6. The criminal law in its relation to women presents some points of interest. Adultery was punished with death by Constantine, but the penalty was reduced by Justinian to relegation to a convent. A woman condemned for adultery could not re-marry. A marriage between a Christian and a Jew rendered the parties guilty of adultery. Severe laws were enacted against offences of unchastity, especially procurement and incest. It was a capital crime to carry off or offer violence to a nun. A wife could not commit fürtium of her husband's goods, and was liable to action for damages. By several sumptuary constitutions, contained in the Code, bk. xi., women as well as men were subject to penalties for wearing dress or ornaments (e.g., rings) imitating those reserved for the emperor and his family. Adultery and incest were a liability of dead bodies, the bodies of virgins dedicated to Heaven. If a consul had a wife or other living with him, he was allowed to incur greater expense than if he lived alone. The interests of working women were protected by enactments for the regulation of the gyneecia, or workshops for spinning, dyeing, &c.

The canon law, looking with disfavour on the female independence prevailing in the later Roman law, tended rather in the opposite direction. The Decretum specially inculcated subjection of the wife to the husband, and obedience to his will in all things. The chief differences between canon and Roman law lay in the degree of the independence of the wife, as regards the introduction of publicity and of the formalities of the ring and the kiss. The bar to marriage was a necessary part of the ceremony, as indeed it had been made by the civil power, as has been already stated, in the post-Justinian period of Roman law. But in practice this rule appears to have fallen into disuse until it was again revived by the council of Trent. It was, however, the rule of the English common law after the Reformation. The ceremony was not to be performed during Lent. The woman was to be veiled during the ceremony. A promise of marriage was so sacred that it made a subsequent marriage with another person void. Spiritual cognition was a bar to marriage. The sentence of the church was made necessary for divorce. As to women in general the law does not say very much. Women, even relatives, were not to live with priests unless in case of necessity. It was not to approach the altar or fill any public place in the church; nor might they lead money on usury. Baptism might be valid although administered by a woman. Women who had professed religion could not be forced to give evidence as witnesses. In some cases the evidence of women was not receivable.

The early law of the northern parts of Europe is interesting from the different ways in which it treated women. In the words of Sir H. Maine, The position of women in these barbarous states of inheritance varies very greatly. Sometimes they inherit, either as individuals or as classes, only when the same generation have failed. Sometimes they do not inherit, but transmit a right of inheritance to their male issue. Sometimes they succeed to one kind of property, for the most part movable property, which they probably took a great share in producing by their household labour; for example, in the real Salić law (not in the imaginary code) there is a set of rules of succession which, in my opinion, clearly admit women and their descendants to a share in the inheritance of movable property, but confine land exclusively to males and the descendant. It is likely that the proper mode of providing for a woman is by giving her a marriage portion; but, when she is once married into a separate community consisting of strangers in blood, neither she nor her children are deemed to have any further claim on the parent group. Among the Scandinavian races women were under perpetual tutelage, whether married or unmarried. The first to obtain freedom were the widows. As late as the code of Christian V., at the end of the 17th century, it was enacted that if a woman married without the consent of her tutor he might have, if he wished, administration and usufruct of her goods during her life. The provision made by the Scandinavian laws under the name of marriage-gift was perhaps the parent of the modern settled property. The Breton law of Ireland excepted women from the ordinary course of the law. They could disfranchise or contract only in certain named cases, and distress upon their property was regulated by special rules. In the pre-Conquest codes in England severe laws were denounced against unchastity, and by a law of Canute a woman was to lose nose and ears for adultery. The laws of Athelstan contained the peculiarly brutal provision for the punishment of a female slave convicted of theft by her being burned alive by eighty other female slaves. Other laws were directed against the practice of witchcraft (gr.) by women. Monogamy was enforced both by the civil and ecclesiastical law; and second and third marriages involved peneance. A glimpse of cruelty in the household is afforded by the provision, occurring no less than three times in the ecclesiastical legislation, that if a woman scourged her female slave to death she must do penance. Traces of wife-purchase are seen in the law of Ethelbert, enacting that if a man carry off a freeman's wife he must at his own expense procure the husband another wife. The codes contain few provisions as to the property of married women, but those few appear to prove that she was in a better position than at a later time.

On this branch of the subject see Mansens's Het Christendom en de Vrouwen (Leiden, 1877).

6 Early Law and Custom, ch. v.
7 See Stiernhook, De jure Scandoniae (Stockholm, 1672), bk. ii. ch. i.; Henrici, Leges Scandoniae (Stockholm, 1714).
8 Bk. iii. ch. xvi. § 3.
9 The development of the bride-price no doubt was in the same direction. Its original meaning was, however, different. It was the sum paid by the husband to the wife's family for the purchase of part of the family property, while the morning-gift was paid as pretium virginisatis to the bride herself. In its English form morning-gift occurs in the laws of Canute; in its Latinized form morgantia it occurs in the Leges Henrici Primi.
WOMEN

period. The laws of Ine gave her a third of her husband’s property; the laws of Edmund as to betrothal allowed this to be increased to half by antenuptial contract, to the whole if she had children and did not re-marry after her husband’s death. No doubt the dowry ad ostium ecclesie favoured by the church generally superseded the legal rights where the property was large (in fact credit of amassing wealth). 2. “Provisio hominis tollit provisionem legi.” The legal rights of a wife, the woman apart from contract were gradually limited, until by the time of Glanvill her person and property had become during her husband’s lifetime entirely at his disposal, and after his death limited to her dower and her pars rationabili.

A few of the more interesting matters in which the old common and statute law of England placed women in a special position may be noticed. A woman was exempt from legal duties more particularly attaching to men and not performable by deputy. She could apparently originally not hold property feud, i.e. one of which the tenure was by military service. 3. The same principle appears in the rule that she could not be endowed of a castle maintained for the defence of the realm and not for the private use of the owner. She could receive homage, but not render it in the form used by men, and was privileged from suit and service at the sheriff’s tourn. She was not sworn to the law by the oath of allegiance in the lev. or tourn, and so could not be outlawed, but was said to be waived. She could be constable, either of a castle or a vill, but not sheriff, unless in the case of Wives of knights, who might exercise in person in the 17th century by the famous Anne, countess of Dorset, and Montgomery. In certain cases a woman could transmit rights which she could not enjoy. On such a power of transmission, as Sir H. Maine shows, 4 rested the claim of Edward III. to the crown of France. The claim through a woman was not a breach of the French constitutional law, which rejected the claim of a woman. The jealousy of a woman’s political influence is strikingly shown by the case of Alice Ferrers, the mistress of Edward III. She was accused of breaking an ordinance by which women were forbidden to do business for hire and by way of maintenance in the king’s court.

By Magna Carta a woman could not accuse a man of murder except of that of her husband. This disability did not arise from the fact that in trial by battle she naturally did not appear in person but by a champion. She was not admitted as a witness to prove the statute at common law the question arising whether he were free or a serf. She could not nor was entitled to a guardian ad litem only being a guardian even of her own children to a limited extent. Her will was revoked by marriage, that of a man only by marriage and not by death. The new marriage was specifically provided by Magna Carta, c. 9. That a woman writ out of chancery was granted to a woman alleging that she had become bound by an obligation through force or fraud. By 39 Hen. VI. c. 2 a woman might have livery of land as hostess at fourteen. By the Act 27 Hen. VIII. c. 12 she was partially allowed to have rights of wife, and if a woman; partly of wife, and if a nun, even with her consent. The Six Articles, 31 Hen. VIII. c. 14 forbade marriage and concubinage of priests and sanctioned vows of abstinence by women.

In Scotland, as early as Regiam Majestatem (12th century) women were the object of special legal regulation. In that work the mercheta mulieris (probably a tax paid to the lord on the marriage of his tenant’s daughter) was fixed at a sum differing according to the rank of the woman. Numerous ancient laws dealt with trade and sumptuary matters. By the Leges Quatuor Burgorum female brewers making bad ale were to forfeit eightpence and be put on the ebbing-stand, and were to set an ale-ward outside their houses and to be liable to fine of fourpence. The same laws also provided that a married woman committing a trespass without her husband’s knowledge might be punished by a whipping of the child. The child (if the case) was enacted that a married woman might not buy wool in the streets or buy more than a limited amount of oats. The same code also ensured the protection of the father of the child. The statute of Edward I. for the daughter of one of the guild-brethren unable to provide for herself through marriage was one of the acts for putting her in a convenant. By the act 1420, c. 9, wives were to be arrayed after the estate of their husbands. By 1457, c. 13, no woman was allowed to church in the clothes in which she was regarded as a nun unless known. 1581, c. 18, was conceived in a more liberal spirit, and allowed women to wear any head-dress to which they had been accustomed. 1621, c. 25, permitted servants to wear their mistress’ cast-off clothes. 1681, c. 80, contained the remarkable provision that not more than two changes of raiment were to be made by a bride at her wedding. In its more modern aspect the law is in most respects similar to that of England.

In separate legal articles attention is drawn on various subjects, to any special provisions or disabilities affecting women; see, for instance, EVIDENCE, DEVISES, MARRIAGE, CHILDREN (Law relating to), INFANT, HUSBAND AND WIFE. The movement for removing the older disabilities has progressed at such different rates in various countries that it is impossible to do more than note here the chief distinctions remaining under English law in 1910.

Civil Rights.—The age at which a girl can contract a valid marriage, contract marriage, is at least 16 years in England, 18 years in all the countries of the empire, 18 or 21 years in advance of a boy, who must be fourteen. Under the Indian Settlement Act 1855, a valid settlement could be made by a woman at common law with the approval of the court, the age for a man being twenty; by the 1872 Indian Wives’ Property Act a settlement by a husband of his wife’s property is not valid unless executed by her if she is of full age, or confirmed by her after she attains full age. An unmarried woman is liable for the support of illegitimate children till they attain the age of sixteen. She is generally assisted, in the absence of agreement, by an affiliation order granted by magistrates. A married woman having separate property is, under the Married Women’s Property Acts 1882 and 1898, liable for the support of her parents, husband, children and grandchildren becoming chargeable to any union or parish. At common law the father was entitled to an allowance for the maintenance of a legitimate child up to the age of sixteen, and could only forfeit such maintenance by misconduct. But the Court of Chancery, wherever there was trust property and the infant could be made a ward of court, took a less rigid view of the power of the court to require the support of the child, and consequently in some cases to the extension of the mother’s rights at common law. Legislation has tended in the same direction. The Romilly Act 1881, the Matrimonial Causes Act 1883, the Act of 1875, the Chancery Act of 1877, the Court of Chancery was empowered to enforce a provision in the registration of birth, and the Act 1875 dealt with the custody or control of a child to the mother. The Judicature Act 1873, § 25 (10), enacted that in questions relating to the custody and maintenance of a child, in the appointment of a guardian and the Guardianship of Infants Act 1886 largely extended the mother’s powers of appointing and acting in court, and gave the court power to regard the mother’s wishes as to the custody of the children. The Summary Jurisdiction Act 1855 enabled a court of summary jurisdiction, to whom a married woman has made application, to commit to the applicant the custody of any children of the marriage between the applicant and her husband, while under the age of sixteen years.

1 It is remarkable that the great fiefs of France, except the Isle of France, the special apogony of the crown, all became in time female.

2 This is shown by the table at the end of Laboulaye’s Recherches.

3 Early Law and Custom, ch. v.

The most remarkable disabilities under which women were still placed in 1910 were (1) the exclusion of female heirs from intestate inheritance (Habicht's case, 1748; see also Smedley, Inheritance; Succession); and (2) the fact that a husband could obtain a divorce for the adultery of his wife, while a wife could only obtain it for her husband's adultery if coupled with some other cause, such as cruelty or desertion.

Suits in which either necessarily or practically only women are plaintiffs are: breach of promise, affi liation (q.v.) and (though not nominally) seduction. The action for breach of promise may indeed be brought by a man, but this is very rare, and its only real interest is as a protection for women. It may be brought by not against an infant, and not against a person who has, or has been, married or is debarred from marriage (s. 469 of the Long Parliament). The causes of action which women seem to be the vestiges of the period when women, besides being chatted, were treated as chattels. Formerly a wife could not steal her husband's property, but since the Married Women's Property Act 1882 has been passed, it became possible. Adultery is no crime in England because of the only country where such is the case. It was punished by fine in the ecclesiastical courts up to the 17th century, and was made criminal by the marriage of a woman to another man by the Long Parliament. The offences which can be committed only against a woman are those against decency, such as rape, procurement and similar crimes, in which a considerable change in the law in the direction of increased protection to women was made by the Criminal Law Amendment Act 1885. In regard to the protection given to a wife against her husband modern legislation has considerably strengthened the wife's position by means of judicial separation and maintenance in case of desertion (see Desertion). The marriage of a woman to a man if she was married was abolished in 1820. Chastisement of a wife by a husband, possibly at one time lawful to a reasonable extent, would now certainly constitute an assault. The husband's rights are limited to restraining the wife's liberty in case of her misconduct.

In Scotland the criminal law differs slightly from that of England. At one time drowning was a punishment specially reserved for women. Incest (q.v.), or an attempt to commit incest, has always been punishable as a crime. Adultery and fornication are still nominally crimes, but criminal proceedings in these cases have fallen into desuetude. The age of testamentary capacity is still twelve, notwithstanding the banishment of the death penalty in 1907.

The whole idea of women's position in social life, and their ability to take their place, independently of any question of sex, in the work of the world, was radically changed in the English-speaking countries, and also in the more progressive nations beyond their bounds, during the 19th century. This is due primarily to the movement for women's higher education and its results. To deal in detail with this movement in various countries would here be too intricate a matter; but in the English-speaking countries at all events the change is so complete that the only curious thing coming to mind is what sort of education the women of the parts of England and Wales were imposed upon, and the means by which the instruction was given. The higher education of women has been almost entirely in the hands of girls' schools and colleges (see higher education and its results).

1 The action for breach of promise of marriage is in some of its incidents similar to English law. In Roman law, however, *sponsalia* imposed a duty on the betrothed to become husband and wife within a reasonable time, subject to the termination of the obligation by death, repudiation by the words *condicionem tua non siter* or *calce*, or of the Roman Forum. The woman was then legally bound to marry unless *arreha sponsalistis* had been given, i.e. the exchange of promises of marriage, to be enforced by the party refusing to carry it out. The *arreha* might also be given by a parent, and was equally binding to the heir (see *sponsalia consanguinis*). If the husband were not in the household, could not recover any *arreha* which might have been given, it being supposed that he was in a position of authority and able to exercise the action in his own behalf. In the canon law breach of the promise made by the *sponsalia* (whether *de praesenti* or *de futuro*), a division unknown to Roman law, does not without more appear to have sufficed to found an action for its breach, except so far as it fell under ecclesiastical censure as *laisio fluid*. But it had the more serious legal effect of avoiding as a canonical disability the subsequent marriage, while the original *sponsalia* continued, of a betrothed person to any other than the one to whom he or she was betrothed. In England the betrothed were not specifically, either by mutual consent or by certain supervening impediments, such as ordination or a vow of chastity. The canonical disability of marriage, *sponsalia continentes*, in England in 1682, Hen. VIII, was re-established in the reign of Edward VI., and finally abolished in 1753. In England the duty of the parties is the same as in Roman law, viz. to carry out the contract within a reasonable time, if no time is appointed. If the woman was formerly or now married specifically enforced by the ecclesiastical court compelling a celebration of the marriage *in factione ecclesiae*. The last instance of a suit *in factione* was brought in 1713, to be tried by jury. It was abolished in 1753 by Lord Hardwicke's Act (26 Geo. II. c. 23). In Scotland a promise in the nature of *sponsalia de futuro* not followed by consummation may be rescinded from subject, to the liability of the husband to make reparation and to marry the wife. The Act of 1290, s. 28, is a proper cause for trial by jury. If, however, the *sponsalia* be *de praesenti*, and, according to the above probable opinion, if they be *de futuro* followed by consummation, a pre- contract is constituted, giving a right to a decree of divorce of marriage and equivalent to marriage, unless declared void during the lifetime of the parties. It was abolished in 1755 by Lord Hardwicke's Act (26 Geo. II. c. 23). In Scotland a promise in the nature of *sponsalia de futuro* not followed by consummation may be rescinded from subject, to the liability of the husband to make reparation and to marry the wife. The Act of 1290, s. 28, is a proper cause for trial by jury. If, however, the *sponsalia* be *de praesenti*, and, according to the above probable opinion, if they be *de futuro* followed by consummation, a pre- contract is constituted, giving a right to a decree of divorce of marriage and equivalent to marriage, unless declared void during the lifetime of the parties.

Higher education and its results.

WOMEN
WOMEN

Catholic university in Ireland, it was provided that two members of the senate should be women; and Queen's University, Belfast, had three women in 1910 in its senate. Women may point with justifiable pride to the fact that within a very few years of their admission to university examinations, they provided at Cambridge both a senior classic and a senior wrangler. In America (see Co-education) the movement has gone much farther than in Great Britain.

The correct, calm, earnest demeanour of women, both in the schools and in university life, awakened admiration and respect from all; and the movement brought into existence a vast number of women, as well-educated as men, hard-working, persevering and capable, who invaded many professions, and could hold their ground where a sound education was the foundation of success. The pioneers of female education spent their energies in developing their higher and more intellectual ideals, but later years opened up other positions which better education has enabled women to fill. In the literary field they soon invaded journalism (see Newspapers), and took an important place on the staffs of libraries and museums. They form an important (and in America, the predominating) section of the teaching profession in the state schools, and in all research work play an increasingly valuable part. It is not possible for every woman to be a scholar, a doctor (see below), a lawyer, or possibly to attain the highest position in professions where competition with men is keen, but the development of women's work has opened many other outlets for their energies. As members of school boards, factory inspectors, poor law guardians, sanitary inspectors, they have added a new perspective and more scope for gratifying their ambition and energy. The progress made in philanthropy and religious activity is largely due to their devotion, under the auspices of countless new societies. And increasing provision has been made, in the arts and crafts, for the furtherance of their careers. There are successful women architects now working in England, and in 1905 a woman won the silver medal of the Royal Society of British Architects; a large number of women travel for business firms; in decorative work, as silversmiths, dentists, law copyists, proof-readers, and in plan tracing women work with success; wood-carving has become almost as recognized a career for them as that of typewriting and shorthand, in which an increasing number are finding employment. Agriculture and gardening have opened up a new field of work, and, with it, kindred occupations.

Women have always found a peculiarly fitting sphere as nurses, though it is only in recent years that nursing (q.v.) has been professionalized by means of proper education. But their admission to the medical profession itself was one of the earliest triumphs of the 19th-century movement. It began in America, but was quickly followed in England. After having been refused admission to instruction by numerous American medical schools, Miss Elizabeth Blackwell was allowed to enter as a student by the Geneva Medical College, N.Y., in 1847, from which she graduated in 1849. Hers was the first woman's name to be placed on the Medical Register of the United Kingdom (1859). In Great Britain the struggle to obtain admission to the teaching schools and to the examinations for medical degrees and diplomas was long and bitter. Though the Society of the Apothecaries admitted Mrs Garrett Anderson (q.v.) to their diploma in 1865, it was only after a series of rebuffs and failures that women were admitted to the degree examinations of the various universities. In August 1876 an "enabling" act was passed, empowering the nineteen British medical examining bodies to confer their degrees or diplomas without distinction of sex. In 1908 the Royal College of Physicians and Surgeons decided to admit women to their diplomas and fellowships. In the meantime women doctors had become a common phenomenon.

Women in England may fill some of the highest positions in the state. A woman may be queen, a regent, and, as queen regnant has, by 1 Mary, sess. 1 c. 1, as full rights as a king. Among the public offices a woman may hold are those of county, borough, parish and rural or urban district councillor, overseer, guardian of the poor, churchwarden and sexton. In 1908 Mrs Garrett Anderson was elected mayor of Aldeburgh, the first case of a woman holding that position. Women have also been nominated as members of Royal Commissions (e.g. those on the Poor Law and Divorce). A woman cannot serve on a jury, but may, if married, be one of a "jury of matrons" empanelled to determine the condition of a female prisoner on a writ de ventre inspiciendo. She can vote (if unmarried or a widow) in county council, municipal, poor law and other local elections. The granting of the parliamentary franchise to women was, however, still withheld in 1910. The history of the movement for women's suffrage is told below. It may be remarked that, with or without the possession of a vote on their own account, politics in England have in modern times been very considerably influenced by the work of women as speakers, canvassers and organizers. The great Conservative auxiliaries to political organization in the 19th century were the woman's movement in its two main aspects, namely, the movement of women in Great Britain, and the Women's Liberal Federation, on the opposite side, has done much for the Liberal party. The Women's Liberal Unionist Association, which came into being in 1886 at the time of the Irish Home Rule Bill, also played an active part in defence of the Unionist cause.

The movement for the abolition of the sex distinction in respect of the right conferred upon certain citizens to share in the election of parliamentary representatives dates for practical purposes from the middle of the 19th century. Women's suffrage.

Women's suffrage.
idea are seen; many of the great English abbesses discharged their territorial duties as landowners, and women as custodians of castles voted for knights of the shire. In the 17th and 18th centuries in England and America, under the influence of advancing political theory, and in France in the 18th century, this idea began to take shape. In England the writings of Mary Astell (Serious Proposal to Ladies, 1697) and others led to the gradual revision of the inherited idea of the education and the true sphere of women, while in 1790 Mary Wollstonecraft published her Vindication of the Rights of Women. In America the dawning of a political consciousness is evidenced by the claim made in 1864 by women's suffrage movement to sit in the Assembly of Maryland as the executor of Lord Baltimore, and by the requests made by Abigail Adams (wife of John Adams), Mercy Otis Warren and Hannah Lee Corbin, that women taxpayers should enjoy direct representation. In France the movement towards democracy did not in the hands of Rousseau include the enfranchisement of women, and Comte taught that women were politically inferior to men; Condorcet, however, demanded equal rights for both sexes. Although, through an oversight, women could vote under the first constitution of New Jersey from 1775 to 1807, there is no doubt that there was a gradual process of change in this area. There was no extension of this process till comparatively late in the 19th century. There has been considerable discussion as to whether women had constitutionally a right to vote in England prior to the Reform Act of 1832 (see Mrs C. C. Stopes, British Freewoman). The discussion, however, is one of purely antiquarian interest, and the Reform Act made quite clear what had certainly been the recognized custom before, by introducing specifically the word "male" in the new franchise law (2 and 3 Will. IV., cap. 45, sections 19 and 20).

The earliest known handbill representing the modern "women's suffrage" movement in England dates from about 1847, and in 1857 the first society was formed in Sheffield, the "Sheffield Female Political Association," due largely to the work of a Quaker lady, Anne Kent of Chelford. In July of the same year Mrs John Stuart Mill published an article in the Westminster Review.1 The earliest outstanding figure, however, is Lydia Ernestine Becker (1827-1890), descended on the mother's side from an old Lancashire family, her father being the son of a German who settled in England in early youth. She became a well-known botanist, and an intimate friend of Charles Darwin. In 1858 the Englishwoman's Journal was started, and by this time there was a vigorous agitation for the alteration of the law relating to the property and earnings of married women. Among the leaders of that movement were Barbara Leigh Smith (Mrs Bodichon) and Bessie Rayner Parkes (Madame Belloc). At the same time a famous group of women, Emily Davies, Miss Beale and Miss Buss (founders respectively of the Cheltenham Ladies' College and the North London Collegiate School) and Miss Garrett (Dr Garrett Anderson), Miss Helen Taylor (John Stuart Mill's stepdaughter) and Miss Wolstenholme (afterwards Mrs Elmy), discussed women's suffrage at the "Kensington Society."

A new era began with the election in 1865, as member for Westminster, of John Stuart Mill, who placed women's suffrage in his election address. From that time the subject became more or less prominent in each successive parliament. Mill presented the first petition in May 1867. In 1868 the case of Chorlton v. Lings was decided against women applicants for the vote by the Court of Common Pleas, and a similar decision was given by the Supreme Court of Appeal in Scotland. From this time the suffrage movement in local committees (in London, Manchester, Bristol, Edinburgh and Birmingham) were directed to promoting a bill in parliament, and to forwarding petitions (an average of 200,000 signatures a year was maintained from 1870 to 1880). The Women's Suffrage Journal was founded in 1870, and in the same year Jacob Bright moved the second reading of the Women's Disabilities Bill which was carried by a majority of 33 votes. Mr Gladstone then threw his opposition into the scale, and the bill was rejected in committee by 220 to 94. In 1871 the same bill was again lost by 220 to 151, in spite of a memorial headed by Florence Nightingale, Mary Carpenter, Augusta Webster, Harriet Martineau, Frances Power Cobbe and Anna Louisa Chisolm (Mrs H. W. Chisholm). G. O. Trevelyan's Household Franchise Bill in 1873 raised the hopes of the women's suffragist, and Mr Joseph Chamberlain at a great Liberal meeting in Birmingham carried a resolution in favour of the proposed change. From 1874 to 1876 the bill was in charge of a conservative, Mr Forsyth, and, despite the opposition of John Bright and the efforts of a parliamentary committee for "maintaining the present law," the Government majority of 100 was maintained. The work proceeded uneventfully from 1876 to 1884, huge meetings being held in all the chief towns. In 1880 the franchise was conferred upon women owners in the Isle of Man, subsequently upon women occupiers also. In 1883 a great Liberal conference at Leeds voted in favour of women's suffrage under the leadership of Dr Crosskey and Walter S. B. McLaren. The next notable event in the movement was the defeat of W. Woodall's amendment to the Reform Bill (1884), providing that words importing the masculine gender should include women, and the refusal of the House of Commons to accept the appeal to his party to withdraw the support which they had given in the past. 104 Liberal members crossed over in answer to this appeal. Numerous bills and resolutions followed year by year in the names of W. Woodall, L. H. Courtney (Lord Courtney, whose bill was read a second time without a division, 1886), W. S. B. McLaren, Baron Dimsdale, Caleb Wright, Sir Albert K. Rollit, F. Faithfull Begg (1897; second reading majority 71). Up to 1906 all those attempts had failed, in most cases owing to time being taken for government business.

The period 1896 to 1910 witnessed entirely new developments. The suffragists of the existing societies still carried on their constitutional propaganda, and various bills were introduced. In 1907 Mr W. H. Dickinson's bill was talked out, and in 1908 Mr H. Y. Stanger's bill was carried on its second reading by a majority of 179, but the government refused facilities for its progress. Prior to this, however, a number of suffragists had come to the conclusion that the failure of the various bills was due primarily to government hostility. Furthermore the advent of a Liberal government in 1906 had aroused hopes among them that the question would be officially taken up. Questions were therefore put with a general feeling of discomfit at the relations between the so-called "militant" suffragists and the authorities, led in the spring of 1910 to the formation of a committee (called the Conciliatory Committee) of members of parliament under the presidency of the earl of Lytton. This committee, consisting of some 55 members belonging to all parties, succeeded in agreeing upon a new bill based upon the occupier franchise established by the Municipal Franchise Act of 1884. It was urged on behalf of this bill that it would establish the principle on a sufficiently

---

1 This article was written in reference to the Women's Rights Convention held in Worcester, Mass., U.S.A., in October 1850.
representative basis without altering the numerical balance of parties in the country. It was calculated that slightly over 1,000,000 women would be disfranchised. After considerable pressure both inside the house and outside, Mr Asquith consented to give two days of government time for the debate, and the second reading, moved by the Labour member, Mr D. J. Shackleton, was carried by a majority of 110 votes. A further attempt to commit the bill to a Grand Committee failed by 175 votes; the bill was therefore sent to a committee of the whole house, and Mr Asquith announced that he would not give further facilities for its discussion by requiring that the bill be presented to the House as undemocratic by Mr Lloyd-George and other Liberals, it was supported by 32 out of 40 of the Labour members, and evidence was given that a large proportion of the new voters would have been working women.

The leading women's suffrage societies may here be mentioned. All these societies have advocated precisely the same view, namely that women should have the same electoral privileges as men, whatever franchise system be adopted.

1. The National Union of Women's Suffrage Societies is the oldest organization. It began about 1867 as a number of separate local committees, and after various reorganizations a great amalgamation of all local societies was framed in 1896 under the present title. This union had 200 branches in 1910. All the early suffragists belonged to this body and in the latter years the chief name was that of Mrs Henry Fawcett. The union was based on the "constitutional" policy and stood apart altogether from the "militant" societies. Its official organ, The Common Cause, was founded in 1898.

2. The National Women's Social and Political Union, associated chiefly with the name of Mrs Emmeline Pankhurst and Miss Christabel Pankhurst, formed in 1906, originated the more militant policy. Its income in 1909-1910 reached the figure of £60,000, and up to September 1910 some 500 of its members had undergone imprisonment. It undertook a widespread campaign of meetings, and though at first its speakers were subjected to an opposition of a violent character, there was no doubt that the movement received from its activities a wholly new stimulus. Its official organ, Votes for Women, obtained a large circulation.

Societies of various kinds multiplied. In 1907 were formed (3) the Women's Freedom League (chiefly associated with the name of Mrs C. Despard, a prominent supporter of the Labour party), whose members were addressed to the internal administration of the Social and Political Union, but agreed in adopting its policy in a modified form; and (4) the Men's League for Women's Suffrage, a society which included men of all parties, and in September 1910 adopted the anti-government election policy. Numerous other party- and non-party societies were formed, and resolutions supporting the principle, either in the abstract or as a part of adult suffrage, were passed by various Conservative, Liberal and Labour conferences and associations.

The remarkable prominence of the movement and the fact that successive parliaments contained a majority of pledged suffragists led to attempts to exclude opposition societies. In 1908 was formed the Women's National Anti-Suffrage League, of men and women, which drew into its ranks prominent persons such as Lord Cromer, Lord Curzon, Lady Jersey and Mrs Humphry Ward; and about the same time the Men's League for Opposing Women's Suffrage came into existence. These two leagues amalgamated in December 1910, as the National League for Opposing Women's Suffrage, with Lord Cromer as president. The Anti-Suffrage Review was founded in 1907.

In New Zealand a measure for the enfranchisement of women, introduced by Richard Seddon, was carried in September 1893 (in the upper house by a majority of 2). In Australia the vote has been extended to all adult women both in the states (the first being South Australia, 1894, the last Victoria, 1908) and for the Commonwealth parliament. They have, moreover, the right to sit in the representative assemblies.

The movement assumed an organized form in the United States somewhat earlier than in the United Kingdom. It arose out of the interplay of the temperance movement, slavery agitation, and was fostered by the discussion on women's property rights. In 1840 the question was raised in a more acute form by the exclusion of women delegates from the World's Convention, and in 1848 the first women's suffrage convention was held at Seneca Falls, the leading spirits being Mrs Elizabeth Cady Stanton, Martha C. Wright and Lucretia Mott. Later conventions at Salem and Worcester, Massachusetts, in 1850, were the predecessors of annual meetings, but the extravagant dress adopted by some of the women brought ridicule upon the movement, which was further thrown into the background by the Civil War. In 1869 were formed: (1) in New York, the National Women's Suffrage Association, and (2) in Cleveland, the American Woman's Suffrage Association. In 1890 these two societies amalgamated as the National American Woman's Suffrage Association, of which in 1900 Mrs Carrie Chapman Catt became president. The question was considered by a select committee in the 48th Congress, and 200 petitions, representing upwards of 400,000 individuals, were presented in 1900. The Labour and Socialist parties in general supported the women's claim, but there was considerable opposition in other parties. In 5 states (Wyoming since 1869; Colorado, 1893; Utah, 1896; Idaho, 1896; and Washington, 1910) women are electors, and in 25 states they have exercised the school suffrage. In Louisiana they obtained the suffrage in connexion with tax levies in 1898. Anti-suffrage societies have also been formed in Brooklyn (1894), Massachusetts (1895), Illinois (1897), Oregon (1899).

In Finland all adult men and women over the age of 24, except those of whom papers were presented, received the right to vote for members of the Diet in 1906, in which year nineteen women became members of the Diet. In Norway, where there is male suffrage for men over 25 years of age, women were entitled to vote by a law of 1907, provided they or, if married, their husbands (i.e. where property is jointly owned) had paid income tax on an annual income of 400 kroner (£2) in the towns, or 300 kroner (£1, 6s.) in country districts. In Sweden a suffrage bill was carried in the lower but rejected in the upper house in 1905. In all the chief countries there are suffrage societies of greater or less strength. In Russia the question was placed in the forefront of the demands made by the Duma in 1906, and in 1907 property women received the right to confer votes on their sons who would otherwise be unenfranchised. In France a feminist congress met at Lyons in 1909. The International Woman Suffrage Alliance originated in the United States in 1888. Its membership increased steadily, and at the Convention held in London in 1909 delegates were present from twenty-two countries. In the United Kingdom this Alliance is represented by the National Union of Women's Suffrage Societies. A social and propagandist club was founded in London in 1900 with an international membership. An international journal under the title Jus Suffragii (Brussels) was founded in 1907.

Authorities.—It is impossible to do more than mention a few works out of many dealing with various phases of the modern movement: the Championships of Women's Education in England (1898); A. R. Clevelpid, Women under English Law (1866); J. L. de Lannass, L'Education de la femme moderne (1908); M. Ostrogorski, Femme ou point de vue du droit public (1897); Mrs C. P. Gilman, Women and Economics (1909); Miss C. E. Collet, Report on Changes in the Employment of Women (1898); Faris, papers, C. 8754; B. and M. Van Vorst, Woman in Industry (1909); A. Loria, Le feminisme au point de vue sociologique (1907); Helen Blackburn, Record of Women's Suffrage, in the United Kingdom (1902); Susan B. Anthony, History of Woman's Suffrage, in the United States (4 vols., 1881-1902); C. C. Stupes, British Women (1864); H. Lyon Beale, The Emancipation of Women (1910). The classical exposition of the arguments on behalf of women's suffrage is J. S. Mill's Subjection of Women; the most important statement in opposition is perhaps that of Professor A. V. Dicey in the above-mentioned work.

WORLD, ANTHONY A (1632-1695). English antiquary, was the fourth son of Thomas Wood (1582-1643), B.C.L. of Oxford, where Anthony was born on the 17th of December 1632. He was sent to New College school in 1641, and at the age of twelve was removed to the free grammar school at Thame, where his studies were interrupted by civil war skirmishes. He was then placed under the tuition of his brother Edward (1637-1655), who was a fellow of Merton College, Oxford. The latter was killed in this condition his mother would always be soliciting him to be an apprentice which he could never endure to hear of. He was entered at Merton College in 1647, and made postmaster. In 1652 he amused himself with ploughing and bell-ringing.

1 In the Life he speaks of himself, and his family as Wood or Wood, the last form being a pedantic return to old usage adopted by himself. A pedigree is given in Clark's edition.
WOOD, MRS HENRY

WOOD, SIR H. EVELYN

and "having had from him most tender years an extraordinary ravishing delight in music," began to teach himself the violin, and in 1691, having gained the degree of B.A. He engaged a music-master, and obtained permission to use the Bodleian, "where he took to the happiness of his life." He was admitted M.A. in 1655, and in the following year published a volume of sermons by his late brother Edward. He began systematically to copy monumental inscriptions and to search for antiquities in the city and neighbourhood. He went through the Christ Church registers, "at this time being resolved to set himself to the study of antiquities." Dr John Wallis, the keeper, allowed him free access to the university registers in 1660; "here he laid the found of his varieties which, when ultimately published, viz. Hist. et Antiq. Univ. Oxon." He also came to know the Oxford collections of Brian Twone to which he was greatly indebted. He steadily investigated the muniments of all the colleges, and in 1667 made his first journey to London, where he visited Dugdale, who introduced him into the Cottonian library, and Prynne showed him the same civility for the Tower records. On October 22, 1669, he was sent for by the delegates of the press, "that whereas he had taken a great deal of pains in writing the Hist. and Antiq. of the University of Oxford, they would for his pains give him an allowance of books, people, council," that he should "not be allowed to be translated into Latin.

He accepted the offer and set to work to prepare his English MS, for the translators, Richard Peers and Richard Reeve, both appointed by Dr Fell, dean of Christ Church, who undertook the expense of printing. In 1674 appeared Historia et antiquitates Universitatis Oxoniensis, handsomely reprinted "e Theatro Sheldoniano," in two folio volumes, the first devoted to the university in general and the second to the colleges. Copies were widely distributed, and university and author received much praise. On the other hand, Bishop Bisham was so annoyed by the whole work that he declared the history itself is in "many things ridiculously false" (Genuine Remains, 1693, p.183). In 1678 the university registers which had been in his custody for eighteen years were removed, as it was feared that he would be implicated in the Popish plot. To relieve himself from suspicion he took the oaths of supremacy and allegiance. During this time he had been gradually completing his great work, which was produced by a London publisher in 1691-1692, 2 vols. folio, Athenae Oxonienses: An Exact History of all the Writers and Bishops who have had their Education in the University of Oxford from 1500 to 1690, a book which the Bodleian Catalogue of 1691-92, 3 vols. folio, lists the work as "unwritten," by A. Gutch (in 1693, 4to, 3 vols. folio). Some letters between Aubrey and Wood were given in the Gentleman's Magazine (3rd ser., ix. 356). Dr Wood consulted Dr Hudson about getting a third volume of the Athenae printed in Holland, saying, "When this volume comes out I'll make you laugh again" (Reliquiae Britannicae, 1. 597). If the third volume of the Athenae had been published by R. Knaplock and J. Tonson in 1721 (2 vols. folio), "very much corrected and enlarged, with the addition of above 900 new lives." The third appeared as a "new edition, with additions, and a continuation by Philip Blis" (1813-1826, 4 vols. folio). The Ecclesiastical History Society proposed to bring out a fourth edition, which stopped at the Life, ed. by Bliss (1848, 8vo; see Gent. Mag., N.S., xxix. 135, 266). Dr Bliss's intention was to give a new copy in the Bodleian, and Dr Griffiths announced in 1859 that a new edition was contemplated by the Press, and asked for additional matter (see Notes and Queries, 2nd ser., vi. 514, and 6th ser., vi. 51). Wood bequeathed his library (174 MSS. and 670 works) to the Rev. Dr William Williams, of Huddersfield, a catalogue of the MSS. in 1761. In 1858 the whole collection was transferred to the Bodleian, where 25 had been reprinted (Wood's MS.) in 1813-1826, and 410 papers from which the Athenae was written, as well as several large volumes of Wood's correspondence and all his diaries, are in the Bodleian.

He became intimately acquainted with the most particular of Wood's life from his Diaries (1657-1695) and autobiography; all earlier editions are now superseded by the elaborate work of Andrew Clark, The Life and Times of Anthony Wood, Antiquary, Oxford, 1852-1695, described by himself (Oxford Historical Society, 1891-1900, 5 vols. 8vo). See also Reliquiae Hearniane, ed. Bliss (2nd ed., 1860, 3 vols. 12mo); Hearne's Remarks and Collections (Oxford Historical Society, 1885-1907), vols. i.-vii.; Macray's Annals of the Bodleian Library (2nd ed., 1890); Nichols's Literary Anecdotes, i. iv. v. viii.; Noble's Biogr. Hist. of England, i. (H. R. T.)

WOOD, MRS HENRY [Ellen] (1814-1887), English novelist, was born at Worcester on the 17th of January 1814. Her maiden name was Price; her father was a glove manufacturer in Worcester. She married Henry Wood in 1836, and after her marriage lived for most part in France, her husband, who died in 1866, being at the head of a large shipping and banking firm. In 1860 she wrote a temperance tale, Dovesbury House, which gained a prize of £100 offered by the Scottish Temperance League; but before this she had regularly contributed anonymous stories to periodicals. Her first great success was made with East Lynne (1861), which obtained enormous popularity. It was translated into several languages, and dramatic versions were made. The Channings and Mrs Halliburton's Troubles followed in 1862; Verner's Pride and The Shadow of Ashby Dale in 1863; Lord Oakburn's Daughters, Oswald Croy and Trevlyn Hold in 1864. She became proprietor and editor of the Argosy magazine in 1867, and the Johnn Lyme tales, published anonymously there, are the most artistic of her works. Among the thirty-five novels Mrs Henry Wood produced, the best of those not hitherto mentioned were Roland Yorke (1866); Within the Maze (1872) and Editha (1876). She continued to edit the Argosy, with the assistance of her son, Sir H. W. Wood, till her death, which occurred on the 28th of February 1887.

Memories of Mrs Henry Wood, by her son, were published in 1894.

WOOD, SIR HENRY EVELYN (1838– ), British field marshal, was born at Braintree, Essex, on the 9th of February 1838, the youngest son of Sir John Page Wood, Bart. Educated at Marlborough, he entered the Royal Navy in 1852, and served as a midshipman in the Russian war, being employed on shore with the naval brigade in the siege operations before Sebastopol, and was in despatches, having been severely wounded at the assault on the Redan on June 18, 1855. Immediately afterwards he left the navy for the army, becoming a cornet in the 13th Light Dragoons. Promoted lieutenant in 1856, he exchanged into the 17th Lancers in 1857, and served in the Indian Mutiny with distinction as brigade-major of a flying column, winning the
WOOD, J. G.—WOODBURY

Victoria Cross. In 1861 he became captain, in 1862 brevet-major, exchanging about the same time into the 73rd Highlanders (Black Watch), but returned to the cavalry three years later. Having meantime served as aide-de-camp at Dublin, he was next employed on the staff at Aldershot until 1871, when he was appointed to the 90th (now 2nd Scottish Rifles) as a regimental major. In 1867 he had married the Hon. Mary Pauline Southwell, sister of the 4th Lord Southwell. In 1873 he was promoted brevet-lieutenant-colonel, and in 1874 served in the Ashanti War (brevet-colonel). In 1874-1878 he was again on the staff at Aldershot, and in November 1878 he became regimental lieutenant-colonel, the 90th being at that time in South Africa engaged in the Kaffir War. In January 1879 he was in command of the left column of the army that crossed the Zulu frontline, and shortly afterwards he received the local rank of brigadier-general. Under him served Colonel Redvers Buller and also the Boer leader, Piet Uys, who fell at Inhlobana, but the re-pulse at that place was more than counterbalanced by the successful battle of Kambula. At the close of the war Sir Evelyn Wood, who received the K.C.B. for his services, was appointed to command the Chatham district. But in January 1881 he was again in South Africa with the local rank of major-general, and after Sir G. P. Colley's death at Majuba it fell to his lot to negotiate the armistice with General Joubert. Remaining in Natal until February 1882, he then returned to the Chatham command, having meantime been promoted substantive major-general. In 1882 he was made a G.C.M.G. and commanded a brigade in the Egyptian expedition. He remained in Egypt for six years. From 1883 to 1885 he was Sirdar of the Egyptian army, which he reorganized and in fact created. During the Nile operations of 1884-93 he commanded the forces on the line of communication of Lord Wolseley's army. In 1886 he returned to an English command, and two years later (January 1889), with the local rank of lieutenant-general, he was appointed to the Aldershot command. He became lieutenant-general in 1891, and was given the G.C.B. at the close of his tenure of the command, when he went to the War Office as quartermaster-general. Four years afterwards he became adjutant-general. He was promoted full general in 1895. He commanded the II. Army Corps and Southern Command from 1901 to 1904, being promoted field marshal on the 8th of April 1903. In 1907 he became colonel of the Royal Horse Guards. After retiring from active service he took a leading part, as chairman of the Association for the City of London, in the organization of the Territorial Force. Sir Evelyn Wood published several works, perhaps the best known of which to the soldier are Achievements of Cavalry (1897) and Cavalry in the Waterloo Campaign (1899). He also wrote The Crimean in 1854 and in 1893; an autobiography, From Midshipman to Field Marshal; and The Revolt in Hindostan.

WOOD, JOHN GEORGE (1827-1889), English writer and lecturer on natural history, was born in London on the 21st of July 1827. He was educated at Ashbourne grammar school and at Merton College, Oxford; and after he had taken his degree in 1848 he worked for two years in the anatomical museum at Christ Church under Sir Henry Acland. In 1832 he was ordained a deacon of the Church of England, became curate of the parish of St Thomas the Martyr, Oxford, and also took up the post of chaplain to the Boatmen's Floating Chapel at Oxford. He was ordained priest in 1854, and in that year gave up his curacy to devote himself for a time to literary work. In 1858 he accepted a readership at Christ Church, Newgate Street, and he was assistant-chaplain to St Bartholomew's Hospital, London, from 1856 until 1862. Between 1868 and 1876 he held the office of precentor to the Canterbury Diocesan Choral Union. After 1876 he devoted himself to the production of books and to delivering in all parts of the country lectures on zoology, which he illustrated by drawing on a black-board or on large sheets of white paper with coloured crayons. These "sketch lectures," as he called them, were very popular, and made his name widely known both in Great Britain and in the United States. In 1838-1839 he delivered the Lowell lectures at Boston. Wood was for a time editor of the Boy's Own Magazine. His most important work was a Natural History in three volumes, but he was better known by the series of books which began with Common Objects of the Sea-Shore, and which included popular monographs on shells, moths, beetles, the microscope and Common Objects of the Country. Our Garden Friends and Foes was another book which found hosts of appreciative readers. He died at Coventry on the 3rd of March 1889.

WOOD, SEARLES VALENTINE (1795-1880), English palaeontologist, was born on the 14th of February 1795. He went to sea in 1811 as a midshipman in the East India Company's service, which he left, however, in 1826. He then settled at Hasketon near Woodbridge, Suffolk. He devoted himself to a study of the mollusca of the Newer Tertiary (Crag) of Suffolk and Norfolk, and the Older Tertiary (Eocene) of the Hampshire basin. On the latter subject he published A Monograph of the Eocene Bivalves of England (1861-1874), issued by the Palaeontographical Society. His chief work was A Monograph of the Crag Mollusca (1848-1866), published by the same society, for which he was awarded the Wollaston medal in 1860 by the Geological Society of London; a supplement was issued by him in 1872-1874, a second in 1879, and a third (edited by his son) in 1882. He died at Martlesham, near Woodbridge, on the 26th of October 1880. His son, Searles Valentine Wood (1830-1884), was for some years a solicitor at Woodbridge, but gave up the profession and devoted his energies to geology, studying especially the structure of the deposits of the Crag and glacial drifts.

WOODBRIDGE, a market town in the Woodbridge parliamentary division of Suffolk, England; 70 m. N.E. by E. from London by the Great Eastern railway. Pop. of urban district (1901) 4640. It is pretty situated near the head of the Deben estuary, which enters the North Sea 10 m. S. by E. The church of St Mary the Virgin is a beautiful Perpendicular structure, with a massive and lofty tower of flint work. The large estate left by Thomas Seeker of Sekforde (1758) endows the grammar school and hospital. Woodbridge Abbey, built by Seeker, occupies the site of an Augustinian foundation of the 12th century. There is a large agricultural trade, and general fairs and horse fairs are held.

WOODBURY, CHARLES HERBERT (1864-- ), American marine painter, was born at Lynn, Massachusetts, on the 14th of July 1864. He graduated at the Massachusetts Institute of Technology, Boston, in 1886, was a pupil of the Académie Julien, Paris. He was president of the Boston Water Color Club, and became associate of the National Academy of Design, New York. His wife, Marcia Oakes Woodbury, born in 1865 at South Berwick, also became known as a painter.

WOODBURY, LEVI (1790-1851), American political leader, was born at Frencestown, New Hampshire, on the 22nd of December 1810. He graduated from Dartmouth College in 1809, was admitted to the bar in 1812, and was a judge of the superior court from 1816 to 1823. In 1822-1823 he was governor of the state, in 1825 was a member and speaker of the state House of Representatives, and in 1825-1831 and again in 1841-1845 was a member of the U.S. Senate. He was secretary of the navy in 1831-1834, secretary of the treasury in 1834-1841, and associate justice of the U.S. Supreme Court from 1846 until his death, at Portsmouth, New Hampshire, on the 4th of September 1851. From about 1825 to 1845 Woodbury was the undisputed leader of the Jacksonian Democracy in New England.

See his Writings, Political, Judicial and Literary (3 vols., Boston, 1852), edited by Nahum Capen; and an article in the New England Magazine, new series, xxxvi. p. 698 (February 1908).

WOODBURY, a city and the county-seat of Gloucester county, New Jersey, U.S.A., in the western part of the state, 9 m. S. of Philadelphia. Pop. (1900) 4087, including 246 foreign-born and 517 negroes; (1910) 4642. It is served by the West Jersey & Seashore Railroad. Among its public institutions is the Deptford Female Free School. The city manufactures Woodbury is said to have been settled about 1684; it became the county-seat in 1787. It was chartered as a borough in 1854 and as a city in 1870.
WOOD-CARVING, the process whereby wood is ornamented with design by means of sharp cutting tools held in the hand. The term includes anything within the limit of sculpture in the round up to hand-worked mouldings such as help to compose the tracery of screens, &c.

Material.—The texture of wood limits the scope of the carver in that the substance consists of bundles of fibres (called grain) growing in a vertical direction without much lateral cohesive strength. It is therefore essential to arrange the more delicate parts of a design with the grain instead of across it, and the more slender stalks or leaf-points should not be too much separated for fine effect. The failure to appreciate these primary rules may constantly be seen in damaged work, when it will be noticed that, whereas tendrils, tips of birds' beaks, &c., arranged across the grain have been broken away, similar designs detailed more in harmony with the growth of the wood and not too deeply undercut remain intact. Oak is the most suitable wood for carving, on account of its durability and toughness without being too hard. Chestnut (very like oak), American walnut, mahogany and teak are also very good woods; while for fine work Italian walnut, lime, sycamore, apple, pear or plum, are generally chosen. Decoration that is to be varnished and of not too delicate a nature is as a rule carved in pine.

Tools.—The carver requires but few kinds of tools:—(1) the gouge—a tool with a curved cutting edge—used in a variety of forms and sizes for carving hollows, rounds and sweeping curves; (2) the chisel, large and small, whose straight cutting edge is used for lines and cleaning up flat surfaces; (3) the "V" tool used for veining, and in certain classes of flat work for emphasizing lines. A special screw for fixing work to the bench, and a mallet, complete the carver's kit, though other tools, more or less legitimate, are often used, such as a router for bringing grounds to a uniform level, bent gouges and bent chisels for cutting hollows too deep for the ordinary tool.

Method.—The process for relief carving is usually as follows. The carver first fixes the wood to his bench by means of the screw already referred to. He then (a) sketches on the main lines of his idea, indicating the flowers, foliage, &c.; or (b) should the design be very intricate or of a geometrical character, he traces the whole design from a pattern first prepared on paper; or (c) he may combine the first two methods. Next he grounds out the spaces between the lines with a gouge to a more or less uniform depth. Then he "hosts" the upstanding pattern that remains, i.e. he models and shapes the details of his design, carefully balancing the lights and shadows; and finally, after having obtained the result he desires, he cleans up the whole. The quicker he works, the fewer times he goes over the same part, the more sketchy the subsidiary portions, the less high finish he puts into the detail, the better the result. Incised work, chip-carving, &c., are generally finished at once and not in stages. Much carved work, that of savage nations for instance, is of course carved without the assistance of a bench. Many small articles, too, are carved in the hand. Little models of antelopes or bears, so familiar in Switzerland, are carved in this way with a tool somewhat like a half-open knife but with the blade fixed.

Style.—From the remotest ages the decoration of wood has been a foremost art. The tendency of human nature has always been to ornament every article in use. Just as a child of to-day instinctively cuts patterns on the bark of his switch freshly taken from the hedgerow, so the primitive man, to say nothing of his more civilized successor, has from the earliest times cut designs on every wooden article he is accustomed to handle. The North American Indian carves his wooden fish-hook or his pipe stem just as the Polynesian works patterns on his paddle. The native of British Guiana decorates his cassava grater with a well-conceived scheme of incised scrobes, while the savage of Loango Bay distorts his spoon with a hopelessly unsuitable design of perhaps figures standing up in full relief carrying a hammock.

Figure-work seems to have been universal. The carving to represent one's god in a tangible form finds expression in numberless ways. The early carver, and, for that matter, the native of the present day, has always found a difficulty in giving expression to the eye, and at all times has evaded it by inlaying this feature with coloured material.

Obisidian, for example, is used by the modern Easter Islander in common with the Egyptian craftsmen of the earlier dynasties. To carve a figure in wood is not only more difficult but is less satisfactory than marble (for which see SCULPTURE), owing to the tendency of wood to crack, to be injured by insects, or to suffer from changes in the atmosphere. The texture of the material, too, does not lend itself to the expression of the features, especially in the classic type of youthful face. On the other hand, magnificent examples exist of the more rugged features of age: the beetling brows, the furrows and lines neutralizing the defects of the grain of the wood. However, in ancient work the surface was not of such consequence, for figures as a rule were painted.

It is not always realized at the present day to what extent colour has even from the most ancient times been used to enhance the effect of wood-carving and sculpture. The modern prejudice against gold and other tints is perhaps due to the modern painted woodcarver's failure to appreciate what colour associates coloured carvings too readily with theatre galleries and the triumphal arch of the circus procession. The "restored" work too of some church screens does anything but encourage the revival of this time-honoured custom. The arrangement of a proper and harmonious scheme of colour is not the work of the house-painter, but of the specially trained artist. Witness the old coloured screens of Norfolk, the harmonious greens and reds, the proper proportion of gold, the panels adorned with saints on backgrounds of delicate diaper work, and compare these triumphs of decoration with the rougher blues and reds of the newly restored screen, and one ceases to wonder why we now prefer the wood plain.

Of late years carving has gone out of fashion; a change has come about. The work is necessarily slow, thus causing charges to appear high. Other and cheaper methods of decoration have driven carving from its former place. Machine work has much to offer, and the endeavour to popularize the craft by means of the village class has not always achieved its own end. The gradual disappearance of the individual artist, exhowed out as he has been by the contractor, is fatal to the continuance of an art that demands not only constant but never diminishing skill. So long as the carver is expected to work to some one else's pattern—so long as he is, in detail at least, not his own designer—this art, which attained its zenith in the glories of the 15th-century cathedral and in the continental domestic work of the hundred years to follow, can never hope to live again.

Ancient Work before the Christian Era.—The extreme dryness of the climate of Egypt accounts for the existence of a number of wood-carvings from this remote period (see EGYPT: ART AND ARCHAEOLOGY). Some wood panels from the tomb of Housul at Sakkarah are of the III. dynasty (over 4000 B.C.). The carving consists of hieroglyphs and figures in low relief, and the style is extremely delicate and fine. A stool shown on one of the panels has the seat carved and the four legs like the fore and hind limbs of an animal, a form common in Egypt for thousands of years.

In the Cairo museum may be seen the statue of a man of 50 years of age, of the period of the great pyramid, possibly 4000 B.C. The expression of the face and the realism of the carriage have never been surpassed by any Egyptian sculptor of this or any other period. The figure is carved out of a solid block of sycamore, and in accordance with the Egyptian custom, the arms are joined on. The eyes are inlaid with pieces of opaque white quartz, with a line of bronze surrounding to imitate the lid; a small disk of transparent rock crystal forms the iris, while a tiny bit of polished ebon wood forms the crystal imprints to it a lifelike sparkle. "The IV., V., and VI. dynasties cover the finest period of Egyptian sculpture. The statues found in the tombs show a freedom of treatment which was never reached in later times. There were no rigid rules by which the artist was expected to render exactly like his model. For these are not, like more modern statues, simply works of art, but had primarily a religious significance" (Maspero). As the spirits of the deceased might inhabit these "Ka" statues, the features and proportions were closely copied.

There are to be found in the principal museums of Europe many Egyptian examples of the utmost interest—mummy cases of human
Mummy cases.

Wood-carving.

being's with the face alone carved, animal mummy cases, sometimes boxes, with the figure of a lizzard, perhaps, carved in full relief standing on the lid. Sometimes the animal, a crocodile or a fish, was inscribed with its hieroglyphic name (or name and number), crouching on all fours, would be carved in the round and its hollowed body used as the case itself.

Of furniture, folding seats like the modern campstool, and chairs with caned seats, the latter, some of the finest work ever done in Egypt, still exist. Beds supported by lions' paws (XI. and XII. dynasties, from Gebelein, now in the Cairo Museum), head-rests, 6 ft. 6 in., high, carved of象木, the beard with a leaf claw, quite Louis Quinze in character. There are insect ladles, the handle representing a busket of flowers, the bowl formed like the leaf of an aquatic plant with serrated edges from (Gurnah, XVII. dynasty); and perfume boxes such as a fish, the two halves forming the bottom and top—the perfume or pomatum was removed by licking it with a fish. This is not done ! A fish formed from a full-blotted lotus, another shaped like the neck of a goose, a third consisting of a dog running with a fish in its mouth, the fish forming the bowl. The list might be prolonged, but enough has been said to show the spirit of a period. Wood-carving had reached thousands of years before the birth of Christ.

Of the work of Assyria, Greece and Rome, little is actually known except from fragments. In the first, the work was largely funereal, a craft kept pace with the varying taste and refinement of the all the older civilizations. Important pieces of wood sculpture which once existed in Greece and other ancient countries are only known to us from the descriptions of Pausanias and other classic writers. Many examples of the wooden images of the gods (θεοί) were preserved down to late historic times. The temple at Eleusis, the theatre of Dionysus, the Vestal Virgins in Rome and was fabled to have been brought by Aeneas from the burning Troy, was one of these wooden θεοί. 

First Eleven Centuries after Christ.—Wood-carving examples of the first eleven centuries are very rare. As early as the 5th century was the Saxon Church of St. Sabina on the Aventine Hill, Rome, very interesting specimens of early Christian relief sculpture in wood, dating, as the dresses show, from the 6th century. The doors are made up of a large number of small square panels, each minutely carved with a scene from the Old or New Testament. The whole feeling of these reliefs is thoroughly classic, though, obvious in a very debased form. A very fine fragment of Byzantine art (11th-12th centuries) is preserved in a monastery at Mount Athos in Macedonia. It consists of two panels (one above the other) of relief sculpture, surmounted by a semicircular arch of conventional foliage springing from columns ornamented with web work. The base is a series of coffers, the bases are square, each face being carved with a figure. It is a wonderfully fine piece of work, conceived in the best decorative spirit.

The wood-carvers of this period were not afraid to ask for excellenit design. In the Christiania Museum there are some fine Saxon wood-carvings which are very remarkable. Some 9th or 10th century wood-carved carvings are very well suited for the windows of the beautiful schemes of coloured carved work. Red, blue, green and white and gilding were the tints as a rule used. Not only were the screens painted in colours, but the parts painted white were often further decorated with delicate lines and sprigs of foliage in conventional pattern. The plain surfaces of the panels were also adorned with saints, often on a ground worked out of small interlace scrolls, and sometimes very fine. Nothing could exceed the beauty of the tripetychs or retabules of Germany, Flanders (Plate I. fig. 1) or France; carved with scenes from the New Testament in high relief arranged under a delicate lace-like arch, the figures groing out of the leaf of the vine or tendrils, and brilliant colours. In Germany the effect was further enhanced by emphasizing parts of the gilding by means of a transparent varnish tinted with gold. This was introduced to Germany early in the 15th century.

The style of design used during this great period owes much of its interest to the new obsolete custom of employing direct the craftsman and his men, instead of the present-day habit of giving the work to specialists trained to do one thing and then moved on to another and travelled about from church to church. In one district the designer would employ a particular form and arrangement of vine leaf, while in another adjoining quite a different style repeatedly appears. A design such as a leaf or a vine leaf is really a sort of scheme, rather than a design in the popular sense, and the skill in design and execution. The general scheme was of course planned by one master mind, but the carrying out of each section, each part, each detail, was left to the individual workman. Hence that variety of treatment, that endless diversity, which gives a charm and interest to Gothic art, unknown in more symmetrical epochs. The Gothic craftsman appreciated the cardinal fact that in design beautiful and original results could be reached only by the co-operation of the individual part to the general effect. He also often carved in situ, a practice seldom if ever followed in the present day. Here and there one comes across the work of long years ago still visible on a wall or a pillar. A large part of a rood-screen or coffer, carved with scenes from the life of St. George, the Crucifixion, the Annunciation, etc., can be seen on the church of Flanders (Plate 1). The effect is by no means plain, clearly show that sometimes at least the church was the workshop.

Gothic and Renaissance: a Comparison.—Gothic design roughly divides itself into two classes: (1) the geometrical, i.e. tracery and diaper patterns, and (2) the foliage designs, where the mechanical scroll of the Renaissance is as a rule absent. The lines of foliage treatment so common in the bands of the 15th-century rood-screens and the panel work especially of Germany, serve to illustrate the widely different motives of the craftsmen of these two great nations. In the rood-screens of the 13th and early 14th century the two sides of the panel alike, the Gothic carver seldom repeated a single detail. While his main lines and grouping corresponded, his detail differed. Of numberless examples a 15th-century chest at Bruges shows the difference. In the panel at the left the leaf is plain, but at the right it is elaborately worked, the pointed form,留给 merchants, is more elaborate. The Gothic style is thus seen to have been a decorative style, the mediaeval craftsmen of the north being the greatest in the world.

End of the 12th century—1300.—As this period of art is setting in Europe generally, and not by any one country alone, the dates just named must be of necessity only approximate. The 13th century was marked not only by great skill both in design and treatment, but also much devotional feeling. The craftsman seems to have not merely carved, but to have carved to the glory of God. At no time was work more delicately conceived or more beautifully cut. This early Gothic style certainly lent itself to fine finish, and in this sense it always produced the best of its kind. The loving care bestowed on each detail seems to point to a religious devotion which is sometimes absent from later work. Very good examples of capitals (now, alas, divided between various museums) are to be seen in the cathedrals of Ypres, Flanders, and in Berlin. The panels and the rood-screens should be considered in their relation to the art of the period and not only as ornamental details. The sculptors and wood-carvers of the early 14th century were often very fine, but the wood-carver was of secondary importance. The woodcarving of this period is surpassed in the work of the stone-masons who produced the great cathedrals of the north. The cathedrals of England, France, and Germany are alone sufficient to demonstrate the extent to which the mason and sculptor monopolized the subject of religious art and the height of his achievement. The works of the wood-carvers have been largely overlooked by modern scholars who have been ruled by the spirit of the age.

During this period folio forms, though still conventional, began to be more closely allied to the human form. The carver's work of the choir of Winchester contains exquisite carvings of oak and other leaves. The choir stalls of Ely and Chichester and the tomb of Edward III. in Westminster Abbey are of the same period, and one of the finest specimens of oak work is to be seen in the choir of the cathedral of Bamberg, Germany. The carver's work is in each case combined with painted and gilded. The colors and design are often very fine. The early 14th century is a period of great artistic development, and the wood-carving of this period is characterized by a spirit of realism and a greater love for nature. The designs are often very fine, and the workmanship is of the highest order. The carvers of this period were not only skilled in the art of carving, but also had a fine sense of design and a love for beauty. The wood-carving of this period is a beautiful example of the art of the period and a fine example of the skill and artistry of the wood-carvers of the time.
Fig. 1.—Centre panel of Retable in Dijon Museum. Flemish, 1301 A.D.
of St Benoit-sur-Loire, Lisieux, and Evesee are good 14th-century examples. But little Gothic work is now to be seen in the churches of this country. It is to the museums we have to look for traces of the old Gothic carvers. The two retables in Dijon Museum, the work of a sculptor who must be a sculptor and not a wood-carver, are examples of sculpture and not of wood-carving. A very large amount of 15th-century work remains to us, but the briefest reference only can be made to some of the more beautiful examples that help to make this period so great.

The rood screen of the cathedral of Atherington, which is a typical example of the transitional period between the medieval church, was now universal. It consisted of a tall screen of usually about 11 ft. high, on the top of which rested a roof, i.e., a platform about 6 ft. in width guarded on either side by a gallery or side-screen. The wood-carver, who was placed the rood, i.e., a large crucifix with figures of St Mary and St John on either side. This rood screen sometimes spanned the church in one continuous length (Beds, Kent), but more often the aisle and chancel arched in three separate divisions (Church Hand- borough, Oxon.). The loft was as a rule approached by a winding stair built in the thickness of the aisle wall. The lower part of the screen was built in and the top part of it is the upper part of this panelling was filled in with tracery (Carbrook, Norfolk), while the remaining flat surfaces of the panels were often picturised with saints on a background of foliage and architectural decoration. With Suffolks, the panel at the end of the period the employment of figures became less common as a means of decoration, and the panels were sometimes filled entirely with carved foliage (Swimbridge, Devon). The decorated carved foliage was seen and with the heads filled in with pierced tracery, often enriched with crockets (Scarning, Norfolk), embossed transoms (Castle Hedingham, Essex), or flowered cusps (Eye, Suffolk). The motifs were constantly varied and the French influence was apparent. The rood screen and was usually balanced and kept in position by means of a groined vaulting (Harberton, Devon) or a cove (Eddington, Somerset). The finest examples of vaulting are to be seen in Devon (Plate IV. fig. 10). The bosses at the intersections of the ribs and the carved tracery of the screen on Honiton stand unrivalled. Many screens still possess the beam which formed the edge of the loft floor and on which the gallery rested. It was here that the medieval rood-screen carver gave way to his fancy, and carved the finest designs in foliage to be seen throughout the whole Gothic period. Although these mace moulds, crests and bands have the appearance of being a florid tracery, the leaves are for the most part formed up in parts, much of the foliage, &c., being pierced and placed in hollow moulds in order to increase the shadow. As a rule the arrangement consisted of a crest running along the top, with a smaller one developing in the middle, and a smaller one below these, and this all rounded off with the heads, and separate the bands are carved with twisted foliage as at Abbs Kerswell and other places in the district round these the carvers worked in groups, in the same manner with the best effect.

The variety of design used is very great. That at Winchcombe, Gloucester, consists of designs combined with vine leaves and foliage. It illustrates how Gothic carvers sometimes repeated their patterns in a mechanical way as the worst workmen of the present time. Little can be said of the galleries, so few remain to us. They were nearly all pulled down when the order to destroy the roods was issued. The heads of the angels under niches (Llanawale, Wales), or painted figures (Stretham, Wtney, York) are certainly from the examples that have survived the Reformation. At Atherington, Devon, the gallery front is decorated with the royal coat of arms, other heraldic devices, and with prays. The Breton screen at St Fiacre-le-Fauoit is a wonderful example of French work of this time, but does not compare with the best English examples. Its flambant lines and its small tracery never again obtained any foothold. The French style of rood screen was not carried in this way (Colebrook, Devon) are sometimes to be found.

The rood was sometimes of such dimensions as to require some support through a leg. The carver, who had been used from which a chain connected the roof itself. At Culmpton, Devon, such a beam still exists, and is carved with foliage; an open creasing ornaments the underside and two angels support the top. There are several similar examples with skulls and bones, carved out of two solid logs averaging 18 in. wide and 21 in. high, and together measuring 15 ft. 6 in. long; there are round holes along the top which were probably used for lights.

No country in Europe possesses so fine a group of rood screens in the 15th century. The great roof of Westminster Hall (see ROOF) remains to the present day without an equal. In Norfolk and Suffolk roofs abound of the hammer-beam class; that at Woolpit, Suffolk, is of the first rank. Each bracket is carved with strongly designed foliage, the end of every beam terminated by a sculptured angel carved in wood and with which it is united, while each truss is supported by a canopied niche (containing a figure) resting on an angel corbel. Here, too, as at Ipswich and many other churches there is a variety of angels, and the angels support the ribs and the centres more or less open, and the beams, which are carved and embattled, contain a row of angels on either side. In Devon, Culmpton possesses a very fine semi-circular ceiling supported at intervals by ribs pierced with small panels, of which the roofs are divided up into small square panels, crossed by diagonal ribs of seating, while every joint is ornamented with a boss carved in the decorative manner peculiar to the Gothic craftsmen. The planit at Trull, Somerset, is a cathedral is nearly flat, and is also divided up into small compartments and boxed; the beams are supported by carved brackets resting on corbels with angels at each base.

In early times the choir alone possessed seats, the nave being left bare. Gradually benches were introduced, and during the 15th century became universal. The "poppy-head" form of ornamentation which was introduced in the 14th century was also employed, though common on the Continent, is of a kind hardly known in England, consisting as it does of arches springing from arches, and decorated with crockets and finials. The tabernacle work on the sides of the choir is produced with the same stretching up towards the roof in tapering lines of the utmost delicacy. The choir stalls (the work of Jorg Syrfin, 1468) in Ulm cathedral are among the finest produced of their period (see Plate, III. fig. 4). The front panels are carved with foliage of splendid decorative beauty, strength and character; the stall ends were carved with foliage and sculpture along the edge, as what sometimes the case in Bayeux.

By the 15th century, choir stalls with their canopies continued to increase in magnificence. Manchester cathedral (middle of 15th century) and Henry VII.'s chapel in Westminster Abbey (early 15th) are good examples of the fashion of massing magnificent gilded canopies, of foliated form, and with tracery faces, perhaps with the more simple beauty of the 14th-century work of Ely cathedral. The stalls of Amiens cathedral were perhaps the finest in the world. The stalls at the 16th-century intended to be fitted with stalls with the most realistic arms and stools (see Plate, III. fig. 1). In contrast to these, the stalls of the cinema are frequently seen seen in the form of the large circle sometimes takes the place of the English poppy-head. In the Copenhagen Museum there is a set of bench ends of the 15th century with such a decoration carved with the coat of arms, for instance, in the church at Trull, Somerset, the elaborate form when the poppy-head springs from a crocketed circle filled in, with sculpture, at St Nicholas, King's Lynn. Often the foliage contained a face (Clay, Norfolk), or the poppy-head consisted of the head of a bird, with feathers (Crabtree, Suffolk); or, as may be seen at Stansted Mountfichet (Great Brington, Northampton); occasionally the traditional form was departed from and the final carved like a lemon in outline (Bury St Edmunds). The "tracery kind of a large circle sometimes takes the place of the English poppy-head. In the Kunstgewerbe Museum, Berlin, some beautiful stall ends are to be seen. Out of a dragon's mouth grows a conventional tree arranged and balanced in excellent manner. One stall end is a tree of a kind of a large circle grows out of the mouth of a flower. This custom of making foliage grow out of the mouth or eyes is hardly defensible, and was by no means confined to any country or time. We have plenty of examples of similar examples.

Before the 15th century preaching had not become a regular institution in England, and pulps were not so common. However, they were sometimes used, and in some cases are used to which the Lollards and other sects put this method of teaching doctrine, and pulps became a necessity. A very beautiful one exists at Kenton, Devon. It is, as is generally the case, of oak. It has a straight back and a flat seat. On the right hand side is an upright column of foliage between pillars, and the panels, which are painted with saints, are enriched with carved canopies and foliage; it is, however, much restored. A large figure standing under a canopy fills each of the panelled sides, while many other smaller
WOOD-CARVING

figures help to enrich the general effect. Examples of Gothic sound- ing tabor- pieces, such as that in the pulpit, in the church of St Margaret, Winchester, is of the time of Prior Silkstede (1520), and is carved with his rebus, a stein of twisted silk.

The usual form of font cover has long been the habit, especially with the rise of the salient angles being straight and cusped (Fridenbury, Kent) or of curved outline and cusped (St Mildred, Canterbury). There is a very pretty example of this of the 15th century, with a small door quite plain but for a little angel kneeling on the top, with its hands clasped in prayer. But the most beautiful form is the massed collection of panelling and canopy work, of which there is such a fine example in the Chapel of St Margaret in the church of Saffron Walden, Essex. Here we have a dove on the topmost pinnacle (Castleacre, Norfolk), in allusion to the descent of the Holy Spirit. The finest font in England is undoubtedly that in St John the Baptist Church, Suffolk. It will be seen how, when the panels were painted with saints and the exquisite tabernacle work coloured and gilded, must have been a masterpiece of Gothic craftsmanship. A cord connecting the tops of these covers with the font. The magnificent altarpiece in Schleswig cathedral something like a crane (Salle, Norfolk), was used to remove the cover on the occasion of baptism.

Many lections of the Gothic period do not exist to-day. They usually had a double sided desk which revolved round a central moulded post. The lectern at Swansea, Kent, has a circle of good foliage ornamenting each face of the box, but this is of the 18th century. The box at the top of the pulpit in the church of St Mary in the Hayes, Kent, is common in France than in England, the pedestal of such a lectern being surrounded by a casing of three or more sides. A good example is St Mary-le-Bow, London. There is an example of a lectern still in use in the church of Lenham, Kent. The Gothic prayer desk, used for private devotional purposes, is hardly known in England. The Musée of Orleans contains one. A very fine specimen in the Musée, Bourges; the front and sides of the part for kneeling are carved with that small tracery of flowing character so common in France and Belgium during the latter part of the 15th century, and the back, which rises to a height of 6 ft., contains a little crucifix with traceries decorated above and below. A word should be said about the ciborium, so often found on the continent of Europe. In taping arrangement of tabernacle doors rival the English font covers in delicacy of outline (Musée, Rouen).

Doors.

Doors of doors are to meet not only in churches but also in private houses, such as the Sun Inn, Suffolk, and the Swan, Middlesex. In England the general custom was to carve the head of the door only with tracery (East Brent, Somerset), but in the Tudor period doors were sometimes covered entirely with "linenfold" panelling (St Albans Abbey). This form of decoration was exceedingly common on the Continent as well as in England. In France the doors towards the latter part of the 15th century were often so over-headed, or whoever fixed the carving, that the doors were usually divided into some six or eight oblong panels of more or less equal size. One of the doors of Bourges Cathedral is treated thus, the panels being filled with very good tracery enriched with small figures and scrolls. But the general treatment of this kind is employed, as at the church of St Godard, Rouen, where the upper panels only are carved with tracery and coats of arms and the lower adorned with simple pilasters.

Altar-places.

A most important object of church decoration, the retable; the Reformation accounting for the absence in England of any work of this kind. The masterpiece was carved by Hans Bruggerman, and consists, like many others, of a number of panels filled with figures standing some four or five deep. The figures in the foremost rows are carved entirely separate, and stand out by themselves, while the background is composed of figure work and architecture, &,c., in diminishing perspective. The panels are grouped together under canopy work forming one head, or perhaps two. Hans Bruggerman is said to have shown himself in the large variety of the facial expression of those wonderful figures all instinct with life and movement. In France few retables exist outside the museums. In the little church of Marissel, not far from Beuvais, there is a retablo consisting of eleven panels, the crucifixion being, of course, the principal subject. And there is a beautiful example from Antwerp in the Musée Cluny, Paris; the pierced tracery work which decorates the upper part being admirably executed and, like the subject matter, is very rare in England. The greatest circles so common on the Continent during late Gothic times and but seldom practised in England. In Spain the cathedral of Valladolid was much adorned with pierced work, and that is why the cathedral there is frequently used wood for large statuary, which was painted in a very realistic way with the most startlingly lifelike effect. Denmark also possessed a school of able wood-carvers who imitated the great and little panels of the Continent. A very pretty example of this exists in the cathedral of Roskilde. But besides these great altar-pieces tiny little models were carved on a scale the minuteness of which staggered the beholder. Triptychs and shrines, &,c., measuring but a few inches were filled in with tracery and figures that excite the utmost wonder. In the British Museum there is such a triptych (Flemish, i6th century; the centre panel, measuring an inch or two square, is said to have been cut out of a single piece of wood). It was used during the custom of this period. This rests on a semicircular base which is carved with the Lord's Supper, and is further ornamented with figures and animals. The whole thing inclusive measures about 9 in. high and 18 in. wide, and is chiefly distinguished by the extraordinary delicacy and minuteness of detail of this microscopic work buffs description. There is another such a piece, also Flemish, in the Victoria and Albert Museum, and this is even more delicate and admirably suited. For, marvellous as these works of art are, they fail to satisfy. They make one's eyes ache, they worry one as to how the result could ever have been obtained, and after the first astonishment one begins to think that such a miniature could never have a large enough for a cathedral could have been carved with half the labour.

With regard to paneling generally, there were, during the last five centuries, two schools of paneling. The one is that of the English school followed by most European carvers, each of which attained great notoriety. Firstly, a developed form of small tracery which was very common in France and the Netherlands. But it was also the custom to make these compositions with the other-boyant character, the perpendicular line or mullion being always subordinate, as in the German chasse (Musée Cluny), and in some cases absent, as the screen work of Evreux cathedral shows us. Secondly, the "linenfold" design. The great majority of examples are of a very conventional form, but at Bére Regis, Dorsetshire, the designs with tassels, and at St Siuvier, Caen, those with fringe work, are very realistic and admirably applied. The little panels or carvings of a crucifix, a dove, etc, is sufficiently curbed and turned, to form part of the new art—the great Renaissance. From this time onward Gothic work, in spite of various attempts, has never again taken a place in domestic decoration. The lines of the tracery style, the pinnacle, and the crocket—unequalled as they have always been in devotional expression—are universally considered unsuited for decoration in the ordinary dwelling-house.

But little reference can be made to the domestic side of the period which coincided with the beginning of the 16th century, because so few remains exist. On the Continent we have a certain proportion of timbered houses, the feature of which is the open window or louver, and this is still to be seen in our own day. In Rouen, we see by the figures of saints, bishops or virgins, how much the religious feeling of the middle ages entered into the domestic life. In England the carved corner post (which generally carried a bracket at the top to support the overhanging storey) calls for comment. In Ipswich there are several such posts. On one house near the river, that celebrated subject, the fox preaching to geese, is carved in great size on a corner post. In Cologne, at the top of the cathedral of St Peter, there is a tomb with a most elaborate carving (Oranges, 15th century). There are a number of mantelpieces there is a good example in the Rouen Museum. The overhanging corners are supported by dragons and the plain mouldings have little bunches of foliage carved at either end, a style of work much cut down in the Netherlands at this time. In England a century earlier; the screen beam at Eastbourne parish church, for example.

As a rule, cabinets of the 15th century were rectangular in plan. In some cases, and especially in the last part of the century, the lower part was sometimes filled with panelling of the most elaborately carved work. A good example of this is the Rotherhithe Museum. There is a splendid chest (14th century) in the Cluny Museum; the front is carved with twelve knights in armour standing under many arches, and the spandrels are filled in with faces, dragons and so on. But it is to the 15th century that we look for the best work of this class; there is no finer example than that in the Kunstgewerbe Museum, Berlin (Plate III, fig. 6). The front is a very animated hunting scene most decoratively arranged in a scheme of design that is admirably suited to the carving in low relief. Mantling. But the more general custom in chest decoration was to employ tracery with or without figure work; Avignon Museum contains a typical and highly elaborate example.

A certain number of seats used for domestic purposes are of great interest. A good example of the long bench placed against the wall, with lofty panelled back and canopy over, is in the Musée Cluny, Paris. An interesting example is the little altar-tray with a low panelled back of pierced tracery, and in the Dijon Museum there is a good example of the typical chair of the period, with arms and high panelled and traceries back. There was a style of design admirably suited to the decoration of furniture when made of softwood such as pine. It somewhat resembled the excellent Scandinavian

treatment of the 16th-17th centuries already referred to. A pattern of Gothic foliage, often of beautiful outline, would be simply ground out to a shallow depth. The shadows, curves and twists only being emphasized by a few well-disposed cuts with a V tool. This is the method of the Teutonic carvers. A Swabian door of the 15th century in the Berlin Museum, and some German, Swiss and Tirolean work in the Victoria and Albert Museum, offer patterns that might well be imitated to-day by those who revel in simple decoration while avoiding the hackneyed Elizabethan forms.

It is hard to compare the figure work of England with that on the Continent owing to the lack of good decoration of the rich houses and churches. A Swiss door of the 15th century in the Berlin Museum, and some German, Swiss and Tirolean work in the Victoria and Albert Museum, offer patterns that might well be imitated to-day by those who revel in simple decoration while avoiding the hackneyed Elizabethan forms.

Figure work was not the only art of the woodcarver. Here are examples of the English, German, Swiss and Italian schools. We may take the instance of a door carved in the 16th century by Perret, one of the chief carvers in the early days of the French Renaissance. The panels of the door are divided by narrow arches, and carved, as was generally the case in England, in oak. At Clifton Reynes, Buckingham, there are two figures of the 13th century. The manger in the solid oak was hollowed out from the back in order to season the wood and to prevent cracking. During the 13th, 14th and 15th centuries there are numberless instances of figure carving of the most graphic description afforded in the misericors in many of our churches. They were very much less expensive than statues, and from their surroundings hardly an instance remains. At the little chapel of Cartmel Fell, in the wilds of Westmorland, there is a figure of Our Lord from a crucifix, some 2 ft. 6 in. in length, which is said to have been burnt off. A second figure of Our Lord (originally in the church of Keynes Inferior) is in the museum of Caerleon, and a third, from a church in the diocese of Lincoln, is in the British Museum. In the Swiss manner some of the finest figure work is to be found in the retables, some of which are in the Victoria and Albert Museum. A Tirolean panel of the 15th century carved in high relief, representing St John seated with his back to the onlooker, is a masterpiece of perspective and foreshortening, and the drapery folds are perfect. The same may be said of a small statue of the Virgin, carved in lime by a Swiss hand in the late 15th century. This vase, in the Museum of Wurzburg (1466-1531) shows that stone sculptures of medieval times were not ashamed of wood.

Renaissance Period (16th-17th Centuries).—With the beginning of the 16th century, there was a fine use of wood in decoration, partly due to the exclusion of Gothic design. But the process was not sudden, and much transition work has great merit. The rood screen at Hurst, Berkshire, the stall work of Cartmel Priory, Westmorland, and the bench ends of many of the churches in Somerset, give good illustrations. But the new style was unequal to the old in devotional feeling, except in classic buildings like St Paul's cathedral, where the stalls of Wren, which are not on a high level with the altar, but the wooden work of these two centuries, is still in use. In the Victoria and Albert Museum, there are many examples of medieval and early Gothic work. A number of the fine pieces in this article will therefore be devoted to the main in domestic work, and the exact location of examples can only be given when not the property of private owners or where the public have access.

One of the greatest works of art that can be found on the Continent, France, Germany and the Netherlands producing numberless examples not only of house decoration but of furniture as well. The wealth of the newly discovered American cabinets was due to the importation of Dutch work in this time, and hand in hand with the spread of commerce came the desire for refinement. The custom of building houses chiefly in wood wherever possible was popular. The Pilasters of the 16th century, and vases or dolphins assisted the acanthus leaf to ousted the older forms of design. House fronts of wood gave ample scope to the carver. That of Sir Paul Pinder (1600), formerly in Bishopsgate, but now preserved in the Victoria and Albert Museum, is a good example of decorative treatment without overloading. The brackets carved in the shape of monsters which support the projecting upper storey are typical of the work of that time. Of objects in wood, the panels, too, of Sir Paul Pinder's house should be noted as good examples of that Jacobean form of medallion surrounded by scroll work which is at once as decorative as it is simple.

In England that familiar style known as Elizabethan and Jacobean prevailed throughout the 16th and 17th centuries. At the present time hardly a home in the land has not its old oak chest carved with the familiar half circle or scroll border along the top rail, or the arch cut and saving of the more expensive style. The oak chest, with four panels under the back board, and the chest covered with legs supported by turned balusters of extravagant thickness, are to be seen wherever one goes. And chairs, real and fancy, or solid and in three parts, in oak, beech and in relief, are bought up with an avidity incomparable from fashion. Four-post bedsheads are harder to come by. The back is usually broken up into small panels and carved, the best effect being seen in those that are divided by a latticework form (Plate IV, Fig. 3). This name is usually associated with a very heavy form of decoration which was copied direct from nature. Great swags of drapery and foliage with fruit and dead birds, &c., were to be carved in lines of thinnest and thickest. For technical skill these examples are unsurpassed; each grape would be undercut, the finials of birds and legs stand out quite work or dolphins. But the feature which distinguished the period was the fire mantel. It always must be the principal object in a room, and the Elizabethan carver fully appreciated this fact. By carving the chimney breast as a rule to the ceiling and covering the surrounding space in this manner, the carver was enabled to concentrate the attention on one point, often produced results of a high order. Caryatid figures, pilasters and friezes were among the customary details employed to produce good effect. Not only were the balusters, or pinnacles, much-restored palace at Bromley-by-Bow to the Victoria and Albert Museum. The mantelshelf is 6 ft. from the ground and consists of a deep quadrant mould decorated with flat acanthus and scroll work, supported on a cluster of carved lions and a carved plinth.
WoOd-CarViNg

separate, and as a consequence soon succumb to the energy of the bow saws. The good work is to be found at Petworth; Trinity College, Oxford; Trinity College, Cambridge; St Paul’s cathedral; St James’, Piccadilly; and many other London churches. In the reigns of Louis XIV. and XV. the principal merit of carved design, i.e. its appropriateness and suitability, gradually disappeared. Furniture was often carved in a way hardly legitimate. The legs, the rails, the stretchers, and even the frames of cabinets, of looing, instead of being first made for constructional strength, and then (i.e. rock and shell ornament), quite regardless of utility. A wealth of carving was thus taken from the design of the seat, to say nothing of bedsheads and other furniture. However, the wall panelling of the mansions of the rich, and sometimes the panelling of furniture, was decorated with rocco design. The characteristic forms of the early rococo panel was that the surface would be left plain, while the central part would be carved with a medallion surrounded by foliage, vases or trophies of torches and muses. Such a work of art would be the work of a skilled craftsman, and the price would be thus treated. France led the fashion, which was more or less followed all over Europe. In England gilt chairs in the style of Louis XIV. were made in many quantities. But Thomas Chippendale, Lacey and Mayhew, Sheraton, Johnson, Hepplewhite and other cabinet-makers did not as a rule use much carving in their designs. Scrolls, shells, ribbon, ears of corn, &c., in very fine relief, were, however, used in the embellishment of chairs, &c., and the claw and ball foot was a terminus to the cabriole legs of cabinets and other furniture. The mantelpieces of the 18th century were as a rule carved in pine and mahogany, and usually the edges of these narrow surfaces were by pilasters often of flat elliptic plan, sometimes by caryatids, and the frieze would consist of a raised centre panel carved with a classic scene in relief, or with a mask alone, and on either side a swag of flowers. Interior doorways were often decorated with a broken pediment more or less ornate, and a swag of foliage commonly depended from either side over a background of scroll work. The outer porches so often seen in Queen Anne houses were of a character peculiar to the 18th century. A small platform or carved roof was supported by two large and heavy brackets carved with acanthus scroll work. The brackets were as a rule exceedingly good. Carved and pierced brackets were fixed to the “open strings” (i.e. the sides of the steps), giving a very pretty effect to the graceful balustrade of turned and twisted columns.

Persia.—The Persian carvers closely followed Arab design. A pair of doors of the 14th century from Samarkand (Victoria and Albert Museum) are typical. Boxes, spoons and other small articles were often treated with interlacing lines of Saracen character, the delicacy and minuteness of the work requiring the utmost patience and skill. Many of the patterns remind one of the sandalwood work of Madras, with its typical square or hexagonal, triangular or other shapes, and each small space filled in with conventional scroll work. Much of this simple flat design reminds one of that Byzantine method from which the Elizabethan carver got his inspiration.

India and Burma.—Throughout the great Indian peninsula wood-carving of the most luxurious kind has been continuously produced for many centuries. The ancient Hindu temples were decorated with doors, ceilings and various fittings carved in teak and other woods with patterns of extreme richness and minute elaboration. We have architectural remains from Kashmir Smats (Punjab) dating from the 3rd or 4th century A.D. from illustrated manuscripts, and decorative character strongly resembling the best Elizabethan design. The doors of the temple of Somnath, on the north-west coast, were famed for their magnificence and were highly valued as works of art. In the time of the great Moslem conqueror, Sultan Mahmud, and are now lying at the fort at Agra. The gates which now exist are very fine specimens of ancient wood-carving, and are of great interest as an example of Moslem doors. The Asiatic carver, like certain of his European brethren, is apt to be carried away by his own enthusiasm and to overcrowd his surfaces. Many a door, column, gallery or even a whole house-front is covered with the most intricate design, bewildering to behold (Bhera, Shahpur). But this is not always the case, and the Oriental is at times more restrained in his methods. Architectural detail is often introduced with only a simple enrichment carved round the framing, producing the happiest result. The Hindoo treatment of the circle is often exceedingly good, and might perhaps less rarely inspire western design. Sometimes native work strongly resembles Scandinavian of the 16th century, but the materials may be had in India, and the foliage and flowers (beyond elementary buds) are not employed (Burma, 17th century, Victoria and Albert Museum). The pierced work of Bombay calls for note. Foliage, fruit and flowers are con- nected (or adapted) to a lattice fret-cut decoration for doors or windows as well as the frames of chairs and the edges of tables. A reference should also be made to those wonderful sandalwood tables, tables and boxes to be seen in Southern India, always covered with design, often with acanthus, &c., with every space filled in with the minutest decoration. Many of the gong stands of Burma show the highest skill; the arrangement of two figures showing two hands, one hand hung over the other, and the hand of one gong hangs is familiar. The Burmese are sculptors of proved merit. Chine and Japan.—In these countries the carver is unirrelated for deftness of hand. Grotesque and imaginative work of the utmost picturesque effect is characteristic of the Japanese carver, and decoration is of various kinds. Paper, wood and other materials. In Japan, in particular, are beautiful works of art, especially when the carver copies the lotus, lily, or other aquatic plant. A favourite form of decoration consists of breaking up the architectural surfaces, such as ceilings, friezes, &c., into frames, panels and filling up each
WOODCHUCK

WOODCOCK

panel with a circle, or diamond of conventional treatment with a spandrel in each corner (door of T'ai-hê Hall, Pekin). A very Chinese feature is the finial of the newel post, so constantly left more or less straight in profile and deeply carved with monsters and scrolls. A heavy hand and a sense of exaggeration, which is characteristic of the gadroon pattern is commonly used to give emphasis to edges, and the dragon arranged in curves imitative of nature is frequently encountered. This fatuity may also be referred to the Chinese taste for biomorphic forms, which is at least as old as that of the ancient Egyptians. The general rule that in every country designers use much the same means whereby a pattern is obtained holds good in China. There are forms of band decoration here which closely resemble those of Greek or Spartaist (from 3rd cent. B.C.) and Egyptian art in its most baroque stage. This method of treating a pattern is not only the Chinese idea, but is found also, in a master-piece of intricate design. The back consists of one central panel of considerable height, with two of lesser degree on either side towards the top. The top then is a large panel of carved design, and the doors of a cabinet in the same building show how rich an effect of foliage can be produced without the employment of stalk or scroll. The Chinaman, who is unequalled as a microscopic worker, does not limit himself to ivory or metal. One might almost say, he wastes his talent on such an ungrateful material as wood. In this manner, lions and other tigers are carved with a delicacy and beauty of line that exceeds all others.

In Japan much of the Chinese type is apparent. The native carver is fond of massing foliage without the stalk to lead him. He appears to want to make each flower and foliage stalk he has carved, and then the stalk here and there, thus reversing the order of the Western method. Such a treatment, especially when birds and beasts are introduced, has the highest decorative effect. The Japanese carver, especially in the design of dragons and scroll work; the throne also is a wonderful example of carved treatment, and the doors of a cabinet in the same building show how rich an effect of foliage can be produced without the employment of stalk or scroll. The Chinaman, who is unequalled as a microscopic worker, does not limit himself to ivory or metal. One might almost say, he wastes his talent on such an ungrateful material as wood. In this manner, lions and other tigers are carved with a delicacy and beauty of line that exceeds all others.

There is a general similarity running through the carved design of most races of primitive culture, the "chip" form of ornament being almost universally employed. Decorated surfaces depending almost entirely on line and the variety of the over-all workmanship may no doubt be accounted for by the extensive use of stonecutting tools. The savage carver shows the same tendency to over-exalt his art by crowding on too much detail as the more civilized craftsmen of other lands, while he also on occasion exercises a good deal of restraint by a harmonious balance of decoration and plain space. So far as his chip design and those patterns more or less depending on the line are concerned, his work as a whole is so full of such figures that his attempts do not usually meet with success. Primitive carving, generally, shows that very similar stages of artistic development are paralleled in very ancient, if not even more ancient, times.

A very favourite style of "chipp" pattern is that formed by small triangles and squares entirely covering a surface (Hervey Islanders). The monotony being sometimes varied by a band of different arrangement. The Melanesian type of chip carving, however, shows both the beauty and faults of art is hardly of a kind calculated to enlarge the imagination, thought so far as the cultivation of patience and accuracy is concerned, has no equal. But many natives, as for example the Fiji Islanders, employ chip designs rivalling those of Europe in variety. Upon occasion the savage appreciates the way in which plain surfaces contrast and emphasize decorated parts, and judiciously restricts his skill to borders of decoration or to special points (Marquesan Islands). The tops of the lower Niger design their paddles in a masterly way, and show a fine sense of proportion between the plain and the decorated surface. Their designs, though slightly in relief, are of the chip nature, which consists of a definite and branching group of interlacing lines, straight or curved, though often very effective and in every way suitable, is not a very advanced form of art and has decided limitations. The development of this form is much in evidence.

Carving in relief is common enough, idols being produced in many forms, but savage relief work seldom calls for praise. The Kafr carves the handle of his spoon perhaps in the form of a giraffe, and in the round, with each leg cut separately and the four hoofs meeting at the bowl, hardly a comfortable form of handle to hold. The North American Indian shows a wider invention than some nations, the twist in various shapes being a favourite treatment say of pipe stems. The Micmac shows the whole of the handle in a form that is not at all uncommon in Indian shawls, and in some cases the scroll entwines in a way which faintly suggests the guilloche. The native of New Guinea, the most truthful fellow of all, provides a loop in which reminds one of a similar method in use in Scandinavian countries. The work of the New Zealander is greatly in advance of the average primitive type; he uses a very good scheme of scroll work for decorative purposes, the lines of the scrolls often being enriched with a small pattern in a way reminding one of the familiar Norman treatment, as for example the prows of his canoes. The Maori sometimes carves not only the "bargboard" of his house but the gables also, snakes and grotesque figures being as a rule introduced; the main posts and rafters, too, of the inside receive attention. Unlike the Hindu he has a good store of imaginative propensities and does not plan his scheme of design on too small a scale.

WOODCHUCK, the vernacular name of the common North American representative of the marmots (see MARMOT), scientifically known as Arctomys monax. The typical race of this species ranges from New York to Georgia and westward to the Dakotas, but it is represented by a second and darker race in Labrador, and by a third in Canada; while several other North American species have been named. The ordinary woodchuck measures about 18 in. in length, of which the tail forms a third. In colour it is usually brownish black above, with the nose, chin, cheeks and throat tending to whitish, and the under parts brownish chestnut; while the feet and tail are black and blackish. Like other marmots it is a burrower.

WOODCOCK (O. Eng. wode-coc, wudu-coe, and wudu-smite), the Scolopax rusticola, of ornithology, a game-bird which is prized both by the sportsman and for its excellence for the table. The name "woodcock", first applied to an upland species of woodcock, is suggestive of its nocturnal or crepuscular habits—with mottled plumage, chestnut- andumber-brown, ashy-grey, buff and shining white—the last being confined to the tip of the lower side of the tail. The weight, and the rest intermixed for the most part in beautiful combination. Setting aside the many extreme aberrations from the normal colouring which examples of this species occasionally present (and some of them are extremely curious, not to say beautiful), there is much variation to be almost constantly observed in the plumage of individuals, in some of which white and rufous tints prevail while others exhibit a greyer complexion. This variation is often, but not always, accompanied by a variation in size or at least in weight. The paler birds are generally the larger, but the difference, whether in bulk or tint, cannot be attributed to age, sex, season or, so far as can be ascertained, to locality. It is, notwithstanding, a very common belief among sportsmen that there are two "species" of woodcock, and many persons of experience will have it that, beside the differences just named, the "little red woodcock" invariably flies more sharply than the other. However, a sluggish behaviour is not really associated with colour, though it may be so with the redder "correl". Its voice is very limited, and tends to suggest that a fat bird will rise more slowly, when flushed, than one which is in poor condition. Ornithologists are practically unanimous in declaring against the existence of two "species" or even "races," and, moreover, in agreeing that the sex of the bird cannot be determined from its plumage, though there are a few who believe that the young of the year can be discriminated from the adults by having the outer web of the first quill-feather in the wing marked with angular notches of a light colour, while the old birds have no trace of this "vandyke" ornament. Field observations and sightings seem to show that the male varies most in size; on an average he is slightly heavier than the female, yet some of the lightest birds have proved to be cocks.

Though there are probably few if any counties in the United Kingdom in which the woodcock does not almost yearly breed, it is rare (since the Spring Gun has a Sketche toShoot the woodcocks for the protection of the species, there can be no doubt that by far the greater number of those shot in the British Islands have come from stock, and if the measures of the species are of a nature to render the woodcock scarce, it must be understood that the woodcock is a bird of times and seasons like the other birds.)

1 By Linnaeus, and many others after him, misspelt rusticola. The correct form of Pliny and the older writers seems to have been first recorded in 1816 by Oken (Zoologist, ii, p. 59). 2 The difference in weight is very great, though this seems to be exaggerated by some writers. A friend who has had much experience tells us that the heaviest bird he ever knew weighed 161 oz., and the lightest 9 oz. and a fraction. 3 Cf. Dr Hoffmann's monograph Die Waldseept, ed. 2, p. 35, published at Stuttgart in 1887.
WOOD ENGRAVING, the art of engraving (q.v.) on wood, by lines so cut that the design stands in relief. This method of engraving was historically the earliest, done for the purpose of taking impressions upon paper or other material. It is natural that wood engraving should have occupied first the primitive mind, because the manner in which woodcuts are produced is the most obvious of all the kinds of printing. If a block of wood is inked with a greasy ink and then pressed on a piece of paper, the ink from the block will be transferred at once to the paper, on which we shall have a black patch exactly the size and shape of the inked surface. Now, suppose that the simple Chinese who first discovered this was ingenious enough to go a step further, it would evidently occur to him that if one of the elaborate signs, each of which in his own language stood for a word, were drawn upon the block of wood, in relief, then when the whole of the white wood sufficiently cut away to leave the sign in relief, an image of it might be taken on the paper much more quickly than the sign could be copied with a camel-hair brush and Indian ink. No sooner had this experiment been tried and found to answer than block-printing was discovered, and from the printing of signs to the printing of rude images of things, exactly in the same manner, the step was so easy that it must have been made insensibly. Wood engraving, then, is really nothing but that primitive block-cutting which prepared the way for the printing of signs in relief now replaced by movable types, and the only difference between a delicate modern woodcut and the rude letters in the first printed books is a difference of artistic skill and knowledge. In Chinese and Japanese woodcuts we can still recognize traditions of treatment which come from the designing of their written characters. The main elements of a Chinese or a Japanese woodcut, uninfluenced by European example, are dashes or delicate outlines and markings of various thickness, exactly such as a clever writer with the brush would make with his Indian ink or vermilion. Often we get a perfectly beautiful execution which is quite for the purpose, and these broad vigorous blacks are quite in harmony with the kind of printing for which wood engraving is intended.

It has not hitherto been satisfactorily ascertained whether wood engraving came to Europe from the East or was rediscovered by some European artificer. The precise date of the first European woodcut is also a matter of doubt, but here we have certain data which at least set limits to the possibility of error. European wood engraving dates certainly from the first quarter of the 15th century. It was used to be believed that a two-line description with pinacles as often seen in illuminated manuscripts, rudely executed and dated 1433, was the Adam of all our woodcuts, but since 1844 investigations have somewhat shaken this theory. There is a cut in the Brussels library, of the "Virgin and Child" surrounded by four saints, which is dated 1418, but the composition is so elegant and the drawing so refined and beautiful, that one has a difficulty in accepting the date, though it is received by many as authentic, while it is repudiated by others in the belief that the letters have been tampered with. The "Virgin and Child" of the Paris library is without date, but is supposed, apparently with reason, to be earlier than either of the two mentioned; and Delaborde proved that two cuts were printed in 1406. The "Virgin and Child" at Paris may be taken as a good representative specimen of very early European wood engraving. It is simple art, but not bad art. The forms are drawn in bold thick lines, and the black blot is used with much effect in the hollows and recesses of the design. Beyond this there is no shading. Rude as the work is, the artist has expressed exquisite maternal tenderness in the chief details of the design. The Virgin is crowned, and stands against a nude body decoration with pinacles as often seen in illuminated manuscripts. In the woodcut this architectural decoration is boldly but effectually drawn. Here, then, we have real art already, art in which appeared both vigour of style and tenderness of feeling.

The earliest wood engraving consisted of outlines and white spaces with smaller black spaces, cut with a knife, not with a graver, and shading lines are rare or absent. Before passing

1 The etymology and consequently the correct spelling of these expressions seem to be very uncertain. Some would derive the term from the Greek word, others from an old Slavonic word, but the most generally accepted derivation seems to be that the Scandinavian rods, an open space in a wood (see Notes and Queries, ser. 5, ix. p. 214, and ser. 6, viii. pp. 532, 524). Looking to the regular routine followed by the bird, the natural supposition would be the etymology of such a word as woodcut.

2 Cf. J. E. Harting, Zoologist (1879), pp. 433-440, and Mr Wolf's excellent Illustration. Sir R. Payne-Gallwey, in the Badminton Library (St. Ives, 1811, note), states that he himself has witnessed the performance.

3 The pair of muscles said by Loche (Espl. Scienc. d'Algérie, ii. p. 293) to exist in the maxilla, and presumably to direct the movement of the teeth have never been seen by myself.

WOOD ENGRAVING

799
to shaded woodcuts we may mention a kind of wood engraving practised in the middle of the 17th century by a French engraver (often called Bernard Millet, though his name is a matter of doubt) and by other engravers nearer the beginning of that century. This method is called the crâle, a word for which there is no convenient translation in English, unless we call it drilled. It means riddled with small holes, as a target may be riddled with small shot. The effect of light and dark is produced in this kind of engraving by sinking a great number of round holes of different diameters in the substance of the wood, which, of course, all come white in the printing; it is, in effect, a sort of stippling in white. When a more advanced kind of wood engraving, which became prevalent the crâle was no longer used for general purposes, but it was retained for the grounds of decorative wood engraving, being used occasionally in borders for pages, in printers' marks and other designs, which were survivals in black and white of the ancient art of illuminating. Curiously enough, this kind of wood engraving, though long disused for purposes of art, was in recent times revived with excellent effect for scientific purposes, mainly as a method of illustration for astronomical books. The black given by the untouched wooden block represents the night sky, and the holes, small or large, are furnished by the snow and stars and sun. The process was perfectly adapted to this purpose, being cheap, rapid and simple. It has also been used in a spasmodic and experimental manner by one or two modern engravers.

The earlier workmen turned their attention to woodcut in simple black lines, including outline and shading. In early work the outline is firm and very distinct, being thicker in line than the shading, and in the shading the lines are simple, without cross-hatchings, as the workmen found it easier and more natural to take out long single lines of white in the pronounced black and white or nearly parallel black lines than to cut out the twenty or thirty small white lozenges into which the same space would have been divided by cross-hatchings. The early work would also sometimes retain the simple 'black patch which we find in Japanese woodcuts, for example, in the "Christmas Dancers," of Wohlghemuth, all the shoes are black patches, though there is no discrimination of local colour in anything else. A precise parallel to this treatment is to be found in a Japanese woodcut of the Wild Boar and Hare, given by Aimé Humbert in his book on Japan, in which the boar has a cap which is a perfectly black patch though all other local colour is omitted. The similarity of method between Wohlghemuth and the Japanese artist is close: they both take pleasure in drawing thin black lines at a little distance from the patch and following its shape like a border. In course of time, as wood engravers became more expert, they were not so careful to spare themselves trouble and pains, and then cross-hatchings were introduced, but at first more as a variety to relieve the eye than as a common method of shading. In the 16th century a simple kind of wood engraving reached such a high degree of perfection that the best work of that time has never been surpassed in its own way.

Wood engraving in the 16th century was much more conventional than it became in more recent times, and this very conventionalism enabled it to express what it had to express with greater decision and power. The wood engraver in those days was free from many difficult conditions that beclouded his vision in the 19th and 20th centuries. He did not care about the least about aerial perspective, and nobody expected him to care about it; he did not trouble his mind about local colour, but generally omitted it, sometimes, however, giving it here and there, but only when it suited his fancy. As for light-and-shade, he was content only when he wanted to give relief, but never worked out anything like a studied and balanced effect of light-and-shade, nor did he feel any respect for crosses and little dots so perfectly united as to make the line at the edge for a border. In the "Memoir," the side of the frying-pan in the vignette of "The Cat and the Mouse" is indicated by the contour of the bone, and this, of course, is a very long step in comparison with the method of "The Fisherman," at the end of the twentieth chapter of the "Memoir," the space of dark shade under the bushes is left quite black, whilst the leaves and twigs, and the rod and line too, are all drawn in pure white lines. Bewick, indeed, was more careful in his adherence to the technical conditions of the art than any of the primitive woodcutters except Millet. The black line was his primary line, his graver was his only tool, and if he wished to express light and shade, he did it by the judicious addition of black, or by the omission of black, or by the use of black and white. Bewick therefore, in his "Memoir," is more correct in his treatment of light and shade than any other engraver. Bewick artistically contrives his arrangement of light and shade so that the net shall be in light against a space of black shade under some dark shading, but so far is this piece of local colour from being carried out in the rest of the composition that the important foreground figures, with their drapery, are shaded as if they were white statues. Again, the sky itself is false in its shading, for it is without gradation, but he is careful upon the lower part of the composition from looking too empty, and the conventionalism of wood engraving was so accepted in those days that the artist could have recourse to this expedient in defiance alike of pictorial harmony and of nature. There were many small and well-filled compositions, the "Dance of Death," the firm and matter-of-fact drawing is accompanied by a sort of light-and-shade adumbration for other figures, which the engraver had no desire to be seen, and which have as much the appearance of a window as might be expected in a stained-glass window. There is a most interesting series of little woodcuts drawn and engraved in the 16th century by J. Amman as illustrations of the different habits of birds and trouts, and entitled "The Blaker," "The Milnet," "The Butcher," and soon. Nothing is more striking in this valuable series than the remarkable closeness with which the artist observed everything in the nature of a hard fact, such as the shape of a hatchet or a spade; but he sees no mystery anywhere—he can draw leaves but no foliage, feathers but no plumage, locks but no hair, a hill but no a landscape. In the "Witches Kitchen," a woodcut by Harmen Bock, is quite a distinct art, being based on different principles, but from the pot is so hard that it has the appearance of two trunks of trees denuded of their bark, and makes a pendant in the composition to a real tree on the opposite side which does not more substance. For was it this or that shade that was to be made, or was the artist to give an idea of the way the engraving was to be done? The engraving was to be done by his own way of engraving clouds and vapour, and all the engravers of that time followed it. Their conceptions were much more those of a carpenter than of an artist. J. Amman, who was taught to carve in high relief, and Grin's "Witches Kitchen," might be considered in the same manner without loss. When the engravers were rather draughtsmen than carvers, their drawing was of a decorative character. For example, the magnificence of Wohlghemuth and Jacob Binck, one of the very finest examples of old wood engraving, the face and beard are drawn with few lines and very powerfully, but the costume is treated strictly as decoration, the lines of the patterns being all given, with as little shading as possible, and what shading there is, is simply, without cross-hatching.

The perfection of simple wood engraving having been attained so early as the 16th century by the use of the graver, the art became extremely productive. During the 17th and 18th centuries it still remained a comparatively severe and conventional form of art, because the workmen shaded as much as possible either with straight lines or simple curves, so that there was never much appearance of freedom. Modern wood engraving is the more genuine from his frequent habit of engraving his own designs, which left him perfect freedom of interpretation; but the genuineness of it is not only of the kind which comes from independence of spirit, it is due also to his fidelity to the technical conditions of the process. The reader will remember that in wood engraving every cutting prints white, and every space left untouched prints black. Simple black lines are obtained by cutting out white lines or spaces between them, and crossed black lines have to be obtained by laboriously cutting out all the white lozenges between them. In Bewick's cuts white lines, which had appeared before him in the "Fables" of 1722, are abundant and are often crossed, but black lines are never crossed; but the white lines are drawn black in a series of lozenges, and the black wood-engravers and Dürr's master Wohlghemuth used to do. The line at the edge of the border is an example of the method. The side of the frying-pan in the vignette of "The Cat and the Mouse" is indicated by the contour of the bone, and this, of course, is a very long step in comparison with the method of "The Fisherman," at the end of the twentieth chapter of the "Memoir," the space of dark shade under the bushes is left quite black, whilst the leaves and twigs, and the rod and line too, are all drawn in pure white lines. Bewick, indeed, was more careful in his adherence to the technical conditions of the art than any of the primitive woodcutters except Millet. The black line was his primary line, his graver was his only tool, and if he wished to express light and shade, he did it by the judicious addition of black, or by the omission of black, or by the use of black and white. Bewick therefore, in his "Memoir," is more correct in his treatment of light and shade than any other engraver. Bewick artistically contrives his arrangement of light and shade so that the net shall be in light against a space of black shade under some...
Wood engraving showed to great advantage in such newspapers as the Illustrated London News and the Graphic of that day, and also in vignettes for book illustration. A certain standard of vignette was re-established by Edmund Evans in Bleriot Fosler's edition of Cowper's Task, not likely to be surpassed in its own way, either for delicacy of tone or for careful preservation of the drawing.

An important extension of wood engraving was due to the invention of compound blocks by Charles Wells about the year 1860. Formerly a woodcut was limited in size to the dimensions of a block of boxwood cut across the grain, except in the primitive condition of the art, when commoner woods were used in the direction of the grain; but by this invention many small blocks were fitted together so as to form a single large one, sometimes of hundreds of square inches. They could be separated or joined together again at will, and it was this facility which rendered possible the rapid production of large cuts for the newspapers, many cutters working on the same subject at once, each taking his own section.

The process employed for wood engraving may be briefly described as follows. The surface of the block is lightly whitened with Chinese white so as to produce a light yellowish-grey tint, and on this the artist draws, either with a pen if the work is intended to be in line, or with a hard-pointed pencil and a brush if it is intended to be in shade. If it is to be a line woodcut the cutter simply digs out the whites with a sharp scalpel (he has these tools of various shapes and sizes), and that is all he has to do; but if the drawing on the wood is shaded with a brush, then the cutter has to work upon the tones in such a manner that they will come relatively true in the printing. This is by no means easy, and the result is often a disappointment, besides which the artist's drawing is destroyed in the process. It therefore became customary to have the block photographed before the engraver touches it, when the drawing is specially worth preserving. This was done for Leighton's illustrations to Paradise Lost. In the development of the process-block, made upon paper, was by photography printed on the block, and the drawing remained untouched any witness for or against the engraver.

In recent years the position of wood engraving in Great Britain has wholly changed. Up to 1880 and for a little while longer it was the chief means of book and newspaper illustration, and a frequent method of fine-art reproduction; but by the beginning of the 20th century it had been all but driven out of the field by "process" work of various kinds. It still flourishes in the hands of a few commoner artists for commercial and mechanical work; it is still occasionally maintained in its finest form by a sympathetic publisher here and there, who deplores and would arrest its decay. But the photographer and facsimile reproduction have captivated the public, who want "illustration" and who do not want "art." The great body of the wood engravers have therefore found their occupation entirely gone, while the minority have found themselves forced to devote their skill to "restouching" the process-block—sometimes carrying their work so far that the print from the finished block is a close imitation of a wood engraving. This system has been carried farthest in America. It is not only to considerations of economy that is due the supersession of engraving by "process." The apparent superiority of truthfulness claimed by the photographer over the artist's drawing is a factor in the case—the public forgetting that a photographic print shows us what a thing or a scene looks like to the undiscriminating lens, rather than what it looks like to the two eyes of the spectator, who unconsciously selects that part of the scene which he specially wishes to see. The rank and file of engravers—evensuch as "cut" a "facsimile artist's" sketch—succumbed not only to the public, but to the artists themselves, who frequently insisted upon the process-block for the translation of their work. They preferred the greater truth of outline (though not necessarily of tone) which is yielded by "process," to all the inherent charm of the beautiful (and expensive) art of xylography.
In Great Britain a few engravers of high rank and ability still followed the art which was raised to so high a pitch by W. J. Linton (d. 1898). Such were Mr. Charles Roberts, Mr. Biscombe Gardner, Mr. Comforth, Mr. Ulrich and a few more—the first two the better engravers among the list. There was a mechanical mechanism which made it feared that it would wood engraving as a craft, for ordinary purposes, cease to exist, wood engraving as a fine art must disappear as well—as there could be no difference between some years of apprenticeship and practice required to make an "artist" of him, and nothing to compensate him if he fail to attain at once the highest accomplishment.

A great contribution which has contributed to the overthrow of wood engraving in England is the rapture begotten of the extraordinary executive perfection to which the art had been brought in America. These engravings, published in magazines and books have been bought in England, wood engraving not being so highly esteemed there, as a but a foolish appreciation among the public, just as the over-refinement of engraving on steel of Finden and his school killed his art in England. There is not much help from the American wood engraver, by the law of paradox, effectively stilled xylography in England, as it has since done to an almost equal degree in America. The reason is simple. With the object of "dis-individualising" himself, as he called it, the engraver sought to suppress his own recognizable manner of craftsmanship when transmuting the work of the artist for the public; and the more he succeeded, the more he refined and elaborated his technique and imitated textures, the more extreme minuteness and excessive dexterity (so as to secure faithfulness and smoothness) the more closely did the result approximate to a process-block. More than this, the "reductio ad absurdum" of the passion for the minute and the perfection of mere technique. The result was amazing in its completeness, but curiously grey and monotonous; and matter-of-fact publishers and publishers of colouring-books, (hence: Housman, with I. II. I.) gave it such a difference so very much (except in being a little greyer and more monotonous) reproduced by the half-tone block, while the cost of the blocks was one of the reasons of the decline of the art. The elaboration, satisfying a craving of an acrobatic kind, defeated its own end. The public were pleased for a time, and the result has been disastrous for the art.

In England, in spite of the International Society of Wood Engravers, of which little is now heard, there are no signs of a general enervating, and it seems as if the art must be born again, so long as the public interest in photographs continues. Charles Ricketts and Miss Margaret Macdonald have in this direction done much. The Early Renaissance woodcut, while others are striving to begin engraving where Bewick began it. If the true art is ever restored, the revival will rather be based on a revolt against the greeyness of the process-block, and the offensively shiny surface of the chalk-coated paper on which it is printed, than on any aesthetic delight in intelligent wood engraving, its expressive line, its delicate, early tones, and its rich blacks.

In America, where the power of resurrection is great, the miraculous technical perfection brought about by Timothy Cole and Frederick H. V. Jones, as leaders of the school, has prompted given way to a greater desire for a less mechanical finish ment, and, within strict limits, wood engraving is saved. Curiously enough, Cole (an Englishman by birth) was equally a leader in reducing the process-block, but Jones was the greater artist, because he helped to bring about the "decadent de luxe" who had overwhelmed his art in the refinements which threatened to destroy it, and who had been scolded by the splendid printing-presses of America (which might without exaggeration be called instruments of precision), gave up what may be termed hyper-engraving, and, surrendering his wonderful power of imitating surfaces and textures, changed his manner. He became broader in handling; his example was followed by others, and wood engraving in a very few hands still prospers in the United States.

In France, where the art has reached the highest perfection and the highest position in the artistic esteem of the public, a certain point on the true artistic instinct of the engraver, on the taste of an intelligent and appreciative public, and on official recognition and encouragement. Nevertheless, it was found necessary to establish a "Société de Wood-Engraving" (with a magazine of its own) to protect it against the inroad of the process-block. The art doubtless produces more engravers of skill than it can provide work for; but that is evidence rather of vitality than of decay. Lepers, Baude, Jonnard and Florian have been among the leaders who, in different styles of wood engraving, have sustained the extraordinarily high level which has been attained in France, and which is fairly well maintained in England. They were the most and least technical; the most and least appreciated. Florian, who died in 1890, was a man who successfully sought to obtain effects of tone rather than line, leaving masses of unbroken surface of the same value, such as quite early greys, but in rebelling against the mechanical style formerly in vogue in Germany, of indicating roundness of form by curved lines carried as far as possible at right angles to the convexity, and in substituting more or less elongation in lines of shade, he has made a good deal of the logic of form-rendering, and started a method that has not been entirely successful.

In Germany the artistic standard is lower than in France. It is true that few outside Germany could model a head as finely as M. Klinkhardt in his own style of a judicious mingling of the black line and the white line; but, as a rule, German engraving is far more general and more popular according to the taste of the people, and more old-fashioned than that of either France or America. The art has been injured by the great "studios" or factories designed to make woodcuts in series, and by the strict business principles, workshops which, in the education of the craftsman, to some extent annihilated the artist. There are, however, of great ability and taste. The attempt to print wood engravings in colours has done little to improve the status of the art. In other countries the attempt was better, and to raise the standard. Thus the work of Elbridge Kingsley, who would sit down in the woods and engrave the scene before him directly on the block, exercised no little influence in America. The similar work of J. E. Bicknell was of influence. Some of the trees of Fontainebleau Forest or the palace at Westminster, in its time much appreciated in his own country and in England. The efforts at block-printing by Chatto, and others, not only with colour, but by reinforcing it with blocks that print neither lines nor colour but "blind" pattern, raised or depressed upon the paper, are evidence of the movement by which new methods have been sought to interest the public. The immediate results have not been very serious, yet the fact shows the existence of a vitality that gives some hope for the future. But while the practice of dry-printing upon "surface paper" is maintained, it is hopeless to expect in the immediate future, in Germany at least, any permanently good results from orthodox wood engraving.

WOODFALL, HENRY SAMPSON (1739-1809), English printer and journalist, was born in London on the 21st of June 1739. His father, Henry Woodfall, was the printer of the newspaper the Public Advertiser, and the author of the ballad Darby and Joan, for which his son's employer, John Darby, and his wife, were the originals. H. S. Woodfall was apprenticed to his father and, during the age of majority, took over the conduct of the Public Advertiser. In it appeared the famous letters of "Junius." Woodfall sold his interest in the Public Advertiser in 1793. He died on the 12th of December 1805. His younger brother, William Woodfall (1746-1803), also a journalist, established in 1789 a daily paper called the Diary, in which, for the first time, reports of the parliamentary debates were published on the morning after they had taken place.

WOODFORD, an urban district in the Walthamstow (S.W.) parliamentary division of Essex, England, 9 m. N. from London, near the boundary with Middlesex. It has a central station on the Eastern railway. Pop. (1901) 13,798. Its proximity to the southern outskirts of Epping Forest has brought it into favour both with residents and with holiday visitors from London. A converted mansion, Woodford Hall, forms a convivial home. On high ground to the N. is the ecclesiastical parish (one of three) of Woodford Wells, where there is a mineral spring.

WOOD GREEN, an urban district in the Tottenham parliamentary division of Middlesex, England, suburban to London, 7 m. S. from Finsbury Park. Pop. (1891) 25,831, (1901) 34,233. The name covers a populous residential district lying north of Hornsey and west of Tottenham. To the west lies Muswell Hill, with the grounds and building of the Alexandra Palace, an establishment somewhat similar to the Crystal Palace. It was opened in 1873, destroyed by fire almost immediately, and reopened in 1875. Muswell Hill
woods-louse—woodpecker

took name from a holy well, of high repute for curative powers, over which an oratory was erected early in the 17th century, attached to the priory of St John of Jerusalem in Clerkenwell.

Wood-louse, a name commonly applied to certain terrestrial crustacea of the order Isopoda (see Malacostraca), which are found in damp places, under decaying dead leaves, or among decaying wood. They form the tribe Oniscidea and are distinguished from all other Isopoda by their habit of living on land and breathing air, and by a number of structural characters, such as the small size of the antennae and the absence of the mandibular pulp. As in most Isopods, the body is flattened, and consists of a head, seven thoracic segments which are always free, and six abdominal segments which may be free or fused. The "telson" is not separated from the last abdominal segment. The head bears a pair of sessile compound eyes as well as the minute antennae and the longer antennae. Each of the seven thoracic segments carries a pair of walking legs. The appendages of the abdomen (with the exception of the last pair) are flat membranous plates and serve as organs of respiration. In many cases their outer branches have small cavities opening to the outside by slit-like apertures, and giving rise internally to a system of ramifying tubules filled with air. From their similarity to the air tubes or tracheae of insects and other air-breathing Arthropods these tubules are known as "pseudo-tracheae."

The female wood-louse carries her eggs, after they are extruded from the body, in a pouch or "marsupium" which covers the under surface of the thorax and is formed by overlapping plates attached to the bases of the first five pairs of legs. The young, on leaving this pouch, are like miniature adults except that they are without the last pair of legs. Like all Arthropods, they cast their skin frequently during growth. As a rule the skin of the hinder half of the body is moulted some days before that of the front half, so that individuals in process of mouthing have a very peculiar appearance.

Some twenty-four species of wood-louse occur in the British Islands. Some, like the very common slaty-blue Porcellio scaber, are practically cosmopolitan, in the distribution of which, having been transported, probably by the unconscious agency of man, to nearly all parts of the globe. Equally common is the brown, yellow-spotted Oniscus asellus. Armadillidium vulgare belongs to a group which have the power of rolling themselves up into a ball when touched, and resembles the Glomeris. It was formerly employed in popular medicine as a ready-made pill. The largest British species is Ligia oceanica, which frequents the seashore, just above the tide mark. In many points of structure, for instance in the long, many-jointed antennae, or in the intermediate, as between terrestrial and marine forms, habits, between the truly terrestrial forms and their marine allies. Finally, one of the most interesting species is the little, blind, and colourless Piazythrus hoffmannseggii, which lives as a guest or commensal in the nests of ants. (W. T. Ca.)

Woodpecker, a bird that pecks or picks holes in wood, and from this habit is commonly reputed to have its name; but it is in some parts of England also known as "Woodspight" (exclusively "Woodspite")—the latter syllable being cognate with Ger. Spiecht and Fr. Épeiche, possibly with Lat. Picus. More than 300 species have been described, and they have been very variously grouped by systematists; but all admit that they form a very natural family Picidae of Coraciiformes, birds, their nearest allies being the toucans. They are generally of bright particoloured plumage, in which black, white, brown, olive, green, yellow, orange or scarlet—the last commonly visible on some part of the head—mingled in varying proportions, and most often strongly contrasted with one another, appear; while the less conspicuous markings take the form of bars, spots, or streaks. Some wood-peckers inhabit parts of the world, with the exception of Madagascar and the Australian Region, save Celebes and Flores; but it may be worth stating that no member of the group is known to have occurred in Egypt. Of the three British species, the green woodpecker, Geicus or Picus viridis, though almost unknown in Scotland or Ireland, is the commonest, frequenting wooded districts, and more often heard than seen, its laughing cry (whence the name "Yaffil" or "Yaffle") being heard by Frith in many parts known; and undulating flight affords equally good means of recognition, even when it is not near enough for its colours to be discerned. About the size of a jay, its scarlet crown and bright yellow rump, added to its prevailing grass-green plumage, make it a sightly bird, and hence it often suffers at the hands of those who wish to keep its stuffed skin as an ornament. Besides the scarlet crown, the cock bird has a patch of the same colour running backward from the base of the lower mandible, a patch that in the hen is black. Woodpeckers in general are very shy birds, and to obtain a fair view of the habits of the species not easy. Its ways, however, are well worth watching. As the evening sun begins to sink below the horizon, it is noticed that the woodpecker, almost always spirally, the vertical trunks and oblique arms of trees as it searches the interstices of the bark for its food, flying off when it reaches the smaller or upper branches—either to return to the base of the same tree and renew its course on a fresh line, or to begin upon another tree near by—and the care it shows in its close examination, will repay a patient observer. The nest almost always consists of a hole chiselled by the bird's strong beak, impelled by very powerful muscles, in a bare trunk, or arm of a tree, the opening being quite circular, but containing a windage by means of which there is access to the core, whence it is pierced downward for nearly a foot. There a chamber is hollowed out in which the eggs, often to the number of six, white, translucent and glossy, are laid with no bedding but a few chips that may have not been thrown out. The young are not only hatched entirely naked, but seem to become hatched without any of the downy growth common to most birds. Their first plumage is dull in colour, and much marked beneath with bars, crescents and arrowheads. Of the two generally similar birds here mentioned one, the pied woodpecker which inhabit Britain—the pied or greater spotted and the barred or lesser spotted woodpecker—Dendrocopus major and D. minor—each of great beauty, from the contrasted white, blue-black and scarlet that enter into its plumage. Both of these birds have an extraordinary habit of causing by quickly-repeated blows of their beak on a branch, or even on a small bough, a vibrating noise, louder than that of a watchman's rattle, and enough to excite the attention of the most incurious. Though the pied woodpecker is a resident in Britain, its numbers receive a considerable accession nearly every autumn.

