipari Islands; but in most volcanoes the activity is more decidedly intermittent, paroxysms of greater or less violence occurring after intervals of comparative, or even complete, repose. If the period of quiescence has been very protracted, the renewed activity is apt to be exceptionally violent. Thus, Krakatoa before the great eruption of 1883 had been dormant for something like two centuries, and it is believed that the Japanese
VOLCANO

By far the greatest proportion of the vapour is steam, which sometimes occurs almost to the exclusion of other gaseous products. Such, at least, is the usual and probably correct view, though it is opposed by A. Brun, who regards the volcanic vapours as chiefly composed of chlorides with steam in only subordinate amount. In the case of a mild eruption, like that occurring normally at Stromboli, the vapours may be discharged in periodical puffs, marking the explosion of bubbles rising more or less rhythmically from the seething lava in the volcanic cauldron. S. Wise observed at the volcano of Sangay, in Ecuador, no fewer than 267 explosions in the course of an hour, the vapour here being associated, as is so often the case, with ashes. During a violent eruption the vapour may be suddenly shot upwards as a vertical column of enormous height, penetrating the passing clouds. For a short distance above the vent the superheated steam, striking April 1906, the transparent vapour, but it soon suffers partial condensation, forming clouds, which, if not dispersed by winds, accumulate over the mountain. When the vapour is free from ash it forms rolling balls of fleecy cloud, but usually it carries in mechanical association more or less finely divided lava as volcanic dust and ashes, whereby it becomes yellow, brown, or even black, sometimes as foul as the densest smoke. In a calm atmosphere the dust-laden vapour may rise in immense rings with a.rotatory movement, like that of vortex-rings. Frequently the vapours, emitted in a rapid succession of jets, form cumulus clouds. In the eruption of Vesuvius in April 1906 the steam and dust rose to a height of between 6 and 8 m.

At Krakatoa in 1883 the column of vapour and ashes reached an altitude of nearly 20 m.; whilst it was estimated by some authorities that during the most violent explosions the finely divided matter must have been carried to an elevation of more than 30 m. The emission of vast volumes of vapour at high tension naturally produces much atmospheric disturbance, often felt at great distances from the centre of eruption.

Electrical Excitement.—It is probably to the upwelling current of vapour that much of the electrical excitement which invariably accompanies an eruption may be referred. The friction of the steam rushing in jets through the volcanic vent must produce electrical disturbance, and indeed an active volcano has been aptly compared to a hydroelectric machine of gigantic power. Another cause of excitement may be found in the mutual friction of the ejected cinders and ashes as they rise and fall in showers through the air. Much trituration of volcanic material may go on in the crater and elsewhere during the eruption, whereby the solid lava is reduced to a fine dust. Other means of generating electricity are found in the chemical reactions produced in the passage and transformation of the emitted vapour. L. Palmieri, in the course of his investigations at the observatory on Vesuvius, found that the vapours free from cinders carried a positive charge, whilst the cinders were negative.

The electrical phenomena attending an eruption are often of great intensity and splendour. The dark ash-laden clouds of vapour are shot through and through by volcanic lightning, sometimes in rapid horizontal flashes, then in oblique forked streaks, or again in tortuous lines compared to fiery serpents, whilst the borders of the cloud may be brilliant with electric scintillations, often forming balls and stars of fire. During the great eruption of Krakatoa remarkable phenomena were observed by ships in the Strait of Sunda, luminous balls like “St Elmo’s fire” appearing at the mast-heads and the
VOLCANO

yard-arms, whilst the volcanic mud which fell upon rigging and deck was strongly phosphorescent.

Quite distinct from any electrical phenomena is that intermittent reddish glare which is often seen at night in clouds hanging over an active crater, and which is simply a glow due to reflection from the incandescent lava and stones in the volcanic cauldron below.

Volcano Rain or Mud.—The condensation of the vast volumes of steam exhaled during an eruption produces torrentes of rain, which, mingling to a greater or less extent with the volcanic ashes, forms a hot muddly stream known in Italy as lava d’acqua and lava di fango, and in South America as maya. Deluges of such mud-lava may rush violently down the mountain-side and spread over the neighbouring country with terribly destructive effect, whence they are greatly dreaded by those who dwell at the base of a volcano. The solidified volcanic mud, often mingled with larger fragments of lava, is known as tuff or tuja. Herculanenum was buried beneath a flood of mud swept down from Vesuvius during the Plinian eruption of 79, and the hard tuffaceous crust which thus sealed up the ill-fated city came in turn to be covered by lava-flows from subsequent eruptions: hence the difficulty of excavating at Herculaneum compared with similar work at Pompeii, where there was probably much less mud, since the city, having been at a greater distance from the volcanic centre, was overwhelmed in great measure by loose ashes, capable of removal with comparative ease.

It often happens that the volcanic mud is formed by the mingling of hot ashes not directly with rain but with water from streams and lakes, or even, as in Iceland, with melted snow. A torrent of mud was one of the earliest symptoms of the violent eruption of Mont Pelée in Martinique in 1902. This mud had its source in the Etang Sec, a crater-basin high up on the S.W. side of the mountain. By the explosive discharge of ashes and vapours mingled with the water of the tarn there was produced a vast volume of hot muddy matter which on the 5th of May suddenly escaped from the basin, when a huge torrent of boiling black mud, charged with blocks of rock and moving with enormous rapidity, rolled like an avalanche down the gorge of the Rivière Blanche. If a stream of lava obstracts the drainage of a volcano, it may give rise to floods.

Ejected Blocks.—When a volcano after a long period of repose starts into fresh activity, the materials which have accumulated in the crater, including probably large blocks from the disintegration of the crater-walls, have to be ejected. If the lava from the last eruption has consolidated as a plug in the throat of the volcano, the conduit may be practically closed, and hence the first effect of the renewed activity is to expel this obstruction. The hard mass becomes shattered by the explosions, and the angular fragments so formed are hurled forth by the outrushing stream of vapour. When the discharge is violent, the vapour, as it rushes impetuously up the volcanic duct, may tear fragments of rock from its walls and project them to a considerable distance from the vent. Such ejected blocks, by no means uncommon in the early stages of an eruption, are often of large size and naturally vary according to the character of the rocks through which the duct has been impelled. They may be irregular masses of loose rocks, possibly lavas of earlier eruptions, or they may be stratified, sedimentary and fissiliferous rocks representing the platform on which the volcano has been built, or the yet more deeply seated fundamental rocks. By Dr. H. J. Johnston-Lavis, who specially studied the ejected blocks of Vesuvius, the volcanic materials broken from the cone are termed “accessory” ejecta, whilst other fragmentary materials he conveniently calls accidental products, leaving the term “essential” ejecta for plastic lava, ashes, crystals, &c. Masses of Cretaceous or Apenine limestone ejected from Somma are scattered through the tuffs on the slopes of Vesuvius; and objects carved in such altered limestone are sold to tourists as “lava” ornaments.

Under the influence of volcanic heat and vapours, the ejected blocks suffer more or less alteration, and may contain in their cavities many crystallized minerals. Certain blocks of sandstone ejected occasionally at Etna are composed of white granular quartz, permeated with vitreous matter and encased in a black scoriaceous crust of basic lava.

A rock consisting of an irregular aggregation of coarse ejected materials, including many large blocks, is known as a “volcanic agglomere.” Any fragment of matter discharged from a volcano may form rocks which are described as “pyroclastic.”

Cinders, Ashes and Dust.—After the throat of a volcano has been cleared out and a free exit established, the copious discharge of vapour is generally accompanied by the ejection of fresh lava in a fragmentary condition. If the ejected masses bear obvious resemblance to the products of the hearth and the furnace, they are known as “cinders” or “scoriae,” whilst the small cinders not larger than walnuts often pass under their Italian name of “lapilli” (q.v.) When of globular or ellipsoidal form, the ejected masses are known as “bombs” (q.v.) or “volcanic tears.” Other names are given to the smaller fragments. If the lava has become granulated it is termed “volcanic sand”; when in a finer state of division it is called ash, or if yet more highly comminuted it is classed as dust; but the latter terms are sometimes used interchangeably. The pulverized material, consisting of lava which has been broken up by the explosion, or triturated in the crater, is often discharged in prodigious quantity, so that after an eruption the country for miles around the volcano may be covered with a continuous layer of fine ash and dust. Although much of this is a mixture of snow, but often of greyish colour, looking rather like Portland cement, and in many cases becoming reddish by oxidation of the ferruginous constituents. Even when first ejected the ash is sometimes cocoa-coloured. This finely divided lava insinuates itself into every crack and crevice, reaching the interior of houses even when windows and doors are closed. A heavy fall of ash or cinders may cause great structural damage, crushing the roofs of buildings by sheer weight, as was markedly the case at Ottajano and San Giuseppe during the eruption of Vesuvius in 1782. On the other hand, the ejecta from the sides of the volcanic cone like an avalanche, forming great ash-slides with ridges and furrows rather like barrancos, or ravines, caused by rain. The burial of Ottajano and San Giuseppe in 1906 by Vesuvian ejecta, mostly lapilli, has been compared with that of Pompeii in 79.

Deposits of volcanic sand and ashes retain their heat long after ejection, so that rain will cause them to evolve steam, and if the ground is dry the moisture and sudden it may produce explosions with emission of great clouds of vapour. The fall of ash is at first prejudicial to vegetation, and is often accompanied or followed by acid rain; but ultimately the ash may prove beneficial to the soil, chiefly in consequence of the alkalies which it contains. The “May dust” of Barbados was a rain of volcanic ash which fell in May 1812 from the eruption of the Soufrière in St. Vincent. It is estimated that the amount of dust which during this eruption fell on the surface of Barbados, 100 m. distant from the eruptive centre, was about 3,000,000 tons. The distance to which ash is carried depends greatly on the atmospheric conditions at the time of the eruption. Ashes from Vesuvius in an eruption in the year 472 were carried, it is said, as far as Constantinople. During an eruption of Cotopaxi, on the 3rd of July 1880, observed by E. Whymer, an enormous cloud of dust and ashes was discharged between 20 and 30,000 ft. above sea-level, which it was dispersed by the wind over a very wide area. It is believed that the amount of dust in this discharge must have been more than 2,000,000 tons. Enormous quantities of dust ejected from Krakatoa in 1883 were carried to prodigious distances, samples having been collected at more than 2,000 miles from the volcano; whilst the very fine material in ultramicroscopic grains which remained suspended for months in the higher regions of the atmosphere seems to have enjoyed an almost perpetual circulation, wandering far beyond all previous limits of distribution and have been responsible for the remarkable sunsets at that period.

The ash falling in the immediate vicinity of a volcanic vent will generally be carried to considerable distances, and is termed “fallen ash” as they are wafted through the air under a kind of sifting. Professor J. W. Judd, who made an exhaustive examination of the products of the eruption of Krakatoa, found that the dust near the volcano was comparatively coarse, dense and rather dark-coloured, in consequence of the presence of numerous fragments of
VOLCANO

181

heavy, dark, crystalline minerals, whilst the dust at a distance was excessively fine and perfectly white. According to this observer, the "invasing" of the pumice, ash, and dust continued from day to day, forming a thin and continuous layer of white dust. The finely comminuted material, carried to a great height in the atmosphere, consisted largely of delicate threads and atmospbheric vapour, with occasional coarse quartz dust. The ashes and dust were found to have fallen from the air at the rate of three months during which the eruption lasted, the quantity of finely pulverized material must have been enormous; yet the amount of ejected matter was probably very much less than that extruded during some other historical eruptions, such as that of Tomboro in Sumbawa, in 1815. The explosions at Krakatoa were, however, exceptionally violent, having been sufficient to project fragments of rock upwards of 3 miles, and it is said that the flame has been observed to have been at least 30 m. It is usually impossible during a great eruption to determine the height of the column of "smoke," since it hangs over the country as a pall of darkness.

The great black cloud, which was so characteristic a feature in the terrible eruptions in the West Indies in 1902, was formed of steam with sulphur dioxide and other gases, very heavily charged with incandescent sand or dust, forming a dense mixture that in some respects behaved like a liquid. Unlike the Krakatoa dust, which was derived from a vitreous pumice, the solid matter of the black cloud was largely composed of fragments of crystalline minerals, the bulk of which was vitreous, and the smoke cloud of ashes and dust. On the afternoon of the 17th of May 1902, the solid matter ejected from the Soufrière of St Vincent amounted to several billions of tons, and that some of the dust fell at distances more than 100 miles from the vent, is attested by many observers.

In Mexico and Central America, under the favourable influence of warmth and moisture, rich soils are rapidly formed by the decompositions of the ashes. These contain a large part of the ashes, but are covered with thick deposits of volcanic dust, partly from recent eruptions but principally from volcanic activity in geologic time. The dust is used in the arts as an abrasive agent.

Lava.—The volcanic cinders, sand, ashes and dust described above are but varied forms of solidified lava. Lava is indeed the most characteristic product of volcanic activity. It consists of mineral matter which, or has, in a molten state; but the liquidity is not due to simple dry fusion. The magma, or subterranean molten matter, may be regarded as composed essentially of various silicates, or their constituents, in a state of mutual solution, and heavily charged with certain vapours or gases, principally water-vapour, superheated and under pressure. In consequence of the peculiar constitution of the magma, the order in which minerals separate and solidify from it is determined by a law of physical chemistry, concerning the order of their relative fusibility. The lava differs from the magma before eruption, inasmuch as water and various volatile substances may be expelled on extrusion. The rapid escape of vapour from the lava contributes to the explosive phenomena of an eruption, whilst the rate at which the vapour is disengaged depends largely on the viscosity of the magma.

The lava on its immediate issue from the volcanic vent is probably at a white heat, but the temperature is difficult of determination since the molten matter is usually not easy of approach, by reason of the enshrouding vapour. Determinations of temperature are generally made at a short distance from the exit, when the lava has undergone more or less cooling, or on a small stream from a subordinate vent. A. Bartoli, using a platinum electric resistance pyrometer, found that a stream of lava near a bocca, or orifice of emission, on Etna, in the eruption of 1891, had at a depth of one foot a temperature of 1060° C. In this case, it is evident that independent of cooling, iron and copper have frequently been melted. Probably the lava at the surface of the stream has a temperature of something like 1100° C., but this must not be assumed to be its temperature at the volcanic focus. C. Doelter, in some experiments on the melting-point of lava by means of an electric furnace, found that a lava from Etna softened at from 962° to 975° C. and became fluid at 1010° to 1040°, whilst a Vesuvian lava, not unfrequently a gushy fluid, was melted by the silver and gold of the latter. These results were obtained at ordinary atmospheric pressure, but it has been assumed that the melting-point of lava at a great depth would, through pressure alone, exceed that obtained in the laboratory. On the other hand, the solidification of Volcanic glass falls the tinier point, and hence the extruded lava from which these have largely escaped may be much less fluid.

Determinations of the melting-points of various glasses formed by the fusion of certain igneous rocks have been made by J. A. Douglas, with the molderm of Professor J. Joly. The results give temperatures ranging from 1260° C. for rhyolite to 1790° for dolerite from the Clee Hills in Shropshire. The melting-points of the rocks are usually lower than those of the corresponding rocks in a crystalline state.

It should be noted that all determinations of the melting-points of natural glasses and rocks are of necessity approximate, since the physical state of the material are liable to considerable error, and a more accurate method seems to be that of determining the point at which absorption of heat abruptly occurs—the latent heat of fusion. This has been done in the refined investigations by Mr. A. H. Geikie and his colleagues in the Geophysical Laboratory of the Carnegie Institution at Washington.

It is believed that the temperature of lava in the volcanic conduit may in some cases sufficiently to fuse the glass and so melt out a passage through the magma and rock thus dissolved in the magma will not be without influence on the character of the ultimate eruption. When it becomes more superficial.

Many interesting observations are on record regarding the heating effect of lava on metals and other objects with which it may have come in contact. Thus, after the destruction of Torre del Greco by a current of lava from Vesuvius in 1794, it was found that brass in the houses under the lava had suffered decomposition, the copper having become crystallized; whilst silver had been not only fused but sublimed. This indicates a temperature of upwards of 1000° C. Panes of glass in the windows at Torre del Greco on the same occasion suffered devitrification.

Notwithstanding the high temperature of lava on emission, it can, in some cases, become so cooled down as to be able to form vegetable shapes. This partial solidification of vegetable shapes may be involved in a lava-flow without being entirely destroyed. A stream of lava on entering a wood, as in the sylvan region on Etna, may burn up the underlying growths, and in some cases of the lava has been seen to flow under the trunks of trees.

On Vesuvius a lava-flow has been observed to surround trees while the foliage has been apparently uninjured. A vertical trunk of a tree may be enveloped in a sheet of lava and emerge, as at Grimon in the Isle of Mull, as described by Sir A. Geikie and others. Plant-remains in basalt from the Bo'ness coalfield in Linlithgowshire have been noticed by H. M. Cadell, and attention has been called to similar occurrences from French basalt, from which shows the impression of cars of maize and even relics of the actual grains. In consequence of the slow transmission of heat by solid lava, the crust on the surface of a stream may be crossed without serious injury whilst the pointed projections of the underlying magma may be burst by the weight of the overlying lava. Lichens may indeed grow on a lava which remains highly heated in the interior.

Solidified surface of a sheet of lava may be smooth and shining, sometimes quite satiny in sheen, though locally wrinkled and perhaps evenropy or hummocky, the irregularities being mainly due to superficial movement after partial solidification. The "corded lava" has a surface similar to that often seen on blast-furnace slag, and is suggestive of a turbulent flow. After a lava stream has become crusted over on cooling, the subjacent lava, still moving in a viscous condition, tends to tear the crust, forming great cracks which later contract, and ultimately left in the form of confused heaps, perhaps of considerable magnitude. The front of a stream may present a wall of fragments, and where the lava is of very fluid consistence, the clinkers are carried along, on the surface of the lava, the producers of mutual friction a crushing noise; and the sluggish flow of the lava-stream laden with its burden has been compared with that of a glacier. Once the upper portion of the structure becomes solidified the lower, which is retarded by cooling in contact with the bed-rock, the superficial clinkers are carried forward, and rolling over the end, may become embedded in the lava as it advances. Scoriae formed on the top of a stream may thus find their way to the base. Rock-fragments or other detrital matter occurring in the path of the lava will be caught up by the flow and become involved in the lower part of the molten mass; whilst the rocks over which the lava travels may suffer more or less alteration by the heat of the stream.

The rapidity of a lava flow is determined partly by the slope of the bed over which it moves and partly by the consistency of the lava, the former tending to make the flow slow in portions, the latter being determinative of the rate of setting up of the lava. In an eruption of Mauna Loa, in Hawaii, in 1855, the lava was estimated to flow at a rate of 40 m. an hour; and at an elevation of Vesuvius in 1855 velocity of more than 50 m. an hour, at the moment of emission, was recorded. The rate of flows, however, rapidly checked as the stream advances, the retardation being very marked in small flows. Where lava travels down a steep incline it becomes subject to foaming, and in Hawaii, where a quiet flow over a flat plane favours smoothness. If the lava meet a precipice it may form a cascade of great beauty, the clinkers rapidly rolling down with a clatter, as described by Sir W. Hamilton in his account of the eruption of Vesuvius in 1771, when the fiery torrent had a perpendicular fall of 50 ft.

In Hawaii the smooth shining lava, often superficially waved and layered down as many as 20 or 30 feet, is considered to be termed az. These terms are now used in the general terminology, having been introduced by American geologists. The fields of aa often contain lava-balls and bombs. It may be said that the
VOLCANO

pahoehoe corresponds practically with the Fladen lava of German vulcanologists, and the aa with their Schallen lava. Rugged flows are known in Auvergne as chateurs. The surface of a clinker-field has often a horizontally jointed character, being covered with rough blocks bristling with sharp points. In the case of an obsidian-flow a most dangerous surface is produced by the keen edges and points of the fragmentary volcanic glass.

When an eruption has become crusted over, the underlying magma should flow away, a long cavern or tunnel may be formed. Should the flow be rapid the roof may collapse and the fragments, falling into the lava-stream may become imbedded, or become part of the fused mass. The walls and roof of a lava-cave are occasionally adorned with stalactites, whilst the floor may be covered with stalagmitic deposits of lava. The volcanic stalactites are slender, turned upwards, whilst the fragrant stalagmites are more rounded. Beautiful examples of lava stalactites from Hawaii have been described by Professor E. S. Dana. Caverns may also be formed in lava-flows by the presence of large bubbles, or by the union of several bubbles. It may happen, too, that certain monticules thrown up on the surface of the lava are hollow, of which a famous example is furnished by the Caverne de Rosemond, at the base of Piton Barry, in the Isle of Reunion.

It is of great interest to determine whether molten lava contracts or expands on solidification, but the experimental evidence on this subject is rather conflicting. According to some observers a piece of obsidian lava flows more slowly in the surface of the same state will sink, while according to others it floats. It has often been observed that cakes formed by the natural fracture of the crust on this lava, when plunged in the liquid, sink, and that the fragments are drawn down by convection-currents. On the other hand a solid piece, though denser than the corresponding liquid, may be buoyed up for a time by the viscous condition of the molten lava. Moreover, the presence of minute vesicles may lighten the mass. Although the minerals of a rock-magma may separately contract on solidification it does not follow that the magma itself, in which they probably exist in a state of solution, will undergo any crystallization a similar change of volume. On the whole, however, there seems reason to believe that lava on solidifying almost always diminishes in volume and consequently increases in density.

According to the experiments of C. Doelter the specific gravity of molten lava is invariably less than that of the same lava when solid, though in some cases the difference is but slight. In a vitreous or isotropic condition the lava has a lower density when than crystalline.

The figures are indicated by the following table, where the figures give the specific gravity:

I. From Vesuvius, eruption of 1906; by M. Pisani.

II. | Etna. Mean of several analyses by Silvestri and Fuchs (Mercalli).
III. | StrombolI, 1891; by Ricciardi.
IV. | Krakatoa, eruption of 1883; by C. Winkler.
V. | Mont Pelé, Martinique, eruption of 1902; by M. Pisani.
VI. | Kilauea; Hawaii; by O. Silvestri.

In the course of the life of a volcano, the lava which it emits may undergo changes, within moderate limits, being at one time more acid, and at another more basic. Such changes may be due to a shifting of the axis of eruption. Thus the Etna from the old axis of Trifoglietto in the Valle del Bove were andesites, with absence of silica, but now lava of a hypabyssal type are doleritic, with a silica-content of only about 90%. It seems probable that, to a limited extent, changes in the character of a lava may sometimes be due to contact of the magma with different rocks underground; if these are of an amorphic or semi-amorphic character the weight of the crystals; and the higher the temperature of the magma the greater the corrosion or resorption. Possibly under certain conditions the phenocrysts and the ground-mass may have solidified simultaneously.

In some cases the entire igneous mass assumes a crystalline structure, or becomes holocrystalline. Such a structure is well shown when the magma has solidified at considerable depth, cooling slowly under great pressure, and forming rocks which are termed "plutonic" or "abyssal" to distinguish them from rocks truly volcanic, or those which, if not effusive, like lava-flows, have at least a certain water-transport near to the surface as those of quarry rocks. Volcanic and plutonic lava-flows pass, however, into each other by gradual transition. The dyke-rocks, or intrusive masses, form an intermediate type sometimes distinguished under the name of "hypabyssal" rocks, as suggested by W. C. Brögger. Lava extruded in submarine eruptions may have solidified under a great weight of seawater, and therefore to that extent rather under plutonic conditions.

Chemical Composition of Lava.—Lava are usually classified roughly, from a chemical point of view, in broad groups according to the proportion of silica which they contain. Those in which the proportion of silica reaches 66% or upwards are said to be acid or acid-like; whilst those in which it falls to 55% or below are called basic lavas. The two series are connected by a group of intermediate composition, whilst a small number of igneous rocks of exceptional type have been distinguished, which, as for example, in Reunion, a group of igneous rocks as per-silicic, medio-silicic and sub-silicic, in which the proportion of silica is relatively more than 60%, between 50 and 60, or less than 50%.

The last form consists of various silicates, either crystallized as definite minerals or unindividualized as volcanic glass. In addition, however, to the mineral silicates, a volcanic rock may contain a limited amount of free acid and basic oxides represented by such minerals as quartz and magnetite. Rhyolite may be cited as a typical example of an acid lava, andesite as an intermediate and basalt as a basic lava. The various volcanic rocks are described under their respective headings, so that it is needless to refer here to their chemical or mineralogical composition. It may, however, be useful to cite a few selected analyses of some recent lavas and ashes:

acid and basic lavas, and ending with those of extreme composition, indicating progressive change in the magma.

The old idea of a universal magma, or continuous pyroosphere, has been modified by the discovery of independent volcanic reservoirs. It has been shown that the volcanoes of southern Italy and the neighbouring islands exhibit little or no sympathy in their action, and emit lavas of diverse type. The lavas of Volcano, one of the Lipari Isles, are rhytic, whilst those of Stromboli, Vesuvius, and Mauna Loa in Hawaii, only 20 m. apart, suggests a want of communication between the conduits; and though the lavas are very similar at these two centres, it would seem that they cannot be derived from the same source.

It is believed that the magma in a subterranean reservoir, though originally homogeneous, may slowly undergo certain changes, whereby more basic or more acid lavas migrate to one quarter, whilst the acid segregate in another, so that the channel, at successive periods, may bring up material of different types. The cause of this "magnatic differentiation," which has been the subject of much discussion, is of fundamental importance in any broad study of the genetic relations of igneous rocks.

It has often been observed that all the rocks from a definite igneous centre have a general similarity in a chemical and mineralogical point of view, yet the interaction of their physical properties, as for example, after Professor Ididins, the "consanginuity," and appears to be due to the fact that the rocks are drawn from a common source. Professor Judd pointed out the existence of analogous characteristics among this class of rocks that have been in eruptive activity for a long period of time. Hence, it is generally believed that the lavas are produced from a common magma body that is located in the subearth. The processes by which the lava bodies are formed are generally associated with the Atlantic type of coast-line and sub-alkali lavas with the Pacific type.

While the character of a eruption from a given source are usually brought about very slowly, it has often been suggested that even in the course of a single prolonged eruption, or series of eruptions, the character of the lava may vary to some extent, due to the fact that the mafic and felsic lava are formed in the same area by the evolution of the same magma. Therefore, the lava obtained from the summit of a volcano is generally more basic than that obtained from the lower parts of the volcano.

The volcanic rocks of the world are generally classified into three types: the basic, intermediate, and acid lavas. The basic lavas are the most common and are formed from molten rock that has a high content of magnesium. The intermediate lavas are formed from molten rock that has a moderate content of magnesium and has a composition between that of the basic and acid lavas. The acid lavas are the least common and are formed from molten rock that has a high content of aluminium.

When a stream of lava flows into the sea it no doubt immediately generates a prodigious volume of steam; but this is only a temporary phenomenon, for the lava rapidly becomes chilled by the cold water, with formation of a superficial solid layer, which by its low thermal conductivity itself forms an internal constricting plug. During the time the lava is fluid, it is also in the nature of a huge safety-valve of the steam-boiler. The tension of the elastic fluids being increased by this repression would give rise subsequently to an eruption, since the water-vapour, carrying with it the paroxysmal characteristic of the Krakatoa eruption were due to what he calls a “check and rally” of the subterranean forces. The action in the volcanic conduit has, indeed, been compared with that of a steam-engine.

The downward passage of water through fissures must be confined to the upper portion of the earth’s crust known as the “zone of fracture,” for it is there only that openings are广阔 enough to allow water to percolate through the pores of the rocks, but even the pores are closed at great depths. It was shown many years ago by G. A. Daubree that water could pass to a limited extent through a heated rock against the pressure of steam in the opposite direction.

According to S. Arrenhius, water may pass inwards through the sea-bottom by osmotic pressure. As the melting points of various silicates are lowered by admixture with water, it is possible that the access of surface-water to heated rocks must promote their fusibility. Judd has suggested that the proximity of large bodies of water may be favourable to volcanic manifestation, and that the hydrothermal waters may become readily melted by internal heat and thus yield a supply of lava.

Whilst some of the water-vapour exhaled from a volcano is undoubtedly derived from superficial sources, notably in such volcanic areas as Carlsbad, it is remarkable how little it differs in composition from the water drawn from near-by springs, and the water-vapour which forms the condensation in the cold atmosphere after it has been carried to a very high elevation in the Hawaiian volcanoes, it may be inferred, with sufficient projectile force to toss up the lava in little fountains. If, after being thrown up on a lava-flow, and when vapour escapes from terminal or lateral orifices they are known as “spiracles.” The steam may issue with sufficient projectile force to toss up the lava in little fountains. If, after being thrown up on a lava-flow, and when vapour escapes from terminal or lateral orifices they are known as “spiracles.” The steam may issue with sufficient projectile force to toss up the lava in little fountains.

Vapor Fumes.—It seems not unlikely that the vapours and gases exist in the volcanic magma in much the same way that they can exist in molten metal. It is a familiar fact that certain metals when melted can absorb large volumes of gases without entering into chemical combination with them. Water, for instance, can absorb as much as 20 per cent of its volume of air at 15 minutes’ boiling at 400° by a simple condensation of the water-vapour, and by being contained in a fund of cavities, or by the water-vapour being absorbed from the surface, or by the water-vapour being carried away with the water-vapour of the atmosphere, or by the water-vapour being absorbed by the magma in the solid state. The water, however, is held in the water-vapour in the atmosphere by the air, and when this is absorbed by the magma it is therefore possible that the magma will absorb the water-vapour as well as the gases which it contains.

VOLCANO

has pointed out, similar phenomena have no doubt occurred elsewhere, especially in the Azores. By Drs Tempest Anderson and W. F. Flett, who were commissioned by the Royal Society to report on the phenomena, this type of explosive eruption is distinguished as the "Peléan type." Its distinctive character is found in the sudden emission of a dense black cloud of superheated and suffocating gases, heavily charged with incandescent dust, moving with great velocity and accompanied by the discharge of immense volumes of volcanic sand, which are not rained down in the normal manner, but descend like a hot avalanche. The cloud, with the avalanche, is called by Lacroix a nade Peléenne, or nade ardente, the latter term having been applied to a formation of the type discovered in the Cantal region of France in 1812. In its typical form, the cloud seems to Pelé appeared as a solid bank, opaque and impenetrable, but having the edge in places hanging like folds of a curtain, and apparently of brown or purplish colour. Rolling along like an inky torrent, it produced in its passage intense darkness, relieved by vivid lightning. So much solid matter was suspended in the cloud, that it became too dense to surmount obstacles and behaved rather like a liquid. It has, however, been suggested that its peculiar movement as it swept down the mountain was due not simply to its heavy charge of solids, but partly to the oblique direction of its explosion. After leaving the crater, it underwent enormous expansion, and Anderson and Flett were led to suggest that possibly at the moment of emission it might have been partly in the form of liquid drops, which on solidifying evolved large volumes of gas held previously in occlusion. The deadly effect of the blast seems to have been mostly due to the irritation of the mucous membrane of the respiratory passages by the fine hot dust, but suffocating gases, like sulphur dioxide and sulphuretted hydrogen, were associated with the water-vapour. Possibly the incandescent dust was even hotter than the surrounding vapour, since the latter might be cooled by expansion.

It is said that the black cloud as it swept along was accompanied by an indraught of air, not however sufficiently powerful to check its rapid advance. The current of air was likened by Anderson and Flett to the irrush of air at a railway station as an express train passes. An attempt was made to determine the temperature of the fatal blast which destroyed St Pierre, but without very definite results. Thus it was assumed that as the telephone wires were not melted the temperature was below the fusing-point of copper; possibly, however, the blast may have been hot enough to partially to prevent the effects which might normally be due to its temperature.

Shape of Volcanic Cones.—Those volcanic products which are solid when ejected, or are solidified when they descend, are generally a stack or heap of material, much of which their accumulation around the eruptive vent a hill, which, though generally more or less conical, is subject to much variation in shape. It occasionally happens that the hill is composed wholly of ejected blocks, not themselves of volcanic origin. In this case an explosion has rent the ground, and the effluent vapours have hurled forth fragments of the shattered rock through which the vent was opened, but no ash or other fragmentary volcanic material has been ejected, nor has any lava been poured forth. This exceptional type is represented in the Eifel by certain monticules which consist mainly of fragments of Devonian slate, more or less altered. In some cases the area within a ring of such rock may be occupied by a lake, known in the Eifel as a maar. Piles of fragmentary matter of this character, though containing neither cinders nor lava, may be fairly regarded as volcanic, inasmuch as they are due to the explosive action of hot subterranean vapours.

In the ordinary paroxysmal type of eruption, however, cinders and ashes are shot upwards by the explosion and then descend in showers, forming around the orifice a mound, in shape rather like the diminutive black hills called "pelés" by the Hawaiians. The sides of a cinder cone have, generally a steep slope, varying from 30° to 45°, depending on the angle of repose of the ejectamenta. Excellent examples of small scoria-cones are found among the puy of Auvergne in central France, whilst a mag-

nificent illustration of this type of hill is furnished by Fujiyama, in Japan, which reaches an altitude of 13,000 ft. How such a cone may be rapidly built up was well shown by the formation of Monte Nuovo, near Pozzouli—a hill 400 ft. high and a mile in circumference, which was not noticed until it had been formed in the course of a few days in September 1538. The shape of a cinder cone may be retained for ages, since it is not liable to suffer greatly by denudation, as the rain soak into the loose bulk of material, and it is not subject to the process of incrustation in the duct of a cinder cone, it may, on accumulation in the crater, break down the wall, and thus effect its escape as a steam Cones.

It often happens that the cinders and ashes ejected from a volcano become mixed with water, and so form a paste, which sets readily as a hard tufaceous mass. Such natural tufa is indeed similar to that formed by the eruption of the fumaroles which are formed in volcanic ashes, and is renowned for durability. Although streams of volcanic mud are commonly associated with the ashes of a cinder-cone they may also form independent structures or tuft-cones. These are generally broad-topped hills, having sides with an angle of slope as low in some cases as 15°.

Lava-cones are built up of streams of lava which have consolidated after reaching the surface. Associated with the lava, however, there is usually more or less fragmentary matter, so that the cones are composite in structure and consequently more acute in shape than if they were composed wholly of lava. As the streams of lava flow, they may, as a rule, run at first in a current, either from the centre, or flow from lateral or eccentric orifices, as irregular tongues, and do not generally form continuous sheets covering the mountain. The lava is the sole or chief element in the cone, the shape of the hill is determined to a great extent by the chemical composition and viscosity of the lava, its copiousness and the rapidity of its flow. If it be highly fluid and very mobile, it may spread a great distance before solidifying; if thus formed, it may be pressed into a rounded area and rising perhaps to a great height, but remarkably flat in profile. Were the lava perfectly liquid, it would indeed form a sheet without perceptible slope of surface. As a matter of fact, even very fluid lavas are so fluent as to run down an incline of 1°, and flat cones of basalt have in some cases a slope of only 10° or even less. The colossal mass of Mauna Loa, in Hawaii, forms a remarkably flat broad cone, spreading over a base of enormous horizontal extent, and rising in September 1902, to a height of 13,900 ft. Major Dutton, writing in 1883, said that "a moderate eruption of Mauna Loa represents more matter than Vesuvius has vomited since the eruption of Pompeii." Yet the lava is so mobile that it generally wells forth without disturbance, without explosive demonstration, and therefore unaccompanied by fragmentary ejectaments. Fluent lavas like those of Hawaii are also poured forth from the volcanoes and volcanic fissures of Iceland.

If the lava be less basic and less fusible, the hill formed by its accumulation instead of being a low dome will take the shape of a cone with sides of higher gradient: in the case of andesite cones, for instance, the slope may be as much as 50°. No other vulcanic material tends to form cone-shaped hills so regularly as lava. It is a fact that highly viscous lavas tend to form dome-shaped, or bulbous, masses. A cone of andesite, therefore, may be formed from lava, or perhaps acid lava extruded as a homogeneous mass, without conspicuous chimney or crater. Although domes are usually composed of acid rocks, it seems possible that they may be formed also of basic lavas, and may be protruded slowly at a low temperature so as to be rapidly congealed.

The Spine of Pei.—A peculiar volcanic structure appeared at Monte Pelé on the coast of the eruption of 1902, and was the subject of a critical investigation by Professor Heilprin, and other observers. It appears that from fissures in the floor of the Etang Sec a viscous andesitic lava, partly quartziferous, was poured forth and rapidly solidified superfiциально, forming a dome- shaped mound, nearly circular in plan, some 750 feet in diameter. According to Lacroix, the crust soon became fractured, partly by shrinkage on consolidation and partly by internal tension, and the dome grew rapidly by injection of molten matter. Then there gradually rose from the dome a huge monolith or needle, forming a terminal spine. But in the course of its existence varied in shape and height, having been at its maximum in July 1903, when its absolute height was about
bladder-like, was practically a solid cone of erupted matter: hence this view came to be known as the "crater-of-eruption theory." Its general soundness has been demonstrated whenever an insight has been gained into the structural character of the mountain. The eruption of Kratok in 1883 a magnificent natural section of the great cone of Rakata, at the S. end of the island, was exposed—the lava having been pushed into a great valley. It then evident that this mountain was practically a solid cone, built over a great succession of irregular beds of tuff and lava, braced together by intersecting dykes. The internal architecture of a volcano is rarely perfect, but the type is modified either by the local expansion and rupture of the ground required by the old theory. It may be noted, however, that in recent years the view of evolution has been modified by the removal of such supporters.

Where the growth of a volcanic mound takes place externally, as in certain steep-sided trachytic cones, there may be no perceptible crater or external outlet. Again, there are many volcanoes which have craters at the summit, because the eruptions always take place from lateral outlets. Even when a terminal pit is present, the lava may issue from the body of the mountain, and in some cases it exudes from so many vents or cracks that the volcano has been described as "steam-volcano.

Parasitic Cones.—In the case of a lofty volcano the column of lava may not have sufficient ascensional force to reach the crater at the summit, but may form a cinder-cone within a few miles of a previously one week spot, often along radial cracks, on the flanks of the mountain. Thus at Etna, which rises to a height of more than 10,800 ft., the eruptions usually proceed from lateral fissures, sometimes at least 5,000 ft. long. When the eruption has subsided the matter ejected from a lateral vent a cinder-cone is formed, and by frequent repetition succession of such the flanks of Etna have become dotted with hundreds of scoria-cones much like the pays of Auvergne, the largest (Monte Mimare) rising to a height of as much as 750 ft. Hills of this character, seated on the parent mountain, are known as parasitic cones, minor cones, lateral cones, etc., and show a tendency to a linear arrangement, rising from vents or boches along the floor of a line of fissure. Thus in 1892 a chain of five cones arose from a rift on the S. side of Etna, running in a N. and S. direction, and the hills became known as the "Vulcani di Sorrento."

In the large areas of lava flow there has been a tendency to a linear arrangement, forming a chain of cinder cones. These chains, known as "driblet cones." The name of "driblet cones" was given to groups of lateral cones which either project a single crack or are projected from blowing holes at Kilauea, the drops of lava remaining plastic and cohering as they fell. Such drops may form columns and may be found with almost every lava eruption. "The greater part or less of this character occur elsewhere, but are usually built up around spires. Small cones formed by mere dabs of lava are known trivially as "spatter cones.

Pyroclastic Explosions.—Certain parts of the world there are vast tracts of basaltic lava with little or no evidence of cones or of pyroclastic accommodation. To explain their formation, Baron F. von Richthofen suggested that they represent great floods of lava which were poured forth not from ordinary volcanic craters with more or less explosive violence, but from great fissures in the earth's crust, whence they may have quietly well forth and spread as a flood over the surface of the country. The eruptions were essentially effusive rather than explosive. Such phenomena, constituting a distinct type of volcanism, are distinguished as fissure eruptions or massive eruptions—termed which suggest the mode of extrusion and the character of the extruded matter as the lava in such outflows must be very fusible, it is generally of basaltic type, like that of Hawaii; indeed, the Hawaiian volcanoes, with their quiet emission of highly fluid lavas, connect the fissure eruptions with the "central craters" of Iceland. At the time of the "central eruptions" in Iceland, the eruptions were accompanied by the formation of sheets of lava which have issued from long chasms, studied in most cases with rows of small cones, but these generally so insignificant that they make no scenic features and might be described as "shred cones.

That one of the 87 great rifts and lines of cones in Iceland, and even the larger cones of Vesuvian type are situated on fissures.

It is believed that fissure eruptions must have played a far more important part in the history of the earth than eruptions of the familiar cone-and-cratet type, the latter representing indeed only

"decline phase of volcanism. Sir Archibald Geikie, who has
specially studied the subject of fissure eruptions, regards the Tertiary
basaltic plateaux of N.E. Ireland and the Inner Hebrides as out-
flows from fissures, which may be represented by the gigantic
stream of basaltic lava which forms the two great basaltic plateaux of
the northern part of Britain and Ireland. These dykes extend over
an area of something like 40,000 sq. m., while the outflows form an aggregate of about 3000 ft. in thickness. In parts of Scilly
and Wight, and the Criffel Shields of Moffat, a formation of basalt
from fissure eruptions occupy an area of about 200,000 sq.
m., and constitute a pile at least 2000 ft. thick. In India the
"Deccan traps" represent immense masses of volcanic matter,
which are spread out like a blanket over Cretaceous rock. According
to him a number of vents opened at the points of inter-
section of lines of weakness in a high plateau, giving rise to many
small cones, and the simultaneous outflows of lava from these cones

"Eruptive and Intrusive Magmas.—When the molten magma in
the interior of the earth makes its way upwards and flows forth
super-

"as a stream of lava, the product is described as extrusive,
effusive, eruptive or effusive; but if, failing to reach the surface,
the magma solidifies in a fissure or other subterranean cavity, it
is said to be intrusive or intrusive. Rocks of the former group only
are now seen as having condensed in fissures; but considerable
concreations and stalactites have been formed of the lavas in fissures.

"Subaqueous Lava.—The term subaqueous lava is not always
resorted to. A great thickness of lava has been thrown up
especially in the eastern United States, and in Japan, where it is
beaten from the sea-bottom. It is no doubt a form which should be
considered in all cases of extrusion of lava on the sea-bottom. Its
peculiarity consists in its having been thrown up on the sea-bottom,
while in a fluid state, and in being immediately hardened by the
cooling of the water. The lava is thus thrown up in the form of
masses, and may be found in the ocean as well as on the land. The
lava of the sea-bottom is more fluid than that of the land, and
therefore tends to follow the laws of fluid mechanics more closely.
It is therefore thrown up in the form of masses, and may be found in
the ocean as well as on the land. The lava of the sea-bottom is more
fluid than that of the land, and therefore tends to follow the laws of
fluid mechanics more closely. It is therefore thrown up in the form of
masses, and may be found in the ocean as well as on the land.
Reef. In 1891 a submarine eruption occurred near the isle of Pantelleria in the same waters, and the eruptive centre was termed by Professor H. S. Washington and Fosler, a volcano, but it gave rise to no ash. The well-worn term of volcanics, for the most part was furnished by Sabrina—an islet of cinders thrown up by sub-
marine eruptions in 1811, off the coast of St Michael’s, one of the Azores. The island of Bogoslof, or Castle Island, in Bering Sea, about 40 m. W. of Mount St. Helens, was an eruption which was first observed in 1796 after an eruption. In 1883 another eruption
in the neighbouring water threw up a new volcanic cone of black sand and ashes, known as the New Bogoslof or Fire Island, situated about half a mile to the N.W. of Old Bogoslof, with which it was
connected by a low beach. Another island, called Perry Island, larger than either of the others, made its appearance in the
neighbourhood about the same time. A short earthquake in 1906. It is reported that some of these islands have since dis-
appeared.

Mud Volcanoes.

Mud volcanoes are small conical hills of clay which discharge, more or less persistently, streams of fine mud, sometimes as-
associated with naphtha or petroleum, and usually with bubbles of
gas. As the mud is generally saline, the hills are known also as “saltes.” The gases are chiefly hydrocarbons, often with more or less sulphurated hydrogen and carbon dioxide, and
sometimes with nitrogen. Though generally less than a yard in height, some have been observed to rise to an elevation of as
little as half an inch. The mud oozes from the top and
spreads on the sides, or is spurted forth with the gases.
Occasionally the discharge is vigorous, mud and stones being
thrown up to a considerable height, sometimes accompanied
by flames due to combustion of the hydrocarbons.

Mud volcanoes occur in groups, and have a wide distribu-
tion. They are known in Iceland; in Modena; at Taman and
Ketch, in the Crimea; at Baku on the Caspian; in Java and in
Trinidad: Humboldt described those near Turbaco, in Colombia.
In Sicily they occur near Etna, and a group is known at Fiumicoli, an Etna. By the Sicilians they are termed, *mazzolato*, a word of Arabic origin. The “paint-pots” of the Yellowstone
National Park are small mud volcanoes.

Many so-called mud volcanoes appear to be due to the de-
rangement of subterranean water-flow or to land-slips in con-
exion with earthquakes, whilst others may be referable to
certain chemical reactions going on underground; but there are
others again which seem to be truly of volcanic origin. Hot
water and steam escaping through clays, or crumbling tufts
reduced to a clayey condition, may form conical mounds of
powdered material, which may be carried to a considerable
height in a short space of time.

Geyser is closely related to volcanos, but in consequence of
their special interest they are treated separately (see GEYSER).
For natural steam-holes and other phenomena connected with declining vulcanicity, see SOUFFLON, SOLFATARA and MOPETTA.

Geographical Distribution of Volcanoes.

It is matter of frequent observation that volcanoes are most
abundant in regions marked by great seismic activity. Although
the volcano and the earthquake are not usually connected in
the direct relation of cause and effect, yet in many cases they seem referable to a common origin. Both volcanic ex-
ploration and crustal movement may be the means of raising
local strains in the earth’s crust, and both are found to occur,
also might reasonably be expected, in many parts of the earth
where folding and fracture of the rocks have frequently
happened and where mountain-making appears to be still in
progress. Thus, volcanos may often be traced along zones
of crustal deformation, or folded mountain-chains, especially
where they run near the borders of the oceanic basins. They
are frequently associated with the Pacific type of coast-line.

The most conspicuous example of linear distribution is furnished by the great belt of volcanos, coinciding for the most part with
a band of seismic disturbance, which engirdles intermittently the
huge basin of the Pacific; though here, as elsewhere in studying vulcanic topography, regard must be paid to dormant and extinct centres as well as to those that are active at the present time. As volcanos are in many cases ranged along what are commonly regarded as
lines of fracture, it is not surprising that the centres of most intense vulcanicity are in many cases situated at the intersection of two or
more fracture-lines. On the eastern side of the Pacific Ocean the
great volcanic ring may be traced, though with many and extensive interruptions, from Cape Horn to Alaska. In South America the
chain of the Andes between Corcovado in the south and Tolima in
the north, is a distinct and well-marked range, though much
more extensive, including the loftiest volcanic mountains in
the world. The grandest group of South American volcanos,
though mostly in eastern, is in Ecuador. Cotopaxi, seen in activity
in 1877, is 8662 ft. high; Pichincha, 13,555 ft., is the highest
but does not exceed 16,000 ft. and is rarely active. Cotopaxi
whilst Sangay is said to be one of the most active volcanos in the
world. The linear arrangement, often a marked feature in the
appearance of a volcanic mountain, is well exemplified in the general north-and
south trend of the Andean volcanos, the volcanos being situated along the
orographic axis. These folded mountains with their volcanos also illustrate the close relationship to the sea so frequently observed between those on the coast and those in the interior. There are
only a few exceptions. The volcanic rock called andesite was so named by L. von Buch from its characteristic occurrence in the Andes. It is
notable that the volcanic rocks throughout the great Pacific belt
of America are of a similar nature; it has been described in detail by A. Stübel and others (see ANDES).

Central America contains a large number of active volcanos and
solfatara, many of which are located on the mountains parallel to
the western coast. Conagua, on the south side of the Gulf of
Fonseca, is remarkable for its eruption in 1835, when an enormous
volume of ash was ejected and the summit of the mountain blown
away. Volcanoes in San Salvador and in Izalco, on the coast of
Guatemala, are particularly remarkable; Izalco is now, at any
rate, and habitually active. In the centre of Lake Ilopango in Salvador,
which possibly occupies an ancient crater, a volcanic island arose
in 1880 and attained a height of 160 ft. Guatemala is peculiarly
rich in volcanic phenomena, as it has been visited in 1897, the Cerro Quemado, or the Volcano of Quezaltenango, was the scene of a great eruption in 1785. At
the time of the eruption of Santa Maria in 1841 the mountains
became much more violent than the simultaneous eruptions in the Lesser Antilles.
The cones of Guatemala include the Volcan del Fuego and the
Volcan de Agua, the former often active in historic times, whilst
the latter, though not so famous as the former, is at present
active. The mountain and destroyed Old Guatemala, but this flood was
probably not of volcanic origin.

The plateau of Mexico is the seat of several active volcanos which
rise in a band stretching across the country from Colima in
the west to Tuxtlas near Vera Cruz. The highest of these volcanos
in Orizaba, or Cithaltepelt, rising to an altitude of 15,420 ft., and known for many years have been active in the Past, Popocatapelt ("the smoking mountain") reaches a height of about 17,880 ft., and from its crater sulphur was at one time systematically
collected. The famous volcano of Jorullo, near Toluca, at a
distance of about 120 m. from the sea, has been the centre of much
scientific discussion since it was regarded by Humboldt, who visited
it in 1803, as a striking proof of the elevation theory. It came into
existence rapidly during an eruption which began in September
1803 and was said to be one of the most intense in human
history, so that the ground became suddenly inflated from below. The cone
of exceptional magnitude, is situated in an elevated district, and its
height is now about 15,100 ft. In the district of Jorullo there are three subordinate cones of similar
character known as volcanocitos, with great numbers of small mounds of
cinder and ash formed around fumaroles on the lava, and locally called *malpays,* "bad places." Or from Jorullo form rough barren surfaces, which pass under the
name of malpays, or bad lands.

In the United States very few volcanos are active at the present
day, though many have become extinct only in times that are
geologically recent. An eruption occurred in 1857 at Tres Virgenes, in
the south of California, and the cinder cone on Lassen’s Peak
(California) was also active in the middle of the 19th century.
The Mono Valley craters and Mount Shasta, in California, are extinct.
The Cascade Range contains numerous volcanic peaks, but only a few show signs of activity. Mount Hood, in Oregon, exhalas vapour,
and Mount Bachelor, in the same state, is a recent and active volcano. Mount Baker (Washington) was in eruption in 1831 and 1842; and Mount Baker (Washington), the most northern of the volcanos connected with the Cascade Range, is said to have been active in 1843. Few
volcanic peaks occur in the Rocky Mountains, but extreme of lingering activity is very marked in the geyser and hot springs of
the Yellowstone National Park. The earth’s internal heat is also manifest at many points elsewhere, as at Steamboat Springs in
the Virginia Range, an offshoot of the Sierra Nevada, and in
the Comstock Lode.

Volcanic activity is prominent in Alaska, along the Coast Range and near the Brandon Islands. The crater of Mount Edgecumbe,
in Lazarus Island, is said to have been active in 1796, but this is
doubtful. Mount Fairweather has probably been in recent activity,
(Coats Island has a crater), but it is not known whether it has
ever to have been in eruption in 1819. In the neighbourhood of Cook’s
Inlet there are several volcanos, including the island of St Augustine.
Unimak Island has two volcanos, which have supplied the natives
with sulphur and obisidian; one of these volcanos being Mount
Shishaldin, a cone rivaling Fusiyanke in graceful contour. The
Aletian volcanic belt is a narrow, curved chain of islands, extending from Cook’s Inlet westwards for nearly 1600 m. It is notable that the convexity of the curve faces the great ocean, as has been observed in other cases, the arcs following the direction of the rock-folds. Although they appear to be a part of the Aleutian and Kamchatka chain of N. America, there are in the Aletian Islands and in the peninsula no fewer than 57 craters, either active or recently extinct.

Eastwards from Sumatra, a chain of volcanoes runs longitudinally, and may possibly be continued northwards in the Bay of Bengal by Barrier Island and Norcondam—the former an active and the latter an extinct volcano. On the western side of the bay, the islands of the Mascaren group, several craters in Réunion (Bourbon) being still active. Far south in the Indian Ocean are the volcanic islands of New Amsterdam and St Paul. The Komoro Islands in the Pacific have a volcanic activity, and in the Indian Ocean, off the east coast of Central Africa there are several centres, mostly extinct but some partially active, associated with the Rift Valleys. The enormous cones of Kenia and Kilimanjaro are extinct, being on K. Kilimanjaro the summits of the latter, a crater is still preserved.

The Mumburo volcanoes, S. of Lake Edward, rise to a height of more than 14,700 feet. Kirunga, N. of Lake Kivu, is still partially active. Eldon is an old volcanic peak, but Ruwenzori is not of volcanic origin. On the west side of Africa, the Cameroon Peak is a volcano which was active in 1909, and the island of Fernando Po is also volcanic.

Passing to the Atlantic, a broad band of volcanoes, recent and extinct, may be traced longitudinally through certain islands, some of which, particularly those of the Cape Verde archipelago, have been of importance in part of its length, into an eastern and a western trough. The northern extremity of the series is found in Jan Mayen, an island in the Arctic Ocean, where an eruption occurred in 1880. Iceland, Greenland, and Spitsbergen, are also on one of the great arcs of the world. From Iceland to the volcanic archipelagoes of the Azores, the Canaries, and the Cape Verde Islands. Palma—a little island in the Canary group, with a caldera or large crater at its summit, from which fissures of eruptions radiate—is famous in the history of vulcanology, in that it furnished L. von Buch with evidence on which he founded the "crater-of-elevation" theory. The remaining volcanic islands of the Atlantic are, in general, composed of more recent formations than those of the Mediterranean, and the most important of all the Atlantic centres. According to Dr T. Thorroldsen there are in Iceland about 130 post-glacial volcanoes, and it is known that from 25 to 30 have been in eruption during the historic period. Many of the (cellular) lava-flow, such as the immense flood from Laki (Skafta Jökull) in 1783, are referable to fissure eruptions, which are the characteristic though not the exclusive form of volcanic action in Iceland. Iceland has not only been responsible for the sheets of old lava in the terraced hills of the Faroe Islands, to which may have been related the Tertiary volcanoes of the west of Scotland and the north of Ireland.

The volcanic regions of the Pacific are connected with those of the Indian Ocean by a grand train of islands rich in volcanoes, stretching from the west of New Guinea through the Moluccas and the Philippines, but they form a distinct and independent series from Java and Sumatra. Here is situated the principal theatre of terrestrial vulcanicity, apparently representing an enormous fissure, or system of fissures, in the earth’s crust, sweeping in a bold curve, with its convexity towards the Indian Ocean.

Numerous volcanic peaks occur in the string of small islands to the east of Java—notably in Flores, Sumbawa, Lombok and Bali; and it is from these terrific eruptions on record in ancient times, which occurred in the period of 1815, in the island of Sumbawa, in the year 1815. Java contains within its small area as many as 49 great volcanic mountains—active, dormant and extinct. The largest of these is Gunung Salak, 7,000 ft. high. The activity of this peak is said to be Gownon Lamongang, which is in almost uninterupted activity, emitting usually only ashes and vapour, though in 1883 lava stream forth. Many of the Javanese volcanoes present curious forms of structure, of the cave or caldera type, rather symmetrically furrowed by tropical rains and sometimes ridged by ash-slides. The radial furrows on volcanic cones are sometimes known as "barrancos."

The little uninhabited island of Krakatoa in the Strait of Sunda appears to be situated at a volcanic node, or the intersection of two curved fissures, and it is believed that the island itself represents part of the basal wreck of what was once a volcanic gigantic structure. After two centuries of repose, a violent catastrophe occurred in 1883, that was at once a tremendous explosion, with a terrific eruption and its effects were made the subject of careful study by Verbeek, Brion and Judd.

From the eastern end of the Mediterranean the evidence of former
volcanic activity may be traced into Asia Minor and thence to Armenia and the Caucasus. East of Smyrna there is a great desolate tract which the ancients recognized as the Mediterranean and Caspian Sea. The volcanic districts of Lydia were studied by Professor H. S. Washington. In the plateau of Armenia there are several extinct volcanic mountains, more or less destroyed, of which the best known is Ararat. Nimrud Daght on the shore of Lake Van is said to have been in eruption in the year 1441. Dr F. Oswald has described the volcanoes of Armenia. Of the volcanoes in Persia territory not now active, Demavend, south of the Caspian, is the most impressive example. It is also described as an old volcano. It has been said that in Central Asia there are certain vents still active, and recent volcanic rocks are known from the Przhevalsky chain and other localities.

The number of volcanoes known to be actually active on the earth is generally estimated at between 300 and 400, but there is reason to believe that this estimate is far too low. If account be taken of those volcanic cones which have not been active in historic time, the total will probably rise to several thousands. The distribution of volcanoes at various periods of the earth's history, as revealed by the local occurrence of volcanic rocks at different horizons in the crust of the earth, is discussed below. Moreover, periods of great earth movement have been marked by exceptional volcanic activity.

Causes of Volcanicity.

In discussing the cause of volcanicity two problems demand attention: first the origin of the heat necessary for the manifestation of volcanic phenomena, and secondly the nature of the force by which the heated matter is raised to the surface and ejected. According to the old view, which assumed that the earth was a sphere of molten matter invested by a comparatively thin crust of solid rock, the explanation of the phenomena appeared fairly simple. The molten interior supplied the heated matter, while the shrinkage of the cooling crust caused the volcanic activity. The magma, through which it was assumed the magma might be squeezed out in the process of contraction. When physicists urged the necessity of assuming that the globe was practically solid, vulcanologists were constrained to modify their views. Following a suggestion of W. Hopkins of Cambridge, they supposed that the magma, instead of existing in a general central cavity, was located in comparatively small subterranean lakes. Some authorities again, like the Rev. O. Fisher, regarded the magma as constituting a liquid zone, intermediate between a solid core and a solid shell.

If solidification of the primitive molten globe proceeded from the centre outwards, so as to form a sphere practically solid, it is conceivable that portions of the original magma might nevertheless be retained in caviities, and thus form "residual lakes." Although the mass might be for the most part solid, the outer portion, or "crust," could conceivably have a honeycomb structure, and any magma retained in the cells might serve indirectly to feed the volcanoes. Neighbouring volcanoes seem in some cases to draw their supply of lava from independent sources, favouring the idea of local cisterns or "intercrustal reservoirs." It is probable, however, that subterranean reservoirs of magma, if they exist, do not represent relics of an original fluid condition of the earth, but the molten material may be merely rock which has become fused locally by a temporary development of heat or more likely by a relief of pressure. It should be noted that the quantity of magma required to supply the most copious lava-flows is comparatively small, the greatest recorded outflow (that of Tomboro in Sum- bawa, in 1815) not having exceeded, it is said, six cubic miles; and even this estimate is probably too high. Whilst in many cases the magma-cisterns may be comparatively small and temporary, it must be remembered that there are regions where the volcanic rocks are so similar throughout as to suggest a common origin, thus needing intercrustal reservoirs of great extent and capacity. It has been suggested that comparatively small basins, feeding individual volcanoes, may draw their supply from more extensive reservoirs at greater depths.

Much speculation has been rife as to the source of the heat required for the local melting of rock. Chemical action has naturally been suggested, especially that of superficial water, but its adequacy may be doubted. After Sir Humphry Davy's discovery of the metals of the alkalies, he thought that their remarkable behaviour with water might explain the origin of subterranean heat; and in more recent years others have seen a local source of heat in the oxidation of large deposits of iron, such as that brought up in the basalt of Disco Island in Greenland. It has been assumed by Moissan and by Gautier that water might attack certain metallic carbides, if they occur as subterranean deposits, and give rise to some of the products characteristic of volcanoes. But it seems that all such action must be very limited, and utterly inadequate to the general explanation of volcanic phenomena. At the same time it must be remembered that access of water to a rock already heated may have an important physical effect by reducing its melting point, and may thus greatly assist in the production of a supply of molten matter. The admission of surface-waters to heated rocks is naturally regarded as an important source of motive power in consequence of the sudden generation of vapour, but it is doubtful to what extent it may contribute, if at all, to the origin of volcanic heat.

According to Robert Mallet a competent source of subterranean heat for volcanic phenomena might be derived from the transformation of the mechanical work of compressing and crushing parts of the crust of the earth as a consequence of secular contraction. This view he worked out with much ingenuity, supporting it by mathematical reasoning and an appeal to experimental evidence. It was claimed for the theory that it explained the linear distribution of volcanoes, their relation to mountain chains, the shallow depth of the foci and the intermittence of eruptive activity. A grave objection, however, to the difficulty of conceiving that the heat, whether due to crushing or compression, could be concentrated at the surface so as to produce a sufficient elevation of temperature for melting the rocks. According to the calculations of Rev. O. Fisher, the crushing could not, under the most favourable circumstances, evolve heat enough to account for volcanic phenomena.

Since pressure raises the melting-point of any solid that expands on liquefaction, it has been conjectured that many deep-seated rocks, though actually solid, may be potentially liquid; that is, they are maintained in a solid state by pressure only. Any local relief of pressure, such as might occur in the folding and faulting of rocks, would tend, without further accession of heat, to induce fusion. But although moderate pressure raises the fusing-point of most solids, it is believed, from modern researches, that very great pressures may have a contrary effect.

It is held by Professor S. Arrhenius that at great depths in the earth the molten rock, being above its critical point, can exist only in the gaseous condition; but a gas under enormous pressure may behave, so far as compressibility is concerned, like a rigid solid. He concludes, from the high density of the earth as a whole and from other considerations, that the central part of our planet consists of gaseous iron (about 80% of the earth's diameter) followed by a zone of rock magma in a gaseous condition (about 15%), which passes insensibly outwards into liquid rock (4%), covered by a thin solid crust (less than 1% of diameter). If water from the crust penetrates by osmosis through the sea-floor to the molten interior, it acts, at the high temperature, as an acid, and decomposes the silicates of the magma. The liquid rock, expanded and rendered more mobile by this water, rises in fissures, but in its ascent suffers cooling, so that the water then loses its power as an acid and is displaced by silicic acid, when the escaping steam gives rise to the explosive phenomena of the volcano. The mechanism of the volcano is therefore much like that of a geyser, a comparison long ago suggested by Rev. O. Fisher and other geologists.

According to the "planesimal theory" of Professor T. C. Chamberlin and Dr F. R. Moulton, which assumes that the earth was formed by the accretion of vast numbers of small cosmical bodies called planetesimals, the original heat of the earth's interior was due chiefly to the compression of the growing globe by its own gravity. The heat, proceeding from the
VOLCANO ISLANDS—VOLE

VOLCANO ISLANDS, three small islands in the western Pacific Ocean, S. of the Bonin Islands, forming part of the Japanese empire (annexed in 1891). They are also known as the Magellan Archipelago, and in Japan as Kwa-zan-rettō (series of volcanic islands). They are situated between 24° and 26° N. and 141° and 142° E. Their names are Kita-wo-jima (Santo Alessandro), Iwo-jima (Sulphur) and Minami-wo-jima (of the foot) and, the latter-jima, as which, its name (kita) implies, is the most northerly of the three—said to be 2520 ft. above the water, and Minami-wo-jima the most southerly, to a height of 3021 ft. The islands are not inhabited. With this group is sometimes included another island, Arzo-biso, nearer the Bonin group.

VOLECI (mod. VULCI), an ancient town of Lucania, 2128 ft. above sea-level, the chief town of the independent tribe of the Volcanii, Volcuntii or Volcentani, whose territory was bounded N. by that of the Hirpini, W. and S. by Lucania and E. by the territory of Tursia. Some pre-Roman ruins still exist (Not. Soc., 1884, i5). It became a municipium and in a.d. 323 had an extensive territory attached to it, including the town of Numistro, the large Cyclopean walls of which may still be seen, 24 m. below Muro Lucano. Below the town is a well-preserved Roman bridge over the Tanager (mod. Tanaro).

See G. Patrolius in Notizie degli scavi (1897), 183.

VOLCI, or VULCI, an ancient town of Etruria. The circuit of the walls measures about 4 m., and scanty traces of them and of Roman buildings within them still exist. The Ponte della Badia over the Fóra, a bridge with a main arch of 66 ft. span, 38 ft. above the stream, is also Roman. An aqueduct passes over the valley. The former wealth of the town is mainly proved by the discoveries made in its extensive necropolis from 1828 onwards—Greek vases, bronzes and other remains—many of which are now in the Vatican. By 1856 over 15,000 tombs had, it was calculated, been opened. These were entirely subterranean, and little is now to be seen on the site but a great tumulus, the Cumucumela, and a few smaller ones. The frescoes from the Francois tomb, discovered in 1857, illustrating Greek and Etruscan myths, are now in the Musco Torlonia at Rome. Volci was one of the twelve towns of Etruria. Coruncanuus triumphed over the people of Vulcanii and Volci in 280 B.C., and the colony of Cosa was founded in their territory. This seems to have led to the decline of the city, and it does not seem to have been of great importance in the Roman period, though it became an episcopal see.

See G. Dennis, Cities and Cemeteries of Etruria (London, 1883), i. 437; ii. 503; S. Gessel, Fouilles dans la nécropole de Vulci (Paris, 1867), for the excavations of 1859 (with copious references to earlier publications).

VOLE, a book-name (invented by Dr J. Fleming, author of a work on British animals) for the water-rat and those species of field-mice which have cheek-teeth of the same general type. Although the British representatives of this group should undoubtedly retain their vernacular designations of water-rat and short-tailed field-mouse, the term "vole" is one of great convenience in zoology as a general one for all the members of the group. Systematically voles are classed in the mammalian order Rodentia, in which they constitute the typical section of the subfamily Microtinae in the Muridae, or mouse-group. A great number of species are characterized by being more heavily built than rats and mice, and by their less brisk movements. They have very small eyes, blunt snouts, inconspicuous ears and short limbs and tails, in all of which points they are markedly contrasted with true rats and mice. In common with lemmings and other representatives of the Microtinae, voles are, however, broadly distinguished from typical rats and mice by the structure of their three pairs of molar teeth. These, as shown in the figure, are composed of a variable number of vertical triangular prisms, in contact with one another by two cusplets of the upper pairs, and five to eight of the lower pairs. Two or three of these prisms the voles, which form an exceedingly large group, ranging all over Europe and Asia north of (and inclusive of) the
The prisms, due to its native black color, is known for its distinct Microtus body, which extends from the south-eastern 150-200 miles, to the north-west. These prisms, commonly known as **Microtus arvicola amphibus**, although some writers employ the inappropriate specific name **terestris**. It is about the size of a rat, and has long soft thick fur, of a uniform grayish-brown color, except where the “vacant” is black. The tail is about half the length of the head and body, and the hind feet are long and powerful, although not webbed, and have five rounded pads on their lower surfaces. In the upper jaw the first molar has 5, the second 4 and the third 4 prisms, of which the last is irregular and sometimes divided into two, making 5. In the lower jaw the first molar has 7 prisms, of which the 3 anterior are generally not fully separated from one another, the second 5 and the third 3. The water-rat is perhaps the most often seen of all European mammals, owing to its unusual habit. It frequents rivers and streams, burrowing in the banks, and often causing considerable damage. Its food consists almost wholly of water-weeds, rushes and other vegetable substances, but it will also eat animal food on occasion, in the shape of insects, mice or young birds. The female has during the summer three or four litters, each of from two to seven young. The range of the water-rat extends over Europe and North Asia from England to China, but the species is not found in Ireland, where no member of the group is native.

The red-backed field-mouse or “bank-vole” may be distinguished externally from the first species by its more or less rusty or rufous-coloured back, its larger ears and its comparatively longer tail, which attains to about half the length of the head and body. On account of an important difference in the structure of its molar, or number of teeth, it is now very generally referred to a distinct genus, under the name of Eosomys glareolus; these teeth, developing roots at a certain stage of existence, instead of growing permanently. Their prisms number respectively 5 and 4 above, and 7, 3 and 3 below. The habits of this species are in every way similar to those of the one first on the list. Its range in Great Britain extends northwards to Morayshire, but it is represented in an island off the Pembroke coast by a distinct form; on the continent of Europe it extends from France and Italy to southern Russia, where it is represented in northern Asia and North America by closely allied species. Fossil voles from the Pliocene of England and Italy with similar ears which are rooted as soon as developed form the genus *Mimomys*. (R. L.*

**VOLGA** (known to the Tatars as *Estil, Ilil or Atel*; to the Finnish tribes as *Rau*, and to the ancients as *Rha and Oraus*), the longest and most important river of European Russia. It rises in the Valdai plateau of Tver and, after a winding course of 3255 m. (1070 in a straight line), falls into the Caspian at Astrakhan. It is by far the longest river of Europe, the Danube, which comes next to it, being only 1775 m., while the Rhine (760 m.) is shorter even than two of the chief tributaries of the Volga—the Oka and the Kama. Its drainage area, which includes the whole of middle and eastern as well as part of south-eastern Russia, amounts to 563,300 sq. m., thus exceeding the aggregate superficies of Germany, France and the United Kingdom, and containing a population of fifty millions. Its tributaries are navigable for an aggregate length of nearly 20,000 m. The “basin” of the Volga is not limited to its actual catchment area. By a system of canals which connects the upper Volga with the Neva, the commercial mouth of the Volga has been transferred, so to speak, from the Caspian to the Baltic, thus making St Petersburg, the capital and chief seaport of Russia, the chief port of the Volga basin as well. Other less important canals connect it with the Western Dvina (Riga) and the White Sea (Archangel); while a railway only 45 m. in length joins the Volga with the Don and the Sea of Azov, and three great trunk lines bring its lower parts into connexion with the Baltic and western Europe.

The Volga rises in extensive marshes on the Valdai plateau, where the W. Dwina also has its origin. Lake Seliger was formerly considered to be the principal source; but that distinction is now given to the rising issuing between Big (57° 19' E.) and Small (57° 17' E.) in the midst of a large marsh to the west of Seliger. The honour has also been claimed, not without plausibility, for the Kunav rivulet. Recent exact surveys have shown these originating points not to be the more noted. To the north the current first traverses several small lakes, all having the same level, and, after its confluence with the Runa, enters Lake Volga. A dam connects these two miles below a shallow point with a 100 foot (25 million cub. ft.) storage of water, it makes it possible to raise the level of the Volga as far down as the Shakesna, thus rendering it navigable, even at low water, from its 6th mile onwards. It joins the Shakesna with the Shikesna the Volga flows with a very gentle descent towards the south-east, past Yaroslavl and Kostroma, along a broad valley hollowed to a depth of 150-200 ft. in the Permian and Jurassic deposits. In fact, its course lies through a series of depressions formed with their bases linked together. When the Volga at length assumes a due south-east direction it is a large river (8920 cub. ft. per second, rising occasionally in high flood to as much as 178,300 cub. ft.) of its numerous tributaries, the Unzha (365 m. 330 navigable), from the north, is the most important. The next great tributary is the Oka, which comes from the south-west after having traversed, on its course of 950 m., the Great Russian provinces of central Russia. It rises in the government of Orel, among hills which also send tributaries to the Dnieper and the Don, and receives on the left the Upa, the Plyny (300 m.), the Dnepro-Pryinga (300 m.), which extends up to Moscow, the Klyazma (765 m.), on whose banks arose the middle-Russian principality of Suzdal, and on the right the navigable Oka (300 m.) and Mossok. The entire course of the Oka is connected with some important event in the history of Great Russia. The drainage area of the Oka is a territory of 97,000 sq. m. It has been maintained that of the two rivers which unite at Nizhny-Novgorod, the Oka, not the Volga, is the chief; the fact is that both in length (818 m.) and in drainage area above the confluence (85,900 sq. m.), as well as in the aggregate length of its tributaries, the Volga is the inferior stream.

At its confluence with the Oka the Volga enters the broad lacustrine depression which must have communicated with the Caspian during the post-Pliocene period by means of at least a broad strait. At low water it is only 100 ft. above that of the ocean. Immediately below the confluence the breadth of the river ranges from 350 to 1750 yds. There are many islands which change their appearance and position after each inundation. On the right bank of the Volga is the Suma, which drains a large area and brings a volume of 2700 to 22,000 cub. ft. of water per second, the Vetluga (465 m. long, of which 365 are navigable), from the forest-tracts of Yaroslavl, and many smaller tributaries. Then the Volga turns south-west and enters a wide, long, shallow, lacustrine depression, where it receives the Kama, below Kazan. Remains of molluscs still extant in the Caspian occur extensively throughout the Volga basin and up the Oka.

The Kama,1 which brings to the Volga a contribution ranging from 52,500 to 144,400 cub. ft. and occasionally reaching 315,000 cub. ft. per second, might again be considered as the more important of the two rivers. It rises in the Ural, near Bashkortostan, and enters a wide sweep towards the north and east, and then flows south and south-west to join the Volga after a course of no less than 1150 m.1

1 To the Votyaks it is known as the Budzh-Kam, to the Chuvashas as the Shoiga-adil and to the Tatars as the Cholman-idel or Ak-idel, all words signifying "White river."
Among the next 735 m. of its course the Volga—now 580 to 2600 yds. wide—flows south-south-west, with but one great bend at Samara. At this point, where it pierces a range of limestone hills, the Volga is one of the finest river pictures in the world. Here it is by cliffs which rise 1000 ft. above the level of the stream (which is only 54 ft. above the sea at Samara). Along the whole of the Samara bend the Volga is accompanied on its right bank by high cliffs, which it is constantly undermining, while broad lowland areas stretch along the left or eastern bank, and are intersected by several old beds of the Volga.

At Tsarskoye the river reaches its extreme south-western limit, and is then, operated from below by an isthmus only 45 m. in width. The isthmus is too high to be crossed by means of a canal, but a railway to Kalach brings the Volga into some sort of connexion with the Don and the Sea of Azov. At Tsarskoye the river takes a sharp turn in a south-easterly direction towards the Caspian; it enters the Caspian steppes, and for a few miles above it sends off a branch—the Khabub—where it is 350 m. before falling into the Caspian. Here the Volga receives no tributaries; its right bank is skirted by low hills, but on the left it anastomoses freely with the Akhtub as its waters are high, and floods the country for miles. Below Akhtub navigation is difficult, and on the sands at the mouth the maximum depth is only 12 ft. in calm weather.

The figures given show how immensely the river varies in volume, and the greatness of the changes which are constantly going on in the channel and on its banks. Not only does its level occasionally rise in flood as much as 50 ft. and overflow its banks for a distance of 5 to 15 m.; even the level of the Caspian sea, and the rivers as well as the Caspian, are affected by sudden rises in the sea water brought by the Volga. The amount of suspended matter brought down is correspondingly great. Along all its course the Volga is eroding and destroying its banks with great rapidity; towns and loading ports have constantly to be shifted farther back.

The question of the gradual desiccation of the Volga, and its causes, has often been discussed, and in 1838 a committee which included Karl Baer among its members was appointed by the Russian academy of sciences to investigate the subject. No positive result was, however, arrived at, principally on account of the want of regular measurements of the volume of the Volga and its tributaries—measurements which began to be made on scientific principles only in 1880. Still, if we go back two or three centuries, it is indisputable that rivers of the Volga basin which were easily navigable then are now hardly accessible to the smallest craft. The desiccation of the rivers of Russia has been often attributed to the steady destruction of its forests. But it is obvious that there are other general causes at work, which are of a much more important character, which the purely local causes. It has been shown that the general desiccation of Eastern and Western Turkestan are contemporaneous manifestations. The gradual elevation of the whole of northern Russia and Siberia, and the consequent draining of the marshes, is one of these deeper-seated, ampler causes; another is the desiccation of the lakes all over the northern hemisphere.

Fisheries.—The network of shallow and still limans or "cut-offs" in the delta of the Volga and the shallow waters of the northern Caspian (these are by much the most of the Volga, and the Volga are easily navigable) is a paradise of the fisher, the Kura and the Terek, is exceedingly favourable to the breeding of fish, and as a whole constitutes one of the most productive fishing grounds in the world. As soon as the ice breaks up in the delta in March, the gravelly spawning grounds (Luciortutra leucithys) rush up the river. They are followed by the great sturgeon (Acipenser hase), the pike, the bream and the pike perch (forasm). A few anadromous species, including the herring (Clupea caspia), which formerly was neglected, but has now become more important than sturgeon; the sturgeon A. stellatus and "wels" (Silurus glanis) follow, and finally the sturgeon Anguilla, which, in much abundance, after its casval journey to the Caspian Sea, becomes a gravelly spawning-ground the sturgeon go up the river as far as Sarepta (250 m.). The lamprey, now extensively pickled, the sturgeon (A. rufescens), the tench, the gudgeon and a species of minnow (Pseudorasbas dace) are also very common. It is estimated that 180,000 tons of fish of all kinds, of the value of considerably over 1,500,000, are taken annually in the four fishings districts of the Volga, Ural, Terek and Kura. Seal-hunting is carried on off the Volga mouth, and every year about 40,000 of Phoca vitulina are killed to the north of the Manghishlak peninsula on the east side of the Caspian.

Climbing.—In winter the numberless tributaries and sub-tributaries of the Volga become highways for sledges. The ice lasts 90 to 160 days, and breaks up earlier in its upper course than in some lower. The average date of the break-up is April 17th at Samara, April 14th later at Astrakhan, and March 17th at Astrakhan.

Traffic.—The greater part of the traffic is up river, the amount of merchandise which reaches Astrakhan being nearly fifteen times that than reaching St Petersburg by the Volga canals. The goods transmitted in largest quantity are fish, metals, manufactured goods, and the like. About 150,000 tons of goods are transported in this way, and all other kinds of goods are transported in this way, and all other kinds of goods are transported annually on the river. This traffic traffic consists chiefly of manufactured goods and timber, the latter mostly for the treeless governments of Samara, Saratov and Astrakhan, as well as for the region adjacent to the lower course of the Don. Drifting wood from the Don, while steamers are stationed near the most dangerous sandbanks to assist vessels that run aground. The following table shows the principal river ports, with the movement of shipping in an average year:

Formerly tens of thousands of buraki, or porters, were employed in dragging boats up the Volga and its tributaries, but this method of traction has disappeared unless from a few of the tributaries. Horse-power is still extensively resorted to along the three canal systems. The first large steamers of the American type were built in 1872. Thousands of steamers are now employed in the traffic, to say nothing of smaller boats and rafts. Many of the steamers use as fuel mazut or petroleum refuse. Large numbers of the boats and rafts are broken up after a single voyage.

History.—The Volga was not improbably known to the early Greeks, though it is not mentioned by any writer previous to Plutarch. According to him, the Rha is a tributary of an interior sea, formed from the confluence of two great rivers, the sources of which are separated by twenty degrees of longitude, but it is scarcely possible to judge from his statements how far the Slavs had by that time succeeded in penetrating into the basin of the Volga. The Arab geographers throw little light on the condition of the Volga during the great migrations of the 3rd century, or subsequently under the invasion of the Huns, the growth of the Khazar empire in the southern steppes and of that of Bulgaria on the middle Volga. But we know that in the 9th century the Volga was a current of commerce and by Khazars and various Turkish races in the south. The Slavs, driven perhaps to the west, had only the Volkhov and the Dnieper, while the (Mahomedan) Bulgarian empire, at the confluence of the Volga with the Kama, was so powerful that for some time it was an open question whether Islam or Christianity would gain the upper hand among the Slav idolaters. But, while the Russians were driven from the Black Sea by the Khazars, and later on by a tide of Ugrian migration from the north-east, a stream of Slavs moved slowly towards the north-east, down the upper Oka, into the borderland between the Finnish and Turanian region. After two centuries of struggle the Russians succeeded in colonizing the fertile valleys of the Oka basin; in the 12th century they built a series of fortified towns on the Oka and Klyazma; and finally they reached the mouth of the Oka, there founding (in 1222) a new Novgord—the Novgorod of the Lowlands, now Nizhniy-Novgorod. The great lacustrine depression of the middle Volga was thus reached; and when the Mongol invasion of 1239-42 came, it encountered in the Oka basin a dense agricultural population with many districts, many trade facilities. The Mongols found they could conquer, indeed, but were unable to drive before them as they had done so many of the Turkish tribes.
This invasion, checked but did not stop the advance of the Russians down the Volga. Two centuries elapsed before the Russians covered the river, which separate the mouths of the Oka and the Kama and took possession of Kazan. But in the meantime a flow of Novgorodian colonization had moved eastward, along the upper portions of the left-bank tributaries of the Volga, and had reached the Urals.

With the capture of Kazan (1552) the Russians found the lower Volga open to their boats, and eight years afterwards they were masters of the mouth of the river at Astrakhan. Two centuries more elapsed before the Russians secured a free passage to the Black Sea and became masters of the Sea of Azov (1596). During these two centuries they fortified the lower river, settled it, and penetrated farther eastward into the steppes towards the upper Ural and thence to the upper parts of the Tobol and other great Siberian rivers.

**Bibliography.**—P. P. Semenov's Geographical and Statistical Dictionary (5 vols., St Petersburg, 1863–85) contains a full bibliography of the Volga and tributaries. See also V. Hagozin's Volga (3 vols., St Petersburg, 1880–81, with atlas; in Russian); N. Bogoljubov, The Volga from Tart to Astrakhan (Russian, 1876); H. Koksoschly, Die Wolga und ihre Zuflüsse (Leipzig, 1887, vol. 1), historical and hydrographical; J. J. Keesing, The Volga as a Means of Communication (Russian, 1887), with detailed profile and maps; Peretyatkovich, Volga Region in the 17th and 18th Centuries, i and 2 (Leipzig, 1887); and Lender, Die Wolga (1889).

**Volhynia,** a government of south-western Russia, bounded by the Polish governments of Lublin and Siedlce on the W., Grodno and Minsk on the N., Kiev on the E. and Podolia and Galicia (Austria) on the S., with an area of 27,600 sq. m. A broad, flat spur of the Carpathians—the Avravynsk plateau—which enters from the west and stretches out eastward towards the Dniper occupies its southern portion, reaching a maximum elevation of 1,200 ft.; another branch of the Carpathians in the west of the government ranges between 700 and 900 ft. at its highest points. Both are deeply grooved in places, and the crags give a hilly aspect to the districts in which they occur. The remainder of the government, which is quite flat, with an imperceptible slope towards the marshes of Pinsk, is known as the Polesye (see Minsk).

The population in 1896 was estimated at 3,547,500. Some three-fourths of the population are Little Russians; the other elements are White and Great Russians, Poles (5-2%), Jews (13-2%) and Germans (5-7%). The government is divided into twelve districts, the chief towns of which are Zhitomir, the capital, Dubno, Kovel, Kremenets, Lučk, Nohhody, Priluki, Ostrog, Ovruch, Vladimir Volhynsky, Rovno, Staro-Konstantinov and Zaslaw. The conditions of peasant ownership differ from those which prevail in other parts of Russia, and of the total area the peasants hold approximately one-half; 42% of the total is in the hands of private owners, a considerable number of Germans having settled and bought land in the government.

Forests cover nearly 40% of the area in the north (that is, in the Polesye) and 15% elsewhere. Agriculture is well developed in the south, and in 1900 there were 3,224,400 acres (24%) under cereal crops alone. In the Polesye the principal occupations are connected with the export of timber and firewood, the preparation of pitch, and the sawing of wooden bar and wood. Lignite and coal, some graphite and kaolin, are mined, as also amber, which is often found in big lumps. Manufacturing industries are not very highly developed. The factories are confined to sugar works, distilleries (calor), and glass and agricultural machinery works. Domestic industry in the villages is chiefly limited to the making of wooden goods, including parquetry. The chief trades are those of the timber, chiefly to Germany and Great Britain, and of wool and flax, which are considerable.

Volhynia has been inhabited by Slavs from a remote antiquity. In Nestor's *Annals* its people are mentioned under the name of Dulebs, and later in the 12th century they were known as Volhynians and Buzhans (dwellers on the Bug). From the 9th century the towns of Volhynia-Vladimir, Ovruch, Luisk and Dubno were ruled by descendants of the Scandinavian or Varangian chief Rurik, and the land of Volhynia remained independent until the 14th century, when it fell under Lithuania. In 1569 it was annexed to Poland, and so remained until 1795, when it was taken possession of by Russia.

**Volk, Leonard Wells** (1845–1897), American sculptor, was born at Wellstown (now Wells), Hamilton county, New York, on the 7th of November 1828. He first followed the trade of a marble cutter with his father at Pittsfield, Massachusetts. In 1848 he opened a studio at St Louis, Missouri, and in 1855 was sent by his wife's cousin, Stephen A. Douglas, to Rome to study. Returning to America in 1857, he settled in Chicago, where he helped to establish an Academy of Design and was for eight years its head. Among his principal works is the Douglas monument at Chicago and the Soldiers' and Sailors' monument at Rochester, New York, and statues of President Lincoln and Stephen A. Douglas (in the Illinois State Capitol at Springfield, Ill.), and of General James Shields (in Statuary Hall, Capitol, Washington), Elihu B. Washburn, Zachariah Chandler and David Davis. In 1860 he made a life-mask (now in the National Museum, Washington) of Lincoln, of whom only one other, by Clark Mills in 1865, was ever made. His son, Douglas Volk (b. 1856), figure and portrait painter, who studied under J. L. Gerome in Paris, became a member of the Society of American Artists in 1880 and of the National Academy of Design in 1889.

**Volksrust,** a town of the Transvaal, 175 m. S.E. of Johannesburg and 306 m. N.N.W. of Durban. Pop. (1904) 23,832, of whom 13,442 were whites. The town lies at an elevation of 5,256 ft. just within the Transvaal frontier and 4 m. N. of the pass through the Drakensberg known as Laing's Nek. It is the centre of a rich agricultural district. It was founded by the Boer government in 1888. As a customs port of entry it was of some importance, and it maintains its position as a distributing depot. It was created a municipality in 1903. Sand is quarried in the district.

**Vollandem,** a small town in a village of Holland in the province of North Holland, adjoining Edam on the shores of the Zuider Zec. It is remarkable for the quaintness of the buildings and the picturesque costume of the villagers, who are of a singularly dark and robust type. Many artists have been attracted to settle here. Vollandem has its origin in the building of the great sea-dam for the new waterway to Edam in the middle of the 14th century. On the seaward side of the dike are some houses built on piles in the style of lake dwellings.

**Vollmar, Georg Heinrich von** (1830– ), German sociologist, was born at Munich in 1850. He was educated in a school attached to a Benedictine monastery at Augsburg, and in 1865 entered the Bavarian army as a lieutenant in a cavalry regiment. He served in the campaign of 1866, and then entered the papal army as a volunteer. In 1869 he returned to Germany, and during the war with France served in the army railway department. He was severely wounded at Blies and pensioned. Permanently crippled by his wounds, he devoted himself to political and social studies. In 1872 he was converted to the principles of Social Democracy, and threw himself with great energy into political agitation. In 1877 he became editor of the party organ at Dresden, and under the Socialist law was repeatedly condemned to various terms of imprisonment, and was also expelled from that city. From 1879 to 1882 he lived at Zürich, then the headquarters of Social Democracy, where, besides attending the university, he took part in editing the *Social Demokrat*. In 1881 he was elected member of the Reichstag, and from 1883 to 1889 was a member of the Saxon diet. After 1885 he resided in Bavaria, and it was to him that was given the chiefie duty of the great success of the Socialists in the older Bavarian provinces. He identified himself with the more moderate and opportunistic section of the Socialist party, decisively dissociating himself from the doctrine of a sudden and violent overthrow of society, and urging his associates to co-operate in bringing about a gradual development towards the Socialistic state. He refused to identify Social Democracy with the extreme views as to religion and the family advocated by Bebel, and successfully resisted attempts made in 1891 to expel him from
VOLENEY—VOLOGDA

196

the party in consequence of his opinions. He became a member of the Bavarian Diet in 1893.

In addition to a couple of books on the preservation of forests, he published Der isolierte Soziale Staat (Zürich, 1889).

VOLENEY, CONSTANTIN FRANÇOIS CHASSELIERE, COMTE DE (1757-1820), French savant, was born at Creon (Maine-et-Loire) on 10th February 1757, of good family; he was first named Boisgrais from his father's estate, but afterwards assumed the name of Volney. He spent some four years in Egypt and Syria, and published his Voyage en Egypte et en Syrie in 1787, and Considérations sur la guerre des Turcs et de la Russie in 1788. He was a member both of the States-General and of the Constituent Assembly. In 1791 appeared Les Ruines, ou mélablations sur les révolutions des empires, an essay on the philosophy of history, containing a vision which predicts the final union of all religions by the recognition of the common truth underlying them all. Volney tried to put his politico-economic theories into practice in Corsica, where in 1792 he bought an estate and made an attempt to cultivate colonial produce. He was thrown into prison during the Jacobin triumph, but escaped the guillotine. He was some time professor of history at the newly founded École Normale. In 1795 he undertook a journey to the United States, where he was accused in 1797 of being a French spy sent to prepare for the reoccupation of Louisiana by France. He was obliged to return to France in 1798. The results of his travels took form in his Tableau du climat et du sol des États-Unis (1802). He was not a partisan of Napoleon, but, being a moderate man, a savant and a Liberal, was impressed into service by the emperor, who made him a count and put him into the senate. At the restoration he was made a peer of France. He became a member of the Institute in 1795. He died in Paris on the 25th of April 1820.

VOLO, a town and seaport of Greece, on the east coast of Thessaly, at the head of the gulf to which it gives its name. Pop. (1907) 23,319. It is the chief seaport and second industrial town of Thessaly, connected by rail with the town of Larissa. The anchorage is safe, vessels loading and discharging by means of lighters. The port has a depth of 23 to 25 ft.

The Kastro, or citadel, of Volos stands on or close to the site of Pagasia, whence the gulf took the name of Sinus Pagasiae or Pagassiacus, and which was one of the oldest places of which mention occurs in early literary history. From the year 301 A.D., the Argonautic expedition was said to have sailed, and it was already a flourishing place under the tyrant Jason, who from the neighbouring Phæra ruled over all Thessaly. Two miles farther south stand the ruins of Demetrias, founded (200 B.C.) by Demetrius Poliorcetes, and for some time a favourite residence of the Macedonian kings. On the opposite side of the little inlet at the head of the gulf rises the hill of Iolcos, which stood the ancient city of Iolcus. At Dimini, about 3 m. W. of Volos, several tombs have been found which yielded remains of the later Mycenean Age.

VOLOGAESE (Vologaeus, Vologases; on the coins Ologaes; Armen. Valarsh; Mod. Pers. Balash), the name of five Parthian kings.

(1) Vologases I., son of Voneses II. by a Greek concubine (Tac. Ann. xiii. 44), succeeded his father in A.D. 51 (Tac. Ann. xiii. 14; cf. Joseph. Ant. xx. 3, 4). He gave the kingdom of Media Atropatene to his brother Pacorus, and occupied Armenia for another brother, Tiridates (Tac. Ann. xii. 50, xv. 2; Joseph. Ant. xx. 3, 4). This led to a long war with Rome (54-63), which was ably conducted by the Roman general Corbul. The power of Vologases was weakened by an attack of the Dahan and Sacan nomads, a rebellion of the Hyrcanians, and the usurpation of Vardanes II. (Tac. Ann. xii. 7, 37; xiv. 25; xv. 1; cf. Joseph. Ant. xx. 4, 2, where he is prevented from attacking the vassal king of the Parthian Arsacids by the intervention of the nomads). At last a peace was concluded, by which Tiridates was acknowledged as king of Armenia, but had to become a vassal of the Romans; he went to Rome, where Nero gave him back the diadem (Tac. Ann. xv. 1 f.; Dio Cass. Ixii. 19 f., Ixiii. 1 f.); from that time an Arsacid dynasty ruled in Armenia under Roman supremacy. Vologases was satisfied with this result, and honoured the memory of Nero (Suet. Nero, 57), though he stood in good relations with Vespasian also, to whom he offered an army of 40,000 archers in the war against Vitellius (Tac. Hist. iv. 31; Suet. Vespas. 6; cf. Joseph. Ant. vii. 5, 2, 7, 5; Dio Cass. Ixvi. 11). Soon afterwards the Alani, a great nomadic tribe beyond the Caucasian, invaded Media and Armenia (Joseph. Bell. vii. 7, 4; Dio Cass. Ixvi. 11; Suet. Britann. 2). It appears that the Persian losses in the east also could not be repaired; Hyrcania remained an independent kingdom (Joseph. Bell. vii. 7, 4; Aurel. Vict. Epit. 15, 4). Vologases I. died about A.D. 77. His reign is marked by a decided reaction against Hellenism; he built Vologesocerta (Balashkert) in the neighbourhood of Ctesiphon with the intention of drawing to this new town the inhabitants of the Greek city Seleucia (Plin. vii. 222). Another town founded by him is Vologesiana on a canal of the Euphrates, south of Babylon (near Hira; cf. Nöldeke in Zeitschrift der deutschen-morganl. Gesellschaft, xxviii. 93 ff.). On some of his coins the initials of his name appear in Aramaic letters.

(2) Vologases II., probably the son of Vologases I., appears on coins, which bear his name, in 77-79, and again 121-47. During this time the Parthian kingdom was torn by civil wars between different pretenders, which reached their height during the war of Trajan, 114-17. Besides Vologases II., we find 262-279, son in the authors Pacorus (185-203) and Artabanus III. (80-81), Oseses (160-20), Mithridates V. (c. 129-47) and some others; thus the Parthian empire seems during this whole time to have been divided into two or three different kingdoms. By classic authors Vologases II. is mentioned in the time of Hadrian (c. 131), when Cappadocia, Armenia and Media were invaded by the Alani (Dio Cass. Ixix. 15).

(3) Vologases III., 147-91. Under him, the unity of the empire was restored. But he was attacked by the Romans under Marcus Aurelius and Verus (162-65). In this war Seleucia was destroyed and the palace of Ctesiphon burnt down by Aurelius (161); the Romans even advanced into Media. In the peace, western Mesopotamia was ceded to the Romans (Dio Cass. Ixvi. 1 f.; Capitolin. Marc. Aur. 8 f.; Verus 8, ccc.). Vologases III. is probably the king Volgash of the Parsee tradition, preserved in the Dinkart, who began the gathering of the writings of Zoroaster.

(4) Vologases IV., 191-209. He was attacked by Septimius Severus in 195, who advanced into Mesopotamia, occupied Nisibis and plundered Ctesiphon (196), but attempted in vain to conquer the Arabic fortress Atra; in 202 peace was restored. Vologases IV. is said to have been succeeded by a brother, Vologases V., who, according to Joseph. (Ant. xvi. 12), was succeeded by a brother, Oresanes, under whom the empire fell, and who was succeeded by a third brother, Vologases V. (A.D. 218-28), who was himself succeeded by Crescus, who gave up his kingdom to his son Artabanus IV., the last Arsacid king, rebelled against him, and became master of the greater part of the empire (Dio Cass. Ixxvii. 12). But Vologases V. maintained himself in a part of Babylonia; his dated coins reach down to A.D. 222. (Ed. M.)

VOLOGDA, a government of north-eastern Russia, having the government of Archangel on the N., Tobolsk on the E., Perm, Vyata, Kostroma and Yaroslavl on the S., Novgorod, Olonetz and Archangel on the W. This immense government, which, according to its traditional area, includes an area of 1,218,000 square miles or nearly 3,128,000 square miles, has an area of 1,551,148 square miles, the space between the main chain of the Ural, and the southern spur of the Timan Mountains, in the upper basin of the Pechora. It is above the parmes—especially over those which are nearest the Ural proper—that the highest summits of the Ural rise in the form of dome-shaped mountains (Toll-poz, 5,535 ft.; Kozhem-iz, 4,425 ft.; Shadzha, 4,115 ft.). The Timan
VOLOGDA—VOLSCI

Mountains are a swampy plateau, where the rivers flowing to the N. Dvina or to the Pechora take their rise in common marshes; so that on the Mylva portage boats have to be dragged a distance of only 3 m. to be transported from one system to the other.

Permall sandstones and cupriferous slates cover most of the terraced areas; patches of Jurassic clays overlie them; in the east, in the Ural parmas, coal-bearing Carboniferous, Devonian and Silurian slates and limestones appear, wrapping the crystalline slates of the foundation layers of bedrock and limestones over the whole. Rock-salt and salt springs, iron ore, millstones and grindstones are the chief mineral products; but mining is in its infancy.

The climate is colder: the average yearly temperature being 1° C at Vologda (Jan., 10°7; July, 63°5 and 32°5 at Us-Sysolsch (Jan., 4°8; July, 64°7). The flora and the physical aspect vary greatly as the traveller moves north-east, and the Acanthus sect. parmas of the Pechora. In the south-west the forests are cleared, and the dry slopes of the hills have been converted into fields and meadows; the population is relatively dense, and nearly one-quarter of the area is cultivated. These zones of growing trees are used for distilleries, and apples are extensively cultivated. The flora is middle-Russian. Farther north-east the climate grows more severe; but still, until the Dvina is reached, corn succeeds well, and there is no lack of excellent meadows on the river-terrace. Clay is cultivated for export; but only 4% of the area is tilled, the remainder being covered with thick fir forests with occasional groups of deciduous trees (birch, aspen, elder).

The climate is tonometer 46° E. The larch (Larix siberica) is the chief tree. Several plants unknown in western Russia make their appearance (Silene tartarica, Anthyllis vulneraria, Euphorbia palustris, Filipago arenstii, Lycopodium complanatum, Stipa tritici, officinalis). The Veresum is especially characteristic; it sometimes encroaches on the meadows to such an extent as to compel their abandonment. The region of the upper Mezen (the Udora) again has a distinctive character. The winter is still colder, and the snowfall so copious that the Soyga and Usarey are sometimes compelled to clear away the snow from their barley-fields. But the summer is still hot (a mean of 54° for the three summer months) and the larches in some places grow to such a size as to lose their beauty; the Timan plateaux are a marked boundary for the middle-Russian flora.

To the east of them are uninhabitable: even on the banks of the rivers the climate is so severe, especially on account of the heavy snowfall, that they have only thinly peopled with the steppe pasture and barrens, and the timber is almost extinct.

The whole is covered with quite impenetrable forests, growing on a soil saturated with water. Mosquitoes swarm in the forests; birds are rare. The Siberian cedar begins and the lime trees disappear. Fir, cedar, pine and larch compose the forests, with birch and aspen on their outskirts. Hunting is the chief occupation of the Syryennian inhabitants.

The population was estimated in 1906 at 1,517,500, of whom 37,407 lived in towns; 90% were Great Russians and 8% Syryennians (rs). The arrangement into ten districts, the chief towns of which are Vologda, Gryan, Vologda, Nikolsk, Solychevsk, Totma or Tottyma, Ustyug Velikiy, Us-Sysolsch, Velsk and Yarenens. Agriculture thrives in the three south-western districts. Live-stock breeding occupies considerable numbers of people. A little industry is carried on, and there are a few ironworks, but manufacturing industries are in their infancy; the chief branch is the weaving of linen in the villages.

Vologda, a town of Russia, capital of the government of the same name, situated in its southerly corner on the river Vologda, above its confluence with the navigable Svelin. Pop. 172,728 (1807) 27,822. It is an old town, having many ancient churches, including one which dates from the 12th century, and the cathedral, founded in 1488. Vologda is a considerable commercial centre—flax, linen, oats, hemp, butter and eggs being exported to both St Petersburg and Archangel. It has distilleries, tanneries, and oil, soap, tobacco, candle and furnishing works.

Vologda existed as a trading town as early as the 12th century. It was a colony of Novgorod, and was founded in 1147, and carried on a brisk trade in furs, timber and manufactured goods. In 1273 it was plundered by the prince of Tver in alliance with the Tatars, but soon recovered. Moscow disputed its possession with Novgorod until the 15th century; the Moscow princes intrigued to find support amidst the poorer inhabitants against the richer Novgorod merchants, and four successive times Vologda had to fight against its metropolis. It was definitely annexed to Moscow in 1447. When Archangel was founded, and opened for foreign trade in 1553, Vologda became the chief depot for goods exported through that channel. Polish bands plundered it in 1613, and the plague of 1648 devastated it; but it maintained its commercial importance until the foundation of St Petersburg, when Russian foreign trade took another channel.

VOULSCI, an ancient Italian people, well known in the history of the first century of the Roman Republic. They then inhabited the partly hilly, partly marshy district of the S. of Latium, bounded by the Aurunci and Sammites on the S., the Hernici on the E., and stretching roughly from Norba and Cora in the N. to Antium in the S. They were among the most dangerous enemies of Rome, and frequently fell on the Latins with the Hernici. To the south-eastwards were the allies of Rome. In the Volscian territory lay the little town of Velitrae (Vellerti), the birthplace of Augustus. From this town we have a very interesting though brief inscription dating probably from early in the 3rd century B.C.; it is cut upon a small bronze plate (now in the Naples Museum), which has once been fixed to some votive object, dedicated to the god Declenus (or the goddess Decluma).

The language of this inscription is clear enough to show the very marked peculiarities which rank it close besides the language of the Iguvine Tables (see Icuvium). It shows on the one hand the labialization of the original velar g (Volsian pis = Latin quis), and on the other hand it palatalizes the guttural c before a following i (Volsian faici = Latin facit). Like Umbrian also, but unlike Latin and Oscan, it has degraded all the diphthongs into simple vowels (Volsian se parallel to Oscan savi; Volsian dene, Old Latin and Oscan deuvi or detuvi).

This phenomenon of what might have been taken for a piece of Umbrian text appearing in a district remote from Umbria and hemmed in by Latins on the north and Oscan-speaking Sammites on the south is a striking feature in the geographical distribution of the Italian dialects, and is clearly the result of some complex historical movements.

In seeking for an explanation we may perhaps trust, at least in part, the evidence of the Ethnicon itself. The name Volsi belongs to what may be called the -CO group of tribal names in the centre, and mainly on the west coast, of Italy, all of whom were subdued by the Romans before the end of the 4th century B.C.; and many of whom were conquered by the Sammites about a century or more earlier. They are, from south to north, Osc, Aurunci, Lat, Hernici, Labici, and among these the southernmost are doubt associated the original inhabitants of Aricia and of Sidicini-uns, of Vescia among the Aurunci, and of Labici close to Hernici territory. The same formative element appears in the adjective Mons Massicus, and the names Glonica and Marica belonging to the Aurunci district, with Gratissae in south Etruria, and a few other names in central Italy (see "I due strati nella popolazione Indo-Europea dell' Italia Antica," in the Atti del Congresso Internazionale di Scienze Storiche, Rome, 1903, p. 17). With these names must clearly be judged the forms Tusci and Etrusci, although these forms must not be regarded as anything but the names given to the Tuscanians by the folk among whom they settled. Now the historical fortune of these tribes is reflected in several of their names (see SABINI). The Samnite and Roman conquerors tended to impose the form of their own Ethnicon, namely the suffix -NO, upon
the tribes they conquered; hence the Marruci became the Marrucini, the *Arisci became Ariscini, and it seems at least probable that the forms Seditini, Carecini, and others of this shape are the results of this same process. The conclusion suggested is that these -CO- tribes occupied the centre and west coast of Italy at the time of the Etruscan invasion (see Eturria: Language); whereas the -NO- tribes only reached this part of Italy, or at least only became dominant there, long after the Etruscans had settled in the Peninsula. It remains, therefore, to ask whether any information can be had about the language of this primitive -CO- folk, and whether they can be identified as the authors of any of the various archaeological strata now recognized on Italian soil. If the conclusions suggested under Sabini may be accepted as sound we should expect to find the Volsci speaking a language similar to that of the Ligures, whose fondness for the suffix -so- we have noticed (see Ligures), and identical with that spoken by the plebeians of Rome, and that this branch of Indo-European was among those which preserved the original Indo-European Velars from the labialization which befell them in the speech of the Samnites. The language of the inscription of Velitrae offers at first sight a difficulty from this point of view, in the conversion which it shows of g to p; but it is to be observed that the Ethnicon of Velitrae is Velierus, and that the people are called on the inscription itself Velcestrom (genitive plural); so that there is nothing to prevent our assuming that we have here a settlement of Sabines among the Volscian hills, with their language to some extent (e.g. in the matter of the diphthongs and palatais) corrupted by that of the people round about them; just as we have reason to suppose was the case with the Sabin language of the Iguvini, whose very name was later converted into Iguvinates, the suffix -i- being much more frequent among the -CO- tribes than among the Sabin (see Sabini).

The name Volsci itself is significant not merely in its suffix; the older form Volusi clearly contains the word meaning "marsh" identical with Gr. ὑδάς, since the change of *voslos-to *vosus- is phonetically regular in Latin. The name Martica ("goddess of the salt-marshes") among the Aurunci appears also both on the coast of Picenum and among the Ligurians; and Stephanus of Byzantium identified the Oscii with the Siculi, whom there is reason to suspect were kinsmen of the Ligures. It is remarkable in how many marshy places this -co- or -ca-suffix is used. Besides the Aurunci and the dea Marica and the intertemporae Graviscae (Vulg. Aen. x. 184), we have the Ustica cubans of Horace (Od. i. 17, 11), the Hernici in the Trerus valley, Satricum and Glanica in the Pomptine marshes.

For the text and fuller account of the Volscian inscription, and for other matters of the dialect, see R. S. Conway, The Italic Dialects, pp. 267 sqq.

**VOLSCII.** An ancient town of Etruria, Italy. The older Volsci occupied in all probability the isolated tufa rock, so strongly defended by nature, upon which in Roman times stood the town which Procopius (B.G. ii. 11 seq.) calls Ophisberos (Urbs vetus, the modern Orvieto). This conjecture, first made by O. Mülert, has been generally accepted by modern archaeologists; and it is a strong point in its favour that the bishop of Orvieto in 955 signs himself episcopus civitatis Bulsinisinius (Gregor. Magn. Regist. v. 57a; cf. ii. 11, vi. 27). It had, and needed, no outer walls, being surrounded on all sides except the N.W. by abrupt tufa cliffs; but a massive wall was found by excavation on the S.W. side of the town may have belonged to the acropolis. No remains of antiquity are to be seen within the city; but at the foot of the hill on the N. a large Etruscan necropolis was found in 1874, dating from the 5th century B.C. The tombs, constructed of blocks of stone and arranged in rows divided by passages (like houses in a town), often had the name of the deceased on the façade. Many painted vases, &c., were found; some of the best are in the Museo Civico at Orvieto. Tombs with paintings have also been found to the W. of the town on the way to Bolsena.

Volsci was reputed the richest of the twelve cities of Etruria. Wars between Volsci and Rome are mentioned in 392, 308 and 294 B.C., and in 265-64 B.C. the Romans assisted the inhabitants against their former slaves, who had successfully asserted themselves against their masters and took the town. Fulvius Flaccus gained a triumph for his victory, and it was probably then that the statue of Vertumnus which stood in the Vicus Tuscus at Rome was brought from Volsci. Zonaras states that the city was destroyed and removed elsewhere, though the old site continued apparently to be inhabited, to judge from the inscriptions found there. The new city was certainly situated on the hills on the N.E. bank of the Lake of Bolsena (Lacus Volsiniiensis), 12 m. W.S.W. of Orvieto, where many remains of antiquity have been found, on and above the site of the modern Bolsena (g.v.). These remains consist of Etruscan tombs, the sacred enclosure of the goddess Nothia, with votive objects and coins ranging from the beginning of the 3rd century B.C. to the middle of the 3rd century A.D., remains of Roman houses, &c., and an amphitheatre of the imperial period (E. Gabrici in Monumenti dei Lincei, xvi. 1906, 169 sqq., and in Notizie degli Scavi, 1906, 59 sqq.).

The history of the new Volsci is somewhat scanty. Sejanus, the favourite of Tiberius, and Musonius Rufus the Stoic were natives of the place. The earliest dated inscription from the cemetery of S. Christina (discovered with its subterranean church in 1880-81) belongs to A.D. 376 and the first known bishop of Volsci to A.D. 499. In the next century, however, the see was transferred to Orvieto. Etruscan tombs have been found on the Isola Bisentina, in the lake; and on the west bank was the town of Visentium, Roman inscriptions belonging to which have been found. The site is marked by a medieval castle bearing the name Bisenzio.

See E. Bornmann in Corp. Inscr. Lat. xi. 1888, pp. 423 sqq.; Notizie degli Scavi, passim; G. Dennis, op. cit. (ii. 18 sqq.).

**VOLTA; ALESSANDRO** (1745-1827), Italian physicist, was born at Como on the 18th of February 1745. He is celebrated as a pioneer of electrical science, after whom the "volt" is named. In 1774 he was appointed professor of physics in the gymnasium of Como, and in 1777 he travelled through Switzerland, where he formed an intimate friendship with H. B. de Sausure. In 1779 a chair of physics was founded in Pavia, and Volta was chosen to occupy it. In 1782 he journeyed through France, Germany, Holland and England, and became acquainted with many scientific celebrities. In 1791 he received the Copley medal of the Royal Society. In 1801 Napoleon called him to Paris, to show his experiments on contact electricity, and a medal was struck in his honour. He was made a senator of the kingdom of Lombardy. In 1815 the Emperor of Austria made him director of the scientific faculty of Padua. In 1810 he retired and settled in his native town, where he died on the 5th of March 1827. For Volta's electrical work, and his place in the history of discovery (see Electricity; also Voltmeter).

**VOLTA, the largest river of the coast of Upper Guinee, between the Gambia and the Niger, with a length of about 900 m. Its mouth and the greater part of its course are in British territory. Its lower course had been known since the discoveries of the Portuguese, from whom it received (15th century) its name of the "river of the black man's land." It was not, however, until the last fifteen years of the 19th century that the extent of its basin—extending far north within the bend of the Niger—was made known.

There are two main branches, the Black and the White Volta. Their sources lie on the grassy plateaux north of the forest belt of the Guinea coast, the Black Volta rising (as the Baule) in about 11° N. 4° E. Its course is rather meandering, for it meanders round a point, after receiving a tributary from nearly 14° N.—the most northerly point of the basin,—it turns sharply south. From the seventh to the ninth parallel the river forms the boundary between the Northern Territories of the Gold Coast (British) and the French Ivory Coast colony. The southerly course of the stream ceases at 8° 15' N. where it is deflected E., and even N., by a mountain range composed of sandstone and granite, which it finally breaks through by a narrow pass, in which its width is only some 50 yds. Elsewhere
it has a general width of 150 to 200 yds. In 6° 50' W. it receives the White Volta, which flows generally south from about 13° N. and likewise forms both banks in the escarpment. The rivers shrink greatly in the dry season, reaching their lowest level at the end of January. Below the junction the Volta flows S.E. and S., turning, however, E. for 40 m. just north of 5°. In 3° 37' N. it receives on the left bank a large tributary, the Oti, coming from 12° N. In its lower course, through the forest belt, the river has often a width of over half a mile, with a depth in places of 40 to 50 ft. in the rains, but in 6° 19' N. it traverses a granite plain, its width is narrowed to 30 yds. Its use as a waterway is limited by a number of rapids, the lowest of which occur in 6° 7' N., above the trading port of Akuse. Its mouth is also obstructed during the greater part of the year by reefs which are usually navigable by small vessels from its mouth for about 60 m.

The lower Volta was explored by M. J. Bonnâit in 1875, but the upper basin was first traversed by the German traveller G. A. Krause (1886–87) and the French captain L. G. Binger (1889). It has since been explored by a number of colonial officials—German, French and British. Between 6° 41' and 5° 8' N. the Volta forms the boundary between the Gold Coast and Togoland.

VOLTAIRE, FRANÇOIS MARIE AROUET DE (1694–1778), French philosopher, historian, dramatist and man of letters, whose real name was François Marie Arouet simply, was born on the 21st of November 1694 at Paris, and was baptized the next day. His father was François Arouet, a notary; his mother was Marie Marguerite Daumart or D'Aumard. Both father and mother were of Poitevin extraction, but the Arouets had been for two generations established in Paris, the grandparent of the family belonging to a yeoman-tradesman class; their special home was the town of Saint-Loup. Voltaire was the fifth child of his parents—twin boys (of whom one survived), a girl, Marguerite Catherine, and another boy who died young, having preceded him. Not very much is known of the mother, who died when Voltaire was but seven years old. She pretty certainly was the chief cause of his early introduction to good society, the abbé de Châteauneuf (his sponsor in more ways than one) having been her friend. The father appears to have been a yeoman, neither infamously nor tyrannically. Marguerite Arouet, of whom her younger brother was very fond, married early, her husband's name being Mignot; the elder brother, Armand, was a strong Jan- senist, and there never was any kind of sympathy between him and Francois.

The abbe de Châteauneuf instructed him early in belles-lettres and deism, and he showed when a child the unsurpassed faculty for facile verse-making which always distinguished him. At the age of ten he was sent to the Collège Louis-le-Grand, which had been a Jesuit establishment, but in which the Jesuits reigned supreme, and remained there till 1711. It was his whim, as part of his general liberal- ism, to depreciate the education he received; but it seems to have been a very sound and good education, which formed the basis of his extraordinarily wide, though never extraordinary accurate, collection of knowledge subsequently, and (more important thing) disciplined and exercised his literary faculty and judgment. Nor can there be much doubt that the great attention bestowed on acting—the Jesuits kept up the Renaissance practice of turning schools into theatres for the performance of plays both in Latin and in the vernacular, and had much to do with Voltaire's lifelong devotion to the stage. It must have been in his very earliest school years that the celebrated presentation of him by his godfather to Ninon de Lenclos took place, for Ninon died in 1705. She left him two thousand francs "to buy books with." He worked fairly, played fairly, lived comfortably, made good and lasting friends. Some curious traits are recorded of this life—one being that in the terrible famine year of Malplaqueat a hundred francs a year were added to the usual boarding expenses, and yet the boys had to eat "patis bis."

In August 1711, at the age of seventeen, he came home, and the usual battle followed between a son who desired no profession but literature and a father who refused to consider literature a profession at all. For a time Voltaire submitted, and read law at least nominally. The abbe de Châteauneuf died before his godson left school, but he had already introduced him to the famous and dissipated coterie of the Temple, of which the grand prior Vendôme was the head, and the poets Chaulieu and La Fare the chief literary stars. It does not appear that Voltaire got into any great scrapes; but his father tried to break him into literary life by sending him first to Caen and then, in the suite of the marquis de Châteauneuf, the abbe's brother, to the Hague. Here he met a certain Olympe Dunoyer ("Pimpette"), a girl apparently of respectable character and not bad connections, but a Protestant, penniless, and daughter of a literary lady whose literary reputation was not spotless. The mother discouraged the affair, and, though Voltaire tried to avail himself of the mania for proselytizing which then distinguished France, his father stopped any idea of a match by procuring a lettre de cachet, which, however, he did not use. Voltaire, who had been sent home, submitted, and for a time pretended to work in a Parisian lawyer's office; but he again manifested a faculty for getting into trouble—this time in the still more dangerous way of writing libellous poems—so that his father was glad to send him to stay for nearly a year (1714–15) with Louis de Camuartin, marquis de Saint-Ange, in the country. Here he was still supposed to study law, but devoted himself in part to literary essays, in part to storing up his immense treasure of gossiping history. Almost exactly at the time of the death of Louis XIV. he returned to Paris, to finish off his master's history, and to make the tragedy of Edipe, which he had already written, privately known. He was now introduced to a less questionable and even more distinguished coterie than Vendôme's, to the famous "court of Sceaux," the circle of the beautiful and ambitious duchesse du Maine. It seems that Voltaire lent himself to the duchess's frantic hatred of the regent Orleans, and helped to compose lampoons on that prince. At any rate, in May 1716 he was exiled, first to Tulle, then to Sully. Allowed to return, he again fell under suspicion of having been concerned in the composition of two violent libels—one in Latin and one in French—called from their first words the Pygmaeus and the Dajwv, was inveigled by a spy named Beauregard, into a real or burlesque confession, and on the 16th of May 1717 was sent to the Bastille. There he recast Edipe, began the Henriade and determined to alter his name. Ever after his exit from the Bastille in April 1718 he was known as Arouet de Voltaire, or simply Voltaire, though legally he never abandoned his patronymic. The origin of the famous name has been much debated, and attempts have been made to show that it actually existed in the Daumont society, and to make the tragedy of Edipe, which he had to maintain that it was an abbreviation of a childish nickname, "le petit volontaire." The balance of opinion has, however, always inclined to the hypothesis of an anagram on the name "Arouet le jeune," or "Arouet l. j.," u being changed to v and j to i according to the ordinary rules of the game.

A further "exile" at Châténay and elsewhere succeeded the imprisonment, and though Voltaire was admitted to an audience by the regent and treated graciously he was not trusted. Edipe was acted at the Théâtre Français on the 18th of November of the year of release, and was very well received, a rivalry between parties not dissimilar to that which not long before had helped Addison's Cato assisting its success. It had a run of forty-five nights, and brought the author not a little profit. With these gains Voltaire seems to have begun his long series of successful financial speculations. But in the spring of next year the production of Lagrange-Chancel's libels, entitled the Philosophiques, again brought suspicion on him. He was informally exiled, and spent much time with Marshal Villars, again increasing his store of reminiscences. He returned to Paris in the winter, and his second play, Artémise, was produced in February 1720. The libelary, however, was recked with some success Voltaire never published it as a whole, and used parts of it in other work. He again spent much of
his time with Villars, listening to the marshal's stories and
making harmless love to the duchess. In December 1721 his
father died, leaving him property (rather more than four
thousand livres a year), which was soon increased by a
pension of half the amount from the regent. In return for this,
or in hopes of more, he offered himself as a spy—or at any rate as
a secret diplomat—to Dubois. But meeting his old enemy
Beauregard in one of the minister's rooms and making an
offensive remark, he was waylaid by Beauregard some time
afterwards and severely beaten.

His visiting espionage, as unkind critics put it—his secret
diplomatic mission, as he would have liked to have it put
himself—began in the summer of 1722, and he set out for it
in company with a certain Madame de Rupelmonde, to whom
he as usual made love, taught désim and served as an amusing
travelling companion. He stayed at Cambrai for some time,
where European diplomatists were still in full session, jour-
neyed to Brussels, where he met and quarrelled with Jean
Baptiste Rousseau, went on to the Hague, and then returned.
The Henriade, he got on considerably during the journey,
and, according to his lifelong habit, the poet, with the help
of his friend Thibriot and others, had been “working the
oracle” of puffery. During the late autumn and winter of
1722–23 he abode chiefly in Paris, taking a kind of lodging in
the town house of M. de Bernières, a nobleman of Rouen, and
endeavouring to procure a “privilege” for his poem. In this
he was disappointed, but he had the work printed at Rouen
nevertheless, and spent the summer of 1723 revising it.
In November he caught smallpox and was very seriously ill,
so that the book was not given to the world till the spring of
1724 (and then of course, as it had no privilege, appeared
privately). Almost at the same time, the 4th of March, his
third tragedy, Mariamne appeared, was well received at first,
but underwent complete damnation before the curtain fell.
The regent had died shortly before, not to Voltaire’s advantage;
for he had been a generous patron. Voltaire had made, however,
a useful friend in another grand seigneur, as profligate and
nearly as intelligent, the duke of Richelieu, and with him he
passed 1724 and the next year chiefly, recasting Mariamne
(which was now successful), writing the comedy of L’indiscrèt,
and courting the queen, the ministry, the favourites, and
everybody who seemed worth the. The end of 1725 brought a
disastrous close to this period of his life. He was insulted by
the chevalier de Rohan, replied with his usual sharpness of
tongue, and shortly afterwards, when dining with the duke of
Sully, was called out and bastinadoed by the chevalier’s hire-
lings, Rohan himself looking on. Nobody would take his part,
and at last, nearly three months after the outrage, he challenged
Rohan, who accepted the challenge, but on the morning
appointed for the duel Voltaire was arrested and sent, for the
second time to the Bastille. He was kept in confinement a
fortnight, and was then packed off to England in accordance
with his own request. Voltaire revenged himself on the duke of
Sully for his conduct towards his guest by cutting Maxi-
milien de Béthune’s name out of the Henriade.

No competent judges have ever mistaken the importance
of Voltaire’s visit to England, and the influence it exercised
on his future career. In the first place, the ridiculous and
discreditable incident of the beating had time to blow over;
In the second, England was a very favourable place for French-
men of note to pick up guineas; in the third, and most im-
portant of all, his contact with a world then far more different
in every conceivable way from their neighbours than any two
peoples of Europe are different now, acted as a sovereign tonic
and stimulant on his intellect and literary faculty. Before
the English visit Voltaire had been an elegant trîler, an adept
in the forms of literature popular in French society, a sort of
superior Dorat or Boufflers of earlier growth. He returned
from that visit one of the foremost literary men in Europe,
with views, if not profound or accurate, yet wide and acute
on all les grands sujets, and with a solid stock of money.
The visit lasted about three years, from 1726 to 1729; and, as if
to make the visitor’s luck certain, George I. died and George II.
succeeded soon after his arrival. The new king was not fond of
“boetry,” but Queen Caroline was, and international jealous was pleased at the thought of welcoming a distin-
guished exile from French illiberality. The Walpoles, Bubb
Dodington, Bolingbroke, Congreve, Sarah, duchess of Marl-
borough, Pope, were among his English friends. He made
acquaintance with, and at least tried to appreciate, Shake-
peare. He was much struck by English manners, was deeply
moved by old friends, and by the suave excellence of his own
bearers.

If the English visit may be regarded as having finished
1 Gabrielle Emilie Le Tonnelier de Breteuil, marquise du Châtelet (1706–1749), was the eldest daughter of the marquis de Breteuil. She married the marquis du Châtelet-Lomont in 1725. She was an accomplished linguist, musician and mathematician, and deeply interested in metaphysics. When she first became intimate with Voltaire she was forty years old, but their friendship deepened from that day, and when he eventually visited Châtelet she was fifty years old. She visited Cirey. She is only important from her connexion with Voltaire, though an attempt has been made to treat her as an original thinker; see R. Hazlitt, An Essay on the Marquise du Châtelet (1793). She wrote Institutions de physique (1740), Dissertation sur la nature et la propagation du feu (1744), Droits sur les religions recelées (1792), and in 1796 published a translation of Newton’s Principia.
Voltaire's education, the Cirey residence may be justly said to be the first stage of his literary time. He had written important and characteristic work before; but he had always been in a kind of literary Wanderjahre. He now obtained a settled home for many years, and, taught by his numerous brushes with the authorities, he began and successfully carried out that system of keeping out of personal harm's way, and of at once denying any awkward responsibility, which made him for nearly half a century at once the chief and the most prosperous of European heretics in regard to all established ideas. It was not till the summer of 1734 that Cirey, a half-dismantled country house on the borders of Champagne and Lorraine, was fitted out for the habitation of the bishop's quarters of himself, of his hostess, and now and then of her accommodating husband. Many pictures of the life here, some of them not a little malicious, survive. It was not entirely a bed of roses, for the "respectable Emily's" temper was violent, and after a time she sought lovers who were not so much d'étrangers as Voltaire. But it provided him with a safe and comfortable retreat, and with every opportunity for literary work. In March 1735 the ban was formally taken off him, and he was at liberty to return to Paris, a liberty of which he availed himself amusingly, owing to some law-business. At Cirey he wrote indefatigably and did not neglect business. The principal literary results of his early years here were the Discours en vers sur l'homme, the play of Alzire and L'Enfant prodigue (1736), and a long treatise on the Newtonian system which he and Madame du Châtelet wrote together. But, as usual, Voltaire's extraordinary literary industry was shown rather in a vast amount of fugitive writings than in substantive works, though for the whole space of his Cirey residence he was engaged in writing, adding to, and altering the Pacelle. In the very first days of his sojourn he had written a pamphlet with the imposing title of Travels in the Metaphysics of Metaphysics proper Voltaire neither then nor at any other time understood anything, and the subject, like every other, merely served him as a pretext for laughing at religion with the usual reservation of a tolerably affirmative disdain.

In March 1736 he received his first letter from Frederick of Prussia, then crown prince only. He was soon again in trouble, this time for the poem of Le Mondain, and he at once crossed the frontier and then made for Brussels. He spent about three months in the Low Countries, and in March 1737 returned to Cirey, and began a series of experiments in physics (he had at this time a large laboratory), and busying himself with iron-founding, the chief industry of the district. The best-known accounts of Cirey life, those of Madame de Graffigny, date from the winter of 1738-39; they are somewhat spiteful but very amusing, depicting the frequent quarrels between Madame du Châtelet and Voltaire, his intense suffering under criticism, his constant dread of the surreptitious publication of the Pacelle (which nevertheless he could not keep his hands from writing or his tongue from reciting to his visitors), and so forth. The chief and most galling of his critics at this time was the Abbé Desfontaines, and the chief of Desfontaines's attacks was entitled La Voltairemonique, in reply to a libel of Voltaire's called Le Prérésoif. Both combatants had, according to the absurd habit of the time, to disown their works, Desfontaines's disavowal being formal and procured by the exertion of all Voltaire's own influence both at home and abroad. For he had as little notion of tolerance towards others as of dignity in himself. In April 1739 a journey was made to Brussels, to Paris, and then again to Brussels, which was the beginning of his life-permitting engagements in paying affairs, of the Du Châtelets. Frederick, now king of Prussia, made not a few efforts to get Voltaire away from Madame du Châtelet, but unsuccessfully, and the king earned the lady's cordial hatred by persistently refusing or omitting to invite her. At last, in September 1740, master and pupil met for the first time at Cleves, an interview followed three months later by a longer visit. Brussels was again the headquarters in 1741, by which time Voltaire had finished the best and the second or third best of his plays, Mérope and Mahomet. Mahomet was played first at Lille in that year; it did not appear in Paris till August next year, and Mérope not till 1743. This last was, and deserved to be, the most successful of its author's whole theatre. It was in this same year that he received the singular diplomatic mission to Frederick which nobody seems to have taken seriously, and after his return the oscillation between Brussels, Cirey and Paris was resumed. During these years much of the Essai sur les mœurs and the Siècle de Louis XIV. was composed. He also returned, not too well-advisedly, to the business of courtiership, which he had given up since the death of the regent. He was much employed, owing to the influence of Madame de Pompadour in the fêtes of the dauphin's marriage, and was rewarded through the influence of Madame de Pompadour on New Year's Day 1745 by the appointment to the post of historiographer-royal, once jointly held by Racine and Boileau. The situation itself and its accompanying privileges were what Voltaire chiefly aimed at, but there was a salary of two thousand livres attached, and he had the year before come in for three times as much by the death of his brother. In the same year he wrote a poem on Fontenoy, he received medals from the pope and dedicated Mahomet to him, and he wrote court divertissements and other things to admiration. But he was not yet at the height of his career. One of the best-known of Voltairean is the contempt or at least silence with which Louis XV. —a sensualist but no fool!—received the maladroit and almost insolent inquiry Trojan est-il content? addressed in his hearing to Richelieu at the close of a piece in which the emperor had appeared with a transparent reference to the king. All this assentation had at least one effect. He, who had been for years admitted the first writer in France, had been repeatedly passed over in elections to the Academy. He was at last elected in the spring of 1746, and received on the 4th of May. Then the tide turned. His favor at court had naturally exasperated his enemies; it had not secured him any real friends, and even a gentlemanship of the chamber was no solid benefit, except from the money point of view. He did not indeed hold it very long, but was permitted to sell it for a large sum, retaining the rank and privileges. He had various proofs of the instability of his hold on the king during 1747 and in 1748. He once lay in hiding for two months with the duchesse de Maine at Sceaux, where were produced the comedietta of La Prude and the tragedy of Rome sauvée, and afterwards for a time lived chiefly at Lunéville; here Madame du Châtelet had established herself at the court of King Stanislaus, and carried on a liaison with Saint-Lambert, an officer in the king's guard. In September 1749 she died after the birth of a child.