1 The number of English names, ancient and modern, by which these birds are known is very great, and even a bare list of them could not be here given. The Anglo-Saxon was higara or higere, and to this may plausibly be traced "higare"—a word nowdays used in some parts of the country, and the older "kickway," "corrupted first into "highway," and, after its original meaning was lost, into "hewhole," which in North America has been still further corrupted into "high-hole" and more recently to "high-whole." Another "hewhole" includes "whettle" and "woodwale," which, different as they look, have a common derivation perceptible in the intermediate form "hiewale." The Mid. Eng. wedake ("woodack") is another name apparently identical in meaning with that commonly applied to woodpecker.

2 A patch of conspicuous colour, generally red, on this part is characteristic of very many woodpeckers, and careless writers often spell it "mystacial," or some more barbarously "monstacial." Considering that mossatches spring from above the mouth, and have nothing to do with the mandible or lower jaw, no term could be more misleading.

3 It often happens that, just as the woodpecker's labours are over, a pair of starlings will take possession of the newly-bored hole, and, by conveying into it some nesting furniture, render it unfit for the rightful tenants, who thereby suffer ejectment, and have to begin all over again. Much has been said of this and other woodpeckers that the chips made in cutting the hole are carefully removed by the birds to guard against their leading to the discovery of the nest. The present writer, however, had ample opportunity of observing the contrary as regards this species and, to some extent, the pied woodpecker next to be mentioned. Indeed there is no surer way of finding the nest of the green woodpecker than by scanning the ground in the presumed locality, for the tree which holds the nest is always recognizable by the chips scattered at its foot.
WOODSTOCK, SIR A.—WOODSTOCK

The three species just mentioned are the only woodpeckers that inhabit British America, though several others are mistakenly recorded as occurring in the country—and especially the great black woodpecker, the Picus maritius of Linnaeus, which must be regarded as the type of that genus. This fine species considerably exceeds the green woodpecker in size, and except for its red cap is wholly black. It is chiefly an inhabitant of the forests of the Old World, from Lapland to Galicia and across Siberia to Japan. In North America this species is replaced by Picus pileatus, there generally known as the logcock, an equally fine species, but variegated with white; and farther to the southward occur two which are finer still, P. pruiniatus and P. sordida, the latter in the south over much of the United States we can mention only a few.

First of these is the Californian woodpecker, Melanerpes formicivorus, which has been said to display an amount of providence beyond almost any other bird in the number of acorns it fixes tightly in holes which it makes in the bark of trees. And thus there is no pine forty or fifty feet high will present the appearance of being closely studded with brass nails, the heads only being visible. This is not done to furnish food in winter, for the species migrates, and only returns in spring to the forest to which its supplies are laid up. It has been asserted that the acorns thus stored are always those which contain a maggot, and, being fitted into the sockets prepared for them cup-end foremost, the insect is unable to escape, as they otherwise would, and are thus ready for consumption by the birds on their return from the south. But this statement has again been contradicted, and, moreover, it is alleged that these woodpeckers follow their instinct so blindly that "they do not distinguish between an acorn and a pebble," so that they "fill up the holes they have drilled with so much labor, not only with acorns but occasionally with stones," (cf. Baird, Brewer and Ridgway, North American Birds, ii. pp. 565-577.)

The next North-American form deserving notice is the genus Colaptes, represented in the north and east by C. auratus, the golden-winged woodpecker or flicker, in most parts of the United States the most conspicuous woodpecker, and in the south and west replaced by the allied C. mexicanus, easily distinguishable among other characteristics by having the shafts of its quills red instead of yellow. It is curious, however, that, in the valleys of the upper Missouri river, this species is one of the range of the two kinds overlap, birds are found presenting an extraordinary mixture of the otherwise distinctive features of each. Other woodpeckers of the American forest are the hairy woodpecker, small birds with spotted black and white plumage, which are very valuable as destroyers of harmful grubs and borers; the red-headed woodpecker, a very handsome form with strongly contrasted red, black and white plumage, common west of the Alleghany Mountains; and the yellow-bellied woodpecker ("sapsucker").

Some other woodpeckers deserve especial notice—the Colaptes or Soropile cappistris, which inhabits the treeless plains of Paraguay and Brazil; Geocolaptes bairdii, the American woodpecker with white square; and the oriole-like dinasius, which lives almost entirely on the ground or rocks, and picks a hole for its nest in the bank of a stream (Zoologist, 1852, p. 268).

The woodpeckers, together with the flickers (g.f.), form a very natural division of scapular birds with zygodycastic feet, and were regarded by T. H. Huxley as forming a distinct division of birds to which he gave the name Celephorinae, whilst W. K. Parker separated them from all other birds as Sarcopterygii.

WOODS, SIR ALBERT (1816-1904), English herald, son of Sir William Woods, Garter king-of-arms from 1838 to his death in 1842, was born on the 16th of April 1816. In 1838 he became a member of the chapter of the Heralds' College, of which he was appointed registrar in 1886. In 1886 he was knighted and became Garter king-of-arms. In this capacity he was entrusted with many missions to convey the order to foreign sovereigns; he was also registrar from 1838 of the orders of the Star of India and of the Indian Empire; and from 1896 he was Garter king-of-arms of the order of St Michael and St George. He officiated at the coronations both of Queen Victoria and of King Edward VII., and his authority on questions of precedence was unique. His later distinctions were K.C.B. (1857), K.C.M.G. (1890) and G.C.V.O. (1903). He died on the 7th of January 1904.

WOODS, LEONARD (1774-1854), American theologian, was born at Princeton, Massachusetts, on the 19th of June 1774. He graduated at Harvard in 1796, and in 1798 was ordained pastor of a Congregational Church at West Newbury. He was prominent among the founders of' the Missionary Society, and was its first professor, occupying the chair of Christian theology from 1808 to 1846, and being professor emeritus until his death in Andover on the 24th of August 1854. He helped to establish the American Tract Society, the American Education Society, the Temperance Society and the American Board of Commissioners for Foreign Missions. He was an orthodox Calvinist and an able dialectician. His principal works (5 vols., Andover, 1849-50) were Lectures on the Inspiration of the Scriptures (1829), Memoirs of American Missionaries (1833), Examination of the History of the United States (1836), Lectures on New Testament Government (1834), and Lectures on Swedenborgianism (1846); he also wrote a History of Andover Seminary (1848), completed by his son.

His son, LEONARD WOODS (1807-1878), was born in West Newbury, Mass., on the 24th of November 1807, and graduated at Union College in 1827 and at Andover Theological Seminary in 1830. His translation of Georg Christian Knapp's Christian Theology (1831-1833) was long used as a text-book in American theological seminaries. He was assistant Hebrew instructor (1832-1833) at Andover, and having been licensed to preach by the Londonderry Presbytery in 1830 was ordained as an evangelist by the Third Presbytery of New York in 1833. In 1834-1837 he edited the newly-established Literary and Theological Review, in which he opposed the "New Haven" theology. After being professor of sacred literature in the Bangor Theological Seminary for three years, he was president of Bowdoin College from 1839 to 1866, and introduced there many important reforms. From June 1867 to September 1868 Dr Woods worked in London and Paris for the Maine Historical Society, collecting materials for the early history of Maine; he induced J. G. Kohl of Bremen to prepare the first volume (1868) of the History of the discretion of the Church, and he discovered a MS. of Hakluyt's Discourse on Western Planting, which was edited, partly with Woods's notes, by Charles Dean in 1877. He was elected in Boston on the 24th of December 1878. He was a remarkable linguist, conversationalist and orator, notable for his uncompromising independence, his opinion that the German reformation was a misfortune and that the reformation should have been within the church.

ALVA WOODS (1794-1887), a nephew of the elder Leonard and the son of Abel Woods (1775-1850), a Baptist preacher, graduated at Harvard in 1817 and at Andover Theological Seminary in 1821, and was ordained as a Baptist minister. In 1824-1828 he was professor of mathematics and natural philosophy at Brown University, acting as president in 1826-1827; in 1828-1831 was president of Transylvania University, Lexington, Kentucky; and in 1831-1837 was president of the University of Alabama at Tuscaloosa, where he organized the Alabama Female Athenaeum. After 1839 he lived in Providence, R.I.

WOODSTOCK, a town and port of entry of Oxford county, Ontario, Canada, 80 m. S.W. of Toronto by rail, on Cedar creek, the Thames river and the Grand Trunk and Canadian Pacific railways. Pop. (1901) 8833. It is in one of the best agricultural sections of the province, and has a large export trade in cheese, butter and farm produce. Organos, pianos and agricultural implements are manufactured. It contains a residential school, under the control of the Baptist church, affiliated with McMaster University, Toronto.
WOODSTOCK, a market town and municipal borough in the Woodstock parliamentary division of Oxfordshire, England, 724m. W.N.W. of London, the terminus (Blenheim and Woodstock) of a branch of the Great Western railway. Pop. (1901) 1684.

The little river Glyme, in a steep and picturesque valley, divides the town into two distinct parts, and enters the Thames at St Mary Magdalen, in New Woodstock, is of Norman date, but has additions in the later styles, and a west tower built in 1375. The town-hall was erected in 1766 after the designs of Sir William Chambers. The picturesque almshouses were erected in 1798 by Caroline, duchess of Marlborough. The town is dependent chiefly on agriculture, but a manufacturer of leather gloves (dating from the 16th century) is carried on. Woodstock is governed by a mayor, 4 aldermen, and 12 councillors.

Area, 156 acres.

Blenheim, the mansion of the duke of Marlborough, is the scene of the battle of Blenheim. The town was incorporated within the court; and a princely mansion erected by Parliament for the duke of Marlborough in consideration of his military services, and especially his decisive victory at Blenheim. The sum of £50,000 was voted for the purchase of the mansion and the erection of the building, a huge pile built by Sir John Vanbrugh (q.v.), in a heavy Italian-Chinese style. The greater part of the £50,000 and £2,000 was spent in 1686, and the great library containing 10,000 volumes of books collected by Charles Spencer, earl of Sunderland, the son-in-law of the first duke of Marlborough, in 1881. The magnificent park contains Fair Rosamund's well, near which stood her bower. On the summit of a hill stands a column commemorating the duke. Blenheim Park forms a separate parish.

Domesday describes Woodstock (Wodestock, Wodestok, Woodstok) as a royal forest; it was a royal seat from early times and Ethelred is said to have held a council there, and Henry I. to have kept a menagerie in the park. Woodstock was the scene of Henry II.'s courtship of Rosamund Clifford (q.v.) (Fair Rosamund (q.v.)). The town was exempted from the military duties during the Civil War, when the manor house was "almost totally destroyed."

In the Hundred Rolls of 1290 Woodstock is described as a small, but a burgess is alluded to in the same document, and it returned two members to parliament as a borough in 1302 and 1305. A mayor of Woodstock was witness to a deed in 1398, but the earliest known charter of incorporation was that from Henry VI. in 1453, establishing the town of New Woodstock a free borough, with a merchant guild and the same liberties and customs as New Windsor; and incorporating that town under the title of "the Mayor and Commonalty of the Town of New Woodstock." The mayor and the serjeant-at-mace were to be elected by the commonalty and an independent borough court with the right of appeal to the Great Court of Gloucester. The corporation was divided into 11 wards, of which the mayor resided in the town.

The borough was also exempted from the burden of sending representatives to parliament, but it again returned two members in 1553 and then regularly from 1570 until 1881, when the representation was reduced to one member. In 1889 the borough was disfranchised. The charter of Henry VI. was confirmed by Henry VII., Edward VI. and Elizabeth, but before 1580, when an ordinance was drawn up for the government of the borough, the corporation had considerably developed, including a high steward, recorder, mayor, 6 aldermen, 20 common councillors, a town clerk and a cryer of the court; and the new charter granted by Charles II. in 1660 did little more than confirm this corporation. The hamlet of Old Woodstock is said to have been founded by Henry I., and was never included within the borough. The existing Tuesday market is stated in the Hundred Rolls of 1270 to have been granted by Henry II. and the St Matthew's fair by John. The latter was confirmed in 1453, with the addition of a fair at the feast of St Mary Magdalen. Queen Elizabeth in 1565 granted to the mayor and commonalty a market on Friday, and two fairs of four days each at the feast of St Nicholas and Lady Day.

WOODSTOCK, JOHN (1665-1728), English naturalist and geologist, was born in Derbyshire on the 1st of May 1665. At the age of sixteen he went to London, where he studied with Dr Peter Barwick, physician to Charles II. In 1692 he was appointed professor of physic in Gresham College. In 1693 he was elected F.R.S., in 1695 was made M.D. by Archbishop Tenison and also by Cambridge, and in 1702 became F.R.C.P. While still a student he became interested in botany and natural history, and during visits to Gloucestershire his attention was attracted by the fossils that are abundant in many parts of that county; and he began to form the great collection with which his name is associated. His views were set forth in An Essay towards a Natural History of Minerals (2 vols., 1705), a book containing a general account of minerals, especially those of England, and a dissertation and catalogue of British fossils (1706). This was followed by Brief Instructions for making Observations in All Parts of the World (1696). He was also author of An Attempt towards a Natural History of the Fossils of England (2 vols., 1728 and 1729). In these works he showed that the stony surface of the earth was divided into strata, and that the enclosed shells were originally generated at sea; but his views of the method of formation of the rocks were entirely erroneous. In his elaborate Catalogue he described his rocks, minerals and fossils in a manner far in advance of the age. He died on the 24th of April 1728, and was buried in Westminster Abbey.

By his will he directed that his personal estate and effects were to be sold, and that land of the yearly value of one hundred and fifty pounds was to be purchased and conveyed to the University of Cambridge. A lecturer was to be chosen, and paid £100 a year to read at least four lectures every year, on some one or other of the subjects treated of in his Natural History of the Earth. Hence arose the Woodwardian professorship of geology. To the same university he bequeathed his collection of English fossils, to be taken care of the lecturer, and these formed the nucleus of the Woodwardian museum at Cambridge. The specimens have since been removed to the new Sedgwick museum.

A full account of Woodward's life and views and a portrait of him are given in the Life and Letters of the Rev. Adam Sedgwick, by J. W. Clark and T. McK. Hughes, where it is mentioned that his paper, read before the Royal Society in 1699, entitled Some Thoughts and Experiments concerning Vegetation, "shows that the author should be ranked as a founder of experimental plant-physiology, for he was one of the first to employ the method of water-culture, and to make refined experiments for the investigation of plant-life." See also The Lives of the Professors of Gresham College, by John Ward (1740).

WOODWARD, SAMUEL (1790-1838), English geologist and antiquary, was born at Norwich on the 3rd of October 1790. He was for the most part self-educated. Apprenticed in 1804 to a manufacturer of camlets and bombazines, a taste for serious study was stimulated by his master, Alderman John Herrig and by Joseph John Gurney. Becoming interested in geology and archaeology, he began to form the collection which after his death was purchased for the Norwich museum. In 1820 he obtained a clerkship in Gurney's (afterwards Barclay's) bank at Norwich, and in 1827 became a fellow of the college. The Geologists' Association, of which he was a fellow, the Royal Society, encouraged his scientific work. He communicated to the Archaeologia articles on the round church towers of Norfolk, the Roman remains of the country, and, and other papers on natural history and geology to the M.N. Hist. and Phil. Mag. He died at Norwich on the 14th of January 1838. He was author of A Synopsis Table of British Organic Remains (1830), the first work of its kind in Britain; An Outline of the Geology of Norfolk (1833); and of two works issued posthumously, The Norfolk Topographer's Manual (1842) and The History and Antiquities of Norwich Castle (1847).

His eldest son, Bernard Bolingbroke Woodward (1816-1869), was librarian and keeper of the prints and drawings at Windsor Castle from 1860 until his death. The second son, Samuel Pickworth Woodward (1821-1865), became in 1845 professor of geology and natural history in the Royal Agricultural College, Cirencester, and in 1848 was appointed assistant in the department of geology and mineralogy in the British Museum. He was author of A Manual of the Mollusca (in three parts, 1851, 1853 and 1860).

S. P. Woodward's son, Horace Bolingbroke Woodward (b. 1848), became in 1863 an assistant in the library of the Geological Society, and joined the Geological Survey in 1867, rising to be assistant-director. In 1865-1864 he was president of the Geologists' Association, and he published many important works on geology. Samuel Woodward's youngest son, Henry Woodward
WOOL, WORSTED AND WOOLLEN MANUFACTURES

(b. 1832) became assistant in the geological department of the British Museum in 1852, and in 1880 keeper of that department. He became a F.R.S. in 1873, LL.D. (St Andrews) in 1878, president of the Geological Society of London (1884-1896), and was awarded the Wollaston medal of that society in 1906. He published a Monograph of the British Fossil Crustacea, Order Merostomata (Falaconthropog. Soc. 1866-1878); A Monograph of Carboniferous Trilobites (Pal. Soc. 1883-1884), and many articles in scientific journals. He was editor of the Geological Magazine from its commencement in 1864.

Wool, worsted and woolen manufactures. Wool is a modified form of hair, distinguished by its slender, soft and wavy or curly structure, and, as seen under the microscope, by its highly imbricated or serrated surface. At what point an animal fibre ceases to be hair and becomes wool it is impossible to determine, because the one by imperceptible gradations merges into the other, so that a continuous chain can be formed from the finest and softest merino to the rigid bristles of the wild boar. Thus the fine soft wool of the Australian merino merges into the crossing of New Zealand; the crossing of New Zealand merges into the long English and lustre wool, which in turn merges into alpaca and mohair-materials with clearly marked but undeveloped scale structure. Again, such animals as the camel and the Cashmere goat yield fibres, which it would perhaps be difficult to class rigidly as either wool or hair.

Wool is one of the most important of the textile fibres. Owing to the ease with which it may be spun into thread, and the comfort derived from clothing made of wool, it would naturally be one of the first textiles used by man for clothing. Ancient records prove the high antiquity of wool textures and the early importance of the sheep. The different kinds of wool and the cloth made from them in antiquity are described by Pliny and referred to by other writers, and among the arts which the British Isles owe to the Romans not the least important is the spinning and weaving of wool. The sheep certainly was a domestic animal in Britain long before the period of the Roman occupation; and it is probable that some use was made of sheep skins and of wool. But the Romans established a wool factory where they produced wool from wild sheep brought from Spain, and the value of the manufacture was soon recognized by the Britons, of whom Tacitus remarks, "Inde etiam habitus nostri honor et frequens toga" (Agric. c. 21). The product of the Winchester looms soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." This reputation was maintained throughout the middle ages, and the fibre was in great demand in the Low Countries and other continental centres. There are many allusions to woolen manufactures in England in early times; but the native industry could not rival the products of the continent, although the troubles in various industrial centres, from time to time, caused skilled workers in wool to seek an asylum in England. In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but subsequently they were removed to Pembroke. At various subsequent periods there were further immigrations of skilled Flemish weavers, who were planted at different places throughout the country. The cloth fair in the church yard of the priory of St Bartholomew was instituted by Henry II.; gilds of weavers were established; and the exclusive privilege of exporting woolen cloth was granted to the city of London. Edward III. made special efforts to encourage wool industries. He brought weavers, dyers and fullers from Flanders; he himself wore British cloth; but to stimulate native industry he prohibited, under pain of life and limb, the exportation of English wool. Previous to this time English wool had been in large demand on the continent, where it had a reputation exceeded only by the wool of Spain. The Customs duties levied on the export of wool were an important source of the royal revenue. Edward III.'s prohibitory law was, however, found to be inapplicable, and the utmost that he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much smuggling of wool. Thus while Edward III. limited the right of exporting to merchant strangers, Edward IV. decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth, when the free exportation of English wool was permitted; and Smith, in his Memoirs of Wool, points out that it was during this reign that the manufacture made the most rapid progress. In 1660 the absolute prohibition of the export of wool was again enforced, and it was not till 1825 that this law was finally repealed. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool—"running" or smuggling became an organized traffic; and the whole industry became disorganized. Extraordinary expedients were resorted to for stimulating the demand for woolen manufactures, among which was an act passed in the reign of Charles II. decreeing that all dead bodies should be buried in woolen shrouds—an enactment which remained in the Statute Book, if not in force, for a period of 150 years. On the opening up of the colonies, every effort was made to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

It was not without reason that the attention of monarchs and legislators was so frequently directed to the wool industries. Wool was indeed the "flower and strength and revenue and blood of England," and till the development of the cotton trade, towards the end of the 18th century, the wool industries were, beyond comparison, the most important sources of wealth in the country. Towards the close of the 17th century the wool produced in England was estimated to be worth 2,000,000 yearly, furnishing 5,000,000 worth of manufactured goods, of which there was exported about 2,000,000 in value. In 1700 the official value of woolen goods exported was about 3,000,000, and in the third quarter of the century the exports had increased in value by about 5,000,000 only. In 1774 Dr Campbell (Political Survey of Great Britain) estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at 5,000,000, the manufactured products at 13,000,000, and the exports at 5,000,000 to 4,000,000. He added that the consumption amounted to 1,000,000 persons. These figures, in the light of the dimensions of present-day industries, may appear small, but they bore a predominant relationship to the other great sources of employment and trade of the period. In 1800 the native crop of wool was estimated to amount to 66,000,000 lb; and, import duty being imposed till 1802, the quantity brought from abroad was 5,000,000 lb, 5,000,000 lb of which came from Spain. In 1825 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per lb, and in 1844 the duty was finally remitted on foreign wool also.

Sheep were introduced at Jamestown in Virginia in 1600, and in 1633 the animals were first brought to Boston. Ten years later a fulling mill was erected at Rowley, Mass., "by Mr Rowley's people, who were the first that set upon making cloth in this western world." The factory woolen industry was, however, not established till the close of the 18th century, and it is recorded that the first carding machine put in operation in the United States was constructed in 1794 under the supervision of John and Arthur Schofield.

For centuries the finer wools used for cloth-making throughout Europe had been obtained from Spain—the home of the famous merino breed developed from races of sheep originally introduced into the Peninsula by the Moors. Till early in the 19th century the superiority of Spanish merinos remained unchallenged, but the Peninsular War and its attendant evils produced a depreciation of quality concurrently.
with the introduction of Saxon and Silesian wools, which suddenly supplanted the product of Spain. The Spanish merino sheep had been introduced into Saxony by the elector in 1765, and by judicious crossing with the best native race developed the famous electoral breed. Merino sheep completely dominated Hungary in 1775, and to Princes in 1776, and in 1786 Daubenton brought them to Rambouillet, whence a famous race developed. In 1802 the first merinos known to have left pure descendants were taken to the United States, and in 1809-1810 an introduction (some) of merino sheep was made.

The introduction of the merino sheep into the United States was an important move, but its results are not to be compared with the results of the introduction of the merino sheep into Australasia about the end of the 18th century and into South America a little later. It is probable that the marked improvement in the appearance of the first sheep taken out by the early colonists suggested the possibilities of Australia as a wool-growing country. As has been noted above, marked endeavours were being made at this time to extend the merino breed of sheep, so that it was but natural that this breed should be given the first chance. That marked success did not attend the first endeavours is shown by the fact that the London Colonial Wool Sales originated in the necessity of selling Australian wools just for what they would bring under the hammer, as distinct from the private treaty method of selling and buying the more highly priced continental merinos. It should here be noted that the Australian fine wools were first shipped from Botany Bay, hence the now universal term "botany" for fine wools. The colonists were not to be repressed however, and eventually, through the endeavours of Captain MacArthur, Sir J. Banks, the Rev. Samuel Marsden and others, the merino breed became established on a firm basis, and in a comparatively short time Australian wools were no longer a drug on the market. The evolution was not to stop, however, with the development of merino flocks and the exportation of merino wool. The possibilities of raising larger sheep on the better coastal pasturage was naturally suggested. Until about 1885 this tendency was largely repressed owing to the demand for merino as distinct from cross-bred wool. In other words wool was the dominating factor. But with the possibilities and the development of the frozen meat trade from 1880 to 1890 this condition was changed, and the tendency to breed a large sheep with a valuable carcass and mediocre wool grew apace. New Zealand was specially adapted for this development; thus New Zealand frozen meat wool completely dominated the market, and in this manner it came about that cross-bred wool supplemented merino wool to a very considerable extent throughout Australasia. This change would have been serious for the wool combers and spinner had not the Bradford combers, spinners and manufacturers put their shoulder to the wheel and developed a world-wide renown for their cross-bred tops, yarns and fabrics. Again the change was not altogether for the bad so far as the Australian sheep was concerned. Sheep-breeding developed into a real science, and remarkable results were obtained with such crosses as Merino-Lincoln, Merino-Leicester, Merino-Shropshire; all probably originating in the first place in the desire to produce a large-bodied early-fattening sheep, but later developing into a strenuous endeavour to develop more useful types of wools. Thus the wool produced from the first cross Merino-Lincoln might be very defective judged from a pure merino standpoint, but by breeding back to the merino practically none of the useful merino characteristics were sacrificed, while length of staple was added and the weight of the fleece perhaps doubled.

A somewhat different evolution has taken place in later years with reference to the interior sheep stations. The merino sheep will thrive where a larger sheep would starve, hence its value for the stations where salt-bush dominates all vegetation. But the merino sheep is a "wool" sheep, not a "frozen mutton" sheep, hence all crossing here was carried out with the idea of simply developing the weight of fleece and if possible retaining the merino wool characteristics. The most marked development in this direction was effected by the introduction of the United States merino or Vermont breed. Opinions differ as to the wisdom of this introduction. The weight of fleece carried per sheep has been remarkable, and the fact that largely to the present weight multiplied by price per lb paid in London or elsewhere has been entirely in favour of first and second cross Vermonts, has undoubtedly influenced breeders in its favour. Against this must be placed the fact that the Australian-Vermont merino cross produces a sheep of unstable physique, naturally unable to withstand drought, and—worst of all so far as London is concerned—producing a fleece very difficult to judge for yield of pure scoured wool. Again, the Australian-Vermont first cross is very liable to produce a very strong botany wool, while what is required is a long battue wool technically termed a long and shifty 60's to 64's quality.

Hardly second in importance to Australia as a wool-growing country comes South America, or more correctly Argentina along with Patagonia, Punta Arenas and the Falkland Islands. In most years Australia has produced the greater bulk, but just occasionally S. America has come out top and is likely to do so more frequently in the future owing to the remarkable developments there taking place. The history of the introduction of the merino sheep into S. America and the summing up of results would be too long to attempt. In 1842 Henri Solanet, a Frenchman, began the breeding of the comparatively few sheep round Buenos Aires. His example was soon followed by Edouardo Olivera and José Planer. The idea almost at once came to these pioneers of importing well-bred rams, and as S. America is essentially a Latin country it was but natural that the French flocks of Rambouillet should be first drawn upon. With the development of the meat trade—just as in the case of Australia and New Zealand—a larger carcass was then sought after. This led to the introduction of the Lincoln ram and the development of cross-bred flocks about the year 1855. Perhaps this is the case of the crossing of merino and Angora wool to the skill of the Bradford spinners, who made excellent use of the cross-bred wool produced. Flocks of sheep were first introduced into the Falkland Islands in 1867. The pasturage here being limited, the flocks have probably attained their limit, but from the Falkland Islands flocks have been passed on to Punta Arenas, where there is practically unlimited pasturage. The chief centres from which wool from S. America comes to Europe are Buenos Aires, which exports chiefly long and cross-bred wools, Montevideo, which exports chiefly merino wools, and the Falkland Islands and Punta Arenas, which are important in supplying Zeeland wools. The industry is largely in the hands of Englishmen. Unfortunately, however, the British manufacturer early took a dislike to the Buenos Aires, &c., wools, and consequently these wools go largely to the continent of Europe. To-day they by no means merit their previous bad name, and the Bradford combers and spinner are endeavouring to make up for lost opportunities.

Prior to the introduction of the merino sheep into Australia it had been introduced into S. Africa by the Dutch. There the climate was not so helpful as was that of Australia. The newly acclimatized sheep appears to have cast its wool at about the fifth generation and to have generally deteriorated, necessitating the reintroduction of fresh blood form Europe. In this manner have been developed the Cape flocks and the considerable Cape wool trade—largely centred at Port Elizabeth, East London, Cape Town, Mossel Bay and Port Natal. The country is evidently specially adapted for the rearing of the merino type of sheep, as cross-bred Cape wool is practically unknown. The term snow-white Cape wool, on the other hand, betokens a quality of whiteness no doubt due to the atmosphere and pasturage conditions. Cape wools are also known as non-felting wools, and consequently are largely employed in the manufacture of flannels. In 1907 most marked endeavours were being made to develop the Cape flocks by the introduction of some thousands of Australian merino sheep. The opinion of wool experts was that the Cape had a great future before it as a wool-producing country.
Large quantities of wool also come from the East and from Russia, while even Iceland contributes its quota. It is interesting to note that, notwithstanding all the developments instanced, Europe still maintains its supremacy as the chief wool-producing continent, though, as the wool is largely manufactured locally, one hears little of European wools.

The following statistics give an idea of the development of the colonial and foreign wool trade as gauged by the London wool sales:

It must not be forgotten, however, that a large quantity of S. American, W. Indian, Russian, &c., wools, along with mohair and alpaca, come through Liverpool, and consequently are not taken into account here.

With reference to wools grown in the United Kingdom the truth seems to be that a fine short wool has never been produced. English wools are known the world over as being of a long and lustrous type, which was doubtless that much in demand in the middle ages. That it was as long and lustrous as the typical Leicester or Lincoln of to-day is doubtful, as the new Leicester breed of sheep was only fully developed by Mr. Bakewell after the year 1747, and the latter day Lincoln was even a later development of a similar character. What the exact type of English wool or wools was prior to the 18th century will probably never be decided, but from the closing years of that century there is no difficulty in being fairly precise. As already remarked, the long and lustrous wools are the typical English, being grown in Lincolnshire, Yorkshire, Nottinghamshire, Devonshire, &c., in fact in all those districts where the pasturage is rich and specially fitted for carrying a heavy sheep. It is claimed that the lustre upon the wool is a direct result of the environment, and that to take a Lincoln sheep into Norfolk means the loss of the lustre. This is partially true, but it is perhaps better to take a larger view and remember that the two influencing factors are race and environment: which is the more potent it is impossible to say. Attempts were made in the 18th century to develop a fine wool breed in England, George IV. importing a number of merino sheep from Spain. The discovery was soon made that it was impossible to maintain a breed of pure merinos in Great Britain, but the final outcome was by no means unsatisfactory. By crossing with the indigenous sheep a race of fairly fine woolled sheep was developed, of which the present day representative is the Southdown—a sheep which feeds naturally on the Downs of Sussex, &c., forming a marked contrast to the artificially turnip-fed Lincoln, Leicester, &c., sheep. Following the short, curly Southdown, but rather longer, come such as the Sussex, Oxford and Hampshire Down sheep; these are followed by such as the Shropshires and Shropshire crosses, Kent and Romney Marsh, until at last the chain from the Southdown to the Lincoln is completed. Of course there are several British wools not included in this chain. Scotch or black-face wool is long and rough, but well adapted for being spun into carpet yarns. Welsh wool has the peculiarity of early attaining its limit of shrinkage when washed, and hence is specially chosen for flannels. Shetland wool is of a soft nature specially suited for knitting yarns, while Cheviot wool—said to be a cross between merino sheep saved from the wreck of the Great Armada and the native Cheviot sheep—has made the reputation of the Scottish manufacturers for Tweed. North wool—wool from an animal of the Border Leicester and Cheviot breed—Ripon, Wensleydale and Teasdale wools are also specially noted as lustre wools, Ripon and Wensleydale wools being, by many judges, considered superior so far as lustre is concerned to Lincoln and Leicester.

Such remarkable advances have been made in the weights of fleeces carried by sheep of particular breeds that it is difficult to say if finility has been reached. The following list gives average weights:

<table>

</table>

In 1865 the average weight of wool per sheep per year was about 5 lb, while 7 to 8 lb is now the average weight. Roughly speaking the weights of Australian fleeces are to-day about as compared with 1865.

The prevailing colour of sheep's wool is white, but there are races with black, brown, fawn, yellow and green shades of wool. For manufacturing purposes generally white wool is, of course, most valuable, but for the homespuns, which in earlier times absorbed the bulk of wool, natural colours were in many cases used with good effect. In domestic spinning, knitting, and weaving, natural colours are still largely taken advantage of, as in the cases of rough yarns, Shetland knitted shawls, Highland tweeds, &c.

As has already been indicated, the distinction between wool and hair lies chiefly in the great fineness, softness, and waved delicacy of woolen fibre, combined with a highly serrated surface. These peculiarities are precisely the characteristics which give its distinctive value as a textile fibre, the most distinctive characteristic of all being the serrated structure which specially belongs to wool and markedly aids the important property of felting, upon which many of its applications depend. The serrations of wool and the wavy structure it assumes are closely connected, those wools which have the greatest number of serrations being usually most finely waved in structure. The appearance presented by wool under the microscope is shown in figures 1-6 (Plate). Under the influence of moisture and pressure, aided by alkalis or acids, masses of wool thoroughly mat together, by the mutual interlocking of the fibres. The lustre and sheen of various kinds of woolen textures under washing is accounted for, the capacity of wool cloth for felting or fulling being due to this condition of the fibre, possibly along with a certain shrinkage of the true fibre mass. The serrations are most numerous, acute, pointed and distinct in fine merino wools, as many as 2800 per inch, being counted in specimens of the finest Saxony wools. In the Leicester wool of England, on the other hand, which is a long bright staple, the serratures are not only much fewer in number, counting about 1800, but they are also less pronounced in character, so that the Leicester wool possesses a smoother waved character. In some inferior wools the serrations are not so many as 500 per inch. A similar difference may be noted in the fineness of the fibres. The finest wool has a diameter of from 35 to 37 μ, whilst coarse Algerian wools may rise to a maximum diameter of about 70 μ. Other distinguishing qualities of good wool consist in uniformity and strength of fibre with freedom from tender or weak portions in its length, a condition which not infrequently arises from ill health in the sheep, or is due to violent climatic changes. In ill-bred wool there may also be found intermingled "kelps" or dead hairs—straight, coarse, dull fibres which show conspicuously among the wool, and become even more prominent in the manufactured and dyed goods, as they will not take dye. Wool also possesses a softness of touch and an elasticity both in the raw and manufactured condition which distinguish it from all other fibres. In length of staple it varies very much, attaining in combing wools to a length of as much as 15 to 20 in. In dealing with wool from a practical point of view it must be recognized that it is by no means a simple body, but has a somewhat complex physical structure. Its composition in the raw state may be said to be threefold. Thus there is the wool-yolk—which may be termed a natural impurity; the wool-fat, which is not only present in the yolk but also permeates the fibre and seems to give it its plastic and soft handle; and the cell structure proper of the fibre. The natural impurity or wool-yolk is truly a skin product and is a protector of the wool-fibre rather than part of the true fibre substance. The wool-fat also may be regarded as...
independent of the true fibrous substance, but it is well to recognize that if the wool-fibre be entirely freed from the wool-fat it loses its plastic and elastic nature and is considerably damaged. In cleansing wool the true fibre mass may be disturbed and partially destroyed not only by dry but also by "wet" heat, and may be entirely disintegrated by means of alkali, &c., with heat. The wool-fibre will almost free itself from the natural impurities through the presence of liquid water. This is taken advantage of in the various steeping machines placed on the market, which partially scour the wool by means of its own yolk—principally through the potash salts present.

According to Hummel the composition of the average wool-yolk is as follows:

<table>
<thead>
<tr>
<th>Commodity</th>
<th>Quantity</th>

</tbody>
</table>

The potash salts are usually recovered from the wash-water products and a marked economy thereby effected.

The natural wool-fat—popularly known as "lanoline"—may be partially removed from the body of the living animal, but is almost wholly necessary to free the wool still further from it by actually scouring the wool on either the "emulsion" or "solvent" method, in either case the action being largely physical. As previously pointed out, however, the wool cannot be washed too long or too strongly, otherwise the fibre will lose its "natural." According to Dr Bowman, the chemical composition of the cell structure of the average wool-fibre is:

<table>
<thead>
<tr>
<th>Substance</th>

It is said to be a most complex body of the probable formula is \(\text{CaH}_{13}\text{N}_3\text{S}_4\text{O}_8\). The scale of the yolk is a rich brown color. It is not a true fat, it largely resolves itself into ammonia gas—whence it derives its characteristic odour—and carbon "head" or "reminis," which serve to distinguish wool from cotton, which, upon being burnt, does not smoulder but burns with a flash and leaves no backs. For further particulars on the organic nature of the wool-fibre see FIBRES.

The bulk of the wool of commerce comes into the market in the form of wool-fleece, the product of a single year's growth, cut from the body of the living animal, and is almost completely the wool of the sheep, but is termed "lams' wool," may be taken from the young sheep at about the age of eight months. When the animal is not sheared, it is known as THE whole fleece, which may be cut into twelve or fourteen months, and in the wool is known as hogs or hogget, and, like lambs' wool, is fine and tapers to a point. All subsequently cut fleeces are known as wether wool, and possess relatively somewhat less value than the first cut of the wool when it comes into the market or "the greasy," that is, washed, and with all the dirt which gathers to the surface of the greasy wool present; or it is received as "washed wool," the washing being done as a preliminary to the sheep-shearing, or, in some few cases, it is scoured and is consequently stated as "scoured." Skin wool is that which is obtained from sheep which either die or are killed. Typical skin wool is that which has been removed by a sweating process. The worst type of skin wool—technically known as "slip"—is removed from the skins bylime, which naturally affects the handle of the wool and renders it difficult to bring into a workable condition later. Mazamet in France is the great continental centre for skin wools.

Where there is abundance of water and other conveniences it is the practice to wash or half-wash sheep previous to shearing, and thus a much cleaner and more marketable fleece is obtained.

Sheep washing. The surface of a fleece has usually a thick coating of dirt, and in the case of merino breeds the fleece surface is firmly caked together into solid masses, from the adhesion of dirt to the wool constantly moist with the exudation from the skin of the greasy yolk or "sweat," so that in an unwashed very greasy fleece 30% of weight may represent dirt, and about 40% the greasy sweat. Both notes that while the pure wool is not more than one-third of the whole, there may be 2.5% of the whole in a dirt. When the skins are panned by the side of the water, and taken one by one and held in the stream while they are washed, one man holding and the other washing. The water is then thrown rapidly into the stream, and conveyed by the stream, and it dissipates no mean amount of potash salts, valuable for manure or for other chemical purposes. Sheep washing appliances are largely employed, the arrangement consisting of a pen into which the sheep are driven and moist with the exudation from the skin. When the sheep are driven and moist with the exudation from the skin, they are caught and subjected to a strong douche of pure water. They should then be kept on grass land free from straw, sand, &c., so that the wool may be sheared free from vegetable matter, &c. After a few days the wool on the sheep must be sheared free from dirt and grease or clipping.

The relative advantages of shipping wool in the greasy or the washed state have been fiercely debated. Although there are naturally exceptions, the superiority of greasy wool is now generally recognized. It is not only because it retains the body and character of the fibre, but because it is more readily judged for "yield" and its spinning qualities are, perhaps, more readily estimated.

The following list gives an idea of the yield in clean wool of the chief wool-producing countries. It is to be noted that roughly merino greasy wool yields about 50% clean wool and English about 75% clean wool.

A skilful shearer will clip the fleece from a sheep in one unbroken course, and the fleece is then untied and passed on to the dresser, who returns them in the 56's, 60's, 64's, 70's, 80's, 90's &c. according to their fineness. These numbers approximately indicate the worsted counts to which the wool will be spun. The shorter Australian wool is not generally considered as suitable for the finer worsted work, and is sold for the production of the cheaper goods or for counting, or stapling which all wool undergoes for the separation of the several qualities which make up the fleece. Mechanical shears have almost revolutionized the shearing industry, a good shearer shaving from 100 to 120 sheep per day. On the great Australian sheep stations wool classing is one of the most important operations, largely taking the place of sorting in the English wool trade. This is no doubt due to the wonderful success which has attended the efforts of the Australian sheep breeders to breed a sheep of uniform staple through out. Thus the fleeces as taken from the sheep are skirted and trimmed down to one table and then passed on to the classer, who bales them in the 56's, 60's, 64's, 70's, 80's, 90's &c. according to their fineness, these numbers approximately indicating the worsted counts to which it is supposed they will spin. The shorter Australian wools not coming up to European standards are classified as super-cloths, ordinary clothing, &c., being more suitable for the woollen industry.

The art of sheep shearing, sorting, classing, packing and transporting has been brought up to a wonderful state of perfection in Australia, and the "get up" of the wool is usually much superior to the "get up" of the home-clip. Of late there has been an outcry against the prevalence of vegetable matter in colonial wools, but it is not so prevalent as considered, and the quality is improving. The exercising of a little more care in sorting at the home end, this difficulty will be satisfactorily surmounted.

Sorting or stapling was formerly a distinct industry, and to some extent it is still, but the work is now done in the premises of the comber or spinner. Carding wools are separated and classed differently from combing wools, and in dealing with fleeces from different districts the classific.

**Wool classing.**

In the wool trade short-staple wool is separated into qualities, known, in descending series from the finest to the most worthless, as picklock, prime, choice, super, head, seconds, ab and breede, and the proportions in which the higher and lower qualities are present are determined by the "class" of the fleece. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright, seconds, to abb for English wool. The last three are short and not commonly used in the worsted trade. The greater proportion of good English long wool will be classified as blue, neat and brown; it is only in excess quality wool, from 5 to 8%, "fine" or "best," that the wool is liable to contain grey hairs. In these wools come "classified," and consequently are only as a rule sorted into three or four qualities. Thus a 60's fleece may be sorted into 56's, ordinary 60's, super 60's and skirtings.

**Wool sorting.**
Photomicrographs of the most representative hairs and wools used in the textile industries.

XXVIII. 868.
its allotted receptacle. Sorting is very far removed from being a mere mechanical process of selecting and separating the wool from certain parts of the fleece, because in each individual fleece qualities and proportions differ, and it is only by long time and exhaustive work that this selection can be enabled, almost as it were by instinct, rightly to divide up its lots, so as to produce even qualities of raw material. Cleanliness is most essential if the wool sorter is to keep his health and not succumb to the dread disease known as "antrax" or "burr". Quality of the former type is determined by the following:

- Certain wools such as Persian, Van Mohair, &c., are known to be very liable to carry the anthrax bacilli, and must be sorted under the conditions imposed by government for "dangerous" wools. Wool which is non-dangerous wools are perfectly harmless from this point of view.

The washing which a fleece may have received on the live sheep is not sufficient for the ordinary purposes of the manufacturer. On the careful and complete cleansing which for scouring should be soft and pure, both to save soap and still more because the soluble lime soap formed in dissolving soap in hard water is deposed on the wool fibres and becomes so fixed that its removal is a matter of extreme difficulty. In former times stale urine was a favourite medium in which to wash the wool dried in the open air; and there is now a thing of the past, and a specially prepared potash solution is the detergent usually relied on. Excess of alkali has to be guarded against, since uncombined caustic acts energetically and especially on the wool-fibre—especially in the presence of heat—and is indeed a solvent of it. A small quantity of a strong solution leaves the wool harsh and brittle, and the same objection arises when the soap solution is applied too hot.

In former days, when the method of hand-scouring prevailed, the wool to be washed was placed with hot soapsuds in a large scouring bowl, and the men with long poles kept stirring it gently about till the soap was worked in, and the dirt and dirtiness separated the dirt and discharged the greasy mud around the base of the bowl.

Many firms now steep the wool previous to the true scouring operation, the object being to scour the wool with its own potash salts, to obtain wash-waters savouring of the soap employed, and to remove the potash salts that these salts, &c., may be readily extracted and put to some good use, and lastly to save the artificial scouring agent employed in the true scouring operation. The scouring of wool has passed through many vicissitudes during the past fifty years, but to-day the principle upon which all scouring machines are based is that wool naturally opens out in water. The mechanical arrangements of the machines are such as to ensure the passage of the wool without undue lifting and "stringing" or "mingling", the aim of vegetable actions, &c., once taken out of the wool with that wool again, to give time for the thorough action of the scouring agents, so that neither too strong a solution nor too great a heat be employed. The following are the general cleansing of the machines so that there is no unnecessary waste of time. In England the recognized type of merino wool-washing machine is the fork-frame bowl. Three to five of these machines are employed. The "fork" is strongest in the first bowl (unless this is used as a "stepper") as the wool at first is protected from the caustic by the wool-fat, &c., present. The last bowl is so situated that with modern "nip rollers" botany wool is sufficiently dry to be passed on directly to the carding. This the worsted spinner does, thereby saving time and money. The woolen spinner, however, may require the wool for blending, and so may require some further oiling. He, therefore, will employ one or other of the drying processes to be immediately described. For English and cross-bred wools more agitation in the scouring bath may be desirable. If so, the eccentric fork action machine is employed, in which the agitation of the bath is satisfactorily controlled by the setting of the forks which propel the wool forward. An average wool will be in the scouring liquor about eight minutes, the temperature will vary from 120° F. to 110° F., and the length of bath through which it will have passed will be from 48 to 60 ft.

It is interesting to note how the "emulsion" method of wool scouring as described above is practically universal in England. In the United States of America the "solvent" method is largely in use, for the two points aimed at are quantity of production and cleanliness. Quality of the former type is determined by the following:

- Certain wools such as Persian, Van Mohair, &c., are known to be very liable to carry the anthrax bacilli, and must be sorted under the conditions imposed by government for "dangerous" wools. Wool which is non-dangerous wools are perfectly harmless from this point of view.

The more gently and uniformly the drying can be effected the better is the result attained; over-drying of wool has to be specially guarded against. By some manufacturers the wool from the wool-washing rollers or bowls is exposed to air naturally, which drives out so much of the moisture that the further drying is easily effected. The commonest way, however, of drying is to spread the wool uniformly as possible over a framework of wire netting, under or over which is a range of steam-heated pipes. A fan blast blows air over these hot pipes, and the heated air passes up and is forced upwards through the layer of wool which rests on the lower end of the wire netting. The wool may be kept either in continuous motion or stationary. The wool is spread with great evenness, it is unequally dried, and at points where the hot air escapes freely it may be much over-dried. A more rapid and uniform result may be obtained by the use of the oil-burning rollers. The oil is introduced into the machine by drums, the floors of which have alternate fixed and movable bars. Under the chamber is a tubular heating apparatus, and a fan by which the hot air is blown up the side of the chamber, and through all the shelves or compartments, either following or opposing the wool in its passage through the machine. The wool is introduced by a continuous feed at one side of the chamber or apparatus, and the warm air is blown over the wool as a chaff, turns through, and owing to the rotation of the cylinders, the wool is carried forward, and the wool is dry and uniformly also in the air. Another drying machine in extensive use is what is known as the "Jumbo Dryer." This consists of a large cylinder with a fluted inner cylinder which turns over the wool—as a churn turns butter—and owing to the rotation of the cylinders, the wool is carried forward, and the wool is dry and uniformly also in the air. A hot air blast follows the wool through the machine. In this and in all drying machines it is more important to get the moisture laden air away from the wool than to develop a great heat.

The dried wool may be in a partially matted condition. If so, it must be opened out and the whole material brought into a uniformly free and loose condition. This is effected in the Willey, or "scouring" machine, with which this description concludes.

Teasing. Two methods of effecting this—one chemical, the other mechanical—may be pursued. The chemical treatment consists in steeping the wool in a dilute solution of sulphuric acid (or other carbonizing agent) leaving off the dyeing vat, &c., in which it was immersed, and then heat-drying in a temperature of about 250° F. The acid leaves the wool practically uninjured, but is concentrated on the more absorbent vegetable matter, and the hot gases cause it to act so that the vegetable matter becomes completely carbonized. The bums are then brushed and the wool washed in water rendered sufficiently alkaline to neutralize any free acid which may remain, and then dried by the usual process. The chemical carbonizing is a process which leaves the wool less hurtful to the attendant workmen than is the sulphuric acid. The "burning" of this apparatus is a large drum or shaft armed with fine short spikes curved slightly in the direction in which it rotates. By a series of beaters and circular brushes the wool is carried to and fed on to the short spikes, and in its rotation the burrs, owing to their weight, hang out from the swift. The swift as it travels round is met by a
series of three burning rollers rotating in an opposite direction, the producing a higher grade of yarn than can be obtained by the process. The burning rollers rotate at different speeds, and the yarn is finally passed through a series of rolls which smooth and remove any remaining fibers. The resulting yarn is then wound on bobbins or placed on a spool for further processing or use.

The processes described are used in the production of worsted yarn, which is characterized by its smoothness and uniformity. This type of yarn is produced from the fibers of sheep that are used in the highest quality clothing and fabric production.

Wool is a natural, renewable resource that has been used for thousands of years. It is harvested from sheep and other animals and is processed to create a variety of materials, including yarn, fabric, and insulation. The processing of wool involves several steps, including washing, spinning, and weaving, and the different types of wool can be distinguished based on their properties and uses.
Wool, Worsted and Woollen Manufactures

casting of wool into the slowly retracting teeth of the doffer H, which carries it forward until angle stripper C strips the doffer, to be in its turn stripped by swift D and so on. The speeds of the cylinders are in the first place obviously dependent upon the principle of carriage, and adapted to the greater speed always stripping (end of the fancy). As to whether the speed shall be obtained by actual revolutions or by a larger diameter of cylinder depends upon the nature of the wool to be carded (long or short), the part which this cylinder has to play in the card, and upon the question of wear of clothing and power consumed. As a rule the strippers are all driven from a smaller circumference of the swift to obtain conveniently the necessary reduction in speed, and the slowly retracting workers are chain driven from the doffer, which indirectly receives its motion from the swift. The principles involved in the relative inclinations of teeth are very apparent, but the principles involved in the relative densities of teeth on the respective cylinders are again much involved and little understood.

A complete scribbler or first card engine consists of a breast, or small swift, and two swifts with the accompanying workers, strippers, fancies, doffers, &c. The wool is stripped from this card as a thin film by means of the dosing comb. This is usually weighed on to the next machine—whether intermediate or condenser—a given weight giving a definite count of condensed sliver. Should an intermediate be employed, there must be an automatic feed, taking the wool, as stripped from the last doffer of the intermediate, and feeding it perfectly evenly on to the feed sheet of the condenser. The condenser is usually a one-swifted card, the only difference in principle being that, whereas the sliver comes out of the scribbler or intermediate in one band film, it is broken up into a number of small condensing roller engines, by which it will ultimately be drafted or drawn out and twisted into a more or less perfect thread. These condensers—which are delicate and pith-like in substance—are wound on to light bobbins, and these bobbins are placed on the mule fast for driving and winding. There are many forms of condensing mechanisms such as the single-doffer, the double-doffer and the tape-condensers, but their construction is too complex to be described here. Whatever the type may be, the result is that noted above, but it should be noted that the tape enables a much finer sliver to be taken from the card than is possible with either the single- or double-doffer condenser.

The principles involved in mule spinning are comparatively simple, but the necessary machinery is very complex; indeed it is questionable if a more ingenious machine than the mule exists.

**Mule spinning.**

The pith-like slivers received from the card-loom must be attenuated until the correct count of yarn is obtained; they must be twisted while this attenuation or drafting is in process, otherwise they would at once break; and after being attenuated to the required fineness the requisite number of turns must be inserted. Great stress must be laid on the effects of what is termed the "Drafting-twist" noted above; it is probably this simultaneous drafting and twisting which develops the most pronounced characteristics of the woollen yarn and cloth, and differentiates it entirely from the

strengthens them and thus from beginning to end equalizes the thread. Upon the completion of drafting the slivers are thrown on to "double speed" to complete the twisting of the 72" of yarn just spun as rapidly as possible, the carriage being allowed to run-inwards for a few inches, to allow for the take-up due to twisting. The mule now stops dead, backs-off the turns of yarn from the bottom of the spindle to the top, the faller II wire falls into position to guide the thread on to the spool; to form the required cop G, and the counter-faller I wire rises to maintain a nice tension on the yarn. The carriage now runs in, the slivers being revolved to wind up the yarn, and, in conjunction with the guiding on of the faller wire, builds up a firm cord or rope as the case may be.

Woollen mules are made with several hundred spindles and of varying pitch to suit particular requirements. Thus if the mules are to follow a set of say three carders with a tape condenser, and are required to spin fine counts, the pitch of the spindles may be much finer than ordinary, but a greater number will be required to work up the sliver delivered by the set of machines. There are many other details that require careful consideration; the inclination of the spindles, for example, must be suited to the material to be spun. And when all the mechanical arrangements are perfect there is still the necessity of correct judgment as to the qualities of the blend in hand, for in this case perhaps more than in any other the machine must be adjusted to the material and not the material to the machine.

**Fig. 10.—Plan and Section of a Preparing Box (Sheeter).**

A is the back-shaft receiving its motion from the driving shaft upon which are the pulleys. This back-shaft A drives the back-rollers B at a slow speed by the reducing train of wheels C; also the front rollers D at a much quicker speed through the train of wheels E and the fallers F at an intermediary speed by means of the levels and screws G, G. The wool is "made up" on the feed sheet and on emerging from the front rollers is built up layer by layer into the lap H, which is finally broken across and feeds up at the next machine.

The yarn as delivered by the mule is "single" and will serve as warp or weft for the great bulk of woollen cloths, warp being as a rule twisted harder than weft. Sometimes for strength, sometimes for colour, however, it will be necessary to twist two or more of these single strands together. This is best effected on a twisting frame of the ring type, which consists of delivery rollers, to deliver a specified length of yarn in relationship to the turns of the spindles, and the spindles, which serve to put in twist and to wind the yarn upon the bobbin or tube, which they carry by reason of the retarding action of the traveller. Fancy twists such as knops, loops, slubs, &c., may also be produced if the frame is fitted up with two pairs of delivery rollers and two or three special but simple appliances.

The essential feature of a worsted yarn is straightness of fibre. Prior to the introduction of automatic machinery there was little difficulty in attaining this characteristic, as long wool was invariably employed and the sliver was made up by hand and then twisted. With the introduction of Arkwright's water frame or "throttle" the necessity for prepared slivers became apparent, and with the later introduction of cap and mule spinning the necessity for perfectly prepared slivers has been so accentuated that the preparatory machinery has quite
WOOL, WORSTED AND WOOLLEN MANUFACTURES

exceeded the actual spinning machine in extent and complexity. To-day there are three distinct methods of producing worsted yarn. scour the slivers again, this being effected in what is termed a back-washing machine. This machine as shown in fig. 11 usually consists

![Fig. 11.—Sectional View of Back-washer.]

A are the delivering rollers, B, B are the immersing rollers in the first tank, C, C are the press rollers to squeeze out superfluous liquors, D is the immersing roller in the second tank, and C', C' are the press rollers for the second tank. Drying cylinders E to E'' may be arranged as "live-heat" cylinders, as secondary heated cylinders or as air drying cylinders. The roller F directs the slivers into the back rollers G of the gill-box, which in turn delivers the slivers to the fallers H, which in turn delivers the wool to the front rollers I.

Firstly, there is the preparing and spinning of the true worsted of two scouring tanks with immersing rollers; drying cylinders, a thread, this being made from long English and colonial wool. In gill-box and oiling motion. The slivers on emerging from this machine this class should also be included mohair and alpaca. Secondly, there is the preparing and spinning of what are known as cross-bred and botany yarns, these being made from cross-bred and botany wool. Thirdly, there is the preparing and spinning of short botany wools on the French system. There is a fourth class of worsted yarns, principally carpet and knitting yarns, which are treated in a much readier manner than any of the foregoing, but as the treatment is analogous—with the elimination of certain processes—to the second of the foregoing, it is not necessary to refer specially to it.

To obtain a sliver or "roving" which can be satisfactorily spun into a typical worsted thread the following operations are necessary:—preparing (five or six operations), back-washing, straightening, combing, straightening and drawing (also six operations), and finally spinning on the flyer frame.

After long wool has been scoured and dried it is necessarily considerably entangled, and if it were to be combed straight away a large proportion of the long fibres would be broken and combed out as "noil" or short fibre. To obviate this the wool is fed as straight as possible into a sheeter gill-box; after this it passes through other two sheeter gill-boxes, then through a can gill-box. As in fig. 2. the main features of a preparing or gill-box are the following: the feed sheet upon which the wool is "made up," the back rollers B which take hold of the wool and deliver it to the fallers F which, working away from the back rollers more quickly than the wool is delivered, comb it out. The fallers in turn deliver the wool to the front rollers D, which, taking in the wool more quickly than the fallers delivering it, again draft and comb it, but with a reversing of the former combing operation. The wool emerges from the front rollers as thin attenuated continuous fibre about 12 in. wide, which is wound upon an endless leather sheet H from which the box takes its name. When a sliver of sufficient thickness has been wound upon the sheet, it is broken across and fed up at the next gill-box. The fourth gill-box delivers into cans instead of on to a sheet. A number of cans are then placed behind the fifth box and the slivers from these fed up into the back rollers, and similarly with the sixth. The primary object of "preparing" or gillling is to straighten and parallelize the fibres in the sliver. This is effected by means of the combining or doubling and drafting to which the slivers are subjected. In addition to this, however, a level sliver suitable for combing is formed by the combined action of the drafting and doubling which has taken place at each box.

Oil will have been added to the wool at the first preparing-box to cause the fibres to work well. We referred this, there would perhaps not be the necessity for back-washing. But the slivers during their passage through the preparing-boxes become sufficed naturally, and in addition, owing to the opening out of the locks of wool, dirt which was not "got at" in the scouring now works out and further suffices the slivers. It is consequently necessary to should be clean, fairly straight and in good condition for combing. Their condition may be further improved by passing them through

![Fig. 12.—Plan and Section of the Noble Comb.]

A, A is the large comb circle and B, B' the two small comb circles. The slivers are delivered by the mechanism C to the feed boxes D, being thrown across the pins of the large and small circles at position E. A stroke at F suitably directs the fringes of fibre as the circles separate and the combed fibres are taken hold of by drawing-off rollers G and G' and combined to form the "top." The brushes H, H and the noil knives I clear the small circles of the "noil." The feed knife J in conjunction with the inclined planes at K are instrumental in feeding a previously directed length of sliver over the two circles as they practically touch one another at the point E, and so the process is continued.
Wool, Worsted and Woollen Manufactures

one or two more gill-boxes, prior to combing, to ensure straightness
of fibre and even distribution of the lubricant.

Prior to the mechanical era wool was combed immediately after
scouring; there was no preparatory process. As a matter of fact
Combing, the first combing process took the place of the processes
just described and was termed "straightening," the
"combing proper" following. Prior to the invention of a really
satisfactory mechanical comb, between 1850 and 1860, the combing
operation was the limitation of the worsted trade. English wools
could be satisfactorily combed by hand, and perhaps the results of
combing by hand were better, but there was no method by which a
quality of result was concerned, but the cost was largely prohibitive.
The history of the colonial wool trade is inextricably bound up with
the combing industry. How eventually botany wools were combed
by machines and how the wool industry was thereby revolutionized
can only be briefly referred to here. About 1779 Dr Edmund Cart-
wright invented two distinct types of combs, the vertical and the
horizontal circular. The former type was developed on the contin-
ent by Hellmann and others, and has only within the last five years
taken its rightful place as a successful short wool comb in this
country. The latter type was worked upon by Donisthorpe, Noble,
Lister, the Holdens and others, and largely through the "driving
force" of Lister (later Lord Masham) was made a truly practical
success about the year 1850. Latter-day combs of this type may
be readily grouped under three heads. The Lister or "nip" comb
is specially suitable for long wools and mohair and alpaca.
The Holden or square-motion comb is specially suited for short and
very good quality wools. The last type, the Noble, is the most popular
of all and, by a change of large and small circles, may be adapted to the
combing of long, medium or short wools. As the great bulk of cross-
bred and a considerable proportion of botany wool is combed upon
the Noble comb a brief description is here called for. The object of
all wool combing is to straighten the long fibres and to comb out from
the slivers treated all the fibres under a certain length, leaving the
long fibres or "top" to form the sliver which is eventually spun into
the worsted yarn. The Noble comb, which so effectually accompl-
ishes this, consists in the main of a large revolving circle A inside
which revolves two smaller circles B, B' as shown in fig. 12, each of
which touches the larger comb circle at one point only. At this
point the slivers of wool to be carded are firmly dabbed into the pins
of both the large and small circles. As the circles continue to revolve

FIG. 14.—Two-Spindle Drawing-Box.

revolving funnel into a can. The short fibres, or "noil," are lifted
out of the pins of the small circle by "noil knives." The continuous
slivers, the ends of which remain in the pins of the large circle after
the drawing-off rollers have been passed, are now lifted up until
these ends are above the pins, at the same time an additional length
of sliver being drawn into the comb, so that, as they reach the second
small circle, they are ready to be again dabbed into the pins of both
circles and the combing operation repeated. Thus the combing on a
Noble comb is absolutely continuous. All the movements of this
machine—with the exception of the dabbing-brush motion—are
circular, so that mechanically it is an almost perfect machine.
As illustrating the extent of the combing industry, it is interesting
to note that even the making of dabbing-brushes is a separate and by
no means unimportant trade.

After combing it is usual to pass the "top" through two gill-boxes
termed "finishers." The last of these boxes, and often the first,
delivers the "top" in the form of a ball, thus it is often spoken of as
a "balling gill-box." This stage marks one of the greatest divisions
of the worsted trade, the combing taking the wool up to this point, but
now handing it forward in the shape of top to the "worsted spinner,
who draws and spins the slivers into the most desirable worsted yarns.

English tops are usually prepared for spinning by seven or eight
operations. Three of these operations are effected in gill-boxes of a
somewhat similar type to the preparing-box, only lighter
in build. The remaining four are drawing-boxes, i.e. as
shown in figs. 13 and 14, they consist of back and front rollers with
small carrying-rollers—not gills—to support the wool in between.
Thus an English set of drawing usually consists of a single-can gill-
box, a double-can gill-box, a two-spindle gill-box, a four-spindle
drawing-box, a four-spindle weigh-box, a six-spindle drawing-box,
two six-spindle finishers and three thirty-spindle rovers. About
fifteen flyer frames of 160 spindles each will be required to follow this
process, although the balance varies partly in accordance with the counts
spun to, in this case 1/24's English being the standard.

The object of drawing is to obtain firstly a level sliver from which
an even thread may be spun, and secondly to reduce the compara-
tively thick top down to a relatively thin roving from which the
required count of yarn may be spun. Of course parallelism of fibres
must be retained throughout, so far as possible. To accomplish
these objects doubling and drafting is resorted to. Thus the ends
put up at the back of the above boxes will be 6, 6, 4, 4, 3, 3, 2
respectively, while the drafts may be 5, 6, 8, 8, 6, 9, 9 approximately.
As the drafts markedly preponderate over the doubleds, so in exactly this proportion will the sliver be reduced in thickness.

The flyer spinning frame is very similar to the drawing frame, consisting of back rollers, carriers and front rollers, with the necessary spindle and flyer to put twist into the yarn and to wind it upon the bobbin. From the two-spindle gill-box to the spinning frame the spindle, bobbin and flyer combination is employed with the object just mentioned. From fig. 13 the action of this combination will be clearly understood. Drafting takes place as usual between the back and front rollers, the carriers controlling the yarn between the two. On emerging from the front rollers the yarn usually passes through an eyelet, to centre it over the centre of the spindle; it then takes a turn or two round the flyer leg, through the twistle or eyelet on the flyer and on to the bobbin F. The flyer may be freely rotated by means of the whirl J and through the spindle G upon the top of which it is screwed. The bobbin fits loosely over the spindle and rests upon the lifter plate I; this latter, being controlled by the flyer mechanism, slowly raises and lowers the bobbin during the "spin" past the fixed plane of delivery of the yarn, i.e. the eyelet of the revolving flyer. Now, if for one moment it be considered that the bobbin may not revolve on the spindle but may be the operation of carding. On first thought it might be imagined that carding would result in broken fibres and a poor yield of top. That this is not so is evident from the fact that there is a tendency to card wools from 7 to 10 in. long, this tendency being due to the relative cheapness of carding as compared with preparing. If long wools were fed directly on to a swift, no doubt serious breakage of fibre would occur, but it is customary to place before the first swift of a worsted card a series of four opening rollers and dividers—with their accompanying "burring rollers"—to open out the wool gradually, so that when it eventually reaches the first swift it is so opened out that further opening out instead of breakage occurs. Some carders use a breast or small swift in place of those opening rollers—mostly on account of economy. The swift is usually surmounted with four workers and strippers and is very similar to the woollen carder, save that the workers and doffer are larger, thereby effecting more of a combing action and working economically by reason of the greater wearing surface brought into play. As botany wool is usually brought directly from the wash bowl to the feed sheet of the card, it is usual to clothe the first cylinders with galvanized wire clothing.

After the carding the wool is back-washed and gilled—on similar lines to English wool—and then is ready for combing. The largest combers of botany wools, Messrs. Isaac Holden & Co., employ the square-motion comb, in fact this comb is known in the trade as the Holden comb. Other combers, however, almost without exception employ the Noble comb with a fine "set over," i.e. fine spinning of the comb circles. After combing, the tops are "finished" by being passed through two finisher-boxes, the last of which "balls" the tops ready for marketing.

Short wools are drawn and spun on very similar lines to the longer wools, save that the boxes are more in number and are in some cases lighter in build. The boxes usually employed in a botany set are as follows: two double-head can gill-boxes, two two-spindle gill-boxes, a four-spindle drawing-box, a sixspindle weigh-box, an eight-spindle drawing-box, two eightspindle finishing-boxes, two twenty-four-spindle second finishers, three thirty-two-spindle dandy reducers, ten thirty-two-spindle dandy rovers, with ten two-hundred-spindle cap spinners to follow. The doublings as a rule are about 7, 6, 6, 5, 5, 4, 4, 2 and the drafts 5, 6, 6, 7, 7, 8, 8 at the respective boxes, an endeavour as a rule being made to obtain a roving of which 40 yds. = 1 dram, as this is the most convenient size for being spun into fine botany count of yarn.

Following the lead of the cotton trade endeavours have been made in the wool industry to improve the quality and efficiency of the spinning processes.
Wool, Worsted and Woollen Manufactures

The characteristic feature of wool and of wool yarns and cloths is the quality of "felting." This quality has always been made use of in woolen cloths, but, in worsted cloths, until comparatively recently, it has been largely ignored. To-day, however, cloths are made, ranging from the truest woollen to the typical worsted, of which it would be impossible to find the type of yarn employed without very careful analysis. As it is obviously impossible to give here every variety of finish

![Fig. 18.—Section of French Drawing-Box.](image)

A, A', delivery rollers which control the slivers during the drafting operation. B is the porcupine (or circular Gill) and C are the front drafting rollers. D is the funnel through which the slivers pass to the consolidating rubbers E, E, F is a second funnel and G is the condensed sliver wound up at a uniform rate on the roller H. Employed, the two typical styles for woollen and worsted cloths are dealt with in detail, and further to elucidate the matter the finishing of a Bradford "stuff" or "fust" piece is also given in outline.

The fabric on leaving the loom is first mended and then scoured. The operation of scouring is effected in a "dolly," and must thoroughly clear the yarn of all refuse before the desired finish. The piece is now soaped and "milled," i.e. felted. Milling may be effected either in the stocks or in the milling machine. The stocks, the main features of which are huge hammers which are caused to fall or are driven positively into the cloth, exert a bursting action eliminating the thread structure. The milling machine acts more by compression, arrangements being made to compress the cloth in length or breadth at will. After milling scouring follows to clear the cloth thoroughly of the milling agents previous to the finishing proper. The cloth is now taken in a damp state to the tentering machine and, being hooked upon a frame running into a heated chamber, is stretched in width and dried in this condition. Raising follows, this being effected by subjecting the surface of the fabric to the action of "teazles" fixed on a large revolving cylinder, the whole machine being termed a "gig." After raising the fabric is "cropped" by being passed over a blade near which revolving knives work; on the principle of a lawn-mower, shearing away the top level of the piece. Sometimes fabrics are raised wet, especially if a velvet finish is required. Brushing follows to clear the piece of all stray fibres. The fabric is now ready for "crabbing," which consists in winding it tightly on to a perforated roller through which steam may be blown or upon which the piece may be boiled. The pieces are then rewound and the operation repeated at least once, to obtain even distribution of finish. Being now ready for pressing, the fabric is cutted, usually with press papers between each cuttle, and placed in the hydraulic...
WOOL, WORSTED AND WOOLLEN MANUFACTURES

press either hot or cold. After pressing dry steaming is frequently necessary to take away cakeiness and a certain false lustre which sometimes develops. Final cutting completes the finishing operations.

Worsted cloth finishing is very similar to woolen cloth finishing save that some operations are less severe, condensing, singeing, milling and tentering are similar. The raising as a rule is effected by brushing, although it is by no means uncommon for finishing to be done by the croppings. Croppings and singeing are the same for both woolen and worsted cloths.

Of course the real difference between the woolen and the worsted cloth is due to the selection of the right material, to correct roving, spinning, and finishing, and in many respects the finishing similes as a "developer" in the case of the woollen fabric, while in the case of the typical worsted fabric it simply serves as a "cleaner," the cloth really being produced during the actual spinning process. A woolen cloth as it leaves the loom is unsightly and in a sense may be said to be made in the finishing, although it is truer to say "developed" in the finishing: in the case of the worsted cloth it is altogether otherwise.

A cotton warp, lustre weft style, is treated altogether differently from either of the foregoing. It is first cradled, then steamed, then scoured and dried, then singed by being passed over a red-hot copper plate or through gas jets, then scoured again, and if necessary dyed. It is then washed, dried, then tentered and finally pressed. Of course these operations are applied with discrimination to the varied styles of goods made in the Bradford district. Thus in connection, finishing, the finishing of an "Italian" may be considerably varied from the foregoing, being more complex, while other styles, such as plain all-wool goods, are treated very simply.

It will be gathered from the foregoing remarks that the varieties of woolen and worsted cloths are many and very different in character. This is perhaps realized best by contrasting a heavy melton cloth weighing 24-30 oz. per yard with a fine mohair texture weighing 2-3 oz. per yard. None the less the remarkable diversity in the treatment of the different materials can be readily seen.

A rough Harris tweed, for example, contrasts strangely with a smooth fine wool Italian. Of course these differences are not created in any one process or merely by the selection of the raw material or yarn. Every process of manufacture must be directed to attain the desired end, and it is well to realize that huge businesses have been built up upon what, by the outsider, would only be regarded as unimportant details.

The principal styles of woolen cloth are tweeds, meltons, Venetians, beavers, doesskins, buckskins, cassimeres and diagonals. The largest class of worsted cloth is as varied as any extensive coatings and trowsers and to the cheap styles made of the re-manufactured materials. Tweeds for ladies' wear also form a large class.

The principal styles of worsted cloths are coatings and trowsersings, delaines, voiles, merinones, merinoes, lastings, crape-de-chines, amazons, Orleans, lustres of various types (plain and figured), alpacas, Italians, moreens, &c., &c. Many of these are made entirely of worsted yarns, but others are compounded so far as material or yarn is concerned. An extension of the term upon which the warp is made, and the worsted a woollen weft. Lustres are made from fine hard spun cotton warp and English or mohair weft, and so on. Perhaps the most important point to note is the skill developed by Englishto foreign designers during recent years. Fifty years ago the continental designer ruled the market. To-day the English designer can at least claim an equality with and in some respects is already considered as superior to the rival.

Prior to the development of native ingenuity and skill England was remarkable as a wool-growing country, most of the wool being shipped to the continent, so that it may be said that the wool of England met the skill of southern Europe in Flanders, which thus became the great textile centre so far as wool was concerned. With the extension of the process of re-manufacturing and the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that all manner of goods would be manufactured on the Continent and export the woolen cloth. With the remarkable colonial developments of the 17th, 18th and 19th centuries, in conjunction with the invention of the spinning frame and power-loom, this expectation was more than realized. As a class of commerce worsted fabrics were concerned. Latterly, however, with the development of skill in newly developed countries, the tendency has been to partially reverse this condition. To-day England's chief cloth was wool, in 1875 the yarn trade had markedly developed. In 1900 the top trade was well established, and to-day Bradford has a large wool export trade. Fabrics are made for the home and general export trade; yarns are exported mostly to the continent; and wool mainly to the United States of America.

The following tables give a useful idea of (a) the sources of supply of the raw material, wool, also of the changes which have taken place in the trade since 1890; (b) the changes which have taken place in the monetary value of the chief sorts of wool during recent years; (c) the number of factories and of persons employed in the textile industries during the past half century; (d) the amount of export trade in woolens and worsteds of the United Kingdom during the past century. For further details see Hooper's admirable tables now issued by the Bradford Chamber of Commerce.

Prior to the actual manufacture of the goods, the most remarkable development in textile appliances at the end of the 18th and beginning of the 19th centuries, the textile industries were scattered all over the country, in only a few cases more less concentrated. Toward the end of the century it may be said that the wool industry is centralized where the coal supply of south Yorkshire meets the wool supply of north Yorkshire, i.e., in the Bradford and Leeds districts, though much of the wool dealt in which this district is imported and consequently can only be said to follow the trend already established. Of course there are wool manufacturing districts other than those mentioned. Scotland is noted for its Scotch tweeds manufactured in the Hawick and Galashiels district, the West of England still makes some magnificent all-wool cloths; Norwich guards a remnant of its once flourishing worsted industry, and Leicester has developed recently as the hosier trade center. Again, firms whose existence is due to individual enterprise are still studied up and down the country, and manage to compete fairly well with the main manufacturing districts. Since about 1850, however, there can be no doubt that the English wool trade has been centring more and more round Bradford, while the remanufactured materials and the blanket trade is centred round Batley and Dewsbury. Wales retains only a fragment of its once large branch of manufacture, this being located in the Conwy and Denbigh district, with the exception of one or two individual firms elsewhere. The carpet trade is centred in Halifax, Kidderminster and Glasgow. Whether further development of the industry is due to any one cause or combination of causes is undoubtedltys favours Bradford, as there the wool, top, yarn and fabric branches of the industry are individually developed to great advantage; but the development of means of communication and of some such factor as the electric power may rate more highly in the present balance of the industry. (A. F. B.)

WOOLLETT, WILLIAM (1735-1785), English engraver, was born at Maidstone, of a family which came originally from Holland, on the 15th of August 1735. He was apprenticed to John Tinney, an engraver in Fleet Street, London, and studied in the St Martin’s Lane academy. His first important plate was from the “Niobe” of Richard Wilson, published by Boydell in 1761, which was followed in 1763 by a companion engraving from the “Phaethon” of the same painter. After West he engraved his fine plate of the “Battle of La Hogue” (1781), and the “Death of General Wolfe” (1776), which is usually considered Woollett’s masterpiece. In 1775 he was appointed engraver-inordinary to George III.; and he was a member of the Incorporated Society of Artists, of which for several years he acted as secretary. He died in London on the 23rd of May 1785.

In his plates, which unite work with the etching-needle, the dry-point and the graver, Woollett shows the greatest richness and variety of execution. In his landscapes the rendering of water is particularly excellent. In his portraits and historical subjects the rendering of flesh is characterized by great softness and delicacy. His works rank among the great productions of the English school of engraving. Louis Fagan, in his Catalogue Raisonné of the Engraved Works of William Woollett (1853), has enumerated 123 plates by this engraver.

WOOLMAN, JOHN (1720-1772), American Quaker preacher, was born in Northampton, Burlington county, New Jersey, in August 1720. When he was twenty-one he went to Mount Holly, where he was a clerk in a store, opened a school for poor children and became a tailor. After 1743 he spent most of his time as an itinerant preacher, visiting meetings of the Friends in various parts of the colonies. In 1772 he sailed for London to visit Friends in the north of England, especially Yorkshire, and died in York of smallpox on the 7th of October. He spoke and wrote against slavery, refused to draw up bills transferring slaves, induced many of the Friends to set their negroes free, and in 1760 at Newport, Rhode Island, memorialized the Legislature to forbid the slave trade. In 1773 at Wehahoesing (now Wyalusing), on the Susquehanna, he preached to the Indians; and he always urged the whites to pay the Indians for their lands and to forbid the sale of liquor to them.

Woolman wrote Some Considerations on the Keeping of Negroes (1754; part ii., 1762); Considerations on Pure Wisdom and Human Policy, on Labor, on Schools, and on the Right Use of the Lord’s Outward Gifts (1768); Considerations on the True Harmony of Mankind, and How it is to be Maintained (1770); and A Word of Remembrance and Caution to the Rich (1793); and the most important of his writings, The Journal of John Woolman’s Life and Travels in the Service of the Gospel (1776), which was begun in his thirty-sixth year and was continued until the year of his death. The best-known edition is that prepared, with an introduction, by John G. Whittier in 1871. The Works of John Woolman appeared in two parts at Philadelphia, in 1774-1775, and have been often republished; a German version was printed in 1852.

WOOLNER, THOMAS (1825-1892), British sculptor and poet, was born at Hadleigh, Suffolk, on the 17th of December 1825. When a boy he showed talent for modelling, and when barely thirteen years old was taken as an assistant into the studio of William Behnes, and trained during four years. In December 1842 Woolner was admitted a student in the Royal Academy, and in 1843 exhibited his “Eleanor sucking Poison from the Wound of Prince Edward.” In 1844, among the competitive works for decorating the Houses of Parliament was his life-size group of “The Death of Boadicea.” In 1846 he had at the Royal Academy a graceful bas-relief of Shelley’s “Alastor.” Then came (1847) “Feeding the Hungry,” a bas-relief, at the Academy; and at the British Institution a brilliant statuette
of "Puck" perched upon a toadstool and with his toe rousing a frog; "Eros and Euphrosyne" and "The Rainbow" were seen at the Academy in 1848.

Woolner became, in the autumn of 1828, one of the seven Pre-Raphaelite Brethren, and took a leading part in The Germ (1850), the opening poem in which, called "My Beautiful Lady," was written by him. He had already modelled and exhibited portraits of Carlyle, Tennyson and Browning. Unable to make his way in art as he wished, Woolner in 1852 tried his luck as a gold-digger in Australia. Failing in this, he returned to England in 1857, where during his absence his reputation had been increased by a number of "Lectures on the Love of Art" as a damsel lost in a daydream. Then came his second portraits of Carlyle, Tennyson and Browning, the figures of Moses, David, St John the Baptist, and St Paul for the pulpit of Llandaff cathedral, the medallion portrait of Wordsworth in Grasmere church, the likeness of Sir Thomas Fairbairn, Rajah Brooke of Sarawak, Mrs Tennyson, Sir W. Hooker and Sir F. Palgrave. The fine statue of Bacon in the New Museum at Oxford was succeeded by full-size statues of Prince Albert for Oxford, Macaulay for Cambridge, William III. for the Houses of Parliament, London, and Sir Bartle Freere for Bombay; busts of Tennyson, Fitzwilliam, Corbin, Cambridge, Dr John Wesley, and Harriet; statues of Lord Lawrence for Calcutta, Queen Victoria for Birmingham, Field for the Law Courts, London, Palmerston for Palace Yard, the noble colossal standing figure of Captain Cook that overlooks the harbour of Sydney, New South Wales, which is Woolner's masterpiece in that class; the recumbent effigy of Lord F. Cavendish (murdered in Dublin) in Cartmel church, the seated Lord Chief Justice Whiteside for the Four Courts, Dublin, and John Stuart Mill for the Thames Embankment, London; Landseer, and Bishop Jackson for St Paul's, Bishop Fraser for Manchester, and Sir Stamford Raffles for Singapore. Among Woolner's busts are those of Newman, Darwin, Sedgwick, Huxley, Cabden, Professor Lushington, Dickens, Kingsley, and Sir William Gull, besides the repetition, with variations, of Gladstone for the Bodleian, Oxford, and Mansion House, London, and Tennyson. The last was acquired for Adelaide, South Australia. Woolner's poetic and imaginative sculptures include "Elaine with the Shield of Lancelot," three fine panels for the pedestal of the Gladstone bust at Cambridge, the noble and original "Moses" which was commissioned in 1864 and is on the apex of the gable of the Museum of Science and Art in Manchester; and, among others, the "Tutor," sculpture in the street; "Debra," a statue (1896); "In Memoriam;" "Virlgilia sees in a vision Coriolanus routing the Volscies;" "Guinevere;" "Mercury teaching a shepherd to sing," for the Royal College of Music; "Ophelia," a bust (1878); "Godiva," and "The Water Lily."

In 1864 he married Alice Gertrude Waugh, by whom he had two sons and four daughters. He was elected an associate of the Royal Academy in 1871, and a full member in 1874. Woolner wrote and published two amended versions of "My Beautiful Lady" from The Germ, as well as "Pygmalion" (1881), "Silenus" (1884), "Tiresias" (1886), and "Poems" (1887) comprising "Nelly Dale" (1886) and "Children." Having been elected professor of sculpture in the Royal Academy, Woolner began to prepare lectures, but they were never delivered, for he resigned the office in 1879. He died suddenly on the 7th of October 1892, and was buried in the churchyard of St Mary's, Hendon.

WOOLSAK, i.e. a sack or cushion stuffed with wool, a name more particularly given to the seat of the lord chancellor in the House of Lords. It is a large square cushion of wool, without back or arms, covered with red cloth. It is stated to have been placed in the House of Lords in the reign of Edward III. to remind the peers of the importance of the wool trade of England. The earliest legislative mention, however, is in an act of Henry VIII. (c. 10 s. 8): "The lord chancellor, lord treasurer and all other officers who shall be under the degree of a baron of a parliament shall sit and be placed at the uppermost part of the sacks in the midst of the said parliament chamber, either there to sit upon one form or upon the uppermost sack." The wool sack is technically outside the precincts of the house, and the lord chancellor, wishing to speak in a debate, has to advance to his place as a peer.

WOOLSEY, THEODORE DWIGHT (1810–1889), American educationalist, was born in New York City on the 31st of October 1810. He was the son of a New York merchant, a nephew of Timothy Dwight, president of Yale, and a descendant of Jonathan Edwards. He graduated at Yale in 1820; was a tutor at Yale in 1823–1825; studied Greek at Leipzig, Berlin and Bonn in 1827–1830; became professor of Greek language and literature at Yale in 1831; and was elected president of the college and of the academy in 1838. He resigned the presidency in 1874, and died on the 1st of July 1889 in New Haven. During his administration the college grew rapidly, the scientific school and the school of fine arts were established, and the scholarly tone of the college was greatly improved. Much of his attention in his last years was devoted to the American commission for the revision of the authorized version of the New Testament, of which he was chairman (1871–1881). He prepared excellent editions of Alcestis (1838), Antigone (1853), Prometheus (1857) and Gorgias (1843). He published several articles and the writings of New England. In 1866 he was a founder, for the North American Review, for the Princeton Review and for the Century, and his Introduction to the Study of International Law, designed as an Aid in Teaching and in Historical Studies (1860) and his Divorce and Divorce Legislation (1882) went through many editions. He also wrote Political Science, or the State Theoretically and Practically Considered (1877), and Communism and Socialism, in their History and Theory (1880). His son, THEODORE SALISBURY WOOLSEY (b. 1852), became professor of international law at Yale in 1878. He was one of the founders of the Yale Review (1861), a continuation in the New Englander, and is the author of America's Foreign Policy (1893).

WOOLSTON, THOMAS (1666–1731), English deist, born at Northampton in 1666, the son of a "reputable tradesman," entered Sidney College, Cambridge, in 1685, studied theology, took orders and was made a fellow of his college. After a time, by the study of Origen, he became possessed with the notion of the importance of an allegorical interpretation of Scripture, and advocated its use in the defence of Christianity both in his sermons and in his first book, The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Received of the Greeks in Detail. The Discourses, 30,000 copies of which were said to have been sold, were six in number, the first appearing in 1727, the next five 1728–1729, with two Defences in 1729–1730. For these publications he was tried before Chief Justice Raymond in 1729 and sentenced (November 28) to pay a fine of £25 for each of the first four Discourses, with imprisonment till paid, and also to a year's imprisonment and to give security for his good behaviour during life. He failed to find this security, and remained in confinement until his death on the 21st of January 1731.
Woolwich—Woonsocket

Upwards of sixty more or less weighty pamphlets appeared in reply to his *Moderator and Discourses*. Amongst the siller and more popular of them may be mentioned Z. Pearce's *The Miracles of Jesus Vindicated* (1779); T. Sherlock's *The Tryal of the Witnesses of our Saviour's Resurrection, etc.* (1779, 3rd ed., 1775); and N. Lardner, *A Vindication of Three of our Saviour's Miracles* (1779), Lardner being one of those who did not approve of the prosecution of Woolston (see Lardner's *Life by Kippis*, in Lardner's *Works*, vol. 1.).

See *Life of Woolston prefixed to his Works in five volumes* (London, 1733); *Memoirs of Life and Writings of William Whiston* (London, 1749, pp. 231-235); Appendix to *A Vindication of the Miracles of our Saviour, etc.*, by J. Ray (2nd ed., 1755); and N. Lardner, *Unkiloc to the Eighteenth Century* (1860); Sayous, *Les Déités anglais* (1882); and the article DEISM, with its bibliography.

Woolwich, a S.E. metropolitan borough of London, England, bounded W. by Greenwich and Lewisham, and extending N., E., and S., to the boundary of the county of London. Pop. (1901) 117,178. Area, 8,776 acres. Its N. boundary is in part the river Thames, but it includes two separate small areas on the N. bank, embracing a portion of the district called N. Woolwich. The area is second to that of Wandsworth among the metropolitan boroughs, but is not wholly built over. The most populous part is that lying between Shooter's Hill Road (called “Boughton's Docks”) and the river, the elevation of 418 ft. at Shooter's Hill to the river level. To the E. lies Plumstead, with the Plumstead marshes bordering the river to the N., and in the S. of the borough is Eltham. A large working population is employed in the Royal Arsenal, which occupies a large area on the river-bank, and includes the Royal Gun Factory, Royal Carriage Department, Royal Laboratory and Building Works Department. The former Royal Dockyard was made over to the War Office in 1872 and converted into stores, wharves for the loading of troopships, &c. The Royal Artillery Barracks, facing Woolwich Common, originally erected in 1775, has been largely extended at different times, and contains for the ranges of brick building, including a church in the Italian Gothic style erected in 1863, a theatre, and a library in connexion with the officers' mess-room. Opposite the barracks is the memorial to the officers and men of the Royal Artillery who fell in the Crimean War, a bronze figure of Victory cast out of cannon captured in the Crimea. Near the barracks is the Royal Artillery Institution, with a fine museum and a lecture hall. On the W. of the barrack field is the Royal Military Repository, within the enclosure of which is the Rotunda, originally erected in St James's Park in 1716 for the storage of the sovereign's arms and shortly afterwards transferred to its present site. It contains models of the principal dockyards and fortifications of the British empire, naval models of all dates, and numerous specimens of weapons of war from the remotest times to the present day. On the Common is the Royal Military Academy, a castellated building erected from the design of Sir J. Wyattville in 1801, where cadets are trained for the artillery and engineer services. There are a number of other barracks. At the S.E. extremity of the Common is the Herbert Military Hospital. Among several military memorials, one in the Academy grounds was erected to the Prince Imperial of France, for two years a student in the Academy. Other institutions include the Woolwich polytechnic and the Brook fever hospital, Shooter's Hill. The parish church of St Mary Magdalene was rebuilt, in 1726-1729, near the site of the old one dating from before the 12th century. Woolwich Common (142 acres) is partly within this borough, but mainly in Greenwich. South of it is Eltham Common (37 acres), and in E. of the borough are Plumstead Common (103 acres) and Bostall Heath (134 acres). Behind the Royal Military Academy is a very fine forest, the Hall woods, formerly the property of the Woolwich estate, alienated by Evelyn. Near Woolwich Common there are brick and tile kilns and sand and chalk pits, and there are extensive market-gardens in the locality. The parliamentary borough of Woolwich returns one member. The borough council consists of a mayor, 6 aldermen, and 60 councillors. It was only by the London Government Act 1899 that Woolwich was brought into line with other London districts, for in 1855, as it had previously become a local government district under a local board, it was left untouched by the Metropolis Management Act. Woolwich (Wulwic) is mentioned in a grant of land by King Edward in 964 to the abbey of St Peter at Ghent. In Demosey the manor is mentioned as consisting of 63 acres of land. The Roman Watling Street crossed Shooter's Hill, and a Roman cemetery is presumed to have occupied the site of the Royal Arsenal, numerous Roman urns and fragments of Roman pottery having been dug up in the neighbourhood. Woolwich seems to have been a small fishing village until in the beginning of the 17th century it rose into prominence as a dockyard. Dockyards and naval shipyards were built at Woolwich in the reign of Henry VII., but it was with the purchase by Henry VIII. of two parcels of land in the manor of Woolwich called Boughton's Docks, that the foundation of the navalyard was laid. The present site of the Royal Arsenal was transferred to Woolwich in 1667, its building begun in 1668, and the first ship was launched in 1671. In 1674, war was declared with the Dutch; in 1664 the Dutch fleet, in 1666 the invading Dutch fleet, although in 1664 mention is made of storehouses and sheds for repairing ship carriages, in 1668 guns, carriages and stores were concentrated at Woolwich, and in 1695 the laboratory was moved hither from Greenwich. Before 1716 ordnance was manufactured in the London Ordnance Works, and to manufactory by the Board of Ordnance. In 1716 a new dockyard was made for the Royal Navy, and it was called “Kensington Dockyard.” In 1744, “Tower Place,” as the establishment at Woolwich was called until 1805, foundries were opened. In 1819 a dockyard was added to the military branch of the ordnance. It was not until 1805, however, that the collection of establishments at Woolwich became the Royal Arsenal.

Woolwich-and-Reading Beds, in geology, a series of argillaceous and sandy deposits of lower Eocene age found in the London and Hampshire basins. By the earlier geologists this formation was known as the "Plastic Clay" so called by T. Webster in 1816 after the *Argile plastique* of G. C. F. D. Cuvier and A. Bronniart. It was called the "Mottled Clay" by J. Prestwich in 1846, but in 1853 he proposed the name "Woolwich Beds". But the Woolwich beds of others were not applicable to the different local aspects of the series. Three distinct types of this formation are recognized: (1) The Reading type, a series of lenticular mottled clays and sands, here and there with pebbly beds and masses of fine sand converted into quartzite. These beds are generally unfossiliferous. They are found in the W. portions of the London Basin and in the Hampshire Basin. (2) The Woolwich type, grey clays and pale sands, often full of estuarine shells and in places with a well-marked oyster bed. At Boughton's Docks, in the shell-bed type, fossiliferous clays are found. (3) A third type consisting of light-coloured clays, sometimes sandy, but not of oyster beds occurs in the Reading Basin, in or near the Reading beds, and it rests on the Thanet beds it is an argillaceous greensand with rounded flint pebbles; where it rests on the Chalk it is more clayey and the flints are less prominent and are green-coated. Except in the Hampshire basin the Woolwich-and-Reading beds usually rest on the Thanet beds, but they are found on the Chalk near Bromley, Charlton, Hungerford, Hereford, Reading, &c. In Dorsetshire the Reading beds appear on the coast at Studland Bay and other points inland. The "Hertfordshire Pudding Stone" is a well-known rock from near the base of the formation; it is a flint pebble conglomerate in a siliceous matrix. The fossils, estuarine, freshwater and marine, are *Amphiporus, Corbicula, Impression*, etc. *Limulites*, *Viviparous lentus*, *Planorbis hemistoma*, *Melania (Melanaria) inquinata*, *Nerita globulus*, and the remains of turtles, crocodiles, *Muscovus*, *Gastornis*, and *Hesperornis* are common. The coal and pottery and occasionally firebricks have been made from the clay beds in this formation.

Woonsocket, a city of Providence county, Rhode Island, U.S.A., on both banks of the Blackstone river, about 16 m. N. by W. of Providence. Pop. (1900) 28,204; (1905, state census) 32,106 (15,734 foreign-born, including 8,939 French Canadians and 1,360 Irish); (1910) 38,125. Woonsocket is served by the New York, New Haven & Hartford railway and by an interurban electric line. Among its institutions are the Sacred Heart College and the Harris Institute Public Library, founded (1863) by Edward Harris, a local manufacturer. Woonsocket has ample
water power from the Blackstone river and its tributaries, the Mill and the Peters rivers. The value of its factory products in 1905 was $19,260,357. Worsted and woollen yarns are manufactured in Woonsocket by the French and Belgian processes. Other manufactures are cotton goods and yarns, rubber goods, clothes wringers, silks, bobbins and shuttles, and foundry products.

The first settlement in the vicinity was made apparently about 1666 by Richard Arnold, who at about that time built a saw-mill on the bank of the Blackstone river. Woonsocket was set off from Cumberland and was incorporated as a township in 1807; was enlarged by the addition of a part of Smithfield in 1871, and was chartered as a city in 1888.

WOOSTER, a city and the county-seat of Wayne county, Ohio, U.S.A., on Killbuck Creek, about 50 m. s. by W. of Cleveland. Pop. (1900) 6063 (407 foreign-born); (1910) 6156. Wooster is served by the Baltimore & Ohio and the Pennsylvania railways. It is the seat of the university of Wooster (co-educational; Presbyterian; chartered 1866 and opened in 1870), which in 1900 had 37 instructors and 1454 students. The Ohio Agricultural Experiment Station is in the city, which also has various manufactures. Wooster was laid out in 1808, was incorporated as a town in 1817, and became a city of the second class in 1860. It was named in honour of General David Wooster (1710-1777), who was killed in the War of Independence.

WOOTTON BASSETT, a market town in the N. parliamentary division of Wiltshire, 8 m. S.W. of London; it is on the Great Western railway. Pop. (1901) 2200. It is the junction of the direct railway (1903) between London and the Severn tunnel with the main line of the Great Western system. The town has large cattle markets and an agricultural trade.

Wootton Bassett (Wodoen, Woloen) was held in the reign of Edward the Confessor by one Levenod, and after the Norman Conquest was included in the fief of Miles Crispin. About a century later the manor was acquired by the Bassett family. The town received its first charter from Henry VI., and returned members to parliament from 1446-1447 until the passing of the Reform Act in 1832. In 1537 Elizabeth granted to the town a market on Tuesday and two fairs each to last two days, at the feasts of St George the Martyr and the Conception of the Virgin. In 1679 the town received a charter from Charles II., and the corporation consisted of a mayor, two aldermen and 12 capi tal burgesses, until abolished by the Municipal Corporations Act of 1886, under which the property is now vested in seven trustees, one of whom is appointed by the lord of the manor, and there are also two aldermen and four elected members. In 1856 fairs were instituted on the Tuesday before Easter and on the Wednesday before Whitsuntide, which are held on the 2nd Sunday of each month, and a large cattle market is held on the first Wednesday of every month. The manufacture of broadcloth was formerly carried on, but is now entirely decayed.

WOOSTER, EARLS AND MARQUESSES OF. Urso de Abitot, constable of Worcester castle and sheriff of Worcestershire, is erroneously said to have been created earl of Worcester in 1076. Waleran de Beaumont (1104-1160), count of Meulan in France, a partisan of King Stephen in his war with the emperor Matilda, was probably earl of Worcester from 1136 to 1145. He was deprived of his earldom, became a crusader and died a monk. From 1397 to 1403 the earldom was held by Sir Thomas Percy (c. 1343-1403), a brother of Henry Percy, 1st earl of Northumberland. Percy served with distinction in France during the reign of Edward III.; he also held an official position on the Scottish borders, and under Richard II. he was the admiral of a fleet. He deserted Richard II. in 1399, and was employed and trusted by Henry IV., but in 1403 he joined the other Percies in their revolt; he was taken prisoner at Shrewsbury, and subsequently beheaded, the earldom becoming extinct. The title of earl of Worcester was revived in 1421 in favour of Richard Beauchamp, Lord Abergavenny, but lapsed on his death in 1422.

The next earl was John Tipoft, or Tibet, a noted Yorkist leader during the wars of the Roses, who was executed in 1470 (see below). On the death of his son, Edward, in 1485 the earldom reverted to the crown.

In February 1491 the earldom was bestowed by Henry VIII. on Charles Somerset (c. 1460-1526), a bastard son of Henry Beaufort, duke of Somerset. Having married Elizabeth, daughter of William Herbert, earl of Huntingdon, he was styled Baron Herbert in right of his wife, and in 1506 he was created Baron Herbert of Raglan. He became lord-lieutenant of Glamorgan and was tenant-in-chief of the earldom of Pembroke. He was chamberlain of the household to Henry VIII. His son Henry, 2nd earl (c. 1495-1548), obtained Tintern Abbey after the dissolution of the monasteries. The title descended in direct line to Henry, the 5th earl (1577-1646), who advanced large sums of money to Charles I. at the outbreak of the Great Rebellion, and was created marquess of Worcester in 1643.

Edward Somerset, 2nd marquess of Worcester (1601-1667), is better known by the title of earl of Glamorgan, this earldom having been conferred upon him, although somewhat irregularly, by Charles I. in 1644. He became very prominent in the service and 1645 in connexion with Charles's scheme for obtaining military help from Ireland and abroad, and in 1645 he signed at Kilkenny, on behalf of Charles, a treaty with the Irish Roman Catholics; but the king was obliged by the opposition of Ormonde and the Irish loyalists to repudiate his action. Under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I., but he did not obtain this, nor was his earldom of Glamorgan restored.

In 1660 the title of earl of Somerscythe was revived in his favour, and he joined the Parliament of 1662. The title of earl of Worcester was confirmed by the Act of Settlement of 1701. He was created earl of Buckingham in 1667. He died at Oxford in January 1700.

Edward was succeeded by his son, Richard (1673-1753), who was educated at Westminster school and at Christ Church, Oxford, and afterwards entered the army. He entered Parliament in 1701. He was made a Privy Councillor in 1705, and in 1707 was created a baron, Viscount of Rookhope. He succeeded to the earldom of Somerset in 1717. He was created earl of Lindsey in 1722, and earl of Hardwicke in 1723. He was created earl of Hardwicke in 1727. He was created earl of Lindsey in 1727. He was created earl of Hardwicke in 1727.

Henry's only son Henry (1669-1700), the 3rd marquess, abandoned the Roman Catholic religion and was created a peer of Great Britain and Earl of Lindsay. He was created earl of Lindsey in 1701. He was created earl of Lindsey in 1701.

These marquesses of Worcester are represented in the following:

WORCESTER, JOHN TIPTOFF, EARL OF (1427-1470), was son of John Tipoft (1375-1443), who was Speaker of the House of Commons in 1406, much employed in diplomacy by Henry V., a member of the council during the minority of Henry VI., and created Baron Tipoft in 1426. The younger Tipoft was educated at Oxford, where John Rous says that he was one of his fellow-students; he is stated to have been a member of Balliol College. He married Cicely, daughter of Richard Neville, earl of Salisbury, and widow of Henry Beauchamp (d. 1443), duke of Warwick. In 1440 he was created earl of Warwick. His wife died in 1450, but he continued the association with the Yorkist party. During York's protectorate he was treasurer of the exchequer, and in 1456-1457 deputy of Ireland. In 1457 and again in 1459 he was sent on embassies to the pope. He was abroad three years, during which he made a pilgrimage to Jerusalem; the rest of the time he spent in Italy, at Padua, where he studied law and Latin; at Ferrara, where he made the acquaintance of Guarino of Verona; and at Florence, where he heard the lectures of John Argyropoulos, the teacher of Greek. He returned to England early in the reign of Edward IV., and on the 7th of February 1462 was made constable of England. In this office he had at once to try the earl of Oxford, and judged him by "lawe padoue" (sc. of Padua; Warkworth, 5). In 1463 he commanded at sea, without success. In the following year as constable he tried and condemned Sir Ralph Grey and other Lancastrians. In 1467 he was again appointed deputy of Ireland.
During a year's office there he had the ear of Desmond attained, and cruelly put to death the earl's two infant sons. In 1470, as constable, he condescended twenty of Warwick's adherents, and gave them some money for which for ever afterwards the earl was greatly hated among the people, for their disproportionate death, that he used contrary to the law of the land" (Warkworth, 9). On the Lancastrian restoration Worcester fled into hiding, but was discovered and tried before the earl of Oxford, son of the man whom he had condemned in 1462. He was executed on Tower Hill on the 18th of October 1470.

Worcester was detested for his brutality and abuse of the law, and was called "the butcher of England" (Fabiany, 650). More than any of his contemporaries in this country he represented the combination of culture and cruelty that was distinctive of the English of the Renaissance. Apart from his moral character he was an accomplished scholar, and a great purchaser of books in Italy, many of which he presented to the university of Oxford. He translated Cicero's De amicitia and Buonaccorso's Declaration of Nobleness, which were printed by Caxton in 1481. Caxton in his epilogue eulogized Worcester as superior to all the temporal lords of the kingdom in moral virtue as well as in science. Worcester is also credited with a translation of Caesar's Commentaries printed in 1530. His ordinances for justices and triumphs, made as constable to king Henry, are reprinted in Harrington's Workes. Worcester was a patron of the early English humanist John Free, and his Italian friends included, besides those already mentioned, Lodovico Carbo of Ferrara, and the famous Florentine bookseller Vespasiano da Bisticci.

AUTHORITIES.—For Worcester's English career see especially the contemporary accounts in Three Fifteenth Century Chronicles, Collections of a London Citizen (Gregory's Chronicle), and Warkworth's Chronicle—all three published by the Camden Society. Vespasiano da Bisticci gave an account of him in his Vita di uomini illustri, i. 222-224, where inedita e rarissima provinciae (c. Emilia. (C. L. K.)

Worcester, William (c. 1415-1482), English chronicler, was a son of William of Worcester, a Bristol citizen, and is sometimes called William Botoner, his mother being a daughter of Thomas Botoner. He was educated at Oxford and became secretary to Sir John Fastolf. When the knight died in 1439, Worcester, although one of his executors, found that nothing had been bequeathed to him, and wrote one of his colleagues, Sir William Yelverton, he disputed his fastolf. See the Past and Present Letters edited by J. Gairdner (1904); and F. A. Gasquet, An Old English Bible and Other Essays (1897).

Worcester also wrote Annales rerum Anglicarum, a work of some value for the history of England under Henry VI. This was published by T. Hearne in 1728, and by Joseph Stevenson for the "Rolls" series with his Letters and Papers illustrative of the Wars of the English in France during the Reign of Henry VI. (1864). Stevenson also printed here collections of papers made by Worcester respecting the wars of the English in France and Normandy. Worcester's other writings include William Yelverton, he disputed his fastolf. See the Past and Present Letters edited by J. Gairdner (1904); and F. A. Gasquet, An Old English Bible and Other Essays (1897).

Worcester, a town of the Cape province, S. Africa, 109 m. by rail (68 in a direct line) N.E. of Cape Town, and the starting point of the railway to Mossel Bay and Port Elizabeth. Pop. (1904) 7853. It lies in the Little Karroo, about 800 ft. above the sea at the foot of the Hex River mountains. Tanning and wagon-building are among the industries of the surrounding country. There is large wine and brandy producing districts in the province. At Brandvlei, 9 m. S., near the Breede river are thermal springs with a temperature of 145 °F.

Worcester, an episcopal city and county of a city, municipal, parliamentary, and county borough, and county town of Worcestershire, England, on the river Severn, 1203 f. W.N.W. of London. Pop. (1901) 46,624. It is served by the Great Western railway and by the Bristol-Birmingham line of the Midland railway. Branches of the Great Western diverge to Malvern and Hereford, and to Leominster. Worcester lies mainly upon the left (E.) bank of the Severn, which is here a broad and placid river, the main part of the city lying on a ridge parallel with its banks. The city is governed by a mayor, 12 aldermen and 36 councillors. Area 3242 acres.

The cathedral church of Our Lord and the Blessed Virgin Mary is beautifully placed close to the river. The see was founded by the advice of Archbishop Theodore of Canterbury about 679 or 680, though, owing to the opposition of the bishop of Lichfield it was not finally established till 780. In its formation the tribal division was followed, and it contained the people of the Hwicas. A new cathedral church was built with 26 canons, was absorbed by Bishop Oswald into the monastery of St Mary. The canons became monks, and in 983 Oswald finished the building of a new monastic cathedral. After the Norman Conquest the see was occupied by Bishop Worcester, Wulfsatan, was the only English prelate who was left in possession of his see, and it was he who first undertook the building of a great church of stone according to the Norman pattern. Of the work of Wulfsatan, the outer walls of the nave, aisles, a part of the walls of the transepts, some shafts and the crypt remain. The crypt (1084) is one of the finest cruciform crypts in England, the others being in Winchester, Gloucester, and Peterborough cathedrals. Wulfsatan's building seems to have extended no farther than the transepts, but the nave was continued, though much of it was destroyed by the fall of the central tower in 1175. The two W. bays of the nave date from about 1160. In 1203 Wulfsatan, who had died in 1055, was canonized, and on the completion and dedication of the cathedral in 1218, his body was placed in a shrine, which became a place of pilgrimage, and thereby brought wealth to the monks. They devoted this to the building of a lady chapel at the E. end, extending the building by 50 ft.; and a new choir sanctuary was begun in 1257, upwards of 700,000 being spent. Among the monuments in the cathedral, that of King John, in the choir, is the earliest sepulchral effigy of an English king in the country. There is an altar tomb, in a very fine late Perpendicular chantry chapel, of Arthur, Prince of Wales, son of Henry VII., who died in 1502. There are also monuments of John Gauden, the bishop who wrote Icon basiliké, often attributed to Charles I., of Bishop Hough by Roubilac, and of Mrs Digby by Chantrey.

Of the eleven parish churches, St Alban's has considerable Norman remains. St Peter's contains portions of all Gothic styles, St Helen's, with a fine peal of bells commemorating the victories of Marlborough, has also Gothic portions, but the majority were either rebuilt in the 18th century, or are modern. St Andrews has a beautiful spire, erected in 1751, 155 ft. in. in height. Holy Trinity preserves the ancient roof of the Guesten Hall. St John's in Bedwardine was a parish church in 1371.
WORCESTER

There are no remains of the old castle of Worcester; it adjoined the monastery so closely that King John gave its yard to the monks, and after that time it ceased to be a stronghold. The Commandery, founded by St. Wulstan in 1085, was a hospital, and its name appears to lack authority. It was rebuilt in Tudor times, and there are records in 1563. In 1642, during the Civil War, it was used as a hospital, and its fine Georgian houses are still used as an almshouse. The Commandery is the only almshouse still in use.

In 1350, Queen Elizabeth's almshouses were founded, and in 1563, there are also a choir school, and municipal art, science, and technical schools. In the vicinity of the city there is a large Benedictine convent, at Stanbrook Hall, with a beautiful modern chapel. The Clothiers' Company possesses a charter granted by Queen Elizabeth; but the great industries are now the manufacture of gloves and of porcelain. A company of gloves was incorporated in 1651. The manufacture of porcelain is famous. The materials employed are china clay and china stone from Cornwall, felspar from Sweden, fire-clay from Stourbridge and Brosley, marl, flint and calcined bones. The Royal Porcelain works cover 5 acres. Among Worcesters' other trades are those of iron, iron goods and engineering works, carriage making, rope spinning, boat building, tanning and the production of chemical manures and of cider and perry. There is a considerable trade in the Severn.

The charitable almshouses are numerous, and include St. Oswald's hospital, Nash's almshouses, Wyatt's almshouses, the Berkeley hospital, Goulding hospital, Shewring's hospital, Inglethorpe's almshouses, Waldgrave's almshouses, Moore's blue-coat school, Queen Elizabeth's charity, and others.

Traces of British and Roman occupation have been discovered at Worcester (Wigerae Caester, Wiciparia), but its history begins with the foundation of the episcopal see. Being the chief city on the borders of Wales, Worcester was frequently visited by the kings of England. In 1130 it was taken by the Empress Matilda and retaken and burnt by Stephen in 1149. It surrendered to Simon de Montfort in 1266, and in 1361, during the Great Rebellion, a handful of cavaliers was besieged here, and in spite of an attempted relief by Prince Rupert, the city was pillaged, as it was again in 1646. In 1651 Charles II. with the Scottish army marched into Worcester, where he was welcomed by the citizens. Cromwell took up his position on the Red Hill just outside the city gates. Lambert succeeded in passing the Severn at Apton, and drove back the Royalist troops towards Worcester. Charles, seeking an advantage of this division of the enemy on opposite sides of the river, attacked Cromwell's camp. At first the Scots beat Cromwell, but, reinforced by 8,000 of the troops in time to drive back Charles' foot, who were not supported by the Scottish horse, and the rout of the King's force was complete.

In the reign of King Alfred, Æthelred and Æthelfled, ealdorman and lady of the Mercians, at the request of the bishop "bought a burghe at Worcester " and granted to him half of their rights and privileges there "both in market and street within the borough and without." Richard I. in 1189 granted the town to the burgesses at a fee-farm of £24, and Henry III. in 1227 granted a guild merchant and exemption from toll, and raised the farm to £30. The first incorporation charter was granted by Philip and Mary in 1554 under the title of bailiffs, aldermen, chamberlains and citizens, but James I. in 1622 made the city a separate county and granted a corporation of a mayor, 6 aldermen, and a common council consisting of one body of 24 citizens, including the mayor and aldermen, and another body of 48, who elected the mayor from among the 24. By the Municipal Reform Act of 1853 the government was again altered. The burgesses returned two members to parliament from 1295 to 1885, when the number was reduced to one. As early as 1203 the men of the town paid 10s. for licence to buy and sell cloth and wool, and the present corporation, in 1885, composes of 111, and in 1890 the weavers, walkers and clothiers received an incorporation charter, but the trade had already begun to decline and by 1879 had ceased to exist. Its place was taken by the manufacture of porcelain, introduced in 1751 by Dr Wall, and by the increasing manufacture of gloves, a trade in which is known to have been carried on in the 15th century.

See Victoria County History, Worcestershire: John Noake, Worcestershire in Olden Times (1849); Valentine Green, The History and Antiquities of the City and Suburbs of Worcester (1760).

WORCESTER, a city and the county-seat of Worcester county, Massachusetts, U.S.A., about 44 m. W. of Boston on the Blackstone river, a branch of the Providence river. Pop. (1900) 118,421 (57,652 foreign-born); (1905, state census) 28,135; (1910) 145,086. Area, 30 sq. m. Worcester is served by the Boston & Albany, the New York, New Haven & Hartford and the Boston & Maine railways, and is connected with Springfield and Boston by interurban electric lines. The park system of the city comprises about twenty tracts with a total area of more than 1100 acres; among them are Elm Park (88 acres) in the W. including Newton Hill (670 ft. above sea-level), and Green Hill Park (500 acres) in the N. Other parks in the city are Park Square Park (18 acres) and Boynton Park (113 acres) in the N.W. on Salisbury Pond, given to the city by Stephen Salisbury; Dodge Park (13 acres, N.); Burncoat Park (42 acres, N.E.); Chandler Hill Park (80 acres, E.); Hadwen (50 acres), University (14 acres) and Crompton Park (15-25 acres) in the S.W. and S.; and Greenwood (12-65 acres), Beaver Brook (15-5 acres), Tatunck (2-94 acres), Kendrick (14-87 acres) and Vernon Hill (16-4 acres). Two miles N.E. of the centre of the city lies lake Quinsigamond, 4 miles long, from which flows the river of the same name, a branch of the Blackstone. On its shores is Lake Park (110 acres). Fronting the Common, a wooded square in the centre of the city, is the City Hall, near which is a bronze statue, by D. C. French, of G. F. Hoar. On the Common there is a monument, designed by Randolph Rogers, to the soldiers and sailors of the Civil War, and one to Colonel Timothy Bigelow (1779-1790), one of Worcester's soldiers of the War of Independence. The E. side of the Common was the site of an old burying ground, and the W. side of the First Church, built in 1663. About $4 m. N. of the Common is Lincoln Square, adjacent to which is the granite memorial to General George Washington (1732-1799). In the centre of the town, on the place of General Charles Devens (1820-1897) by French. The old Salisbury mansion, dating back to Colonial days, stands in this square. At Salisbury Street and Park Avenue are the library and museum (1916) of the American Antiquarian Society, established in 1812 by Isaiah Thomas, with a collection of interesting portraits, a library of 90,000 vols. and many thousands of pamphlets, particularly rich in Americanica. The Art Museum was erected and endowed (1890-1903) by Stephen Salisbury, and contains a fine collection of casts, many valuable paintings, and the Banq's collection of Japanese art. The city has many fine churches.

Worcester is an important educational centre. Clark University was established here in 1889 by Jonas Gilman Clark as a purely graduate institution. In 1902 Clark College was opened for undergraduate work under the presidency of Carroll D. Wright, with a separate endowment of $1,300,000. In 1910 it had 30 teachers and 177 students. The university in 1910 had 15 instructors, 80 students and a library of 50,000 volumes. Under G. Stanley Hall, who was made president in 1888, the university became well known for its work in child-psychoanalysis. Worcester Polytechnic Institute (founded in 1865 by John Boynton of Templeton, Massachusetts; opened in 1868) is one of the best-equipped technical schools of college rank in the country; in 1910 it had 49 instructors, 525 students and a library of 12,700 vols.; the buildings are near Institute Park.
WORCESTERSHIRE

823

On Packachoag Hill or Mt. St James (560 ft.) is the Jesuit college of the Holy Cross, with a preparatory school, founded in 1813 by Benedict J. Fenwick, bishop of Boston, and chartered in 1805; in 1810 it had 30 pupils and 450 students. There is a State Normal School (1874), and connected with it is a kindergarten training school (1910).

The city library (175,000 vols.), founded in 1859, was one of the first in the country to be open on Sunday. There are four daily newspapers, one printed in French. From 1775 to 1848 was published here the weekly edition of the Worcester Spy, established by Isaiah Thomas in 1770 in Boston; he endowed it by him to Worcester at the outbreak of the War of Independence; a daily edition was published from 1845 to 1904. Early in the 19th century the city was an important publishing centre.

Worcester is one of the most important manufacturing centres in New England: in 1905 the value of the factory product was $52,144,665, ranking the city third among the cities of the state. Manufacturers of hardware and tools at an early date laid the foundation for the present still and other metal industries, in which 42.8% of all the workers were employed in 1905. Large processions are employed in the wire and wire-working industry, one plant, that of the American Steel and Wire Company, employing about 5000 hands; in 1905 the total value of work in these was $1,726,088, and of foundry and machine shop products $7,377,005.

The first grant of land in this part of the Blackstone Valley was made in 1637, and the town, Quansigmond (or Quinsigmond) Plantation, was laid out in October 1668. In 1675, on the outbreak of King Philip's War, it was temporarily abandoned. In 1684 it was settled again and its name was changed to Worcester because several leaders in the settlement were natives of Worcestershire, England. In 1711 the vicinage was opened up to settlement, a tavern and a mill were constructed, and a turnpike road was built to Boston. Worcester was incorporated as a town in 1722. In 1755 a small colony of the exiled Acadians settled here. At the outbreak of the War of Independence Worcester was little more than a country market town. During Shays’s Rebellion it was taken by the rebels and the courts were closed. The first real impetus to its growth came in 1835 with the construction of the Boston & Worcester railway, and it received a city charter in 1848. The strong anti-slavery sentiment of the city led in 1855 to the founding of the Co-operative Commonwealth, an early forerunner of the Fugitive Slave Law. In Worcester, or within a radius of a dozen miles of it, were the homes of Elias Hove, inventor of the sewing machine; Eli Whitney, inventor of the cotton gin; Erastus Bigelow (1814-1879), inventor of the carpet weaving machine; Dr Russell L. Hawes, inventor of an envelope machine; Thomas Blanchard (1788-1864), inventor of the machine for turning irregular forms; Samuel Crompton (1753-1827) and Lucius James Knowles (1810-1884), the perfectionists of the modern loom; and Draper Ruggles, Joel Nourse and J. C. Mason, perfectionists of the modern plough and originators of many inventions in agricultural machinery.

See F. E. Blake, Incidents of the First and Second Settlements of Worcester (Worcester, 1884); Wm. Lincoln, History of Worcester in 1836 (Worcester, 1837); also same extended to 1862 by Charles Heresy (Worcester, 1862); Dr H. H. Burt, History of the City of Worcester (Worcester, 1866); I. N. Metcalh, Illustrated Business Guide to City of Worcester (Worcester, 1880); C. F. Jewett, History of Worcester County (2 vols., Worcester, 1879); the Collections and Proceedings (1861 sq. ft. of the Worcester Society of Antiquity (instituted in 1877).

WORCESTERSHIRE, a midland county of England, bounded N. by Staffordshire, E. by Warwickshire, S. by Gloucestershire, W. by Herefordshire, and N.W. by Shropshire. The area is 751 sq. m. It covers a portion of the rich valleys of the Severn and Avon, with their tributary valleys and the hills separating them. The Severn runs through the county from N. at Bewdley to S. near Tewkesbury, traversing the Vale of Worcester. Following this direction it receives from E. the Stour at Stourport, the Salwarpe above Worcester, and the Avon, whose point of junction is just outside the county. The Avon valley is known in this county as the Vale of Evesham, and is devoted to orchards and market gardening. The Coteswold Hills rise sharply from it on the S.E., of which Bredon Hill, within this county, is a conspicuous spur. The Avon forms the county boundary with Gloucestershire for a short distance above its mouth. The Teme joins the Severn from the W. below Worcester, and forms short stretches of the W. boundary. Salmon and lampreys are taken in the Severn; trout and grayling abound in the Teme and its feeders. Besides the Cotteswolds, the most important hills are the Malvern and the Lickey or Hagley hills. The Malvern Forest, now formed a park, is on the W. boundary, being partly in Herefordshire, and reach a height of 1395 ft. in the Worcester Beacon, and 1114 in the Hereford Beacon. They are divided by the Teme from a lower N. continuation, the Abberley Hills. The Lickey Hills cross the N.E. corner of the county, rarely exceeding 1000 ft. Their N. part is called the Clent Hills. Partly within the county are the sites of two ancient forests. That of Wyre, bordering the Severn on the W. in the N. of Worcestershire and in Shropshire, retains to some extent its ancient character; but Malvern Chase, which clothed the slopes of the Malvern Hills, has been largely reclaimed.

Geology.—Archean gneisses and schists (Malverian) and volcanic rocks (Urician) form the core of the Malvern Hills; being the most durable rocks in the district, they form the highest ground. Similarly well-laid down are the carboniferous limestones, which have also been eroded away in places. The Trias rocks overlie the old rocks unconformably on the east of both Bredon Hills and the Lickey Hills near Bromsgrove. They are succeeded by the Cambrian rocks (Hollybush Sandstone and Malvern Shales), which are well developed at the S. end of the Malvern Hills, where in places the Archean rocks have been thrust over them. The Lickey Quarzite, probably of the same age as the Hollybush Sandstone, is extensively quarried for roadstone. Strata of Ordovician age being absent in Worcestershire, the oldest rocks rest unconformably on the earth; the Belvedere Shales include the Upper Llandovery, Wenlock and Ludlow series. These dip steeply W. from the Malvern and Abberley axes and plunge under the Old Red Sandstone; some of the lower beds are represented at the Linton quarry, while the Wenlock and Ludlow series are found in the quarries at Evesham and at Malvern and Bromsgrove. They include the Upper Llandovery, Wenlock and Aymestry are all represented in the Malvern district. The Trias rocks are most extensive on the W. borders of the county. The Carboniferous Limestone and Millstone Grit were not deposited, so that the Coal Measures rest unconformably on the older rocks. These are represented in the Wyre Forest coalfield near Bewdley and in the S. end of the S. Staffordshire coalfield near Halesowen; they contain rich seams of coal and ironstone and several intrusions of basalt (dhuestone, Rowley-rag). The so-called Permian red rocks are now known to be Trias rocks, but their intensity is much more apparent in the Clent Hills (1065 ft.). The Triassic red rocks—unconformable to all below—cover the centre of the county, and on the W. are faulted against the older rocks. They form the Cotswold Hills and the Brinklow and Bredon Hills, and form the core of the S.E. of the county; the Lower Lias consists of blue clays and limestones; the latter are burnt for lime and yield abundant ammonites. The sands and limestones of the Middle Lias and the clays of the Upper Lias are present in the lower slopes of Bredon Hill and of the Cotteswolds, and are succeeded by the sands and siltstone limestones of the Inferior Oolite. Glacial deposits—boulder-clay, isolated boulders, sand and gravel—are met with in many parts of the county, while later valley-gravels have yielded remains of mammoth, rhinoceros, &c. Coal, ironstone, salt, limestone and roadstone are the chief mineral products.

Climatic conditions In the N. Worcestershire is generally equable and healthy, and is very favourable to the cultivation of fruit, vegetables and hops, for which Worcestershire has long held a high reputation, the red maris and the rich loams being good both for market gardens and market farms. About the middle of the area there is still some cultivation, and of this about five-eighths is in permanent pasture. Orchards are extensive, and there are large tracts of woodland. Wheat and oats are the chief grain crops, being grown about one-third of the green crop acreage, and potatoes on about one-fourth. There is a considerable acreage under beans. In the neighbourhood of Worcester there are large nurseries.
Redditch for needles, fish-hooks, &c. Salt is produced from brine at Droitwich and Stoke. The fire-clays and limestone of the N. unite with the coal measures to form a basis of the industries in the Black Country. Furniture, clothing and paper-making and leather-working are also important.

**Administration.**—The Great Western railway serves Evesham, Worcester, Droitwich and Kidderminster, with branches from Worcester to Malvern and into Herefordshire, from Kidderminster to Worcestershire, with an extension to the Severn River at Kidderminster, and another serving Malvern from Ashchurch, and an alternative route from Birmingham to Ashchurch by Redditch and Evesham. The Severn is an important highway, being locked up to Evesham, but is traversed by pleasure-boats. Canals follow the courses of the Stour and the Salwarpe, and serve the towns of the Black Country.

**Administration and Population.**—The area of the ancient county is 480,560 acres, with a population in 1901 of 488,338. The area of the administrative county is 480,950 acres. The county is of very irregular shape, and has detached portions enclosed in Herefordshire, Staffordshire, Warwickshire and Gloucestershire. It comprises five hundreds. The municipal boroughs are Bewdley (2860), Droitwich (4201), Dudley (47,723), Evesham (7101), Kidderminster (24,681) and Worcester (46,624). Dudley and the city and county town of Worcester are county boroughs. The urban districts are Droitwich (5418), King's Norton and Northfield (57,122; forming a S. suburb of Birmingham), Lye and Wollescote (10,976; adjacent to Stourbridge), Malvern (16,449), North Bromsgrove (5688), Oldbury (25191), Redditch (13,493), Stourbridge (16,302) and Stourport (4529). Halesowen (4057), Pershore (3348), Tenbury (2086) and Upton-upon-Severn (2225) may be mentioned among other towns. The county is in the Oxford circuit, and assizes are held at Worcester. It has one court of quarter-sessions, and is divided into 17 petty sessional divisions. Worcester and Dudley have one court of quarter-sessions, and all the boroughs have commissions of the peace. The total number of civil parishes is 239. The ancient county, which is mostly in the diocese of Worcester, with a few parishes in that of Hereford, contains 231 ecclesiastical parishes or districts wholly or in part. The county contains five parliamentary divisions—West or Bewdley, East, South or Evesham, Mid or Droitwich, and North or Oldbury. The parliamentary boroughs of Kidderminster and Worcester return one member each, and parts of the boroughs of Dudley and Birmingham. Parishes and in the 8th and 9th centuries the English settlers in the district now known as Worcestershire were a tribe of the Hwiccas of Gloucestershire, who spread along the Severn and Avon valleys in the 6th century. By 679 the Hwiccan kingdom was formed into a separate diocese with its see at Worcester, and the Hwiccas had made themselves masters of the modern county, with the exception of the N.W. corner beyond the Abberley Hills. From this date the town of Worcester became not only the religious centre of the district, but the chief point of trading and military communication between England and Wales. A charter of the reign of Alfred alludes to the erection of a "burh" at Worcester by Edward and Æthelbald, and it was after the recovery of Mercia from the Danes by Edward that the shire originated as an administrative area. The first political event recorded by the Saxon Chronicle in Worcestershire is the destruction of Worcester by Hardicanute in 1041 in revenge for the murder of two of his tax-gatherers by the citizens.

In no county has the monastic movement played a more important part than in Worcestershire. Foundations existed at Worcester, Droitwich, Pershore, Tewkesbury, Malvern, Abbots Morton and Avesbury in the 7th century; at Great Malvern in the 11th century; and in the 12th and 13th centuries at Little Malvern, Westwood, Bordesley, Whistones, Cookhill, Dudley, Halesowen and Astley. At the time of the Domesday Survey more than half Worcestershire was in the hands of the church. The church of Worcester held the triple hundred of Oswaldslow, with such privileges as to exclude the sheriff's jurisdiction entirely, the profits of all the local courts accruing to the bishop, whose baillifs in 1276 claimed to hold his hundred outside Worcester, at Drybrook, and at Wimborne. The two hundreds owned by the church of Westminister, and that of Droitwich Pershore, had in the 13th century been divided into the following hundred of Worcestershire: the hundred of Evesham owned by Evesham Abbey had been converted into Blakenhurst hundred; and the irregular boundaries and outlying portions of these hundreds are explained by their having been formed out of the scattered endowments of their ecclesiastical owners. Of the remaining Domessday hundreds, Came, Clent, Cresselaw and Esch had been combined to form the hundred of Halfshire by the 13th century, while Doddington remained unchanged. The shire-court was held at Worcester.