The death of Madame du Châtelet is another turning-point in the history of Voltaire. He was fifty-five, but he had nearly thirty years more to live, and he had learnt much during what may be called his Cirey cohabitation. For some time, however, after Madame du Châtelet's death he was in a state of pitiable unsettlement. At first, after removing his goods from Cirey, he hired the greater part of the Châtelet town-house, and then the whole. He had some idea of settling down in Paris, and might perhaps have done so if mischief had not been the very breath of his nostrils. He went on writing satiric tales like Zadig. He engaged in a foolish and undignified struggle with Crébillon fils (not filz), a rival set up against him by Madame de Pompadour, but a dramatist who, in part of one play, Rhadames et Zénobie, has struck a note of tragedy in the grand Cornelian strain, which Voltaire could never hope to echo. Semirame (1748), Oronte (1750) and Rome sauvée itself were all products of this period. He used the most extraordinary efforts to make himself more popular than he was, but he could not help being uncomfortable.

All this time Frederick of Prussia had been continuing his invitations. Voltaire left Paris on the 13th of June 1751, and reached Berlin on the 10th of July. This Berlin visit is more or less familiar to English readers from the two great essays of Macaulay and Carlyle as well as from the Frederick of the
latter. But these two masters of English were not perhaps the best qualified to relate the story. Both were unjust to Voltaire, and Macaulay was unjust to Frederick as well. It is curious that the king of Prussia last three years. It was quite impossible that Voltaire and Frederick should get on together for long. Voltaire was not humble enough to be a mere butt, as many of Frederick's led poets were; he was not enough of a gentleman to hold his own place with dignity and discretion; he was constantly jealous both of his equals in age and reputation, such as Maupertuis, and of his juniors and inferiors, such as Baculard D'Arnaud. He was greedy, restless, and in a way Bohemian. Frederick, though his love of teasing the sable has been exaggerated by Macaulay, was a marinet of the first water, had a sharp thought, and one-sided idea of justice, and had not the slightest intention of allowing Voltaire to insult or to tyrannize over his other guests and servants. If he is to be blamed in this particular matter, the blame must be chiefly confined to his impudence in inviting Voltaire at the beginning and to the brutality of his conduct at the end. Within Voltaire there was always a mischievous and ill-behaved child; and he was never more mischievous, more ill-behaved and more childish than in these years. He tried to get D'Arnaud exiled, and succeeded. He got into a quite unnecessary quarrel with Lessing. He had not been in the city more than three months before he engaged in a disgraceful piece of financial gambling with Hirsch, the Dresden Jew. He was accused of something like downright forgery—that is to say, of altering a paper signed by Hirsch after he had signed it. The king's disgust at this affair (which came to an open scandal before the tribunals) was so great that he was on the point of ordering Voltaire out of Prussia, and Darget the secretary had no small trouble in arranging the matter (February 1751). Then it was Voltaire's turn to be disgraced with an occupation he had undertaken himself—the occupation of "king's physician." How he succeeded in finishing and printing the Sijte Le Louis XIV., while the Dictionnaire philosophique is said to have been devised and begun at Potsdam. But Voltaire's restless temper was brewing up for another storm. In the early autumn of 1751 La Mettrie, one of the king's parasites, and a man of much more talent than is generally allowed, horrified Voltaire by telling him that Frederick had in conversation applied to him (Voltaire) a proverb about "sucking the orange and flinging away its skin," and about the same time the dispute with Maupertuis, which had more than anything else to do with his exclusion from Prussia, came to a head. Maupertuis got into a dispute with one König. The king took his president's part; Voltaire took König's. But Maupertuis must needs write his Letters, and thereupon (1752) appeared one of Voltaire's most famous, though perhaps not one of his most read works, the Diatribe du Docteur Akokia. Even Voltaire did not venture to publish this lampoon on a great official of a prince so touchy as the king of Prussia without some permission, and if all tales are true he obtained this by another piece of something like forcery—getting the king to endorse a totally different pamphlet on its last leaf, and affixing that last leaf to Akokia. Of this Frederick was not aware; but he did get some wind of the Diatribe itself, sent for the author, heard it read to his own great amusement, and either actually burned the MS., or believed that it was burnt. In a few days printed copies appeared. Frederick did not like disobedience, and he still less liked being made a fool of, and he put Voltaire under arrest. But again the affair blew over, the king believing that the edition of Akokia confiscated in Prussia was the only one. Alas! Voltaire had sent copies away; others had been printed abroad, and the thing was irrecoverable. It could not be proved that he had ordered the printing, and all French correspond did was to have the pamphlet burnt by the hangman. Things were now drawing to a crisis. One day Voltaire sent his orders &c., back; the next Frederick returned them, but Voltaire had quite made up his mind to fly. A kind of reconciliation occurred in March, and after some days of good-fellowship Voltaire at last obtained the long-sought leave of absence and left Potsdam on the 26th of the month (1753). It was nearly three months afterwards that the famous, ludicrous and brutish arrest was made at Frankfort, on the persons of himself and his niece, who had met him meanwhile. The reasons were a faint excuse for Frederick's wrath. In the first place, the poet chose to linger at Leipzig. In the second place, in direct disregard of a promise given to Frederick, a supplement to Akokia appeared, more offensive than the main text. From Leipzig after a month's stay, Voltaire moved to Gotha. Once more on the 25th of May, he moved on to Frankfort. Frankfort nominally a free city, but with a Prussian resident who did very much what he pleased, was not like Gotha and Leipzig. An excuse was provided in the fact that the poet had a copy of some unpublished poems of Frederick's, and as soon as Voltaire arrived hands were laid on him, at first with courtesy enough. The resident, Freytag, was not a very wise person (though he probably did not, as Voltaire would have it, spell "poesie" "poesie"); constant references to Frederick were necessary; and the affair was prolonged so that Madame Denis had time to join her uncle. At last Voltaire tried to steal away. He was followed, arrested, his niece seized separately, and sent to join him in custody; and the two, with the secretary Collini, were kept close prisoners at an inn called the Goat. This situation was at last put an end to by the city authorities, who probably felt that they were not playing a very creditable part. Voltaire left Frankfort on the 7th of July, travelled safely to Mainz, and thence to Mannheim, Strassburg and Colmar. The latest named place he reached (after a leisurely journey and many honours at the little courts) was at the beginning of October, and here he proposed to stay the winter, finish his Annales of the Empire and look about him.

Voltaire's second stage was now over. Even now, however, in this sixty-third year, it required some more external pressure to induce him to make himself independent. He had been in the first blush of his Frankfort disaster, refused, or at least not granted, permission even to enter France proper. At Colmar he was not safe, especially when in January 1754 a pirated edition of the Essai sur les mœurs, written long before, appeared. Permission to establish himself in France was now absolutely refused. Nor did an extremely offensive performance of Voltaire's—the solemn partaking of the Eucharist at Colmar after due confession—at all mollify his enemies. His exclusion from France, however, was chiefly metaphorical, and really meant exclusion from Paris and its neighbourhood. In the summer he went to Plombières, and after returning to Colmar for some time journeyed in the beginning of winter to Lyons, and thence in the middle of December to Geneva. Voltaire had no purpose of remaining in the city, and almost immediately bought a country house just outside the gates, to which he gave the name of Les Délites. He was here practically at the meeting-point of four distinct jurisdictions—Geneva, the canton Vaud, Savoia and France. All other cantons were within easy reach; and he bought other houses dotted about these territories, so as never to be without a refuge close at hand in case of sudden storms. At Les Délites he set up a considerable establishment, which his great wealth made him able easily to afford. He kept open house for visitors; he had printers close at hand in Geneva; he fitted up a private theatre in which he could enjoy what was perhaps the greatest pleasure of his whole life—acting in a play of his
own, stage-managed by himself. His residence at Geneva brought him into correspondence (at first, quite amicable) with the most of her citizens, J. J. Rousseau. His Orphelin de la Chine, performed at Paris in 1755, was very well received; the notorious La Pucelle appeared in the same year. The earthquake at Lisbon, which appalled other people, gave Voltaire an excellent opportunity for ridiculing the beliefs of the orthodox, first in verse (1756) and later in the (from a literary point of view) unsurpassable tale of Candide (1759).

All was, however, not yet quite smooth with him. Geneva had a law expressly forbidding theatrical performances in any circumstances whatever, Voltaire had infringed this law already and had been imprisoned (which he increased by other purchases and leases) he became a complete country gentleman, and was henceforward known to all Europe as squire of Ferney. Many of the most celebrated men of Europe visited him there, and large parts of his usual biographies are composed of extracts from their accounts of Ferney. His new occupations by no means quenched his literary activity. He did not make himself a slave to his visitors, but reserved much time for work for and for his immense correspondence, which had for a long time once more included Frederick. He was now getting on very well when they were not in contact. Above all, he now, being comparatively secure in position, engaged much more strongly in public controversies, and resorted less to his old labyrinthine tricks of disavowal, garbled publication and private libel. The suppression of the Encyclopédie, to which he had been a considerable contributor, and whose conductors were his intimate friends, drew from him a shower of lampoons directed now at "l'infiné (see infra) generally, now at literary visitors, such as Le Franc de Pompeigian (who had written one piece of verse so much better than anything serious of Voltaire's that he could not be forgiven), or Palissot (who in his play Les Philosophes had boldly gibbetted most of the persons so termed, but had not included Voltaire), now at Fréron, an excellent critic and a dangerous writer, who had attacked Voltaire from the conservative side, and at whom the patriarch of Ferney, as he now began to be called, levelled in return the very inferior farce-lampoon of L'Écosaise, of the first night of which Fréron himself did an admirably humorous criticism.

How he built a church and got into trouble in so doing at Ferney we have to exerit Voltaire " on it (1760-61) and obtained a relief from the price for his new building; how he entertained a grand-niece of Cornelle, and for her benefit wrote his well-known "commentary" on that poet, are matters of interest, but to be passed over briefly. Here, too, he began that series of interferences on behalf of the oppressed and the ill-treated which, whatever mixture of motives may have prompted it, is an honour to his memory. Volumes and almost libraries have been written on the Calas affair, and we can but refer here to the only less famous cases of Sirven (very similar to that of Calas, though no judicial murder was actually committed), Espinasse (who had been sentenced to the galleys for harbouring a Protestant minister), Lally (the son of the unjustly treated but not blameless Irish-French commander in India), D'Étalone (the companion of La Barre), Montbailli and others. In 1768 he entered into controversy with the bishop of the diocese; he had differences with the superior landlord of part of his estate, the president de Brosses; and he engaged in a long and tedious return match with the republic of Geneva. But the general events of this Ferney life are somewhat of that happy kind which are no events.

But the story of his stay at Ferney—how he established himself at Ferney, became a very old one almost, without noticing it. The death of Louis XV. and the accession of Louis XVI. excited even in his aged breast the hope of re-entering Paris, but he did not at once receive any encouragement, despite the reforming ministry of Turgot. A much more solid gain to his happiness was the adoption, or practical adoption, in 1776 of Reine Philiberte de Variocourt, a young girl of noble but poor family, whom Voltaire rescued from the convent, installed in his house as an adopted daughter, and married to the marquis de Villette. Her pet name was "Belle et Bonne," and nobody had more to do with the happiness of the last years of the "patriarch" than she had. It is doubtful whether his last and fatal visit to Paris was due to his own wish or to the instigation of his niece, Madame Denis; but this lady—a woman of disagreeable temper, especially to her inferiors—appears to have been rather hardly treated by Voltaire's earlier, and sometimes by his later, biographers. The suggestion which has been made that the success of Beaumarchais' piqued him has nothing impossible in it. At any rate he had, at the end of 1777 and the beginning of 1778, no very bad idea of finding a new tragedy—perhaps for Mme. du Barry, if he could find a part for her—after that of Cato. In 1778, however, he returned to Paris for the last time. He returned to the city which he had not seen for eight and twenty years.

He was received with immense rejoicings, not indeed directly by the court, but by the Academy, by society and by all the more important foreign visitors. About a fortnight after his arrival, age and fatigue made him seriously ill, and a confessor was sent for. But he recovered, scoffed at himself as usual, and prepared more eagerly than ever for the first performance of Frédéron at the 16th of March. At the end of the month he was able to attend a performance of it, which was a kind of apotheosis. He was crowned with laurel in his box, amid the plaudits of the audience, and did not seem to be the worse for it. He even began or proceeded with another tragedy—Agathocle—and attended several Academic meetings. But such proceedings in the case of a man of eighty-four were impossible. To keep himself up, he exceeded even his usual excess in coffee, and about the middle of May he became very ill. On the 30th of May the priests were once more sent for to wit his nephew, the abbé Mignot, the abbé Gaultier, who had officiated on the former occasion, and the parish priest, the curé of St Sulpice. He was, however, in a state of half-insensibility, and petulantly motioned them away, dying in the course of the night. The legends about his death in a state of terror and despair are certainly false; but it must be regarded as singular and unfortunate that he, who had more than once gone out of his way to conform ostentatiously and with his tongue in his cheek, should have neglected or missed this last opportunity. The result was a difficulty as to burial, which was compromised by hurried interment at the abbey of Scellière in Champagne, anticipating the interdict of the bishop of the diocese by an hour or two. On the 10th of July 1791 the body was transferred to the Pantheon, but during the Hundred Days it was once more, it is said, disinterred, and stowed away in a piece of waste ground. His heart, taken from the body when it was embalmed, and given to Madame Denis and by her to Madame de Villette, was preserved in a silver case, and when it was proposed (in 1864) to restore it to
the other remains, the sarcophagus at Sainte Geneviève (the Panthéon) was opened and found to be empty.

In person Voltaire was not engaging, even as a young man. He resembled the Christianity he decried, among other things, by the very poor but well-known epigram attributed to Young, and identifying him at once with "Satàn, Death and Sin." In old age he was a mere skeleton, with a long nose and eyes of preternatural brilliancy peering out of his wig. He never seems to have been addicted to any manly sport, and took little exercise. He was sober enough (for his day and society) in eating and drinking generally; but drank coffee, as his contemporary, counterpart and enemy, Johnson, drank tea, in a hardened and inveterate manner. It may be presumed with some certainty that his attentions to women were for the most part platonic; indeed, both on the good and the bad side of him, he was all brain. He appears to have had no great sense of natural beauty, in which point he resembled his generation (though one remarkable story is told of his being deeply affected by Alpine scenery); and, except in his passion for the stage, he does not seem to have cared much for any of the arts. Conversation and literature were, again as in Johnson's case, the sole gods of his idolatry. As for his moral character, the wholly intellectual cast of mind just required to make it difficult to judge that. His beliefs or absence of beliefs emancipating him from the conventional and restricted choice of language, a crammed and monotonous prosody, and none of that indefinite suggestion which has been rightly said to be of the poetic essence. But there is immense wit, a wonderful command of such metre and language as the taste of the time allowed to the poet, occasionally a singular if somewhat artificial grace, and a curiously felicitous diction and manner.

The third division of his prose romances or tales. These productions—incomparably the most remarkable and most absolutely good fruit of his genius—were usually composed as pamphlets, with a purpose of polemik in religion, politics, or literature; Candide attacks religious and philosophical optimism, L'Homme aux quatre âges certain social and political views of the time. Zadig and others received the form of moral and metaphysical orthodoxy, while some are mere sermons on the Bible, the unfailing source of Voltaire's being. But (as always happens in the case of literary work where the form exactly suits the author's genius) the purpose in all the best of them (there are so many almost equally) is to rebuke some other than that the peculiar quality of Voltaire—ironic style without exaggeration—appears. That he learned it partly from Saint Evremond, still more from Anthony Hamilton, partly even from David Hume, and Lemoyne Le Sable, and partly out he gave it in his fashion and completion. If one especial peculiarity can be singled out, it is the extreme restraint and simplicity of the verbal treatment. As in his epigrams: "The thing he has said, elucidates or comments on his own jokes, guffaws over them or exaggerates their form. The famous "Pour encourager les autres" (that the shooting of Byng did encourage the others) very much is not to the point) is a typical example, and indeed the whole of Candide shows the style at its perfection.

The fourth division of Voltaire's work, the historical, is the bulkiest of all except his correspondence, and some parts of it are or have been among the most execrable but it is far from being even among the best. The small treatises on Charles XII. and Peter the Great are indeed models of clear narrative and ingenious if somewhat artificial rhetoric. The Histoire de Louis XIV. and Stéle de Louis XV. (the latter inferior to the former but still valuable) contain a great miscellany of interesting matter, treated by a man of great acuteness and unsurpassed power of writing who had also had access to much important private information. But even in these books defects are present, which appear much more strongly in the singular olla podrida entitled Essai sur les mauvais, in the Annales de l'Empire and the Mélanges, which are a profusion of facts without any compre- ncion of what has since been called the philosophy of history, the constant presence of gross prejudice, frequent inaccuracy of fact, and an almost total absence except from the narrow standpoint of a half-pessimist and half self-satisfied philosophe of the 18th century.

His work in physics concerns us less than any other here; it is, however, not entirely inconsiderable in bulk, and is vailed by experts to give proof of aptitude.

To his own age Voltaire was pre-eminent a poet and philosopher; the unkindness of succeeding ages has sometimes questioned
VOLterra

205

whether he had any title to either name, and especially to the latter. His philosophical work, at least so called, is the curious medley entitled Dictionnaire philosophique, which is compounded of the articles contributed by him to the great Encyclopédie and of several minor works. In English, English scholars have shown the ancient religious at least anti-eclesiastical animus more strongly. The various title-words of the several articles are often the merest stalking-horses, under cover of which to shoot at the Bible or the church, the miscreant or the folk of the writer's country, his personal foes, &c., and the whole being largely seasoned with that acute, rather superficial, common-sense, but also commonplace, ethical and social courage that has been fully described. In metaphysique the author makes his grand effort, but scarcely succeeds in doing more than show that he had no real conception of what metaphysics is.

In general criticism and miscellaneous writing Voltaire is not inferior to himself in any of his other functions. Almost all his more substantive works, whether in verse or prose, are preceded by prefaces of one sort or another, which are read or discarded for his own revelation and pungent causerie; and in a vast variety of nondescript pamphlets and writings he shows himself a perfect journalist. In literary criticism pure and simple his principal work is the Commentaire à l’Encyclopédie, a great book, which is sometimes (as in his Life and notices of Molère) independently sometimes as part of his Œuvres. Nowhere, perhaps, except when he is dealing with religion, are Voltaire's defects felt more than here, a work which, as an acknowledgment of the history of language and literature, and more than anywhere else he showed the extraordinarily limited and conventional spirit which accompanied him. Voltaire fought against all traditions and conventions in theological, ethical and political matters.

There remains only the huge division of his correspondence, which is constantly being augmented by fresh discoveries, and which, according to Corneille's estimate, has not been fully or correctly printed, even in some of the parts longest known. In this great mass Voltaire's personality is of course best shown, and perhaps his literary qualities not worst. His immense energy and versatility, his administrative faculty, his absolute power to deal with the most ruthless sackman when he chose to be sarcastic, his rather unscrupulous business faculty, his more than rather unscrupulous eloquence, are the very features which he is alleged to have escaped from history, — all these things appear throughout the whole mass of letters.

Most judgments of Voltaire have been unduly coloured by sympathy with or dislike of what may be briefly called his polemical side. When sympathetic and dislike are both discarded or allowed for, he remains one of the most astonishing, if not exactly one of the most admirable, figures of letters. That he never, as Carlyle complains, gave utterance to one great truth is strictly true. That his character always, or even more often than the opposite, contained rather than positive genius is also true. But that he was merely a mocker, which Carlyle and others have also said, is not strictly true. In politics poor seems indeed to have had few or no constructive ideas, and to have been entirely ignorant or quite regardless of the fact that his attacks were destroying a state of things for which as a whole he neither had nor apparently wished to have any substitute. But when he permits and does, he is perfectly, and even sincerely, that his own attitude was not purely negative; but here also he seems to have failed altogether to distinguish between prying and cutting down. Both here and elsewhere his great fault was an innate superficiality. But this superficiality was accommodated by such wonderful acuteness within a certain range, by such an absolutely unsurpassed literary aptitude and sense of style in all the lighter and some of the graver modes of literature, by such untiring energy and versatility in enterprise, that he has no parallel among ready writers anywhere. Not the most elaborate work of Voltaire is of much value for matter; but not the very slightest work of his has any value in his literary craft. Furthermore, he is at once versatile and accomplished, he has no superior and scarcely a rival.

BIBLIOGRAPHY.—The bibliography of Voltaire is a very large subject. The best edition of a diplomatist of much erudition and judgment, Georges Bensence, Bibliographie de Voltaire (4 vols., Paris, 1882-90). The best edition of the works is that by Louis Moland in 52 volumes (Paris, Garnier); the half-finished edition was issued in 1865, royal octavo by Furne, and kept in print by the house of Didot. Of the earlier editions, though their bulk is an objection, several are interesting in some degree. Especially must be noticed the first edition of Kehl, in which Voltaire himself, and later Beaumarchais, were concerned (70 vols., 1758-80); those of Dailbon and Baudouin, each in 97 volumes (from which "the hundred volumes of Voltaire" have their origin), by S. F. L. de Saussure; and the most popular edition of Beuchot (1829) in 72 volumes. Editions of separate or selected works are innumerable, and so are books upon Voltaire. There is not really good detailed life of him, with complete examination of his work, in any language, though the works containing materials for such are numerous (the first of importance being that of T. J. Duvernet in 1797), and sometimes (especially in the case of M. Destouches, Voltaire et la société française, 1867 and others) with a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. G. E. Talley (London, 1903, 2 vols.) is gossiping and popular. Francis Espinasse’s Voltaire (1882), which contains a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. C. Talley (London, 1903, 2 vols.) is gossiping and popular. Francis Espinasse’s Voltaire (1882), which contains a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. G. S. Talley (London, 1903, 2 vols.) is gossiping and popular. Francis Espinasse’s Voltaire (1882), which contains a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. G. S. Talley (London, 1903, 2 vols.) is gossiping and popular. Francis Espinasse’s Voltaire (1882), which contains a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. G. S. Talley (London, 1903, 2 vols.) is gossiping and popular. Francis Espinasse’s Voltaire (1882), which contains a useful bibliography and fair accuracy, but with little power of criticism. That of Mr. G. S. Talley (London, 1903, 2 vols.) is gossiping and popular.
82–80 B.C. As a result of its resistance Sulla carried a law for the confiscation of the land of those inhabitants of Volaterrae who had had the privileges of Roman citizenship. This, however, does not seem to have been carried out until Caesar as dictator divided some of the territory of Volaterrae among his veterans. Among its noble families the chief was that of the Cacciae, who took their name from the river which runs close to Volaterrae and still retains the name Cecina. Cicero defended one of its members in an extant speech. It is included by Pliny among the municipal towns of Etruria. In the 12th and 13th centuries it enjoyed free institutions; in 1361 it fell under the power of Florence. It rebelled, but was retaken and pillaged in 1472. Persius the satirist and the painter Daniele da Volterra were both natives of the town. Several works of the latter are preserved there.

VOLTMETER—An instrument for measuring difference of electric potential (see Electrostatics) in terms of the unit called a volt. The volt (so called after A. Volta) is defined to be difference of potential which act between the terminals of a resistance of one ohm sends through it a continuous current of one ampere. A voltmeter is therefore one form of electro- meter (q.v.), but the term is generally employed to describe the instrument which indicates on a scale, not merely in arbitrary units but directly in volts, the potential difference of its terminals. Voltmeters may be divided into two classes, (a) electrostatic, (b) electrokinetic.

Electrostatic voltimeters are based on the principle that when two conductors are at different potentials they attract one another with a force which varies as the square of the potential difference (P. D.) between them. This mechanical stress may be made the measure of the P. D. between them, if one of the conductors is fixed while the other is movable, this last being subject to a constraint due to a spring or to gravity, means being also provided for measuring either the displacement of the movable conductor against the constraint or the force required to hold it in a fixed position relatively to the fixed conductor. One large class of electrostatic voltmeters consists of a fixed metal plate or plates and a movable plate or plates, the two sets of plates forming a condenser (see Leyden Jar). The movable system is suspended or pivoted, and when a P. D. is created between the fixed and movable plates, the latter are drawn into a new position which is resisted by the torque of a wire or by the force due to a weight. Utilizing this principle many inventors have devised forms of electrostatic voltmeter. One of the best known of these is Lord Kelvin's multicellular voltmeter. In this instrument (fig. 1) there are two sets of fixed metal plates, connected to the other member of the circuit, and a difference of potential is created between them, then the movable needle is drawn in so as to indicate the difference of potential more included between the fixed plates. This movement is resisted by the torsional elasticity of the suspending wire, and hence a fixed indicating needle attached to the movable system is used to indicate directly on a scale the difference of potential between the terminals of the instrument in volts. Instruments of this kind have been constructed not only by Lord Kelvin, but also by W. E. Ayton and others, for measuring a potential difference from 1000 to 1 volt. In other types of electrostatic instruments the movable system rotates round a horizontal axis or rests upon knife edges like a scale beam; in others the movable system is attached to a wire. In the former case the control is generally due to gravity, the plates being so balanced on the knife edge that they tend to take up a certain fixed position from which they are constrained when the electric current is changed into potential displacement relatively to the fixed plates being shown on a scale and thus indicating the P. D. between them. In the case of high tension voltmeters, the movable plate takes the form of a single plate of paddle shape, and for extra high tensions it may simply be suspended from the end of a balanced arm; or the movable system may take the form of a cylinder which is suspended within, but not touching, another fixed cylinder, the position being such that the electric forces draw the suspended cylinder more into the fixed one. Electrostatic voltmeters are now almost entirely used for the measurement of high voltages from 2000 to 50,000 volts employed in electrotechnics. For this purpose the instrument is enclosed in a case and possesses the shape of a metal case, the indicating needle moving over a divided scale which is calibrated to show directly the potential difference in volts of the terminals of the instrument. One much-used electrostatic voltmeter of this type is the Kelvin multi-cellular electrostatic voltmeter (fig. 2). For use at the switch-boards of electric supply stations the instrument takes another form known as the "edge-wise" pattern.

Another class of voltmeters comprises the electrokinetic voltmeters. In these instruments the potential difference between two points is measured by the electric current passing through a conductor connected to the points of interest and connected to two terminals, each of which is fixed. In any case of potential difference measurement it is essential not to disturb the potential difference being measured; hence it follows that in electrokinetic voltmeters the wires connecting the points of which the potential difference is to be measured first, the difference being measured, may take any of the forms of practically used ammeters (see Amperemeter). Electromagnetic voltmeters may therefore be thermal, electromagnetic or electrodynamic.

As a rule, electromagnetic voltmeters are only suitable for the measurement of relatively low potentials—say 200 to 300 volts. Numerous forms of hot-wire or thermal voltmeters have been devised. In that known as the Cardew voltmeter, a fine platinum-silver wire, having a resistance of about 300 ohms, is stretched in a tube or upon a frame insulated at one end. The free end of the wire is contacted by the passage of an electric current. Its expansion will move the indicating needle over the scale, the motion being multiplied by the gear. In the Hartmann and Braun form of hot-wire voltmeter, the fine wire is fixed between two supports and the expansion produced when a current is passed through it causes the wire to sag down, the sag being multiplied by a gear and made to move an indicating needle over a scale. In this case, the actual working wire, being short, must be placed in series with an additional high resistance. Hot wire voltmeters, like electrostatic voltmeters, are suitable for use with alternating currents of any frequency as well as with continuous currents, since their indications depend only on the difference of potential, which is proportional to the square of the current and therefore to the square of the difference of potential between the terminals.

Electromagnetic voltmeters consist of a coil connected to the terminals of the instrument and the current produced in that wire by a difference of potential between the terminals creates a magnetic field proportional at any point to the strength of the current. This magnetic field may be made to cause a displacement.
in a small piece of soft iron, as in the case of the corresponding ammeters, this may be made to displace an indicating needle over a scale so that corresponding to every given terminal potential difference the needle of the instrument will be in a corresponding fixed position of the needle. One of the most useful forms of electromagnetic voltmeter is that generally known as a movable coil voltmeter (fig. 3). In this instrument there is a fixed permanent magnet, producing a magnetic field in the inter space between the poles of which is fixed a delicately pivoted coil of wire carried in jewelled bearings. The needle is carried by the movable coil. The movable coil has to be freely flexible wires. The movable coil has attached to it an index needle moving over a scale, and a fixed coil of high-resistance wire is included in series with the movable coil between the terminals of the instrument. When a difference of potential is made between the terminals, a current passes through the instrument. The needle will then take a position in which the deflection of the needle is proportional to the current. If the scale is graduated so as to present a linear scale of divisions, and the needle is wound so that there is no dead part in the scale, whereas both the electrostatic and electrothermal voltmeters, above described, labour under the disadvantage that the scale divisions are out of proportion to the resistances, hence no generally a portion of the scale near the zero point where the divisions are so close as to be useless for reading purposes and are therefore omitted. For the measurement of voltages in connection with generating sets and for fixed and movable coil voltmeters are much employed, generally constructed in the edgewise pattern (fig. 4).

Electrodynamic Voltimeters.—A high-resistance electromagnetometer may be employed as a voltmeter in the case both of fixed and movable circuits consist of fine wires, and the instrument is constructed and used in a manner similar to the Siemens dynamometer. It is employed for measuring continuous alternating current (see Appendix A). Another method used for measuring continuous unidirectional potential difference (no doubt preceded by an older port of Capua) was founded in 194 B.C. at its mouth on the S. bank by the Romans; it is now about one mile inland. A fort had already been placed there during the Roman siege of Capua, in order, with Puteoli, to serve for the provisioning of the army. Augustus placed by external electric or magnetic fields. This last point is important in connexion with voltmeters used on the switchboards of electric systems. Electric voltages are also liable to have their indications disturbed by the electrification of the glass cover of the instrument; this can be avoided by varnishing the glass with a semi-conducting varnish so as to prevent the location of electrostatic charges on the glass.

Volturno.—In Appendix A it is stated that for the Electrostatic Laboratory and Testing-Room (London, 1903); G. Aspinall Parr, Electrical Engineer- ing Measuring Instruments (London, 1903); K. Edgecombe and E. England. 1. The instrument should give the same P.D. whether this has been arrived at by increasing from a lower value or decreasing from a larger value; in other words, there should be no inflexion of the instrument. (iii) The instrument should have no temperature correction; this is the case for electrostatic instruments, but in all voltmeters of the electrokinetic type which are wound with copper wire an increase of one degree centigrade alters the resistance by about 0.4%, and therefore to the same extent alters the correctness of the indications. (iv) It should, if possible, be available both for alternating and continuous currents. (v) It should be portable, and therefore the best good resistance or magnetic fields may be present, due to strong currents passing through conductors near or on the board. It is therefore always necessary to check the readings of such an instrument in situ. Electrostatic voltmeters are also liable to have their indications disturbed by the electrification of the glass cover of the instrument; this can be avoided by varnishing the glass with a semi-conducting varnish so as to prevent the location of electrostatic charges on the glass.

Volturno (anc. Volturnus, from vetere, to roll), a river of central Italy, which rises in the neighbourhood of Alfedena in the central Apennines of Samnium, runs S. as far as Venafro, and then S.E. After a course of some 75 m. it receives, about 5 m. E. of Caiasso, the Calore, only 3 m. less in length, which runs first N. and then W., and after 37 m. reaches Benevento, near which it receives several tributaries; then curves round the mountain mass to the N. of the Caudine Forks, and so beyond Telese joins the Volturno. The united stream now having relatively strong electric or magnetic fields may be present, due to strong currents passing through conductors near or on the board. It is therefore always necessary to check the readings of such an instrument in situ. Electrostatic voltmeters are also liable to have their indications disturbed by the electrification of the glass cover of the instrument; this can be avoided by varnishing the glass with a semi-conducting varnish so as to prevent the location of electrostatic charges on the glass.

Volturno.—In Appendix A it is stated that for the Electrostatic Laboratory and Testing-Room (London, 1903); G. Aspinall Parr, Electrical Engineering Measuring Instruments (London, 1903); K. Edgecombe and E. England. 1. The instrument should give the same P.D. whether this has been arrived at by increasing from a lower value or decreasing from a larger value; in other words, there should be no inflexion of the instrument. (iii) The instrument should have no temperature correction; this is the case for electrostatic instruments, but in all voltmeters of the electrokinetic type which are wound with copper wire an increase of one degree centigrade alters the resistance by about 0.4%, and therefore to the same extent alters the correctness of the indications. (iv) It should, if possible, be available both for alternating and continuous currents. year he was accused of peculation and other offences to the
emperor, who censured him severely and deprived him of his
plenipotentiary powers, despite his undeniable services in
Persia, but for which Peter could never have emerged so tri-
umphantly from the difficult Persian war of 1722–23. Cath-
erine’s artillery and infantry units, been assaulted around by
and he held the same post for two years (1728–30) under
Peter II. But his incorruptible corruption and unbridled temper
so discredited the government that he was deprived of the
post shortly after the accession of Anne. From 1730 to 1736
Voluinsky served in the army under Münich. In 1737 he
was appointed the second Russian plenipotentiary at the
abruptive congress of Nemirov held for the conclusion of peace
with the Porte. In 1738 he was introduced into the Russian
cacinet by Biren as a counterpaise against Andrei Osterman.
Voluinsky, however, now sought himself strong enough to
attempt to supersede Biren himself, and openly opposed the
favourite in the Council of State in the debates as to the In-
demnity due to Poland for the violations of her territory during
the war of the Polish Succession. Biren advising that a liberal
indemnity should be given, whereas Voluinsky objected to any
indemnity at all. Biren thereupon forced Anne to order an
inquiry into Voluinsky’s past career, with the result that he
was tried before a tribunal of Biren’s creatures and condemned
to be broken on the wheel and then beheaded. On the scaffold,
"by the clemency of the empress," his punishment was miti-
gated by imprisonment in the Peter and Paul fortress, that was
followed by decapitation. The whole business seems to have been purely a piece of
vindicativeness on the part of Biren.

See R. N. Bain, The Pupils of Peter the Great (London, 1897); D. A. Korsakov, From the Lives of Russian Statesmen of the XVIIIth Century (Rus.) (Kazan, 1891).

VOLUNTEERS, a general term for soldiers who are not pro-
nessionals nor permanently embodied under arms in peace.
Although it would be difficult to say when the principle
of volunteer organization for national defence was first adopted in
England, it is certain that voluntary military societies existed
in various parts of the country in the reign of Henry VIII., who
in fact granted a charter in 1537 to the "Fraternity or Gylde
of Saint George: Maisters and Rulers of the said Science of
Artillery as aforesaid rehearsed for long-bowes Cros-bowes and
Hand-Gonnes." This ancient corps is now the Honourable
Artillery Company of London. Although the Honourable Artillery
Company has always been a distinct association, it was at one
time (notably during the Great Rebellion) a centre of instruction
for the City-trained bands, and in later times the H.A.C., divided
into various branches, has served as a type for the training and
obligations to the Volunteer or Territorial Forces.

Charters of a similar kind were granted to a Colchester society
in 1619 and to one at Bury St Edmunds in 1628. In the 16th
and 17th centuries also various temporary corps outside the
militia or trained-band organization were called volunteers.

At Boston, Massachusetts, there is established a corps bearing
the name of the "Antient and Honorable Artillery Company
of Massachusetts." This company was formed in 1638 after its
London prototype. Notice of a large organized Volunteer Force, however,
seems to have originated in England at the time of the Militia
Bill of 1757, which was amended in 1758 so as to allow the
militia captains to accept volunteers instead of the ordinary
militiamen who were compulsorily furnished pro rata by each
parish. In 1778 the volunteers were still voluntary substitutes
for militiamen, though formed in separate companies of the
militia unit, but volunteer corps soon began to form themselves independently of the militia. In the meantime a large volunteer force had sprung up in Ireland. In 1779, Ireland being threatened with foreign invasion, a levy of 20,000 Protestants was made by the
government in the north. The 20,000 Protestants had grown in
1782 to 100,000 of all arms and both creeds, and they used their
strength effectively for political purposes. After the establish-
ment of the parliament at Dublin, and the general peace of 1783,
 Attempts were made to use this army for party purposes, and
the moderate men in parliament therefore hastened to disband
it. But this military coup d'état was not forgotten in England.
Ireland indeed supplied 70,000 volunteers during the Napoleonic
wars, practically in place of her militia quota. But the rebellion
of 1798 kept alive the memory of 1783, and about 1800 the
government of the Irish press became more and more

The English and Scottish volunteers, disbanded in 1783, were
promptly revived when the French Revolutionary Wars pro-
duced a new and more formidable enemy. Volunteer corps,
some dependent as companies upon the militia, others inde-
pendent units, were raised in 1794, volunteer service counting
as militia service for the purposes of raising the county, town
or parish quota. This was followed in 1798 by the formation, for
purely local defence, of the Armed Associations, the equivalent
of the modern "rifle clubs." At the peace of Amiens the 340,000
volunteers were nearly all disbanded, but one or two corps passed into the regular army as entire regiments,
and some others managed to avoid disbandment until the
renewal of the war revived the whole force. The danger of
invasion was then at its height, and in a few months the force
numbered 380,000 men, or 3% of a population which already
kept up a regular army and a militia. But the training of this
mass was very unequal; the numbers fell off as the likelihood of
invasion decreased, and in the reaction from the first enthusiasm
it began to be questioned whether the volunteers could be of
much value under the easy conditions of service prevailing.
In 1808, therefore, the Local Militia was formed, in which the
terms of enlistment and training liabilities were both stricter and better
defined. The greater part of the volunteers transferred them-
selves to the Local Militia, which by 1812 (aided by the ballot)
reached a strength of 215,000 as against the 70,000 of the
remaining volunteers. With the general peace of 1814 all these
forces except the H.A.C. and the Yeomanry (q.v.) disappeared.

After an interval of nearly half a century the warlike attitude of
France caused British citizens once more to arm for the
protection of their country. The British army and navy had
indeclined in strength and efficiency; France, on the other hand,
by the energetic development of her military and naval power;
and the early application of steam to ships of war, brought
the possibilities of the invasion of England in 1846 within
measurable distance. England at this time was awakened to
the gravity of the situation by the publication of a letter from
Wellington to Sir John Burgoyne,1 followed by a well-
timed pamphlet by Sir Charles Napier, entitled The Defence
of England by Volunteer Corps and Militia. The French
danger, in aberrance during the Crimean War, was revived in 1857,
the tone of the Local Militia was more serious and menacing. The war in China, the Indian Mutiny and diffi-
culties with the United States taxed the regular army to the
utmost; while at home, besides the actual garrisons, there were
barely 36,000 militia. This threatening condition of affairs
tended to aggravate, if not to produce, a serious commercial
panic. It was then that the volunteer movement began, and the
Orsini episode and the openly expressed threats of French officers
was all that was necessary to free the pent-up enthusiasm.

A few rifle clubs were already in existence, and two of these,
with the approval of the military authorities, namely the 53rd
Infantry and the two senior volunteer battalions—1st V.B. (now 4th Bn.)(Devonshire Regts., and Victoria Rifles (now 9th Bn. London
Regt.). But it was not until the situation became acute that the
War Office took the step of raising the "Volunteer Force." A circular letter, dated 12th May 1859, from the secretary for
war to the lords-lieutenant of counties in Great Britain authorized
the formation of volunteer corps. The general enrolment took
place at first under the old statute (44 Geo. III.). The main
provisions of that act, however, were found inapplicable to the
altered conditions under which invasion was now possible, and
they failed also to provide for the maintenance of the volunteer
force on a permanent footing in peace. A new act (Volunteer
Act 1863) was therefore passed, the most important provision
of which was that apprehended invasion should constitute a

1 See Life and Letters of Field-Marshal Sir John Burgoyne.
sufficient reason for the sovereign to call out the volunteers, in lieu of the old condition which required the actual appearance of the enemy. The volunteers were, when called out, bound to serve in Great Britain until released by a proclamation declaring the occasion to have passed. This was modified in 1900 during the South African War, a new enactment allowing the authorities to call them out at times of the crisis. The 'rifle' title and great conscription. In 1877 the volunteers were removed from the control of the lords-lieutenant and placed under the War Office. In 1881 the infantry battalions were affiliated to the various line regiments.

The force thus brought into existence was composed of corps of light horse, mounted rifles, garrison and heavy artillery, engineers and rifle volunteers.1 Later there existed also in connexion with the admiralty a corps of "Royal Naval Artillery Volunteers"2 for the coast defences. The terms of service and training liabilities underwent no alteration of principle during the forty-eight years of the force's existence. The property belonging to the corps was vested in the commanding officer and administered by a committee of officers under the rules of the corps. These rules were in the first instance agreed on at a general meeting of officers and men, and, having received the queen's approval, became legal, and could be enforced. The commanding officer could dismiss a man from the corps, and a volunteer not on actual service could terminate his engagement at fourteen days' notice. But, as it became the almost universal practice for the government or the regimental commander to issue clothing and equipment from the corps funds, the officers in control of these funds, who had at first joined the corps, were in the course of time, in some instances, for five years, and, if they exercised their statutory rights, were obliged to refund part of the cost. Further, when capitulation grants were given for the maintenance of the corps, the volunteer had either to earn this by continued service or repay the sum lost to the corps by his resignation. These conditions materially modified the statute law in practice, and in fact the term of four years exacted from the Territorial to-day differs in little more than the requirements of the former "corps rules." Military law was applicable to officers and men when training with regulars.

The formation of volunteer corps was so rapid that in the course of a few months in 1859-60 a force of 110,000 was created. More, however, remained to be done to put an end to the ever-recurring commercial panics. The government, which in the beginning had tolerated rather than encouraged the movement, and had required the volunteer to serve and to equip himself entirely at his own expense, now followed the lead of public opinion, and decided on maintaining the volunteer force as a part of the regular defensive system. The personnel of the volunteer corps (with a few exceptions) thereupon underwent a change. The wealthy who previously enrolled at first joined the corps in order to give the ranks in anticipation of war, cared no longer to bear arms. Their places were taken by the artisan class, which added materially to the number and permanence of the force. But, as contributions and subscriptions now flagged, it became evident that public grants would have to be voted for its maintenance, and a scale of capital allowances, subject to regulation, was fixed, on the recommendation of a Royal Commission. This capitalization allowance per efficient volunteer was thenceforward the basis of all regimental finance and administration.

The turn of the century in the history of the volunteers was the South African War. In January 1900, and on several subsequent occasions, the volunteers were invited to supply service companies for South Africa, to be incorporated in the regular battalions to which the volunteer battalions were affiliated. About one-third of the whole force volunteered for service in South Africa, and some 20,000 served in the volunteer companies with the line and in the "City Imperial Volunteers," besides a great number of volunteers whom the higher pay, the light horse and mounted rifles disappeared in the end, or else were converted into yeomanry. The "rifles" title was retained even after the infantry had been assimilated in drill, uniform and other respects to the fine battalions. For this reason even scarlet-clad battalions had no colours, pouch-belts instead of sabres, &c.

easier conditions and better prospects of active employment in the mounted guerrilla warfare tempted into the ranks of the yeomanny. The return of these companies infused into the force a leaven of officers and men who had been through an experience of constant small skirmishes and prolonged marching and bivouacking. Meantime the force as a whole had been subjected to a more earnest and vigorous training than it had ever had before. The establishment was greatly increased, and 24 battalions were selected for special training and included with the regular home army in the field force. Various partial reorganizations followed in 1902-5, and at last, in 1907-8, the whole force was re-cast, re-enlisted upon somewhat different terms, and organized along with the yeomanny into the new Territorial Force (see United Kingdom: Army).

**VOLUSENUS, FLORENTIUS** [Florence Wilson, or Wolsey, in later writers Wilson, though in letters in the vernacular he writes himself VOLUSENUS (c. 1504-c. 1547), Scottish humanist, was born near Elgin about 1504. He studied philosophy at Aberdeen, and in the dialogue De Animis Tranquilisatus says that the description of the abode of tranquillity was based on a dream that came to him after a conversation with a fellow-student on the banks of his native Lossie. He was then a student of philosophy for four years' standing. Proceeding to Paris, he became tutor to Thomas Wynter, reputed son of Cardinal Wolsey. He paid repeated visits to England, where he was well received by the king, and, after Wolsey's fall, he acted as one of Cromwell's agents in Paris. He was in England as late as 1534, and appears to have been rector of Speldhurst in Kent. In Paris he knew George Buchanan, and found patrons in the cardinal of Lorraine and Jean du Bellay. He was to have gone with du Bellay on his mission to Italy in 1535, but illness kept him in Paris. As soon as he recovered he set out on his journey, but at Avignon, by the advice of his friend Antonio Bonvisi (d. 1538), he sought the patronage of the bishop of the diocese, the learned and pious Paul Sadolet, who made him master in the school at Carpentras, with a salary of seventy crowns. Volusenus paid frequent visits to Lyons (where Conrad Gesner saw him, still a young man, in 1540), probably also to Italy, where he had many friends, perhaps even to Spain. A letter addressed to him by Sadolet from Rome in 1546 shows that he had then resolved to return to Scotland, and had asked advice on the attitude he should adopt in the religious dissensions of the time. He died on the journey, however, at Vienne in Dauphiné, in 1546, or early in the next year.

Volusenus's linguistic studies embraced Hebrew as well as Greek and Latin. His reputation, however, rests on the beautiful dialogue, De Animi Transfusione, first printed by S. Gryphius at Lyons in 1543. From internal evidence it appears to have been composed about that time, but the subject had exercised the writer for many years. The dialogue shows Christian humanism at its best. Volusenus is a great admirer of Erasmus, but he criticizes the purity of his Latin and also his philosophy. His own philosophy is Christian and Biblical rather than classical or scholastic. He takes a fresh and independent view of Christian ethics, and he ultimately reaches a doctrine as to the witness of the Spirit and the
assurance of grace which breaks with the traditional Christianity of his time and is based on ethical motives akin to those of the German Reformers. The verses which occur in the dialogue, and the poems which conclude it, give Volusenus a place among the Latin poets, but it is as a Christian philosopher that he attains distinction.

The dialogue was reissued at Leiden in 1637 by the Scots writer David Edinburne, with seven poems, with a selection of three poems from the dialogue of Volusenus, appear, with others, in the famous Amsterdam collection Deelitae Poetarum Scotorum hujus aevi, printed by Blaeu in 2 vols. in 1637. Later editions of the dialogue appeared in 1792 and 1793 (the last by G. Wishart). All the reissues contain a short life of the author by Thomas Wilson, advocate, son-in-law and biographer of Archbishop Patrick Adamson. Supplementary facts are found in the extracts and some of the pieces in Sadoleto's Letters.

VOLUTE (Lat. volutum, volvere, to roll up), in architecture, the spiral scroll of the capital of the Ionic order. As in the earliest example known, that of the archaic temple of Diana at Ephesus, the width of the abacus is twice that of the depth, constituting therefore a bracket-capital; it is probable that at first it consisted of an oblong block of timber, which, raised on a vertical post or column, lessened the bearing of the architrave or beam, and the first volutes or scrolls were painted on. In volute columns carrying a sphinx, as at Delphi, or satyrs, as at Bassae, the form of the volute was enlarged. The last volute was long retained, but in the porticoes of the Greek temples the abacus was made square and the volute diminished in projection on each side. In the side elevation the portion of the capital which joins the two volutes is known as the cushion, and when the Ionic column was used in porticoes in the capitals of the angle columns the volute was brought out on the diagonal, so as to present the same design on front and side; this, however, at the back led to a very awkward arrangement of two half volutes at right angles to one another, which was not much noticed under the portico, but when, in the open peristyle of the Pompeian house, it faced the open court, another design was necessary, and the angle volute was employed on all four sides. A similar arrangement was devised by Ictinus for the capitals in the interior of the temple at Bassae (430 B.C.), and was employed in the semidetached columns of the raised stage at Epidauros. The Romans adopted the angle volute in the temple of Fortuna Virilis at Rome, but, except in their porticoes and as semidetached between arces, the Ionic order was rarely employed by them, and few Roman examples are known.

The architects of the Revival in the 18th century entirely misunderstood the meaning of the volutes (the inner fillet of which was always carried horizontally across the abacus in Greek and Roman work), and mistook them for horns, which they turned down into the echinus moulding.

VONDEL, JOOST VAN DEN (1587-1679), Dutch poet, was born at Cologne on the 17th of November 1587. His father, a hatter, was an exile from Antwerp on account of his Ana- baptist opinions; but he returned to Holland when Joost was about ten years old, and settled in Amsterdam, where he carried on a hosiery business. Joost was the eldest son, and was expected to succeed to his father's shop. He was early introduced to the chamber of the Egiantine, however, and devoted most of his time to poetry and study. When the elder Vondel died he married Maria de Wolf, and seems to have left to the management of his affairs in her capable hands. He read the French contemporary poets, and was especially influenced by the Divin Sépoyne of Du Bartas; he made some translations from the German; he was soon introduced to the circle gathered in the house of Roemer Visscher, and with these friends began to make a close study of classical writers. His first play, Het Pascho, was printed in 1612, and proved to be the beginning of a long and brilliant literary career (see DUTCH LITERATURE). After the production of his political drama of Palamedes, or Murdered Innocence (1625), which expressed his indignation at the judicial murder of Oldenbarneveldt in 1619, Vondel had to go into hiding, but the Amsterdam magistrates eventually satisfied themselves with his writings. In the following years he issued a number of stinging satires against the extreme Calvinists, and he entered into close relationship with Hugo Grotius, another sufferer for his liberal opinions. Vondel had long been attracted by the aesthetic side of the Roman Catholic Church, and this inclination was perhaps strengthened by his friendship with Marie Tessel schade Visscher, for the Visscher household had been Catholic and liberal. Tessel schade's husband died in 1634; Vondel's wife died in 1635; and the ties between the two were strengthened by time. Vondel eventually showed his revolt against the Calvinist tyranny by formally embracing the Roman Catholic faith in 1651. The step was approved by many of his friends, and Hooft forbade him the hospitality of his castle at Mulden. In 1657 his only surviving son, who was entrusted with the hosier business, mismanaged affairs to such an extent that he had to take ship for the East Indies, leaving his father to face the creditors. Vondel had to sacrifice the whole of his small fortune, and became a government clerk. He was pensioned after ten years' service, and died on the 8th of February 1679.

The more important of his thirty-two dramas are: Historiam Veroost ("Jerusalem Levi de isolade") (1620); Palamedes, of Vermoorde onnooseldey ("Palamedes, or Murdered Innocence") (1625); Bijbreght van Aanstel (1637); De Gebroeders (1640), the subject of which is the ruling class of the Netherlands; Maria Stuart, of gemartelete majestie (1646); the pastoral of De Leeswandelers (1648); Lucifer (1654); Solomone (Solomon) (1657); Koning David in balsingleue ("King David in banishment") (1663); and Samson (1660); Batavische Gebroeders, the subject of which is the story of Claudius Civilia (1663); Adam in balsingleue ("Adam in banishment") (1664), after Byblis; and Martin van den Vondel's Complete Works (12 vols., 1890-1896). A bibliography (1888) was published by J. H. W. Unger, who revised Vondel's edition in 1888-94. Lucifer was translated into English verse by L. C. Van Noppen (New York, 1888). See also E. G. Pommers, Studies in Northern Literature (2nd Edmund) and Milton and Vondel (1885), where Milton's supposed indebtedness to Vondel is discussed; and critical studies by A. Baumgarten, Vondel's Werk (Leipzig, 1884) and by V. M. Thijm (Portretten van Joost van den Vondel, 1786); and especially the chapters on Vondel (pp. 133-325) in W. J. A. Jonckbroeck's Geschiedenis der nederlandse letterkunde (vol. iv. 1890).

VON HOLST, HERMANN EDUARD (1841-1904), German-American historian, was born at Pellin in the province of Livonia, on the 10th of June 1841. He was educated at the universities of Dorpat and Heidelberg, receiving his doctor's degree from the latter in 1865. He emigrated to America in 1867, remaining there until 1872. He was professor of history in the newly reorganized university of Strassburg from 1872 to 1874, and at Freiburg in Baden from 1874 to 1892, and for ten years he was a member of the Baden Herrenhaus, and vice-president for four. He revisited the United States in 1878-79 and in 1884, and in 1892 he became head of the department of history at the university of Chicago. Retiring on account of ill-health in 1906, he returned to Germany and died at Freiburg on the 20th of January 1904. Both through his books and through his lectures at the university of Chicago, Von Holst exerted a powerful influence in encouraging American students to follow more closely the German methods of historical research. His principal work is his Constitutional and Political History of the United States (German ed., 5 vols., 1875-91; English trans. by Lalor and Mason, 8 vols., 1877-92), which covers the period from 1783 to 1861, though more than half of it is devoted to the decade 1850-60; it is written from a strongly anti-slavery point of view. Among his other writings are Three Constitutioal Law of the United States of America (German ed., 1885; English trans., 1887); John C. Calhoun (1882), in the American Statesmen Series; John Brown (1888), and The French Revolution Tested by Mireabeau's Career (1894).

See the Political Science Quarterly, vol. 67-78; the Nation, lviii. 66-67.

VONNOH, ROBERT WILLIAM (1858- ). American portrait and landscape painter, was born in Hartford, Connecticut, on 1st September 1858. He was a pupil of O. Boulanger and Lefebvre in Paris; became an instructor at the Cowles Art School, Boston (1884-85), at the Boston
VONONES—VORONEZH

Museum of Fine Art Schools (1885–87), and in the schools of the Pennsylvania Academy of the Fine Arts, Philadelphia (1891–96), and a member of the National Academy of Design, New York (1906), and of the Secessionists, Munich. His wife, Bessie Potter Vonnoh (b. 1872), a sculptor, was a pupil of the Art Institute, Chicago, and became a member of the National Sculpture Society.

VONONES (on coins ONONES), the name of two Parthian kings.

(1) Vonones I., eldest son of Phraates IV. After the assassination of Orodes II. (c. a.d. 7), the Parthians applied to Augustus for a new king from the house of Arsaces. Augustus sent them Vonones (Mon. Anc. 5, 9; Tac. Ann. ii. 1 f.; Joseph. Antiq. xviii. 2, 4), who was living as a hostage in Rome. But Vonones could not maintain himself; he had been educated as a Roman, and was despised as a slave of the Romans. Another member of the Arsacid house, Artabanus II., who was living among the Dahan nomads, was invited to the throne, and defeated and expelled Vonones. The coins of Vonones (who always uses his proper name) date from a.d. 8-12, those of Artabanus II. begin in a.d. 10. Vonones fled into Armenia and became king here. But Artabanus demanded his deposition, and as Augustus did not wish to begin a war with the Parthians he removed Vonones into Syria, where he was kept in custody (Tac. Ann. ii. 4). When he tried to escape, a.d. 19, he was killed by his guards (Tac. Ann. ii. 58, 68).

(2) Vonones II., governor of Media, was raised to the throne after the death of Artabanus, and possibly that of his brother, cf. Joseph. Antiq. xx. 3, 4. But he died after a few months, and was succeeded by his son Vologases I. (Tac. Ann. xii. 14).

(Ed. M.)

VOODOO or VAUDOIS (Creole Fr. vaudois, a negro sorcerer, probably originally a dialectic form of Fr. Vaudois, a Waldensian), the name given to certain magical practices, superstitions and secret rites prevalent among the negroes of the West Indies, and more particularly in the Republic of Haiti.

VORARLBERG, the most westerly province of the Austrian empire, extending S. of the Lake of Constance along the right bank of the Rhine valley. It consists of three districts, Bregenz, Bludenz and Feldkirch, which are under the administrative authority of the Statthalter (or prefect) at Innsbruck, but possess a governor and a diet of their own (twenty-one members), and send four members to the imperial parliament. Vorarlberg is composed of the hilly region of the Bregenzerwald, and, to its south, of the mountain valley of Montafon or of the upper Ill, through which an easy pass, the Zeinisjoch (6076 ft.), leads to the Tirolean valley of Paznaun, and so to Landeck. Near Bludenz the Kloster glen parts from the Ill valley, through the latter runs the Arlberg railway (1848)—beneath the pass of that name (5912 ft.)—to Landeck and Innsbruck. The Ill valley is bounded south by the sunken chain of the Rhätikon (highest point, the Seskaplana, 9741 ft., a famous view-point), and of the Silvretta (highest point, Gross Piz Buin, 10,860 ft.), both dividing Vorarlberg from Switzerland; slightly to the north-east of Piz Buin is the Dreiländerspitze (10,530 ft.), where the Vorarlberg, Tirolean and Swiss frontiers unite.

The total area of Vorarlberg is 10043 sq. m. Of this 881%, or about 886 sq. m., is reckoned "productive," 30% of this limited area being occupied by forests, while 118 sq. m. rank as "unproductive." In 1900 the total population was 129,237, all but wholly German-speaking and Romanist. The largest town is Dornbirn (pop. 13,952), but Bregenz (pop. 7593) is the political capital; Feldkirch has about 4000 inhabitants, while Bludenz has rather more (see the separate articles on the three former).

In the hilly districts the inhabitants mainly follow pastoral pursuits, possessing much cattle of all kinds. In the towns the spinning and weaving of cotton (introduced towards the end of the 18th century) is very flourishing. Forests cover about one-sixth of the district, and form one of the principal sources of its riches. But the Vorarlberg is predominantly an agricultural province, though this rate of the whole, though not of the single count, is higher than on the lower level. Ecclesiastically it is in the diocese of Brixen, whose vicar-general (a suffragan bishop) resides at Feldkirch.

The name of the district means the "land that is beyond the Arlberg Pass," that is, as it seems to one looking at it from the Tirol. This name is modern and is a collective appellation for the various counties or lordships in the region which the Habsburgs (after they secured Tirol in 1363) succeeded in purchasing or acquiring—Feldkirch (1375, but Hohenems in 1765 only), Bludenz with the Montafon valley (1394), Bregenz (in two parts, 1451 and 1523) and Sonnenberg (1455). After the annexation of Hohenems (its lords having became extinct in 1759), Maria Theresa united all these lordships into an administrative district of Hither Austria, under the name Vorarlberg, the governor residing at Bregenz. In 1782 Joseph II. transferred the region to the province of Tirol. The lordship of Blumenegg was added in 1824, but in 1850 all these lands were handed over, by virtue of the peace of Pressburg, to Bavaria, which in 1814 gave them all back, save Hohenec. In 1815 the present administrative arrangements were established.

Vorarlberg") (Vienna, 1893), of the great official work entitled Die oesterreichisch-ungarische Monarchie im Kriege (New edition). (W. A. B. C.)

VORONEZH, a government of southern Russia, bounded N. by the government of Tambov, E. by Saratov and the Don Cossacks, S. by Kharkov and W. by Kursk and Orel; area, 25,435 sq. m. It occupies the southern slopes of the middle-Russian plateau, and its average elevation is from 450 to 700 ft. The surface is hilly, and intersected by ravines in the west (where two ranges of chalk hills separated by a broad valley run north and south); but flat and low east of the Don. Devonian sandstones crop out in the north; further south these are covered with clays and clays; in the north, terrigenous boulders extend as far south as Voronezh, and extensive areas are covered with Lacustrine clays and sands. The soil is very fertile, owing to the prevalence of black earth; it becomes, however, sandy towards the east.
VORONEZH—VORONTSOV

Voronezh lies on the border between the forest and meadow region of middle Russia and the southern steppes; the forests disappear rapidly towards the south, and those which in the time of Peter the Great stood on the upper tributaries of the Don, and were used for shipbuilding, have now been almost entirely destroyed. Less than one-tenth of the entire area is under wood.

The Don traverses Voronezh from N. to S.E., draining it for more than 400 m.; it is an important channel for the export of corn and other raw produce, as well as for the import of wood, floated down from the north. Its tributary, the Voronezh is also navigated, and the Bityug and Khoper, both left-hand affluents of the Don, flow in part through the government. Many other small streams flowing into the Don intersect the territory, but the influence of the dry steppes begins to make itself felt; there are no lakes, and marshes persist only in the valleys. The climate is continental, and although the mean temperature at the town of Voronezh is 42° 8' F., that of January is as low as 8° 3', and that of July as high as 74° 2'.

The estimated pop. in 1906 was 3,097,700. The inhabitants consist in nearly equal parts of Great Russians in the north and Little Russians in the south, but there are a few Poles, Germans and Jews, both Orthodox and Karaites. The government is divided into twelve districts, the chief towns of which are Voronezh, Biryuch, Bobrov, Boguchar, Korotoyak, Nizhne-Dyevitsk, Novo-Khopersk, Ostrogozhsk, Pavlovsk, Valuki, Zadonsk and Zemlyansk. Agriculture is the chief occupation, and grain is exported to a considerable amount. The peasants own 75% of the land, the crown and the imperial domains 3% and private owners 30%.

The principal crops are rye, wheat, oats, barley and potatoes. Aniseed, sunflowers, tobacco and beetroot are extensively cultivated, and much attention is paid to the growth of the pineapple. There are large tracts of excellent pasture land, on which cattle are bred. There are large herds of cart-horses and troikas. There are nearly two hundred breeding establishments, those at Hrenovoye and Chesmenka being the most important. In many villages the inhabitants are engaged in the making of wooden wares. There are flour-mills, distilleries, oil, sugar and woollen mills, iron works and tobacco factories.

VORONEZH, a town of Russia, capital of the government of the same name, on the river Voronezh, 5 m. above its confluence with the Don and 367 m. by rail S.S.E. of Moscow. Pop. (1901) 84,146. It is one of the best-built and most picturesque provincial towns of Russia, and is situated on the steep bank of the river, surrounded by three large suburbs —Trotskaya, Yamskaya and Chizhovka. It has a military school of cadets, two museums, a monument (1860) to Peter the Great, a railway college, a pilgrimage church, and a theatre which figures in the history of the Russian stage. It was the birthplace of two peasant poets, who wrote some of the finest examples of Russian poetry—A. V. Koltsov (1809-1842) and I. S. Nikitin (1824-1861). A memorial to the former was erected in 1868. There are factories for cleansing wool and for the preparation of linen, woollens, bellows, tallow and oil, as well as some distilleries. Voronezh is an important entrepôt for corn, flax, tallow, hides, sugar, wood and coal from the Don.

The city was founded in 1586, as a fort against Tatar raids, on a site which had been occupied from the 12th century by a Khazar town, but had been deserted during the 14th and 15th centuries. Four years afterwards it was burned by the Tatars, but again rebuilt, and soon became an important trading place. Peter the Great recognized its importance, and in 1693 built here a flotilla of boats for the conquest of Azov. The town was almost completely destroyed by fire in 1703, 1748 and 1773, but was always rebuilt.

VORONTSOV (or Voronozoff), the name of a Russian family, various members of which are distinguished in Russian history.

MIKHAIL ILARIONOVICH VORONTSOV (1714-1767), Russian imperial chancellor, was the first to become prominent. At the age of fourteen he was appointed a Kammer juncker at the court of the cesarevna Elizabeth Petrovna, whom he materially assisted during the famous coup d'etat of the 6th of December 1741, when she mounted the Russian throne on the shoulders of the Preobrazhenski Grenadiers. On the 3rd of January 1742 he married Anna Skavronskaya, the empress's cousin; and in 1744 was created a count and vice-chancellor.

His jealousy of Alexis Bestuzhev induced him to participate in Lestocq's conspiracy against that statesman. The empress's affection for him (she owed much to his skilful pen and still more to the liberality of his rich kinsfolk) saved him from the fate of his accomplices, but he lived in a state of semi-obliteration during the domination of Bestuzhev (1744-1758). On the disgrace of Bestuzhev, Vorontsov was made imperial chancellor in his stead. Though well-meaning and perfectly honest, Vorontsov as a politician was singularly timorous and irresolute, and always took his cue from the court. Thus, under Elizabeth he was an avowed enemy of Prussia and a warm friend of Austria and France; yet he made no effort to prevent Peter III. from reversing the policy of his predecessor. Yet he did not lack personal courage, and endured torture after the Revolution of the 9th of July 1762 rather than betray his late sovereign.

He generally refused to serve under her, though she reinstated him in the dignity of chancellor. When he found that the real control of foreign affairs was in the hands of Nikita Panin, he resigned his office (1763). Vorontsov was a generous protector of the nascent Russian literature, and, to judge from his letters, was a highly cultivated man.

ALEXANDER ROMANOVICH VORONTSOV (1741-1802), Russian imperial chancellor, nephew of the preceding and son of Count Roman Vorontsov, began his career at the age of fifteen in the Izmailovsky regiment of the Guards. In 1768, his kinsman, the grand chancellor Mikhail Illarionovich, sent him to Strasburg, Paris and Madrid to train him in diplomacy. Under Peter III. he represented Russia for a short time at the court of St James's. Catherine II. created him a senator and president of the Board of Trade; but she never liked him, and ultimately (1791) compelled him to retire from public life. In 1802 Alexander I. summoned him back to office and appointed him imperial chancellor. This was the period of the triumph of the Vorontsovs, who had always insisted on the necessity of a close union with Austria and Great Britain, in opposition to Panin and his followers, who had leaned on France or Prussia till the outbreak of the Revolution made friendship with France impossible. Vorontsov was also an implacable opponent of Napoleon, whose "topsy-turvyness" he was never weary of denouncing. The rupture with Napoleon in 1803 is mainly attributable to him. He also took a leading part in the internal administration and was in favour of a thorough reform of the senate and the ministries. He retired in 1804. He possessed an extraordinary memory and a firm and wide grasp of history.

His "Memoirs of my Own times" (Rus.) is printed in vol. vii. of the Vorontsov Archives.

SEMEH ROMANOVICH VORONTSOV (1744-1832), Russian diplomatist, brother of Alexander Romanovich, distinguished himself during the first Turkish War of Catherine II. at Larga and Kagula in 1770. In 1783 he was appointed Russian minister at Vienna, but in 1785 was transferred to London, where he lived for the rest of his life. Vorontsov enjoyed great influence and authority in Great Britain. Quickly acquainting himself with the genius of English institutions, their ways and methods, he was able to render important services to his country. Thus during Catherine's second Turkish War he contributed to bring about the disarmament of the auxiliary British fleet which had been fitted out to assist the Turks, and in 1793 obtained a renewal of the commercial treaty between Great Britain and Russia. Subsequently, his extreme advocacy of the exiled Bourbons, his sharp criticism of the Armed Neutrality of the North, which he considered disadvantageous to Russia, and his denunciation of the partition of Poland as contrary to the first principles of equity and a shock to the conscience of western Europe, profoundly irritated
the empress. On the accession of Paul he was raised to the rank of ambassador extraordinary and minister plenipotentiary, and received immense estates in Finland. Neither Vorontsov's detention of the Russian squadron under Makarov in British ports nor his refusal, after the death of Bezborodko, to accept the dignity of imperial chancellor could alienate the favour of Paul. It was only when the emperor himself began to draw nearer to France that he began to consider Vorontsov as incompetent to serve Russia in England, and in February 1800 all the count's estates were confiscated. Aleksander I. on his accession at once reinstated him, but ill-health and family affairs prevented his joining the Russian army until 1803, when he was wounded at Austerlitz, and was present at the battles of Pultusk and Friedland. From 1800 to 1811 he participated in the Turkish War and distinguished himself in nearly every important action. He was attached to Bagration's army during the war of 1812, was seriously wounded at Borodino, sufficiently recovering, however, to rejoin the army in 1813. In 1814, at Craonne, he brilliantly withstood Napoleon in person. He was the commander of the corps of occupation in France from 1815 to 1818. On the 7th of May 1817 he was appointed governor-general of New Russia, as the southern provinces of the empire were then called, which under his administration developed marvellously. He may be said to have been the creator of Odessa and the benefactor of the Crimea. He was the first to start steamboats on the Black Sea (1828). The same year he succeeded the wounded Menshikov as commander of the forces besieging Varna, which he captured on the 28th of September. In the campaign of 1829 it was through his energetic efforts that the plague, which had broken out in Turkey, did not penetrate into Russia. In 1830-1 he was appointed governor-general of the Caucasus and in 1837 he was made a full general and commander-in-chief and governor of the Caucasus with plenipotentiary powers. For his brilliant campaign against Shamyl, and especially for his difficult march through the dangerous forests of Ichkerenia, he was raised to the dignity of prince, with the title of Serene Highness. By 1848 he had captured two-thirds of Daghestan, and the situation of the Russians in the Caucasus, so long almost desperate, was steadily improving. In the beginning of 1853 Vorontsov was allowed to retire because of his increasing infirmities. He was made a field-marshal in 1856, and died the same year at Odessa. Statutes have been erected to him both there and at Tiflis.

See V. V. Ogarkov, The Vorontsovs (Russ.) (Petersburg, 1892); Vorontsov Archives (Russ. and Fr.) (Moscow, 1870, 8vo); M. P. Shelyverbinin, Biography of Prince M. S. Vorontsov (Russ.) (Petersburg, 1858).

VÖRÖSMARTY, MIHALY (1800-1855), Hungarian poet, was born at Puszta-Nyék on the 1st of December 1800, of a noble Roman Catholic family. His father was a steward of the Nadasdys. Mihály was educated at Székesfejér by Mihály, and at Pest by the Piarists. The death of the elder Vörösmarty in 1821 left his widow and numerous family extremely poor. As tutor to the Perecz family, however, Vörös-

martiny contrived to pay his own way and go through his aca-

demical course at Pest. The doings of the diet of 1825 first enkindled his patriotism and gave a new direction to his poetical genius (he had already begun a drama entitled Salamon), and he flung himself the more recklessly into public life as he was consumed by a hopeless passion for Elekka Perecz, who socially was far above him. To his unrequited love we owe a whole host of exquisite lyrics, while his patriotism found expression in the heroic epics Zalaszt jutása (1824), gorgeous in colouring, exquisite in style, one of the gems of Magyar literature. This new epic marked a transition from the classical to the romantic school. Henceforth Vörösmarty was hailed by Kisfaludy and the Hungarian romanticists as one of themselves. All this time he was living from hand to mouth. He had forsaken the law for literature, but his contributions to newspapers and reviews were miserably paid. Between 1823 and 1831 he composed four dramas and eight smaller epics, partly historical, partly fanciful. Of these epics he always regarded Cserkem a zsidó (The Jew), his best work, superior to all his previous efforts. He was probably the first to introduce the term 'hetény' (wine estates) into Hungarian. After 1831 his popularity increased rapidly. In 1832, when he was 31 years of age, the Academy of Sciences in Pest conferred on him the title of 'kis erdélyi és Pest ország országai' (a small magnate of Transylvania and Pest county), after which he was admitted to the Hungarian Academy. In 1833 he was elected as one of the seven members of the Hungarian Academy. He died at Pest in 1855 in the same house where Karoly Kifsaludy had died twenty-five years before. His funeral, on the 21st of November, was a day of national mourning. His penniless children were provided for by a national subscription collected by Perencz Deák, who acted as their guardian.

The allied genera Cervichium and Zoanthium the two produced by fission remain united, so that a branching colony is ultimately produced. The genus is a large one, and many species are epizoic on various water animals.

VORTIGERN (GUORTHIGIRNUS, WYRTGEORN), king of the Britons at the time of the arrival of the Saxons under Hengest and Horsa. The records do not agree as to the date of the arrival of these chieftains or the motives which led them to come to Britain. It seems clear, however, that Vortigern
made use of them to protect his kingdom against the Picts and Scots, and rewarded them for their services with a grant of land. Later we find the Britons at war with the new-comers, now established in Kent, and four battles are fought, in the last of which, according to the "Historia Brittonum," the king's son Vertemir, their leading opponent, is slain. The "Historia Brittonum" is our only authority for the marriage of Vertigern with the daughter of Hengest before the war. It also records the massacre of the British nobles after the death of Vertemir and the subsequent grant of Essex and Sussex to the invaders by Vertigern.

VOSGES, a frontier department of eastern France, formed in 1790 chiefly of territory previously belonging to Lorraine, together with portions of Franche-Comté and Champagne, and bounded N. by the department of Meurthe-et-Moselle, E. by Alsace, S.E. by the territory of Belfort, S. by the department of Haute-Saône, W. by Haute-Marne and N.W. by Meuse. Pop. (1906) 429,812; area, 2,279 sq. m. The Vosges mountains (see below) form a natural boundary on the east, their highest French eminence, the Hoheneck, attaining 4,482 ft. The Monts Faucilles traverse the south of the department in a broad curve declining on the north into elevated plateaus, on the south encircling the upper basin of the Saône. This chain, dividing the basins of the Rhone and the Rhine, forms part of the European watershed between the basins of the Mediterranean and Atlantic. The Moselle and the Meuse, tributaries of the Rhine, have the largest drainage areas in the department; a small district in the N.W. sends its waters to the Seine, the rest belongs to the basin of the Rhone. The Moselle rises in the Col de Bussang in the extreme south-east, and in a N.N.W. course of about 70 m. in the department receives the Moselotte and the Vologne on the right; the Mortagne and Meurthe on the right and the Madon on the left bank also belong to this department though they join the Moselle outside its borders. The source of the Saône is on the southern slope of the Faucilles. On the shore of Lake Gérardmer lies the beautifully situated town of Gérardmer, a well-known centre for mountain excursions.

The elevation and the northward exposure of the valleys make the climate severe, and a constant dampness prevails, owing both to the abundance of the rainfall and to the impermeability of the subsoil. The average temperature at Épinal (1707 ft.) is 49.5° F. The annual rainfall at Épinal is 28 in., at St Die 32 in. and in the mountains more. Arable farming flourishes in the western districts where wheat, oats and potatoes are largely grown. The vine is cultivated on the river banks, to best advantage on those of the Moselle. Pasture is abundant in the mountainous region, where cheese-making is carried on to some extent, but the best grazing is in the central valleys, Forests, which occupy large tracts on the flanks of the Vosges, cover about one-third of the department, and are a principal source of its wealth. Sawmills are numerous in the Vosges and the manufacture of furniture, sabots, brushes and wood-working in general are prominent industries. The department has mines of lignite and stone quarries of various kinds. There are numerous mineral springs, of which those of Contrexéville, Plombières, Vittel, Bains-les-Bains, Martigny-les-Bains and Vittel are the best known. The manufacture of textiles is the chief industry, comprising the spinning and weaving of cotton, wool, silk, hemp and flax, and the manufacture of hosiery and of embroidery and lace, Mirecourt (pop. 5,902) being an important centre for the two last. The department forms the diocese of St Die (province of Besançon), has its court of appeal and educational centre at Nancy, and belongs to the district of the XX. Army Corps. It is divided into the arrondissements of Épinal, Mirecourt, Neufchâteau, Remiremont and St Die, with 30 cantons.

VOSGES (Lat. Vessius or Vossagis, Ger. Wagsau or Vosgenen), a mountain range of central Europe, stretching along the west side of the Rhine valley in a N.N.E. direction, from Basel to Mainz, for a distance of 150 m. Since 1873 the southern portion, from the Ballon d'Alscace to Mont Donon, has been the frontier between France and Germany. There is a remarkable similarity between the Vosges and the corresponding range of the Black Forest on the other side of the Rhine: both lie within the same degrees of latitude and have the same geological formation; both are characterized by fine forests on their lower slopes, above which are open pasturages and rounded summits of a uniform altitude; both have a steep fall to the Rhine and a gradual descent on the other side. The Vosges in their southern part are composed of porphyritic masses, and of a kind of red sandstone (occasionally 1,640 ft. in thickness) which on the western versant bears the name of "grès Vosgien."

Orogographically the range is divided south to north into four sections: the Grandes Vosges (62 m.), extending from Belfort to the valley of the Bruche; the Central Vosges (31 m.), between the Bruche and the Col de Sarre; the Lower Vosges (30 m.), between the Col de Sarre and the source of the Lauter; and the Hardt Vosges, comprising the N.W. summit of the Black Forest, from the Rhine to the frontier. The Grandes Vosges are a sandstone plateau ranging from 1000 to 1500 ft. high, and are crossed by the railway from Haguenau to Sarre- guemines, defended by the fort of Bitche.

Meteorologically the difference between the eastern and western sections of the range is due to the annual rainfall being much higher and the mean temperature being much lower in the latter than in the former. On the eastern slope the vine ripens to a height of 1300 ft.; on the other hand, its only rivers are the Ill and other shorter streams. The Moselle, Meurthe and Sarre all rise on the Lorraine side. Moraines, boulders and polished rocks testify the existence of the glaciers which formerly covered the Vosges. The lakes, surrounded by trees, heathes and maples, the green meadows which provide pasture for large herds of cows, and the fine views of the Rhine valley, Black Forest and snow-covered Swiss mountains, all contribute to the district pittoresques. On the western heights and buttresses of the main chain on the south side are numerous castles, generally in ruins. At several points on the main ridge, especially at St Odile above Ribeauville (Kappoltsweiler), are traces of the passes of a way from the Rhine to Strassburg to the district picturesque. On the eastern side are the passes and summits of the Grandes Vosges, the Colmar, the Fort de Belfort, the Rue du Cher, the Col d'Alsen (62 ft.) from St Die to Colmar, and the pass from St Die to Ste Marie-aux-Mines. The Lower Vosges are a sandstone plateau ranging from 1000 to 1500 ft. high, and are crossed by the railway from Haguenau to Sarreguemines, defended by the fort of Bitche.

VOSMAER, CAREL (1826-1888), Dutch poet and art-critic, was born at the Hague on the 26th of March 1826. He was trained to the law, and held various judicial posts, but in 1873 withdrew entirely from legal practice. His first volume of poems, 1860, did not contain much that was remarkable. His temperament was starved in the very air of the intellectual Holland of those days, and it was not until after the sensational appearance of Multatuli (Edward Douwes-Dekker) that Vosmaer, at the age of forty, woke up to a consciousness of his own talent. In 1876 he published a monograph on Rembrandt, which was issued in French. Vosmaer became a contributor to, and then the leading spirit and editor of, a journal which played an immense part in the awakening of Dutch literature; this was the Nederlandsche Spectator, in which a great many of his own works, in prose and verse, originally appeared. The remarkable miscellanies of Vosmaer, called Birds of Diverse Plumage, appeared in three volumes, in 1872, 1874 and 1876. In 1879 he selected from these all the pieces in verse, and added other poems to them. In 1886 he published an archaeological novel called Amazone, the scene of which was laid in Naples and Rome, and which described the raptures of a Dutch antiquary in love. Vosmaer
undertook the gigantic task of translating Homer into Dutch hexameters, and he lived just long enough to see this completed and revised. In 1873 he came to London to visit his lifelong friend, Sir (then Mr) Lawrence Alma-Tadema, and on his return published "Londiniana," an exceedingly brilliant mock-epic poem in hexameters. His last poem was "Nanno," an idyll on the Greek model. Vossmaer died, while travelling in Switzerland, on the 12th of June 1888. He was unique in his fine sense of plastic expression; he was eminently tasteful, lettered, refined. Without being a genius, he possessed imagination, talent, which he could combine with so much pathos of the wrongs of the Dutch poetry. His verse was modelled on Heine and still more on the Greeks; it is sober, without colour, stately and a little cold. He was a curious student in versification, and it is due to him that hexameters were introduced and the sonnet reintroduced into Holland.

He was the first to repudiate the traditional, wooden alexandrine. In prose he was greatly influenced by Maltzulin, in praise of whom he wrote an eloquent treatise, "Ben Zaater (A Sower). He was also somewhat under the influence of English prose modell (E.C.)

VOSS, JOHANN HENRICH (1752-1802). He was born at Sommersdorf in Mecklenburg-Strelitz on the 20th of February 1751, the son of a farmer. After attending (1766-69) the gymnasium at Neubrandenburg, he was obliged to accept a private tutorship in order to earn money to enable him to study at a university. At the invitation of H. C. Boie, whose attention he had attracted by poems contributed to the Göttingen "Musenalmanach," he went to Göttingen in 1772. Here he studied philology and became one of the leading spirits in the famous "Hain or Dichterbund.

In 1775 Boie made over to him the editorship of the "Musenalmanach," which he continued to issue for many years. He married Boie's sister Ernestine in 1777 and in 1778 was appointed rector of the school at Otterndorf in Hanover. In 1782 he accepted the rectorship of the gymnasium at Eutin, where he remained until 1802. Retiring in this year with a pension of 600 thalers he settled at Jena, and in 1805, although Goethe used his utmost endeavours to persuade him to stay, accepted a call to a professorship at Heidelberg. Here, in the enjoyment of a considerable salary, he devoted himself entirely to his literary labours, translations and antiquarian research until his death on the 29th of March 1802.

Voss was a man of a remarkably independent and vigorous character. In 1785-95 he published in two volumes a collection of original poems, to which he afterwards made many additions. The best of these works is his idiolic poem, "Dichterbund," a sort of "irregular" epic. In 1795 he published "Grundzüge derlatinischen Sprache," and apply the style and methods of classical poetry to the expression of modern German thought and sentiment. In his "Mythologische Briefe" (2 vols., 1794), in which he attacks theFetcher, he in his "Antitymbolik" (2 vols., 1824-26), written in opposition to Georg Friedrich Creuzer (1771-1858), and in other writings he made important contributions to the study of mythology. He was also prominent as an advocate of the right of free judgment in religion, and at the time when some of his members of the Romantic school were being converted to the Roman Catholic church he produced a strong impression by a powerful article, in "Sphosphoria," on his friend Friedrich von Stolberg's "reputation of Protestantism" (1819). It is, however, as a translator that Voss chiefly owes his place in German literature. His translations indicate not only sound scholarship but a thorough mastery of the original. His "translation" of Homer's "Iliad" (4 vols., 1824-26) was a critical edition of Tullius. In 1818-29 was published, in 9 vols., a translation of Shakespeare's plays, which he completed with the help of his sons Heinrich and Abraham, both of whom were scholars and writers of considerable ability.

J. H. Voss's "Ständische poetische Werke" were published by his son Abraham in 1835; new ed. 1850. A good selection is in A. Sauer, Der Voss, ein Deutscher Schriftsteller (1882).

VOSS, RICHARD (1831-). German dramatist and novelist, was born at Neugrave, in Pomerania, on the 2nd of September 1851, the son of a country squire. Though intended for the life of a country gentleman, he showed no inclination for outdoor life, and on his return from the war of 1870-71, in which he was wounded, he studied philosophy at Jena and Munich, and then settled at Berchtesgaden. In 1884 Voss was appointed by the grand duke of Weimar librarian of the Wartburg, but, in consequence of illness, he resigned the post.

Chief among his dramas are "Savonarola" (1878); "Magda" (1879); "Die Patricierin" (1880); "Der Mohr der Zaren" (1883); "Unchel Volck" (1885); "Alexandra" (1888); "Eva" (1889); "Wehe dem Besiegten" (1889); "Die neue Zeit" (1891); "Schuldig" (1892). Among his novels may be mentioned "San Sebastian" (1883); "Der Sohn der Valkyrien" (1884); "Der Mönch von Berchtesgaden" (1891); "Der neue Gott" (1898); "Die Rächerin" (1899); "Altlerche Erlebnis" (1902); and "Die Leute von Vandal" (1902). See M. Goldmann, Richard Voss, ein literarisches Charakterbild (1900).

VOSSEVANGEN, or Voss, a village and favourite tourist-centre of Norway, in South Bergishus amt (county), 67 m. N.W. of Bergen by rail. It was the terminus of the finely engineered Bergen & Vossevange railway, which, however, forms part of the projected trunk line between Christiania and Bergen. Vossevangen is pleasantly situated on the Vangsvang, in fertile upland, and has a stone church of the 13th century, and a Sunness or two-storied timber house of the 14th century, which, however, has a stone chimney; one of the oldest in Bergend. Voss, the former, passing Stalheim, descends into the sombre Naærdal, a precipitous valley terminating in the Naærd Fjord, a head-branch of the Sogne Fjord. The latter route follows the deep but gentler valley of the Skjerve, whence from Øvre Vassend road continues to Eide (18 m.), and to Ulvik (32 m.), both on branches of the Hardanger Fjord.

VOSSIUS [Voss], GERHARD JOHANN (1757-1849), German classical scholar and theologian, was the son of Johannes Voss, a Protestant of the Netherlands, who fled from persecution to Palatinate and lived in personal peace in the town of Heidelberg where Gerhard was born. Johannes was a Calvinist, however, and the strict Lutherans of the Palatinate caused him once more to become a wanderer; in 1750 he settled at Leiden as student of theology, and finally became pastor at Dort, where he died in 1758. Here the son received his education, until in 1759 he entered the university of Leiden, where he became the lifelong friend of Hugo Grotius, and studied classics, Hebrew, church history and theology. In 1760 he was made rector of the high school at Dort, and devoted himself to philology and classical studies. In 1770 he went to Oxford to study the language and literature of the theological college at Leiden. Meanwhile he was gaining a great reputation as a scholar, not only in the Netherlands, but also in France and England. But in spite of the moderation of his views and his abstention from controversy, he came under suspicion of heresy, and escaped expulsion from his office only by resignation (1761). The year before he had published his valuable history of Pelagian controversies, which his enemies considered favoured the views of the Armillians or Monarchians. In 1762, however, he was appointed professor of rhetoric and chronology, and subsequently of Greek, in the university. He declined invitations from Cambridge, but accepted from Archbishop Laud a prebend in Canterbury cathedral without residence, and went to England to be installed in 1762, when he was made L.L.D. at Oxford. In 1763 he left Leiden to take the post of professor of history in the newly founded Athenaeum at Amsterdam, which he held till his death on the 19th of March 1769.

His son Isaak (1658-1698), after a brilliant career of scholarship in Sweden, became residential canon at Windsor in 1673. He was the author of "De septuaginta interpretibus" (1665); "De propositis canantu et rhythmis rhythm" (1673), and "Variorum observationum liber" (1685). Vossius was amongst the first to treat theological dogmas and the historical religions from the historical point of view. His principal works are "Historia Pelagiana sive Historia de controversiis quae Pelagius ejusque religiae movetur" (1618); "Aristarchus, sive de arte grammatic" (1635 and 1655; new ed. in 2 vols. 1835-38); "Ezemo- logiurn lingua Latinae" (1662; new ed. in two vols. 1762-63).
VOTE

Commentariorum Rhetoricon oratoria institutionum Libri VI. (1606 and often): De Historiae Graecis Libri III. (1642); De Historiae Latinis Libri III. (1627); De Theologia Gentilis (1642); Dissertatioes Tres de Tribus Symbolis, Apostolico, Apostolico, Apostolico (1642). Collected works published at Amsterdam (6 vols., 1695-1701).

See P. Niceron, Mémoires pour servir à l'histoire des hommes illustres, vol. xii. (Paris, 1750); Herzog's Realencyclopädie, vols. ii. (Leipzig, 1875) and iii. (Leipzig, 1882), and in the Allgemeine Deutsche Biographie.

VOTE and VOTING. The Latin volum, derived from vocere, to vow, meant a solemn promise, hence a wish, desire or prayer, in which sense the doublet "vow," derived through French, is used now chiefly. "Vote" is specially employed in the sense of a registering of one's choice in elections or on matters of debate, and the political meaning is the only one which requires comment.

Ancient.—In ancient Greece and Italy the institution of suffrage already existed in a rudimentary form at the outset of the historical period. In the primitive monarchies it was customary for the king to invite pronouncements of his folk on matters in which it was prudent to secure its assent beforehand. In these assemblies the people recorded their opinion by clamouring (a method which survived in Sparta as late as the 4th century B.C.), or by the clashing of spears on shields. This latter practice may be inferred to have obtained originally in Rome, the word suffragium meaning literally a responsive crash. Owing to the lack of routine in the early monarchies and aristocracies of Greece and Italy the vote as yet lacked importance as an instrument of government. But in the days of their full political development the communities of these countries had firmly established the principle of government according to the will of majorities, and their constitutions required almost every important act to be directed by a formal vote. This rule applied equally to the decisions of general assemblies, administrative councils and law courts, and obtained alike in states where suffrage was universal and where it was restricted.

In every case the taking of votes was effected in the form of a poll. The practice of the Athenians, which is shown by inscriptions to have been widely followed in the other states of Greece, was to hold a show of hands (χειροτονία), except on questions affecting the status of individuals: these latter, which included all lawsuits and proposals of ostracism (q.v.), were determined by secret ballot (ψηφοφορία, so called from the ψήφος or pebbles with which the votes were cast). At Rome the method which prevailed up to the 2nd century B.C. was that of division (discessio). But the economic and social dependence of many voters on the nobility caused the system of open suffrage to be vitiated by intimidation and corruption. Hence a series of laws enacted between 150 and 120 B.C. regulated the use of the ballot ("tabella," a slip of wood coated with wax) for all business done in the assemblies of the people.

For the purpose of carrying resolutions a simple majority of votes was deemed sufficient. Regulations about a quorum seem to have been unusual, though a notable exception occurs in the case of motions for ostracism at Athens. As a general rule equal value was made to attach to each vote; but in the popular assemblies at Rome a system of voting by groups was in force until the middle of the 3rd century B.C. by which the richer classes secured a decisive preponderance (see ancient). As compared with modern practice the function of voting was restored to the poorer democracies of Greece the use of the lot largely supplanted polling for the elect of magistrates: at Athens voting was limited to the choice of officers with special technical qualifications (q.v. Realencyclopädie, art. theoriae). For those who resided in the seat of government as a condition of franchise, the suffrage could as a rule only be exercised in the capital town. The only known exception under a centralized government was that of the content under the reign of Augustus, who arranged for polling stations to be opened at electiontime in the country towns of Italy. In federal governments the election of deputies to a central legislature seems to be attested by the practice of the Achaean League, where the federal council was probably elected in the several constituent towns. But little is known as to ancient methods of electing delegates to representative institutions, and in general it may be said that the function of suffrage in Greece and Italy throws no light upon contemporary problems, such as the use of single-constituency and proportional representation.

Modern.—The modern method of obtaining a collective expression of opinion of any body of persons may be either "open" or secret. An open expression of opinion may be by some word of assent or negation, or by some visible sign, as the holding up of a hand. Indeed any method of voting which does not expressly make provision for concealing the identity of the person registering the vote is "open." Some methods of voting are still employed (as in the case of parliamentary elections for some of the English universities, where votes may be sent by post) must necessarily reveal the manner in which the elector has recorded his vote. It is in connexion with the election of members of representative bodies—especially legislative bodies—that the qualifications for and methods of voting become especially important. Practically every civilized country has accepted and put in force some form of representation, which may be defined as the theory and principles on which the obtaining of a vote is founded. These are dealt with in the article REPRESENTATION, and it will be sufficient to give here the various qualifications which are considered by different countries as sufficient to give effect to the principle of representation and the methods of recording votes. In detail these are given for the United Kingdom and the United States in the articles REGISTRATION of Voters and ELECTIONS, and for other countries under their respective titles in the sections dealing with the Constitution.

The first consideration is the age at which a person should be qualified for a vote. This in a large number of countries is fixed at the age of manhood, namely, twenty-one years of age, but in Hungary the age is fixed at twenty years, in Austria twenty-four years, while in Belgium, Baden, Bavaria, Hesse, Prussia, Saxony, Japan, the Netherlands and Norway the age is twenty-five years, and in Denmark thirty years. Some countries (e.g. Austria, Germany, France) have adopted the principle of what is often termed "manhood or universal suffrage," i.e. every male adult, not a criminal or a lunatic, being entitled to a vote, but in all cases some further qualifications than mere manhood are required, as in Austria a year's residence is a certain qualifying period of residence. This tangible sign of interest in the state may take the form of possession of property, however small in amount, or the payment of some amount of direct taxation, indeed in some cases, as will be seen, this is rewarded by the conferring of extra votes.

In the United Kingdom possession of freehold or leasehold property of a certain value or occupation of premises of a certain annual value gives a vote. This qualification of property may be said to be included in what is termed the "lodger's vote," given to the occupier of lodgings of the yearly value unfurnished of not less than £30. In Hungary, the payment of a small direct tax on house property or land, or on an income varying with occupation is necessary. So in Prussia, Saxony, Bavaria, Hesse, Italy (unless a certain standard in elementary education has been reached), Japan, the Netherlands, Portugal (unless the elector is able to read and write) and Russia. Some of the states in the United States also require the payment of a poll tax. On the other hand, in Russia, students, soldiers, governors of provinces and police officers are disqualified from voting; in Portugal, bankrupts, beggars, state servants, workmen in government service and non-commissioned officers are not electors; it must be noted, however, that the government
of the new Portuguese republic promised in 1910 a drastic revision of the existing franchise. Italy disfranchises non-commissioned officers and men in the army while under arms, as do France and Brazil. The United Kingdom and Denmark disqualify those in actual receipt of parish relief, while in Norway apparently, receipt of parish relief at any time is a disadvantage, which, however, may be removed by the recipient paying back the sums so received. In some countries, e.g. Brazil, the suffrage is refused to members of monastic orders, and, under vows of obedience. Apart from those countries where a modicum of education is necessary as a test of right to the franchise, such as Belgium or Norway, there are special restrictions in granting the franchise. In the United Kingdom the members of eight universities (Oxford, Cambridge, London, Dublin University, Glasgow, Edinburgh, Aberdeen and St Andrews) send nine members to parliament; in Hungary members of the professional, scientific, learned and other classes (over 80,000) are entitled to vote without any other qualification; in Brunswick the scientific classes elect three members to the legislative chamber; in Saxon, members of scientific or artistic professions have extra votes; in Italy, members of academies and professors are qualified to vote by their vote and in the Netherlands legal qualifications for any profession or employment give a vote.

Many objections have been urged of late years to the principle of giving a plurality of votes to one individual on account of superior qualifications over others which he may be considered to possess. In the United Kingdom, where, roughly speaking, the principle of representation is that of taxation, the possession of qualifying property in any number of electoral districts will give a vote in each of those districts. Whether those votes can be actually registered will of course depend on certain circumstances, such as the distance of the districts apart and whether the elections are held on the same day or not. The Radical party in the United Kingdom have of late years been hostile to any system of plurality of votes (whether gained by educational, property or other qualifications), though it may be said that the tendency of some recent electoral systems has been to introduce a steadying principle of this nature. In 1906 a bill was introduced for reducing the system of plural voting in the United Kingdom; it passed through the House of Commons, but was rejected by the House of Lords. The most remarkable system of plural voting that has been introduced in Belgium by the electoral law of 1894. Under it, every citizen over thirty-five years of age with legitimate issue, and paying at least 5 francs a year in house tax, has a supplemental vote, as has every citizen over twenty-five owing immovable property to the value of 2000 francs, or having a corresponding income from such property, or who for two years has derived at least 100 francs a year from Belgian funds either directly or through the savings bank. Two supplementary votes are given to citizens over twenty-five who have received a diploma of higher instruction, or a certificate of higher secondary instruction, or who fill or have filled offices, or engaged in private professional instruction, implying at least average higher instruction. Three votes is the highest number allowed, while failure to vote is punishable as a misdemeanour. In 1908–9 the number of electors in Belgium was 1,651,647, of whom 981,866 had one vote, 378,264 two votes and 291,517 three votes. In some other countries weight is given to special qualifications. In the town of Bremen the government is in the hands of a senate of 16 members and a Chambers of Bürgerschaft of 150 members. These latter are elected by the votes of all the citizens divided into classes. University men return 14 members, merchants 40 members, mechanics and manufacturers 20 members, and the other inhabitants the remainder. So in Brunswick and in Hamburg legislators are returned by voters representing various interests. In Prussia, representatives are chosen by direct electors who in their turn are elected by indirect electors. One direct elector is elected from every complete number of 250 souls. The indirect electors are divided into three classes, the first class comprising those who pay the highest taxes to the amount of one-third of the whole; the second, of those who pay the next highest amount down to the limits of the second third; the third, of all the lowest taxed. In Italy electors must either have attained a certain standard of elementary education, or pay a certain amount of direct taxation, or if peasant farmers pay a certain amount of rent, or if occupants of lodgings, shops, &c., in towns, pay an annual rent according to the population of the commune. In Japan, voters must pay either land tax of a certain amount for not less than a year or direct taxes other than land tax for more than two years. In various States of the United States, the successful candidate varies greatly in different countries. In the United Kingdom the candidate who obtains a relative majority is elected, i.e. it is necessary only to obtain more votes than any other candidate (see Representation).

Voting Machines. The complications in the voting at American elections have resulted in the invention of various machines for registering and counting the ballots. These machines are in fact mechanical Australian ballots. The necessity for them has been emphasized by election practice in many parts of the United States, where in a single election there have been from five to ten parties on the ballot, with an aggregate of four hundred or five hundred candidates, making the paper ballots large and difficult to handle. The objections to the paper ballot are further emphasized in the results obtained. The number of void and blank ballots is seldom less than 5% of the number of voters voting, and is often as high as 40%. This lost vote is often greater than the majority of the successful candidate. In close elections there is an endless dispute as to whether the disputed ballots do or do not comply with the law. The election contest and recount expenses frequently exceed the cost of holding the election, and the little chance the candidates to the office is frequently held in abeyance by a protracted contest until after the term of office has expired. A number of ways have been devised for marking the Australian ballot for identification without destroying its legality. The X is a very simple and well-known mark, yet in the case of Coulahan v. White, before the Supreme Court of Maryland, twenty-seven different ways of making the mark "X" were shown in the ballots. In controversy, and all of them were a subject for judicial consideration, on which the judges of even the highest court could, find room for disagreement. Wigmore in his book on the Australian ballot system points out thirteen ways of wrongly placing the mark, and forty-four errors in the style of the mark, besides many other errors tending to invalidate the ballot, all of them having frequently occurred in actual practice. These errors are not confined to the illiterates, but are just as common among the best-educated people. The ballots can and have frequently been altered or misconstrued by unscrupulous election officers, and the detection of the fraud is frequently difficult and always expensive.

Voting machines were devised first by English, and later with more success by American inventors. The earlier machines of Vassie, Chamberlain, Syderuff (1860) and Davie (1870) were practically all directed toward voting for the candidates of a single office by a ball, the ball going into one compartment or the other according to the choice of the voter. The use of the ball is in accordance with the original idea of ballot, which means "a little ball"; and because of the requirement of many of the constitutions of the states of the United States, that "elections shall be by ballot," many American inventors
VOTING MACHINES

follow this idea of using balls to indicate their votes. Others, however, maintaining that secrecy was the essential idea of voting by ballot, and that the form of the ballot was immaterial, worked out other methods using a key. In England in 1862, the counter registering the successive impulses given to it by the key, the machine preventing the voter from giving the key more than one impulse, and preventing the voter from operating more keys than he is entitled to vote. The highest courts of four different American states have ruled that any form of voting machine that secured secrecy would be constitutional.

The first voting machine used in an election was the Myers Ballot box, a simple device in which each voter placed his vote in a box, and was locked. The ballot box had a vertical handle with columns of push keys thereon, each column representing a party, and each key belonging to a candidate of that party, the keys of each horizontal line belonging to the candidate parties for a particular office. The voter pushed one of the knobs in each office line, which knob operated its counter and locked all other possible votes for the same office until the voter left the booth. The operated keys were released by the operation of the second booth door as the voter left the machine, and they were then reset by springs. The doors were so arranged that the voter must first pass through one and lock it behind him before he could pass through the other. This both prevented secrecy and permitted repeating. Some sixty-five or more of these machines were used in the election in the city of Rochester, N.Y., in November 1866, and with marked success.

The next machine, operated by keys which punched holes in a web of paper. On this web the votes of each candidate were all punched in a single column, each separate column representing a separate candidate. The voter does not see the column which is registered by his key, but the column which is read by the machine by the election officers after the election is over, and the vote thereon is canvassed by passing the web through a pneumatic counting machine. The paper web makes a separate record of each candidate on the line, and is not used to identify by a punch called in the body of the machine. The machine is also slow in giving returns, due to the fact that the vote has to be counted after the election.

In other types of machines each candidate had a separate receptacle, into which the machine dropped a ball for each vote that was cast for the candidate. These machines have so far not been successful. The whole development of practical voting machines has been limited to such a machine in which a separate counter is provided for each candidate, the counter being operated either directly or indirectly by the voter. Of this type is the Myers machine, as well as the other machines mentioned here.

The first of these was the Speaking Clock, invented by Mr. R. Myers of Buffalo. The Speaking Clock was a machine which had a key for each candidate, and when the key was turned to a certain extent, a small bell was rung, or the machine made a click. After voting had been completed, the Speaking Clock was rung, so that each key bears a number and a letter distinguishing it from all others. At the left of each party row is a party lever, by the movement of which all of the keys in that party row are operated simultaneously, and the voter who has not cast a party circle on the ballot these levers are omitted. Extending outward from the top of the machine is a rail, from which is suspended a curtain. Pivoted in the middle of the top of the machine is a lever, which extends outwardly and has a loose connection with a curtain. The operation of the lever by a convenient handle enables the voter to close the curtain and unlock the machine for voting, after which the voter cannot retire from the machine until he has voted on the ballot. The only provision made for counting the vote before the voter retires from the machine is the movement of the curtain lever, which counts the vote, resets the machine for the next voter and opens the curtain. Before the development of this key, the whole question of voting not certain, and the voter would only be able to go back or change his vote. Repeating is prevented by a knob on the end of the machine, which locks the curtain lever against a second movement until it is released by the election officer. At the top of the Speaking Clock is a paper roll, and the voter can write the names of candidates whose names do not appear on the machine in connection with keys. This roll is concealed by slides, one for each of the candidates whose names have been written thereon.

An interlocking mechanism controls all the voting devices so that the voter cannot vote more than he is entitled to vote. These machines have been built large enough to provide for seven parties of sixty candidates each, and for thirty questions and amendments, a machine of such size carrying 480 counters, besides the total vote and protective counters.

The Dean Machine has its keyboard placed horizontally, the keys being seated in a row, which are arranged in party columns and transverse office rows. Party levers are provided by which the keys of the party are moved to voted position. Considerable stress has been placed upon the accuracy of this machine, a peculiar type of counter used on it, and the separate cards allow for voting on unnominated candidates.

Each state that adopts voting machines first enacts a law specifying the requirements that must be met in the construction of the machines. These requirements are substantially the same in all the states, the laws being copied largely from the New York Voting Machine Law. The laws require in general that the machine shall give the voter all the facilities for expressing his choice which the Australian ballot gives him, and further require that the machine shall prevent those mistakes or frauds, which if made on an Australian ballot would invalidate it.

Many of the states have special requirements, to meet which many ingenious features have been provided on the various machines. Among these is the group of 18 supervisors in San Francisco, for which office as many as 108 candidates have appeared upon one ballot, out of which the machine must permit the voter to vote any 18 and no more, regardless of the sequence in which they are selected, or the position in which they occur.

Many of these machines is the primary election feature required by Minnesota, in which state the various parties must hold their primary election at the same time and on the same machine. The voter announcing the party of his preference finds the voting machine in the same set of all the parties locked against him, but the voting devices of his own party are open to his use.

Still another is the lockout, by which the voter of limited voting from a variety of other practical and political features in the offices. Another is the endorsed candidate in a group. Here the same candidate's name is provided with two or more voting devices in a group wherein the voter is allowed to vote for two or more of the candidates.

As to the important benefits attending the use of machines, there can be mentioned accuracy both in the casting and the counting of the vote, speed in getting in returns, and economy in holding elections. The improvement in accuracy is shown by the fact that the vote for each office usually runs 95% or more of the highest possible vote that could be registered by the number of voters that have voted. Speed is shown by the fact that in the city of Buffalo, with 60,000 voters voting on election day, the complete returns, including the vote on over 100 candidates for the whole city, have been collected, tabulated and announced within 75 minutes from the closing of the polls. Economy is shown by the fact that although these machines are used but one or two days in each year, election expenses are reduced to such an extent that the machines pay for themselves in five or six elections. This is partly due to the smaller number of precincts necessary and the smaller number of election officers in each precinct and the shorter hours that they must work.

The city of Buffalo has a dozen or more precincts, in each of which 850 voters or more are voted in an election day of ten hours, and in that city as many as 1041 voters have voted in one election day on one machine.
VOTKINSK, a town and iron-works, in the Russian government of Vyatka, 40 m. N. of Sarapul and 8 m. W. from the Kama, founded in 1756. Pop. 21,000. Votkinsk was formerly one of the chief government establishments for the construction of steamers for the Caspian, as well as for locomotives for the Siberian railway, and it has long been renowned for its excellent tarantasses (driving vehicles) and other splendid iron-wares, as well as for its knitted goods. Its agricultural machinery is known throughout Russia.

VOUCHER (from: to vouch), a warrant, answer for, O. Fr. vouchon, to cite, call in aid, Lat. parare, to call, summon), any document in writing which confirms the truth of accounts or establishes other facts, more particularly a receipt or other evidence in writing which establishes the fact of the payment of money.

VOUET, SIMON (1590-1649), French painter, was born at Paris on the 9th of January 1590. He passed many years in Italy, where he married, and established himself at Rome, enjoying there a high reputation as a portrait painter. Louis XIII. recalled him to France and lodged him in the Louvre with the title of First Painter to the Crown. All royal work for the palace was left in his hands; he was an intimate friend of the king in his hands; the king became his pupil; he formed a large school, and renewed the traditions of that of Fontainebleau. Among his scholars was the famous Le Brun. Vouet was an exceedingly skilful painter, especially in decoration, and executed important works of this class for Cardinal Richelieu (Rueil and Palais Royal) and other great nobles. His better easel pictures bear a curious resemblance to those of Sassoferrato. Almost everything he did was engraved by his sons-in-law Tardieu and Thomas Sauvage.

VOUSSOIR (Ger. Wöblestein), the French term used by architects for the wedge-shaped stones or other material with which the arch (q.v.) is constructed; the lowest stone on each side is termed the spriniger (Fr. cousiniat sommiere) and the upper one at the crown of the arch the keystone (Fr. claveau).

VOW (Lat. votum, vow, promise: cf. VOTE), a transaction between a man and a god, whereby the former undertakes in the future to render some service or gift to the god or devotes something valuable now and here to his use. The god on his part is reckoned to be going to grant or to have granted already some special favour to his votary in return for the promise made or service declared. Different formalities and conditions may in different religions attend the taking of a vow, but in all the wrath of heaven or of hell is visited upon one who breaks it. A vow has to be distinguished, firstly, from other and lower ways of persuading or constraining supernatural powers to give what man desires and to help him in time of need; and secondly, from the ordered ritual and regularly recurring ceremonies of religion. These two distinctions must be examined a little more at length.

It would be an abuse of language to apply the term vow to the uses of imitative magic, e.g. to the action of a barren woman among the Battas of Sumatra, who in order to become a mother makes a wooden image of a child and holds it in her lap. For in such rites no promise is given to the idea—
even if it exists—of a personal relation between the petitioner and the supernatural power. The latter is, so to speak, mechanically constrained to act by the spell or magical rite; the forces liberated in fulfilment, not of a petition, but of a wish are not those of a conscious will, and therefore no thanks are due from the wisher in case he is successful. The deities, however, to whom vows are made are thought of as superhuman, personal beings, capable of entering into contracts or covenants with man, of understanding the claims which his vow establishes on their benevolence, and of valuing his gratitude; conversely, in the taking of a vow the petitioner's piety and spiritual attitude have begun to outweigh those merely ritual details of the ceremony which in magical rites are all-important.

Sometimes the old magical usage survives side by side with the more developed idea of a personal power to be approached in prayer. For example, in the Maghrib (in North Africa), in time of drought the maidens of Mazouza carry every evening in pro-

cession through the streets a doll called gnousa, really a dressed-up wooden spoon, symbolizing a pre-Islamic rain-spirit. Often one of the girls carries on her shoulders a sheep, and her companions sing the following words:

"Rain, fall, and I will give you my kid.
He has a black head; he neither bleats
Nor complains; he says not, 'I am cold.'
Rain, who fillest the skins,
Wet our rainment.
Rain, who feedest the rivers,
Overtu'r the doors of our houses."

Here we have a sympathetic rain charm, combined with a prayer to the rain viewed as a personal goddess and with a promise or vow to give her the animal. The point of the promise lies of course in the fact that water is in that country stored and carried in sheep-skins.

Secondly, the vow is quite apart from established cults, and is not provided for in the religious calendar. The Roman vow (votum), as W. W. Fowler observes in his work The Roman religion, 1899, p. 348, "was the exception, not the rule; it was a promise of a sacrifice made by an individual at some critical moment, not the ordered and recurring ritual of the family or the State." The vow, however, contained so large an element of ordinary prayer that in the Greek language one and the same word (eisx) expressed both. The characteristic mark of the vow, as Suidas in his lexicon and the Greek Church fathers remark, was that it was a promise either of things to be offered to God in the future and at once consecrated to Him in view of their being so offered, or of austerities to be undergone. For offering and austerity, sacrifice and suffering, are equally calculated to appease an offended deity's wrath or win his goodwill.

The Bible affords many examples of vows. Thus in Judges xi. 28, Jephthah "vowed a vow unto the Lord, and said, If thou wiltindeed deliver the children of Ammon into my hand, then it shall be that whosoever cometh forth out of the doors of my house to meet me, when I return in peace from the children of Ammon, it shall be the Lord's, and I will offer it up for a burnt-offering." In the sequel it is his own daughter who so meets him, and he sacrifices her after a respite of two months granted her in order to "bawl her virginity upon the mountains." A thing or person thus vowed to the deity became holy or taboo; and for it, as the above story indicates, nothing could be substituted. It belonged to once to the sanctuary or to the priests who represented the god. In the Jewish religion, the latter, under certain conditions, defined in Leviticus xxvii., could permit it to be redeemed. But to substitute an unclean for a clean beast which had been vowed, or an imperfect victim for a flawless one, was to court with certainty the divine displeasure.

It is often difficult to distinguish a vow from an oath. Thus in Acts xxii. 21, over forty Jews, enemies of Paul, bound themselves, under a curse, neither to eat nor to drink till they had slain him. In the Christian Fathers we hear of vows to abstain from flesh diet and wine. But of the abstentions observed by votaries, those which had relation to the barber's art were the commonest. Wherever individuals were concerned to create or confirm a tie connecting them with a god, a shrine or a particular religious circle, a hair-offering was in some form or other imperative. They began by rolling their locks at the shrine and left them as a soul-token in charge of the god, and never pulled them afresh until the vow was fulfilled. So Achilles consecrated his hair to the river Spreeheus and vowed not to cut it till he should return safe from Troy; and in the Hebrew Nazarite, who was thought to reside in his flowing locks, only cut them off and burned them on the altar when the days of his vow were ended, and he could return to ordinary life, having achieved his mission. So in Acts xviii. 18 Paul "had shorn his head in Cenchreae, for he had a vow." In Acts xx. 23 we hear of four Jews who, having a vow on them, had their heads shaved at Paul's expense. Among the ancient Chatti, as Tacitus relates (Germania, 31), young men allowed their hair and beards to grow, and vowed to court danger in that guise.
VOZNESENSK—VRIENDT

until they each had slain an enemy. Robertson Smith (Religion of the Semites, ed. 1901, p. 283) with much probability explains such usages from the widespread primitive belief that a man’s life lurks in his hair, so that the devotee being consecrated or taboo to a god, his hair must be retained during the period of taboo or purification (as it is called in Acts xxi. 26) lest it be dissipated and profaned. The hair being part and parcel of the votary, its profanation would profane him and break the taboo. The same author remarks that this is why, when the hair of a Mazor chief cut off it was, being like the rest of his person solemnly taboed, collected and buried in a sacred place or hung on a tree. And we meet with the same scruple in the initiation rite, called oyjya, of Eastern monks. First, the novice is carefully denuded of the clothes, shoes and headgear, which he wore in the world, and which, being profane or unclean, would violate the taboo about to be set on him. His hair is then polled crosswise by way of consecrating it; and in some forms of the rite the presiding monk, called “the father of the hair,” collects the shorn locks and deposits them under the altar or in some other safe and sacred place. Greek nuns used to keep the hair thus shorn off, leave it into girdles, and wear it for the rest of their lives round their waists, where close to their holy persons there was no risk of its being defiled by alien contact. The rest of this rite of oyjya, especially as it is preserved in the old Armenian versions, smacks no less of the most primitive taboo. For the novice, after being thus tonsured, advances to the altar holding a taper in either hand, just as tapers were tied to the horns of an animal victim; the new and sacred garb which is to demarcate him henceforth from the unclean world is put upon him, and the presiding father laying his right hand upon him devotes him with a prayer which begins thus:—

“To thee, O Lord, as a rational whole burnt-offering, as mystic frankincense, as voluntary homage and worship, we offer up this thy servant N. or M.”

From the same point of view is to be explained the prohibition to one under a vow of flesh diet and fermented drinks; for it was believed that by partaking of these a man might introduce into his body the unclean spirits which inhabited them—the brute soul which infected meat, especially when the animal was strangled, and the cardiac demon, as the Rabbis called it, which harboured in wine.

The same considerations help to explain the custom of votive offerings. Any popular shrine in Latin countries is hung with wax models of limbs that have been healed, of ships saved from wreck, or with pictures representing the votary’s escape from perils by land and sea. So Cicero (de Deorim Natura, iii. 37) relates how a friend remarked to Dingoras the Athenian when they reached Samothrace: “You who say that the gods neglect men’s affairs, do you not perceive from the many pictures how many have escaped the force of the tempest and reached harbour safely.” Dingoras’s answer, that the many more who had suffered shipwreck and perished had had no pictures to record their fate does not concern us here. It is only pertinent to remark that these votiva tabellae and offerings may have had originally another significance than that of merely recording the votary’s salvation and of marking his gratitude. The model ship may be a substitute for the entire ship which is become sacred to the god, but cannot be deposited in the shrine; the miniature limbs of wax are substitutes for the real limbs which now belong to the god. In other cases the very objects which are taboo are given to the god as when a sailor deposits his salt-stained suit before the idol.

The general idea, then, involved in vows, whether ancient or modern, is that to express which the modern anthropologist borrows the Polynesian word taboo. The votary desirous to antedate his future act of service and make its efficacy begin at once, formally dedicates through spoken formula and ritual act a lifeless object such as a ring, an animal, his hair or his entire person to the god. He so either makes sure of future blessings, or shows gratitude for favours already conferred. Most of the ritual prescriptions that accompany vows are intended to guard inviolate the sanctity or taboo, the atmosphere of holiness or ritual purity, which envelops the persons or objects vowed or reserved to the god, and thereby separated from ordinary secular use.

The consideration of the moral effect of vows upon those who take them belongs rather to the history of Christian ascetism. It may, however, be remarked here that monkish vows, while they tend to a man’s life a certain fixity of aim and moral intensity, nevertheless tend to narrow his interests, and paralyse his wider activities and sympathies. In particular, monastic vows and partisanship led to a lifelong and often moral struggle against the order of nature; and motives become for him not good or bad according to the place they occupy in the living context of social life, but according as they bear upon an abstract and useless ideal.

(Β. C. C.)

VOZNESENSK, a town of Russia, in the government of Kherson, on the left bank of the river Bug, at the head of navigation, 55 m. N.W. from Nikolayev, to which steamers ply regularly. Pop. 14,178. It is a river port of some importance, and holds four large fairs annually. It contains a cathedral and public gardens and distilleries and breweries.

VRANCE, SEBASTIAN, born about 1572, was a painter of the Antwerp school, of very moderate ability. Most of his pictures represent scenes of war, such as the sack of towns, cavalry combats and the like. Though occasionally vigorous in drawing, his paintings are dull and heavy in tone. The date of his death is uncertain.

VRANTA, or VRANYÉ, the most southerly town of the kingdom of Servia, 73 m. from the Macedonian frontier, on a slope descending from Mount Placevitza to the plain of the Upper Morava, in a picturesque and fertile country. Pop. (1900) 11,921. In the Russo-Turkish War of 1877 it was captured by the Servian army from the Turks, and subsequently was incorporated in the kingdom. It is the capital of a department of the same name, and is an important station on the railway from Nish to Salonica, with a custom house, principally for merchandise imported into Servia via Salonica. Its inhabitants are employed chiefly in the cultivation of flax and hemp, and in the making of ropes. There is a much frequented summer resort 4½ m. E., called Vranyska Banya, with baths of hot sulphurous mineral water.

VRTAZA, the capital of the department of Vratza, Bulgaria, on the northern slope of the Stara Planina and on a small subtributary of the Danube. Pop. (1906) 14,852. Vratza is an archbishopric see and the headquarters of a military division. Wine, leather and gold and silver filigree are manufactured, and there is a school of sericulture.

VRIENDT, JULIEN JOSEPH DE (1842—), and ALBRECHT FRANÇOIS LIEVEN DE (1843—1900), Belgian painters, both born at Ghent, sons of a decorative painter. The two brothers were close friends, and their works show marked signs of resemblance. Having received their early training from their father at Ghent, they removed to Antwerp, where they soon yielded to the influence of the painter Baron Henri Leys. Albrecht became director of the Academy of Fine Arts at Antwerp and was succeeded by his brother. Albrecht’s principal works are “Jacqueline of Bavaria imploring Philip the Good to pardon her Husband” (1871, Liège Gallery), “The Excommunication of Bouchard d’Avesnes” (1877, Brussels Gallery), “The Angelus” (1877, acquired by Leopold II., king of the Belgians), “Pope Paul III. before Luther’s Portrait” (1883, Antwerp Gallery), “The Citizens of Ghent paying hommage to the child Charles V.” (1887, Brussels Gallery), “Philip the Handsome swearing fidelity to the privileges of the Town of Furnes” (1893, Furnes town hall), “The Virgin of St Luc” (1894, triptych in Antwerp Cathedral), and the decoration of the municipal hall at Bruges, which was completed by his brother. Among Julian’s more notable works are “The Citizens of Eisenach driving out St Elizabeth of Hungary” (1871, Liège Gallery), “Jairus’s Daughter” (1888, Antwerp Gallery), mural paintings in the Palace de Justice at Antwerp (1893), and “The Christmas Carol” (1894, Brussels Gallery).
VRYHEID—VULTURE 221

VRYHEID, a town of northern Natal, 291 m. by rail N. by W. of Durban. Pop. (1904) 2287, of whom 1344 were whites. It is the chief town of a district, of the same name, rich in mineral wealth, including copper, coal and gold. The coalfields of Hlobane are S.E. of the town. Originally part of Zululand the district of Vryheid was ceded by Dinizulu to a party of Boers under Lucas Meyer, who aided him to crush his opponents, and was proclaimed an independent state under the title of the New Republic in 1884. In 1888 it was incorporated with the Transvaal and in 1903 annexed to Natal (see TRANSVAAL, § History; and ZULULAND, § History).

V-SHAPED DEPRESSION, in meteorology, a narrow area of low pressure usually occurring between two adjacent anticyclones, and taking the form of a V or tongue, as do the isobars representing it on a weather chart. Such a depression may be regarded as a projection from a cyclonic system lying to one side of the two anticyclones. A similar depression, however, is frequently formed within a larger area of depression, i.e., an ordinary cyclone, and sometimes develops so far as to have a complete circulation of its own; it is then known as a secondary.  

The line of lowest depression following the axis of the depression with steady equal change of wind from one direction almost to the opposite. It is preceded by signs of break in the weather such as usually herald the approach of an ordinary cyclone, and is followed by the usual signs of clearance. The occurrence of a V-depression or secondary within an ordinary cyclonic system intensifies, often to a dangerous degree, the usual disturbances in the weather accompanying that system. Conditions exactly opposite to those accompanying a V-shaped depression are provided by a "wedge" (q.v.).

VULCAN (Volcanus), the Roman god of fire, and more especially of devouring flame (Virg. Aen. 5. 662). Whether he was also, like Hephaestus, the deity of smiths, is very doubtful; his surname Mulciber may rather be referred to his power to alloy conflagrations. In the Comitium was an "area Volcani," also called "Volcanal;" and here on the 23rd of August (Volcanalia) the Flamen Volcanalis sacrificed, and the heads of Roman families threw into the fire small fish, which the Tiber fishermen sold on the spot. This flamen also sacrificed on the 1st of May to Maia, who in an old prayer formula (Gellius 13. 23) was coupled with Volcanus as Maia Volcani. It is not easy to explain these survivals of an old cult. But in historical times the association of this god with conflagrations becomes very apparent; when Augustus organized the city in regions and vicini to check the constant danger from fires, the magistri vicorum (officers of administrative districts) worshipped him as Volcanus quietae augusti (C.I.L. vi. 801 and 802) and on the 23rd of August there was a sacrifice to him together with Ops Opifera and the Nymphae, which suggests the need of water in quenching the flames. At Ostia, where much of the corn was stored which fed the Roman population, the cult of this god became famous; and it is probable that the fixing of his festival in August by the early Romans had some reference to the danger to the newly harvested corn from fire in that month. (W. W. F."

VULGATE (from Lat. vulgus, the common people), a Latin version of the Bible prepared in the 4th century by St Jerome, and so called from its common use in the Roman Catholic Church (see BIBLE: Texts and Versions). Pius X. in 1908 entrusted to the Benedictine Order the task of revising the text, beginning with the Old Testament.

VULPECULA ET ANSER ("The Fox and Goose"), in astronomy, a modern constellation of the northern hemisphere, introduced by Hevelius, who catalogued twenty-seven stars. Interest is attached to Nova Vulpeculae, a "new" star discovered by Anthelm in 1670; T Vulpecula, a short period variable; and the famous "Dumb-bell" nebula.

VULPIUS, CHRISTIAN AUGUST (1762-1827), German author, was born at Weimar on the 23rd of January 1762, and was educated at Jenæ and Erlangen. In 1790 he returned to Weimar, where Goethe, who had entered into relations with Vulpius's sister Christine (1765-1816), whom he afterwards married, obtained employment for him. Here Vulpius began, in imitation of Christian Heinrich Spiess, to write a series of romantic narratives. Of these (about sixty in number) his Rinaldo Rinaldini (1797), the scene of which is laid in Italy during the middle ages, is the best. In 1797 Vulpius was given an appointment on the Weimar library, of which he became chief librarian in 1806. He died at Weimar on the 23rd of June 1827.  

VULTURE, the name of certain birds whose best-known characteristic is that of feeding upon carcasses. The genus Vultur, as instituted by Linnaeus, is now restricted by ornithologists to a single species, V. monachus. The other species included therein by him, or thereto referred by succeeding systematists, being elsewhere relegated (see LAMMERGEYER). A most important taxonomic change was introduced by T. H. Huxley (Proc. Zool. Society, 1867, pp. 462-64), who pointed out the complete structural difference between the vultures of the New World and those of the Old, regarding the former as constituting a distinct family, Cathartidae (which, however, would be more properly named Sarcorhamphidae), while he united the latter with the ordinary diurnal birds of prey as Gypaetidae.

The American vulture may be said to include four genera: (1) Sarcorhamphus, the gigantic condor, the male distinguished by a large fleshy comb and wattle; (2) Gypaetus, the king-vulture, with its gaudily "coloured head and nasal caruncle;

King-Vulture (Gypaetus popus).

(3) Catharista, containing the so-called turkey-buzzard with its allies; and (4) Pseudogryphus, the great Californian vulture—of very limited range on the western slopes of North America. Though all these birds are structurally different from the true vultures of the Old World, in habits the Vulturidae and Sarcorhamphidae are much alike.

The true vultures of the Old World, Vulturidae in the restricted sense, are generally divided into five or six genera, of which Neophron has been separated as forming a distinct subfamily, Neophroninae—its members, of comparatively small size, differing both in structure and habit considerably from the rest. One of them is the so-called Egyptian vulture or Pharaoh's hen, N. percnopterus, a remarkably foul-feeding species, living much on ordure. It is a well-known species in some parts of India, and thence westward to Africa, where

1 In the eastern part of the Indian peninsula it is replaced by a smaller race or (according to some authorities) species, N. gingoianus, which has a yellow instead of a black bill.
it has an extensive range. It also occurs on the northern shores of the Mediterranean, and has strayed to such a distance as to have suffered capture in England and even in Norway. Of the genera composing the other subfamily, Vulturinae, Gyps numbers seven or eight local species and races, on more than one of which the English name griffon has been fastened. The best known is G. fulvus, which by some authors is accounted "British" from an example having been taken in Ireland, though under circumstances which suggest its appearance so far from its nearest home in Spain to be due to man's intervention. The species, however, has a wider distribution on the European continent (especially towards the north-east) than the Egyptian vulture, and in Africa nearly reaches the Equator, extending also in Asia to the Himalaya; but both in the Ethiopian and Indian regions its range inosulates with that of several allied forms or species. Pseudogyps with two forms—one Indian, the other African—differs from Gyps by having 12 instead of 14 rectrices. Of the genera Ototgyps and Lophogyps nothing here need be said; and then we have Vultur, with, as mentioned before, its sole representative, V. monachus, commonly known as the cinereous vulture, a bird which is found from the Straits of Gibraltar to the seaward of Norway, and is most numerous in the mountains on the shores of the Mediterranean. It is ranging in the Mediterranean, and is most numerous in the mountains on the shores of the Mediterranean.

The question whether vultures in their search for food are guided by sight of the object or by its scent has excited much interest. It seems to be now generally admitted that the sense of sight is in almost every case sufficient to account for the observed facts. (A. N.)

VURJEVANDAS MADHOWDAS (1817-1896), Hindu merchant of Bombay, of the Kapole Bania caste, was born on the 28th of January 1817 at Gogla, in Kathiawar, whence his father came to Bombay with Sheth Machchawa. For several years Vurjandavas was educated in Bombay, started a new firm under the name of Vurjandavas & Sons, and soon became one of the wealthiest merchants in Bombay. He was appointed a justice of the peace and a member of the Bombay Port Trust. He took a keen interest in the Royal Asiatic Society and the Bombay university, where a prize has been established to commemorate his name. He constructed the Madhav Bang in memory of his father, and gave it to the use of poor Hindus, endowing it with nearly five lakhs of rupees. He built a rest-house in Bombay in memory of his brother Moollibhoy, and another one at Nasik. The sanatorium which he built in memory of his youngest son Rumhoredas at Sion Hill is a great boon to the poor people of his community. He also established a dispensary at Matoonga and a fund for the relief of indigent Hindus. He died on the 12th of January 1896.

VYATKA, or VYATKA, a government of N.E. Russia, with the government of Vologda on the N., Perm on the E., Ufa and Kazan on the S. and Nizhny-Novgorod and Kostroma on the W., having an area of 59,100 sq. m. It has on its northern boundary the flat water-parting which separates the basins of the Northern Dvina and the Volga, and its surface is an undulating plateau 800 to 1400 ft. above sea-level, deeply grooved by rivers and assuming a hilly aspect on their banks. The Kama rises in the N.E., and, after making a wide sweep through Perm, flows along its S.E. boundary, while the rest of the government is drained by the Vyatka and its numerous tributaries. Both the Kama and the Vyatka are navigable, as also are several tributaries; the Izh and Votka, which flow into the Vyatka, have important ironworks on their banks. The only railway is one from Perm to Archangel, through the town of Vyatka; the government is traversed by the great highway to Siberia, and by two other roads by which goods from the south are transported to loading-places on the Vychedga and the Yug to be shipped to Archangel. Lakes are numerous, and vast marsh exist everywhere, especially in the north. The climate is very severe, the average yearly temperature being 36° F. at Vyatka (January, 8-2°; July, 67-9°) and 35° at Slobodsk (January, 3-5°; July, 65-5°).