The vast possessions of the church prevented the growth of a large and important urban centre. In the 11th century the two seats of Worcestershire were the priory of Worcester Castle, which passed from William Fitz-Ansculf to the families of Paynel and Someri, was the sole residence of a feudal baron. The Domessday fie of Ure d'Abitot the sheriff, founder of Worcester Castle, and of his brother Robert le Despenser passed in the 12th century to the Beauchamps, who owned Esmey and Hanley Castles. The possessions of William Fitz Osbern in Doddington hundred and the Teme valley fell to the crown after his rebellion in 1074 and passed to the Mortimers. Hanley Castle and Malvern Chase were granted by Henry III. to Gilbert de Clare, with the permission of the king. In the 15th century the area of Worcestershire was 488,338 acres. In the 16th and 17th centuries the county and the boroughs of Worcestershire, Evesham, Pershore and Malvern were owned by the Despensers, while the hundred of Evesham owned by Evesham Abbey had been converted into Blakenhurst hundred; and the irregular boundaries and outlying portions of these hundreds are explained by their having been formed out of the scattered endowments of their ecclesiastical owners. Of the remaining Domessday hundreds, Came, Clent, Cresselaw and Esch had been combined to form the hundred of Halfshire by the 13th century, while Doddington remained unchanged. The shire-court was held at Worcester.

The early political history of Worcestershire centres round the city of Worcester. In the Civil War of the 17th century Worcestershire was conspicuously loyal. On the retreat of Essex from Worcester in 1642 the city was occupied by Sir William Russell for the king, and only surrendered in 1646. In 1642 Prince Rupert defeated the parliamentary troops near Powick. Sudeley Castle surrendered in 1644, and Dudley and Hartlebury by command of the king in 1646.

The Droitwich salt industry was very important at the time of the Domessday Survey. Bromsgrove alone sending 300 cartloads of wood yearly to the salt-works. In the 15th and 16th centuries Bromside monastery and the abbey of Evesham and Pershore exported wool to the Florentine and Flemish markets, and in the 16th century the Worcestershire clothing industry gave employment to 8000 people; fruit-culture with the manufacture of cider and perry, nail-making and glass-making also flourished at this period. The clothing industry declined in the 17th century, but the silk-manufacture re-placed it at Kidderminster and Blockley. Coal and iron were mined at Dudley in the 13th century. As early as 1295 Worcestershire was represented by sixteen members in parliament, having two knights for the shire and two burgesses each for the city of Worcester and the boroughs of Bromsgrove, Droitwich, Dudley, Evesham, Kidderminster and Pershore. In the Dissolution of the Monasteries the exceptions held until 1311 and again recovered representation in 1554, the boroughs ceased to make returns. Evesham was re-enfranchised in 1604, and in 1666 Dudley returned one member. Under the Reform Act of 1832 Worcestershire had five members for the county returns: one for each of the five boroughs, Dudley returning one member each; Dudley and Kidderminster were re-enfranchised, returning one member each. In 1806 Evesham lost one member.

**Antiquities.**—Remains of early camps are scarce, but there are examples at Berrow Hill near the Teme, W. of Worcester, at Round Hill by Spetchley, 3 m. E. of Worcester, and on the Herefordshire Beacon. Roman remains have been discovered on a few sites, as at Kempsey on the Severn, S. of Worcester, at Ripple, in the S. near Upton, and at Droitwich. There are remains of the great abbeys at Evesham and Pershore, and the fine priory church at Malvern, besides the cathedral at Worcester. There are further monastic remains at Halesowen and at Bordesley near Redditch, and there was a Benedictine priory at Astley, 3 m. S.W. of Stourport. There are fine churches in several of the larger towns, as Bromsgrove. The village churches are generally of mixed styles. Good Norman work remains in those at Stourton, Martley, 5 m. W. of Worcester, Astley, Rous Lench in the Evesham district. The Church from Pershore: St. Matthew near the N.W. of the county; while the Early English churches of Kempsey and Ripple are noteworthy. In domestic architecture, the half-timbered style adds to the picturesque nature of streets in the towns and villages; and among country houses this style is well exemplified in Birts Morton Court and Eastington Hall, in the district of S. of Malvern, in Elmley Lovett Manor between Droitwich and Kidderminster, and in Pirton Court near Worcestershire
Kempsey. Westwood Park is a mansion of the 16th and 17th centuries, with a picturesque gateway of brick; the site was formerly occupied by the ancient nunneries of Malvern and Almonds. Between Worcester and Malvern, embodies remains of a fine Elizabethan moated mansion.

WORDSWORTH, CHARLES (1806-1832), Scottish bishop, son of Christopher Wordsworth, Master of Trinity, was born in London on the 22nd of August 1806, and educated at Harrow and Christ Church, Oxford. He was a brilliant classical scholar, and a famous cricketer and athlete; he was in the Harrow cricket eleven in the first regular matches with Eton (1822) and Winchester (1824), and is credited with bringing about the first Oxford and Cambridge match in 1827, and the first university boat-race in 1828, in both of which he took part. He won the Chancellor's Latin verse at Oxford in 1827, and the Latin essay in 1831, and took a first-class in classics. From 1830 to 1833 he had as pupils a number of men (including W. E. Gladstone and H. P. G. Sharp) whom he afterwards trained as a master famous. He then travelled abroad during 1833-1834, and after a year's work as tutor at Christ Church (1834-1835) was appointed second master at Winchester. He had previously taken holy orders, though he only became priest in 1840, and he had a strong religious influence with the boys. In 1839 he brought out his Greek Grammar, which had a great success. In 1846, however, he resigned; and then accepted the wardenship of Trinity College, Glenalmond, the new Scottish Episcopal public school and divinity college, where he remained from 1847 to 1854, having great educational success in all respects; though his views on Scottish Church questions were afterwards some important papers to W. E. Gladstone. In 1852 he was elected bishop of St Andrews, Dunkeld and Dunblane, and was consecrated in Aberdeen early next year. He was a strong supporter of the establishment, but conciliatory towards the Free churches, and this brought him into a good deal of controversy. He was a voluminous writer, and one of the compiler of revisers of the New Testament (1870-1882), among whom he displayed a conservative tendency. He died at St Andrews on the 5th of December 1892. He was twice married, first in 1855 to Charlotte Day (d. 1859), and secondly to Katherine Mary Barter (d. 1897). He had thirteen children altogether.

See his Annals of My Early Life (1901), and Annals of My Life, edited by W. Earl Hodgson (1853); also The Episcopate of Charles Wordsworth, by his nephew John, bishop of Salisbury (1896).

WORDSWORTH, CHRISTOPHER (1774-1850), English divine and scholar, youngest brother of the poet William Wordsworth, was born on the 9th of June 1774, and was educated at Trinity College, Cambridge, where he became a fellow in 1798. Twelve years later he received the degree of D.D. He took holy orders, and obtained successive prebendarys through the patronage of Manners Sutton, bishop of Norwich, afterwards (1805) archbishop of Canterbury, to whose son Charles (afterwards Speaker of the House of Commons, and viscount Canterbury) he had been tutor. He had in 1802 attracted attention by his defence of Granville Sharp's then novel canon “on the uses of the definitive article” in New Testament textual criticism. In 1810 he published an Ecclesiastical Biography in 6 volumes. On the death of Bishop Mansel, in 1820, he was elected Master of Trinity, and retained that position till 1844, when he resigned. He regarded as the head of the “classical” party, since he had, as vice-chancellor, originated in 1832 a proposal for a public examination in classics and divinity, which, though then rejected, bore fruit in 1822. Otherwise his masterly was un-distinguished, and he was not a popular head with the college. He died on the 2nd of February 1846, at Buxted. In his Who wrote Ikon Basilike? (1824), and in other writings, he advocated the claims of Charles I. to his authorship; and in 1836 he published, in 4 volumes, a work of Christian Institutes, selected from English divines. He married in 1804 Miss Priscilla Lloyd (d. 1852), a sister of Charles Lamb's friend Charles Lloyd; and he had three sons, John W. (1805-1839), Charles (q.v.), and Christopher (q.v.); the latter two both became bishops, and John, who became a fellow and classical lecturer at Trinity College, Cambridge, was an industrious and erudite scholar.

WORDSWORTH, CHRISTOPHER (1807-1889), English bishop and man of letters, youngest son of Christopher Wordsworth, Master of Trinity, was born in London on the 30th of October 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete. He was a fellow and tutor of Trinity in 1830; shortly afterwards he took holy orders. He went for a tour in Greece in 1832-1833, and published various works on its topography and archaeology, the most famous of which is "Wordsworth's Greece" (1839). In 1836 he became Public Orator at Cambridge, and in the same year was appointed headmaster of Harrow, a post he resigned in 1844. He then became a canon of Westminster, and from 1850 to 1870 he held a country living in Berkshire. In 1865 he was made archdeacon of Westminster, and in 1869 bishop of Lincoln. He died on the 20th of March 1905, at his home at 20, Hyde Park Gardens, London, aged 98. His brother John (b. 1843), bishop of Salisbury (1885), and author of Fragments of Early Latin (1874); the eldest daughter, Elizabeth (b. 1840), was the first principal (1879) of Lady Margaret Hall, Oxford.

His Life, by J. H. 'Overton and Elizabeth Wordsworth, was published in 1888.

WORDSWORTH, DOROTHY (1777-1855), English writer and diarist, was the third child and only daughter of John Wordsworth of Cockermouth and his wife, Anne Cookson-Crackanthorpe. The poet William Wordsworth married her in 1816, and she was one of the very close friends of the poet. On the death of her father in 1783, Dorothy found a home at Penrith, in the house of her maternal grandfather, and afterwards for a time with a maiden lady at Halifax. In 1787, on the death of the elder William Cookson, she was adopted by her uncle, and lived in his Norfolk parish of Forncett. She and her brother William, who dedicated to his sister the Evening Walk of 1792, were early drawn to one another, and in 1794 they visited the Lakes together. They determined that it would be best to combine their small capitals, and that Dorothy should keep house for the poet. From this time forth her life ran on lines closely parallel to those of her great brother, whose companion she continued to till his death. It is thought that they made the acquaintance of Coleridge in 1797.

From the autumn of 1795 to July 1797 William and Dorothy Wordsworth took up their abode at Racedown, in Dorsetshire. At the latter date they moved to a large manor-house, Alfoxden, in the N. slope of the Quantock hills, in W. Somerset, S. T. Coleridge about the same time settling near by in the town of Nether Stowey. On the 20th of January 1798 Dorothy Wordsworth bore and a year her second child, by successive biographers of her brother, but first printed in its quasi-entirety by Professor W. Knight in 1807. The Wordsworths, Coleridge, and Chester left England for Germany on the 14th of September 1798; and of this journey also Dorothy Wordsworth preserved an account, portions of which were published in 1897. On the 14th of May 1800 she started another Journal at Grasmere, which she kept very fully until the 31st of December of the same year. She
resumed it on the 1st of January 1803 for another twelve months, closing on the 11th of January 1803. These were printed first in 1809. She composed *Recollections of a Tour in Scotland*, in 1803, with her brother and Coleridge; this was first published in 1814. Her next contribution to the family history was her *Journal of a Mountain Ramble*, in November 1803, an account of a walking tour in the Lake district with her brother. In July 1815 the Wordsworths made a tour on the continent of Europe, of which Dorothy preserved a very careful record, portions of which were given to the world in 1844, the writer having refused to publish it in 1824 on the ground that her "object was not to make a book, but to leave to her niece a neatly- penned memorial of those few interesting months of our lives." Meanwhile, without her brother, in the company of Joanna Hutchinson, Dorothy Wordsworth had travelled over Scotland in 1825, and had composed a *Journal* of that tour. Other MSS. exist and have been examined carefully by the editors and biographers of the poets, but the records which we have mentioned and her letters form the principal literary relics of Dorothy Wordsworth. In 1829 she was attacked by very serious illness, and was never again in good health. After 1836 she could not be considered to be in possession of her mental faculties, and became a pathetic member of the interesting household at Grasmere. She outlined the poet, however, by several years, dying at Grasmere on the 25th of January 1855.

It would be difficult to exaggerate the importance of Dorothy Wordsworth's companionship to her illustrious brother. He had left numerous letters to her, and she received from him the sympathetic origination of her perceptions. "She," he said, "gave me eyes, she gave me ears; And humble cares, and delicate fears; A heart the fountain of sweet tears; A soul, a heart, a love, and thought, and joy." The value of the records preserved by Dorothy Wordsworth, especially in earlier years, is hardly to be over-estimated by those who desire to form an exact impression of the revival of English poetry. When Wordsworth and Coleridge refashioned imaginative literature at the close of the 18th century, they were daily and hourly accompanied by a feminine presence exquisitely attuned to sympathize with their efforts, and by an intelligence which was able and anxious to move in step with theirs. "S. T. C. and my beloved sister," William Wordsworth wrote in 1832, "are the two beings to whom my intellect is most indebted." In her pages we can put our finger on the very pulse of the machine; we are present while the New Poetry is evolved, and the sensitive descriptions in her prose lack nothing but the accomplishment of verse. Moreover, it is certain that the sharpness and fineness of Dorothy's observation, "the shooting lights of her wild eyes," actually afforded material to the poets. Coleridge, for instance, when he wrote his famous lines about "The one red leaf, the last of its clan," used almost the very words in which, on the 7th of March 1798, Dorothy Wordsworth had recorded "One only leaf upon the top of a tree ... danced round and round like a rag blown by the wind."

It is not merely by the biographical value of her notes that Dorothy Wordsworth lives. She claims an independent place in the history of English prose as one of the very earliest writers who noted, in language saturated with the sense, and with no other object than to preserve their fugitive beauty, the little picturesque phenomena of homely country life. When we speak with very high praise of her art in this direction, it is only fair to add that it is called forth almost entirely by what she wrote between 1798 and 1803, for a decline similar to that which fell upon her brother's poetry early invaded her prose; and her later journals, like her *Letters*, are less interesting because less inspired. A *Life* by E. Lee was published in 1886; but it is only since 1897, when Professor Knight collected and edited her scattered MSS., that Dorothy Wordsworth has taken her independent place in literary history. (E. G.)

**Wordsworth, William (1770-1850)**, English poet, was born at Cockermouth, on the Derwent, in Cumberland, on the 7th of April 1770. He was the son of John Wordsworth (1741-1783), an attorney, and the great-grandson of the first Earl of Lonsdale, a prosperous man in his profession, descended from an old Yorkshire family of landed gentry. On the mother's side also Wordsworth was connected with the middle territorial class:

his mother, Anne Cookson, was the daughter of a well-to-do mercer in Penrith, but her mother was Dorothy Crackanthorpe, whose ancestors had been lords of the manor of Newbiggin, near Penrith, from the time of Edward III. He thus came of "gentle" kin, and was proud of it. The country squires and farmers whose blood flowed in Wordsworth's veins were not far enough above local life to be out of sympathy with it, and the words and names of his Lancashire scenes and common folk of the North country hills and dales had a traceable hereditary bias. William Wordsworth was one of a family of five, the others being Richard (1768-1816), Dorothy (g.v.), John (1772-1805), and Christopher (g.v.).

Though his parents were of sturdy stock, both died prematurely, his mother when he was eight years old, his father when he was thirteen. At the age of eight Wordsworth was sent to school at Hawkshead, in the Esthwaite valley in Lancashire. His father died while he was there, and at the age of seventeen he was sent to St John's College, Cambridge. He did not distinguish himself in the studies of the university, and for some time after taking his degree of B.A., in January 1791, he showed what seemed to his relatives a most perverse reluctance to adopt any regular profession. His mother had noted his "stiff, moody and violent temper" in childhood, and it seemed as if this family judgment was to be confirmed in his manhood. After taking his degree, he was pressed to take holy orders, but would not; he had no taste for the law; he idled a few months aimlessly in London, a few months more with a Welsh college friend, who was at the time downwardly making his fortune in Swin-

land during his last Cambridge vacation; then in the November of 1791 he crossed to France, ostensibly to learn the language, made the acquaintance of revolutionaries, sympathized with them vehemently, and was within an ace of throwing in his lot with the Girondins. When it came to this, his relatives cut off his supplies, and he was obliged to return to London towards the close of 1792. But still he resisted all pressure to enter any of the regular professions, published his poems *An Evening Walk* and *Descriptive Sketches* in 1793, and in 1794, still moving about to all appearance in stubborn aimlessness among his friends and relatives, had no more rational purpose of livelihood than drawing up the prospectus of a periodical of strictly republican principles to be called *The Philanthropist.*

But all the time from his boyhood upwards a great purpose had been growing and maturing in his mind. *The Prelude* expounds in lofty impassioned strain how his sensibility for nature was "augmented and sustained," and how it never, except for a brief interval, ceased to be "creative" in the special sense of his subsequent theory. But it is with his feelings towards nature that *The Prelude* mainly deals; it says little regarding the history of his ambition to express those feelings in verse. It is the autobiography, not of the poet of nature, but of the worshipper and priest. The salient incidents in the history of the poet he communicated in prose notes and in familiar discourses. Commenting on the couplet in the *Evening Walk*—"And, fronting the bright west, yon oak entwines its darkening boughs and leaves in stronger lines"—he said:

"This is feeble and imperfectly express; but I recollect distinctly the very spot where this first struck me. It was on the way between Hawkshead and Ambleside, and gave me extreme pleasure. The moment was important in my poetical history: for I date from it my consciousness of the infinite variety of natural appearances which had been unnoticed by the poets of any age or country, so far as I was acquainted with them; and I made a resolution to supply in some degree the deficiency. I could not at that time have been above fourteen years of age."

About the same time he wrote, as a school task at Hawkshead, verses that show considerable acquaintance with the poets of his own country at least, as well as some previous practice in the art of verse-making.1 The fragment, that stands at the

---

1 *Memoirs of William Wordsworth*, by Canon Wordsworth, vol. i. pp. 10, 11. According to his own statement in the memoranda dictated to his biographer, it was the success of this exercise that "put it into his head to compose verses from the impulse of his own
beginning of his collected works, recording a resolution to end his life among his native hills, was the conclusion of a long poem written while he was still at school. And, undistinguished as he was at Cambridge in the contest for academic honours, the Evening Walk, his first publication, was written during his vacations. He published it in 1793, to show, as he said, that he could do something, although he had not distinguished himself in university work. There are touches here and there of the bent of imagination that became dominant in him soon afterwards, notably in the moral aspiration that accompanies his Remembrance of Collins on the Thames, which began with the lines:

"O glide, fair stream! for ever so
Thy quiet soul on all bestowing,
Till all our minds for ever flow
To rest in clear bright waters flowing."

But in the main this first publication represents the poet in the stage described in the twelfth book of The Prelude:

"Bent overmuch on superficial things,
Pampering myself with mesre novelties
Of colour and proportion; to the moods
Of time and season, to the moral power,
The affections, and the spirit of the place
Insensible."

But, though he had not yet found his distinctive aim as a poet, he was inwardly bent upon poetry as "his office upon earth."

In this determination he was strengthened by his sister Dorothy (q.v.), who with rare devotion consecrated her life henceforward to his service. A timely legacy enabled them to carry their purpose into effect. A friend of his, a Barrister, who had nursed at his last illness, RAISLEY CALVERT, son of the steward of the duke of Norfolk, who had large estates in Cumberland, died early in 1795, leaving him a legacy of £500. It may be well to notice how opportunely, as De Quincey half-truefully remarked, money always fell in to Wordsworth, enabling him to pursue his poetic career without distraction. Calvert's bequest came to him when he was on the point of concluding an engagement as a journalist in London. On it and other small resources he and his sister, thanks to her frugal management, contrived to live for nearly eight years. By the end of that time Lord Lonsdale, who owed Wordsworth's father a large sum for professional services, and had steadily refused to pay it, died, and his successor paid the debt with interest. His wife, Mary Hutchinson, whom he married on the 4th of October 1802, brought him some fortune; and in 1813, when in spite of his plain living his family began to press upon his income, he was appointed stamp-distributor for Westmorland, with an income of £500, afterwards nearly doubled by the increase of his district. In 1842, when he resigned his stamp-distributorship, Sir Robert Peel gave him a Civil List pension of £300.

This enabled Wordsworth to live comforted by the sale of his life from the time when he resolved to labour with all his powers in the office of poet. The first two years, during which he lived with his self-sacrificing sister at Racedown, in Dorset, were spent in half-hearted and very imperfectly successful experiments, satires in imitation of Juvenal, the tragedy of The Borderers, and a poem in the Spenserian stanza, now entitled Guilt and Sorrow. How much longer this time of self-distrustful endeavour might have continued is a subject for curious speculation; an end was put to it by a fortunate incident, a visit from Coleridge, who had read his first publication, and seen in it, what none of the public critics had discerned, "that spark of original poetic genius that sustained the whole."

The resolution to supply the deficiencies of poetry in the exact description of natural appearances was probably formed while he was in this state of boyish ecstasy at the accidental revelation of his own powers. The date of his beginnings as a poet is confirmed by the lines in The Idiot Boy, written in 1798:

"I to the Muses have been bound
These fourteen years by strong inducements."

1 In The Prelude, he speaks of his "original poetical genius" during his first vacation as "harassed with the toil of verse, much pains and little progress."

2 Not published till 1832. For the history of this tragedy see Memoirs, vol. i. p. 104, and a sound, if severe, criticism of it, A. C. Swinburne's Miscellanies, p. 118. And yet it was of the blank verse of The Borderers that Coleridge spoke when he wrote to Cottle that he "felt a little man by the side of his friend."

Stubborn and independent as Wordsworth was, he needed some friendly voice from the outer world to give him confidence in himself. Coleridge rendered him this indispensable service. He had begun to seek his themes in "Sorrow, that is not sorrow, but delight; And miserable love, that is not pain But the Mad Mother of the Idiot Boy; Thetron to human kind, and what we are."

He read to his visitor one of these experiments, the story of the ruined cottage, afterwards introduced into the first book of The Excursion.2 Coleridge, who had already seen original poetic genius in the poems published before, was enthusiastic in his praise of them as having "a character, by books not hitherto reflected."

June 1797 was the date of this memorable visit. So pleasant was the companionship on both sides that, when Coleridge returned to Nether Stowey, in Somerset, Wordsworth at his instance changed his quarters to Alfoxden, within a mile and a half of Coleridge's temporary residence, and the two poets lived in almost daily intercourse for the next twelve months. During that period Wordsworth's powers rapidly expanded and matured; ideas that had been gathering in his mind for years, and lying there in dim confusion, felt the stir of a new life, and ranged themselves in clearer shapes under the fresh quickening breath of Coleridge's swift and discursive dialectic.

The Lyrical Ballads were the poetic fruits of their companionship. Out of their frequent discussions of the relative value of common life and unusual incidents as themes for the imaginative treatment grew the idea of writing a volume together, composed of poems of the two kinds. Coleridge was to take the supernatural; and, as his industry was not equal to his friend's, this kind was represented by the Ancient Mariner alone. Among Wordsworth's contributions were The Female Vagrant, We are Seven, Complaint of a Forsaken Indian Woman, The Last of the Latch, The Idiot Boy, The Mad Mother ("Her eyes are wild"), The Thorn, Goody Blake and Harry Gill, The Recess of Poor Susan, Simon Lee, Expostulation and Reply, The Tables Turned, Lines left upon a Yeow-tree Seat, An Old Man Travelling ("An ancient Tragedy and Decay"), Lines above Tintern Abbey. The volume was published by Cottle of Bristol in September 1798.

It is necessary to enumerate the contents of this volume in fairness to the contemporaries of Wordsworth, for their cold or scoffing reception of his first distinctive work. Those Wordsworthians who give up The Idiot Boy, Goody Blake and The Thorn as mistaken experiments have no right to triumph over the first derivative critics of the Lyrical Ballads, or to wonder at the dulness that failed to see at once in this humble issue from an obscure provincial press the advent of a great master in literature. It is true that Tintern Abbey was in the imaginative treatment and that all the highest qualities of Wordsworth's imagination and of his verse could be illustrated from the lyrical ballads proper in this first publication; but clear vision is easier for us than it was when the revelation was fragmentary and incomplete.

Although Wordsworth was not received at first with the respect to which he was entitled, his power was not entirely without recognition. There is a curious commercial evidence of this, which ought to be noted, because a perversion of the fact is sometimes used to exaggerate the supposed neglect of Wordsworth at the beginning of his career. When the Longmans
took over Cottle's publishing business in 1799, the value of the copyright of the Lyrical Ballads, for which Cottle had paid thirty guineas, was assessed at nil. Cottle therefore begged that it might be excluded altogether from the bargain, and presented it to the authors. But in 1800, when the first edition was exhausted, the Lyrical Ballads the赀 of d's order, But the truth issues of a new edition with an additional volume and an explanatory preface. The sum was small compared with what Scott and Byron soon afterwards received, but it shows that the public neglect was not quite so complete as is sometimes represented. Another edition was called for in 1802, and a fourth in 1805.

The new volume in the 1800 edition was made up of poems composed during his residence at Goslar in Germany (where he went with Coleridge) in the winter of 1798-1799, and after his settlement at Grasmere in December 1799. It contained a large portion of poems neither that, when Wordsworth—Ruth, Nutting, Three Years She Grew, A Poet's Epitaph, Hartleap Well, Lucy Gray, The Brothers, Michael, The Old Cumberland Beggar, Poems on the Naming of Places. But it contained also the famous Preface, in which he infuriated critics by presuming to defend his eccentricities in an elaborate theory of poetry and poetic diction.

This document (and let it be noted that all Wordsworth's Prefaces are of the utmost interest in historical literary criticism) is constantly referred to as a sort of revolutionary proclamation against the established taste of the 18th century. For one who has read Wordsworth's original, hundreds have read Coleridge's haste and the havoc which the furious onslaught of Wordsworth's put forth by Wordsworth is taken from that. It is desirable, therefore, considering the celebrity of the affair, that Wordsworth's own position should be made clear. Coleridge's criticism of his friend's theory proceeded avowedly "on the assumption that his words had been rightly interpreted, as purporting that the proper diction for poetry in general consists altogether in a language taken, with due exceptions, from the mouths of men in real life, a language which actually constitutes the natural conversation of men under the influence of natural feelings." Coleridge proceeded to another that Wordsworth spoke of there being "no essential difference between the language of prose and metrical composition," he meant by language not the mere words but the style, the structure and the order of the sentences; on this assumption he argued as if Wordsworth had held that the metrical order should always be the same as the prose order. Given these assumptions, which formed the popular interpretation of the theory by its opponents, it was easy to demonstrate its absurdity, and Coleridge is very generally supposed to have given Wordsworth's theory in its bare and naked exaggration. But the truth is that neither of the two assumptions is warranted; both were expressly disclaimed by Wordsworth in the Preface itself. There is not a single qualification introduced by Coleridge that was not made by Wordsworth himself in the original statement. In the first place, it was not put forward as a theory of poetry in general, although from the vigour with which he carried the war into the enemy's country it was naturally enough for polemic purposes taken as such; it was a statement and defence of the principles on which his own poems of bumble life were composed. Wordsworth also assailed the public taste as "depraved," first

1 Sir Henry Taylor, one of the most acute and judicious of Wordsworth's champions, came to this conclusion in 1834.

2 Although Coleridge makes the qualifications more prominent than they were in the original statement, the two theories are at bottom so closely the same that one is sometimes inclined to suspect that parts, at least, of the original emanated from the fertile mind of Coleridge himself. The two poets certainly discussed the subject together at Somanet when Wordsworth was with Coleridge was at Grasmere when the Preface was prepared in 1800. The diction of the Preface is curiously Hartleian, and, when they first met. Coleridge was a devoted disciple of Hartley, naming his first son after the philosopher while Wordsworth detested Hartley's psychology. If Coleridge did contribute to the original theory in 1798 or 1800, he was likely enough to have forgotten the fact by 1814. At any rate, he evidently wrote his criticism without making a close study of the Preface, and what he did in effect was to restore the original theory against popular misconceptions of it.
Such was Wordsworth's theory of poetic diction. Nothing could be more grossly mistaken than the notion that the greater part of Wordsworth's poetry was composed in defiance of his own theory, and that he succeeded best when he set his own theory most at defiance. The misconception is traceable to the authority of Coleridge. His just, sympathetic and penetrating criticism on Wordsworth's work as a poet did immense service in securing for him a wider recognition; but his proved friendship and brilliant style have done sad injustice to the poet as a theorist. It was natural to assume that Coleridge, if anybody, made him conscious that his poetic work is itself a kind of ideal natural also that readers under the charm of his lucid and melodious prose should gladly grant themselves a dispensation from the trouble of verifying his facts in the harsh and cumbrous exposition of the theorist himself.  

The question of diction made most noise, but it was far from being the most important point of poetic doctrine set forth in the Preface. If in this he merely enunciated a truism, generally admitted in words but too generally ignored in practice, there was real novelty in his plea for humble subjects, and in his theory of poetic composition. Wordsworth's remarks on poetry in general, the fitness of the selection of the imagination in dignifying humble and commonplace incidents, and on the need of active exercise of imagination in the reader as well as in the poet, are immeasurably more important than his theory of poetic diction. Such sayings as that poetry "takes its origin from emotion recollected in tranquillity," or that it is the business of a poet to trace "how men associate ideas in a state of excitement," are significant of Wordsworth's endeavour to lay the foundations of his art in an independent study of the feelings and faculties of men in real life, unbiased as far as possible by poetic custom and convention. This does not mean that the new poet was to turn back on his predecessors and never look behind him to what they had done. Wordsworth was guilty of no such extravagance. He was from boyhood upwards a diligent student of poetry, and was insensible to his obligations to the past. His purpose was only to use real life as a touchstone of poetic substance. The poet, in Wordsworth's conception, is distinctively a man in whom the beneficent energy of imagination, operative as a blind instinct more or less in all men, is stronger than in others, and is voluntarily and rationally exercised for the benefit of all in its proper work of increase and consolation. Not every imagination is the true imagination. Human life is necessarily poetical. It is the business of the poet to select and modify, for his special purpose of producing immediate pleasure. There were several respects in which the formal recognition of such elementary principles of poetic evolution powerfully affected Wordsworth's practice. One of these may be indicated by saying that he endeavoured always to work out an emotional motive from within. Instead of choosing a striking theme and working at it like a decorative painter, embellishing, enriching, dressing to advantage, standing back from it and studying effects, his plan was to take incidents that had set his own imagination spontaneously to work, and to study and reproduce with artistic judgment the modification of the initial feeling, the emotional motive, within himself. To this method he owed much of his strength and also much of his unpopularity. By keeping his eye on the object, as spontaneously modified by his own imaginative energy, he was able to give full and undistracted scope to all his powers in poetic coinage of the wealth that his imagination brought. On the other hand, readers whose nature or education was different from his own, were repelled or left cold and indifferent, or obliged to make the sympathetic effort to see with his eyes, which he refused to make in order that he might see with theirs.

"He is retired as noontide dew
Or fountain in a noon-day grove,
And you must love him ere you see,
He will seem worthy of your love.

From this habit of taking the processes of his own mind as the standard of the way in which "men associate ideas in a state of excitement," and language familiar to himself as the standard of the language of "real men," arises a superficial anomaly in Wordsworth's poetry, an apparent contradiction between his practice and his theory. His own imagination, judged by ordinary standards, was easily excited by emotional motives that have little force with ordinary men. Most of his poems start from humbler, slighter, less generally striking themes than those of any other poet of high rank. But his poetry is not correspondingly simple. On the contrary, much of it, the best of it—for example, the Ode to Duty, and that on the Intimations of Immortality—is intricate, elaborate and abstruse. The emotional motive is simple; the passion has almost always a simple origin, and often is of no great intensity; but the imaginative structure is generally elaborate, and, when the poet is at his best, supremely splendid and gorgeous. No poet has built such magnificent palaces of rare material for the ordinary everyday homely human affections. It is because he has invested our ordinary everyday principles of conduct, which are so apt to come to us with such imperishable robes of finest texture and richest design that Wordsworth holds so high a place among the great moralists in verse.

His practice was influenced also, and not always for good, by his theory that poetry "takes its origin from emotion recollected in tranquillity." This was a somewhat doubtful corollary from his general theory of poetic evolution. A poem is complete in itself; there must be no sting in it to disturb the reader's content with the whole; through whatever agitations it progresses, to whatever elevations it soars, to this end it must come, otherwise it is imperfect as a poem. Now the imagination in ordinary life, though the process is not the best of it in verse, and the poet's special art has thus no share in producing the effect, reaches the poetic end when it has so transfigured a disturbing experience, whether of joy or grief, that this rest tranquilly in the memory, can be recalled without disquietude, and dwelt upon with some mode and degree of pleasure, more or less keen, more or less pure or mixed with pain. True to his idea of imitating real life, Wordsworth made it a rule for himself not to write on any theme till his imagination had operated upon it for some time involuntarily; it was not in his view ripe for poetic treatment till this transforming agency had subdued the original emotion to a state of tranquillity. Out of this tranquillity arises the favourable moment for poetic composition, some day when, as he contemplates the subject, the tranquillity disappears, an emotion kindled to the original emotion is restated, and the poet retraces and supplements with all his art the previous involuntary and perhaps unconscious imaginative chemistry.

When we study the moments that Wordsworth found favourable for successful composition, a very curious law reveals itself, somewhat at variance with the common conception of him as a poet who derived all his strength from solitary communion with nature. We find that the recluse's best poems were written under the excitement of some break in the monotony of his quiet life—change of scene, change of companionship, change of occupation. The law holds from the beginning to the end of his poetic career. An immense stimulus was given to his powers by his first contact with Coleridge after two years of solitary and abortive effort. Above Tintern Abbey was composed in 1807, from these two or subsequent editions; but he argued that it was dangerous for a poet to make alterations on the simple authority of a few individuals or even classes of men, because if he did not follow his own judgment and feelings his mind would infallibly be debilitated.

1 Wordsworth was not an adroit expositor in prose, and he did not make his qualifications sufficiently prominent, but his theory of diction taken with those qualifications left him free without inconsistency to use any language that was not contrary to "true taste and feeling." He acknowledged that he might occasionally have substituted "particular for general associations," and that thus language might be the poetic feeling that was most congenial and ridiculous to others, as in The Idiot Boy and Goody Blake; he even went so far as to withdraw Alice Fell, first published in 1807, from all succeeding editions; but he argued that it was dangerous for a poet to make alterations on the simple authority of a few individuals or even classes of men, because if he did not follow his own judgment and feelings his mind would infallibly be debilitated.

2 The Prelude contains a record of his practice, after the opening lines of the first book, on make a present joy the matter of a song.

3 "Thus far, O friend! did I, not used to make
A present joy the matter of a song.
Pour forth," &c.
during a four days' ramble with his sister; he began it on leaving Tintern, and concluded it as he was entering Bristol. His residence amidst strange scenes and "unknown men" at Goslar was particularly fruitful: She Dwell among the Untried Ways, Ruth, Nutting, There was a Boy, Wisdom and Spirit of the Tintern, All was signalized by the portion of the environment. The breeze that met him as he issued from the city gates on his homeward journey brought him the first thought of The Prelude.

At the end of 1799 he was settled at Grasmere, in the Lake District, and seeing much of Coleridge. The second year of his residence at Grasmere was unproductive; he was "hard at work," then on The Excursion; but the excitement of a tour on the Continent in the autumn of 1802, combined perhaps with a happy change in his pecuniary circumstances and the near prospect of marriage, roused him to one of his happiest fits of activity. His first great sonnet, The Lines on Westminster Bridge, was composed on the roof of the Dover coach; the first of the splendid series "dedicated to national independence and liberty," the most generally impressive and universally intelligible of his poems, Fair Star of Evening, Once did She hold the Gorgeous East in Fee, Tousissant; Milton, thou shouldst be Living at this Hour; It is not to be Thought of that the Flood, When I have Borne in Memory what has Tamed, were all written in the course of the tour, or in London in the month after his return. A tour in Scotland in the following year, 1803, yielded the Highland Girl Ballad, The Solitary, The Chimney Sweeper, The Affliction of Margaret and the Ode to Duty, his greatest poems in two different veins, were coincident with the exaltation of spirit due to the triumphant and successful prosecution of the long-delayed work. The Character of the Happy Warrior, which he described to Harriet Martineau as "a chain of extremely valuable thoughts," though it did not fulfill "poetic conditions," was the product of a calmer period. The excitement of preparing for publication always had a rousing effect upon him; the preparation for the edition of 1807 resulted in the completion of the ode on the Intimations of Immortality, the sonnets The World is too much with us, Methought I saw the Footsteps of a Throne, Two Voices are there, and Lady, the Songs of Spring were in the Grove, and the Song at the Feast of Brougham Castle. After 1807 there is a marked falling off in the quality, though not in the quantity, of Wordsworth's poetic work. It is significant of the comparatively sober and laborious spirit in which he wrote The Excursion that its progress was accompanied by none of those casual sallies of exulting and exuberant power that mark the period of the happier Prelude. The completion and publication of the production which began in the spring of 1807, was inspired by the noble sonnet to Haydon—High is our Calling, Friend. He rarely or never again touched the same lofty height.

It is interesting to compare with what he actually accomplished the plan of life-work with which Wordsworth settled at Grasmere in the last month of 1799. The plan was definitely conceived as he left the German town of Goslar in the spring of 1799. Tired of the wandering unsettled life that he had led hitherto, dissatisfied also with the fragmentary occasional and discursive character of his earlier poems, he longed for a permanent home among his native hills, where he might, as one called and consecrated to the task, devote his powers continuously to the composition of a great philosophical poem on "Man, Nature and Society." The poem was to be called The Recluse, "as having for its principal subject the sensations and opinions of a poet living in retirement." He communicated the design to Coleridge, who gave him enthusiastic encouragement to proceed. But, though he had still before him fifty years of peaceful life amidst his beloved scenery, the work in the projected form at least was destined to remain incomplete. Doubts and misgivings that Wordsworth's reputation, as his inspiration delayed their coming. To sustain him in his resolution he thought of writing as an introduction, or, as he put it, an antechapel to the church which he proposed to build, a history of his own mind up to the time when he recognized the great mission of his life. One of the many laughs at his expense by unsympathetic critics has been directed against his saying that he wrote this Prelude of fourteen books about himself out of diffidence. But in truth the original motive was distrust of his own powers. He turned aside to prepare the second volume of The Poets, Wordsworth's great achievement of the spring of 1807. In 1807 appeared two volumes of collected poems. It was not till 1814 that the second of the three divisions of The Recluse, ultimately named The Excursion, was ready for publication; and he went no further in the execution of his great design.

The derisive fury with which The Excursion was assailed upon its first appearance has long been a stock example of critical blindness, yet the error of the first critics is seen to lie not in their indictment of faults, but in the prominence they gave to the faults and their generally disrespectful tone towards Wordsworth. Wordsworth's genius, Jeffrey's petulant "This will never do," uttered, professorly at least, more in sorrow than in anger, because the poet would persist in spite of all friendly counsel in misapplying his powers, has become a byword of critical coarseness. But The Excursion has not "done," and even Wordsworthians who laugh at Jeffrey are in the habit of repeating the substance of his criticism.

Jeffrey, it will be seen, was not blind to the occasional felicities and unforgettable lines celebrated by Coleridge, and his general judgment on The Excursion has been abundantly ratified. It is not surprising The Excursion has been abundantly ratified. It is not surprising the Excursion has been sufficiently justified by its partial reception. It is not surprising that adverse criticism had a depressing influence on Wordsworth's poetical powers, notwithstanding his nobly expressed defiance of it and his determination to hold on in his own path undisturbed. Its effect in retarding the sale of his poems was a favourable topic with him in his later years; but the absence of general appreciation, and the ridicule of which he considered his best and most distinctive work, contributed in all probability to a still more unfortunate result—the premature depression and deadening of his powers.

1 This casual estimate of his own work is not merely amusing but also instructive, as showing—what is sometimes denied—that Wordsworth himself knew well enough the difference between "poetry" and such "valuable thoughts" as he propounded in The Excursion.

2 Wordsworth's residences in the Lake District were at Dove Cottage, Townsend, Grasmere, from December 1799 till the spring of 1808; Allan Bank, from 1808 to 1811; the parsonage at Grasmere, from 1811 to 1813; Rydal Mount, for the rest of his life. Dove Cottage was bought in 1814 as a public memorial, and is held by trustees.

3 "A poem of love and exquisite sensibility," wrote a reviewer of 1834, "that has the true simplicity of poetry, and the genuine pathos of human feeling."

5 Matthew Arnold elsewhere has said that "for he knew not how many years his poetry had never brought him in enough to buy his shoe-string" (preface to Selection, p. v.). The literal facts are that he received £100 from the Longmans in 1800, and nothing more till 1837. In 1855 Wordsworth purchased the copyright of his writings for £1000 (Prose Works, iii. 437).
For five years after the condemnation of The Excursion Wordsworth published almost nothing that had not been composed before. The chief exception is the Thanksgiving Ode of 1816. In 1817 he published a new edition of his poems, in the arrangement according to faculties and feelings in which they have since stood; and he sought to explain his purposes more completely than before in an essay on "Poetry as a Study." In the same year he was persuaded to publish The White Doe of Ryldstone, written mainly eight years before. In purely poetic charm The White Doe ought to be ranked among the most perfect of Wordsworth's poems. But Jeffrey, who was too busy to enter into a vein of poetry so remote from common romantic sentiment, would have none of The White Doe: he pronounced it "the worst published volume," and the public too readily endorsed his judgment. Two other poems, with which Wordsworth made another appeal, were not more successful. Peter Bell, written in 1798, was published in 1819; and at the instigation of Charles Lamb it was followed by The Waggoner, written in 1805. Both were mercilessly ridiculed and parodied. These tales from humble life are written in Wordsworth's most unconventional style, and with them emphatically "not to sympathize is not to understand."  

Meantime, the great design of The Recluse languished. The neglect with which Wordsworth himself conceived to be his best, and most characteristic work was not encouraging; and there was another reason why the philosophical poem on man, nature, and society did not make progress. Again and again in his poetry Wordsworth celebrates the value of constraint, and the disadvantage of "too much liberty," of "unchartered freedom."  

The formlessness of the scheme prevented his working at it continuously. Hence his "philosophy" was expressed in casual disconnected sonnets, or in sonnets and other short poems connected by the simplest of all links, sequence in time or place. He stumbled upon three or four such serial ideas in the latter part of the poem, and found the public in 1837, clouds of considerable length, which may be regarded as fragments of the project which he had not sufficient energy of constructive power to execute. The Sonnets on the River Duddon, written in 1820, follow the river from its source to the sea, and form a partial embodiment of his philosophy of nature. The Ecclesiastical Sonnets, written in 1820-1821, trace the history of the church from the Druids onwards, following one of the great streams of human affairs, and exhibit part of his philosophy of society. A tour on the Continent in 1820, a tour in Scotland in 1831, a tour in Italy in 1837, furnished him with other serial forms, serving to connect miscellaneous reflections on man, nature and society; and his views on the punishment of death were strung together in still another series in 1840. 

It was Coleridge's criticism in the Biographia Literaria (1817), together with the enthusiastic and unreserved championship of Wilson in Blackwood's Magazine in a series of articles between 1819 and 1822 (Recreations of Christopher North), that formed the turning-point in Wordsworth's reputation. From 1820 to 1830 De Quincey says it was militant, from 1830 to 1840 triumphant. On the death of Southey in 1843 he was made poet laureate. He bargained with Sir Robert Peel, before accepting, that no official verse should be required of him; and his only official composition, an ode on the installation of the Prince Consort as chancellor of Cambridge university in 1847, is believed to have been written either by his son-in-law Edward Quillinan or by his nephew Christopher (afterwards bishop of Lincoln). He died at Rydal Mount, after a short illness, on the 23rd of April 1850, and was buried in Grasmere churchyard. His wife survived him till 1859, when she died in her 90th year. They had five children, two of whom had died in 1832; the two surviving sons, John (d. 1875) and William (d. 1883), had families; the other child, a daughter, Dora, Wordsworth's favourite, married Edward Quillinan in 1841 and died in 1847. 

1 See the Sonnet, Nuns fret not, &c., The Pass of Kirkstone and the Ode to Duty.
WORLD, a word which has developed a wide variety of meanings from its original etymological sense of the "age of man," "course of man's life." In O. Eng. it appears under its true form world, being a compound of wer, man (cf. Lat. vir), and ylde, age, from eold, old. Of the various meanings the principal to the modern are world (q.v.), as planet, or a large division of the earth, such as the "old world," "new world," and the "western hemisphere;" the whole of created things upon the earth, particularly its human inhabitants, mankind, the human race, or a great division of mankind united by a common racial origin, language, religion or civilization, &c. A derived meaning is that of social life, society, as distinct from a religious life.

WORM, a term used popularly to denote almost any kind of elongated, apparently limbless creature, from a lizard, like the blindworm, to the grub of an insect or an earthworm. Linnaeus applied the term to resemble the modern zoological divisions Mollusca, Crustacea, Protozoa, Tentaculata, Echinodermata as well as to those forms which more modern zoologists have recognized as worms. As a matter of convenience the term Vermes or Verminea is still employed, for instance in the International Catalogue of Zoological Names and the Zoological Literature, to cover a number of wormlike animals. In systematic zoology, however, the use of a division Vermes has been abandoned, as it is now recognized that many of the animals that even a zoologist would describe as worms belong to different divisions of the animal kingdom. The so-called flatworms (Platyelminia, &c.), including the Planarians (q.v. Flukes (see Trematodes), Cestodes (see Tapeworm) and the curious Mesozoa (q.v.), are no doubt related. The marine Nemertine worms (see Nemertina) are isolated. The thick-skinned round worms, such as the common horse-worm and the threadworms (see Nematoda), together with the Nematomorpha (q.v.), Chaetosomatida (q.v.), Desmoscolecida (q.v.) and Acanthocephala (q.v.), form a fairly natural group. The Rottera (q.v.), with probably the Kinorhyncha (q.v.) and Gastrotricha (q.v.), are again isolated. The remaining worms are probably all elongated animals. There is a definite Annelid group (seeANNELIDA), including the Archiannelida, the bristleworms (see Chaetopoda), of which the earthworm (q.v.) is the most familiar type, the Myzostomida (q.v.), Hirudinea (see Leech) and the armed Gephyreans (see Echiuroidea). The unarmed Gephyreans (see Gephyrea) are now separated from their former associates and divided into two groups of little affinity, the Sipunculoidea and the Priapulidea (q.v.). The Phoronidea (q.v.) are now associated with Hemichordata (q.v.) in the line of vertebrate ancestry, whilst the Chaetognatha (q.v.) remain in solitary isolation.

Mention is made under Tapeworm of the worms of that species inhabiting the human body as parasites, and it will be convenient here to mention other parasitic varieties. The most common human parasite is the Ascaris lumbricoides or round worm, found chiefly in children and occupying the upper portion of the intestine. They are usually few in number, but occasionally occur in such large numbers that they cause intestinal obstruction. Unlike the tapeworm, no intermediate host is required for the development of this worm. It develops from direct ingestion of the larvate. Various symptoms, such as diarrhea, anaemia, intermittent fever, restlessness, irritability and convulsions are attributed to these worms. The treatment is the administration of antimonial, followed by a purgative. The threadworm or Oxyuris vermicularis is a common parasite infecting the rectum. The larvae of this worm are also directly swallowed, and infection probably takes place through water, or possibly through lettuces and watercress. The symptoms caused by threadworms are loss of appetite, anaemia and intense irritation and itching. Oxyuris probably represents a nematode containing quassia, carbolic acid, vinegar or turpentine or even common salt. In addition mild purgatives should be given.

WORMS, a city of Germany, in the grand-duchy of Hesse-Darmstadt, situated in a fertile plain called the Wonnewaag, on the left bank of the Rhine, 25 m. S. of Mainz, 20 m. N.W. of Darmstadt, and 3 m. E. of Wiesbaden. Pop. (1855) 28,676; (1905) 43,841, about a third of which are Catholics. The town is irregularly built, and some of the old walls and towers still remain, but its general aspect is modern. The principal church and chief building is the spacious cathedral of SS. Peter and Paul, which ranks beside those of Spires and Mainz among the noblest Romanesque churches of the Rhine (see Architecture: Romanesque and Gothic in Germany). This magnificent basilica, with four round towers, two large domes, and a choir at each end, has a specially imposing exterior. It was consecrated in 1208, and the impression of great dignity and simplicity, heightened by the natural colour of the red sandstone of which it is built. Only the ground plan and the lower part of the western towers belong to the original building consecrated in 1110; the remainder was mostly finished by 1181, but the west choir and the vaulting were built in the 13th century, the elaborate south portal was added in the 14th century, and the central dome has been rebuilt. The ornamentation of the older parts is simple to the verge of rudeness; and even the more elaborate later forms show no high development of the art. The baptistery contains five remarkable stone reliefs of the late 15th century. The cathedral is 358 ft. long, and 80 ft. wide, or including the transepts, which are near the west end, 118 ft. (inside measurements). It belongs to the Roman Catholic community, who possess also the church of St Martin and the church of Our Lady (Liebfrauenkirche), a handsome Gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is the Trinity church, built in 1726. Second in interest to the cathedral is the church of St Paul, also in the Romanesque style, and dating from 1102-1116, with a choir three-foored, central tower and other Romanesque buildings. This church has been converted into an interesting museum of national antiquities. The late Romanesque church of St Andrew is not used. The old synodicon, an unassuming building erected in the 11th century and restored in the 13th, is completely modernized. The Jewish community of Worms (about 1300 in number) claims to be the most ancient in Germany and to have existed continuously since the Christian era, though the earliest authentic mention of it occurs in 568. A curious tradition, illustrating the efforts of the dispersed people to conciliate their oppressors, asserts that the Jews of Worms gave their voice against the crucifixion, but that their messenger did not arrive at Jerusalem until after the event.

The town hall was rebuilt in 1884. The Bischofshof, in which the most famous diet of Worms (1251) was held, is now replaced by a handsome modern residence. The Lugisland is an old watch-tower of the 13th century. In the Lutherplatz rises the imposing Luther monument (unveiled in 1886), on a platform 48 ft. sq. In the centre the colossal statue of Luther rises, on a pedestal on the base of which are sitting figures of Peter Waldo, Wycliffe, Hus and Savonarola, the heralds of the Reformation; at the corners of the platform, on lower pedestals, are statues of Luther's contemporaries, Melanchthon, Reuchlin, Philip of Hesse, and Frederick the Wise of Saxony, between which are allegorical figures of Magdeburg (mourning), Spires (protesting) and Augsburg (confessing). The greater part of the work, which took nine years to execute, was designed by Rietschel, and carried out after his death in 1861 by Gustav Kiefer (1826-1908), Adolf von Donndorf (b. 1835) and Johannes Schilling (b. 1828). The "Rosengarten" on the opposite bank of the Rhine.

1 The O. Eng. worm represents a word common to Teutonic languages for a snake or worm, cf. Ger. Warn, Dan. and Swed. erin, Du. Worm. The Lat. vermis must be connected. The Sanskrit word is krimi; which has given karmas, the coelinal insect, whence "crimson." Sleave takes the skeptical view that to be karmic, especially in a circular motion, seen in "curve," "circle," &c. The word "worm" is applied to many objects resembling the animals in having a spiral shape or motion, as the spiral thread of a screw, or the spiral pipe through which a jet is passed, or the spiral track of a screw (q.v.). In disparagement and contempt the word is also used of persons, from the idea of wriggling or creeping on the ground, partly, too, perhaps, with a reminiscence of Genesis iii. 14.
associated with the stories of the wooling of Kriemhild (see Infra), has been laid out in keeping with the old traditions and was opened with great festivities in 1906. Extensive burial-gounds, ranging in date from neolithic to Merovingian times, have recently been discovered near the city.

The trade and industry of Worms are important, and not the least resource of the inhabitants is vine-growing, the most famous vintage being known as Liebfraumilch, grown on vineyards near the Liebfrauenkirche. The manufacture of patent leather employs about 5000 hands. Machinery, wool, cloth, chincory, slates, &c., are also produced. Worms possesses a good naval harbour, and it is a considerable trade by water.

Worms was known in Roman times as Borbetomagus, which in the Merovingian age became Wormatia, afterwards by popular etymology connected with Wurm, a dragon. The name Borbetomagus indicates a Celtic origin for the town, which had, however, before Caesar’s time become the capital of a German tribe, the Vangiones. Drusus is said to have erected a fort here in 14 B.C. In 413 the emperor Jovinus permitted the Burgundians under their king Gunther or Gundir to settle on the left bank of the Rhine between the Lauter and the Nahe. Here they founded a kingdom with Worms as its capital. Adopting Arianism they came into conflict with the Romans, and in 438 Gundahar or Gundir (the Gunther of the Nibelungenlied) rose in 435 against the Roman governor Aetius, who called in the Huns against them. The destruction of Worms and the Burgundian kingdom by the Huns in 456 was the subject of heroic legends afterwards incorporated in the Nibelungenlied (q.v.) and the Rosengarten (an epic probably of the late 13th century). In the Nibelungenlied King Gunther and Queen Brunhild hold their court at Worms, and Siegfried comes hither to woo Kriemhild.

Worms was rebuilt by the Merovingians, and became an episcopal see, first mentioned in 614, although a bishop of the Vangiones had attended a council at Cologne as early as 347. There was a royal palace from the 8th century, in which the Frankish kings, including Charlemagne, occasionally resided. The scene of the graceful though unhistorical romance of Einhard and Emma, the daughter of Charlemagne, is laid here.

Under the German kings the power of the bishops of Worms gradually increased, although they never attained the importance of the other Rhenish bishops. Otto I. granted extensive lands in the Rhineland, in 916 Bishops, and religious councils were held in his city. Burchard I. (bishop from 1000 to 1025) destroyed the castle of the Franconian house at Worms, built the cathedral and laid the foundations of the subsequent territorial power of the see. There were frequent struggles between the bishops and the citizens, who espoused the cause of the emperors against them, and were rewarded by privileges which fostered trade. Henry IV. granted a charter to Worms in 1074, and held a synod there in 1076, by which Pope Gregory VII. was declared deposed. Henry V. acquired Worms in 1121 by the treaty of Würzburg, built a castle and granted privileges to the city, which retained its freedom until 1801, in spite of the bishops, who ruled a small territory south of the city, on both sides of the Rhine, and resided at Ladenburg near Mannheim till 1622.

The city of Worms was frequently visited by the imperial court, and won the title of "Mother of Diets." The concordat of Worms closed the investiture controversy in 1222. The "perpetual peace" (einer Landsfriede) was proclaimed by the emperor Maximilian I. at the diet of 1495, and Luther appeared before the famous diet of 1521 to defend his doctrines in the presence of Charles V. Four years later, Worms formally embraced Protestantism, and religious controversies were held there in 1540 and 1557. It suffered severely during the Thirty Years’ War. After being sacked in turn by Mansfeld, Tilly and the Spaniards, it was taken by Oexenstierna in 1632, who held a convention here with his German allies. The imperialists again took Worms in 1635, and it admitted the French under Turenne in 1644. The French under Mélac burnt the city almost entirely in 1689, and it has only fully recovered from this blow in recent years. Thus the population, which

in its prosperous days is said to have exceeded 50,000, had sunk in 1875 to 6250.

By the treaty of Worms in 1743 an offensive alliance was formed between Great Britain, Austria and Sardinia. The French under Custine took the city by surprise in 1792 and it was annexed by the peace of Lunéville in 1801 to France, together with the bishop’s territories on the left bank of the Rhine. The remaining episcopal dominions were secularized in 1803 and given to Hesse-Darmstadt, which acquired the whole by the Vienna Congress in 1815. In 1849 the Baden revolutionaries seized Worms, but were overthrown by the Mecklenburgers and Prussians in May of that year.

See Zoon, Wormser Chronik (Stuttgart, 1857); Fuchs, Geschichte der Stadt Worms (Worms, 1868); F. Soldan, Der Reichstag zu Worms, 1622 (Worms, 1883); Beiträge zur Geschichte der Stadt Worms (Worms, 1896); G. Wolf, Zur Geschichte der Juden in Worms (Breslau, 1862); Nover, Das alte und neue Worms (Worms, 1895).

**WORMWOOD**, the popular name for an aromatic herb known botanically as Artemisia Absinthium, a member of the family Compositae. It grows from 1 to 3 ft. high and is thickly hairy; the leaves are small and much cut, and the flowers are small yellow hemispherical heads among the leaves at the end of the branches. It grows in waste places. It is a tonic and vermifuge drug, and is used for its flavouring properties in alcohol and in the preparation of absinthe (from the Latin absinthus, "good mercy"), a drink of ancient use and considerable popularity in France. It is also used in the preparation of the liqueur absinthe. Absinthe was once a well-known European drink, but the use of absinthe was banned in 1915 due to its reputed association with the writer Oscar Wilde and its popularity among the Bohemian artists of the Belle Époque.

**WORSBOROUGH**, an urban district in the Holmfirth parliamentary division of the W. Riding of Yorkshire, England, 3 m. S. of Barnsley, near the Sheffield & Barnsley branch of the Great Central railway, and on a branch of the Dearne & Dove canal. Pop. (1901) 10,336. The church of St Mary is an interesting structure with remains of Norman work, but chiefly of Early English date. There are extensive collieries and gunpowder mills near, and in the town iron and steel works and corn mills.

**WORSHIP**, (i.e. "worth-ship"), O. Eng. wordscipe, honour, dignity, reverence, respect. The word is used in a special sense of the service, reverence and honour paid, by means of devotional words or acts, to God, to the gods, or to hallowed persons, such as the Virgin Mary or the saints, and hallowed objects, such as holy images or relics. In this sense, however, it must be borne in mind that the Roman Catholic Church distinguishes three kinds of worship: (1) latres, the worship due to God alone (from Gr. xaria, service, veneration, adoration), (2) dulia, the worship or adoration due to the Virgin Mary as the Mother of God (from Gr. dmia, above, and doulia, service), and (3) hyoia, the worship due to the saints. The public service of God in church is known as "divine worship" or "divine service" (see Liturgy). In the sense of "reverence" or "respect," the verb "to worship" occurs in the English Prayer-book, in the phrase "with my body I worship" in the Marriage Service. In this sense the term "worship" is also used as a title of honour in speaking of or addressing persons of position. Thus a mayor is spoken of as "his worship the mayor," or "the worshipful the mayor." Magistrates are addressed as "your worship.

**WORSLEY**, PHILIP STANHOPE (1835-1886), English poet, son of the Rev. Charles Worsley, was born on the 12th of August 1835, and was educated at Highgate grammar school and Corpus Christi College, Oxford, where he won the Newdigate prize in 1857 with a poem on "The Temple of Janus." In 1861 he published a translation of the Odyssey, followed in 1865 by a translation of the first twelve books of the Iliad, in both of which he employed the Spenserian stanza with success. In 1863 he published a volume of Poems and Translations. Worsley died on the 8th of May 1866. His translation of the Iliad was completed after his death by John Conington.
WORTH, C. F.—WÖRTH

WORTH, CHARLES FREDERICK (1825-1895), the famous dressmaker, was born at Bourne, Lincolnshire, in 1825. His father, a country solicitor, having lost his money in speculation, Charles was sent to London as an apprentice to Swan & Edgar, drapers. Thence, in 1846, he went to Paris, without capital or friends, and after twelve years of hard work made a name in the trade. He began business as a dressmaker in partnership with a Swede named Dobergh. His originality and skill in design won the patronage of the empress Eugénie, and, through her, of fashionable Paris. After the Franco-German War, during which he turned his house into a military hospital, his partner retired, and Worth continued the business, which employed 1200 hands, with his two sons John and Gaston—both naturalized Frenchmen. For more than thirty years he set the taste and ordained the fashions of Paris, and extended his sway over all the civilized and much of the uncivilized world. He died on the 2nd of March 1895.

WÖRTH, a village of Alsace, on the Sauer, 6 m. N. of Haguenau, which gives its name to the battle of the 6th of August 1870, fought between the Germans under the crown prince of Prussia and the French under Marshal MacMahon. The battle is also called Reichshofen and Fröschwiler.

The events which led up to the engagement, and the general situation on the 6th are dealt with under FRANCO-GERMAN WAR. During the 5th of August the French concentrated in a selected position running nearly N. and S. along the Sauer near the former Colmar road, while at the same time the Prussians were moving N. The French position was marked from right to left by Morsbronn, the Niederwald, the heights W. of Wörth and the woods N.E. of Fröschwiler. E. of the Sauer the German III. army was moving S. towards Haguenau, when their cavalry found the French position about noon. Thereafter the German vedettes held the French under close observation, while the latter moved about within their lines and as far as the village of Wörth as if in peace quarters, and this notwithstanding the defeat of a portion of the army at Weissenburg on the previous day. The remnant of the force which had been engaged, with many of its wounded still in the ranks, marched in about noon with so solidly a bearing that, so far from their depressing the morale of the rest, their appearance actually raised it.

About 5 P.M. some horses were watered at the Sauer, as in peace, without escort, though hostile scouts were in sight. A sudden swoop of the enemy's hussars drove the party back to camp. The alarm was sounded, tents were struck and the troops fell in along the line and remained under arms until the confusion died down, when orders were sent to fall out, but not to pitch the tents. The army therefore bivouacked, and for the first time the battle of the Sauer was seen by the public. A map shows the position of the lines on the 6th. The French had disposed their forces on the heights from right to left, from Morsbronn to Froschweiler, the woods N.E. of Fröschwiler. The Prussians, under the crown prince of Prussia, were disposed at Haguenau, ready to march at a moment's notice.

The Prussian guns, as strict orders had been given to avoid all engagement that day, soon withdrew and were about to return to camp, when renewed artillery fire was heard from the S. and presently also from the N. In the latter direction, the II. Bavarian corps had bivouacked along the Mattstall-Langen-sulzbach road with orders to continue the march if artillery were heard to the S. This order was contrary to the spirit of the III. army orders, and moreover the V. Prussian corps to the S. was in ignorance of its having been given.

The outpost battery near Wörth was heard, and the Bavarians at once moved forward. Soon the leading troops were on the crest of the ridge between the Sauer and the Sulzbach, and the divisional commander, anxious to prove his loyalty to his new allies—his enemies in 1866—ordered his troops to attack, giving the spire of Fröschwiler, which was visible over the woods, as the point of direction. The French, however, were quite ready and a furious fusillade broke out, which was multiplied by the echoes of the forest-clad hills out of all proportion to the numbers engaged. The Prussian officers of the V. corps near Dieffenbach, knowing nothing of the orders the Bavarians had received, were already回事ing; but the French, who were retiring, in some cases in great disorder, the corps commander, General von Kirchbach, decided that an effort must at once be made to relieve the Bavarians. His chief of staff had already ordered up the divisional and corps artillery (84 guns in all), and he himself communicated his intention of attacking to the XI. corps (General von Bose) on his left and asked for all available assistance. A report was also despatched to the crown prince at Sulz, 5 m. away.

Meanwhile the XI. corps had become involved in an engagement. The left of the V. corps had occupied Gunstett and the bank of the Sauer, and the French shortly after daylight on the 6th sent down an unarmed party to fetch water. As this appeared through the mist, the Prussians naturally fired upon it, and the French General Larigique (to whose division the party belonged), puzzled to account for the firing, brought up some batteries in readiness to repel an attack. These fired a few rounds only, but remained in position as a precaution.

Hearing the firing, the XI. corps' advanced guard, which had marched up behind in accordance with the general movement of the corps in changing front to the west, and had halted on reaching the crest of a high ridge, was engaged. The French attack came up at Spachbach and Gunstett. In this movement across country to Spachbach some bodies appear to have exposed themselves, for French artillery at Elsaasshausen suddenly opened fire, and the shrapnel bursting high, sent showers of bullets on to the house roofs of Spachbach, in which village a battalion had just halted. As the falling tiles made the position undesirable, the major in command ordered the march to be resumed, and as he gave the order, his horse ran away with him towards the Sauer. The leading company, seeing the battalion commander gallop, moved off at the double, and the others at course of course followed.

Coming within sight of the enemy, they drew a heavy shell fire, and, still under the impression that they were intended to attack, deployed into line of columns and doubled down to the river, which they crossed. One or two companies in the neighbourhood had already begun to do so, and the stream being too wide for the mounted officers to jump, presently eight or ten companies were across the river and out of superior control. By this time the French outposts (some 1500 rifles), lining the edge of the Niederwald, were firing heavily. The line of smoke was naturally accepted by the Prussians as their own, and the whole right flank and the enemy suspected. A French battalion gallop, at course of course followed.

The same thing had happened at Gunstett. A most obstinate struggle ensued and both sides brought up reinforcements. The Prussians, with all their attention concentrated on the wood in their front, and having as yet no superior commanders, soon exhibited signs of confusion, and thereupon General Larigique ordered a counter attack towards the heights of Gunstett, when all the Prussians between the Niederwald and the Sauer gave way. The French followed with a rush, and, forcing the Sauer, made the mistake of giving the place of the long line of German guns upon the heights in considerable danger. At this crisis a fresh battalion of the XI. corps arrived by the road from Surburg to Gunstett, and attacked the French on one flank whilst the guns swept the other. The momentum of the charge died out, and the French drifted backwards after an effort which compelled the admiration of both sides.

In the centre the fight had been going badly for the V. corps. As soon as the 84 guns between Dieffenbach and Spachbach opened fire the French disappeared from sight. There was no longer a target, and, perhaps to compel his adversary to show himself, von Kirchbach ordered four battalions to cross the river. These battalions, however, were widely separated, and coming under fire as soon as they appeared, they attacked in two groups, one from Wörth towards Fröschwiler, the other from near Spachbach towards the Calvar spur, E. of
Elsasshausen. Both were overpowered by infantry fire. A fraction of the S. party maintained itself all day in the elbow of the Hagenau chaussée, which formed a starting-point for subsequent attacks. But the rest were driven back in great confusion. Once more the dashing counter-attack of the French was thrown into confusion by the Prussian shell fire, and as the French fell back the Prussian infantry, now reinforced, followed them up (about 1 p.m.). The commander-in-chief of the German III. army (the crown prince Frederick) now appeared on the field and ordered Kirchbach to stand fast until the pressure of the XI. corps and Würtemberg division could take effect against the French right wing. The majority of these troops had not yet reached the field. Von Bose, however, seeing the retreat of the troops of the V. corps, had independently determined to renew the attack against the Niederwald with such of his forces as had arrived, and had ordered General von Schkopp’s brigade, which was then approaching, to join the troops collecting to the east of Gunstett. Schkopp, however, seeing that his present line of advance led him direct on to the French right about Morsbronn and kept him clear of the confusion to be seen around Gunstett, disregarded the order and continued to advance on Morsbronn. This deliberate acceptance of responsibility really decided the battle, for his brigade quietly deployed as a unit and compelled the French right wing to fall back.

To cover the French retreat Michel’s brigade of cavalry was ordered to charge. The order was somewhat vague, and in his position under cover near Eberbach, General Michel had no knowledge of the actual situation. Thus it came about that, without
WORTHING—WOTTON, SIR H.

recomioitng or manoeuvring for position, the French cavalry rode straight at the first objective which offered itself, and struck the victorious Prussians as they were crossing the hills between the Albrechtsäuferhof and Monsbronn. Hence the charge was costly and only partly successful. However, the Prussians were ridden over here and there, and their attention was sufficiently absorbed while the French infantry rallied for a fresh counterstroke. This was made about 1.30 p.m. with the utmost gallantry, and the Prussians were driven off the hillsides between the Albrechtsäuferhof and Monsbronn which they had already won. But the counter-attack soon came under the fire of the great artillery mass above Gunstett, and, von Bose having at length concentrated the main body of the XI. corps in the meadows between the Niederwald and the Sauer, the French had to withdraw. Their withdrawal involved the retreat of the troops who had fought all day in defence of the Niederwald.

By 3 p.m. the Prussians were masters of the Niederwald and the ground S. of it on which the French right wing had originally stood, but they were in indescribable confusion after the prolonged fighting in the dense undergrowth. Before order could be restored came another fierce counter-stroke. As the Prussians emerged from the N. edge of the wood, the French reserves suddenly came out from behind the Elssasshausen heights, and striking due S. drove the Prussians back. It was a grave crisis, but at this moment von Schoppk, who throughout all this had kept two of his battalions intact, came round the N.W. corner of the wood and the right flank of the French on that side, and again brought the French to a standstill. Meanwhile von Kirchbach, seeing the progress of the XI. corps, had ordered the whole of his command forward to assault the French centre, and away to the right the two Bavarian corps moved against the French left, which still maintained its original position in the woods N.E. of Fröschweller.

MacMahon, however, was not beaten yet. Ordering Bonnemains' cavalry division to charge, by squadrons to gain time, he brought up his reserve artillery, and sent it forward to case-shot range to cover a final counter-stroke by his last intact battalions. But from his position near Fröschweller he could not see into the hollow between Elssasshausen and the Niederwald. The order was too late, and the artillery unlimbered just as the counterattack on the Niederwald alluded to above gave way before von Schoppk's reserve. The guns were submerged in a flood of fugitives and pursuers. Elssasshausen passed into the hands of the Germans. To rescue the guns the nearest French infantry attacked in a succession of groups, charging home the bayonet with the utmost determination. Before each attack the Prussians immediately in front gave way, but those on the flanks held fast, and these in turn were driven by the converging fire each French attempt died out, the Prussians following up their retreat. In this manner, step by step, in confusion which almost defies analysis, the Prussians conquered the whole of the ground to the S. of the Fröschweller-Wörth road, but the French still held on in the village of Fröschweller itself and in the woods to the N. of the road, where throughout the day they had held the two Bavarian corps in check with little difficulty. To break down this last stronghold, the guns of the V. and XI. corps, which had now come forward to the captured ridge of Elssasshausen, took the fire. In the long, hot day the great crowd of infantry, now flushed with victory but in the direst confusion, was broken by the example of two horse artillery batteries which galloped boldly forward to case-shot range, delivered one final rush which swept all resistance before it.

The battle was won and cavalry only were needed to reap its consequences, but the Prussian cavalry division had been left behind without orders and did not reach the battlefield till late at night. The divisional cavalry squadrons did their best, but each pursued on its own account, and the results in prisoners and guns fell far short of what opportunity offered. Under cover of darkness the French escaped, and on the following day the cavalry division was quite unable to discover the direction of the retreat.

MacMahon received no support from the neighbouring French troops (see FRANCO-GERMAN WAR). The battle was won by over-powering weight of numbers. The Prussian general staff were able to direct upon the field no fewer than 75,000 infantry, 6000 cavalry, 300 guns of which 71,000 rifles, 4250 sabres and 234 guns came into action, as opposed to 30,000 French troops and 314 guns on the French side. The superiority of the French chassepot to the needle guns may reasonably be set against the superior number of French against the German cavalry; the German Prussians were generally, thanks to their numbers, able to bring a converging fire on the French, the latter made nearly double the number of hits for about the same weight of ammunition fired, but the French had nothing to lose to the superior German artillery, and in almost every instance it was the terrible shell fire which broke up the French counter attack. All of these attacks were in the highest degree directed and co-operated with the superior German artillery, and many came nearer to imperilling the ultimate success of the French than is generally supposed. One other point deserves special attention. As soon as the fighting became general, all order in the skirmisher lines disappeared on both sides, and while the variable French artillery fire inter-vened, it was the appearance of closed bodies of troops in the rear of the fighting line which determined the retreat of their opponents. Even in the confused fighting in the Niederwald, the mere sound of the Prussian drums or the French bugles induced the adversary to give way even though drums and bugles frequently appealed to non-existent troops.

The losses of the Germans were 9270 killed and wounded and 1370 missing, or 13 %; those of the French were about 8000 killed and wounded, and perhaps 12,000 missing, and prisoners, representing a total loss of about 41 %. Some French regiments retained a semblance of discipline even after the main line was lost and were in all lost 50% of their strength.

WORTHING, a municipal borough and seaside resort in the Lewes parliamentary division of Sussex, England, 61 m. S. by W. from London by the London, Brighton & South Coast railway. Pop. (1901) 26,015. It has a fine marine parade, and a large pier, and a long range of firm sands. A public park, 21 acres in extent, was opened up in 1899. Some of the old buildings are several modern churches, the town hall (1834), municipal buildings, free library, literary institute, infirmary and convalescent homes. The mother parish of Worthing is Broadwater, the church of which, 1 m. north of Worthing, is a cruciform building, and a fine example of transitional Norman work. A Roman villa, evidence of the existence of pottery works, and a so-called mile-stone, have been discovered at Worthing. The town was incorporated in 1590, and is under a mayor, 8 aldermen, 14 councillors, and 1439 acres.

WOTTON, SIR HENRY (1588–1635). English author and diplomatist, son of Thomas Wotton (1521–1587) and grand-nephew of the diplomatist Nicholas Wotton (g.), was born at Bocotth Hall in the parish of Bocotth or Boughton Malherbe, Kent.1 He was educated at Winchester School and at New College, Oxford, where he matriculated on the 5th of June 1584. Two years later he removed to Queen's College, graduating B.A. in 1588. At Oxford he was the friend of Albericus Gentilis, then professor of Civil Law, and of John Donne. During his residence at Queen's he wrote a play, Tancred, which has not survived, but his chief interest appears to have been scientific.

In qualifying for his M.A. degree he read three lectures De oculo, and to the end of his life he continued to interest himself in physical experiments. His father, Thomas Wotton, died in 1587, leaving to his son the very inadequate maintenance of a hundred marks a year. About 1589 Wotton went abroad, with a view probably to preparation for a diplomatic career, and his travels appear to have lasted for about six years. At Altdorf he met Edward, Lord Zouch, to whom he later addressed a series of letters (1590–1591), and acquired a certain taste for political and other news. These (Reliquiae Wottonianae) and a record of the journey. He travelled by way of Vienna

1 His elder half-brother, Edward Wotton (1548–1626) entered the service of Sir Francis Walsingham, and in 1585 was sent on an important errand to James VI. of Scotland. In 1602 he was made comptroller of the royal household, and in 1603 he was created Baron Wotton of Marley. The peerage became extinct on the death of his son Thomas, the 2nd Baron (1588–1630).
and Venice to Rome, and in 1593 spent some time at Geneva in the house of Isaac Casaubon, to whom he contracted a considerable debt. He returned to England in 1594, and in the next year was admitted to the Inner Temple. While he had from time to time provided Robert Devereux, second earl of Essex, with information, and he now definitely entered his service as one of his agents or secretaries. It was his duty to supply intelligence of affairs in Transylvania, Poland, Italy and Germany. Wotton was not, like his unfortunate fellow-secretary, Henry Cuffe, who was hanged at Tyburn in 1601, actually involved in Essex's downfall, but he thought it prudent to leave England, and within sixteen hours of his patron's apprehension he was safe in France, whence he travelled to Venice and Rome. In 1603 he was resident at Florence, and a plot to murder James VI. of Scotland having come to the ears of the grand-duke of Tuscany, Wotton was entrusted with letters to warn him of the danger, and with Italian antidotes against poison. As "Ottavio Baldi" he travelled to Scotland by way of Norway. He was well received by James, and remained three months at the Scottish court, retaining his Italian incognito. He then returned to Florence, but on receiving the news of James's accession hurried to England. James knighted him, and offered him the embassy at Madrid or Paris; but Wotton, knowing that both these offices involved residence in Italy, thanked him, rather to represent the king of Venice. He left London in 1604 accompanied by Sir Albertus Morton, his half-nephew, as secretary, and William Bedell, the author of an Irish translation of the Bible, as chaplain. Wotton spent most of the next twenty years, with two breaks (1612–1616 and 1619–1621), at Venice. He helped the Doge in his resistance to ecclesiastical aggression, and was closely associated with Paolo Sarpi, whose history of the Council of Trent was sent to King James as fast as it was written. Wotton had offended the scholar Caspar Schope, who had been a fellow student at Altorf. In 1611 Schope wrote a scurrilous book against James entitled - diagnosis of the Royal Disease of Wotton, written for his own benefit of which he had incurably written in a friend's album years before. It was the famous definition of an ambassador as an "honest man sent to lie abroad for the good of his country," It should be noticed that the original Latin form of the epigram did not admit of the double meaning. This was added as an example of the morals of James and his servants, and brought Wotton into temporary disgrace. Wotton was at the time on leave in England, and made two formal designs of himself, one a personal attack on his accuser addressed to Marcus Welser of Strasbourg, the other to Wotton himself, in which he reproached the English ambassador for having offended James. He did not rather to represent the king of Venice. In 1614 he was sent to the Hague and in 1616 he returned to Venice. In 1620 he was sent on a special embassy to Ferdinand II. of Vienna, to do what he could on behalf of James's daughter Elizabeth, queen of Bohemia. Wotton's devotion to this princess, expressed in his exquisite verses beginning "You meaner beauties of the night," was sincere and unchanging. At his departure the emperor presented him with a jewel of great value, "which Wotton received with due respect, but before leaving the city he gave it to his hostess, because, he said, he would accept no gifts from the enemy of the Bohemian queen. After a third term of service in Venice he returned to London early in 1624 and in July he was installed as provost of Eton College. This office did not relieve him from his pecuniary embarrassments, and he was even on one occasion arrested for debt, but he received in 1627 a pension of £200, and in 1630 this was raised to £500 on the understanding that he should write a history of England. He did not neglect the duties of his pro- vostship, and was happy in being able to entertain his friends lavishly. His most constant associates were Izaak Walton and John Hales. A bend in the Thames below the Playing Fields, known as "Black Potts," is still pointed out as the spot where Wotton and Izaak Walton fished in company. He died at the beginning of December 1639 and was buried in the chapel of Eton College.

Sir Henry Wotton was not an industrious author, and his writings are very small in bulk. Of the twenty-five poems printed in Reliquiae Wottonianae only fifteen are Wotton's. But of those fifteen two have obtained a place among the best known poems in the language, the lines already mentioned "On his Misfits, the Queen of Bohemia," and "The Character of a Happy Life." During his lifetime he published only The Elements of Architecture (1624), which is a paraphrase from Marcus Vitruvius Pollio, and a Latin prose address to the king on his return from Scotland (1632). In 1651 appeared the Reliquiae Wottonianae, with Izaak Walton's Life. An admirable Life and Letters; representing much new matter by Logan Pearsall Smith, was published in 1907. See also A. W. Wotton, Sir Henry Wotton, a Biographical Sketch (1868).

Wotton, Nicholas (c. 1497–1567), English diplomatist, was a son of Sir Robert Wotton of Boughton Malherbe, Kent, and a descendant of Nicholas Wotton, lord mayor of London in 1415 and 1430, and member of parliament for the city from 1360 to 1429. He early became vicar of Boughton Malherbe and of Sutton Valence, and later of Ickychurch, Kent; but, desiring a more worldly career, he entered the service of Cuthbert Tunstall, bishop of London. Having helped to draw up The Institution of a Christian Man, Wotton in 1539 went to arrange the marriage between Henry VIII. and Anne of Cleves and the union of Protestant princes which was to be the complement of this union. He crossed over to England with the royal bride, but, unlike Thomas Cromwell, he did not lose the royal favour when the king repudiated Anne, and in 1541, having already refused the bishopric of Hereford, he became dean of Canterbury and in 1544 dean of York. In 1543 he went on diplomatic business to the Netherlands, and for the next year or two he had much intercourse with the emperor Charles V. He helped to conclude the treaty of Greenwich England and France in 1545 by which Wotton became ambassador in France from 1546 to 1549. Henry VIII. made Wotton an executor of his will and left him £300, and in 1549, under Edward VI., he became a secretary of state, but he only held this post for about a year. In 1550 he was again sent as envoy to Charles V., and he was ambassador to France during the reign of Mary, doing valuable work in that capacity. He left France in 1557, but in 1558 he was again in that country, helping to arrange the preliminaries of the treaty of Cateau Cambresis. In 1560 he signed the treaty of Edinburgh on behalf of Elizabeth. and he had again visited the Netherlands before his death in London on the 25th of January 1567.

His brother, Sir Edward Wotton (1489–1551), was made treasurer of Calais in 1540, and was one of those who took part in the overthrow of the protector Somerset. His son, Thomas Wotton (1521–1587) was the father of Sir Henry Wotton (q.v.).

Wotton, William (1666–1727), English scholar, son of the Rev. Henry Wotton, was born in his father's parish of Wrentham, Suffolk, on the 13th of August 1666. He was not yet ten years old when he was sent to Catherine Hall, Cambridge, having by this time a good knowledge of Latin, Greek and Hebrew. He obtained a fellowship at St. John's, and was elected an F.R.S. in 1687. Wotton is chiefly remembered for his share in the controversy about the respective merits of ancient and modern learning. In his Reflections upon Ancient and Modern Learning (1694, and again 1697) he took the part of the moderns, although in a fair and judicial spirit, and was attacked by Swift in The Battle of the Books. During some of his later years Wotton resided in Wales and gave himself to the study of Celtic, making a translation of the laws of Howel Dda, which was published after his death (1730). Having taken holy orders, he became a prebend of Salisbury and held it until his death at Buxted, Essex, on the 13th of February 1727. Wotton wrote a History of Rome (1701) and Miscellaneous Discoveries relating to the Traditions and Usages of the Scribes and Phari- seaes (1705).

Wound (O. Eng. wund, connected with a Teutonic verb, meaning to strive, fight, suffer, seen in O. Eng. wynn, whence Eng. "win"), a solution in the continuity of the soft parts of the body. Contused wounds, or bruises, are injuries to the cellular tissues in which the skin is not broken. In parts where the tissues are lax the signs of swelling and discoloration are more noticeable than
in the tender tissues. The discoloration is caused by haemorrhage into the tissues (ecchymosis), and passes from dark purple through green to yellow before it disappears. If a considerable amount of blood is poured forth into the injured tissues it is termed a haematoma. The treatment of a bruise consists in the application of cold lotion, preferably an evaporating spirit-lotion, to limit the subcutaneous bleeding. The haemorrhage usually becomes absorbed, but records of even in haematomata, but should supputation threaten an incision must be made and the cavity aseptically evacuated.

Open wounds are divided into incised, lacerated, punctured and gunshot wounds. *Incised* wounds are made by any sharp instrument and have their edges evenly cut. In these wounds there is usually from tearing of the vessels, and blood vessels are cleanly divided. *Lacerated* wounds are those in which the edges of the wound are torn irregularly. Such injuries occur frequently from accidents with machinery, or blunt instruments. *Punctured* wounds are those in which the depth is greater than the external opening. They are generally produced by sharp-pointed instruments. The chief danger arises from puncture of large blood-vessels, or injury to important structures such as occur in the thorax and abdomen. It is also difficult to keep such wounds surgically clean and to obtain apposition of their deeper parts, and septic organs and the incidence of the infection is very great.

The treatment of incised wounds is to arrest the bleeding (see Haemorrhage), cleanse the wound and its surroundings, removing all necrotic tissue, dress it with gauze, and obtain an aseptic cut surface. This is usually done by means of sutures or stitches of silk, catgut, silkworm gut or silver wire. If the wound can be rendered aseptic, incised wounds usually heal by first intention. In a lacerated wound, the edges are apposed, and whether or erysipelas or tetanus. These wounds do not heal by first intention, and there is consequently considerable scarring. The exact amount of time occupied in the repair depends upon the presence or not of septic material, as lacerated wounds are very difficult to cleanse properly. Carbolic acid lotion should be used for cleansing, while torn or ragged portions should be cut away and provision made for free drainage. Large wounds may have to be syringed in the first, but the wound may be packed with iodioform gauze, and later, when a clean granulating surface has been obtained, skin-grafting may be required. In extensive lacerated wounds, where the flesh has been stripped from the bones, a large dressing of clean gauze is superior to the use of rubber drainage, or in such wounds in conjunction with comminated fractures or with severe sepsis supervening, amputation of a limb may be called for. Punctured wounds should be syringed with carbolic lotion, and all splinters and foreign bodies removed. The location of needles is rendered comparatively easy by the use of the Röntgen rays; the wound can then be packed with gauze and drained. If a large vessel should have been injured, the wound may have to be syringed and the bleeding vessel secured. Should paralysis indicate that a large nerve has been divided, the wound must also be laid open in order to injure the injured structure.

It is impossible to mention some of the special characteristics of gunshot wounds. In the modern small-bore rifle (Lee- Metford, Mauser) the aperture of entry is small and the aperture of exit is large. These bullets are often leaded in the nose. Should no large vessel be torn, and should no portion of septic clothing be carried in, the wound may heal by first intention. Such bullets may be said to disable without killing. They may drill a clean hole in a bone without a fracture, but sometimes there is much splintering. Abdominal wounds may be so small that the intestine may be penetrated and adhesions of neighbouring coils of intestine cover the aperture. Martinis-Hardings shot has many larger apertures, while soft-nosed or "dum-dum" bullets spread out as soon as the bullet strikes, causing great mutilation and destruction of the tissues. Shell wounds cause extensive lacerations. Small shot may inflict severe injuries of the peritoneum, and the entrance of the shot wounds at short distance the skin may be blackened owing to the particles of carbon lodging in it. The chief dangers of gunshot wounds are haemorrhage, shock and the carrying in of septic material or clothing into the wound.

**WOUWERMAN, Philip** (1609-1668), Dutch painter of battle and hunting scenes, was born at Haarlem in May 1619. He learned the elements of his art from his father, Paul Joosten Wouwerman, an historical painter of moderate ability, and he then studied with the landscape painter, Jan Wyants (1620-1679). Returning to Haarlem, he became a member of its guild of painters in 1642, and there he died in May 1668. About 800 pictures were enumerated in John Smith's *Catalogue raisonné* (1848) as the work of Philip Wouwerman, and in C. Hofstede de Groot's *Eerste Ongeklaarde Catalogue*, vol. ii. (1900), the number is given as 2,500. But probably many of these are the productions of his brothers Peter (1625-1682) and Jan (1626-1660), and of his many other imitators. His authentic works are distinguished by great spirit and are infinitely varied, though dealing recurrently with cavalry battle-pieces, military encampments, cavalades, and hunting or hawking parties. He is equally excellent in his vivacious treatment of figures, in his skilful animal painting, and in his admirable and appropriate landscape backgrounds.

Three different styles have been observed as characteristic of the various periods of his art. His earlier works are marked by the prevalence of a foxy-brown colouring, and by a tendency to angularity in draughtsmanship; the productions of his middle period have greater purity and brilliancy; and his latest and greatest pictures possess more of force and breadth, and are full of a delicate silvery-grey tone.

See the *Catalogue raisonné of the works of the most eminent Dutch and Flemish painters of the 17th Century*, by De Groot, vol. ii. (1900), referred to above.

**WRAITH**, a general term in popular parlance for the appearance of the spirit of a living person. (See "Phantoms of the Living," under *Psychical Research.*)

**WRANGEL, Friedrich Heinrich Ernst, Count von** (1784-1877), Prussian general field-marshall, was born at Stettin, on the 13th of April 1784. He entered a dragoon regiment in 1799, and became major and aide-de-camp to the king of Prussia in 1808. He fought as a subaltern against Napoleon, especially distinguished himself as Heilsberg in 1807, and receiving the order *pour le mérite*. In the reorganization of the army, Wrangel became successively first lieutenant and captain, and won distinction and promotion to lieutenant-colonel in the War of Liberation in 1813, won the Iron Cross at Wachau near Leipzig, and became colonel in 1815. He commanded a cavalry brigade in 1821, and two years later was promoted major-general. He commanded the 13th Division, with headquarters at Münster, in Westphalia, in 1833, when riots occurring owing to differences between the archbishop of Cologne and the crown, and the determination and resolution with which he treated the clerical party prevented serious trouble. He was promoted lieutenant-general, received many honours from the court, enjoyed the confidence of the Junker party, and commanded successively at Königsegg and Stettin. In 1848 he commanded the II. Corps of the German Federal army in the Schleswig-Holstein campaign, was promoted general of cavalry, and won several actions. In the autumn he was summoned to Berlin to suppress the riots there. As governor of Berlin and commander-in-chief of the Mark of Brandenburg (a province of Prussia which he held till his death) he conceived a state of siege, and ejected the Liberal president and members of the Chamber. Thus on two occasions in the troubled history of Prussian revival Wrangel's uncompromising sternness achieved its object without bloodshed. From this time onwards he was most prominent in connexion with the revival of the Prussian cavalry from the neglect and inefficiency into which it had fallen during the years of peace and poverty after 1815. In 1856, having then seen sixty years' service, he was made a field marshal. At the age of eighty he commanded the Austro-Prussian army in the war with Denmark in 1864, and though he was too old for active work, and often issued vague or impracticable orders (he himself had always desired that the young and brilliant "Red Prince," Frederick Charles, should have the command), the prestige of his name, and the actual good work of Frederick Charles, Moltke and Vogel von Falkenstein among the Prussian, and of Gablenz among the Austrian generals, made the campaign a brilliant success. After the capture of Dippel he resigned the command, was created a count, and received other honours. In 1866, "Papa" Wrangel assisted in the Bohemian campaign, and was without a command for a period of his great age. He took a keen interest in the second reorganization of the cavalry arm 1866-1870, and in the war with France in 1870-71. He died at Berlin on the 2nd of November 1877. On the seventieth anniversary of his entering the army his regiment, the 3rd Cuirassiers, was given the title "Graf Wrangel."

See supplement to * Militär, Wehrkraft* (1877), and lives by von Kluge, "Wrangels Werke" (1885).

**WRANGEL, Karl Gustav von** (1613-1679), Swedish soldier, was descended from a family of Estonian origin, branches
of which settled in Sweden, Russia and Germany. His father, Hermann von Wrangel (1587-1643), was a Swedish field marshal in Gustavus Adolphus's armies. Wrangel was both a naval and a military man. He was a member of the Swedish army in Germany, where he held the rank of commander-in-chief. He was also a member of the Swedish navy, serving as a captain in the fleet during the Thirty Years' War. Under Wrangel and Turenne the allied Swedish and French armies were defeated at the battle of Parnawa in 1675.

At the outbreak of a fresh Polish war in 1655 Wrangel commanded a fleet in the Baltic, and in 1656 he served on land and in command, along with the Great Elector of Brandenburg, in the three days' battle of Warsaw. In 1657 he invaded Jutland and in 1658 passed over the ice into the islands and took Kronborg. In 1657 he was appointed admiral and in 1664 general of the realm, and as such he was a member of the regency during the minority of Charles XI. But his last campaign was unfortunate. Commanding, ineffectively owing to his broken health, in the war against Brandenburg and Saxony he himself was ordered to bring in the fleet under General Waldermar, Freiherr von Wrangel (1647-1706), had been defeated at Fehrbellin. He died at Rügen shortly afterwards, on the 5th of July 1676.

WRASSE, a name given to the fishes of the family Labridae generally, and more especially to certain members of the family. They are very abundant in the tropical zone, less so in the temperate, and disappear altogether in the Arctic and Antarctic Circles. Their body is generally compressed, like that of a carp, covered with smooth or bony scales; they possess one dorsal fin only, the anterior portion of which consists of numerous spines. Many wrasses are readily recognised by their thick lips, the inside of which is sometimes curiously folded, a peculiarity which has given to them the German name of "lip-fishes." The dentition of their jaws consists of strong conical teeth, of which some in front, and more or less, of the hard masseter muscles are larger than the others. But the principal organs with which they crush shell-fish, crustaceans and other hard substances are the solid and strongly-toothed pterygoid bones, of which the lower are coalesced into a single flat triangular plate. All wrasses are surface fishes, and rocky parts of the coast overgrown with seaweed are their favourite haunts in the temperate, and coral-reefs in the tropical seas. Some 450 species of wrasses (including parrot-wrasses) are known, chiefly from the tropics.

Of the British wrasses the ballan wrasse (Labrus maculatus) and the striped or red or cook wrasse (Labrus mixtus) are the most common. Both belong to the genus Labrus, in which the teeth stand in a single series, and which has a smooth edge of the preoperculum and only three spines in the anal fin. The ballan wrasse is larger, attaining to a length of 18 in., and it is said, to a weight of 8 lb.; its colours are singularly attractive, given or brown on the back, red and blue lines and spots; the dorsal spines are twenty in number. The cook wrasse offers an instance of well-marked secondary sexual difference—the male being ornamented with blue streaks or a black band along the side of the body, whilst the female has two or three large black spots across the back of the tail. This species possesses only from sixteen to eighteen spines in the dorsal fin. The goldfinny or cokewing (Ctenolabrus melops) is much more frequent on the S. coasts of England and Ireland than farther north, and rarely exceeds the length of 10 in. As in other wrasses, its colours are beautiful, but variable; but it may be readily distinguished from the two preceding species by the toothed edge of the preoperculum. The three other British wrasses are much scarcer and more local, viz. Jago's goldfinny (Ctenolabrus rupestris), with a large black spot on the anterior dorsal spines and another on the base of the upper caudal rays; Acantholabus polion, which is so rarely captured that it lacks a vernacular name, but may be easily recognized by its five anal spines and by the teeth in the jaws forming a band; and the rock-cook (Centro-
on the sea coast, wreck has almost within modern times ceased to be a perquisite of either, or to enrich the casual finder at the expense of its rightful owner. The history of the law as sketched below will indicate how this has come about.

Wrecks have long been the general rule in the civilized maritime countries of Europe that the right to wreck belonged to the sovereign, and formed part of the royal revenue. This was so under the Roman, French and feudal law; and in England the crusading law of the 13th century (17 Edw. I., 1324), provided that the king has wreck of the sea, whales, and sturgeons taken in the sea and elsewhere within the kingdom, except the proceeds thereof. The general rule that such wreck is said had for its object the prevention of the practice of destroying the property of the shipwrecked, was, however, gradually relaxed; and the owner of wreck was allowed to recover it if he made claim to it within a year and a day after the wreck, or to the owners of the wreck, there being a vessel cast away, a last among shipwrecks; or at a year or a day and a half by a decree of Antonine the Great, the feudal law, the general maritime law, the law of France and English law Richard I. released his prerogative right to wreck to the extent of allowing children, or if there were none, brothers and sisters of a perishing owner, to have his goods; and Henry III., by a charter of 1236, allowed the owner of wrecked goods to have his property again if he claimed with the sheriff; this was provided that any man or beast escaped from the ship. The statute of Westminster the First (1276, 3 Edw. I.) provided that where a man, a dog, or a cat escape alive out of the ship, such ship or barge or any other vessel was to be adjudged as wreck which had been saved and kept by view of the sheriff, or the king’s bailiff, and delivered into the hands of such as are of the town where the goods have been saved; if any other vessel be lost, and not that they were his, or perished within his keeping, within a year and a day, they shall be restored to him without delay, and if not they shall remain to the king or to such others to whom the wreck belongs. The modern admiralty law is based almost entirely on the safe custody of wreck, but coroners were relieved of their duties in respect of wreck by the Coroner’s Act 1887. An act of 1533 provided for the delivery to the merchants of goods coming to land which may not be said to be wreck, on payment of salvage. In Scotland, a statute of Alexander II., similar to that of Westminster, declared that where any creature escapes alive from a wreck vessel, or from a ship cast away, unless for the purpose of saving the ship, the safe custody of wreck, but coroners were relieved of their duties therein; otherwise they shall escheat to the crown. For a long time the view of English law was that the right to recover wreck was still identified as a personal right which was vested in the king’s council, before whom it came, by certiorari from the admiralty of the north, decided against the claim. In 1543, ships grounded on the Goodwins were held to be wreck and wreck, although their crews were saved; and it was not until 1743 that the Cinque Ports was proceeded against in admiralty and condemned. "no man or dog being on board, but only a dead man with his head shot through, and without the presence of any court or council." It was early in the 15th or at the close of the 14th century, it became usual for the crown to grant to the lord admiral by his patent of appointment, amongst other profits et commodities appertaining to his office, wreck of the sea; and when, early in the reign of Henry VIII., vice admirals of the coast were created, the lord admiral by patent under his own hand delegated to them his rights and duties in the several counties, including those in connexion with wreck. He did not, however, part with the whole of his emoluments; his vice admirals were required to render account of the proceeds of wreck, and to hand over to him a part, usually one-half, of their gains. This system of partial or proportional, but absolute, guardianship, led to an arrangement between the lord-admiral and his vice-admirals, continued until the year 1846. In that year an act (9 & 10 Vict. c. 99) was passed forbidding the vice-admirals to intermeddle with wreck, and that it be the receivers of droits of admiralty to receive all wreck from the finders and to detain it for twelve calendar months; at the end of that period it was to be sold and the proceeds carried to the credit of the consolidated fund. The transfer to this fund of the hereditary casual revenues of the crown had previously been effected by legislation in the first years of the reigns of William IV., and Victoria, by which the civil list was instituted. The last lord-admiral to put in hand the transfer under the act of 1846 was the duke of Buckingham in the reign of Charles I. Prince George of Denmark, Queen Anne’s husband and lord-admiral, took wreck by patent, but by a collateral instrument he surrendered the greater part of his revenues. Without this arrangement, the vice-admirals of counties, who, in the absence of a lord admiral, received their appointments sometimes from the crown and sometimes from the commissioners of the admiralty, appear to have taken the whole or part of the proceeds of wreck until the passing of the act of 1846. The ancient law by which the unfortunate owner was deprived of his property was by no means abandoned. The act of 1846 was followed by the enactments of the 17th centuries that this was an error; that all the 17th centuries been gradually but tacitly relaxed; it required, however, a decision of Lord Mansfield and the king’s bench in 1771 (Hale’s Decretals, 1771. 3 Edw. 46), that the sovereign had no right, whether or no any living creature escaped, the property in a wreck remains in the owner. In Scotland it seems that the same law had been laid down in 1725, and there are indications that upon the conclusion of a contract with the crown or the king by De profundis of the 11th century, the old law in the same direction. As early as 1269 a treaty with Norway provides that owners of ships wrecked upon the coasts of England shall have warrants from the crown of Norway to recover by patent, for the proceeds of wreck. The system under which the lord-admiral and the vice-admirals of counties had for more than three centuries taken charge of wreck never worked well. Their interest was directly opposed to that of the owner. For a century or more, the owners except the owners and crew of ships in distress, that nothing should alienate. Apart from this, the system discouraged legitimate salvors. The admirals and vice-admirals had by degrees assumed that all salvage operations were exclusively their business; they took possession of wreck brought or cast ashore, whether it was legal wreck or not, and this often gave rise to conflicts with outside possessing sales. It was not until the 17th century a compromise was reached, and wreck salvors established the right, which they now have, to a lien upon property saved as a security for adequate remuneration of their exertions in saving it; and if the vice-admirals restored to its owners the wreck that the owners had recovered, they were in every way entitled to payment of extravagant demands for salvage, storage and often legal expenses. A curious side light is thrown upon their practices by the case of a wreck as the "tankard," which was presented to Prussia in 1743. Frederick the Great restored her to her owners, but before doing so he exacted from them a bond for the full value of ship and cargo, and the condition of the bond was that the owners were to pay him 24,000 crowns. In six years, by the time of the English admiral that by the law of England no "salvage" was payable to the crown or to the admiralty of England in the like case of a Prussian ship going ashore upon an English coast. The records of the admiralty court show that Frederick’s action in this case was intended as a protest, not against the payment of a fair reward to salvors of Prussian ships, but against exactions by English vice-admirals and their friends. Stories of wilful wrecking of ships and of even more evil deeds are probably exaggerations, but modern research has authenticated sufficient abuses to show that further legislation was necessary to regulate the taking possession of wreck and to limit the demands of the vice-admirals as far as possible. The act of 1846 the only substantial protection against plunderers of wrecked ship could get was to apply to the admiral a considerable, but not to obtain such a commission took time and cost money, and before the commissioners arrived at the scene of the wreck a valuable cargo would have disappeared and the value dispersed. In the case of the Cinque Ports there was more common, and the crowds that collected for the purpose set law at defiance. The vice-admirals, even if they had been able, did little to protect the ship wrecked. Complaints from the lord-admiral that had neglected their duties in the wrecked ship, and although the crown and the lord-admiral profited little by wreck, there is reason to think that the gains of vice-admirals and their friends, and owners, and of lords of admiralty, were more considerable. Many of the vice-admirals’ accounts of the 17th and following centuries are extant. Most of them are for trifling sums, but occasionally the amounts are considerable. A vice-admiral for Cornwall charges himself in his account for the years 1628-1634 with a sum of £25,253, and in 1624 the duke of Buckingham found it worth his while to buy out the rights of the warden of the Cinque Ports over wreck. It was not until 1646 that some of them swore that their office was worth less than £250 in the year.

The right of the warden of the Cinque Ports to wreck, above alluded to, was derived from charters granted to the ports by Edward I. and his successors; many of these charters enjoyed a similar right under earlier charters. It would seem that these rights were of some value; for in 1629 the little towns of Dunwich and Southwold litigated at a cost of £1000 the question whether a tub of whisky picked up at sea belonged to the admiralty jurisdiction of the one town or the other; and the town of Yarmouth is said to have spent no less than £7000 upon a similar question. It was partly in order to put an end to such disputes with the crown and the admiralty, that the Corporations Act of 1835 was passed, abolishing all of them, except that of the Cinque Ports.

Grants of wreck were earlier than those to towns. Even before the conquest it seems to have been rather unusual for grantees from the crown of lands adjoining the sea to get the franchise of wreck included in their grants. A charter purporting to be of the year 1023 contains a grant by King Canute to the dean and chapter of Canterbury of wreck found at sea below low-water mark as far as a
WRECK

848

man could by wading touch it with a sprit (Kemble, Cod. Dipl., No. 737). There is reason to think that before the end of the reign of Henry II, the crown had granted away its right to wreck round a great part of the coast of England. Although a landowner of the present day may, as a general rule, have a right to wreck in respect of wreck itself, derive no substantial benefit, nevertheless the grant may be of great value as evidence of his right to the shore; and even where no grant of wreck can be produced, if he can show that he has in fact possessed the wreck, the possession of wreck on the foreshore, it is strong evidence as against the crown of his right to the foreshore, and a lost grant may be presumed. The different charts of the different counties patrimony regularly had *wreccum mari* within their counties patrimony as part of their *jura regalia*, but yet inferior lords might prescribe for wreck belonging to their several mansions within a county. *Wreccum mari* cannot be lawfully possessed without the consent of the lord, and it is not the same as the *jura regalia*.

*De jure mari* (i. vii.; Hargrave, 44). In the Isle of Man unreclaimed wreck, whether cast on shore or found in the sea, within the headlands of Man, belongs to the lord, now the crown. In the Isle of Wight, wreck is divisible, somewhat like a patrimony. The lords of the different counties patrimony regularly had *wreccum mari* within their counties patrimony as part of their *jura regalia*, but yet inferior lords might prescribe for wreck belonging to their several mansions within a county.

In the United Kingdom, when they are strictly *adventus regius*, or otherwise are *adventus regalis* no manner of cognizance, power nor jurisdiction, but all such manner of contracts, plea and querelles, and all other things rising within the bodies of the counties as well by land as by water and the sea, shall be tried by the laws of the land and not before nor by the admiral nor his lieutenant in any wise.

In spite of this statute, instances still occurred of the admiralty court exercising this jurisdiction, until by frequent prohibition by the crown and the admiralty, in frequent admittance of the admiral judges themselves, it was recognized as beyond the scope of their authority. These admiralty droits are classified as flotsam, jetsam, lagan and derelict. In Lord Coke words, flotsam is "when a ship sinks or otherwise perishes, and the goods float on the sea"; jetsam is "when goods are cast out of a ship to lighten her when in danger of sinking, and afterwards the ship perishes", and derelict is "when goods lie upon the deck, the ship cast out and sunk in the sea to a buoy or cork, or some thing that will not sink, in order that they may be found again and recovered". Derelict also means lost at sea, either by *adventus regalis* or by its master and crew * sine especere pandis et sine animo revertendi*. "None of these goods," adds Coke, "which are so called, are called wreck so long as they remain in or upon the sea; but if any of them by the violence of the waves or the undertow be driven on the shore, they do come into the province of wreck, and of common right belong to the king, in case where the ship perished or the owner cannot be known... But if the owner can be known he ought to have his goods again, for the casting them overboard was not a loss of the goods, but a kind of declaration of the adventures of the sea within the king's seas belongs to him where the owner cannot be known, yet the king hath little advantage of it, for by the law of the land all the goods lying on the sea, they do proceed, and the right of the owner to reclaim them in a year and a day, go to the royal revenue (Lord Stowell, The Aquila, 1798, c. Rob. 37). Lord Stowell bases this prerogative right, "on the general rule of civilized countries that what is found derelict on the sea is acquired beneficially for the sovereign, if no owner shall appear." It seems that this was also Coke's view (2 Inst. 166).

The provisions of the Merchant Shipping Act 1854, mentioned below, upon the subject of droits of admiralty are not clear. In practice the only derechos of the admiralty that are commonly dealt with are anchor patrimony that have been slipped or parted from in heavy weather. In the Downs and other roadsteads these are very numerous, for by creepers towed over the sea bottom, and in former days sweeping for anchors was a common industry. In the Downs large buoys have been made after gales in this way. In the 17th century it became customary to obtain from the crown grants of the right to fish for sunken wreck and treasure not only upon English coasts but all over the world.

Admiralty courts sit in the county courts of his majesty's courts of record on board which, or by means of which a man was killed, might be a deodand (g.v.), yet qua wreck she was not subject to forfeiture as deodand.

**Present British Law.**—From the above sketch of the development of the law of wreck it will be seen that it owes little to the legislature. After the act of 1353 no statute dealt with the subject until 1712. In that year a salvage act was passed, but it made no material alteration in the law; and although during the two or three hundred years following there were occasional acts dealing fragmentarily with wreck and salvage, the act of 1854, above mentioned, is the only one that calls for notice. That act was embodied in and added to by the Merchant Shipping Act 1847, which again was repealed, re-enacted and added to by the Merchant Shipping Act 1847. The last mentioned act contains the whole of the existing statute law upon the subject of wreck within the territorial waters of the United Kingdom. For its purposes wreck includes jetsam, flotsam, lagan and derelict, found in or on the shores of the sea or any tidal water. The act defines a wreck as "an abandoned ship or raft of timber after it; it must be the hull, cargo or appurtenances of a vessel. Under the Sea Fisheries Act 1883, passed to give effect to the North Sea Fisheries Convention, the provisions of the Merchant Shipping Act as to wreck apply to fishing boats with their rigging and gear.

The provisions of the Merchant Shipping Act dealing with wreck (ninth part) may be summarized as follows: The Board of Trade (as the receiver-general of droits of admiralty) has the general supervision of wreck proceeding, the right of removing the wreck of the coast, who are paid by fees. Where a British or foreign vessel is wrecked, stranded or in distress, at any place on or near the coasts of any tidal water within the limits of the kingdom, it is the duty of the receiver for the district to proceed there and give directions for preserving the ship, the lives on board her and her cargo and apparel. He can require the assistance of any person, or to the master of any vessel, or any other persons, or horses, near at hand; and for this purpose any person may,
unless there is a public road equally convenient, pass and repass with the same freedom; the carriage of the owner, the owner’s or occupier’s consent, doing as little damage as possible, and may also deposit there any things recovered from the ship; any damage so done is a charge on the ship, cargo or articles; and is recoverable (by virtue of the act) from the receiver. The receiver may be allowed compensation for or occupying or hinder the operations. The receiver has power to suppress any plundering or disorder, or any hindering of the preservation of the ship, cargo, or articles. When a vessel is wrecked or in distress as above, is plundered, damaged or destroyed, by any riotous or tumultuous assembly ashore or afloat, compensation must be made to her owner in England and Scotland by the same means as any ship wrecked or in distress, as above mentioned (see d.c.); and in Ireland in cases of malicious injuries to property. In the absence of the receiver, his powers may be exercised by the following officers or persons in successive order, viz. a chief officer or the chief officer or ex-captain, or if a constable or officer of police, in the absence of all the said sheriff, justice of the peace, and naval or military officer on full pay. These persons act as the receiver’s agent and put the salvage in his charge. They are entitled to a share of the proceeds of any right to salvage by so doing. An examination is also directed to be held, in cases of ships in distress on the coasts of the kingdom, by a wreck receiver, wreck commissioner or his deputy, at the request of the Board of Trade or of a justice of the peace, by evidence oath as to the name and description of ship, name of master, shipowner and owner of cargo, ports to and from which the ship was bound, the particulars of distress, the services rendered and the like. The act provides as follows for dealing with a ship wreck, if she is the owner of it, must give notice of his having done so to the receiver of the district, and if he is not the owner he must deliver notice to the same end. He must appoint a person to receive for the ship, its cargo, and other effects. e.g. if, as a salvor, he retains it with the knowledge of the receiver. No articles belonging to a wrecked ship found at the time of the casualty must be taken or kept by any person, whether the owner of the wreck receiver, salver, receiver, etc. (in all cases.) For the taking possession of any wreck must give notice of it, with a description, at the nearest custom-house; and if the wreck is in his opinion wrecked, to apply to the Lord-Lieut. of the wreck, or in the hands of a receiver must establish his claim to it within a year, and on so doing, and paying all expenses, is entitled to have it restored to him. Where a foreign ship has been wrecked on or near the coast, and any articles forming part of her cargo are found on or near the coast, or are brought into any port, the consular officer of the foreign country to which the ship or cargo belongs is entitled to the agent for the owner, or as the custody and disposal of the articles is concerned. No goods may in any case be sold without the owner’s consent, if small, sell the wreck and hold the proceeds till claimed. The right to unclaimed wreck belongs to the crown, except in places where the crown has granted that right to others. Persons so entitled, such as admirals—vice-admirals are mentioned in the act (sed quae) lords of manors and the like, are entitled, after giving the receiver notice and particulars of their title, to receive notice from the receiver of their right. Where a ship is abandoned, or if any one within a year after it was found, and has been in the hands of a receiver, it can be claimed by the person entitled to wreck in the place where it is found, and by the owner, and the proceeds of the wreck and salvage connected with it; if no such person claims it, it is sold by the receiver, and the net proceeds are applied for the benefit of the crown, either for the duchy of Lancaster or the duchy of Cornwall; or, as the receiver sees fit. It goes to the crown, unless an unclaimed wreck is disposed, the dispute may be settled summarily as in cases of salvage; either party, if dissatisfied, may within three months after a year since the wreck came, and they of the receiver proceed in any competent court to establish his title. Delivery of unclaimed wreck by the receiver discharges him from liability, but does not prejudice the title thereto. The Board of Trade has power to purchase rights of wreck. No person exercising any admiralty jurisdiction as grantee of wreck may interfere with wreck otherwise than in accordance with the act. Duties are payable on wreck goods coming into the United Kingdom or Isle of Man as if they were goods in ordinary commerce. A wreck receiver on a voyage may be forwarded to their original destination, or, if wrecked on their outward voyage, to their port of shipment, on due security being taken for the preservation of the revenue. Wreck commissioners may be appointed by the lord chancellor to hold investigations into shipping casualties, to act as judges of courts of inquiry, and to take examinations in respect of ships in distress.

WREDE, KARL PHILIPP, PRINZ VON (1767-1838), Bavarian field-marshal, was born at Heidelberg on the 29th of April 1767, and educated for the career of a civil officer under the Palatinate government, but on the outbreak of the campaign of 1799 he raised a volunteer corps in the Palatinate and was made its colonel. This corps excited the mirth of the well-drilled Austrians with whom it served, but its colonel soon brought it into a good condition, and it distinguished itself during Kray’s retreat on Ulm. At Hohenlinden Wrede commanded one of the Palatinate infantry brigades with credit, and distinguished himself very much in the Bavarian army, which was entering upon a period of reforms. Wrede soon made himself very popular, and distinguished himself in opposing the Austrian invasion of 1805. The Bavarians were for several years the active allies of Napoleon, and Wrede was...
engaged in the campaign against Prussia, winning especial distinction at Pultusk. But the continuous attitude of the French towards the Bavarian troops, and accusations of looting against himself, exasperated the general’s fiery temper, and both in 1807 and in 1809 even outward harmony was only maintained by the tact of the king of Bavaria. In the latter year, under Lefebvre, Wrede conducted the rearguard operations on the Isar and the Abens, commanded the Bavarians in the bitter Tirolean war, was wounded in the decisive attack at Wagram, and returned to Tirol in November to complete the subjection of the mountains under. Napoleon made him a count of the Empire in this year. But after a visit to France, recognizing that Napoleon’s way was the猟 of his ambitions, he gradually went over to the anti-French party in Bavaria, and though he displayed his usual vigour in the Russian campaign, the retreat convinced him that Napoleon’s was a losing cause and he left the army. At first his resignation was not accepted, but early in 1813 he was allowed to return to Bavaria to reorganize the Bavarian army. But he had no intention of using that army on Napoleon’s side: and when the king of Bavaria resolved at last to join Napoleon’s enemies, Wrede, he declared, was the only one of his commanders who did not leave Napoleon. Wrede threw himself across Napoleon’s line of retreat from Germany at Hanau, but on the 30th of October he was driven off the road with heavy losses. Next year, after recovering from a dangerous wound, he led a corps in the invasion of France, and supported Blücher’s vigorous policy. In 1815 the Bavarians took the field but were not actively engaged. After Waterloo, Wrede, who had been made a prince in 1814, played a conspicuous part in Bavarian politics as the opponent of Montgelas, whom he succeeded in power in 1817, and in 1835 he was made head of the council of regency during the king’s absence. He died on the 12th of December 1838.

See lives by Riedel (1844) and Heilmann (1881).

WREN, SIR CHRISTOPHER (1632-1723), English architect, the son of a clergyman, was born at East Knoyle, Wilts, on the 20th of October 1632; he entered at Wadham College, Oxford, in 1646, took his degree in 1650, and in 1653 was made a fellow of All Souls. While at Oxford Wren distinguished himself in geometry and applied mathematics, and Newton, in his Principia, p. 19 (ed. of 1713), speaks very highly of his work as a geometrician. In 1657 he became professor of astronomy at Oxford, and in 1660 was elected Savilian professor of astronomy at Oxford. It is, however, as an architect that Wren is best known, and the great fire of London, by its destruction of the cathedral and nearly all the city churches, gave Wren a unique opportunity. Just before the fire Wren was asked by Charles II. to prepare a scheme for the restoration of the old St Paul’s. In May 1666 Wren submitted his report and designs (in the All Souls collection), for this work; the old cathedral was in a very ruinous state, and Wren proposed to remodel the greater part, as he said, "after a good Roman manner," and not, "to follow the Gothic Rudeness of the Old Design." According to this scheme only the old choir was left; the nave and transepts were to be rebuilt after the classical style, with a lofty dome at the crossing—not unlike the plan eventually carried out. In September of the same year (1666) the fire occurred, and the old St Paul’s was completely gutted. From 1668 to 1670 attempts were being made by the chapter to restore the ruined building; but Dean Sancroft was anxious to have it wholly rebuilt, and in 1668 he had asked Wren to prepare a design for a wholly new church. This first design, the model for which is preserved, was rather too tall, and Wren, according to what Wren afterwards devised. In plan it is an immense rotunda surrounded by a wide aisle, and approached by a double portico; the rotunda is covered with a dome taken from that of the Pantheon in Rome; on this a second dome stands, set on a lofty drum, and this second dome is crowned by a tall spire. But the dean and chapter objected to the absence of a structural choir, nave and aisles, and wished to follow the medieval cathedral arrangement. Thus, in spite of its having been approved by the king, this design was happily abandoned—much to Wren’s disgust; and he prepared another scheme with a similar treatment of a dome crowned by a spire, which in 1675 was ordered to be carried out. Wren apparently did not himself approve of this second design, for he got the king to give him permission to alter it as much as he liked, without showing models or drawings to any one, and the actual building bears little resemblance to the approved design, to which it is very superior in almost every possible point. Wren’s earlier designs have the exterior of the church arranged with one order of columns; the division of the whole height into two orders was an immense gain in increasing the apparent scale of the whole, and the external of St Peter’s in Rome is an almost prior to that of St Peter’s in Rome, which is utterly dwarfed by the colossal size of the columns and pilasters of its single order. The present dome and the drum on which it stands, masterpieces of graceful line and harmonious proportion, were very important alterations from the earlier scheme. As a scientific engineer and practical architect Wren was perhaps more remarkable than as an artist. The construction of the wooden external dome, and the support of the stone lantern by an inner cone of brickwork, quite independent of either the external or internal dome, are wonderful examples of the skill with which mathematics, engineering, and art were combined in his work.

Wren also designed a colonnade to enclose a large piazza forming a clear space round the church, somewhat after the fashion of Bernini’s colonnade in front of St Peter’s, but space in the city was too valuable to admit of this. Wren was an enthusiastic admirer of Bernini’s designs, and visited Paris in 1665 in order to see him and his proposed scheme for the rebuilding of the Louvre. Bernini showed his design to Wren, but would not let him copy it, though, as he said, he “would have given his skin” to be allowed to do so.

After the destruction of the city of London Wren was employed to make designs for rebuilding its fifty burnt churches, and he also prepared a scheme for laying out the whole city on a new plan, with a series of wide streets radiating from a central space. Difficulties arising from the various ownerships of the ground prevented the accomplishment of this scheme.

Among Wren’s city churches the most noteworthy are St Michael’s, Cornhill; St Bride’s, Fleet Street, and St Mary-le-Bow, Cheapside, the latter remarkable for its graceful spire; and St Stephen’s, Walbrook, with a plain exterior, but very elaborate and graceful interior. In the design of spires Wren showed much taste and wonderful power of invention. He was also very judicious in the way in which he expended the limited money at his command; he did not fritter it away in an attempt to make the whole of a building remarkable, but devoted it chiefly to one part or feature, such as a spire or a rich scheme of internal decoration. Thus he was in some cases, as in that of St James’s, Piccadilly, content to make the exterior of an almost barnlike plainness.

The other buildings designed by Wren were very numerous. Only a few of the principal ones can be mentioned:—the Custom House, the Royal Exchange, Marlborough House, Buckingham House, and the Hall of the College of Physicians—now destroyed; others which exist are—at Oxford, the Sheldonian theatre, the Ashmolean museum, the Tom Tower of Christ Church, and Queen’s College chapel; at Cambridge, the library of Trinity College and the chapel of Pembroke, the latter at the cost of Bishop Matthew Wren, his uncle. The western towers of Westminister Abbey are usually attributed to Wren, but they were Wren’s and not Wren’s. Wren’s works were carried out till 1735-1745, many years after Wren’s death, and there is no reason to think that his design was used. Wren (D.C.L. from 1660) was knighted in 1673, and was elected president of the Royal Society in 1681. He was in parliament for many years, representing Plympton from 1685, Windsor from 1689, and Weymouth from 1700. He occupied the post of surveyor of the royal works for fifty years, but by a shamful cabal was dismissed from this office a few years before his death.
WREN—WRESTLING

He died in 1723, and is buried under the choir of St Paul’s; on a tablet over the inner north doorway is the well-known epitaph—St monimentum requiris, circumspice.

For further information the reader should consult the Parentalit, and the library of the British Museum, which contains a full account of the Wren family and especially of Sir Christopher and his works; also the two biographies of Wren by Elmes and Miss Phillimore; Milman, Annals of St Paul’s (1868); and Longman, Three Churches dedicated to St Paul in London (1873), pp. 77 seq. See also Church, Churches of Sir C. Wren (1848–1849); Taylor, Towers and Steeples of London (1881); Niven, City Churches (London, 1887), illustrated with fine engravings; A. H. Mackmurdo, Wren’s City Churches (1883); A. Stratton. The Life, Work and Influence of Sir Christopher Wren (1897); Lena Milman, Sir Christopher Wren (1908). In the library of All Souls at Oxford are preserved a large number of drawings of Wren’s by the English masters; these are among almost all his chief works, and a fine series showing his various schemes for St Paul’s Cathedral.

WREN (O. Eng. wrenna, Mid. Eng. wrenne; Icl. rindill), the popular name for birds of the passerine family Troglodytidae, of which the best known example is Troglodytes parvulus, the little brown bird—with its short tail, cocked on high—inquisitive and familiar, that braves the winter of the British Islands, and even that of the European continent. Great interest is taken in this bird in Europe. It was not until the middle of the last century that Britain comparatively few vernacular names have been applied to it, two of them—"jenny" or "kitty-wren"—are terms of endearment. M. Rolland records no fewer than 139 local names for it in France; and Italy, Germany and other lands are only less prolific. Many of these carry on the old belief that the wren was a bird of kings, a belief connected with the fable that once the owls of the air resolved to choose for their leader that one of them which should mount highest. This the eagle seemed to do, and all were ready to accept his rule, when a loud burst of song was heard, and perched upon him was seen the wren which, in the contest, had been borne aloft by the giant. The curious association of this bird with the Feast of the Three Kings, on which day in S. Wales, or, in Ireland and in the S. of France, on or about Christmas Day, men and boys used to "hunt the wren," addressing it in a song as "the king of birds," is remarkable.

The better known forms in the United States are the house-wren, common in the eastern states; the winter-wren, remarkable for its resonant and brilliant song; the Carolina-wren, also a fine singer, and the marsh-wren, besides the cactus wrens and the cinnamon wrens of the western states.

Wrens have the bill slender and somewhat arched: their food consists of insects, larvae and spiders, but they will also take any small creatures, such as worms and snails, and occasionally eat seeds. The note is shrill. The nest is usually a domed structure of ferns, grass, moss and leaves, lined with hair or feathers, and from three to nine eggs are produced, in most of the species white.

The headquarters of the wrens are in tropical America, but they reach Greenland in the N. and the Falkland Islands in the S. Some genera are confined to the hills of tropical Asia, but Troglodytes, the best known, ranges over N. and S. America, Asia and Europe.

The Troglodytidae by no means contain all the birds to which the name "wren" is applied. Several of the Syrinxia (cf. Warbler) bear it, especially the beautiful little golden-crested wren (cf. Kinglet) and the group commonly known in Britain as "willow-wrens"—forming the genus Phylloscopus. Three of these are habitual summer-visitors. The largest, usually called the wood-wren, P. sibilatrix, is more abundant in the N. than in the S. of England, and chiefly frequents woods of oak or beech. It has a loud and peculiar song, like a repeated twit, sounded very long, and repeated at first slowly, but afterwards more quickly, while at uncertain intervals comes another note, which has been syllabled as she, uttered about three times, and is given on the wing. This wren is common proper. P. trochilus, is in many parts of Great Britain the commonest summer-bird, and is the most generally dispersed. The third species, P. collybita or minor (frequently but most wrongly called Sylvia rufa or P. rufus), colorfully known as the chiffchaff, from the peculiarity of its constant repeated two-noted cry, is very numerous in the S. and W. of England, but seems to be scarcer N. These three species make their nest upon or very close to the ground, and the building is always camouflaged. Hence they are commonly called "overground" and occasionally, from the grass used in their structure, "hay-jacks," a name common to the white-throat (q.v.) and its allies. (A. N.)

WRESTLING (O. Eng. wresling), a sport in which two persons strive to throw each other to the ground. It is one of the most primitive and universal of sports. Upon the walls of the temple-tombs of Beni Hasan, near the Nile, are sculptured many hundred scenes from wrestling matches, depicting practically all the holds and falls known at the present day, thus proving that wrestling was a highly developed sport at least 3000 years before the Christian era. As the description of the bout between Odysseus and Ajax in the 23rd book of the Iliad, and the evolutions of the classic Greek wrestlers, tally with the sculptures of Beni Hasan and Nineveh, the sport may have been introduced into Greece from Egypt or Asia. In Homer's celebrated description of the match between Ajax and Odysseus the two champions were only a girdle and a tunic, which was a very simple and old-fashioned garment. Neither Homer nor Eustathius, who also minutely depicted the battle between Ajax and Odysseus, mentions the use of oil, which, however, was invariable at the Olympic games, where wrestling was introduced during the 18th Olympiad. The Greek wrestlers were, after the application of the oil, rubbed with fine sand, to afford a better hold.

Wrestling was a very important branch of athletics in the Greek games, since it formed the chief event of the penteleion, or quintuple games (see Games, Classic). All holds were allowed, even strangling, but not striking. Crowd-longing, or crowd, was a feature used especially in the panraction, a combination of wrestling and boxing. Wrestlers were taught to be graceful in all their movements, in accordance with the Greek ideas of aesthetics. There were two varieties of Greek wrestling, the panaia or deith, or upright wrestling, which was that generally practised, and the dikilnos or dikilonom (diplapollo, lucta volutatoria) or squirming contest after the contest had fallen, which continued until one acknowledged defeat. It was this variety that was employed in the panraction. The upright wrestling was very similar to the modern catch-as-catch-can style. In this three falls out of five decided a match. A variation of this style was that in which one of the contestants stood within a small ring and resisted the efforts of his adversary to pull him out of it. Other local varieties existed in the different provinces. The most celebrated wrestler of ancient times was Milo of Crotona (c. 520 B.C.), who scored thirty-two victories in the different national games, six of them at Olympia. Greek athletic sports were introduced into Rome in the last quarter of the 2nd century B.C., but it never attained to the popularity that it enjoyed in Greece.

The Romans were largely the Germans, and the Romans were wrestling, at least as a method of fighting, was of course always known; how popular it had become as a sport during the middle ages is proved by the voluminous literature which appeared on the subject after the invention of printing, the most celebrated work being the Ringer-Kunst of Fabian von Auerswald (1539). Albrecht Dürer made 119 drawings illustrating the different holds and falls in vogue in the 15th and 16th centuries. These singularly resembled those used in the Greek games, even to certain brutal tricks, which, however, were considered by the German masters as not geistig (friendly) and were not commonly used. Wrestling was adopted by the German Turnvereine as one of their exercises, but with the elimination of tripping and all holds below the hips. At present the most popular style in Europe is the so-called Gracco-Roman.

In Switzerland and some of the Tyrolese valleys a kind of wrestling florishes under the name of Schwunges (swinging). The wrestlers wear schwungkosen or wrestling-breeches, with stout belts, on which the holds are taken. The first man down loses the bout. In Styria, wrestlers stand firmly on both feet and pull up on the other's hands. When the word is given each tries to push or pull the other from his stance, the lightest movement of a foot sufficing to lose. The popularity of wrestling has survived in many Asiatic countries, particularly in Japan, where the first match recorded took place in 23 B.C., the victor being Sukune, who has ever since been regarded as the tutelary deity of wrestlers. In the 8th century the emperor Shōmu made wrestling one of the features of the annual harvest "Festival of the Five Grains;"
the victor being appointed official referee and presented with a fan bearing the legend, "Prince of Lions." In 858 the shogun of Japan was wrestled for by the two sons of the emperor Buntoku, and the victor, Koeshito, succeeded his father under the name of Seiwa. Imperial patronage of wrestling ceased in 1175, after the war which resulted in the establishment of the Shogunate, but continued to be a part of the training of the samurai or military caste. About 1600, professional wrestling again rose to importance, the best men being in the employ of the great Lords, generals, and nobles. It was kept up by the samurai, and eventually developed into the peculiar combination of wrestling and system of doing bodily injury called ju-jutsu (q.v.), which survives with wrestling as a separate though allied art. The national championships were re-established in 1624, when the celebrated Shiganosuke won the honour, and have continued to the present day. The Japanese wrestlers, like those of India, lay much stress upon weight and are generally men of great bulk, although surprisingly light on their feet. They form a guild which is divided into several ranks, the highest being composed of the joshiyori, or elders, in whose hands the superintendence of the wrestling schools and tournaments lies, and who in feudal times used to rank next to the samurai. The badges of the three highest ranks are damask aprons richly embroidered. Every public wrestler must have passed through a thorough course of instruction under one of the joshiyori and have undergone numerous practical tests. The wrestling takes place in a ring 24 ft. in diameter, the wrestlers being naked but for a loin-cloth. At the command of the referee the two adversaries crouch with their hands on the ground and watch for an opening. The method is very similar to that of the ancient Greeks and the modern catch-as-catch-can style, except that a wrestler who touches the ground with any part of his person except the feet, after the first hold has been taken, loses the bout.

Indian wrestling resembles that of Japan in the great size of its exponents or Putwans, and the number and subtility of its attacks, called penches. It is of the "loose" order, the men facing each other nude, except for a loin-cloth, and manoeuvring warily for a hold. Both shoulders placed on the ground simultaneously constitute a fall.

In Great Britain wrestling was cultivated at a very early age, both Saxons and Celts having always been addicted to it, and English literature is full of references to the sport. On St James's and St Bartholomew's days special matches took place throughout England, those in London being held in St Giles's Field, whence they were afterwards transferred to Clerkenwell. The lord mayor and his sheriffs were often present on these occasions, but the frequent brawls among the spectators eventually brought public matches into disrepute. English monarchs have not disdained to patronize the sport, and Henry VIII. is known to have been a powerful wrestler.

It was inevitable, in a country where the sport was so ancient and so universal, that different methods of wrestling should grow up. It is likely that the "loose" style, in which the contestants took any hold they could obtain, generally prevailed throughout Great Britain until the close of the 18th century, when the several local fashions became gradually coherent; but it was not until well into the 19th that their several rules were codified. Of these the "Cumberland and Westmorland" style, which prevails principally in the N. of England (except Lancashire) and the S. of Scotland, is the most important. In this the wrestlers stand chest to chest, each grasping the other with locked hands round the body with his chin on the other's right shoulder. The right arm is below and the left above the adversary's. When this hold has been firmly taken the umpire gives the word and the bout proceeds until one man touches the ground with any part of his person except his feet, or he fails to retain his hold, in either of which cases he loses. When both fall together the one who is underneath, or first touches the ground, loses. If both fall simultaneously side by side, it is a "dog-fall," and the bout begins anew. The different manoeuvres used in British wrestling to throw the adversary are called "chips," those most important in the "Cumberland and Westmorland" or "North Country" style being the "back-heel," in which a wrestler gets a leg behind his opponent's heel on the outside; the "outside stroke," in which after a sudden twist of his body to the left the opponent is struck with the left foot on the outside of his ankle; the "hank," or lifting the opponent off the ground after a sudden turn, so that both fall together, but with the opponent underneath; the "inside click," a hank applied after jerking the opponent forward, the pressure being applied to a man's back heel applied by a wrestler as he is on the point of being lifted from the ground—it prevents this and often results in over-turning the opponent; the "cross-buttock," executed by getting one's hip underneath the opponent's, throwing one's leg across both his, lifting and throwing him; the "buttock," in which one's hip is worked still further under that of the opponent, who is then thrown right over one's back; the "hipe" or "hype," executed by lifting the opponent, and, while swinging him to the right, placing the left knee under his right leg and carrying it high as possible before the throw; the "swinging hipe" in which the opponent is swung nearly or quite round before the hipe is applied; and the "breast-stroke," which is a sudden double twist, first to one side and then to the other, followed by a throw.

In the "Cornwall and Devon" or "West Country" style the men wrestle in stout, loosely cut linen jackets, the hold being anywhere above the waist or on any part of the jacket. A bout is won by throwing the opponent on his back so that two shoulders and a hip, or two hips and a shoulder (three points), shall touch the ground simultaneously. This is a difficult matter, since ground is (in Cornwall) loose and sandy, and if the wrestler feels himself falling, will usually turn and land on his side or face. Many of the "chips" common to other styles are used here, the most celebrated being the "flying mare," in which the opponent's left wrist is seized with one's right, one's back turned on him, his left elbow grasped with the left hand and he is then thrown over one's back, as in the buttock. Until comparatively recently there was a difference between the styles of Cornwall and Devon, the wrestlers of the latter county having worn heavily-soled shoes, with which it was legitimate to break the adversary's shins. In 1828 a memorable match took place between Polkinhorne, the Cornish champion, and the best wrestler of Devon, Abraham Cann, who wore "kicking-boots of an appalling pattern." Polkinhorne, however, encased his shins in leather, and the match was eventually drawn.

The "Lancashire" style, more generally known as "catch-as-catch-can," is practised not only in Lancashire and the adjacent districts, but throughout America, Australia, Turkey and other countries. It is the legitimate descendant and representative of the ancient Greek sport and of the wrestling of the middle ages. A bout is won when both shoulders of one wrestler touch the floor together. No kicking, striking or other foul practices are allowed, but theoretically every hold is legitimate. Exceptions are, however, made of the so-called strangle-holds, which are sufficiently described by their designation, and any hold resulting in a dislocation or a fracture. This style contains practically all the manoeuvres known to other methods, and in its freedom and opportunity for a display of strategy, strength and skill, is the most preferable. A fall, though invariably begun standing, is nearly always completed on the ground (mat). The holds and "chips" are varied and complicated as to make anything but an elaborate description inadequate. The best book on the subject is the Handbook of Wrestling by Hugh F. Leonard (1897).

In Scotland a combination of the Cumberland and catch-as-catch-can styles has attained some popularity, in which the wrestlers begin with the North Country hold, but continue the bout on the ground should the fall not be a clean one with two shoulders down.

In Ireland the national style is called "collar and elbow" (in America, "back-wrestling"), from the holds taken by the
two hands. The man loses, any part of whose person, except the feet, touches the ground.

The style mostly affected by the professional wrestlers of Europe at the present day is the Graeco-Roman (falsely so called, since it bears almost no resemblance to classic wrestling), which arose about 1860 and is a product of the French wrestling schools. It is a very restricted style, as no tripping is allowed, no men from the hips, the outside being that the hands which are contested almost entirely prone on the mat, are usually terribly low. British and American wrestlers, being accustomed to their own styles, are naturally at a disadvantage when wrestling under Graeco-Roman rules.

WREXHAM—WRIGHT, S.

Wrexham (Welsh'rweysiamn, in the Anglo-Saxon Chronicle Wrichtesham), a market town and parliamentary and municipal borough of Denbighshire, N. Wales, 11 m. S.S.W. of Chester, with stations on the Great Western railway, and on the Great Central railway, 202 m. from London. Pop. (1901) 14,996. "One of the seven wonders of Wales" is St. Giles's church, of the 14th, 15th and 16th centuries, with a panelled tower of several stages erected between 1520 and 1520, and containing ten famous bells cast (1726) by Rudhall; the interior is Decorated, and has two monuments by Roubiliac to the Myddletons. Wrexham is the seat of the Roman Catholic bishop of Menevia, whose diocese includes all Wales except Glamorganshire. The endowed free school was established in 1603. The markets and fairs are good, and the ales, mills (corn and paper) and tanneries locally famous. Brymbo Hall, in the neighbourhood, is said to have been built from a design by Inigo Jones, as was formerly the Gwydyr chapel (1613) and the Conway bridge (1636), both at Llanrwst. Eddig Hall was noted for its Welsh MSS. Near Wrexham, but in a detached portion of Flintshire, to the S.E., is Bangor-is-coed (Bangor on Maesol), the site of the most ancient monastery in the kingdom, founded before 810; some 1200 monks were slain there by Æthelfrith of Northumbria, who also spoiled the monastery. Bangor-is-coed was probably Antoninus's Brevium, and the Banchorium of Richard of Cirencester. Wrightesham was of Saxon origin, and lying E. of Offa's Dyke, was yet reckoned in Mercia. It was given (with Bromfield and Vale, or Id) by Edward I. to Earl Warenne.

WRIGHT, CARROLL DAVIDSON (1840-1909), American statistician, was born at Dunbarton, New Hampshire, on the 25th of July 1840. He began to study law in 1860, but in 1862 enlisted as a private in a New Hampshire volunteer regiment. He became colonel in 1864, and served as assistant-major-general of a brigade in the Shenandoah Valley campaign. He was admitted to the New Hampshire bar after the war, and in 1867 became a member of the Massachusetts and United States bars. From 1872 to 1873 he served in the Senate of Massachusetts; and from 1873 to 1878 he was chief of the Massachusetts Bureau of Statistics of Labor. He was U.S. commissioner of labour from 1885 to 1905, and in 1893 was placed in charge of the Eleventh Census. In 1894 he was chairman of the commission which investigated the great railway strike of Chicago, and in 1902 was a member of the Anthracite Strike Commission. He was honorary professor of social economics in the Catholic university of America from 1895 to 1904; in 1900 became professor of statistics and social economics in Columbian (now George Washington) University, from 1900 to 1901 was university lecturer on wage statistics, and in 1902 was a member of the special committee appointed to revise the labour laws of Massachusetts. In 1902 he was chosen president of Clark College, Worcester, Mass., where he was also professor of statistics and social economics from 1904 until his death. Dr Wright was president of the American Association for the Advancement of Science in 1903, and in 1907 received the Cross of the Legion of Honour for his work in improving industrial conditions, a similar honour having been conferred upon him in 1906 by the Italian government. He died on the 20th of February 1909.

His publications include The Factory System of the United States (1880); Relation of Political Economy to the Labor Question (1882); History of Wages and Prices in Massachusetts, 1725-1883 (1889); The Industrial Evolution of the United States (1887); Outline of Practical Sociology (1899); Battles of Labor (1906); and numerous papers on social and economic topics.

WRIGHT, CHAUNCEY (1830-1875). American philosopher and mathematician, was born at Northampton, Mass., on the 20th of September 1830, and died at Cambridge, Mass., on the 12th of September 1875. In 1852 he graduated at Harvard, and became computer to the American Ephemeris and Nautical Almanac. He made his name by contributions to mathematical and physical subjects in the Mathematical Monthly. He soon, however, turned his attention to metaphysics and psychology, and for the North American Review and later for the National he wrote philosophical essays on the lines of Mill, Darwin and Spencer. In 1870-71 he lectured on psychology at Harvard. Although, in general, he adhered to the evolution theory, he was a free lance in thought. Among his essays may be mentioned The Evolution of Self-Consciousness and two articles published in 1871 on the Genesis of Species. Of these, the former endeavours to explain the most elaborate psychological activities of men as developments of elementary forms of conscious processes in the animal kingdom as a whole; the latter is a defence of the theory of natural selection against the attacks of Stoddard and Wallace. In 1873 and 1874, jointly with J. H. Mivart, he joined in the suggestion of Darwin. From 1863 to 1870 he was secretary and recorder to the American Academy of Arts and Sciences, and in the last year of his life he lectured on mathematical physics at Harvard.

His essays were collected and published by C. E. Norton in 1877, and later in 1893. They were privately printed at Cambridge, Mass., in 1878 by James Bradley Thomas.

WRIGHT, JOSEPH (1734-1797), styled Wright of Derby, English subject, landscape and portrait painter, was born at Derby on the 3rd of September 1734, the son of an attorney, who was afterwards town-clerk. Deciding to become a painter, he went to London in 1751 and for two years studied under Thomas Hudson, the master of Reynolds. After painting portraits for a while at Derby, he again placed himself for fifteen months under his former master. He then settled in Derby, and varied his work in portraiture by the production of the subjects seen under artificial light with which his name is chiefly associated, and by landscape painting. He married in 1773, and in the end of that year he visited Italy, where he remained till 1775. While at Naples he witnessed an eruption of Vesuvius, which formed the subject of many of his subsequent pictures. On his return from Italy he established himself at Bath as a portrait-painter; but meeting with little encouragement he returned to Derby, where he spent the rest of his life. He was a frequent contributor to the exhibitions of the Society of Artists, and to those of the Royal Academy, of which he was elected an associate in 1781 and a full member in 1788. He, however, declined the latter honour on account of a slight which he believed that he had received, and severed his official connexion with the Academy, though he continued to contribute to the exhibitions from 1783 till 1794. He died at Derby on the 29th of August 1797. Wright's portraits are frequently defective in drawing, and without quality or variety of handling, while their flesh tints are often hard. He is seen at his best in his subjects of artificial light, of which the "Orrery" (1760), the property of the corporation of Derby, and the "Air-pump" (1768), in the National Gallery, are excellent examples. His "Old Man and Death" (1774) is also a striking and effective production. An exhibition of Wright's works was brought together at Derby in 1883, and twelve of his pictures were shown in the winter exhibition of the Royal Academy in 1886. His biography, by William Bemrose, was published in 1885.

WRIGHT, SILAS (1705-1847), American political leader, was born at Amherst, Mass., on the 24th of May 1705. He graduated at Middlebury College, Vermont, in 1815, was admitted to the bar in 1810, and began practice at Canton, now named New York. He was appointed surrogate of St Lawrence county in 1820, and elected a successive a member of the state Senate in 1824-1826, a member of the national House of Representatives in 1827-1829, comptroller of the state in 1820-1833.
U.S. senator in 1833-1844, and governor of New York in 1844-1846. During his public life he had become a leader of the Democratic party in New York, Martin Van Buren being his closest associate. He was an influential member of the so-called "Albany Regency," a group of Democrats in New York, including such men as J. A. Dix and W. L. Marcy, who for many years virtually controlled their party within the state. Wright's influence was best illustrated in 1844, when the "disaffection" (see New York) broke out and it seemed probable that the votes of the disaffected would decide the coming election. The governor asked and obtained from the legislature the power to suppress the disturbance by armed force, and put an end to what was really an insurrection. When the national Democratic party in 1844 nominated and elected James K. Polk to the presidency, instead of Martin Van Buren, Wright and the state organization took an attitude of armed neutrality towards the new administration. Renominated for governor in 1846, Wright was defeated, and the result was a marked reaction in part to the alleged hostility of the Polk administration. He died at Canton on the 27th of August 1847.

The best biography is that by J. D. Hammond, Life and Times of Silas Wright (Syracuse, N.Y., 1848), which was republished as vol. ii of a new work, Historical Sketches of New York.

WRIGHT, THOMAS (1809-1884), British palaeontologist, was born at Paisley in Renfrewshire on the 9th of November 1809. He studied at the Royal College of Surgeons in Dublin, and qualified as a doctor in 1832. Soon afterwards he settled at Cheltenham, and graduated M.D. at St Andrews in 1846. He devoted his leisure to geological pursuits, became an active member of the Cottewold Naturalists' Club (founded in 1846), and gathered a fine collection of Jurassic ammonites and echinoderms. He contributed to the Palaeontographical Society monographs on Jurassic shelly fauna from the Oolitic and Cretaceous formations (1855-1882); he also began (1878) a monograph on the Lias ammonites of the British Islands, of which the last part was issued in 1885, after his death. He wrote many papers in the Ann. and Mag. Nat. Hist. and Proc. Cottewold Club. The Wollaston medal was awarded to him by the Geological Society of London in 1878, and he was elected F.R.S. in 1879. He died at Cheltenham on the 17th of November 1884.

WRIGHT, THOMAS (1810-1877), English antiquary, was born at Waddow, in Shropshire, on the 21st of April 1810. He was descended from a Quaker family of the name of Wright, living in Blackburn, Yorkshire. He was educated at the old grammar school, Ludlow, and at Trinity College, Cambridge, where he graduated in 1834. While at Cambridge he contributed to the Gentleman's Magazine and other periodicals, and in 1835 he came to London to devote himself to a literary career. His first separate work was Early English Poetry in Black Letter, with Prefaces and Notes (1836, 4 vols. 12m0), which was followed during the next forty years by a very extensive series of publications, many of lasting value. He helped to found the British Archaeological Association and the Percy, Camden and Shakespeare societies. In 1842 he was elected corresponding member of the Académie des Inscriptions et Belles Lettres of Paris, and was a fellow of the Society of Antiquaries as well as member of many other learned British and foreign bodies. In 1859 he superintended the excavations of the Roman city of Uriconium, near Shrewsbury, of which he issued a description. He died at Chelsea on the 23rd of December 1877, in his sixty-seventh year. A portrait of him is in the Drawing Room Portrait Gallery for October 1st, 1859. He was a great scholar, but will be chiefly remembered as an industrious antiquary and the editor of many relics of the middle ages.

His chief publications are—Queen Elizabeth and her Times, a Series of Original Letters (1838, 2 vols.); Religiones antiquae (1839-1843, again 1845, 2 vols.), edited with Mr J. O. Halliwell-Phillips; Works of an English Delineator (1841); Collections of Historical, Ballads and Carols, published by the Percy Society (1841); Popular Treatises on Science (1841); History of Ludlow (1841, 2 vols.; again 1852); Collections of Latin Stories (1842, Percy Society); The Vision and Creed of Fiers Ploughman (1842, 2 vols. 2nd ed., 1855); Biographia literaria, vol. i, Anglo-Saxon Period (1842), vol. ii, Anglo-
and the paries curiae or other witnesses. In England such writs were passed and joined in the verdic in case of disputed right to 12 Edw. II. st. 1. c. 2. The breve testatum in England developed into the feoffment, later into the deed of grant; in Scotland into the charter, and later into the instrument. The breve testatum consisted of a letter from the pope, sealed with the seal of the fisherman and less formal than a bull. In old English ecclesiastical law a brief—still named in one of the rubrics of the Book of Common Prayer—was deemed more solemn than a writ, and its delivery to the sheriff in the event of disobedience, generally in those terms, eü nisi feceris, vicemos de N. fato violento clamorem audiam in defectu justitiae. If the writ was not found when it should have been at the court, the sheriff or the lord sat as the deputy of the king, not by virtue of his inherent jurisdiction. The writ was not necessary for the initiation of proceedings in these courts or before the justices of the peace, but a custom existed, and a writ from the king where the claim was above 40s. Cases were transferred from the lord's court to the county court by writ of toll (so called because it removed, tollit, the case), from the latter to the king's court by writ of pon (so called from its first word). By Magna Carta the power of bringing a suit in the king's court in the first instance by writ of praestatio was taken away, and the writ was henceforth only required in the county court, i.e., where the case had never been heard or, where the lord had no court or abandoned his right. Hence it became a common form in the writ of right to allege that the lord had renounced his court (dominus remissit curiam) so as to be subject to the jurisdiction of the common law courts.

Besides being used for the trial of disputes, writs addressed to sheriffs, mayors, commissioners or others were in constant use for financial and political purposes, e.g., for the collection of fines, scutage, tallage, and later to entailment, and for dissolving a parliament, the last by means of the rarely occurring writ de revocatione parliamenti.

In some cases, so-called writs (excluding those purely financial and political), the most important being that into original and judicial, the former (testatus in the name of the king) issued to bring a suit before the proper court, the latter (tested in the name of the judge) issued during the progress of a suit or to enforce judgment. Original were either optional, i.e., giving an option of doing a certain act or of showing cause why it was not done, beginning with the words praestacio quod reddat, the principal of the recovery (see Fine) were based, or peremptory, i.e., calling on a person to do a certain act, beginning with the words si A. fecit etc. securum. Original were also either de cursu (also called by Bracton formate) or magistratia, the former those fixed in form and depending on precedent, the latter those fixed by the masters in chancery under the powers of the Statute of Westminster the Second. They were also either general or special, by the granting of the defendant's particularity as the former. In regard to real estate they might be possessory or personal. By 5 Geo. II. c. 27 (1732) special writs were more confined to the county court. The recovery (see Fine) were also a division of writs into writs of right (ex debito justitiae), such as habeas corpus, and prerogative writs (ex gratia), such as mandamus and prohibition. Coke and other authorities mention some other and various divisions, but those which have been named appear to be the principal.

The most interesting form of writ from the historical point of view was the writ of right (breve de recto curia) called a bill of complaint, a writ for ouret, or privation of the freehold. By it property as well as possession could be recovered. It generally lay in the king's court, as has been, by virtue of a fictitious allegation. In that case it was directed against a person who had the estate that was attacked, or in the king's name against his own estate. It was addressed to the lord and tried in his court, it was generally a writ of right patent. After the appearance of the tenant the defendant in a writ of right can sue for his costs. In a writ, but in more precise terms, the writ being as it were the embryo of the future court. The trial was originally by battle (see Trial), but in the reign of Henry II. an alternative and optional procedure was introduced, interesting as the earliest example of the substitution of something like the jury (q.e.) for the judicial combat. A de magnis assisa eligenda was directed to the sheriff commanding him to return four knights of the county and vicinities to try the cause. This reference to a jury returned the writ (by return in the common law) upon on oath the question contained in the writ of right (technically called the mise). This mode of trial was known as trial by the grand assize. Generally throughout the whole of the Middle Ages it was a sufficient number. The last occasion of trial by the grand

1 See W. A. Bewes, Church Briefs (1896). The lines in Cowper's "Charity" allude to such a brief.

2 "But first the square's—a compliment but due."—See article by F. W. Maitland in 3 Harv. Law Rev. 177.

3 The place where writs were deposited was called breviarium or breviarium. This use of the word must be distinguished from legal compendia, such as the Breviarium Alarici or Breviarium extraognitum.
asize was in 1835. But long before that date possessory had from their greater convenience tended to supersede proprietary remedies, and in most cases the title was sufficiently determined by the asizes of other kinds, especially those of trespass and waste, and became curiously equivocal. The oath of the champion on proceedings in a writ of right where the alternative of the judicial combat was accepted was regulated by statute, 3 Edw. I. c. 41 (1757). The writ of right was not further compromised by the property of the proceeding by the Statute of Merton (1226) no seisin could be alleged by the defendant but from the time of Henry II. By 3 Edw. I. c. 39 the time was fixed at the reign of Richard I., by 32 Hen. III. c. 13. The writ of right with special names, e.g. the writ of right of the custom of London for land in London, the writ of right by advowson, brought by the patron to recover the advowson of his benefice, the right of dower, ne injusque vestes and de rationabili parte, the latter brought by coparceners or brothers in gavelkind. Coheirs and coparceners also had the nuper oblit for dissaisin by one of themselves. There was laboured from the nature of a writ of right, dower, ne injusque vestes, to prohibit the lord from exacting services or rents beyond his due; de auto habeo, to recover the inheritance in a villein; and the little writ of right close according to the custom of the manor, to try in the lord's court the King's tenants in antient demesne. They had also the writ of monstrarunt.

Up to 1832 an action was (except as against certain privileged persons, such as attorneys) begun at law by original writ, and the practice of pleadings in that court, as in other courts of record, is described in old books of practice. The law was gradually altered by legislation and still more by the introduction of fictitious proceedings in the common law courts. There were such proceedings in the courts of the crown, for example, whereby a judgment was suspended, except in real actions, which were of comparatively rare occurrence. The original writ is no longer in use in civil procedure, an action being now in all cases commenced by the writ of summons, a judicial writ, a procedure first introduced in 1832 by 3 Will. IV. c. 39. In the following year an immense number of the old writs was abolished by the Real Property Limitation Act 1833. An exception is made in favour of the right of writ of dower, nisi iniuri utrum, mort d'ancusmeet et darein presentem, conspiracy, estrepment and waste, false judgment, monstrons de droit, nuisance partition, preemunire, quo warranto, falsely facias, subpoena and serviento charitas.

The number of writs, especially those connected with ecclesiastical procedure, was so large that any exhaustive list of them is almost impossible, but a few of those of more special interest and which could otherwise be omitted will be mentioned. Admissuario lay against persons usurping more than their share of property. It was either dolis or pastuce, the latter, like the other, is abolished in the Ecclesiastical Law Procedure Act 1860, by which they were abolished. Other writs which have been superseded by simpler proceedings, generally by ordinary actions, are those of the four assizes of novel disseisin, of trespass, of dower, of dower, ne injusque vestes, to prohibit the lord from exacting services or rents beyond his due; de auto habeo, to recover the inheritance in a villein; and the little writ of right close according to the custom of the manor, to try in the lord's court the King's tenants in antient demesne. They had also the writ of monstrarunt.

The action of right—by which the trial by battle and the appeal of felony tended to become obsolete. Leproso amoveo explains itself. Moretta mutationi was the means of reviewing an excessive amendment of an inferior court, especially after an amendment had tended to become a fixed sum of twelve pence. Nisi prius was given by the Statute of Westminster the Second, 13 Edw. I. c. 30. Its place was taken by the Act for the reformation of the courts of law and admiralty and the regno, before the present Book of Common Prayer, enjoined public prayers for the high court of parliament. Protection was given for the first time by the Statute of Westminster the Second, 28 Edw. I. c. 7. It was possibly among the means—the like of the writ of right—by which the trial by battle and the appeal of felony tended to become obsolete. Leproso amoveo explains itself. WRIT

writ was obsolete, and that the same relief could be obtained by
imposition. On appeal this refusal was sustained by the Privy
Council.

Of writs now in use, other than those for elections, all are judicial,
or part of the machinery of justice, and are adapted to the needs of
criminal cases. They are to be henceforth issued out of the
central office of the supreme court, or the office of the clerk of
the crown in chancery. By the Crown Office Act 1873, writs
containing causes addressed to the court of King's Bench are
writs now in use.

In local civil courts, other than county courts, writs are usually
issued in the form of orders of the court, or of officers of the
court, such as the sheriff or coroner. It follows, however, that
in counties, in which county coroners are not appointed, the</p>
OUTLAWYING, calling upon the party to appear. Under the old practice a seuer facias de novo was the means of obtaining a new trial. Virend inspiciendo appears still to be competent, and is a curious relic of antiquity. It issues on the application of an heir presumptive in order to test the right of an heir-in-being who is the heir of a deceased owner of lands be with child or not. Almost exactly the same proceeding was known in Roman law.

The person desiring the issue of the writ must be able to maintain a legal action. Proceedings may be had without a writ in cases where it is within the power of the court to give immediate relief, as for example in divorce or partition actions. In the case of non-resident employers, where the matter is so urgent as to necessitate an immediate order of the court, the court may give such order without a writ of summons and may enforce it by distress or by imprisonment of the agent who is charged with the non-payment of wages.

The object of the writ is to command the defendant to appear, or some proper substitute to appear, and to answer the issue of the court.

The court is supposed to have a right to give such remedy as the circumstances of the case demand. If the suit is for a debt, the defendant may be ordered to make the sum of money demanded by the plaintiff. In cases of personal injuries or for breach of contract or of a covenant in a bill or for any debts, the defendant may be ordered to answer the suit and to appear before the court, and the court may grant an injunction to restrain the defendant from doing any act which would tend to nullify the plaintiff's case,

If the court is unable to give the proper relief, it will be dismissed without prejudice to the plaintiff's right to a new suit. The writ of prohibition is the only one by which a person may be freed from the jurisdiction of a court. It is a writ of prohibition nisi upon the ground of error in the proceedings of the court. It restrains the court from acting on the ground of error in the proceedings of the court.

Writing (the verbal noun of "to write," O. Eng. *writan*, to inscribe), the use of letters, symbols or other conventional characters, for the recording by visible means of significant sounds, more specifically, the art of tracing by hand these symbols on paper or other material, by pen and ink, pencil, stylus or other such means, as opposed to mechanical methods such as printing. The principal features in the development of writing in its primary sense are dealt with in separate articles (see Alphabet, Palaeography, Inscriptions, Book, Manuscript, Shortland, &c.). Here it is only necessary briefly to refer to the origins of a system which has eventually followed the history of the various languages and has been stereotyped by the progress of typography (q.v.). Very early in the history of mankind, knots have become pressing. These are (a) to recall at a particular time something that has to be done; (b) to communicate with some other person who is not present, nor for the moment easily accessible; (c) to assert rights over tools, cattle, &c., by a distinctive mark, or by a similar mark to distinguish one's own production (e.g. a special make of pottery) from that of others. The last-named use, out of which in time develops every kind of trade-mark, is itself a development of the earlier property mark. The right to property must be established before traffic, whether by way of barter or of sale, is possible. Every one is familiar with devices to achieve the first of these aims; one of the commonest is to tie a knot in a handkerchief. It is obvious that by multiplying the number of knots a number of points equal to the number of knots might in this way be referred to, though it is probable that the untrained memory would fail to recall the meaning attached to more than a very limited number of knots. The simplest application of these knots is in keeping a record of a number of days, as in the story related by Herodotus (iv. 98), to the effect that Darius, on crossing the Ister in his Scythian expedition, left with the Greeks appointed to guard the bridge a thong with a number of knots equal to the number of days that their watch over the bridge was to be continued. One knot was to be undone each day, and if the king had not returned by the time that all the knots were undone, the Greeks were to break down the bridge and go away. A development of this is found in the Peruvian *quipus*, which consists of a number of thongs or cords hanging from a top-band or cross-bar. In its simplified form, knots are merely tied upon the individual cords. In its more elaborate forms the cords are of different colours, and are knotted together to form open loops of various shapes. In the *Antiquededes Peruanus*, we are told that the knots of the *quipus* in all probability indicated only numbers originally, but that as time went on the skill of the makers became so great that historical events, laws and edicts could thus be communicated. In every place of any importance there was an official whose business it was to interpret *quipus* received from a distance, and to make *quipus* himself. If, however, the *quipus* which was received came from a distant province, it was not intelligible without an oral explanation. Unfortunately, the art of interpretation of *quipus* is lost, so that it is impossible to ascertain how far the knots were merely a mnemonic for the messenger, and how far they were intelligible without explanation to a stranger. Similar mnemonics are said to have been used in the remotest antiquity amongst the Chinese, the Thibetans, and other peoples of the Old World.

Similar in character to the *quipus* is the message-stick, which is still in use amongst the natives of Australia. A branch of a tree is taken and notches made upon it. These are now cut with a knife; in earlier times they were made by the bending of a portion of a leaf or a thorn. In the presence of the messenger, who receives his instructions while they are being made, the notches are thus merely aids to memory, and not self-explanatory, though if messages frequently passed between two persons, practice would in time help the person to whom the message was sent to guess at the meaning, even without a verbal explanation. The following was the method of the Wotjobalukk of the Wimmera river in Victoria. "The messenger carried the message-stick in a net bag, and on arriving at the camp to which he was sent, he handed it to the headman at some place apart from the others, saying to him, 'So-and-so sent you this,' and he then gives his message, referring as he does so to the notches on the message-stick; and if his message requires it, also enumerates the days or stages, as the case may be," by a method of counting on different parts of the body.

For the purposes of communication with absent persons, however, another method commended itself, which in time was adopted also for mnemonic purposes. This method is called *quipus*. It was published in the discourses of the *quipus* of various original peoples, in which form writing have been derived. From the very earliest times to which the energy of man can be traced, date two kinds of writing: (a) engraving of a visible object on some hard substance, such as the flat surface of a bone; (b) drawing, painting or engraving marks which could again be identified. Of the first kind are the engravings of reindeer, buffaloes and other animals by the cave men of prehistoric times; of the second are a large number of pebbles discovered by M. Ed. Piette at Mas d'Azil, on the left bank of the Arize, an account of which was published in the discourses of *L'Anthropologie* (1856) viii. 384 sqq. This layer of coloured pebbles is intercalated between the last layer of the Reindeer Age and the first of the Neolithic period. The layer is over 2 ft. thick, of a reddish-black colour, and along with the pebbles are found cinders, peroxide of iron, teeth of deer perforated, probably in order to be strung like beads, harpoons of various kinds, and the bones of a large number of animals, some wheat, and, in the upper part of the layer, nuts, cherry-stones and plums. The stones were coloured with peroxide of iron. The characters are of two kinds: (a) a series of strokes which possibly indicate numbers, (b) graphic symbols. The stones were scattered about without connexion or relation one with another. Whatever the meaning may be, it is clear that the markings are not accidental. It is noticeable, however, that none of them definitely represent any animal, though some of them bear a certain resemblance to catterpillars or serpents. Others look like rough attempts to represent trees and river plants. A great number closely resemble symbols of the alphabet. Piette himself was inclined to see in the symbols the forerunners of the later syllabaries and alphabets of the East, nine of them agreeing with forms in the Cypriot syllabary (see below) and eleven with those of the Phoenician alphabet. A certain amount of likeness, however, could not well be avoided, for as soon as the artist advances beyond the single perpendicular or horizontal line he must, by crossing two lines, get forms which resemble alphabetical symbols. It might be therefore a safer conclusion to suppose that if they passed beyond magic symbols, to be buried like the Australian *churring*, they were conventional marks understood by the members of the clan or tribe which frequented the caves of Mas d'Azil. It has been suggested that, like similar things among the American Indians, they may have been used in playing games or gambling. A very large number of conventional marks, however, are demonstrably reductions from still older forms, conventional marks often developing out of pictographs. Pictography has, in fact, left its traces in all parts of the world. It has, however, been most widely developed in the New World as a system lasting down to modern times. The American Indians, besides picture-writing, used also (1) the simple mnemonic of a notched stick to record various facts as such as the number of days spent on an expedition, the number of enemies slain and the like; (2) wampum belts, consisting of strung beads, which could be utilized as a mnemonic, exactly like a rosary. Wampum belts, however, were employed in more intricate forms; white beads indicated peace, purple or violet meant war. Sometimes a pattern was made in the belt with beads of a different colour, as in the belt presented to

1 Quoted by Middendorff, *Das Runa Simi oder die Keshus Sprache* (Leipzig, 1890), p. 8.
3 American picture-writing.
William Penn on the making of a treaty with the Leni-Lenape chiefs in 1682. Here, in the centre of the belt, two figures, intended to represent Penn and an Indian, join hands, thus clearly indicating a treaty. Very simple pictures are drawn upon birch bark, indicating by their order the subjects in a series of song-chants with sufficient precision to enable the singer to recall the theme of each in his recitation. An account can be kept of sales or purchases by representing in perpendicular strokes the number of items, and adding at the end of each series a picture of the animal or object to which the particular series refers. Thus three strokes followed by the picture of a deer indicate that the hunter has brought three deer for sale. A conventional symbol (a circle) is used to show that a dot represents ten, and an upright stroke one cent, so that the price can be quite clearly set forth. This practice is followed in many other parts of the world. In clay tablets discovered by Dr Arthur Evans during his exploration of the great palace at Knossos, in Crete, a somewhat similar method of enumeration is followed; while at Athens conventional symbols were used to express drachme and obols upon the revenue records, of which considerable fragments are still preserved.

In comparatively recent times, according to Colonel Mallery (col. Annual Rep. Bureau of American Ethnology), the Delaware Indians invented a chronological table, or winter count, wherein each year is recorded by a picture of some important event which befell during that year. In these pictures a considerable amount of symbolism was necessary. A black upright stroke indicates that a Dakota Indian was killed, a rough outline of the head and body spotted with blotsches indicates that in the year thus indicated the tribe suffered from smallpox. Sometimes, in referring to persons, the symbol is of the nature of a rebus. Thus, Red Coat, an Indian chief, was killed in the winter of 1807-1808; this fact is recorded by a picture of a red coat with pikes projecting from its back, and a red streamer hanging down from it; and blood dripping down from it. However, nothing of the nature of a play upon words intended, and even when General Manyadier is represented as a figure in European dress, with the heads of two deer behind his head and connected with his mouth, no rebus was intended (many a deer), but the Indians supposed that his name really meant this, like their own names Big Crow, Little Beaver, and so forth. Here the Mexicans proceeded a stage further, as in the often quoted case of the name Itz-coatl, literally knife-snake, which is ordinarily represented by a reptile (coatl) with a number of knives (42) projecting from its body. It has been supposed that this was a picture of the name, but it is thought by some that it was a representation of the act of cutting, as when one cuts with a knife; but it could not distinguish between long and short vowels. In its consonant system it is unable to distinguish between breathed, voiced and aspirated stops, thus having but one symbol to represent the sounds /t/, /d/, and /n/. The picture of this sound has been found in many words, but it is conventionalized. It is not worth noticing that at a very early period a colony of Greeks from the Peloponnese, speaking a dialect closely akin to the Arcadian (which is known to us only from a much later period), had settled in the island of Cyprus. Alone among the Greeks this colony did not write in an alphabet, but among the Persians the Greek inhabitants continued to write in their syllabary. In the recent excavations made by the authorities of the British Museum an inscription of the 4th century B.C. was discovered, wherein a dedication to Demeter and Persephone was given in both Greek and Cypro-Minoan. The Cyprians, who had settled in Cyprus, had derived their alphabet from the Greeks, and in consequence they could not distinguish between long and short vowels. In its consonant system it is unable to distinguish between breathed, voiced and aspirated stops, thus having but one symbol to represent the sounds /t/, /d/, and /n/. The picture of this sound has been found in many words, but it is conventionalized. The Cypro-Minoan alphabet was devised by the Cyprians for the convenience of the language, and was not intended as a representation of the sounds; it represented the sounds as purely abstract sounds, and was conventionalized for the convenience of the language. In consequence it takes the colour of the succeeding vowel. In other cases, however, it follows the preceding vowel, as in a-ro-ri-ti-po-pa-o-a-ri-ti-ti-go-ro-a-w & Aµpaikèhôs & Aµpaikèhôs. For a further chronicle of the history of writing, see the bibliographies to the articles Alphabet, C., and under the headings of the various languages and peoples.
WROMTH—WUHU

WROMTH, an urban district in the Medway parliamentary division of Kent, England, 10 m. W. of N. of Maidstone, on the South-Eastern & Chatham railway. Pop. (1901) 3,351. The church of St George, Early English and later, contains numerous brasses; and near it is the site of a palace of the archbishops of Canterbury, maintained until the time of Archbishop Simon Islip (c. 1350). Wromth is situated on the village of the same name, in a fine quadrangular moated manor-house, the Mote, in part of the 14th century, but with portions of Tudor dates.

WRYNECK (Ger. Wendehals, Dutch draaiholtsen, Fr. torcel), a bird so called from its way of writhing its head and neck, especially when captured on its nest in a hollow tree. The Lyra

torquilla is a regular summer visitant to most parts of Europe, generally arriving a few days before the cuckoo, and is known in England as "cuckoo's leader" and "cuckoo's mate," but occasionally is called "snake-bird," not only from the undulating motions just mentioned, but from the violent hissing with which it seeks to repel an intruder from its hole.2

The unmistakable note of the wryneck is merely a repetition of what may be syllabled gu, sue, sue, many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling tone. The observer, without special detection, will have found that the bird's stay in Europe it seems to be mute. It feeds almost exclusively on insects, especially on ants. It is larger than a sparrow, but its plumage is not easily described, being beautifully variegated with fine and graceful shades of grey and brown, with a peculiar tinge of specks of blackish-brown on a light ground—the darker markings disposed in patches, vermiculated bars, freckles, streaks or arrow-heads—and the whole blended most harmoniously, but nevertheless washed over with the color of lavender or straw-coloured (q.v.). The wryneck commonly lays its translucent white eggs on the bare wood of a hole in a tree, and it is one of the few wild birds that can be induced to go on its nest during the day. It is said to return to its nest in the same way the year after, and thus upwards of forty have been taken from a single hole—but the proper complement is from six to ten. As regards Britain, the bird is most common in the S.E., its numbers decreasing rapidly towards the W., and N., so that in Cornwall and Wales and beyond Cheshire and Yorkshire its occurrence is but rare, while it appears only by accident in Scotland and Ireland.

WRYNECKS have been inclined to recognize five other species of the genus Lyra, by the so-called P. japonica is specifically indistinguishable from I. torquilla; while that designated, through a mistake in the locality assigned to it, I. indicus, has been found to be identical with the I. neofasciata of Africa. Near to this is I. pulchricollis, discovered by Emin Pasha in the E. of the Bar-el-Djebel (Ibis, 1884, p. 28, pl. ili). Another distinct African species is the I. oquecostrens, originally described from Abyssinia. The wrynecks (I. torquilla) form a subfamily, characterized by the atrophy of the tympanum and the coloration of the more normal groups of which they differ but little in internal structure, but much in coloration and in having the tail-quills ribboned, or at least not stiffened to serve as props as in the king Pintails.

WRY-NECK (Lat. Turticollis), a congenital or acquired deformity, characterized by the affected side of the head being drawn downwards towards the shoulder together with deviation of the face towards the sound side. There are various forms.

(1) The congenital, due to a lesion of the sterno-mastoid muscle, either the result of a malposition in utero or due to the rupture of the muscle in the delivery of the aftercoming head in the birth of the breech presentation.

(2) The rheumatic, due to exposure to a draught or cold. This is commonly known as "stiff-neck."

(3) The nervous or spasmodic, the result of (a) direct irritation of the cerebellum, (b) direct irritation of the nuclei of the pons varolii, (c) of the direct irritation of the cerebellum and the cerebral irritation. In this form there is generally a family history of nervous diseases, notably epilepsy. This spasm is one of a group of nervous spasms known as "tics," a variety of habit spasm. The character of the movements varies with the muscles involved, the most usual muscle being the sterno-mastoid. The spasm ceases during sleep. Many cases are also due to hysteria and some to spinal clavus. When wry-neck is congenital, massage and manipulation may be tried and some form of apparatus. Failing this, division of the muscle surgically may be practised. In the spasmodic forms, anti-nerveot treatment is recommended, the use of the bromides, valerianates and belladonna, and hydrobromide of hyoscine injected into the muscles has been found of value. T. Grainger Stewart recommendations in persistent tic the trial of continuous and regular movements in the affected group of muscles with a view to replacing the abnormal movements by normal ones. In severe cases it may be necessary to cut down on and stretch or excise the spinal accessory nerve. In rheumatic torticollis the spasm is usually overcome by the application of hot compresses and appropriate anti-rheumatic treatment.

WUCHANG, the capital of the combined provinces of Hup-ch and Hu-nan, China. It is one of the three cities, Wuchang, Hanyang and Hankow, which stand together at the mouth of the Han river, and is situated on the right bank of the river Yangtze, almost directly opposite the foreign settlement of Hankow. It is the seat of the provincial government of the two Hu or Hu-kwang, as these provinces are collectively termed, at the head of which is a viceroy. Next to Nanking and Canton, it is one of the most important vice-royalties in the empire. It possesses an arsenal and a mint. The provincial government has established ironworks for the manufacture of rails and other railway material. As the works did not pay under official management, they were transferred to the director-general of railways. Wuchang is not open to foreign trade and residence, but a considerable number of missionaries, both Roman Catholic and Protestant, reside there. It is estimated at 800,000, including cities on both banks. Wuchang is an important junction on the trunk railway from Peking to Canton; and is on the route of the Sze-ch'uan railway.

WUCHOW, a treaty port in the province of Kwang-si, China, opened to foreign trade in 1897, and situated on the left bank of the Si-kiang (West river) at its junction with the Fu or Kwei-Kiang (Cassia) river. It is 220 m. above Canton, with which it is in navigable connexion for vessels drawing up to 8 ft. of water. In 1908 the value of the trade passing through the maritime customs amounted to £1,660,000, representing however, only a portion of the trade. Of this total, two-thirds were for imports, consisting principally of cotton and cotton goods, kerosene oil, woolens, &c. Sugar, various oils, hides and aniseed were the chief exports. The native population is estimated at 65,000. At Shuiling the river flows for 5 m. through a deep gorge bordered by limestone cliffs 2000 ft. in height. Farther up the river threads its way through a series of rocky defiles, forming at intervals what seems an inland lake with no apparent outlet. During summer floods the water thus pent up by the defiles is carried at Wuchow 500 ft. In consequence of the variation of river level, the principal offices and shops are built upon pontoons which are moored alongside the river-bank. The situation of Wuchow makes it the natural distributing centre between Kwei-chow, Kwang-si and Canton. Great things were therefore expected of it as a treaty port, but disorders in Kwang-si delayed the fulfilment of the hopes. Trade, however, has improved, and a large native passenger traffic has sprung up between it and Canton. It is connected with Hong Kong and Shanghai by telegraph.

WUCHOW, the old name of a city in the province of Ngn-hui, China, about 1 m. from the S. bank of the Yangtsze-kiang, with which it is connected by a straggling suburb. It is about 50 m. above Nanking, and in 1838 it was marked out as a treaty port, but was not opened to trade until 1877. It is connected by canals, with the important cities of Ning-Kwo Fu, Tal-ping Hien, Nan-ling Hien and Ching Hien, the silk districts in the neighbourhood of the two last cities being within 50 m. of Wuchow. Coal to a considerable extent exists in the country round. At first its commercial progress was very slow, the older ports of Kiu-kiang and Chia-kiang militating against its success; but of late there has been a distinct improvement in the trade of the port, the net value of which was about 13,000,000 in 1906. The principal exports are rice, cotton, wheat, tea, furs and feathers. For the production of feathers large quantities of ducks are reared in the surrounding districts. Of imports, opium formed
the most considerable item; other imports being matches, needles, sand, wood and window glass. The city, which is one of the largest of its rank in China, was laid desolate during the T'ai-p'ing rebellion, but has been repopulated, the population being estimated (1896) at 137,000. The streets are comparatively broad and are well paved. The land set apart for the British settlement, advantageously situated, was little built upon. A new general foreign settlement was opened in 1905.

WULFENITE, a mineral consisting of lead molybdate, PbMoO₄, crystallizing in the hemimorphic-tetrahedral class of the tetragonal system. Crystals usually have the foliation square plates bevilled at the edges lost lamellated plates. They have a metallic luster, vary in color from greyish to bright yellow or red: the hardness is 3, and the specific gravity 6-7. Small amounts of calcium are sometimes present isomorphously replacing lead. The mineral occurs in veins of lead ore, and was first found in the 18th century in the lead mines at Bleiberg in Carinthia. Bright yellow crystals are found in New Mexico and Utah, and brilliant red crystals in Arizona.

WULFHERE (d. 675), king of the Mercians, was a younger son of King Penda, and was kept in concealment for some time after the defeat and death of 655. In 658 or 659, however, the Mercians threw off the supremacy of Oswin, king of Northumbria, and Wulfhere became their king. He took energetic measures to spread Christianity, and was greatly helped by his bishop, Jaruman, and afterwards by St Chad. Outside Mercia he did something to induce the East and the South Saxons to accept Christianity, and is said to have founded one or two monasteries. He gained Lindsey from Northumbria in 657, and was successful against Wessex. He extended his borders in all directions, and was the founder of the passing greatness of Mercia. He was buried just before his death. Wulhere’s wife was Eormenhild, a daughter of Eorcenberht, king of Kent, and he was succeeded by his brother Aethelred. His only son Coenred became king in 704 in succession to Aethelred. His only daughter was St Werburga or Werburh, abbess of Ely.

WULFSAN, archbishop of York from 1003 until his death in 1012, and also bishop of Worcester from 1003 to 1016, is generally held to be the author of a remarkable homily in alliterative English prose. Its title, taken from a manuscript, is Lupi sermo ad Anglos, quando Dani maxime prosecuti sunt eos, quod fuit anno 1014. It is an appeal to all classes to repent in the prospect of the imminent day of judgment, and gives a vivid picture of the desperate condition of England in the year of King Aethelred II’s flight (1014). Of the many other homilies ascribed to Wulfstan very few are authentic. Subsequent legislation, especially that of Canute, bears clear traces of his influence.

See the edition of his homilies by A. Napier (Berlin, 1883); also the same writer’s Über die Werke des allenglichen Erzbischofs Wulfsan (Göttingen dissertation, 1882), and his paper in An English Miscellany (Oxford, 1901). Also E. H. Brandt, ‘A contribution der germanischen Philologie’ (2nd ed., 1901-1909), ii. pp. 111-112.

WULFSAN, ST (c. 1012-1005), bishop of Worcester, was born at Little Itchington near Warwick and was educated in the monastic schools of Evesham and Peterborough. He became a monk at Worcester, and schoolmaster in prior and in the cathedral monastery there. In 1062 he was chosen bishop of Worcester, and the choice was approved by the witan; with some reluctance Wulfstan accepted, and was consecrated at York in September. The presence of the archbishop of York had been held together before 1062 by Archbishop Aldred, who, when he was compelled to resign Worcester, retained twelve manors belonging to the see, which Wulfstan did not recover for some years. About 1070, however, it was decided that Worcester was in the province of Canterbury. Although he had been on friendly terms with Harold, the bishop submitted to William at Berkhamstead, and he was very useful in checking the rebellious barons during the revolt of 1075. He was equally loyal to William II. in his struggle with the Welsh. Wulfstan’s relations with his ecclesiastical superiors were not so harmonious, and at one time both Lanfranc of Canterbury and Thomas of York unsuccessfully demanded his removal. He was the only survivor of the Anglo-Saxon bishops when he died on the 18th of January 1095. In 1203 he was canonized by Pope Innocent III. By his preaching at Bristol Wulfstan is said to have put an end to the kidnapping of English men and women and selling them as slaves. He rebuilt the cathedral church of Worcester, and some parts of his building still remain. Lives of St Wulfstan by Henning and Florence of Worcester are in the Wharton’s Anglia sacra (1691). See also E. A. Freeman, Norman Conquest (1867-1875).

WULFENWEBER, JÜRGEN (c. 1492-1537), burgomaster of Lübeck, was born probably at Hamburg. Settling in Lübeck as a merchant he took some part in the risings of the inhabitants in 1530 and 1531, being strongly in sympathy with the democratic ideas in religion and politics which inspired them. Having joined the governing council of the city and become leader of the democratic party, he was appointed burgomaster early in 1533 and threw himself into the movement for restoring Lübeck to its former position of influence. Preparations were made to attack the Dutch towns, the principal trading rivals of Lübeck, when the death of Frederick I, king of Denmark, in April 1535 changed the tide of the War of the Poles. The Lübeckers objected to the budding of the Danish crown upon any prince favourable to the Empire or the Roman religion, and Wulffenweber went to Copenhagen to discuss the matter. At length an alliance was concluded with Henry VIII. of England; considerable support was obtained in N. Germany; and in 1534 an attack was made on Christian, duke of Holstein, afterwards King Christian III, who claimed the throne. At first the Lübeckers gained several successes, but Christian of Holstein appeared before Lübeck; the efforts of Wulffenweber to secure allies failed; and the citizens were compelled to make peace. The imperial court of justice at Vienna in 1536 declared the old constitution, and in August 1535 the aristocratic party returned to power. Soon afterwards Wulffenweber was seized by Christopher, archbishop of Bremen, and handed over to his brother Henry II, duke of Brunswick-Lünefbutt. Having been tortured and sentenced to death as a traitor and an Anabaptist, he was beheaded at Wolfenbütel on the 29th of September 1537. Wulffenweber, who was long regarded as a popular hero in Lübeck, inspired tragedies by Heinrich Kruse and Karl Ferdinand Gutzkow, and a novel by Ludwig Köhler.

See also Kitzitz, Lübeck unter Jürgen Wulffenweber und die europäische Politik (Berlin, 1855-1856).

WUNDT, WILHELM MAX (1832-1920), German physiologist and philosopher, was born on the 16th of August 1832 at Neckarau, in Baden. He studied medicine at Tübingen, Heidelberg and Berlin, and in 1857 began to lecture at Heidelberg. In 1864 he became assistant professor there, and in 1866 was chosen to represent Heidelberg in the Baden Chamber, but soon resigned. In 1874 he was elected regular professor of philosophy at Zürich, and in the following year was called to the corresponding chair at Leipzig, where he founded an Institute for Experimental Psychology, the precursor of many similar institutes. The list of Wundt’s works is long and comprehensive, including physiology, psychology, logic and ethics. His earlier works deal chiefly with physiology, though often in close connexion with psychology, as in the Vorlesungen über die Menschens- und Tierseelen (1863; 4th ed., 1906; transl. Creighton and Titchener, 1896), Lehrbuch der Physiologie des Menschen (1865; 4th ed., 1878) and Grundzüge der physiologischen Psychologie (1874; 6th ed., 3 vols., 1908). He published an important work on Logik (1880-1883; 3rd ed., 1906-1907), and this was followed in 1886 by his Ethik (3rd ed., 1905). According to Wundt, the straight road to ethics lies through ethnic psychology, whose especial business it is to consider the history of custom and of ethical ideas from the psychological standpoint. We must look for ethics to supply the corner-stone of metaphysics, and psychology is a necessary preadecessor. The System der Philosophie (1899; 3rd ed., 1907) contained the results of Wundt’s work up to that date, both in
The domain of science and in the more strictly philosophical field. The metaphysical or ontological part of psychology is in Wundt's view the actual part, and with this the science of nature and the science of mind are to be brought into relation, and thus constituted as far as possible philosophical sciences. In 1892 Wundt published Hypnotismus und Suggestion. Subsequent important works were Wahrheitslehre der Psychologie (1896, 5th ed., 1907; translated by Judd, 3rd ed., 1907); Vielfalt und Einheit in der Wissenschaft (1901; 4th ed., 1906). Two other works, containing accounts of the work of himself and his pupils, are Psychologische Studien (1883–1902) and Psychologische Studien (1905 foll.).

WUNTHO, a native state of Upper Burma annexed by the British and incorporated in the district of Katha in 1892. Wuntho was classed by the Burmese as a Shan state, but was never on the same footing as the true Shan states, and only escaped becoming an integral part of the Burmese empire through Burmese want of system. The Shan name is Wying Hsá, "the city of the high. It had an area of about 2,400 sq. m., with 150,000 inhabitants, and lay midway between the Irrawaddy and Chindwin rivers. When the British annexed Upper Burma in 1885 the state became a refuge for rebels and dacoit leaders. Finally in 1891 the state broke out into open rebellion, the sawbwas were deposed, and a force of 1,800 troops under General Sir George Wolseley occupied the town of Wuntho and reduced the state to order.

WUPPER, a river of Germany, a right-bank tributary of the Rhine, rising in the Sauerland near Meinerzhagen. The most remarkable part of its course is that in the so-called Wuppertal. In this section, 30 m. in length, it passes through the populous towns of Barmen and Elberfeld and supplies water-power to about five hundred mills and factories. Leaving the hills above Opladen, it debouches on to the plain and enters the Rhine at Rheindorf between Cologne and Düsseldorf, after a course of 63 m.

See A. Schmidt, Die Wupper (Lennep, 1902).

WÜRTTEMBERG, a kingdom of Germany, forming a tolerably compact mass in the S.W. angle of the empire. In the south it is left by the long narrow territory of Hohenzollern, belonging to Prussia; and it encloses six small enclaves of Baden and Hohenzollern, while it owns nine small exclaves within the limits of these two states. It lies between 47° 34' 48" and 49° 35' 17" N., and between 8° 15' and 10° 30' E. Its greatest length from N. to S. is 140 m.; its greatest breadth is 100 m.; its boundaries, almost entirely arbitrary, have a circuit of 1160 m.; and its total area is 7,534 sq. m., or about 72% of the entire empire. It is bounded on the E. by Bavaria, and on the other three sides by Baden, with the exception of a short distance on the S., where it touches Hohenzollern and the lake of Constance.

Physical Features.—Württemberg forms part of the South-German tableland, and is hilly rather than mountainous. In fact the undulating fertile terraces of Upper and Lower Swabia may be taken as the characteristic parts of this agricultural country. The usual estimates return one-fourth of the entire surface as "plain," less than one-third as "mountainous," and nearly one-half as "hilly." The average elevation above the sea-level is 150 ft.; the lowest point is at Böttingen (410 ft.), where the Neckar quits the country; the highest is the Katzenkopf (3775 ft.), on the Hornisgrinde, on the western border.

The chief mountains are the Black Forest (q.v.) on the west, the Swabian Jura or Raub Alb stretching across the middle of the country, and the still more northern Black Forest of Aargau and Schaffhausen, stretching in the extreme south-east, adjoining the Algan Alps in Bavaria. The Raue Alb or Alp slopes gradually down into the plateau on its south side, but on the north it is somewhat rugged and steep, and has its line broken by isolated projecting hills. To the north and west, viz. the Lemburg (3326 ft.), Ober-Hohenberg (3312 ft.) and Plettenberg (3393 ft.), are joined at the south of the Raue Alb the Black Forest, with its abrupt uplands and stark, and 38% forest, of instruments, photographic apparatus, clocks (in the Black Forest), electrical apparatus, and gold and silver goods. There are also extensive chemical works, pottery, cabinet-making works, sugar factories, wine distilleries. Water-power and petrol largely compensate for the lack of coal. Among other interesting developments is the manufacture of liquid carbonic acid gas procured from natural gas springs beside the Eyach, a tributary of the Neckar.

Commerce.—The principal exports are cattle, cereals, wood, pianos,
salt, oil, leather, cotton and linen fabrics, beer, wine and spirits. The chief commercial cities are Stuttgart, Ulm, Heilbronn and Fried- richshafen. The book trade of Stuttgart, called the Leipzig of South Germany, is the greatest.

Communications.—In 1907 there were 1,219 m. of railways, of which all except 150 m. belonged to the state. The Neckar, the Schussen and the lake of Constance are all navigable for boats; the Danube becomes navigable for about 20 m. between Ulm and Passau. Würtemberg, being Bavaria, retained the control of its own postal and telegraph service on the foundation of the new German empire.

Constitution.—Würtemberg is a constitutional monarchy and a member of the German empire, with four votes in the federal council (Bundesrat); seven votes in the imperial diet. The constitution rests on a law of 1819, amended in 1868, in 1874, and again in 1906. The crown is hereditary, and conveys the simple title of king of Württemberg. The king receives a civil list of £163,227. The legislature is bi-cameral. The upper chamber (Standesherren) is composed of adult princes of the blood, heads of noble families from the rank of count (Graf) upwards, representatives of territories (Standesherrschaften), which possessed votes in the old German imperial diet or in the local diet; it has also members (not more than 6) nominated by the king, 8 members elected by the diet, 6 ecclesiastical dignitaries, a representative of the university of Tübingen, 1 of the normal high school of Stuttgart, 2 representatives of commerce and industry, 2 of agriculture, and 1 of handicrafts. The lower house (Abgeordnetenhaus) has 92 members, viz. a representative from each of the administrative divisions (Oberamtsbezirke), 63 in all without Stuttgart, which has 6 representatives; also 1 from each of the six chief provincial towns, and 17 members elected by the two electoral divisions (Landeswahlkreise) into which the kingdom is divided. The latter class of members as well as those for Stuttgart are elected on the principle of proportional representation by a council, consisting of the ministers and some nominated councillors (staatliche Staatsräte), who advise the sovereign at his command. The judges of a special supreme court of justice, called the Staatsgerichtshof (which is the guardian of the constitution), are partly elected by the chambers and partly appointed by the king. Each of the chambers has the right to impeach the ministers. The country is divided into four governmental departments (Kreise) and subdivided into sixty-four divisions (Oberamtsbezirke), each of which is under a headman (Oberamtmann) assisted by a local council (Amtesersamm lung). At the head of each of the four departments is a government (Regierung).

Religion.—The right direction of the churches resides in the king, who has also, so long as he belongs to the Protestant Church, the guardianship of the spiritual rights of that Church. The Protestant Church is controlled (under the minister of religion and education) by a consistory and a synod—the former consisting of a president, 9 councilors and 6 general superintendents or "prelates" from six principal towns, and the latter of a representative council, including both lay and clerical members. The Roman Catholic Church is subject to the bishop of Rottenburg, in the archdiocese of Freiburg. Politically it is under a Roman Catholic council, appointed by government. The Jews also, since 1828, have been admitted to a similar council (Judenrat).

Education.—According to official returns there is not an individual in the kingdom above the age of ten years who cannot both read and write. The higher branches of learning are provided in the university of Tübingen, in the technical high school (with academic rank) of Stuttgart, the veterinary high school at Stuttgart, the commercial college at Stuttgart, and the agricultural college of Hohenheim. There are gymnasia and other schools in all the larger towns, while every commune has a school. There are numerous schools and colleges for women. There is also a school of viticulture at Weinsberg.

Army.—By terms of the convention of 1871 the troops of Württemberg form the XIII. army corps of the imperial German army.

Finances.—The state revenue for 1909-1910 was estimated at £8,840,520, which is nearly balanced by the expenditure. About one-fifth of the revenue is from direct taxes, and fully half from indirect taxes, the post-office and sundry items. In 1909 the public debt was £52,734,000, and the national debt £1,400,000 from direct taxation; and the remainder from indirect taxes, the post-office and sundry items. In 1909 the public expenditure was £29,285,335, of which more than £27,000,000 was incurred for railway construction. Of the expenditure over £1,000,000 is spent upon public worship and education, and over £1,200,000 goes in interest and repayment of the national debt. To the treasury of the crown was handed the kingdom contributed £500,000 and more.

Authorities.—See Württembergische Jahrbücher für Statistik und Landeskunde; Das Königreich Württemberg, eine Beschreibung nach Kreisen, Oberämtern und Gemeinden (Stuttgart, 1904); Statistisches Handbuch für das Königreich Württemberg, 1885 fol.; Das Königreich Württemberg, eine Beschreibung von Land, Volk und Stadt (1903); Die Jahresthier der Handels- und Gewerbeschäftmmern in Württemberg; Lang, Die Entwickelung der Bewohner Württembergs im Laufe des zehnten Jahrhunderts (Tübingen, 1903); Engel und Schulze, Geographischer Wegweiser durch Württemberg (Stuttgart, 1908); Göx, Staatsrecht des Königreichs Württemberg (Tübingen, 1908); and F. Bitzer, Regierung und Stände in Württemberg (Stuttgart, 1882).

History.—The origin of the name Württemberg is uncertain, but the once popular derivation from Wirth am Berg is now universally rejected. Some authorities derive it from a proper name, Wiruto or Wirinto; others from a Celtic place-name, Volurinum or Verdonum. At all events from being the name of a castle near the village of Rothenberg, not far from Stuttgart, it was extended over the surrounding country, and as the lords of this district increased their possessions so the name covered an ever-widening area, until it reached its present denomination. Early forms of it are Wirtemburg, Wirtenbenc and Wirtenberg. Wirtemberg was long current, and in the latter part of the 16th century Württemberg and Württemberg appeared. In 1866 Württemberg was adopted as the official spelling, though Württemberg is also common and occurs sometimes in official documents and even on coins issued after that date.

As far as we know, the first inhabitants of the country were the Celts, and then the Suebi. In the 1st century a.D. the Romans conquered the land and defended their position there by a rampart (limes). Early in the 3rd century the Alamanni drove the Romans beyond the Rhine and the Danube, but in their turn they were conquered by the Franks under Clovis, the decisive battle being fought in 496. For about four hundred years the country was part of the kingdom of Bavaria, and was divided into numerous counties, but in the 9th century it was incorporated with the German duchy of Swabia. The duchy of Swabia was ruled by the Hohenstaufen family until the death of Conrad in 1268, when a considerable part of it fell to the count of Württemberg, the representative of a family first mentioned about 1080, a certain Conrad von Beutelsbach, having called himself after his ancestral castle of Württemberg. The earliest count whom anything is known is one Ulrich, who ruled from 1241 to 1265. He was marshal of Swabia and advocate of the town of Ulm, and had large possessions in the valleys of the Neckar and the Rems. Under his sons, Ulrich II. and Eberhard I., and their successors the power of the family grew steadily. Eberhard (d. 1325) was the opponent, and not always the unsuccessful one, of three German kings; he doubled the area of his county and transferred his residence from Württemberg to Stuttgart. His successors were not perhaps equally important, but all added something to the lands of Württemberg. The lands of the family were several times divided, but in 1482 they were declared indivisible and were united under Count Eberhard V., called im Bart. This arrangement was confirmed by the German king, Maximilian I., and the imperial diet in 1495. Eberhard was one of the most energetic rulers that Württemberg ever had, and in 1495 his county was raised to the rank of duchy. Dying in 1496, he was succeeded by his cousin, Duke Eberhard II., who, however, was deposed after a short reign of two years. The long reign (1496-1550) of Ulrich I., who succeeded to the duchy while still a child, was a most eventful period for the country, and many traditions cluster round the name of this gifted, unscrupulous and ambitious man. The extortions by
which he sought to raise money for his extravagant pleasures excited a rising known as that of derne Konrad (poor Conrad), not unlike the rebellion in England led by Wat Tyler; order was soon restored, and in 1541 by the treaty of Tübingen the people undertook to pay the duke's debts in return for various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later Ulrich quarrelled with the Swabian League, and its forces, helped by William IV., duke of Bavaria, who was angered by the treatment meted out by Ulrich to his wife Sabina, a Bavarian princess, invaded Württemberg, expelled the duke and sold his duchy to the emperor Charles V. for 220,000 gulden. Charles handed over Württemberg to his brother, the German king, Ferdinand I., who was his nominal ruler for a few years. Soon, however, the discontent caused by the oppressive Austrian rule, the disturbances in Germany leading to the Peasants' War and the commotions aroused by the Reformation gave Ulrich an opportunity to recover it. Aided by Philip, landgrave of Hesse, and other Protestant princes, he fought a victorious battle against Ferdinand's troops at Laufsen in May 1534, and then by the treaty of Cadam he was again recognized as duke, but was forced to accept his duchy as an Austrian fief. He now introduced the reformed doctrines and proceeded to endow Protestant churches and schools throughout his land. Ulrich's connexion with the league of Schmalkalden led to another expulsion, but in 1547 he was reinstated by Charles V., although on somewhat onerous terms.

Ulrich's son and successor, Christopher (1515-1568), completed the work of converting his subjects to the reformed faith. He introduced a system of church government, the Grosse Kirchenordnung, which has endured in part to the present day. In this reign a standing commission was established to superintend the finances, and the members of this body, all of whom belonged to the upper classes, gained considerable power in the state, mainly at the expense of the towns. Christopher's son Louis, the founder of the Collegium illustre, died childless in 1553 and was succeeded by a kinsman, Frederick I. (1557-1608). This energetic prince, who disregarded the limits placed to his authority by the rudimentary constitution, by paying a large sum of money, induced the emperor Rudolph II. in 1559 to free the duchy from the suzerainty of Austria. Thus once again Württemberg became a direct fief of the Empire. Unlike his predecessor, the next duke, John Frederick (1582-1628), was not allowed to become an absolute ruler, but was forced to recognize the checks on his power. During this reign, which ended in July 1628, Württemberg suffered severely from the Thirty Years' War, although the duke himself took no part in it. His son and successor Eberhard III. (1614-1674), however, placed the state of Württemberg as Sweden in March 1632. He was as of age in 1633, but after the battle of Nordlingen in 1634 the duchy was occupied by the imperialists and he himself was for some years an exile. He was restored by the peace of Waldshult, but it was to a depopulated and impoverished country, and he spent his remaining years in efforts to repair the disasters of the great war. During the reign of Eberhard IV. (1676-1733), who was only one year old when his father Duke William Louis died in 1677, Württemberg made the acquaintance of another destructive enemy. In 1688, 1703 and 1707 the French entered the duchy and inflicted brutalities and sufferings upon the inhabitants. The sparsely populated country was not well prepared to the fugal Wurtsdenses, who did something to restore it to prosperity, but this benefit was partly neutralized by the extravagance of the duke, anxious to provide for the expensive tastes of his mistress, Christiana Wilhelmina von Gritnitz. Charles Alexander, who became duke in 1733, had embraced the Roman Catholic faith while an officer in the Austrian service. His fortunate adviser was the Jew Suss Oppenheim, and it was thought that master and servant were aiming at the suppression of the diet and the introduction of the Roman Catholic religion. However, the sudden death of Charles Alexander in March 1737 put an abrupt end to these plans, and the regent, Charles Rudolph of Württemberg-Neuenstadt, had Oppenheim hanged.

Charles Eugene (1728-1793), who came of age in 1744, was gifted, but vicious and extravagant, and he soon fell into the hands of unworthy favourites. He spent a great deal of money in building palaces at Stuttgart and elsewhere, and took the course, unpopular to his Protestant subjects, of fighting against Prussia during the Seven Years' War. His whole reign was disturbed by dissensions between the ruler and the ruled, the duke's irregular and arbitrary methods of raising money arousing great discontent. The intervention of the emperor and even of foreign powers was invoked, and in 1770 a formal arrangement removed some of the grievances of the people. But Charles Eugene did not keep his promises, although in his old age he made a few further concessions. He died childless, and was succeeded by one brother, Louis Eugene (d. 1795), and by another, Frederick Eugene (d. 1797). This latter prince, who had served in the army of Frederick the Great, to whom he was related by marriage, educated his children in the Protestant faith. Thus, when his son Frederick II. became duke in 1797, the ruler of Württemberg was again a Protestant, and the royal house has adhered to this faith since that date. During Frederick Eugene's short reign the French invaded Württemberg, compelled the duke to withdraw his troops from the imperial army and to pay a sum of money.

Frederick II. (1754-1816), a prince whose model was Frederick the Great, took part in the war against France in defiance of the wishes of his people, and when the French again invaded and devastated the country he retired to Erlangen, where he remained until after the conclusion of the peace of Lunéville in 1801. Württemberg was left to the private fortune of the ruler, and he ceded his possessions on the left bank of the Rhine, receiving in return nine imperial towns, among them Reutlingen and Heilbronn, and some other territories, amounting altogether to about 850 sq. m. and containing about 124,000 inhabitants. He also accepted from Napoleon the title of elector. These new districts were not incorporated with the duchy, but remained separate; they were known as New Württemberg and were ruled without a diet. In 1805 Württemberg took up arms on the side of France, and by the peace of Pressburg in December 1805 the electorate was rewarded with various Austrian possessions in Swabia and with other lands in the neighbourhood. On the 1st of January 1806 Frederick assumed the title of king, abrogated the constitution and united old and new Württemberg. Subsequently he placed the property of the church under the control of the state. In 1806 he joined the Confederation of the Rhine and received further additions of territory containing 160,000 inhabitants; a little later, by the peace of Vienna in October 1809, about 110,000 more persons were placed under his rule. In return for these favours Frederick joined Napoleon in his campaigns against Prussia, Austria and Russia, and of 16,000 of his subjects who marched to Moscow only a few hundred returned. Then after the battle of Leipzig he despaired the waning fortunes of the French emperor, and by a treaty made with Metternich at Fulda in November 1813 he secured the confirmation of his royal title and of his recent acquisitions of territory, while his troops marched with those of the allies into France. In 1815 the king joined the Germanic Confederation, but the congress of Vienna made no change in the extent of his lands. In the same year he laid before the representatives of his people the sketch of a new constitution, but this was rejected, and in the midst of the revolutionary ferment the king abdicated in October 1817.

At once the new king, William I., took up the consideration of this question and after much discussion a new constitution was granted in September 1819. This is the constitution which, with subsequent modifications, is still in force, and it is described in an earlier section of this article. A period of quietness now set in, and the condition of the kingdom, its education, its agriculture and its trade and manufactures, began to receive earnest attention, while by frugality, both in public and in private matters, King William helped to repair the shattered finances of his country. But the desire for greater political freedom had not been entirely satisfied by the constitution of 1819, and after 1830 there was a certain amount of unrest. This, however,
soon passed away, while trade was fostered by the inclusion of Württemberg in the German Zollverein and by the construction of railways. The revolutionary movement of 1848 did not leave Württemberg untouched, although no actual violence took place within the kingdom. The king was compelled to dismiss Johannes Schlayter (1792–1856) and his other ministers, and to call to power men with more liberal ideas, the exponents of the idea of a united Germany. A democratic constitution was proclaimed, but as soon as the movement had spent its force the liberal ministers were dismissed, and in October 1849 Schlayter and his associates were again in power. By interfering with popular electoral rights the king and his ministers succeeded in assembling a constitutional diet which surrendered all the privileges gained since 1848. In this way the constitution of 1819 was restored, and power passed into the hands of a bureaucracy. Almost the last act of William's long reign was to conclude a Concordat with the Papacy, but this was repudiated by the diet, which preferred to regulate the relations between church and state in its own way.

In July 1864 Charles I. (1823–1891) succeeded his father William as king and had almost at once to face considerable difficulties. In the duel between Austria and Prussia for supremacy in Germany, William I. had recently taken the part of the former power, and this policy was equally acceptable to the new king and his advisers. In 1866 Württemberg took up arms on behalf of Austria, but three weeks after the battle of Königgrätz her troops were decisively beaten at Tauberbischofsheim, and the country was at the mercy of Prussia. The Prussians occupied the northern part of Württemberg and peace was made in August 1866; by this Württemberg paid an indemnity of 8,000,000 gulden, but at once concluded a secret offensive and defensive treaty with her conqueror.

The end of the struggle was followed by a renewal of the democratic agitation in Württemberg, but this had achieved no tangible results when the great war between France and Prussia broke out in 1870. Although the policy of Württemberg had continued antagonistic to Prussia, the country shared in the national enthusiasm which swept over Germany, and its troops took a creditable part in the battle of Wörth and in other operations of the war. In 1871 Württemberg became a member of the new German empire, but retained control of her own post office, telegraphs and railways. She had also certain special privileges with regard to taxation and the army, and for the next ten years the policy of Württemberg was one of enthusiastic loyalty to the new order. Many important reforms, especially in the realm of finance, were introduced, but a proposal for a union of the railway system with that of the rest of Germany was rejected. Certain reductions in taxation having been made in 1889, the reform of the constitution became the question of the hour. The king and his ministers wished to strengthen the conservative element in the chambers, but only slight reforms were effected by the laws of 1874, 1876 and 1879, a more thorough settlement being postponed. On the 6th of October 1891 King Charles died suddenly, and was succeeded by his cousin William II. (b. 1848), who continued the policy of his predecessor. The reform of the constitution continued to be discussed, and the election of 1895 was memorable because of the return of a powerful party of democrats. King William had no sons, nor had his only Protestant kinsman, Duke Nicholas (1833–1903); consequently the succession would ultimately pass to a Roman Catholic branch of the family, and this prospect raised certain difficulties about the relations between church and state. The heir to the throne in 1910 was the Roman Catholic Duke Albert (b. 1873).

Between 1900 and 1910 the political history of Württemberg centred round the settlement of the constitutional and the educational questions. The constitution was revised in 1906 on the lines already indicated, and a settlement of the education difficulty was brought about in 1909. In 1904 the railway system was united with that of the rest of Germany.

For the history of Württemberg see the Württembergisches Urkundenbuch (Stuttgart, 1849–1907); and the Darstellungen aus der württembergischen Geschichte (Stuttgart, 1904 fol.). Histories are those of P. F. Stälin, Geschichte Württembergs (Gotha, 1882–1887); E. Schneider, Württembergische Geschichte (Stuttgart, 1956); Belser, Geschichte Württembergs (Stuttgart, 1923); W. Pfister, Geschichte Württembergs (Stuttgart, 1902); Weller, Württemberg in der deutschen Geschichte (Stuttgart, 1990); K. V. Fricker and Th. v. 'WURTZ, CHARLES ADOLPHE (1817–1884), French chemist, was born on the 26th of November 1817 at Wolfsheim, near Strassburg, where his father was Lutheran pastor. When he left the Protestant gymnasium at Strassburg in 1834, his father allowed him to study medicine as next best to theology. He devoted himself specially to the chemical side of his profession with such success that in 1839 he was appointed "Chef des travaux chimiques" at the Strasbourg faculty of medicine. By means of the vacant chair in organic chemistry at Strasbourg created by the departure of Dr. Wurtz, and in which he was later placed, he went on for a year under J. von Liebig at Giessen, and then went to Paris, where he worked in J. B. A. Dumas's private laboratory. In 1845 he became assistant to Dumas at the École de Médecine, and four years later began to give lectures on organic chemistry in his place. His laboratory at the École de Médecine was very poor, and to supplement it he opened a private one in 1850 in the Rue Garencière; but soon afterwards the house was sold, and the laboratory had to be abandoned. In 1850 he received the professorship of chemistry at the Institut Agronomique at Wolfisheim, but this was abolished in 1852. In the following year the chair of organic chemistry at the faculty of medicine became vacant by the resignation of Dumas and the chair of mineral chemistry and toxicology by the death of M. J. B. Orfila. The two were united, and Wurtz appointed to the new post. In 1856 he undertook the duties of dean of the faculty of medicine. In this position he exerted himself to secure the rearrangement and reconstruction of the buildings devoted to scientific instruction, urging that in the provision of properly equipped teaching laboratories France was much behind Germany (see his report Les Hauts Études spéciales, Paris, 1856). In 1858 he was elected to the Académie des Sciences, and in 1875, resigning the office of dean but retaining the title of honorary dean, he became the first occupant of the chair of organic chemistry, which he induced the government to establish at the Sorbonne; but he had great difficulty in obtaining an adequate laboratory, and the building ultimately provided was not opened until after his death, which happened at Paris on the 10th of May 1884. Wurtz was an honorary member of almost every scientific society in Europe. He was one of the founders of the Paris Chemical Society (1858), its first secretary and thrice served as its president. In 1880 he was vice-president and in 1884 president of the Académie, which he entered in 1867 in succession to T. J. Pelouze. He was made a senator in 1881.

Wurtz's first published paper was on hypophosphorous acid (1842), and the continuation of his work on the oxides of phosphorus (1843) resulted in the discovery of sulphotrophic acid and phosphorus oxychloride, as well as of copper hydride. But his original work was mainly in the domain of organic chemistry. Investigation of the cyanic ethers (1848) yielded a class of substances which opened out a new field in organic chemistry, for, by treating those ethers with copper potash, he obtained methylamine, the simplest organic amine. A common error of the chemist at this time was to suppose that all organic compounds were capable of being hydrolysed, and Wurtz, in 1855, reviewing the various substances that had been obtained from glycine, he reached the conclusion that glycine is a body of alcholic nature formed on the type of the three molecules of water, as common alcohol is on that of one body and two. He showed that the discovery of the glycols or diatomic alcohols, bodies similarly related to the double water type. This discovery he worked out very thoroughly in investigations of ethylene oxide and the more glycolic alcohols. The oxidation of the glycols led him to homologues of lactic acid, and a controversy about the constitution of the latter with H. Kolbe resulted in the discovery of many new facts
and in a better understanding of the relations between the oxygen and the amido-acids. In 1867 Wurtz prepared neurine synthetically by the reaction: \( \text{Wurtz hydrolysis} \). He discovered aldox, pointing out its double character as at once an alcohol and an aldehyde. In addition to this list of some of the new substances he prepared, reference may be made to a large number of abnormal and unexpected values. While working on the olongens he noticed that a change takes place in the density of the vapour of amylene hydrochloride, hydrobromide, &c., as the temperature is increased, and in the gradual passage from a gas of approximately normal density to one of half-normal density he saw a powerful argument in favour of the view that abnormal vapour densities, such as are exhibited by sal-ammoniac or phosphorus pentachloride, are to be explained by dissociation. From 1865 onwards he continued this question in several papers, and in particular maintained the dissociation of vapour of chloral hydrate, in opposition to H. Sainte-Claire Deville and M. E. Berthelot.

In 1856 Wurtz was transferred to Wurzburg, and attended the University of Wurzburg, was the city of the old university of Wurtzberg. The present university was founded by Bishop Julius in 1582. The medical faculty speedily became famous, and has remained the most important faculty in Würzburg ever since. Here W. K. Röntgen discovered the "Röntgen rays" in 1896. Würzburg was long the stronghold of Jesuitism in Germany, and the Roman Catholic theological faculty still attracts a large number of students. The university has a library containing 300,000 volumes, and is attended by about 14,000 students. In no other university city of Germany has so much of the medieval academic life been preserved.

Würzburg is surrounded by vineyards, which yield some of the best wine in Germany. Its principal industries are the manufacture of tobacco, furniture, machinery, scientific instruments and railway carriages. It has also breweries, and produces bricks, vinegar, malt and chocolate.

The site of the Leibenten was occupied by a Roman fort, and was probably fortified in the 13th century. Würzburg was the old Latin form of the name of the town; Herbipolis (hemp town) first appears in the 12th century. The bishopric was probably founded in 741, but the town appears to have been fortified in the 9th century. The first bishop was St Burhard, and his successors soon acquired much temporal power; about the 12th century they had ducal authority in Eastern Franconia. It is not surprising that quarrels broke out between the bishops and the citizens, and the latter espoused the cause of the emperor Henry IV., while the former joined the emperor's foes. The struggle continued intermittently until 1400, when the citizens were decisively defeated and submitted. Several imperial diets were held in Würzburg, chief among these being the one of 1180 when Henry the Lion, duke of Saxony, was placed under the ban.

By the peace of Lunéville the bishopric was secularized, and in 1803 Würzburg passed to Bavaria. The peace of Pressburg in 1805 transferred it, under the name of an electorate, to Ferdinand, formerly grand-duke of Tuscany, who joined the confederation of the Rhine and took the title of grand-duke of Würzburg. In 1815 the congress of Vienna restored Würzburg to Bavaria. The Würzburg Conference is the name given to the meeting of representatives of the smaller German states in 1839 to devise some means of mutual support. The conference, which met in 1839 and 1840, was attended by 16 states, but was dissolved in 1848 by the Prussians in 1866, in which year it ceased to be a fortress.

The bishopric of Würzburg at one time embraced an area of about 1,000 sq. m. and had about 250,000 inhabitants. A new bishopric of Würzburg was created in 1817.

For the town see S. Göhl, Würzburg. Ein kulturhistorisches Städtebild (Würzburg, 1896); B. Gramich, Verfassung und Verwaltung der Stadt Würzburg (Würzburg, 1882); M. Cronthaler, Die Stadt Würzburg im 15. und 16. Jh. (Frankfort, 1888); H. Heyn, Würzburg und seine Umgebungen (Würzburg, 1879); Beckmann, Führer durch Würzburg (1906); and Holänder, für Heissler, Muralisches aus Alte Würzburg (Würzburg, 1895). For the university see F. X. von Wegele, Geschichte der Universität Würzburg (Würzburg, 1882). For the bishopric see J. Hofmann, Die Heiligen und Seligen des Bistums Würzburg (Würzburg, 1886). For the town see F. J. B. Brummiere and A. Amorbe, Franconia sacra. Geschichte des Bistums Würzburg (Würzburg, 1890), and T. Henner, Die kirchliche Verwaltung der Bischöfe von Würzburg (Würzburg, 1874).

Würzen, a town of Germany in the kingdom of Saxony, on the Mulde, here crossed by two bridges, 15 km. by road N.E. of Leipzig on the main line (via Riesa) to Dresden. Pop. (1905) 17,212. It has a cathedral dating from the 14th century, a castle, at one time a residence of the bishops of Meissen and now utilized as law courts, several schools and an agricultural college. The industries comprise iron-founding, weaving and brewing, and the making of machinery, carpets, cigars, furniture, leather and paper.
Wurzen was founded by the Sorbs, and was a town early in the 12th century, when Herwig, bishop of Meissen, founded a monastery here. In 1581 it passed to the elector of Saxony, and in the Thirty Years' War was sacked by the Swedes.

WUTTKE, KARL FRIEDRICH ADOLF (1819-1879), German Protestant theologian, was born at Breslau on the roth of November 1819. He studied theology at Breslau, Berlin and Halle, where he eventually became professor ordinarius; and is known as the author of a treatise on Christian ethics (Handbuch der protestantischen Ethik, 2d ed. 1847; 3d ed. 1875; Eng. trans., New York, 1873) and works on heathen religions (Die Geschichte des Heidentums, 1831-1833) and superstition (Der deutsche Volksaberglaube der Gegenwart, 1865, 2d ed. 1866). He died on the 12th of April 1870.

WYANDOT, or HURON (q.v.), a tribe of N. American Indians of Iroquoian stock. When first met by the French early in the 17th century, the Wyandots lived between Georgian Bay and Lake Simcoe, Ontario. They were then estimated at about 10,000, scattered over twenty villages. They were continually the victims of raids on the part of their neighbours the Iroquoian league, whose soldiers being driven from place to place, and a dispersal in 1650 resulted in one section settling in Quebec, while others found their way to Ohio, where they fought for the English in the Wars of Independence and 1812. By a treaty made in 1817 the latter section was granted territory in Ohio and Michigan, but the larger part of this was sold in 1819. In 1842 they migrated to Kansas. In 1855 many became citizens, the remainder being in 1867 removed to a reservation (now N.E. Oklahoma), numbering about 400 in 1903. The Hurons at Lorette, in Quebec, also number about 400.

WYANDOTTE, a city of Wayne county, Michigan, U.S.A., on the Detroit river, about 6 m. s. by W. of Detroit. Pop. (1900) 51,531, of whom 1267 were foreign-born; (1902) 5425; (1910) 8287. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Detroit, Toledo & Ironton, and (for freight only) the Detroit & Toledo Shore Line railways, and by two interurban electric lines. Salt and limestone are found here and the city has various manufactures. Wyandotte was first settled about 1820, was laid out as a town in 1854, and charted as a city in 1867.

WYANDOTTE CAVE, a cave in Jennings township, Crawford county, Indiana, U.S.A., 5 m. N.E. of Leavenworth, on the Ohio river, and 12 m. from Corydon, the early territorial capital. The nearest railway station is Milltown, 9 m. distant. The cave is in a rugged region of high limestone hills, in one of which its main entrance is found, 220 ft. above the level of the Blue river, whose original name, the Wyandotte, was transferred to the cave by Governor David Wallace; it having previously been styled the Mammoth Cave of Indiana, the Epsom Salts Cave, and the Indiana Saltperce Cave. The exact date of discovery is not known; but early records show it to have been pre-empted by a Dr Adams in 1812 for the manufacture of saltpetre, and his vats and hoppers are still to be seen. After the War of 1812 he relinquished his claim; and in 1819 the ground was bought from the United States government by Henry P. Rothrock, whose heirs are its owners. The earliest account is in Flint's Geography (1831); the first official report of it was by Dr R. T. Brown (1831); and it was first mapped by the writer (1852), whose map was revised by John Collett, state geologist (1878).

No instrumental survey has been made, nor have all its intricate windings been explored. Its known passages aggregate more than 23 m. in length, and 144 places are named as new ones. The Old Cave contains the saltpetre works, and ends in a remarkable chamber exactly 144 ft. long and 56 ft. wide, which stands the Pillar of the Constitution, a stalagmitic column perfectly cylindrical and 71 ft. in circumference, entirely composed of crystalline carbonate of lime (satin-spar), fluted and snow-white. A cavity in the column was first claimed by H. C. Hovey as a prehistoric quarry, proved to be such by the stag horns and boulder pounders found in its vicinity. His careful estimate of the rate of stalagmitic growth showed that 1000 years would have been needed to form the lip now covering the incision.

In the N. arm of the newer part of the cave, opened in 1850, is an immense room, styled Rothrock's Cathedral, 1000 ft. in circumference and 200 ft. high, with a rugged central hill 135 ft. high, surmounted by statuesque stalagmites, near which is another quarry of satinspar with similar forms. There are also numerous footprints, in the soft nitrates earth of certain avenues, which were left by prehistoric animals previous to the coming of the white man.

In the Pilled Palace a number of large alabaster shafts had been thrown down and fragments carried away. Near by were so-called "bear-wallows," proved to be the remains of an aboriginal workshop, where masses of flint were broken into rectangular blocks; and spalls and flint-chips en- cumbered the floor of the passage-way. Milroy's Temple is a magnificent room, 100 by 150 ft. in its dimensions. It contains many remarkable formations, and its display of helictites, or twisted stalactites, is unsurpassed.

As Wyandotte Cave has no large streams and few pools or springs, its fauna and flora are not extensive. Formerly bears, wolves and other wild animals took refuge in its fastnesses; and bats, rats, mice and salamanders are frequent visitors. Blind crawfish (Cambarus pelidous) and the crawfish Spring. Cave crickets (Hemiscelis subterraneus) abound. A dozen kinds of insects, with a few varieties of spiders, flies and worms, complete the meager list. The flora include mainly forms brought in from the outside.

For more full descriptions of Wyandotte Cave and its contents, see Hovey's Celebrated American Caverns, pp. 125-151; Indiana State Geological Reports, by R. T. Brown, E. T. Cox, John Collett and S. Batchley; and concerning cave fauna reports and papers by C. H. Eigemen, professor of zoology, Indiana State University.

WYANT, ALEXANDER H. (1836-1892), American artist, was born at Port Washington, Ohio, on the 11th of January 1836. He was a pupil of Hans Gude in Karlsruhe, Germany. A trip with a government exploring expedition in the west of America undermined his health, and he painted mainly in the high altitudes of the Adirondack Mountains. He was elected a full member of the National Academy of Design, New York, in 1869, and died in New York City on the 29th of November 1892. He was only moderately appreciated during his lifetime, though after his death his works were eagerly sought for.

WYAT, SIR THOMAS (1503-1543), English poet and statesman, elder son of Henry Wyat, or Wiat, afterwards knighted, and his wife Anne, daughter of John Skinner of Reigate, Surrey, was born at Allington Castle, near Maidstone, Kent, in 1503. His father (1460-1537) belonged to a Yorkshire family, but bought Allington about 1493. He was an adherent of the Lancastrian party, and was imprisoned and put to the torture by Richard III. The family records (in the possession of the earl of Romney) relate that during his imprisonment he was saved from starvation by a cat that brought him pigeons. At the time of the death of Henry VIII, he was knighted of the Bath (1509), knight banneret (1513) and held various offices at court. His son, Thomas Wyat, was admitted at St John's College, Cambridge, when about twelve years of age, took his B.A. degree in 1518, and proceeded M.A. in 1522. The vague statement of Anthony à Wood (Athen. Oxon. i. 124), that he was transferred to Oxford to attend Welsey's new college there, has no foundation in fact. He married very early Elizabeth Brooke, daughter of the 3rd
Wyat, Sir Thomas

Lord Cobham. The marriage was an unhappy one, for a letter (29th March 1537) from the lady’s brother to Thomas Cromwell complains that Wyat had gone abroad and made no provision for his wife, and a letter from the Spanish ambassador Chapuys to Charles Bount (28th Feb. 1533) complains. He having got his release by her husband. As early as 1536 Wyat was server extraordinary to the king, and in 1534 he was at court as keeper of the king’s jewels. He was one of the champions in the Christmas tournament of 1525. His father had been associated with Sir Thomas Boleyn as constable of Norwich Castle, and he had thus been early acquainted with Anne Boleyn. He appears to have been generally regarded as her lover, but it is possible that the relations between them were merely of the fashionable poetic sort. In 1536 he was sent with Sir Thomas Cheney to congratulate Francis I. on his safe return from Spain; in 1537 he accompanied Sir John Russell, afterwards 1st earl of Bedford, on an embassy to the papal court. He was sent by Russell, who was incapacitated by a broken leg, to negotiate with the Venetian republic. On his return journey to Rome he was taken prisoner by the Spanish troops, who demanded 3000 ducats for his ransom, but he contrived to escape. In 1538 he was acting as high marshal at Calais with a salary of two shillings per day, and was only superseded in November 1530. During the following years he was constantly employed in Henry’s service, and was apparently high in his favour. He was, however, sent to the Tower in 1539, perhaps because it was desired that he should incriminate the queen. His father’s correspondence with Cromwell does not suggest that his arrest had anything to do with the proceedings against Anne Boleyn, but the connexion is assumed (Letters and Papers of Henry VIII. vol. x. No. 910) in the letters of John Hussey to Lord Lisle, deputy of Calais. The Roman Catholic writer, Nicholas Harpsfeld, makes a circumstantial statement (Prentended Divorce . . . Camden Soc. p. 253) that Wyat had confessed his intimacy with Anne to Henry VIII., and warned him against marrying her; but this, in his uncalled and lowly position, he was not allowed to do, and he was released after a month’s imprisonment, and in the autumn of that year took part in the suppression of the Lincolnshire rising. In March 1537 he was knighted, and a month later was sent abroad as ambassador to Charles V., whose ill-will had been revived by the declaration of the illegitimacy of the princess Mary. In 1538 he was joined by Edmund Bonner, then a simple priest, and one Simon Haynes, and seems to have been ashamed of their bad manners, and to have offended them in various ways. Bonner had evidently been desired by Thomas Cromwell to send his account of the negotiation that he was preparing (2nd Sept. 1538) a long letter (Petyt MS. 47, Middle Temple; first printed in the Gentleman’s Magazine, June 1830) in which he accused Wyat of disloyalty to the king’s interests, and of many personal slights to himself. Wyat was unsuccessful in the difficult affairs entrusted to him, but so long as Cromwell ruled he had a firm friend at court, and no notice was taken of Bonner’s allegations. Cromwell even seems to have taken some care of his private affairs, which were left in considerable disorder. He was recalled in April 1539, but later in the same year he was employed on another embassy to the emperor, who was on his way to the Low Countries. After Cromwell’s death Wyat’s enemies renewed their attacks, and he was imprisoned (17th Jan. 1541) in the Tower on the old charges, with the additional accusation of treasonable correspondence with Cardinal Reginald Pole. Being privately informed of the nature of the charges, he prepared an eloquent and manly defence of his conduct in two documents addressed to the Privy Council and to his judges, in which he cleared himself effectually and exposed his accusers’ motives. He was released at the intercession of the queen, Catherine Howard, on condition that he confessed his guilt and took back his wife, from whom he had been separated for fifteen years, on pain of death if he were thenceforth intrude to her (see Chapuys to Charles V., March 1541). He received a formal pardon on the 21st of March, and received during the year substantial marks of the king’s favour. In the summer of the next year he was sent to Falmouth to meet the ambassadors of the emperor. The beat brought on a fever to which he succumbed at Sherborne, Dorset, on the 11th of October. A Latin elegy on his death was written by his friend John Leland, and Næsni in mortem Thomae Viati etquis incomparabilis; and Henry Howard, earl of Surrey, celebrated his memory in some well-known lines beginning “Wyat resteth here, that quick could never rest,” and in two sonnets.

Wyat’s work falls readily into two divisions: the sonnets, rondains, and lyric poems dealing with love; and the satires and the version of the penitential psalms. The love poems probably date from before his first imprisonment. A large number were published in 1557 in Songs and Sonettes (Tottel’s Miscellany). Wyat’s contributions number 96 out of a total of 310. These have been supplemented from MSS. He was the pioneer of the sonnet in England, and the acknowledged leader of the “company of courtiers” who cultivated the Italian idiom. He readily took back the sweet and stately measures and atle of the Italian Poesie, as novices newly crept out of the schools of Dante, Arioste and Petrarche, greatly pollished our rude and homely maner of vulgar Poesie, from that it had been before” (Puttenham’s Art of English Poesie, 1589). Wyat wrote in all thirty-one sonnets, ten of which are direct translations of Petrarch. The sentiment is strained and artificial. Wyat shows to greater advantage in his lyrical metres, in his epigrams and songs, especially in those written for music, where he is less hampered by the rhymes of the Petrarchan tradition, to which his singularly robust and frank nature was ill-fitted. His thought is generally far in advance of his technical skill, and his disciple Surrey has been far more widely recognized, chiefly because of the superior smoothness of his versification. His works are preserved in a MS. in possession of the Harrington family, which originally belonged to Wyat himself, and in another belonging to the duke of Devonshire in which are inscribed the names of Wyat’s sister, Margaret Lee, and of the duchess of Richmond, Surrey’s sister. The text differs considerably from Tottel’s, which has been generally accepted. It is an edition quite explicit of the manuscripts, and the surnames of the scribes are given, and of the “Courtier’s Life,” to the same, and “How to use the court and himself.” They are written in terza rima and in form and matter owe much to Luigi Alamanni. In the “Penitential Psalms” each is preceded by a prologue describing the circumstances under which the psalmist wrote, and the psalms themselves are very freely paraphrased, with much original matter from the author. They were published in 1549 by Thomas Raynal and John Harrington as Ceruieyne Psalmes . . . drawn into English meter by Sir Thomas Wyat Kyngs writer (1549). After 1551, in the possession of the earl of Romney, were collected by Richard Wyat in 1727. Some use of these is made in The History of Bolley Parish (1892), by J. Cave Browne. See also Brewer and Gairdner, Letters and Papers of Henry VIII., (especially from 1538 to 1542); The Poetical Works of Sir Thomas Wyatt (1866), with a memoir in the Aldine Edition of the British Poets; Professor E. Arber’s introductory matter to the edition of Songs and Sonnets (1870) in his English Reprints; R. Altschuler, “Sir Thomas Wyat . . .” (1886), in Wiener Beiträge der deutschen u. engl. Philologie, giving a full account of Wyat’s metrical practice; W. E. Simonds, Sir Thomas Wyatt (Boston, 1880); W. J. Courthope, Hist. of Eng. Poetry, vol. ii. (1887), the second chapter of which is devoted to a critical study of Wyat; E. Fabiger, “Die handschriftliche Uberlieferung der Gedichte von Sir Thomas Wyat,” in Anglica, vol. xviii.; F. M. Padel,op., Early Sixteenth Century Lyrics (1907).

Wyat, Sir Thomas (d. 1554). English conspirator, son of the preceding, was over twenty-one in 1543, but the date of his birth is uncertain. He is said to have accompanied his father on his mission to Spain, and to have been turned into an enemy of the

1 Ed. J. Haslewood, Ancient Critical Essays, i. 48 (1811).

2 One of the most musical of the pieces printed in his works, however, “The Lover complayeth the unkindness of his lady,” My Lady’s Letter to her Gentleman (1527), George Boleyn, Lord Rochford (see E. Bapst, Deux Gentilshommes nobles de la cour de Henri VIII, p. 142).
Spaniards by the menaces of the insurrection. In 1537 he married Jane, daughter of Sir William Hawte of Bishopshourne in Kent, by whom he had ten children. Wyat was noted in his youth as dissipated, and even as disorderly. He is known to have had a natural son, whose mother Elizabeth was a daughter of Sir Edward Darrell of Littlecote. In 1542 he inherited the family property of Allington Castle and Boxley Abbey on the death of his father. From 1543 to 1550 he saw service abroad as a soldier. In 1554 he joined with the conspirators who combined to prevent the marriage of Queen Mary with Philip the prince of Spain, afterwards King Philip II. A general movement was planned; but his fellow-conspirators were timid and inept, the rising was more than he could manage, and he made no adequate resistance. A few days later he was arrested and was sentenced to death, but he was reprieved on the 17th of May by the Earl of Warwick. Wyat was a favorite rebel mostly by accident. On the 22nd of January 1555 he summoned a meeting of his friends at his castle of Allington, and the 25th was fixed for the rising. On the 26th Wyat occupied Rochester, and issued a proclamation to the country. The country people and local gentry collected, but at first the queen's supporters, led by Lord Aberavenny and Sir Robert Southwell, the sheriff, appeared to be able to suppress the rising with ease, gaining some successes against isolated bands of the insurgents. But the Spanish marriage was unpopular, and Kent was more affected by the preaching of the reformers than most of the country districts. Aberavenny and Southwell were deserted by their men, who either disbanded or went over to Wyat. A detachment of the London train-bands sent against him by Queen Mary, under the command of the duke of Norfolk, followed their example. The rising now seemed so formidable that a deputation was sent to Wyat by the queen and council to ask for terms. He insisted that the Tower should be surrendered to him, and the queen put under his charge. The insolence of these demands caused a reaction in London, where the reformers were strong and were at first in sympathy with him. When he reached Southwark on the 8th of February, London Bridge occupied in force, and was unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Brydges (or Bruges), afterwards Lord Chandos, who was prepared to fire on the suburbs with the guns of the Tower. Wyat now marched up the river to Kingston, where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after a futile attempt to force the gate Wyat surrendered. He was brought to trial on the 25th of March, and could make no adequate defense. Execution was delayed, no doubt in the hope that in order to save his life he would say enough to compromise the queen's sister Elizabeth, afterwards Queen Elizabeth, in whose interests the rising was supposed to have been made. But he would not confess enough to render her liable to a trial for treason. He was executed on the 11th of April, and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterwards partly restored to his son George, the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia in 1623-26 and 1639-1642. A fragment of the castle of Allington is still inhabited as a farm-house, near Maidstone, on the bank of the Medway.

WYATT, JAMES (1746-1833), English architect, was born at Burton Constable in Staffordshire on the 3rd of August 1746. He was the sixth son of Benjamin Wyatt, a farmer, timber merchant and builder. At the age of fourteen his taste for drawing attracted the attention of Lord Bagot, newly appointed ambassador to the pope, who took him with him to Rome, where he spent two years in studying architecture. He returned to England in 1766, and gained his first great success by the adaptation for dramatic purposes of the Pantheon in Oxford Street, London (1772), a work which was destroyed by fire twenty years later. In 1776 he was made surveyor of Westminster Abbey, and in 1778 and the following years executed many important commissions at Oxford. During this earlier period Wyatt shared the prevailing contempt for Gothic architecture; thus the New Buildings at Magdalen College, Oxford, designed by him, formed part of a scheme, the plans for which are extant, which involved the demolition of the famous medieval quadrangle and cloisters. He built many country houses in the classic style, of which he proved himself a master. Gradually, however, he turned his attention to Gothic, the spirit of which, in spite of his diligent study of medieval models, he never understood. The result is still visible in such "Gothic" fakes as that at Ashridge Park, Hertfordshire, built for Lord Bridgewater to replace the ancient priory, and in the lamentable "restorations," e.g. in Salisbury and Lichfield cathedrals, which earned for him even among contemporary archaeologists the title of the "Destroyer." Of these Gothic experiments the most celebrated was Fonthill Abbey, built for Beckford (the eccentric author of *Vathek*), the great tower of which speedily collapsed, while much of the rest has been pulled down. None the less, Wyatt must be regarded as the pioneer of the "Gothic revival," while his general influence may be gauged by the fact that nearly every county and large town in England possesses or possessed buildings by him.

On the death of Sir William Chambers in 1796, he was appointed surveyor-general to the Board of Works. In 1785 he became a member of the Royal Academy, and during a misunderstanding between Benjamin West and the Academy, in 1805, he filled the presidential office at the wish of King George III. He was killed by a fall from his carriage on the 4th of September 1813, and was buried in Westminster Abbey. His son, Benjamin Dean Wyatt (1775-1850), who succeeded him as surveyor of Westminster Abbey, was also an architect of some distinction.

WYCHERLEY, WILLIAM (c. 1640-1716), English dramatist, was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about 600 a year. Like Vanbrugh, Wycherley spent his early years in France, whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle on the banks of the Charente. Wycherley's friend, Major Pack, tells us that his hero "improved, with the greatest refinements," the "extraordinary talents" for which he was "obliged to nature." Although the harmless affectations of the circle of Madame de Montausier, formerly Madame de Rambouillet, are certainly not chargeable with the "refinements" of Wycherley's comedies—condemned by his admirer Voltaire to say afterwards of them, "Il semble que les Anglais prennent trop de liberté et que les Français n'en prennent pas assez"—these same affectations seem to have been much more potent in regard to the "refinements" of Wycherley's religion.

Wycherley, though a man of far more intellectual power than is generally supposed, was a fine gentleman first, a responsible being afterwards. Hence under the manipulations of the heroine of the "Garland" he turned from the Protestantism of his fathers to Romanism—turned at once, and with the same ease and facility as afterwards, at Oxford, he turned back to Protestantism under the manipulations of such an accomplished master in the art of turning as Bishop Barlow. And if, as Macaulay hints, Wycherley's turning back to Romanism once more had something to do with the patronage and unwonted liberality of James II., this merely proves that the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover, as a professional fine gentleman, at a period when, as the genial Major Pack says, "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabutin, or those of Nero's court written by Petronius," Wycherley was obliged to be a loose liver. But, for all that, Wycherley's sobriquet of "Manly Wycherley" seems to have been fairly earned by him, earned by that frank and straightforward way of confronting life which, according to Pope and Swift, characterized also his brilliant successor Vanbrugh.

That effort of Wycherley's to bring to Buckingham's notice
WYCHERLEY

the case of Samuel Butler (so shamefully neglected by the court Butler had served) shows that the writer of even such heartless plays as The Country Wife may be familiar with generous impulses, while his uncompromising lines in defence of Buckingham, when the duke in his turn fell into trouble, show that the inventor of so shameless a fraud as that which forms the pivot of The Plain Dealer may in actual life possess that passion for fairplay which is believed to be a specially English quality. But among the "ninety-nine" religions with which Voltaire accredited England there is one whose permanency has never been shaken—the worship of gentility. To this Wycherley remained as faithful to the day of his death as Congreve himself. And, if his relations to that "other world beyond this," which the Puritans had adopted, were liable to change with his environments, it was because that other world was really out of fashion altogether.

Wycherley's university career seems also to have been influenced by the same causes. Although Puritanism had certainly not contaminated the universities, yet English "quality and politeness" (to use Major Pack's words) have always, since the great rebellion, been rather ashaméd of possessing too much learning. As a fellow-commoner of Queen's College, Oxford, Wycherley only lived (according to Wood) in the provost's lodgings, being entered in the public library under the title of "Philosophiae Studiosus" in July 1660. And he does not seem to have matriculated or to have taken a degree.

We are left to believe that on acquiring the degree Wycherley took up his residence in the Inner Temple, where he had been entered in 1659, did give any more attention to the dry study of the law than was proper to one so warmly caressed by the persons most eminent for their quality or politeness. "Pleasure and the stage were alone open to him, and probably early in 1671 was produced, at the Theatre Royal, Love in a Wood. It was published the next year. With regard to this comedy Wycherley told Pope—told him "over and over" till Pope believed him—believed him, at least, until they quarrelled about Wycherley's verses—that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inkbhorn Lotharios are not nearly so wicked as they would have us believe. When Wycherley charges himself with having written, as a boy of nineteen, scenes so callous and so depraved that even Barbara Palmer's appetite for profligacy was, if not satisfied, appeased, there is, we repeat, no need to believe him. Indeed, there is every reason to disbelieve him,—not for the reasons advanced by Macaulay, however, who in challenging Wycherley's date does not go nearly deep enough. Macaulay points to the allusions in the play to gentlemen's periwiggs, to guineas, to the vests which Charles ordered to be worn at court, to the great fire, &c., as showing that the comedy could not have been written the year before the author went to Oxford. We must remember, however, that even if the play had been written in that year, and delayed in its production till 1672, it is exactly this kind of allusion to recent events which any dramatist with an eye to freshness of observation, eager to make known to the public the fact that "the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley," but that "the whole air and spirit of the piece" belong to a man—an experienced and hardened young man of the world—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Wycherley against his foolish impeachments of himself is this, that Love in a Wood, howsoever inferior in structure and in all the artistic economies to The Country Wife and The Plain Dealer, contains scenes which no inexperienced boy could have written-scenes which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. With regard to dramatic ripeness, indeed, if we were asked to indicate the finest touch in all Wycherley, we should very likely select a speech in the third scene of the third act of this very play, where the vain, foolish and boastful rake Dapperwit, having taken his friend to see his mistress for the express purpose of advertising his lordship over her, is coolly denied by her and insolently repulsed. "I think," says Dapperwit, "women take inconstancy from me worse than from any man breathing."

Now, does the subsequent development of Wycherley's dramatic genius lead us to believe that, at nineteen, he could have given this touch, worthy of the hand that drew Malvolio? Is there anything in his two masterpieces—The Country Wife or The Plain Dealer—that makes it credible that Wycherley, the boy, could have thus delineated by a single quiet touch vanity as a chain-armour which no shaft can pierce—vanity, that is to say, in its perfect development? However, Macaulay (forgetting that, among the myriad vanities of the writing fraternity, this of pretending to an early development of intellectual powers that ought not to be, even if they could be developed early is at once the most comic and the most common) is rather too severe upon Wycherley's disingeniousness in regard to the dates of his plays. That the writer of a play far more daring than Etheredge's She Would if She Could—and far more brilliant too—should at once become the talk of Charles's court was inevitable; equally inevitable was it that the author of the song at the end of the first act, in praise of harlots and their offspring, should touch to its depths the soul of the duchess of Cleveland. Possibly Wycherley intended this famous song as a dedication to Her Grace and her profession, for he seems to have been more delighted than surprised when, as he passed in his coach through Pall Mall, he heard the duchess address him from her coach window as a "rascal," a "villain," and as a son of the very kind of lady his song had lauded. For his answer was perfect in its readiness: "Madam, you have been pleased to bestow a title on me which belongs only to the fortunate." Perceiving that Her Grace received the compliment in the spirit in which it was meant, he lost no time in calling upon her, and was from that moment the recipient of those "favours" to which he alludes with pride in the dedication of the play to her. Voltaire's story (in his Letters on the English Nation) that Her Grace used to go to Wycherley's chambers in the Temple disguised as a country wench, in a straw hat, with pattens on and a basket in her hand, may be apocryphal—very likely it is—for disguise was quite superfluous in the case of the mistress of Charles II. and Jacob Ball, but it at least shows how general was the opinion that, under such patronage as this, Wycherley's fortune as poet and dramatist, "eminently for his quality and politeness," was now made.

Consideration of Her Grace and her profession, for he seems to have determined to bring up his son, the duke of Richmond, like a prince, was desirous of securing for tutor a man so entirely qualified as was Wycherley to impart what was then recognized as the princely education, and it seems pretty clear that, but for the accident, to which we shall have to recur, of his meeting the countess of Drogheda at Bath and secretly marrying her, the education of the young man would actually have been entrusted by his father to Wycherley as a reward for the dramatist's having written Love in a Wood.

Whether Wycherley's experiences as a naval officer, which he accorded himself to have been "in the line," in which "he was in betwixt the English and the Dutch," occurred before or after the production of Love in a Wood is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of Love in a Wood but after the production of The Gentleman Dancing Master, in 1673. We also think, with Macaulay, that he went to sea simply because it was the "polite" thing to do so—simply because, as he himself in the epilogue to The Gentleman Dancing Master says, "all gentlemen must pack to sea."

This second comedy was published in 1673, but was probably acted late in 1671. It is inferior to Love in a Wood. In The Relapse the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In The Gentleman Dancing Master this mingling of discordant
elements destroys a play that would never in any circumstances have been strong—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic pathos.

It is, however, on his two last comedies—*The Country Wife* and *The Plain Dealer*—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humoristic comedy of the Eliza-

bethans. *The Country Wife*, produced in 1672 or 1673 and published in 1675, is so full of wit, ingenuity, animal spirits and conventional humour that, had it not been for its motive—a motive (as Mr. Brugh so spiritedly says) which all writers must wish to repulse to the most lax as to the most moral reader—it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Major John Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Van-

brugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place along with Congreve and Vanbrugh. And, indeed, if scarcely inferior to his in low and full weight, it seems difficult to challenge Professor Spalding's dictum that Wycherley is "the most vigorous of the set."

In order to do justice to the life and brilliance of *The Country Wife* we have only to compare it with *The Country Girl*, after-

wards made famous by the acting of Mrs Jordan, that Bowdlerized form of *The Country Wife* in which Garrick, with an object more praiseworthy than his success, endeavoured to free it of its load of unparalleled licentiousness by disturbing and sweetening the motive—even as Voltaire afterwards (with an object also more praiseworthy than his success) endeavoured to disturb and soften the motive of *The Plain Dealer* in *La Prude*. While the two Bowdlerized forms of Garrick and Voltaire are as dull as the *Aesop* of Boursault, the texture of Wycherley's scandalous dialogue would seem to scintillate with the changing hues of shot silk or of the neck of a pigeon or of a shaven prism, were it not that the many-coloured lights rather suggest the misnomastic radiance of a foul ditch shimmering in the sun. It is easy to share Macaulay's indignation at Wycherley's satyr-like defilement of art, and yet, at the same time, protest against that disfigure-

ment of their literary riches which nullifies the value of Macaulay's criticisms. And scarcely inferior to his in low and full weight, it seems difficult to challenge Professor Spalding's dictum that Wycherley is "the most vigorous of the set."

The comedy had an immense influence, as regards manipulation of dialogue, upon all subsequent English comedies of repartee, and he who wants to trace the ancestry of Tony Lumpkin and Mrs Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montaigue, sat), though he is perhaps overdone, has dominated this kind of stage character ever since. If but few readers know how constantly the blunt sentient utterances of this character are reappearing, not on the stage alone, but in the novel and even in poetry, it is because a play whose motive is monstrous and intolerable can only live in a monstrous and intolerable state of society; it is because Wycherley's genius was followed by Nemesia, who always dogs the footsteps of the defiler of literary art. When Burns said—

"The rank is but the guinea stamp,
The man's the gaud for 'a that's it",
when Sterne, in *Tristram Shandy*, said, "Honours, like impres-
sions upon coin, may give an ideal and local value to a bit of base metal, but gold and silver will pass all the world over without any other recommendation than their own weight,"

what did these writers do but adopt—adopt without improving—Manly's fine saying to Freeman, in the first act:—"I weigh the man, not his title; 'tis not the king's stamp can make the metal better or heavier?" And yet it is in the fourth and fifth acts that the conclusions of Wycherley's comic genius are the most dazzling; also, it is there that the licentiousness is the most astonishing. Not that the worst scenes in this play are really more wicked than the worst scenes in Vanbrugh's *Rape of* 

England, but they are more seriously imagined. Being less humorous than Vanbrugh's scenes, they are more terribly and earnestly realistic; therefore they seem more wicked. They form indeed a striking instance of the folly of the artist who selects a story which cannot be actualized without hurting the finer instincts of human nature. When Manamer declared that, having selected his plot, he looked upon his comedy as three parts finished, he touched upon a point which is decisive. It is upon imaginative literature that the most just criticism can be decreed; it is upon imaginative literature of every kind—would do well to consider. In all literatures—ancient and modern—an infinite wealth of material has been wasted upon subjects that are unworthy, or else incapable, of artistic realization; and yet Wycherley's case is, in our literature at least, without a parallel. No doubt it may be right to say, with Aristotle, that comedy is an imitation of bad characters, but this does not mean that in comedy art may imitate bad characters as earnestly as she may imitate good ones,

—a fact which Thackeray forgot when he made Becky Sharp a murderess, thereby destroying at once what would otherwise have been the most interesting character of the world. And perhaps it was because Vanbrugh was conscious of this law of art that he blended comedy with farce. Perhaps he felt that the colossal depravity of intrigue in which the English comedians indulged needs to be not only warmed by a super-

abundance of humour but softened by the playful mockery of farce before a dramatic circle such as that of the Restoration drama can be really brought within human sympathy. Pho-

tarch's impeachment of Aristophanes, which affirms that the master of the old comedy wrote less for honest men than for men sunk in base vices, was no doubt unjust to the Greek poet, one side of whose humour, and one side, could thus be impeached. But does it not touch all sides of a comedy like Wycherley's—a comedy which strikes at the very root of the social compact upon which civilization is built? As to comparing such a comedy as that of the Restoration with the comedy of the Eliza-

bethans, Jeremy Collier did but a poor service to the cause he undertook to advocate when he set the occasion coarseness of Shakespeare alongside the wickedness of Congreve and Vanbrugh. And yet, ever since Macaulay's essay, it has been the fashion to speak of Collier's attack as being levelled against the immoralities of the English drama, and it is nothing of the kind. It is (as was pointed out so long ago as 1699 by Dr Drake in his little-known vigorous reply to Collier) an attack upon the English drama generally, with a special reference to the case of Shakespeare. While dwelling upon that noxious and highly immoral play *Hamlet*, Collier actually leaves un-

scathed the author of *The Country Wife*, but fastens on Congreve and Vanbrugh, whose plays—prolific enough in all conscience—seem almost decent beside a comedy whose incredible *vis mortis* is the modish distemper.

The stage, indeed, upon which was given with applause *A Woman Killed with Kindness* (where a wife dies of a broken heart for doing what any one of Wycherley's married women would have gloried in doing) should, in seventy years, have given with applause *The Country Wife* shows that in historic and social evolution, as in the evolution of organisms, "change" and "progress" are very far from being convertible-terms. For the barbarism of the society depicted in these plays was, in the true sense of the word, far deeper and more brutal than any barbarism that has ever existed in these islands within the historic period. If civilization has any meaning at all for the soul of man, the Englishmen of Chaucer's time, the Anglo-Saxons of the Heptarchy, nay, those half-naked heroes, who in the dawn of English history clustered along the southern coast to defend it from the invasion of Caesar, were far more civilized than that "race gangrenée"—the treacherous rakes, mercenary slaves and brazen streaks of the court of Charles II., who did their best to substitute for the human passion of love (a passion which
WYCLIFFE was cast perhaps even to palaeolithic man) the promiscuous intercourse of the beasts of the field. Yet Collier leaves Wycherley unassailed, and classes Vanbrugh and Congreve with Shakespeare!

It was after the success of The Plain Dealer that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard The Plain Dealer acted for by a lady who, in her person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, probably in 1680, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. He had not seen enough of life to learn that in the long run nothing is politic but "straightforwardness." Whether because his countenance wore a pensive and subdued expression, suggestive of a poet who had married a dowager countess and awakened to the situation, or whether because treacherous ridicule was followed by a public declaration of his marriage oozed out—it reached the royal ears, and deeply wounded the father anxious about the education of his son. Wycherley lost the appointment that was so nearly within his grasp—lost indeed the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and Love in a Wood had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the countess followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid; and the result of his marrying the beautiful and titled widow was that the contents of his marriage were legislated for, and that the countess, as queen of debauches, were smuggled into the Fleet prison. There he remained for seven years, being finally released by the liberality of James II.—a liberality which, incredible as it seems, is too well authenticated to be challenged. James had been so much gratified by seeing The Plain Dealer acted that, finding a parallel between Manly's "maulin" and his own, such as no spectator before discovered, he paid off Wycherley's execution creditor and settled on him a pension of £800 a year. Other debts still troubled Wycherley, however, and he never was released from his embarrassments, even not after succeeding to a life estate in the family property. In coming to Wycherley's death, we come to the worst allegation that has ever been made against him as a man and as a gentleman. At the age of seventy-five he married a young girl, and is said to have done so in order to spite his nephew, the next in succession, knowing that he himself must shortly die and that the jointure would impoverish the estate.

Wycherley wrote verses, and, when quite an old man, prepared them for the press by the aid of Alexander Pope, then not much more than a boy. But notwithstanding all Pope's tinkering, they remain contemptible. Pope's published correspondence with the dramatist was probably edited by him with a view to giving an impression of his own precocity. The friendship between the two cooled, according to Pope's account, because Wycherley took offence at the numerous corrections on his verses. It seems more likely that Wycherley discovered that Pope, while still professing friendship and admiration, satirized his friend in the Essay on Criticism. Wycherley died on the 1st of January 1746, and was buried in the vault of the church in Covent Garden.

(T.W.-D.)
books of Queen's College, as paying rent for rooms as a ‘pen-
sioner’ or ‘commoner’ for the years 1371-1372, 1372-1375, and
1380-1381. It has thus been commonly assumed (e.g. by
Loserth) that the reformer was at one time in residence at Queen's,
the date being given as 1363. It is probably, however, that the
John Wyclif of the Queen’s College accounts is the same as the
John Wyclif who appears in the College comptus for 1371-1372
as one of the “almoony boys” of the College, and, therefore,
certainly not the reformer.  

These questions, even that of the wardenship of Canterbury,
are, however, of comparatively unimportant, unless we are prepared
with Woodford to impute mean motives to a great man. What
is certain is that long before Wycliffe had become a power outside
Oxford his fame was established in the university. He was
acknowledged supreme in the philosophical disputations of
the schools, and his lectures were crowded. His influence was,
however, purely academic, nor does it seem to have been inspired
at the outset by any conscious opposition to the established order in the
church; and, as Loserth points out, it was not until he was drawn into the arena of the politico-ecclesiastical
conflicts of the day that Wycliffe became of world-importance.
It was his opposition of its chief exponent, John Akener,
and that Wycliffe published his Determinatio quaedam de dominio
in support of the action of parliament in refusing the tribute
demanded by Pope Urban V.; but Loserth has shown that this
work, which contains the first trace of that doctrine of dominium
or lordship which Wycliffe afterwards developed in a sense
hostile to the whole papal system, must be assigned to a date
some years later. Wycliffe, in fact, for some years to come
had the reputation of a good “curialist.” Had it been other-
wise, the pope would scarcely have granted him (January 1375)
the license to keep his Westbury prebend even after he should have
obtained one at Lincoln (Cal. Papal Letters, ed. Bliss and Twem-
low, iv. 193). Moreover, it is uniformly asserted that Wycliffe
fell into heresy after his admission to the degree of doctor
(Fasc. Zis, p. 2), and the papal document above quoted shows
that he had only just become a doctor of theology, which is
in 1372.  

This, of course, does not mean that Wycliffe’s tendencics may
not already have been sufficiently pronounced to call attention
to himself in high places as a possibly useful instrument for the
anti-papal policy of John of Gaunt and his party. Evidence
of the clergy, which had gained him a ready hearing into
him was presented by the crown to the rectory of Lutterworth in
Leicestershire, which he held until his death; and on the
26th of July he was nominated one of the royal envoys to proceed
to Bruges to confer with the papal representatives on the long
vexed question of “provisions” (q.v.). It is probable that he
was attached to this mission as theologian, and that this was
so is sufficient proof that he was not yet considered a persona
ingrata at the Curia. The rank he took is shown by the fact
that his name stands second, next after that of the bishop of
Llangor, on the commission, and that he received pay at the princely rate of twenty shillings a day. The commission itself
was appointed in consequence of urgent and repeated com-
plaints on the part of the Commons; but the king was himself
interested in keeping up the papal system of provisions and
reservations, and the negotiations were practically fruitless.

After his return to England Wycliffe lived chiefly at Lutter-
worth and Oxford, making frequent and prolonged visits to
London, where his fame as a popular preacher was readily established. It is from this period, indeed, that dates the
development of the trenchant criticisms of the folly and corrup-
tion of the church, which had gained him a ready hearing into
was a systematic attack on the whole established order in the church.
It was not at the outset the dogmatic, but the political elements

1 See H. T. Riley’s remarks in the Second Report of the Historical Manuscripts Commission, appendix, pp. 141 sqq. The appearance of a John Wyclif on the books of Queen’s led to the common mistake, repeated in Milman’s Hist. of Latin Christianity (bk. xiii. ch. 17.), that Wycliffe began his university career at Queen’s College. The whole question is argued at length by Dr Rashdall in the Dict. Nat. Biog.

in the papal system that provoked his censure. The negotiations at Bruges had doubtless strengthened the sympathy which he already felt for the anti-curial tendencies in English politics from Edward I.’s time onwards, and a final impulse was given by the attitude of the “Good Parliament” in 1376; in the autumn of that year he was reading his treatise on civil lordship (De
civilis dominio) to his students at Oxford. Of its propositions
some, according to Loserth, were taken bodily from the 140
titles of the bill dealing with ecclesiastical abuses introduced
in the parliament; but it may perhaps be questioned whether
could have really not read the bill. However this may be, the reformer now for the first time publicly
proclaimed the revolutionary doctrine that righteousness is
the sole indefeasible title to dominion and to property, that an
unrighteous clergy has no such title, and that the decision as
to whether or no the property of ecclesiastics should be taken
away rests with the civil power—“politiorum qui intendunt
praxi et statui regnum” (De civ. dom. i. 37, p. 269). It was
unlikelier than a doctrine so convenient to the secular authorities
should long have remained a mere subject of obscure debate
in the schools; as it was, it was advertised abroad by the in-

troductions of those who taught it. Wycliffe probably would declare that it was not his fault if it had been brought down
into the streets and “every sparrow twittered about it.”