The estimated pop. in 1906 was 3,532,600. The bulk of the inhabitants (78 %) are Russians; Vyatkas make 12-2 % Chereemisses 5 %, and Tatars 31 %, the remainder being Bashkirs, Teptyars and Permians. The Vyatks (Otyaks), a Finnish tribe, calls themselves Ot, Ut or Ud, and the Tatars call them Ar, so that they may possibly be akin to the Ars of the Yenisei. They are middle-sized, with fair hair and eyes, often red-haired; and the general structure of the face and skull is Finnish. By their dialect they belong to the same branch as the Permians.

The government is divided into eleven districts, the chief towns of which are Vyatka, Elabuga, Glazov, Kotelich, Malmymz, Nolinsk, Orlov, Sarapul, Slobodsk, Uzbhun and Yaransk. Izhbas and Slobodsk are the educational centres, the former having 85 % of the surface is covered with forests, two-thirds of which belong to the crown, and hunting (especially squirrel-hunting) and fishing are of commercial importance. The peasant's form of 89 % of the population, own 44 % of the whole government, the crown 53 % and private persons 2 %. The soil is fertile, especially in the valleys of the south. Vyatka is one of the chief grain-producing governments of Russia. The principal crops are rye, wheat, oats, barley and potatoes. Flax and hemp are extensively cultivated, and large numbers of cattle are kept, but they are mostly of inferior breed. The government has a race of good ponies that are widely exported. Domestic industries occupy large numbers of the inhabitants. The principal manufacturing establishments are tanneries, distilleries, ironworks, chemical works, and sawmills; and for the supply of coal, sawdust and wood-furniture, and hardware, machinery, paper and fur-dressing works. (P. A. K.: T. Le.)

VYATKA, a town of Russia, capital of the government of the same name, on the Vyatka river, 304 m. by rail W.N.W. of Perm. Pop. 24,782. It is built on the steep hills which rise above the river and at their base. Its old walls have been demolished, and its old churches built anew. It is an episcopal see and has a fine cathedral. Its manufactures include silver and copper wares, and ecclesiastical ornaments, and it has an important trade in cloth, leather, tallow, candles, soap, wax, vinegar and furs (especially the hot-bird's feather). It was the old manufacturing town of the Vyatka district and was included in the Vyatka trade route.

VYAZMA, a town in Russia, in the government of Smolensk, 109 m. by rail E.N.E. of the town of Smolensk. Pop. 15,676. It was a populous place as early as the 11th century, and a lively trade with Narva on the Gulf of Finland. In the 15th century it fell under the dominion of Lithuania, but was reattached to the Russian crown in 1530, and again in 1611, and kept it till the peace of 1634. It is now an important centre for trade. It has a cathedral, dating from 1596.

VYERNYI (formerly ALMATY), a town and fort of Asiatic Russia, capital of the province of Semirechensk, 50 m. N. of Lake Issyk-kul, at the northern foot of the Trans-Ili Ala-tau Mountains, at an altitude of 2544 ft. Pop. 24,798. Founded in 1854, it is well-built, provided with boulevards and surrounded by luxuriant gardens. It has a cathedral, being an archiepiscopal see of the Orthodox Greek Church, a school of gardening and horticulture, a public library, and a few distilleries, tanneries and oil works. Situated at the intersection of two roads—from Kulja to Tashkent, and from Semipalatinsk to Kashgar—Vyernyi carries on an active trade in wheat, rice, corn, tea, oil and tobacco. It was the centre of a remarkable earthquake on the 9th of June 1887.

VYRNWY (Fyrveny), an artificial lake or reservoir in the north-west of Montgomeryshire, N. Wales, constructed for the Liverpool water-supply. It was formed by damming the river Wyvern, which runs through Montgomeryshire and joins the Severn above Shrewsbury.

VYSHNIY-VOLOCHOK, a town of Russia, in the government of Tver, 74 m. by rail N.W. of the city of Tver. Pop. 16,722. The place owes its importance to its situation in the centre of the Vyshne-Volotchok navigation system (540 m. long, constructed by Peter the Great in 1703), which connects the upper Volga with the Neva. The portage (volok) is less than 17 m. between the Vetsera, a tributary of the Volga, and the Tsa, which flows into the Matsa and the Volkov (Lake Ladoga); but boats now prefer the Marlinsk system.
W—WAAGEN, G. F.

the twenty-third letter of the English alphabet, shows its origin in its name; it is but VV, and, as the name shows, V had the vowel value of u, while the "double u" was employed for the consonant value. In German the same symbol w is called Vey, because in that language it has the value of the English v, while the German v (Vau, few in pronunciation) is used with the same value as f. In the English of the 9th century the wv of the old texts (and the u of the Northern) was found not to represent the English w satisfactorily, and a symbol b was adopted from the Runic alphabet. This survived sporadically as late as the end of the 13th century, but long before that had been generally again replaced by uv (w only in Early Middle English) and by w. For w the earliest English printers had a type, but French printers had not; hence a book like the Roman Catholic version of the New Testament printed at Rheims in 1582 prints w with two v's set side by side. Throughout the history of English the sound seems to have remained the same—the consonantal u. For this value as well as for u Latin-always used only V; in Greek, except in a few dialects, the consonantal value was early lost (see under F). w is produced by leaving a very small opening between the slightly protruded lips while the back of the tongue is raised towards the soft palate and the nasal passage closed. The ordinary w is voiced, but according to some authorities the w in the combination wh (really hvw) is not, in when, what, &c., even when the h is no longer audible. The combination WH (hw) represents the Indo-European qh* when changed according to Grimm's law from a stop to a spirant. Thus what corresponds phonemically to the Latin quod and the first syllable of the Greek word quod, but the English h has now been generally dropped. In Scotland, along the line of former contact with Gaelic, it changes into j: f Jacqueline, first name in Jacob. The combination WH (hw) appears not only before r as in write, but also before l in wisep (lispa). In write, wring, &c., the w is now silent, though dialectically, e.g. in Aberdeenshire, it has changed to v and is still pronounced, wreet, wring, &c. In English and in other languages there is considerable difficulty in pronouncing w before long u sounds: hence it has disappeared in pronunciation in two (doo), but survives in Scotch two, though otherwise the difficulty is most noticeable in Scottish dialects than in literary English, as in oo = wool and in the Scottish pronunciation of English words like wood as wool.

(P. Gl.)

WA, a wild tribe inhabiting the north-east frontier of Upper Burma. Their country lies to the east of the Northern Shan States, between the Salween river and the state of Keng-Tung, extending for about 100 m. along the Salween and for considerably less than half that distance inland to the watershed between that river and the Mekong. The boundaries may be roughly said to be the Salween on the W., the ridge over the Namling valley on the N., the hills E. of the Nam Hka on the eastern and southern sides, while the country ends in a point formed by the junction of the Nam Hka with the Salween. The Wa claim to have inhabited the country where they now are since the beginning of time; but it appears more probable that they were the aborigines of the greater part of northern Siam at least, if not of Indo-China, since old records and travellers (e.g. Captain McLeod in 1837) speak of their having been the original inhabitants with small communities left behind from Keng Tung down to Chiangmai; while the state of Keng Tung, just S.E. of the Wa country, has still scattered villages of Was and traditions that they were once spread all over the country. Their fortified village sites too are still to be found covered over with jungle. The people are short and dark-fleshed, with negroid features, and some believe that they are allied to the Andamanese and the Selungs inhabiting the islands of the Mergui archipelago, who have been driven back, or retreated, northwards to the wild country they now inhabit; but their language proves them to belong to the Môn-Khmer family. They are popularly divided into Wild Was and Tame Was. The Wild Was are remarkable as the best authenticated instance of head-hunters in the British Empire. They were formerly supposed to be also cannibals; but it is now known that they are not habitual cannibals, though it is possible that human flesh may be eaten as a religious function at the annual harvest feast. Their head-hunting habits have an animistic basis. In the opinion of the Wa the ghost of a dead man goes with his skull and hangs about its neighbourhood, and so many skulls posted up outside his village gate mean so many watch-dog umbrae attached to the village, jealous of their own preserves and intolerant of interlopers from the invisible world. Thus every addition to the collection of skulls is an additional safeguard against ill-affected demons, and a head-hunting expedition is not undertaken, as was once thought, from motives of cannibalism or revenge, but solely to secure the very latest thing in charms as a protection against the powers of darkness. Outside every village is an avenue of human skulls, amid groves conspicuous from long distances. These consist of strips of the primeval jungle, huge forest trees left standing where all the remaining country is cleared for cultivation. The undergrowth is usually cut away, and these avenues are commonly but not always in deep shade. Along one side (which side apparently does not matter) is a line of posts with skulls fitted into niches facing towards the path. The niche is cut sometimes in front, sometimes in the back of the post. In the latter case there is a round hole in front, through which sometimes only the teeth and empty eye-sockets, sometimes the whole skull, gives a ghastly smile. Most villages count their heads by tens or twenties, but some of them have hundreds, especially when the grove lies between several large villages, who combine or run their collections into one another. The largest known avenue is that between Hsüng Ramang and Hsün Hhung. Here there must be a couple of hundred or more skulls; but it is not certain that even this is the largest. It is thought necessary to add some skulls to this pathway every year if the crops are to be good. The heads of distinguished and pious men and of strangers are the most efficacious. The head-hunting season lasts through March and April, and it is when the Wa hill fields are being got ready for planting that the roads in the vicinity become dangerous to the neighbouring Shans. The little that is known of the practice seems to hint at the fact that the victim selected was primarily a harvest victim. A Wild Wa village is a very formidable place to attack, except for civilized weapons of offence. All the villages are perched high on the slope of the hills, usually on a knoll or spine-like spur, or on a narrow ravine near the crest of the ridge. The only entrance is through a long tunnel. There is sometimes only one, though usually there are two, at opposite sides of the village. This tunnelled way is a few inches over 5 ft. high and not quite so wide, so that two persons cannot pass freely in it, and it sometimes winds slightly, so that a gun cannot be fired up it; moreover, the path is frequently studded with pegs in a sort of dice arrangement, to prevent a rush. None of the tunnels is less than 30 yds. long, and some are as much as 100 yds. Round each village is carried an earthen rampart, 6 to 8 ft. high and as many thick, and this is overgrown with a dense covering of shrubs, thin bushes and cactuses, so as to be quite impenetrable. Outside this is a deep ditch which would effectively stop a rush. These preparations indicate the character of the inhabitants, which is so savage and suspicious that the Wa country is still unadministered and naturally does not appear in the 1901 census returns. The total number of the Wa race is estimated at more than 50,000.

(J. G. Sc.)

WAAGEN, GUSTAV FRIEDRICH (1794–1868), German, art historian, was born in Hamburg, the son of a painter and nephew of the poet Ludwig Tieck. Having passed through the college
of Hirschberg, he volunteered for service in the Napoleonic campaign of 1813–1814, and on his return attended the lectures at Breslau University. He devoted himself to the study of art, which he pursued in the great European galleries, first in Germany, then in Holland and Italy. A pamphlet on the brothers Van Eyck led to his appointment to the directorship of the newly founded Berlin Museum in 1832. The result of a journey to London and Paris was an important publication in three volumes, *Kunstwerke und Künstler in England und Paris* (Berlin, 1837–1839), which became the basis for his more important *The Treasures of Art in Great Britain* (London, 1854 and 1857). In 1844 he was appointed professor of art history at the Berlin University. In 1861 he was called to St. Peter’sburg as adviser in the arranging and naming of the pictures in the imperial collection. On his return he published a book on the Hermitage collection (Munich, 1864). Among his other publications are some essays on Rubens, Mantegna and Signorelli; *Kunstwerke und Künstler in Deutschland und Die vornehmsten Kunstdenkmäler in Wien*. He died on a visit to Copenhagen in 1898. In the light of more recent research his writings are not of much value as regards trustworthy criticism, though they are useful as catalogues of art treasures in private collections at the time when they were written. His greatest respect was in England, where he was invited to give evidence before the royal commission inquiring into the condition and future of the National Gallery.

WAAGEN, WILHELM HEINRICH (1841–1900), German palaeontologist, was born at Munich on the 23rd of June 1841. He was educated at Munich and Zurich, and through the influence of A. Oppel he commenced to study the rocks and fossils of the Jurassic system, and published an essay in 1865, *Vorzeichen einer Allgemeinen Clasification der Schichten des oberen Jura*. In 1870 he succeeded the staff of the Geological Survey of India, and was appointed palaeontologist in 1874, but was obliged to retire through ill-health in 1875. He published important monographs in the *Palaeontologia Indica* on the palaeontology of Cutch (1875–1876) and the Salt Range (1879–1883), dealing in the last-named work with fossils from the Lower Cambrian to the Trias. In 1879 he was appointed professor of mineralogy and geology in the German technical high school at Prague, and he became a contributor to the continuation of Barrande’s great work on the *Systeme Silurien de Bohême*. In 1890 he became professor of palaeontology at the university of Vienna, and in 1898 the Lyell medal was awarded to him by the Geological Society of London. He died in Vienna on the 24th of March 1900.

WABASH, a city and the county-seat of Wabash county, Indiana, U.S.A., about 42 m. S.W. of Fort Wayne. Pop. (1890) 5105, (1900) 8618, of whom 498 were foreign-born and 134 negroes; (1910 U.S. census) 8687. It is served by the Cleveland, Cincinnati, Chicago & St Louis railway (which has extensive shops here), by the Wabash railway, and by interurban electric lines. It has a public library, a Memorial Hall (1897), erected to the memory of Federal soldiers in the Civil War and occupied by the local “camp” of the Grand Army of the Republic, a Masonic temple, a county hospital and two parks. The city is in a fertile agricultural region, and has a considerable trade in grain and produce. Among its manufactures are furniture, agricultural implements and foundry and machine-shop products. In 1905 the factory products were valued at $2,203,932 (31.2% more than in 1900). Wabash was settled about 1834, incorporeal as a village in 1854, and first chartered as a city in 1866. It is one of the first cities in the vicinity, and is lighted with electricity, a lighting plant being established in February 1880.

WACE, HENRY (1836– ), English divine, was born in London on the 10th of December 1836, and educated at Marlborough, Rugby, King’s College, London, and Brasenose College, Oxford. He was ordained in the Church of England in 1861, and held various curacies in London, being chaplain at Lincoln’s Inn in 1872 and preacher in 1880. From 1875 to 1896 he was prominently connected with King’s College, London, where he was professor of ecclesiastical history, and subsequently (1883) principal. Both as preacher and writer Dr Wace, who took his D.D. degree in 1834, became conspicuous in the theological world. He was Boyle lecturer in 1874 and 1875, and Bampton lecturer in 1879; and besides publishing several volumes of sermons, he was co-editor of the Dictionary of Christian Biography (1877–1887), and editor of The Speaker’s Commentary on the Apocalypse. He took a leading part as the champion of historic orthodoxy in the controversies with contemporary Rationalism in all its forms, and firmly upheld the importance of denominational education and of the religious test at King’s College; and when the test was abolished in 1902 he resigned his seat on the University Board. He died within a few months of his 86th birthday, and in 1889 was appointed a chaplain-in-ordinary to Queen Victoria. When he resigned the principalship of King’s College in 1896 he was made rector of St Michael’s, Cornhill; and in 1903 he became dean of Canterbury, in succession to Dr Farrar.

WACE, (? ROBERT (1100–1175), Anglo-Norman chronicler, was born in Jersey. He studied at Caen; he became personally known to Henry I., Henry II., and the latter’s eldest son, Prince Henry; from Henry II. he received a bend at Bayeux and pontifical and archdiocesan insignia. It is said that he was the author of two metrical chronicles in the Norman-French language. Of these the earlier in date is the *Roman de Brut*, completed in 1155, which is said to have been dedicated to Eleanor of Aquitaine (ed. A. J. V. Le Roux de Lincy, 2 vols., Rouen, 1836–1838). This is a free version of the Latin *Historia Britonum* by Geoffrey of Monmouth, in rhyming octosyllabics; it was rendered into English, shortly after 1200, by Layamon, a mass-priest of Worcestershire, and is also largely used in the rhymed English chronicle of Robert Mannyng. Wace’s second work, the *Romance de Rou* (ed. C. Grétry, 4 vols., 1840), was written between 1160 and 1175, has a less fabulous character than the *Brut*, being a chronicle of the Norman dukes from Rollo to Robert Curthose. It has been ably dissected by Gustav Körting (Über die Quellen des Roman de Rou, Leipzig, 1867), who shows that it is mainly based upon Dudo and William of Jumièges. There is also reason for thinking that Wace used the *Gesta regum* of William of Malmsbury. Where Wace follows no ascertainable source he must be used with caution. Undoubtedly he used oral tradition; but he also seems to have given free play to his imagination.

The *Roman de Rou* is written in rhyming octosyllabics, varied by assonance and alexandrines. It is read by F. Flandin (ed. and supplement, Rouen, 1827–1829) and more completely by H. Andresen (2 vols., Heilbronn, 1877–1879).

WACHSMUTH, CHARLES (1829–1896), American palæontologist, was born in Hanover, Germany, on the 13th of September 1829. Educated as a lawyer in his native city, he abandoned the profession on account of ill-health, and in 1852 went to New York as agent for a Hamburg shipping house. Two years later, for reasons of health, he removed to Burlington, Iowa, U.S.A., where he settled. Here he was attracted by the fossils, and especially the crinoids, of the Burlington Limestone, and in a few years possessed a fine collection. In 1864 he made acquaintance with L. Agassiz, and in the following year paid a visit to Europe, where he studied the crinoids in the British Museum and other famous collections. He now decided to devote all his energies to the elucidation of the crinoids, and with signal success. He made further extensive collections, and supplied specimens to the Agassiz museum at Cambridge, U.S.A., and the British Museum. Becoming acquainted with Frank Springer (1848–1884), a lawyer at Burlington, he stirred up his enthusiasm, and dedicated them to studying the crinoids and published a series of important papers. These include “Discovery of the Ventral Structure of Taxocrinus and haplocrinus, and Consequent Modifications in the Classification of the Crinoida” (Proc. Acad. Nat. Sci., Philadelphia, 1889); “The Perisomic Plates of the Crinoids” (Ibid., 1891); and a monograph on “The North American Crinoida Camera,” published, after the death of Wachsmuth, in the Memoirs of the Museum of Comparative Zoology at Harvard (1897). Of this last-named work a detailed
review and analysis was published by F. A. Bath, of the British Museum, in the Geol. Mag. for 1888—1890. Wachamuthi died on the 7th of February 1896.

Obituary (with portrait) by F. A. Bath, Geol. Mag. (April 1896).

WACO, a city and the county-seat of McLennan county, Texas, in the centre of the state, is sit on both sides of the Brazos river, about 100 m. S. by W. of Dallas. Pop. (1890) 14,445; (1900) 26,686, of whom 326 were negroes; (1910) census 26,425. Waco is served by the Missouri, Kansas & Texas, and by other railways. Waco is the seat of Baylor University (co-educational) and of the Texas Christian University (Christian; co-educational). Baylor University was founded at Independence, Texas, by the Texas Union Baptist Association, in 1845, and was consolidated in 1886 with Waco University (Baptist, 1851, founded by Dr Rufus C. Burleson, a former president of Baylor University). It was named in honour of Robert E. Baylor (1793-1874), a representative in Congress from Alabama in 1830-1831, and one of its founders. In 1908-1909 it had 46 instructors and 1265 students (664 women), of whom 647 were in the college. The Texas Christian University was founded in 1873 at Thorp's Springs as a private school, chartered as Add Ran College, transferred to the Christian Churches of Texas in 1889, and removed to Waco in 1895. Its present name was adopted in 1902, the name Add Ran College being retained for the college of arts and sciences. In 1908-1909 the university had 26 instructors and 379 students (279 in the college of arts and sciences); it was located in an outlying farming region. In 1905 the factory products were valued at $2,070,830. The city was named after the Waco (or Hueso) Indians (Caddoan stock), who had a large village here until 1830, when they were nearly exterminated by the Cherokees; in 1835 they removed to a reservation, and after 1889 became incorporated with the Wichita. The first white settlement was made in 1849. Waco was incorporated as a town in 1856; in 1869 the city was incorporated as a town in 1856; in 1909 the administration was entrusted to a mayor and four commissioners.

WAD, a black, earthy mineral consisting mainly of hydrated manganese dioxide; of importance as an ore. Being a heavy substance, it varies considerably in chemical composition, and contains different impurities often in large amount. A variety containing much cobalt oxide is called "asbolite," while "lampadite" is a cupferous variety. It is very soft, readily soiling the fingers, and may be considered as an earthy form of psilomelane (q.v.). It results from the decomposition of other manganese minerals, and is often deposited in marbles ("bog manganese") or by springs. The name wad is of uncertain origin, and has been applied also to graphite. (L. J. S.)

WADAI, a country of north central Africa, bounded on the E. by the Sahara desert, on the W. by the Nile, and on the S. and W. by Kanem and Bagirmi, and E. by Darfur. Formerly an independent Mahomedan sultanate, it was in 1908 annexed to French Equatorial Africa (French Congo). Wadai has an area estimated at 150,000 sq. m., and a population of 3,000,000 to 4,000,000.

The general level of the country is about 1000 ft. North, north-east, south-west and in the centre are ranges of hills rising another 1000 ft. West and north-west the fall to the Sahara is gradual. Here occur remarkable sand-ridges of fragmental shape—hollow mounds, pyramids, coves, &c. which are characteristic of the Libyan desert. The surface here possesses—red, yellow or brown, black, &c.—presenting the aspect of ruined castles, ramparts and churches. North-west is a wide district of dreary plain—part of the chy zone which stretches from the middle Niger to the Nile—covered with thorn bush and dun palms. The central and eastern regions are the most fertile, and contain large forest areas. The country belongs to the Chad drainage area, though it is possible that the Bahr-el-Ghazal (of the Chad system) may afford a connection with the Nile. Streams run from the north-eastern districts, of which the Batha (over 300 m. long) is the largest, flow west, the Batha ending in a depression, some 200 m. In the western districts, the Wadai river, with a more northerly course than the Batha, goes in the direction of Chad, but ends in swamps in the clayey soil. These rivers are intermittent, and after seasons of drought Fitti is completely dry. In the Ruma there is a confluence, the Wadai river itself running at a short distance from the same stream, and it is possible that the Batha may have once conveyed more water than now. The rivers of Dar Runga flow westward towards the Shari, but, save the Bahr Salamat, none reaches it. They only contain water in the rainy season. About 190 m. above the Salamat-Shari confluence is Lake Injova, which is a short channel. In the forests are large herds of elephants, and hippopotami abound along the river-beds. In the north are the camel and the ostrich. Among the trees is a species of wild coffee which reaches 50 to 60 ft. and yields berries of excellent quality. The cotton plant is indigenous.

Inhabitants and Trade.—The inhabitants consist of negro and lighter tribes, Arabs, Fula, Tibbu and half-castes. The Maba, the dominant race, are said to be of Nubian origin; they are believed not to number more than 75,000, and live chiefly in the north-eastern district. They are in political alliance with the Arab tribes, known in Wadai as Zoruk (dark) and Homr (red). The Maba have a reputation for pride, valour, cruelty, drunkenness and barbaric splendour.

The capital, Abeshr, is in the N.E., in about 21° E., 13° 50' N. Thence a caravan route crosses the Sahara via the Kufra oases to Benghaz in Barca. Another trade route goes east through Darfur to Khartum. The people possess large numbers of horses, cattle, sheep and goats. Maize, durra, cotton and indigo are cultivated, and cloth is woven. Ivory and ostrich feathers, the chief articles of export, are taken to Tripoli by the desert route, together with small quantities of coffee and other produce. There is a trade in cattle, horses and coffee with the countries to the south. Until the French conquest Wadai was a great centre of the slave trade. Slaves were obtained by raiding and in the form of tribute from Bagirmi, Kanem and other countries once dependent on Wadai. The slaves were sent chiefly to Barca. Wadai was also notorious for its traffic in eunuchs.

History.—Situated between the Sahara and eastern dense forest lands of equatorial Africa, Wadai early became a melting ground of negro and Arab culture. Eastern influences and the Mahomedan religion ultimately obtained predominance, though the sovereignty of the country reverted to the negro race. It was sometimes tributary to and sometimes the overlord of the neighboring countries, such as Bagirmi and Kanem. It was made known to Europe by the writings of the Arab geographers, but it was not until Nachtigal's visit in 1873 that accurate knowledge of the land and people was obtained. About 1840 a Maba chiefman named Abd-el-Kerim conquered the country, driving out the Tunkah, a dynasty of Arabian origin. These Sambodi Wadai, notorious as a great slave-raiding state, suffered from many civil and foreign wars. MahomedSherif, sultan from 1835 to 1858, introduced Senussism into the country.

In the last decade of the 19th century the French advancing from the Congo and from the Niger made their influence felt in Wadai, and by the Anglo-French declaration of the 23rd of March 1899 Wadai was recognized as within the French sphere. That state was then torn by civil wars. The Sultan Ibrahim (see SENUSSI) was murdered in 1900, and Ahmed Ghaizili became sultan. He was warned by the Shari, that the Wadai is in the path of the Christian missionaries, and in 1903, the Maba, of whom 75,000, declared war on the French, and in 1904, the French, under the command of M. de la Chaze, arrived at Wadai. The Wadai massacre, in which 4000 men were killed, was an outrage from which the French have not recovered. The French now hold the country, which is well adapted for agricultural purposes.
1909 Captain Fiegenschuh, with a small force of tirailleurs, and Acyl's contingents, advanced up the Bathe to a place within 15 m. of Abeshr, where, on the 1st of June, the enemy were defeated. The next day another fight took place close to Abeshr. The Wadaians were again put to flight and the town bombarded with cannon. Doud Murra with a small following fled north, and Abeshr was occupied by the French. The prince Acyl was subsequently placed on the throne, and, under French guidance, governed Wadai proper, Dar Sila, Dar Runga and other tributary states being directly governed by French residents.

The war was not, however, ended by the occupation of Abeshr. Captain Fiegenschuh's column, operating south-east of Abeshr, was cut off by the Massalit Arabs near the Darfur frontier, but a punitive force retrieved this disaster in April following. While these operations were in progress, Lient. Boyd Alexander (b. 1873), who had previously crossed from the Niger to the Nile, the first British explorer to enter Wadai, passed through Abeshr on his way to Darfur. At the station of Nyeri, in N. Tana, on the Darfur border, he was murdered on the 2nd of April 1910.

In November 1910 a French column, 300 strong, under Colonel Moll, while operating in the Massalit country was attacked by 2000 men under Doud Murra and the sultan of the Massalit. The enemy was beaten off, but the French had over 100 casualties, including Colonel Moll killed.

WADDINGTON, WILLIAM HENRY (1826-1894), French statesman, was born at St Remi-sur-l'Avre (Eure-et-Loir) on the 12th of December 1826. He was the son of a wealthy Englishman who had established a large spinning factory in France and had been naturalized as a French subject. After receiving his early education in Paris, he was sent to Rugby, and thence proceeded to Trinity College, Cambridge, where he was second classic and chancellor's medallist, and rowed for the university in the winning boat against Oxford. Returning to France, he devoted himself for some years to archaeological research. He undertook travels in Asia Minor, Greece and Syria, the fruits of which were published in two Mémores, crowned by the Institute, and in his Mélanges de numismatique et de philologie (1861). Except his essay on "The Protestant Church in France," published in 1836 in Cambridge Essays, his remaining works are likewise archaeological. They include the Festes de l'empire romain, and editions of Diocletian's edict and of Philippe Lebas's Voyage archéologique (1868-1871). He was elected in 1865 a member of the Académie des Inscriptions et Belles-Lettres.

After standing unsuccessfully for the department of the Aisne in 1865 and 1866, Waddington was returned by that constituency at the election of 1871. He was minister of public instruction in the short-lived cabinet of the 19th of May 1873, and in 1876, having been elected senator for the Aisne, he was again entrusted by Dufaure with the ministry of public instruction, with which, as a Protestant, he was not permitted to combine the ministry of public worship. His most important project, a bill transferring the conferment of degrees to the state, passed the Chamber, but was thrown out by the Senate. He continued to hold his office under Jules Simon, with whom he was overthrown on the famous séance mai 1877. The triumph of the republicans at the general election brought him back to power in the following December as minister of foreign affairs under Dufaure. He was one of the French plenipotentiaries at the Berlin Congress. The cession of Cyprus to Great Britain was at first denounced by the French newspapers as a great blow to his diplomacy, but he obtained, in a conversation with Lord Salisbury, a promise that Great Britain in return would allow France a free hand in Tunis.

Early in 1879 Waddington succeeded Dufaure as prime minister. Holding office by sufferance of Gambetta, he halted in an undetermined attitude between the radicals and the republican, indulging delay of urgent reforms lost him the support of all parties. He was forced on the 27th of December to retire from office. He refused the offer of the London embassy, and in 1880 was reporter of the committee on the adoption of the scrup de liste at elections, on which he delivered an adverse judgment. In 1883 he accepted the London embassy, which he continued to hold till 1893, showing an exceptional tenacity in defence of his country's interests. He died on the 13th of January 1894. His wife, an American lady, whose maiden name was Mary A. King, wrote some interesting recollections of their diplomatic experiences—Letters of a Diplomatist's Wife, 1883-1900 (New York, 1903), and Italian Letters (London, 1905).

WADE, BENJAMIN FRANKLIN (1800-1878), American statesman, was born near Springfield, Massachusetts, on the 27th of October 1800, of Puritan ancestry. He was reared on a farm, receiving little systematic education, and in 1813 he removed with his family to Andover, in the Western Reserve of Ohio. Here he spent two more years on a farm, and then, securing employment as a drover, worked his way to Philadelphia and finally to Albany, New York, where for two years he taught school, studied medicine, and was a labourer on the Erie Canal. Returning to Ohio in 1825, he studied law at Canfield, was admitted to the bar in 1827, and began practice at Jefferson, Ashtabula county; where from 1831 to 1837 he was a law partner of Joshua R. Giddings, the anti-slavery leader. During 1837-1839 and 1841-1843 he was a Whig member of the Ohio State Senate. From 1847 until 1851 he was a state district judge, and from 1853 until 1869 was a member of the United States Senate, first as an anti-slavery Whig and later as a Republican. In the Senate Wade was from the first an uncompromising opponent of slavery, his bitter denunciations of that institution and of the slaveholders receiving added force from his rugged honesty and sincerity. His blunt, direct style of oratory and his somewhat rough manners were characteristic. After the outbreak of the Civil War he was one of the most vigorous critics of the Lincoln administration, whose Ohio member, Salmon P. Chase, had long been a political rival. He advocated the immediate emancipation and arming of the slaves, the execution of prominent Southern leaders, and the wholesale confiscation of Confederate property. During 1861-1862 he was chairman of the important joint-committee on the conduct of the war, and in 1862, as chairman of the Senate Committee on Territories, was instrumental in abolishing slavery in the Federal Territories. In 1864, with H. W. Davis (q.v.), he secured the passage of the Wade-Davis Bill (for the reconstruction of the Southern States), the fundamental principle of which was that reconstruction was a legislative, not an executive, problem. This bill was passed by both houses of Congress, just before their adjournment, but President Lincoln withheld his signature, and on the 8th of July 1864, although the House of Representatives reenacted his course and denied his position. Soon afterward (Aug. 3) Wade and Davis published in the New York Tribune the famous "Wade-Davis Manifesto," a vituperative document impugning the President's honesty of
purpose and attacking his leadership. As long as President Johnson promised severe treatment of the conquered South, Wade supported him, but when the President definitively adopted Cullom, policy of his predecessor, Wade became one of his most bitter and uncompromising opponents. In 1867 he was elected president pro tem. of the Senate, thus becoming acting vice-president. He voted for Johnson's conviction on his trial for impeachment, and for this was severely criticized, since, in the event of conviction, he would have become president; but Wade's whole course before and after the trial would seem to belie the charge that he was actuated by any such motive.

After leaving the Senate he resumed his law practice, becoming attorney for the Northern Pacific railway, and in 1871 he was a member of President Grant's Santo Domingo Commission. He died at Jefferson, Ohio, on the 2nd of March 1878. His son, James Franklin Wade (b. 1843), was colonel of the 6th United States (coloured) cavalry during the Civil War, and attained the rank of major-general in the regular army in 1903, commanding the army in the Philippines in 1903-1904.

See A. G. Riddle, Life of Benjamin F. Wade (Cleveland, Ohio, 1886).

WADE, GEORGE (1673-1746), British field marshal, was the son of Jerome Wade of Kilavally, Westmeath, in Ireland, and was a member of the British army in 1690. He was present at Steinkirk in 1692, and in 1702, when he was second in command of the British army, earning particular distinction at the assault on the citadel of Lübeck, and in 1703 he became successively major and lieutenant-colonel in his regiment (later the 10th Foot). In 1704, with the temporary rank of colonel, he served on Lord Galway's staff in Portugal. Wade distinguished himself at the siege of Alcantara in 1706, in a rearguard action at Villa Nova in the same autumn (in which, according to Galway, his two battalions repulsed twenty-two allied squadrons), and at the disastrous battle of Almanza on the 25th of April 1707. He had now risen to the command of a brigade, and on the following 2nd of January (1707/8) he was promoted brigadier-general in the British army. His next service was as second in command to James (1st earl) Stanhope in the expedition to Minorca in 1708. In 1710 he was again with the main Anglo-allied army in Spain, and took part in the great battle of Saragossa on the 20th of August, after which he was promoted major-general and given a command at home. The Jacobite outbreak of 1715 brought him into prominence in the new role of military governor. He twice detected important Jacobite conspiracies, and on the second occasion procured the arrest of the Swedish ambassador in London, Count de Moncey. Thereafter he was employed in the service of army and forces in the successful "conjoint" military and naval expedition to Vigo. In 1724 he was sent to the Highlands to make a thorough investigation of the country and its people, and two years later, having meantime been appointed commander-in-chief to give effect to his own recommendations, he began the system of metalled roads which is his chief title to fame, and is commemorated in the lines--

"Had you seen these roads before they were made,
You would lift up your hands and bless General Wade."

In the course of this engineering work Wade superintended the construction of no less than 40 stone bridges. At the same time, slowly and with the tact that came of long experience, he disarmed the clans. In 1742 he was made a privy councillor and lieutenant-general of the ordnance, and in 1743 field marshal. In this year he commanded the British contingent in Flanders, and was associated in the supreme command with the duke d' Arenberg, the leader of the Austrian contingent. The campaign, as was to be expected when the enemy was of one nation, superior in numbers and led by Saxe, was a failure, and Wade, who in 1745 became a prisoner of war, was sent home, resigned the command in March 1744. George II., promptly made him commander-in-chief in England, and in that capacity Field Marshal Wade had to deal with the Jacobite insurrection of 1745, in which he was utterly baffled by the perplexing rapidity of Prince Charles Edward's marches. On the appointment of the duke of Cumberland as commander-in-chief of the forces, Wade retired. He died on the 14th of March 1748.

WADE, THOMAS (1805-1879), English poet and dramatist, was born at Woodbridge, Suffolk, in 1805. He early went to London, where he began to publish verse of considerable merit under the inspiration of Byron, Keats, and especially Shelley. He wrote some plays that were produced on the London stage with a certain measure of success, owing more perhaps to the acting of Charles and Fanny Kemble than to the merits of the dramatist. Wade frequently contributed verses to the magazines, and for some years he was editor as well as part-proprietor of Bell's Weekly Messenger. This venture proving financially unsuccessful, he retired to Jersey, where he edited the British Press, continuing to publish poetry from time to time until 1871. He died in Jersey on the 19th of September 1875. His wife was Lucy Eager, a musician of some repute.

The most notable of Wade's publications were: Tasso and the Sisters (1829), a volume of poems, among which 'The Nuptials of Juno' in particular showed rare gifts of imagination, though like all Wade's work deficient in sense of melody and feeling for artistic form; Woman's Love (1828), a play produced at Covent Garden; The Phenomenists, a farce produced at Covent Garden in 1830; The Jew of Arragon, a play that was 'howled from the stage' at Covent Garden in 1830 owing to the libretto of the Scotchman; and The Sad Lovers, which, with the two above, were among three being published in the form of pamphlets in 1837: Prokofiev's Sonnets (1839). Wade also wrote a drama entitled King Henry II., and a translation of Dante's Inferno in the metre of the original, both with some claim in metre, and a number of sonnets inspired by his wife, some of which have been published.

WADE, SIR THOMAS FRANCIS (1818-1893), British diplomat, born in London on the 24th of August 1818, was the son of Major Wade of the Black Watch, by his wife Anne, daughter of William Smythe of Barbavilla, Westmeath. In 1838 his father purchased for him a commission in the 81st Regiment. Exchanging (1839) into the 42nd Highlanders, he served with his regiment in the Ionian Islands, devoting his leisure to the congenial study of Italian and modern Greek. On receiving his commission as lieutenant in 1841 he exchanged into the 98th Regiment, then under orders for China, and landed in Hong-Kong in June 1842. The scene of the war had at that time been transferred to the Yangtze-kiang, and thither Wade was ordered with his regiment. Thereafter he served in various capacities in China, and in the advance on Nanking. In 1845 he was appointed interpreter in Cantonese to the Supreme Court of Hong-Kong, and in 1846 assistant Chinese secretary to the superintendent of trade, Sir John Davis. In 1842 he was appointed vice-consul at Shanghai. The Tai-ping rebellion had so disorganized the administration in the neighbourhood of Shanghai that it was considered advisable to put the collection of the foreign customs duties into commission, a committee of three, of whom Wade was the chief, being entrusted with the administration of the department. This favour marked the beginning of the imperial martires' customs service. In 1855 Wade was appointed Chinese secretary to Sir John Bowring, who had succeeded Sir J. Davis at Hong-Kong. On the declaration of the second Chinese War in 1857, he was attached to Lord Elgin's staff as Chinese secretary, and with the assistance of H. N. Ley he conducted the negotiations which led up to the treaty of Tientsin (1858). In the following year he accompanied Sir Frederick Bruce in his attempt to exchange the ratification of the treaty, and was present at Taku when the force attending the mission was treacherously attacked and driven back from the Pehlo. On Lord Elgin's return to China in 1859, he succeeded the late Mr. Homer, post of Chinese secretary, and was mainly instrumental in arranging for the advance of the special envoys and the British and French forces to Tientsin, and subsequently towards Peking. For the purpose of arranging for a camping ground in the neighbourhood of Tungchow he accompanied Mr. (afterwards Sir) Harry Parkes on his first visit to that city, where on the next day Parkes with
Mr. Loch and others was by an act of shameless treachery made prisoner. In the succeeding negotiations Wade took a leading part, and on the establishment of the legation at Pekin he took up the post of Chinese secretary of legation. In 1862 he was made a Companion of the Bath. On the return of Sir Frederick Bruce to England in 1864 he remained as chargé d'affaires, and again from 1869 to 1871, when he was appointed minister, he filled the acting post. The Tientsin massacre in 1870 entailed long and difficult negotiations, which were admirably conducted by Wade. On the assumption of power by the emperor T'ung-chih he, in common with his colleagues, requested an audience in accordance with the treaties, which was for the first time granted as a right. The murder of A. R. Margary near Man-wyne in Yunnan in 1871 threatened at one time to cause a rupture with the Chinese government, and as a matter of fact Wade did leave Peking. But the Chinese, finding that he was in earnest, despatched Li Hung-Chang after him to Chefoo, where the two diplomatists arranged the penalties which were to be paid for the crime, and concluded a convention which, after a considerable interval, was ratified by the governments. Wade was then made K.C.B., and in 1883 retired from the service. On his return to England the attractions of his old university induced him to take up his residence at Cambridge, where he was appointed the first professor of Chinese. He died there on the 31st of July 1895. In 1889 he was made G.C.M.G. In 1868 he had married Amelia, daughter of the late Rev. John Herschel.

WADE (or WAD), SIR WILLIAM (1546-1623), English statesman and diplomatist, was the eldest son of Armagh Wade (d. 1568), the traveller, who sailed with a party of adventurers for North America in 1536, and later became (1547) one of the clerks of the privy council in London and a member of parliament. William Wade obtained his entrance into official life by serving William Cecil, Lord Burghley, sending information to this statesman from Paris and from Italy. He also passed some time in Strassburg; then in 1581 he became secretary to Sir Francis Walsingham and in 1583 a clerk of the privy council. He visited Vienna, Copenhagen and Madrid on public business, and in 1585 he went to Paris, being waylaid and maltreated on his return near Amiens by influential personages who disliked the object of his mission. In 1586 he went to Chartley and took possession of Mary Stuart's papers, and in 1587 was again in France. During the remainder of Elizabeth's reign Wade was much occupied in searching for Jesuits and in discovering plots against the life of the queen. James I., who knighted him in 1603, employed him in similar ways, and he was fully occupied in unravelling the plots which marked the early years of the new reign. For some time Wade was a member of parliament. He retired from public life in 1613, and died on the 21st of October 1623. Sir William was a shareholder in the Virginia company, and the Wades of Virginia claim descent from his father.

WADEBRIDGE, a market town and seaport in the St Austell parliamentary division of Cornwall, England, on the Great Western and London & South-Western railways, 36 m. W.N.W. of Plymouth. Pop. of urban district (1901), 2186. It is picturesquely situated at the head of the estuary of the river Camel, 7 m. from its mouth in Padstow Bay on the north coast. A stone bridge, consisting of seventeen arches, was built in 1485 over the river, and made a county bridge under James I. The parish church of Egloshayle, nearly 2 m. from the town, is in the main Perpendicular, with a beautiful tower; but part of the fabric is Early English. The neighbouring church of St Brock is Decorated and Perpendicular, with a fine font of the earlier period. An ancient round-headed cross stands near the town. There is considerable agricultural trade, and iron founding is carried on; while in the neighbourhood some copper, lead, granite and slate are worked and exported in small vessels; coal, timber and general merchandise being imported.

WADELAI, a station on the east bank of the Upper Nile in the British protectorate of Uganda, in 2° 50' N., 31° 35' E., 200 m. in a direct line N.N.W. of Entebbe on Victoria Nyanza, and 72 m. by river below Butala on Albert Nyanza. The government station was built on a hill 160 to 200 ft. above the Nile at a spot where the river narrows to 482 ft. and attains a depth of 30 ft. At this place was a gauge for measuring the discharge of the river. Wadelai was first visited by a European, Lieut. H. Chippendale, in 1875, and was named after a chieftain who, when visited by Gesu Pasha (on the occasion of that officer's circumnavigation of Albert Nyanza), ruled the surrounding district as a vassal of Kabarega, king of Unyoro. The region was annexed to the Egyptian Sudan and Wadelai's village chosen as a government post. This post was on the western bank of the Nile, 14 m. below the existing station. Here for some time Emin Pasha had his headquarters, evacuating the place in December 1882. Thereafter, for some years, the district was held by the Mahdists. In 1894 the British flag was hoisted at Wadelai, on both banks of the Nile, by Major E. R. Owen. Some twelve years later the government post was withdrawn. There is a native village at the foot of the hill.

WADHWAJN, a town in Kathiawar, Bombay, the capital of a petty state of the same name, and the junction of the Kathiawar railway system with the Bombay and Baroda line, 389 m. N. of Bombay. Pop. (1901) 16,223. It has considerable trade and manufactures. There is a school for giriasias or subordinate chiefs. The civil station, under British administration, had a population in 1901 of 11,255. The state of Wadhwan has an area of 236 sq. m.; pop. (1901), 34,857; revenue, £25,000. Cotton trade and stone-quarrying are important, and there are manufactures of soap and saddlery.

WADI, also written wady, in some dialects wad; Arabic for a "valley," hence a stream or river flowing through a valley, as well as the valley itself. It is a common term in place names.

WADI HALFA, or HALFA, a town of the Anglo-Egyptian Sudan, in 21° 55' N., 31° 10' E., on the right bank of the Nile, 5 m. S. of the northern frontier of the Sudan. It is the chief town of the Halfa mudiria, is 770 m. S. of Cairo by rail and steamer, and 757 m. N.N.W. of Khartoum by rail. Some 6 m. above the town is the second cataract, and on the west bank of the Nile opposite Halfa are the ruins of the ancient Egyptian city of Buhen (Bohon). Halfa is the northern terminus of the Sudan railway and the southern terminus of a steamboat service on the Nile, which, running to Shellal (Assuan), connects there with the Egyptian railways.

Wadi Halfa is a general designation including the native village of that name, the camp, founded by the British in 1884 as their base in the operations for the relief of General Gordon, and the civil cantonment established at the same time. This cantonment occupies the site of a Nubian village, and round it has grown a thriving town, first named Taufikia, but now called Halfa. It has a population (1901) of about 3000. The camp is 34 m. S. of Halfa. Here are the barracks, officers' quarters, railway works, and an esplanade along the river front. The village of Wadi Halfa is 3 m. S. of the camp.

WAD MEDANI, a town of the Anglo-Egyptian Sudan, capital of the Blue Nile mudiria, in 14° 24' N., 33° 31' E., on the left bank of the Blue Nile, 110 m. by rail and 147 m. by river, S.E. of Khartoum. Pop. about 20,000. It is the chief depot for grain raised in the Gezira, has oil and soap works, and is a thriving commercial centre, being on the main trade route between Khartoum and Abyssinia. The town, which is of considerable antiquity, contains some fine buildings, the chief mosque having a conspicuous tower. Wad Medani was almost destroyed during the Mahdia, but its return to prosperity under Anglo-Egyptian rule was rapid. In 1900 it was connected by railway with Khartoum, and thus the hindrance to trade through the Blue Nile being scarcely navigable between January and June was overcome. In 1910 railway communication between the town and Khartoum was established. (See Sudan, § Anglo-Egyptian.)

WAFAER, a thin flat cake of sheet of paste, usually circular in shape. The derivation of the word, which is the same as "waffle," a batter-cake cooked in waffle-irons and served hot, is given under "Goffer," which is adapted from the French form of the Teutonic original. As articles of stationery, wafers consist of thin brittle, adhesive disks, used for securing papers together, and for forming a basis for impressed official seals. They are
made of a thin paste of very fine flour, baked between "wafer irons" over a charcoal fire till the thin stratum of paste becomes dry and brittle and the flour starch is partly transformed into glutinous mass and extrins. The cake is cut into rounds and baked in the steel punches. Bright non-poisonous colouring matter is added to the paste for making coloured wafers. They are also made of gelatin. Wafers of dry paste are used in medical practice to enclose powders or other forms of drugs, thus rendering them easy to swallow.

In ecclesiastical usage the term "wafer" is applied to the thin circular disk of unleavened bread, stamped with a cross, the letters I.H.S. or the Agnus Dei, which is the form of the consecrated bread as used in the service of the Eucharist by the Roman Catholic Church.

WAGES (derived, through Fr. wagier, gagger, from Lat. radiun, a pledge), a bet or stake. Wagers in the ordinary sense of the term are dealt with under the headings GAMING and BETTING; but the method of wagering—in principle the putting of a decision to the hazard—has had extended employment in various cases which may be noticed here. The determination of cases, civil and criminal, by means of wager or analogous forms of procedure, was a characteristic feature of ancient law. The legis actio sacramentii at Rome—at first a real, then a fictitious, wager—and the wagers "of battle" and "of law" in England, of the old and ancient in their original form and in a comparatively late period in the history of both legal systems. The form of the wager survived long after its reason had been forgotten. The general prevalence of the wager form of proceeding is perhaps to be attributed to the early conception of a judge as a mere referee who decided the dispute submitted to him, not as an executive officer of the state, but as an arbitrator casually called in (see Maine, Ancient Law, c. x.).

"Wager of battle" in England was a mode of trial allowed in certain cases, viz., on a civil writ of right for recovery of land (see TUR) and chancery suits upon the question of the issue of an Appeal. Trial by battle, or single combat, was a common Teutonic custom in days when criminal "appeal" was really a prosecution by a private individual; and it remained in vogue on the continent of Europe (where hired champions were allowed) to a much greater extent than in England, where after the Conquest it was to some extent substituted for trial by ordeal (q.v.). It was an institution suited to the days of chivalry, and may be regarded as the parent of the duel (q.v.). In England the 'appellant' first formulated his charge, which was proclaimed at five successive county courts. If the "appellant" did not appeal, he was outlawed; if he did he could plead various exactions; and unless the court upheld them he was obliged to offer battle by throwing down his glove as a gage. When an ordinary court ordered the battle, it was fought on foot with staves and leather shields; but when a court of chivalry ordered it, on horse with spear and sword. If defeated, the appellee was liable to sentence of death by hanging, and an undecided fight still left him liable, though acquitted on the appeal, to trial by indictment; if the appellant yielded, the appellee was free. The right of "wager of battle" was claimed as late as 1818 by a man named Thornton, who had been acquitted at assizes of a charge of murdering a girl named Ashford; her brother brought an "appeal," and the judges upheld Thornton's claim, but the appellant then withdrew. Next year appeals for felony or treason were abolished by statute.

"Wager of law" (radiatio legis) was a right of a defendant in actions of simple contract, debt and detinue. It superseded the ordeal (itself called lex in the Assize of Clarendon and other

ancient constitutional records). The procedure in a wager of law is traced by Blackstone to the Mosaic law, Ex. xxii, 10; but it seems historically to have been derived from the system of compurgation, introduced into England from Normandy, a system which is now thought to have had an appreciable effect on the development of the English jury (q.v.). It also has some points of resemblance, perhaps some historical connexion, with the sponsio and the decisors' oath of Roman law, and the reference to oath of Scots law (see Oath). The use of the oath instead of the real or feigned combat—real in English law, feigned in Roman law—no doubt represents an advance in legal development. The technical term sacramentum is the bond of union between the two stages of law. In the wager of law the defendant, with eleven compurgators, appeared in court, and the defendant swore that he did not owe the debt, or (in detinue) that he did not detain the plaintiff's chattel; while the compurgators swore that they believed that he spoke the truth. It was an eminently unsatisfactory way of arriving at the merits of a claim, and it is therefore not surprising to find that the policy of the law was in favour of its restriction rather than of its extension. Thus it was not permitted where the defendant was not a person of good character, where the king sued, where the defendant was the executor or administrator of the person alleged to have owed the debt, or where it arose in any dispute in which the shareholders could be involved, even though the cause of action were the same. No wager of law was allowed in assumpstis, even though the cause of action were a simple debt. This led to the general adoption of assumpstis—proceeding originally upon a fictitious averment of a promise by the defendant—as a means of recovering debts. Where a penalty was created by statute, it became a common form to insert a proviso that no wager of law was to be allowed in an action for the penalty. Wager of law was finally abolished in 1833 (3 & 4 William IV. c. 42).

Another form of judicial wager in use up to 1845 was the feigned suit alleging nullity of marriage, in which questions arising in the course of chancery proceedings were sent for trial by jury in a common law court. The plaintiff averred the laying of a wager of £5 with the defendant that a certain event was as he alleged; the defendant admitted the wager, but disputed the allegation; on this issue was joined. This procedure was abolished by s. 19 of the Gaming Act 1845.

(W.F.C.)

WAGES (the plural of "wage," from Late Lat. wadium, a pledge, O. Fr. wagier, gagger). Wages, although one of the most common and familiar terms in economic science, is at the same time one of the most difficult to define accurately. The natural definition is that wages is the "reward for labour," but then we are at once confronted with the difficulty so well stated by Adam Smith: "The greater part of people understand better what is meant by a quantity of a particular commodity than by a quantity of labour; the one is a plain palpable object, the other an abstract notion, which, though it can be made sufficiently intelligible, is not altogether so natural and obvious." If we regard wages as the reward for a quantity of labour, it is clear that to make the meaning precise we must give a precise meaning to this abstract notion of Adam Smith. From the point of view of the labourer the quantity of labour refers not so much to the work accomplished (e.g. raising so many foot-pounds) as to "all the feelings of a disagreeable kind, all the bodily inconvenience or mental annoyance, connected with the employment of one's thoughts or muscles or both in a particular occupation" (J. S. Mill). But this analysis seems only to make the task of definition more difficult, for the class of labourers, in this wide sense of the term labour, would include the capitalist who racks his brains in making plans just as much as the navvy who digs with the sweat of his brow. Thus "profits," in the ordinary sense of the term, instead of being contrasted, would to a large extent be classified with wages, and in fact the wages of superintendence or of management is one of the recognized elements in the classical analysis of profits. It is only when we refer to the list of "occupations" in any civilized country that we can really form an adequate idea of the variety of classes to which the term labour, as defined by Mill, may be extended.
It may be granted that in certain economic inquiries it is extremely useful to bring out the points of resemblance between "workers" at the various stages of the social scale; and it is especially serviceable in showing that the opposition between "employed" instances is a deployment of the "classes" of "wage" and the "masses," is often exaggerated. At the same time the differences, if not in kind at any rate in degree, are so great that if the analogy is carried very far it becomes misleading. Accordingly it seems natural to adopt as the preliminary definition of "wages" something equivalent to that of Francis Walker in his standard work on the Wages Question, viz. "the reward of those who are employed in production with a view to the profit of their employers and are paid at stipulated rates."

It may be observed that by extending the meaning of production, as is now done by most economists, to include all kinds of labour, and by substituting benefit for profit, this definition will include all grades of wages.

Having thus limited the class of those who earn "wages," the next point is to consider the way in which the wages ought to be measured. The most obvious method is to take as the rate of time-wages the amount of money earned in a certain time, and as the rate of task-wages the amount of money obtained for a given amount of work of a given quality; and in many inquiries this rough mode of measurement is sufficient. But the introduction of money as the measure at once makes it necessary to assume that for purposes of comparison the value of the money to the wage-earners may be considered constant. This supposition does not hold good even between different places in the same country at the same time, and still less with variations in time as well as place. To the labourers, however, the amount of money they obtain is only a means to an end, and accordingly economists have drawn a sharp distinction between nominal and real wages. "Labour, like commodities," says Adam Smith, "may be said to have a real and a nominal price. Its real price may be said to consist in the quantity of the necessaries and conveniences of life which are given for it; its nominal price in the quantity of money. The labourer is rich or poor, is well or ill rewarded, in proportion to the real not to the nominal price of his labour."

Walker (op. cit. pp. 12 sqq.) has given a full analysis of the principal elements which ought to be taken into account in estimating the real wages of labour. They may be classified as follows. (1) Variations in the purchasing power of money may be due in the first place to causes affecting the general level of prices in a country. Such, for example, in the extreme states of "debasement" and "recoinage," a good example is furnished in English history in the reigns of Henry VIII. and Edward VI. Thordol Rogers has ascribed much of the degradation of labour which ensued to this fact; and Macaulay has given a graphic account of the evils suffered by the labouring classes prior to the recoginace of 1696. The issues of inconvertible paper notes in excess have frequently caused a disturbance of real wages, and it is generally asserted that in this case wages as a rule do not rise so quickly as commodities. A general rise in prices due to great discoveries of the precious metals would, if nominal wages remained the same, of course cause a fall in real wages. There are, however, good grounds for supposing that the stimulus given to trade in this case would raise wages at least in proportion; and certainly the great gold discoveries in Australia and California raised wages in England, as is shown in Tooke's History of Prices, vol. v. p. 284. Similarly it is possible that a general fall in prices, owing to a relative scarcity of the precious metals, may lower the prices of commodities before it lowers the price of labour, in which case there is a rise in real wages. In the controversy as to the possible advantages of bimetallism this was one of the points most frequently discussed. It is impossible to say a priori whether a rise or fall in general prices, or a change in the value of money, will raise or lower real wages, since the result is effected principally by indirect influences. But, apart from these general movements in prices, we must, in order to find the real value of nominal wages, consider variations in local prices, and in making this estimate we must notice the principal items in the expenditure of the labourers. Much attention has been given recently by statisticians to this subject, with the view of finding a good "index number for real wages. (2) Varieties in the form of payment require especial attention. Sometimes the payment is only partly in money, especially in agriculture in some places. In many parts of Scotland the labourers receive meal, peats, potatoes, etc. (3) Opportunities for extra earnings are sometimes of much importance, especially if we take as the wage-earning unit the family and not the individual. At the end of the 18th century Arthur Young, in his celebrated tours, often calls attention to this fact. In Northumberland and other counties a "hind" (i.e. agricultural labourer) is more valued if he has a large working family, and the family earnings are relatively large. (4) Regularity of employment is always, especially in modern times, one of the most important points to be considered. Apart from such obvious causes of fluctuation as the nature of the employment, e.g. in the case of fishermen, guides, etc., there are various social and industrial causes (for a particular and able investigation of which the reader may consult Professor Foxwell's essay on the subject). Under the system of production on a large scale for foreign markets, with widely extended division of labour, it seems impossible to adjust accurately the supply to the demand, and there are in consequence constant fluctuations in the employment of labour. A striking example, happily rare, is furnished by the cotton famine during the American Civil War. (5) In forming a scientific conception of real wages we ought to take into account the longer or the shorter duration of the power to labour: the man whose employment is healthy and who lives more comfortably and longer at the same nominal rate of wages may be held to obtain a higher real wage than his less fortunate competitor. It is worth noting, in this respect, that in nearly every special industry there is a liability to some special form of disease: e.g. lace-workers often suffer from diseases of the eyes, miners from diseases of the lungs, etc. Thus, in attempting to estimate real wages, we have to consider all the various comforts involved in the "quantity of labour" as well as all the conveniences which the nominal wages will purchase and all the supplements in kind.

In a systematic treatment of the wages question it would be natural to examine next the causes which determine the general rate of wages in any country at any time. This is a problem to which economists have given much attention, and is one of great complexity. It is difficult, when we consider the immense variety of commodities and occupations under which the wages of labour are paid, and the constant changes which are taking place, even to form an adequate conception of the general rate of wages. There are thousands of occupations of various kinds, and at first sight it may seem impossible to determine, in a manner sufficiently accurate for any useful purpose, an average or general rate of wages, especially if we attempt to take real and not merely nominal wages. At the same time, in estimating the progress of the working-classes, or in comparing their relative positions in different countries, it is necessary to use this conception of a general rate of wages in a practical manner. The difficulties presented are of the same kind as those met with in the determination of the value of money or the general level of prices, and may be overcome to some extent by the same methods. An "index number" may be formed by taking various kinds of labour as fair samples, and the nominal wages thus obtained may be corrected by a consideration of the elements in the real wages to which they correspond. Care must be taken, however, that the quantity and quality of labour taken at different times and places are the same, just as in the case of commodities similar precautions are necessary. Practically, for example, errors are constantly made by taking the rate of wages for a short time (say an hour), and then, without regard to regularity of employment, constructing the annual rate on this basis; and again, insufficient attention is paid to Adam Smith's pithy caution that "there may be more labour in an hour's hard work than in two hours' easy business." But, however difficult it may be to obtain
an accurate measure of the general rate of wages for practical purposes, there can be no doubt as to the value and necessity of the conception in economic theory. For, as soon as it is assumed that industrial competition is the principal economic force in the distribution of the wealth of a community—and this is in reality the fundamental assertion of modern economic science,—a distinction must be drawn between the most general causes which affect all wages and the particular causes which lead to differences of wages in different employments. In other words, the actual rate of wages obtained in any particular occupation depends partly on causes affecting that group compared with others, and partly on the general conditions which determine the relations between labour, capital and production over the whole area in which the industrial competition is effective. (See A. L. Bowley's _Wages in the United Kingdom in the Nineteenth Century_ (1900), § 3, for an account of the meaning and use of the average wage.)

Thus the theory of the wages question consists of two parts, or gives the answers to two questions: (1) What are the causes which determine the general rate of wages? (2) Why are wages in some occupations and at some times and places above or below this general rate?

With regard to the first question, Adam Smith, as in almost every important economic theory, gives an answer which combines two views which were subsequently differentiated into antagonism and sympathy. "The principal component parts of the natural recompense or wages of labour," is the opening sentence of his chapter on wages. And then he goes on to say that "this original state of things, in which the labourer enjoyed the whole produce of his own labour, could not last beyond the first introduction of the appropriation of land and the accumulation of stock." And he thus arrives at the conclusion that "the demand for those who live by wages, it is evident, cannot increase but in proportion to the increase of the funds which are destined to the payment of wages." This is the germ of the celebrated wages-fund theory which was carried to an extreme by J. S. Mill and others; and, although Mill abandoned the theory some time before his death, he was unable to eradicate it from his systematic treatise and to reduce it to its proper dimensions. It is important to observe that in the hands of Mill this theory was by no means, as was afterwards maintained by Elliot Cairnes, a mere statement of the problem to be solved. According to Cairnes (Leading Principles of Political Economy, bk. ii.), the wages-fund theory, as given in Mill's _Principles_ (bk. ii. ch. xi. § 2), embraces the following statements: (1) the wages-fund is a general term used to express the aggregate of all wages at any given time in possession of the labourers, irrespective of the quantum of production on which it depends on the proportion of this fund to the number of people; (2) the amount of the fund is determined by the amount of general wealth applied to the direct purchase of labour. These propositions Cairnes easily reduces to mere verbal statements, and he then states that the real difficulty is to determine the causes which govern the demand and supply of labour. But the most superficial glance, as well as the most careful survey, will convince the reader of Mill's chapters on wages that he regarded the theory not as the statement but as the solution of the problem. For he applies it directly to the explanation of movements in wages, to the criticism of popular remedies for low wages, and to the discovery of what he considers to be legitimate and possible remedies. In fact, it was principally on account of the application of the theory to concrete facts that it aroused so much opposition, which would have been impossible if it had been a mere statement of the problem.

The wages-fund theory as a real attempt to solve the wages question may be resolved into three propositions, which are very different from the verbal truisms of Cairnes. (1) In any country at any time there is a determinate amount of capital unconditionally destined for the payment of labour. This is the wages-fund. (2) There is also a determinate number of labourers who must work independently of the rate of wages—that is, whether the rate is high or low. (3) The wages-fund is distributed amongst the labourers solely by means of competition, masters competing with one another for labour, and labourers with one another for work, and thus the average rate of wages depends on the proportion between wage-capital and population. It follows then, according to this view, that wages can only rise either owing to an increase of capital or a diminution of population; and this accounts for the exaggerated importance attached by Mill to the Malthusian theory of population. It also follows from the theory that any restraint of competition in one direction can only cause a rise of wages by a corresponding fall in another quarter, and in this form it was the argument most frequently urged against the action of trade unions. It is worth noting, as showing the vital connexion of the theory with Mill's principles, that it is practically the foundation of his propositions on capital in his first book, and is also the basis of the exposition in his fourth book of the effects of the progress of society on the condition of the working-classes.