If the position at which Wycliffe had now arrived was originally
inspired, as Loserth asserts, by his intimate knowledge of and
sympathy with the legislation of Edward I., i.e. by political rather
than by theological considerations, the necessity of any further
philosophical and religious basis led inevitably to its development
into a criticism not only of the political claims but of the doctrinal
standpoint of the church. As a philosopher, indeed, Wycliffe was
no more than the last of the conspicuous Oxford scholastics, and his
philosophy is of importance mainly in so far as it determined his
doctrine of dominium, and so set the direction in which his political
thought afterwards moved. His views were the logical outgrowth of the
contradictions between Realism and Nominalism he stood on the side of the former,
though his doctrine of universals showed the influence of the criti-

cisms of Ockham and the nominalists. He is Platonistic in his
conception of God as the forma rerum, whom the rationes exemplae
exist eternally, being in fact his Word, who is omnis in omnibus
(1 Cor. xv. 28); every creature in respect of its esse intelligibile is
God, since every creature is in essence the same as the idea, and all
rationes ideales are essentially the same as the Word of God (De
dominio divino, pp. 42, 43). There is one ens, the ens analogum,
which includes in itself and comprehends all other entia—all uni-
era of the whole, including the rational souls, and even the
propositions of the mathematical sciences (ibid. p. 48 sqq.). The process by which the primary ens is specified, or
by which a higher and more general class passes into sensible exist-
ence, is that it receives the addition of substantial form whereby it is
transformed into a substantial individual, or in other words into an
ens ens (ibid. pp. 48 sqq.). To Wycliffe the doctrine of arbitrary divine decrees
was anathema. The will of God is his essential and eternal nature, by
which all his acts are determined; it was thus with the creation, and
by which he created all things; by his will, in which lies their
natures, and species, or in their material essences, secundum rationes
absconditae seminum (ibid. p. 66). God’s creation is conditioned by
his own eternal nature; the world is therefore not merely one
among an infinity of alternatives, an arbitrary selection, so to speak,
but is the only possible world; it is, moreover, not in the nature
of an eternal emanation from God, but was created at a given
moment of time—to think otherwise would be to admit its absolute
necessity, which would destroy free-will and merit. Since, however,
all things came into being in this way, it follows that the creature
can produce nothing save what God has shown it is capable of
God has vested all power and authority, both civil and ecclesiastical,
the supreme lordship of God and is inseparable from, since whatever God gives to his
servants is part of himself, from the first gift, which is the esse
intelligibile, i.e. really the divine essence, down to those special gifts
which flow from the communication of his Holy Spirit; so that in
him we live and move and have our being. But, in giving, God
does not part with the lordship of the thing given; his gifts are of
himself, and are of the least none, and is held subject to due service to the supreme
overlord. Thus, as in feudalism, lordship is distinguished from possession. Lordship is

This leads to the question of predestination and free-will, in which
Wycliffe takes a middle position with the aid of the Aristotelian
distinction between that which is necessary absolutely and that
which is necessary on a given supposition. God does not will
that anything be, but only what is consistent with the good of
being; he necessitates men to perform actions which are in them-
sethemselves neither right nor wrong; they become right or wrong
through man’s free agency.

867
chronicler states with lamentation, made serious objections to receiving the bull at all; and in the end it merely directed Wycliffe to keep within his lodgings at Black Hall for a time.

If the university was disposed to favour the reformer, the government was not less so. John of Gaunt was for the moment in retirement; but the mother of the young king appears to have adopted his policy in church affairs, and she naturally occupied a chief position in the new council. As soon as parliament met in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that treasure should pass out of the country in obedience to the pope's demand. Wycliffe's affirmative judgment is contained in a state paper still extant; and its tone is plain proof enough of his confidence that his views on the main question of church and state had the support of the nation. Indeed he had laid before this same parliament his answer to the pope's bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were true (i.e., orthodox), though their expression was such as to admit of an incorrect interpretation. But Wycliffe was still bound to clear himself before the prelates who had summoned him, and early in 1378 he appeared for this purpose in the chapel of Lambeth Palace. His written defence, expressed in some respects in more cautious language than he had previously used, was laid before the council; but its session was rudely interrupted, not only by an inroad of the London citizens with a crowd of the rabble, but also by a messenger from the pope, who accused Wycliffe of sacrilege against the church, and thus a second time he escaped, either without sentence, or at most with a gentle request that he would avoid discussing the matters in question. Meanwhile his "protestatio" was sent on to Rome. Before, however, any further step could be taken at Rome, Gregory XI. died.

In the autumn of this year Wycliffe was once more called upon to prove his loyalty to John of Gaunt. The duke had violated the sanctuary of Westminster by sending a band of armed men to seize two squires who had taken refuge there. One of them was taken a prisoner, the other was wounded, together with the servant of the church who attempted to resist his arrest. After a while the bishop of London excommunicated all concerned in the crime (except only the king, his mother and his uncle), and preached against the culprits at Paul's Cross. At the parliament held at Gloucester in October, in the presence of the legates of Pope Urban VI., Wycliffe read an apology for the duke's action at Westminster, pleading that the men were killed in resisting legal arrest. The paper, which forms part of the De ecclesia, lays down the permissible limits of the right of asylum, and maintains the right of the civil power not to pass judgment against Wycliffe; and thus a second time he escaped, either without sentence, or at most with a gentle request that he would avoid discussing the matters in question. Meanwhile his "protestatio" was sent on to Rome. Before, however, any further step could be taken at Rome, Gregory XI. died.

The schism in the papacy, owing to the election of Clement VII. in opposition to Urbin I., accentuated Wycliffe's hostility to the Holy See and its claims. His attitude was not, indeed, as yet fully developed. He did not object to a visible head of the church so long as this head possessed the essential qualification of righteousness, as a member of the elect. It was only later, with the development of the scandals of the schism, that Wycliffe definitely branded the pope, quisque popes, as Antichrist. He addressed a letter to the king, in which he describes the government of Clement VII. as having made all his successors apostates (Sermones, ii. 37). The year 1378, indeed, saw the beginning of an aggressive propaganda which was bound sooner or later to issue in a position wholly revolutionary. Wycliffe's criticism of the established order and of the accepted doctrines had hitherto been mainly

1 See R. L. Poole's preface to his edition of the De dominio divino, where Wycliffe's indebtedness to Richard Fitz Ralph, archbishop of Armagh, for his views on lordship and property is shown at some length (pp. xxxiv sq.).
2 Fitz Ralph was a fellow of Balliol, and was engaged in the university at the time of the visitation (A. W. Boughey, Fasti Oxon. p. 21, ed. Gutch, 1790). The first four books of his De pauperis Salvatoris were edited by R. L. Poole for the Wycliffe Society, and published in 1890 in an appendix to the edition of the De Wyclifiana. Fitz Ralph actually held that lordship was conditioned by grace, and that property had come into the world with sin. Fitz Ralph's work was, however, directed to the settlement of the controversy raised by the mendicant orders as to "possessions" and "use." Wycliffe extended the scope of the doctrine so as to include all civil and ecclesiastical society.
3 When he says that the bull was only received at Oxford shortly before Christmas, he is apparently confounding it with the bull of 1375 (see note 1 supra). The latter was dated December 18 (Lewis, appendix xvii.).—Chron. Angl. p. 173.
4 In one text of this document a note is appended, to the effect that the council enjoined silence on the writer as touching the matter contained (Pascali Zittarioeum, p. 271). This, if true, was apparently a measure of precaution.
5 So he describes the popes in the first sermon in vol. ii. of the Sacrosanctae. This may be doubtless refer to the papacy of Benedict XIII. Book iii. of his Opus evangelicul is also significantly entitled De Antichristo.
confined to the schools; he now determined to carry it down into the streets. For this purpose he chose two means, both based on the thesis which he had long maintained as to the supreme authority of Holy Scripture, as the great charter of the Christian religion. The first means was his institution of the "poor" or "simple" priests to preach his doctrines throughout the country; the second was the translation of the Vulgate into English, which he accomplished with the aid of his friends Nicholas Hereford and John Purvey (see BIBLE, ENGLISH). This version of the Bible, and still more his numerous sermons and tracts, established Wycliffe's now undisputed position as the chief exponent of the Trinitarian position.

The choice of secular priests to be his itinerant preachers was significant of another change of attitude on Wycliffe's part. Hitherto he had been on good terms with the friars, whose ideal of poverty appealed to him; as already mentioned, four doctors of the mendicant orders had appeared with him at his trial in 1377. But he had come to recognize that all organized societies within the church, "sects" as he called them, were liable to the same corruption, while he objected fundamentally to the principle which had established a special standard of morality for the "inhabitants of heaven," i.e. the clergy. While the friars were not necessarily intended to work as rivals to the benedictine monastery. The idea that underlay their mission was rather analogous to that which animated Wesley four centuries later. Wycliffe aimed at supplementing the services of the church by regular religious instruction in the vernacular; and his organization included a good number of men who held or had held respectable positions in their colleges at Oxford. The influence of their teaching was soon felt throughout the country. The common people were rejoiced by the plain and homely doctrine which dwelt chloride on the simple "law of nature," while they no doubt rejoiced at the designation of existing evils in the church which formed, as it were, the burchen of such discourses. The feeling of disaffection against the rich and careless clergy, monks and friars was widespread but undeveloped. Wycliffe turned it into a definite channel.

Meanwhile, in addition to his popular propaganda and his interventions in politics, Wycliffe was appealing to the world of learning in a series of Latin treatises, which followed each other in rapid succession, and collectively form his summa theologica. During the years 1378 and 1379 he produced his works on the truths of Holy Scripture, on the church, on the office of king, on the papal power.

Of all these, except the third, the general character has already been indicated. The De officio regis is practically a declaration of war against the papal monarchy, an anticipation of the theocratic conception of that political body as established by the Reformation. The king is God's vicar, to be regarded with a spiritual fear second only to that due to God, and resistance to him for personal wrong suffered is wicked. His jurisdiction extends over all causes. The bishops—who are to the king as Christ's Humanity is to his Divinity—derive their jurisdiction from him, and whatever they do is done by his authority. Thus in his palpable dignity, towards the world, the king is superior to the priest; it is only in his impalpable dignity, towards God, that the priest is superior to the king. Wycliffe thus passed from an avowed of the papal to an aviantial of the sacerdotal power; and in this way he was ultimately led to examine and reject the distinctive symbol of that power, the doctrine of transubstantiation.

1 J. Loerth, in his paper "Die Genesis von Wiclifas Summa Theologiae" (Sitzungsber. der K. Akad. der Wissenschaften, Vienna, 1908, vol. 186) gives proofs that the Summa was not produced on a prolonged thought out plan, but that even the larger works forming part of it "were the outcome of those conflicts which were fought out inside and outside the Good Parliament," i.e. they were primarily intended as weapons in the ecclesiastico-political controversies of the time.

3 Sporadic attacks had been made on this before, though it had not reached the same degree. See the interlocutor of the heretic priest Ralph of Tregem in the Register of John de Grandison, Bishop of Exeter, edited by F. C. Hingeston-Randolph (London and Exeter, 1894), pp. 1147 and 1179.

Wycliffe himself had for some time, both in speech and writing, indicated the main characteristics of his teaching on the Eucharist. It was not, however, till 1379 or 1380 that began a formal public attack on what he calls the "new" doctrine in a set of theses propounded at Oxford. These were followed by sermons, tracts, and, in 1381, by his great treatise De eucharistia. Finally, at the close of his life, he summed up his doctrine in this as in other matters in the Triologus.

The language in which he denounced transubstantiation anticipated that of the Protestant reformers; it is a "blasphemous folly," a "deceit," which "despoils the people and leads them to commit idolatry"; a philosophically it is nonsense, since it presupposes the possibility of an accident existing without its substance; it overlooks the very nature of a sacrament. Yet the consecrated bread and wine are the body and blood of Christ, for Christ himself says so (Pasc. Zizan., p. 115); we do not, however, corporeally touch and break the Lord's body, which is present only sacramentaliter, spiritualiter et virtualiter—in the present in the body. The present is not denied; what Wycliffe "dares not affirm" is that the bread is after consecration essentially, substantially, corporeally immediately widened by the outbreak of the great Peasants' Revolt of 1381, the result of which was to draw the conservative elements in church and state together, in defence of their common interests.

With the Peasants' Revolt it has been supposed that Wycliffe had something to do. The only positive fact implicating him is the confession of one of its leaders, John Ball, that he learned his subversive doctrines from Wycliffe. But the confession of a condemned man can seldom be accepted without reserve; and we have not only the precise and repeated testimony of Knyghton that he was a "precursor of Wycliffe, but also documentary evidence that he was communicated as early as 1366, long before Wycliffe exposed himself to ecclesiastical censure. Wycliffe in truth was always careful to state his communistic views in a theoretical way; they are confined to his Latin scholastic writings, and thus could not reach the people from him directly. At the same time it is very possible that his less scrupulous followers translated them in their popular discourses, and thus fed the flame that burst forth in the rebellion. Perhaps it was a consciousness of a share of responsibility for it that led them to cast the blame on the friars. In any case Wycliffe's advocates must regret that in all his known works there is only one trace of any reprobation of the excesses that accompanied the outbreak.

4 1381 (corrected by the editor from 1380) is the date given in Shirley's edition of the Fasciculi Zizantorum. F. D. Matthews, in the Eng. Hist. Rev. for April 1890 (v. 328), proves that the date must have been 1379 or 1380.

5 Tractatus, lib. iv. cap. 22: De Euch, p. 249.

6 The difference is summed up by Melancthon, in his rejection of Bucer's elenconon, thus:—Fucm facisci hominibus per hoc quid quod poste corpore, e lam postes filtrum consimiles facit i.e. imagine. Sic iterum negant presentiam realem. Nos docemus, quod corpus Christi est realiter ad unum capere vel in pane (Corpus Reformatorum, ii. 224 sq.).
In the spring following the Revolt his old enemy, William Courtenay, who had succeeded the murdered archbishop Sud bury as archbishop of Canterbury, resolved to take measures for stamping out Wycliffe's crowning heresy. He called a court of bishops, theologians and canons at the Blackfriars' convent in London, which assembled on the 17th to 21st of May and sat with intervals until July. This proceeding was met by a hardly expected manifestation of university feeling on Wycliffe's side. The chancellor, Robert Rygge, though he had joined in the condemnation of the theses, stood by him, as did also both the proctors. On Ascension Day (the 15th of May) his most prominent disciple, Nicholas Hereford, was allowed to preach a violent sermon against the regulars in the churchyard of St Frideswyde. The archbishop protested through his commissary, the Carmelitine Dr Peter Stokes, who was charged with the execution of the archbishop's mandate (on the 28th of May) for the publication in the university of the decision of the Blackfriars' council, by which 24 articles extracted from Wycliffe's works were condemned, ten as heretical and fourteen as erroneous. The reply of the chancellor was to deny the archbishop's jurisdiction within the university, and to allow Philip Repton, another of Wycliffe's disciples, to preach on Corpus Christi day before the university. Chancellor and preacher were guarded by armed men, and Stokes wrote that his life was not safe at Oxford. The chancellor and proctors were then summoned to Lambeth, and directed to appear before the Blackfriars' court on the 12th of June. The result was that the university officers were soon brought to submission. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question at issue was for them one of philosophy rather than faith, and they were quite prepared to make formal submission to the authority of the Church. For the rest, a few of the reformer's more prominent adherents were arrested, and imprisoned until they recanted.

Wycliffe himself remained at large and unmolested. It is said indeed by Knyghton that at a council held by Courtenay at Oxford in the following November Wycliffe was brought forward and made a recantation; but our authority fortunately gives the text of the recantation, which proves to be nothing more nor less than a plain English statement of the condemned doctrine. It is therefore lawful to doubt whether Wycliffe appeared before the council at all, and even whether he was ever summoned before it. Probably after the overthrow of his party at Oxford by the action of the Blackfriars' council Wycliffe found it advisable to withdraw permanently to Lutterworth. That his strength among the laity was unimpaired is shown by the fact that some ordinances passed by the council of the Lords alone, in May 1353, against the itinerant preachers was annulled on the petition of the Commons in the following autumn. In London, Leicester and elsewhere there is abundant evidence of his popularity. The reformer, however, was growing old. There was work, he probably felt, for him to do, more lasting than personal controversy. So in his retirement he occupied himself, with restless activity, in writing numerous tracts, Latin and English. To this period, too, belong two of his most important works: the Trialogus and the unfinished Opus ecclesiasticum.

The Trialogus is as it were his summum summum theologica, a summary of all his sentiments and conclusions on philosophy, theology, and church discipline, cast in the form of a discussion between three persons, Alithia, representing "solid theology," Phirones, representing "subtle and mature theology," and Pseustis, representing "capacious infidelity," whose function is to bring out the truth by arguing and demonstrating against it. The Trialogus was the best known and most influential of all Wycliffe's works, and was the first to be printed, which gave it a still more conspicuous position. Its significance lies in the fact that all the four known complete MSS. of the work, preserved in the Imperial Library at Vienna, are of Hussite origin. The note of both the Trialogus and of the Opus ecclesiasticum, Wycliffe's last work, is their insistence on the "sufficiency of Holy Scripture."

In 1382, or early in 1383, Wycliffe was seized with a paralytic stroke, in spite of which he continued his labours. In 1384 it is stated that he was cited by Pope Urban VI. to appear before him at Rome; but to Rome he never went. On the 28th of December of this year, while he was hearing mass in his own church, he received a final stroke, from the effects of which he died on the New Year's eve. He was buried at Lutterworth; but by a decree of the council of Constance, May 4, 1415, his remains were ordered to be dug up and burned, an order which was carried out, at the command of Pope Martin V., by Bishop Fleming in 1426. The effect of his complete sincerity and earnest striving after what he believed to be right. If he cannot be credited (as he has been by most of his biographers) with all the Protestant virtues, he may at least claim to have discovered the secret of the immediate dependence of the individual Christian upon God, a relation which needs no mediation of any priest, and to which the very sacraments of the Church, however desirable, are not essentially necessary. When he divorces the idea of the Church from any connexion with its official or formal constitution, and conceives it as consisting exclusively of the righteous, he may seem to have gone the whole length of the most radical reformers of the 16th century. And yet, powerful as was his influence in England, his doctrines in his own country were doomed to perish, or at best to become for a century and a half the core of obscurity and persecuted sectaries (see Lollards). It was otherwise in Bohemia, whither his works had been carried by the scholars who came to England in the train of Richard II.'s queen, Anne of Bohemia. Here his writings were eagerly read and multiplied, and here his disciple, John Huss (p.), with less originally and with much less power, with the aid of a collection of contemporary documents, raised Wycliffe's doctrine to the dignity of a national religion. Extracts from the De ecclesia and the De potestate Papae of the English reformer made up the greater part of the De ecclesia of Huss, a work for centuries ascribed solely to the Bohemian divine, and for which he was condemned and burnt. It was Wycliffe's De sufficientia legis Christi that Huss carried with him to convert the council of Constance; of the fiery discourses now included in the published edition of Wycliffe's Sermones many were likewise long attributed to Huss. Finally, it was from the De eucharistia that the Taberones derived their doctrine of the Lord's Supper, with the exception of the granting of the chalice to the laity. To Huss, again, Luther and other continental reformers owed much, and thus the spirit of the English reformer had its influence on the reformed churches of Europe.

BIBLIOGRAPHY.—The documentary materials for Wycliffe's biography are to be found in John Lewis's Life and Sufferings of J. Wycliffe (1881), Oxford, which contains a list of illustrative papers and records: Foxe's Acts and Monuments, vol. iii., ed. 1845, with app.: Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the Pseustis and Eulogium, with notes and apparatus bearing on the history of Wycliffe and the Lollards, with interspersed narrative and comments (probably the work of Thomas Netter of Walden) (1859); and H. T. Riley's notices in the appendices to the Second and Fourth Reports of the Historical Manuscripts Commission. Among contemporary records the narrative of a monk of St Albans—a bitter opponent of John of Gaunt—is of conspicuous value; it was published under the title of Chronicum Anglicanum, by Sir E. Maunde Thompson (1874). Of this account in Walsingham's Historia Anglicana (ed. H. T. Riley, 1863, 1864) is mainly a modified version. Knyghton, who wrote De evellentibus Anglic at 1369, also left a book, which he called the Wyclifian, and it is very well informed as to certain passages in the reformer's history, though his chronology is extremely faulty (ed. J. R. Lumby, 1889-95). There are valuable notices by A. M. L. of the Historia Eboracensis; of the Historia Eboracensis, 1160-1563, F. S. Haydon (1863), in the Chronicle of Adam of Usk (ed. E. M. Thompson, 1876), and in more than one of the continuations of Higden. For the study of Wycliffe's theology the controversial works of Wodeford and Walden are important, but must necessarily be used with caution.

Of modern biographies that by G. V. Lecher (Johann von Wicliff und die Vorgeschichte der Reformation, 2 vols., Leipzig, 1873) and that by F. Baur (Wyclif and his Times, 1844) are the most comprehensive; it includes a detailed exposition of the reformer's system, based to a considerable extent on works which were then unknown. Sir I. G. Butler, in his History of the English Works of Wyclif, lithoed unprinted (1850), as well as Creighton's History of the Papacy, vol. i., 1882, and Sir H. C. Maxwell Lyte's account in his History of the University of Oxford (1886), add to or correct our stock of biographical materials, and contain much valuable criticism.
Wycliffe's political doctrine is discussed by Mr. R. L. Poole (Illustrations of the History of the English Church, 1846) in his and his relation to the charter of 1358, but in 1792 only one fair was held on the Monday after Trinity Sunday, unlike Michaelmas for hiring, but there was now a pleasing fair on the same day.

See John Parker, History and Antiquities of Wycombe (1878).

**WYE, a river of England, famous for its beautiful scenery. It rises in Montgomeryshire on the E. slope of Plynlimon, and, as the source of the Severn, has the dignity of which it joins after a widely divergent course. Its length is 130 m.; its drainage area (which is included in the basin of the Severn), 1609 sq. mi. Running at first S.E. it crosses the W. of Radnorshire, passing Rhayader, and receiving the Elan, in the basin of which are the Birmingham reservoirs. It then divides Radnorshire from Brecknockshire, receives the Ithon on the left, passes Builth, and presently turns N.E. to Hay, separating Radnorshire from Herefordshire, and thus forming a short stretch of the Welsh boundary. The river, which rose at an elevation exceeding 2000 ft., has now reached a level of 250 ft., 55 m. from its source. As it enters Herefordshire it bends E. by S. to reach the city of Hereford. It soon receives the Lugg, which, augmented by the Arrow and the Frome, joins from the N. The course of the Wye now becomes extremely sinuous; and the valley narrows nearly to Chepstow. For a short distance the Wye divides Herefordshire from Gloucestershire, and for the rest of its course Gloucestershire and Monmouthshire. It passes Monmouth, where it receives the Monnow on the right, and finally Chepstow, 2 m. above its junction with the Severn estuary. The river is navigable for small vessels for 15 m. up from the mouth, or high tides to Chepstow. The average spring rise of the tide is 38 ft. at Chepstow, while 50 ft. is sometimes exceeded; the average neap rise is 28 ft. The scenery is finest between Rhayader and Hay in the upper part, and from Goodrich, below Ross, to Chepstow in the lower, the second being the portion which gives the Wye its fame.

The name of Wye belongs also to two smaller English rivers:—(1) a right-hand tributary of the Severn between Newent and Bredon, rising in the uplands near Buxton, and having part of its early course through one of the caverns characteristic of the district; (2) a left-hand tributary of the Thames, watering the valley of the Chilterns in which lies Wycombe and joining the Thames at Maidenhead.

**WYKES, THOMAS**, English chronicler, was a canon regular of Osney Abbey, near Oxford. He was the author of a Chronicle extending from 1066 to 1289, which is printed among the monastic annals edited by H. R. Luard for the “Rolls” Series. He gives an account of the barons’ war from a royalist standpoint, and is a severe critic of Montfort’s policy. He is of some value for the reign of Edward I. His work is closely connected with the Osney Annals, which are printed parallel with his work by Luard, but from 1258 to 1278 Wykes is an independent authority.

See H. R. Luard’s Annales monastici, vol. iv. (1869); and earlier editions of J. A. Chepman’s Scrutiniorium Britanniae (2 vols., 1725), and B. Waite, History of the Barons’ War (1815).

**WYLIE, ALEXANDER** (1815–1887), British missionary, was born in London on the 6th of April 1815, and went to school at Drumlimie, Kincardineshire, and at Chelsea. While apprenticed to a cabinet-maker he picked up a Chinese grammar written in Latin, and after mastering the latter tongue made such good progress with the former, that in 1846 James Legge engaged him to superintend the London Missionary Society’s press at Shanghai. In this position he acquired a wide knowledge of Chinese religion and civilization, and especially of their mathematics, so that he was able to show that Sir George Horner’s method (1850) of solving equations of all orders had been known to the Chinese mathematicians of the 14th century. He made several journeys into the interior, notably in 1858 with Lord Elgin up the Yang-tze and in 1868 with Griffith John to the capital of Sze-ch’uan and the source of the Han. From 1868 he was an agent of the British and Foreign Bible Society. He settled in London in 1877, and died on the 10th of February 1887.

In Chinese he published books on arithmetic, geometry, algebra (De Morgan’s), mechanics, astronomy (Herschel’s), and the Marine and English Navy (Main and Brown), as well as translations of the first two gospels. In English his chief works were Notes on Chinese Literature (Shanghai, 1867), and scattered articles collected under the title Chinese Researches by Alexander Wylie (Shanghai, 1867).

See H. Cordier, Life and Labours of A. Wylie (1887).
WYLIE, ROBERT (1839–1877). American artist, was born in the Isle of Man in 1839. He was taken to the United States when a child, and studied in the schools of the Pennsylvania Academy of the Fine Arts, Philadelphia, the directors of which sent him to France in 1863 to study. He won a medal of the second class at the Paris Salon of 1872. He went to Pont Aven, Brittany, in the early sixties, where he remained until his death on the 4th of February 1877. He painted Breton peasants and scenes in the history of Brittany; among his important works was a large canvas, "The Death of a Vendean Chief," now at the Metropolitan Museum of Art, New York.

WYNADON. A town and market town in the mid-parliamentary division of Norfolk, England, 10 m. S.W. of Norwich by the Great Eastern railway. Pop. (1901) 4764. The church of St Mary the Virgin rises on an eminence on the outskirts of the town. It was attached to a Benedictine priory, founded about the beginning of the 12th century as a cell of St Albans abbey by William de Albini. In 1448 this foundation became an abbey. The nave is of ornate Norman work, with a massive triforium, surmounted by a Perpendicular clerestory and a beautiful wooden roof. The broad N. aisle is Perpendicular, and the W. end is crowned by a lofty and graceful Perpendicular tower. The choir, which was used as the conventual church, has left only slight traces, and one arch is standing of a large chapel which adjoined it on the S. In the centre of the town is a picturesque half-timbered market cross (1616), with an octagonal upper chamber raised on massive pillars of wood. A chapel, dedicated to St Thomas of Canterbury, is used as a grammar school. At Wymondham on the 7th of July a festival was formerly held in honour of the saint. It was at this festival in 1549 that the rebellion of Robert Ket or Ket came to a head.

WYNAD, or WNAAD, a highland tract in S. India, forming part of Malabar district, Madras. It consists of a table-land amid the W. Ghats, 60 m. long by 30 m. broad, with an average elevation of 3000 ft.; pop. (1901) 75,149. It is best known as the district where a large amount of British capital was sunk during the decade 1876–1886 in gold mines. It had yet earlier been a coffee-planting district, but this industry has recently declined. Tea, pepper and cardamoms are produced in increasing quantities. There are also valuable forest reserves.

WYNHAM, SIR CHARLES (1787–1873). English actor, was born in Liverpool on the 23rd of March 1837, the son of a doctor. He was educated abroad, at King's College, London and at the College of Surgeons and the Peter Street Anatomical School, Dublin, but his taste for the stage was too strong for him to take up either the clerical or the medical career, suggested for him, and early in 1862 he made a first appearance in London as an actor. Later in the year, being in America, he volunteered during the Civil War, and became brigade surgeon in the Federal army, resigning in 1864 to appear on the stage in New York with John Wilkes Booth. Returning to England, he played at Manchester and Dublin in Her Ladyship's Guardian, his own adaptation of Edward B. Hamley's novel Lady Lee's Widowhood. He reappeared in London in 1866 as Sir Arthur Lascelles in Morton's All that Glitters is not Gold, but his great success at that time was in F. C. Burnand's burlesque of Black-eyed Susan, as Hatchett, "with dance." This brought him to the St James's theatre, where he played with Henry Irving in Idealia; then with Ellen Terry in Charles Reade's Double Marriage, and Tom Taylor's Still Waters Run Deep. As Charles Surface, his best part for many years, and in a breezy three-act farce, Pink Dominoes, by James Albery, and in Brighton, an Anglicized version of Saragossa by Bronson Howard (1842–1908), who married his sister, he added greatly to his popularity both at home and abroad. In 1876 he took control of the Criterion theatre. He produced a long succession of plays, in which he took the leading part, notably a number of old English comedies, and in such modern plays as The Liars, The Case of Rebellious Susan and others by Henry Arthur Jones; and he became famous for his acting in David Garrick. In 1890 he opened his new theatre, called Wyndham's. In 1902 he was knighted. From 1889 onwards his leading actress was Miss Mary Moore (Mrs Albery), who became his partner in the proprietorship of the Criterion and Wyndham's theatres, and of his New Theatre, opened in 1903; and her delightful acting in comedy made their long association memorable on the London stage.

WYNHAM, SIR WILLIAM, BART. (1687–1740), English politician, was the only son of Sir Edward Wyndham, Bart., and a grandson of William Wyndham (d. 1683) of Orchard Wyndham, Somerset, who was created a baronet in 1661. Educated at Eton and at Christ Church, Oxford, he entered parliament in 1710, and became secretory-at-war in the Tory ministry in 1712 and chancellor of the exchequer in 1713. He was closely associated with Lord Bolingbroke, and he was privy to the attempts made to bring about a Jacobite restoration on the death of Queen Anne; when these failed he was dismissed from office. In 1715 the failure of a Jacobite movement led to his imprison-ment, but he was soon set at liberty. Under George I. Wyndham was the leader of the opposition in the House of Commons, fighting for his High Church and Tory principles against Sir Robert Walpole. He was in constant communication with the Whigs during his imprisonment: in 1723 the two were actively associated in abortive plans for the overthrow of Walpole. He died at Wells on the 17th of June 1740. Wyndham's first wife was Catherine, daughter of Charles Seymour, 6th duke of Somerset. By her he had two sons, Charles, who became 2nd earl of Egremont in 1750, and Percy, who took the name of O'Brien and was created earl of Thomond in 1726.

The Wyndham Family. Sir John Wyndham, a Norfolk man, was knighted after the battle of Stoke in 1487 and beheaded for high treason on the 2nd of May 1502. He married Margaret, daughter of John Howard, duke of Norfolk, and his son Sir Thomas Wyndham (d. 1521), of Felbrigg, Norfolk, was vice-admiral of England under Henry VIII. By his first wife Sir Thomas was the father of Sir John Wyndham, who married Elizabeth, daughter of John Sudeyn of Orchard, Somerset, and founded the Somerset branch of the family, and also of Sir Edmund Wyndham of Felbrigg, who was sheriff of Norfolk at the time of Robert Ket's rebellion. By his second wife Sir Thomas was the father of the seaman Thomas Wyndham (c. 1510–1553), an account of whose voyage to Morocco in 1552 is printed in Hakluyt's Voyages.

From Sir John Wyndham of Orchard Wyndham was descended Thomas Wyndham (1687–1745), lord chancellor of Ireland from 1726 to 1739, who in 1731 was created Baron Wyndham of Finglass, a title which became extinct on his death. His nephew, Henry Penruddocke Wyndham (1736–1810), the topogra-pher, wrote A Gentleman's Tour through Monmouthshire and Wales in June and July 1774 (1775); and Wiltshire from Domes-day Book, with a Translation of the Original Latin into English (Salisbury, 1788).

Sir John Wyndham of Orchard Wyndham was also the ancestor of the Windhams of Felbrigg, who adopted this form of spelling the family name, the most noteworthy members of which were the statesman William Windham (q.v.), and Sir Charles Ash Windham (1810–1870), a soldier who commanded in the Crimea and in the Indian Mutiny.

The Wyndhams are also connected through a female line with the family of Wyndham-Quin, which holds the earldom of Dun-raven. Valentine Richard Quin (1752–1824), of Adare, county Limerick, was created Baron Adare on the union with England in 1800, and earl of Dunraven and Mount-Earl in 1822. His son, the 2nd earl (1782–1850), married Caroline (d. 1870), daughter and heiress of Thomas Wyndham of Dunraven Castle, Glamorgan, and took the name of Wyndham-Quin. Their son, the 3rd earl (1822–1871), who was created a peer of the United Kingdom as Baron Kenry in 1866, was a well-known man of science, especially interested in archaeology. His son, Windham Thomas Wyndham-Quin (b. 1841), the 4th earl, was under-secretary for the colonies in 1885–1887, and became later a prominent figure in Irish politics, as chairman of the Irish Land Conference and president of the Irish Reform Association;
he was also prominent as a yachtsman, competing for the America cup (see Yachting) in 1893 and 1895.

WYNN, SIR JOHN (1553–1627), Welsh antiquary, was the son of Morris Wynn and descended from the princes of Wales. He was educated at Oxford, succeeded to his father's estate of Gwydir in Carnarvonshire in 1580, and was member of parliament for this county in 1586. In 1606 he was made a knight and in 1611 a baronet. He was interested in several mining ventures and also found time for antiquarian studies. He died on the 1st of March 1627. At Llanrwst Wynn founded an hospital and endowed schools. His History of his Family, which had a great reputation in North Wales, was first published by Daines Barrington in 1776, and in 1785 an edition was published at Oswestry. It is valuable as the only work which describes the state of society in North Wales in the 15th and the earlier part of the 16th century. His son Richard (d. 1649) was in attendance on Prince Charles, afterwards Charles I, when he visited Spain in 1623, and was afterwards treasurer to Queen Henrietta Maria; he wrote an account of the journey to Spain, published by T. Hearne in 1729 with the Historia vitae et regni Ricardi II. He built the bridge over the Conway at Llanrwst. The benefaction he left to Llanrwst, when Wynn, near Ruabon, passed to Sir Watkin Williams, who took the name of Williams-Wynn and founded the family of that name.

Sir John Wynn's estate of Gwydir came to the 1st duke of Ancaster in the 17th century by his marriage with the heiress of the Wynns. On the death of the last duke in 1779, Gwydir was inherited by his sister Priscilla, Lady Willoughby de Eresby in her own right, whose husband was created Baron Gwydir. On the death of Alberic, Lord Willoughby de Eresby (1870), this title (now merged in that of earl of Ancaster) fell into abeyance between his two daughters, while that of the Baron Gwydir passed to his cousin and heir male Gwydir itself was sold by the earl of Ancaster in 1895, the house and part of the estate being bought by Earl Carrington, who also claimed descent from Sir John Wynn.

WYNTOUN, ANDREW OF (17350–17420), author of a long metrical history of Scotland, called the Orcynagyle Cronykil of Scotland, was a canon regular of St Andrews, and prior of St Serf's in Locheilene. He wrote the Chronicle at the request of his patron, Sir John of Wemyss, whose representative, Mr Erskine, was a justice of the Court of Session. An extant MS. of the work is the subject of the history of Scotland from the mythical period (hence the epithet "original") down to the accession of James I. in 1406. The earlier books are of no historical value, but the later have in all outstanding matters stood the test of comparison with contemporary records. The philological interest is great, for few works of this date, and no other of like magnitude, are extant in the vernacular.

The text is preserved in eight MSS., of which three are in the British Museum, the Royal (17 D xx.), the Cottonian (Nero D. xii.) and the Lansdowne (197); two in the Advocates' library, Edinburgh (19, 2, 3 and 19, 2, 4), one at Wemyss Castle (u.s.); one in the university library at St Andrews, and one, formerly in the possession of the Bowells of Anchinleck, now the property of Mr John Ferguson, Duns, Berwickshire. The first edition of the Chronicle (based on the Royal MS.) was published by David Macpherson in 1795; the second by David Laing; in the series of "Scottish Historians" (Edin., 1879), both are published by the elaborate edition by Mr Amours for the Scottish Text Society (1896).

Wyoming, one of the Central Western states of the United States of America, situated between the parallels of latitude 41° and 45° N., and the meridians of longitude 27° and 34° W. of Washington. It is bounded on the N. by Montana, on the E. by S. Dakota and Nebraska, on the S. by Colorado and Utah, and on the W. by Utah, Idaho, and a small southward projection of Montana. The state has a length of about 375 m. E. and W., along its southern border and a breadth of 276 m. N. and S. It has an area of 87,014 sq. m., of which 320 sq. m. are water surface.

Physical Features.—The greater portion of the state belongs to the Great Plains Province, which extends from N. to S. across the United States between the 100th meridian and the Rocky Mountains. Within this province are found the Black Hills of S. Dakota, and their W. slopes extend across the boundary into N.E. Wyoming. The N.W. portion of the state is occupied by the S. end of the Northern Rocky Mountain Province; and the N. end of the Southern Rockies extends across the Colorado line into southern Wyoming. The Great Plains in Wyoming have an elevation of from 5000 to 7000 feet, and are characterized by much rolling country, barren of tree growth, but often covered with nutritious grasses, and affording pasturage for vast numbers of live stock. Erosion buttes and mesas occasionally rise as picturesque monuments above the general level. In the S.W. part of the state the mountains the plains strata, elsewhere nearly horizontal, are bent sharply upward and curved by erosion into hogback ridges. These features are well developed about the Bighorn Mountains, an outlying barrier of the southern Rocky Mountains, which separates the continuity of the plains in central Wyoming. The plains sediments contain important coal beds, which are worked in nearly every county of the state. In the S.W. portion of the Southern Rockies, the plains are interrupted by minor Mountain groups, volcanic buttes and lava flows, among which the Leucite Hills and Pilot Butte are prominent examples.

North of the Bighorn Mountains the Great Plains of the state makes a distinct break in the continuity of the Northern and Southern Rockies, and forms a water divide for a broad, relatively low pass utilized by the Oregon Trail in early days by the Union Pacific railway at a later period. The Black Hills District in the N.E. contains the Little Missouri Buttes and the Mato Pepee (or Devil's Tower), prominent erosion remnants of volcanic intrusions. Local glaciation has modified the higher eastern slope of the Bighorns, with the Little Missouri. The Northern Rockies extending into the N.W. of the state affords the most magnificent scenery. Here is the Yellowstone National Park (13,800 sq. m.), the highest point in the state, and Fremont Peak (13,909 ft.), hot springs, and the Shoshone's river, which here splits and form a striking feature. In the Wind River Range, farther S.E., are the Gannett Peak (13,775 ft.), the highest point in the state, and Fremont Peak (13,909 ft.). In the central part of the state, a Region of Table mountains, rising abruptly from the low basin of Jackson's Hole to elevations of from 3000 to 4000 feet, forms a striking landscape.

The streams are well stocked with rainbow and brook trout. The former fish were introduced from California in 1885. They thrive in the Wyoming streams and rivers and are superior game fish. Specimens of eight and ten pounds weight have been taken most notably by fishermen from the Big Laramie river. Other fish native to the waters of the state are the sturgeon, catfish, perch (locally called pike), buffalo fish, flathead, and suckers.

There is a great variety of birds. Eared grebes and ring-billed gulls breed on the sloughs of the plains, and rarely the white pelican nests about the lake shores. Here, too, breed many species of ducks, the mallard, the ring-necked and the mallard's cousin, the ring-billed, hooded mergansers, and Canada geese; other ducks and geese are migrants only. Formerly the trumpeter swan nested here. On the plains a few waders breed, as the avocet, western willet and long-billed curlew. Out montane species found in the state are the sandhill crane, the lesser sandhill, trumpeter swan, whooping crane, the sage-hen. The turkey-lizard is found mainly in the plains. Various hawks and owls are common; the golden eagle nests on the mountain crags and the burrowing owl on the plains. The red-naped sapsucker is found in the mountains. Lewis's woodpecker; the Nuttall's willow-say, Tell's phoebe, the desert horned lark, Bullock's oriole, the yellow-headed blackbird and McCown's longspur are characteristic of the open lowlands.

The nearest great group of mountains is limited to the western ranges, the most important being in the Black Hills region in the N.E., on the lower slopes of the Bighorn Mountains, and in the Rocky Mountain ranges of the N.W. of the state, including Yellowstone National Park. The yellow pine is the most common, and in the Bighorns, and small lodge-pole pine makes up the greater
part of the N.W. forests. White fir is found above the foot hill zone, and heavy growths of cottonwood along the streams in the Bighorn region. The Douglas species and some others (not mountain white) are the only trees on the plains. The common sage brush, artemisia, is the characteristic shrub of the plains where the soil is comparatively free from alkali, and is abundant in the valleys of the arid foothills. Western white pines and a few other species are found, with grease wood and species of tribes, including the so-called white sage. Grease wood is likewise abundant in the foothills wherever the soil is not too deep and in the nutritious grasses of many of the plains and foothills, and even clothes the apparently barren mountain peaks.

Climate.—In the lower Bighorn Valley, summer temperatures rise to an average of 87°, but in the higher ranges, summer temperatures seldom rise above 90°, and frosts may occur at any time. Elevations under 6000 ft. have a mean annual temperature of from 40° to 47°, but high mountain areas and cold valleys may have mean temperatures as low as 34°. The air is clear and dry, and although temperatures of 100° are recorded, sunstrokes are practically unknown. Winter temperatures as low as -41° have been recorded, but these very low temperatures occur in the valleys rather than on the higher elevations. The cold is sharp and bracing rather than disagreeable, on account of the dryness of the air; and the periods of cold weather are generally of short duration. The average air temperatures, July, 63°; January, 16°; the summer mean 72°. Thayne, on the mountainous W. border of the state, has a winter mean of 15°, and a summer mean of but 55°; Cheyenne, in the S.E., has a winter mean of 27°, and a summer mean of 85°. The percentage of sunshine in the state is high. Precipitation varies in different areas from 8 to 20 in., the average for the state being 12.5 in. Wyoming thus belongs with the arid states, and irrigation is necessary for agriculture. A greater precipitation doubtless prevails on the higher mountains, but record keeping is rather unreliable. Spring is the wettest season. The prevailing winds are W. and reach a height on the level plains.

Soil.—While some of the more arid districts have soils so strongly alkaline as to be practically unproductive, there are extensive areas of fertile lands which only require irrigation to make them highly productive. Alluvial deposits brought down by mountain streams, and strips of floodplain along larger streams on the plains are very fertile and well repay irrigation. Lack of water rather than poverty of soil renders most of the plains region fit for grazing only. In the mountains, ruggedness combines with thin and scattered soil to make these districts of small agricultural value.

Agriculture.—The total area in farms in 1880 was 121,433 acres, of which 113,758 acres (94.2 per cent.) were improved, and 12,675 acres, of which 792,332 acres (6.5 per cent.) were improved. The large increase in unimproved acreage in farms was principally due to the increased importance in sheep-raising. In 1880 Wyoming ranked from number one to number three in the number of sheep, and in wool. The number of sheep in 1880 was 7,416,000, valued at $32,190,000, being more than one-eighth in numbers and nearly one-half in value of the sheep in the entire Union. In 1890 the number of sheep in the state was 12,433,000, valued at $48,410,000; in 1891, 12,675,000, valued at $52,710,000; in 1892, 12,675,000, valued at $53,715,000. The sheep in Wyoming are usually of low grade, but high-quality sheep are occasionally imported. In 1891 the wool in Wyoming was valued at $49,210,000, and in 1892 at $49,710,000. The average weight per fleece was 6 lb. The Bureau of Animal Industry of the U.S. Department of Agriculture gave the following statistics of the number of sheep in the state:

The number of cattle on farms and ranges in 1910 was 986,000 (including 27,000 milch cows) valued at $26,277,000; horses, 14,000; valued at $12,284,000, mules, 2000, valued at $1,120,000; and swine, 21,000, valued at $178,000.

In 1909 the hay crop (alfalfa, native hay, timothy hay, &c.) was valued at $5,918,000, and the crop of all other crops at $1,564,000, making a total crop of $7,482,000. The value of all crop produce in 1910 was $12,111,000, valued at $9,715,000.

Cattle and hogs.—The number of cattle in Wyoming in 1900 was 83,700, valued at $2,274,000; in 1910, 120,000, valued at $3,095,000. The number of hogs in 1900 was 7,000, valued at $75,000; in 1910, 8,000, valued at $90,000. The value of all beef cattle increased from 1,800,000 in 1879 to 12,111,000 in 1900, and the value of hogs increased from 75,000 in 1879 to 975,000 in 1900.

The total number of cattle and hogs on farms and ranges in Wyoming in 1910 was 1,014,000, valued at $12,111,000, and the number of sheep in the state was 1,050,000, valued at $52,710,000.

The Department of Agriculture of Wyoming's naturally rich mineral resources has been retarded by inadequate transport and by insufficient capital. The value of the state's mineral product was $5,654,286 in 1902 and $9,453,341 in 1908. In 1908 Wyoming ranked first in coal in the Union. The estimated production of sodium carbonate from the Soda Springs mine, located near the mouth of the Bighorn River, was 4,248,050,000 short tons of the bituminous or sub-bituminous variety, this amount being second only to that for North Dakota, 500,000,000,000 short tons, which, however, is entirely lignite. Coal was mined in all the counties of the state, and the largest amount of coal, 1,680,933 tons came from Sweetwater county, in the S.W. of the state, and Uinta county (adjoining Sweetwater) in the north-central part of the state. Carbon county, in the south-central part and Weston county in the N.E. were the next largest producers. The product of coal to the end of 1908 was 1,156,000,000 short tons, valued at $39,000,000.

The mining product next in value to coal in 1908 was copper, taken chiefly in Carbon county in a zone of brecciated quartzite underlying schist, the original ore being chalcopyrite, with possibly some pyrite, a secondary enrichment, which has produced important bodies of chalcolite in the upper workings, but these are replaced by chalcopyrite at greater depth. The production in 1908 was 2,416,197 lb., valued at $178,938. The gypsum product (from the Laramie plains) in 1908 was 31,188,000 tons, valued at $94,095.

There are extensive deposits of petroleum and natural gas, which have become of commercial importance. Oil has been found in eight counties, although only in Carbon county does it make much difference. Carter, Hilliard, Spring Valley and Twin Creek in Uinta county; the popo Agie, Lander, Shoshone, Beaver and a part of Dutton in Carbon county; the northern part of the county of Laramie and Lander fields produce the largest quantities of oil, the wells being partly gasers from which a heavy fuel oil is obtained. This is now being used by the Chicago & Northern Western Railroad Company on its lines; and it is also used in Omaha (Nebraska) by manufacturing establishments. There is a great variety in the grades of oils produced in the state, ranging from the heavy asphaltic oils of the Laramie field to the light oils of the Carbon and Lander fields.

The discovery of natural gas in the Douglas oil field has opened new and important new possibilities. The establishment of this cheap and convenient fuel the distance to be covered by a pipe line is not prohibitive, and the matter has been under consideration by the owners and lesses of the iron mines.

There are sandstone deposits in Carbon county, which supplied the stone for the Capitol at Cheyenne and the state penitentiary; and from the Iron mountain quarries in Laramie county was taken the white variety used in building the Carnegie library and the Federal building in Cheyenne. Sandstones and quartzites were also quarried in 1902 in Albany, Crook and Uinta counties. Limestone occurs in thick formations near Lava Creek, and in the valley of the East Fork of Wind River. The principal limestone deposits are in the central range, and in the Wind River range. Gold was discovered on the Sweetwater river in 1867, and placer and quartz deposits have been found in almost every county in the state. Sulphur has been found near Thermopolis, and valued at $50,000.

Irrigation.—The irrigable area of Wyoming is estimated at about 6,200,000 acres, lying chiefly in Bighorn, Sheridan and Johnson counties. In 1899 the Bureau of Reclamation reported that irrigable lands in these counties in the S.E., though there are large tracts around the headwaters of the Bighorn river, in Fremont county in the west-central part, along the Platte river and its tributaries in Converse and Platte counties, in Sheridan county in the south-central part, and in the Powder river, in the north-central part, and in the Billings and Branch River in Laramie county, were not being reclaimed, and in that year about 800,000 acres were in process of reclamation, mostly by private companies. Settlers intending to occupy such lands must satisfy the state that they have entered into contracts with the irrigating company for a sufficient water-right.

1 The breed of horses in Wyoming has improved rapidly; in 1904, when the U.S. Department of Agriculture purchased eighteen mares and a stallion in hope of improving the American carriage horse, six of the mares were from Wyoming and were principally of Morgan stock.
and a perpetual interest in the irrigation works. The principal underground reservoir of the general government is the Shoshone project in Bighorn county. This provides for a storage reservoir, controlled by Shoshone dam on Shoshone river, about 8 m. above Cody; a canal diverting the water into the reservoir; a dam on Shoshone river and covering lands in the vicinity of Cody, Corbett, Eagle Nest and Ralston; a dam at Corbett about 16 m. below the reservoir diverting water to Ralston reservoir and thence to lands in the Big Horn and Shoshone river valleys. Canal from Bighorn river and hewn 11 m. below Shoshone dam and covering lands in the vicinity of Cody, Corbett, Eagle Nest and Ralston; a dam on the Colorado river near Eagle Nest diverting water into a canal covering the lands of the Shoshone River Valley. This project was authorized in 1904; it will affect, when completed, 131,000 acres and 1,300,000 acres will be actually under irrigation. Near Douglas, in Converse county, there is a reinforced concrete dam, impounding the waters of Larphee Creek, to furnish water for the city of Douglas and for irrigating the existing and future irrigated lands. There are large irrigated areas in Johnson and Sheridan counties. 

Forests.—The woodland area of Wyoming in 1900 was estimated at 12,500 sq. m. (13% of the area of the state), of which the United States had reserved about 3,500 sq. m. in the Yellowstone National Park and 5,500 sq. m. chiefly in the Bighorn Mountains in the N. and the Medicine Bow Mountains in the S.E. of the state. The salable timber consists almost entirely of yellow pine, though there is a relatively small growth of other conifers and of hard-wood trees. 

Manufactures.—Wyoming's manufacturing industries are relatively unimportant. In the period 1900–1905 the value of factory products increased from $1,332,288 to $1,655,558; the total value of capital invested, from $1,047,882 to $2,065,880, and the number of establishments from 139 to 160; the average number of employees decreased from 2,660 to 1,834. In the same period (1900–1905), the value of the agricultural products increased from $1,332,288 to $1,655,558, and the amount of capital invested increased from $871,531 to $968,615; but the value of the products of rural establishments decreased from $1,936,267 to $2,975,037, and the capital invested from $1,176,794 to $2,433,874. 

The principal products of the principal industries in the state are: 

- Cheese and general shop construction and repairs by steam railway companies, $1,661; lumber and timber products, $469,433; flour and gist mill products, $283,653; butter, $144,354. 
- Other manufactures are gypsum wall-plaster, saddlery and harness, malt liquors and tobacco, cigars and cigarettes. 

Transportation.—Transportation is relatively important in the development of transport facilities in Wyoming. The railway mileage, which was only 459 m. in 1870, increased to 1,022 m. in 1890, 1,250 m. in 1905, and 1,623 m. on January 1, 1910. The Union Pacific railroad, which crosses the S. of the state, connects with the Oregon Short Line at Green river and extends both E. and W. from Cheyenne. The Colorado & Southern (controlled by the Chicago, Burlington & Quincy Railroad Company) extends N. from Cheyenne to Orin Junction, where it connects with the Chicago & North Western, which runs across the south-central part of the state as far as Lander (under the name of the Wyoming & North Western railroad). Four branches of the same railroad cross the state, and one extends westward to Green river. One extends from Cheyenne S.E. to Holdredge, Nebraska; the main line crosses the N.E. of the state to Billings, Montana, whence it extends to the Kanab River in Arizona. The administration of the railroad is divided into three divisions, with headquarters at Cheyenne, Laramie, and Denver. A line completed to Orin Junction will be a main through route from the Mexican Gulf to the N.W. Pacific coast. There are also several shorter railways in the state, and various stage lines reach the more inaccessible regions.

Population.—The population in 1870 was 918; in 1880, 20,789; in 1890, 60,705; in 1900, 85,531; in 1910, 145,065. 

The density of the population was 0.6 per sq. m. in 1890 and 1.5 per sq. m. in 1910, there being in this year only one state with a smaller average number of inhabitants to the sq. m., namely Nevada, with 0.7. Of the total population in 1900, 88,051, or 66.2% were whites; 16,866 were Indians; 9,460 were negroes; 461 were Chinese and 303 were Japanese. The Indians are all taxed. They belong to the Arapaho and Shoshone. 

The Wind River Reservation, under the Shoshoni School, is in the central part of the state. There were 17,415 foreign-born in the state in 1900, of whom 2,566 were English, 2,146 Germans, 1,277 Swedes, 1,501 Irish, 1,253 Scotch and 1,220 Finns. Of the 41,993 persons of foreign parentage (i.e. having either or both parents of foreign birth) in that year 40,732 were of English, 4,571 of German, and 4,462 of Irish parentage, i.e. on both the father's and the mother's side. Of the 75,116 born in the United States, 74,072 were foreign-born (i.e. Cheyenne and Laramie) having a population in 1900 of more than 8,000.

1 The Report of the Commissioner of Indian Affairs for 1900 gives 854 Arapaho and 816 Shoshoni under the Shoshoni School. 

19,507 were natives of Wyoming, 6112 were born in Iowa, 5000 in Nebraska, 4923 in Illinois, 4413 in Missouri and 3750 in Utah. Among the numbers of religious denominations in the state, the Roman Catholics, with 12,264 communicants, had the largest membership, followed by the Latter-day Saints, or Mormons, with 2511 communicants (21.8% of the total church membership for the state), the Protestant Episcopalians with 1741, the Methodists with 1621 and the Presbyterians with 984. The urban population (i.e. the population of places having 4000 inhabitants or more) increased from 18,078 in 1890 to 26,657 in 1900 or 47.5% the urban being 28.8% of the total population in 1900. The semi-urban population (i.e. population of incorporated places, or the approximate equivalent, having fewer than 4000 inhabitants, but governed by a council, with or without a mayor, or a board of commissioners) increased from 12,725, and the rural population (i.e. the population outside of incorporated places) increased from 26,576 to 53,149, which was 78.7% of the total increase. The principal cities of the state (with population) in 1900 were: Cheyenne, 14,087; Laramie, 8207; Rock Springs, 4363; Rawlins, 2317, and Evanston, 2110. After 1900 the population of the centre and N. of the state increased in proportion faster than the older settled portions in the S. In 1910, in Sheridan county, Douglas in Converse county and Lander in Fremont county were as important as those of the central part of the state. 

Government.—Wyoming is governed under its first constitution, which was adopted in November 1889. An amendment may be proposed by either branch of the legislature. If it is approved by two-thirds of the members of each branch, it must be submitted to the people at the next general election and, if approved by a majority of the electors, it then becomes a part of the constitution. Whenever two-thirds of the members elected to each branch of the legislature vote for a convention to revise or amend the constitution and a majority of the people voting in the general election favour it, the legislature must provide for calling and holding a convention. Suffrage is for the pollen of citizens, and the right to vote at a general election is given to all citizens of the United States who have attained the age of twenty-one years, are able to read the constitution, and have resided in the state one year and in the county sixty days immediately preceding, with the exception of idiots, insane persons, and persons convicted of an infamous crime; at a school election the voter must also own property on which taxes are paid. General elections are held biennially, in even-numbered years, the first Tuesday after the first Monday in November, and the election administration begins the first Monday in the following January. 

Executive.—The governor is elected for a term of four years. He must be at least thirty years of age, and have resided in the state for five years next preceding his election. If the office becomes vacant there shall be elected to fill the unexpired term a governor from the state legislature. The governor, with the concurrence of the Senate, appoints the attorney-general, the state engineer and the members of several boards and commissions. He has the power to veto bills, to remit, to grant reprieves and commutations, and to remit fines and forfeitures, but the Board of Charities and Reform constitutes a Board of Pardons for investigating all applications for executive clemency and advising the governor with respect to them. The secretary of state, auditor, treasurer and superintendent of public instruction are elected for the same term as the governor. 

Legislature.—The legislature consists of a Senate and a House of Representatives. This is a bicameral legislature, with two representatives of each county in the Senate, and one or more representatives of each of the larger counties in the House of Representatives. The members are elected for two years; but both senators and representatives are apportioned among the several counties according to their population; each county, however, is entitled to at least one senator and one representative. The legislature meets biennially, in odd-numbered years, on the second Tuesday in January. It is noteworthy that the constitution provides for reapportioning the number of representatives of each county, and provides that for the purpose of apportioning the state to each house is required to override his veto. 

Judiciary.—The administration of justice is vested principally in a supreme court, district courts, justices of the peace and municipal courts. The supreme court consists of three justices who are elected by the state at large for a term of eight years, and the one having the shortest term to serve is chief justice. The court has original
jurisdiction in quo warranto and mandamus proceedings against state officers and in habeas corpus cases, general appellate jurisdiction, and a superintending control over the inferior courts. It holds two terms annually, at the capital, one beginning the first Monday in April and one on the first Monday in November, by the orders of its president, the four judicial districts, and in each of these a district judge is elected for a term of eight years. The district courts have original jurisdiction in all actions and matters not expressly vested in some other court or courts, and they shall have, in the counties where they are held, the power to determine in the common pleas. Justices of the peace, one of whom is elected bennially in each precinct, have jurisdiction in civil actions in which the amount in controversy does not exceed $500, and in all criminal actions and proceedings not punishable with death or imprisonment in the county. The tenor of which the punishment prescribed by law does not exceed a fine of $100 and imprisonment for six months. Each incorporated city or town is a municipal court for the trial of offences arising under its ordinances.

Local Government.—A board of three commissioners is elected in each county, one for four years and one for two years at each biennial election, who constitute the county board, and are responsible to the people for the management of the public business, builds and repairs the county buildings, apportions and orders the levying of taxes, and establishes the election precincts. The other county officers are a treasurer, a clerk, an attorney, a surveyor, a sheriff, a coroner and a superintendent of schools, each elected for a term of two years. A justice of the peace and a constable are elected for and by each precinct. Cities and towns are incorporated under special laws.

Miscellaneous Laws.—A married woman may hold, acquire, manage and convey property and carry on business independently of her husband. When a wife or a wife dies intestate one-half of the personal property is devised to the survivor, as well as to the children or the descendants of any child three-fourths of it goes to the survivor; if there are no children or descendants of any child there is a third of it to the survivor and the wife; $100 to each of the children or descendants of the three. The causes for a divorce are adultery, incompetency, conviction of a felony and sentence to imprisonment therefor after marriage, conviction of a felony or infamous crime before marriage, prior marriage and inability to live together before marriage. The husband and wife live without his knowledge. The plaintiff must reside in the state for one year immediately preceding his or her application for a divorce unless the parties were married in the state and the applicant has resided there since the marriage. Neither party is permitted to marry a third party until one year after the divorce has been granted. The desertion of a wife or of children under fifteen years of age is a felony punishable with imprisonment for not more than three years or less than one year. The homestead of a homestead holder who is the head of a family or of any resident of the state who has attained the age of sixty years is exempt, to the value of $1,000, or the amount of any judgment, execution or attachment, made or confessed by his own or any other person for any debt, contract or civil obligation other than taxes, purchase money or improvements, so long as it is occupied by the owner or his or her family, and the exemption inures for the benefit of a widow without children for life. If the homestead is sold, the homestead holder may be allowed the net proceeds sold, and the homestead holder remitted to the county treasurer, to be held by him as a trust fund for the education of a minor child of the homestead holder. It may be used for the reduction of taxes, and in cases of emergency where life or property is in imminent danger. The sale of intoxicating liquors is licensed only in incorporated cities and towns.

Charities and Corrections.—The state charitable and penal institutions consist of the Wyoming General Hospital at Rock Springs, with one branch at Sheridan and another branch at Casper; the Big Horn Hot Springs at Thermopolis, the Wyoming State Hospital for the Insane at Evanston, the Wyoming Home for the Feeble-Minded and Epileptic at Laramie, Wyoming Home for the Blind and the State Penitentiary at Rawlins. The general supervision and control of all these institutions is vested in the Board of Charities and Reform, consisting of the governor, the secretary of state, the treasurer, the auditor, and the superintendent of public instruction; the same officers also constitute the Board of Parcels. Convicts other than those for life are sentenced to the penitentiary for a maximum and a minimum term, and when one has served one-half of the term prescribed by the governor, he may, by rules published by the board of parole officers, shall be permitted to parole, he may be returned to prison at any time upon the request of the Board of Parcels. The Board of Charities and Reform is the state board of superintendents of public instruction, county superintendents and district boards. Whenever 100 freeholders request it, the county commissioners must submit to the voters of a precinct a proposition for the establishment of a public school district, and each precinct giving a majority vote for it constitutes a part of such a district for establishing and maintaining a high school. All children between seven and fourteen years of age must attend a public, private or parochial school during the entire time that the public school of their district is in session unless excused by the district board. The common schools are maintained with the proceeds of school taxes and an annual income from school funds which are derived principally from lands. At the head of the educational system is the University of Wyoming (1886), at Laramie (q.v.); it is governed by a board of twelve members, nine of whom are the superintendent of public instruction, and nine other members appointed by the governor with the concurrence of the Senate for a term of six years. It is maintained with the proceeds from funds that consist of $200 for each quarter section of state land, $200 per year for each one-half mile of street in the city of Laramie, $500 for each one-half mile of street in the city of Rawlins, and a small endowment from the United States. The college, together with a university tax amounting in 1910 to one-half mill on a dollar.

Finance.—The principal sources of revenue are a general property tax appropriation by the state for the support of schools, a tax on the gross products of mines, an inheritance tax, a poll tax and a tax on liquor licences. Railways, telegraph lines and mines are assessed by the state board of equalization, which consists of the secretary of state, the treasurer, the auditor. Other property is assessed by the county assessors. The county commissioners constitute the county board of equalization. A commissioner of taxation who is appointed by the governor with the concurrence of the Senate for a term of four years exercises a general supervision over all tax officers and the boards of equalization. By a law enacted in 1899 county commissioners are forbidden to levy a tax which will yield more than $500,000 annually, whereas the constitution limits the state tax for other than the support of educational and charitable institutions and the payment of the state debt to not more than four mills on the dollar; the county tax for supervision of the schools, the maintenance of the jails, is not to exceed four mills on the dollar. The interest on the county debt is not to exceed two mills on the dollar; the tax of an incorporated city or town for other than the payment of its debt and the interest thereon to eight mills on the dollar. The constitution also forbids the taxation of public buildings, real and personal property, for the support of the public schools, for the support of the county debt, the taxable property in the state; of a county debt in excess of 2% of the assessed value of the taxable property in the county; or of a municipal corporation, under a warrant for the support of taxes, in excess of 2% unless for building sewerage, when a debt of 4% may be authorized. Wyoming entered the Union with a bonded indebtedness of $200,000. This has been reduced as rapidly as the funds permit, and on the 50th of June 1910 the debt was only $140,000.

History.—Spanish historians have claimed that adventurers from the Spanish settlements in the S. penetrated almost to the Missouri river during the first half of the 17th century and even formed settlements within the present limits of Wyoming, but these stories are more than doubtful. The first white men certainly known to have traversed the region were Sieur de la Verendrye and his sons, who working down from Canada spent a part of the year 1743-1744 in examining the possibilities of the fur trade. Apparently no further French explorations were made from that direction, and the transfer of Canada from France to Great Britain (1763) was followed by lessened interest in exploration. The expedition of Meriwether Lewis and William Clark in 1804-1806 did not touch the region, but a discharged member of the party, John Colter, in 1807 discovered the Yellowstone Park region and then crossed the Rocky Mountains to the head of Green river. Trappers began to cover the N. portion about the same time, and in 1817 the overland party of the Pacific Fur Company crossed the country on their way to Astoria. In 1824 William H. Ashley with a considerable party explored and trapped in the Sweetwater and Green river valleys, and in 1836 wagons were driven from St Louis to Wind river for the Rocky Mountain Fur Company. Captain B. L. E. Bonneville was the first to cross the Rockies with wagons (1832), and two years later Fort Laramie, near the mouth of the Laramie river, was established to control the fur trade of the Arapahoes, Cheyennes and Sioux. The United States exploring expedition, commanded by John Charles Frémont, explored the Wind River Mountains and the South Pass in 1842, under the guidance of Kit Carson. From this time the favourite route to the Pacific led through Wyoming; but of all the thousands who passed few or none settled permanently within the present limits of the state, partly because of the aridity of the land and partly because of the pronounced hostility of the Indians. For the latter reason the National Congress on the 19th of May 1846 authorized the construction at intervals along the trail of military stations for the protection of the emigrant trains, and Fort Kearny was built (1848), and Fort Laramie was purchased (1849). The great

1 See Washington Irving, "Adventures of Captain Bonneville" (New York, 1860).
2 See Francis Parkman, "The Oregon Trail" (Boston, 1849).
Mormon migration passed along the trail in 1847-1849, and in 1853 fifty-five Mormons settled on Green river at the trading post of James Bridger, which they purchased and named Fort Supply. This S.W. corner of the present state was at that time a part of Utah. With the approach of United States troops under Albert Sidney Johnston in 1857, Fort Supply was abandoned, and in the next year the Mormon settlers retired to Salt Lake City, again leaving the region almost without permanent inhabitants.

The following year Fort Laramie was abandoned, and during the winters of 1856-1857, 1857-1858 and 1858-1859, many whites, through their hunting grounds and became increasingly unfriendly. By a treaty negotiated at Fort Laramie in 1851, the Arapahoes, Sioux, Cheyennes and others agreed to confine themselves within the territory bounded by 109° and 107° W. longitude and 39° and 44° N. latitude; but, besides minor conflicts, a considerable portion of the garrison of Fort Laramie was killed in 1854 and there was trouble for more than twenty years. During the Civil War (1861-1865) the Indians were especially bold as they realized that the Federal troops were needed elsewhere. Meanwhile, there began a considerable emigration to Montana, and the protection of the N. of the trail demanded the construction of posts, of which the most important were Fort Reno, on the Powder river, and Fort Phil Kearny in the Bighorn Mountains. In spite of the treaty allowing the opening of the road, during a period of six months fifty-one hostile demonstrations were made, and on the 21st of December 1866 Captain W. J. Fetterman and seventy-eight men from Fort Phil Kearny were ambushed and slain. Hostilities continued in 1867, but the troops were harried on account of the scarcity of cavalry. Congress in 1868, after a long conflict, paid $400,000 to the warriors. In 1868 (29th April, at Fort Laramie) were any terms agreed upon. The posts on the Montana trail were abandoned, and the Indians agreed to remove farther E. and to cease attacking trains, not to oppose railway construction, etc. The territory N. of the Platte river and E. of the Bighorn Mountains was to be reserved as an Indian hunting ground and no white men were to settle on it without the consent of the Indians. Gold was discovered on the Sweetwater river in 1867, and a large influx of population followed. This unorganized territory E. of the Rocky Mountains was a part of Dakota, and in January 1869 Carter (later Sweetwater) county was erected.

Farther E. Cheyenne was laid out by the Union Pacific Railroad (July 1867), a city government was established in August, newspapers began publication, and Laramie county was organized before the arrival of the first railway train on the 13th of November 1867. About six thousand persons spent the winter in Cheyenne, and disorder was checked only by the organization of a vigilance committee. Almost the same scenes followed the laying off of Laramie in April 1868, when 400 lots were sold during the first week and 300 habitations were erected within a fortnight. Albany and Carbon counties were organized farther W. in the same year.

A bill to organize the Territory of Wyoming had been introduced into Congress in 1865, and in 1867 the voters of Laramie county had chosen a delegate to Congress. He was not permitted to take a seat, but his presence in Washington hastened action, and on the 25th of July 1868 the act of Congress establishing a Territory with the present boundaries was approved by President Andrew Johnson. The portion of the Territory E. of the Rocky Mountains was taken from Dakota and that W. from Utah and Idaho, and included parts of the three great additions to the original territory of the United States. That portion E. of the mountains was a part of the Louisiana Purchase (1803), the W. portion above 42° was a part of the Oregon country, and that S. of that parallel came by the Mexican cession of 1848. The first governor, John A. Campbell, was appointed in April 1869, and the organization of the Territory was completed in May of the same year. At the first election, on the 2nd of September 1869, 5,366 votes were cast. The legislature established the seat of government at Cheyenne, and granted full suffrage and the right of holding public office. The first great influx of population, following the discovery of gold and the opening of the railway, brought many desperate characters, who were held in check only by the stern, swift measures of frontier justice. After the organization of the Territory, except for the appearance of organized bands of highwaymen in 1877-1879, there was little turbulence, in marked contrast with conditions in some of the neighboring Territories. Agriculture began in the narrow but fertile river valleys, and stock-raising became an important industry, as the native grasses are especially nutritious. The history of the Territory was marked by few striking events other than Indian troubles. The N.E. of the Territory, as has already said, had been set apart (1868) as a hunting ground for the Sioux Indians, but the rumour of the discovery of gold in the Black Hills and the Bighorn Mountains in 1874-1875 caused a rush to the region which the military seemed powerless to prevent. The resentful Indians resorted to war. After a long and arduous contest in Wyoming, Montana and Dakota, which lasted from 1874 to 1879, and during which General George A. Custer (g.v.) and his command were killed in 1876 on the Little Bighorn in Montana, the Indians were thoroughly subdued and confined in the future of this region. The settlers in Wyoming shared the general antipathy to the Chinese, common to the western country. On the 2nd of September 1885 the miners at Rock Springs attacked about 400 Chiricahuans who had been brought by the railway to work in the mines, killing about fifty of them and driving the remainder from the district. Governor Warren summoned Federal troops and prevented further destruction of life and property.

The Territory increased in population and more rapidly in wealth, owing chiefly to the large profits in cattle raising, though the cattle suffered severely during the severe winter of 1886-1887, when nearly three-fourths of the range cattle died of exposure. Agitation for statehood increased, and on the 29th of September 1889 a constitution was formed which was adopted by the people in November of the same year. The Constitution, which continued the Territorial provision of full suffrage for women, met the approval of Congress, and on the 10th of July 1890 Wyoming was formally admitted as a state. Since admission the progress of the state has been steady. Extensive irrigation projects have made available many thousand acres of fertile land, and much more will be subjected to cultivation in the future. The ranges are being opened up by settlers, and in some sections a system of dry-farming, by which the scanty rainfall is protected from evaporation by deep ploughing and mulching the soil, has proved profitable.

The transition of the principal stock-raising industry from large herds of cattle to small, and the utilization of the ranges for sheep grazing almost exclusively covered a period of over twenty years preceding 1910, during which time many conflicts occurred between range cattle-owners and sheep flockmasters over the use of the grazing grounds. The settlers also, who selected his hotel and were covered by a sheep pen, felt that a race was much more profitable and better able to stand the cold on the open range.
While many cattlemen have been driven out of business by the encroachments of sheep, the majority of the present flockmasters were range cattle owners in the past and have changed to the more profitable occupation. At the present time serious collisions between sheep and cattle owners are rare. There are still many cattle in the state, but they are divided up into small herds, no longer depending on the open range for a precarious subsistence during the winter, but are sheltered and fed during the winter in their own enclosures. The breeds of cattle are far superior now to the old range stock, so that it pays to take care of them; many thousands are fed during the winter on alfalfa hay.

**Wyoming Valley**, a valley on the N. branch of the Susquehanna river, in Luzerne county, Pennsylvania, U.S.A. Its name is a corruption of a Delaware Indian word meaning "large plains." The valley, properly speaking, is about 33 m. wide and about 25 m. long, but the term is sometimes used historically in a broader sense to include all of the territory in the N.E. of the state once in dispute between Pennsylvania and Connecticut. In Connecticut the Susquehanna Land Company was formed in 1753 to colonize the valley, and the Delaware Land Company was formed in 1754 for the region immediately W. of the Delaware river. The rights of the Six Nations to all this territory were purchased at Albany, New York, by the Susquehanna Company in 1754, but the work of colonization was delayed for a time by the Seven Years' War. A few colonists sent out by the Susquehanna Company settled at Mill Creek near the present site of Wilkes-Barre in 1763, but were (October 15th) attacked and driven away by the Indians. In December 1768 the company divided a part of the valley into five townships of 5 sq. m. each, granting to forty proprietors the choice of one of these on condition that they should take possession of it by the 1st of February 1769, and the other four townships to 200 settlers on condition that they should follow by the 1st of May. The first group arrived on October 12th, the second on November 5th, the land being in possession by the 14th of May, and the five original towns of Wilkes-Barre (q.v.), Kingston (q.v.), Hanover, Plymouth and Pittston were soon founded.

In the meantime the Six Nations (in 1768) had repudiated their sale of the region to the Susquehanna Company and had sold it to the Penns; the Penns had erected here the mansions of Stoke and Sunbury, the government of Pennsylvania had commissioned Charles Stewart, Amos Ogden and others to lay out these townships, and they had arrived and taken possession of the block-house and huts at Mill Creek in January 1769. This conflict which followed between the Pennsylvania and the Connecticut settlers is known as the first Pennamite-Yankee War. Although defeated in the early stages of the conflict, the Yankees or Connecticut settlers finally rallied in August 1771 and compelled the Pennsylvanians to retreat, and the war terminated with the defeat of Colonel William Plunket (1720-1791) and about 700 Pennsylvanians by a force of 300 Yankees under Colonel Zebulon Butler (1721-1795) in the battle of "Rampart Rocks" on the 25th of December 1772. The General Assembly of Pennsylvania, in January 1774, ordered the township of Westmoreland and attached it to Litchfield county, and in October 1776 the same body erected it into Westmoreland county. On the 3rd of July 1778, while a considerable number of the able-bodied men were absent in the Connecticut service, a motley force of about 400 men and boys under Colonel Zebulon Butler were attacked and defeated near Kingston in the "battle of Wyoming" by about 1100 British, Provincial (Tory) and Indian troops under Major John Butler, and nearly three-fourths were killed or taken prisoners and subsequently massacred. Thomas Campbell's poem, *Gertrude of Wyoming* (1800), is based on this episode, various liberties being taken with the facts. As the War of Independence came to a close the old trouble with Pennsylvania was revived. A court of arbitration appointed by the Continental Congress met at Trenton, New Jersey, in 1782, and on December 30th gave a unanimous decision in favour of Pennsylvania. The refusal of the Pennsylvania government to confirm the private land titles of the settlers, and the arbitrary conduct of a certain Alexander Patterson whom they sent up to take charge of affairs, resulted in 1784 in the outbreak of the second Pennamite-Yankee War. The Yankees were dispossessed, but they took up arms and the government of Pennsylvania despatched General John Armstrong with a force of 400 men to aid Patterson. Armstrong induced both parties to give up their arms with a promise of impartial justice and protection, and as soon as the Yankees were defenceless he made them prisoners. This treachery and the harsh treatment by Patterson created a strong public opinion in favour of the Yankees, and the government was compelled to adopt a milder policy. Patterson was withdrawn, the disputed territory was assigned to the crown of Great Britain, and the land titles were confirmed (1787), and Colonel Timothy Pickering (q.v.) was commissioned to organize the new county and to effect a reconciliation. But a few of the settlers under the lead of Colonel John Franklin (1749-1831) attempted to form a separate state government. Franklin was seized and imprisoned, under a warrant from the State Supreme Court. As Pickering was held responsible for Franklin's imprisonment, some of Franklin's followers in retaliation kidnapped Pickering and carrying him into the woods, tried in vain for nearly three weeks to get him to promise to intercede for Franklin's pardon. The trouble was again revived by the repeal in 1790 of the confirming act

1 In place of De Forest Richards, deposed.
2 Several Scotch-Irish families from Lancaster county, Pennsylvania, accepted Connecticut titles and settled at Hanover under Captain Lazarus Stewart.
of 1787 and by a subsequent decision of the United States Circuit Court, unfavourable to the Yankees, in the case of Van Horn versus Dorrance. All of the claims were finally confirmed, by a series of statutes passed in 1799, 1802 and 1807. Since 1808, mainly through the development of its coal mines (see Pittston, L. A.), the valley has made remarkable progress both in wealth and in population.

For a thorough study of the early history of Wyoming Valley see O. J. Harvey, A History of Wilkes-Barré (3 vols., Wilkes-Barré, 1909-1910); see also H. M. Hoyt, Brief of a Title in the Seventeen Townships in the County of Luzerne (Harrisburg, 1879).

WYON, THOMAS (1792-1817), English medallist, was born at Birmingham. He was apprenticed to his father, the chief engraver of the king's seals, and studied in the schools of the Royal Academy, London, where he gained silver medals in both the antique and the life class; he also obtained a gold medal from the Society of Arts. He was appointed professional engraver to the mint in 1811, and soon after engraved his medal commemorative of the peace, and his Manchester Pitt medal. In 1815 he was appointed chief engraver to the mint. His younger brother, Benjamin Wyon (1802-1858), his nephews, Joseph Shepherd Wyon (1836-1873) and Alfred Benjamin Wyon (1837-1884), and his cousin, William Wyon (1795-1851), were also distinguished medallists.

WYSE, SIR THOMAS (1797-1862), Irish politician, belonged to a distinguished family. He was apprenticed at the age of fourteen to the University of Marburg, and passed through a four years' course there. His parents intended that he should become a Lutheran pastor. The first two years were given up to general education, principally to mathematics, 'philology,' philosophy and history. The professor of mathematics, Spangenberg, acquired great influence over young Wytenbach. He is said to have taught his subject with great clearness, and with equal seriousness and piety, often referring to God as the supreme mathematician, who had constructed all things by number, measure and weight. "Philology" in the German universities of that age meant Hebrew and Greek. These two languages were generally handled by the same professor, and were taught almost solely to theological students. Wytenbach's university course at Marburg was troubled about the middle of the time by mental unrest, due to the fascination exercised over him by Bunyan's Pilgrim's Progress. The disorder was cured by Spangenberg. The principal study of the third year was metaphysics, which took Wytenbach entirely captive. The fourth and last year was to be devoted to theology and Christian dogma. Wytenbach had hitherto submitted passively to his father's wishes concerning his career, in the hope that some unexpected occurrence might set him free. But he now turned away from theological lectures, and privately devoted his time to the task of deepening and extending his knowledge of Greek literature. He possessed at the time, as he tells us, no more acquaintance with Greek than his own pupils at a later time could acquire from him during four months' study. He was almost entirely without equipment beyond the bare texts of the authors. But Wytenbach was undaunted, and four years' persistent study gave him a knowledge of Greek such as few Germans of that time possessed. His love for philosophy carried him towards the Greek philosophers, especially Plato. During this period Ruhnken's notes on the Platonic lexicon of Timaeus fell into his hands. Ruhnken was for him almost a superhuman being, whom he worshipped day and night, and with whom he imagined himself as holding converse in the spirit. When Wytenbach had acquired sufficient knowledge to make himself useful in the city of Waterford, he set forth on a tour of the universities of the country. At Oxford he received a fellowship and entered as a student at Balliol College.

Wytenbach, Daniel Albert (1746-1820), German-Swiss classical scholar, was born at Bern, of a family whose nobility and distinction he loved to recall. In particular, he was proud of his descent from Thomas Wytenbach, professor of theology in Basel at the end of the 16th and beginning of the 17th century, who numbered the Reformer Zwingli and other distinguished men among his pupils. Wytenbach's own father was also a theological professor of considerable note, first at Bern, and then at Marburg. His removal to Marburg, which took place in 1756, was partly due to old associations, for he had studied there under the famous Christian Wolf, and embodied the philosophical principles of his master in his own theological teaching. Young Wytenbach entered at the age of fourteen the university of Marburg, and passed through a four years' course there. His parents intended that he should become a Lutheran pastor. The first two years were given up to general education, principally to mathematics, 'philology,' philosophy and history. The professor of mathematics, Spangenberg, acquired great influence over young Wytenbach. He is said to have taught his subject with great clearness, and with equal seriousness and piety, often referring to God as the supreme mathematician, who had constructed all things by number, measure and weight. "Philology" in the German universities of that age meant Hebrew and Greek. These two languages were generally handled by the same professor, and were taught almost solely to theological students. Wytenbach's university course at Marburg was troubled about the middle of the time by mental unrest, due to the fascination exercised over him by Bunyan's Pilgrim's Progress. The disorder was cured by Spangenberg. The principal study of the third year was metaphysics, which took Wytenbach entirely captive. The fourth and last year was to be devoted to theology and Christian dogma. Wytenbach had hitherto submitted passively to his father's wishes concerning his career, in the hope that some unexpected occurrence might set him free. But he now turned away from theological lectures, and privately devoted his time to the task of deepening and extending his knowledge of Greek literature. He possessed at the time, as he tells us, no more acquaintance with Greek than his own pupils at a later time could acquire from him during four months' study. He was almost entirely without equipment beyond the bare texts of the authors. But Wytenbach was undaunted, and four years' persistent study gave him a knowledge of Greek such as few Germans of that time possessed. His love for philosophy carried him towards the Greek philosophers, especially Plato. During this period Ruhnken's notes on the Platonic lexicon of Timaeus fell into his hands. Ruhnken was for him almost a superhuman being, whom he worshipped day and night, and with whom he imagined himself as holding converse in the spirit. When Wytenbach had acquired sufficient knowledge to make himself useful in the city of Waterford, he set forth on a tour of the universities of the country. At Oxford he received a fellowship and entered as a student at Balliol College.
forwarded to the elder Wytenbach, with a strong recommendation from Heyne. The old man had been himself in Leiden in his youth, and entertained an admiration for the scholarship of the Netherlands; so his consent was easily won. Young Wytenbach reached Leiden in 1770. A year was spent with great contentment; in learning the language of the people, in attending the lectures of the great "duumviri" of Leiden, and in collating MSS. of Plutarch. At the end of 1771 a professor was wanted at Amsterdam for the College of the Remonstrants. By the recommendation of Ruhnken, Wytenbach obtained the chair, which he filled with great success for eight years. His lectures took a wide range. Those on Greek were repeated also to the students of the university of Amsterdam (the "Athenaeum"). In 1775 a visit was made to Paris, which was fruitful both of new friendships and of progress in study. About this time, on the advice of Ruhnken, Wytenbach began the issue of his Bibliotheca criticæ, which appeared at intervals for the next thirty years. The methods of criticism employed were in the main those established by Hemsterhuis, and carried on by Valckenaer and Ruhnken, and the publication met with acceptance from the learned all over Europe. In 1777 the younger Burmann ("Burmannus Secundus") retired from his professorship at the Athenaeum, and Wytenbach hoped to succeed him. When another received the appointment, he was sorely discouraged. Only his regard for Ruhnken and for Dutch freedom (in his own words "Ruhnkeni et Batavae liberitatis cogitatio") kept him in Holland. For fear of losing him, the authorities at Amsterdam nominated him in 1779 professor of philosophy. In 1783 Toll, Burmann's successor, resigned, and Wytenbach was at once appointed to succeed him. His full title was "professor of history and eloquence and Greek and Latin literature." He had hardly got to work in his new office when Valckenaer died, and he received a call to Leiden. Greatly to Ruhnken's disappointment, he declined to abandon the duties he had so recently undertaken. In 1787 began the internal commotions in Holland, afterwards to be aggravated by foreign interference. Scarcely during the remaining thirty-three years of Wytenbach's life was there a moment of peace in the land. About this time two requests were made to him for an edition of the Moralia of Plutarch, for which a recension of the tract De sero nominis vindicâ had marked him out in the eyes of scholars. One request came from the famous "Societas Bipontina," the other from the delegates of the Clarendon Press at Oxford. Wytenbach, influenced at once by the reputation of the university, and by the liberality of the Oxonians in tendering him assistance of different kinds, declined the offer of the Bipontine Society,—very fortunately, since their press was soon destroyed by the French. The fortunes of Wytenbach's edition curiously illustrate the text "habent sua fata libelli." The first portion was safely conveyed to Oxford in 1794. Then war broke out between Holland and Great Britain. Randolph, Wytenbach's Oxford correspondent, advised that the next portion should be sent through the British ambassador at Hamburg, and the MS. was duly consigned to him "in a little chest well protected by pitch." After sending Randolph a number of letters without getting any answer, Wytenbach in disgust put all thought of the edition from him, but at last the missing box was discovered in a forgotten corner at Hamburg, where it had lain for two years and a half. The work was finally completed in 1805. Meanwhile Wytenbach received invitations from his native city Bern, and from Leiden, where vacancies had been created by the refusal of professors to swear allegiance to the new Dutch republic set up in 1795, to which Wytenbach had made submission. But he only left Amsterdam in 1799, when on Ruhnken's death he succeeded him at Leiden. Even then his chief object in removing was to facilitate an arrangement by which the necessities of his old master's family might be relieved. His removal came too late in life, and he was never so happy at Leiden as he had been at Amsterdam. Before long appeared the ever-delightful Life of David Ruhnken. Though written in Latin, this biography deserves to rank high in the modern literature of its class. Of Wytenbach's life at Leiden there is little to tell. The continual changes in state affairs greatly disorganized the universities of Holland, and Wytenbach had to work in face of much distraction; still, his success as a teacher was very great. In 1805 he narrowly escaped with his life from the great gunpowder explosion, which killed 150 people, among them the Greek scholar Luzac, Wytenbach's colleague in the university. One of Wytenbach's letters gives a vivid account of the disaster. During the last years of his life he suffered severely from illness and became nearly blind. After the conclusion of his edition of Plutarch's Moralia in 1805, the only important work he was able to publish was his well-known edition of Plato's Phædo. Many honours were conferred upon him both at home and abroad, and in particular he was made a member of the French Institute. Shortly before his death, he obtained the licence of the king of Holland to marry his sister's daughter, Johanna Gallien, who had for twenty years devoted herself to him as housekeeper, secretary and aider in his studies. The sole object of the marriage was to secure for her a better provision after his husband's death, because as the widow of a professor she would be entitled to a pension. Johanna Gallien was a woman of remarkable culture and ability, and wrote works held in great repute at that time. On the festival of the tercentenary of the foundation of the university of Marburg, celebrated in 1827, the degree of doctor was conferred upon her. Wytenbach died of apoplexy in 1820, and he was buried in the garden of his country house near Amsterdam, which stood, as he noted, within sight of the dwellings of Descartes and Boerhaave.

Although his work can hardly be set on the same level as that of Hemsterhuis, Valckenaer and Ruhnken, yet he was a very eminent exponent of the sound methods of criticism which they established. These four men, more than any others after Bentley, laid the foundations of modern Greek scholarship. The precise study of grammar, syntax and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the Continent, and were only pursued with partial success in England. Wytenbach may fairly be regarded as closing a great period in the history of scholarship. He lived indeed to see the new birth of German classical learning, but his work was done, and he was unharmed. Wytenbach's criticism was less rigorous, precise and masterly, but perhaps more sympathetic and kindly; he was a benefactor of at least of his great predecessors in the Netherlands. In actual acquaintance with the philosophical writings of the ancients, he has probably never been surpassed. In character he was upright and simple-minded, but shy and retiring, and often failed to make himself appreciated. His life was not passed without strife, but his few friends were warmly attached to him, and his many pupils were for the most part his enthusiastic admirers. Wytenbach's biography was written in a somewhat dry and lifeless manner by Mahne, one of his pupils, who also published some of his letters. His Opuscula, other than those published in the Bibliotheca critica, were collected in two languages (Leiden, 1823).

WYVERN, or Wyvern, the name of an heraldic monster, with the forepart of a winged dragon and the hind part of a serpent or lizard (see HERALDRY). The earlier spelling of the word was wyver or wyvere; O. Eng. wyere; O. Fr. wyver, mod. givre. It is a doublet of "viper," with an excrescent n, as in "bittern," M. Eng. biore.
XANTHONE yellow used obtained the In into Constantinople-Salonica formed small needles the it 3983; a colourless xanthene heterocyclic 280), C. xanthydrol municipal According early garden. of 4000) but pronounced to mention Constantinople-Salonica (Zeise, 1849, 95, p. 1271) as yellow and their use in the preparation of various terpenes, the methyl ester when distilled under slightly diminished pressure decomposing, in the sense of the equation, C6H5-CH2COOH + CO2 + CS2SH. According to the author molecular change in the hydrocarbon is prevented, since no acid is formed.

XANTHIC, the wife of Socrates (q.v.). Her name has become proverbial in the sense of a nagging, quarrelsome woman. Attempts have been made to show that she has been malignant, notably by E. Zeller (“Zur Erkenntniss der Xanthic,” in his Vorlesungen und Abhandlungen, i., 1875).

XANTHONE (dibenzo-y-pyrene, or diphenylene ketone oxide), C6H4O2, in organic chemistry, a heterocyclic compound containing the ring system shown below. It is obtained by the oxidation of xanthene (methylenediphenylene oxide) with chromic acid; by the action of phosphorus oxychloride on disodium salicylate; by heating 2,2'-dioxynobenzophenone with concentrated sulphuric acid; by distilling fluoron with lime; by the oxidation of xanthyl alcohol (R. Meyer, Ber., 1893, 26, 1297); by heating dithio-carbonic anhydride with water (Heyl., Ber., 1898, 31, p. 3034); by heating salol with concentrated sulphuric acid (C. Graebe, Ann., 1880, 254, p. 280), and by heating potassium-ortho-chlorobenzoate with sodium phenolate and a small quantity of copper powder to 180–190° C. (F. Ullmann, Ber., 1905, 38, pp. 729, 2120, 2211). It crystallizes in needles which melt at 173–174° and boil at 349–350° C., and are volatile in steam. Its solution in concentrated sulphuric acid is of a yellow colour and shows a marked blue fluorescence. The carbonyl group is not ketonic in character since it yields neither an oxime nor hydrazone. When fused with caustic potash it yields phenol and salicylic acid. Mild reducing agents convert it into xanthyl alcohol, the group >CO becoming >CH-OH, whilst a strong reducing agent like hydriodic acid converts it into xanthone, the group >CO becoming >CH=. Phosphorus pentasulphide at 140–150° C. converts it into xanthion by transformation of >CO to >CS (R. Meyer, Ber., 1900, 33, p. 2380), and this latter compound condenses with hydroxylamine to form xanthone oxime.

All four mono-hydroxyxanthones are known, and are prepared by heating salicylic acid with either resorcin, pyrocatech or hydroquinone; they are yellow crystalline solids, which act as dyeuffs. The 1,7-dihydroxyxanthone, known as euxanthone, is prepared by heating euxanthenyl acid with hydrochloric acid or by heating hydroquinone carboxylic acid with β-resorcylic acid and acetic anhydride (S. Kostanecki, Ber., 1891, 24, p. 3983; C. Graebe, Ann., 1889, 254, p. 268). It is also obtained from Indian yellow (Graebe, ibid.), formed in the urine of cows fed on mango leaves. It crystallizes in yellow needles which sublime readily. On fusion with caustic potash it decomposes with formation of tetrahydroxy-benzoquinone, which then breaks up into resorcin and hydroquinone. The isomeric 1,6-dihydroxyxanthone, isoxanthone, is formed when β-resorcylic acid is heated with acetyl anhydride. Gentisic, or 1,3,7-trihydroxyxanthone, is found in the form of its methyl ether (gentisin) in gentian root; it is obtained synthetically by condensing phloroglucin with hydroxyquinone carboxylic acid.

Xanthone, C6H4O2, may be synthesized by condensing phenol with ortho-cresol in the presence of aluminium chloride. Its tetramethyl-diamino derivative, which is formed by condensing formaldehyde with 2,2-dichloroethylene and subsequent elimination of water from the resulting diphenyl methane derivative, is the leuco base of pyrine, into which it passes by oxidation.

Xanthone. Xanthone.
XANTHUS (mod. Gunhūk), an ancient city of Lycia, on the river Xanthus (Eshen Chai) about 8 m. above its mouth. It was besieged by the Persian general Harpagus (346 B.C.), when the acropolis was burned and all the inhabitants perished (Herod. l. 176). The city was afterwards rebuilt and in 42 B.C. it was besieged by the Romans under M. Junius Brutus. It was taken by storm and set on fire, and the inhabitants perished in the flames. The ruins lie on a plateau, high above the left bank of the river. The nearest port is Kalamaki, whence a tedious ride of three to four hours round the edge of the great marsh of the Eshen Chai brings the traveller to Xanthus. The whole plan of the city with its walls and gates can be discerned. The well-preserved theatre is remarkable for a break in the curve of its auditorium, which has been constructed so as not to interfere with a sarcophagus on a pedestal and with the "Happy Monument" which still stands to its full height, robbed of the relics of its parapet (now in the British Museum). In front of the theatre stands the famous stele of Xanthus inscribed on all four sides in Lycian and Greek. Behind the theatre is a terrace on which probably the temple of either the Xanthian Apollo or Sarpedon stood. The best of the tombs—the "Payava Tomb," the "Nereid Monument," the "Ionic Monument," and the "Lion Tomb"—are in the British Museum, as the result of Sir Chas. Fellow's expedition; only their bases can be seen on the site. A fine triple gateway, much polygonal masonry, and the walls of the acropolis are the other objects of most interest.

See O. Benndorf and G. Niemann, Reisen in Lykien und Karien (1884).

XAVIER, FRANCISCO DE (1506-1552), Jesuit missionary and saint, commonly known in English as St Francis Xavier and also called the "Apostle of the Indies." He was the youngest son of Juan de Jasso, privy councillor to Jean d'Albret, king of Navarre, and his wife, María de Azpilcuta y Xavier, sole heiress to the house of the count de Zuñiga. He was born at the mother's castle of Xavier or Xavero, at the foot of the Pyrenees and close to the little town of Sanguesa, on the 7th of April 1506, according to a family register, though his earlier biographers fix his birth in 1497. Following a Spanish custom of the time, which left the surname of either parent optional with children, he was called after his mother; the best authorities write "Francisco de Xavier" (Lat. Xaverius) rather than "Francisco Xavier," as Xavier is originally a place-name. In 1524 he went to the university of Paris, where he entered the College of St Barthelemy, then the headquarters of the Spanish and Portuguese students, and in 1528 was appointed lecturer in Aristotelian philosophy at the Collège de Beauvais. In 1530 he took his degree as master of arts. He and the Savoyard Pierre Lefèvre, who shared his lodgings, had already, in 1529, made the acquaintance of Ignatius of Loyola—like Xavier a native of the Spanish Basque country. Ignatius succeeded, though in Xavier's case after some opposition, in gaining their sympathy for his missionary schemes (see LOYOLA, IGNATIUS 08); and they were among the company of seven persons, including Loyola himself, who took the original Jesuit vows on the 15th of August 1534. They continued in Paris for two years longer; but on November 15th, 1536, they started for Italy, to concert with Ignatius plans for converting the Moslems of Palestine. In January 1537 they arrived in Venice. As some months must elapse before they could sail for Palestine, Ignatius determined that the time should be spent partly in hospital work at Venice and later in the journey to Rome. Accordingly, Xavier devoted himself for nine weeks to the hospital for incurables, and then set out with eight companions for Rome, where Pope Paul III sanctioned their enterprise. Returning to Venice, Xavier was ordained priest on Midsummer Day 1537; but the outbreak of war between Venice and Turkey put an end to the Palestine expedition, and the companions dispersed for a twelvemonth's home mission work in the Italian cities. Nicolás Bobadilla and Xavier betook themselves first to Monselice and thence to Bologna, where they remained till summoned to Rome by Ignatius at the close of 1538.

Ignatius retained Xavier at Rome until 1541 as secretary to the Society of Jesus (see JESUITS for the events of the period 1538-41). Meanwhile John III., king of Portugal, had resolved on sending a mission to his Indian dominions, and had applied through his envoy Pedro Mascarenhas to the pope for six Jesuits. Ignatius could spare but two, and chose Bobadilla and a Portuguese named Simão Rodrigues for the purpose. Rodrigues set out at once for Lisbon to confer with the king, who ultimately decided to retain him in Portugal. Bobadilla, sent for to Rome, arrived there just before Mascarenhas was about to depart, but fell too ill to respond to the call made on him. Hereupon Ignatius, on March 14th, 1540, told Xavier to leave Rome the next day with Mascarenhas, in order to join Rodrigues in the Indian mission. Xavier compiled, merely waiting long enough to obtain the pope's benediction, and set out for Lisbon, where he was presented to the king, and soon won his entire confidence, attested notably by procuring for him from the pope four briefs, one of them appointing him papal nuncio in the Indies. On April 7th, 1541, he sailed from Lisbon with Martim Alfonso de Sousa, governor designate of India, and lived amongst the common sailors, ministering to their religious and temporal needs, especially during an outbreak of scurvy. After five months' voyage the ship reached Mozambique, where the captain resolved to winter, and Xavier was prostrated with a severe attack of fever. When the voyage was resumed, the ship touched at Malindi and Sokotra, and reached Goa on May 6th, 1542. Exhibiting his brief to D. João d'Albuquerque, bishop of Goa, he asked his permission to officiate in the diocese, and at once began walking through the streets ringing a small bell, and telling all to come, and send their children and servants, to the "Christian doctrine" or catechetical instruction in the principal church. He spent five months in Goa, and then turned his attention to the "Fishery Coast," where he had heard that the Paravas, a tribe engaged in the pearl fishery, were of an essentially Christian character. He laboured assiduously amongst them for fifteen months, and at the end of 1543 returned to Goa.

At Travancore he is said to have founded no fewer than forty-five Christian settlements. It is to be noted that his own letters contain, both at this time and later on, express disproof of that miraculous gift of tongues with which he was credited even in his lifetime, and which is attributed to him in the breviary office for his festival. Not only was he obliged to employ interpreters, but he relates that in their absence he was compelled to sign himself "Speaking and writing in the vernacular.

He sent a missionary to the isle of Manaar, and himself visited Ceylon and Malapar (Meliapur), the traditional tomb of St Thomas the apostle, which he reached in April 1544, remaining there four months. At Malacca, where he arrived on September 25th, 1545, he remained another four months, but had comparatiively little success. While in Malacca he urged King John III. of Portugal to set up the Inquisition in Goa to repress Judaism, but the tribunal was not set up until 1560. After visiting Ambon, the Moluccas and other isles of the Malay archipelago, he returned to Malacca in July 1547, and found three Jesuit recruits from Europe awaiting him. About this time an attack upon the city was made by the Achinese fleet, under the raja of Pedir in Sumatra; and Xavier's early biographers relate a dramatic story of how he roused the governor to action. This story is open to grave suspicion, as, apart from the miracles recorded, there are wide discrepancies between the secular Portuguese histories and the narratives written or inspired by Jesuit chroniclers of the 17th century.

While in Malacca Xavier met Ono Yajiro, a Japanese exile (known to the biographies as Anger, Angero or Anjiro), who fired him with zeal for the conversion of Japan. But he first visited India and then, returning to Malacca, took ship for Japan, accompanied by Yajiro, now known as Paul of the Holy Faith. They reached Kagoshima on the 10th of August 1549, and remained in Japan until the 20th of November 1551. (See JAPAN, § viii.) On board the "Santa Cruz," the vessel in which he returned from Japan to Malacca, Xavier discussed
with Diogo Pereira, the captain, a project for a missionary journey to China. He devised the plan of persuading the viceroy of Portuguese India to despatch an embassy to China, in whose train he might enter, despite the law which then excluded foreigners from that empire. He reached Goa in February 1552, and obtained from the viceroy consent to the plan of a Chinese embassy and to the nomination of Pereira as envoy. Xavier left India on the 29th of April 1552 for Malacca, intending there to meet Pereira and to re-embark on the “Santa Cruz.”

The story of his detention by the governor (officially styled captain) of Malacca—a son of Vasco da Gama named Alvaro de Xavier or Athayde—is told with many picturesque details by F. M. Pinto and some of the Jesuit biographers, who have pilloried Ataide as actuated solely by malice and self-interest. Ataide appears to have objected not so much to the mission as to the rank assigned to Pereira, whom he regarded as unfit for the office of envoy. The right to send a ship to trade with China was one for which large sums were paid, and Pereira, as commander of the expedition, would enjoy commercial privileges which Ataide had, ex offcio, the power to grant or withhold. It seems doubtful if the governor exceeded his legal right in refusing to allow Pereira to proceed as envoy.

If the Jesuit biographers may be trusted, exhibited the brief by which he held the rank of papal nuncio, and threatened Ataide with excommunication. On Xavier’s personal liberty no restraint was placed. He embarked without Pereira on July 16th, 1552. After a short stay at Singapore, whence he despatched several letters to India and Europe, the ship at the end of August 1552 reached Chang-chuen-shan (St John Island) off the coast of Kwang-tung, which served as port and rendezvous for Europeans, not then admitted to visit the Chinese mainland.

At this point, Xavier was seized with fever soon after his arrival, and was delayed by the failure of the interpreter he had engaged, as well as by the reluctance of the Portuguese to attempt the voyage to Canton for the purpose of landing him. He had arranged for his passage in a Chinese junk, when he was again attacked by fever, and died on December 2nd, or, according to some authorities, November 27th, 1552. He was buried close to the cabin in which he had died, but his body was later transferred to Malacca, and thence to Goa, where it still lies in a magnificent shrine (see J. N. da Fonseca, An Historical and Archaeological Sketch of Goa, 1878). The body was translated to Goa in 1610 and canonized by Gregory XV. in 1621.

In appearance Xavier was neither Spanish nor Basque. He had blue or grey eyes, and fair hair and beard, which turned white through the hardships he endured in Japan. That he was of short stature is proved by the length of the coffin in which his body is still preserved, less than 5 ft. 1 in. (Fonseca, op. cit. p. 296). Many miracles have been ascribed to him; an official list of these, said to have been attested by eye-witnesses, was drawn up by the auditors of the Rota when the processes for his canonization were formed, and is preserved in manuscript in the Vatican library. The contention that Xavier should be regarded as the greatest of Christian missionaries since the first century A.D. rests upon more tangible evidence. His Jesuit biographers attribute to him the conversion of more than 700,000 persons in less than ten years; and though these figures are absurd, the work which Xavier accomplished was enormous. He inaugurated new missionary enterprises from Hormuz to Japan and the Malay Archipelago, leaving an organized Christian community wherever he preached; he directed by correspondence the ecclesiastical policy of John III. and his vicerey in India; he established and controlled the Society of Jesus in the East. Himself an ascetic and a mystic, to whom things spiritual were more real than the visible world, he had the strong common sense which distinguished the other Spanish mystics, St Theresa, Luis de Leon or Raimon Lull. This quality is nowhere better exemplified than in his letters to Gaspar Baertsz (Barzaeus), the Flemish Jesuit whom he sent to Hormuz, or in his suggestions for the establishment of a Portuguese staple in Japan. Supreme as an organizer, he seems also to have had a singularly attractive personality, which won him the friendship even of the pirates and braves with whom he was forced to consort on his voyages. Modern critics of his work note that he made no attempt to understand the oriental religions which he attacked, and censured him for involving the aid of the Inquisition and the Confession of Faith in the persecution of the Nestorians in Malabar. He strove, with a success disastrous to the Portuguese empire, to convert the government in Goa into a proselytizing agency. Throughout his life he remained in close touch with Ignatius of Loyola, who is said to have selected Xavier as his own successor at the Society of Jesus. Within a few weeks of Xavier’s death, indeed, Ignatius sent letters recalling him to Europe with that end in view.

**Bibliography.**—Many of the authorities on which the biographies of Xavier have been based are untrustworthy, notably the Peregrinacion d’Ataide, M. A. de la Pezuela, which contains the chief incidents of his life in the Far East (especially in Japan and Malacca). Xavier’s extant letters, supplemented by a few other 16th-century documents, are extremely sparse. Between the letters, there is no doubt that Xavier himself never mentions Pinto; but the omission may be explained by the numerous gaps in his correspondence. A critical text of the letters, with notes, bibliography and a life in Spanish, was published in Mexico, 1904, and in English, T. F., The Admirable Life of St Francis Xavier, Paris, 1631; and Historia do Vida do Padre Francisco de Xavier, &c., by Joao Lucena (Lisbon, 1660). Later works by the Jesuits Bartoli, Maffei, de Sousa, Poussines, Menchacha, Leon Pagis and others owe much to Torsellini and Lucena, but also incorporate many traditions which can no longer be verified. St François de Xavier, sa vie et ses lettres, by J. M. Cros, S. J. (2 vols., Toulouse, 1909), embodies the results of long research. The Missionary Life of St Francis Xavier, by the Rev. H. Venn, prebendary of St Paul’s cathedral, London (London, 1862), is polemical, but contains an interesting map of Xavier’s journeys and a non-partisan account of the missions, which, though written for the East, see K. G. Jayne, Vasco da Gama and his Successors, chapters 25–32 (London, 1910); and Otis Cary, A History of Christianity in Japan (2 vols., London, 1899).
XENOPHANES

(470 B.C.), in company with Aristotle he paid a visit to Hermias at Atarneus. In 339, Aristotle being then in Macedon, Xenocrates succeeded Specusius in the presidency of the school, defeating his competitors Menedemus and Heraclides by a few votes. On three occasions he was member of an Athenian legation, once to Philip, twice to Antipater. Soon after the death of Democritos in 322, resuming the Macedonian influence then dominant at Athens, Xenocrates declined the citizenship offered to him at the instance of Phocion, and, being unable to pay the tax levied on alien residents, withdrew it. He died in 314, and was succeeded as scholar by Polemon, whom he had reclaimed from a life of profligacy. Besides Polemon, the statesman Phocion, Chaeon, tyrant of Pellene, the Academic Crantor, the Stoic Zeno and Epicurus are alleged to have frequented his lectures.

Xenocrates's earnestness and strength of character won for him universal respect, and stories were remembered in proof of his purity, integrity and benevolence. Wanting in quickness of apprehension and in native grace, he made up for these deficiencies by a conscientious love of truth and an untried industry. Less original than Specusius, he adhered more closely to the letter of Platonic doctrine, and is accounted the typical representative of the Old Academy. Xenocrates, who at an earlier period had covered nearly the whole of the Academic programme; but metaphysics and ethics were the subjects which principally engaged his mind, and to have written, or at least to have emphasized, the tripartition of philosophy under the heads of physics, dialectic and ethic.

In his ontology Xenocrates stood upon Plato's foundations: that is to say, with Plato he postulated ideas or numbers to be the causes of nature's organic products, and derived these ideas or numbers from unity (which is active) and plurality (which is passive). But he put upon the general idea of interpretation prevailing from Plato, existence is mind pluralized: mind as a unity, i.e., universal mind, apprehends its own plurality as eternal, immutable, intelligible ideas; and mind as a plurality, i.e., particular mind, perceives ideas as trinomial, i.e., three, or triadic, ideas. The idea, inasmuch as it is a law of universal mind, which in particular minds produces aggregates of sensations called things, is a "determinant (êîµâï ëâëô), and as such is styled "quantity (êîµâëô)" and perhaps "number" (êâôëëâëêë), but the ideal numbers are distinct from arithmetical numbers. Xenocrates, however, failing, as it would seem, to grasp the idealism which was the metaphysical foundation of Plato's theory of natural kinds, took for his principles arithmetical unity and plurality, and accordingly identified ideal numbers with arithmetical numbers. In thus reverting to the crudities of certain Pythagoreans, he laid himself open to the criticism, which is in his case more valid, that the contemporary Platonists three principal groups—(1) those who, like Plato, distinguished mathematical and ideal numbers; (2) those who, like Xenocrates, identified the ideal numbers; (3) those like Specusius, postulated mathematical numbers only—has much to say against the Xenocratean interpretation of the theory, and in particular points out that, if the ideas are numbers made up of arithmetical units, they are not only outside being, but the principles of which they become subject to arithmetical operations. Xenocrates's theory of inorganic nature was substantially identical with the theory of the elements which is propounded in the Timaeus, § 3 C seq. Nevertheless, holding that every dimension has a principle of its own, he rejected the derivation of the elemental solids—pyramid, octahedron, icosaedron and cube—from triangular surfaces, and in so far approximating to atomism. Moreover, to the tetrad of simple elements—viz., fire, air, water, earth—he added the êîâôëëìëëêëë, ether.

His cosmology, which is drawn almost entirely from the Timaeus; and, as he intimates, is not to be regarded as a cosmogony; should be studied, perhaps, with his psychology. Soul is a self-moving, number, derived from the two fundamental principles, unity (êî) and plurality (êîëëêëë), whence it obtains its powers of rest and motion, as it is eternal, and may exist apart from body. The irrational soul, as well as the rational soul, is immortal. The universe, the heavenly bodies, man, animals, and presumably plants, are each of them endowed with a soul, which is more or less perfect, according to his position in the scale of creation. With this Platonic philosophy Xenocrates combines the current theology, identifying the universe and the heavenly bodies with the greater gods, and reserving a place between them and the gods for the lesser gods.

If the extant authorities are to be trusted, Xenocrates recognized three grades of cognition, each appropriated to a region of its own. By the lower grade of cognition, he supposed, had an opinion or sensation, but did not think. By the middle grade of cognition, he supposed, had a judgment, the equivalent of our inchoate notions. By the higher grade of cognition, he supposed, had a reason, the equivalent of our definite knowledge.

Of Xenocrates's utterances about (1) God, (2) the world, (3) knowledge, the following survive: (1) There is one God, greatest and most perfect, who is above and beyond the universe, governing the universe. (2) A logos (law) exists over the universe, being the reason of all things. (3) This logos is the mover of the universe. (4) It is thought that the logos is a self-moving, number, for the lesser gods.

"In order to make all things known to him, the logos must be set in motion by another logos, and this is the great god. . . . He is all sight, all mind, all ear (i.e., not a composite organism). . . . Without an effort ruler he all things by thought. . . . . . . He beholds every soul, he is the sovereign law. . . . He fitteth him not to wander hither and thither. . . . Yet men imagine gods to be born, and to have raiment and voice and body, like themselves. . . . Even so the gods of the Ethiopians are swarthy and have a face. . . . He is invisible, and not seen, hidden from the eye. . . . Even so Homer and Hesiod attributed to the gods all that is a shame and a reproach among men—theft, adultery, deceit and other lawless acts. . . . Even so oxen, lions and horses, if they had hands wherewith to grave images, would fashion gods.
after their own shapes and make them bodies like to their own.

(2) From earth all things are and to earth all things return.

From earth and water come all of us... The sea is the well whence water springeth... Here at our feet is the end of the earth, and I hold it to be the middle of all things, without end... The rainbow, which men call Iris, is a cloud that is purple and red and orange.

(3) No man hath certainly known, nor shall certainly know, that gods or men are the first cause of all things; for, that which he saith over so perfect, yet doth he not know it; all things are matters of opinion... That which I say is opinion unto truth... The gods did not come to us at all, not at all to begin; long is the search ere man findeth that which is better.

There is very little secondary evidence to record. "The Eleatic school," says the Stranger in Plato's Sophist, 222 D, "beginning with Parmenides, the most ancient of all philosophers,..." Aristotle, in a passage already cited, Meta.

physics, A5, speaks of Xenophanes as the first of the Eleatic unitarians, adding that his most significant doctrine was contained in his answer to the sophists: "He was the first... Theophrastus (in Simplicius's Ad Physicam, 5) sums up Xenophanes's teaching in the propositions, "The All is One and the One is God." Timon (in Sext. Empir. Pyrrh. i. 224), ignoring Xenophanes's theology, makes him resolve all things into one and the same unity. The demonstrations of the unity and the attributes of God, with which the treatise De Melissa, Xenophane et Gorgias (now no longer ascribed to Aristotle or Theophrastus) ac-

ceed, are the same as those of Eleatic unitarians. The unity of the and the attributes of the Ent, and must therefore be set aside. The epitomators of a later time added nothing to the testimony of the ancients.

Thus, whereas in his writings, so far as they are known to us, Xenophanes appears as a theologian protesting against an anthropomorphic polytheism, the ancients seem to have regarded him as a philosophical systematizer who was willing to stand these conflicting, though not irreconcilable, testimonies. According to Zeller, the discrepancy is only apparent. The Greek gods being the powers of nature personified, pantheism lay too close hand to hand, to Xenophanes. Xenophanes was, then, a pantheist. Accordingly his assertion of the unity of God was at the same time a declaration of the unity of Being, and in virtue of this declaration he regarded the Eleaticism, in which the philosophy of Parmenides was his forerunner's pantheism, divested of its theistic element. This reconciliation of the internal and the external evidence, countenanced as it is by Theophrastus, one of the best judges of the ancients, and denied by Zeller, one of the most learned of the modern critics, is more than plausible; but there is something to be said on the contrary part. In the first place, it may be doubted whether to a Greek of the 6th century pantheism was nearer than monothelism. Secondly, the external evidence does not bear examination. The Platonic testimony, if it proved anything, would prove too much, namely, that the author of the De Melissa was not Xenophanes, but before him; and, in fact, the passage from the Sophist no more proves that Plato attributed to Xenophanes the philosophy of Parmenides than Thesaeus, 160 D, proves that Plato attributed to Hesiod the Promethean theories of Heracleitos. Again, Aristotle's de-

scription of Xenophanes as the first of the Eleatic unitarians does not necessarily imply that the unity asserted by Xenophanes was the unity of Being. On the contrary, the same argument, as Aristotle puts it, declares that the One is God," leaves it doubtful whether Aristotle attributed to Xenophanes any philosophical theory whatever; and the epithet ἀποτρέπων discourages the belief that Aristotle regarded Xenophanes as the author of a new and important departure. Thirdly, when Xenophanes himself says that theories about gods and about things are not knowledge, that his own utterances are not verities but verisimilitudes, and that, so far from learning things by revelation, man must laboriously seek a better opinion, he plainly renounces the "disinterested pursuit of truth." If then he was indifferent to the problem, he can hardly be considered the Eleatic unitarian. In the eyes of the present writer, Xenophanes was neither a philosopher nor a sceptic. He was not a philosopher, for he despaired of knowledge. He was not a sceptic, if by "sceptic" meant the masochist whose despair of knowledge is the conscious and deliberate endavour, for he had never hoped. Rather he was a theologian who arrived at his theory of the unity of the Supreme Being by criticism of the contemporary mythology. But, whatever good afloat from philosophy, Xenophanes influenced its development in two ways: first, his theological heresies led the way to the philo-

sophical heresies of Parmenides and Zeno; secondly, his assertion that the gods were human, and so mankind, taught his successors to distinguish knowledge and opinion, and to assign to each a separate province.

A part of the old controversy about Xenophanes's relations to philosophy. The recent critical revision of his position is in fragments i., xiv., xvi., &c., he recognizes, thinks Freudenthal, a plurality of deities; whence it is inferred that, besides the One God, most high, perfect, eternal, who, as inscrutable wise, unifies the plurality of things, there were also lesser divinities, who govern portions of the universe, being themselves eternal parts of the one all-embracing God. Whilst it can hardly be allowed that Xenophanes, so far denying, actually affirms a plurality of gods, it must be conceded to Freudenthal that Xenophanes's polemic was directed against the anthropomorphizing tendencies and the mythological details of the contemporary polytheism rather than against the polytheistic principle, and that he may, as the Sophists of the 6th century have been wrongly discarded, there is no direct evidence to prove him a consistent monotheist. The wisdom of Xenophanes, like the wisdom of the Hebrew Prophets, showed itself, not in a theory of the uni-

versal God, but in a scornful criticism of the meaningless things and the futility of endeavor. His theism was a declaration not so much of the greatness of God as rather of the littleness of man. His cosmology was an assertion not so much of the immutability of the World as rather of the contingency of the Many. Like the other sophists, he was not a philosopher, and did not pretend to be one; but, as the reasoned scepticism of Socrates cleared the way for the philosophy of Plato, so did Xenophanes's "abominis sapientia" for the philosophy of Parmenides.

XENOPHON, Greek historian and philosophical essayist, the son of Gryllus, was born at Athens about 430 B.C.1 He belonged to an eastern family of the deme of Erech. It may be inferred from passages in the Hellenica that he fought at Arginusae (406), and that he was present at the return of Alcibades (408), the trial of the Generals and the overthrow of the Thirty. Early in life he came under the influence of Socrates, but an active life had more attraction for him. In 401, being invited by his friend Proxesus to join the expedition of the younger Cyrus against his brother, Artaxerxes II. of Persia, he at once accepted the offer. It held out the prospect of riches and honour, while he was little likely to find favour in democratic Athens, where the knights were regarded with suspicion as having supported the Thirty. At the suggestion of Socrates, Xenophon went to Delphi to consult the oracle; but his mind was already made up, and he at once proceeded to Sardis, the place of rendezvous. Of the expedition itself he has given a full and detailed account in his Anabasis, or the "Up-Country March. After the battle of Cunaxa (401), in which Cyrus lost his life, the officers in command of the Greeks were treacherously murdered by the Persian satrap Tissaphernes, with whom they were negotiating an armistice with a view toพระ Wendou. The part which he took was now in the heart of an unknown country, more than a thousand miles from home and in the presence of a troublesome enemy. It was decided to march northwards up the Tigris valley and make for the shores of the Euxine, on which there were several Greek colonies. Xenophon became the leading spirit of the army; he was elected an officer, and he was who mainly directed the retreat. Part of the way lay through the wilds of Kurdistan, where they had to encounter the harassing guerrilla attacks of savage mountain tribes, and part through the highlands of Armenia and Georgia, with part of the march made in the dead of winter. The reflection of Xenophon's march on the Euxine (February 400), where a tendency to demoralization began to show itself, and even Xenophon almost lost his control over the soldiery. At Cotyora he aspired to found a new colony; but the idea, not being unanimously accepted, was abandoned, and ultimately Xenophon with his Greeks arrived at Chrysopolis [Scutar] on the Bosporus, opposite Byzantium. After a brief period of service under a Thracian chief, Scuthes, they were finally incorporated in a Lacedaemonian armil which

1 As the description of the Ionian campaign of Thrasyllus in 410 (Hellenica, 1.2) is clearly derived from Xenophon's own reminiscences, he must have taken part in this campaign, and cannot have therefore been less than twenty years of age at the time.
had crossed over into Asia to wage war against the Persian satraps Tissaphernes and Pharnabazus. Xenophon, who accompanied them, captured a wealthy Persian nobleman, with his family, near Pergamum, and the ransom paid for his recovery secured Xenophon a competency for life.

On his return to Greece Xenophon served under Agesilaus, king of Sparta, at that time the chief power in the Greek world. With his native Athens and its general policy and institutions he was not in sympathy. At Coronea (334) he fought with the Spartans against the Thessalians, for whom several of his fellow-citizens decreed his banishment. The Spartans provided a home for him at Scillus in Elis, about two miles from Olympia; there he settled down to indulge his tastes for sport and literature. After Sparta's crushing defeat at Leuctra (371), Xenophon was driven from his home by the people of Elis. Meantime Sparta and Athens had become allies, and the Athenians repelled the decree which had condemned him to exile. There is, however, no evidence that he ever returned to his native city. According to Diogenes Laërtius, he made his home at Corinth. The year of his death is not known; all that can be said is that it was later than 335, the date of his work on the _Revenues of Athens._

The _Anabasis_ (composed at Scillus between 379 and 371) is a work of singular interest, and is brightly and pleasantly written. Xenophon, in the person of his narrator, describes a straightforward manliness about the style, with a distinct flavour of a cheerful lightheartedness, which at once enlists our sympathies. His purpose after the end of his _Helena_ is to recount the story, and painstaking. The researches of modern travellers attest his general accuracy. It is expressly stated by Plutarch and Diogenes Laërtius that the _Anabasis_ was the work of Xenophon, and the evidence from style is conclusive. The allusion (Hellenica, iii. 1. 2) to Thémistocles of Syracuse as the author shows that Xenophon published it under an assumed name.

The _Hellenica_ written at Corinth, after 352, is the only contemporary account of the period covered by it (411-362) that has come down to us. It consists of two distinct parts; books i. and ii., which contain the narrative of the war that followed the Battle of Leuctra in 371, and bring the history down to the fall of the Thirty, and books iii.-vii., the _Hellenica_ proper, which deal with the period from 401 to the year of the death of Alexander and the accession of Thémac, king of Macedon. There is, however, no ground for the view that these two parts were written and published as separate works. There is probably no justification for the charge of deliberate falsification. It must be admitted, however, that he had strong political prejudices, and that these prejudices have influenced his narrative. He was a partian of the reactionary movement which triumphed after the fall of Athens; Sparta is his ideal, and Agesilaus his hero. At the same time, he was a believer in a divine overruling providence. He is compelled, therefore, to see in the fall of Sparta the punishment inflicted by heaven on the treacherous policy which had prompted the seizure of the Cadmus and the ravaging of Sphodrias. Hardly less serious defects than his political bias are his omissions, his want of the sense of proportion and his failure to grasp the meaning of historical criticism. The most that can be said in his favour is that as a witness he is at once honest and well-informed. For this period of Greek history he is, at any rate, an indispensable witness.

The _Memorabilia_ or "Recollections of Socrates," in four books, was written to defend Socrates against the charges of impiety and corrupting the youth, repeated after his death by the sophist Polycrates. The work is not a literary masterpiece; it lacks coherence, and the picture of Socrates which it contains seems to be given for the purpose of showing how the legend grew, and how he seems to have made no attempt to enter; for these indeed he had neither taste nor genius. Moving within a limited range of ideas, he doubtless written a book very much inferior than the real Socrates; while Plato gives us something more." It is probable that the work in its present form is an abridgment.

Xenophon has left several minor works, some of which are very interesting and give an insight into the home life of the Greeks.

The _Oeconomicus_ (to some extent a continuation of the _Memorabilia_, and of the same nature as the _Hellenica_), describes the management of the house and of the farm, and presents a pleasant and amusing picture of the Greek wife and of her home duties. There are some good practical remarks on matrimony and on the responsibility of the wife for the management of the household. The form of a dialogue between Socrates and a certain Iischomachus, was translated into Latin by Cicero.

In the _Cyropaedia_ (book 1) and hunting (Cynegeticus), Xenophon deals with matters of which he had a thorough practical knowledge. In the first he gives rules how to choose a horse, and then tells how it is to be groomed and ridden and generally managed. The _Cynegeticus_ deals with the care of dogs for hunting. He speaks also of boar-hunting and describes the hounds, tells how they are to be bred and trained, and gives specimens of suitable names for them. On all this he writes with the zest of an enthusiastic sportsman, and he occasional allusions have a taste for field-sports will be most likely to be successful in war. Both treatises may still be read with interest by the modern

The _Hiero_ works out the line of thought indicated in the story of the Sword of Damocles. It is a protest against the notion that "the tyrant" is a man to be envied, as having more abundant means of happiness than a private person. This is one of the most pleasing of Xenophon's minor works; it is cast into the form of a dialogue between a tyrant of Syracuse, Socrates, and the poet Simonides.

The _Symposium_, or "Banquet," is one of the most important of the _Memorabilia_, is a brilliant little dialogue in which Socrates is the prominent figure. He is represented as "improving the conversation of a Athenians, to show that there is much drinking, with flute-playing, and a dancing-girl from Syracuse, who amuses the guests with the feats of a professional conjurer. Socrates' table-talk runs through a variety of topics, and winds up with a philosophical disquisition on the superiority of true heavenly love to its earthly or sensual counterfeit, and with an earnest exhortation to one of the party, who had just won a victory in the public games, to lead a noble life and do his duty to his country.

There are also two short essays, attributed to him, on the political constitution of Sparta and Athens, written with a decided bias in favour of Sparta and against Athens, and on the art of the dialogue, which was so much in vogue among the ancient Grecians. Sparta seems to have presented to Xenophon the best conceivable mixture of monarchy and aristocracy. The second is certainly not the work of Xenophon, but is probably something by a member of the oligarchical party shortly after the beginning of the Peloponnesian war.

In the essay on the _Revenues of Athens_ (written in 352) he offers suggestions for making Athens less dependent on tribute received from its allies. Above all, he would have Athens use its influence for the maintenance of peace in the Greek world and for the settlement of questions by diplomacy, the temple at Delphi being for this purpose an independent centre and supplying a divine sanction. The _Syntopon_, Socrates' defence before his judges, is rather a feeble production, and in the general opinion of modern critics is not a genuine work of Xenophon, but belongs to a much later period. Xenophon was a man of great personal beauty and considerable intellectual gifts; but he was of too practical a nature to take an interest in abstract philosophical speculation. His dislike of the democracy of Athens induced such lack of patriotism that he even fought on the side of Sparta against his own country. In religious matters he was narrow minded, a believer in the efficacy of sacrifice and in the prophetic art. His plain and simple style, which at times makes wearisome, was greatly admired and procured him many imitators.

The editions of Xenophon's works, both complete and of separate portions, are very numerous, especially of the _Anabasis_; only a few are worthy of attention, among which are those by A. H. Schiller (20 vols., 1800-45), E. de G. Rolle (1806-20), W. Müller (1861), E. W. Bickmann (1890-1913), J. G. Schneider (1790-1849); G. Sauppe (1865-66); L. Dindorf (1875); E. C. Marchant (1900-), in the Clarendon Press _Scriptorium Classorum Bibliotheca_; _Anabasis;_ R. Kühner (1852); G. C. Petrucci (1862); F. C. W. Krüger and W. Pökel (1888); W. W. Goodwin and J. W. White (1887-94). _Cyropaedia;_ G. M. Gorham (1876); L. Breiten- bach (1874); A. H. Harnack (1874-84); H. A. Nitsche (1886); A. H. Holdcn (1887-90). _Hellenica;_ L. Breiten- bach (1874-84); R. Büchenschütz (1880-91); J. I. Manatt

(1888); L. D. Dowdall (i., ii., 1890). Memoria: F. Frost (1867); A. R. Clee (1880); R. Kühn (1882); L. Breiten- lach (1889); J. Marshall (1890). Oecus: H. A. Engelmann (1890); C. Graux and M. H. Morgan (U.S.A., 1890). Of general works bearing on the subject may be mentioned: G. Sauppe, Lexicon Xenophontes (1864); A. Croiset, X...: son carac... (1873); Roquette, Lexicon Xenophontes Vi. (1884); L. Hart- mann, Anecdota Xenophontea Nova (1899); C. Jöel, Der echte und der Xenophontische Sacrates (1892); Lange, X...: sein Leben, seine Geiselsa... (1890). And works quoted: J. B. Bury, Ancient Greek Historians (1909); Mure's History of Greek Literature and Grant's monograph in Black- wood's Ancient Classics for English Readers, with read- able Bibliography in Engelmann-Preuss, Bibliotheca Scriptorum Classiciorum, (1890) and in C. Bursian's Jahrbuch (E. M. W; J. H. F. E.).

XERXES (the Greek form of the Pers. Khshayarshâ; Old Testament Akhasuerus, Akhashezer—i.e. Akhasuerus (g.v.).) with wrong vocalization and substitution of y for v, instead of Akhshavarsh; in Aramaic inscriptions and papyri from Egypt the name is written Kshavarsh; the name of two Persian kings of the Achaemenid dynasty.

1. XERXES I., son of Darius I. and Atossa, the daughter of Cyrus the Great, and therefore appointed successor to his father in preference to his eldest half-brothers, who were born before Darius had become king (Herod. vii. 2 f.). After his accession in October 485 B.C. he suppressed the revolt in Egypt which had broken out in 486, appointed his brother Achaemenes as satrap and "brought Egypt under a much heavier yoke than it had been before" (Herod. vii. 7). His predecessor, probably Darius, had not been successful in his attempts to conciliate the ancient city-states. This probably was the reason why Xerxes in 484 abolished the "kingdom of Babylon" and took away the golden statue of Bel (Marduk, Merodach), the hands of which the legitimate king of Babylon had to seize on the first day of each year, and killed the priest who tried to hinder him.

Therefore Xerxes does not bear the title of "King of Babylon" in the Babylonian documents dated from his reign, but "King of Persia and Media," or simply "King of countries" (i.e. of the world). This proceeding led to two rebellions, probably in 481 and 479; in the Babylonian documents occurring in the names of two episcopal kings of Sura and Tarsih, who belong to this time. One of these rebellions was suppressed by Megabyzus, son of Zopyrus, the satrap whom the Babylonians had slain. Darius had left to his son the task of punishing the Greeks for their interference in the Ionian rebellion and the victory of Marathon. From 483 Xerxes prepared his expedition with great care: a channel was dug through the isthmus of the peninsula of Mount Athos; provisions were stored in the stations on the road through Thrace; two bridges were thrown across the Hellespont. G. Ctesias concluded an alliance with Carthage, and thus he saved Greece of the support of the powerful Carthaginian fleet. Thucydides and Agrigent. Many smaller Greek states, moreover, took the side of the Persians ("Medized"), especially Thessaly, Thebes and Argos. A large fleet and a numerous army were gathered. In the spring of 480 Xerxes set out from Sardis. At first Xerxes was victorious everywhere. The Greek fleet was beaten at Artemisium, Thermopylai stormed, Athens conquered, the Greeks driven back to their last line of defence at the Isthmus of Corinth and finally in the bay of Salamis. But Xerxes was not pleased because of the Institute message of Themistocles (against the advice of Artemisia of Halicarnassus) to attack the Greek fleet under unfavourable conditions, instead of sending a part of his ships to the Pelopon- nessus and awaiting the dissolution of the Greek armament. The battle of Salamis (28th of September 480) decided the war (see SALAMIS). Having lost his communication by sea with Asia, Xerxes was forced to retire to Sardis; the army which he left in Greece under Mardonius was in 479 beaten at Plataea (q.v.). The defeat of the Persians at Mycale roused the Greek cities of 480.

Of the later years of Xerxes little is known. He sent out Sataspes to attempt the circumnavigation of Africa (Herod. iv. 143), but the victory of the Greeks threw the empire into a state of languid torpor, from which it could not rise again. The king himself became involved in intrigues of the harem (cf. Herod. ix. 108 f.—compare the late Jewish novel of Esther, in which a remembrance of the true character of the king is retained) and was much dependent upon courtiers and eunuchs. He spent his last days at Perseopolis, where he added a new palace to that of Darius, at Van in Armenia, and on Mount Elwend near Ecbatana; in these texts he merely copies the words of his father. In 465 he was murdered by his vizier Artabanus (g.v.), who raised Artaxerxes I. to the throne.

2. XERXES II., son and successor of Artaxerxes I., was assassinated in 442 after a reign of forty-five days by his brother Sercyadius or Sagdianus, who in his turn was murdered by Darius II. (g.v.).

See Ctesias, Pers. 44; Diod. xii. 64, 71. and the chronographers; neither of the two episcopal kings is mentioned in the canon of Polyam in the days of Babylonian contracts of this time. The name Xerxes was also borne by a king of Armenia, killed about 212 B.C. by Antiochus the Great (Polyb. viii. 25; Johannes Antiochenus, p. 53; his name occurs on copper coins); and by a son of Mithradates the Great of Pontus (Appian, Mithr. 108, 117) (Ed. M.).

XIPHILINUS, JOANNES, epimeteo of Dio Cassius, lived at Constantinople during the latter half of the 11th century a.D. He was a monk and the nephew of the patriarch of Con- stantinople of the same name, a well-known chronicler of his times, Patrologia Graeca, (Appian, Xiphilinus (Xhipylinou); the title of Michael Parapinaeus (1071-1798), but is incompletely incomplete. It comprises books 36-80, the period included being from the times of Pompey and Caesar down to Alexander Severus. In book 70 the reign of Antoninus Pius and the early years of Marcus Aurelius appear to have been missing in his copy, while in books 78 and 79 a mutilated original must have been used. Xiphilinus divided the work into sections, each containing the life of an emperor. He omitted the name of the consuls and sometimes altered or emended the original. The epitome is valuable as preserving the chief inci- dients of the period for which the authority of Dio is wanting.

X-RAY TREATMENT. The X rays (see röntgen) are now used extensively in medical work for purposes of treatment. They have been found to be valuable in many forms of skin disease, more particularly in those of a chronic character. They have a favourable influence upon gout, rheumatism, for example in enlargements of the lymphatic glands, of the spindle cell of the thyroid gland. They give useful palliative effects in certain forms of malignant disease, although it is not yet certain that any permanent cures of cancerous conditions have been obtained by their use. In the disease known as ulcer, which is a process of destructive ulceration, and to that extent presents features allied to cancer, there is no doubt of the efficacy of X-ray treatment for bringing about a complete cure in the majority of cases, provided that the disease has not advanced too deeply into the tissues.

1 Herod. i. 183, by Ctesias changed into a plundering of the belt of Belians or Belus; cf. Aelian, loc. cit., p. 623; H. H. H. 13. 3; Aristobulus ap. Arrian vii. 17. 2, and Strabo xi. 7. 379.

2 Ctesias, Pers. 22; his legendary history is transferred by Herodotus, iii. 190 ff., to the former rebellion against Darius.
X-RAY TREATMENT

The idea of using X rays in the treatment of disease arose from the recognition of the injurious effects which followed the prolonged application of the rays for diagnostic purposes. It fell to the lot of many early workers with X rays to notice the production of an inflammation of the skin, or a falling out of the hair over parts which had been subjected to X rays, and Leopold Freund, of Vienna, has stated that his first attempts to utilize X rays in treatment were made in 1896 to cure a hairy mole and were prompted by what he had read of such occurrences. A definite action of the rays upon the skin having been observed, their employment in the treatment of skin diseases followed as a natural corollary. Amongst the earliest investigators of the possible therapeutic effects of X rays the names of Schiff, Freund, Kienböck, Holtzknecht, Sjögren and Stenbeck may be mentioned. In Great Britain Sir Malcolm Morris, E. Dore and J. H. Sequeira were amongst the earliest investigators.

For operating successfully with an agent capable of producing decidedly harmful effects when given in large doses it is necessary to have some method of measurement, and the need for this quickly became apparent when X rays were used for treatment. The results of X-ray photography had already shown that the tubes employed were capable of emitting radiations of very varying powers of penetration, and that the tubes were by no means constant in this respect; and the question whether highly penetrating rays or rays of feeble penetration were to be preferred for therapeutic use became the subject of much discussion. Recognized tubes were those in which the tissues are those which are absorbed by the tissues, and consequently the softer or less penetrating rays are now regarded as those to be used in treatment. So too the problem of measuring the quantity of rays emitted by a tube during a given time began to call for a solution, if that were in any way possible. In 1901 Benoist designed an apparatus by which the quality of the rays emitted by a tube at any moment could be accurately determined, and in 1902 Holtzknecht brought out the first quantitative device. It was called a chromo-radiometer, and it enabled the dose administered to a patient to be observed, and recorded for future guidance. Holtzknecht also drew up a scale of units by means of which the indications of his apparatus could be interpreted. The units of Holtzknecht's method of measurement consisted in observing the change of colour in certain pastilles when exposed to X rays, and his apparatus consisted of a scale of tints, and a number of pastilles of a yellow tint which acquired a green colour during exposure. The last-mentioned apparatus is universal in X-ray treatment in that devised by Sabouraud and Noire, and used with signal success by them in an enormous number of cases of ringworm, in which disease measurement of dose is of the most critical importance, for the following reason. The cure of ringworm by X rays requires that all the hair of the affected region shall be caused to fall out, but, nevertheless, it is necessary for obvious reasons that the hair should grow again after the disease has disappeared. Now if the dose of X rays be insufficient the hair does not come out and no cure results, while if the dose be too great the hair comes out but does not grow again; and the margin of safety is quite a narrow one. The method of Sabouraud and Noire which has proved itself reliable for such critical measurements of dosage as are required for ringworm treatment, has to-day the universal acceptance of all X-ray workers for other forms of X-ray treatment, although the use of their pastilles has certain disadvantages.

Sabouraud's pastilles consist of small disks of platino-cyanide of baryum. This chemical compound has a bright yellow-green colour when freshly prepared, and changes through gradations of yellow to a brown colour when exposed to X rays. The pastilles are supplied in a book with which a permanent tint of colour is supplied, to indicate the colour change in the pastille which corresponds with a quantity of X rays equal to the maximum dose which the healthy skin will stand without inflammatory consequences. This is often spoken of as a "pastille dose." As the amount of irradiation needed to produce the change of colour is considerable, the salt is fixed, during the treatment, at a point half-way between the source of the rays and the skin surface under treatment. During an exposure the chemical salt, in the form of a small disk of the material on cardboard, is adjusted to the required position by means of a pastille holder, and it is examined at intervals during the course of the exposure, until it has reached the required tint. When in the holder the pastille must be protected from light, and should have a piece of metal as a backing, if its indications are to be accurate.

In X-ray treatment some protection of the surrounding healthy parts is usually necessary. With this object various methods of shielding have been devised, either by coverings of the patient by impermeable materials, or by enclosing the tube in an impermeable box. Both methods are used, but tubes are now manufactured with suitable windows or openings of different sizes for the passage of the pencil of rays which is to fall upon the part under treatment.

The effect of the rays on healthy tissues is in the main a destructive one, but some of the cells of the tissues are more sensitive to the rays than are others; and this permits of a selective effect being obtained, with the destruction of some cells and not of the whole tissue. Young cells, and actively growing cells, are the most susceptible, and for this reason it is possible to influence the glands of the skin and the papillae of the hairs with a dose which will not destroy the skin itself. The art of successful working with X rays is based upon a careful adjustment of the dose so as to secure a selective destruction of the morbid elements, and to avoid wholesale damage to the part treated. The effects of excessive doses of X rays is to produce an inflammation which may result in painful sores which obstinately refuse to heal for many weeks or months. A quantity up to double that of the usual maximum or pastille dose may be employed in urgent cases without risk of any serious damage. Care must be taken not to exceed this dose, and the dosages must be numbered over and over again to be avoided most carefully.

In the treatment of ringworm the exact pastille dose must not be exceeded, for after a dose of about one and a half pastilles the fall of the hair is likely to be followed by permanent baldness.

In X-ray treatment it is customary to make use of moderate currents, and to bring the X-ray tube in its tube-holder and box into position so that the pencil of rays may fall upon the part to be treated. The distance of the skin surface from the centre of the tube must be known, and the pastille arranged in place accordingly. Fifty-centimetres is a usual distance, and at this distance a tube working with a current of a milliamperc should give the full therapeutic dose or "pastille dose" in about 15 minutes. In general X-ray treatment it is quite usual at the present time to proceed by the method of full doses at rather long intervals. From the experience obtained by Sabouraud in numerous cases of ringworm it has been found that a full dose must not be repeated until a month has elapsed. So too in the treatment of rodent ulcer full doses at long intervals are now thought better than smaller doses repeated more often, and such doses are more easily measured by the Sabouraud pastille, which records large doses more simply than small ones, in which the slighter changes of tint are not easy to distinguish.

A great amount of work has been done with X rays for the treatment of cancer, but it is now recognized that the X rays
XYLANDER—YSTUS

889

do not cure a cancer, although they are of value for the relief of pain and for the healing of cancerous ulcers. Diminution of size of the symptom, and application of X rays have been observed, and in some instances sarcomatous tumours have completely disappeared under X-ray treatment. Sooner or later, however, the cancer or sarcoma returns either in the original site or elsewhere, and the patient dies of the disease. It is probable that X-ray treatment is able to prolong life in a fair number of cases, and by its agency in causing a healing of ulceration in cancer cases it is able to give valuable relief both to the body and mind of the patient, and this relief may last for a year or more.

In rodent ulcer X rays are usually sufficient to provide a lasting chill, but there are some exceptions, as for instance when the rodent ulcer has been long neglected, and has spread deeply so as to invade bony structures. An important factor in the successful treatment of rodent ulcer by X rays is to continue the applications at intervals for several months after apparent cure. If this precaution is omitted there is a very great likelihood of relapse taking place later on.

In the treatment of skin diseases by X rays the method finds a very suitable field. Almost all chronic skin affections yield to X-ray treatment fairly quickly, and maximal doses are not usually necessary.

In ringworm X rays have achieved wonderful results. The rays act upon the hair papillae, and not upon the ringworm fungus. They cause a shedding of the hair fifteen days after exposure and the fungus then dies out from the hair follicles, so that when in due course the hair begins to grow again after a period of two months it grows healthily and without disease.

The X-ray treatment of ringworm has been a real advance, and Sabouraud has told us of the enormous pecuniary saving which has been effected in Paris by the shortening of the stay of the ringworm cases in the special schools maintained there for the ailing.

In lupus X rays are valuable, but not fully satisfactory. The treatment by the rays will often succeed in bringing about a healing of the ulceration of lupus, but relapses are frequent, because foci of infection are apt to remain in the healed scar tissue and after a period of quiescence these may gradually provoke fresh mischief.

X-ray treatment is of service for the treatment of enlarged "strumous" glands in the neck. When these glands are in the early stages, and there has not been any softening or breaking down of gland tissue, the application of X rays, a few times repeated in moderate doses, will determine the subsidence of the enlargement and may effect a complete cure.

In the massive glandular enlargements of lymphadenoma a great reduction of the tumours can be brought about by heavy doses of X rays, but the results are to give a symptomatic rather than a real cure, for fresh glandular growths take place internally, and the usual course of the disease is not fundamentally modified.

So too in leukemia, the symptom of excessive abundance of white cells in the circulating blood can be surprisingly altered for the better by X rays, but generally without real cure of the underlying condition. The effect appears to be due to a direct destructive action upon the leucocytes or white corpuscles of the blood.

Quite recently the use of X rays in fibroid tumours of the uterus has been advocated, particularly by Courmelles in France and Albert-Schonberg in Germany. The action of the rays seems to be in part due to their influence upon the activity of the ovaries and in part to a direct effect upon the growing fibroids themselves, causing decrease of activity, relief of symptoms and reduction of the tumour. Frequently

XYLANDER, GUILIELMUS (WILHELM HOLTZMAN, according to his own spelling) (1532—1576), German classical scholar, was born at Augsburg on the 26th of December 1532. He studied at Tübingen, and in 1558, when in a state of abject poverty (caused, according to some, by his intemperate habits), he was appointed to succeed Michylus (Molshem, Molseym or Molsheyn) in the professorship of Greek at Heidelberg, which he exchanged for that of logic (publicus organi Aristotelii interpres) in 1562. He died at Heidelberg on the 10th of February 1576. XYLANDER was the author of a number of important works, among which his Latin translations of Dio Cassius (1558), Plutarch (1560—1570) and Strabo (1571) deserve special mention. He also edited (1668) the geographical lexicon of Stephanus of Byzantium; the travels of Pausanias (1680). Following the edition by F. Syrburg, 1581, he translated the "Ammihalai" of Marcus Aurelius (1583), the "De quattuor mathematicis scientiis" of Michael Psellus into Latin.

XYLENE, or DIMETHYL BENZENE, C6H5(CH3)2. Three isomeric hydrocarbons of this formula exist; they occur in the light oil fraction of the coal tar distillate, but they cannot be separated by fractional distillation owing to the closeness of their boiling points. The mixture can be separated by shaking with sulphuric acid, whereupon the ortho and meta forms are converted into soluble sulphonic acids, the para form being soluble only in concentrated acid; the ortho and meta acids may be separated by crystallization of their salts or sulphon-amides. Orthoxyylene is obtained from ortho-bromotoluene, methyl iodide and sodium as a colourless mobile liquid boiling at 142°, melting at —28°, and having a specific gravity of 0.9832. Para-xylene is obtained from diortho-toluene, dibromomethane, methyl iodide and acid; whilst chloroform gives carbon dioxide and water. Meta- or iso-xyylene, the most important isomer, may be prepared by nucleus-synthetic reactions, or by distilling mesitylene, C6H4(CH3)3, which is produced on the condensation of acetone with lime; this reaction is very important, for it orientates meta-compounds. It boils at 139°, melts at —54°, and has a specific gravity of 0.8812. Para-xyylene is obtained when camphor is distilled with zinc chloride, but it is best prepared from para-bromotoluene and di-bromomethane, methyl iodide and acid.

Dilute nitric acid oxidizes it first to para-toluic acid and then to terephthalic acid. It boils at 138°, melts at 15°, and has a specific gravity of 0.880 at 0°.

XYLOPHONE (Fr. xylophone; Ger. Xylophon, Strohflöte or Holzflöte or Holzharmonika; Ital. armónica de legno), a small instrument of percussion, of definite sonorousness, used in the orchestra to mark the rhythm. The xylophone consists of a series of little wooden staves in the form of a half cylinder and graduated in size. The staves, each of which represents a semitone, rest on two, three or four wooden bars, covered with straw and converging to form an acute angle. They are so arranged that each stave is isolated. In some models the staves are grouped in two rows, comprising the naturals and the accidentals. The xylophone is played with two little wooden hammers, and has a compass of two or three octaves. The quality of tone is inferior to that of the steel harmonica or glockenspiel. (K. S.)

YSTUS, the Greek architectural term for the covered portico of the gymnasium, in which the exercises took place during the winter or in rainy weather; this was known as the ἱλισκόν ἱπποδόμος, from its polished floor (ἱππόδομος, to polish). The Romans applied the term to the garden walk in front of the porticoes, which was divided into flower beds with borders of box, and to a promenade between rows of large trees.
The twenty-fifth letter of the English alphabet, one of four variants (v, v, υ, ϛ) which have been developed out of one Greek symbol. It was taken into the Roman alphabet as a form distinct from V in the 1st century B.C., when it was desired to represent the sound of the Greek υ more accurately than could be done by the ordinary Roman alphabet. Many Greek words had been borrowed from Greek long before this and pronounced like genuine Latin words. Thus the proper name Ἱππος was borrowed as Burreas, Phryges as Bruges. But with the growth of literary knowledge this was felt to be a very inexact representation of the Greek sounds, and the words were respelled as Pyrrhus and Phryges. The philosopher Pythagoras is said to have regarded this letter as a symbol of human life (Servius, on Vergil, Aeneid vi. 136). To this there are various references in the Roman poets. Two lines of Persius (iii. 56-57) seem to throw some light upon the particular form of Y interwoven-

"Et tibi quae Samios didixit littera ramos
surgentem dextra monstrat limite callam."

These lines appear to imply that the letter took the form ϒ, which can only be one of the oldest forms (Y) written from right to left. The sound read in the deviant, the deviating line is the easier path of vice. Anglo-Saxon took over the Roman Y with its Roman value of the "modified w" (ι), and employed it accordingly for the sound which arose from a u sound under the influence of an i in the following syllable: fyllan, "fill," cp. Gothic fuljan; mûs, "mouse," plural màsís, from an earlier lost màsí. The y sounds were often confused with i, whence, in modern English, mice.

The vowel use was the only use of the old symbol. The consonant Y is of a different origin. The early English g (always hard as in gig) was palatalized before e and i sounds into a consonant i (ι) or y, which was written in Middle English with the symbol ϒ. With this letter also was written the original consonant i (ι), which appears in Latin as i (ι) in iugum, iuvencus. This Latin sound seems, at least initially, to have represented two originally separate sounds, for Greek represents the first sound of iugum by ι (ιγνο), while in other words it represents a ι (ι) of other languages by the "rough breathing" ( h or ι): ιγνος, "holy," is the same word as the Sanskrit yajnas. The English words that correspond etymologically to iugum and iuvencus are "yoke" and "young." In Northern English the symbol ϒ survived longer than in the southern part of the island, and in Scottish documents of the 16th century was confused with z. From this cause various Scottish names that were never pronounced with z are so spelt, as Menzies (Mengies), Dalziel, Cadzow. In others like Mackenzie, z is now universally pronounced, though as late as the middle of the 18th century Lord Kames declared that to hear Mackenzie pronounced with a z turned his stomach.

YABLONOI, or Yablonoii ("Apple Mountains," known to the Mongols as Dynae-daban), a range of E. Siberia, stretching N.E. from near the sources of the river Kerulen (N.E. of Urga in N. Mongolia) to the bend of the river Olekma in 56° N., and forming the S.E. border ridge of the upper terrace of the great plateau of Central and E. Asia. Its summits reach altitudes of 3000-6000 ft., culminating in Mount Sokhondo (8040 ft.) near the Transbaikal-Mongolia frontier. The range serves as the water-parting between the streams which flow to the Pacific and those which flow to the Arctic Ocean, and is a dividing line between the Siberian and the Daurian flora. The passes have altitudes of 2000-3500 ft. The range is a continuation of the Kentel Mountains, but is not onographically connected with the Stanovoi Mountains, farther to the N.E., though the names Yablonoii and Stanovoi are commonly used alternatively. The latter are the S.E. border-range of the lower terrace and are connected with the Great Khingan Mountains.

YACHT-W-FU, a prefectural city in the province of Szch'uen, China, in 36° N., 103° E.; pop. about 40,000. It is situated in a valley on the banks of the river Ya, where tea is grown. The town owes its importance to the fact that it stands at the parting of the tea and tobacco trade route to Tibet via Tachien-lu and the cotton trade route to west Yunnan via Ningyuen-Fu. The city wall measures 2 m. in circumference, and is pierced by four gates. Yachow-Fu is first mentioned during the Chow dynasty (1122-255 B.C.).

YACHTING, the sport of racing in yachts and boats with sails, and also the pastime of cruising for pleasure in sailing steam or motor vessels. Yacht racing dates from the beginning of the 19th century; for, although there were sailing yachts long before, they were but few, and belonged exclusively to princes and other illustrious personages. For instance, in the Anglo-Saxon period Athelstan had presented to him by the king of Norway a magnificent royal vessel, the sails of which were purple and the head and deck wrought with gold, apparently a kind of state barge. Elizabeth had one, and so has every English sovereign since. During her reign a pleasure ship was built (1588) at Cowes (Isle of Wight), so that the association of that place with the sport goes back a long time. In 1610 Charles II. of London presented to the Dutch by a yacht named the "Mary" until which time the word "yacht" was unknown in England. The Merrie Monarch was fond of sailing, for he designed a yacht of 25 tons called the "Jamie," built at Lambeth in 1662, as well as several others later on. In that year the "Jamie" was matched for £100 against a small Dutch yacht, under the duke of York, from Greenwich to Gravesend and back, and beat her, the king steering part of the time—apparently the first record of a yacht match and of an amateur helmsman. Mr Arthur H. Clark, in his History of Yachting (1904), traces the history of pleasure craft from 1600 to 1815, and gives an interesting illustrated account of the yachts belonging to Charles II.

The first authentic record of a sailing club is in 1720, when the Cork Harbour Water Club, now known as the Royal Cork Yacht Club, was established in Ireland, but the yachts were small. Maitland, in his History of London (1739) mentions sailing and rowing on the Thames as among the amusements then indulged in; and Strutt, in his Sports and Pastimes (1801), says that the Cumberland Society, consisting of gentlemen partial to this pastime, gave yearly a silver cup to be sailed for in the vicinity of London. The boats usually started from Blackfriars Bridge, went up the Thames to Putney, and returned to Vauxhall, being, no doubt, mere sailing boats and not yachts or decked vessels. From the middle of the end of the 18th century yachting developed very slowly: although matches were sailed at Cowes as far back as 1780, very few yachts of any size, say 35 tons, existed in 1800 there or elsewhere. In 1812 the Royal Yacht Squadron was established by fifty yacht-owners at Cowes and was called the Yacht Club, altered to the Royal Yacht Club in 1820, but no regular regatta was held there until some years later. The yachts of the time were built of heavy materials, like the revenue cutters, full in the fore body and fine aft; but it was soon discovered that their timbers and scantlings were unnecessarily strong, and they were made much lighter. It was also found that the single-masted cutter was more weatherly than the brig and schooners of the time, and the former rig was adopted for racing, and, as there was no time allowance for difference of size, they were all built of considerable dimensions. Early English Yachts.—Among the earliest of which there is any record were the "Pearl," 97 tons, built by Sainty at Wivenhoe near Colchester in 1720, for the marquess of Anglesey, and the "Arrow," 84 tons, originally 61 ft. 93° in. long and 18 ft. 53 in. beam, built by Joseph Weld in 1822, which for many years remained extant as a racing yacht, having been rebuilt and improved in various ways. It was sold in 1873. It is now (1900) the "Aberdour" (Clyde).}

The English word "yacht" is the Dutch jacht, jagt, from jachten, "to hurry," "to hunt." See also Ship and Shipbuilding.
altered several times, and again entirely rebuilt in 1887–88. The Thames soon followed the example of the Solent and established the Royal Thames Yacht Club in 1823, the Clyde founding the Royal Northern Yacht Club in 1824, and Plymouth the Royal Western in 1827. In this year the Royal Yacht Squadron passed a resolution disqualifying any member who should apply steam to his yacht—the enactment being aimed at T. Anstee Smith, an enthusiastic yachtsman and yachtsman, who was having a paddle-wheel steamer yacht called the “Menai,” built on the Clyde. In 1830 one of the largest cutters ever constructed was launched, viz., the “Alarm,” built by Inman at Lymping for Joseph Weld of Lulworth Castle, from the lines of a famous smuggler captured off the Isle of Wight. She was 82 ft. on the load-line by 24 ft. beam, and was reckoned of 193 tons, old measurement, in which length, breadth and half-breadth (supposed to represent depth) were the factors for computation. Some yachtsmen at this time preferred still larger vessels and owned square-top sail schooners and brigs, like the man- o’-war brigs of the day, such as the “Waterwitch,” 381 tons, built by White of Cowes, in 1832, for Lord Belfast, and the “Brilliant,” barque, 403 tons, belonging to J. Holland Ackers, who invented a scale of time allowance for competitive sailing. In 1834 the first royal cup was given by William IV. to the Royal Yacht Squadron. In 1836 the Royal Eastern Yacht Club was founded at Granton near Edinburgh; in 1838 the Royal St George’s at Kingstown and the Royal London; in 1843 the Royal Southern at Southampton and the Royal Harwich; in 1844 the Royal Mersey at Liverpool and the Royal Victoria at London. The number of vessels kept pace with the clubs—the fifty yachts of 1812 increasing nearly tenfold before the middle of the century.

First Alteration in Type.—In 1848, after J. Scott Russell had repeatedly drawn attention to the unwisdom of constructing sailing vessels on the “cod’s head and mackerel tail” plan, and had enunciated his wave-line theory, Mere built at Blackwall an entirely new type of vessel, with a long hollow bow and a short after-body of considerable fullness. This was the iron cutter “Mosquito,” of 59 ft. 2 in. water-line, 15 ft. 3 in. beam, and measuring 50 tons. Prejudice against the new type of yacht being as strong as against the introduction of steam, there were no vessels built like the “Mosquito,” with the exception of the “Volante,” 50 tons, by Harvey of Wyvenhoe, until the eyes of English yachtsmen were opened by the Americans three years later. About this period yacht racing had been gradually coming into favour in the United States, the first yacht club being founded at New York in 1844 by nine yacht-owners; and in 1846 the first match between yachts in the States was sailed, 25 m. to windward and back from Sandy Hook lightship, between J. C. Stevens’s new sloop “Maria,” 170 tons, 100 ft. water-line and 26 ft. 8 in. beam, with a draught of 5 ft. 3 in. of water, and the “Coquette,” schooner, 74 tons, belonging to J. H. Perkins, the latter winning; but the appearance of the “Maria,” which had a clipper or schooner bow, something like that of the racing cutters of 1887–88, did much for yachting in America. Stevens then commissioned George Steers of New York, builder of the crack pilot schooners, to construct a racing schooner to visit England in the year of the great exhibition, and the result was the “America” of 170 tons. She crossed the Atlantic in the summer of 1851, failed to complete for the Queen’s cup at Cowes in August, although the club for that occasion threw the prize open to all the world, as her owner declined to concede the usual time allowance for difference of size. The members of the Yacht Squadron, not wishing to risk the reproach of denying the visitor a fair race, decided that their match for a cup given by the club, to be sailed round the Isle of Wight later in the same month, should be without any time allowance. The “America,” thus exceptionally treated, entered and competed against fifteen other vessels. The three most dangerous competitors being put out through accidents, the “America” passed the winning-post 18 minutes ahead of the 47-ton cutter “Aurora,” and won the cup; but, even if the time allowance had not been waived, the American schooner yacht would still have won by fully a couple of minutes. The prize was given to the New York Yacht Club and constituted a challenge cup, called “the America’s cup,” for the yachts of all nations, by the deed of gift of the owners of the winner. (See below for a complete account of these races."

Not only was the “America” as great a departure from the conventional British type of yacht as the “Mosquito,” but the set of her sails was a decided novelty. In England it had been the practice to make them baggy, whereas those of the “America” were flat, which told materially in working to windward. The revolution in yacht designing and canvassing was complete, and the bows of existing cutters were lengthened, that of the “Arrow” among others. The “Alarm” was also lengthened and turned into a schooner of 248 tons, and the “Wildfire,” cutter, 59 tons, was likewise converted. Indeed there was a complete craze for schooners, the “Flying Cloud,” “Gloriana,” “Lalla Rookh,” “Albertine,” “Aline,” “Egeria,” “Pantomime” and others being built between 1852 and 1865, during which period the centre-board, or sliding keel, was applied to schooners as well as sloops in America. The national or cutter rig was nevertheless not neglected in England, for Hatcher of Southampton built the 35-ton cutter “Glance”—the pioneer of the subsequent 40-tonners—in 1855, and the “Vampire”—the pioneer of the 20-tonners—in 1857, in which year Weld also had the “Lulworth,” an 82-ton cutter of comparatively shallow draught, constructed at Lymping. At this time too there came into existence a group of cutters, called “flying fifties” from their tonnage, taking after the “Mosquito” as their pioneer; such were the “Extravaganza,” “Audax” and “Vanguard.” In 1866 a large cutter was constructed on the Clyde called the “Condor,” 135 tons, followed by the still larger “Oimara,” 163 tons, in 1867. In 1868 the “Cambria” schooner was built by Ratsey at Cowes for Ashbury of Brighton, and, having proved a successful match-sailer, was taken to the United States in 1870 to compete for the America’s cup, but was badly beaten, as also was the “Livonia” in 1871.

The First Great Era of Yacht Racing.—The decade between 1870 and 1880 may be termed the first Golden Age of yachting, inasmuch as the racing fleet had some very notable additions made to it, of which it will suffice to mention the schooners “Gwendolin,” “Cetonia,” “Corinne,” “Miranda” and “Waterwitch”; the large cutters “Kriemhilda,” “Vol au Vent,” “Fornossa,” “Samena” and “Vanduara,” a cutter built of steel; the 40-tonners “Foxhound,” “Bloodhound,” “Myosotis” and “Norman”; the 20-tonners “Vanessa” (Hatcher’s masterpiece), “Quickstep,” “Enriqueta,” “Louise” and “Feda”; and the yawls “Florinda,” “Carissma,” “Julliano,” “Lyonna,” “Julliana” and “Juliana.” These were characteristic of a specially clever design. Built in 1879 from the ideas of Bentall, an agricultural implement maker of Maldon, Essex, she had no dead wood forward or aft, and possessed many improvements in design which were embodied and developed by the more scientific naval architects, G. L. Watson, William Fife, jun., and others in later years. Lead, the use of which commenced in 1846, was entirely used for ballast after 1870 and placed on the keel outside.

Of races there was a plethora; indeed no fewer than 400 matches took place in 1876, as against 63 matches in 1856, with classes for schooners and yawls, for large cutters, for 40-tonners, 20-tonners and 10-tonners. The sport, too, was better regulated, and was conducted on a uniform system: the Yacht-Racing Association, established in 1875, drew up a simple code of laws for the regulation of yacht races, which was accepted by the yacht clubs generally, though a previous attempt to introduce uniformity, made by the Royal Victoria Yacht Club in 1868, had failed. The Association adopted the rule for ascertaining the size or tonnage of yachts which had been for many years in force, known as the Thames rule; but in 1889 they altered the plan of reckoning length from that taken on deck to that taken at the load water-line, and two years later they adopted an entirely new system of calculation.
The Plank-on-edge.—These changes led to a decline in yacht-racing, the new measurement exercising a prejudicial effect on the sport, as it enabled vessels of extreme length, depth and narrowness, kept upright by enormous masses of lead on the outside of the keel, to compete on equal terms with vessels of greater width and less depth, in other words, smaller yachts carrying a deeper draft than their larger contemporaries. This practice was known as the "lead mine" or plank-on-edge type. Of this type were the yaws "Lorna" and "Wendur," the cutters "May," "Annacona," "Sleuth-bound," "Tara," "Marjorie" and "Margarita"—the most extreme of all being perhaps the 40-tonner "Tara," six times as long as she was broad, and unusually deep, with a displacement of 75 tons, 38 tons of lead on her keel, and the sail-spread of a 60-tonner like "Neva."

In 1884 two large 80-ton cutters of the above type were built for yacht-racing, "Genesta" on the Clyde and the "Ire" at Southampton. Having been successful in her first season, the former went to the United States in 1885 in quest of the America's cup; but she was beaten by the "Puritan," which had a moderate draught of 8 ft. 3 in. of water, considerable beam and a deep centre-board. The defeat of the "Genesta" was not surprising; she drew 13 ft. of water, had a displacement or weight of 141 as against the "Puritan's" 106 tons, and a sail area of 788 sq. ft. to the American's 798—a greater mass with less driving power. Still, she did not leave the States empty-handed, as she won the two West India May and British Submarine Reef challenge cups, though they were wrested from her by the "Ire" in the following year. The same thing happened to the "Galatea," which was beaten by the "Mayflower" in 1886. In all classes, British vessels the narrow type was not carried to excess; indeed, as the narrowness of the new yachts increased annually, so did the popularity of racing decrease.

Plank-on-edge Type abandoned.—Prior to 1886 it had been the custom in Great Britain for several reasons to build the yachts deep, narrow, wall-sided, with very heavy lead keels and heavy displacement. The system of measurement had been a tonnage measurement, and under this system designers found, from the knowledge they had then attained from racing trials, that a narrow heavy vessel would beat a wider and lighter craft when both were measured by the tonnage rules. In America this was not the case. There a much lighter and wider form of yacht had been in vogue, having shallower draught and relying upon a centre-board for weatherliness instead of a deep lead keel. Hence in the International contests from 1884 to 1886 for the America's cup and other events the trials were between deep and narrow British yachts and broad American yachts. Even in 1887, when G. L. Watson built the "Thistle," much broader than "Genesta" and "Galatea," this vessel was met and defeated by a far wider and shallower American sloop, namely, the "Volunteer" above referred to. British yachtsmen claimed that their narrow deep-keeled vessels were more weatherly and better sea-boats than the light American sloops, but racing honours rested with the Americans.

In 1887 the plank-on-edge type was completely abandoned in the United Kingdom. Thenceforward, therefore, the old spirited contests between deep British yachts and shallow American sloops ceased. Whilst Britain abandoned her narrow deep type, America soon also began to modify the old shallow centre-board sloop type, and so between 1887 and 1893 the rival types began to converge very rapidly, until the old idea of a race for the America's cup being a test of a British type against an American type completely died out. Races sailed for that trophy, after 1887, were less and less trials of opposing national types, but merely contests between British and American designed yachts built upon the same general principle of similar type.

Dixon Kemp in 1887 induced British yachtsmen to abandon the system of measuring yachts by tonnage and to adopt a new system of rating them by water-line length and sail area. The new system contained no taxes or penalties upon beam or depth nor upon "over all" length. The only factors measured were the water-line and the area of the sails. All the old tonnage rules taxed the length and the breadth. The effect of this change of the system measurement was electrical. It crushed the plank-on-edge type completely. There was not and you not a vestige of it left.

Revival of Yacht-Racing under Length and Sail Area Rule.—Yachtsmen were greatly pleased with the broader and lighter types of yachts that designers began to turn out under the length and sail area rule. They were more comfortable and drier in a seaway than the old vessels. The first large cutters built with considerable beam were "Yarana" and "Petronilla" in 1888, and in 1889 the first of Lord Dunraven's Valkyries was a vessel that was much admired. They in 1896 "Iverna," a handsome clipper-bowed cutter owned by Mr Jameson, came out and raced against "Thistle." Meanwhile, up to 1892 a host of splendid 40-raters had been built; "Mohawk," "Deerhound," "Castanet," "Reverie," "Creole," "Thalia," "Corsair," "White Slave," "Queen Mah" and "Varuna" formed a class of yachts that were never surpassed in British waters. Watson, Fife and Payne were the most successful designers.

While a revival of yachting in the larger classes was notable under the rule Dixon Kemp had originated, the sudden popularity attained in the small classes in the Solent was even more remarkable. It was a new class of small boats—"light with a superb keel"—seventeen feet in length and carrying a sail of about three square yards. These small vessels were designed for racing, and small sailings and regattas were arranged in various localities, to which all the more adventurous yachtsmen came. At Southampton, prior to Dixon Kemp's rule being adopted by the Yacht-Racing Association in 1887, there were some sporting classes which were known as "schooners" and "ketches." These were the small excursion vessels, for afternoons' sailing, and were chosen for the race as they were allowed a large number of yachtsmen, who did not sail their own vessels, but were all provided with a sail. The object of the race was to determine which vessel was the fastest and to make a change of the rules. The ship "Satanita" was the first and is still the only champion of this class, and it was known as the 5-tonner. In 1887, the "Doris," built by Watson in 1885, was 33 ft. 6 in. L.W.L., 6 ft. 7 in. beam, 7 ft. draught; displacement of 12-55 tons; 1681 sq. ft. of sail. The "Yvonne," built by Fife in 1889, was 34 ft. 11 in. L.W.L., 9 ft. beam, 8 ft. 1 in. draught, with a displacement of 12-9 tons and a sail area of 1200 sq. ft. The design of the "Iverna" and "Valkyrie" makes it clear that it is barely possible for such small yachts to succeed, and it was not until the late 1890s that "Iverna," "Iverna" and "Valkyrie" were taken as the standard rule the Solent at once became the fashionable rendezvous for small racing yachts, and the craft known as the Solent classes, 5-raters, 20-raters and 40-raters, flourished greatly.

The Second Great Era in Yachting.—As the years 1870 to 1880 will always be remembered for the great schooners and the glorious fleet of old-fashioned cutters and yaws, which showed such fine sport before they were ousted by the planks-on-edge, so will the seasons following 1892 be identified with the big cutter racing. In that year it was commonly said that yachtsmen would build no more very large cutters. The revival under the length and sail area rule, extended to "Iverna," "Tara," "Petronilla," and "Valkyrie," I being built in the first class, but then there had been a pause of some years during which large numbers of 40-raters, 20-raters and the Solent classes had been built. Just when the critics were declaring that in the future no yachtsmen would build a class racer larger than a 40-rater (60 ft. L.W.L. with 4000 sq. ft. of sail), the prince of Wales (afterwards Edward VII) gave an order for the cutter "Britannia," while Lord Dunraven built "Valkyrie II," Mr. A. D. Clarke built "Satanita," and Mr Peter Donaldson, "Valkyrie III," and in this last season (1893), an American yachtsman took the Herreshoff yacht "Navajo" over the Atlantic. The new vessels averaged 87 ft. L.W.L. and carried about 10,000 sq. ft. of canvas, their beam being as much as 23 ft. They were an entirely different type from "Iverna" or
"Thistle," being developed from the form of the 40-raters "Varuna" and "Queen Mab." The main differences between the "Britannia" and other yachts of her year and the older vessels was that the new yachts had an overhanging shallow-sectioned mizzen or pram bow instead of a fiddle or clipper bow with a wedge-shaped transverse section; the outline of the under-water profile was hollow, sloping in a concave curve from the deep part of the keel under the mast to the forward end of the water-line; the keel was deep, practically developing into a fin. The new vessels skimmed over the waves instead of cutting and plunging through them. The seaworthiness, speed, weatherliness and general handiness for racing purposes of the cutters of 1893 far exceeded all previous results. Yacht designing and building now became a science demanding the highest tax upon the skill and ingenuity of the naval architect. The cutter "Valkyrie II." visited the United States in 1893, but Lord Dunraven's vessel was beaten by the "Vigilant." Curiously enough, when the crack Herreshoff cutters "Navahoe" and "Vigilant" visited the British Isles they were severely beaten by the British yachts. In 1893 the "Navahoe" started 13 times and only won two first prizes. In 1894 "Vigilant" did a little better, but she only won six races in 19 starts. During the years that followed the "Britannia" held a wonderful record:

Some other famous racing yachts which were built under the length and sail area rule were "Allisa" (1894), a first-class cutter designed by Fife, "Isolde," a very beautiful 40-rater for Mr. Donaldson by the same designer, "Cares," a 40-rater by Watson, and the 30-raters "Audrey," from Lord Dunraven's own model, "Niagara," by Herreshoff, and the "Sibbick"-designed 5-rater "Norman," owned by Captain Orr-Ewing. Since the introduction of Dixon Kemp's rule the smaller classes from 20-rating right down to 1-rating had been built in great numbers, but whilst these classes had flourished exceedingly, the type of boat built had developed a very peculiar form. Each succeeding craft was made lighter and lighter in weight and more extreme in the overhang at the bow and stern. The stability was now attained by means of a cigar-shaped piece of lead placed at the bottom of a steel plate or fin, the hull of the boat being nothing more than the bowl of a dessert spoon resting upon the water.

**Pin and Ball Keels. Downfall of Length and Sail Area Rule.**

It was apparent in 1895 that if plate and bulb skimming-keel craft were to win all the races in the 30-rating and larger classes, it would be easy to design a modified form of fin and bulb yacht to beat "Isolde," "Britannia" and "Allisa" in the larger classes. It was equally obvious that a skimming-dish of "Britannia's" or "Isolde's" rating would be an utterly useless machine with no cabin accommodation or head room, and that the evolution of such type would be as bad for the sport as the development of the old plank-on-edge had been in 1885. It seemed strange that whilst the old tonnage rule had evolved the plank-on-edge ten years previously, the sail area measurement now evolved a plank-on-side, balanced by a fin. The fact was that designers had solved the problem. The rule measured only the length and the area of canvas. Taking the length of the vessel on the water-line as constant, then the vessel with the smallest possible weight could be driven with less sail at the same speed as vessels with greater weight and greater sail. This solution of the problem was not apparent to designers from 1880 to 1885, because of the difficulty of obtaining stability. From 1880 to 1885 stability was obtained by means of very heavy keels. In 1895 the stability was obtained by means of a light piece of lead placed at the bottom of a deep steel fin. "Navahoe" and "Vigilant" were among the first cutters "(5-raters)" so thus built. They were wonderful sailing machines in heavy weather,—fast, powerful, handy and efficient in all weathers.

But if head room and cabin accommodation are considered essential parts of a yacht these fliers, as "yachts," were entirely inefficient.

**The First Linear Rating Rule.**—To endeavour to check the tendency to build skimming-dishes the Yacht-Racing Association introduced in 1896 a new system of measurement which was proposed by Mr. R. E. Froude. The novelty of the system consisted of a tax upon the skin-girth of the yacht, whereby a vessel with hollow midship section was penalized by her girth being measured round the skin surface. Froude's first system of rating began on the 1st of January 1896 and ended at the close of the year 1900. It therefore had a career of five seasons. The measurement of the yacht was obtained by the following formula:

$$\text{Length} \cdot \text{L.W.L.} + \text{beam} + \frac{1}{2} \text{skin girth} + \frac{1}{2} \text{stay area} = \text{linear rating}.$$  

This rule partially failed in its object. It was hoped that the skin-surface measurement would prevent the fin-bulb type being successful, but Froude and his colleagues had under-estimated the possible developments of exaggerated pram bows, immense scow-shaped shoulders and steep-waterlines, on which a vessel could be introduced into the skimming-dish type with great success. So, notwithstanding the small premium on displacement this rule contained, the dishes could still beat the full-bodied yachts.

Yachts built in the small classes were very shallow bodied, and in the 20-rating and 40-rating, now called the 52 ft. and 65 ft. classes respectively, showed surprisingly, that all but the 52-footers in the large classes were undoubtedly well formed and useful yachts; indeed in the larger classes the rule seems to have checked excesses. Under this rule in 1896 the German Emperor ordered a huge first-class cutter, the "Meteor II.," from Watson. By sheer size and power this vessel out-sailed "Britannia." She carried a main boom of 96 ft. long against the "Britannia's" boom of 91 ft. In 1900 Watson designed another great cutter called the "Distant Shore," the same size as "Britannia," but she was not launched until 1901. In 1896 also Watson crowned all his previous successes by turning out the yawl "Sybaris," the same size as "Meteor." "Senta Tutty," "Pilates," and "Asrat," were among the 65-footers, and "Penitent," "The Saint," "Morning Star," and "Senga" about the best 52-footers. Probably the yacht which emphasized the possibilities of the rule more than any of her contemporaries was Captain Orr-Ewing's 36-footer "Sakunila," built by Sibbick. She was a complete scow-shaped skimming-dish. The 30-footers "Marjory" and "Flatfish" were similar craft, and they outsailed everything in their respective classes in the Solent. Many fine vessels were launched in 1893, not by Watson nor Herreshoff, but by W.L. Brown, Daniel Smith, and Alfred Benzon, a Danish scientist and yachtsman. The rule, so far as the development of a full-bodied cabin yacht went, proved very successful. It had certain marked faults: the measurement of the girth at a fixed station caused a shallowness of keel at that particular spot, and there was no check upon the full pram bows, which when introduced into vessels of heavy displacement strained the ships terribly as they smashed into a heavy seaway. The new racing yachts generally, however, from 1896 onwards, proved worthy and fast vessels.

As an instance of what could be done with them, in 1901 a memorable match was sailed on the Clyde between the Watson cutter
YACHTING

"Kairi", (originally the "Distant Shore", previously mentioned) and the same designer's 90-foot yawl "Sybarita." It was blowing a gale at the time, and as the yachts raced past at speeds of 10 to 15 knots, they put back, a distance of 75 m., averaging 12-3 knots, with closed reeled sails, housed topmasts and in a mountainous sea. Several steam yachts attempted to follow, but all put back, owing to the same reasoning as that of the racing yachts. This yawl had the advantage of being the larger vessel, and "Sybarita" on this occasion won one of the greatest races ever recorded in Scottish waters.

Class 1: Racing, Handicapping and Cruiser Racing.—Yacht racing may be subdivided under these three heads. Yacht racing by rating measurement or tonnage, when either the first yacht to finish is the winner, or the yacht saving her time by a fixed scale of time allowance in proportion to the rating of the vessel and the length of the course, is called class racing, and it obviously tends to encourage the fastest possible vessel under the current rating rule to be produced. It has always been regarded as the highest form of the sport. It is naturally, however, the most expensive form, because only the most up-to-date and perfectly equipped vessels can keep in the first flight.

From time to time, chiefly from about the years 1884 and 1885 onwards, handicaps framed according to merits have been fashionable amongst yachtsmen. They were originally devised to afford amusement and sport to owners of second-class yachts who obviously did nothing to encourage owners to build very fast vessels, nor to stimulate improvement in design. When a handicap is allotted to each yacht entered specifically on the basis of weight and most ill-designed craft should have an equal chance with the best. Nevertheless, owing to the expense of class racing, handicap racing thrived greatly during the period of the first and second Girih Rules. During these years second- and third-class racing came into vogue, namely cruiser racing: either very fast cruisers were built specially for the purpose of handicap racing, or a number of yachts of exactly similar design were built specially to compete under the handicap rules. The fast handicap cruisers had the great advantage over class racers from 1896 up to 1906, inasmuch as they were much more strongly built, and held their waterline better, than were the older boats, thus allowing them to record faster times. The fast handicap cruisers were capable of making an average of 10 knots for more than 100 miles, and were considered to be a well-made, well-constructed vessel of her type. In form they did not differ vastly from the racers of their period, but in scantling of hull, fittings, ballwarks and rig they were more comfortable and better than any other class-racing sisters. It was obvious in the larger classes that many yacht-owners were not prepared to put up with the discomfort of the thin-skinned racer. During the whole period of the Girih Rules (1896-1906), while the class racers developed a good enough form of body—they were latterly yachts with plenty of cabin-room—they were necessarily built in the lightest possible construction and with the smallest decks for the sake of saving weight. The light scantling began to tell severely upon large yacht racing. Meanwhile, in the small classes, the Solent one-design class, South Coast one-design class, numerous berries, and the like, were clothed in the most well-mannered and substantial Appendage covings of all periods, and others, show how an inexpensive form of cruiser racing had usurped the place of class racing and competitive designing. Many yachtsmen were really of handicap racing, as the ratings of the place of the higher form of class racing the whole sport of yachting must soon deteriorate. It was obvious that had handicap racing and the one-design principle been seriously introduced in 1890 or 1896 and obtained a strong hold on yachtsmen such improved types as the modern cruisers of 1906 would never have evolved. For all the best cruisers, even the "Valdora" and the ketches "Cariad I." and "Cariad II." are but modified types evolved from the crack racers. Hence yachtsmen began to give careful attention—during the early period of the Second Linear Rating rule—to suggestions that in the future every class-racing yacht should satisfy the conditions of the new ratings, and for all the various scantlings, so that her hull should be as strong as a bona fide cruiser.

Yachts Built under the Second Linear Rating Rule.—A few large vessels were built expressly for racing under this rule; indeed the Fife 63-footer "Zinna" (1904) was the only light-scantling yacht of any importance. However, two very handsome first-class vessels were constructed to the rule: "White Heather I." by Fife in 1904, and "Nyria" by Nicholson in 1906. They were some 12 ft. shorter than the great cutters "Heather II." and "Lloyd's," having lines all round and draught and some 1700 sq. ft. less sail area. To these two growing dissatisfaction of yacht-owners at the extreme light scantling of modern racing yachts was strongly demonstrated by the fact that both "White Heather I." and "Nyria" were specially ordered to be of heavy scantling, and they were classed A1 at Lloyd's. They were therefore of the semi-cruiser type. "Nyria," however, was the extreme type of a yacht of her period in shape, although heavy in construction. The only conspicuous fault to be found with the form of the racing yachts under the rule was a skimping of the mean draught and an exaggeration of the full pram-shaped overhanging bow.

The 52-footers were a very popular class. Fife made a great advance in yacht architecture with a 52-foot cutter called the "Maligne." (1901). All the other successful vessels under the rule—"Camelius" (Payne), "Luccia" and "Maymon" (Fife), "Moyana" and "Britomart" (Mylne), and the first-class cutter "Nyria"—followed her closely in design. An important trial took place in 1906, when the first-class cutter "Kairi" (1906) was brought out to compete with "Nyria" and "White Heather I.," and decidedly out-sailed—to show that yacht architecture had steadily improved in the past six seasons.

International Rules Introduced.—In April 1904 Mr Heckstall Smith drew the attention of German, French and British yachtsmen to the fact that the yacht measurement rules (then different in the various countries) were generally due to terminate about the end of 1907, and suggested that many advantages would accrue if an international rule could be agreed upon.

The Yacht-Racing Class was discussed at a meeting at London and at two International Conferences, held in London in January and June 1906, an international rule of yacht measurement and rating was unanimously agreed to by all the nations of Europe. America alone refused to attend the Conference. Mr R. E. Froude struck the keynote of the object of the Conference by statement that the ideal yacht should be a vessel combining "habitability with speed." The truth of this axiom was generally accepted. Old plunk-on-edge types under the tonnage rules were habitable but slow. Skimming-dishes attained the maximum speed, but were uninhabitable. Neither, therefore, attained the ideal type. A good form was attained in 1901 with "Maligne," but since that year the bane of light construction had become harmful to yachting. Hence the conference aimed at a rule which would produce a yacht combining habitability with speed. They adopted a form of linear rating comprising certain penalties upon hollow midship section (i.e. Benzoni's d) tax and also upon full pram bows. The following was adopted as the rule by which all racing yachts in Europe are rated:

\[
L + B + \frac{1}{2} G + \frac{3}{2} + 1 V + S + F = \text{ Rating in linear units, i.e. either ft. of}
\]

Where \(L = \text{Length in linear units.} \)
\(B = \text{Beam in linear units.} \)
\(G = \text{Girth in linear units.} \)
\(V = \text{Volume in cubic units.} \)
\(S = \text{Sail area in square units.} \)
\(F = \text{Freeboard in linear units.} \)

The length \(L\) for the formula is the length on the water-line, with the addition (1) of the difference between the girth, covering-board to covering-board, at the bow water-line ending, and twice the freeboard at that point, and (2) one-fifth of the difference between the girth, covering-board to covering-board, at the stern water-line ending, and twice the freeboard at that point. The additions (1) and (2) penalize the full overhangs and the bow overhang in particular. The girth, \(G\), is the chain girth measured at that part of the yacht at which the measurement, is greatest, less twice the freeboard at the same station, but there are certain provisions allowing the measurement of girth generally to be taken 0-55 from the bow end of the water-line. The girth difference, \(d\), in the formula, is the difference between the chain girth, measured as above described, from covering-board to covering-board, and the skin girth between the same points, measured along the actual outline of the cross-section.

In racing the yachts are divided into eleven classes. Class A1 for schooners and yawls only, above 23 metres (75 ft) of rating, with a time allowance of four seconds per metre per mile. All the yachts in this class must be classed A1. In racing, yawls sail at their actual rating and schooners at 12% less than their actual rating. The other classes are the ten
separate cutter classes, in which there is no time allowance whatever:

Under the international rule the old trouble of ultra-light sculling in racing yachts has been completely abolished, for all yachts must be built under the survey and classed with one of the three classification societies—Lloyd's Register of British and Foreign Shipping, Germanischer Lloyd, or Bureau Veritas; and yachts of the international cutter classes enumerated above so built will be classed R., denoting that their scullings are as required for their respective rating classes. This rule was introduced on the 1st of January 1908; England, Germany, France, Norway, Sweden, Denmark, Austria-Hungary, Belgium, Holland, Italy, Spain, Finland, Russia and the Argentine Republic agreed to adopt it until December 31st, 1917. England adopted the new system a year before it formally became international, on the 1st of January 1907.

**Racing Yachts Built under the International Rule**—The new rule produced the type of yacht desired—a vessel combining habitability with speed. Amongst the handsomest examples were the German Emperor's schooner “Meteor” (1909), and the schooner “Germania” (1908), 400 tons or 31½ feet measurement, Class A, both built by Krupp’s at Kiel. German designed, German built, and German rigged and manned, they demonstrated the wonderful strides made by Germany in yachting. A few years before there were not a dozen smart yachts in Germany, and indeed the Kaiserlich Yacht Club at Kiel was only founded in 1887. The “Germania” holds the record over the old “Queen’s course” at Cowes, having in 1908 sailed it a quarter of an hour faster than any other vessel. Her time over the distance of about 47 to 48 nautical m. was 3 hours 35 min. 11 secs., or at the rate of 13-1 knots. In 1910 Herrchenhoff built a wonderful racing schooner of A class for the international rules called the “Westward,” and in the races this Yankee clipper sailed at Cowes she proved the most weatherly schooner ever built.

It is interesting to recall some old records of speed over courses inside the Isle of Wight.

In 1907, 1908, 1909 and 1910, 380 yachts were built under the international rules—A class, 23; 25 metres class, 3; 15 metres class, 15; 12 metres, 21; 10 metres, 33; 9 metres, 17; 8 metres, 83; 7 metres, 46; 6 metres, 144; and 5 metres, 22. The 23-metre cutters “Shamrock,” designed by Fife (1908), belonging to Sir Thomas Lipton, “White Heather II.” (Fife, 1907), owned by Mr Kennedy, and “Brynhold” (Nicholson, 1907), owned by Sir James Pender; and also “Ostara,” 15 metres (Mylne, 1909), owned by Mr W. P. Burton; “Hispania,” 15 metres (Fife, 1909), owned by the king of Spain; “Alachie and Cintra” (Fife) in the 12-metre class, have been amongst the best yachts built for the international rules. During the seasons of 1908, 1909 and 1910 there was splendid sport in England, Germany, France, Belgium, Norway and Sweden, and indeed all over the continent; the yachts were very closely matched, the 15-metres (49-2 ft.), 8-metres (36-2 ft.) and 6-metres (19-7 ft.) proving perhaps the most popular. The national authorities of the countries which adopted the international rules in 1906 have now formed an International Yacht-Racing Union, under the chairmanship of the British Yacht-Racing Association.

**Yacht Building Statistics.**

The number and tonnage of yachts shown on Lloyd's Register (1909) as built in the several countries are as follows:

American yachts of 75 gross registered tons and upwards are included under "Other Countries"; the number of these yachts built in America is 248 of 57,119 tons.

In 1909, in the United Kingdom, from January to May, the time of the year when yachts are generally constructed, there were building, or built, 27 steam yachts of 3471 tons, and 25 sailing yachts of 963 tons; this includes only yachts of 100 tons and upwards. Excluding the small craft built in America, particulars of which are difficult to obtain, there were on the register 7508 yachts with a tonnage of 377,427. In 1887 there was a total of about 3000 yachts on the register with a tonnage of 132,718. Since that date, therefore, in round figures, 1500 had been added to the number and more than 100,000 tons to the tonnage. This fact seems to show clearly the extension of the pastime of yachtling.

The America's Cup.

This international trophy was originally a cup given by the Royal Yacht Squadron at Cowes, Isle of Wight, on the 22nd of August 1851, for a race open to all yachts, with no time allowance of any kind, the course being "round the Isle of Wight, inside the No Man's bay and Sand Head buoy and outside the Nab." Fifty vessels took up their stations off Cowes and started from moorings. In the table on the following page are the names of the competitors. The fleet started at 10 o'clock. At the No Man's bay the yachts were in a cluster, "Volante" leading, then "Fores," "Aurora," "Gipsy Queen," "America," "Beatrix," "Alarm," "Arrow" and "Bacchante" in the order named. The other six brought up the rear, and the "Wyvern" returned to Cowes. Passing out to the
Y A C H T I N G

The deed of gift, however, is an elastic document, for it contains the following clause which is known as the Mutual Agreement Clause: The club challenging for the cup and the club holding the same may by mutual agreement vary the rules in respect to both as to the dates, courses, number of trials, rules and sailing regulations, and any and all other conditions of the match, in which case also the ten months' notice may be waived.

Mr James Nelstorp, who had challenged with the schooner "Cambria," and in 1871 with another schooner the "Lionia." In both cases the event was a test of rive types, "Cruiser" and "Cutty" types of vessels, while the vessels they met were the pick of the American and broader and shallower types. "Cruiser" had to meet fourteen opponents, but in 1871 the "Lionia" raced against one opponent only. The American yacht,"Cruiser", however, had an advantage over the "Lionia," brought several yachts up to the line and only selected their defender at the last moment. The first defender who met the "Lionia" had to be the "Columbia," which won the first and second events and even in the case of a strong wind the British schooner hammered the "Columbia" severely, and eventually the American yacht, having carried away some gear, was beaten by a quarter of an hour. The two remaining races of the series the Americans were represented by the "Sappho," which easily defeated the "Lionia." The next challenges came from Canada in 1876 and 1881, but neither the schooner "Genesee" nor the sloop "Atlanta" met with any success.

The race of 1885 and 1886, when Sir Richard Sutton challenged with the yacht "Thistle" against the "Cruiser," was particularly interesting chiefly because they were of the nature of trials between the heavy plank-on-edge type of cutter and the prevailing American type of broad light-draught sloop. The contests proved the superiority of the English yacht in every department.

In 1886 the plank-on-edge type was abandoned in England, and when the Scottish yacht, "Thistle," was built in 1887 to challenge for the cup it was hoped that she would meet with success. "Thistle," however, although of greater beam and proportionately lighter displacement than such vessels as "Genesee" and "Galatea," was quite easily defeated by the centre-board sloop, "Volunteer." The first of the big American type again defeated this English yacht, a case which seems to show that the American type prevail even against the modified form of the "Thistle."

The race between the "Thistle" and "Volunteer" of 1887 may be said to have been the last race for the cup wherein there were Engish yachts on both sides. In all subsequent races the form of the challenger and defender became approximately similar, but while the types were gradually converging the American yachts were still usually somewhat lighter in displacement than the challengers. The "Thistle" was the first vessel built in Great Britain expressly for the match, and after her race in 1887 the types in fashion on both sides of the Atlantic rapidly converged, and deep-draught fin-keeled vessels with deep fins and light shallow hulls took the place of the former types of the shallow American sloops and deep-keeled wall-sided British cutters. In 1892 some splendid semi-fin-keeled cutters of the new pattern were entered, and the British yachtsmen, with their characteristic "Vigilant," crossed the Atlantic and raced in British waters in 1894 against the "Britannia," and was frequently beaten. G. L. Watson, who had designed "Thistle" and "Valkyrie II," as well as "Britannia" was commissioned by Lord Dunraven to design "Valkyrie III." specially for an "America's cup" race in 1895. "Valkyrie III." was a very extreme fin-keeled boat, and for the first time the challenger appeared to have outbuilt the defending designer. "Valkyrie III." was 13', 4270, of silt to the American "Defender" 12', 602. It was said that the Watson boat actually had less displacement. Both were 90 f. with "Valkyrie III." being 120 f. all against "Defender" s 12', and "Valkyrie III." 26', 2 f. beam against "Defender" 23', 0 ft. The races were unsatisfactory. In the first race Lord Dunraven claimed that "Valkyrie III." was hampered by the wash of "Defender". In the second race "Valkyrie" left "Defender" by 49 seconds on the corrected time and actually by 1 m. 14 sec., but there was a foul at the start in which "Defender" was partially disabled. In the third race "Valkyrie" was disqualifie by the English officials, which was counted to "Defender." In the third race Lord Dunraven objected that ballast had been added to the American yacht since measurement, which was allowed, for "Valkyrie III." had already crossed the line, and retired, giving the "Defender" the match.

In 1899, 1901 and 1903 Sir Thomas Lipton tried to win the cup.
with three very costly and extreme vessels, "Shamrock I.,” "Shamrock II.” and "Shamrock III.” No. I. and No. III. were designed by W. Fife, and No. II. by G. L. "Watson. In 1899 "Shamrock I.” was rather easily defeated by "Columbia. In 1901 the Americans were not especially successful in building the vessel which they had prepared to defend the cup, and in the trial races the old 1899 yacht "Columbia,” sailed by Captain Charles Hurry—a half-brother of the skipper of the Scottish yacht "Thistle"—defeated the new vessel "Constitution,” which had been built for the defence of the trophy for 1901: consequently the New York Yacht Club again selected the "Columbia” to defend the cup against "Shamrock II.” After very close racing the "Columbia” —which was the better handled boat—retained the prize.

The next contest for the cup was in 1903. On this occasion Herreshoff turned out in "Reliance,” a wonderful example of a large fin-keeled boat with full pram-bow and light skimming-dish hull. She was of the lightest possible construction (bronze with steel web frames), 90 ft. length L.W.L., 144 ft. length over all, with 16,160 sq. ft. of sail area, 25 ft. 10 in. beam, and a draught of 19 ft. 9 in. "Reliance” was a far more extreme vessel than "Shamrock III.” The latter had a deeper body and less prammed overhang forward. With the same water-line as "Reliance,” the English yacht had rather over a foot less beam. The chief difference in dimensions, however, was in the sail area. "Shamrock III.” carried 14,437 sq. ft., or 1823 sq. ft. less than "Reliance.” The result was a very easy victory for the "Reliance.”

* Rereamed. † Disqualified for fouling “Defender.” ‡ Withdrawn on crossing the line. § Carried away topsmast and withdrew. (B. H.-S.)
YAK—YAKUTSK

Yak, the wild (and domesticated) ox of the Tibetan plateau; a species nearly allied to the bison group. The yak, Bos (Poephagus) grunniens, is one of the finest and largest of the wild oxen, characterized by the growth of long shaggy hair on the flanks and under parts of the body and the well-known bushy tail. In Europe a false impression of the yak is prevalent, owing to the fact that all the specimens imported have belonged either to a small domesticated breed from Darjiling, or to half-breeds; the latter being generally black and white, instead of the uniform black of the pure-bred and wild animal. None of such half-breeds can compare with the magnificent half-tamed animals kept by the natives of the elevated Rupsu plateau, S. of the Indus, where they afford the only means of transport by this route between Ladak and India. But even these are inferior to the wild yak, which stands nearly 6 ft. at the shoulder, and is absolutely confined to the arid central plateau of Tibet. Yak have the great disadvantage that they will not eat corn, and the large pure-bred animals will not live at low elevations. The tails are used in India as fly-whisks, under the name of chowries. The title of “grunting ox” properly belongs only to the domesticated breed.

YAKUB KHAN (1840- ), ex-amir of Afghanistan, son of the amir Shere Ali, was born in 1840. He showed great ability at an early age, and was made governor of Herat by his father, but broke out into open rebellion against him in 1870, and was imprisoned in 1874 in Kabul. However, when Shere Ali in 1878 fled before the British, he handed over the government to Yakub, who, on his father’s death in the following February, was proclaimed amir, and signed a treaty of peace with the British at Gandamak. He agreed to receive a British resident, and was in turn to receive a subsidy and support against foreign attack. But in September of the same year his revolted troops attacked the British residency, and the resident, Sir Louis Cavagnari, and his staff and suite were cut to pieces. This outrage was instantly avenged, for in October Earl (then Sir Frederick) Roberts with a large force defeated the Afghans on the 6th and took possession of Kabul on the 12th. Yakub Khan thereupon abdicated, took refuge in the British camp, and was sent to India on the 13th of December.

YAKU-SHIMA, an island belonging to Japan, lying S. of Kyushu, in 30° 30' N. and 130° 30' E. It is an irregular pentagon, 14 m. in width and the same in length. It is separated from Tanega-shima by the Vincennes Straits (Yaku-kaiyō), 124 m. wide, and its surface is broken by lofty mountains, of which Yae-dake rises to a height of 6,615 ft., and Eoboshi-dake to a height of 4,840 ft. It is covered with dense forest, in which are some of the finest cryptomeria in Japan, known as Yaku-sugi.

YAKUTSK, a province of E. Siberia, including nearly the whole of the basin of the Lena, and covering an area of 1,530,255 sq. m. It has the Arctic Ocean on the N., the governments of Yeniseisk and Irkutsk on the W., and Irkutsk and Amur on the S., and is separated from the Pacific (Sea of Okhotsk) by the narrow Maritime Province. The Vitim plateau, 2500 to 3500 ft. in altitude, bordered on the S.E. by the Stanovoi Mountains, occupies the S.E. portion of the province. Its moist, elevated valleys, intersected by ranges of flat, dome-shaped hills, which rise nearly 1000 ft. above the plateau, form an immense desert of forest and marsh, visited only by Tungus hunters, save in the S.W., where there are a few gold-mining settlements. The high border-ridge of the plateau (see Siberia) stretches from the South Muya Mountains towards the N.E., and is separating the river Aldan to make a great bend in that direction. An alpine country skirts the plateau all along its N.W. margin, and contains productive gold-mines in the spurs between the Vitim and the Lena. The latter stream drains the outer base of this alpine region. It is a wild land, traversed by several chains of mountains, all having a N.E. strike, and intersected by deep, narrow valleys, down which the mountain-streams tumble uncontrolled. The whole is clothed with dense forests, through which none but the Tunguses can find their way. The summits of the mountains, up to 2000 ft., mostly consist of tufa stone, but in no case pass the snow-line. The summits and slopes alike are strewn with débris of crystalline rock, mostly hidden under thick incrustations of lichens, amid which the larch alone is able to find sustenance. Birch and aspen grow on the lower slopes; and in the narrow valley bottoms thicketts of poplar and willow or patches of grass spring up on the scanty alluvium. All the necessaries of life for the gold-diggers have to be shipped from Irkutsk down the Lena, and deposited at entrepots, whence they are transported in winter by means of sledge and runners, and in summer by the river. A line drawn from the mouth of the Vitim N.E. towards that of the Aldan separates the mountain regions from the elevated plains (1500 to 2000 ft.) which fringe the highlands all the way from the upper Lena to Verkhne-Kolymsk, and probably to the mouth of the Kolyma. Vast meadows, sometimes marshy, extend over these plains in the S.W.; farther N. mosses and lichens are the predominant vegetation. The surface is much furrowed by rivers and diversified by mountain-chains (Verkhoyansk, Kolymsk and Alazeya) about the real character of which little is known. Beyond the elevated plains vast tundras, carpeted with mosses and lichens, stretch to the shores of the ice-bound ocean.

The Arctic coast is indented by several bays—Berkhaya and Yana E. of the Lena delta, and Omulukt, Kolyma and Chul until farther E. The islands fall into three groups—the Lyakhov, the Anjou or New Siberian and the De Long Islands. The Medveyzech (Bear) Islands and off the Bay of Anadyr the Kolyma Bay are merely litoral. Wrangled Land seems to be the outer island of a great and as yet unknown archipelago. Every year a narrow passage close to the coast is left almost free of ice, enabling a ship or two sometimes to reach the estuary of the Yenisei, or even the delta of the Lena.

The great artery of Yakutsk, the Lena, rises on the W. slope of the Baikal Mountains, close to Lake Baikal. About 60° N. it receives from the right its first great tributary, the Vitim (1250 m. in length), which is navigable by steamers in its lower course. The Olekma (700 m.) is navigable only in the very lowest part of its course, and the Aldan (1450 m.) is navigable from Ust-Mai to Yeniseisk. On the left is the Viluy (1300 m.), which has an immense drainage area on the lower plains, and has been navigated since 1887. The lower course of the Lena is subject to terrible inundations when the ice breaks up on its upper reaches. The Olenek (1200 m.), which enters the Arctic Ocean to the W. of the Lena, is also a considerable river; the Yana (750 m.), Indigirka (950) and Kolyma rivers rise in the mountainous region between 61° and 62° N., and flow N. and E. into the Arctic Ocean.

The granites, granitic syenites and gneisses of the high plateau are wrapped about by a variety of crystalline slates, Huronian and Lower Devonian shales and sandstones, all of which extend over vast areas. Farther N. the Carboniferous, Cretaceous and Jurassic formations are spread over a wide region, and the whole is covered with Glacial deposits in the highlands and with post-Glacial elsewhere. The mineral wealth of Yakutsk is very great; but gold and salt (obtained from springs) only are worked. Coal has been discovered on the Viluy and on the lower Lena.

Yakutsk has unparalleled extremes of cold and heat. At
The founders of the New Haven colony, like those of Massachusetts Bay, cherished the establishment of a college as an essential part of their ideal of a Christian state, of which education and religion should be the basis and the chief fruits. New Haven since 1644 had contributed annually to the support of Harvard College, but the distance of the Cambridge school from southern New England seemed in those days considerable; and a separate educational establishment was also called for by a divergent development in politics and theology. Yale was founded by ministers selected by the churches of the colony, as President Thomas Clap said, to the end that they might "educate ministers in our own way." Though "College land was set apart," Yale College did not begin until 1700 when a few clergymen, who had "assembled" in the New Haven settlement, to "stand as trustees or undertakers to found, erect and govern the College," for which at various times donations of books and money had been made. The formal establishment was in 1701. The Connecticut legislature in October granted a charter which seems to have been partly drafted by Judge Samuel Sewall of Boston; the Mather family also were among those in Boston who welcomed and laboured for the establishment of a seminary of a stricter theology than Harvard, and the ten clergy who were the founders and first trustees of the College were graduates or members of the New Haven clergy.

The legislature, fearful of provoking in England attention either to the new school or to the powers used in chartering it, assumed merely to license a "collegiate school," and made its powers of conferring degrees as unobtrusive as possible. In 1702 the teaching of Yale began. In the early years the upper students studied where the rector lived, and considerable groups of the lower students were drawn off by their tutors to different towns. In 1716 the trustees purchased a lot in New Haven, and in the next year the College was established there by the latter part of 1719. "The College, and was held at New Haven until the purpose "to aid in the education of clergy. This had been made possible by a gift from Elihu Yale (1649-1721), a native of Boston and son of one of the original settlers of New Haven; he had amassed great wealth in India, where he was governor of the East India Company's settlement at Madras. The trustees accordingly named it Yale College in his honour.

The charter of 1701 stated that the end of the school was the instruction of youth "in the arts and sciences," that they might "be "for public employment, both in church and civil state." To the clergy, however, who controlled the College, theology was the basis, security and test of "arts and sciences." In 1722 the rector, Timothy Cutler, was dismissed because of a leaning toward Episcopacy. Various special tests were employed to preserve the doctrinal purity of Calvinism among the instructors; that of the students was carefully looked after. In 1753 a stringent test was fixed by the Corporation to ensure the orthodoxy of the teachers. This was abolished in 1778. From 1808 to 1818 the President and tutors were obliged to signify their consent to a general formulation of orthodox belief. When George Whitefield, in 1746, initiated by his preaching the "Great Awakening," a local schism resulted in Connecticut between "Old Lights" and "New Lights." When the College set up an independent church the Old Lights made the contention that the College did not owe its foundation to the original trustees, but to the first charter granted by the legislature, which might therefore control the College. This claim President Clap triumphantly controverted (1763), but Yale fell in consequence under popular distrust, and her growth was delayed by the shutting off of financial aid from the legislature and civil state.

By the first charter (1701) the trustees of the College were required to be ministers (for a long time, practically.

1 In 1668 the Hopkins Grammar School, next after the Boston Latin School the oldest educational institution of this grade in the United States, was established in New Haven.

2 This number was increased to eleven, the full number allowed by the charter, within a month after it was granted.
YALE UNIVERSITY

Congregationalists) residing in the colony. By a supplementary act of 1723 the rector was made ex-officio a trustee. By a second charter (1745) ample powers were conferred upon the president (rector) and fellows, constituting together a governing board or Corporation. This charter is still in force. In 1792 the governor and lieutenant-governor of the state, and six state senators, were elected ex-officio members of the Corporation. In 1872 the six senators were replaced by six graduates, chosen by the alumni body. The clerical element still constitutes one half of the Corporation. In the first half of the 19th century, under the leadership of Nathaniel W. Taylor (q.v.), the Divinity School of Yale became nationally prominent for "Taylorism" or "New Haven Theology." Daily attendance at prayers is still required of all college students.

The first college professorship established was that of divinity (1753), which, in a sense, was the beginning of extra-college or university work. The theological department was not organized as a distinct school until 1822. In 1770 a second professorship was established, of mathematics and natural philosophy. Timothy Dwight (president, 1795-1817) planned the establishment of professional schools; his term saw the foundation of the Medical School (1813) besides the Divinity School. In 1820 a chair was created for Benjamin Silliman, Sr. (1779-1864) in chemistry and natural history; English grammar and geography did not disappear from the curriculum until 1826, nor arithmetic until 1838; politics and economics were introduced in 1825, and modern languages (French) in the same year. Not until 1847 did modern history receive separate recognition. The Library had been given the status of an independent department in 1843. Compulsory examinations were abolished in 1842, thus removing one feature of a private boarding school. Corporeal punishment ("cutting of the offender's ears by the President") had disappeared before the War of Independence; and so also had the custom of printing the students' names according to their social rank, and using a "degradation" in precedence as punishment; while Dwight had abolished the ancient custom of faggling, and the undemocratic system of fines that enabled a rich student to live as he pleased at the expense only of his pocket. The School of Law was established in 1843. Instruction to graduates in non-professional courses seems to have been begun in 1826. The appointment of Edward E. Salisbury to the chair of Arabic and Sanskrit (1841) was the first provision at Yale for the instruction of graduates by professors independent of the College. About the same time graduate instruction in chemistry became important. In 1846 also a chair of agricultural chemistry was established, the first of its kind in the country. In 1846 an extra-College department of Philosophy and Arts was created, conferring degrees since 1834; and from this were separated in 1854 the sciences, which were entrusted to a separate Scientific School, the original promoter or agricultural experiment stations in the United States. Since that time this school and the College have developed much as complementary and co-ordinate schools of undergraduates, Yale affording in this respect a very marked contrast with Harvard. Graduate instruction was concentrated in 1871 into a distinct Graduate School. This with the three traditional professional schools—the Art School, established in 1856 (instruction since 1869), and the first university art school of the country, the Music School, established in 1864 (instruction since 1890), and the Forest School, established in 1900—make up the University, around the College. For the founding of the Peabody Museum of Natural History, George Peabody, of London, contributed $150,000 in 1866. The Observatory, devoted exclusively to research, was established in 1871. In 1887 the name Yale University was adopted. The organic unity of the whole was then recognized by throwing open to students of any department the advantages of all. In 1886, for the first time, a president was chosen who was not of the College faculty, but from the University faculty.

Great as were the changes in the metamorphosis of old Yale, none had more influence upon its real and inner life than the gradual extension of the freedom accorded the students in the selection of their studies. In 1854 there was no election permissible until late in the Junior year. In 1876, 1884 and 1893 such freedom was greatly extended. In 1892 the work of the Graduate School was formally opened to women (some professors having admitted them years past by special consent). Yale was the first college in New England to take this step.

The buildings number sixty-four in all. Connecticut Hall (1792-52), long known as South Middle College, a plain brick building with the only ornament recognized by those in the late style (restored, 1905). Around it are fourteen buildings forming a quadrangle with the College campus on the W. side of the New Haven Green, between Elm and Chapel Streets. The oldest are the Old Library (1824) and the first Chemistry building (1826) (near the Old Hall (1869), Durfee Hall (1870), Lawrance Hall (1886), Battell Chapel (1876), Osborn Hall (1889), Vanderbilt Hall (1894), Chittenden Hall (1888) and Linsly Hall (1898). Dwight Hall, erected in 1843 for the Medical School (1892) and Phelps Hall complete the quadrangle. Across from the W. side of the quadrangle is the Peabody Museum (1876). On the N. side of Elm Street is a row of buildings, including the Gymnasium (1892), the Divinity School (1870) and the Law School (1897). University Avenue leads N. from the College campus to the University court or campus, on which are the Bicentennial Hall (1814), known as the Bent, and the Davis Hall (1818-26) containing the buildings of the Sheffield Scientific School. Farther N. E. are the Observatory, Hammond Metallurgical Laboratory, Forestry Building and Infrmary, and to the S.W. of the College campus are the Medical School and the Medical Library.

The University is organized in four departments—Philosophy and the Arts, Theology, Medicine, and Law—each with a distinct board of managers. The first of these, the Sheffield Scientific School, named in honour of Joseph Earle Sheffield (1793-1882), a generous benefactor, the School of the Fine Arts, the Department of Music, the Graduate School and the Forest School, founded in 1900 by a gift of $150,000 from J. W. Pinchot and his wife. Other institutions organized independently of any one department are: the Library, the Peabody Museum of Natural History, the Arthur and the Garden, established 1890 on the estate of Professor O. C. Marsh. The special treasures of the Library include the classical library of Ernst Curtius; the collection of Oriental books; the collections of periodicals of George Berkeley, who also gave to the College his American farm, as a basis of a scholarship, the first established in America. The Library is especially strong in the departments of American and English history, and in geography. The total number of volumes in 1910 was nearly 600,000, exclusive of many thousand pamphlets. The Peabody Museum contains an unrivalled collection of Sicilian trilobites; a fine collection of pseudo-scorpions; a magnificent collection of Chinese bird life and bird skins; and a remarkable collection of birds and mammals made by Samuel Wells Williams; a notable mineralogical collection; a fine collection of meteorites made by Professor Hubert Aspinwall (1830-1886); and the magnificent palaeontological collection of Professor O. C. Marsh. The School of the Fine Arts possesses the Jarves gallery of Italian art, a remarkable collection of Italian "primitives" dating from the 13th to the 17th century; the Alden collection of Belgian wood-carvings, of the 17th century; and a large collection of modern paintings among which are fifty-four pictures by John Trumbull. The organization of the school of art was established in 1843 by a group of nearly a thousand women, in 1873 divided between the United States toward the introduction of the fine arts into a university. The equipment of the Observatory consists principally of a six-inch heliometer by Repsold, an eight-inch equatorial by Grubb, and two sets of equatorially mounted cameras for photographing meteors.

In the College and the Medical School four years are required to complete the course of instruction; in the Divinity School and the Law School, five years; and in the Scientific School there are both three-year and five-year courses, five years being required for all engineering degrees. Admission to the College and the Divinity School is by examination in Latin, Greek or substitutes for Greek, French or German, English, mathematics and ancient history. Admission to the Scientific School is also by examination. Substantially the program of a four-year degree admission to the Divinity School, but the Medical School and the Law School require only two years of college work, and a student may obtain a degree from Yale College and a degree in divinity, medicine or law in six years. The Forest School, with an extensive equipment at New Haven and a Forest Experiment Station comprising about
200 acres of forest and open land at Milford, Pike county, Pennsylvania—the estate of J. W. Pinchot—is open only to such graduates of colleges and scientific schools as have had a suitable scientific training, especially in advanced botany. It confers the degree of Master of Forestry.

In the College the individual courses are arranged in twenty-six groups within three divisions, and each student must complete his major minor in one of the three divisions and one minor in each of the other two divisions. In the Freshman and Sophomore years the student's freedom of election is further restricted. In the Scientific School there is a selection system. In the College graduates now have the degree of Bachelor of Arts, but the Scientific School confers the degrees of Bachelor of Philosophy, Master of Science (requiring a three-year course of graduate study), and the engineering degrees. In the Divinity School the student has the choice of three courses—the historical, the philosophical and the practical—or, by the use of electives, he may combine the three; the study of Hebrew is required only in the historical course. In the Law School there is one course for candidates for the degree of Bachelor of Laws and another for candidates for the degree of Bachelor of Civil Law, the latter requiring the study of Roman law and allowing the substitution of certain studies in political science for some of the law subjects. The Graduate School confers the degrees of Master of Arts and Doctor of Philosophy; the School of Music, the degree of Bachelor of Music; the School of Fine Arts which is open to both sexes, the degree of Bachelor of the Fine Arts.

In 1916 the body of officers and instructors in all departments numbered 496, and the students 3312.

In addition to the regular work of the departments there are several lecture courses open to all students of the University. Among them are: the Dodge Lectures on the Responsibilities of Citizenship (1900); the Bostock Lectures on Journalism, Literature, and Public Affairs (1900); the Lyman Beecher Lectures on Preaching (1871); the Silliman Memorial Lectures (1884) on subjects connected with "the natural and moral world"; the Stanley Woodward Lectures (1907) by distinguished foreigners; the Harvard Lectures (1905) by members of the faculty of Harvard University; the Sheffield Lectures on scientific subjects; and the Medical Alumni Lectures.

The principal publications in which the University is more closely associated are: The Yale Review, a Quarterly Journal for the Scientific Discussion of Economic, Political and Social Questions; the Sources in Political Science and History, the Yale Law Journal, edited by a board of students; the Yale Medical Journal, edited by members of the Medical Faculty with the assistance of a board of students; the Yale Alumni Weekly; and the Yale News, a daily paper managed by the students. The Yale Bicentennial Publications contain reprints of Research Papers from the Kent Chemical Laboratory, Studies in Physiological Chemistry and Contributions to Mineralogy and Petrography. Numerous other works the Yale University Press are issued only with the approval of the University.

In addition to several million dollars invested in lands and buildings, there were at the end of 1909, proceeds of funds amounting to $10,652,130 (in 1886, $2,111,000). The income from all sources for the year 1898-9, exclusive of benefactions ($1,650,512), was $1,240,208. Up to 1908 more than three-fourths of the buildings had been erected as private gifts; the rest were built with College funds, or from legislative grants.

Yale shares with its fellow colleges founded in colonial days the advantages of old traditions and social prestige. In particular it shared these with Harvard so long as New England retained its literary and intellectual dominance over the rest of the country. But the spirit of the two institutions has always been very different. Harvard has on the whole been radical and progressive; Yale conservative. Yale could not draw, like Harvard, on the leaders of the New England schools of letters and philosophy to fill her professorial chairs. Her "comparative poverty, the strength of college feelings and traditions" (President Hadley) united with the lesser stimulus of her intellectual environment to delay her development. Harvard's transformation into a modern university was more spontaneous and rapid; Yale remained much longer under the dominance of collegiate traditions. But, according to Dr Charles F. Thwing (The American College in American Life, New York, 1897), of the men filling "the highest political and judicial offices," and coming from American colleges founded before 1770, Yale had helped (up to 1897) to train the largest number. On the roll of her alumni are such names as Philip Livingston, Eli Whitney, John C. Calhoun, James Kent, Samuel F. B. Morse, Chief-Justice Morrison R. Waite and President Taft.

The Presidents have been as follows: in 1700-1707, Abraham Pierson (1645-1707); pro tem. 1707-1719, Samuel Andrew (1656-1737); in 1719-1722, Timothy Cutler (1684-1765); in 1722-1726, office filled by the College trustees in rotation; in 1726-1739, Elisha Williams (1694-1753); in 1739-1766, Thomas Clap (1703-1757); pro tem. 1766-1777, Naphthali Daggett (1772-1780); in 1777-1795, Ezra Stiles (1727-1795); in 1795-1817, Timothy Dwight (1752-1817); in 1817-1846, Jeremiah Day (1773-1867); in 1846-1871, Theodore Dwight Woolsey (1801-1850); in 1871-1886, Noah Porter (1811-1892); in 1886-1899, Timothy Dwight (b. 1828); and Arthur Twining Hadley (b. 1856).

Welch and Walter Camp, Yale, Her Campus, Class Room and Athletics (Boston, 1889); Charles Franklin Thwing, A History of Higher Education in America (New York, 1906).

YALTA, a seaport of Russia, in the government of Taurida, on the S. coast of the Crimea, at the foot of the Yalta Mountains, 32 m. S. of Simferopol. Pop. 13,269. It is the Yalta or Jalta of the Arab geographers. Its roadstead is open, and the annual mean temperature is 56-5° F. The town is a fashionable summer resort.

YAM, a term usually applied to the tubers of various species of Dioscorea. These are plants with thick tubers (generally a development of the base of the stem), from which prostrate long, slender, annual climbing stems, bearing alternate or opposite, entire or lobed leaves and unsexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers, and surmounting a three-celled, three-winged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres. According to Professor Church's analysis of the Chinese yam, it contains more nitrogenous matter, but less starch, than potatoes: in 100 parts there are of water 82-6, starch 13-5, fibre 1-2, fat 0-2, woody fibre c-4 and mineral matter 1-3 parts.

D. sativa and D. alata are the species most widely diffused in tropical and subropical countries. D. aculeata, grown in India, Cochin China and the South Sea Islands, is one of the best varieties. D. Batatas, the Chinese yam, is hardy in Great Britain, but the great size to which its enormous tubers desire renders its cultivation unprofitable. It has deeply penetrating, thick, club-shaped, fleshy roots, full of starch, which when cooked acquire a mild taste like that of a potato; they grow 3 ft. or upwards in length, and sometimes
YAMA—YANG-CHOW FU

YAMA, a prefectural city in the province of Kiangsu, China, forming the two distinct cities of Kiang-su and K'ang-ch'uan, on the Grand Canal, in 32° 21' N., 119° 15' E. Pop. about 100,000. The walls are built of brick and mortar. The streets are well supplied with shops, and there are handsome temples, colleges, and other public buildings. There was a serious religious outbreak in 1868, when Hudson Taylor, the founder of the China Inland Mission, opened a station here; but Yang-chow is now one of the centres of the Protestant mission.

It is probable that Yancey was approached with the offer of the vice-presidential nomination on the Douglas ticket by George N. Sanders. There was a movement to nominate him on the ticket with Breckinridge also.
missionaries in the province. Yang-chou Fu possesses an early historical connexion with foreigners, for Marco Polo ruled over it for three years by appointment from Kublai Khan (1282-85).

**Yangtsze-Kiang**, a great river of China, and the principal commercial watercourse of the country. It is formed by the junction of a series of small streams draining the E. slopes of the Tibetan plateau, and for the first third of its course flows almost parallel with the Mekong and the Salween, each having, per mile, a fall from the other by intervening ridges of great height. The total length of the Yangtsze is calculated to be not less than 3000 m. Although the term Yangtsze is applied by Europeans to the whole course of the river, in China it indicates only the last three or four hundred miles, where it flows through a division of the empire which in ancient time was known as “Yang,” a name which also survives in the city of Yang-Chow in the province of Kiang-su. The ordinary official name for the whole river is Ch’ang Kiang (pronounced in the north, Chiang) or Ta Chiang, meaning the “long river” or the “great river.” Popularly in the upper reaches every section from Tibet into China it is known as the Kunsha Kiang or river of Golden Sand, and farther down as the Pai-shu Kiang. In Sze-ch’uen, after its junction with the large tributary known as the Min, it is for some distance called the Min-kiang, the people being of opinion that the Min branch is in fact the main river. The fall in the upper reaches is very rapid. At the junction of the two main affluents in Upper Tibet, where the river is already a formidable torrent barely fordable at low water, the altitude is estimated at 13,000 ft. From Patang (5,450 ft.) to Wa-Wu (3,650 ft.), the fall is about 2 ft. per mile, thence to Hwang-kwao-shu (1200 ft.) about 6 ft. per mile, and farther down to Pingshan (1035 ft.) the fall is about 3 ft. per mile. At Pingshan, in the province of Sze-ch’uen, the river first becomes navigable, and the fall decreases to about 6 in. per mile down to Chungking (630 ft.). From Chungking through the gorges to Ich’ang (130 ft.), a distance of nearly 400 m., the fall again increases to about 14 in. per mile; but from Ich’ang down to the sea, a distance of 1000 m., the fall is exceedingly small, being as far as Hankow at the rate of 25 in., and from Hankow to the mouth at the rate of little more than 1 in. per mile. The last 200 m. are practically a dead level, for at low-water seasons there is a rise of tide enough to swing ships as far up as Wuhu, 200 m. from the mouth.

The principal tributaries, counting from the sea upwards, are: (1) the outlet from Poyang lake, draining the province of Kiang-si; (2) the Han river, entering on the left bank at Hankow; (3) the outlet from Tungting lake on the right bank, draining the provinces of Anhwei, Chekiang, Kiangsu, the To Kiang and the Min, all entering on the left bank; and (5) the Yang, draining a vast area on the borderland between Sze-ch’uen and Kiang-su, and falling into the sea by four mouths (1800 ft. each), which is more than one-fifth of the whole. The period of low water is from December to March. The melting of the snows on the Siberian highlands combined with the summer rainfall causes an annual rise in the river of from 70 to 90 ft. at Chungking and from 40 to 50 at Hankow and Kiukiang. The mean volume of water discharged into the sea is estimated at 770,000 cub. ft. per second. The quantity of sediment carried in solution and deposited at the mouth is similarly estimated at 6,428 million cub. ft. per annum, representing a subaerial denudation of the whole drainage area at the rate of one foot in 3707 years. (See Journal of the China Branch of the Royal Geographical Society, October, 1901.)

The Yangtsze-Kiang forms a highway of first-class importance. As the rise in the river is only about 130 ft. for the first 1000 m., it resembles a huge canal expressly formed for steam navigation. Early in 1894, the Chinese government laid 6000 m. of railway at Hankow with ease. Between Hankow and Ich’ang, especially above the outlet from Tungting lake, the volume of water diminishes very little, but the coarse shifting sand-banks, navigation is more difficult. Above Ich’ang, where the river flows between rocky gorges, and where a series of rapids is encountered, navigation is still more difficult. But taking the river as a whole with its outlets, canals, and lakes, it forms a highway of communication univalled in any country in the world. About half the sea-borne commerce of all China is further distributed by means of the Yangtsze and its affluents. It is hardly necessary to mention the interchange of native produce between the provinces, which is carried by native sailing craft numbered by thousands.

The Yangtsze valley as a political term indicates the sphere of influence or development which by international agreement was assigned to Great Britain. This was first acquired in a somewhat similar manner by the Chinese government for their railways, which they did in 1898, not to alienate any part of the Yangtsze valley to any other power. A more formal recognition of the British claim was embodied in the agreement between the British and Great Powers in 1899 by which the Chinese government was granted the right to build four railways designed to comprise the four provinces bordering on the Yangtsze river, with the provinces of Ho-nan and Chekiang. This agreement was generally acknowledged. The object of the negotiations was to guard against conflict of railway interests; in all other respects the policy known as that of the “open door” was advocated by Great Britain and the chief commercial states. This policy was more fully declared by mutual engagements entered into in 1900 by the Great Powers on the initiative of the United States, whereby each undertook to guarantee equality of treatment to the commerce of all nations within its own sphere. As to railway enterprise, an agreement of 1910 admitted French, German and American financial interests equally with those of great Britain in the projected line from Hankow to Sze-ch’uen.

**YANKEOE**, the slang or colloquial name given to a citizen of the New England states in America, and less correctly applied, in familiar European usage, to any citizen of the United States. It was used by the British soldiers of their opponents during the War of Independence, and during the Civil War by the Confederates of the Federal troops and by the South of the North generally. The origin of the name has given rise to much speculation. In Dr William Gordon’s History of the American War (ed. 1847), p. 342, he printed a term used at Cambridge, Mass., early as 1773, where it was used to express excellence, and he quotes such expressions as “a Yankee good horse.” Webster gives the earliest recorded use of its accepted meaning, from Oppression, a Poem by an American (Boston, 1793), “From meanness first this Portsmouth Yankee rose,” and states that it is considered to represent the Indian pronunciation of “English” or Anglais, and was applied by the Massachusetts Indians to the English colonists. On the other hand, the Scots “yankie,” sharp or clever, would seem more probable as the origin of the sense represented in the American expression. Other suggestions give a Dutch origin to the name. Thus it may be a corruption of “Jankin,” diminutive of “Jan,” John, and applied as a nickname to the English of Connecticut by the Dutch of New York. Skect (Elym. Dict., 1910) quotes a Dutch captain’s name, Yankie, from Dampier’s Voyages (ed. 1699, i. 38), and accepts the theory that “Yankie” was formed from Jan, John, and Kees, a familiar diminutive of Cornelius (H. Logeman, Notes and Queries, 1879, series, iv. 509, v. 15).

**YANKTON**, a city and the county-seat of Yankton county, South Dakota, U.S.A., on the left bank of the Mississippi river, about 60 m. N.W. of Sioux City, Iowa. Pop. (1900) 4725 (850 foreign-born); (1910) 3787. It is served by the Chicago, Milwaukee & St. Paul, the Great Northern, and the Chicago & North-Western railways. The Missouri is navigable at this point, and the city has a considerable river traffic. Yankton is the seat of Yankton College (founded by Congregationalists in 1881, opened in 1882; now non-sectarian). The city is built on a nearly level plateau, averaging about 1200 ft. above the sea-level. It is in a rich grain-growing and stock-raising district, has grain-elevators, and manufactures flour, beer and cement. Russian government aid in 1869 for the delimitation of the respective permanent settlement, a trading post, was made here in 1858, when a treaty was concluded with the Yankton Indians. This was the first settlement made in the Missouri Valley in Dakota. Yankton was laid out in 1859, first chartered as a city in 1869, chartered again in 1873, and in 1910 adopted a commission form of government. In 1851-82 Yankton was the capital of the Territory of Dakota. The name is a corruption of the Sioux name Thankwoneen, meaning “end village.”

**YAOS, or AJAWA**, a Bantu-Negroid people of east-central Africa, whose home is the country around the upper reaches of
the Rovuma river, and the north of Portuguese East Africa. They are an enterprising and intelligent race, and have spread into British territory south of Lake Nyasa and throughout the Shiré districts. They are the tallest and strongest of the natives in the Mozambique country, have negroid features and faces which are noticeable for their roundness, and, for Africans, have light skins. They have long been popular among Europeans as carriers and servants. They earned, however, a bad name as slave-traders, and gave much trouble to the British authorities in Nyasaland until 1896, when they were reduced to submission. They do not talk tattoo except for tribal marks on their foreheads. The women wear dresses of ivory or burnished lead in the sides of their nostrils, and some, probably of Anyanja origin, disfigure the lip with the pelele or lip-ring. The Yaoos have elaborate ceremonies of initiation for the youth of both sexes. They bury their dead in a contracted position, the grave being roofed with logs and earth sprinkled over; in the case of a rich man, some of his property is buried with him and the rest is inherited by his eldest sister's son.

See Miss A. Werner, The Native of British Central Africa (1906); Sir H. H. Johnston, British Central Africa (1897); H. L. Duff, Nyasaland under the Foreign Office (1903). For the Yao language see H. L. Duff, Le Leyu, Ya'qubi—Yarkand

YA'QUBI [Ali b. ibn abd Ya'qubi ibn Ja'far ibn Wadh ibn Wadib] (9th century), Arab historian and geographer, was a great-grandson of Wadib, the freedman of the caliph Mansur. Until 872 he lived in Armenia and Khorasan; then he travelled in India, Egypt and the Maghrib, where he died in 891. His history is divided into two parts. In the first he gives a comprehensive account of the pre-Mahomedan and non-Mahomedan peoples, especially of their religion and literature. For the time of the patriarchs his source is now seen to be the Syriac work published by C. Bezold as Die Schatzkohle. In his account of India he is the first to give an account of the stories of Kailla and Ama and of Sindbad (Sinbad). When treating of Greece he gives many extracts from the philosophers (cf. M. Klamroth in the Zeitschrift der deutschen morgenländischen Gesellschaft, vols. xI. and xII.). The second part contains Mahomedan history up to 872, and is neither extreme nor unfair, although he inherited Shi'ite leanings from his great-grandfather. The work is characterized by its detailed account of some provinces, such as Armenia and Khorasan, by its astronomical details and its quotations from religious authorities rather than poets.

Edition by T. Houtsma (2 vols., Leiden, 1883). Ya'qubi's geo-

Yaqut, or Yakut (Ya'qut ibn 'Abdallah ur-Rumil) (1179-1220), Arab geographer and biographer, was born in Greece of Greek parentage, but in his boyhood became the slave of a merchant of Hamah (Hamath), who trained him for commercial travelling and sent him two or three times to Kish in the Persian Gulf (on his journeys, cf. F. Wüstenfeld, "Juct's Reisen" in the Zeitschr. d. deutsch. morg. Gesellschaft, vol. xvIII, pp. 397-403). In 1194 he quarrelled with his master and had to support himself by copying; he took advantage of the opportunity of studying under the grammarian al-'Ukhari. After five years he returned to his old master and again travelled for him to Kish, but on his return found his master dead, and set up for himself as a bookseller and began to write. During the next ten years he travelled in Persia, Syria, Egypt and visited Merv, Balkh, Mosul and Aleppo. About 1220 he settled in Mosul and worked on his geography, the first draft of which was ready in 1224. After a journey to Alexandria in 1227 he went to Aleppo, where he died in 1229. In his large geography, the Mu'jam ul-Buldân (ed. F. Wüstenfeld, 6 vols., Leipzig, 1866-73), the places mentioned in the literature or the stories of the Arabs are given in alphabetical order, with the correct vocalization of the names, an indication whether they are Arabic or foreign and their locality. Their history is often sketched with a special account of their castes by the Moelms and the name of the governor at the time is recorded. Attention is also given to the monuments they contain and the celebrities who were born in them or had lived there. In this way a quantity of old literature, both prose and poetry, is preserved by Ya'qut.

The parts of this work relating to Persia have been translated and extracted by Barbier de Meynard under the title Dictionnaire géographique de l'Afghanistan (Paris, 1871). Some account of its sources is given in F. J. Hee. Lebens- und geographischen Quellen in Jacot's geographischem Wörterbuch (Strassburg, 1898), and the material relating to the Crusades is treated by T. Vectole, "Les Croisades d'après le dictionnaire géographique de Jacot" in the volume of the Centenaire de l'école des langues orientales vivantes, 71-92. A digest of the whole work was made by Ibn 'Abdillah (d. 1338) under the title Marâtib al-abâd (ed. T. C. J. Juyunbdl, Leiden, 1850-1866). Ya'qut also wrote a dictionary of geographical homonyms, the Mushitarik (ed. F. Wüstenfeld, Göttingen, 1846). Besides all this activity in geography Ya'qut also turned to biography, and wrote an important dictionary of learned men, the Ma'jam ul-Udâbâ'. Parts of this work exist in MS. in different libraries; vol. I. has been edited by D. S. Margoliouth, Ishrâd ul-Arîb ilâ Mafrîf al 'Adîb (London, 1905).

YARKAND (Chinese name Sochê Fu), the chief town of the principal oasis of Chinese Turkestan, on the Yarkand-Darya, in 38° 25' N., 77° 16' E., and 3900 ft. above sea-level. The settlements of the Yarkand oasis occupy the S.W. corner of E. Turkestan, and are scattered along the numerous rivers which issue from the steep slopes of the Pamir in the W., and the Karakoram and Kuen-Lun Mountains in the S. The oasis of Kašgår limits it in the N., and a tract of desert separates it from the oasis of Khotan in the S.E. The Yarkand-Darya and its numerous tributaries, which are fed by the glaciers of the mountain region, also make it an agricultural oasis. On the S. side of the desert, amidst the irrigated fields, bring abundance of water to the desert; one of them is called Zarasfânshân ("gold-strewing"), as much on account of the fertility it brings as of its auriferous sands. Numberless irrigation canals carry the water to the fields, which occupy a broad zone of loess skirting the base of the mountains. In the spurs of the mountains there are rich pasturages, where goats, yaks, camels, sheep and cattle are reared. The oasis of Yarkand is regarded as the richest of E. Turkestan, and its population probably numbers about 200,000 inhabitants. Wheat, barley, rice, beans and various oil-yielding plants are grown, and melons, grapes, apples and other fruits. The cotton tree and the mulberry are cultivated in the warmer parts of the oasis. Gold, lead and precious stones are found in the mountains, though only the first-named is worked. Yarkand is renowned for its leather-ware and saddlery. Carpets and silk fabrics, cotton and woollen goods are manufactured. The population consists of Persians, who now speak Turkish, and of Turkish Sarts.

The town of Yarkand, which has a population of about 10,000 (5000 houses in the city, and as many in Yangihshar and the suburbs), is situated on the right bank of the river Yarkand, about 7 miles to the S.E. from Kashgar. It is surrounded by a thick earthen wall, nearly 4 m. long, with towers in the Chinese style of architecture, and is well watered by canals. The square fortress of Yangihshar, which was built by the Chinese, stands within 400 yds. of the walls of the town. This is one of the three strong places in Chinese Turkestan. The ten mosques and madrasas of Yarkand, although poorer than those of Bokharâ or Samarkand, enjoy wide renown in the Moslem world. There is a brisk trade, especially in horses, cotton, leather-ware and all kinds of imported manufactures.

Yarkand is surrounded by a number of smaller towns, the chief of which are—Yanghi-hissar, which has about 600 houses, Tashkurgan on the Pamirs, Postam (1600 houses), Kargalyk, at the junction of the routes leading to Ludakh and Khotan (2000 houses), Sanju (2000), Tagarchi, Karchtum, Besh-taryk (1800) and Guma (3000).

Yarkand was very imperfectly known until the second half of the 19th century. Marco Polo visited it between 1271 and 1275, and Goethe in 1635; but the continuous war which then prevented Europeans from frequenting it, so that until 1864 the information borrowed from medieval travellers and from Chinese sources, with that supplied by the pundit Mir Isset Ullah in 1812, was all that was known about the Yarkand region. The first European who reached it in the 19th century was Adolph Schlagintweit, who passed by Yarkand in August 1857, but was killed a few days later at Kashgar. The pundit Mohammed Hamid visited it
YARMOUTH, a seaport town and port of entry, Yarmouth county, Nova Scotia, Canada, on the Dominion & Atlantic railway, 218 m. from Halifax. Pop. (1901) 6430. Steamers run daily to Boston (Mass.), and weekly to St John (N.B.) and Halifax. It contains the county buildings, and has good schools and small local manufactories. Fish and lumber are exported in large quantities.

YARMOUTH (Great Yarmouth), a municipal, county and parliamentary borough, water-ranging, and seaport of Norfolk, England (with a small portion in Suffolk), 121 m. N.E. from London by the Great Eastern railway, served also by the Midland & Great Northern joint line. Pop. (1901) 57,516. It lies on a long and narrow strip of land between the North Sea and the Breydon Water (formed by the rivers Yare and Waveney) and the river Bure. The neighbouring country is very flat, but the Bure affords access to the Norfolk Broads, which give the district its well-known individuality. The old town of Great Yarmouth was built chiefly along the E. bank of the Yare, but the modern town has extended beyond its ancient walls, of which some remains exist, to the seashore, where there are a marine drive and three piers. On the landward or Suffolk side of the estuary is the suburb of Southtown, and farther S. that of Gorleston. The principal features of Yarmouth are the N. and S. quays, and the straight narrow lanes called "rows," 145 in number, running at right angles to them. These rows were at one time inhabited by the wealthy burgesses, and many of the houses, now tenanted by the poorer classes, have panelled rooms with richly decorated ceilings. The old town is connected with Little Yarmouth by a bridge across the Yare of stone and iron, erected in 1854. The Bure is crossed by a suspension bridge. The church of St Nicholas, founded in 1010 by Herbert Losinga, the first bishop of Norwich, and consecrated in 1109, is a curious church in the form, with a central tower, which perhaps preserves a part of the original structure, but by successive alterations the form of the church has been completely changed. The Transitional clerestoried nave, with columns alternately octagonal and circular, was rebuilt in the reign of King John. A portion of the chancel is of the same date. About fifty years later the aisles were widened, so that the nave is now the narrowest part of the building. A grand W. front with towers and pinnacles was constructed in 1330-1338, but the building was interrupted by a visitation of the plague. In the 16th century the monumental brasses were cast into weights and the gravestones cut into grindstones. Within the church there were at one time eighteen chapels, maintained by gilds or private families, but these were dissolved by the Reformers, who sold the valuable utensils of the building and applied the money to the widening of the channel of the harbour. During the Commonwealth the Independents appropriated the chancel, the Presbyterians the N. aisle and the Churchmen were allowed the remainder of the building. The brick walls erected at this time to separate the different largings of the building remained till 1847. In 1804 the tower was restored, and the E. end of the chancel rebuilt; in 1806-1870 the S. aisle was rebuilt; and in 1884 the S. transept, the W. end of the nave and the N. aisle underwent restoration. The width of the nave is 56 ft., and the total length of the church is 235 ft. St John's is a noteworthy modern church, and the Roman Catholic church is a handsome Gothic building erected in 1850. A grammar-school was founded in 1553, when the great hall of the old hospital, founded in the reign of Edward I. by Thomas Fastolfe, was appropriated to its use.

It was closed from 1757 to 1860, was re-established by the charity trustees, and settled in new buildings in 1872. Among the principal public buildings are the town hall and public offices (1883); a picturesque toll-house of the 14th century, carefully preserved and serving as a free library; assembly rooms, museum, drill hall, custom house, barracks at Southtown and theatres. Among charitable and benevolent institutions are a royal naval lunatic asylum, three hospitals, and fishermen's hospital, the North Sea Church Mission and various homes and minor charities. To the S. of the town, on the part of the peninsula known as the South Dunes, are a race-course and a Doric column erected in 1817 to commemorate Lord Nelson. To the N. (on the North Dunes) are golf links. Winter gardens were opened in 1904. The municipal and parliamentary borough became coextensive with the inclusion in the former of Gorleston in 1890. The parliamentary borough, returning one member, falls between the E. division of Norfolk and the Lowestoft division of Suffolk. Yarmouth is governed by a mayor, 12 aldermen and 36 councillors. Area, 3568 acres.

Yarmouth Roads, off the coast, afford excellent anchorage except in E. or N.E. winds. The channel to the quays was made by Joost Jansen, a Dutch engineer, in 1567, and affords a depth at the bar of 19 ft. at low water. The herring and mackerel fisheries are most extensive, and fish-curing is an extensive industry. Yarmouth is noted for its blotters being famously popular. The fishing fleet numbers some 500 vessels of 20,000 tons, and employs about 3000 hands. The principal imports are coal, timber and food, and exported grain and fish.

Yarmouth (Gernemewa, Yernemuth), which lies near the site of the Roman camp of Gariannonum, is believed to have been the landing-place of Cerdic in the 5th century. Not long afterwards, the convenience of its situation having attracted many fishermen from the Cinque Ports, a permanent settlement was made, and the town numbered seventy burgesses before the Conquest. Henry I. placed it under the rule of a reeve. The charter of King John (1208), which gave its burgesses of Yarmouth general liberties according to the customs of Oxford, a gild merchant and weekly husting, was amplified by several later charters asserting the rights of the borough against Little Yarmouth and Gorleston. In 1552 Elizabeth granted a charter of admiralty jurisdiction, afterwards confirmed and extended by James I. In 1668 Charles II. incorporated Little Yarmouth in the borough by a charter which with one brief exception remained in force until 1885. It was included in the town which was served by a mayor, reducing the aldermen and common councilmen to eighteen and thirty-six. By the Boundary and Municipal Corporation Acts of 1832 and 1855, Gorleston was annexed to the borough, which became a county borough in 1888. Yarmouth returned two members to parliament from 1300 to 1868, when it was disfranchised until 1885. From the 11th to the 16th century the herring trade, which has always been the main industry of Yarmouth, was carried on at an annual fair between Michaelmas and Martinmas. This was regulated by the barons of the Cinque Ports, and many quarrels arose through their jurisdiction and privileges. Yarmouth has had a weekly market at least from the 13th century.

See Victoria County History, Norfolk; H. Swinden, History of Great Yarmouth (1772); C. J. Palmer, History of Great Yarmouth (1854).
YARN; the name given to any textile fibre when prepared by the process of spinning for being woven into cloth. It is only in a few minor and exceptional cases, such as the weaving of haircloth or wire, that there is any making of fabrics without the previous spinning of yarn. But yarn is of the most diverse description, and its value varies in proportion to its lustre, its bleaching and dyeing properties, its fineness, strength, elasticity, uniformity of diameter, smoothness, suppleness and colour in its natural condition. Yarn is single, folded and fancy, and if twisted to the right it is called twist way, and if to the left, weft way, but those terms do not necessarily imply that the yarn is for either warp or weft.

**Single Yarn** consists of fibres matter as twisted together during the process of spinning. If it is intended for warp it should be elastic and smooth; if for weft it has less twist and is more spongy. The raw material from which yarn is made has much to do with its appearance and value. Thus, Deet wool, though it is in itself a good material, is a loosely twisted and closely packed yarn, is generally dull in appearance, soft, pliable and of moderate strength and elasticity. Dyedness in this material is not, however, a constant feature; when combed and gassed it is brighter than when simply carded, and when mercerized it assumes a high lustre. **Cotton waste Yarn** is of two classes, both of low counts, and is made from the cotton waste in the preparing, spinning and weaving operations; one from soft material that had not previously been spun; the other from hard threads which were broken up into separate filaments. The best grades of cotton have been spun into commercial throughs, 500 to 5000, of which weighs 1 lb., but for finer purposes many finer threads have been spun. Yarn for more general use is the range up to 250,000 yds. per lb. When spun from soft waste it is up to 13,400,000 yds. per lb, and from hard waste it is up to 25,000,000 yds. per lb. Yarns of this kind are sold by the hank and tow. In their natural conditions both are stiff, inelastic and somewhat rough, but the method of spinning has much to do with their appearance. If spun wet they are more compact, smoother and firmer; if spun dry the yarn is dry, more inelastic and better in these respects than tow, which is by comparison soft, full and hairy. Both bleach to a pure white, become lustrous and moderately soft. Exceptionally fine fine linen yarn contains 186,000 yds. per lb., but the range of line yarn in general use is up to 60,000 yds. per lb, and that of tow 10,000 yds. per lb. **Woollen Yarn** is soft, spongy, hairy, elastic, moderately strong and possesses felt forming properties in a high degree; it bleaches very indifferently without readily. It is spun into threads that range up to 15,000 yds. per lb. Several kinds of waste yarn are spun from wool, such as Shoddy, Monge, and Tows; the latter is a thin and very lustrous, but imperfectly suitable for coarse counts, but they dye well. Shoddy is made from the liberated fibres of soft spun woolen threads and clothes that have not been felted. Monge is made from the liberated fibres of hard spun woolen yarn, and felted clothes, while Extract is made from the woolen material contained in mixed goods, the vegetable fibres matters from which have been destroyed by acids and heat. **Worsted Yarn** is made from combed material; it is, as a general rule, glossy, smooth, very elastic and strong. It is spun into threads that range up to 56,000 yds. per lb. **Silk** is made into Net, Span and Noil yarns, all of which are readily dyed; also into many varieties of mercerized yarn; both are divided by proportion to the diameter, the strongest and most elastic of textile threads, and are highly lustrous and smooth; but organizes is hand twisted and used for warp, while tram is slightly twisted and used for weft. **Twist** is at the rate of 145,000 yds. per lb. **Spun Silk** is made by combing and spinning the material wasted during the conversion of cocoons into fabrics; it is less lustrous and elastic than silk, also weaker. Silk Noil is made from the fibres rejected by the comber due to silk in the wool, and is used in all respects like worsted. Mixed Yarn is obtained by mixing different fibrous materials together; as cotton and wool, silk and ramie, and the proportions in which they are mixed vary from 10% to 30% of each. Yarns made from such mixed fibres are expressed, as are occasionally those spun in different districts from similar fibres. Cotton yarns are based upon the number of hanks, of 840 yds., contained in a bundle, a hank being equal to 840 yds.; worsted, upon the number of hanks, of 560 yds., in 1 lb. Wool is expressed in the West End of England by the number of hanks, of 900 yds.; and in different parts of France by the number of 1520 yds., in 6 lb; in some parts of the United States by the number of runs, of 1600 yds., in 1 lb. Silk is expressed by the weight of 1000 yds., in drams; also by the weight, in denominations, of one, each, six, handkerchief, double, and a larger size. The measure is based on the weight of 1 lb; spun silk, by the number of hanks, of 840 yds., in 1 lb.

**Folded Yarn**—Yarn is folded to impart increased strength, elasticity and smoothness; and is used, both glazed and unglazed, for warp and weft in ordinary fabrics. It is also made for such special purposes as sewing, lace-making, crocheting and hoaxery. The counts of these yarns are expressed according to the number of threads twisted together, as 2/50, 3/60; the former indicating that two threads of 50, and the latter three threads of 60, were twisted together to yield yarn of 25 hanks and 20 hanks per lb respectively; the count of the single yarn being invariably named in the same manner. The count of twilled linen, worsted, and the practice adopted is to name the count of the folded yarn; thus, 7/2 and 40/3 imply that two threads of 140 and three threads of 40, were respectively twisted together, and thus it is more smooth and strong, and much of it is from two to six cord. When two or three cord, the doubling twist is in the opposite direction to that of the singles. When more than three cords, it usually undergirds the winding cord. In plain twills, which are made of cords, the second is in the opposite direction to, and more closely twisted than the first. Thus:—A six-cord thread is first folded and doubled, which gives it the appearance of two cords, which are further doubled, one after which it is sized and polished. lace Yarn should be strong, elastic, smooth and spun twist way in the singles, but doubled weft way. Crochet Yarn is bulky, elastic and has a corded appearance. It is spun in the same manner as the opposite direction to the singles, the second time in the same direction as the singles. Hosiery Yarn is often a soft, bulky, single thread, but it is also folded, sometimes without being twisted, at other times it is slightly twisted. There are two types, namely, wool and silk, neither of which need be made from the fibres named. For the former a hairy surface is not objectionable, but the latter should be smooth, and may be gassed. Polished Yarn may be either single or folded, but it should be fully twisted and level. It is bleached or dyed in hanks, immersed in size and polished with brushes while the size is moist.

**Fancy Yarn** is made by twisting together threads of different colours, materials or twistings, at regular or irregular tensions, and in the same or opposite directions. The effects thus produced are known in commerce under a great variety of names, of which naming is made on account of the regularity or irregularity of the twist, to which is added the colour of the thread, and to a still greater extent to the various tension in the twist. With the exception of a few, all yarns are made of fibres which are in greatest demand; it has a mottled effect which is due to uniformly twisting together threads of different colours, but of approximately equal counts. In some cases the folding twist is slight in others it is considerable. Mock grandrille presents a ladder appearance to true grandrille, but is made at the spinning machine by twisting together two rovings that are dyed in different colours. Flaked Yarn has a cloudy appearance imparted to it, (a) by twisting a hard spun thread with a roving, which, at regular or irregular intervals is made thick and thin by drawing rollers; (b) by supplying intermittently, during carding or spinning, tufts of extra fibre to a thread; or (c) as in Knitlocker Yarn, by dropping small quantities of dyed fibres into two, similar or dissimilar, rovings at the spinning machine, or into two, similar or dissimilar, threads at the distaff. Corrugated Yarn has a spiral surface effect which is produced in different ways, in each of which a thread, that differ in tension, in count and in the quantity or direction of the twist in the single threads. If a fine, hard spun, single or folded thread is twisted with a loose spinning that is fine and soft, the latter will wrap itself about the fine one and give a corrugated surface.

**Chain**, and other effects may be given by two foldings and twistings, if the first doubling a coarse soft thread is twisted with a finer thread, the result will be a medium coarse thread. A twilled thread is twisted with the twofold one, but in the opposite direction and with a different number of twists per inch. Gymn Yarn is spiral in structure, and requires a doubled thread which is twisted twice, then, at the second doubling, a fine tight thread is added. Knotted Yarn is formed by twisting together several strands, one of which is at intervals delivered in greater lengths than the others, in order to form a loop at the surface, the result may differ from that in another. Curled Yarn is produced by twisting two supple threads round a longer and stiffer one, after which a fourth thread is added.
YAROSLAVL, or YAROSLAV, a government of central Russia, separated from the government of Moscow by the governments of Vladimir and Tver on the S., and having Tver and Novgorod on the W., Volgoda on the N. and Kostroma on the E. It is one of the smallest, but most populous and busiest, governments of Great Russia; area, 13,747 sq. m. It consists of a broad and shallow depression, elongated from W. to E., where the Volga departs from the sea, and where the surrounding hills rise to 700 or 800 ft. In the W., especially between the Mologa and the Sheksna, the country contains very many marshes and ponds, and there are low and marshy tracts in the S. about Rostov.

Jurassic clays, sandstones and sands cover nearly the whole of Yaroslavl, but they are concealed almost everywhere under thick deposits of Glacial boulder clay, which is regarded by Russian geologists as the central margin of the great glacial period. Triassic "variegated marls," widely disseminated throughout the whole of the middle Volga region, undoubtedly underlie nearly all the Jurassic deposits of the government, but a few patches emerge at the surface; many salt springs exist in these deposits. The Upper Carboniferous limestones crop out only in the N.W. and towards the E. The chief mineral products are bog-iron ores, sulphate of copper and pottery clays.PEAT was once in thick beds in the Lower Carboniferous. The general soil is moorland of low quality; it is composed of peat, and kind of loose of moderate fertility; sandy tracts are not uncommon.

The principal river is the Volga, which traverses the government for nearly 400 m., and is bordered by the N., the chief towns—Rybinsk, Yaroslavl, Mologa, Romanovo-Borisoglebsk, Uglikh and Meshkin—are situated on its banks, and a brisk traffic is carried on, both by the river itself and by two canals, Marinsk and Tikhvin, which have been opened to join the Volga at the villages of the Sheksna and the Mologa. Another tributary of the Volga is the Kotorost, which has many factories on its banks and is navigated, especially in spring. The Kostroma flows along the E. border, and is a channel for the export of timber and fuel.

The forests, chiefly fir and Scotch pine, cover one-third of the area; but they are being rapidly destroyed. The flora bears a northern stamp, owing to the presence of the dwarf birch, of the Arctic raspberry (Rubus arcticus), and of Linnæa borealis.

The average temperature at the city of Yaroslavl is 40° F. (January, 6·5°; July, 64·5°); the prevailing S.W. and W. winds render it milder than in central Russia. The rivers remain frozen from November 18th to 20th, and every year.

The population, which is Yaroslavl, Russian, numbered 1,175,900 in 1906. The government is divided into ten districts, the chief towns of which are Yaroslavl, Danilov, Lyubim, Mologa, Myshkin, Poshekhn, Romanovo-Borisoglebsk, Rostov, Rybinsk and Uglikh. Yaroslavl belongs to the manufacturing region of central Russia, but the domestic character of many industries permits the inhabitants to cultivate their fields and also to work in small factories. The peasants and peasant communities own over 5,000,000 acres, or about 57% of the total area, of which they have acquired nearly 1,000,000 acres by purchase since their emancipation in 1861; 30% is held by private persons aged 7% by the crown. There were in 1900 1,150,000 acres (13·3% of the total area) under cereals, the principal crops being rye, wheat, oats, barley and potatoes. Flax is widely cultivated both for linseed and fibre, and both fresh and dried vegetables are exported; Rostov enjoys a great reputation as the centre of this industry. Live-stock breeding is of less importance than agriculture, and poultry is exported. Large numbers find employment in the making of hardware, locks, felt boots, gloves, wooden wares, pottery and metal wares. Factories have considerably developed; the principal are cotton, flax and woollen mills, flour-mills, tobacco factories, distilleries, breweries, chichory works, tanneries, candle works, petroleum refineries, machinery, chemical and match works. Rybinsk and Yaroslavl are the chief commercial centres, but Rostov, Mologa, Romanovo and Poshekhn carry on an active trade in corn, timber and manufactured wares. Many of the male population annually leave their homes to work all over Russia as locksmiths, masons, plasterers, waiters in restaurants, greengrocers, tailors, gardeners, carpenters, joiners, pilots, butchers.