It has often been remarked that, in economics as in other sciences, what eventually assumes the form of the development of or supplement to an old theory at first appears as if in direct antagonism to it, and there is reason to think that the criticism of the wages-fund theory was carried to an extreme, and that the essential elements of truth which it contains were overlooked. In many respects the theory may be regarded as a good first approximation to the complete solution of the problem. The plan favoured by some modern economists of regarding wages simply as the price of labour determined as in the case of other prices, and by demand and supply, through the wages-fund, is apt to lead to a maladjustment of opinion in other directions. The supply of labour, for example, is in many ways on a different footing from the supply of commodities. The causes which the wages-fund theory emphasizes too exclusively are after all _sera causae_, and must always be taken into account. There can be no doubt, for example, that under certain conditions a rapid increase in the labouring population may cause wages to fall, just as a rapid decline may make them rise. The most striking example of a great improvement in the conditions of the working classes in English economic history is found immediately after the occurrence of the Black Death in the middle of the 14th century. The sudden and extensive thinning of the ranks of labour was manifestly the principal cause of the great improvement in the condition of the survivors. Again, as regards the amount of capital competing for labour, the reality of the cause admits of no dispute, at any rate in any modern society. The force of this element is perhaps best seen by taking a particular case and assuming that the general wages-fund of the country is divided into a number of smaller wages-funds. Take, for example, the wages of domestic service, when the payment of wages is made simply for the service rendered. We may fairly assume that the richer classes of the community practically put aside so much of their revenue for the payment of the wages of their servants. The aggregate of these sums is the domestic wages-fund. Now, if owing to any cause the amount available for this purpose falls off, whilst the number of those seeking that class of employment remains the same, the natural result would be a fall in wages. It may of course happen in this as in other cases that the result is not so much a direct fall in the rate of wages as a diminution in the employment. But even in this case, if people employ fewer servants, they must do more work. Again, if we were to seek for the reason why the wages of governnesses are so low, the essence of the answer would be found in the excessive supply of that kind of labour compared with the funds destined for its support. And similarly through the whole range of employments in which the labour is employed in perishable services and not in material products, the wages-fund theory brings into prominence the principal causes governing the rate of wages, namely, the number of people competing, the supply of the fund, and the effects of the competition. This view also is in harmony with the modern principles of demand and supply. If we regard labour as a commodity and wages as the price paid for it, then we may say that the price will be so adjusted that the quantity demanded
will be made equal to the quantity offered at that price,—the agency by which the equation is reached being competition.

But when we turn to other facts for the verification of the theory we easily discover apparent if not real contradictions.

The case of Ireland after the potato famine affords an instance of a rapidly declining population without any corresponding rise in wages, whilst in new countries we often find a very rapid increase of population accompanied by an increase in wages.

In a similar manner we find that the capital of a country may increase rapidly without wages rising in proportion—as, for example, seems to have been the case in England after the great mechanical improvements at the end of the 18th century up to the repeal of the Corn Laws—whilst in new countries where wages are the highest there are generally complaints of the scarcity of capital.

But perhaps the most striking conflict of the theory with facts is found in the periodical inflations and depressions of trade. After a commercial crisis, when the shock is over and the necessary liquidation has taken place, we generally find that there is a period during which there is a glut of capital and yet wages are low. The abundance of capital is shown by the low rate of interest and the difficulty of obtaining remunerative investments. Accordingly this apparent failure of the theory, at least partially, makes it necessary to examine the propositions into which it was resolved more carefully, in order to discover, in the classical economic phraseology, the "disturbing causes."

As regards the first of these propositions—that there is always a certain amount of capital destined for the employment of labour—it is plain that this destination is not really unconditional.

In a modern society whether or not a capitalist will supply capital to labour depends on the rate of profit expected, and this again depends proximately on the course of prices. But the theory as stated can only consider profits and prices as acting in an indirect roundabout manner upon wages. If profits are high then more capital can be accumulated and there is a larger wages-fund, and if prices are high there may be some stimulus to trade, but the effect on real wages is considered to be very small. In fact Mill writes it down as a popular delusion that high prices make high wages. And if the high prices are due purely to currency causes the criticism is in the main correct, and in some cases, as was shown above, high prices may mean real low wages. If, however, we turn to the great classes of employment in which the labour is embodied in a material product, we find on examination that wages vary with prices in a real and not merely in an illusory sense. Suppose, for example, that, owing to a great increase in the foreign demand for British produce, a rise in prices takes place, there will be a corresponding rise in nominal wages, and in all probability of real wages. Such was undoubtedly the case in Great Britain on the conclusion of the Franco-German War.

On the other hand, if prices fall and profits are low, there will so far be a tendency to contract the employment of capital. At the same time, however, to some extent the capital is applied unconditionally—in other words, without obtaining what is considered adequate remuneration, or even at a positive loss. The existence of a certain amount of fixed capital practically implies the constant employment of a certain amount of labour.

Nor is the second proposition perfectly true, namely, that there are always a certain number of labourers who must work independently of the rate of wages. For the returns of pauperism and other statistics show that there is always a proportion of "floating" labour sometimes employed and sometimes not. Again, although, as Adam Smith says, man is of all luggage the most difficult to be transported, still labour as well as capital may be attracted to foreign fields. The constant succession of strikes resorted to in order to prevent a fall in wages shows that in practice the labourers do not at once accept the "natural" market rate.

Still, on the whole, this second proposition is a much more adequate expression of the truth than the first; for labour cannot afford to live idle or to emigrate so easily as capital.

The third proposition, that the wages-fund is distributed solely by competition, is also found to conflict with facts. Competition may be held to imply in its positive meaning that every individual strives to attain his own economic interests regardless of the interests of others. But in some cases this end may be attained most effectively by means of combination, as, for example, when a number of people combine to create a practical monopoly. Again, the end may be attained by leaving the control to government, or by obeying the unwritten rules of long-established custom. But these methods of satisfying economic interests are opposed to competition in the usual sense of the term, and certainly as used in reference to labour.

Thus on the negative side competition implies that the economic interests of the persons concerned are attained neither by combination, nor by law, nor by custom. Again, it is also assumed, in making competition the principal distributing force of the national income, that every person knows what his real interests are, and that there is perfect mobility of labour both from employment to employment and from place to place.

Without these assumptions the wages-fund would not be evenly distributed according to the quantity of labour. It is, however, obvious that, even in the present industrial system, competition is modified considerably by these disturbing agencies; and in fact the tendency seems to be more and more for combinations of masters on one side and of men on the other to take the place of the competition of individuals.

The attempted verification of the wages-fund theory leads to so many important modifications that it is not surprising to find that in practice the tendency has been to reject it altogether. And thus we arrive at the development of Adam Smith's introductory statement, namely, that the produce of labour constitutes the natural recompense or wages of labour. The most important omission of the wages-fund theory is that it fails to take account of the quantity produced and of the price obtained for the product. If we bring in these elements, we find that there are several other causes to be considered besides capital, population and competition. There are, for example, the various factors in the efficiency of labour and capital, in the organization of industry, and in the general condition of trade. To some extent these elements may be introduced into the old theory, but in reality the point of view is quite different. This is made abundantly clear by considering Mill's treatment of the remedies for low wages. His main contention is that population must be rigidly restrained in order that the average rate of wages may be kept up. But, as several American economists have pointed out, in new countries especially every increase in the number of labourers may be accompanied by a more than proportionate increase in produce and thus in the wages of labour. Again, the older view was that capital must be first accumulated in order afterwards to be divided up into wages, as if apparently agriculture was the normal type of industry, and the workers must have a store to live on until the new crop was grown and secured. But the "produce" theory of wages considers that wages are paid continuously out of a continuous product, although in some cases they may be advanced out of capital or accumulated stores.

According to this view wages are paid out of the annual produce of the land, capital and labour, and not out of the savings of previous years. Thus we arrive at the extreme theory to an untenable extreme, and overlooking altogether the function of capital in determining wages; and the true solution seems to be found in a combination of the "produce" theory with the "fund" theory.

An industrial society may be regarded, in the first place, as a great productive machine turning out a vast variety of products for the consumption of the members of the society. The distribution of these products, so far as it is not modified by other social and moral conditions, depends upon the principle of "reciprocal demand." In a preliminary rough classification we may make three groups—the owners of land and natural agents, the owners of capital or reserved products and instruments, and the owners of labour. To obtain the produce requisite even for the necessary wants of the community a combination of these three groups must take place, and the relative reward obtained.
by each will vary in general according to the demands of the others for its services. Thus, if capital, both fixed and circulating, is scanty, whilst labour and land are both abundant, the reward of capital will be high relative wage and wages. This is well illustrated in the high rates of profits obtained in early societies. According to this view of the question the aggregate amount paid in wages depends partly on the general productiveness of all the productive agents and partly on the relative power of the labourers as compared with the owners of land and capital (the amount taken by government and individuals for taxes, charity, &c., being omitted). Under a system of perfect industrial competition the general rate of wages would be so adjusted that the demand for labour would be just equal to the supply at that rate. (Compare Marshall's Principles of Economics, bk. vi. ch. ii.)

If all labour and capital were perfectly uniform it would not be necessary to carry the analysis further, but, as a matter of fact, instead of two great groups of labourers and capitalists, we have a multitude of subdivisions all under the influence of reciprocal demand. Every subgroup tries to obtain as much as possible of the general product, which is practically always measured in money. The determination of relative wages depends on the constitution of these groups and their relations to one another. Under any given social conditions there must be differences in wages and retrenchments which may be regarded as permanent until some change occurs in the conditions; in other words, certain differences of wages are stable or normal, whilst others depend simply on temporary fluctuations in demand and supply. A celebrated chapter in the Wealth of Nations (bk. i. ch. x.) is still the best basis for the investigation of these normal differences—which, as stated above, is the second principal problem of the wages question. First of all, a broad distinction may be drawn between the natural and artificial causes of difference, or, in Adam Smith's phraseology, between those due to the nature of the employments and those due to the policy of Europe. In the former division we have (1) the agreeableness or disagreeableness of the employment, illustrated by two classical examples—"honour makes a great part of the reward of all honourable professions," and "the most detestable of all employments—that of public execution—is, in proportion to the work done, better paid than any common trade whatever." There is, however, much truth in Mill's criticism, that in many cases the worst paid of all employments are at the same time the most disagreeable, simply because the people engaged in them have practically no other choice. (2) The ease with which men may change their occupation—the reverse of learning the business. This factor operates in two ways. A difficult business implies to some extent peculiar natural qualifications, and it also involves the command of a certain amount of capital to subsist on during the process of learning, and thus in both respects the natural supply of labour is limited. (3) The constancy or inconstancy in the employment—a point already noticed under real wages. (4) The great or small trust reposed in the workmen, an important consideration in all the higher grades of labour, e.g. bankers, lawyers, doctors, &c. (5) The chance of success or the reverse. Here it is to be observed that, owing to the hopefulness of human nature and its influence on the gambling spirit, the chance of success is generally overstated, and therefore that the wages in employments where the chance of success is really small are lower than they ought to be. The most striking instance is furnished by the labour in gold mines, diamond fields, and the like, and the same cause also operates in many of the professions.

All these causes of differences of wages in different employments may be explained by showing the way in which they operate on the demand and supply of labour in the particular group. If the "net advantages," to adopt Marshall's phraseology, of any group are relatively high, then labour will be directly attracted to that group, and the children born in it will be brought up to the same occupation, and thus in both ways the supply of labour will be increased. But the "net advantages" embrace the conditions just enumerated. Again, if the other members of the community require certain forms of labour to a greater extent, there is an increase in the demand and a rise in their price.

In addition to these so-called natural causes of difference, there are those arising from law, custom, or other so-called artificial causes. They may be classified under four headings. (1) Certain causes artificially restrain industrial competition by limiting the number of any particular group. Up to the close of the 18th century, and in many instances to a much later date, the regulations of gilds and corporations limited the numbers in each trade (cf. Brentano, Gilds and Trade Unions). They did this by making a long apprenticeship compulsory on those wishing to learn the craft, by restricting the number of apprentices to be taken by any master, by exacting certain qualifications as to birth and wealth, by imposing heavy entrance fees, either in money or in the shape of a useless but expensive masterpiece. Some of these regulations were originally passed in the interests of the general public and of those employed in the craft, but in the course of time their effect was, as is stated by Adam Smith, simply to unduly restrain competition. The history of the craft-gilds is full of instructive examples of the principles governing wages.

No doubt the regulations tended to raise wages above the natural rate, but as a natural consequence industry migrated to places especially noted for the cheapness of labour. The gilds thus played a large part in opening up the new countries, with "passing rich on forty pounds a year," whilst many only obtained £30—below the wages earned by a journeyman shoemaker. In the same way state-sided education of a commercial and technical kind may result in lowering the rates (relatively) of the educated business classes. It is said that one reason why the Germans replace Englishmen in many branches is that, having obtained their education at a low rate, there are more of them qualified, and consequently they accept lower wages. The customary idea that the position of a clerk is more genteel than that of an artisan accounts largely for the excessive competition in the former class, whereas now long education is practically universal. (2) In some cases law and custom may impede or promote the circulation of labour. At the time Adam Smith wrote the laws of settlement were still in full operation. "There is not a man of forty who has not felt most cruelly oppressed by this ill-contrived law of settlement." Differences in wages in different parts of the same country and in different occupations are still largely due to impediments in the way of the movement of labour, which might be removed or lessened by the government making provisions for migration or emigration. (3) On many occasions in the past the law often directly interfered to regulate wages. The Statute of Labourers, passed immediately after the Black Death, was an attempt in this direction, but it appears to have failed, according to the investigations of Thorold Rogers. The same writer, however, ascribes to the celebrated Statute of Apprentices (5th of Elizabeth) the degradation of the English labourer for nearly three centuries (Agriculture and Prices, vol. v.). This, he asserts, was due to the wages being fixed by the justices of the peace. It is, however, worth noting that Brentano, who is equally sympathetic with the claims of labour, whereas not so long as this statute was actually enforced, the customs founded upon it were observed, the condition of the labourers was prosperous, and that the degradation only began when the statute fell into disuse (Origin of Gilds and Trade Unions. For a full account of the effect of the Statute of Apprentices see W. Cunningham's Growth of English Industry and Commerce, vol. ii.).
WAGES

Something must be said as to the power of the state to regulate wages. As far as any direct regulation is concerned, it seems to be only possible within narrow limits. The state might of course institute certain complex slitting-scales. The State regulation of wages. The state of trade and prices would not bear could not be enforced: masters could not be compelled to work at a loss or to keep their capital employed when it might be more advantageously transferred to another place or occupation. Thus the legal rate could not exceed to any considerable extent the market rate. Nor, on the other hand, could a lower rate in general be enforced, especially when the labourers have the right of combination. The possessor of work would tend to raise wages above the legal rate, and evasion would be extremely easy.

The best illustration of the failure to raise the rate of wages directly by authority is found in the English poor law system between 1796 and 1834. "In the former year (1796) the decisive fatal step of legalizing out-relief to the able-bodied, and in aid of wages, was taken," and "in February 1834 was published perhaps the most remarkable and startling document to be found in the industrial range of English, perhaps indeed of all social history." (Fowle's Poor Law). The essence of the system was in the justices determining a natural rate of wages, regard being paid to the prices of necessaries and the size of the labourer's family, and an amount was given from the rates sufficient to make up the wages received to this natural level. The method of administration was certainly bad, but the best administration possible could only have kept the system in existence a few years longer. In one parish the poor-rate had swallowed up the whole value of the land, which was going out of cultivation, a fact which has an obvious bearing on land nationalisation as a remedy for the vicissitudes of the individual.

The labourers became careless, inefficient and imprudent. Those who were in regular receipt of relief were often better off (in money) than independent labourers. But the most important consequence was that the real wages obtained were, in spite of the relief, lower than otherwise they would have been, and a striking proof was given that wages are paid out of the produce of labour. The Report of the Poor Law Commissioners (1834) states emphatically (p. 48) that 'the severest sufferers are those for whose benefit the system is supposed to have been introduced and to be perpetuated, the labourers of all classes who have suffered directly through the unfair competition of the pauper labour, but, as one of the sub-reporters stated, in every district the general condition of the independent labourer was strikingly distinguishable from that of the pauper and superior to it, though the independent labourers were commonly maintained upon less money. In New Zealand and Australia in recent years a great extension has been made of the principle of state intervention in the regulation of wages.

But, although the direct intervention of the state, with the view of raising the nominal rates of wages, is, according to theory, and experience, of doubtful advantage, still, when we consider real wages in the evident sense of the term, there seems to be an almost indefinite scope for state interference. The effects of the Factory Acts and similar legislation has been undoubtedly to raise the real wages of the working-classes as a whole, although at first the same arguments were used in opposition to these proposals as in the case of direct relief from the poor-rates. But there is a vital difference in the two cases, because in the former the tendency is to increase whilst in the latter it is to diminish the energy and usefulness of the workers. An excellent summary of the results of this species of industrial legislation is given by John Morley (Life of Cobden, vol. i. p. 303):

"We have to-day a complete, minute, and voluminous code for the protection of labour: buildings must be kept pure of effluvia; dangerous machinery must be fenced; children and young persons must not clean it while in motion; their hours are not only limited but fixed; continuous employment must not exceed a given number of hours, varying with the trade but prescribed by the law in given cases; a statutable number of holidays is imposed; the children must go to school, and the employer must have every week a certificate to that effect; if an accident happens notice must be sent to the proper author to antherial unions are made for housing, for lace-making, for colliers, and for a whole schedule of other special callings; for the due enforcement and vigilant supervision of this immense host of minute prescriptions there is an immense host of inspectors, magistrates, surgeons, and other authorities whose business it is to 'speed and post o'er land and ocean' on sullen guardianship of every kind of labour, from that of the poor woman who plait straw at her cottage door to the miner who descends into the bowels of the earth and the seaman who conveys the fruits and materials of universal industry to and from the remotest parts of the globe.

The analysis previously given of real wages shows that logically all these improvements in the conditions of labour, by diminishing the "quantity of labour," involve, whilst in many cases tend to a real rise in wages. Experience has also shown that the state may advantageously interfere in regulating the methods of paying wages. A curious poem, written about the time of Edward IV., on England's commercial policy (Political Songs and Poems, Rolls Series, i. 282), shows that even in the 15th century the "truck" system was in full operation, to the disadvantage of the labourers. The cloth-makers, in particular, compelled the workers to take half of their wages in merchandise which they estimated at higher than its real value. The writer proposes that the "lyrk folk be paid in good monye," and that "for better ordinance of the rates a law to this effect was enacted in the 4th year of Edward IV. The Truck Acts have since been much further extended. Again, the legislation directed against the adulteration of all kinds of goods, which also finds its prototypes in the middle ages, is in its effects equivalent to a rise in real wages.1

The power of trade unions in regulating wages is in most respects analogous in principle to that of legislation just noticed. Nominal wages can only be affected within comparatively narrow limits, depending on the condition of the trade and the state of the market. Once a trade union has been formed, it is possible for the members to agree on a scale of rates of wages. It is not the rate in some trades or places can only be accomplished by a corresponding depression elsewhere. At the same time, however, it can hardly be questioned that through the unions nominal wages have on the whole risen at the expense of profits—that is to say, that combinations of labourers can make better bargains than individuals. But the debatable margin which may make either extra profits or extra wages is itself small, and the principal direct effect of trade unions is to regulate wages, with the object of balancing the pressure of the amount of wages. The rise of the price of labour, and the rise of the rate of wages, has been caused simply by a more rigid enforcement of the law. The profits of the employer are increased by the state, and the cost of living to the wage-earner is raised by the same power. The state has thus to face the interests of its members in many ways which improve their general condition or raise the real rate of wages, and to some extent wages have attained a natural maximum, and some method or arbitration or sliding-scale is in force, this indirect action seems the principal function of trade unions. The effects of industrial partnership (cf. Sedley Taylor's Profit Sharing) and of productive co-operation (cf. Holyoake's History of Co-operation) are small in amount compared with the total industry of any country) though excellent in kind, and there seem to be no signs of the decay of the entrepreneur system. The industrial revolution which took place about the end of the 18th century, involving radical changes in production, destroyed the old relations between capital and labour, and perhaps the most interesting part of the history of wages is that covered by the 19th century. For fifty years after the introduction of production on a large scale, the condition of the working-classes was on the whole deplorable, but great progress has since been made. The principal results may be summed up under the effects of machinery. Machinery may be made for both words in their widest sense; it affects the condition of the working-classes in many ways. The most obvious mode is the direct substitution of machinery for labour. It is clear that any sudden and extensive adoption of labour-saving machinery

---

---
may, by throwing the labourers out of employment, lower the rate of wages, and it is easy to understand how riots arose repeatedly owing to this cause. But as a rule the effect of labour-saving machinery in diminishing employment has been greatly exaggerated, because two important practical considerations have been overlooked. In the first place, any radical change made in the methods of production will be only gradually and continuously adopted throughout the industrial world; and in the second place these radical changes, these discontinuous leaps, tend to give place to advances by small increments of invention. We have an instance of a great radical change in the steam-engine. Watt's patent for "a method of lessening" the consumption of steam and fuel in fire-engines was published on January 5, 1769, and the movement for utilizing steam-power found room for extension for a century and a half afterwards. The history of the power-loom again shows that the adoption of an invention is comparatively slow. In 1813 there were not more than 2,400 power-looms at work in England. In 1820 they increased to 14,150. In 1853 there were 100,000, but the curious thing is that during this time the number of hand-looms had actually increased to some extent (Porter's Progress of the Nation, p. 186). The power-loom also illustrates the gradual continuous growth of improvements. This is clearly shown by Porter. A very good hand-weaver, twenty-five or thirty years of age, could weave two pieces of flannel per week. The power-loom, where he worked, about fifteen years of age, attending two looms, could weave nine similar pieces in a week. In 1826 a steam-loom weaver, about fifteen, attending to four looms, could weave twelve similar pieces a week. In 1833 a steam-loom weaver, from fifteen to twenty, assisted by a girl of twelve, attending to four looms, could weave eighteen pieces. This is only one example, for, as Porter remarks, it would fill many large volumes to describe the numerous inventions which during the 19th century imparted facility to manufacturing processes, and in every case we find a continuity in the improvements which lead to the final progressive character of invention operates in favour of the labourer—in the first place, because in most cases the increased cheapness of the commodity consequent on the use of machinery causes a corresponding extension of the market and the amount produced, and thus there may be no actual diminution of employment even temporarily; and secondly, if the improvement takes place slowly, there is time for the absorption of the redundant labour in other employments. It is quite clear that on balance the great increase in population during the 19th century was largely caused, or rather rendered possible, by the increased use of machinery and the resulting decrease in the amount required of the hand-weaver, the straw-plaiter, and the blacksmith. The working-classes were at first injured by the adoption of machinery not so much by a diminution in the number of hands required as by a change in the nature of the employment. Skilled labour of a certain kind lost its peculiar value, and children and women were able to do work formerly only done by men. But the principal evils resulted from the wretched conditions under which, before the factory legislation, the work was performed; and there is good reason to believe that a deterioration of the type of labourer, both moral and physical, was effected. It is, however, a mistake to suppose that on the whole the use of machinery tends to dispense with skill. On the contrary, everything goes to prove that under the present system of production on a large scale there is on the whole far more skill required than formerly—a fact well brought out by Sir Robert Giffen in his essay on the progress of the working-classes (Essays on Finance, vol. ii. p. 395), and expressed by the official reports on wages in different countries.

J. S. N.)

WAGGA-WAGGA, a town of Wyndham county, New South Wales, Australia, on the left bank of the river Murrumbidgee, 300 m. by rail W.S.W. of Sydney and 267 m. N.E. of Melbourne. Pop. (1901) 5,114. The Murrumbidgee is here spanned by a steel viaduct, the approaches of which are formed by heavy embankments. Wagga-Wagga has a school of art with a library attached, a fine convent picturesquely situated on Mount Erin, a good racecourse and agricultural show-grounds. There is a consider-

WAGNER, R. (1835- ), German economist, was born at Erlangen on the 25th of March 1835. Educated at Göttingen and Heidelberg, he was professor of political science at Dorpat and Freiburg, and after 1870 at Berlin. A prolific writer on economic problems, he brought out in his study of the subject the close relation which necessarily exists between economics and jurisprudence. He ranks without doubt as one of the most eminent German economists and a distinguished leader of the historical school. His leanings towards Christian socialism made him one of those to whom the appellation of "Katheder-sozialisten," or "socialists of the (professional) chair," was applied, and he was one of the founders of the Verein für Socialpolitik. In 1871 he undertook, in conjunction with Professor E. Nasse (1820-1890), a new edition of Rau's Lehrbuch der politischen Ökonomie, and his own special contributions, the Grundlegung und Finanzwissenschaften, afterwards published separately, are probably his most important works. He approaches economic studies from the point of view that the doctrine of the furs naturae, on which the physiocrats reared their economic structure, has lost its hold on belief, and that the old prius and absolute conception of personal freedom and property have given way to it. He lays down that the economic position of the individual, instead of depending merely on so-called natural rights or even on his natural powers, is conditioned by the contemporary juristic system, which is itself an historical product. These conceptions, therefore, of freedom and property, half economic, half juristic, require a fresh examination. Wagner accordingly investigates, before anything else, the conditions of the economic life of the community, and in sub-

order to this, determines the sphere of the economic freedom of the individual. Among his works are Beiträge zur Lehre von der Genossenschafts- und Agrar-und Industriesta (1902).

His brother, HERMANN WAGNER (1840- ), a distinguished geographer, joined the Geographic Institute of Justus Perthes in 1868, and was editor of the statistical section of the Gothaer Almanack up to 1876. In 1872 he founded Die Bevölkerung der Erde, a critical review of area and population, and in 1880 he was appointed professor of geography at Göttingen. He was editor of the Geographisches Jahrbuch from 1880 to 1908. His publications include Lehrbuch der Geographie (7th ed., 1903) and Methodischer Schüleratlas (4th ed., 1907).

NICHOLAS, RUDOLPH (1855- ), a German anatomist and physiologist, was born on the 30th of June 1855 at Bayreuth, where his father was a professor in the gymnasium. He began the study of medicine at Erlangen in 1872, and finished his curriculum in 1836 at Würzburg, where he had attached himself mostly to J. L. Schönlein in medicine and to K. F. Heusinger in comparative anatomy. Aided by a public stipendium, he spent a year or more studying in the Jardin des Plantes, under the friendly eye of Cuvier, and in making zoological discoveries at Cagliari and other places on the Mediterranean. On his return he set up in medical practice at Augsburg, whether his father had been transferred; but in a few months he found an opening for an academical career, on being appointed prosector at Erlangen. In 1882 he became full professor of zoology and comparative anatomy there, and held that office until 1840, when he was called to succeed J. F. Blumenbach at Göttingen. At the Hano-

verian university he remained till his death, being much occupied with administrative work as pro-rector for a number of years, and for nearly the whole of his residence troubled by ill-health (phthisis). In 1860 he gave over the physiological part of his teaching to a new chair, retaining the zoological, with which his career had begun. While at Frankfurt, on his way to examine the Neanderthal skull at Bonn, he was struck with paralysis, and died at Göttingen a few months later on the 13th of May 1864.

Wagner's activity as a writer and worker was enormous, and his range extensive, most of his hard work having been done at Erlangen while his health was good. His graduation thesis was on the
ambitious subject of "the historical development of epidemic and other diseases all over the world, with the diseases of their diffusione," which showed the influence of Schönlein. His first treatise was *Die Naturgeschichte der Menschen* (in 2 vols., Kempten, 1831). Frequent journeys to the University of Berlin gave him abundant materials for research on invertebrate anatomy and physiology, which he communicated first to the Munich academy of sciences, and republished in his *Beiträge zur naturwissenschaftlichen Zoologie* (Leipzig, 1831, 2nd ed. 1835, with additions in 1838). In 1834-1835 he brought out a *textbook* on the subject of his chair (Lehrbuch der vergleichenden Anatomie, Leipzig), which recommended itself to students by its clear and comprehensive style and its accurate descriptions of the figures. In 1835 and 1836 he edited the fifth edition of *Lehrbuch der Zootomie*, of which only the vertebrate section was corrected by himself. The precision of his earlier work is evidenced by his *Zoologie und Anatomie der Wirbeltiere und Haustiere* (Leipzig, 1834). His zoological labours may be said to conclude with the atlas *Icones zoologicae* (Leipzig, 1841). In 1835 he communicated to the Munich academy of sciences his researches into *Atrophie*, and in *Philosophische-und medicinische Literatur* (1832, and subsequent numbers) he discussed the *physiologic* and *physiologicae* of the anatomy of the ovum. These were republished under the title *Prodomus historiae generationis hominis antque animalium* (Leipzig, 1836). As in zoology, his original researches in physiology were followed by a students' *textbook*, *Lehrbuch der speziellen Physiologie* (Leipzig, 1838), which soon reached a third edition, and was translated into French by H. C. L. Etienne and Jean B. Metzger (Paris, 1843), and into German by a supplementary volume of *Lehrbuch der Zootomie*, of which only the vertebrate section was corrected by himself. The precision of his earlier work is evidenced by his *Zoologie und Anatomie der Wirbeltiere und Haustiere* (Leipzig, 1834). To the same period belongs a very interesting but now little known work on medicine proper, of a historical and synthetic scope, *Grundriss der Encyclopédie der Medizin* (Leipzig, 1839), which was translated into Danish. About the same time he worked at a translation of J. C. Prichard's Natural History of Man, 1837; 2nd ed. 1839; and numerous writings of S. T. Sömmering, with a biography of that anatomist (1844), which he himself fancied most of all his writings. In 1843, after his removal to Göttingen, he began his great *Handwörterbuch der Physiologie, mit Rücksicht auf die physiologische Pathologie*, and brought out the fifth (supplementary) volume in 1852; the only contributions of his own in it were on the sympathetic nerve, nerve-ganglia and nerve-ends, and he modestly disclaimed all merit except as being the organizer. But from his 2nd ed. onwards he occupied himself with researches on the electrical organ of the torpedo and on nervous organization generally; these he published in 1853-1854 (*Neurologische Untersuchungen, Göttingen*), and therewith his physiological period may be said to end. His next period was stormy and controversial. He entered the lists boldly against the materialism of "Stoff und Kraft," and avowed himself a Christian believer, whereupon he lost the constancy of a number of his old friends and pupils, and was unfeignedly told that he was suffering from an "atrophy of the brain." His quarrel with the materialists began with the report of the *Versammlung der Naturforscher und Aerzte* in Göttingen in 1854, on "Menschenschöpfung und Seelenabstammung." This was followed by a series of "Physiological Letters," in the *Allgemeine Zeitung*, by an essay on "Glauben und Wissen," and by the publication of a series of discourses, known as the *Vorträge* in Göttingen, 1857. Having come to the consideration of these philosophical problems late in life, he was at some disadvantage; but he endeavoured to join as he best could in the current of contemporary discussion. He began by making up, in German writings, more especially of Goethe's, and of the literature connected with him. In what may be called his fourth and last period, Wagner became an anthropologist and archaeologist, occupied himself with the cabinet of skulls in the Göttingen museum collected by Blumenbach and with the excavation of prehistoric remains, corresponded actively with the anthropological societies of Paris and London, and organized, in co-operation with the veteran R. L. von Baer, a successful congress of anthropologists at Göttingen in 1867. His last writings were memoirs on the convolutions of the human brain, on the weight of brains, and on the brains of idiots (1860-1865). See memoir by his eldest son in the *Göttinger gelehrte Anzeigen*, "Nachrichten" for 1864.

WAGNER, WILHELM RICHARD (1813-1883), German dramatic composer, poet and essay-writer, was born at Leipzig on the 22nd of May 1813. In 1822 he was sent to the Kreuzschule at Dresden, where he did so well that, four years later, he translated the first twelve books of the *Odyssey* for amusement. In 1833 he entered the University of Berlin, where he studied for a time the law, but was less successful. His first music master was Gottlieb Müller, who thought him self-willed and eccentric; and his first production as a composer was an overture, performed at the Göttingen theatre in 1830. In that year he matriculated at the university, and took lessons in composition from Theodor Weinig, cantor at the Thomasschule. A symphony was produced at the Gewandhaus concerts in 1833, and in the following year he was appointed conductor of the opera at Magdeburg. The post was unprofitable, and Wagner's life at this period was very unsettled. He had composed an opera called *Die Feen* adapted by himself from Dorn's *La Donna del Lago*, and another, *Das Liebesverbot*, founded on Shakespeare's *Measure for Measure*, but only *Das Liebesverbot* obtained a single performance in 1836.

In that year Wagner married Wilhelmina Planer, an actress at the theatre at Königsberg. He had accepted an engagement there as conductor; but, the lessee becoming bankrupt, the scheme was abandoned in favour of a better appointment at Riga. Accepting this, he remained actively employed until 1839, when he made his first visit to Paris, taking with him an unfinished opera based on Bulwer Lytton's *Rienzi*, and, like his earlier attempts, it left the score unattached. The venture proved most unfortunate. Wagner failed not to gain a footing, and *Rienzi*, destined for the Grand Opera, was rejected. He completed it, however, and in 1842 it was produced at Dresden, where, with Madame Schroeder Devrient and Herr Tichatschek in the principal parts, it achieved a success which went far to make him famous. But though in *Rienzi* Wagner had shown energy and ambition, that work was far from representing his preconceived ideal. This he now endeavoured to embody in *Der fliegende Holländer*, for which he designed a libretto quite independent of any other treatment of the legend. The piece was warmly received at Dresden in the summer of 1843. It was not till June 1845, however, that it was given at Hamburg, and *Der fliegende Holländer* is thus the first of his operas to reach the stage. His attempt was not a success, and in the following year he abandoned it, not without regret, and moved to Paris. Here, in 1846, he was engaged by the Société des Concerts du Conservatoire, and the *Rienzi* was produced for the first time. He was given the *Wagner Prize* for this, and *Mephistopheles* in *Faust*. On the night of the production of the opera, his libretto *Lohengrin*, and so led Wagner to the study of Wolfram von Eschenbach's *Parsifal* and *Titurel*, with great results later on. But for the present he confined himself to the subject in hand; and on the 10th of October 1845 he produced his *Tannhäuser*, with Schroeder Devrient, Johanna Wagner, Tichatschek and Mitterwurzer in the principal parts. Notwithstanding this powerful cast, the success of the new work was not brilliant, for it carried still further the principles embodied in *Der fliegende Holländer*, and the time was not ripe for them. But Wagner was not discouraged, for he knew that his name was fast becoming known, and he had not yet received the political agitations of 1849, after which his position in Dresden became untenable. In fact, after the flight of the king and the subsequent suppression of the riots, a warrant was issued for his arrest; and he had barely time to escape to Weimar, where Liszt was at that moment engaged in preparing *Tannhäuser* for performance, before the storm burst upon him with alarming violence. In all haste Liszt procured a passport and escorted his guest as far as Eisenach. Wagner fled to Paris and thence to Zürich, where he lived in almost unbroken retirement until the autumn of 1859. During this period most of his prose works—including *Oper und Drama, Über das Dirigiren, Das Judentum in der Musik*—were given to the world.

The medieval studies which Wagner had begun for his work at the libretto of *Tannhäuser* bore rich fruit in his next opera *Lohengrin*, in which he also developed his principles on a larger scale and with a riper technique than hitherto. He had completed the work before he fled from Dresden, but could not get it produced. But he took the score with him to Paris, and, as he himself tells us, when ill, miserable and despairing, "my eye fell on the name of my Lohengrin, which I had totally forgotten. Suddenly I felt something like compassion that the music should never sound from off the death-pale paper. Two words I wrote to Liszt; his answer was the news that preparations were being made for the performance of the work, on the grandest scale that the limited means of Weimar would permit. Everything that care and accessories

1 The composer's niece.
could do was done to make the design of the piece understood. Liszt saw what was wanted at once, and did it. Success was his reward; and with this success he now approaches me, saying "See, we have come thus far; now create us a new work, that we may go further."

Lohengrin, was, in fact, produced at Weimar under Liszt's direction on the 28th of August 1850. It was a severe trial to Wagner not to hear his own work, but he knew that it was in good hands, and he responded to Liszt's appeal for a new creation by studying the Nibelungenlied and gradually shaping it into a giant tetralogy. At this time also he first began to lay out the plan of Tristan und Isolde, and to think over the possibilities of Parsifal.

During his exile Wagner matured his plans and perfected his musical style; but it was not until some considerable time after his return that any of the works he then meditated were placed upon the stage. In 1855 he accepted an invitation to London, where he conducted the concerts of the Philharmonic Society with great success. In 1857 he completed the libretto of Tristan und Isolde at Venice, adopting the Celtic legend modified by Gottfried of Strassburg's medieval version. But the music was delayed until the strange incident of a message from the emperor of Brazil encouraged Wagner to complete it in 1859. In that year Wagner visited Paris for the third time; and after much negotiation, in which he was nobly supported by the Prince and Princess Metternich, Tannhäuser was accepted at the Grand Opera. Magnificent preparations were made; it was rehearsed 104 times, 14 times with the full orchestra; and the scenery and dresses were placed entirely under the composer's direction. More than £5000 was expended upon the venture; and the work was performed for the first time in the French language and with the new Venusburg music on the 13th of March 1861. But, for political reasons, a powerful clique was determined to suppress Wagner. A scandalous riot was inaugurated by the members of the Parisian Jockey Club, who interrupted the performance with howls and dog-whistles; and after the third representation the opera was withdrawn. Wagner was broken-hearted. But the Princess Metternich continued to befriend him, and by 1861 she had obtained a pardon for his political offences, with permission to settle in any part of Germany except Saxony. Even this restriction was removed in 1862.

Wagner was invited for a time in Vienna, where Tristan und Isolde was accepted, but abandoned after fifty-seven rehearsals, through the incompliance of the tenor. Lohengrin was, however, produced on the 6th of May 1861, when Wagner heard it for the first time. His circumstances were now extremely straitened; it was the darkness before dawn. In 1863 he published the libretto of Der Ring des Nibelungen. King Ludwig of Bavaria was much struck with it, and in 1864 invited Wagner, who was then at Stuttgart, to come to Munich and finish his work there. Wagner accepted with rapture. The king gave him an annual grant of 2000 gulden (£120), considerably enlarging it before the end of the year, and placing a comfortable house in the outskirts of the city at his disposal. The master expressed his gratitude in a "Huldigungsmarsch." In the autumn he was formally commissioned to proceed with the tetralogy and to furnish proposals for the building of a theatre and the foundation of a Bavarian music school. All promised well, but no sooner did his position seem assured than a miserable court intrigue was formed against him. His political indiscretions at Dresden were made the excuse for bitter persecutions; scandalmongers made his friendship with the ill-fated King a danger to both; and Wagner was obliged to retire to Triebschen near Lucerne for the next six years.

On the 10th of June 1865 at Munich, Tristan und Isolde was produced for the first time, with Herr and Frau Schnorr in the principal parts. Die Meistersinger von Nürnberg, first sketched in 1843, was completed in 1867 and first performed at Munich under the direction of Hans von Bülow on the 21st of June 1868. The story, though an original one, is founded on the character of Hans Sachs, the poet-shoemaker of Nuremberg. The success of the opera was very great; but the production of the Nibelungentetralogy as a whole still remained impracticable, though Das Rheingold and Die Walküre were performed, the one on the 22nd of September 1869 and the other on the 26th of June 1870. The scheme for building a new theatre at Munich having been abandoned, there was no opera-house in Germany fit for so colossal a work. A project was therefore started for the erection of a suitable building at Bayreuth (q.v.). Wagner laid the first stone of this in 1872, and the edifice was completed, after almost insuperable difficulties, in 1876.

After this Wagner resided permanently at Bayreuth, in a house named Wahnfried, the garden of which he built his tomb. His first wife, from whom he had parted since 1861, died in 1865; and in 1870 he was united to Liszt's daughter Cosima, who had previously been the wife of von Bülow. Meantime Der Ring des Nibelungen was rapidly approaching completion, and on the 13th of August 1876 the introductory portion, Das Rheingold, was performed at Bayreuth for the first time as part of the great whole, followed on the 14th by Die Walküre, on the 16th by Siegfried and on the 17th by Göttterdammerung. The performance, directed by Hans Richter, excited extraordinary attention; but the expenses were enormous, and burdened the management with a debt of £7500. A small portion of this was raised (at great risk) by performances at the Albert Hall in London, conducted by Wagner and Richter, in 1877. The remainder was met by the profits upon performances of the tetralogy at Munich.

Wagner's next and last work was Parsifal, based upon the legend of the Holy Grail, as set forth, not in the legend of the Mort d'Arthur, but in the versions of Chrestien de Troyes and Wolfram von Eschenbach and other less-known works. The libretto was complete before his visit to London in 1877. The music was begun in the following year, and completed at Palermo on the 13th of January 1882. The first sixteen performances took place at Bayreuth, in July and August 1882, under Wagner's own directing, and fully realized all expectations.

Unhappily the exertion of directing so many consecutive performances seems to have been too much for the veteran master's strength, for towards the close of 1882 his health began to decline rapidly. He spent the autumn at Venice, and was well enough on Christmas Eve to conduct his early symphony (composed in 1833) at a private performance given at the Liceo Marcello. But late in the afternoon of the 13th of February he and his friends were shocked by his sudden death from heart-failure.

Wagner was buried at Wahnfried in the tomb he had himself prepared, on the 18th of February; and a few days afterwards King Ludwig rode to Bayreuth alone, and at dead of night, to pay his last tribute to the master of his world of dreams.

(W. S. R.; D. F. T.)

In the articles on Music and Opera, Wagner's task in music-drama is described, and it remains here to discuss his progress in the operas themselves. This progress has perhaps no parallel in any art, and certainly none in music, for even Beethoven's progress was purely an increase in range and power. Beethovens, we know, lost sympathy with his early works as he grew older; but that was because his later works absorbed his interest not because his early works misrepresented his ideals. Wagner's earlier works have too long been treated as if they represented the pure and healthy childhood of his later ideal; as if Lohengrin stood to Parsifal as Haydn, Mozart and early Beethoven stand to Beethoven's last quartets. But Wagner never thus represented the childhood of an ideal, though he attained the manhood of the most comprehensive ideal yet known in art. To change the metaphor—the ideal was always in sight, and Wagner never swerved from his path towards it; but that path began in a blaze of garish false lights, and it had become very tortuous before the light of day prevailed. Beethoven was trained in the greatest and most advanced musical tradition of his time. For all his Wagnerian impatience, his progress was no struggle out of a squalid environment; on the contrary, one of his latest discoveries was the greatness of his master Haydn. Now Wagner's excellent teacher Weinig did certainly, as Wagner himself testifies, teach him more of good music than Beethoven,
Haydn and Mozart could have seen in their youth; for he showed him Beethoven. But this would not help Wagner to feel that contemporary music was really a great art; indeed it could only show him that he was growing up in a pseudo-classical time, in which the approval of persons of "good taste" was seldom directed to things of vital promise. Again, he began with far greater facility in literature than in music, if only because a play can be copied ten times faster than a full score. Wagner was always an omnivorous reader, and books were then, as now, both cheaper than music and easier to read. Moreover, the higher problems of rhythmic movement in the classical sonata forms are far beyond the scope of the wonderful interludes, which somehow serve to complement it, with a practical plausibility of musical design; and the instrumental music which was considered the highest style of art in 1830 was as far beyond Wagner's early command of such plausibility as it was obviously already becoming a mere academic game. Lastly, the rules of that game were useless on the stage, and Wagner soon found in Meyerbeer a master of grand opera who was dazzling the world by means which merely disgusted the more serious academic musicians of the day.

Wagner would already have been Meyerbeer's rival, but that his sincerity, and his initial lack of that musical savoir faire which is prior to the individual handling of ideas, put him at a disadvantage. Though Meyerbeer wrote much that is intrinsically more dull and vulgar than the overture to Rienzi, he never combined such serious efforts with a technique so like that of a military bandmaster. The step from Rienzi to Der fliegende Holänder is without parallel in the history of music, and would be inexplicable if Rienzi contained nothing good and if Der fliegende Holänder did not contain many reminiscences of the decline of Italian opera; but it is noticeable that in this connection the lapes into vulgar music have a distinct dramatic value. Though Wagner cannot as yet be confidently credited with a satiric intention in his batos, the fact remains that all the Rossinian passages are associated with the character of Daland, so as to express his vulgar delight at the prospect of finding a rich son-in-law in the mysterious Dutch seaman. Meanwhile the rest of the work (except in the prettily scored "Spinning Song," and other harmless and vigorous tunes) has more affinity with Wagner's mature style than the bulk of its much more ambitious predecessor Rienzi; and although Wagner uses less Leit-motiv than Weber (see Opera, ad fin.) and divides the piece into "numbers" of classical size, the effect is so continuous that the divisions could hardly be guessed by ear. Moreover, the work was intended to be in one act, and is now so performed at Bayreuth; and, although it is very long for a one-act opera, this is certainly the only form which does justice to Wagner's conception.1

Spohr's appreciation of Der fliegende Holänder is a remarkable point in musical history; and his criticism that Wagner's style (in Tannhäuser) "lacked rounded periods"2 shows the best effect of that style on a well-disposed contemporary mind. Of course, from Wagner's mature point of view his early style is far too much cut up by periods and full closes; and its prophetic traits are so incomparably more striking than its resemblance to any earlier art that we often feel that only the full closes stand between it and the true Wagner. But Spohr would feel Wagner's works to be an advance upon contemporary opera rather than a foreshadowing of an unknown future. When we listen to the free declamation of the singers at the outset of Der fliegende Holänder—a declaration which is accompanied by an orchestral and thematic texture as far removed from that of more realistic compositions as is the form of the classical aria—the repetition of a whole sentence in order to form a firm musical close has almost as quaint a ring as a Shakespearean rhymed tag would have in a prose drama of Ibsen. To Spohr the frequency of these incidents must have produced the impression that Wagner was perpetually beginning arias and breaking them off at once. With all its defects, Der fliegende Holänder is the most masterly and the least unequal of Wagner's early works. As a drama it stood immeasurably above any opera since Cherubini's Médée. As a complete fusion between dramatic and musical movement, between recitatives and arias, its inspiration is nowhere found. In the solution of the problem, propounded characteristically at the beginning of the 17th century by Monteverde, and solved in a simple form by Gluck. And as the twofold musical and dramatic achievement of one mind, it already places Wagner beyond parallel in the history of art.

Tannhäuser is on a grander scale, but its musical execution is disappointing. The weakest passages in Der fliegende Holänder are not so helplessly as the original recitatives of Venus in the first act; or Tannhäuser's song, which was too far involved in the whole; or in the overture, which would have delighted the man with which Wagner fifteen years later got rid both of the end of the overture and what he called his "Palais-Royal" Venus. It is really very difficult to understand Schumann's impression that the musical technique of Tannhäuser shows a remarkable improvement. Not until the third act does the great Wagner arbitrate in the struggle between amateurishness and theatricality in the music, though at all points his epoch-making stagecraft asserts itself with a force that tempts us to treat the whole work as if it were on the Wagnerian plane of Tannhäuser's account of his pilgrimage in the third act. But the history of mid-19th-century music is unintelligible until we face the fact that, when the anti-Wagnerian storm was already at its height, Wagner was still fighting for the recognition of music which was most definite just where it realized with ultra-Meyerbeerian brilliancy all that Wagner had already begun to denounce. No contemporary, unaided by personal knowledge, could be expected to trust in Wagner's purity of ideal on the strength of Tannhäuser, which actually achieved popularity by such coarse methods of climax as the revolusional end of the overture, by such maduline paths to the act of getting "away from" the "sleazy" Remorse of the act. But, by the amiable child, the grand-opera skill with which half the action is achieved by processions and a considerable fraction of the music is represented by fanfares. These features established the work in a position which it will always maintain by its unprecedented dramatic qualities and by the glory reflected from Wagner's later achievements; but we shall not appreciate the marvel of its nobler features if we continue at this time of day to regard the bulk of the music as worthy of a great composer. After even the finest things in Tannhäuser, the Vorspiel to Lohengrin comes as a revelation, with its quiet solemnity and breadth of design, its ethereal purity of tone-colour, and its complete emancipation from earlier operatic forms. The suspense and climax in the first act is so intense, and the whole drama is so well designed, that we must have a very vivid idea of the later Wagner before we can see how far the quality of musical thought still falls short of his ideals. The elaborate choral writing sometimes rises to almost Hellenic regions of dramatic art; and there is no crudeness in the passages that carry on the story quietly. In reaction from the climaxes—a test far too severe for Tannhäuser—and rather severe for even the mature works of Gluck and Weber. The orchestra is already almost classically Wagnerian; though there remains an excessive amount of tremolo, besides a few lapses into comic violence, as in the yelpings which accompany Ortrud's rage in the night-scene in the second act. But the mere tone-colours of that scene are enough to make a casual listener imagine that he is dealing with the true Wagner: the variety of tone never fails, and depends on no immediate paraphernalia; for, far-reaching as are the results of the systematic increase of the classical pairs of wind-instruments to groups of three, this is...
a very modest reform compared to the banalistic "extra attractions" of every new production of Meyerbeer's. But there is another side to the picture. With the growing certainty of touch a stiffness of movement appears which gradually disturbs the listener who can appreciate freedom, whether in the classical forms which Wagner has now abandoned, or in the发展阶段 of his later style. Full closes and repeated sentences no longer confuse the issue, but in their absence we begin to notice the incessant squareness of the ostensibly free rhythms. The immense amount of pageantry, though (as in Tannhäuser) good in dramatic motive and executed with splendid stage-craft, goes far to stultify Wagner's already vigorous attitude of protest against grand-opera methods; by way of preparation for the ever-renewal poetic end he gives us a disinfectant present from Meyerbeer at the beginning of the last scene, where mounted trumpeters career round the stage in full blast for three long minutes; and the prelude to the third act is an outburst of sheer gratuitous vulgar. Again, the anti-Wagnerians were entirely justified in penetrating below the splendidly simple and original orchestration of the night-scene between Ortrud and Telramund, and pointing out how feebly its music drifts among a dozen vague keys by means of the diminished 7th; a device which teachers have tried to weed out of every high-flown exercise since that otiose chord was first discovered in the 17th century. The mature Wagner would not have carried out twenty bars in his flattest scenes with so little musical invention. We feel not only that these were a desertion of the work of a man of thirty-five whose claims and aspirations already purported to dwarf the whole record of the classics. And the defects are in all respects commonplace; there are no resemblance to that uncanny discomfort which often warns the wise critic that he is dealing with an immortal.

The crowning complication in the effect of Der fliegende Holländer, Tannhäuser and Lohengrin on the musical thought of the 19th century was that the unprecedented fusion of their musical with their dramatic contents revealed some of the meaning of serious music to ears that had been deaf to the classics. Wagnerism was henceforth proclaimed to the multitude of babes and sucklings; learned musicians felt that it had an unfair advantage; and by the time Wagner's popularity began to thrive as a persecuted hero he had left it in the lurch. Wagner had hardly finished the score of Lohengrin before he was at work upon the poem of Der Ring des Nibelungen. And with this he suddenly became a mature artist. On a superficial view this is a paradox, for there are many more violations of probability and much graver faults of structure in the later works than in the earlier. Every critic could recognize the structure of earlier as a far more obvious factor in later; the vilenesses and abruptness of motive are always intelligible as stage devices. Jealousy might prompt a doubt whether these plays were within the scope of "legitimate" music; but they were obviously stories of exceptional musical and romantic beauty, presented with literary resources unprecedented in operatic libretti. Now the later dramas are often notoriously awkward and redundant; while the removal of those convenient operatic devices which symbolize situations instead of developing them, does not readily appear to be compensated for by any superior artistic resource. But there is a higher point of view than that of story-telling. In the development of characters and of intellectual ideas Wagner's later works show a power before which his earlier stagecraft shrinks into insignificance. It would not have sufficed even to indicate his later ideas. To handle these so successfully that we can discriminate defects from qualities at all, is proof of the technique of a master, even though the faults extend to whole categories of literature. The faults make analysis exceptionally difficult, for they are no longer commonplace; indeed, the gravest dangers of modern Wagnerism arise from the fact that there is hardly any non-musical aspect in which Wagner's later work is not important enough to produce a school of essentially non-musical critics who have no notion how far Wagner's mature music transcends the rest of his thought, nor how often it rises where his philosophy falls. Thus the prominent school of criticism which appraised Wagner in the 19th century by his approximation to Darwin and Herbert Spencer, appraises him in the 20th by his approximation to Bernard Shaw; with the absurd result that Götterdämmerung is ruled out as a reactionary failure. It is true that its only combative morale is lofty to the opposite of that "reactionary" by love "which Wagner strenuously preaches in a passage at the end which remained unset because he considered it already expressed by the music. Indeed, though Wagner's later treatment of love is perhaps the main source of his present popularity it seldom rises to his loftiest regions except where it is thwarted. The love that is disguised in the deadly feud between Isolde and Tristan, before the drinking of the fatal potion, rises even above the music; the love-duet in the second act depends for its greatness on its introduction, before the lovers have met, and its wonderful slow movement (shortly before the catastrophe) where they are almost silent and leave everything to the music; the intervening twenty minutes is an exhausting storm in which the words are the sophisticated rhetoric of a 19th-century novel of passion, translated into terribly turgid verse and set to music that is more interesting as an intellectual ferment than effective as a representation of emotions which previous dramatists have wisely left to the imagination. But so long as we treat Wagner like a prose philosopher, a librettist, a poet, a mere musician, or anything short of the complex and many-sided artist he really is, we shall find insuperable obstacles to understanding his work. A true work of art requires two nameless attendant characters in a long opening scene, for the sole purpose of telling the antecedents of the story, when a situation is thereby revealed which for subtlety and power has hardly a parallel since Greek tragedy. The vast myth of the Ring is related in full several times in each of the three main dramas, with ruthless disregard for the otherwise magnificent dramatic effect of the whole; hosts of original dramatic and ethical ideas, with which Wagner's brain was even more fertile than his voluminous prose works would indicate, are not observed. His work is often saved by repeated attempts to allegorize the philosophy of Schopenhauer; all efforts to read a consistent scheme, ethical or philosophical, into the result are doomed to failure; but all this matters little, so long as we have Wagner's unflagging later resources in those higher dramatic verities which present to us emotions and actions, human and divine, as things essentially complex and conflicting, inevitable as natural laws, incalculable as natural phenomena. Wagner's choice of subjects had from the outset shown an imagination far above that of any earlier librettist; yet he had begun with stories which could attract ordinary minds, as he humorously realized when the matter which he imagined in Der fliegende Holländer so pleased the Parisian art critics that it was promptly set to music by one of their friends. But with Der Ring des Nibelungen Wagner devoted himself to a story which any ordinary dramatist would find as unwieldy as, for instance, most of Shakespeare's subjects; a story in which ordinary canons of taste and probability were violated as they are in real life and in great art. Wagner's first inspiration was for an opera (Siegfried's Tod, projected in 1848) on the death of Germany's mythical hero; but he found that the story needed a preliminary drama to convey its antecedents. This preliminary drama soon proved to need another to explain it, which again finally needed a short introductory drama. Thus the plan of the Ring was sketched in reverse order; and it has been remarked that Götterdämmerung
WAGNER shows traces of the fact that Wagner had begun his scheme in the days when French grand opera, with its ballets and pageantry, still influenced him. There is little doubt that some redundant narratives in the Ring were of earlier conception than the four complete dramas, and that their survival is due partly to Wagner's natural affection for work on which he had spent pains, and partly to a dim notion that (like Browning's method in The Ring and the Book) they might serve to reveal the story amid in the light of each character. Be this as it may, we may confidently date the purification of Wagner's music at the moment when he set to work on a story which carried him finally away from that world of stereotyped operatic passions into which he had already breathed so much disturbing life.

The disturbing life already appears in Der fliegende Holländer, at the point where Senta's father enters with the Dutchman, and Senta (who is already in an advanced state of Schweramerei over the legend of the Flying Dutchman) stands rooted to the spot, comparing the living Dutchman with his portrait which hangs over the door. The conflict between her passionate fascination and her disgust at her father's vulgarity is finely realized both in music and drama; but, if we are able to appreciate it, then the operatic convention by which Senta avows her passion becomes crude. Ethical and operatic points of view are similarly confused when it is asserted that the Flying Dutchman can be saved by a faithful woman, though it appears from the relations between Senta and Erik that so long as the woman is faithful to the Dutchman it does not matter that she jilts one else.

Erik would not have been a sufficiently pathetic operatic tenor if his claim on Senta had been less complete. In Tannhäuser and Lohengrin Wagner's intellectual power develops far more rapidly in the drama than in the music. The Sängerkrieg, with its disastrous conflict between the sincere but unnatural asceticism of the orthodox Minnesingers and the irrepressible human passion of Tannhäuser, is a conception the vitality of which would reduce Tannhäuser's repentance to the level of Robert le Diable, were it not that the music of the Sängerkrieg has no structural power, and little distinction beyond a certain poetic value in the tones of violas which had long ago been fully exploited by Mozart and Méhul, while the music of Tannhäuser's pilgrimage ranks with the Verstieft to Lohengrin as a wonderful foreshadowing of Wagner's mature style. Again, the appeal to "God's judgment" in the trial by battle in Lohengrin is a subject of which no earlier librettist could have made more than a plausible mess—which is the best that can be said for the music as music. But as dramatist Wagner compels our respect for the poetry that without gloss or apology brings before us the king, a model of royal fair-mindedness and good-nature, acquiescing in Telramund's monstrous claim to accuse Elsa without evidence, simply because it is a hard and self-evident fact that the persons of the drama live in an age in which such claims seemed reasonable. Telramund, again, is no ordinary operatic villain; there is genuine tragedy in his moral ruin; and even the melodramatic Ortrud is a much more life-like intrigante than might be inferred from Wagner's hyperbolical stage-directions, which almost always show his manner at its worst.

In Lohengrin we take leave of the early music that obscured Wagner's ideals, and in the Ring we come to the music which takes us through the four and a half operas of the artist, a man of more urbane literary intellect he might have been less ambitious of expressing a world-philosophy in music-drama; and it is just conceivable that the result might have been a less intermittent dramatic movement in his later works, and a balance of ethical ideas at once more subtle and more orthodox. But it is much more likely that Wagner would then have found his artistic difficulties too formidable to let the ideas descend to us from Walhalla and the Hall of the Grail at all. More than a modicum of rusticity is needed as a protection to a man who attempts such colossal reforms. This necessity had its consequences in the disquieting inequalities of Wagner's early work, and the undeniable egotism that embittered his fiery nature throughout his life; while the cut-and-dried system of culture of later Wagnerian discipleship has revenged him in a specially sacerdotal type of tradition, which makes progress even in the study of his works impossible except through revolt. Such are the penalties exacted by the irony of fate for the world's persecution of its prophets.

Genuinely dramatic music, even if it seem as purely musical as Mozart's, must always be approached through its drama; and Wagner's masterpieces demand that we shall use this approach; but, as with Mozart, we must not stop on the threshold. With Mozart there is no temptation to do so. But with Wagner, just as there are people who have never tried to follow a sonata but who have been awakened by his music-dramas to a sense of the possibilities of serious music, so there are lovers of music who avow that they owe to Wagner their appreciation of poetry. But people whose love of literature is more independent find it hard to take Wagner's poetry and prose seriously, unless they have already measured him by his music. He effected no reform in literature; his meticulous adherence to the archaic alliteration of the Nibelungenlied is not allied with any sense of beauty in verbal sound or verse-rhythm; and his ways of expressing emotion in language consist chiefly in the piling-up of superlatives. Yet he was too full of dramatic inspiration to remain perpetually victimized by the conscientious affectations of the amateur author; and, where dramatic situations are not only poetical but (as in the first act of Die Walküre and the Walther scene in Siegfried) too elemental for strained language, Wagner is often supremely eloquent simply because he has no occasion to try to write poetry. Sometimes, too, when a great dramatic climax has given place to a lyric antithesis, retrospective moods, subtilities of emotion and crowning musical thoughts press in upon Wagner's mind with a closeness that determines every word; and thus not only is the whole third act of Tristan, as Wagner said when he was working at it, of "overwhelming tragic power," but Isolde's dying utterances (which occupy the last five minutes and are, of course, totally without action or dramatic tension) were not unlike fine poetry even before the music was written. But, as a rule, Wagner's poetic diction must simply be tolerated by the critic who would submit himself to Wagner's ideas.

If we wish to know what Wagner means, we must fight our way through his drama to his music; and we must not expect to find that each phrase in the mouth of the actor corresponds word for note with the music. That sort of correspondence Wagner leaves to his imitators; and his views on "Leit-motif-hunting," as expressed in his prose writings and conversation, are contemptuously tolerant. We shall indeed find that his orchestra interprets the dramatic situations which his poetry roughly outlines. But we shall also find that, even if we could conceive the poetry to be a perfect expression of all that can be given in words and actions, the orchestra will express something greater; it will not run parallel with the poetry; the Leitmotiv system will not be a collection of labels; the musical expression of singer and orchestra will not be a mere heightened resource of dramatic declamation. All that kind of pre-established harmony Wagner left behind him the moment he deserted the heroes and villains of romantic opera for the visionary and true tragedy of gods and demi-gods, giants and gnomes, with beauty, nobility and love in the wrong, and the forces of destruction and hate set free by the Hand of Justice.

Let us illustrate Wagner's mature use of Leitmotif by the theme which happens to be associated with Alberich's ring. The fact that this theme is commonly called the "Ring-motif" is a glaring instance of what Wagner has had to endure from his friends. Important as the ring is throughout the tetralogy, Wagner would no more think of associating a theme with it for its own sake than he would think of associating a theme with Wotan's hat. Why should a Ring-motif be transformed into the theme representing Walhalla? Are we to guess that the connexion of ideas is that Wotan had eventually to pay for Walhalla by the ring? But if we attend to the circumstances under which this theme arises, its purport and development become deep and natural. The Rhine-daughters have been tearing the Nilbelung Alberich, and are rejoicing in the light of the Rhine-gold which shines at
the top of a rock as the sun strikes it through the water. Alberich does not think much of the gold if its only use is for these water-children’s games. But one of the Rhine-daughters tells him that ‘he who could make the gold into a ring would become master of the world,’ and to these words the so-called Ring-motif is first sung (see MELODY, Example 11). The Rhine-daughter sings it in a childlike, indolently graceful way which well expresses the kind of joy the ring or the world itself would be to her. One of the most remarkable and beautiful parts of the Ring is the scene in which the gods come to the Rhine and, with themselves the thought that the Rhine-gold is safe, since no one can win it who does not renounce love. Alberich broods over what he hears, and already the theme changes its character as he thinks of such mastery of the world as he might gain by it (MELODY, Ex. 12). He curses love and grasps the gold. The theme of world-mastery grows dark with the darkness of the Nibelung’s mind. The waters of the Rhine change into black mists which grow grey and thin, while the now sinister theme becomes softer and smoother. Then it breaks gently forth in a noble, swinging rhythm and massively soft brazen tones, as Wotan awakes on a mountain height and gazes upon Valhalla, his newly finished palace which he has bid the giants build, so that from it he may rule the world (MELODY, Ex. 13). The theme thus shows no trivial connexion with a stage-property, mechanically important in the plot; but it represents the desire for power, and what that desire means to each different type of mind. The gods, as the giants plaintively admit, ‘rule by beauty’; hence the ‘Walhalla-motif.’ What it becomes in the mind of the Nibelung is grimly evident when Alberich uses his ring in Nibelheim. The Rhine-daughters’ exultant cry of ‘Rhine-gold’ is transformed into a solemn glowing countenance of the end of a very sinister transformation of the theme; and the orchestra, with its lurid but smothered brass instruments, its penetrating low reed tones and its weird drum-roll beaten on a suspended cymbal, is more awe-inspiring than anything dreamed of by the cleverest of those composers who do not create intellectual causes for their effects.

A famous and typical instance of Wagner’s use of Leitmotif in tragic irony is the passage where Hagen gives Siegfried friendly welcome, to the melody of the curse which Alberich pronounced on the ring and all who approached it. The more subtle examples are inexhaustible in variety and resource; as perhaps the climax of subtlety is the almost entire absence of Leitmotif in the first scene of the third act of Gotterdammerung, when Siegfried throws away his last chance of averting his doom. The Rhine-daughters appear to him, and ask him to give them the ring that is on his finger. Siegfried refuses. They laugh at his stiffness and disappear. Siegfried is piqued, and calls them back to offer them the ring. Unfortunately they tell him of its curse, and prophesy death to him if he keeps it. This arouses his spirit of contradiction; and he tells them that they might have won it from him by coaxing, but never by threats, and that he values his life no more than the stone he tosses away as he speaks to them. In spite of the necessary allusions to the ominous theme of the curse, which would give any less great composer ample excuse for succumbing to the listener’s sense of impending doom, Wagner’s music speaks to us through the child-minds of the Rhine-daughters and terrifies us with the ruthless calm of Nature. Almost as subtle, and much more directly impressive, is the pathos of the death of Siegfried, which is heightened by an unprecedented appeal to a sense of musical form on the scale of the entire tetralogy. Siegfried’s whole character and career is, indeed, annihilated in the clumsy process of his falling into the magic circle of Hagen’s very old and ancient ring. But Shakespeare might have condoned worse plots for the sake of so noble a result; and indeed Wagner’s awkwardness arises mainly from fear of committing oversights. Hagen, the Nibelung’s son, has managed to make Siegfried unwittingly drink a love-poison with Gutrune, which causes him to forget his own bride, Brunnhilde. Siegfried is then persuaded to transform himself by his magic Tarnhelm into the likeness of his host, Gutrune’s brother Gunther, in order to bring Brunnhilde (whose name is now quite new to him) from her fire-encircled rock, so that Gunther may have her for his bride and Siegfried may wed Gutrune. This is achieved; and Brunnhilde’s horror and bewilderment at meeting Siegfried again as a stranger in his own shape creates a situation which Siegfried cannot understand, and which Hagen pretends to construe as damning evidence that Siegfried has betrayed Gunther’s honour as well as Brunnhilde’s. Hagen, Gunther and Brunnhilde therefore agree that Siegfried must die. In order to spare Gutrune’s feelings it is arranged that his death shall appear as an accident in a hunting party. While the hunting party that Eka shall never ask to know his boyhood, thus recalling the antecedents of this drama with a charming freshness and sense of dramatic and musical repose. When he comes to the point where his memory has been clouded by Hagen’s spells, Hagen restores his memory with another magic potion. Siegfried calmly continues to tell how he found Brunnhilde asleep on the fiery mountain. Hagen affects to construe this as a confession of guilt, and slays him as if in righteous wrath. The dying Siegfried calls on Brunnhilde to awaken, and asks “Who hath locked thee again in sleep?” He believes that he is once more with Brunnhilde on the Valkyrie’s mountain height; and the harmonies of her awakening move in untroubled splendour till the light of life fades with the light of day and the slain hero is carried to the Gilsingh’s hall through the moonlit mists, while the music of love and death tells in terrible triumph more of his story than he ever knew.

The bare conception of such art as this shows how perfect is the unity between the different elements in Wagner’s later music-drama. If the music of Tristan is more polyphonic than that of Lohengrin, it is because it is hardly figurative to call its drama polyphonic also. Compare the mere fairy-tale mystery of Lohengrin’s coming with that of Kriemhild’s earning its everyday resource, showing that its vitality does not depend on that extreme emotional force that makes Tristan und Isolde almost unbearably poignant. Few things are finer in music or literature than the end of the second act of Die Meistersinger, from the point where Sachs’s apprentice begins the riot, to the moment when the watchman, frightened at the silence of the moonlit streets so soon after he has heard all that noise, announces eleven o’clock and bids the folk pray for protection against evil spirits, while the orchestra tells us of the dreams of Walther and Eva and ends by putting poetry even into the pedantic inaptitudes of the malicious Beckmesser. Die Meistersinger is perhaps Wagner’s most nearly perfect work of art; and it is a striking proof of its purity and greatness that, while the whole work is in the happiest comic vein, no one ever thinks of it as in any way lighter than Wagner’s tragic works. The overwhelming love-tragedy of Tristan und Isolde is hardly less perfect, though the simplicity of its action exposes its longueur to greater notoriety than those which may be found in Die Meistersinger.

These two works interrupted the execution of the Ring and formed the stepping-stones to Parsifal, a work which may be compared, in its way of development, to that subtle and poetical conception which, as we have seen, gave the determining impulse to Wagner’s true musical style. But in music he had no more to learn, and Parsifal, while the most solemn and concentrated of all Wagner’s dramas, is musically not always suggestive of old age. Its harmonic style is, except in the Grail music, even more abstruse than in Tristan; and the intense quiet of the action is far removed from the forces which in that tumultuous tragedy carry the listener through every difficulty. Again, while the Eucharistic features that Parsifal attract some listeners, the material effect of their presentation was
on the stage has been known to repel others who are beyond suspicion of prejudice. But the greatness of the art is, like its subject, worlds away from material impressions; and a wide consensus regards Wagner's last work as his loftiest, both in music and poetry. Certainly no poet would venture to despise Wagner's imaginative conception of Kundry. In his letters to his friend Mathilde Wesendonck, it appears that while he was composing Tristan he already had the inspiration of working out the identification of Kundry, the messenger of the Grail, with the temptress who, under the spell of Klingsor, seduces the knights of the Grail; and he had, moreover, thought out the implications of Wagner's hereditary system as embodied in the later Grail mysteries which he himself regarded as pure physical sensations; but he was more troubled with Strauss's first systematic refusal to regard them as anything else, and secondly in his extreme sensibility to harshness. We have seen (in the articles on Harmony and Music) how harmonic music originated in just this habit of regarding combinations of sound as mere sensations; and how for centuries the habit opposed itself to the intellectual principles of contrapuntal harmony. These intellectual principles are, of course, not without their own ground in physical sensation; but it is evident that Debussy appeals beyond them to a more primitive instinct; and on it he bases an almost perfectly coherent system of the laws and practices of his new music, precisely the opposite of those of classical harmony. The only illogical point in his system is that the beauty of his dreamlike chords depends not only on his artful choice of a timbre that minimizes their harshness, but also on the fact that they enter the ear with the meaning they have acquired through centuries of harmonic evolution on classical lines. There is a special pleasure in the subsidence of that meaning beneath a soothing sensation; but a system based thereon cannot be universal. Its phenomena are, however, perfectly real, and can be observed wherever artistic conditions make the tone of a mass of harmony more important than the interior threads of its texture. This is of constant occurrence in classical pianoforte music, in which thick chords are subjected to polyphonic laws only in their top and bottom notes, while the inner notes make a solid mass of sound in which numerous consecutive fifths and octaves are not only harmless but essential to the balance of tone. In Debussy's art the top and bottom are also involved in the antipolyphonic laws of such masses of sound, thus making these laws paramount. The irrational discords of Strauss are also real phenomena in musical aesthetics. They are an extension of the principle on which gongs and cymbals and all instruments without notes of determinate pitch are employed in otherwise polyphonic music. But it is important to realize that both these types of modern harmony are radically non-Wagnerian. Haydn uses a true Strussian discord in The Seasons, in order to imitate the chirping of a cricket; but the harshest realism in Götterdämmerung (the discord produced by the horns of Hagen and his churls in the muttering-scene in the second act) has a harmonic logic which would have convinced Corelli. And of Debussy's antipolyphonic art there is less in Wagner than in Beethoven. The present influence of Wagnerian harmony is, then, somewhat indefinite, since the most important real phenomena of later music indicate a revolt both from it and from earlier classical methods. It has had, however, a marked effect on weaker musical individualities. Musical public opinion now puts an extraordinary pressure on the young composer, urging him at all costs to abandon "out-of-date" styles however stimulating they may be to his invention. It is no exaggeration to say that a parallel condition in literature would be produced by a strong public opinion to the effect that any English style was hopelessly out of date unless it consisted exclusively of the most difficult types of phrase to be found in the works of Browning and Meredith. The brilliant success of Humperdinck's Hänsel und Gretel, in which Wagnerian technique is applied to the diatonic style of nursery songs with a humorously accurate undreamed of by Wagner's imitators, points a moral which would have charmed Wagner himself; but until the revival of some rudiments of musical common sense becomes widespread, there is little prospect of the influence of Wagner's harmonic style being productive of anything better than nonsense.

chords is hardly less Wagnerian than the perfect smoothness of the melodic lines which combine to produce them. Wagnerian harmony is, then, neither a side-issue nor a progress per saulum, but a leading current in the stream of musical evolution. That stream is sure sooner or later to carry with it every reality that has been reached by side-issues and leaps; and of such things we have important cases in the works of Strauss and Debussy. Strauss makes a steadily increasing use of avowedly irrational discords, in order to produce an emotionally apt physical sensation. Debussy has this in common with Strauss, but he regards harmonies as pure physical sensations; but he differs from Strauss first in systematically refusing to regard them as anything else, and secondly in his extreme sensibility to harshness. We have seen (in the articles on Harmony and Music) how harmonic music originated in just this habit of regarding combinations of sound as mere sensations, and how for centuries the habit opposed itself to the intellectual principles of contrapuntal harmony. These intellectual principles are, of course, not without their own ground in physical sensation; but it is evident that Debussy appeals beyond them to a more primitive instinct; and on it he bases an almost perfectly coherent system of the laws and practices of his new music, precisely the opposite of those of classical harmony. The only illogical point in his system is that the beauty of his dreamlike chords depends not only on his artful choice of a timbre that minimizes their harshness, but also on the fact that they enter the ear with the meaning they have acquired through centuries of harmonic evolution on classical lines. There is a special pleasure in the subsidence of that meaning beneath a soothing sensation; but a system based thereon cannot be universal. Its phenomena are, however, perfectly real, and can be observed wherever artistic conditions make the tone of a mass of harmony more important than the interior threads of its texture. This is of constant occurrence in classical pianoforte music, in which thick chords are subjected to polyphonic laws only in their top and bottom notes, while the inner notes make a solid mass of sound in which numerous consecutive fifths and octaves are not only harmless but essential to the balance of tone. In Debussy's art the top and bottom are also involved in the antipolyphonic laws of such masses of sound, thus making these laws paramount. The irrational discords of Strauss are also real phenomena in musical aesthetics. They are an extension of the principle on which gongs and cymbals and all instruments without notes of determinate pitch are employed in otherwise polyphonic music. But it is important to realize that both these types of modern harmony are radically non-Wagnerian. Haydn uses a true Strussian discord in The Seasons, in order to imitate the chirping of a cricket; but the harshest realism in Götterdämmerung (the discord produced by the horns of Hagen and his churls in the muttering-scene in the second act) has a harmonic logic which would have convinced Corelli. And of Debussy's antipolyphonic art there is less in Wagner than in Beethoven. The present influence of Wagnerian harmony is, then, somewhat indefinite, since the most important real phenomena of later music indicate a revolt both from it and from earlier classical methods. It has had, however, a marked effect on weaker musical individualities. Musical public opinion now puts an extraordinary pressure on the young composer, urging him at all costs to abandon "out-of-date" styles however stimulating they may be to his invention. It is no exaggeration to say that a parallel condition in literature would be produced by a strong public opinion to the effect that any English style was hopelessly out of date unless it consisted exclusively of the most difficult types of phrase to be found in the works of Browning and Meredith. The brilliant success of Humperdinck's Hänsel und Gretel, in which Wagnerian technique is applied to the diatonic style of nursery songs with a humorously accurate undreamed of by Wagner's imitators, points a moral which would have charmed Wagner himself; but until the revival of some rudiments of musical common sense becomes widespread, there is little prospect of the influence of Wagner's harmonic style being productive of anything better than nonsense.
The very sense of dramatic fitness has temporarily vanished from public musical opinion, together with the sense of musical form, by another prevalent habit, that of presenting shapeless extracts from Wagner's operas as orchestral pieces without voices or textbooks or any hint that such adjacents are desirable. But this vandalism, which Wagner conformed with a very bad grace, now happily begins to give way to the practice of presenting long scenes or entire acts, with the singers, on the concert-platform. This has the merit of bringing the real Wagner to ears which may have no other means of hearing him, and it fosters no delusion as to what is missing in such a presentation. The guidance of Hans Richter has given us a sure-darkness among the minor orchestras of Wagner; and so there is hope that Wagner may yet be saved from such an oblivion in fetish-worship as has lost Handel to us for so long. As with Shakespeare and Beethoven, the day will never come when we can measure the influence of so vast a mind upon the history of art. Smaller artists can make history; the greatest absorb it into that daylight which is its final cause.

List of Wagner's Works

The following are Wagner's operas and music-dramas, apart from the unpublished Die Hochzeit (three numbers only), Die Beie, and Die Chaise (afterward discovered in the Kaisermarsch of Faust) and the Gymnasialmarchen (poem written last of the series, which was begun in 1848 and finished in 1851-1852; music, 1853-1854).

1. Ring des Nibelungen, 5 acts (1831-1840).
2. Die Meistersinger von Nürnberg, 3 acts (sketch of play, 1845; poem, 1861-1862; music, 1862-1867).
3. Die Vorspann der Ring des Nibelungen, 3 acts (Siegfried's Tod already sketched dramatically in 1834; music, 1870-1874).
4. Parsifal: ein Musenwerkfetspiel (a solemn stage festival play of 1876), 3 acts (music, 1877-1882; Churfürstengau already sketched in 1857).
5. Tristan and Isolde: 3 acts (poem written in 1857; music, 1857-1859).
6. Die Walküre: der Ring des Nibelungen, erster Tag; 3 acts (as Siegfried's Tod already sketched dramatically in 1834; music, 1870-1874).
7. Die Walküre: der Ring des Nibelungen, dritter Tag; 3 acts (as Siegfried's Tod already sketched dramatically in 1834; music, 1870-1874).
8. Parsifal: ein Musenwerkfetspiel (a solemn stage festival play of 1876), 3 acts (music, 1877-1882; Churfürstengau already sketched in 1857).
10. Göttterdammerung: der Ring des Nibelungen, dritter Tag; introduction and 3 acts (Siegfried's Tod already sketched dramatically in 1834; music, 1870-1874).
11. Parsifal: ein Musenwerkfetspiel (a solemn stage festival play of 1876), 3 acts (music, 1877-1882; Churfürstengau already sketched in 1857).

As regards other compositions, the early unpublished works include a symphony, a cantata, some incidental music to a pantomime, and a score of songs, of which only the melodies have been set and produced. The important small published works are Eine Faust Overture (1839-1840; rewritten, 1855); the Siegfried Idylle (an exquisite serenade for small orchestra on themes from the finale of Siegfried, written as a surprise for Frau Wagner in 1870); the Kaisermarsch (1871), the Heldigmarsch (1864) for military band (the scoring of the concert-version finished by Raff); Pfand Gedichte (1862), a set of songs containing two studies for Tristan; and the early quasi-oratorio scene for male-voice chorus and full orchestra, Das Liebesmahl der Apostel (1843). Wagner's retouching of Gluck's Iphigenie en Aulide and his edition of Palestrina's Sibylls' Musar demand mention as important services to music, by no means to be classified (as in some catalogues) with the hack-work with which he kept off starvation in Paris.

The works of Wagner in German fill ten volumes, and include political speeches, sketches for dramas that did not become operas, autobiographical chapters, aesthetic musical treatises and polemics of vitriolic violence. Their importance will never be comparable to that of his operas, but just as the reaction against Ruskin's ascendency as an art-critic has coincided with an increased respect for his ethical and sociological thought, so the rebellious forces that are compelling Wagnerism to grant music a central position in art have been a great aid to the development of mental powers. The prose works have been translated into English by W. A. Ellis (8 vols., 1802-1899). The translation by F. Jameson (1855-1859) was one of the first attempts to render the full scores) is the most wonderful tour de force yet achieved in its line. A careful reading of the score to this English text reveals not a single false emphasis or loss of rhetorical point in the fitting of words. The music, nor a single extra word or phrase in the music; and wherever the language seems stilted or absurd the original will be found to be at least equally so, while the spirit of Wagner's poetry is faithfully reflected. Such work deserves more recognition than it is ever likely to get. Rapidly as the standard of musical translations was improving before this work appeared, no one could have foreseen what has now been abundantly verified, that the Ring can be performed in English without any appreciable loss to Wagner's art. The same may be said of other works, but the English books we may cite Ernest Newman, A Study of Wagner (1899); H. E. Krechsel, Studies in the Wagnerian Drama (1891); Jesse L. Weston, Legends of the Wagner Dramas (1906). The Perfect Wagnerite, by G. Bernard Shaw, though conceived mainly with the social philosophy of the Ring, gives a luminous account of Wagner's mastery of musical movement. The highest English authority on Wagner is his friend Dannreuther, whose article in Grove's Dictionary of Music and Musicians:

See also Aria, Harmony, Instrumentation, Music, Opera, and Overture.

(D.F.T.)

WAGRAM, or WAGON, a large four-wheeled vehicle for the carriage of heavy loads, and drawn by two or more horses. This is the general English use of the term, where it is more particularly confined to the large vehicles employed in the carrying of agricultural produce. It is also used of the uncovered heavy rolling stock for goods on railways. In America the term w'agon or w'agan is applied to such large vehicles used for express delivery, police work, and, to various forms of four-wheeled vehicles used for driving, to which the English term "cart" would be given. The word "wagon" appears to be a direct adaptation of Du. Wagen (cf. Ger. Wagen, Swed. Vagn, etc.). Skant finds the earliest use of the word in Lord Berners's translation of Froissart (1523-1525), so that it is by no means an early word. The O.E. cognate word was wagen, later wen, by dropping of g (cf. rege, ren, rain), modern "wagon." The root of all these cognate words, meaning to carry, is seen in Lat. vehere. The term "wagon" or "waggon" is applied technically in America for a binding to a frame of cane used for trimming the edges of gold leaf. In architecture a "wagon-ceiling" is a boarded roof of the Tudor time, either of semicircular or polygonal section. It is bounded with thin panels of oak or other wood ornamented with mouldings and with loops at the intersections.

WAGRAM (DEUTSCH-WAGRAM), a village of Austria situated in the plain of the Marchfeld, 1 1/3 m. N.E. of Vienna. It gives its name to the battle of the 5th and 6th of July 1809, in which the French army under Napoleon defeated the Austrians commanded by the archduke Charles. On the failure of his previous attempt to pass his whole army across the Danube at Aspern (see NAPOLEONIC CAMPAIGNS AND ASPERN), Napoleon set himself to accumulate, around Vienna and the island of Lobau, not only his own field forces, but also every man, horse and gun available from Italy and South Germany for a final effort. Every detachment was drawn in within forty-eight hours' call, his rearward communications being practically rendered of covering troops. The island of Lobau itself was converted practically into a fortress, and 150 heavy guns were mounted on its banks to command the Austrian side of the stream. Giving up, in face of this artillery, the direct defence of the river-side, the Austrians drew up in a great arc of about 6 m. radius extending from the Bisamberg, overlooking the Danube, in the west, to Markgrafneusiedl on the east. From this point to the Danube below Lobau a gap was left for the deployment of the archduke Johann's army from Pressburg. This army, however, arrived too late. Their total front, therefore, was about 12 m. for 150,000 men, which by a forward march of a couple of hours could be reduced to about 6 m.—giving a density of occupation of about 20,000 men to the mile.

Meanwhile Napoleon reconstructed the bridge over the main stream (see ASPERN) more solidly, protecting it by palisades of piles and floating booms, and organized an armed flotilla to command the waterway. On the island itself preparations were made to throw three bridges across the Lobau arm of the stream opposite Aspern and Essling, and seven more on the right, facing east between Gross Enzersdorf and the main river.

For several days previous to the great battle the French had sent across small detachments, and hence when on the afternoon of the 4th of July, an advanced guard was put over near Gross
Enzersdorf, the attention of the Austrians was not particularly attracted and they did not interfere. The emperor, however, had now men available for the battle, and under cover of this detachment his pontoniers made the seven bridges. Long before daylight on the 6th the troops began to stream across, and about 9 A.M. the three corps destined for the first line (Davout, Oudinot and Masséna) had completed their deployment on a front of some 6000 yds. and were moving forward to make way for the second line (Eugène and Bernadotte) and the third line (Bessières and the guard). About noon the general advance began, the French opening outwards like a fan to obtain space for manœuvre, Davout direct on Markgrafneusiedl and the Austrian left, Masséna (slightly refused to cover the French left) by Breitenlee on Süssenbrunn.

The Austrians held a strong position along the line of the Russbach from Deutsch-Wagram to Markgrafneusiedl with their left, whilst their right was held ready for a counter-attack intended to roll up the French attack from left to right when the proper moment should come. The movements of the great French masses in the confined space were slow, and the attack on the line of the Russbach did not declare itself till 8 P.M.; the corps did not attack simultaneously, and failed altogether to make any serious impression on the Austrian position. Masséna on the left was scarcely engaged.

But, hearing of the success of his left wing on the Russbach, the archduke determined to anticipate the French next morning on that side, and four corps were directed upon Masséna, who had bivouacked his troops overnight on the line Leopoldsau–Süssenbrunn–Aderklaa, the latter, a strongly built village, forming, as it were, a bridge-head to the passages of the Russbach at Deutsch-Wagram. Another corps with a strong cavalry force was also directed to pivot round Markgrafneusiedl and to attack Davout on his right; on this flank also the arrival of the archduke Johann was expected later in the day.

The Austrian movements were somewhat ill-connected; nevertheless, by 11 A.M. Masséna's left had been driven back almost to Aspern, and his right, though aided by Bernadotte, had failed to recapture Aderklaa, from which the Austrians had driven his advanced posts early in the morning. The situation for the French looked very serious, for their troops were not fighting with the dash and spirit of former years. But Napoleon was a master in the psychology of the battlefield, and knew that on the other side things were much the same. He therefore sent orders along the whole line for a gigantic counter-stroke. Davout on the right was to attack Markgrafneusiedl again. Masséna was to move against the troops immediately to his front; Bernadotte and Marmont to advance respectively against Breitenlee and Aderklaa, whilst in the gap which would thus open between them marched the 5th corps (MacDonald) on Süssenbrunn, covered by a battery of 104 guns and followed by the guard and reserve cavalry.

MacDonald formed his 30,000 men in a gigantic hollow square—on a front of one battalion, fourteen battalions deployed at six paces distance leading, whilst the remainder of the infantry marched in column of sections on either flank, and cavalry closed the rear. The idea was to compel even the weakest to go on, on pain of being trampled to death under the feet of the following men and horses, but the terror caused by the Austrian round-shot tearing huge gaps through the mass proved enough to counteract even this danger, and the men in the advance threw themselves down wholesale. It is admitted by French authors (Ardant du Picq) that of the 30,000 only 3000 actually delivered the attack, about 2000 were killed or wounded, 24,000 evaded their duty somehow, and the trail of the column appeared one mass of dead and dying, creating a terrible impression on all who saw it. Nevertheless, Macdonald reached his destination, for the guns had literally torn a gap in the opposing line, and the guards and cavalry then followed intact. At the same time Davout also had made progress, and, learning that the archduke Johann could not be counted on for that day, the archduke Charles issued orders for a retreat. The whole Austrian army was gradually withdrawn, unbeaten and still available for a renewed offensive if necessary the following day.

The French, however, were in no condition to follow up their advantage. They had seen more of the slaughter than their adversaries, and except the emperor and Davout all seem to have been completely shaken. Even in Davout's command, always the steadiest in danger, the limit of endurance had been passed, for when about 5 P.M. the advanced patrols of the archduke Johann's force appeared on their flank, panic on a scale hitherto unknown in the Grande Armée seized the whole right wing, and Napoleon had to confess that no further advance was possible with these men for several days.

Berndt (Zahl im Kriege) gives the following figures. French, 161,700 (including 39,000 cavalry) and 450 guns engaged, of whom 25,000 men were killed and wounded, 7000 missing (16%); 11 guns and 12 eagles and colours were lost. Austrians,
The wagtail *Motacilla lugubris* is a common and generally distributed species in the British Islands, and common throughout northern Europe, but migrating southwards over a relatively narrow range in winter. The white wagtail, *M. alba* of Linnaeus, has a wide range in Europe, Asia and Africa, visiting England almost yearly, and chiefly differing from the ordinary British in its lighter-coloured tints—the cock especially having a clear grey instead of a black back. Three other species occur in England, but the subfamily with several genera and very many species ranges over the Old World, except Australia and Polynesia, whilst the Asiatic species reach North-West America.

Wagtails are generally parti-coloured birds, frequenting streams and stagnant water, and feeding on seeds, insects, worms, small molluscs and crustaceans. The bill is thin and elongated, and the tail is very long. The nests are made of moss, grass and roots, with a lining of hair and feathers; four to six eggs are laid, bluish white or brown, or yellowish with spots and markings.

The genus *Motacilla* (an exact rendering of the English “wagtail,” the Dutch *Kwikstaart*, the Italian *Cotidiemola* and other similar words), which, as originally founded by Linnaeus, contained nearly all the “soft-billed” birds of early English ornithologists, was restricted by various authors in succession, following the example set by Scopoli in 1769, until none but the wagtails remained in it.

**Wahhābīs**, a Mahomedan sect, the followers of Ibn 'Abd ul-Wahhāb, who instituted a great reform in the religion of Islam in Arabia in the 18th century. Mahmohmed Ibn 'Abd ul-Wahhāb was born in 1691 (or 1705) at al-Jūfàtā of the Nejd in central Arabia, and was of the tribe of the Bāni Tamīm. He studied literature and jurisprudence of the Hanifite school. After making the pilgrimage with his father, he spent some further time in the study of law at Medina, and resided for a while at Isfahān, whence he returned to the Nejd to undertake the work of a teacher. Aroused by his studies and his observation of the luxury in dress and habits, the superstitions and pilgrimages to shrines, the use of omens and the worship given to Mahomet and Mahomedan saints rather than to God, he began a mission to proclaim the simplicity of the early religion founded on the Koran and Sunna (i.e. the manner of life of Mahomet). His mission in his own district was not attended by success, and for long he wandered with his family through Arabia, until at last he settled in Dārā-īlyān, or Dārāy (in the Nejd), where he succeeded in converting the greatest notable, Mahmohmed Ibn Sa‘ūd, who married his daughter, and so became the founder of an hereditary Wahhābī dynasty. This gave the missionary the opportunity of following the example of Mahmohmed himself in extending his religious teaching by force. His instructions in this matter were strict. All unbelievers (i.e. Moslems who did not accept his teaching, as well as Christians, &c.) were to be put to death. Immediate entrance into Paradise was promised to his soldiers who fell in battle, and it is said that each soldier was provided with a written order from Ibn 'Abd ul-Wahhāb to the gate-keeper of heaven to admit him forthwith.

In this way the new teaching was established in the greater part of Arabia until its power was broken by Mahmohet Ali (see Arabia: History). Ibn 'Abd ul-Wahhāb is said to have died in 1791.

The teaching of ul-Wahhāb was founded on that of Ibn Taimiyya (1263-1328), who was of the school of Ahmad ibn Hanbal (q.v.). Copies of some of Ibn Taimiyya's works made by ul-Wahhāb are now extant in Europe, and show a close study of the writer. Ibn Taimiyya, although a Hanbalite by training, refused to be bound by any of the four schools, and claimed the power of a *muqāddam*, i.e. of one who can give independent decisions. These decisions were based on the Koran, which, like Ibn Hazm (q.v.), he accepted in a literal sense, on the Sunna and Qiyās (analogy). He protested strongly against all the innovations of later times, and denounced as idolatry the visiting of the sacred shrines and the invocation of the saints or of Mahomet himself. He was also a bitter opponent of the Sunnis of his day. The Wahhābīs also believe in the literal sense of the Koran and the necessity of deducing one's duty from it apart from the decisions of the four schools. They also pointed to the abuses current in their times as a reason for rejecting the doctrines and practices founded on *Hijād*, i.e. the universal command of the believer or their teachers (appear in GREEN RELIGIONS). They forbid the pilgrimage to tombs and the invocation of saints. The severe simplicity of the Wahhābīs has been remarked by travellers in central Arabia. They attack all luxury, loose administration of justice, all laxity against infidels, addiction to wine, impurity and treachery. Under 'Abd ul-Azīz they instituted a form of Bedouin (Bedawi) commonwealth, insistent on the observance of law, the payment of tribute, military conscription for war against the infidel, internal peace and the rigid administration of justice in courts established for the purpose.

It is clear that the claim of the Wahhābīs to have returned to the earliest form of Islam is largely justified; Burckhardt (vol. ii. p. 172) says, "The only difference between his (i.e. ul-Wahhāb's) sect and orthodox Turks, however improperly so termed, is that the Wahhypas rigidly follow the same laws which the others neglect or have ceased altogether to observe." Even orthodox doctors of Islam have confessed that in Ibn 'Abd ul-Wahhāb's writings there is nothing but what they themselves hold. At the same time the fact that so many of his followers were rough and unthinking Bedouins has led to the over-emphasis of the most points of practice, so that they often appear to observers to be characterized chiefly by a strictness (real or fancied) in such matters as the prohibition of silk for dress, or the use of tobacco, or of the rosary in prayer.

**WAL,** a town in Satara district, Bombay, ou the Kistna river. Pop. (1901) 13,089. The river of Hindoo pilgrimage, with a large Brahman population, the river being lined with temples and bathing ghats. In the neighbourhood are Buddhist caves.

**Wailingen,** a town in Germany, in the kingdom of Württemberg, in the centre of a fruitful vine-growing district on the Rems, 10 m. N.E. from Stuttgart by the main line of railway to Nuremberg via Nördlingen and at the junction of a branch to Hesselhent. *Pop. (1905) 5097.* It has two Evangelical churches, one of which is a fine Gothic structure of the 15th century, restored in 1866, a Roman Catholic church and a modern town hall. Its industries, which include the making of pottery and silk, are rapidly increasing. The town is free.

Wailingen is mentioned in the 9th century, when it had a palace of the Carolingian sovereigns. Subsequently it belonged to the dukes of Franconia, and gave a surname to the emperor Conrad II. It was in this way that the Hohenstaufen family, which was descended in the female line from Conrad, received the name of Wailingen, corrupted by the Italians into Gibelline.

**Waily, Noël François de** (1724-1801), French grammatian and lexicographer, was born at Amiens on the 31st of July 1724. His life was spent in Paris, where for many years he carried on a school which was extensively patronized by foreigners who wished to learn French. In 1754 he published *Principes généraux de la langue française*, which revolutionized the teaching of grammar in France. The book was adopted as a textbook by the university of Paris and generally used throughout France, an abstract of it being prepared for primary educational purposes.

**Wagtail—Waily**

128,600 (including 14,600 cavalry) men and 410 guns engaged; losses, 19,110 killed and wounded, and 6,740 missing (20%); 9 guns and one colour were lost. The casualties in general officers were unusually severe, 21 French and 15 Austrians being killed and 27 wounded.

---

*Wagtail* (Wagster and Wagstyt, 15th century fide T. Wright, *Vol. Vocabulary*, ii. 221, 253; Uuagatale, Turner, 1544, p. 53), the popular name for birds of the subfamily *Motacillinae*, which, together with the *Anthicine* (see PRTR), form the passerine family *Motacillidae*.

The white wagtail, *M. albo* of Linnaeus, has a wide range in Europe, Asia and Africa, visiting England almost yearly, and chiefly differing from the ordinary British in its lighter-coloured tints—the cock especially having a clear grey instead of a black back. Three other species occur in England, but the subfamily with several genera and very many species ranges over the Old World, except Australia and Polynesia, whilst the Asiatic species reach North-West America.
In 1771 de Waill published *Moyens simples et raisonnés de diminuer les imperfections de notre orthographe*, in which he advocated phonetic spelling. He was a member of the Institute from its foundation (1793), and took an active part in the preparation of the Dictionnaire de l'Académie. His works, in addition to those cited, include L'Orthographe des dames (1785) and Le Nouveau Vocabulaire français, ou abrégé du dictionnaire de l'Académie (1801). He died in Paris on the 7th of April 1801.

WAINEWRIGHT, THOMAS GRIFFITHS (1794–1842), English journalist and subject-painter, was born at Chiswick in October 1794. He was educated by his distant relative Dr Charles Burney, and served as an orderly officer in the guards, and as cornet in a yeomanry regiment. In 1819 he entered on a literary life, and began to write for the *Literary Pocket-Book, Blackwood's Magazine* and *The Foreign Quarterly Review*. He is, however, most definitely identified with *The London Magazine*, to which, from 1820 to 1823, he contributed some smart but flippant art and other criticisms, under the signatures of "Janus Weathercock," "Egmont Bonmout" and "Herr Vinkvooms." He was a friend of Charles Lamb—who thought well of his literary productions, and in a letter to Bernard Barton, styles him the "kind, light-hearted Wainewright"—and of the other brilliant contributors to the journal. He also practised as an artist, designing illustrations to Chamberlayne's poems, and from 1821 to 1825 exhibiting in the Royal Academy figure pictures, including *The Witches from Undine* (1821), "Paris in the Chamber of Horrors," and *the "Milkmaid's Wagen"*. Ovalds's and other extravagant habits, Wainewright's affairs became deeply involved. In 1839 he incurred the life of his sister-in-law in various offices for a sum of £18,000, and when she died, in the December of the same year, payment was refused by the companies on the ground of misrepresentation. Wainewright retired to France, was seized by the authorities as a suspected person, and imprisoned for six months. He had in his possession a quantity of strychnine, and it was afterwards found that he had destroyed, not only his sister-in-law, but also his uncle, his mother-in-law and a Norfolkshire friend, by this poison. He returned to London in 1837, but was at once arrested on a charge of forging, thirteen years before, a transfer of stock, and was sentenced to transportation for life. He died of apoplexy in Hambur Town hospital in 1853.

The *Essays and Criticisms* of Wainewright were published in 1880, with an account of his life, by W. Carew Hazlitt; and the history of these writings suggested to Dickens his story of *Hunted Down* and to Bulwer Lytton his novel of *Lucretia*. His career as an artist and poisoner, has interested letter-day writers, notably Oscar Wilde in "Pen, Pencil and Poison" (*Fortnightly Review*, Jan. 1899), and A. C. Swinburne *In T. S. Seccombe's Twelve Bad Men* (1894).

WAINGANGA, a river of India, flowing through the Central Provinces in a very winding course of about 560 m. After joining the Wardha the united stream, known as the Pranhita, ultimately falls into the Godavari.

WAISCOT, properly a superior quality of oak, used for fine panel work, hence such panel-work as used for the lining or covering of the interior walls of an apartment. The word appears to be Dutch and came into use in English in the 16th century, and occurs in lists of imported timber. The Dutch word *waagen-schot*, adapted in English as *waungschoot, weynschoot* (Hakluyt, *Voyages*, i. 173, has "boards called waungschoot"), was applied to the best kind of oak, well-grained, not liable to warp, and free from knots. The form shows that it was, in popular etymology, formed from *wagen* (i.e. *wain*, wagon) and *schoot*, a term which has a large number of meanings, such as shot, cast, partition, an enclosure of boards, cf. "sheet," and was applied to the fine wood paneling used in coaching-buildings. This is, however, doublet, and relations have been suggested with Dutch *weeg*, wall, cognate with O. Eng. *wah*, wall, or with M. Dutch *waeghe*, Ger. *Wage*, wave, the reference being to the grain of the wood when cut. The term "waiscot" is sometimes wrongly applied to a "dado," the lining, whether of paper, paint, panels, *waenschoot", or a lower portion of the walls of a room. A "dado" (*Ital. dado*, die, cube; Lat. *datum*, something given, a die for casting lots; cf. O. Fr. *det*, mod. *dé*, Eng. *die* "die") meant originally the plane-faced cube on the base of a pedestal between the mouldings of the base and the cornice, hence the flat surface between the plinth and the capping of the wooden lining of the lower part of a wall, representing a continuous pedantel.

WAIST, the middle part of the human body, the portion lying between the ribs and the hip-bones, comprising the compressible part of the trunk. The word "waist" is also a general name of any part of a draper's of other objects, particularly to the narrowest portion of musical instruments of the violin type and to the centre of a ship. The word appears in the M. Eng. as *waist*, "a waste of a man's mynd." (*Prompt. parv. c. 1440*), and is developed from the O. Eng. *waestm*, growth, the "waist" being the part where the growth of a man is shown and developed; cf. Icel. *vástr*, stature; Dan. *vaest*, size, growth, &c. It is thus to be derived from the O. Eng. *weaxan*, "to grow, wax.

WAITE, MORRISON REMICK (1816–1888), American jurist, was born at Lyme, Connecticut, on the 20th of June, 1816, the son of Henry Matson Waite (1787–1856), who was judge of the superior court and associate judge of the supreme court of Connecticut in 1834–1854 and chief justice of the latter in 1854–1857. He graduated at Yale in 1837, and soon afterwards removed to Maumee City, Ohio, where he studied law in the office of Samuel L. Young, and was admitted to the bar in 1839. In 1850 he removed to Toledo, and he soon came to be recognized as a leader of the state bar. In politics he was first a Whig and later a Republican, and in 1849–1850 he was a member of the state senate. In 1871, with William M. Evarts and Caleb Cushing, he was appointed to the supreme bench of the United States. He presided over the "Alabama" Tribunal at Geneva, and in 1874 he presided over the Ohio constitutional convention. In the same year he was appointed by President U. S. Grant to succeed Judge Salmon P. Chase as chief-justice of the United States Supreme Court, and he held this position until his death at Washington, D.C., on the 23rd of March 1888. In the cases which grew out of the Civil War and Reconstruction, and especially in those which involved the interpretation of the Thirteenth, Fourteenth and Fifteenth amendments, he sympathized with the general tendency of the court to restrict the further extension of the powers of the Federal government. He concurred with the majority in the *Head Money Cases* (1882), the *Ku-Klux Case* (*United States v. Harris*, 1882), the *Civil Rights Cases* (1883) and the *Jaillard v. Greenman* (legal tender) *Case* (1883). Among his own most important decisions were those in the *Enforcement Act Cases* (1875), the *Sinking Fund Case* (1878), the *Railroad Commission Cases* (1886) and the *Telephone Cases* (1887).

WAITHMAN, ROBERT (1764–1833), Lord Mayor of London, was born at Wrexham in 1764. After being employed for some years in the London offices of the United East India Company, he opened a shop of his own, and made a considerable fortune. In 1818 he was returned to parliament, as a liberal, for the city of London. He lost his seat at the election of 1820, but regained it in 1826, and retained it till his death, taking part vigorously in the parliamentary debates, and strenuously supporting reform. In 1823 he was Lord Mayor of London. Waithman died in London on the 6th of February 1833. An obelisk erected by his friends in Ludgate Circus, London, adjoining the site of his first shop, commemorates his memory.

WAITS (A.S. *waet*, to "wake" or "watch"), the carol-singing and minstrel musicians who parade the streets at night at Christmas time. The earliest waits (those of the 14th and 15th centuries) were simply watchmen who sounded horns or even played a tune on a flute or flageolet to mark the hours. This appears to have been known as "piping the watch." The black book of the royal household expenses of Edward IV., under date 1478, provides for "a wayte, that myghtly from Mychelmas to Shreve Thordsayle pipe the watch within this courte fowre tymes; in the somere nightes three tymes and maked bon gayte at every chambr Argentina, as well as in the yeares of peace as of poyntes or pillers." Elaborate orders as his housing. Thus he was to eat in the hall with the minstrels and was to sup off half a loaf and half a gallon of ale. During his actual attendance at court he was to receive fourpence halfpenny a day or less in the discretion of the steward of the
household. He had a lively given him and during illness an extra allowance of food. Besides "piping the watch" and guarding the palace against thieves and fire, this wait had to attend at the installation of knights of the Bath. The northern and all the chief boroughs had their corporation waits certainly from the early 16th century, for in the privy purse accounts of Henry VIII. occurs (1532) the entry " Item, the XI daye (of October) paid to the waytes of Canterbury in reward ... vjs. vjd." In 1582 Dudley, earl of Leicester, writes to the corporation of London asking that a servant of his should be admitted to the city waits. These borough waits appear, however, to have been more nearly akin to the medieval troubadours or minstrels who played to kings and nobles at and after the evening meal. The duties of the bialdow war 3 which included playing before the mayor during his annual progress through the streets and at city dinners, seem to have been typical of all 16th- and 17th-century city waits. The London waits had a special uniform of blue gowns with red sleeves and caps, and wore a silver collar or chain round the neck. In the 16th and early 17th century the ordinary street watchmen appear to have arrogated to themselves the right to serenade householders at Christmas time, calling round on Boxing Day to receive a gratuity for their tunefulness as well as their watchfulness. When in 1829 their place as guardians of the city's safety was taken by police, it was left for private individuals to keep up the custom.

WAITZ, GEORGE (1813-1886), German historian, was born at Flensburg, in the duchy of Schleswig, on the 9th of October 1813. He was educated at the Flensburg gymnasium and the universities of Kiel and Berlin. The influence of Ranke early diverted him from his original purpose of studying law, and while still a student he began that series of researches in German medieval history which was to be his life's work. On graduating at Berlin in August 1836, Waitz went to Hanover to assist Pertz in the publication of the Monumena Germaniae historica; and the energy and learning he displayed in that position won him a summons to the chair of history at Kiel in 1842. The young professor soon began to take an interest in politics, and in 1846 entered the provincial diet as representative of his university. His leanings were strongly German, so that he became somewhat obnoxious to the Danish government, a fact which made an invitation in 1847 to become professor of history at Göttingen peculiarly acceptable. The political events of 1848-1849, however, delayed his appearance in his new post. He threw himself into the work with all his former vigour, and took journeys to England, France, and Italy to collate works preserved in these countries. He died at Berlin on the 24th of May 1886. He was twice married— in 1842 to a daughter of Schelling the philosopher, and in 1858 to a daughter of General von Hartmann.

Waitz is often spoken of as the chief disciple of Ranke, though perhaps in general characteristics and mental attitude he has more affinity with Pertz or Dahlmann. His special domain was medieval German history, and he rarely travelled beyond the confines of the North Sea.

Waitz's chief works, apart from his contributions to the Monumena, are:—Deutsche Verfassungsgeschichte (8 vols., Kiel, 1844-1878; 2nd ed., 2 vols. only, 1865-1870); Schleswig-Holsteinische Geschichte (11 vols., Kiel, 1859-1888); Lübeck unter Jürgen Wallenower und die europäische Politik (3 vols.; Berlin, 1855-1856); and Grundzüge der Politik (Kiel, 1862). Among his smaller works, which, however, indicate the line of his researches, are the following:—Jahrbücher des deutschen Rechts unter Heinrich I. (Berlin, 1837, 3rd ed., 1885); Über das Leben und die Lehre des Ulfega (Hanover, 1840); Das alte Recht der slawischen Franken (Kiel, 1846); Untersuchungen über Karl dem Großen bis Maximilian (Berlin, 1872). In conjunction with his school he was a leading spirit in the publication of the Forschungen zur deutschen Geschichte (Munich, 1852 sqq.), and in the Norddeutsche Studien, published in the proceedings of the Schleswig-Holsteinische Historische Gesellschaft (Kiel, 1884-1885). A Bibliographische Übersicht über Waitz's Werke was published by E. Steindorff at Göttingen in 1886.

WAITZ, THEODOR (1821-1864), German psychologist and anthropologist, was born at Gotha on the 17th of March 1821. Educated at Leipzig and Jena, he made philosophy, philology and mathematics his chief studies, and in 1848 he was appointed professor of philosophy in the university of Marburg. He was a severe critic of the philosophy of Fichte, Schelling and Hegel, and considered psychology to be the basis of all philosophy. His researches brought him into touch with anthropology, and he will be best remembered by his monumental work in six volumes, Die Anthropologie der Naturvölker. He died on the 21st of May 1864 at Marburg.

In addition to his Anthropologie, the first four volumes of which appeared at Leipzig, 1859-1864, the last two posthumously, he published Grundlegung der Psychologie (1846); Lehrbuch der Psychologie abgekürztes 2. Auflage (1852); Altertumliche Pflanzenkunde (1852); and a critical edition of the Organon of Aristotle (1844).

WAKE, THOMAS (1297-1340), English baron, belonged to a Lincolnshire family which had lands also in Cumberland, being the son of John Wake (d. 1300), who was summoned to parliament as a baron in 1295, and the grandson of Baldwin Wake (d. 1282), both barons and warriors of repute. Among Thomas Wake's guardians were Piers Gaveston and Henry, earl of Lincoln, whose daughter Blanche (d. 1357) he married before her marriage to the Black Prince. The lady Wake was at the time of her marriage the ward of Thomas, earl of Lancaster, and her husband was thus attached to the Lancastrian party, but he did not follow Earl Thomas in the proceedings which led to his death in 1322. Hating the favourites of Edward II. Wake joined Queen Isabella in 1326 and was a member of the small council which advised the young king, Edward III.; soon, however, he broke away from the queen and her ally, Roger Mortimer, and in conjunction with his father-in-law, now earl of Lancaster, he joined the malcontent barons. He was possibly implicated in the plot which cost his brother-in-law, Edmund, earl of Kent, his life in 1330, and he fled to France, returning to England after the overthrow of Isabella and Mortimer. Edward III. made him governor of the Channel Islands and he assisted Edward Bruce to invade Scotland, being afterwards sent on an errand to France. In 1341 he incurred the displeasure of the king and was imprisoned, but he had been restored and had been employed in Brittany and elsewhere when he died childless on the 31st of May 1340. His estates passed to his sister Margaret (d. 1349), widow of Edmund, earl of Kent, and to his son John (d. 1352), and later to the Holand family. Wake established a house for the Austin canons at Newton near Hull; this was afterwards transferred to Haltemprice in the same neighbourhood.

WAKE, WILLIAM (1657-1737), English archbishop, was born at Blandford, Dorset, on the 26th of January 1657, and educated at Christ Church, Oxford. He took orders, and in 1682 went to Paris as chaplain to the ambassador Richard Graham, Viscount Preston (1648-1695). Here he became acquainted with many of
the savants of the capital, and was much interested in French clerical affairs. He also collated some Paris manuscripts of the Greek Testament for John Fell, bishop of Oxford. He returned to England in 1651; in 1658 he became preacher at Gray's Inn, and in 1689 he received a canonry of Christ Church, Oxford. In 1693 he was appointed rector of St James's, Westminster. Ten years later he became dean of Exeter, and in 1705 he was consecrated bishop of Lincoln. He was translated to the see of Canterbury in 1716 on the death of Thomas Tenison. During 1718 he negotiated with leading French churchmen about a projected union of the Gallican and English churches to resist the claims of Rome (see J. H. Lupton, Archbishop Wake and the Project of Union, 1856). In dealing with nonconformity he was tolerant, and even advocated a revision of the Prayer Book if that would allay the scruples of dissenters. His writings are numerous, the chief being his State of the Church and Clergy of England...historically deduced (London, 1705). He died at Lambeth on the 24th of January 1757/8.

Sir Isaac Wake (c. 1580-1632), the diplomatist, was a kinsman of the archbishop. He commenced his diplomatic career in Venice, and for one year spent years in the Netherlands, where he was knighted in 1619, and after being sent on various special missions by James I. he was British ambassador in Paris from 1630 until his death in June 1632. Among Sir Isaac's writings is Rex Platonics, a description of how the King should conduct himself at Oxford in 1605; this was published in 1606 and has often been reprinted.

Wake (A.S. wacan, to "wake" or "watch"), a term now restricted to the Irish custom of an all-night "waking" or watching round a corpse before burial, but anciently used in the wider sense of a vigil kept as an annual church celebration in commemoration of the completion or dedication of the parish church. This strictly religious wake consisted in an all-night service of prayer and meditation in the church. These services, popularly known as "wakes," were officially termed Vigilae by the church, and appear to have existed from the earliest days of Christianity. The custom is recorded in the prayer-book as early as 1445, and the ceremonies which were observed in the churchyard before the dawn which heralded in a day devoted to feasting, dancing and sports, each parish keeping the morrow of its vigil as a holiday. Wakes soon degenerated into fairs; people from neighbouring parishes journeyed over to join in the merrymaking, and as early as Edgar's reign (958-975) the revelry and drunkenness had become a scandal. The vigilae usually fell on Sundays or saints' days, those being the days oftenest chosen for church dedications, and thus the abuse was the more scandalous. In 1445 Henry VI. attempted to suppress merrymaking with extra-sermons and a special order of Convocation ordered that the yearly "waking" should be held in every parish on the same day, viz. the first Sunday in October, but this regulation was disregarded. Wakes are specially mentioned in the Book of Sports of James I. and Charles I. among the feasts which should be observed.

Side by side with these church wakes there existed from the earliest times the custom of "waking" a corpse. The custom, as far as England was concerned, seems to have been older than Christianity, and to have been at first essentially Celtic. Doubtless it had a superstitious origin, the fear of evil spirits hurrying or even removing the body, aided perhaps by the practical desire to keep away rats and other vermin. The Anglo-Saxons called the custom lich-wake or like-wake (A.S. lic, a corpse). With the introduction of Christianity the offering of prayer was added to the mere vigil, which until then had been characterized by formal mourning chants and recitals of the life story of the dead. As a rule the corpse, with a plate of salt on its breast, was placed under the table, on which was liquor for the watchers. These private wakes soon tended to become drinking orgies, and during the reign of Edward III. the provincial synod held at Oxford proclaimed by its 10th canon the object of wakes to be the offering of prayer for the dead, and ordered that in future none but near relatives and friends of the deceased should attend. The penalty for disobedience was excommunication. With the Reformation and the consequent disuse of prayers for the dead the custom of "waking" in England became obsolete and died out. Many countries and peoples have been found to have a custom equivalent to "waking," which, however, must be distinguished from the funeral feasts pure and simple.

For detailed accounts of Irish wakes see Brand's Antiquities of Great Britain (W. C. Hazlitt's edition 1808) under "Irish Wake.

Wakefield, Edward Gibbon (1796-1862), British colonial statesman, was born in London on the 20th of March 1796, of an originally Quaker family. His father, Edward Wakefield (1774-1854), author of Ireland... Statistical and Political (1812), was a surveyor and land agent in extensive practice; his grandmother, Priscilla Wakefield (1751-1832), was a popular author for the young, and one of the introducers of savings banks. Wakefield was for a short time at Westminster School, and was brought up to his father's profession, which he relinquished on occasion of his elopement at the age of twenty with Miss Pattle, the orphan daughter of an Indian civil emigrant. The young man's relatives ultimately became reconciled to the match, and procured him an appointment as attaché to the British legation at Turin. He resigned this post in 1820, upon the death of his wife, to whom he was fondly attached, and, though making some efforts to connect himself with journalism, spent the years immediately succeeding in idleness, residing for the most part in Paris. In 1826 he appeared before the public as the hero of a most extraordinary adventure, the abduction of Miss Ellen Turner, daughter of Miss Turner, of Shrigley Park, Cheshire. Mr. Wakefield was decoyed from school by means of a forged letter, and made to believe that she could only save her father from ruin by marrying Wakefield, whom she accordingly accompanied to Greene Green. This time the family refused to condone his proceedings; he was tried with his confederates at Lancaster assizes, March 1827, convicted, and sentenced to three years' imprisonment in Newgate. The marriage, which had not been consummated, was dissolved by a special act of parliament. A disgrace which would have blasted the career of most men made Wakefield a practical statesman and a benefactor to his country at home and abroad. In 1828, however, he turned his attention while in prison to colonial subjects, and acutely detected the main causes of the slow progress of the Australian colonies in the enormous size of the landed estates, the reckless manner in which land was given away, the absence of all systematic effort at colonization, and the consequent discouragement of immigration and death of labour. He proposed to remedy this state of things by the sale of land in small quantities at a sufficient price, and the employment of the proceeds as a fund for promoting immigration. These views were described in an extraordinary article in the Morning Chronicle, and were followed by a letter from Sydney (1829), published while he was still in prison, but composed with such graphic power that it has been continually quoted as if written on the spot. After his release Wakefield seemed disposed for a while to turn his attention to social questions at home, and produced a tract on the Punishment of Death, with a terribly graphic picture of the condemned sermon in Newgate, and another on incendiariism in the rural districts, with an equally powerful exhibition of the degraded condition of the agricultural labourer. He soon, however, became entirely engrossed with colonial affairs, and, having impressed John Stuart Mill, Colonel Torrens and other leading economists with the value of his ideas, became a leading though not a conspicuous manager of the South Australian Company, by which the colony of South Australia was ultimately founded. In 1833 he published anonymously England and America, a work primarily intended to develop his own colonial theory, which is done in the appendix entitled "The Art of Colonization." The body of the work, however, is fruitful in seminal ideas, though some statements may be rash and some conclusions extravagant. It contains the distinct proposal that the transport of letters should be wholly gratuitous—the precursor of subsequent reform—and the prophecy that, under given circumstances, "the Americans would raise cheaper corn than has ever been raised." In 1836 Wakefield published the first volume of an edition of Adam Smith, which he did not complete. In 1837 the New Zealand Association was established, and he became its managing director. Scarcely, however, was this great undertaking fairly
commenced when WAKEFIELD was named a major by the Canadian government. After the war, he moved to the United States and became a prominent figure in American society. WAKEFIELD was also known for his political activities and his role in the anti-slavery movement. He was a supporter of the cause of African Americans and worked to improve their treatment and living conditions.

For an impartial examination of the WAKEFIELD system, see Leroy Beaulieu, De la colonisation des peuples modernes (3rd ed. pp. 562-575 and 696-700). See also R. Garnett's Life of WAKEFIELD (1898).

WAKEFIELD, Gilbert (1756-1801), English classical scholar and politician, was born at Nottingham on the 22nd of February 1756. He was educated at Jesus College, Cambridge (fellow, 1776). In 1778 in the debate on the government's policy of encouraging the emigration of the Irish to the new colony, he took a part, and at the close of the discussion he served to the public through The Times, 1798, to prevent its being tampered with by the government. He acted in the same spirit a few months later, when (about July 1819), understanding that the authorities intended to prevent the despatch of emigrants to New Zealand, he hurried them off on his own responsibility, thus compelling the government to annex the country just in time to anticipate a similar step on the part of France. For several years WAKEFIELD continued to direct the New Zealand Company, fighting its battles with the colonial office and the missionary interest, and secretly advising and guiding many parliamentary committees on colonial subjects, especially on the abolition of transportation. The company was by no means a financial success, and many of its proceedings were wholly unscrupulous and indefensible; its great object, however, was attained, and New Zealand became the Britain of the south. In 1846 WAKEFIELD, exhausted with labour, was struck down by apoplexy, and spent more than a year in complete retirement, writing during his gradual recovery his Art of Colonization. The management of the company had meanwhile passed into the hands of others, whose sole object was the mere accounts with the government. WAKEFIELD joined Lord Lyttelton and John Robert Godley in establishing the Canterbury settlement as a Church of England colony. A portion of his correspondence on this subject was published by his son as The Founders of Canterbury (Christchurch, 1868). As usual with him, however, he failed to retain the confidence of his coadjutors to the end. In 1853, after the grant of a constitution to New Zealand, he took up his residence in the colony, and immediately began to act a leading part in colonial politics. In 1854 he appeared in the first New Zealand parliament as extra-official adviser of the acting governor, a position which excited great jealousy, and as the mover of a resolution demanding the appointment of a responsible ministry. It was carried unanimously, but difficulties, which will be found detailed in W. Swainson's New Zealand and its Colonisation (ch. 12), prevented its being made effective until after the mover's retirement from political life. In December 1854, after a fatiguing address to a public meeting, followed by prolonged exposure to a south-east gale, his constitution entirely broke down. He spent the rest of his life in retirement, dying at Wellington on the 16th of May 1862. His eldest son, Edward Jerningham WAKEFIELD, was a New Zealand politician. Three of WAKEFIELD's brothers were also interested in New Zealand. After serving in the Spanish army, William Hayward WAKEFIELD (1803-1848) emigrated to New Zealand in 1839. As an agent of the New Zealand Land Company he was engaged in purchasing enormous tracts of land from the natives, but the company's title to the greater part of this was later declared invalid. He remained in New Zealand until his death on the 19th of September 1848. Arthur WAKEFIELD (1799-1843), who was associated with his brother in these transactions about land, was killed during a fight with some natives at Wairau, near Lyttelton, on the 21st of June 1843. The third brother was Felix WAKEFIELD (1807-1875), an engineer. WAKEFIELD was a man of large views and lofty aims, and in private life displayed the warmth of heart which commonly accompanies these qualities. His main defect was unscrupulousness: he hesitated at nothing necessary to accomplish an object, and the conviction of his untrustworthiness gradually alienated his associates, and left him politically powerless. Excluded from parliament by the fatal error of his youth, he was compelled to resort to indirect means of working out his plans by influencing public men. But for a tendency to paradox, his intellectual powers were of the highest order, and as a master of nervous idiomatic English he is second to Cobbett alone. After every deduction it remains true that no contemporary showed equal genius as a colonial statesman, or in this department rendered equal service to his country.
of the choir, the construction of the retrochoir and other works were undertaken in 1900 and consecrated in 1905 as a memorial to Dr Walsham How, the first bishop. During restoration of the spire (the height of which is 247 ft.) in 1905, records of previous work upon it were discovered in a sealed receptacle in the spire. Among the principal public buildings are the town hall (1850), in the French Renaissance style; the county hall (1898), a handsome structure with octagonal tower and dome over the principal entrance; the large corn exchange (1837, enlarged 1862), including a concert-room; the market house, the sessions house, the county offices (1896) and the prison for the West Riding; the mechanics' institution with large library, church institute and library, and the fine art institution. A free library was founded in 1895, and a statue of Queen Victoria unveiled in the Bull Ring at the same time. Benevolent institutions include the Clayton Hospital (1859), on the pavilion system, and the West Riding pauper lunatic asylum with its branches. The Elizabethan grammar school, founded in 1592, is the principal educational establishment. Among several picturesque old houses remaining, that known as the Six Chimneys, an Elizabethan structure, is the most striking.

Formerly Wakefield was the great emporium of the cloth manufacture in Yorkshire, but in the 19th century it was superseded in this respect by Leeds. Foreign weavers of cloth were established at Wakefield by Henry VII.; and Leland, writing in the time of Henry VIII., states that its "white profit standeth by coarse drapery," and that by the beginning of the 18th century it became noted for the manufacture of worsted yarn and woollen stuffs. Although its manufacturing importance is now small in comparison with that of several other Yorkshire towns, it possesses mills for spinning worsted and carpet yarns, coco-nut fibre and China grass. It has also rag-crushing mills, chemical works, soap-works and iron-works; and there are a number of collieries in the neighbourhood. Wakefield is the chief agricultural town in the West Riding, and has one of the largest corn markets in the north of England. It possesses agricultural implement and machine works, grain and flour mills, malt-works and breweries. A large trade in grain is carried on by means of the Calder, and the building of boats for inland navigation is a considerable industry.

In the vicinity of Wakefield is Walton Hall, the residence of the famous naturalist Charles Waterton (1782-1865). The parliamentary borough returns one member. The municipal borough is under a mayor, 9 aldermen and 27 councillors. Area, 4060 acres.

In the reign of Edward the Confessor, Wakefield (Wachefeld) was the chief place in a large district belonging to the king and was still a royal manor in 1866. Shortly afterwards it was granted to William, Earl Warenne, and his heirs, under whom it formed an extensive baronial liberty, extending to the confines of Lancashire and Cheshire. It remained with the Warenne family until the 14th century, when John Warenne, earl of Warenne and Surrey, having no legitimate heir, settled it on his mistress, Maud de Kelford and her two sons. They, however, pre-deceased him, and after Maud's death in 1360 the manor fell to the crown. Charles I. granted it to Henry, earl of Holland, and after passing through the hands of Sir Gervase Clifford and Sir Christopher Chichester, was purchased by the corporation of Leeds in 1693 by Edward, 1st Duke of Leeds, ancestor of the present duke, who is now lord of the manor.

In 1293-1294 William Earl Warenne received a grant of a fair at Wakefield on the vigil, day and morrow of All Saints' day. As early as 1231 the town seems to have had some form of borough organization, since in that year a burgage there is mentioned in a fine. In 1337, at the request of John de Warenne, earl of Surrey, the king granted the "good men" of the town pagavage there for three years, and in the same year the earl obtained a grant of another fair there on the vigil, day and morrow of St Oswald. There is no further indication of a borough or market. The battle of Wakefield was fought in 1460 on the banks of the river Calder just outside the town.

Leland gives an interesting account of the town in the 16th century, and while showing that the manufacture of clothing was the chief industry, says also that Wakefield is "a very quirk market town and mostly large, well served of flesh and fish both from sea and by rivers... so that all vitaille is very good and chepe there. A right honest man shall fare well for ad. a meal. ... There be plenti of se coal in the quarters about Wakefield." The corn market, which on Fridays, is of remote origin, is also held on alternate Wednesdays under charter of 1765. The town was enfranchised in 1832, and was incorporated in 1848 under the title of the mayor, aldermen and councillors of the borough of Wakefield. Before this date it was under the superintendence of a constable appointed by the steward of the lord of the manor.

Wakefield, History of Yorkshire; W. S. Banks, History of Wakefield (1871); E. Parsons, History of Leeds, &c. (1854); T. Taylor, History of Wakefield (1886).

WAKEFIELD, a township of Middlesex county, Massachusetts, U.S.A., about 10 m. N. of Boston. Pop. (1890) 6832; (1900) 9296, of whom 2347 were foreign-born; (1910) census 11,404. Wakefield is served by three branches of the Boston & Maine railway and by electric interurban railway to neighbouring towns and cities. It contains the outlying villages of Greenwood, Montrose and Boyntonville; and, larger than these, Wakefield, near the centre of the township. In this village is the town hall, the gift of Cyrus Wakefield (1811-1873), and the Beebe Town Library, founded in 1856 as the Public Library of South Reading, and later renamed in honour of Lucius Beebe, a generous patron. The town park (about 25 acres), shaded by some fine old elms, extends to the S. shore of Lake Quannapowitt and contains a soldiers' monument; and in the S. part of the township are Crystal Lake and Hart's Hill (50 acres), a public park. In the township is the Wakefield Home for Aged Women, and a Y.M.C.A. building. Manufacturing is the principal industry; and among the manufactures are rattan goods, hosieries, stones and furnaces, boots and shoes, and pianos. The value of the factory products increased from $2,647,150 in 1900 to $4,807,728 in 1905, or 81.6%. The township owns and operates the electric lighting and gas plants and the water-works.

Within the present limits of Wakefield the first settlement was made, in 1639, in that part of the old township of Lynn which in 1644 was incorporated as Reading. In 1874 the southern or "Old Parish" of Reading, which was strongly Democratic-Republican while the other two parishes were strongly Federalist, was set apart and incorporated as the town of South Reading. In 1868 the present name was adopted in honour of Cyrus Wakefield, who established the rattan works here. A portion of Stoneham was annexed to Wakefield in 1880.

WAKKERSTROOM, a town and district of the Transvaal. The district occupies part of the S.E. of the Transvaal, being bounded S. by the Orange Free State and Natal. The frontier line is in part the crest of the Drakensberg. The town of Wakkerstroom, pop. (1904) 1402, lies 18 m. E. of Volksrust and 4 m. N. of the Natal frontier. It is built on the high veld, at an elevation of 5900 ft., and possesses a bracing climate. The neighbouring hills rise over 7000 ft. The plain on which the town stands is drained by the Siang and other tributaries of the Buffalo affluent of the Tugela. The district, a fertile agricultural region, was organized as one of the divisions of the Transvaal in 1850 by President M. W. Pretorius, and after his Christian names the town was called Martinhus-Wessel-Stroom, an unwieldy designation dropped in favour of Wakkerstroom. During the war of 1880-81 the town was unsuccessfully besieged by the Boers. In 1903 a small portion of the district was annexed to Natal.