As early as the 9th century the Slavs had become established in the Yaroslavl territory, which was formerly occupied by the Finnish tribes of Vess and Meyra, as also by Mordvinians, Muroms and Cheremisses in the S. Rostov was already in existence; but Yaroslavl, Rybinsk and Uglikh begin to be mentioned in the annals only in the 11th and 12th centuries. The independent principality of Rostov was divided in the 13th century into three parts, but these were soon afterwards successively annexed to Moscow.

YAROSLAVL, a town of Russia, capital of the government of the same name, on the right bank of the Volga, at its confluence with the Kotorost, 174 m. by rail N.E. of Moscow. Pop. about 70,000. Yaroslavl is an archiepiscopal see. The Uspensky cathedral was begun in 1573 and rebuilt in 1646–48; the churches of the Preobrazhensky monastery, St John's and Voskresenkiye date from the 15th and 17th centuries. Yaroslavl has a lyceum, founded (1863) by a wealthy member of the Demidov family. The manufactories include cotton-mills, flour-mills, tobacco and linen factories. The town was founded 1326–36. It became the chief town of a principality in 1218 and remained so until 1473, when it fell under the dominion of Moscow.

YARRELL, WILLIAM (1784–1856), British naturalist, was born in London on the 3rd of June 1784. His father was a newspaper agent, and he succeeded to the business, and prosecuted it till within a few years of his death. He acquired the reputation of being the best shot and the first angler in the metropolis, and soon also became an expert naturalist. In 1825 he was elected a fellow of the Linnean Society, of which he subsequently became treasurer, and was a diligent contributor to their Transactions. He was a member of the Zoological Society. The greater part of his leisure towards the end of his life was devoted to his two great works, The History of British Fishes (2 vols., 1836) and The History of British Birds (2 vols., 1843). These works from the first took rank as authority. He died at Yarmouth on the 1st of September 1836.

YARROW, a river and parish of Selkirkshire, Scotland. The river, issuing from St Mary's Loch, flows for 14 m. by N. to the Tweed, which it joins about 3 m. below the county town. The stream and vale are famous in poetry. Only a fragment remains of Dryhope Tower, on Dryhope Burn, the home of Mary Scott, "the flower of Yarrow," whom Walter Scott of Harden married about 1576. On Douglas Burn, a left-hand tributary, are the ruins of the keep of "the good Sir James Douglas, the friend of Robert Bruce; and Blackhouse, Mount Benger and the farm of Altivre are all connected with James Hogg. Near Broadmeadows Sir William Douglas, the knight of Liddesdale, was murdered by his kinsman (1533) in revenge for the death of Sir Alexander Ramsay of Dalhousie at his maumturk Castle. The body lay for a night in Lindean church, now in ruins, near Selkirk, before it was buried in Melrose Abbey. On the right bank are the ruins of Newark Castle, built by James III. in 1466 as a hunting seat, afterwards the property of the Scotts of Buccleuch. It was burned by the English in 1548, but the tower was restored. On the right side of the Yarrow is Bowhill, a seat of the duke of Buccleuch.

yataghan (from Turk, yataghan; sometimes spelled in English "attaghan" and "ataghan"), the name of a type of sword common to Mahomedan peoples. It has no guard or quillons, but a large and often decorated pommel; its blade has a double curve on the cutting edge, fine convex and then convex; the back is usually straight (see SWORD).

YATES, EDMUND HODGSON (1831–1894), English journalist and author, son of Frederick Henry Yates (1797–1842), was born at Edinburgh on the 3rd of July 1831. His father and mother (née Brunton; 1799–1860) were both prominent figures on the London stage from about 1817 onwards. Edmund Yates was educated at Highgate School and at Düsseldorf. In 1847 he obtained a clerkship in the General Post Office, with which he continued to be connected up to 1872, becoming in 1863 head of the missing letter department. He married in 1853, and soon began to write for the press. Charles Dickens made him dramatic critic to the Daily News, and he was a contributor
to Household Words. He wrote several farces which were acted between 1857 and 1860. In 1857 he had begun writing a column for the Illustrated Times (under Henry Vizetelly), headed "The Loungers at the Clubs"; this was the first attempt at combining "smart" personal paragraphs with the better class of journalism, and in 1858 Yates was made editor of a new paper called Town Talk, which carried the innovation a step further. His first number contained a laudatory article on Dickens, and the second a disparaging one on Thackeray, containing various references to private matters. Thackeray, regarding this as a serious affair, brought the article before the committee of the Garrick Club, of which he contended that Yates had made improper use, and the result was that Yates was expelled. Besides editing Temple Bar and Tinsley's Magazine, Yates during the 'sixties took to lecturing on social topics, and published several books, including his best novel, Black Sheep (1867); and under the heading of "Le Flâneur" he continued in the Morning Star the sort of "personal column" which he had inaugurated in the Illustrated Times. On his return from France in 1872 he went to America on a lecturing tour, and afterwards continued his special tours for the New York Herald, travelled through Europe. But in 1874, with the help of E. C. Grenville Murray, he established a new London weekly, The World, "a journal for men and women," which he edited himself. The paper at once became a success, and Yates bought out Grenville Murray and became sole proprietor. The World was the first of the new type of "society papers," abounding in personal criticism and gossip: one of its features was the employment of the first person singular in its columns, a device by which the personal element in this form of journalism was emphasized. After Truth was started in 1877 by Mr Henry Labouchere (who was one of Yates's earliest contributors), the rivalry between the two weeklies was amus-ingly pointed by references in The World to what "Henry" said, and in Truth to the mistakes made by "Edmund." In 1885 Yates was convicted of a libel in 1884 on Lord Lonsdale, and was imprisoned in Holloway gaol for seven weeks. In the same year he published his Recollections and Experiences in two volumes. He died on the 24th of May 1894. He had been the typical Flâneur in the literary world of the period, an entertaining and industrious historian, a talent in the modern sense, a developed, in doubt, from his theatrical parentage—which, through his imitators, was destined to have considerable influence on journalism.

YATES, MARY ANN (1728-1787), English actress, was the daughter of William Graham, a ship's steward. In 1753 she appeared at Drury Lane as Marcia in Samuel Crisp's (d. 1783) Virginia, Garrick being the Virginus. She was gradually en-trusted with all the leading parts. Mrs Yates, whose husband, Richard Yates (c. 1706-1760), was a well-known comedian, succeeded Mrs Cibber as the leading tragedian of the Eng-lish stage, and was in turn succeeded—and eclipsed—by Mrs Siddons.

YATES, RICHARD (1818-1873), American political leader, was born at Warsaw, Kentucky, on the 18th of January 1818. He graduated at the Illinois College at Jacksonville in 1838, was admitted to the bar, and entered politics as a Whig. From 1842 to 1845 and again in 1849 he served in the state House of Representatives. He was a representative in Congress in 1851-1855, but having become a Republican, was defeated for a third term. From 1861 to 1865 he was governor of Illinois, and was successful in enlisting troops and in checking the pro-Southern sentiment in the state. He was a member of the United States Senate in 1865-71, and was prominent in Reconstruction legislation. He died at St Louis, Missouri, on the 27th of November 1873. His son Richard (b. 1860) was governor of Illinois from 1901 to 1905.

YATSUAK, called by the Shans Lawksaw-kh, a state in the central division of the southern Shan States of Burma. Area, 21,201 square miles; (Pop. 101,248,) whom less than one-half are Shans; revenue, £3,000. The crops grown are rice, segaumum, cotton, ground-nuts and oranges. As a whole the state is moun-tainous, with ranges running N. and S. The main range has a general height of 9000 ft., with peaks, such as Loi Samphu, rising to 7840 ft. The middle and S., however, consist of open roll-ing country, with an average height of 3500 ft. To the N. the country falls away to the Nam Tu (Myitang), where there are fine teak forests, as well as along the Nam Lang and Nam Et, which with the Zawgyi form the chief rivers of the state. Most of them disappear underground at intervals, which makes the extraction of timber impossible except for local use. Lawksaw-kh, the capital, stands on the N. bank of the Zawgyi, near a small weedy lake. The old brick walls and the moat are falling into decay. The chief at the time of annexation had been at war with the Bur-mese, but refused to submit to the British, and fled to Kêng Hing, where he died some years afterwards. The sawbwa chosen in 1887 belonged to another Shan ruling house. He died in 1900, and was succeeded by his son.

YATUNG, a trade-market of Tibet, situated in the mouth of the Chumbi valley near the Indian frontier. According to the Con-vention of 1890-93, the market at Yatung was opened to India, and the conduct of the Tibetans in building a wall across the road between Yatung and Tibet was one of the incidents that led to the British mission of 1904. According to the treaty of that year, a British trade-agent was to be maintained at Yatung.

YAUCO, a city of the department of Ponce, Porto Rico, 20 m. W. by N. of the city of Ponce. Pop. (1899) 6108. Yauco is served by the American Railroad of Porto Rico. The city is situated about 15 ft. above the sea, and has a delightful climate. It is connected by a wagon road with its port, Guanica (pop. about 1000), which has an excellent harbour. Cofee and tobacco are the chief industries. Yauco was first settled in 1756.

YAVORSKY, STEPHEN (c. 1658-1722), Russian archbishop and statesman, one of the ablest coadjutors of Peter the Great, was educated at the Kiev Academy and various Polish schools. Becoming a monk, he settled at the Kiev Academy as a preacher and professor, being appointed prefect of the institution and prior of the monastery of St Nicholas. He attracted the attention of Peter by his funeral oration over the boyar Shein, and was made archbishop of Ryazan in 1700. In 1702, on the death of the last patriarch of Moscow, Yavorsky was appointed custodian of the spiritualities of the patriarchal see. Not-withstanding frequent collisions with Peter, and his parti-ality for the unfortunate tsarevich Alexius, Yavorsky was too valuable a man to be discarded. In 1721 he was made first president of the newly erected Holy Synod, but died in the following year.

Yavorsky's chief works are his Rock of the Faith of the Orthodox-Catholic Eastern Church and Dogmatic, Moral and Panteogogical Sacramentaries. See Y. T. Stepanoff, Yavorsky (Russ.) (Moscow, 1844); I. Morev. "The Rock of the Faith" of the Metropolitan Stephen Yavorsky (Russ.) (Petersburg, 1904).

YAWL, the name of a special rig of small sailing vessels or yachts, with two masts, the mainmast cutter-rigged, and a small mizen stepped far aft with a spanker or driving sail. The name has also been applied to a small ship's boat rowed with four or more oars. The word is apparently an adaptation of the Dutch jol, skiff.

The English "jolly-boat," a small staff-bowed, wide-transomed ship's boat, swung at the stern of a vessel for ready use, is probably a corruption of the Danish form of the word jolle. Other authori-ties take it to be a corruption of a late 15th-century jolywat, a small ship's boat, which is supposed to represent galleot, galiot (see Galley). A galiot, however, was never a small boat, but an independent vessel propelled by oars or sails.

YAWS, the name in use in the British West Indies for a contagious inurable tropical disease, running a chronic course and characterized by a peculiar eruption, together with more or less constitutional disturbance. It is known by various local names in different parts. In the French Antilles it is called pien; in Brazil, beba; on the west coast of Africa, yaut, dudé and farango; in Fidji, coko; in the Malay Peninsula, puru; in the Moluccas, botun d'Ambone; in Samoa, tonga or tono; in Batulonland, makaola; and in Ceylon it is
spoke of under the name of **parangi**. The name *frambesia* was first given to the disease by Sauvages in 1759 from the likeness of the typical excrescences to a raspberry. For many years yaws was thought to be peculiar to the African negro, either in his home (both west and east coasts) or in the West Indies and Brazil. But a disease the same in every respect has long been known in the East Indies (first mentioned by Bonitius early in the 17th century), affecting the Malays rather than the negroes, its chief seats being Ambonaya, Ternate, Timor, Celebes, Java and Sumatra. It has been identified by De Rochas and other observers in New Caledonia.

The general character of the disease is as follows. Previous to the eruption there may or may not be any disorder of health: in children (who form a large part of the subjects of yaws) there will probably be rheumatic pains in the limbs and joints, with languor, debility and fever. But the diagnosis of ordinary diseases is of little help, as the eruption is often the first sign, and it is attended with few or no constitutional troubles. The eruption begins as small pimples like a pin's head, smooth and almost invisible. They have a little whitish speck on their tops, grow rapidly and reach the size of a sixpence or a shilling. The pustules then break and a thick viscous lecher exudes and dries upon them as a whitish slough and a rough crust. As the whitish slough is the raspberry excrescence or yaw proper, a reddish fungous growth with a nodular surface. The favourite seats of the eruption are the forehead, face, neck, arm-pits, groin, genitals, perineum, buttocks and other parts adjacent. Yaws affects the hairs and skin of the head. In young children or infants the corners of the mouth ulcerate, as in syphilis, and the perineal excrescences resemble condyloploma. The pustules and ulcerations do not all arise in one part: some are of mature nature while others are only starting. If the patient be of sound constitution and good repute, the yaws may reach the full size of a mulberry in a month, in which case they will probably be fatal to persons of poor health they may take three months to attain the size of a wood-strawberry, in which case they will be numerous inversely to their size. Often there is one yaw much larger than the rest, and longer in lasting; it is called the "master yaw" or "mother yaw." On the soles of the feet (less often on the palms of the hands) the bursting yaws are as if imprisoned beneath the horny cuticle; they cause swelling and tenderness and increase in size on setting the foot down to the ground; these yaws are called "crab yaws" or *tubbas.* Usually a yaw is painless unless rubbed or irritated. The absence of pain is used as a diagnostic sign if there be any doubt as to the nature of the attack; a pustule is opened and a little of the juice of capiscum dropped into it; if it be a yaw, no smarting will be felt. In some cases a few yaws will show themselves long after the primary attack is over; these are called "mama yaws" (from the nourishment derived by them from the mother). In contact cases with successive crops of eruption. Six weeks is the average time in a good case, from the first of the eruption to the cutting. In some cases a second attack may be seen, and as if with difficulty, crop after crop; foul, excoriating and corroding ulcers may remain, or a limb may be in part seamed and mutilated by the scars of old ulceration. The scars after ulceration are not so dark as the skin around.

**Antiology.**—Yaws is a highly contagious disease. It is neither hereditary nor congenital. The disease spreads by contact with previously infected cases, though it has been stated that infection also arises from inhabiting dirty houses, the floors and walls of which are contaminated with yaws matter from former yaws cases; and it is also believed, and has been proved by experiment, that infection may be conveyed by flies, which act as go-betweens, carrying infective material from a yaws sore to an ordinary ulcer. The virus must be introduced directly through a breach of the skin or mucous membrane; an attack in childhood gives a large degree of immunity, a term being some years applied also to protrocted cases with successive crops of eruption. Six weeks is the average time in a good case, from the first of the eruption to the cutting. In some cases a second attack may be seen, and as if with difficulty, crop after crop; foul, excoriating and corroding ulcers may remain, or a limb may be in part seamed and mutilated by the scars of old ulceration. The scars after ulceration are not so dark as the skin around.

(2) that when the *Spirochaeta pertenue* is removed by filtration the material becomes inert; (3) that the injection of blood from the general circulation of a yaws patient gave positive results in monkeys; (4) by means of the Bordet-Gengou reaction it is possible to test specific anti-bodies and antigens.

The prophylaxis consists in the segregation of the patients suffering from the disease, the antiseptic dressing of the eruption, the application of a covering to protect it from flies, and the thorough cleansing and disinfection of infected houses and clothing, even to the destruction of the local sanitation, and finally the compulsory notification of cases of yaws to the local sanitary authority.

As regards treatment, the malady in a person of good constitution runs its course and gets well in a few weeks. Whatever tends to check the eruption, such as exposure to chill, is to be avoided. A week's course of cream of tartar and sulphur (confection of sulphur) at the beginning of the illness is often resorted to, so as to bring the eruption well out. The patient should remain indoors, in a well- aired room, and take daily exercise. If the general health is very poor and unhealthy, it is an indication for generous diet. When the eruption is declared, iodide of potassium and arsenic are very beneficial. As external applications, weak lotions of zinc or carbolic acid may be used, and, if the excrescences are irritable, a watery solution of opium. Tousid and unhealthy yaws should be dressed with a wash of sulphate of zinc or of copper; the same may be applied to a yaws ulcer. The crab yaws of the horny soles or palms, after they are let through by paring the cuticle, may be dusted with alum powder.

On the whole, the mortality is small. In 1757 West Indian cases of yaws caused various hospital deaths, where only 185 deaths, a mortality of 25.8 per thousand (Nicholls).

**YAZDEGERD** ("made by God," *Izdegerd*), the name of three Sassanid kings of Persia. (1) **Yazdegerd I.**, son of Shapur III, 390–420, called "the sinner" by the Persians, was a highly intelligent ruler, who tried to emancipate himself from the dominion of the magnates and the Magian priests. He punished the nobles severely when they attempted oppression; he stopped the persecution of the Christians and granted them their own organization. With the Roman Empire he lived in peace and friendship; and it is therefore much praised by the Byzantine authors (Procop. Pers. i. 2, Agath. iv. 26) as he is blamed by the Persians. After a reign of 25 years he appears to have been murdered in Khorasan.

(2) **Yazdegerd II.**, the son of Bahram V. Gor, 438–457. He persecuted the Christians and Jews, and had a short war with Rome in 441. He tried to extend his kingdom in the East and fought against the Kushans and Kidarites (or Huns).

(3) **Yazdegerd III.**, a grandson of Chosroes II., who had been murdered by his son Kavadh II. in 628, was raised to the throne in 632 after a series of internal conflicts. He was a mere child and never really ruled; in his first year the Arab invasion began, and in 637 the battle of Kadsisaya decided the fate of the empire. Ctesiphon was occupied by the Arabs, and the king fled into Media. Yazdegerd fled from one district to another, till at last he was murdered at Merv in 652 (see CALLIPHATE, sect. A. i.). The Parsees, who use the old Persian calendar, continue to count years from his accession (era of Yazdegerd, beginning June 16th, a.d. 632).

**YEAST** (O.E. *gysett er gyssi*; the root *yeo*, to boil, ferment, is seen in Sans. *nir-ydha*, exudations from trees, and Gr. *tymaiov*, to boil). Yeast is a cellular organism present in the fermentation of saccharine liquids (see FUNGI, FERMENTATION, BREWING).

**YEATS, WILLIAM BUTLER** (1865– ). Irish author, son of J. B. Yeats (b. 1839), a distinguished Irish artist and member of the Royal Hibernian Academy, was born at Sandymount, Dublin, on the 13th of June 1865. At nine years old he went to live with his parents in London, and was sent to the Godolphin School, Hammersmith. At fifteen he went to the Erasmus Smith School in Dublin. Later he studied painting for a short time at the Royal Dublin Society, but soon turned to
literature, contributing poems and articles to the Dublin University Review and other Irish periodicals. In 1888 he was encouraged by Oscar Wilde to try his fortune in London, where he published in 1889 his first volume of verse, The Wanderings of Oisín; its original and romantic touch impressed the discerning critics, and started a new interest in the "Celtic" movement. The same year and the next he contributed to Mr Walter Scott's "Camelot Series," edited by Ernest Rhys, Fairy and Folk Tales, a collection of Irish folklore, and Tales from Carleton, with original introductions. In 1891 he wrote anonymously two Irish stories, John Sherman and Dhoura, for Mr Fisher Unwin's "Pseudonym Library." In 1892 he published another volume of verse, including The Countess Kathleen (a romantic drama), which gave the book its title, and in 1893 The Celtic Twilight, a volume of essays and sketches in prose. He now submitted his earlier poetical work to careful revision, and it was in the revised versions of The Wanderings of Ussheen and The Countess Kathleen, and the lyrics given in his collected Poems of 1895 that his authentic poetical note found adequate expression and was recognized as marking the rise of a new Irish school. In the meantime he had followed The Countess Kathleen with another poetical drama, The Land of Heart's Desire, acted at the Avenue Theatre for six weeks in the spring of 1894, published in May of that year. He contributed to various periodicals, notably to the National Observer and the Bookman, and also to the Book of the Rhymers' Club, the English Parnassus Contemporaries of the early 'nineties. With Edwin J. Ellis he edited the Works of William Blake (1893), and also edited A Book of Irish Verse (1895). In 1897 appeared The Secret Rose, a collection of Irish legends and tales in prose, with poetry interspersed, containing the stories of Hanrahan the Red. The same year he printed privately The Tables of the Law and the Adoration of the Magi, afterwards published in a volume of Mr Elkin Mathew's Vigo Street Cabinet (1904). In 1898 he published The Wishing of the Waters, a collection of his lyrics, and in 1899 another poetical drama, The Shadowy Waters. He now became specially interested in the establishment of an Irish literary theatre; and he founded and conducted an occasional periodical (appearing fitfully at irregular intervals), called first Beltain and later Samhain, to expound its aims and preach his own views, the first number appearing in May 1899. In the autumn of 1901 Mr F. R. Benson's company produced in London the play Diarmid and Grainn, written in collaboration by him and George Moore. In 1902 he published his own first original play in prose, Cathleen ni Houlihan, which was printed in Samhain in October that year. In 1903 he collected and published a volume of literary and critical essays, to which he gave the title, Ideas of Good and Evil. In the same and the following years he published a collected edition of his Plays for an Irish Theatre, comprising Where There is Nothing, The Hour-Glass, Cathleen ni Houlihan, The Pot of Broth, The King's Threshold and On Beale's Strand. In 1904 he also edited two volumes of Irish Representative Tales. Whether or not "Celtic" is the right word for it, Mr Yeats's art was quickly identified by the enthusiasts with the literary side of the new Irish national movement. His inspiration may be traced in some measure to the Pre-Raphaelites and also to Blake, Shelley and Maeterlinck; but he found in his native Irish legend and life matter apt for his romantic and often elfin music, with its artful simplicities and unhampered cadences, and its elusive, inconclusive charm.

See the section on W. B. Yeats in Poets of the Younger Generation by William Archer (1902), and for bibliography up to June 1903, English Illustrated Magazine, vol. xxix. (N.S.) p. 285. A literary edition of his collected works in verse and prose was issued by Mr Bulfin the Shakespeare Head Works, Stratford-on-Avon, in 8 vols., 1908.

YECLA, a town of E. Spain, in the extreme N. of the province of Murcia, on the Yecla-Villena railway; it is situated on the W. slope of Monte Castillo, which rises above the left bank of the Arroyo del Jua. Pop. (1900) 18,743. The chief buildings are a half-ruined citadel, a modern parish church with a pillared Corinthian façade, and a town hall standing in a fine arcade square. Yecla has a thriving trade in the grain, wine, oil, fruit and esparto grass produced in the surrounding country.

YEISK, a town of Russis, in the province of Kuban (Caucasus), founded in 1848 on a sandbank which separates the shallow Bay of Yeisk from the Sea of Azov, 76 m. S.W. of Rootov-on-the-Don. Pop. 35,446. Notwithstanding its shallow roadstead, Yeisk has grown with great rapidity, and exports corn, linseed and wool. There are wool-cleansing factories, oil-works and tanneries.

YELLOW FEVER, a specific infective tropical fever, the germ of which is transmitted by the Stegomyia fasciata or domestic mosquito, occurring endemically in certain limited areas. The area of distribution includes the West Indies, Mexico, part of Central America, the W. coast of Africa and Brazil. The first authentic account of yellow fever comes from Bridgetown, Barbados, in 1647, where it was recognized as a "nova pestis" that was uncontrollable in its origin, except that Ligon, the historian of the colony, who was then on the spot, connected it with the arrival of ships. It was the same new pestilence that Duterre, writing in 1667, described as having occurred in the French colony of Guadeloupe in 1652 and 1649; it recurred at Guadeloupe in 1668, and broke out in a peculiarly disastrous form at St. Kitts the same year, and again in 1675; in 1655 it was at Port Royal, Jamaica; and from those years onwards it became familiar at many harbours in the West Indies and Spanish Main. It appeared at the Brazilian ports in 1849. In 1853 it appeared in Peru and in 1860 on the W. coast of Africa. In Georgetown (British Guiana) 69% of the garrison died in 1854.

During the great period of yellow fever (1793-1805), and for some years afterwards, the disease found its way time after time to various ports of Spain. Cadiz suffered five epidemics in the years 1794, 1795, 1800, 1801, and 1804. From 1800 to 1821 the disease assumed much more alarming proportions, Cadiz being still its chief seat, while Seville, Malaga, Cartagena, Barcelona, Palma, Gibraltar and other shipping places suffered severely, as well as some of the country districts nearest to the ports. In the severe epidemic at Barcelona in the summer of 1811, 3000 persons died. At Lisbon in 1857 upwards of 6000 died in a few weeks. In New Orleans 7070 people died in 1853, 3093 in 1867, and 4056 in 1878. In Rio de Janeiro died in 1850, 1043 in 1854, and 1397 in 1856. The various climate, food, and sanitary conditions have seemed to be necessary for an outbreak. Foremost we may notice a high atmospheric temperature, one of 75° F. or over. As the thermometer sinks, the disease ceases to spread. Moisture favours the spread of yellow fever, and epidemics in the tropics have usually occurred about the rainy season. Seaport towns are most affected. In many instances the elevated airy and hygienic quarters of a town may escape, while the shore districts are decimated. Usually the disease does not spread to villages or sparsely populated districts. Certain houses become hotbeds of the disease, case after case occurring in them; and it is usually in houses that the disease is contracted. A house may be said to be infected when it contains infected mosquitos, whether there be a yellow-fever patient there or not. Ships become infected in the same way, the old wooden trading ships affording an ideal hiding-place to the Stegomyia in a way that the modern and airy steamship does not.

The incubation period of yellow fever is generally four or five days, but it may be as short as twenty-four hours. There are usually three marked stages: (1) the febrile period, (2) the period of remission or lull, (3) in severe cases, the period of reaction. The illness usually starts with languor, chilliness, headache, and muscular pains, which might be the precursors of any febrile attack. These are followed by a peculiar look of the eyes and face, which is characteristic: the face is flushed, and the eyes suffused at first and then congested or ferretty, the nostrils and lips red, and the tongue scarlet; these being the most obvious signs of
universal congestion of the skin, mucous membranes and organs. Meanwhile the temperature has risen to fever heat, and may reach a very high figure (maximum, about 110° Fahr., it is said); the pulse is quick, strong and full, but may not keep up in these characters with the high temperature throughout. There are all the usual accompaniments of high fever, including hot skin, failure of appetite, thirst, nausea, restlessness and delirium (which may or may not be violent); albumen will nearly always be found in the urine. The fever is continued; but the febrile excitement comes to an end after two or three days. In a certain class of ambulatory or masked cases the febrile reaction may never come out, and the shock of the infection after a brief initial illness is terminated by prostration and death. The cessation of the paroxysm makes the stay of the illness, or lull, characteristic of yellow fever. The hitherto militant or violent symptoms cease, and prostration or collapse ensues. The internal heat falls below the normal; the action of the heart (pulse) becomes slow and feeble, the skin cold and of a lemon-yellow tint, the act of vomiting effortless, like that of an infant, the first vomit being clear fluid, but afterwards black from an admixture of blood. It is at this period that the prospect of recovery or of a fatal issue declares itself. The prostration following the paroxysm of fever may be so great as to produce these high nerve symptoms, with the continuous flow of urine, which even then is very dark-coloured from the presence of blood. The prostration will be all the more profound according to the height reached by the temperature during the acute paroxysm. Much blood in the vomit and in the stools, together with all other haemorrhagic signs, is of evil omen. Death may also be ushered in by suppression of urine, coma and convulsions, or by fainting from failure of the heart. In severe types of the disease an apoplectic, an agid and a choleraic form have been described. The case mortality averages from 12 to 30%. In Rio in 1898 it reached the appalling height of 94.5%. In cities where it is endemic the case mortality is usually lower. In 269 cases observed by Sternberg, the mean mortality was 27.7%. In 158 cases of yellow fever in Vera Cruz in 1905 there were 91 deaths. The death-rate, however, tends to vary in different epidemics. In the epidemic occurring in Zacapa, Mexico, in 1905 in a population of 6000 there were 700 cases, and the mortality among the infected was 40%. Treatment.—The patient should be removed from the focus of infection and nursed in a well-ventilated room, screened from mosquitoes and other disease entities. The mosquito, infective, followed by hot baths, is useful in the early stages to relieve congestion, high temperature may be controlled by sponging; vomiting, by ice; or, if haemorrhagic, by ergot, perchloride of iron or other styptics; and pilocarpine may be given if the urine be scanty. Sternberg has introduced a system of treatment by alcaloids to counteract the hyperacidity of the intestinal contents and increase the flow of urine. Of 301 whites treated by this method only 7.3% died, and of 72 blacks all recovered. Causation.—The pathology of the disease is discussed in the article PARASITIC DISEASES. In 1881 Dr Charles Finlay, of Havana, propounded the theory that mosquitoes were the carriers of the infection. Numerous theories had previously been brought forward, notably that of the Bacillus icteroides, described by Sanarelli; but it is now certain that this organism is not the cause. Other authorities held that the disease was spread by contagion, by miasmata, or some other of the vague agencies which have always been put forward in the absence of exact knowledge. Finlay’s mosquito theory remained in abeyance until attention was again drawn to it by the demonstration in recent years of the part played by these insects in the causation of other tropical diseases. The mosquito selected by Finlay was the Stegomyia fasciata, a black insect with silvery markings on the thorax, which is exceedingly common in the endemic area. It frequents towns, and breeds in any stagnant water about houses. Specimens were caught, fed upon yellow-fever patients, kept for a fortnight, and then allowed to bite susceptible persons established in a special camp with other susceptible persons as a control. Those bitten developed the fever, the others did not. An American commission was appointed in 1900, consisting of Walter Reed, James Carroll, A. Agramont and Lazear, and its conclusions were: that the Stegomyia fasciata is the agent of infection, that the virus of yellow fever is present in the blood during the first three days of the fever, and is generally absent on the fourth; that the germ is so small that it can pass through a Chamberland porcelain filter; that the bite of all infected Stegomyia does not produce yellow fever (about 35% of the experiments proving negative); that mosquitoes fed on yellow-fever blood were not capable of giving rise to infection until after a lapse of twelve or fourteen days, but the experiments showed their infective power for at least fifty-seven days. It can therefore be inferred that yellow fever is a parasite, requiring as in malaria an alternate passage through a vertebrate and an insect host, the analogy to malaria being very complete. E. Marchoux and P. L. Simond, of the French Yellow Fever Commission to Rio de Janeiro, 1906, have observed an interesting fact in connexion with the S. fasciata. In order to lay her eggs she must first have a feed of blood, three days after which she lays them. Before she lays her eggs she strikes both day and night, after that period at night only. Persons bitten in the day-time, therefore, do not develop yellow fever, as the parasites did not receive the necessary inoculation at an appropriate period. Prophylaxis.—Following on the publication of these experiments there was instituted a vigorous campaign against mosquitoes in Havana in 1901, based on the methods applied to the suppression of malaria, and carried out under the direction of Major W. C. Gorgas of the United States army, chief sanitary officer of Havana. The work was begun on the 27th of February 1901. An order was issued that all receptacles containing water were to be kept mosquito-proof; sanitary inspectors were told off for each district to maintain a constant house-to-house inspection, and to treat all puddles, &c., with oil; receptacles found to contain larvae were destroyed and their owners fined; breeding-grounds near the town were treated by draining and oil; hospitals and houses containing yellow-fever patients were screened; infected and adjacent buildings were fumigated with pyrethrum powder. The results exceeded all expectation, and after January 1905 the yellow-fever disease essentially ceased to originate in Havana. Cases occasionally now come into Havana from Mexican ports, but are treated under screens with impunity in ordinary city hospitals and never at any time infect the city. Thus in 1907 there was one death from yellow fever, and the general death-rate of Havana from all diseases was 17 per thousand. In the Bulletin of Public Health and Charities of Cuba it is stated there only occurred between 1905-9 a total of 345 cases of yellow fever in all Cuba, where formerly they numbered many thousands, and in April 1910 the republic was declared to be entirely free from the disease.

Among other modern outbreaks in which sanitary measures have triumphed, the suppression of malaria has been a signal success. New Orleans in 1905, in which a medical staff of 50 with subordinates to the number of 1203 started immediately on the outbreak to clean up the city; the outbreak in Belize, British Honduras, in 1906; the anti-yellow-fever campaign undertaken in the British W. Indies in 1906-7. As soon as the Isthmian Canal commissioners took over the administration of the Panama Canal Zone they undertook a vigorous campaign against the mosquito, as the result of which yellow fever was successfully banished. Colonel Gorgas in his 1908 report wrote: “It is now three years since a case of yellow fever has developed in the Isthmus, the last being in November 1906.” Rio de Janeiro, which had lost 28,078 inhabitants in 13 years by yellow fever, and Santo, have also waged war against the disease; as a result of the anti-Stegomyia policy the deaths from yellow fever in Rio fell to 42 in 1906, 39 in 1907, 4 and 4 in 1908, 1 and 0 in 1909.” See Sir P. Manson, Tropical Diseases (1907); article “Yellow Fever” in Allbutt and Rolleston’s System of Medicine; Sir R. Boyce, Report on Yellow Fever in Honduras (1906), and Health and Administration in the West Indies (1910); Bulletins of the U.S. Yellow Fever Institute; Annales de l’Institut Pasteur (January 1906).
YELLOWSTONE NATIONAL PARK, an American national reservation, situated mainly in N.W. Wyoming, U.S.A., dedicated by the United States government as "a public park or pleasure ground for the benefit and enjoyment of the people." It is nearly a rectangle in shape, with a length, from N. to S., of 62 m., a width of 54 m. and an area of approximately 3350 sq. m. It extends into Montana, on the N., about 24 m. and into Idaho on the W. and S. except the entrance, through the valley of the Yellowstone on the N., the park is entirely surrounded by national forests: the Gallatin and Absaroka national forests, on the N.; the Shoshone and the Beartooth, on the E.; the Teton, on the S.; and the Targhee, the Madison and the Gallatin, on the W.

The central portion, comprising an area of about 2000 sq. m., is an undulating plateau with a mean elevation above the sea of about 8000 ft. Along the entire E. border stretches the Abyssinian range, with peaks exceeding 11,000 ft. (Index Peak, 11,740 ft.) in height. On the N. is the Snowy range with its snow-capped peaks. W. of the Snowy the Gallatin range extends S. for 20 m. along the W. border. Electric Peak, in the N.W. corner of the park, rises to a height of 11,155 ft. Near the S. end of the park are the Red Mountains, which culminate in Mt. Sheridan (10,385 ft.) and afford a magnificent view of the whole region; and farther S. the N. spur of the lofty Tetons juts across the S. border.

In the production of these mountains and plateau there was a period of cooling of the earth's surface to form a mountain rim and a depressed basin. Subsequently, in the Tertiary period, there were enormous outpourings of volcanic material--first andesitic lava, and later, after a long interval of quiet, rhyolitic--which nearly half filled the basin, converted it into a plateau and broke up the mountain rim. Two centres of volcanic activity were Mt. Sheridan, in the S., and Mt. Washburn, in the N. The volcanoes have long been extinct, but the diminished energy now causes hot springs and geysers in all parts of the plateau, about 30 in number. Most of these, including the largest and finest, are in the upper and the lower Geyser basins, near the head of the Madison, here known as the Firehole, river. Several others are farther N. in the Norris basin upon Gibbon river, a branch of the Madison, and others are farther S. in the Shoshone basin.

Excelsior, the largest geyser, with a crater about 300 ft. long and 200 ft. wide, has not been active since 1890, but for several years after its discovery it threw up at intervals a huge mass of water to a height of 340 ft. Old Faithful, in the Geyser basin, has regular intervals of 65-75 minutes, throws up a column of hot water 2 ft. in diameter to a height of 125-150 ft., and the eruption lasts 43-45 minutes. The Giant, at intervals of 2 to 4 days or more, throws up a column to a height of 300 ft., which finally collapses (so called "boiling the shape of its cone"), the Grand and the Lone Star throw up columns to a height of 200 ft. but at irregular intervals. In the Norris basin are the Black Growler and the Hurricane, which consist of small apertures through which steam rushes with such tremendous force that it may be heard for miles. The hot springs are widely distributed over the plateau and number from 3000 to 4000. The water of most of the springs and geysers holds silica in solution in considerable quantities, so that it cools and evaporates it deposits a dazzling white sinter which has covered many square miles of the valleys and contrasts strongly with the dark green of the forest. The waters of some of the springs are scattered over it in the most irregular fashion. The silicious matter has also built up around the springs and geysers cones or mounds of considerable size and at the close of the season the water of many of the springs contains sulphur, iron, alum and other materials in solution, which in places stain the pure white sinter with bright bands of colour. The tints and hues of some of the pools are of matchless beauty. Not far from the mouth of the Gardiner river there is a large group of 70 active springs, known as the Mammoth Hot Springs, which hold carbonate of lime in solution. Their deposits have built up across a valley or across the flat, forming terraces up to 90 ft. high and 300 ft. in height. The water which trickles over the rims of the pools and basins on the upper terraces is a transparent blue, while the formation itself contains a network of fibrous algae which gives it a great beauty of colour. The lower terraces of the Geyser basin are the Mammoth Paint Pots, a group of mud springs with colours varying according to the mineral ingredients in the steam, which not only colours the mud but also forms it into incrustation figures.

Near the centre of the park is Madison, a circular crater about 40 ft. deep with the boiling mud at the bottom. Although there have been some changes in the thermal energy in the park since 1872, there has been no appreciable diminution. Some of the springs and geysers lose some of their energy at intervals, while others gain: certain geysers have become quiescent, but some new ones have formed.

The Continental Divide crosses the park in a S.E. direction from the meeting-point of the states of Wyoming, Idaho and Montana. The portion of this divide in S. of the Divide is drained by the Snake river into the Columbia river and the Pacific Ocean; the large section N. of the Divide is drained by the Yellowstone and Madison rivers into the Missouri, the Mississippi and the Gulf of Mexico. The Lewis river, a fork of the Snake, has its origin in the beautiful Shoshone Lake, and the Heart river, another fork of the Snake, rises in Heart Lake, under Mt. Sheridan.

Rising just beyond its S. limits, it flows into and through Yellowstone Lake, a magnificent sheet of water, very irregular in shape, dotted with forested islands, having an area of about 140 sq. m., lying 7741 ft. above the sea level. This lake drains an area of elevated land by means of its three forks, and upon each of them occurs a fine fall in its descent toward the Yellowstone. The Madison rises in the W. of the park and flows in a south-westerly direction for about 70 m. and empties into the Missouri, mainly collected from the rainfall upon the plateau, and from the hot springs and geysers, most of which are within its drainage area. Upon this river and its affluents there are several falls. Indeed, all the streams, their affluents and affluents of affluents, have, in many cases, courses of a recent change of level in the surface of the country.

The climate, influenced by the high elevation, is characterized by long and severe winters and short summers with great diurnal extremes of temperature. But the low temperature causes the moisture-laden winds to deposit here greater quantities of rain and snow than in the semi-arid regions below, which not only promote the growth of vegetation, but cause the activity of the springs, geysers and waterfalls. The mean annual temperature at the station of the United States Weather Bureau near the N. boundary, is 39° F. The summer (June, July and August) mean is 59°; the winter (December, January and February) mean, 20°.

Extremes have ranged from 96° in July to -35° in February. The temperature has fallen to 30° in July, and a warm summer day may at any time be followed by frost at night. The mean annual precipitation is 19-6 in. Much of this is in the form of snow, and nearly half of it is during the four months from December to March; in the four dryest months, from July to October, it is only 4-3 in. The snow falls in every month, the average annual snowfall amounting to 947 in. The prevailing winds are S.

About four-fifths of the park is covered with dense forests of black pine (Pinus Murrayana), balsam, fir, spruce, cedar and poplar. These trees do not attain a large size. A low blueberry (Vaccinium Myrtillus) forms a thick underbrush in the forest. In the foreground, gooseberries, black currants, red currants and black currants grow along the streams and in moist places of the lower altitudes. In the glades are
bunch-grass and a variety of flowering plants; buttercups, daisies, forget-me-nots and other wild flowers may be found at almost every snow-bank in August. In the hot-spring districts are plants with peculiarities both of those common to the desert and those common to the seashore. In the N.E. corner of the park fossil forests rise one above the other. After the destruction of one forest by volcanic eruptions another grew over it; it, too, was buried under volcanic material, and the process was repeated several times.

The native fauna is abundant and varied. The policy of the government which protects game, both in the park and in the surrounding national forests, has induced elk, deer, antelope, mountain-sheep, bears, porcupines, coyotes, squirrels, geese, ducks, cranes, pelicans and gulls are very numerous in the autumn months.

The park is under the supervision of a superintendent who is appointed and instructed by the Secretary of the Interior. It is policed, however, by troops of United States cavalry with headquarters at Fort Yellowstone, near the Mammoth Hot Springs, and the building of roads and other improvements is in the hands of the Survey. Some miles of the stage line along the approaches to the park are a branch of the Northern Pacific railroad up the valley of the Yellowstone to the main gate at Gardiner, Montana, and a branch of the Oregon Short Line up the valley of the North Fork of the Snake to Yellowstone, Montana. Automobiles are not allowed within the park, and the principal means of conveyance is by stage coaches and by a steamboat on Yellowstone Lake. There are hotels at the Mammoth Hot Springs, at the principal geyser basins, and at Yellowstone Lake. The hotels and stage lines open for the tourist season early in June, and close about the 15th of September.

The strange phenomena of this region were known to some of the Indians; they were discovered by John Colter, a member of the Lewis and Clark expedition, in 1807; the region was visited by James Bridger before 1820; an account of the geyser was published at Nauvoo, Illinois, in The Wasp, a Mormon paper, in 1842; Captain W. F. Raynolds, of the United States Corps of Topographical Engineers, with full knowledge of Bridger's accounts, was ordered to explore the region in 1859, and yet, chiefly because of the persistent incredulity with which the accounts of the phenomena were received, the region remained practically unknown until 1870. From 1863 to 1866 gold seekers repeatedly confirmed the early reports, and the publication of their accounts in Western papers gradually aroused interest. In 1869 a private exploring party, consisting of David E. Folsom, C. W. Cook and William Peterson, set out from the gold-fields of Montana with the express purpose of verifying or refuting the rumours, and they returned full of enthusiasm. In 1870 a semi-official expedition, led by Henry D. Washburn, the surveyor-general of Montana, and Lieutenant Gustavus C. Doane of the Second United States Cavalry, made the "Yellowstone Wonderland," widely known. A year later an expedition under Dr. Ferdinand V. Hayden (1829-1887) made a large collection of specimens and photographs, and with these data, together with the reports of this and the Washburn-Doane expedition, Congress was induced to reserve the area from settlement, which was done by an act approved the 1st of March 1872. In that year further explorations were made, and in subsequent years army expeditions continued the work of exploration. In 1878 and 1879 a survey based upon triangulation was made by the Hayden survey, and in 1883-85 a more detailed map was made by the United States Geological Survey, and a systematic study of its geological phenomena was instituted. See Arnold Hague, Geology of the Yellowstone National Park (Washington, 1899), "Geological History of the Yellowstone National Park," in the Annual Reports of the Smithsonian Institution (for the year 1891), and Nevada, Yellowstone National Park (New York, 1899); also the Smithsonian's Magazine (May, 1904); W. H. Weed, "Formation of Geyser Basin," in the 9th Annual Report of the Director of the United States Geological Survey (1889); and Chittenden, Yellowstone National Park, Historical and Descriptive (Cincinnati, 1895); Annual Reports of the Superintendent of the Park (Washington, 1890-99).

**Yemen**

(Yemen), a province of Arabia, forming the S.W. corner of the peninsula, between 12° 35' and 18° N., and 42° and 49° E., bounded on the N. by Asir and on the E. by the Dahna desert and Hadramut. Pottery and the ancient semitic language are the distinguishing features of the Yemeni, and a people who, in general, consist of black, brown and grizzly bears may be seen at almost any time during the summer season feeding on the garbage from the hotels. A few wild bison still remain at large, and besides these there is a herd of about 100 confined within a pasture in the Lamar Valley. The lakes and rivers are well stocked with trout and other fish, and visitors have the privilege of catching a limited number with rod and line. Robins, bluebirds, warblers, chickadees, finches, vireos, wrens, yellow-headed blackbirds, nutcrackers, nut-hatchers, and woodpeckers, killdeer, warblers, and several other species of small birds are found in the park, but the number of each is not great. Among birds of prey are the golden eagle, bald eagle, hawks and owls. Geese, ducks, cranes, pelicans and gulls are very numerous in the autumn months.

The Turkish vilayet of Yemen includes Asir, and extends along the Red Sea coast from El Jeddah in the N. to Sheik Said at the straits of Bab-el-Mandeb; its land boundary on the E. is undefined, except in the S.E., where the boundary between the Yemeni and the Hedjari tribes, under British protection, was defined by an agreement between Great Britain and Turkey in 1904, by a line running approximately N.E. from Sheik Said to the Dahna desert. The main physical characteristics of the province are described in the article ARABIA. A lowland strip 20 to 30 m. wide extends along the western and southern coasts, skirting the great mountain range which runs along the whole western side of the Arabian peninsula, and attains its greatest height in the Jibal, or highlands of Yemen, and beyond this mountain zone the interior plateau falls gradually towards the N.E. to the Dahna desert.

The lowland, or Tehama, is hot and generally sterile; it contains one exceptionally rich area, near the village of Jibal, where Tahijs, or long yellow flowers, and cafuis, or white grass, are so abundant that they turn the lowland into a veritable flower-bed. The mountains, fertilized and irrigated by hill streams and supporting many large villages and towns. The most important of these are Abu Arish, Bet el Fakh and Zubeid in the western Tehama, the latter a thriving town of 20,000 inhabitants and the residence of a Turkish kaimakan and Abyan and Lahaj, the chief place of the independent Abdali tribe, in the southern Tehama. Hodeida and Aden are the only parts of commercial importance, Lohala and Ghalefika have sunk to insignificance fishing villages, and Mokha, the old centre of the coffee trade, is now almost deserted. The Jibal forms a mountainous zone some 50 m. in width rising steeply from the foothills of the Tehama to an average height of 900 ft.; many summits exceed 10,000 ft.—the highest fixed by actual survey is Jebel Manar, 10,565 ft., about 10 m. E. of the town of Ibb. With its temperate climate and regular rainfall, due to the influence of the S.W. monsoon, the Jibal must be considered the most favoured district of Arabia. The villages are substantially built of stone, often picturesquely situated on the spurs and crests of the hills, the houses clustering round the town or village with dry stone walls, and cultivated terraced slopes and valleys. The principal crops are wheat, barley, millet and coffee, the last-named more particularly on the western slopes within reach of the moist sea-breezes. In many places the hill-slopes are used for raising sheep, and the grazing fields, supported by stone walls, are named by the Greek geographers to the range of S. Arabia was no doubt intended to describe the step-like appearance of the hills due to this method of cultivation. The special characteristic of the Yemen highlands is that fields and inhabited sites are found at the highest elevations, the mountain-tops forming extensive plateaux, often scarped on one side, and only used for grazing, and on the other, with which encircle them like the escarpments of a natural fortress; a remarkable example of this is Jebel Jihaf on the Aden border, 8000 ft.
Ta'iz, Thence Yemen its E. 1871. Hejaz M. (R. contains 30', joined the draining capital, a great occupied Sana historical earlier tribes, more strongholds Manakha, South the Wadi covered in ruins. Thirty miles further N. are the small towns of Ibb (6700 ft.) and Jibila, about 5 miles of lowland stretches with thorough stone-built paved streets. To the E. on the main road to the coast via Zubed is Udên, the centre of a coffee-growing district; 80 m. to the N. is Manâkha, a Turkish post on the main road from Hodeida to the capital, the S. of Jebel Nebel which produces coffee in Yemen. Another group of hill towns lies still further N. in the mountain mass between the Wadi Maur and Wadi La'â, where the strongholds of Dhâbâ, A'bâ Haja and Karkabûn held out for long against the Turkish advance; the last-named town, now almost deserted, was once a city of 20,000 inhabitants, and the capital of a small principality which preserved its independence during the earlier Turkish occupation between 1576 and 1630.

The inner or plateau zone of Yemen stretches along the whole length of the province, with an average width of 120 m.; it lies entirely to the E. of the high range, and has therefore a smaller rainfall than the S., and with the advance of the season it is increasing in aridity towards the E. where it merges in the desert, but broken in places by rocky ranges, some of which rise 2000 ft. above sea-level. Such ranges show evidence of volcanic action. It is intersected by several wadi systems, of which the principal are those in the N. uniting to form the Wadi Ne'mar, in the centre of the Wadi Khârid and Shibwân, running to the Lah. In the S. the Wadi Dâna and the Wadi Yarim draining to the Gulf of Aden. The plateau has a gradual fall from the watershed near Yarim, 8500 ft. above sea-level, to less than 4000 ft. at the edge of the desert.

The northern part of the high plateau, down to the latitude of Sana, is the territory of the warlike Háshîd and Bakîl tribes, which have never submitted to the Turks, and in 1892 and again in 1904-5 drove the Turks from the plateau. A strange proviso in the treaty of 1891 left time held the capital Sana itself for the Imam Muhammad Yahâdi, the representative of the old dynasty that ruled in Yemen from the expulsion of the Turks in 1630 till its reconquest in 1871. The principal places are Sâ'âd, the residence of the Imam, an important town on the old pilgrim road 120 m. N. of Sana, Khâiwan and Khamr. In the N.E., bordering on the desert, is the district of Nejîrân, a mountainous country with several fertile valleys including the Wadi Ne'mar, Bedr and Habâna, all probably draining N.E. to the Wadi Dâwasir. Further S. is the oasis of Jâfû, a hollow or depression, as its name signifies, containing many villages, and of great importance as the only outlet of the westward-draining Sabânean kingdoms, known to the ancients from the earliest historical times through their control of the frankincense trade of S. Arabia. Ma'in, identified by Halâwi as the seat of the former, is a town of important water-wells preserved. In the W. other ruins were found by him in the neighbourhood, together with inscriptions supporting the identification. Márib, the Sabânean capital, has its great temple built accurately by the Queen of Sheba, and the bursting of which in A.D. 120 is said to have led to the abandonment of the city. This was, however, more probably due to the deterioration of the country through desiccation, which has forced the settled population farther westward, where Sana became the centre of the later Himyaritic kingdom. The Arhab district drained by the Wadi Khârid and Shibwân running to the Lah. Dhamar a town of 4000 inhabitants, the residence of a kâmaikâm, and the seat of an ancient university) and Yarim are on the road leading S. to Aden; and two days' journey to the E. is Rada in the extinct S. Yemen, still a flourishing town, but now much decayed. From near Rada the boundary runs S.W. to the small town of Ka'taâbha through which the direct road passes from Aden to Sana, passing through the old capital of the Yemen, the occupation of the invaders, and the several tribes under British protection, of which the principal are the Yafâ, the Haushabî and the Abdâl. The inhabitants of Yemen are settled, and for the most part have adopted the agricultural method of cultivation. The majority are pastoral or Bedouin type found in Hejaz and Nejd hardly existing. As in the adjoining province of Hadramut, with which Yemen has had a long and confused history, the people are divided into four classes: (1) The Seyyid or A'zîmiyah, a farming tribe, with a religious aristocracy: (2) The Kabail, or tribesmen, belonging to the Kahtanic or original S. Arabian stock, who form the bulk of the population, and are the only class habitually carrying arms: (3) the trading class: (4) the servile class, mostly of mixed African descent, and including a number of Jews. These latter latter have been partly absorbed into the agricultural tribes, and partly driven into the towns. Owing to the hardships to which they have been exposed through the disturbed state of the country, many are emigrating to Mecca. See C. Niebuhr, Travels and Description of Arabia (Amsterdam, 1774): D. G. Hogarth, Penetration of Arabia (London, 1904): E. Gussar, Geschichte und Geographie Arabiens (Berlin, 1890), and in Petersmans' Mîllî (1866): R. Manzoni, Il Yemen (Rome, 1884). As Delfers, Voyage en Yenîes (Paris, 1889): S. M. Zwemer, Arabia (Edinburgh, 1900); W. B. Harris, A Journey through Yenîes (London, 1893); H. Burchardt, Z. d. Ges. für Erdkunde (Berlin, 1902), N. 72.
Beyond the Yeniseisk Taiga begin the lowlands, which at no point rise more than a few hundred feet above the sea. They slope gently towards the Arctic Ocean and are covered with lakes, scanty forests and marshes; and, as they approach the ocean, they become more elevated. Beyond 70° N. there are large alders, but deciduous trees occur only along the courses of the rivers. Two ranges, however, break the monotony of the lowlands—the Tungus, which stretches N.E. between the Khargata and Anabar rivers, and the Byrryahn mountains, which skirt the N.W. shore of the Taymyr peninsula. The shores of the Arctic Ocean are indent by deep estuaries, that of the Yax penetrating 600 m. into the interior of the country. The great river systems of Siberia at this point have often been discussed; the difficulty is that the Chulym valley is 440 ft. higher than the other.

Yeniseisk is rich in all kinds of metals and minerals. Gold dust appears in the N. Yeniseisk Taiga, in the region of the Kuznetskii, Baytau and its spurs, with the basins of the Tuba, Sisim and Black Lake, and White Yys, and in the upper parts of the tributaries of the Khatanga, Yuga. Silver ore is found in the basin of the Abakan, but the mines have been abandoned. Iron ore occurs almost everywhere in S. Yeniseisk, but there is only one iron-works on the Abakan. Salt lakes are common.

The climate, though very severe throughout, offers great varieties. The Minusinsk steppes have a dry and relatively mild climate. At Krasnoyarsk (55° N.) the climate is more severe, and the winds are disagreeable. The yearly fall of snow is so small that the winter temperatures are seldom lower than 15°. The climate of Yeniseisk (58° 27' N.) has an average temperature below freezing point, and at Turkhansk the coldest month (February) averages 24° below zero. On the Taymyr peninsula the average summer temperature hardly reaches 45°.

The highlands of Sayan and Ala-tau are thickly clothed with forests of cedar, pitch-pine, larch, elder and birch, with rhododendrons, Berberis and Ribes; the Scotch fir appears only in the lower and drier parts of the valleys. The summits and slopes of the mountains are strewn with drâbir and boulders, and thickly mantled with lichens and mosses; but there are patches of grassland between, most of which are known in Europe. Still, the flora is poor as a rule, and Dr Martianov, after several years' labour, succeeded in collecting only 104 species of phanerogams. 1 The other hand, the Minusinsk plains and the steppes of the Abakan are bright with flowers scattered amid the common Gramineae, and in June and July with the Polygala, Dianthus, Medicago, Lathyrus, yellow sweet-scented lily, and scores of other flowers, mostly frost-borne flowers, but with the time, and the sandy slopes of the Anabar, the region, as described by specialists, have no fewer than 124 have proved to be new. Further N. the fauna is similar in character to that of the Siberian lowlands (see Siberia). In the Taymyr peninsula it is represented by only 124 species of flowering plants.

The steppes of the upper Yenisei have been inhabited from a very remote antiquity, and numberless kurgans, or burial mounds, graves, rock inscriptions and smelting furnaces of the successive inhabitants are scattered all over the prairies of Abakan and Minusinsk. 2 The present population exhibits traces of all their predecessors. Numerous survivals of Turkish and Samoyedic tribes are found in the steppes and in the Sayans; but some of them are greatly reduced in numbers. The eastern Sayan and the Kume, a partly Russian, the rest (about 16%) consisting of Samoyedes, Tunguses, Yakuts, Mongols and Ostyaks. The government is divided into five districts, the chief towns of which are Krasnoyarsk, Achinsk, Kansk, Minusinsk and Yeniseisk.

Some 1,177,000 acres (9-5%) are under crops, the principal being rye, wheat, oats, barley and potatoes. Live-stock, including reindeer, breeding is very extensively carried on. Fishing, especially on the lower Yenisei, is of commercial importance. Sables are not now to be found, and the hunters obtain chiefly squirrels, foxes, mink, great foxes and bears. In the middle of the 19th century 350,000 to 525,000 oz. of gold were obtained annually in N. and S. Yeniseisk, the gold being conveyed to the mining districts on the Lena and 100,000 oz. Salt is extracted as well as Epsom salts. Coal has been found on the Lower Tunguzka, near the mouth of the Yenisei, and in many places in the S. of the government. Silver, copper, lead, brown coal or lignite, rock-salt, graphite and mica all exist in large quantities, but are not regularly mined. There are several distilleries. The trade is in furs (exported), and in groceries and manufactured goods (imported). The gold mines are supplied with grain and cattle by rivers from the Minusinsk region, and with salt, spirits and iron by the Angara. The government is traversed from W. to E. by the Siberian railway, and considerable efforts have been made to establish regular steamer communication between the mouth of the Yenisei and W. Europe. For some years before the close of the 19th century (e.g. that of the English Captain Wiggins) reached the mouth of the Yenisei, importing provisions and machinery for the gold mines. Efforts have been made to clear the rapids of the Angara, so as to bring Lake Baikal into steamer communication with the Yenisei. Owing to the shallowness, however, of the small tributaries of the Yenisei, the canal connecting the Yenisei with the Ob has not proved as serviceable as was expected.

(P. A. K.; J. T. B.)

YENISEISK, a town of Asiatic Russia, capital of the government of the same name, on the right bank of the Yenisei, 170 m. N.N.W. of Krasnoyarsk, with which it has regular communication by steamer. Pop. 12,000. It is the centre of a gold-mining region, and has a public library and a natural history and archaeological museum. The town was founded in 1618.

YEOLA, a town of British India, in the Nasik district of Bombay, on the chord line of the Great Indian Peninsula railway, 18 m. from Mammad junction. Pop. (1901) 16,559. The most important manufactures of cotton and silk cloth and thread, and also a gold royal household. There are, under the word "Yeoman" was the title of the first assistant to the Usher of the Black Rod, the Yeoman Usher of the Black Rod. In the British navy there are petty officers in charge of the signalling styled "Yeomen of Signals." For the history and present organization of the "Yeomany cavalry, see YEOMANY and UNITED KINGDOM (§ Army)."

"Yeoman" is one of the class covered by the word "yeoman" in England has never been very exactly defined. Not only has the meaning of the word varied from century to century, but men writing about it at the same time have given to it different interpretations. One of the earliest pictures of a yeoman is that given by Chaucer in the Prologue to the Canterbury Tales. Here, represented as a forester, he follows the esquire as a retainer or dependant. The yeomen of the ages succeeding Chaucer are, however, practically all occupied in cultivating the

2 See V. Rovd, In Siberia (2 vols., Leipzig, 1880), and N. Savenkov, in Insecta of the East Siberian Geographical Society (xviii, 1887).
land, although, doubtless from its younger sons, the class furnished retainers for the great lords, men-at-arms and archers for the wars, and also tradesmen for the towns. Stubbs (Const. Hist. vol. iii.) refers to them as "a body which in antiquity of possession and purity of extraction was probably superior to the classes that looked down upon it as ignoble," and Medley (Eng. Const. Hist.) describes them as the yeomen in the 16th century representing on the whole "the small freeholders of the feudal manor." Holinshed, in his Chronicle, following Sir T. Smyth (De republica Anglorum), and W. Harrison (Description of England), describes them as having free land worth £6 annually, and in times past 40s., and as not entitled to bear arms, being for the most part farmers to gentlemen, and this description may be accepted as the popular idea of the yeoman in the 16th century. He formed the intermediate class between the gentry and the labourers and artisans, the line of demarcation, however, being not drawn very distinctly.

The yeomen were the smaller landholders, and in the 15th century were practically identical with the forty-shilling freeholders who exercised the franchise under the act of 1430. Occasionally they found their way into parliament, for in 1446 the sheriffs were forbidden to return volletti (i.e. yeomen) as members, but this prohibition had very little result. Soon, however, the name appears to have included tenant farmers as well as small freeholders. Thus Latimer, in his famous sermon before Edward VI., says: "My father was a yeoman, but had no land of his own, and the yeoman was an exceedingly prosperous person, and the same opinion had been expressed about a century before by Sir John Fortescue in his Governance of England. The decay of the class began with the formation of large sheep farms in the 16th century, but its decline was very slow, and the yeomen furnished many sturdy recruits to the parliamentary party during the Civil War. Their decay was accelerated during the 18th century, when many of them were bought out by the large landowners, while they received another blow when the factory system destroyed the country's domestic industries. Many writers lament the decay of the yeoman in the 18th and 19th centuries, but this is partly accounted for by the fact that they exclude all tenant farmers from the class, which they confine to men cultivating their own land. Thus the wheel has come full circle and the word means to-day much the same as it meant in the early part of the 15th century.

YEOMANRY, the name given to the volunteer mounted troops of the home defence army of Great Britain, ever since their original formation; it indicated that recruiting, organization and command were upon a county basis, the yeomen forming the offi-}

1430.

cers of the force, the farmers and yeomen serving in its ranks, and all alike providing their own horses. Although the yeomanry was created in 1761, it was not organized until 1794. Under the stimulus of the French War recruiting was easy, and 5000 men were quickly enrolled. A little later, when more cavalry was needed, the Provisional Cavalry Act was passed, whereby a sort of revived knight-service was established, every owner of ten horses having to find and equip a horseman, and all who owned fewer than ten, grouped by tens of horses, similarly finding one. But as the yeomanry was so suddenly created the cavalry could be substituted for provisional cavalry in the county quota. This gave a great stimulus to yeomanry recruiting, as similar enactments had done in the case of the infantry volunteers. But even so the provisional cavalry, which was embodied only in counties that did not supply the quota in yeomanry, was stronger than the yeomanry at the peace of Amiens. At that peace, partly with a view to preserving internal order, partly because of the probable renewal of the war, the yeomanry was retained, although the provisional cavalry was disbanded. There was thus a nucleus for expansion when Napoleon's threatened invasion (1803-5) called out the defensive powers of the country, and as early as December 1803 there were in England, Scotland and Ireland 44,000 yeomen. At the same time the limitations as to place of service (some undertaking to serve in any part of Great Britain, some within a specified military district, most only in their own county) were abolished. The unit of organization was the troop of 80-100, but most of the force was grouped in regiments of five or more troops, or in "corps" of three or four troops. Permanent paid adjutants and staff sergeants were allowed to corps and regiments, but no assistance was given in the shape of officers on the active list and serving non-commissioned officers of the army and militia. Equipment, supply and mobilization of yeomanry units were wholly regimental, and through all the war years most of the troops and squadrons were ready to take the field, with equipment, food and forage, complete at a day's notice. They were trained as light cavalry, and armed with sabre and pistol. But a few town corps had mounted riflemen, and several corps, both in town and country, had one or more dismounted troops, who were carried on vehicles similar to the "Expedition or Military Fly" pictured by Rowlandson.

From the extinction of Chartist to the South African War the history of the yeomanry is uneventful. The strength of the force gradually sank to 10,000. But when it became apparent that mounted troops would play a decisive part in the war against the Boers, the yeomanry again came to the front. Of its 10,000 serving officers and men, 3000 went to South Africa in newly formed battalions of "Imperial Yeomanry," armed and organized purely as mounted riles, and to these were added over 35,000 fresh men, for whom the yeomanry organization at home and at the seat of war provided the cadres and training, while the home yeomanry organization filled its gaps and expanded. In 1901 the yeomanry, now all styled "Imperial," was remodelled; and the strength of regiments was equalized on a four-squadron basis. In the prevailing conditions practically all regiments were able to recruit up to the increased establishment, and the strength of the force was more than trebled. Fresh regiments were formed, some in the towns, others on the nucleus of special corps disbanded at the close of the South African War. In 1907 the yeomanry became part of the new Territorial Force (see under ORdnance, § Army).

YEOMEN OF THE GUARD, originally "Yeomen of the Guard of (the body of) our Lord the King," or in the 15th-century Latin, "Valeti garde (corporis) domini Regis," the title (mainly maintained with but a slight variation since their institution in 1485, the official wording under Edward VII. being "The King's Body Guard of the Yeomen of the Guard") of a permanent military corps in attendance on the sovereign of England, as part of the royal household, whose duties, now purely ceremonial, were originally that of the sovereign's personal bodyguard. They are the oldest existing body of the kind, having an unbroken record of service from 1485 to 1859, but only filled up its gaps and expanded. Before that time there had been forms of royal guard, but no permanent institution. Under Edward I. we find in England the "cross-bowmen of the household," and under Edward II., as "Archer guard of the King's body"; but the "Archers of the King," "of the crown" or "of the household," who appear in the records up to 1454, seem to have had no continuous establishments. Apparently each sovereign, coming to the throne, established a new Guard of his own particular followers. It was not till Henry VII. created the "Yeomen of the Guard" on 15 August 1485 that a group was taken by a special warrant as the first warrants to individual "Yeomen of the Guard" date from September 16, 1485, and it is a fair inference that the Guard was created by the king on the battlefield of Bosworth (August 22, 1485), its first members being men who had shared Henry's exile in Brittany, followed him on his return, and fought as his private Guard in that action. The warrant of September 16, 1485, now in the Record Office, "to William Brown, Yeoman of the King's Guard," corroborates this view—"in consideration of the good service that our humble and faithful subject William Browne Yeoman of our Garde hath heretofore done unto us as well beyonde the see as at our victorious journeye." It is argued by Sir Reginald Hennell that the title of "Yeomen of the Guard" signified Henry VII.'s intention to choose the special protectors of his person not from the ranks of the nobility, but from the class just below them (see YEOMAN), who had
proved in war the backbone of the national strength. The term "valetti, or "valets" (see VALET), was already in use, as signifying personal attendants, with none of the modern menial sense of the word.

The first official recorded appearance of the king's bodyguard of the Yeomen of the Guard was at the coronation of its founder Henry VII. at Westminster Abbey on the 31st of October 1485, when it numbered 50 members. This number was rapidly increased, for there is an authentic roll of 126 attending the king's funeral in 1509. Henry VIII. raised the strength of the Guard to 100 when he took it to visit Francis I. of France at the Field of the Cloth of Gold. In Queen Elizabeth's reign it numbered 200. The corps was originally officered by a captain (a post long associated with that of vice-chamberlain), an ensign (or standard-bearer), a clerk of the cheque (or chequeur roll, his duty being to keep the roll of one connected with the household), besides petty officers, captains, serjeants or ushers. In 1669 Charles II. reorganized the Guard and gave it a fixed establishment of 100 yeomen, officered by a captain, a lieutenant, an ensign, a clerk of the cheque and four corporals, whose duties are almost the same as they were in the reign of Queen Anne. The only variation is that the captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and that the old rank of "corporals" has been changed to "exon," a title derived from "exempt," i.e. exempted from regular regimental duty for employment on the staff. Formerly officers on the active list were given these appointments in addition to their own.

The original duties of the Guard were of the most comprehensive nature. They were the king's personal attendants day and night at home and abroad. They were responsible for his safety not only on journeys and on the battlefield, but also within the precincts of the palace itself. The regulations for making of the king's bed in Tudor times were of the most elaborate formality. No one but the Yeomen of the Guard under an officer might touch it. Each portion was separately examined. Each sheet or coverlet was laid with the greatest ceremony, and the sovereign could not retire to rest until the work was reported as well and truly done. The existence of the custom is verified at the present day by the designations Y.B.H. ("Yeomen Bed-Hangers") and Y.B.G. ("Yeomen Bed-Guards"), which are still in use, and the names of certain yeomen are given on the roll of the Guard. Another of their duties outside the palace was retained, viz. the searching of the vaults of the houses of parliament at the opening of each session, dating from the "Gunpowder Plot" in 1605, when the Yeomen of the Guard seized Guy Fawkes and his fellow-traitors and conveyed them to the Tower. Owing to the destruction by fire of most of the records of the Guard in St. James's Palace in 1869, the precise history of the search is a matter of controversy. It is recorded in the papers of the House of Lords that the Guard conducted it in 1600 and that it has been continuous since 1670, but Sir Reginald Hennell's contention is that it dated from 1605 and has since been regularly observed.

Though the corps from the earliest day was composed of foot-soldiers, during royal progresses and journeys a portion of the Guard formed a mounted escort to the sovereign until the end of the Georgian period.

The dress worn by the Yeomen of the Guard is in its most striking characteristics the same as it was in Tudor times. It has consisted from the first of a royal red tunic with purple facings and stripes and gold lace ornaments. Sometimes the sleeves have been fuller and the skirts longer. Red knee-breeches and red stockings (white in Georgian period only), flat hat, and black shoes with red, white and blue rosettes are worn. Queen Elizabeth added the ruff. The Stuarts replaced the ruff and round hats with fancy lace and plumed hats. Queen Anne discarded both the ruff and the lace. The Georges reintroduced the ruff, and it has ever since been part of the permanent dress. But the most interesting point connected with the dress is that the gold-embroidered emblems on the back and front of the coats tell the history of the consolidation of the kingdoms of Great Britain and Ireland. From 1485, when the Guard was created, till 1603, the emblems were the Tudor crown with the Lancastrian rose, and the initials of the reigning sovereign. When the Stuarts succeeded the Tudors in 1603, they substituted the St Edward's crown for the Tudor, and added under it and the initials the motto "Dieu et mon Droit," which is still worn. When William and Mary came to the throne in 1689, their initials were entwined, W.M.R.R. (William, Mary, Rex, Regina), the only instance of a queen's regal appearance. Anne restored the Tudor crown, and added the thistle to the rose on the official union with Scotland in 1707. The Georges reverted to the St Edward's crown, and on the union with Ireland in 1801 George III. added the shamrock to the rose and thistle. No change was made during Queen Victoria's reign. But Edward VII. ordered the Tudor crown to be substituted for the St Edward's, and now the coats of the Guard are as they were in 1485, with the additions of the motto "Dieu et mon Droit" and the shamrock and the thistle.

Up to 1830 the officers of the Guard wore the same Tudor dress as the non-commissioned officers and men, but when William IV. ordered that in future no civilian should be appointed, and that the purchase and sale of officers' commissions should cease, the old Tudor dress was discontinued, and the officers were given the dress of a field officer of the Peninsular period.

There has also been little or no change in the arms of the Guard. No doubt they retained during Henry VII.'s reign (1485-1509) the pikes with which they had helped to win the battle of Bosworth Field. Under Henry VIII. archery became a national pastime, and the long-bow and arrow were issued to at least one-half of his Guard. When James I. came to the throne, the pay of the yeomanry was increased, and the old yeomanry uniform was replaced by the harquebus, the Guard being given buff cross belts to support the weight on service. When on duty in the palace gold-embroidered cross belts took the place of the service buff, and are worn now as part of the state dress. The present weapons of the Guard are a steel gilt halberd with a tassel of red and gold, and an ornamental sword.

The real fighting days of this Guard ended with the Tudor period, but it was only at the end of the reign of George II. that the Guard's function of attending a sovereign on the battlefield ceased. Their last duty in this nature was at the battle of Dettingen (1743), when they accompanied the king as personal attendants. For a brief period during the Georgian era the Guard lost to a certain extent its distinctive military character, and a custom crept in of filling vacancies in the corps by civilians. Owing to the height of the sum, the appointments of the yeomen proper and the officers being of great value. But William IV. put a stop to the practice. The last civilian retired Captain had been William, 2nd Duke of Gloucester, in 1801. The officers are of a non-commissioned military character. Every officer (except the captain), non-commissioned officer and yeoman must have served in the Home or Indian army or Royal Marines. They are selected for distinguished conduct in the field, and their title is given to them as a reward. The same. The officers must be of the rank of captain and over, and the yeomen of that of sergeant or warrant officer.

The Guard has a permanent orderly room in St. James's Palace, where the routine of duty is carried on by the adjutant and "clerk of the cheque," the latter old true designation being retained after the former modern title. Under the orderly room is a guard room fixed with lockers in which the uniforms are stored. They are in charge of a resident wardrobe-keeper. Here the division for duty follows once a week in the season and once a fortnight at other times, and here the yeomen dress for state functions. These now are arranged to receive the court of foreign potentates, leverets and state banquets, the Guard still taking part in the searching of the houses of parliament, the ceremony of the distribution of Maundy money in Westminster Abbey, and in the Embassies offerings of the grand duke of Tuscany, was in England, and, writing of the size and stature of this magnificent Guard, said, "They are great eaters of beef, of which a very large ration is given them daily at the court, and a certain number must be sent to the household beyond."

A certain authority holds that the yeomen are not allowed from "Buffetier" (i.e. one who attends at the sideboard) has no authority.
When he failed in 1871 he refused to give any preference to the city of Philadelphia for bonds sold on its account, and was convicted of “misappropriating city funds,” and sentenced to two years and nine months in the penitentiary. After serving seven months of this sentence he was pardoned, and the City Council afterward passed an ordinance cancelling the municipality’s claim against him. He established a banking business in Chicago in 1881; in 1886 got control of the Chicago City Railway Company; and within the next twelve years organized a virtual monopoly of the surface and elevated railway service of Chicago. He disposed of his street railway interests in Chicago, and removed to London (1900). There he acquired in 1902 a controlling interest in the Metropolitan District railway, and by organizing the finances of the Underground Electric Railways Company he took an important initiative in extending the system of London electric railways. Yerkes gave to the university of Chicago the great telescope installed in the Yerkes Observatory at Lake Geneva, Wisconsin, and gathered in his New York residence a remarkable collection of paintings, tapestries and rugs, which were sold at auction in April 1910 for $2,034,450. He died in New York on the 29th of December 1905.

YEOW, a town and municipal corporation in the North-Western division of the county of Middlesex, England; on the Canongate and the borders of the county of York; on the railway to Edinburgh; on the river Tyne; and on the London and Newcastle railway. The town is situated on a high shore of the Tyne, and is connected by a bridge with the town of Tynemouth. The town is governed by a mayor, 12 aldermen, and 29 councillors. Area, 124 acres. Yeovil (Gyolec, Evill, Yvle, Ycoele) before the Conquest was part of the private domains of the Anglo-Saxon kings. The town owed its origin to trade, and became of some size in the 13th century. In 14th-century documents it is described as a town or borough governed by a portreeve, who frequently came into conflict with the parson of St John’s church, who had become lord of the manor of Yeovil during the reign of Henry III. The corporation in the 18th century consisted of a portreeve and eleven burgesses, and was abolished when the town was reincorporated in 1854.

YEVEIVE, or YEW, a tree which belongs to a genus of Coniferae (see GYMNOSPERMS), in which the ordinarily woody...
diverse habit, but generally with dense spreading branches, thickly covered with very dark green linear leaves, which are given off from all sides of the branch, but which, owing to a twist in the base of the leaf, become arranged in a single series on each side of it. The trees are usually dioecious, the male flowers being borne on one individual and the female on another, although instances occur in which flowers of both sexes are formed on the same tree. The male flowers are more or less globular and occur in the axils of the leaves. They consist of a number of overlapping brownish scales, gradually increasing in size from below upwards and surrounding a naked stalk that bears at its summit a head of four to eight white or yellowish star-shaped flowers, each surrounded by a thin petaloid scale, like a shield; from its under-surface, five, six or more pollen cases hang down, and these open lengthwise to liberate the globose pollen-grains. The female flowers are also placed each separately in the axil of a leaf, and consist of a number of overlapping scales, as in the male. These scales surround a cup which is at first shallow, green and thin (the so-called aril), but which subsequently becomes fleshy and red, while it increases so much in length as almost entirely to conceal the single straight seed. It is clear that the structure of the female flower differs from that of the male, and of the which it is now often separated in a distinct order, Taxaceae.

The poisonous properties, referred to by classical writers such as Caesar, Virgil and Livy, reside chiefly if not entirely in the foliage. This, if eaten by horses or cattle, especially when it has been cut and thrown in heaps so as to undergo a process of fermentation, is very injurious. The leaves have also been used for various medicinal purposes, but are not employed now. An alkaloid laxine, said to depress the circulation, is extracted. It forms white crystals soluble in alcohol and ether. As a timber tree the yew is of little value in cabinet-work, bows and the like, while strength and durability are required.

The yew occurs wild over a large area of the northern hemisphere. In N.E. America and in Japan trees are found of a character so similar that by some botanists they are all ranged under one species. Generally, however, the European yew, T. baccata, is regarded as native of Europe, N. Africa, and Asia as far as the Himalayas and the Amur region, while the American and Japanese forms are considered to represent distinct species. The yew is wild in Great Britain, forming a characteristic feature of the chalk downs of the southern counties and of the vegetation of parts of the Lake District and elsewhere. The evidence of fossil remains, antiquities and place-names indicates that it was formerly more widely spread in Europe than at the present day. The varieties grown in the United Kingdom are numerous, one of the most striking being that known as the Irish yew—a shrub with the pyramidal or columnar habit of a cypress, in which the leaves spread from all sides of the branches, not being twisted, as they usually are, out of their original position. In the ordinary yew the main branches spread more or less horizontally, and the leaves are so arranged as to be conveniently exposed to the influence of the light; but in the variety in question the branches are mostly vertical, and the leaves assume a direction in accordance with the ascending direction of the branches. The plants have all sprung from one of two trees found growing wild more than a hundred years ago on the mountains of Co. Fermanagh in Ireland, and afterwards planted in the garden of Florence Court, a seat of the earl of Enniskillen.

The yew is a favourite evergreen tree, either for planting separately or for hedges, for which its dense foliage renders it well suited. Its dense growth, which has led to its extensive use in topiary work, which was introduced by John Evelyn and became very prevalent at the close of the 17th and the beginning of the 18th centuries. The wood is very hard, close-grained and of a deep red-brown colour internally. The planting of the yew in churchyards was at one time supposed to have been done with a view to the supply of yew staves. But, while importation from abroad was fostered, there seems to have been no statute enforcing the cultivation of the yew in Great Britain; a statute, however, of Edward I. (cited in The Gardener's Chronicle, 6th March 1886, p. 306) states that the trees were often planted in churchyards to defend the church from high winds. The Crowhurst yew, mentioned by Evelyn as 30 ft. in circumference, still exists. The large yew at Ankerwyke, near Staines, with a trunk 30 ft. in circumference, in sight of which M. Virgil was said to have lived (1215), probably exceeds a thousand years of age. The fine yew in Buckland churchyard, near Dover, was removed in 1886 to a distance of 60 yds. The trunk had been split so that it had a direction nearly parallel with the soil. This huge yew, 30 ft. in circumference, was divided, including 15 ft. 8 in., by 3 ft. 6 in. in depth, of the weight of the entire mass being estimated at 56 tons. The dimensions of the tree in 1886 were as follows: circumference of the main trunk, 22 ft.; of the upright portion of the trunk, 6 ft. 16 in.; second horizontal trunk, 10 ft. 10 in.; do., south limb forkling off at 9 ft. from the main trunk, 7 ft. 10 in.; do., west limb forkling off at 9 ft. from the main trunk, 7 ft. 5 in.; do, north limb forkling off at 9 ft. from the main trunk, 7 ft. 10 in.; from north to south, 48 ft.; they extend from the main trunk westward 33 ft. The tree was replanted so that the horizontal portions were replaced in their original erect position and the natural symmetry restored.
Mahomet as a prophet with Abraham and the patriarchs. They believe in a future life and practice both circumcision and baptism. The name is probably derived from the Kurdish and Persian Yazdān, God; though some have connected it with the city of Yezd, or with Yezid, the second Omayyad caliph (720–24). Their sacred book is called Al-Yahyā, and its chief exponent was Sháikh Adí (c. 1200).

See Layard, Nineveh and its Remains (London, 1850); Menant, Les Croyances des Yezidis (Paris, 1891).}

YEZO, or Ezo, the most northerly of the five principal islands forming the Japanese empire, the five being Yezo, Nippon, Shikoku, Kiushiu and Formosa. It is situated between 45° 36' and 41° 21' N. and between 146° 7' and 130° 11' E.; its coast-line measures 1423·32 m., and it has an area of 30,148·41 sq. m. On the N. it is separated from Sakhalin by Søyta Strait (6541 ft.). Yubari-take in Ishikari has a height of 6508 ft., and in the province of Kuroshio are O-akan-dake (4470 ft.), the Tokachi-dake (120 m.), the Shiribeshi-gawa (88 m.), the Kushiro-gawa (81 m.), the Toshitsu-gawa (64 m.), and the Yubetsu-gawa (64 m.). The valley of the Ishikari is believed to be the most fertile part of the island; Hokkaido is a place of great scientific and agricultural interest.

Dr. Untersuchungen über die Verbreitung der hessischen Formen, 1894, maintains that Tokachi-dake forms a species of central elevation whence most of the principal rivers flow towards the sea, and that the mountain system is a continuation, or the continuation, of the range of the O-akan-dake. This theory gains support from the fact that the former consisting of granite and old schists, the latter chiefly of volcanic formations. Near Hakodate are two conspicuous volcanic peaks, Komaga-take (3822 ft.) and Tokatsu-dake (3800 ft.), and on the western coast is an island called Atsosi-nobori, or Iwo-zan (sulphur mountain), whence great quantities of first-rate sulphur are exported to the United States. Mention must also be made of Rishiri, an islet on the northern N.W. of Yezo, which has a peak of the same name rising to a height of nearly 6000 ft.

Rivers.—Yezo boasts the largest river in the Japanese empire, the Ishikari-gawa, which is estimated to measure 375 m. Its other long rivers are the Kuroshio-gawa (102 m.), the Tokachi-gawa (120 m.), the Shiribeshi-gawa (88 m.), the Kushiro-gawa (81 m.), the Toshitsu-gawa (64 m.), and the Yubetsu-gawa (64 m.). The valley of the Ishikari is believed to be the most fertile part of the island; Hokkaido is a place of great scientific and agricultural interest.

Dr. Untersuchungen über die Verbreitung der hessischen Formen, 1894, maintains that Tokachi-dake forms a species of central elevation whence most of the principal rivers flow towards the sea, and that the mountain system is a continuation, or the continuation, of the range of the O-akan-dake. This theory gains support from the fact that the former consisting of granite and old schists, the latter chiefly of volcanic formations. Near Hakodate are two conspicuous volcanic peaks, Komaga-take (3822 ft.) and Tokatsu-dake (3800 ft.), and on the western coast is an island called Atsosi-nobori, or Iwo-zan (sulphur mountain), whence great quantities of first-rate sulphur are exported to the United States. Mention must also be made of Rishiri, an islet on the northern N.W. of Yezo, which has a peak of the same name rising to a height of nearly 6000 ft.

Lakes.—There are no large lakes of any extent—Toyako, Shiretoko, and Shiroi, which have a circumference of some 25 m. Lagoons, however, are not uncommon. The largest of these—Saruma-ko in Kitami—is some 17 m. long by 7 wide. It abounds in wild ducks, for which the smaller lagoon at Akkeshi is famous, the molluscs measuring about 18 in. in length.

Climate.—The climate differs markedly from that of the main island of Japan, resembling rather the climate of the British Isles, though the winter is longer and more severe, and the atmosphere in the warm season contains a greater quantity of moisture. During five months the country is free from snow, and the depth of snow is not more than 2 ft. in the regions along the southern coast and more than 6 ft. in the northern and western regions. An ice-drift, setting from the north and working southwards as far as Nemuro, stops all sea trade on the eastern coast until March, February, and March being the extreme N. coast is protected by the warm current of the Kuro-shio. Flows prevail along the E. coast during the summer months, and it is not uncommon to find a choppy atmosphere near the sea in July, whereas a mile above the hills and at points 50 m. from its mouth, but the Teshio has a bar which renders its approach extremely difficult. A peculiarity of several of the rivers is that, on approaching the sea-shore, they run parallel to it for some distance before finding an exit. Those flowing to the S. coast take a W. direction, those flowing to the E. coast a N. direction. This is attributed to the fact that the prevailing winds set up the sand so as to deflect the rivers from their streams to the sea, and it is generally believed that the most remarkable in that respect being the Nishibetsu-gawa, which yields an average of over 2000 tons of fish annually.

History.—Yezo was not brought under Japan's effective control until medieval times. In 1604 the island was granted in fief to Matsumae Yoshihiro, whose ancestor had overrun it, and from the close of the 18th century the E. was governed by officials sent by the shogun, whose attention had been attracted to it by Russian trespassers. In 1871 the task of developing its resources and administering its affairs was entrusted to a special bureau, which employed American agriculturists to assist the work and American engineers to construct roads and railways; but in 1883 this bureau was abolished, and the government abandoned to private hands various enterprises that had been inaugurated.

YGGDRASIL, in Scandinavian mythology, the mystical ash tree which symbolizes existence, and binds together earth, heaven and hell. It is the tree of life, of knowledge, of fate, of time and of space. Its three roots go down into the three great realms—(1) of death, where, in the well Hvergelmer, the dragon Nidhug (Nīðhöggr) and his brood are ever gnawing it; (2) of the giants, where, in the fountain of Mimir, is the source of wisdom; (3) of the gods, Among the sacred foods is Urðr, the sacred fountain, who, at the sacred fountain, is the source of tribal, and the dwelling of the Fates. The stem of Yggdrasil upholds the earth, while its branches overshadow the world and reach up beyond the heavens. On its topmost bough sits an eagle, between whom and Nidhug the squirrel Rátskörss runs to and fro trying to pro
stirle. Honey-dew falls from the tree, and on it Odin hung nine nights, offering himself to himself. G. Vigfusson and York Powell (Corpus Poeticum Boreale, Oxford, 1883) see in Yggdrasill not a primitive Norse idea, but one due to early contact with Christianity, and a fanciful adaptation of the cross.

YO-CHOW FU, a prefectural city in the Chinese province of Hu-nan, standing on high ground E. of the outlet of Tung-t'ing Lake, in 20° 18' N., 113° 2' E. Pop. about 70,000. It was opened to foreign trade in 1899. The actual settlement is at Chinling-ki, a village 53 m. below Yo-chow and half a mile from the Yangtze. From Yo-chow the cities of Chang sha and Chang tê are accessible for steam vessels drawing 4 to 5 ft. of water. The Tu-ting branch of the Sialang and Yuen rivers. The district in which Yo-chow Fu stands is the ancient habitat of the aboriginal San Miao tribes, who were deported into S.W. China, and who, judging from some non-Chinese festival customs of the people, would appear to have left traditions behind them. The present city, which was built in 1371, is about 3 m. in circumference and is entered by four gates. The walls are high and well built, but failed to keep out the Taiping rebels in 1853. Situated between Tung-t'ing Lake and the Yangtze-kiang, Yo-chow Fu forms a depot for foreign goods destined for foreign ports on their way inland. The net value of the total trade of the port in 1906 was 747,000 taels.

YOGI, a Hindu religious ascetic. The word yoga means union, and first occurs in the later Upanishads; and yogi means one who practises yoga, with the object of uniting his soul with the divine spirit. This union, when accomplished by the individual soul, must enhance its susceptibilities and powers, and so the yogis claim a far-reaching knowledge of the secrets of nature and extensive sway over men and natural phenomena. The most complete manifestation of this power is a state of ecstasy, of the nature of self-hypnotism.

YOKOHAMA, a seaport of Japan on the W. shore of Tokyo Bay, 18 m. S. of Tokyo by rail. It stands on a plain shut in by hills, one of which, towards the S.E., terminates in a promontory called Honmoku-missaki or Treaty Point. The temperature ranges from 95° to 43° F., and the mean temperature is 57.7°. The cold in winter is severe, owing to N. winds, while the heat is great in summer, though tempered by S.W. sea breezes. The rainfall is about 70 in. annually. In 1853, when the neighbouring town of Kanagawa was opened to foreign trade, the treaty with the United States, Yokohama was an insignificant fishing village; and notwithstanding the protests of the foreign representatives the Japanese government shortly after wards chose the latter place as the settlement instead of Kanagawa.

The town grew rapidly—in 1886 the population was 111,179 (3904 foreigners, including 2573 Chinese, 625 British and 256 Americans, while in 1903 there were 314,333 Japanese and 2447 foreigners (1069 British, 527 Americans, 270 Germans, 135 French) besides about 3800 Chinese. The Japanese government constructed public works, and excellent water was supplied from the Sagamigawa. The foreign settlement has well-constructed streets, but the wealthier foreigners reside S. of the town, on the Bluff. The land occupied by foreigners was leased to them by the Japanese government, 70% of the annual rent being set aside for municipal expenses. The harbour, which is a part of Tokyo Bay, is good and commodious, somewhat exposed, but enclosed by two breakwaters. There is a pier 2000 ft. long, and two docks were opened in 1857 and 1898, with lengths of 351 ft. and 476 ft. 10 in., and depths of 26 ft. and 35 ft., respectively. The blocks at ordinary spring tides. The average depth in the harbour at high water is about 46 ft., with a fall of tide of about 8 ft., the entrance being marked by a lightship and two buoys. The railway connecting Yokohama with Tokyo was the first in Japan, and was constructed in 1872. The value of exports and imports, which in 1880 was £3,792,901 and £5,378,385, and in the ensuing five years averaged £4,638,615 and £4,360,507, had increased in 1905 to £14,861,823 and £10,068,721. Metals and metal goods, rice, wool and woollen goods, and cotton and cotton goods are the chief imports; and silk, silk goods and tea are the chief exports.

YOKOSUKA, a seaport and naval station of Japan, on the W. shore of Tokyo Bay, 12 m. S. of Yokohama. The town is connected by a branch line with the main railway from Tokyo. The port is sheltered by hills and affords good anchorage. The site was occupied by a small fishing village until 1865, when the shogun's government established a shipyard here. In 1868 the Japanese government converted the shipyard into a naval dockyard, and subsequently carried out many improvements. In 1884 the port became a first-class naval station; and naval barracks, warehouses, offices, hospitals, &c., were erected. The dockyard was first constructed by French engineers; but after 1875 the work passed entirely into the hands of Japanese engineers.

YOLA, once a native state of West Africa, forming part of the Fula emirate of Adamawa, now a province in the British protectorate of Nigeria. The province, which has an area of 16,000 sq. m., occupies the S.E. of the protectorate and both banks of the upper Benue. It is bounded S. and E. by the German colony of Cameroons, N. by the British province of Bornu, and W. by the British provinces of Bauchi and Muri. It has an estimated population of 300,000. The capital is Yola, town founded by the Fula conqueror Adamu around the middle of the 19th century. It was the capital of the emirate of Adamawa, the greater part of which is now a German protectorate. The town is situated in 6° 12' N., 12° 40' E. and is built on the left or S. bank of the Benue, 480 m. by river from Lokoja. It can be reached by shallow draught steamers when the river is in flood. The Niger Company had trading relations with Yola before the establishment of British administration in Northern Nigeria. In 1912 the reigning emir, a son of Adamu, forced them to evacuate their station, and, all attempts to establish friendly relations proving unavailing, the British government despatched an expedition from Lokoja in August 1901. The emir was deposed and a new emir installed in his place. The hostility of certain pagan tribes had to be overcome by British expeditions in January and April of 1902. By 1903 the province was brought fairly under administrative control, and divided into three administrative divisions—the N.W. with a station at Gazi, the N.E. and the S. with Yola for its station. The new emir proved friendly and loyal, but in 1914 he deserted his cause, and was killed in fighting with the British forces. Yola is a town of about 12,000 inhabitants, consisting of a native town, with a European settlement attached.

YOLANTE [or ISABELLA] OF BRIENNE (1221-1228), the daughter of John of Brienne, who had married Mary, daughter of Conrad of Montferrat, heiress on the death of Amalric II. of the kingdom of Jerusalem. Yolante inherited the throne on her mother's death in 1222, but her father ruled as her guardian. In 1228, when she was 6 years old, her father married her to the King of France. Yolante appeared as a young girl and never married. She died on board ship in the Mediterranean, and was buried in the church of the Innocents in Jerusalem. The family of Yolante are said to have been influenced by her mother's Christian faith and her father's Jewish practices, and to have adopted various religious beliefs in her lifetime.

YONGE, CHARLOTTE MARY (1853-1901), English novelist and writer on religious and educational subjects, daughter of William.
Crawley Yonge, 2nd Regiment, and Frances Mary Bargus, was born on the 11th of August 1823 at Otterburne, Hants. She was educated by her parents, and from them inherited much of the religious feeling and High Church sympathy which coloured her work. She resided at Otterburne all her life, and was one of the most prolific writers of the Victorian era. In 1841 she published five works of fiction, including The Clever Woman of the Family, Dynower Terrace and The Trial; and after that she was the author of about 120 volumes, including novels, tales, school manuals and biographies. Her first conspicuous success was attained with The Heir of Redclyffe (1853), which enjoyed an enormous vogue. The Daisy Chain (1856) continued the success; and among her other popular books may be mentioned Heartsease (1854), The Young Stepmother (1861) and The Dove in the Eagle’s Nest (1866). In more serious fields of literature she published Landmarks of History (three series, 1852–57), History of Christian Names (1863), Cameos of English History (1868), Life of Bishop Patteson (1874), English Church History for Use in Schools (1883) and many others. She also edited various educational works, and published, during thirty years editor of the Morning Packet. She died at Otterburne, and is buried there.

Her books err on the side of didacticism, but exercised a wide and wholesome influence. The money realized by the early sales of The Daisy Chain was given to the building of a missionary college at Auckland, N.Z., while a large portion of the proceeds of The Heir of Redclyffe was devoted to the missionary schooner “The Southern Cross.”

See Charlotte Mary Yonge: an Appreciation, by Ethel Romanes (1906).

YONGE, JOHN (1467–1516). English ecclesiastic and diplomatist, was born at Heyford, Oxfordshire, and educated at Winchester and New College, Oxford, where he became a fellow in 1485. He was ordained in 1500 and held several livings before receiving his first diplomatic mission to arrange a commercial treaty with the archduke of Austria in 1504, and in the Low Countries in 1506 in connexion with the projected marriage between Henry VII. and Margaret of Savoy. In 1507 he was made Master of the Rolls, and in the following year was employed in various diplomatic missions. He was one of the ambassadors who arranged the Holy League in 1513, and accompanied Henry VIII. during the ensuing campaign. In 1514 he was made dean of York in succession to Wolsey, and in 1515 he was one of the commissioners for renewing the peace with Francis I. He died in London on the 25th of April 1516. Yonge was on terms of intimate friendship with Dean Colet, and was a correspondent of Erasmus.

YONGE, SIR WILLIAM, Bart. (c. 1603–1759), English politician, was the son of Sir Walter Yonge of Colyton, Devonshire, and great-grandson of Walter Yonge of Colyton (1555–1649), whose diaries (1604–45), more especially four volumes now in the British Museum (Add. MSS. 1877–1890), are valuable material for history. In 1722 he was elected to parliament as member for Honiton; and he succeeded his father, the third baronet, in 1731. In the House of Commons he attached himself to the Whigs, and making himself useful to Sir Robert Walpole, was rewarded with a commissionership of the treasury in 1724. George II., who conceived a strong antipathy to Sir William, spoke of him as “Stinking Yonge”; but Yonge conducted himself so obsequiously that he obtained a commissionership of the admiralty in 1726, was restored to the treasury in 1730, and in 1735 became secretary of state for war. He especially distinguished himself in his defence of the government against a hostile motion by Pulteney in 1742. Making friends with the Pelhams, he was appointed vice-treasurer of Ireland in 1746; and, acting on the committee of management for the impeachment of Lord Lovat in 1747, he won the applause of Horace Walpole by moving that prisoners impeached for high treason should be allowed the assistance of counsel. In 1748 he was elected F.R.S. He died at Escott, near Honiton, on the 10th of August 1755. By his second wife, Anne, daughter and coheirness of Thomas, Lord Howard of Effingham, he had two sons and six daughters. He enjoyed some reputation as a versifier, some of his lines being even mistaken for the work of Pope, greatly to the disgust of the latter; and he wrote the lyrics incorporated in a comic opera, adapted from Richard Brome’s The Jovial Crew, which was produced at Drury Lane in 1730 and had a considerable vogue.

His eldest son, SIR GEORGE YONGE (1731–1812), was member of parliament for Honiton continuously from 1734 to 1794, and held a number of different government appointments, becoming a lord of the admiralty (1766–70), vice-treasurer for Ireland (1773–76), secretary of state (1782–83), and lord president of the council (from April to December 1783), master of the mint (1790–99). In 1790 he was appointed governor of the Cape of Good Hope. Serious charges being brought against his administration, which was marked by great lack of judgment, he was recalled in 1801. He died on the 25th of September 1812. The baronetcy became extinct at his death.

YONKERS, a city of Westchester county, New York, U.S.A., on the E. bank of the Hudson river, immediately adjoining New York City on the N. Pop. (1900) 47,931, of whom 14,634 were foreign-born; of whom 9,503 were negroes; (1910, U.S. census) 79,803. Yonkers is served by both the New York Central & Hudson River railways, and is connected with New York City and other places E. and N. by interurban electric lines. It has also during most of the year steamboat service on the Hudson. There are two principal residential districts: one in the N., including Amackassin Heights and (about 1 m. W.)Glendale, where are the old Collgate Mansion and “Greystone,” the former home of Samuel J. Tilden; the other in the S., including Ludlow, Van Cortlandt Terrace and Park Hill (adjoining Riverdale in the borough of the Bronx), a park-like reserve with winding streets and drives. The business and manufacturing districts occupy the low lands along the river. Among the public buildings are the City Hall, the High School and a Manual Training School, and Yonkers is the seat of St Joseph’s Theological Seminary (Roman Catholic; 1896), the Halsted School (founded 1874) for girls, and a business college. It has a good public library (established 1893; 25,000 vols. in 1910), and the Woman’s Institute (1880) and the Holly- wood Inn Club (1877; for working-men) have small libraries. Philipse Manor Hall, built originally about 1682 as the mansion of the son of Frederick Philipse (1670–1702), the lord of Philipseburgh, and enlarged to its present dimensions in 1745, is of some historic interest. It was confiscated by act of the legislature in 1779 because its owner, Frederick Philipse (1746–1785), was suspected of Toryism, and was sold in 1789. In 1867 it passed into the possession of Yonkers, and from 1872 to 1908 was used as the city hall. In 1908 it was bought by the state, and is now maintained as a museum for colonial and revolutionairy relics. It is one of the best examples of colonial architecture in America. In the square before it stands a monument to the soldiers and sailors of the Civil War. Yonkers is an important manufacturing city, and in 1905 the value of its factory products was $35,428,688.

On the site of Yonkers stood an Indian village known as Nappeckamack, or town of the rapid water, at the time of the settlement of the Dutch in New Amsterdam; and a great rock, near the mouth of the Nepperhan Creek, was long a place of Indian worship. The territory was part of the “Keskeskill purchase,” acquired from the Indians by the Dutch W. India Company in 1630. In 1646 the tract was included in the grant to Adrian van der Donck, the first lawyer and historian of New Netherland, author of A Description of New Netherland (1656), in Dutch. His grant, known as the “Colon Donck” (Donck’s Colony), embraced all the country from Spuyten Duyvil Creek, N. along the Hudson to the Amackassin Creek, and E. to the Bronx river. Some squatters settled here before 1646. Van der Donck encouraged others to remove to his lands along the Hudson river, and in 1649 he built a saw-mill near the mouth of the Nepperhan Creek, which for many years was called “Saw-Mill river.” The whole settlement soon came to be called “De Jonkheer’s Land” or “De Jonkheers”—meaning the estate of the young lord, van der Donck was called by...
his tenants—and afterwards Yonkers. Subsequently the tract passed largely into the hands of Frederick Philipse and became part of the manor of Philipseburgh. Early in the War of Independence Yonkers was occupied for a time by part of Washington's army, and was the scene of several skirmishes. The town of Yonkers was incorporated in 1788 and the village in 1855. In 1872 Yonkers became a city; at the same time the southern part was separately incorporated as Kingsbridge, which in 1874 was annexed to New York.

See Frederic Shonnard and W. W. Spooner, History of Westchester County (New York, 1900); J. T. Scharf, History of Westchester County (New York, 1886); and Allison, History of Yonkers (New York, 1896).

YONNE, a department of central France, formed partly from the province of Champagne proper (with its dependencies, Sénones and Armançon), partly from Burgundy proper (with its dependencies, the county of Auxerre and Avallonais) and partly from Gâtinais (Orléans and Île-de-France). It is bounded by the N.E., Côte-d'Or on the S.E., Nièvre on the S., Loiret on the W. and Seine-et-Marne on the N.W. (1906) 315,199. Area, 2,880 sq. m. The highest elevation (2000 ft.) is in the granitic highlands of Morvan, in the S.E., where other peaks range from 1300 to 1600 ft. The department belongs to the basin of the Seine, except a small district in the S.W. (Puysaye), which belongs to that of the Loing. The river Yonne flows through it from S. to N.N.W., receiving the Cure on its right bank, and the Armançon, which water the S.E. of the department. Farther N. it is joined by the Vanne, between which and the Armançon lies the forest-clad plateau of the Pays d'Othe. To the W. of the Yonne, in the Puysaye, are the sources of the Loing, another tributary of the Seine, and of its affluents, the Ouanne and the Lunain. The Yonne is navigable throughout the department, and is connected with the Loire by the canal of Nivernais, which in turn is connected with that of Briare, which connects the Seine and the Loire. The climate is temperate, and the winter storms where the extremes of heat and cold are greater, and where the rainfall is most abundant. The prevailing winds are S.W. and W.

The department is essentially agricultural. Wheat and oats are the chief cereals; potatoes, sugar-beets, lucerne, alfalfa, wortel and other forage plants are also cultivated, and there is much good pasture.

The vineyards around the Tonnerrois and Auxerrois produce the finest red wines of lower Burgundy, and those of Chablis the finest white. The wine of the Côte St Jacques (Joigny) is also highly esteemed. Cider-apples are the chief fruit. Charny is a centre for the rearing of horses. Forests cover three-quarters of the department and consist chiefly of oak, beech, hornbeam, elm, ash, birch and pine. Quarry products include building-stone, ochre and cement. Among the industrial establishments are tanneries, tile-works, sawmills and breweries, but there is little manufacturing activity. Cereals, wines, firewood, charcoal, ochre and bark are exported.

The department is served chiefly by the Paris-Lyon railway.

The canal of Burgundy, which follows the valley of the Armançon, has a length of 57 m. in the department, of which 36 m. are navigable. It is joined by the Yonne, a length of 33 m. in the department, and by the Seine, which is joined by the Yonne for about 3 m. in the department.

The department has an educational centre at Dijon, and belongs to the district of the V. army corps. It is divided into five arrondissements (37 cantons, or communes), of which the capitals are Auxerre, also capital of the department, Avallon, Sens, Joigny and Auxerre, and which with those of Chablis, St Florentin and Vézelay are its most noteworthy towns and are treated separately. Yonne is rich in objects of antiquarian and architectural interest. At Pontpaill there is a Cistercian abbey, where Thomas Becket spent two years of his exile. Its church is an excellent type of the Cistercian architecture of the 12th century. The fine 12th-century château of Beaune was the seat of a bishop's see, and belonged to the counts of Auxerre and Nevers. Villenouve-sur-Yonne has a medieval keep and gateways and a church of the 12th century, and at Nance was the residence of the bishop of Migennes. The Renaissance châteaux of Fleurye, Ancy-le-Francois and Tansley, the last-named being a part of Washing the property of the Coligny family, and the château of St Fargeau, of the 13th century, rebuilt by Mademoiselle de Montpensier under Louis XIV., are all architecturally remarkable. At St Meri there are remains of the Roman road from Lyons to Gallia Belgica and of a Roman fortified post.

YORCK VON WARTENBURG, HANS DAVID LUDWIG, Count (1759-1830), Prussian general-field-marshall, was of English ancestry. He entered the Prussian army in 1772, but after seven years' service was cashiered for disobedience. Entering the Dutch service three years later he took part in the operations of 1783-84 in the East Indies as captain. Returning to Prussia in 1785 he was, on the death of Frederick the Great, reinstated in his old service, and in 1794 took part in the operations in Poland, distinguishing himself especially at Szekocyn. Five years afterwards Yorck began to make a name for himself as commander of a light infantry regiment, being one of the first to give prominence to the training of skirmishers. In 1805 he was appointed to the command of an infantry brigade, and in the disastrous Jena campaign he played a conspicuous and successful part as a rearguard, especially at Altenau. He was taken prisoner, severely wounded, in the last stand of Blücher's corps at Lübeck. In the reorganization of the Prussian army which followed the peace of Tilsit, Yorck was one of the leading figures. At first major-general commanding the West Prussian brigade, afterwards inspector-general of light infantry, he was finally appointed in command to General Grawert, the leader of the auxiliary corps which Prussia was compelled to send to the Russian War of 1812. The two generals did not agree, Grawert being an open partisan of the French alliance, and Yorck an ardent patriot; but before long Grawert was removed from the command. Opposed in his advance on Rigga by the Russian General Steingell, he displayed great skill in a series of combats which ended in the retirement of the enemy to Rigga. Throughout the campaign he had been the object of many overtures from the enemy's generals, and though he had hitherto rejected them, it was soon borne in upon him that the Grand Army was doomed. Marshal Macdonald, his immediate French superior, retreated before the corps of Diebitsch, and Yorck found himself isolated. As a soldier his duty was to break through, but as a Prussian patriot it was more difficult. He had to judge whether the movement was favourable for the war of liberation; and, whatever might be the enthusiasm of his junior staff-officers, Yorck had no illusions as to the safety of his own head. On December 30th the general made up his mind. The Convention of TaurCoggen "neutralized" the Prussian corps. The news was received with the wildest enthusiasm, but the Prussian Court dared not yet throw off the mask, and an order was despatched suspending Yorck from his command pending a court-martial. Diebitsch refused to let the latter pass through his lines, and the general was finally absolved of all blame. The defeat at Kutschau, which ranged Prussia on the side of the Allies. Yorck's act was nothing less than the turning-point of Prussian history. His veterans formed the nucleus of the forces of East Prussia, and Yorck himself in public took the final step by declaring war as the commander of those forces. On March 17th, 1813, he made his entry into Berlin in the midst of the wildest exuberance of patriotic joy. On the same day the king declared war. During 1813-14 Yorck led his veterans with conspicuous success. He covered Blücher's retreat after Bautzen and took a decisive part in the battle of Kustrin. The advance on Leipzig his corps won the action of Wartenburg (October 4) and took part in the crowning victory of October 18th. In the campaign in France Yorck drew off the shatterd remnants of Sacken's corps at Montmirail, and decided the day at Laon. The storm of Paris was his last fight. In the campaign of 1815 none of the older men were employed in Blücher's army, in order that Gneisenau (the ablest of the Prussian generals) might be free to assume command in case of the old prince's death. Yorck was appointed to a reserve corps in Prussia, and, feeling that his services were no longer required, he retired from the army. His master would not accept his resignation for a considerable time, and in 1821 made him general field-marshall. He had been made Count Yorck von Wartenburg in 1814. The remainder of his life was spent on his estate of Klein-Ols, the gift of the king. He died there on the 4th of
YOREDALE SERIES, in geology, a local phase of the lower Carboniferous rocks of the N. of England. The name was introduced by J. Phillips on account of the typical development of the phase in Yoredale (Wensleydale), Yorkshire. In the Yorkshire dales the lower Carboniferous rocks assume a distinct variety of structure which is characteristic of the beds which contain the S. Beds of detrital sediment, sandstones, shales, and occasional ironstones and thin coals separate the limestones into well-defined beds. These limestone beds have received various names of local significance (Hardraw Scarp, Simonstone, Middle, Undersett, Main and many others), and owing to the country being little disturbed by faulting and being much cut up by the streams, they stand out as escarpments on either side of the valleys.

The first indication of the intercalation of thick detrital deposits within the massive limestone is seen in Ingleborough and Pen-y-ghent. The rocks of these hills are arranged in a series of beds which increases in quantity and the limestones diminish, till in Northumberland the whole Carboniferous series assumes the Yoredale phase, and consists of alternations of detrital and calcareous beds, no massive limestone being seen.

The Yoredale limestones are characterized by the presence of Productus giganteus and the braided corals, a usually usual, especially in the beds of Weardale and the base of the rocks of Weardale is full of corals, including Lonchodila florisimilis, Dibunophyllum sp., Cyclophyllum pachyendothecum, &c., and has a typical Visian fauna; it would therefore correspond, palaeontologically, with the upper part of the Carboniferous Limestone of Derbyshire. On Ingleborough the limestones are not very fossiliferous, but the Main Limestone of the series, is very rich in fish remains, which are identical in many cases with those found in the topmost beds of the massive Carboniferous Limestone at Bolt Edge quarry in Derbyshire. The shales between the limestones are rich in fossils and contain abundant single corals referable to Zaphrentis enshirletus. The Yoredale beds of the south moors, especially the lower part of the Yoredale beds, have a fauna distinct from the remainder of the series; this is in the Penderside Series, the faunas of the Yoredale and Penderside phases being very distinct.

The Red Bed Limestone of Leyburn, the uppermost limestone of the series, is very rich in fish remains, which are identical in many cases with those found in the topmost beds of the massive Carboniferous Limestone at Bolt Edge quarry in Derbyshire. The shales between the limestones are rich in fossils and contain abundant single corals referable to Zaphrentis enshirletus. The Yoredale beds of the south moors, especially the lower part of the Yoredale beds, have a fauna distinct from the remainder of the series; this is in the Penderside Series, the faunas of the Yoredale and Penderside phases being very distinct. The Red Bed Limestone of Leyburn, the uppermost limestone of the series, is very rich in fish remains, which are identical in many cases with those found in the topmost beds of the massive Carboniferous Limestone at Bolt Edge quarry in Derbyshire. The shales between the limestones are rich in fossils and contain abundant single corals referable to Zaphrentis enshirletus.

YORK (HOUSE OF), a royal line in England, founded by Richard, duke of York (q.v.), who claimed the crown in opposition to Henry VI. It may be said that his claim, at the time it was advanced, was rightly barred by prescription, the house of Lancaster having then occupied the throne for three generations, and that it was really owing to the misgovernment of Margaret of Anjou, and her favourites that it was advanced at all. Yet it was founded upon strict principles of royal descent. For the duke was descended from Lionel, duke of Clarence, the third son of Edward III., while the house of Lancaster came of John of Gaunt, a younger brother of Lionel. One thing which might possibly have been considered an element of weakness in his claim was that it was derived (see the Table) through females—an objection actually brought against it by Chief-Justice Fortescue. But a succession through females could not reasonably have been objected to after Edward III.'s claim to the crown of France; and, apart from strict legality, the duke's claim was probably supported in the popular estimation by the fact that he was descended from Edward III. through his father no less than through his mother. For his father, Richard, earl of Cambridge, was the son of Edmund, duke of York, fifth son of Edward III.; and he himself was the direct lineal heir of this Edmund, just as much as he was of Lionel, duke of Clarence. His claim was also favoured by the accumulation of hereditary titles and estates. The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel, duke of Clarence; the earldom of March came from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal uncle. Moreover, his own marriage with Cecilia Neville, though it left him without the youngest daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north of England, to whose support both he and his son were greatly indebted.

The reasons why the claims of the line of Clarence had been so long forborne are not difficult to explain. Roger Mortimer, 4th earl of March, was designated by Richard II. as his successor; but he died the year before Richard was dethroned, and his son Edmund, the 5th earl, was a child at Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the Mortimers, with the difficulties of his reign, may have prevented his making them a part of his plan of government. Henry V., indeed, was indebted to this family and the Percys; and for advocating the cause of Edmund Archbishop Scrope was put to death. It was to put the crown on Edmund's head that his brother-in-law Richard, earl of Cambridge, conspired against Henry V. soon after his accession. The plot was detected, being revealed, it is said, by the earl of March himself, who does not appear to have given it any encouragement; the earl of Cambridge was beheaded. The popularity gained by Henry V. in his French campaigns secured the weak title of the house of Lancaster against further attack for forty years.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking for many years to correct by other means the weakness of Henry VI.'s government, he first took up arms against the ill advisers who were his own personal enemies, and at length claimed the crown in parliament as his right. The Lords, or such of them as did not purposely stay away from the House, admitted that his claim was unimpeachable, but suggested as a compromise that Henry should retain the crown for a time, being the senior male heir of the house of Lancaster, and, when he should come to his majority, for the time being, in the meantime, to defend his claim, and, when the period of his minority was over, to ascend the throne. This was accepted by the duke, and an act to that effect received Henry's own assent. But the act was repudiated by Margaret of Anjou and her followers, and the duke was slain at Wakefield fighting against them. In little more than two months, however, his son was proclaimed king at London by the title of Edward IV., and the bloody victory of Towton immediately after drove his enemies into exile and paved the way for his coronation. After his recovery of the throne in 1471 he had little more to fear from the rivalry of the house of Lancaster. But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly, indeed, within the Tower, but still by his authority and that of parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V., after a nominal reign of two months and a half, was put aside by his uncle, the duke of Gloucester, who became Richard III., and then caused him and his brother Richard, duke of York, to be murdered. But in little more than two years Richard was slain at Bosworth by the earl of Richmond, who, being proclaimed king as Henry VII., shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV. and so unite the houses of York and Lancaster.

Here the dynastic history of the house of York ends, for its claims were henceforth merged in those of the house of Tudor. But, although the union of the Roses ought to have extinguished controversy, a host of debatable questions and plausible pretexts for rebellion remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and his parliament, and, though the act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two
York, Edmund of Langley, Duke of

Genealogical Table of the House of York

Edward III.

Edward, the Black Prince.
Richard II. (dethroned 1399).

William of Hatfield, duke of Clarence.

Lionel, = Elizabeth, d. of William de Burgh, earl of Ulster.

Edmund Mortimer, = Philippa, third earl of March.
Roger Mortimer, = Eleanor Holland, eldest daughter of Thomas, second earl of Kent.

Edmund Mortimer, fourth earl of March.

John of Gaunt, duke of Lancaster.

Edmund, duke of York.

Thomas of Woodstock, duke of Gloucester.

Henry IV.
Henry V.
Henry VI.

Edward, duke of York.

Anne Mortimer = Richard, earl of Cambridge.

Cecily Neville, daughter of = Richard, duke of York.

Ralph, earl of Westmoreland. (killed in battle 1460).

Anne, married Henry Holland, duke of Exeter, and had no child by him. By her second husband, Sir Thomas St Leger, she had a daughter married to Sir Geo. Manns, Lord Ross, and mother of the first earl of Rutland.

Elisabeth = John de la Pole, duke of Suffolk (d. 1401).

Edward V. (murdered 1483).

George, duke of Clarence (attainted 1483).

Richard III. (killed in battle 1483).

Edward, prince of Wales (d. 1484).

Edward, earl of Warwick (executed 1499).

Margaret, countess of Salisbury (executed 1499).

Sir Richard Pole.

Sir Geoffrey Pole (executed 1539).

Arthur Pole, cardinal.

Reginald Pole.

Edward, = Ursula, married to Henry, lord Stafford, son of Edward, duke of Buckingham.

John de la Pole, earl of Lincoln (d. 1523).

Edmund de la Pole, duke of Suffolk (d. 1525).

Humphrey and Edward, churchmen.

Richard de la Pole (d. 1515).

Four daughters.

Henry VIII.
Lord Montague (executed 1539).

Served.

Five sons and one daughter. Among the former were Arthur and Edmund, who were prisoners in the Tower.

children, a son and a daughter, and the attainer of their father could not be a greater bar to the crown than the attainer of Henry VII. himself. Seeing this, Henry had, immediately after his victory at Bosworth, secured the person of the son, Edward, earl of Warwick, and kept him a prisoner in the Tower of London. Yet a formidable rebellion was raised in his behalf by means of Lambert Simnel, who was defeated and taken prisoner at the battle of Stoke in 1487. The earl of Warwick lived for twelve years later in unjust confinement, and was ultimately put to death in 1499 because he had consented to a plot for his own liberation. As to his sister Margaret, she was married to one of Henry VII.'s Welsh followers, Sir Richard Pole (or Poole), and could give no trouble, so that, when Henry VIII. came to the throne, he thought it politic to treat her with kindness. He made her countess of Salisbury, reversed her brother's attainer, created her eldest son, Henry, Lord Montague, and caused one of her younger sons, Reginald, who displayed much taste for learning, to be carefully educated. This, however, was the very thing which involved the whole family in ruin. For Henry looked to the learning and abilities of Reginald Pole to vindicate before Europe the justice of his divorce from Catherine of Aragon; and, when Pole was conscientiously compelled to declare the very opposite, the king's indignation knew no bounds. Pole himself was safe, having secured some time before a retreat in Italy. He was even made a cardinal by the pope. But this only made matters worse for his family at home: his brother, Lord Montague, and even his mother, the aged countess of Salisbury, were beheld as traitors because they had continued to correspond with him. Cardinal Pole, however, came back to his own country with great honour in the reign of Queen Mary, and was made archbishop of Canterbury on the deprivation of Cranmer.

Early in the reign of Queen Elizabeth, two nephews of the cardinal, Arthur and Edmund Pole, being ardent young men, conspired to go over to the duke of Guise in France, hoping to return with an army into Wales and so promote the claims of Mary Queen of Scots to the crown of England, for which service the elder, Arthur, expected to be restored to the dukedom of Clarence. The result was that they were condemned to death, but were only imprisoned for the rest of their days in the Tower, where they both carved inscriptions on the walls of their dungeon, which are still visible in the Beauchamp tower.

Another branch of the house of York might have given trouble to the Tudors if they had not been narrowly watched and ultimately extinguished. Of the sisters of Edward IV., the eldest, Anne, who married the duke of Exeter, left only one daughter by her second husband, Sir Thomas St Leger; but the second, Elizabeth, married John de la Pole, duke of Suffolk, and had several children. Their eldest son was created earl of Lincoln during his father's life, and Richard III., after the death of his own son, had designated him as his successor. Disappointed of a kingdom by the success of Henry VII., he joined in Simnel's rebellion and was killed at the battle of Stoke. His brother Edmund thus became heir to his father; but in the reduced circumstances of the family he agreed to forbear the title of duke and take that of earl of Suffolk. He continued for some years in favour with the king, who made him a knight of the Garter; but, having killed a man in a passion, he fled abroad and was entertained at the court of the emperor Maximilian, and afterwards at that of Philip, king of Castile, when resident in the Low Countries before his departure for Spain. Philip, having been driven on the English coast when going to take possession of his Spanish kingdom, was entertained at Windsor by Henry VII., to whom he promised to deliver up the fugitive on condition that his life should be spared. Edmund de la Pole accordingly was brought back to England and lodged in the Tower. Though the promise to spare his life was kept by the king who gave it, his son Henry VIII. caused him to be executed in 1513, when war broke out with France, apparently for treasonable correspondence with his brother Richard, then in the French service. After his death Richard de la Pole, remaining in exile, called himself earl of Suffolk, and was flattered occasionally by Francis I. with faint hopes of the crown of England. He was killed at the battle of Pavia in 1525. There were no more De la Poles who could advance even the most shadowy pretensions to disturb the Tudor dynasty.

(J. GA.)

York, Edmund of Langley, Duke of (1341–1402), fifth son of Edward III., was born at King's Langley in Hertfordshire on the 5th of June 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain, being present at the sack of Limoges in 1370. After marrying Isabella (d. 1393), daughter of Peter the Cruel, king of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under the earl's leadership to
aid Ferdinand, king of Portugal, in his struggle with John I.,
king of Castile; but after a period of inaction Edmund was
compelled to return to England as Ferdinand had concluded an
independent peace with Castile. Accompanying Richard II. on
his march into Scotland, he was created duke of York in August
1385, and subsequently on three occasions he acted as regent of
England. In this capacity he held a parliament in 1395, and he
was again serving as regent when Henry of Lancaster, after-
wards Henry IV., landed in England in July 1399. After a
feeble attempt to defend the interests of the absent king, York
joined the victorious invader; but soon retired from public life,
and, in the words of Froissart as translated by Lord Berners,
"laye styll in his castell, and medled with nothynge of the
busynesse of Englands." He died at King's Langley on the 1st
of August 1402. York was a man who preferred pleasure to
business, and during the critical events of his nephew's reign he
was content to be guided by his more ambitious brothers, the
dukes of Lancaster and Gloucester. His second wife was Joan,
or Johanna (d. 1434), daughter of Thomas Holland, earl of
Rutland, and deprived of his recent two sons and a daughter,
Constance (d. 1416), by his first wife.

YORK, EDWARD, DUKE OF (c. 1372-1415), elder son of the
preceding, was created earl of Rutland in 1399. Being an
intimate friend of his cousin, Richard II., he received several
important appointments, including those of admiral of the fleet,
constable of the tower of London and warden of the Cinque
Ports. He accompanied the king to Ireland in 1394 and was
made earl of Cork; arranged Richard's marriage with Isabella,
dughter of Charles VI. of France; and was one of the king's
agents at the peace of Troyes, in 1420. On the death of the
earl of Aumerle in 1416, Richard made the duke of Gloucester
"appellant" in 1397. As a reward he secured the office of con-
stable of England and the lands in Holderness which he
previously belonged to his murdered uncle, Thomas of Wood-
stock, duke of Gloucester, together with other estates and the
title of duke of Aumerle or Albemarle. He appears to have
deserted Richard in 1399, but only at the last moment; and in
Henry IV.'s first parliament he was vigorously denounced as the
murderer of Gloucester. After declaring that his part in the
proceedings of 1397 had been performed under constraint, his
life was spared, but he was reduced to his former rank as earl of
Rutland. Henry V. and his elder brother Edmund were
against Henry IV. in January 1400, but his complete acquittal by
parliament in 1401, and the confidence subsequently reposed in
him by the king, point to the conclusion that he was not seriously
involved. Serving as the royal lieutenant in Aquitaine and in
Wales, Rutland, who became duke of York on his father's death
in 1402, was, like all Henry's servants, harried by want of
money, and perhaps began to feel some irritation against the
king. At all events he was concerned in the scheme, concocted
in 1405 by his sister, Constance, widow of Thomas le Despencer,
earl of Gloucester, for seizing the young earl of March, and his
brother Roger Mortimer, and carrying them into Wales. On
her trial Constance asserted that her brother had instigated the
plot, which also included the murder of the king, and York was
imprisoned in Pevensey castle. Released a few months later, he
was restored to the privy council and regained his estates, after
which he again served Henry in Wales and in France. York led
e one division of the English army at Agincourt, where, on the
25th of October 1415, he was killed by "much hete and
thronged." He was buried in Fotheringhay church. The
duke left no children and was succeeded as duke of York by his
nephew, Richard.

York compiled the _Mystre de la Game_, a treatise on hunting
which is largely a translation of the _Livre de Chasse de Gaston Phocbus_,
count of Foix. This has been edited by W. A. and F. Baillie-
Grohman (1903).

YORK, FREDERICK AUGUSTUS, DUKE OF (1763-1827),
second son of George III., was born at St James's Palace on the
16th of August 1763. At the age of six months his father secured
his election to the rich bishopric of Osnabrück. He was invested
a knight of the Bath in 1778, a K.G. in 1779, and was gazetted
colonel in 1780. From 1781 to 1787 he lived in Germany, where
he attended the manoeuvres of the Austrian and Prussian armies.
He was appointed colonel of the 2nd horse grenadier guards
(now 2nd Life Guards) in 1782, and promoted major-general and
appointed colonel of the Coldstream Guards in 1784. He was
created duke of York and Albany and earl of Ulster in 1784,
but retained the bishopric of Osnabrück until 1803. On his
return to England he took his seat in the House of Lords, where,
December 15, 1788, he opposed Pitt's Regency Bill in a speech
which was supposed to have been inspired by the prince of Wales.
A duel fought on Wimbledon Common with Colonel Lennox,
afterwards duke of Richmond, served to increase the duke of
York's popularity, his acceptance of the challenge itself and his
perfect coolness appealing strongly to the public taste. In
1791 he married Princess Frederica Charlotte Ulrica Catherina
(b. 1767), daughter of Frederick William II. of Prussia. The
princess was enthusiastically received in London, but the
marriage was not happy, and a separation soon took place.
The princess retired to Oatlands Park, Weybridge, where she
died on the 18th of August 1825.