WAKLEY, THOMAS (1795-1862), English medical and social reformer, was born in Devonshire, and was early apprenticed to a Taunton apothecary. He then went to London and qualified as a surgeon, setting up in practice in Regent Street, and marrying a lady named Tull. Goodfellow, a merchant, and a governor of St Thomas's Hospital. All through his career Wakley proved to be a man of aggressive personality, and his experiences in this respect had a sensational beginning. In August 1820 a gang of men who had some grievance against him burnt down his
WALACHIA, WALCH

251

house and severely wounded him in a murderous assault. The whole affair was obscure, and Walcky was then suspected, unjustly, of setting fire to his own houses; but he won his case against the insurance company which contested his claim. He became a friend of William Cobbett, with whose radicalism he was in sympathy. In 1833 he started the well-known medical weekly paper, the Lancet, and began a series of attacks on the jobbery in vogue among the practitioners of the day, who were accustomed to treat the medical profession as a close borough. In opposition to the hospital doctors he insisted on publishing reports of their lectures and exposing various malpractices, and he had to fight a number of lawsuits, which, however, only increased his influence. He attacked the noble constitution of the Royal College of Surgeons, and obtained so much support from among the general body of the profession, now roused to a sense of the abuses he exposed, that in 1827 a petition to parliament resulted in a return being ordered of the public money granted to it. But reform in the college was slow, and Walcky now set himself to rouse the House of Commons from within. He became a radical candidate for parliament, and in 1835 was returned for Finsbury, retaining his seat till 1852. In this capacity, and also as censor for West Middlesex—an appointment he secured in 1839—he was indefatigable in upholding the interests of the working-classes and advocating humanitarian reforms, and was pursuing his campaign against medical restrictions and abuses; and he made the Lancet not only a professional organ but a powerful engine of social reform. He died on the 16th of May 1862, leaving three sons, the proprietorship of the Lancet remaining in the family.

See Samuel Squire Sprigge, Life and Times of Thomas Walcky (1897).

WALACHIA, or WALACHIA, a former principality of southeastern Europe, constituting, after its union with Moldavia on the 9th of November 1859, a part of Romania (q.v.).

WALACHIA THEOLOGICAL, Strabo (i.e. "squint-eyed") (d. 849), German monk and theological writer, was born about 808 in Swabia. He was educated at the monastery of Reichenau, near Constance, where he had for his teachers Tattu and Wettin, to whose visions he devotes one of his poems. Then he went on to Fulda, where he studied for some time under Hrabanus Maurus before returning to Reichenau, of which monastery he was made abbot in 838. There is a story—based, however, on no good evidence—that Walachia devoted himself so closely to letters as to neglect the duties of his office, owing to which he was expelled from his house. From this event it seems that the real cause of his flight to Spires was that, notwithstanding the fact that he had been tutor to Charles the Bald, he espoused the side of his elder brother Lothair on the death of Louis the Pious in 840. He was, however, restored to his monastery in 842, and died on the 18th of August 849, on an embassy to his former pupil. His epitaph was written by Hrabanus Maurus, whose elegiacs praise him for being the faithful guardian of his monastery.

Walachia Strabo's works are theological, historical, and poetical. Of his theological works the most famous is the great exegetical compilation which, under the name of Glosa ordinaria or the Glossa, remained for some 500 years the most widespread and important quarry of medieval biblical science, being reproduced in numerous editions as late as the 17th century (see Hist. litter. de la France, t. v. p. 50 ff.). The oldest known copy, in four folio volumes, of which the date and origin are unknown, but which is certainly almost entirely Walachia's work, gives us his method. In the middle of the pages is the Latin text of the Bible; in the margins are the glosses, consisting of a very full collection of patristic extracts in alphabetical order and explanation of them, passing into the first twenty psalms (published by Pez in Anecdota nova, iv.) and an epitome of Hrabanus Maurus's commentary on Leviticus. An Expositio quattuor Evangeliorum is also ascribed to Walachia. Of singular interest also is his Leet, a longer commentary on the first three Gospels, written between 840 and 842 and dedicated to Regenbert the librarian. It deals in 32 chapters with ecclesiastical usages, churches, altars, prayers, benefices, and so forth, and at the same time he introduces into his explanations the current German expressions for the things he is treating of, with the apology that Solomon had set him the example by keeping monkeys as well as peacocks at his court. Of special interest is the fact that Walachia, in his exposition of the Mass, shows no trace of any belief in the doctrine of transubstantiation taught by his contemporaries; but it is not certain according to him, Christ gave to his disciples the sacraments of his Body and Blood in the substance of bread and wine, and taught them to celebrate them as a memorial of his Passion.

WALACHIA, or WALACHIA, the hallowed home of Vita sanctorum Galli, which, though written nearly two centuries after this saint's death, is still the primary authority for his life, and a much shorter Life of St Othmar, abbot of St Gall (d. 955), is appended to Nummulides, the Monumenta Germaniae hist. Petiae Latini, ii. (1854), p. 259 ff. Walachia's poetical works also include a short life of St Blaize, a high-born monk of Iona, murdered on the high-road to Rome; and a Libra de visionibus Wettini. This last poem, like the two preceding ones written in hexameters, was composed at the command of "Fathers" Adalgesus, and based upon the prose narrative of the Histoire de son frere, abbot of Reichenau from 806 to 827. It is dedicated to Wettin's brother Grimald. At the time he sent it to Grimald Walachia had, as he himself tells us, hardly passed his eighteenth year, and he begs his correspondent to revise his verses, because "it is not lawful for a monk to hide anything from his abbot," he fears he may be beaten with deserved stripes. In this curious vision Wettin saw Charles the Great suffering purgatorial tortures for abetting the sins of his noble but incorruptible parents. The tale is not indeed introduced into the actual text, but "Carolus Imperator," form the initial letters of the passage dealing with this subject. Many of Walachia's other poems are in verse (i.e. Charles, Louis, Pippin, Judith, &c.) and to friends (Einhard, Grimald, Hrabanus Maurus, Tatutto, Ebbbo, archbishop of Reims, Drogo, bishop of Metz, &c.). His most famous work, however, is Imagini Thraciae, a dialogue, or a translation of a little garden that he used to tend with his own hands, and is largely made up of descriptions of the various herbs he grows there and their medicinal and other uses. Sage holds the place of honour; then come the antidote of poisons; and so on through melons, fennel, lilies, poppies, and many other plants, to wind up with the rose, "which in virtue and scent surpasses all other herbs, and may rightly be called the flower of flowers." The curious position: Pœ
dogma takes the form of a dialogue; it was inspired by an equestrian statue of Theodoric the Great which stood in front of Charlemagne's palace at Aix-la-Chapelle.

In the miscellaneous works of Walachia, such as exegiheriical, historical, and poetical works, and of writings dealing with them, see Pothenst, Bibliotheca hist. med. aevi (Berlin, 1894), p. 1102 ff. Walachia's works are published in Migne's Patrologia Latina, vols. citii, and citii. For further references see the dictionary of Heto, abbot of Reichenau from 806 to 827.

WALCH, JOHANN GEORG (1693-1775), German theologian, was born on the 17th of June 1693 at Meiningen, where his father, Georg Walch, was general superintendent. He studied at Leipzig and Jena, amongst his teachers being J.-F. Buddeus (1667-1729), whose only daughter he married. He published in 1716 a work, Historia critica Latinae linguae, which soon came into wide use. Two years later he published an extraordinary historical and philological work on the genius of Jena. In 1719 he was appointed professor extraordinarius of rhetoric, in 1721 professor of poetry, and in 1724 professor extraordinarius of theology. In 1728 he became professor ordinarius of theology, and in 1750 professor primarius. His theological position was that of a very moderate orthodox, which had been influenced greatly by the philosophy and controversies of the Deistic period. His university lectures and published works ranged over the wide fields of church history in its various branches, particularly the literature and the controversies of the church, dogmatics, ethics and pastoral theology. He died on the 13th of January 1777. His most valuable work was Bibliotheca theologica (1757-1769); Bibliotheca pioraria (1770, new ed. 1834); his edition of Luther's works in 24 vols. (1740-1742); Historische und theologische en-lutherischen Kirchen erunciiren (3 vols. 1733, ff.); the companion work to this, Einleitung in die Religionsstreitigkeiten der en-lutherischen Kirchen (1730-1739), and Philosophisches Lexikon (1726, 4th ed. 1775). His life and works are briefly reviewed by Grimmelshausen in Satz. Leben und Charakter des Kirchenrats J. G. Walch, published anonymously by his son C. W. F. Walch (Jena, 1777). C. Wilhelm Gass, Protestantismus Dogmatik, i. p. 205 sq. His son, JOHANN ERNST WALCH (1727-1782), studied Semitic languages, and also natural science and mathematics. In 1749 he published Einleitung in die Harmonie der Musik, a preface and a few additions, and divided Einhard's Vita Caroli into chapters, adding an introduction.
Evangelisten, and in 1750 he appointed professor extraordinary of theology. Five years later he became professor of logic and metaphysics. In 1750 he exchanged this for a professorship of rhetoric and poetry. Amongst other theological works he published Dissertatio in Acta Apostolorum (1756-1761); Antiquitates symbolicae (1772); and after his death appeared Observationes in Mathesum ex Graecis inscriptionibus (1779). He also published a periodical Der Naturforscher (1774-1778), and during the years 1749-1756 took an active part in editing the Zeitschriften und gelehrten Sachen.

See article in Allgemeine deutsche Biographie.

Another son, Christian Wilhelm Franz (1726-1784), was educated at Jena under his father's direction, and as early as 1745-1747 lectured in the university in branches of exegesis, philosophy and history. He then travelled with his brother, J. E. I. Walch, for a year in Holland, France, Switzerland and Italy. On his return he was in 1750 made professor extraordinary of philosophy in Jena, but in 1758 he accepted an invitation to become professor of theology at Göttingen. Here in 1758-1773 he became professor extraordinary for theology, and three years later received an ordinary professorship. He lectured on dogmatics, church history, ethics, polemics, natural theology, symbols, the epistles of Paul, Christian antiquities, historical theological literature, ecclesiastical law and the fathers, and took an active interest in the work of the Göttinger Societät der Wissenschaften. In 1766 he was appointed professor primarius. His permanent place amongst learned theologians rests on his works on church history. Semler was much his superior in originality and boldness, and Mosheim in clearness, method and elegance. But to his son was due a wider and more exact knowledge of the facts and impartial examination of the facts and the authorities at first hand, and to his exact presentation of the works and their facts illustrating them, and careful discussion of the most minute details, all succeeding historians are indebted. His method is critical and pragmatic, "pursuing everywhere the exact facts and the supposed causes of the outward changes of history," leaving wholly out of sight the deeper moving principles and ideas which influence its course. He died on the 10th of March 1784.

His principal work was his Entwurf einer vollständigen Historie der Ketzereien, Spaltungen, und Religionstreitigkeiten, bis auf die Zeit der Reformation (11 vols., Leipzig, 1762-1785). Of his other works that of Archontologia, or History and doctrine of the gnostic-lutherian association, as a beacon, is worth being seen (1753). Entwurf einer vollständigen Historie der römischen Päpste (1756, 2nd ed. 1758; Eng. trans. 1759), Entwurf einer vollständigen Historie der Kirchen und Kirchenlehrer (1759), Grundriss der Kirchengeschichte des Neuen Testaments (1751, 2nd ed. 1773, 3rd ed. 1792), Bibliotheca Symbolica vetus (1770), Kritische Untersuchungen vom Gebrauch der heiligen Schrift unter den alten Christen (1797), occasioned by the controversy between G. E. Lessing and J. W. Goethe, and at which Lessing began an elaborate reply just before his death.

A third son, Karl Friedrich (1734-1799), devoted himself to the study of law, and became professor of law at Jena in 1759. His most important works were Introductio in controversias juris civilis recensioris (Jena, 1771) and Geschichte der in Deutschland geltenden Rechte (Jena, 1780). He died on the 20th of July 1799.

WALCOTT, CHARLES DOOLITTLE (1806— ), American geologist, was born at the village of New York Mills, New York, on April 30, 1806. He was the son of John Doolittle and his wife, Polly Temperly. In 1826 he was appointed assistant on the New York State Survey, and in 1839 assistant geologist on the United States Geological Survey; in 1888 he became one of the paleontologists in charge of the invertebrata, in 1893 chief paleontologist, and in 1894 director of the Geological Survey. In 1907 he was appointed Secretary of the Smithsonian Institution. As president of the Geological Society of Washington he delivered in 1894 an important address on The United States Geological Survey. He added largely to contemporary knowledge of the fauna of the Older Palaeozoic rocks of North America, especially with reference to the crustacea and brachiopoda; he dealt also with questions of ancient physical geography and with mountain structure.

His more important works include "Palaontology of the Eureka district" (Mon. U.S. Geol. Survey, 1884); "Cambrian faunas of North America" (Bull. U.S. Geol. Surv., 1890); and "Paleontology of the Lower Cambrian or Olenellus Zone" (1890, issued 1894), and Fossil Mollusca (Mon. U.S. Geol. Survey, 1898).

WALDÖCK—WALDECK-PYRMONT, a principality of Germany and a constituent state of the German empire, consisting of two separate portions lying about 30 m. apart, viz. the county of Prussia, especially with reference to the crustacea and brachiopoda; he dealt also with questions of ancient physical geography and with mountain structure.

His more important works include "Palaontology of the Eureka district" (Mon. U.S. Geol. Survey, 1884); "Cambrian faunas of North America" (Bull. U.S. Geol. Surv., 1890); and "Paleontology of the Lower Cambrian or Olenellus Zone" (1890, issued 1894), and Fossil Mollusca (Mon. U.S. Geol. Survey, 1898).

"Landesdirektor," which the state officials take the oath of allegiance to the king of Prussia. The prince of Waldeck reserves his whole right as head of the church, and also the right of granting pardons, and in certain circumstances may exercise a veto on proposals to alter or enact laws. Education and similar matters are thus all conducted on the Prussian model; a previous convention had already handed over military affairs to Prussia. The budget for 1910 showed a revenue of £57,000 and a like expenditure. The public debt was £70,710, paying interest at 3½%. The prince is supported by the income derived from crown lands. As regards the administration of justice, Waldeck and Pymont belong to the districts of Cassel and Hanover respectively.

The princes of Waldeck-Pymont are descendants of the counts of Schwabenberg, the earliest of whom known to history was one Widukind (d. 1137). His son Volkwin (d. 1178) acquired by marriage the county of Waldeck, and his line was divided into two branches, Waldeck and Landau, in 1397. In 1428 the landgrave of Hesse obtained rights of suzerainty over Waldeck, and the claims arising from this action were not finally disposed of until 1847, when it was decided that the rights of Hesse over Waldeck had ceased with the dissolution of the Holy Roman Empire. The Landau branch of the family became extinct in 1712. In 1807 Waldeck joined the confederation of the Rhine, and in 1815 entered the German federation. Its first constitution was granted in 1816 by Prince George II. (d. 1845). Prince Frederick (b. 1865) succeeded his father, George Victor (1831–1893), as ruler on the 12th of May 1893. The most important fact in the recent history of the principality is its connexion with Prussia, to which reference has already been made.

Waldeck-Rousseau, Pierre Marie René Ernest (1816–1904), French statesman, was born at Nantes on the 2nd of December 1836. His father, René Valdecek-Rousseau (1809–1883), a barrister at Nantes and a leader of the local republican party, figured in the revolution of 1848 as one of the deputies returned to the Constituent Assembly for Loire Inférieure. With Jules Simon, Louis Blanc and others he sat on the committee appointed to inquire into the labour question, making many important proposals, one of which, for the establishment of national banks, was partially realized in 1850. After the election of Louis Napoleon to the presidency he returned to his practice at the bar, and for some time after the coup d'état was in hiding to escape arrest. He came back to political life in the crisis of 1870, when he became mayor of Nantes in August and proclaimed the third republic there on the 4th of September. He shortly afterwards resigned municipal office in consequence of differences with his colleagues, and on 12th of November he substituted the county of Nantes in its place in July 1871.

The son was a delicate child whose defective eyesight forbade him the use of books, and his early education was therefore entirely oral. He studied law at Poitiers and in Paris, where he took his licentiate in January 1869. His father's record ensured his reception in high republican circles. Jules Grévy stood sponsor for him at the Parisian bar, and he was a regular visitor at the houses of Stanislas Dufaure and of Jules Simon. After six months of waiting for briefs in Paris, he decided to return home and to join the bar at St Nazaire, where he inscribed his name early in 1870. In September he became, in spite of his youth, secretary to the municipal commission temporarily appointed to carry on the town business. He organized the National Defence at St Nazaire, and himself marched out with the contingent, though no part of the force saw active service owing to lack of ammunition, their private store having been commandeered by the state. In 1873 he removed to the bar of Rennes, and six years later was returned to the Chamber of Deputies. In his electoral programme he had stated that he was prepared to respect all liberties except those of conspiracy and sedition and to maintain the integrity of the state in hatred of the modern social order. In the Chamber he supported the policy of Gambetta. The Waldeck-Rousseau family was strictly Catholic in spite of its republican principles; nevertheless Waldeck-Rousseau supported the anti-clerical law submitted by Jules Ferry as minister of education in the Waddington cabinet. He further voted for the abrogation of the law of 1814 forbidding work on Sundays and fête days, for compulsory service of one year for seminarists and for the re-establishment of divorce. He made his reputation in the Chamber by a report which he drew up in 1880 and which the committee of the French judicial system of 1870 had condemned, as later he was chiefly occupied with the relations between capital and labour. He had a large share in 1884 in securing the recognition of trade unions. In 1881 he became minister of the interior in Gambetta's grand ministère, and he held the same portfolio in the Jules Ferry cabinet of 1883–1885, when he gave proof of great administrative powers. He sought to put down the system by which civil posts were obtained through the local deputy, and he made it clear that the central authority could not be defied by local officials. He had begun to practise at the Paris bar in 1886, and he did not speak in the Chamber, but devoted himself to his legal work. The most famous of the many noteworthy cases in which his cold and penetrating intellect and his power of clear exposition were retained was the defence of M. de Lesseps in 1893. In 1894 he returned to political life as senator for the department of the Loire, and next year stood for the presidency of the republic against Félix Faure and Henri Brisson, being supported by the Conservatives, who were soon to be his bitter enemies. He received 184 votes, but retired before the second ballot to allow Faure to receive an absolute majority. During the next few years he was recognized by the moderate Republicans as the successor of Jules Ferry and Gambetta, and at the crisis of 1899 on the fall of the Dupuy cabinet he was asked by President Loubet to form a government. After an initial failure he succeeded in forming a coalition cabinet which included such widely different politicians as M. Millerand and General de Galliffet. He himself returned to his former post at the ministry of the interior, and set to work to quell the discontent with which the country was seething, to put an end to the various agitations which under specious pretences were directed against the central authority, and to restore independence to the local authority. His appeal to all Republicans to sink their differences before the common peril met with some degree of success, and enabled the government to leave the second court-martial of Captain Dreyfus at Rennes an absolutely free hand, and then to compromise the affair by granting a pardon to Dreyfus. Waldeck-Rousseau won a great personal success in October by his successful intervention in the strikes at Le Creusot. With the condemnation in January 1900 of Paul Déroulède and his monarchist and nationalist followers by the High Court the worst of the danger was past, and Waldeck-Rousseau kept order in Paris without having recourse to irritating displays of force. The Senate was staunch in support of M. Waldeck-Rousseau, and in the Chamber he displayed remarkable astuteness in winning support from various groups. The Amnesty Bill, passed on 19th December, chiefly through his unwearying advocacy, went far to smooth down the acerbity of the preceding years. With the object of aiding the industry of wine-producing, and of
discouraging the consumption of spirits and other deleterious liquors, the government passed a bill suppressing the **octroi** duties on the three "hygienic" drinks—wine, cider, and beer. The act came into force at the beginning of 1901. But the most important measure of his later administration was the Association Bill of 1902. Like many of his predecessors, he was convinced that the stability of the republic demanded some restraint on the intrigues of the wealthy religious bodies. All previous attempts in this direction had failed. In his speech in the Chamber M. Waldeck-Rousseau recalled the fact that he had endeavoured to pass an Associations Bill in 1882, and again in 1884, but declared that the religious associations were now being subjected for the first time to the regulations common to all others, and that the object of the bill was to ensure the supremacy of the civil power. The royalist bias given to the pupils in the religious seminaries was undoubtedly a principal cause of the passing of this bill; and the government further took strong measures to secure the presence of officers of undoubted fidelity to the republic in the higher positions on the staff. His speeches on the religious question were published in 1904 under the title of *Associations et congrégations*, following a visit he made abroad (his friendship with Robert Walpole is well known). The bill of 1902 approached all sections of the Opposition united their efforts, and M. Waldeck-Rousseau's name served as a battle-cry for one side, and on the other as a target for the foulest abuse. The result was a decisive victory for republican stability. With the defeat of the machinations against the republic M. Waldeck-Rousseau considered his task ended, and on the 3rd of June 1902 he resigned office, having proved himself the strongest personality in French politics since the death of Gambetta. He emerged from his retirement to protest in the Senate against the construction put on his Associations Bill by M. Combes, who refused in mass the application of the bill and preached congregations for official recognition. His health had long been failing when he died on the 10th of August 1904.

His speeches were published as *Discours parlementaires* (1891); *Pour la république, 1883-1903* (1904), edited by H. Leyret; *L'Etat et la liberté* (1906); and his *Plaidoyers* (1906, 5 vols.) were edited by H. Barboux. See also H. Leyret, *Waldeck-Rousseau et la troisième république* (1908), and the article France: History.

**WALDEGRAVE**, the name of an English family, taken from its early residence, Walgrave in Northamptonshire. Its founder was SIR RICHARD WALDEGRAVE, of Walgrave, who was member of parliament for Lincolnshire in 1335; his son, Sir Richard Waldegrave (d. 1380) was a knight of the Garter and of the White and Red Eagle, and was summoned to parliament in 1400. One of Sir Richard's descendants was Sir Edward Waldegrave (c. 1517-1561) of Borley, Essex, who was imprisoned during the reign of Edward VI. for his loyalty to the princess, afterwards Queen Mary. By Mary he was knighted, and he received from her the manor of Chewton in Somerset, now the residence of Earl Waldegrave. He was a member of parliament and chancellor of the duchy of Lancaster. After Mary's decease he suffered a reverse of fortune, and he was a prisoner in the Tower of London when he died on the 3rd of September 1567. Sir Edward's descendant, another Sir Edward Waldegrave, was created a baronet in 1643 for his services to Charles I; and his descendant, Sir Henry Waldegrave, Bart. (1669-1688), was created Baron Waldegrave of Chewton in 1686. Sir Henry married Henrietta (d. 1739), daughter of King James II. and Arabella Churchill, and their son was James, 1st Earl Waldegrave (1684-1741).

Educated in France, James Waldegrave soon crossed over to England, and under George I. he declared himself a Protestant and took his seat as Baron Waldegrave in the House of Lords. His friendship with Sir Robert Walpole, he was sent to Paris as ambassador extraordinary in 1725, and from 1727 to 1730 he was British ambassador at Vienna. In 1729 he was created Viscount Chewton and Earl Waldegrave, and in 1730 he succeeded Sir Horatio Walpole as ambassador in Paris, filling this post during ten very difficult years. He died on the 21st of April 1741. Much of his diplomatic correspondence is in the British Museum.

His son JAMES, the 2nd earl (1715-1763), was perhaps the most intimate friend of George II. and was for a time governor of his grandson, the future king George III. He was very much in evidence during the critical years 1755-1757, when the king employed him to negotiate in turn with Newcastle, Devonshire, Pitt and Fox about the formation of a ministry. Eventually, in consequence of a deadlock, Waldegrave himself was first lord of the treasury for five days in June 1757. He died on the 28th of April 1763, leaving some valuable and interesting *Memoirs*, which were published in 1821.

His brother JAMES, the 3rd earl (1718-1784), was a soldier, who distinguished himself especially at the battle of Minden and was promoted in general in 1772. He was a member of parliament from 1744 to 1773. His younger son, William Waldegrave (1772-1822), entered the British navy in 1766, and after many years of service was third in command at the battle of Cape St. Vincent in 1797. In 1800 he was created an Irish peer as Baron Radstock, and in 1802 he became an admiral. His son, George Granville, 2nd Baron Radstock (1786-1857), followed in his father's footsteps, and was made a vice-admiral in 1851. In 1857 his son, Granville Augustus William (b. 1833), became 3rd Baron Radstock.

The 7th Earl Waldegrave, 4th Earl Waldegrave (1757-1789), the eldest son of the 3rd earl, was a soldier and a member of parliament. His sons, GEORGE (1784-1794) and JOHN JAMES (1785-1835), were the 5th and 6th earls. In 1797 the 6th earl inherited from Horace Walpole his famous residence, Strawberry Hill, Twickenham, but his son, GEORGE EDWARD, the 7th earl (1816-1846), was obliged in 1842 to sell the valuable treasuries collected there. His wife, Frances, Countess Waldegrave (1821-1879), a daughter of the singer John Braham, was a prominent figure in society. He was her second husband, and after his death she married George Granville Vernon Harcourt of Nuneham Park, Oxfordshire, and later Chichester Fortescue, Baron Carlingford.

The 7th earl was succeeded by his uncle William (1788-1859), a son of the 4th earl, and in 1859 William's grandson, WILLIAM FREDERICK (b. 1851), became the 9th earl.

**WALDEN, ROGER** (d. 1406), English prelate, was a man of obscure birth, little or nothing, moreover, being known of his early years. He had some connexion with the Channel Islands, and resided for some time in Jersey; and he held livings in Yorkshire and in Leicester before he became archdeacon of Winchester in 1387. His days, however, were by no means free from trouble, he was deprived of his see, first by Pech, and then by Wulf, in 1389, and in 1388 he was appointed treasurer of Calais, holding about the same time other positions in this neighbourhood. In 1395, after having served Richard II. as secretary, Walden became treasurer of England, adding the deanship of York to his numerous other benefices. In 1397 he was chosen archbishop of Canterbury in succession to Thomas Arundel, who had just been banished from the realm, but he lost this position when the new king Henry IV. restored Arundel in 1399, and after a short imprisonment he passed into retirement, being, as he himself says, "in the dust and under feet of men." In 1405, through Arundel's influence, he was elected bishop of London, and he died at Much Hadham in Hertfordshire on the 6th of January 1406. An *Historia Mundí*, the manuscript of which is in the British Museum, is sometimes regarded as the work of Walden; but this was doubtless written by an earlier writer.

**WALDENBURG**, a town of Germany, in the Prussian province of Silesia, 39 m. S.W. of Breslau by the line to Hirschberg and Górlitz. Pop. (1905) 16,435. It contains a handsome town hall, three Protestant and two Roman Catholic churches. Waldenburg lies in the centre of the productive coal district of the Waldenburger Gebirge, a branch of the Sudetic chain, and its inhabitants are largely occupied in the mining industry. Among other industrial establishments are a large porcelain and earthenware factory, extensive fireclay works, glassworks and a china-painting establishment; there are also numerous flax-spinners and linen-factories in the neighbourhood. Adjoining the town on the south is the village of Oberwaldenburg, pop. (1905)
475; with a château and some coal mines. Waldenburg became a town in 1426.

WALDENSES. The Waldensian valleys lie to the south-west of Vercelli, in the direction of Monte Viso, but include no high or snowy mountains, while the glens themselves are (with one or two exceptions) fertile and well wooded. The principal town near the valleys is Pinerolo (Pignerol). Just to its south-west there opens the chief Waldensian valley, the Val Pellice, watered by the stream of that name, but sometimes called inaccurately the Luserna valley, Luscrna being simply a village opposite the capital, Torre Pellice; near Torre Pellice the side glens of Angroina and Rora join the Pellice valley. To the north-west of Pinerolo, up the Chisone valley, there opens at Perosa Argentina the valley of St Martin, another important Waldensian valley, which is watered by the Germanasca torrent, and at Perrero splits into two branches, of which the Pral glen is far more fertile than that of Massello, the latter being the wildest and most savage of all the Waldensian valleys.

The name Waldenses was given to the members of an heretical Christian sect which arose in the south of France about 1170. The history of the sects of the middle ages is obscure, because the earliest accounts of them come from those who were concerned in their suppression, and were therefore eager to lay upon each of them the worst enormities which could be attributed to them. In later times the apologists of each sect reversed the process, and cleared that in which they were interested as the expense of others. In early times these sectaries produced little literature of their own; when they produced a literature at the beginning of the 15th century they attempted to claim for it a much earlier origin. Hence there is confusion on every side; it is difficult to distinguish between various sects and to determine their exact opinions or the circumstances under which they came into being. The polemical conception which has done much to perpetuate this confusion is that of the historical conflict between the Waldenses and the Holy Church. From this view the church was pure and uncorrupt till the time of Constantine, when Pope Sylvester gained the first temporal possession for the papacy, and so began the system of a rich, powerful and worldly church, with Rome for its capital. Against this secularized church a body of witnesses silently protested; they were always persecuted but always survived, till in the 13th century a desperate attempt was made by Innocent III. to root them out from their stronghold in southern France. Persecution gave new vitality to their doctrines, which passed on to Wycliffe, Hus, and from these leaders the Reformation in Germany and England.

This view rests upon a series of suppositions, and is entirely unhistorical. So far as can be discovered the historical sects of the middle ages rested upon a system of Manicheism which was imported into Europe from the East (see MANICHAEISM). The Manichaean system of dualism, with its severe asceticism, and its individualism, which early passed into antimonism, was attractive to many minds in the awakening of the 11th century. Its presence in Europe can be traced in Bulgaria soon after its conversion in 861, where the struggle between the Eastern and Western churches for the new converts opened a way for the more hardy speculations of a system which had never entirely disappeared, and found a home amongst the Bulgarians (q.v.) in Armenia. The name of Cathar (see CATHARS), taken by the adherents of this new teaching, sufficiently shows the Oriental origin of their opinions, which spread from Bulgaria amongst the Slavs, and followed the routes of commerce into central Europe. The earliest record of their presence there is the condemnation of ten canons of Orleans as Manichæans in 1022, and soon after this we find complaints of the prevalence of heresy in northern Italy and in Germany. The strongholds of these heretical opinions were the great towns, the centres of civilization, because there the growing sentiment of municipal independence, and the rise of a burgher class through commerce, created a spirit of criticism which was dissatisfied with the worldly lives of the clergy and their undue influence in affairs.

The system of Catharianism recognized two classes of adherents, credentes and perfecti. The perfecti only were admitted to its esoteric doctrines and to its superstitious practices. To the ordinary men it seemed to be a reforming agency, insisting on a high moral standard, and upholding the words of Scripture against the traditions of an overgrown and worldly church. Its popular aim and its rationalistic method made men overlook its real contents, which were not put clearly before them. It may be said generally that Catharianism formed the abiding background of medieval heresy. Its dualistic system and its anti-social principles were known only to a few, but its anti-ecclesiastical organization formed a permanent nucleus round which gathered a great deal of political and ecclesiastical discontent. When this discontent took any independent form of expression, zeal, which was not always accompanied by discretion, brought the movement into collision with the ecclesiastical authorities, by whom it was condemned as heretical. When once it was in conflict with authority it was driven to strengthen its basis by a more pronounced hostility against the system of the church, and generally ended by borrowing something from Catharianism. The result was that in the beginning of the 13th century there was a tendency to class all bodies of heretics together: partly their opinions had coalesced; partly they were united.

Most of these sects were stamped out before the period of the middle ages came to an end. The Waldenses, under their modern name of the Vaudois, have survived to the present day in the valleys of Piedmont, and have been regarded as at once the most ancient and the most evangelical of the medieval sects. It is, however, by no means easy to determine their original tenets, as in the 13th and 14th centuries they were a body of obscure and unlettered peasants, hiding themselves in a corner, while in the 16th century they were absorbed into the general movement of the Reformation. As regards their antiquity, the attempt to claim for them an earlier origin than the Waldenses still rests upon the supposed antiquity of a body of Waldensian literature, which modern criticism has shown to have been tampered with. The most important of these documents, a poem in Provençal, "La Nobla Leyezon," contains two lines which claimed for it the date of 1100:

Ben ha mil e cent anez compli entament
Que fo scripta i ora, car sen al derier temp.

But it was pointed out that in the oldest MS. existing in the Cambridge university library the figure 4 had been imperfectly traced. This is a discovery which harmonized well with the results of a criticism of the contents of the poem itself. This discovery did away with the ingenious attempts to account for the name of Waldenses from some other source than from the historical founder of the sect, Peter Waldo or Valdez. To get rid of Waldo, whose date was known, the name Waldenses or Vellenses was derived from Vallis, because they dwelt in the valleys, or from a supposed Provençal word Vaudes, which meant a sorcerer.

Putting these views aside as unsubstantial, we will consider the relation of the Waldenses as they appear in actual history, and which preceded them. Already in the 9th century there were several protests against the rigidity and want of spirituality of a purely sacerdotal church. Thus Berengar of Tours (900-988) upheld the symbolic character of the Eucharist and the superiority of the Bible over tradition. The Paterines in Milan (1045) raised a protest against simony and other abuses of the clergy, and Pope Gregory VII. did not hesitate to enlist their Puritanism on the side of the papacy and make them his allies in imposing clerical celibacy. In 1110 an apostate monk in Zeeland, Tanchelm, carried their views still farther, and asserted that the sacraments were only valid through the merit and sanctity of the ministers. In France, at Embrun, Peter de Bruyas founded a sect known as Petrobrusians, who denied infant baptism, the need of consecrated churches, transubstantiation.

1 Schmitt, "Histoire des Cathares," i. 7.

and masses for the dead. A follower of his, a monk, Henry, gave the name to another body known as Henricians, who centred in Tours. The teachings of these new opinions were of high character and holy lives, who in spite of persecution wandered from place to place, and made many converts from those who were dissatisfied at the want of clerical discipline which followed upon the struggle for temporal supremacy into which the reforming projects of Gregory VII. had carried the church.

It was at this time (1170) that a rich merchant of Lyons, Peter Waldo, sold his goods and gave them to the poor; then he went forth as a preacher of voluntary poverty. His followers, the Waldenses, or poor men of Lyons, were moved by a religious feeling which could find no satisfaction within the actual system of the church, as they saw it before them. Like St Francis, Waldo adopted a life of poverty that he might be free to preach, but with this difference that the Waldenses preached the doctrine of Christ while the Franciscans preached the person of Christ, Waldo reformed teaching while Francis kindled love; hence the one awakened antagonisms which the other escaped. For Waldo had a translation of the New Testament made into Provençal, and his preachers not only stirred up men to more holy lives but explained the Scriptures and the interdictions which ecclesiastical authorities led to difficulties. Pope Alexander III., who had approved of the poverty of the Waldensians, prohibited them from preaching without the permission of the bishops (1179). Waldo answered that he must obey God rather than man. The result of this disobedience was excommunication by Lucius III. in 1184. Thus a reforming movement became heresy through disobedience to authority, and after being condemed embarked on a course of polemical investigation how to justify its own position. Some were re-admitted into the Catholic Church, and one, Durandus de Osca (1210), attempted to found an order of Pauperes Catholici, which was the forerunner of the order of St Dominic. Many were swept away in the crusade against the Albigenians (q.v.). Others made an appeal to Innocent III., protesting their ortho-doxy. Their appeal was not successful, for they were formally condemned by the Lateran council of 1215.

The earliest definite account given of the Waldensian opinion is that of the inquisitor Sacconi about 1250. He divides them into two classes: those north of the Alps and those of Lombardy. The first class hold (1) that oaths are forbidden by the gospel, (2) that capital punishment is not allowed to the civil power, (3) that any layman may consecrate the altar, and (4) that the Roman Church is not the Church of Christ. The Lombard sect went farther in (3) and (4), holding that no one in mortal sin could consecrate the sacrament, and that the Roman Church was the sacrilegious woman of the Apocalypse, whose precepts ought not to be obeyed, especially those appointing fast-days. This account sufficiently shows the difference of the Waldenses from the Cathari: they were opposed to asceticism, and had no official priesthood; at the same time their objection to oaths and to capital punishment are closely related to the principles of the Cathari. Their other opinions were forced upon them by their conflict with the authority of the Church. When forbidden to preach without the permission of the bishop, they were driven to assert the right of all to preach, without distinction of age or sex. This led to the further step of setting up personal merit rather than ecclesiastical ordination as the ground of the priestly office. From this followed again the conclusion that obedience was not due to an unworthy priest, and that his ministrations were invalid. These opinions were subversive of the system of the medieval church, and were naturally viewed with great disfavour by its officials; but it cannot fairly be said that they have much in common with the opinions of the Reformers of the 16th century. The medieval church set forth Christ as present in the orderly community of the faithful; Protestantism aimed at setting the individual in immediate communion with Christ, without the mechanical intervention of the officers of the community; the

Waldenses merely set forward a new criterion of the orderly arrangement of the church, according to which each member was to sit in judgment on the works of the ministers, and consequently on the validity of their ministerial acts. It was a rude way of expressing a desire for a more spiritual community. The earliest known document proceeding from the Waldensians is an account of a conference held at Bergamo in 1218 between the Ultramontane and the Lombard divisions, in which the Lombards showed a greater opposition to the recognized priesthood than did their northern brethren.

As these opinions became more pronounced persecution became more severe, and the breach between the Waldenses and the church broadened. They withdrew altogether from the ministrations of the church, and chose ministers for their own services whose merits were recognized by the body of the faithful. Election took the place of ordination, but even here the Lombards showed their difference from the Ultramontanes, and recognized only two orders, like the Cathari, while the northern body kept the old three orders of bishops, priests and deacons. Gradually the separation from the church became more complete: the sacraments were regarded as merely symbolical; the priests became helpers of the faithful; ceremonies disappeared; and a new religion was retailed, usually unlike the medieval church and the Protestantism of the 16th century.

The spread of these heretical sects led to resolute attempts at their suppression. The crusade against the Albigenians could destroy prosperous cities and hand over lands from a heedless lord to one who was obedient to the church; but it could not get rid of heresy. The revival of preaching, which was the work of the order of St Dominic, did more to combat heresy, especially where its persuasions were enforced by law. The work of inquisition into cases of heresy proceeded slowly in the hands of the bishops, who were too busy with other matters to find much time for sitting in judgment on theological points about which they were imperfectly informed. The greatest blow struck against heresy was the transference of the duty of inquiry into heresy from the bishops to Dominican inquisitors. The secular power, which shared in the proceeds of the confiscation of those who were found guilty of heresy, was ready to help in carrying out the judgments of the spiritual courts. Everywhere, and especially in the district round Toulouse, heretics were keenly prosecuted, and before the continued zeal of persecution the Waldenses slowly disappeared from the chief centres of population into the regions of refuge and the valleys of the Alps. There, in the recesses of Piedmont, where the streams of the Pelice, the Angrogne, the Clusone and others leave the sides of the Alps into valleys which converge at Susa, a settlement of the Waldensians was made who gave their name to these valleys of the Vaudois. In the more accessible regions north and south heresy was exposed to a steady process of persecution, and tended to assume shifting forms. Among the valleys it was less easily reached, and retained its old organization and its old contents. Little settlements of heretics dispersed throughout Italy and Provence looked to the valleys as a place of refuge, and tacitly regarded them as the centre of their faith. At times attempts were made to suppress the sect of the Vaudois, but the nature of the country which they inhabited, their obscurity and their isolation made the difficulties of their suppression greater than the advantages to be gained from it. However, in 1487 Innocent VIII. issued a bull for their extermination, and Alberto de' Captanieri, arch-deacon of Cremona, put himself at the head of a crusade against them. Attacked in Dauphiné and Piedmont at the same time, the Vaudois were hard pressed; but having chosen as their refuge by a fortunate chance upon their chief refuge in the valley of the Angrogne, and were repulsed with great loss. After this Charles II., duke of Piedmont, interfered to save his territories from further confusion, and promised the Vaudois peace. They were, however, sorely reduced by the onslaught which had been made upon them, and lost their ancient spirit of independence. When the Lutheran movement began they were ready to sympathize with it, and ultimately to adapt their old

1 D'Argenrot, Collectio judiciorum de novis erroribus, i. 50, &c.

2 Pfanger, Beiträge zur Geschichte der Waldesier.
beliefs to those of the rising Protestantism. Already there were scattered bodies of Waldensians in Germany who had influenced, and afterwards joined, the Hussites and the Bohemian Brethren.

The last step in the development of the Waldensian body was taken in 1530, when two deputies of the Vaudois in Dauphiné and Provence, the Georges Morel and Pierre Masson, who were sent to confer with the German and Swiss Reformers. A letter addressed to Oecolomnarius gives an account of their practices and beliefs at that time, and shows us a simple and unlettered community, which was the survival of an attempt to form an esoteric religious society within the medieval church. It would appear that its members received the sacraments of baptism and the holy communion from the regular priesthood, at all events sometimes, but maintained a discipline of their own and held services for their own edification. Their ministers were called barbo, a Provençal word meaning guide. They were chosen from among labouring men, who at the age of twenty-five might ask the body of ministers to be admitted as candidates. If their character was approved they were taught during the winter months, when work was slack, for a space of three or four years; after that they were sent for two years to serve as menial attendants at a nunnery for women, who curiously enough existed in a recess of the valleys. Then they were admitted to office, after receiving the communion, by the imposition of hands of all ministers present. They went out to preach two by two, and the junior was bound absolutely to obey the senior. Clerical celibacy influenced their rule, for Bernard III. prohibited fornication. The ministers received food and clothing from the contributions of the people, but also worked with their hands; the result of this was that they were very ignorant, and also were grasping after bequests from the dying. The affairs of the church were managed by a general synod held every year. The duties of the barbas were to visit all within their district once a year, hear their confessions, advise and admonish them; in all services the two ministers sat side by side, and one spoke after the other. In point of doctrine they acknowledged the seven sacraments, but gave them a symbolical meaning; they prayed to the Virgin and saints, and admitted the doctrine of transubstantiation, but they denied purgatory and the sacrifice of the mass, and did not observe fasts or festivals. After giving this account of themselves they ask for information about several points in a way which shows the exigencies of a rude and isolated society; and finally they say that they have been much disturbed by the Lutheran teaching about freewill and predestination, for they had held that men did good works through natural virtue stimulated by God's grace, and they thought of predestination in no other way than as a part of God's foreknowledge.

The Reformation was especially emphasizing the wrongfulness of their outward submission to the ordinances of the church: "God," he said, "is a jealous God, and does not permit His elect to put themselves under the yoke of Antichrist." The result of this intercourse was an alliance between the Vaudois and the Swiss and German Reformers. A synod was held in 1532 at Chanforans in the valley of the Angrogne, where a new confession of faith was adopted, which recognized the doctrine of election, assimilated the practices of the Vaudois to those of the Swiss congregations, renounced for the future all recognition of the Roman communion, and established their own superintendents. This was the beginning of the Reformation in Switzerland, and the first reformation in the world. It was afterwards found by a faithful few, but as public assemblies for the glory of God.

Thus the Vaudois ceased to be relics of the past, and became absorbed in the general movement of Protestantism. This was not, however, a source of quiet or security. In France and Italy alike they were marked out as special objects of persecution, and the Vaudois church has many records of martyrdom. The most severe trial to which the Vaudois of Piedmont were subjected occurred in 1655. The Congregation de Propaganda Fide established, in 1650, a local council in Turin, which exercised a pontifical jurisdiction, and reminded the Vaudois of their loyalty to Rome. They were called on to conform, or suffer. In 1658 the second edict of Modena was issued, and they were called on to give up their church, or pay a fine. This was the last stand of the Vaudois, and they were compelled to yield. The Vaudois church was reduced within the limits of their ancient territory. Fanaticism took advantage of this order; and an army, composed partly of French troops of Louis XIV., partly of Irish soldiers who had fled before Cromwell, entered the Vaudois valleys and spread destruction on every side. They treated the people with horrible barbarity, so that the conscience of Europe was aroused, and England under Cromwell called on the Protestant powers to join in remonstrance to the duke of Savoy and the French king. The pen of Milton was employed for this purpose, and his famous sonnet is but the condensation of his state papers. Sir Samuel Morland was sent on a special mission to Turin, and to him were confided the Vaudois leaders copies of their religious books, which he brought back to England, and ultimately gave to the university library at Cambridge. Large sums of money were contributed in England and elsewhere, and were sent to the suffering Vaudois.

By this demonstration of opinion peace was made for a time between the Vaudois and their persecutors; but it was a treacherous peace, and left the Vaudois with a hostile garrison established among them. Their worship was prohibited, and their chief pastor, Leger, was obliged to flee, and in his exile at Leiden wrote his Histoire générale des églises vaudoises (1684). The revocation of the edict of Nantes in 1685 began a new period of persecution, which aimed at entire extermination. This was found so difficult that the remnant of the Vaudois, to the number of 2600, were at last allowed to withdraw to Geneva. But the love of their native valleys was strong among the exiles, and in 1689 one of their pastors, Henri Arnaud, led a band of 800 men to the reconquest of their country. His first attempts against the Vaudois garrison were successful; and when the news was sent to Amadeus, duke of Savoy, and Louis XIV. brought a sudden change of fortune to the Vaudois. They were recognized once more as citizens of Savoy, and in the war against France which broke out in 1696 the Vaudois regiment did good service for its duke. The peace of Utrecht saw the greater part of the French territory occupied by the Vaudois annexed to Savoy, and, though there were frequent threatenings of persecution, the idea of toleration slowly prevailed in the policy of the house of Savoy. The Vaudois, who had undergone all these vicissitudes, were naturally reduced to poverty, and their ministers were partially maintained by a subsidy from England, which was granted by Queen Anne. The 18th century, however, was a time of religious decadence even among the Alpine valleys, and the outbreak of the French Revolution saw the Vaudois made subjects of France. This led to a loss of the English subsidy, and they applied to Napoleon for an equivalent. It was granted, and their church was organized by the state. On the restoration of the house of Savoy in 1816 English influence was used on behalf of the Vaudois, who received a limited toleration. From that time onwards the Vaudois became the objects of much interest in Protestant countries, and large sums of money were collected to build hospitals and churches among their valleys, and they were looked upon as the possible centre of a Protestant church in Italy. Especially from England did they receive sympathy and help. An English clergyman, Dr Gilly, visited the valleys in 1823, and by his writings on the Vaudois church attracted considerable attention, so that he was enabled to establish a college at La Torre. Moreover, Dr Gilly's book (A Visit to the Valleys of Piedmont), chancing to fall into the hands of an officer who had lost his leg at Waterloo, Colonel Beckwith, suggested an object for the energies of that officer, who was keen at the age of twenty-six to sink into enforced idleness. Beckwith visited the valleys, and was painfully struck by the squarol and ignorance of a people who had so glorious a past. He settled among them, and for thirty-five years devoted himself to promote their welfare. During this period he established no fewer than 120 schools; moreover he brought back the Italian language which had been displaced by the French in the services of the Vaudois church, and in 1849 built a church for them in Turin. He lived in La Torre till his death in 1862, and the name of the English benefactor is still revered by the simple folk of the valleys.

The parent church in the valleys is ecclesiastically governed by a court for internal affairs called the "Table," after the old
stone table round which the ancient barbarus used to sit, and a mission board, with an annual synod to which both the home and mission boards are subject. The total population of the Waldensian valleys (for they also contain Roman Catholics in no small number) amounts to about 20,000 all told. In 1900 there were 15,167 persons, of whom 15,158 were Waldees, a Moltke's Sunday schools (3017 children) and 194 day schools (with 4218 children); the full members (i.e. communicants) of the Waldensian faith amounted to 12,695. There were, besides, branches at Turin (1 temple, 2 pastors and 750 members), in other parts of Italy, including Sicily (46 temples and as many pastors, while the number of members was 5013, of day scholars 2704, and of Sunday school scholars 5707). It is also reckoned that in Uruguay and the Argentine Republic there are about 6000 Waldensians; of these 1225 were in 1900 full members, while the day scholars numbered 364 and the Sunday school children 670.

The literature on the subject of the Waldensian and other sects is copious. For their rise the most important authorities are to be found in Moneta, Adversus Catharos et Waldenses; D'Argentor, Collectio judicatorum de nosis erribus; Alanus, Adversus haereses; D'Achery, Spicilegia, vol. i; Gretser, Opera, vol. x; Limborch, Historia Inquisitionis, at the end of which is the Liber sententiarum of the Inquisition of Toulouse from 1307-1322. Of modern books mention may be made of Histoire des Cathares; Hahn, Geschichte der neunzehnischen Ketten; Dieckhoff, Die Waldenser im Mittelalter; Pregers, Beiträge zur Geschichte der Waldenser; Cantù, Gli Eredit di Ing. Scarrà di Tria in Italia; Cesare Mattioli, L'origine, storia e progresso di N. d. Vailee di Huitz; Toccò, L'Eremita nel medio evo; Montet, Histoire littéraire des Vaillois; Leu, History of the Inquisition of the Middle Ages. Amongst books dealing with the more modern history of the Vaillois specially are Léger, Histoire des Églises vaudoises; Arnaud, Histoire de la rentrée des Vaillois; Perrin, Histoire des Vaillois; Monastier, Histoire de l'église vaudoise; Moston, L'Isard des Alpes; Gilly, Excursion to the Valleys of Piedmont, and Researches on the Waldensians; Todd, The Waldensian Manuscripts; Melia, Origin, Persecution and Doctrines of the Waldensians; Jules Chevalier, Mémoires sur les hérités de Dauphiné, and it appears that the interests of the two sects were the same. Amongst works of the same order are those of the Counts of Vaillois (Valence, 1890); J. A. Chabrand, Vaillois et Protestantistes des Alpes: recherches historiques (Grenoble, 1886); H. Haupt, article in Von Sybel's Historische Zeitschrift (1886), pp. 39–68; W. A. B. Coolidge, articles in the Guardian for 18th August 1886 and 4th December 1889.

WALDENER, ALFRED, Count (1832–1904), Prussian general field marshal, came of a soldier family. Entering the Guard Artillery of the Prussian army in 1850, he soon attracted the favourable notice of his official superiors, and he made his first campaign (that of 1866) as aide-de-camp to General of Artillery Prince Charles of Prussia, with whom he was present at Königgrätz. In the course of this campaign Count Waldener was promoted to lieutenant-colonel of the artillery. In 1870 he was made a general of peace he served on the staff of the V. Army Corps (newly formed from the conquered kingdom of Hanover). In January 1870 he became military attaché at Paris and aide-de-camp to King William. In the Franco-German War Lieut.-Colonel Count Waldener, on account of both his admitted military talents and his recent experience of the enemy's army, proved a most useful assistant to the "supreme War-Lord." He was present at the great battles around Metz, in which he played more than an ordinary officer's part, and in the war against the republic he was specially trusted and placed by the Emperor. After the conclusion of peace he served on the staff of the K. Army Corps (then formed from the Prussian one), of which the指挥官 was operating against the French army on the Loir. The grand duke was a good soldier, but not a brilliant strategist, and the fortunate outcome of the western campaign was largely due to his adviser. At the end of the war Waldener received the First Class of the Iron Cross, and was entrusted with the exceedingly delicate and difficult post of German representative at Paris, in which his tact and courtesy were very marked. At the end of 1871 Waldener took over the command of the 13th Ulians at Hanover, and two years later he became chief of the staff of the Hanoverian army corps, in which he served from 1873 until 1880. During this period he became principal assistant on the general great staff at Berlin, and for seven years was intimately connected with the great field marshal's work, so that, when Moltke retired in 1888, Waldener's appointment to succeed him was a foregone conclusion. Three years later the chief of the general staff was sent to command the IX. Corps at Altona, an appointment which was interpreted as indicating that his close and intimate friendship with Bismarck had made him, at this time of the chancellor's dismissal, a persona non grata to the young emperor. In 1898, however, he was appointed Inspector (7176 f.), at the west end of the Imperial Guard, at Hanover, the order being accompanied by the most eulogistic expressions of the kaiser's goodwill. On the despatch of European troops to quell the Boxer insurrection in China in 1900, it was agreed that Count Waldener should have the supreme command of the joint forces. The preparations for his departure from Germany caused a good deal of satirical comment on what was known as the "Waldener Rummel" or "theatricals." He arrived at the front, however, too late to direct his troops in the fighting before Peking. At the end of the war he returned to Germany. He resumed, by Hanover his duties of inspector-general, which he performed almost to his death, which took place on the 5th of March 1904.

WALDO, SAMUEL LOVETT (1783–1861), American artist, was born in Windham, Connecticut, on the 6th of April 1783. He had a studio in Charleston, South Carolina. In 1806 he went to London, where he painted portraits for some years with success. In 1809 he returned to New York, and was a conspicuous figure in the city's art life until his death there on the 16th of February 1861. He became an associate of the National Academy in 1847. Amongst his works are tried to portray natural scenery.

WALENSEE, also called the LAKE OF WALDENS, a Swiss lake between the basins of the Rhine and the Linth (Limmat), lying S.E. of the Lake of Zürich. It is formed by the Seer river (descending from the Weisstein glen), which once certainly sent its waters to the Rhine, but now enters the lake at its eastern end. Near its western end the Linth has been diverted through the Escher canal (completed in 1811) into the lake, which it soon again issues in order. By means of the Linth canal (completed in 1816), to flow into the Lake of Zürich. The Walensee has an area of 9 sq. m., is about 9 m. in length, 1.5 m. wide and 495 ft. deep, while its surface is 1388 ft. above sea-level. It forms part of the Canton of St Gall, save 1.5 sq. m. towards its west end, which are in that of Glarus. It lies in a deep trench between two comparatively lofty ranges of mountains, so that its scenery is more gloomy than is usual with Swiss lakes. On the north shore there is but a single village of any size (Quinten), while above it rise the cliffs of the seven- mounted range, the easternmost part of which the village of Amden nestles in a hollow high above the lake. On the south side the hills rise less steeply from the shore (on which are Mühlehorn and Murg) towards the fine terrace of the Kerenzenberg, on which are the frequent summer resorts of Obstalde and Filzbach, backed on the south by the singularly imposing crags of the Mürtschentoch (802 ft). The small towns of Wessen and Walenstadt are situated respectively at the western and the eastern extremities of the lake, a railway along the south shore of which connects them with each other (11 m.). Since the construction of this line new steamers run on the lake. (W. A. B. C.)

WALES (Cymru, Gwalia, Cambria), a Principality occupying the extreme middle-west of the southern part of the island of Great Britain, bounded E. by the English counties of Cheshire, Shropshire, Herefordshire and Monmouthshire; S. by the Bristol Channel; W. by St George's Channel; and N. by the Irish Sea. (For map see England, V.) Its area is 7497 sq. m. Its greatest length from N. to S. (from the Point of Air in Flint to Barry Island on the Glamorgan coast) is 136 m., while its breadth varies from 92 m. (from St David's Head to the mouth of the Cardigan) to 371 m. (the distance between Aberystwyth and the Shropshire boundary at Clun Forest). Its total circuit is about 540 m., of which 300 consist of coastline. The principal headlands are Great Ormes Head in Carnarvonshire; Braich-y-Puell, the most westerly point of
Carnarvonshire; St Davids Head, the most westerly point of South Wales; Worms Head, the western extremity of Gower; and Lavernock Point to the W. of Cardiff. The principal islands are Holy Island, off the W. coast of Anglesea; Bardsey (Ynys Enlli), near Brach-y-Pwll; and the islands of Ramsey, Grassholm, Skomer, Skokholm and Caldy (Ynys Pfy) off the Pembroke-sliure coast. The chief inlets are the mouth of the Dee, dividing Flint from Cheshire; the Menai Straits, separating Anglesea from the mainland; Carnarvon Bay; Cardigan Bay, stretching from Brach-y-Pwll to St Davids Head; St Bride’s Bay; Milford Haven; Carmarthen Bay; and Swansea Bay.

For judicial purposes, the Principality is divided into North Wales and South Wales, each of which consists of six counties.

**North Wales.**

- **Anglesea (Ynys Fôn):** 176,630 acres, 50,606 population (1901).
- **Carnarvon (Sir Arfon):** 361,156 acres, 126,883 population.
- **Denbigh (Sir Dinebhy):** 423,499 acres, 129,942 population.
- **Flint (Sir Flint):** 164,744 acres, 81,700 population.
- **Merioneth (Sir Feirionydd):** 34,796 acres, 49,146 population.
- **Montgomery (Sir Drefaldwyn):** 510,111 acres, 54,901 population.

**South Wales.**

- **Brecon or Brecknock (Sir Fycheiniog):** 475,224 acres, 59,997 population.
- **Cardigan (Sir Aberthi):** 462,936 acres, 59,240 population.
- **Carmarthen (Sir Gaerfyrddin):** 587,816 acres, 135,328 population.
- **Glamorgan (Sir Forganw):** 518,863 acres, 88,931 population.
- **Pembroke (Sir Benfro):** 395,151 acres, 88,351 population.
- **Radnor (Sir Faesyfed):** 301,164 acres, 23,281 population.

**Mountains.** Almost the whole surface of Wales is mountainous or undulating. The most important hill system is that of the North Wales mountains, covering the county of Carnarvon and parts of Merioneth and Denbigh, wherein the Snowdon range reaches the height of 3,577 ft. in Snowdon, in Carnedd Llywelyn and of 3,216 ft. in Carnedd Dafydd. South of this system, and separated by it from the upper valley of the Dee, the Berwyn range extends from N.E. to S.E., and is itself adjacent to Aran-fawdwy (2909 ft.) of the highest points of the Cadair Idris group. The system of Mid-Wales or Powys stretches from Cardigan Bay to the English border, and contains Plinlimmon (2462 ft.) in north Cardigan; Dryslwyn (2492 ft.), in mid-Brecon; and Radnor Forest (2163 ft.) in mid-Radnor. From Plinlimmon a range of hills runs in a south-westerly direction towards St Davids, terminating in the Preseli range of north Pembroke (1760 ft.) and dividing the broad valleys of the Teifi and Towy. The combined range of the Black Mountains, the Brecknock Beacons and the Black Forest sweep across south Brecon from W. to E., the chief elevations being the Carmarthen Van (2632 ft.), the Brecon Beacon (2862 ft.) and Pen-y-gader fawr (2660 ft.) near the English border.

**Lakes and Rivers.** Small lakes, such as Llyn Ogwen, Llyn Saffadan (Llangorse Lake), Talyllyn, the Teifi Pools, &c., are fairly numerous in the mountainous districts, but the only natural lake of importance is Bala Lake, or Llyn Tegid, in Merionethshire, 4 m. long and about 1 m. wide. But the great reservoir known as Lake Vyrnwy, which supplies Liverpool with water, is equal in size to Bala; and the chain of lakes in the vicinity of the Birmingham coal district, formed by the upstream impoundment of the rivers Tame, Cole and Arrow, covers a large area in west Radnorshire. The longest river in Wales is the Severn (1854 m.), in Welsh Hafren, which rises in Plinlimmon, and takes a north-westerly course through Montgomeryshire before reaching the English border. The Wye (130 m.) also rises in Plinlimmon, and forms for some 30 m. the boundary between the counties of Radnor and Brecon before encountering English soil near Hay. The Usk (56 m.) flows through Breconshire, and joins the Bristol Channel at Newport in Monmouthshire. The Dee (70 m.) traverses Bala Lake, and drains parts of the counties of Merioneth, Denbigh and Flint. The Teifi (50 m.) enters Carmarthenshire entering Carmarthen Bay at Llanstefan; the Teifi (50 m.) rises near Tregaron and falls into Cardigan Bay below the town of Cardi-gan. The Taff (40 m.), rising amongst the Brecon Beacons, enters the Bristol Channel at Cardiff. Other important rivers are the Dovey (40 m.) falling into Cardigan Bay at Aberdovey; the Taf (55 m.), entering Carmarthen Bay at Laugharne; and the broad navigable Conway (22 m.), dividing the counties of Carnarvon and Denbigh.

**Wislk Place-Names.** The place-names through the Principality may be said to group themselves roughly into four divisions: (i.) Pure and unaltered Celtic names; (ii.) Corrupted or abbreviated Celtic names; (iii.) English names; (iv.) Scandinavian and foreign names. To the first division belong the vast majority of place-names throughout the whole of Wales and Monmouthshire. Except in some districts of the Marches and in certain tracts lying along the South Wales coast, nearly all parishes, villages, hamlets, farms, houses, woods, fields, streams and valleys possess native appellations, which in most cases are descriptive of natural situation, e.g. Nant-y-ffin, the boundary brook; Aberporth, mouth of the harbour; Tal-ybont, end of the bridge; Trosedyrkin, foot of the hill; Doffyn, a valley, &c. In the second and third divisions—those place-names which have been corrupted by English usage—belong most of the older historic towns, in striking contrast with the rural villages and parishes, which in nearly all cases have retained unaltered their original Celtic names. Anglicized in spelling and even to some extent changed in sound are Carmarthen (Caerfyrddin); Pembroke (Penfro); Kidwelly (Cydweli); Cardiff (Caerdydd); Llanelwy (Llanymddyfri); and Lampeter, in Welsh Llanbedr-estyn, affords an example of a Celtic place-name both Anglicized and abbreviated. In not a few instances modern English nomenclature has supplanted the old Welsh place-names in popular usage, though the town's original appellation is retained in Welsh literature and conversation, e.g. Holyhead is Caergybi (fort of Cybi, a Celtic missionary of the 6th century); Presteign is Llanandras (church of St Andrew, or Andras); St Asaph is Llanefydd; the English name commemorating the reputed founder of the see, and the Welsh name recalling the church's original foundation on the banks of the Elwy. Cardigan, in Welsh Aberceiri, from its situation near the mouth of the Teifi, and Brecon, in Welsh Aberhonddu, from its site near the confluence of the Usk and Towy, are additional examples of Welsh names in common use—Ceredigion, Brychan—which possess in addition pure Celtic forms. In the third division, English place-names are tolerably frequent everywhere and predominate in the Marches and on the South Wales coast. Even so thoroughly Welsh a county as Cardiganshire, English place-names are often to be encountered, e.g. New Quay, High Mead, Oakford, &c.; but many of such names are of modern invention, dating chiefly from the 18th and 19th centuries. Of the many English names occurring in south Pembroke and south Glamorgan, some are exact or fanciful translations of the original Welsh, e.g. Cowbridge (Pontyfyon) and Lludchurch (Eglwys Ilwyd), others are of direct external origin, as Bishopstone, Flemingstone, Butter Hill, Briton Ferry, Manselfield, &c. Names derived straight from an Anglo-Norman source are rare; Beaupré, Besumariis, Beaufort, Fleur-de-Lis, Roche, may be cited as examples of such. Scandinavian influence can easily be traced at various points of the coast-line, but particularly in south Pembrokeshire, wherein occur such place-names as Caldy, Tenby, Goodwick, Dale, Skokholm, Hakin and Milford Haven. Specimen of the minimize names which have crept in by the gradual process of fusion, are preserved in Strata Florida and Valle Crucis Abbots. Hybrid place-names are occasionally to be met with in the colonized portions of Wales, as in Gelliswick (a combination of the Celtic gelil, a hazel grove, and the Norse wick, a haven), and in Fletherhill, where the English suffix hill is practically a translation of the Celtic prefix. A striking peculiarity of the Principality is the prevalence of Scriptural place-names; a circumstance due undoubtedly to the popular religious movements of the 19th century. Not only are such names as Horeb, Zion, Peniel, Siloah, &c., bestowed on Nonconformist chapels,
but these Biblical terms have likewise been applied to their surrounding towns and villages. A notable example of this curious nomenclature occurs in Bethesda, Carnarvonshire, where the name of the Congregational chapel erected early in the 19th century has altogether supplanted the original Celtic place-name of Cilioden. But although English and foreign place-names are fairly numerous throughout Wales, yet the vast majority remain Celtic either in a pure or corrupted form, so that some knowledge of the Celtic language is essential to interpret their meaning.

A small glossary of some of the more common component words is appended below.

Abor, the mouth or estuary of a river—Aberystwyth, Aberwth.
Ac, a rock—Caerwen, Caersws.
Afon, a river—a word which retains its primitive meaning in Wales, whilst it has become a proper name in England—Glanalon, Manorafon.
Baeu, a corrupt form of the English "bead-house," or possibly of the Latin "beatus"—Bettws-y-coed, Bettws Ifan.
Blæn, the top—Blaenffynnon, Blaen-cwm.
Bod, house or abode—Heddau, Hafod.
Bro, the human breast, hence breast of hill—Brongest, Cilbronnau.
Bryn, a hill—Brynmawr, Penbryn.
Busch, a gap—Busch-fach, Tany Bach.
Caer, a fortress or fortified camp—Caerleon, Caerwas.