In 1793 the duke of York was sent to Flanders in command of
the English contingent of Coburg's army destined for the
invasion of France (see French Revolutionary Wars). On his
return in 1795 the king promoted him field-marshal, and on
April 3rd, 1798, appointed him commander-in-chief. His
second command was with the army sent to invade Holland in
conjunction with a Russian _corps d'armée_ in 1799. Sir Ralph
Abercromby and Admiral Sir Charles Mitchell in charge of the
vanguard had succeeded in capturing the Dutch ships in the
Netherlands and in derailing the duke of York from his
scheme, when the body of the army disaster followed disaster until, on the 17th of
October, the duke signed the convention of Alkmaar, by which
the allied expedition withdrew after giving up its prisoners.
Although thus unsuccessful as commander of a field army the
duke was well fitted to carry out reforms in the army at home,
and to this task he devoted himself with the greatest vigour and
success until his enforced retirement from the office of com-
mander-in-chief on the 18th of March 1806, in consequence of his
relations with Mary Ann Clarke (1776-1852), who was convicted
of profiting by her intimacy with the duke to extract money
from officers by promising to recommend them for promotion.
A select committee was appointed by the House of Commons
to inquire into the matter, and the duke was acquitted of having
received bribes himself by 278 votes to 106. Two years later,
in May 1811, he was again placed at the head of the army by the
prince regent, and rendered valuable services in this position.
He died on the 5th of January 1827 and was buried at St George's
Chapel, Windsor.

A firm friendship seems to have existed between the duke and his
elder brother, afterwards George IV., and he is also said to have
been his father's favourite son. He was very popular, thanks to
his amiable disposition and a keen love of sport, but it is as the
organizing and administrative head of the army that he has left
his name. He was untiring in his efforts to raise the tone of the
army, restore discipline, weed out the undesirables, and suppress
bribery and favouritism. He founded the Duke of York's School
for the sons of soldiers at Chelsea, and his name is also com-
memorated by the Duke of York's column in Waterloo Place.

YORK, RICHARD, DUKE OF (1441-1450), was born on the
21st of September 1441, the son of Richard, earl of Cambridge,
second son of Edmund of Langley, duke of York. By the death
of his uncle Edward at Agincourt he became duke of York, and
on the death of Edmund Mortimer in 1425 he succeeded to his
claims as representing in the female line the elder branch of the
royal family. He had been kindly treated by Henry V., and his
name appears at the head of the knights made by the
little Henry VI. at Leicester on the 19th of May 1426. York's
first service was in France during 1430 and 1431. In 1432 he
obtained livery of his lands and afterwards went over to Ireland
to take possession of his estates there. In January 1436 he
was appointed lieutenant-general of France and Normandy, but
did not enter on his command till June. He showed vigour and
capacity, and recovered Fécamp and some other places in
York (City)

Normandy. I probably he was not supported cordially by the home government, and in 1437 applied to be recalled. One authority alleges that his council thwarted him in his desire to relieve Montreau, because he had been discharged from his office (Chronicles of London, 1437). York returned to England in the autumn of 1437. From this time at all events he attached himself to the war-party of which Humphrey of Gloucester was head, in opposition to the government under Cardinal Beaufort. By his marriage in 1438 to Cicely, sister of the earl of Salisbury, he allied himself to the rising family of the Nevilles. On the 2nd of July 1440 York was again appointed to the appointment of governor of the Duchy of Cornwall, and granted full powers and a sufficient revenue. He did not, however, go to Rouen till June 1441. During his second government York maintained, if he could not improve, the English position in Normandy. He was again hampered by his political opponents at home, and at the end of 1446 was recalled, on the pretext that his term of office had expired. The death of Humphrey of Gloucester in February 1447 made York the first prince of the blood. Suffolk, now Henry's chief minister, found a convenient banishment for a dangerous rival by appointing York to be lieutenant of Ireland for ten years (9th of December 1447). York, however, contrived to get his deputies off, and to live for eighteen months. During his absence in Ireland English discontent came to a crisis in Jack Cade's rebellion. The use made of the names of Mortimer and York, however unauthorized, shows the trend of popular opinion. In September 1450 York landed in Wales. His opponents endeavoured to waylay him, but he came to London with an armed retinue and forced himself into the king's presence. Nevertheless he declared his loyalty and that he desired only justice and good government. He took part in the punishment of Cade's supporters, and discomfited a proposal in parliament that he should be declared heir to the crown. In March 1452 he came once more in arms to London, and endeavoured to obtain Somerset's dismissal. On a promise that his rival should be held in custody he disbanded his men, and thus outfitted himself virtually a prisoner. However, a nominal agreement was concluded, and York accepted the king's pardon. The situation was changed by the birth of a prince of Wales and the king's illness in October 1453. After a struggle with the queen and Somerset, York secured his recognition as protector on the 27th of March 1454. He declared that he accepted the post only as a duty, and, though he put his own friends in power, exercised his authority with moderation and on the side of good order. But at the end of the year the king's sudden recovery brought York's protectorate to an end. When it was clear that the queen and Somerset would proceed to extremities, York and his friends took up arms in self-defence. Even when the two armies met at St Albans, York endeavoured to treat for settlement. The issue was decided by the defeat and death of Somerset on the 22nd of May 1455. York used his success with moderation. He became constable of England, and his friends obtained office. This was not more than a change of ministers. But a return of the king's illness in October 1455 made York again for a brief space protector. Henry recovered in February 1456, and Margaret, his queen, began to assert herself. Finally, at Coventry, in October, the Yorkist officials were displaced. Still there was no open breach, and in March 1458 there was even a ceremonial reconciliation of all parties at St Paul's in London. York would not again accept honourable banishment to Ireland, but made no move till the queen's presence in London was alarming. In 1459 both parties were once more in arms. York protested that he acted only in self-defence, but the desertion of his best soldiers at Ludlow on the 12th of October left him helpless. With a few followers he escaped to Ireland, where his position as lord-lieutenant was confirmed by an Irish parliament, and he ruled in full defiance of the English government. In March 1460 the earl of Warwick came from Calais to concert plans with his leader. York himself only landed in England on the 8th of September, two months after Warwick's victory at Northampton. All pretence of moderation was put aside, and he marched on London, using the full arms of England, and with his sword borne upright before him. On reaching Westminster, York took up his residence in the royal palace, and formally asserted his claim to the throne in parliament. In the end a compromise was arranged, under which Henry was to retain the crown for life, but Richard was to succeed him. On the 8th of November he was accordingly proclaimed heir-apparent and protector. Meantime the queen was gathering her friends, and early in December, Richard went north with a small force. He kept Christmas at Sandal Castle near Wakefield. There, on the 30th, the battle of Wakefield was fought. Henry was hemmed in by a superior force of Lancastrians. Declaring that he had never kept castle in the face of the enemy, Richard rashly offered battle, and was defeated and slain. His enemies had his head cut off, and set it up on the walls of York adorned with a paper crown.

Richard of York was not a great statesman, but he had qualities of restraint and moderation, and might have made a good king. He had four daughters and four sons. Edmund, earl of Rutland, his second son, was killed at Wakefield. The other three were Edward IV., George, duke of Clarence, and Richard III.

Kingsford, 1905); J. S. Stevenson's Wars of the English in France (Routledge, 1889). The French chronicles of Matthieu d'Ecouhoy, T. Basin and Jehan Waurin should also be consulted (these three are published by the Société de l'Histoire de France). For modern accounts see especially Sir James Ramsay's Lancaster and York, and The Political History of England, vol. iv., by Professor C. Oman. (C. L. K.)

York, a city, municipal, county and parliamentary borough, the seat of an archbishop, and the county town of Yorkshire, England, 158 m. N. by W. from London by the Great Northern railway. It is an important junction of the North-Eastern railway. Pop. (1901) 77,914. It lies in a plain watered by the river Ouse, at the junction of the Foss stream with the main river. It has narrow picturesque streets, ancient walls, and, besides the cathedral, many churches and buildings of architectural interest.

York was a Roman station (see below), and large collections of Roman remains are preserved in the hospital of St Mary's Abbey. Of these a great proportion came from the fortifications of the railway station. A noteworthy relic of the Roman occupation, however, appears in its original place. This is the so-called multangular tower, on the N.W. of the city walls. Its base is Roman, of mingled stone and brick work. The city walls date in part from Norman times, but are in the main of the 14th century. Their circuit is a little over 25 m., and the area enclosed is divided by the river Ouse, the larger part lying on the left bank. The walls have been carefully preserved and are remarkably perfect. On the E. for a short distance the river Foss took the place of a wall. Of the gates, called Bars, the best specimen is Micklegate Bar on the S.W., where the heads of traitors were formerly exposed. It is a square tower built over a circular, probably Norman, arch, and has embattled corner turrets. Others are Bootham Bar, the main entrance from the N., also having a Norman arch; Monk Bar (N.E.), formerly called Goodramgate, but renamed in honour of General Monk, and Walmgate Bar, of the time of Edward L., retaining the barbaric repaired in 1648. The castle stands in the angle between the Ouse and the Foss immediately above their junction. Of the fortress built by William the Conqueror in 1068 the portions were probably incorporated in Clifford's tower, the shell of which, showing an unusual ground plan of four intersecting circles, rises from an artificial mound. The castle serves as the prison and county courts.

The cathedral of St Peter, commonly known as the minster, has no superior in general dignity of form among English cathedrals. It is in the form of a Latin cross, consisting of nave with aisles, transepts, choir with aisles, a central tower, and
two W. towers. The palace of the archbishops is at Bishops- 
thorpe, 2½ m. S. of York. It is of various dates, and includes 
slight remains of the Early English palace of Archbishop Grey. 
The diocese includes over half the parishes in Yorkshire, and 
also covers very small portions of Durham, Nottinghamshire 
and Lincolnshire.

The extreme external length of the cathedral is 52 ft. 6 in., 
the breadth across the transepts 250 ft., the height of the central 
tower 233 ft., and the height of the S. tower 202 ft. The 
material is magnesian limestone. The cathedral occupies the site of 
the wooden church in which King Edwin was baptized by 
Pope innocent II. on Easter Day 664, according to Bede, to begin to 
build a "large and more noble basilea of stone," but it was partly destroyed during the troubles 
which followed his death, and was repaired by Archbishop Wilfrid. 
The present building dates from fire in 1311, and after 1317; it had been 
repaired by Archbishop Albert, was described by Alcuin as "a most 
magnificent basilea." At the time of the Norman invasion the 
Saxon cathedral, with the library of Archbishop Egbert, perished 
in the fire by which the greater part of the city was destroyed, 
the only relic remaining being the central wall of the crypt. 
It was reconstructed by Archbishop Thomas of Bayeux (1070- 
1100); but of this building few portions remain. The apsidal 
choir and crypt were reconstructed by Archbishop Roger 
(1154–81), the S. transept by Archbishop Walter de Grey (1216– 
1255), and the N. transept and central tower by John Romans, 
treasurer, in 1288–90. The foundation of the crypt, the 
transepts are the oldest portions of the building, now 
remaining. They represent the Early English style at its best, 
and are a new departure in architectural effect. The S. transept is the richest and most elaborate 
in its details, one of its principal features being the magnificent 
rose window; and the N. transept contains a series of beautiful 
lancet windows called the Five Sisters. The foundation of the 
new nave was laid by Archbishop Romanus (1286–90), son of 
the treasurer, the building of it being completed by Archbishop 
William de Melton about 1340. The chapter-house, a magnificent ornate 
building, was built during the same period. The W. front, con- 
sisting of a centre and two divisions corresponding with the nave and 
aisles, has been described as "more architecturally perfect as a composite 
developed from the details of the very early English cathedral," the great 
window above the door being considered by 
some to the famous E. window at Carlisle.

In 1361 Archbishop Thoresby (1352–73) began the lady 
chapel and presbytery, both in the Early Perpendicular style. 
The rebuilding of the choir, begun about the same period, was 
not completed till about 1400. It is Late Perpendicular, the great E. 
window being one of the finest in the world. With the rebuilding 
of the choir the whole of the ancient Norman edifice was removed 
and the only Norman architecture now remaining being the E. portion 
of the crypt of the second period, built by Archbishop Roger (1154– 
1181); the building of the E. portion was commenced in 1288, and 
the work was recased and changed into a Perpendicular lantern tower, the 
work being completed in 1444. The S. W. tower was begun in 1432 
during the treasurership of John de Bermingham, and the N. W. 
tower was immediately commenced after the completion of this. The 
work was carried on by the canons, who completed it as it now stands, and on the 3rd of February 1472 it was re- 
consecrated by Archbishop Neville. On the 2nd of February 1829 
the building was occupied by the Right Rev. John Jordan, the 
Archbishop of York. On the 2nd of May 1840 a fire broke out in the S.W. 
tower, reducing it to a mere shell. The stained glass both in the 
cathedral and in other churches of the city is particularly note- 
worthy; its survival may be traced to the stipulation made by 
the citizens when surrendering to parliamentary troops in the civil 
war that it should not be damaged.

The following is a list of the archbishops of York:

**William Fitzherbert,** reinstated, 1153 to 1181.
31. Roger de Pont l’Eveque, 1154-1181.
32. It is now vacant for ten years.
33. Geoffrey, 1191-1207.
34. (The see was vacant for nine years.)
35. William de Grey, 1216-1255.
36. Seawel de Bovil, 1256-1268.
40. John Romans, 1286-1296.
41. Henry de Navarre, 1295- 
1299.
42. Thomas of Corbridge, 1300- 
1304.
43. William Greenfield, 1306- 
1315.
44. William de Melton, 1317- 
1340.
45. William la Zouche, 1342- 
1352.
46. John Thoresby, 1352-1372.
47. Alanus Neville, 1374- 
1388.
48. Thomas Fitzalan, 1388- 
1400.
51. Henry Bowet, 1407-1423.
52. Thomas Grey, 1423-1436.
53. William Booth, 1452-1454.
54. George Neville, 1464-1476.
55. Thomas Booth, 1470-1476.
56. Thomas Scott, 1477-1480.
57. Thomas Savage, 1501-1507.
58. Christopher Bainbridge, 1514.
59. Thomas Wolsey, 1514-1530.
60. Cosmo Gordon Lang, 1908- 
Next to the cathedral, the most interesting building in York is 
St Mary's Abbey, situated in Museum Gardens, founded for 
Benefices by Alan, lord of Richmond, in 1076, its head having the 
right of a mitred abbot with a seat in parliament. The principal 
remains of the abbey (see Abbey) are the N. wall and the ruins 
of the church, in the Early English and Decorated styles, and 
the principal gateway with a Norman arch. They lie near the cathedral, 
outside the walls. The hospital, or infirmary, of the abbey, on the 
upper part is of wood, contains a collection of Roman antiquities; the 
building is of the 14th and 15th centuries. A considerable portion of the 
architectural remains, including the chapel of the abbey, was 
converted into a Roman Catholic college, and in 1453 was 
occupied by the Carrier of York University, and is now 
occupied by the Roman Catholic College of the Roman 
Church. In 1661 the college was shut up as a place of 
the blind. In the garden is also the ambulatory of St Leonard's 
hospital, founded by King Eadgils and rebuilt by Stephen. 
In 1837 the hospital was absorbed by the University of York, and 
in 1873 it was taken over by the York City Council as a 
college for priests holding chantries in the minster; its restoration 
as a church house and meeting-place for convocation was undertaken 
in 1996. York also possesses a large number of churches 
of special architectural interest, including All Saints, North Star, 
St Mary’s-le-Belfry, St Martin’s-le-Grand, St Thomas’s 
Cathedral, St Pancras, All Saints, North Star, and the Minster of 
St Mary’s the Virgin, being the earliest church in England. 
The Minster of St Mary’s the Virgin is the largest church in 
England, being 120 ft. in height; Christ Church, with its 
Interior, is the largest in the world. It is the senior of the 
old English church, being 900 years old. The Minster of St Mary’s the 
Virgin is the largest church in England, being 120 ft. in height; 
Christ Church, with its 

* These bishops did not receive the pall as metropolitan.
The public institutions include the Yorkshire Philosophical Society, which was opened in 1836, and the free library in the building of the York Institute of Science and Art. The principal schools are St Peter's cathedral grammar-school (originally endowed in 1537), Archbishop Holgate's grammar-school, the joint foundation of the lord mayor and city corporation, and the grammar schools for boys (founded in 1705), with the associated grecuoa school for girls. There are numerous charters.

The chief industrial establishments are iron foundries, railway and engineering works, breweries, flour-mills and manufactories of confectionery, artificial manure, &c. There is water communication by the Ouse with the Humber, and by the Foss Navigation to the N.E. This is under the control of the corporation. The parliamentary borough returns 2 members. The county borough was created in 1888. The municipal borough is under a lord mayor, 12 aldermen and 36 councilors. The city within the municipal limits consists of the ancient city and the county. The municipal city and the Ainsty (a district on the S.W. included in the city bounds in 1449) are for parliamentary purposes included in the N. Riding, for registration purposes in the E. Riding, and for all other purposes in the W. Riding. The parliamentary borough extends into the E. Riding. Area, 3730 acres.

History.—York is known to have been occupied by the Britons, and was chosen by the Romans as their most important centre in north Britain and named Eboracum or Eboracum. The fortress of Legio VI Victrix was situated near the site of the cathedral, and a municipality (colonia) grew up, near where the railway station now is, on the opposite side of the Ouse. Many inscriptions and a great quantity of minor objects throughout the kingdom, and King John in 1200 visited York in A.D. 120, and, according to tradition, the body of the emperor Severus who died there in A.D. 211 was burnt on Severus Hill, near the city. After the death of Constantine Chlorus, which also took place in York, his son Constantine the Great, who, according to an ancient but incorrect tradition, was born there, was also inaugurated emperor there. A bishop of York is mentioned, along with, and with precedence of, bishops of London and Lincoln (the last name is uncertain) as present at the council of Arles in 314. Nothing is known of the history of the city from the time the Romans withdrew from Britain in 410 until 627, when King Edwin was baptized there, and where shortly afterwards Paulinus, the first archbishop, was consecrated. In the time of Archbishop Egbert (732-756) and of Alcuin, at first a scholar and afterwards master of the cloister school, York became one of the most celebrated places of education in Europe. It was also one of the chief Danish boroughs, and Earl Siward is said to have died there in 1055. In 1066 it was taken by Harold Hardrada, and in 1069 the men of the north of England, rising under Edgar Atheling and Earl Egbert, forced William the Conqueror to withdraw in 1067. William I. afterwards, putting to death the whole of the Norman garrison. The Conqueror in revenge burnt the town and laid waste the country between the Humber and the Tees. York was frequently visited by the kings of England on the way to Scotland, and several important parliaments were held there, the first being that of 1175, when Malcolm, king of Scotland, did homage to Henry II. In the reign of Richard I., the citizens rose against the Jews, who fled to the castle. Here, however, they were obliged to surrender, many killing themselves after putting to death their wives and children, the rest being murdered. This was soon afterwards (1194) done again. The town was established in York in 1537 after the suppression of the Pilgrimage of Grace. In 1642 York was garrisoned by Royalists and besieged by the parliament. It was relieved by Prince Rupert, but surrendered after the battle of Marston Moor. Being under the rule of the earls of Northumbria, York is not mentioned in the Domesday Survey. In the first charter (which is undated) Henry II. granted the citizens a merchant guild and all the free customs which they had in the time of Henry I. Richard I. in 1194 granted exemption from toll, &c. In 1200 the charter was confirmed by King John in 1202, and in 1212 granted the city to the citizens a fee-farm of £160 a year. These charters were confirmed by most of the early kings. Richard II. conferred the title of lord mayor, and a second charter, given in 1392, shows that the government then consisted of a lord mayor and aldermen, while in a third 1396 made the city a county of itself and gave the burgesses power to elect two sheriffs. Edward IV. in 1464 incorporated the town under the title of "Lord Mayor and Aldermen," and in 1475 directed that all the citizens should choose the mayor from among the aldermen. As this led to constant disputes, Henry VII. arranged that a common council, consisting of two men from each of the more important gilds and one from each of the less important ones, should elect the mayor. The city is now governed under a charter of Charles II., confirming that of 1464, the governing body consisting of a lord mayor, 12 aldermen and 36 councilors. The city has returned two members to parliament since 1295. During the 14th century there were constant quarrels between the citizens and the abbey of St Mary's about the suburb of Bootham, which the citizens claimed as within the jurisdiction of the city, and the abbey as a separate borough. In 1353 the king took the borough of York into his own hands, "to avoid any risk of disturbance and great possible bloodshed such as has arisen before these times," and finally in the same year an agreement was brought about by Archbishop Thoresby that the whole of Bootham should be considered a suburb of York except for the place called St Marygate, which should be in the jurisdiction of the abbey.

From the time of the conquest York was important as a trading and commercial centre. There were numerous trade guilds, one of the chief being that of the weavers, which received a charter from Henry II. During the 17th and 18th centuries the trade declined, partly owing to the distance of the city from the sea, and partly owing to the regulations of the trade gilds.

See Francis Drakeo, Eboracum: or the History and Antiquities of the City of York, from its original to the present time (1736); Extracts from the Municipal Records of the City of York during the Reigns of Edward IV., Edward V. and Richard III. (1843); Victoria County History, Yorkshire: J. Raine, York (1803); A. P. Purey-Cust, York Minster (1897); B. S. Rowntree, Poverty: a Study of Town Life (1901).

 YORK, a township of York county, Maine, U.S.A., on the Atlantic coast about 45 m. S.W. of Portland, and 9 m. by rail N.E. of Portsmouth, New Hampshire. Pop. (1910) 2882. Area, 64 sq. m. York is at the terminus of the York Harbor and Beach division of the Boston & Maine railway. In York village is the county gaol (1653-54), preserved by the Old York Historical and Improvement Society as a museum of local antiquities. Two colonial taverns also remain. York Harbor, York Beach, York Есть, and Long Beach are attractive summer resorts. The first settlement here was about 1624. In early 1641 Sir Ferdinando Gorges, proprietor of the province of Maine, erected this into the Borough of Agamenticus, and on the 1st of March 1642 he chartered it as a city under the name of Gorges. In 1652, when Massachusetts extended her jurisdiction over Maine, the city of Gorges became the town of York. In 1692 most of the houses were burned by the Indians and the inhabitants killed or taken captive. York was the shire town of Yorkshire from 1716 to 1735, the shire town with Portland (then Falmouth) of the district of Maine from 1735 to 1760, and a county-seat of York county from 1760 to 1812. During the middle of the 18th century York had considerable trade with the West Indies and along the coast, and as late as the middle of the 19th century it had important fishing interests. Its development as a summer resort was begun about 1873, but until 1887, when the railway reached it, its chief means of access was by stage from Portsmouth.

 YORK, a city and the county-seat of York county, Nebraska, U.S.A., about 46 m. W. by N. of Lincoln. Pop. (1900) 5132; (1910) 6253. It is served by the Chicago, Burlington & Quincy and Chicago & North-Western railways. It is the seat of the School of the Holy Family and of York College (founded in 1890,}
co-educational). The city is situated in a farming and stock-raising region, and among its manufactures are foundry products, bricks and flour. York was settled in 1664, was laid out in 1669, was incorporated as a town in 1745, and was chartered as a city in 1787.

**YORK**, a city and the county seat of York county, Pennsylvania, U.S.A., about 100 m. W. of Philadelphia and about 28 m. S.E. of Harrisburg. Pop. (1900) 33,705—1304 being foreign-born and 776 negroes; (1910) 44,750. York is served by the Maryland & Pennsylvania, the Northern Central (Pennsylvania) and the Western Maryland railways. Among the public buildings are the County Court House (1899) and a large Federal Building (1910). York is the seat of the York Collegiate Institute (1873), founded by Samuel Small (d. 1885) and of the York County Academy (1783). The Historical Society of York (1895) has a valuable collection of documents relating to local history. York is the commercial centre for a rich agricultural region, and has manufactures of foundry and machine-shop products, silk goods, &c. The total factory product in 1905 was valued at $14,258,666.

York, the first permanent settlement in the state W. of the Susquehanna, was laid out in 1741 in what was then the Manor of Springettsbury (named in honour of Springett Penn, a grand-son of William Penn) by Thomas Cookson, a surveyor for Richard Penn. The first passengers from the parent province were brought to York, named after York, England. The first settlers were chiefly Germans from the Rhenish Palatinate, who were Lutherans, Reformed, Mennonites and Moravians. English Quakers and Scotch-Irish settled here also. The settlement lay on the Monocacy road, the main line of travel to the S. and S.W., and it grew rapidly, especially between 1748 and 1751. In 1749 the county of York was erected (from Lancaster county) and York was made the county-seat. In 1754 York had 210 houses and 1000 inhabitants. Troops from York took part in the Seven Years' War and the War of American Independence. In the old county of York and the part of Pennsylvania brought to the colony, and which was named after York, England, and which, after its resignation of office became the Quebec Act of 1774. On the assumption of the peace by the king, Grafton in 1767, York resigned office, and took little part in the debates in parliament during the next four years. In 1770 he was invited by the duke of Grafton, when Camden was dismissed from the chancellorship, to take his seat on the woolsack. He had, however, explicitly pledged himself to Rockingham and his party not to take office with Grafton. The king exerted all his personal influence to overcome Yorke's scruples, warning him finally that the great seal if now refused would never again be within his grasp. Yorke yielded to the king's entreaty, went to his brother's house, where he met the leaders of the cabinet, and realizing that the feeling at once overwhelmed with shame, fled to his own house, where in three days he was a dead man (January 20, 1770). The patent raising him to the peerage as Baron Morden had been made out, but his last act was to refuse his sanction to the sealing of the document.

Charles Yorke was twice married. His son by his first marriage became earl of Hardwicke; his eldest son by his second marriage, Charles Philip Yorke (1764–1834), member of parliament for Cambridgeshire and afterwards for Liskeard, was secretary of state for war in Addington's ministry in 1801, and president of the Board of Control, a position of great influence, while a member of the cabinet. He made himself exceedingly unpopular in 1810 by bringing about the exclusion of strangers, including reporters for the press, from the House of Commons under the standing order, which led to the imprisonment of Sir Francis Burdett in the Tower and to riots in London. In the same year Yorke joined Spencer Perceval's government as first lord of the admiralty; he retired from public life in 1818, and died in 1834. Charles Yorke's second son by his second marriage was Sir Joseph Sydney Yorke (1768–1831), an admiral in the navy, whose son succeeded to the earldom of Hardwicke.

See under HARDWICKE, PHILIP YORKE, 1st Earl of.

**YORKSHIRE**, a north-eastern county of England, bounded N. by Durham, E. by the North Sea, S.E. by the Humber estuary (separating it from Lincolnshire), S. by Nottinghamshire and Derbyshire, S.W. for a short distance by Cheshire, W. by Lancashire and N.W. by Westmorland. It is the largest county in England, having an area of 6666 sq. m., and being more than double the size of Lincolnshire, which ranks next to it. In a description of the county it is constantly necessary to refer to its three great divisions, the North Riding, East Riding and West Riding (see RIDING, and map of England, Sections I., II.);

The centre of the county is a plain, which in the S., about the head of the Humber, resembles the Fens in character. The hills W. of the central plain, covering nearly the whole of the W. Riding and the N.W. of the N. Riding, are part of the great Pennine Chain (q.v.). These hills consist of high-lying moorland, and are
not generally remarkable for great beauty of outline. The higher party is bleak and wild, and the slope towards the central plain is gradual. The chief beauty of the district is to be found in the numerous deeply scored valleys or dales, such as Teesdale, Swaledale, Wharfedale, and Nidderdale, in which the course of the streams is often broken by waterfalls, such as High Force in Teesdale and Aysgarth Force in Wensleydale.

The hills E. of the central plain cannot be similarly considered as a unit. In the N., wholly within the N. Riding, a line of heights known as the Cleveland Hills, forming a spur of the N. Yorkshire Moors, ranges from 1000 to nearly 1500 ft., and overarch the valley of the Ure, and the Humber and the North Sea. The line of greatest elevation approaches the central plain, and swings sharply S. in the Hambleton Hills to overlook it, while to the S. of the line lies the Vale of Pickering, a narrow valley on the margin of which Moors and Hills, in the wooded region of the elevated country of Craven and Dent. The scenery in the W. of the N. Riding is somewhat similar to that in Craven, except that the lower hills are of sharper outline owing to the perpendicularly precipitous sides.

To the S. E. the hills are lower and farther apart, and the softer rocks are due to the numerous "forces" or waterfalls, which are one of the special features of the scenery of this district. The district is part of the great central plain of Europe, of which Yorkshire is a part, and has given rise to extensive caverns, of which the best examples are those of Clapham and Ingleton in the W. Riding, as well as to subterranean watercourses. At Brimham, Plenton and elsewhere there are fantastic masses of rocks due to irregular weathering of the Millstone Grit. The Pennine region is bounded on the S.E. by the Coal Measures, forming the N. of the Derbyshire, Nottinghamshire and Yorkshire coal-field, which in Yorkshire extends from Sheffield N. to Leeds. The noted fireclays of the Leeds district are obtained from this formation. To the E. the Coal Measures dip beneath the unconformable Permian beds, with magnesian limestone and marl, to form the Yorkshire Dales.

The Permian strata are overlain to the E. by the Trias or New Red Sandstone, scarcely ever exposed, but having been partly worn away is covered with Glacial deposits of clay and gravel, forming the present landscape. The Vale of York, the Mere of Pickering and S. E. beyond York to Market Weighton, near Middleton red rock with gypsum and rock-salt (100 ft.) have been proved. The mineralogical features of the district are the common occurrence of Rhaetic beds have been recorded from near Northallerton. The Lias crops to the surface in a curve extending from Redcar to the Humber. In the Middle Lias there is a seam of valuable iron ore, the "Dogger," and in the Old Lias, the "Doggers" of the Yorkshire coast, which extends from Scarborough and Whitby are formed of liasian strata, and the marls and Greensand beds are commonly covered by the Carboniferous rocks. The calcareous strata are of frequent occurrence and extend from Scarborough and Whitby until the Vale of Pickering, through the Humber, and to the S.W. of the vale to the neighbourhood of Malton. The Vale of Pickering is underlain by faulted Kimeridge Clay. Lias and Oolites fringe the E. of the Vale of York to Ferriby on the Humber in the S.E. of the county. Cretaceous rocks cover up the older strata, N. to the Vale of Pickering and W. to the Vale of York. The Chalk forms the Yorkshire wolds and the country S. through Driffield, Beverley and Holderness. The Vale of Weald from Redcar and Flamborough presents a continuous series of magnificent exposures of the strata from the Lower Lias to the Chalk. The Upper Lias fossils and jet of Whitby is the most noted, long the coast to the S. E. of the county. The Corallian, Oxford Clay, Kellaways Rock, Corbara and Upper Estuarine beds are well exposed in the cliffs. In Filey Bay the Kimeridge Clay appears on the coast, but it is covered farther S. by the Carboniferous rocks. The most remarkable outcrops of Portland, Purbeck, Wealden, and Lower Greensand of S. England. Over the Speeton beds lies the Red Chalk, the Yorkshire equivalent of the Upper Greensand and Cault. The evidences of glacial action are of unusual interest and variety; the great thickness of boulder clay on the coast is familiar to all, but inland also great deposits of glacial clay, sand and gravel obscure the older geology. The Vale of Pickering and many of the smaller northern valleys were in the N. period the sites of Glacial lakes, and the "warp" which covers much of the Vale of York is a fluvo-glacial deposit. The Cleveland Dike is an intrusive igneous dike of augite-andesite of Tertiary age which has intruded its way through the Cretaceous Beds, and is a N.W. direction from the neighbourhood of Fylingdales Moor.

Minerals.—The coal-field in the W. Riding is one of the chief sources of mineral wealth in Yorkshire, there being valuable seams of bituminous and anthracite coal, which extend from the coast to the Fylingdales Moor. The Barnsley coal measures consists of a house coal, and the Barnsley Thick Coal, the great seam of the Yorkshire coal-field, which is of special value, on account of its high anthracite quality and rapidity of rate and of the chemical furnace associated with the Upper Coal Measures the coal, or in the form of nodules. Large quantities of fireclay are also raised, as well as of gannister and oil-shale. The iron ore is the highest grade of ore found in the kingdom. Lead ore is obtained in the W. Riding beds of the Pennine range in Wharfedale, Airedale, Nidderdale, Swaledale, Arkendale and Wensleydale below the river Wharfe.

In the Millstone Grit there are several beds of good building stone, but that most largely quarried is the magnesian limestone of the Permian series, which, however, is of somewhat variable quality.
Yorkshire.

Agriculture.—Nearly nine-tenths of the E. Riding is under cultivation, but of the N. and W. Ridings only from three-fifths to seven-tenths—proportions explained by the different physical conditions. The till or boulder clay of Holderness is the richest soil in Yorkshire, and the chalk wolds, by careful cultivation, form one of the best soils for grain crops. The central plain bears all kinds of crops excellently. Wheat is grown in the E. and W. Ridings, but oats are the principal grain crop in these ridings, and barley exceeds wheat in all three. The bulk of the acreage under green crops is devoted to turnips and swedes. A little flax is grown, and liquorice is often grown in rotation. The importation of hill pasture is greatest in the N. Riding and least in the S. The two coasts of the North Sea, N. and W. Ridings are among the principal sheep-farming districts in England. Cattle, for the rearing of which the W. Riding is most noted, do not receive great attention. The Teeswater breed, however, is increasing in Yorkshire, and in Holderness there is a short-horned breed, chiefly valuable for its milking qualities. Cheese-making is largely carried on in some districts. Of sheep perhaps the most common breeds are the Leicester, Lincoln and South Down, and crosses between the Cheshire, Leicester, and Lincoln. Large numbers of pigs are kept at the dairy farms and for fattening. The short breed is chiefly in favour. Yorkshire bacon is famous. Draught horses are generally of a somewhat mixed breed, but the county is famed for its hunters and carriage and saddle horses. The breed of Cleveland bays is much used for carriages.

Manufactures.—The industrial district of south Yorkshire occupies the S. of the W. Riding, and may be taken as marked off approximately by the watershed from the similar district in S. Lancashire. The W. Riding is now the chief seat of the woollen manufacture of the United Kingdom, and has almost a monopoly in the production of worsted cloth. The early development of the industry was in part due to the abundance of water-power, while later the presence of coal helped to maintain it on the introduction of steam-power. In this industry nearly all the most important towns are engaged, while the names of several of the largest are connected with various specialities. Thus, while almost every variety of woollen and worsted cloth is produced at Leeds, Bradford is especially concerned with yarns and mixed worsted goods, Dewsbury and Batley with shoddy, Huddersfield with fancy goods and Halifax with the manufacture of the known Lancashire linen indigo. The town has been penetrated to the neighbourhood of Halifax. Among the characteristics of the industrial population, the love of music should be mentioned. Choral societies are numerous, and the work of some of those in the larger towns, such as Sheffield, Leeds and Bradford, has attracted wide notice. Next to the woolen industry comes the manufacture of iron and steel machinery and implements of every variety, which is common to most of the larger centres in the district. Sheffield is especially famous for iron-work, fine metal-work and cutlery. The development of the iron ore deposits of Cleveland dates only from the middle of the 19th century. About two and a half million tons of pig-iron are produced in this district annually, and there are considerable attendant industries, such as the production of steel, and shipbuilding. The chemical manufacture is important both here and in the W. Riding, where also a great variety of minor industries have sprung up. Such are leather working (at Leeds), the manufacture of clothing, printing and bleaching, and paper-making. Besides coal and iron ore, great quantities of clay, limestone and sandstone are raised. An excellent building-stone is obtained at several places in the W. Riding. The sea-fisheries are of some importance, chiefly at Hull, Scarborough, Whitby and Filey.

Communications.—N. and E. of Leeds communications are provided almost wholly by the North-Eastern railway, the main line of which runs from Leeds and from Doncaster by York, Thirsk and Northallerton. The main junction with the Great Northern line is effected immediately N. of Doncaster, at which town are the Great Northern works. This company serves the chief centres of the W. Riding, as do also the Midland, Great Central, London & North-Western, Lancashire & Yorkshire, and North-Eastern companies, the trains working over a close network of lines, while the system of running-power is held by one or more companies over the lines of another assists intercommunication. The Midland main line to Carlisle runs by Leeds, Skipton and Carlisle. (The joint line through the Midland and the Great Northern line runs from Hull to Barnsley. A complete system of canals links the centres of the southern W. Riding with the sea both E. and W. of the Aire & Calder Navigation communicating with the Ouse at Goole; the Huddersfield canal, which was never projected, crossing the watershed by the long Standedge tunnel, and other canals are the Leeds & Liverpool, Calder & Nidd Navigation, Sowerby & Holme Valley, and the Sheffield, with which the canals access from Sheffield to the Trent. The Aire & Calder Navigation, the most important of these canals, which has branches from Castleford to Leeds and Wakefield, and other branches to Barnsley, Worsbrough and Gomersal, has through navigation greatly improved since its construction. It was projected by John Rennie and opened in 1826, with a depth of 7 ft. and locks measuring 72 ft. long. Its depth is 5 ft. 11 in. to 10 ft. over a distance of 28 m., between Goole and the collieries, the locks have been enlarged to 460 by 25 ft., and the whole line is now 90 ft. The chief ports are Middlesbrough on the Tees, Hull on the Humber, and Goole on the Ouse.

Population and Administration.—The area of the ancient county is 3,882,328 acres. Its population in 1891 was 3,908,531, and 3,750,193 in 1901. The population increased over fivefold between 1801 and 1901; the increase in the W. Riding exceeding sevenfold. The manner in which the population distribution is described may be inferred from the following statement of the parliamentary divisions, parliamentary, county and municipal boroughs, and urban districts in the three Ridings. It should be premised that each of the three divisions is a distinct administrative county; though there is one high sheriff for the whole county. The city of York (pop. 77,914) is situated partly in each of the three ridings.

The West Riding has an area of 1,771,562 acres, with a population in 1891 of 2,445,932, and in 1901 of 2,750,493. Of this area the S. industrial district, considered in the broadest application of the term as extending between Sheffield and Skipton, Sheffield, Wakefield, and Barnsley, is over half the county, and probably contains less than one-half. The area thus defined includes the parliamentary divisions of Barnsley, Cole Valley, Elland, Hallamshire, Holmfirth, Keighley, Morley, Normanton, Pudsey, Rotherham, Sheffield, Sowerby, Spennymoor, and also includes parts of the divisions of Barkston Ash, Doncaster, Os HBO Cross, Otley and Skipton (a small part). The remaining parts of these last divisions, with that of Ripon, cover the rest of the Riding. Each division returns one member. The following are parliamentary boroughs: Bradford, returning 3 members, Dewsbury 1, Halifax 1, Huddersfield 1, Leeds 5, Pontefract 1, Sheffield 5, Wakefield 1. All these boroughs are parliamentary with the following municipal boroughs (pops. in 1901): Barnsley (41,866), Batley (30,321), Bradford, city and county borough (279,767), Brighouse (21,735), Dewsbury (28,060), Doncaster (28,934), Halifax, town council (28,514), Huddersfield (19,047), Keighley (41,604), Leeds, city and county borough (248,968), Morley (23,636), Ossett (12,905), Pontefract (13,427), Pudsey (11,212), Wakefield, city and county borough (109,070), Todmorden (partly in Lancashire, 25,418), Wakefield, city (14,413). The only municipal boroughs elsewhere in the riding are Harrogate (26,423) and Ripon (cathedral city, 820). Within the industrial region there are 113 other urban districts, those with populations exceeding 10,000 being Bingley (18,449), Castleford (17,386), Cleckheaton (12,524), Elland (10,412), Featherstone (13,045), Huddersfield (30,636), Liversedge (13,980), Mirfield (10,430), Morley (11,341), Normanton (12,352), Rawmarsh (14,587), Rothwell (11,702), Saddleworth (12,320), Shipley (29,573), Skipton (11,968), Sowerby Bridge (11,124), Todmorden (12,172), Thorne (12,172), Wakefield (12,925), Wombwell (12,352), Worsbrough (10,336). The only urban districts in the West Riding not falling within the industrial region are Thirsk (16,576), Ilkley (74,545), Knaresborough (4979) and Selby (7286).

The North Riding has an area of 1,136,378 acres, and a population in 1891 of 359,547 and in 1901 of 377,335. It comprises the district of Richmond, Skipton, Thirsk and Malton, each returning one member; and the parliamentary boroughs of Middlesbrough (one member), Scarborough (one member), and parts of Stockton-on-Tees and York. The industrial division of the North Riding extends between Wetherby and Skipton (borough 91,371), Richmond (3837), Scarborough (38,161) and Thornbury-on-Tees (16,054). The urban districts are Eston (11,199), Guisborough (10,312), Middlesbrough (13,636), Stockton-on-Tees (18,698), Malton (7568), Masham (1555), Northallerton (2009), Ormsby (9342), Pickering (3491), Redcar (7695), Saltburn-by-the-Sea (2578), Selby (1350), Skelton and Brotton (13,240), South
Bank in Normanby (6645), Whitby (11,755). Of these, all except Kirklington, Malton, Masham, Northallerton, Pickering and Whithby are in the populous Cleveland district. Besides Pickering, there lie at the S. of the Cleveland hills the small towns of Kirkby Moorside (1550) and Helmsley (1363). South of the last-named is the village of Ampthill, with its large Roman Catholic college, founded in 1802, and accommodating, in fine modern buildings, about 120 students.

The East Riding has an area of 750,039 acres, with a population in 1891 of 341,560 and in 1901 of 385,007. It comprises the parliamentary divisions of Buckrose, Holderness and Holderness, each returning one member; and contains the parliamentary borough of Hull, returning three members, and part of that of York. The municipal boroughs are Beverley (13,183), Bridlington (12,482), Hedon (1010), and Hull, or Kingston-upon-Hull, a city and county of a city and county borough (240,259). The urban districts are Cottingham, near Hull (3751), Filey (2003), Driffield (5766), Hessle, near Hull (3754), Hornsea (2381), Norton, near Malton (3842), Pocklington (2465) and Withernsea (1426).

The West Riding comprises 9 wapentakes and the liberty of Ripon. It has one court of quarter sessions and is divided into 26 petty sessional divisions. The boroughs of Bradford, Doncaster, Leeds, Pontefract, Rotherham and Sheffield, and the liberty of Ripon, have separate courts of quarter sessions and commissions of the peace; and Barnsley, Batley, Brighouse, Dewsbury, Huddersfield, Halifax, Huddersfield, Keighley, Morley, Ossett and Wakefield have commissions of the peace. The liberty and borough of Ripon are rated separately from the West Riding for the purposes of the county rate.

The North Riding comprises 11 wapentakes, and the liberties of E. and W. Langbaurgh and of Whity Strand. It has one court of quarter sessions and is divided into 19 petty sessional divisions. The boroughs of Richmond and Scarborough have separate courts of quarter sessions and commissions of the peace, and the borough of Middlesbrough has a commission of the peace. The East Riding comprises 6 wapentakes and has one court of quarter sessions, and is divided into 12 petty sessional divisions, while Hull has a separate court of quarter sessions and commission of the peace, and Beverley has a separate commission of the peace. The city of York has a separate court of quarter sessions and commission of the peace. Yorkshire is in the N.E. circuit. The total number of civil parishes is 1586. The county contains
1178 ecclesiastical parishes and districts wholly or in part. It is divided between the dioceses of York, Ripon and Wakefield, with small parts in those of Manchester, Southwell, Durham and Lincoln. York is the seat of the northern archdeaconry.

History.—The kingdom of Deira (q.v.), which was afterwards to include the whole of the modern Yorkshire, is first known to us in the 6th century, an Anglian tribe having seized the promontory at the mouth of the Humber, named by the invaders Holderness, followed by the gradual subjugation of the whole district by the East Saxons. The Sussex and Romney parts of weighton and Flamborough Head were then merely sheep-walks, and the earliest settlements were chiefly confined to the rich valley of the lower Derwent, but the district around Weighton became the Deiran sacred ground, and Goodmanham is said to mark the site of a temple. The area computed in the modern West Riding constituted the British kingdom of Elmet, and at this date presented a desolate and unbroken tract of moor-land in the N.; in the central parts about Leeds stretched a forest region where the last wolf seen in Yorkshire is said to have been slain by John of Gaunt; while in the S. the forest and moor of Hatfield Chase, divided by the River Derwent broken only by the line of Watling Street, which crossed the Don at Doncaster, the Aire at Castleford and the Wharfe at Tadcaster. The N. continuation of the road from York through Catterick to the Tees opened the way to the fertile plain in the heart of the modern North Riding, the S.E. of which offered an unbroken forest area, later known as the forest of Galtres, which in the middle ages stretched from York N. to Easingwold and CRAKE and E. TO Castleward, and as late as the 17th century lay a waste and unfrequented region abounding only in deer. Ella, the first king of Deira, extended his territory N. to the Wear, and his son Edwin completed the conquest of the district which was to become Yorkshire by the subjugation of Elmet, prompted thereto by vengeance on its king, Ceridic, for the murder of his uncle Hereric. Traces of the “burhs” by which Edwin secured his conquests are perhaps visible in the group of earthworks at Barwick and on the site of Cambodunum, but the district long remained scantly populated, and as late as the 17th century deer were said to be as plentiful in Hatfield Chase as “sheep upon a hill,” for Prince Henry in 1600 was assured to have killed 500 in one day’s hunting. The defeat of Edwin at Hatfield in 633 was followed by a succession of struggles between Mercia and Northumbria for the supremacy over Deira, during which the boundaries underwent constant changes. After the Danish conquest of Deira, Guthrum in 875 partitioned the district among his followers, under whose lordship the English population were for the most part allowed to retain their lands. Cleveland came under Scandinavian influence, and the division into tithings probably originated about this date, the boundaries being arranged to meet at York, which, as the administrative and commercial centre of the district, rapidly increased in importance, and it has been estimated that in A.D. 1000 it had a population of over 30,000. At the battle of Stamford Bridge in 1066 Harold Hardrada, who had seized York, and Earl Tosti were both defeated and slain by Harold of England. The merciless harrying with which the Conqueror punished resistance to his claims is proved by the reiterated entries of waste land in the Domesday Survey, and for many years all the towns between York and Durham lay uninhabited. In 1138 the forces of David of Scotland were defeated near Norrhallerton in the Battle of the Standard, in the Normans’ way of the reign of Henry II. The Tanfield and Malgemo and Malgomer Castles, which had been garrisoned against the king by Roger de Mowbray, were captured and demolished. In the harrying of the northern counties by the forces of Robert Bruce in 1318, Northallerton, Boroughbridge, Scarborough and Skipton were reduced to ashes. In 1322, at the battle of Boroughbridge, the rebel barons were defeated by the forces of Edward II. In 1399 Richard II. was murdered in Pontefract Castle. In 1405 Archbishop Scrope and Thomas Mowbray joined in the insurrection against Henry IV., and led the citizens of York to Skipton Moor, where, after a defeat by the earl of Westmorland, the leaders were beheaded under the walls of York. In 1408 the rebel forces of the earl of Northumberland were defeated by Sir Thomas Rokeby, high sheriff of Yorkshire, at Bramham Moor near Tadcaster. In 1455 a skirmish between the Percies and the Nevilles at Stamford Bridge was the opening event in the struggle between the houses of York and Lancaster; in 1460 the duke of York was defeated and slain at Wakefield; in 1461 the Lancastrians were defeated at Towton. The suppression of the monasteries roused deep resentment in the whole of the West Riding, and the inhabitants flocked to join the Pilgrimage of Grace, Skipton Castle being the only place immediately N. of the Humber which remained loyal to the king. On the outbreak of the Civil War of the 17th century, opinion was divided in Yorkshire, the chief parliamentary families being the Fairfaxes and the Hothams, while the Puritan clothing-towns of the West Riding also sided with the parliament. Sir William Savile captured Leeds and Wakefield for the king in 1642, and in 1643 Newcastle, having defeated the Fairfares at Adwalton Moor, held all Yorkshire except Hull, which the Hothams, moved by jealousy of the Fairfaxes, had already designed to give up. In 1645 the Fairfaxes secured the East and West Riding, while Cromwell’s victory at Marston Moor was followed by the capture of York, and in the next year of Pontefract and Scarborough.

On the redistribution of estates after the Norman Conquest, Alan of Brittany, founder of Richmond Castle, received a vast fief which became the honour of Richmond; Gilbert de Laci was rewarded with lands which afterwards constituted the honour of Pontefract. Earl Harold’s estate at Coningsburgh passed to William de Warenne, earl of Surrey, together with Sandal Castle, which on the death of the Warenne line in the 14th century was bestowed on Edmund Langley, duke of York. Other great Domesday landholders were William de Percy, founder of the abbey of Whitby; Robert de Bruce, ancestor of the royal line of Scotland, the head of whose fief in Cleveland was transferred in the 12th century from Danby Castle to Skelton; Roger de Busli owned a large tract in S. Yorkshire, of which Tickhill was the head; the archbishop of York enjoyed the great lordship of Sherburn, and Howdenshire was a liberty of the bishop of Durham. Among the great lordships of the middle ages for which Yorkshire was distinguished were Tickhill, the honour of the Percy; Thirsk, of the Mowbray; Tankersley and the Marmons; Skipton, of the Clifford; Middleton, of the Fitz-Hughes and Nevilles; Helmsley, of the de Roos; Masham and Bolton, of the Scropes; Sheffield, of the Furnivalls and Talbots; Wakefield, of the duke of York. The Fairfaxes were settled in Yorkshire in the 13th century, and in the 16th century Denton became their chief seat.

The shire court for Yorkshire was held at York, but extensive privileges were enjoyed by the great landholders. In the 13th century Henry de Lacy, earl of Lincoln, claimed to hold the sheriff’s tour at Bradford and Leeds; his bailiff administered the wapentake of Staincliffe in his court at Bacsalf and Slaiburn; and his steward judged cases of felony in his court at Almondbury. The sheriff of York held the sheriff’s tour at Otley, and had his own coroners at York, Hull, Beverley and Ripon. Eudo la Zouche held the sheriff’s tour at Bingley, and Thomas de Furnivall in Hallamshire. The bailiffs of Tickhill Castle also held tours in place of the sheriff. The bishop of Durham had a court at Hoveden, and the king’s bailiffs were excluded from executing their office in his estates of Howdenshire and Allertonshire. The abbot of St Mary’s York had his own coroners in the wapentake of Ryedale, and the abbot of Bella Landa in Sutton. The prior of Bradenstoke held a court in his manor of Wales. The archbishop of York, Robert de Ros, and the abbot of St Mary’s York judged felonies at their courts in Holderness. The liberty of Ripon (q.v.), city of Ripon, still constitutes a franchise of the archdeaconry of York.

In the 13th century the diocese of York included in this county the archdeaconry of York, comprising the deaneries of York, Pontefract, Doncaster and Craven; the archdeaconry of Cleveland, comprising the deaneries of Bulmer, Cleveland
and Ryedale; the archdeaconry of East Riding, comprising the deaneries of Harthill (Hull), Buckrose, Dickering and Holderness; and the archdeaconry of Richmond, comprising the deaneries of Richmond, Catterick, Boroughbridge and Lonsdale. In 1541 the deaneries of Richmond were transferred to Henry VIII and diverted to new counties. The remaining archdeaconry was at first given by act of parliament in 1836, and the deaneries of Craven and Pontefract were formed into the archdeaconry of Craven within its jurisdiction, together with the archdeaconry of Richmond. The archdeaconry of Sheffield was created in 1834 to include the deaneries of Sheffield, Rotherham, Ecclesfield and Wath. In 1888 the area of the diocese of Ripon was reduced by the creation of the see of Wakefield, including the archdeaconry of Halifax with the deaneries of Birstall, Dewsbury, Halifax, Silkstone and Wakefield, and the archdeaconry and deanery of Huddersfield. The diocese of Ripon now includes in this county the archdeaconries of Craven with three deaneries, Richmond with three deaneries and Ripon with seven deaneries. The diocese of York includes the archdeaconry of York with six deaneries, Sheffield with four deaneries, East Riding with thirteen deaneries and Cleveland with nine deaneries.

The great woolen industry of Yorkshire originated soon after the Norman Conquest, and when the rich pastures and watercourses of this region were the chief characteristic industries may be traced in the various on the various industrial centres. The time of the American War marked the gradual absorption by Yorkshire of the clothing trade from the English cloth towns, and the industry was to have a prominent part in the revolution of 17th century, and was dug at Leeds in the 13th century. The early fame of Sheffield as the centre of the cutlery and iron trade is demonstrated by the word "Chaucer," a Sheffield whetstone known in the 15th century, and the canons of Gisburn had four "fabricae" in blast in Glaisdale in Cleveland. In the 16th century limestone was dug in many parts of East, and Humber, and its use was increased by the great demand in order to encourage its cultivation in this country. Bolton market was an important distributive centre for cotton materials in the 17th century, and in 1787 there were eleven cotton mills in the county.

Parliamentary Representation.—The county of York was represented by two knights in the parliament of 1295, and the boroughs of Beverley, Hedon, Malton, Pickering, Pontefract, Ripon, Scarborough, Thirsk, Tickhill, Yarm and York each by two burgesses. Northallerton acquired representation in 1529, Boroughbridge in 1530, Kingston-on-Hull and Ravenshaw in 1534. In most of the boroughs of Yorkshire the representation was lost by the lapse of their respective charters from 1328 until 1547 only York, Scarborough and Kingston-on-Hull retained members. Hedon, Thirsk, Ripon and Beverley regained the representation for the county on the re-establishment of the boroughs in 1540. Northallerton, Aldborough and Richmond also returned members. Pontefract was represented in 1623, New Malton and Northallerton in 1640. In 1826 two additional knights were returned for the shire of York, and 14 boroughs were represented. Under the Reform Act of 1852 the county returned 6 members in 3 divisions; Dewsbury and Middleborough were disfranchised; Northallerton and Thirsk lost 1 member each; Bradford, Halifax, Leeds and Sheffield acquired representation by 2 members each, and Wakefield and Whitby by 1 member each. Under the act of 1885 the representation of the West Riding division was increased to 6 members in 3 divisions; Dewsbury and Middleborough were disfranchised, returning 1 member each; Leeds now returned 3 members; Knaresborough, Malton, Richmond and Ripon lost 1 member each. Beverley was disfranchised in 1870. (For arrangements under the act of 1886 see § Administration.)

Antiquities.—Of ancient castles Yorkshire retains many interesting examples. The fine ruins at Knaresborough, Pickering, Pontefract, Richmond, Scarborough and Hessle are described under their respective headings. Barden Tower, situated near Ribblehead, and the upper Wharfedale, was built by Henry de Clifford (d. 1253), called "the shepherd lord" from the story that he was brought up as a shepherd on the Yorkshire moors. A strong tower, not far from Knaresborough, which rises majestically above Wensleydale, was pronounced by Leland "the fairest in Richmondshire." It is a square building with towers at the corners, erected in the reign of Richard II, by Richard de Mortimer, and given by him to Edward II. It was probably a residence of Mary while under the charge of Lord Scrope, was besieged during the civil wars, and rendered untenable in 1647. Of Bowes Castle, in the parish of Barningham, on the Tees, is a circular square keep, supposed to have been built by Alan Nige, 1st earl of Richmond, in the 12th century, but the site was occupied by the Romans. Cawood Castle, on the Ouse near Selby, retains its gate-way tower erected in the reign of Henry VI. The castle, said to have been founded by Æthelstan in 620, was the palace of the archbishops of York, and the castle is said to have been the residence of the last Earl of York. Seat of the Castles stands by the Don between Rotherham and Doncaster. Its origin is uncertain, but dates probably from Saxons times. The keep of Helmsley Castle was built late in the 12th century by Robert de Ros, confraternity Fursan; the earthworks are apparently of much greater age. The keep of Helmsley Castle, but contains no portions earlier than the reign of Edward III. The keep of the Norman Castle was built late in the 12th century by Robert de Ros, confraternity Fursan, afterwards possessed by Roger de Rippon, and was burnt by Henry Percy in 1457. Malvern Castle, near the modern residence of the same name in the Whitby district, is said to have been founded two centuries before the Conquest by a Saxon giant named Wadr. Parts are clearly Norman, but some of the masonry suggests an earlier date. The castle was dismantled after the civil wars. There are slight remain, of the 15th century, of the ruins of a several fortress. Wressle, E. of Selby, built by Thomas Percy, earl of Worcester, in the reign of Edward II. Some of the mansions in the county incorporate remains of ancient strongholds, such as those at Gilling, under the Hambleton Hills in the North Riding, Malton, and Otley. Scarborough was one of the earliest seats of the Whitby Abbey. The ruins of the monasteries are numerous, a noteworthy example being the Elizabeathan hall of Burton Agnes, in the N. of Holderness.

In ecclesiastical architecture Yorkshire is extraordinarily rich. At York there are traces of 4th century work at the Roman Theatre, 23 nunneries, 30 friaries, 13 cells, 4 commanders of Knights Hospitaller and 4 preceptories of Knights Templars. The principal monastic ruins are described under separate headings and elsewhere. There are Bolton Abbey (properly Priory), a foundation of Augustinian canons; Fountains Abbey, a Cistercian foundation, the finest and most complete of the ruined abbeys in England; the Cistercian abbey of Kirkstall near Leeds (q.v.); the Cistercian abbey of Rievaulx, and the Benedictine abbey of St. Mary, at York. For the plans and buildings of Fountains, Kirkstall and St. Mary's, see Abbey. Separate reference is also made to the ruins of St. Mary's at York, and the abbey of Malton, near New Malton; the abbey of Wensleydale, and to the remains at Bridlington, Guisborough, Malton, Whitby, Easby near Richmond, Kirkham near Malton, Metheringham and New Malton, and Mount Grace near Northallerton. There are fine though somewhat neglected remains of Whitby Abbey, the English date, through Thirsk and Malton; the abbey was founded for Cistercian monks in the 12th century, and was previously established at Old Byland near Rievaulx. There was a house of Premonstratensians at Eggleston above the Tres near Barnard Castle. Other ruins are the Cistercian foundations of the 12th century at Meaux in Holderness, Roche, E. of Rotherham, and Sawley in Ribblesdale; the Benedictine nunneries of Marrick in upper Swaledale, and Rosedale under the high moors of the N.E.; and the Gilbertine house of Watton in Holderness, of the 12th century, converted into a dwelling.

Descriptions are given in the articles on the respective cities and towns of the cathedral or minister at York, and of the numerous churches in that city; of the cathedral churches at Ripon and Wakefield; of the main Baltic ports of Hull, Beverley, and the fine late Norman building at Kirkburn. A very perfect though small example of a Norman church is seen at Birkin on the Aire below King’s Pontefract. It is a beautiful Early English church, formerly belonging to a Benedictine nunneries. Goodmanham in the S. Wolds is the scene, in all probability, of the conversion by Paulinus of Edwin of Northumbria in 625, who lived at St. Chad’s, Whitchurch, for the E. Wolds Mission, and whose name is perpetuated in the name Moorside in the N. Riding is a singular example of an inscribed sundial of pre-Conquest date. At Lastingham in the same district is a very fine and early Norman crypt.

See Victoria County History: T. Allen, History of the County of York (3 vols., London, 1828–31); T. Barnes, Yorkshire Past and Present, including an account of the woollen trade

YORKTOWN, a county and the town-seat of York county, Virginia, U.S.A., on the York river 10 m. from its mouth, and about 60 m. E.S.E. of Richmond. Pop. (1910) 135. It is served by the Baltimore & Chesapeake & Richmond steamship line, and about 6½ m. distant is Lee Hall, a station on the Chesapeake & Ohio railway. Large deposits of marl near the town are used for the manufacture of cream of tartar. In the county is the city of York and a number of manufacturing establishments. The county is the home of Thomas Nelson (1738-1780), a signer of the Declaration of Independence. In commemoration of the surrender of Lord Cornwallis in October 1781, there is a monument of Maine granite (100 ft. 6 in. high) designed by R. M. Hunt and J. Q. A. Ward; its corner-stone was laid in 1881 during the centennial celebration of the surrender, and it was completed in 1883. Yorktown was founded in 1691, as a port of entry for York county. It became the county-seat in 1696, and although it never had more than about 200 houses its trade was considerable until it was ruined by the War of Independence. It was in this town that the victorious Americans and their French allies took place to Yorktown.

Baffled by General Nathanael Greene in his campaign in the Carolinas, his diminished force (fewer than 1400) sadly in need of reinforcement, and persuaded that the more southern colonies could not be held until Virginia had been reduced, Lord Cornwallis marched out of Wilmington, N. Carolina, April 25th, 1781, arrived at Petersburg, Virginia, on May 20th, and there with the troops which had been under William Phillips and Benedict Arnold, and with further detachments from New York, marched against Yorktown, which had never approved Cornwallis's plan against Virginia, at first ordered him to send a portion of his troops to aid in the defence of New York; but as other reinforcement came to New York and as the home government approved Cornwallis's plan, Clinton resolved to establish a permanent base in the Chesapeake and directed Cornwallis to fortify a post for the protection of the British navy. Cornwallis seized Yorktown and Gloucester early in August and immediately began fortifying them. While Cornwallis was marching from N. Carolina to Virginia, Washington learned that a large French fleet under Count de Grasse was to come up from the West Indies to aid in the capture of Cornwallis, and on the 14th of August he should sail for the Chesapeake for united action against Cornwallis. About the same time Washington learned from Lafayette that Cornwallis had marched from Yorktown. Sir Samuel Hood, with his 14th-of-the-line arrived at the Chesapeake from the West Indies three days ahead of De Grasse, and proceeding to New York warned Admiral Thomas Graves of the danger. Graves agreed to the plan but was unable to send out any force and on the 31st of August sailed for the Chesapeake in the hope of preventing the union of the French fleet from Newport, under Count de Barras, with that under De Grasse. He arrived at the Chesapeake about the 2nd of September, but after an encounter with De Grasse alone (September 5th), who had 24 ships-of-the-line, he was obliged to retreat to the Delaware, and the French were left in control of the coast. Leaving only about 4000 men to guard the forts on the Hudson, Washington set out for Yorktown with the remainder of his army immediately after learning of De Grasse's plan, and the French land forces followed. The French fleet transported the allied army from the head of the Chesapeake to the vicinity of Williamsburg, and on the 28th of September it marched to Yorktown. Receiving, on the same day, a despatch from the French commander-in-chief, D'Estaing, informing him of the plan, Cornwallis abandoned his outposts during the following night and withdrew to his inner defenses, consisting of seven redoubts and six batteries connected by intrenchments, besides seven forts along the river bank. The redoubts, 16,000 strong, took possession of the abandoned posts and closed in on the town in a semicircle extending from Wombley Creek below it to about a mile east of the town. On the evening of September 28th the French, in a volley from the marines, began the attack on the left. On the night of October 5th-6th the allies opened the first parallel about 600 yds. of the British lines, and it was practically completed on the night of the 14th and 15th, when two British redoubts were carried by assault, one by the Americans led by Alexander Hamilton and one by the French led by Lieut.-Colonel G. de Deux-Ponts. In the morning of the 16th Cornwallis ordered Lieutenant-Colonel Abercrombie to make a assault on two French batteries held by poor care and surtout. He then raised a large force and the whole thing was ready for service again two hours later. On the night of the 16th and 17th Cornwallis attempted to escape with his army to Gloucester on the opposite side of the river, but the storm tormented the sea and prevented this venture. In grave danger of an assault from the allies, Cornwallis offered to surrender on the 17th; two days later his whole army, consisting of 7073 officers and men, was taken and American Independence was assured. The British loss during the siege was about 156 killed and 326 wounded; the American and French losses were 85 killed and 199 wounded.

In 1862 the Confederate defences about Yorktown were besieged for a month (April 4-May 3) by the Army of the Potomac under General McClellan. There was no intention on the part of the Confederates to hold Yorktown, but that which was considered an urban and agricultural people. Pottery, weaving, tanning, dyeing, and forging are among their industries. The houses of chiefs, often containing fifty rooms, are well built, and decorated with carvings representing symbolic devices, fabulous animals and scenes of war or the chase.

The Yoruba have considerable administrative ability. Their system of government places the power in a council of elders presided over by a chief who owes his position to a combination of hereditary descent and personal merit. The ruling line of the Yoruba is divided into four great chief who respectively represent the phases of family life, namely, (1) the deified head of the family, called Orisha; (2) the Yorubas; Yorubaland. The Yoruba, a group of Negro tribes, have given their name to an extensive area in West Africa, in the hinterland of Lagos. The Yoruba are of true Negro stock, in many respects typical of the race, but among them are found persons with lighter skins and features resembling the Hamitic or Semitic peoples. This arises, in all probability, from an infiltration of Berber and Arab blood through the Fula (q.v.). The Yoruba themselves have traditions of an Oriental origin. They are divided into many tribes, among the best known being the Oyo=Yoruba proper, the Egba, Jebu, Ife and Ibadan. They are sometimes called by the French Nago, and are known to the Sierra Leone, many of whom are of Yoruba descent, as Aku. A considerable proportion of the Negro peoples in these river full of water and blood, and the Yoruba (q.v.) are regarded as the children of the gods.
always be taken from the members of one of two families, the succession in many cases passing from one to the other family alternately. Primogeniture is not necessarily considered.

Before the introduction of letters the Yoruba are said to have enjoyed an extensive oral literature. Their language, which has been reduced to writing and carefully studied, has penetrated as far E. as Kano in the Hausa country. The best known dialectic varieties are those of Egba, Jebu, Ido, Ife, Ilu, Yoro (Yoruba proper, called also Nago); but the discrepancies are slight. The most marked feature, a strong tendency towards monosyllabism—produced by phonetic decay—has given rise to the principle of intonation, required to distinguish words of a different but related root. A sound worn away by corroboration to the condition of homophones. The lowering tones, of which there are three—high, low and middle,—Yoruba has also developed a degree of vocalic harmony, in which the vowels of the affixes are assimilated to that of the root. In Bantu, as in Bantu, is effected chiefly by prefixes; and there is a remarkable power of word-formation by the fusion of several relational elements in a single compound term. The Bibile and several other books have been translated into Yoruba, which as a medium of general intercourse in West Africa ranks in importance next to Hausa and Mandingan. The Yoruba religion is that usually known as fetishism.

The Yoruba country extends from Benin on the E. to Dahomey on the W. (where it somewhat overlaps the French frontier), being bounded N. by Borgu and Yoruba, E. by Dahomey, S. by Ijebu and Ekiti, and W. by Abeokuta. Most of it is included in the British protectorate of Southern Nigeria. The land is moderately elevated and a large part of it is densely forested. It is well watered; the rivers belong mainly to the coast systems, though some drain to the Niger. The history of Yorubaland, as known to Europeans, does not go back beyond the close of the 17th century. At that time it was a powerful empire, and had indirectly come—through its connexion with Benin and Dahomey—(to some extent under European influence. There was also a much smaller Moslem influence. One tradition brought the founder of the nation from Bornu. The Yorubas at this time inhabited their present country at least as early as A.D. 1000. In the 16th century the Yoruba were constantly engaged in warfare with their Dahomeyan neighbours, and in 1738 they captured Kaaa, the sacred city of the kings of Dahomey. From 1747 to the time of King Gezo (1818) the Dahomeyans paid tribute to Yoruba. It was not until the early years of the 19th century that the Yoruba came as far S. as the sea, when they founded a colony at Lagos. About 1825 the province of Ilorin, already permeated by Moslem influences from the north, declared itself independent of the Yoruba, and shortly after this date the former trading town of Abeokuta was sold to Fulan invaders. From this time (1830-35) the Yoruba empire—there had been six confederate kingdoms—was broken up into a number of comparatively weak states, who warred with one another, with the Dahomeyans and with their Moslem neighbours. The advent of the British at first led to further complications and fighting, but gradually the various tribes gained confidence in the colonial government and sought its services as peacemaker. A treaty placing their country under British protection was signed by the Egba in January 1853, and the subsequent extension of British control over the other portions of Yorubaland met with no opposition.

Though divided into semi-independent states, the Yoruba retain a feeble sense of common nationality. The direct representative of the old Yoruba power is the alafin or king of Oyo occupying the N. and central parts of the whole region. Round this central state, which has lost much of its importance, are grouped the kingdoms of Ilorin, Ijesa, Ife and Ondo in the E., Ibadan, Ijebu and a. E. in the S., and A. E. and Egba in the W. The ruler of each of these states has a title characteristic of his office. Thus the chief of Ije bears the title of oni (a term indicating spiritual supremecy). To the chief of Ilu, the alafin of Oyo all the other great chiefs pay to from time to time the alafin of Oyo all the other great chiefs pay to from time to time the alafin of Oyo, take the title of Onas. The chief of Ile-Ife is the Ogun, the ruler of the ancient capital. He is the only chief who is not named after a town.

The first British resident in Yorubaland was William MacGregor. The Yoruba chief who received him is known as a chief of the Yoruba fatherhood; (4) motherhood; (4) sonship. The chief representing motherhood is brother to the mother, and in the developed state has become the Balogun or war lord.
The valley was discovered in 1851 by a military company in pursuit of marauding Indians; regular tourist travel began in 1856. The first permanent settler in the valley was Mr. J. C. Lamon, who built a cabin in the upper end of it in 1860 and planted gardens and orchards. In 1864 the valley was granted to the state of California by act of Congress on condition that it should be held as a place of public use, resort and recreation inalienable for all time, was re-ceded to the United States and included in the Yosemite Reservation on March 19th, 1866, and is now included in the Yosemite National Park.

In the number and height of its vertical falls and in the massive grandeur of El Capitan and Half Dome rocks Yosemite is unsurpassed. But there are many other valleys of the same kind. The most noted of them are: Yosemite itself visited every summer by tourists hunting for mountaineers, are the Hetch Hetchy Valley, a wonderful counterpart of Yosemite in the Tuolumne Canyon; Tehapipe Valley, in the Middle Fork canyon of King’s river; and the King’s river Yosemite in the South Fork canyon, the latter being larger and deeper than the Merced Yosemite. All are similar in their trends, forms, sculpture and vegetation, and are plainly and harmoniously related to the ancient glaciers. The Romsdal and Naeridal of Norway and Lauterbrunnen of the Alps are well characterized glacial valleys of the Yosemite type, and in S.E. Alaska many may be observed in process of formation.

S. Creasy, Esq., (Washington, 1891 sqq.) of the Superintendant of the Park; the Guide to the Yosemite published by the California Geological Survey; John Muir, Our National Parks (Boston, 1901); and Bunnell’s Discovery of the Yosemite (New York, 1893).

Youghal—Young, A.

Youghal (pronounced Yearh), a seaport market town, and watering-place of county Cork, Ireland, is, the W, edge of the Blarney district, the water on the Corr & Youghal branch of the Great Southern & Western railway, 263 m. E. of Cork. Pop. (1901) 5393. The collegiate church of St Mary, in the later Decorated style, was erected in the 13th century, but rebuilt in the 15th, and since that time frequently restored. It contains a beautiful monument to the 1st earl of Cork. The college was founded by an earl of Desmond in 1464. There are still a few fragments of the Dominican friary founded in 1269. The Clock Gate (1771) is noticeable, and portions of the old walls are to be seen. Myrtle Grove was formerly the residence of Sir Walter Raleigh. He was mayor of Youghal in 1588-89, and is said to have first cultivated the potato here. The harbour is safe and commodious, but has a bar at the mouth. At the N. extremity of the harbour the river is crossed by a bridge on wooden piles. The principal exports are corn and other agricultural produce; the imports are coal, culm, timber and slate. Coarse earthenware and bricks are manufactured. Fine point-lace commanding high prices is made by the Presentation Sisters. The Blackwater is famous for salmon, and sea-fishing is important. The Strand, the modern portion of the town, has all the attributes of a sea-town.

Youghal (Eskehill, “the Yew wood”) was made a settlement of the Normans in the 1st century, and was incorporated by King John in 1209. The Franciscan monastery, founded at Youghal by FitzGerald in 1224, was the earliest house of that order in Ireland. Sir Roger Mortimer landed at Youghal in 1317. The town was plundered by the earl of Desmond in 1579. In 1641 it was garrisoned and defended by the earl of Cork. In 1649 it declared for the parliament, and was occupied as his headquarters by Cromwell. It sent two members to parliament from 1574 till the Union, after that only one down to 1884.

Young, Arthur (1741-1820), English writer on agriculture and social economy, second son of the Rev. Arthur Young, rector of Bradfield, in Suffolk, chaplain to Speaker Onslow, was born on the 11th of September 1741. After being at a school at Lavenham, he was in 1758 placed in a mercantile house at Lynn, but showed no taste for commercial pursuits. He published, when only seventeen, a pamphlet On the War in North America, and in 1761 went to London and started a periodical work, entitled 2nd Society for the Encouragement of Agriculture, which was dropped by the advice of Samuel Johnson. He also wrote four novels, and Reflections on the Present State of Affairs at Home and Abroad in 1759. After his father’s death in 1759, his mother had given him the direction of the family estate at Bradfield Hall; but the property was small and encumbered with debt. From 1765 to 1776 he devoted himself to farming on his mother’s property. In 1765 he married a Miss Allen; but the union is said not to have been happy, though he was of domestic habits and an affectionate father. In 1767 he undertook on his own account the management of a farm in Essex. He engaged in various experiments on the height and fertility of crops, and published them in A Course of Experimental Agriculture (1770). Though Young’s experiments were, in general, unsuccessful, he thus acquired a solid knowledge of agriculture. He had already begun a series of journeys through England and Wales, and gave an account of his observations in books which appeared from 1768 to 1770—A Six Weeks’ Tour through the Southern Counties of England and Wales, A Six Months’ Tour through the North of England and the Farmer’s Tour through the East of England. He says that these books contained the only extant information relative to the rental, produce and stock of England that was published on actual examination. They were very favourably received, being translated into most European languages by 1792.

In 1768 he published the Farmer’s Letters to the People of England, in 1771 the Farmer’s Calendar, which went through a great number of editions, and in 1774 his Political Arithmetic, which was widely translated. About this time Young acted as parliamentary reporter for the Morning Post. He made a tour in Ireland in 1776, publishing his Tour in Ireland in 1780. In 1784 he began the publication of the Annals of Agriculture, which the subsequent volumes continued. The book was well received by the subscribers, among whom was George III., writing under the nom de plume of “Ralph Robinson.” Young’s first visit to France was made in 1787. Travelling that country in every direction just before and during the first movements of the Revolution, he has given valuable notices of the condition of the people and the conduct of public affairs at that critical juncture. The Travels in France appeared in 2 vols. in 1792. On his return home he was appointed secretary of the Board of Agriculture, then (1793) just formed under the presidency of Sir John Sinclair. In this capacity he gave most valuable assistance in the collection and preparation of agricultural surveys of the English counties. His sight, however, failed, and in 1811 he had an operation for cataract, which proved unsuccessful. He suffered also in his last years from stone. He died on the 20th of April 1820. He left an autobiography in MS., which was edited (1868) by Miss M. Betham-Edwards, and is the main authority for his life; and also the materials for a great work on the “Elements and practice of agriculture.”

Arthur Young was the greatest of all English writers on agriculture; but it is as a social and political observer that he is best known, and his Tour in Ireland and Travels in France are still full of interest and instruction. He saw clearly and exposed un sparingly the causes which retarded the progress of Ireland. He strongly urged the repeal of the penal laws which pressed upon the Catholics; he condemned the restrictions imposed by Great Britain on the commerce of Ireland, and also the perpetual interference of the Irish parliament with industry by prohibitions and bounties. He favored a legislative union of Ireland with Great Britain, though he did not regard such a measure as absolutely necessary, many of its advantages being otherwise attainable.

The soil of France he found in general superior to that of England, and its produce less. Agriculture was neither as well understood nor as much esteemed as in England. He severely censured the higher classes for their neglect of it. “Banishment (from court) alone will force the French nobility to execute what the English do for them by a system of laws.” He deplored the want of a good administration; and of the smallness of the income of the clergy. He wrote his book in 1793 of a tract entitled The Example of France a Warning to England. Of the profound significance of the French outbreak he seems to have had little idea, and thought the crisis would be met by a constitutional adjustment in accordance with the English type. He strongly condemned the mitre system, then widely prevalent in France, as “perpetuating poverty and excluding instruction”—as, in fact, the ruin of the country. Some of his phrases have been often quoted by the advocates of peasant
Young, who was nearly fifty when he decided to take holy orders. It was reported that the author of Night Thoughts was not, in his earlier days, "the ornament to religion and morality which he afterwards became," and his intimacy with the duke of Wharton and with Lord Melcombe did not improve his reputation. A statement attributed to Pope probably gives the correct view: "He had much of a sublime genius, though without common sense; so that his genius, having no guide, was perpetually liable to degenerate into bombast. This made him pass a foolish youth, the sport of peers and poets; but his having a very good heart enabled him to support the clerical character when he assumed it, first with decency and afterwards with honour." (R. Rufhead, Life of A. Pope, p. 291). In 1728 he was made one of the royal chaplains, and in 1730 was presented to the college living of Welwyn, Hertfordshire. He married in 1731 Lady Elizabeth Lee, daughter of the 1st earl of Lichfield. Her daughter, by a former marriage with her cousin Francis Lee, married Henry Temple, son of the 1st viscount Palmerston. Mrs Temple died at Lyons in 1736 on her way to Nice. Her husband and Lady Elizabeth Young died in 1740. These successive deaths are supposed to be the events referred to in the Night Thoughts as taking place "ere thrice youm monon had filled her horn" (Night I.). In the preface to the poem Young states that he composed it at the instigation of the rector of Wharton and Narcissa have been rather rashly identified with Mrs. and Mrs Temple. M. Thomas suggests that Philander represents Thomas Tickell, who was an old friend of Young's, and died three months after Lady Elizabeth Young. It was further supposed that the infidel Lorenzo was a sketch of Young's own son, a statement disproved by the fact that he was a child of eight years old at the time of publication. The Complaint, or Night Thoughts on Life, Death and Immortality, was published in 1742, and was followed by other "Nights," the eighth and ninth appearing in 1745. In 1753 his tragedy of The Brothers, written many years before the manuscript was discovered, was performed. It was produced at Drury Lane. Night Thoughts had made him famous, but he lived in almost uninterrupted retirement, although he continued vainly to solicit preferment. He was, however, made clerk of the closet to the princess dowager in 1761. He was never cheerful, it was said, after his wife's death. He disagreed with his son, who had remonstrated, apparently, on the excessive influence exerted by his housekeeper Miss (known as Mrs) Hallows. The old man refused to see his son before he died, but is said to have forgiven him, and left him his money. A description of him is to be found in the letters of his curate, John Jones, to Dr. Samuel Birch. He died at Welwyn on the 5th of April 1765.

Young is said to have been a brilliant talker. He had an extraordinary knack of epigram, and though the Night Thoughts is long and disconnected it abounds in brilliant isolated passages. Its success was enormous. It was translated into French, German, Italian, Spanish, Portuguese, Swedish and Magyar.

In France it became one of the classics of the romantic school. The suspicion of insincerity that damped the enthusiasm of English readers acquainted with the facts of his career did not exist for French readers. If he did not invent "melancholy and moonlight." In literature, he did much to spread the fashionable taste for them. Madame Klopstock thought the king ought to make him archbishop of Canterbury, and some German critics preferred him to Milton. Young wrote good blank verse, and Samuel Johnson pronounced Night Thoughts to be one of "the few poems" in which blank verse could not be changed for rhymed but with disadvantage.

Other works by Young are: The Instalment (to Sir R. Walpole, 1728) Two Essays in Moral Philosophy (1730); An Ode (1730); An Essay on the Civil and Moral Virtues (1730); A Poem on the Name of Love; An Apology for Punch (1729); a sermon; An Apology; A Letter to the French King (1729), a sermon; Imperium Poloni, a Naval Lyric ... (1730); Two Epistles to Mr Pope concerning the Authors of the Age (1730); A Sea-Piece ... (1733); The Foreign Address, or The Best Argument for Peace (1734); The Centaur Not Fabulous; in Five Letters to a Friend (1755); An Argument ... for the Truth of His [Christ's] Religion (1758), a sermon preached before the king; Conjectures on Original Composition ... (1759), addressed to Samuel Richardson; and Resignation ... (1762), a poem.
Night Thoughts was illustrated by William Blake in 1797, and by Thomas Stothard in 1799. The Poetical Works of the Rev. Edward Young (in three volumes) were issued in 1801. His Political Works are included in the Aldine Edition of the British Poets, with a life by J. Mitford (1830-1836, 1857 and 1866). Sir Herbert Croft wrote the life included in Johnson's Lives of the Poets, but the critical remarks are by Johnson. For Young's influence on foreign literature see Joseph Tainton, Jean Jacques Rousseau, A Study of the Literary Relations between France and England during the Eighteenth Century (Eng. trans., 1886), pp. 304-14; and J. Barnstooff, Young's Nachgelassenen und ihr Einfluss auf die moderne Literatur (Berlin, W. de Gruyter & W. Guttlfenn, 1890). See also W. Thomas, Le Poilé Edward Young (Paris, 1901), who gives an exhaustive study of Young's life and work.

YOUNG, JAMES (1811-1883), Scottish industrial chemist, was born in Glasgow on the 13th of July 1811. During his apprenticeship to his father, a carpenter, he attended evening classes at Anderson's College, where he had Lyon Playfair and David Livingstone for fellow-pupils; and the ability he showed was such that Thomas Graham, the chemist, chose him as lecture assistant in 1832. About 1839, on the recommendation of Graham, whom in 1837 he had accompanied to University College, London, he was appointed chemist to James Muspratt's alkali works in Lanarkshire; in connexion with alkali he showed that cast-iron vessels could be satisfactorily substituted for silver in the manufacture of caustic soda, and worked out improvements in the production of chlorate of potash. But his name is best known in connexion with the establishment of the Scottish mineral-oil industry. In 1854 he took over the management of one of the largest Scottish oil-works, which he had made appear in its final condition in his days as assistant to Ridding's College at Alfreton in Derbyshire, and in the following year he began to utilize it for making both burning and lubricating oils. This spring was practically exhausted by 1851. It had served to draw Young's attention to the question of oil-production, and in 1850 he took out his fundamental patent for the distillation of bituminous substances. This was soon put into operation in Scotland, first with the Boghead coal or Torbanehill mineral, and later with bituminous shales, and though he had to face much litigation Young successfully employed it. In 1854 he obtained a patent of a spring of petroleum which had made its appearance at Ridding's College at Milverton, in 1855, and subsequently of illuminating oils and paraffin wax, until in 1866, after the patent had expired, he transferred his works to a limited company. In 1872 he suggested the use of caustic lime to prevent the corrosion of iron ships by the bilge water, which he noticed was acid, and in 1878 he began a determination of the velocity of white and coloured light by a modification of H. L. Fizeau's method, in collaboration with Professor George Forbes (b. 1839), at Pitlochry. The final results were obtained in 1880-81 across the Firth of Clyde from Kelly, his house at Wemyss Bay, and a hill above Inellan, and gave values rather higher than those obtained by M. A. Cornu and A. A. Michelson. Young was a liberal supporter of David Livingstone, and also gave £10,000 to endow a chair of technical chemistry at Anderson's College. He died at Wemyss Bay on the 14th of May 1883.

YOUNG, THOMAS (1773-1829), English man of science, belonged to a Quaker family of Milverton, Somerset, where he was born on the 13th of June 1773, the youngest of ten children. At the age of fourteen he was acquainted with Latin, Greek, French, Italian, Hebrew, Persian and Arabic. Begging to study medicine in London in 1792, he removed to Edinburgh in 1794, and a year later went to Göttingen, where he obtained the degree of doctor of physic in 1796. In 1797 the death of his grand-uncle, Richard Brocklesby, made him financially independent, and in 1799 he established himself as a physician in Welbeck Street, London. Appointed in 1801 professor of physics at the Royal Institution, in two years he delivered ninety-one lectures. These lectures, printed in 1807 (Course of Lectures on Natural Philosophy), contain a remarkable number of anticipations of later theories. He resigned his professorship in 1809, fearing that its duties would interfere with his medical practice. In the previous year he was appointed foreign secretary of the Royal Society, of which he had been elected a fellow in 1794. In 1811 he became physician to St George's Hospital, and in 1814 he served on a committee appointed to consider the dangers involved by the general introduction of gas into London. In 1816 he was secretary of a commission charged with ascertaining the length of the seconds pendulum, and in 1818 he became secretary to the Board of Longitude and superintendent of the Nautical Almanac. A few years before his death he became interested in life assurance, and in 1827 he was chosen one of the eight foreign associates of the French Academy of Sciences. He died in London on the 10th of May 1829.

Young is perhaps best known for his work in physical optics, as the author of a remarkable series of researches which did much to establish the undulatory theory of light, and as the discoverer of the interference of light (see INTERFERENCE). He has also been called the founder of physiological optics. In 1793 he explained the mode in which the eye accommodates itself to vision at different distances as depending on change of the curvature of the crystalline lens; in 1801 he described the defect known as astigmatism; and in his Lectures he put forward the hypothesis, afterwards developed by H. von Helmholtz, that colour perception depends on the presence in the retina of three kinds of nerve fibres which respond respectively to red, green and violet light. In physiology he made an important contribution to haemodynamics in the publication of the "Explanations of the Passages of the Heart and Arteries," and his medical writings included An Introduction to Medical Literature, including a System of Practical Nostology (1813) and A Practical and Historical Treatise on Consumptive Diseases (1815).

In another field of research, he was one of the first successful workers at the decipherment of Egyptian hieroglyphic inscriptions; by 1814 he had completely translated the enochial (demonic) text of the Rosetta stone, and a few years later had made considerable progress towards an understanding of the hieroglyphic alphabet (see EGYPT, § Language and Writing). He has published an Account of the Recent Discoveries in Hieroglyphic Literature and Egyptian Antiquities. Some of his conclusions appeared in the famous article of Egypt which in 1818 he wrote for the Encyclopedia Britannica.

His works were collected, with a Life by G. Peacock, in 1858.

YOUNG MEN'S CHRISTIAN ASSOCIATION, an organization for social and religious work among young men, founded in England by Sir George Williams (1821-1905), a merchant of London. Williams's organization grew out of meetings he held for prayer and Bible-reading among his fellow-workers in a dry goods business in the city of London, and was founded in 1824; on the occasion of its jubilee its originator was knighted. Similar associations, indeed, had been in existence in Scotland at a much earlier date. In 1824 David Naismith, who also founded city missions in London and Glasgow, started the Glasgow Young Men's Society for Religious Improvement, a movement which spread to various parts of the United Kingdom, France and America: later the name was changed to the Glasgow Young Men's Christian Association. The object of such associations is to provide in large towns a rendezvous for young men who are compelled to live in lodgings or in the apartments provided by the great business houses. An associate of the Y.M.C.A. must not only be of good moral character, but must also express his adherence to the objects and principles of the association. To be a member means a definite acceptance of the doctrines of the Evangelical Christian faith. In 1910 there were about 400 associations in England, Ireland and Wales, and 250 in Scotland—besides various soldiers' and other auxiliaries. The total membership was about 145,000. Some of the buildings, notably in the Midlands and the north of England, are very fine. The London Association, which from 1880 until shortly before its demolition in 1906 used Exeter Hall, Strand, has erected a

1 Commonly abbreviated Y.M.C.A.
handsome block of buildings in Tottenham Court Road, designed to provide, in addition to the usual features, bedrooms at a reasonable rent.

The Young Men's Christian Association is seen at its best in the United States. It is true that Germany has more associations than any other country, but of its 2120 branches only 142 have their own buildings, and the total membership is 187,500. In America, however, the associations have been built on a broad basis and worked with enterprise and business skill. Thus they have been able to secure the generous support of many of the leaders of commerce. America has over 1900 associations, and the total membership is 4,560,000.

In Greater Britain the associations are numerous and flourishing, and Canada has 35,000 members. There are many active associations in Switzerland, Norway, Denmark and the Netherlands, and indeed the Y.M.C.A. is now well known all over the world. Even in Japan, China and Korea there are 150 branches with a membership of nearly 12,000. The value of the association buildings all over the world is £1,040,000 (America, £8,000,000; Greater Britain, £1,012,000; United Kingdom, £1,128,000).

The Young Women's Christian Association was founded in 1855, by two ladies simultaneously. In the south of England Miss Roberts started a Prayer Union with a purely spiritual aim; in London Lady Kinnauld commenced the practical work of opening homes for young women interested in business. In 1877 the two branches united in the Young Women's Christian Association, which seeks to promote the all-round welfare of young women by means of residential and holiday homes, club rooms, restaurants, noon rest rooms, classes and lectures, and other useful departments. The Young Women's Christian Association has spread all over the world, and the total membership is about half a million.

YOUNGSTOWN, a city and the county-seat of Mahoning county, Ohio, U.S.A., on the Mahoning river, about 60 m. S.E. of Cleveland. Pop. (1900) 44,885 (12,027 being foreign-born especially English, Irish and German); (1910 census) 79,066. It is served by the Baltimore & Ohio, the Erie, the Lake Shore & Michigan Southern, the Pennsylvania, and the Pittsburg & Lake Erie railways, and by interurban electric lines. The Rayen High School (incorporated 1856) was endowed under the will of Judge William Rayen (1776-1854). The Reuben McMillan Public Library (about 25,000 volumes in 1910) is housed in a building finished in 1910 and is named in honour of Reuben McMillan (1820-1868), formerly superintendent of schools. Among other public buildings are the post office and Federal court house, the county court house, the city and the Mahoning Valley hospitals, and the Y.M.C.A. building. The business district lies in the valley on the N. of the river; the residential districts are chiefly on the neighbouring hills. Youngstown's iron industry was founded by John Wick (1771-1845) and Wick (48 acres), presented to the city by the Wick family, descendants of the merchant Henry Wick (1771-1845). The value of its factory products increased from $33,908,459 in 1900 to $48,126,885 in 1905. The most important establishments are blast-furnaces, iron and steel works (of the U.S. Steel Corporation) and rolling mills.

Youngstown was named in honour of John Young (1763-1829), a native of Petersborough, New Hampshire, who in 1796 bought from the Connecticut Land Company a tract of land upon which the city now stands, and lived there from 1799 until 1803. The first permanent settlement was made probably in 1796 by William Hillman. The tract was set off as a township in 1800, and the first township government was organized in 1802; the town was incorporated in 1848, and was chartered as a city of the second class in 1867. The county-seat of Mahoning county was removed from Canfield to Youngstown in 1876, and after much litigation the legality of this removal was confirmed by the United States Supreme Court in 1879. The first iron-mining in the region was done in 1803 by Daniel Eaton, who in 1804 built the first blast-furnace W. of Pennsylvania and N. of the Ohio river. Eaton also built in 1826 the first blast-furnace within the present limits of Youngstown.

YPRES, a town of Belgium, in the province of West Flanders, of which it was formerly considered the capital. Pop. (1904) 17,073. It is situated 35 m. S. of Ostend and 12 m. W. of Courtrai, on the Yperlee, a small river flowing into the Yser, both of which have been canalized. In the 11th century it ranked with Bruges and Ghent, and its population in its prime reached 100,000. It is remarkable chiefly for its fine statues and cloth market, with a façade of tented stands in length. The main building was begun in 1201 and completed in 1304. The cathedral of St Martin dates from the 13th century, with a tower of the 15th century. Jansen, bishop of Ypres and the founder of the Jansenist school, is buried in the cathedral. The Butchers' Hall is also of interest and dates from the 15th century. Although Ypres is unlikely to regain the importance it possessed when its "red-coated" contingent turned the day in the great battle of Courtrai (1302), it has an important linen and lace trade and a great butter market. The Belgian cavalry training-school is established at Ypres.

YPISILANTI, or HYPISILANTI, the name of a family of Phanariot Greeks claiming descent from the Comneni. Alexander YpsiLLANTI (1725-1805) was dragoman of the Porte, and from 1774 to 1782 hospodar of Wallachia, during which period he drew up a code for the principality. He was again appointed hospodar just before the outbreak of the war with Austria and Russia in 1790. He allowed himself to be taken prisoner by the Austrians, and was interned at Brunn till 1792. Returning to Constantinople, he fell under the suspicion of the sultan and was executed in 1795. His son Constantine (d. 1834), who had joined in a conspiracy to liberate Greece and, on its discovery, fled to Vienna, had been pardoned by the sultan and in 1799 appointed by him hospodar of Moldavia. Deposed in 1805, he escaped to St Petersburg, and in 1806, at the head of some 20,000 Russians, returned to Bucharest, where he set to work on a fresh attempt to liberate Greece. His plans were ruined by the peace of Tilsit; he retired to Russia, and died at Kiev. He left five sons, of whom two played a conspicuous part in the Greek war of independence.

Alexander YpsiLLANTI (1792-1828), eldest son of Constantine YpsiLLANTI, accompanied his father in 1805 to St Petersburg, and in 1809 received a commission in the cavalry of the Imperial Guard. He fought with distinction in 1812 and 1813, losing an arm at the battle of Dresden, and in 1814 was promoted colonel and appointed one of the emperor's adjutants. In this capacity he attended Alexander I. at the congress of Vienna, where he was a popular figure in society (see La Garde-Chambons, Soubirais). In 1817 he became major-general and commander of the brigade of hussars. In 1820, on the refusal of the imperial government to the demand of the Greek people, this demand being backed by the Greek Hellenia Philike, YpsiLLANTI was elected, and in 1821 he placed himself at the head of the insurrection against the Turks in the Danubian principalities. Accompanied by several other Greek officers in the Russian service he crossed the Pruth on the 6th of March, announcing that he had the support of a "great power." Had he advanced on Ibraila he might have prevented the Turks entering the principalities and so forced Russia to accept the fait accompli. Instead, he remained at Jassy, disgracing his cause by condoning the massacres of Turkish merchants and others. At Bucharest, whither he advanced after some weeks' delay, it became plain that he could not rely on the Vlach peasantry to rise on behalf of the Greeks; even the disconcerting expedition of his Vlach ally Theodore Vladimiriscu, who called on the peasants to present a petition to the sultan against Phanariot misrule, failed to stir the people from their apathy. Then, wholly unexpectedly, came a letter from Cape d'Istria upholding YpsiLLANTI for misusing the tsar's name, announcing that his name had been struck off the army list, and commanding him to lay down his arms. YpsiLLANTI's decision to explain away the tsar's letter and not to have been justified by the success of a plan which was now hopeless. There followed a series of humiliating defeats, culminating in that of Dragashan on the 19th of June.
Alexander, accompanied by his brother Nicholas and a remnant of his followers, retreated to Rimmik, where he spent some days in negotiating with the Austrian authorities for permission to cross the frontier. Fearing that his followers might surrender him to the Turks, he gave out that Austria had declared war on Turkey. As a village in 1820, and he suffered in the city in 1826.

His antecedents were Philemon. The name was given to a commander-in-chief, crossed the frontier. But the character of Francis I. and Metternich was no asylum for leaders of revolts in neighboring countries. Ypsilanti was kept in close confinement for seven years, and then released at the instance of the emperor Nicholas I. of Russia, retired to Vienna, where he died in extreme poverty and misery on the 31st of January 1828.

Demetrius Ypsilanti (1793–1822), second son of Prince Constantine, distinguished himself as a Russian officer in the campaign of 1814, and in the spring of 1821 went to the Morea, where the war of Greek independence had just broken out. He was one of the most conspicuous of the Phanariot leaders during the earlier stages of the revolt, though he was much hampered by the local chiefs and by the civilian element headed by Mavrocordato. In January 1822 he was elected president of the legislative assembly; but the ill-success of his campaign in central Greece, and his failure to obtain a commanding position in the national convention of Astros, led to his retirement early in 1823. In 1828 he was appointed by Capo d’Istria commander of the troops in East Hellas. He succeeded, on the 25th of September, 1830, in having the Turkish commander Aslan Bey to sign a capitulation at the Pass of Petra, which ended the active operations of the war. He died at Vienna on the 3rd of January 1832.

Gregory Ypsilanti (d. 1835), third son of Prince Constantine, founded a princely family still settled near Brunn. Nicholas Ypsilanti wrote Mémoires valuable as giving material for the antecedents of the insurrection of 1820 and the part taken in them by Alexander I. of Russia. They were published at Athens in 1831.

YSAYE, Eugène (1858–1937), Belgian violinist, was born at Liége, where he studied with his father and under R. Massart, at the Conservatoire, until he was fifteen; he had some lessons from Wieniawski, and later from Vieuxtemps. In 1879 Ysaÿe played in Germany, and next year acted as leader of Bilse’s orchestra in Berlin; he appeared in Paris in 1883, and for the first time in London at a Philharmonic concert in 1889. He was violin professor at the Brussels Conservatoire from 1886 to 1898, and instituted the celebrated orchestral concerts of which he was the first conductor. He first appeared in London as a conductor before a London audience in 1900, and in 1907 conducted Fidelio at Covent Garden. The sonata concerts in which he played with Raoul Pugno (b. 1852), the French pianist, became very popular in Paris and Brussels, and were notable features of several London concert seasons. As a violinist he ranks with the finest masters of the instrument, with extraordinary temperamental power as an interpreter. His compositions include a Programme Symphony (played in London, 1903), a Piano Concerto, and a "Suite Wallonne."

Ystad, a seaport of Sweden on the S. Baltic coast, in the district (län) of Malmöhus, 39 m. E.S.E. of Malmö by rail. Pop. (1900) 9862. Two of its churches date from the 13th century. Its artificial harbour, which admits vessels drawing 9 ft., is freer from ice in winter than any other Swedish Baltic port. Apart from a growing import trade in coal and machinery, its commerce has declined; but it is among the first twelve manufacturing places in Sweden, having large mechanical workshops.

YTTERBIUM (Neo-­Ytterbium) [symbol, Yb; atomic weight, 172.0 (O = 16)], a metallic chemical element belonging to the rare earth group. As a mineral it is discovered by Marignac in gadolinite in 1878 (see RARE EARTHS). The oxide, Yb₂O₃, is white and forms colourless salts; the crystalized chloride, YbCl₃·6H₂O, forms colourless, deliquescent crystals; the anhydrous chloride sublimes on heating (C. Maignon, Ann. chim. phys., 1906 (8), 8, p. 440). In 1907 G. Urbain separated ytterbium into two new elements, neo-­ytterbium and luteum (atomic weight, 174.0); and in 1905 C.A. von Welsbach published the same result, naming his elements aldebaranum and cassiopeium (on the question of priority see F. Wenzel, Zeit. anorg. Chem., 1905, 4, p. 303).

YTTRIUM [symbol, Y; atomic weight, 89.0 (O = 16)], a metallic chemical element. In its characteristic yttrium is closely allied to, and in nature is always associated with, cerium, lanthanum, didymium and erbium (see RARE EARTHS). For the preparation of yttrium compounds the best raw material is gadolinite, which, according to König, consists of 22-­61% of silica, 34-­64% of yttria, Y₂O₃, and 42-­75% of the oxides of erbiunm, cerium, didym, lanthanum, iron, beryllium, calcium, magnesium and sodium. The extraction (as is the case with all the rare earths) is a matter of great difficulty. Metallic yttrium is obtainable as a dark grey powder by reducing the oxide or by electrolising the double chloride of yttrium and sodium. It decomposes water slowly in the cold, and more rapidly on heating. Yttria, Y₂O₃, is a yellowish white powder, which at high temperatures radiates out a most brilliant white light. It is soluble, slowly but completely, in mineral acids. It is recognized by its very characteristic spark spectrum. Solutions of yttria salts in their behaviour to reagents are not unlike those of zirconia. The atomic weight was determined by Clev.}

The coast on the N. and W. is low, sandy and semi-barren, and is made dangerous by the Campeche banks, a northward extension of the peninsula, covered with shifting sands. The outer shore-line on the N. for nearly 200 m. consists of a narrow strip of low sand dunes, within which is a broad channel terminating to the E. in a large lagoon. There are a number of openings through the outer bank and several small towns or ports have been built upon it. The E. coast consists of bluffs, indented with bays and bordered by several islands, the larger ones being inhabited. There are large sandy beaches and not unfrequented by the swallows and martins. Campeche is a port. There is more vegetation on this coast, and the bays of Chetumal, Espíritu Santo, Ascension and San Miguel (on Cozumel Island) afford good protection for shipping. It is, however, sparsely settled and has little commerce.

The peninsula is almost wholly composed of a bed of coralline and porous limestone rocks, forming a low tableland, which rises gradually toward the S. until it is merged in the great Central American plateau. It consists of a layer of sand, lying on top of, the storms, running through the slow weathering of the coral rocks. The surface is at low level and monotonous as it appears on many maps; for although there are scarcely any running streams, it is diversified by a few lakes, of which Bacalar and Uchitélakal are the largest, as well as by low isolated hills and ridges in the W., and in the E. by the Sierra Alta, a range of moderate elevation traversing the peninsula from Catoche Point S. to the neighborhood of Lake Peten in Guatemala. The culminating points of the W. ridge do not exceed 900 ft., and some authorities estimate it at 900 ft.
The climate of Yucatan is hot and dry; the Gulf Stream, which sweeps by its N. shores, adds to its naturally high temperature, and hence the existence of high mountainous ridges to intercept the moisture-bearing clouds from the Atlantic gives it a limited rainfall. The temperature ranges from 75° to 98° F. in the shade, but the heat is modified by the good sea breezes which prevail day and night throughout the greater part of the year. The atmosphere is also purified by the fierce temporales, or "northerns," which occasionally sweep down over the Gulf and across this open region. The dry season (from October to May, the hottest months appear to be in March and April), when the heat is increased by the burning of the corn and henequen fields. The rains are quickly absorbed by the light porous soil and leave only temporary effects on the surface, where arboreal growth is stunted and grasses are commonly thin and harsh. For the most part the climate of Yucatan is healthy, though environs. There are undrained, swampy districts in Campeche, in the vicinity of the Telters Lagoon, where malaria and diseases are prevalent, and the same conditions prevail along the coast where mangrove swamps are found. Yellow fever epidemics are common on the Campeche coast, and sometimes appear at Progreso and Mérida. The sites of some of the old Maya cities are also considered dangerous at certain seasons.

All the N. districts, as well as the greater part of the Sierra Alta, are destitute of large trees; but the coast-lands on both sides towards Tabasco and British Honduras enjoy a sufficient rainfall to support forests containing the mahogany tree, several valuable cabinet woods, vanilla, logwood and other dye-woods. Logwood forests cover most of the low lands and swamps, and many of the smaller lakes which are flooded during the rainy season. The chief cultivated plants are maize, the sugar-cane, tobacco, cotton, coffee and especially henequen, the so-called "Sisal hemp," which is a strong, coarse fibre often used by the Indians for the leaf of the Agave plant. It requires very little moisture, grows luxuriantly on the thin calcareous soil of Yucatan and is cultivated almost exclusively by the large landowners. It is used chiefly in the manufacture of coarse sack-cloth and hammocks, and is exported in large quantities. The labour needed in this industry is supplied by Indian peons, who live in a state of semi-servitude and are paid barely enough to sustain life.

History and Antiquities.—The modern history of Yucatan begins with the expedition of Francisco Hernandez de Cordova, a Spanish adventurer settled in Cuba, who discovered the coast of Yucatan in February 1517. In 1519 a third expedition, under Hernando Cortés, the conqueror of Mexico, came into collision with the natives of the island of Cozumel. In 1523 the inland part of the peninsula was traversed by Cortés during an expedition to Honduras. The conquest of the peninsula was undertaken in 1527 by Francisco de Montejo, who encountered a more vigorous opposition than Cortés had on the high plateau of Anahuac. In 1549 Montejo had succeeded in establishing Spanish rule over barely one-half of the peninsula, and it was never extended further. The Spaniards found here the remains of a high aboriginal civilization which had already entered upon decline. There were deserted cities falling into ruins, and others, like Chichen-Itza, Uxmal and Tuloom, which were still inhabited by remnants of their former Maya populations. The Mayas have left no record of their institutions or of the causes of their decline, beyond what may be deduced from their ruined structures. The number and extent of these ruins—temples, palaces, ball courts, market-places, &c.—indicate large towns in the midst of thickly settled, productive districts, for there were then, so far as can be determined, no means of supporting large urban populations through commercial exchanges. The exhaustion of the soil in the vicinity of towns, or epidemics brought on by insanitary habits, might easily cause depopulation in so hot a climate. Other remains which bear witness to the civilization of the Mayas are the paved highways and the artificial reservoirs (aguadas) designed for the preservation of water for towns through the long dry season. These aguadas were huge basins, paved and cemented, with undergrown cisterns also lined with stone and cement, which may have been used for the protection of water against heat when the principal supply had become exhausted. The great problem in all the Maya settlements of Yucatan was that of securing and preserving a water supply for the dry season. Some of their towns were built near large underground reservoirs, called cenotes, that afforded a perennial supply. Since the Spanish conquest, the Mayas have clung to the semi-barren, open plains of the peninsula, and have much less than once revolted. They seceded in 1839 and maintained their independence until 1843. In 1847 another revolt followed, and the Indians were practically independent throughout the greater part of the peninsula until near the beginning of the Diaz administration. In 1910 there was another revolt with some initial successes, such as the capture of Valladolid, but then the Indians withdrew to the unknown fastnesses of Quintana Roo.

The Mexican State of Yucatan is bounded N. by the Gulf of Mexico, E. and S. by the territory of Quintana Roo, S. and W. by the state of Campeche. Pop. (1900) about 306,000. The railways include the three lines of the United Railways of Yucatan (173 m.), and a line from Mérida to Peto (145 m.). The capital is Mérida, and its principal towns, inhabited almost exclusively by Indians and mestizos, are Valladolid, Acanceh, Tekax, Motul, Temaz, Espeia, Maxcanú, Huxumca, Tixkokoh, Peto and Progreso, the port of Mérida.

Quintana Roo was separated from the state of Yucatan in 1902 and received a territorial government under the immediate supervision of the national executive. It comprises the sparsely settled districts along the E. coast of the peninsula, and the wooded sections of the S., which have not been thoroughly explored. Its population is estimated at 3000, but as its inhabitants never submitted to Spanish and Mexican rule, and have maintained their independence against overwhelming odds for almost four centuries, this estimate should be accepted as a conjecture. Little is known of the wild tribes of the territory.

**Yucca**, a genus of the order Liliaceae (p.2), containing about thirty species. They occur in greatest frequency in Mexico and the S.W. United States, extending also into Central America, and occurring in such numbers in some places as to form straggling
forests. They have a woody or fibrous stem, sometimes short, and in other cases attaining a height of 13 to 20 ft., and branching at the top into a series of forks. The leaves are crowded in tufts at the ends of the stem or branches, and are generally stiff and sword-shaped, with a sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped and pendulous, and are borne in much-branched terminal panicles. Each flower has a perianth of six regular pieces, and has as many hypogynous stamens, with dilated filaments, bearing relatively small anthers. The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flower is generally considered as the agelatum.

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage, and in the S.E. United States the leaves of some species, under the name "bear-grass," are used for seating chairs; &c. The fruits, which resemble small bananas, are cooked as an article of diet; and the roots contain a saponaceous matter used in place of soap.

Many of the species are hardy in Great Britain, and their striking appearance renders them attractive in gardens even when not in flower. Their rich, luxuriant foliage are particularly suitable for divisions planted in the open ground, or by pieces of the thick, fleshy roots in sandy soil under heat. Their rigid foliage, invested by thick epidermis, enables them to resist the noxious airs of towns better than most plants. A popular name for the plant is "Adam's needle." The species which split up at the margins of their leaves into filaments are called "Eve's thread."

**YUE-CHI** (or YUEH-CHI), the Chinese name of a Turanian Asiatic tribe who ruled in Bactria and India, are also known as Kushans (from one of their subdivisions) and Indo-Scythians. They appear to have been a nomadic tribe, inhabiting part of the present Chinese province of Kan-suh, and to have been driven W. by Hiung-nu tribes of the same stock. They conquered a tribe called Yueh-chi, situated on both sides of the E. parts of the Illy river, and settled for some time in their territory. The date of these events is placed between 175 and 140 B.C. They then attacked another tribe known as Sakas, and drove them to Persia and India. For about twenty years it would seem that the Yue-Chi were settled in the country between the rivers Chu and Syr-Darya, but here they were attacked again by the Hiung-nu, their old enemies, with whom was the son of the defeated Wusun chieftain. The Yue-Chi then occupied Bactria, and little is heard of them for a hundred years. During this period they became a united people, and their territory was rich, and their towns were surrounded by fortifications. The principal of which, the Kushans (or Kwei-Shwang), supplied the new national name. They also to some extent gave up their nomadic life and became civilized. Bactria about this time was said to contain a thousand cities, and though this may be an exaggeration it was probably a meeting-place of Persian and Hellenic culture; its kings Demetrius and Eucratides had invaded India. It is therefore not surprising to find the warlike and mobile Yue-Chi following the same road and taking fragments of Persian and Greek civilization with them.

The chronology of this invasion and the history of the Kushans in India must be regarded as uncertain, though we know the names of the kings. Indian literature supplies few data for the period, and the available information has been collected chiefly from notices in Chinese annals, from inscriptions found in India, and above all from coins. From this evidence it has been deduced that a king called Kozolokadphises, Kujulakasa or Kieu-tsieu-k'lo (A.D. 45-85) united the five tribes, conquered the Kabul valley and annihilated the remnants of Greek dominion. He was succeeded, possibly after an interval, by Oomokadphises (121) and Thadokadphises, who appears to be the same as the Sakas of the Thadokadphises who conquered the S. part of the Indus and annexed it to the empire of N. India. Then followed Kanishka (A.D. 123-153), who is celebrated throughout eastern Asia as a patron of the Buddhist church and convener of the third Buddhist council. He is also said to have conquered Kashgar, Yarkand and Khotan. His successors were Huvishka and then Vasudeva, who may have died A.D. 225. After Vasudeva's reign the power of the Kushans gradually decayed, and they were driven back into the valley of the Indus and N.E. Afghanistan. Here, according to Chinese authorities, their royal family was supplanted by a dynasty called Kin-to-lo (Kidara), who were also of Yue-Chi stock, and who were subject to one of the tribes who had remained in Bactria when the Kushans withdrew. This dynasty is supposed by some historians, in the person of the Kitolo S. of the Hindu Kush was due to the movements of the Jwen-Jwen, who advanced W. from the Chinese frontier. Under this dynasty a state known as the Little Kushan kingdom flourished in Gandhâra (E. Afghanistan) about A.D. 430, but was broken up by the attacks of the Hunas.

Some authorities do not accept the list of Kushan kings as given above, and think that Kanishka must be placed before Christ and his name probably is that of a Persian king. The next and probably the last in this line was Kanishka, who obtained the dominion of the Turanian tribes and was the chief authority in the region. The Gauharí of the Greek and Roman annals, or the Vars, as called in India, is probably the one referred to. The Kushan dynasty is of importance to the history of India, as it marks the beginning of the introduction of Greek and Buddhist ideas into India. The Kushan language was a mixture of Greek, Persian and other elements, and it is also probable that the Kushans were the first to introduce into India the use of the Greek alphabet. The Kushans were a powerful nation, and their influence extended over a large part of Asia. They were a warlike people, and their conquests were attended with considerable destruction. They were also a commercial people, and their trade extended over a wide area, and they were probably the first to introduce the use of the wheeled cart into India. They were also the first to introduce the use of the horse as a military weapon, and they were the first to introduce the use of the bow and arrow as a military weapon. They were also the first to introduce the use of the sword as a military weapon, and they were the first to introduce the use of the battle-axe as a military weapon.

The Yukon is navigable from May till September, and steamers ply on several of its larger tributaries, making the aggregate navigable length of the Yukon from its mouth to beyond White Horse Rapids about 1,300 miles. The nearest harbour for ocean-going vessels is a poor one at St. Michael's Island, about 60 m. N.E. of the delta; here freight and passengers are discharged for the interior. These enter the delta and the river by the Apon Pass, which is about 4 ft. deep at mean low water, the current varying from 1½ to 4 m. an hour. The Lewes (about 400 m. long) is navigable (with some difficulties) to Fort Yukon, where it enters Lake Lebarge. The river, seldom less than 150 yds. wide, is navigable by light-draught steamers to Frazer Falls, a distance of nearly 200 m. The Porcupine is navigable, in high water, to about the Alaska-Yukon boundary line (c.90 m.); the Chandlar for a few miles; the Tanana (which is about 500 m. long) for about 225 m. to the Chena river (which is navigable for about 100 m.); and the Tolovana, another affluent of the Tanana, is also navigable for about 100 m.

In 1842-43 the Yukon was explored by the Russian Lieutenant Zakoggin, who built a trading post at Nulato, ascended the river, which he named the "Yukon," and which has since been so named. He made a track survey of the stream to that point and reported that it was not navigable beyond there. In 1861 Robert Kennicott made his way overland by the Hudson Bay route from the Mackenzie river down the Yukon to Fort Yukon, and in 1865 he and Captain Charles S. Bulkley led the expedition sent out by the Western Union Telegraph Company to survey a route for a land telegraph line to Europe by way of Alaska and Siberia. Kennicott died at Nulato in 1866, and the expedition was abandoned in that year, but explorations were continued by others, notably into the southwest by Dr. William H. Dall 1 with the result that valuable surveys were made and the Yukon identified as the Kwikpak of the earlier Russian captains. Captain C. W. Raymond made a reconnaissance of the Yukon in 1869; the Indian route by the Lewes to the headwaters of the Yukon was used by gold prospectors as early as 1881, while in 1883 Lieutenant Frederick Schwatka (1849-1892) crossed the Chilkoot Pass (which he called "Perrier Pass"), descended the Lewes to Fort Selkirk, and down the river to the sea. Charles W. Homan, who accompanied Schwatka, made the first sketch survey of the great system; since then it has been frequently explored, but much of the region has not been mapped.

**YUKON TERRITORY.** The most westerly of the northern territories of Canada, bounded S. by British Columbia, W. by Alaska, N. by the Arctic Ocean and E. by the watershed of Mackenzie river. It has an area of 207,076 sq. m. The territory is divided by the Yukon river, which is longer than the Columbia, and more than a third of its length is considered navigable. The S.E. corner of the Yukon, which is territorially a part of Alaska, is claimed by the United States. The Yukon is supplied with telegraphic service by the Alaska Electric Light and Water Company, and is also supplied with electric light.

1 William Healey Dall (1845-1913), American naturalist, was born in Boston, Massachusetts, served with the United States Coast Survey of Alaska from 1871 to 1884, became honorary and chief of the United States Geological Survey in 1884, and in 1886 was appointed professor of invertebrate palaeontology at the Wagner Institute of Science, Philadelphia. He was palaeontologist to the United States Geological Survey in 1884-1909. The white moutain sheep, or Dall's sheep (Ovis dalli), discovered in 1884, was named in his honour.
range with the highest mountains in Canada at the S.W. corner (Mount Logan and Mount St Elias), and the N. extension of the Rocky Mountains along the S. and N.E. sides; here, however, not very lofty. The interior of the territory is high toward the S.W. and sinks toward the N.W., and may be described as a much-dissected penekplain with low mountains to the S. The most important feature of the hydrography is the Yukon (g.v.) and the rivers which flow into it. The Klondike gold mines are reached by river boats, either coming up from St Michael at its mouth, or down 460 m. from White Horse. The White Horse route is now used almost entirely, since the White Pass railway, 111 m. long, was constructed from Skagway, on Lynn Canal, an inlet of the Pacific. As the voyage up the Pacific coast from Vancouver or Victoria is almost entirely through sheltered waters, it is a great advantage to the Klondike route. There have been comparatively recent volcanic eruptions in the region, as shown by a layer of white ash just beneath the soil for many miles along the river, and by a quite perfect cone with a crater and lava stream; but there are no records of volcanic outbreaks within the short modern history of the territory.

Before the discovery of gold on the Forty Mile and other rivers flowing into the Yukon the region was inhabited only by a few Indians, but the sensational finds of rich placers in the Klondike (g.v.) in 1898 brought so many rushers into the country that Dawson City, which was made the capital of the newly constituted Yukon Territory. When the White Pass railway was built, White Horse at its N. terminus became of importance, and since then a fluctuating body of prospectors and miners has been at work, not only in the Klondike but at various points along the other rivers. The territory is ruled by a governor and council, partly elective, seated at Dawson, and has a representative in the parliament of the Dominion. Almost the only economic product of the territory was at first gold, but copper and other ores later began to be mined, and the latter especially in the neighbourhood of White Horse. Though near the Pacific the Yukon territory has a rigorous continental climate with very cold winters seven months long, and delightful sunny summers. Owing to the lofty mountains to the W., the amount of rain and snow is rather small, and the line of perpetual snow is more than 4000 ft. above sea-level, so that glaciers are found only on the higher mountains; but the snow-covered ground is often perpetually frozen to a depth of 100 or 200 ft. Vegetation is luxuriant along the river valleys, where fine forests of spruce and poplar are found, and the hardier grains and vegetables are cultivated with success.

YULE, SIR HENRY (1820-1880), British Orientalist, was born on the 1st May 1820, at Inveresk, near Edinburgh, the son of Major William Yule (1764-1839), translator of the Apothegeus of Ali. He was educated at Edinburgh, Addiscombe and Chatham, and joined the Bengal Engineers in 1840. He served in both the Sikh wars, was secretary to Colonel (afterwards Sir) Arthur Phayre's mission to Ava (1855), and wrote his Narrative of the Mission to the Court of Ava (1850). He retired in 1865 with the rank of colonel, and devoted his leisure to the study of the history and geography of Central Asia. He published Cathay and the Way Thither (1866), the Book of Sir Marco Polo (1871-75), for which he received the gold medal of the Royal Geographical Society, and brought out with Dr Arthur C. Burnett Hobson-Jobson (1886), a dictionary of Anglo-Indian colloquial phrases. For the Haklayt Society, of which he was for some time president, he edited (1863) the Mirabilia descripta of Jordanus and The Diary of William Hedges (1887-88). The latter contains a biography of Governor Pitt, grandfather of Chatham. From 1875 to 1890 Yule was a member of the Council of India, being appointed K.C.S.I. on his retirement. He died on the 30th of December 1890.

See Memoir by his daughter, prefixed to the posthumous third edition of Marco Polo (1903).

YULE, the season of Christmas (q.v.). This word is chiefly used alone as an archaism or in poetry or poetical language, but is more common in combination, as in "yule-tide," "yule-log," &c. The Old English word appears in various forms, e.g. geola, tula, geol, geholk, gehel; cognate forms are Icel. jol; Dan. jual; Swed. jul. It was the name of two months of the year, December and January, the one the former yule (as abra geola), the other the after yule (see olfr. geola), the latter being before and after the winter solstice (Cotton Ms. Tib. B. i.; and Bede, De Temporibus Ratione, 13, quoted in Skeat, Etym. Dict., 1808). According to A. Fick (Vergleichendes Wörterbuch der Indogermanischen Sprachen, vol. iii. 245, 1874) in proper meaning is noise, clamour, the season being one of rejoicing at the turning of the year among Scandinavian peoples before Christian times.

YUN-NAN (i.e. Cloudy South), a S.W. province of China, bounded N. by Szech-uen, E. by Kwei-chow and Kwangsi, S. by Burma and the Laos, W. by Szech-uen (S. E. province). It was ceded at the Treaty of 1821 to 123,000 to 146,000 sq. m. Though the second largest province of the empire, its population is estimated at only 12,000,000. The inhabitants include many races besides Chinese, such as Shan, Laos and Maotzze. The Musus, in N.W. Yun-nan, once formed an independent kingdom which extended into E. Tibet. Many of the inhabitants are nominally Moslems. The greater part of the province may be said to consist of an extensive plateau, generally from 5000 to 7000 ft. in altitude, containing numerous valley plains, which is divided in the N. by mountain ranges that enter at the N.E. corner and separate the Mekong and the Salween. The mountains attain heights of 16,000 ft. The climate is generally healthy and equable; on the plateau the summer heat seldom exceeds 86°, and in winter there is little snow. The principal rivers are the Yangtsze-kiang (locally known as the Kinscha-kiang = Golden Sand river), which enters Yun-nan at its N.W. corner, flows first S.E. and then N.E., forming for a considerable distance the N. boundary of the province; the Mekong, which traverses the province from N. to S. on its way to the sea through Annam; the Salween, which forms a parallel course through its W. portion; and the headwaters of the Songkoi, which rises in the S.E. of the province. This last-named river is navigable from the Gulf of Tongking to Man-hao, a town ten days' journey from Yun-nan Fu. There are two large lakes—one in the neighbourhood of Ta-li Fu, which is 24 m. long by 6 m. broad, and the other near Yun-nan Fu, which measures from 70 to 80 m. in circumference.

Besides Yun-nan Fu, the capital, the province contains thirteen prefectural cities, several of which—Teng-ch'uen Fu, Ta-li Fu, Yung-ch'ang Fu, Chu-chiung Fu and Ling-gan Fu, for example—are situated in the valley plains. Mengtsze, Szemao and Momein (or Teung-yueh) are open to foreign trade. Yun-nan Fu is connected by railway (1910) with Tongking, the line which starts from Hapingkong, runs in Yunnan, Thsengtsze basin (a great commercial centre), to the capital. Several important roads intersect the province; among them are—1. The road from Yun-nan Fu to Bhamo in Burma via Ta-li Fu (12 days), Teng-yueh Chor or Mengtsze, and Mawnyu—beyond Ta-li Fu it is a difficult mountain route. 2. The road from Ta-li Fu N. to Patang via Li-kiang Fu, which thus connects W. Yun-nan with Tibet. 3. The road from Ta-li Fu to Canton, which connects Yun-nan Fu with Pai-se Fu, in Kwang-si, on the Canton West River, a land journey which occupies about twenty days. From this point the river is navigable to Canton.

Agricultural products include rice and maize (the principal crops), wheat, barley and oats. The poppy was formerly extensively cultivated, but after the anti-opium edict of 1906 vigorous efforts were made to stamp out the cultivation of the plant. In certain localities the sugar-cane is grown. Tea from Fu-erh Fu in S. Yun-nan is appreciated throughout the empire. Fruits and vegetables are plentiful, and there are large herds of buffaloes.
goats and sheep: Silkworms are reared. The chief wealth of Yun-nan consists, however, in its minerals. Copper is the most important of the minerals worked. Silver and gold are produced, but they are not known to exist in any large quantities. Lead of frequent occurrence, and indeed the area through which copper, silver, lead, tin and zinc are distributed in sufficient quantities to make mining answer, comprises at least 80,000 sq. m. Coal is also found and several salt mines are worked. The ores are generally of good quality, and are easy of extraction. Cotton yarn and cloth, petroleum, timber and furs are among the chief imports; copper, tin, hides and tea are important exports; medicines, in the shape not only of herbs and roots, but also of fossils, shells, bones, teeth and various products of the animal kingdom; and precious stones, principally jade and rubies, are among the other exports.

Yun-nan, long independent, was subdued by Kublai Khan, but was not finally incorporated in the empire until the 17th century. It was the principal centre of the great Mahommedan rebellion, which lasted sixteen years and was suppressed in 1872. Even in 1910 the province had not wholly recovered from the effects of that struggle and the barbarity with which it was stamped out. The opening of Christian (Protestant) mission work in Yun-nan began in 1877, and was one result of the murder of Mr Margery (see CHINA; History, § D).

See H. R. Davies, Yun-nan, the Link between India and the Yangtze (Cambridge, 1909); A. Little, Across Yun-nan (London, 1909); O. J. Davies, The Carthage of Yuen.” In The Chinese Empire (London, 1907); L. Richard, Comprehensive Geography of the Chinese Empire (Shanghai, 1908).

YUN-NAN FU.—YVETOT

YUN-NAN FU, the capital of the province of Yun-nan, China, in 25° 6’ N., 102° 52’ E. It is about 500 m. by rail N.W. of the port of Haiphong, Tongking. The population was returned in 1907 at 45,000. Originally the surrounding district was known as the “land of the southern barbarians.” The city is situated on a plain, and is surrounded by fortified walls, 63 m. in circuit. For many years Mahommedans have been numerous in the city and neighbourhood; and in 1855 a Mahommedan rising occurred. Before the rebellion Yun-nan Fu had a prosperous aspect; the shops were large and well supplied with native silken goods, saddlery, &c., while English cotton, Russian clothes and raw cotton from Burma constituted the main foreign merchandise. Employment for large numbers of work-people was found in the copper factories. A mint at Yun-nan Fu issued annually 101,000,000 cash. Nearly ruined by the rebellion, the city took many years to recover its prosperity. A fresh impetus to commerce was given by the opening in 1910 of the railway from Tongking, a line built by French engineers and with French capital. The construction of a British railway to connect Burma with Yun-nan Fu and onwards to the Yangtsze-kiang has been in contemplation.

YURIEV (formerly DORAT, also Döps; Russian, Derpë; Estonian, Tarto and Tartoliv; in Lettish, Tehbata), a town of W. Russia, in the government of Livonia, situated on the Embach, 158 m. by rail N.E. of Riga, in 58° 23’ N. and 26° 25’ E. Pop. 42,421. The principal part of the town lies S. of the river, and the more important buildings are clustered round the two eminences known as the Domberg (cathedral hill) and the Schlossberg (castle hill), which in the middle ages were occupied by the citadel, the cathedral and the episcopal palace. Owing to a great fire in 1777, the town is almost entirely modern; and its fortifications have been transformed into promenades. Besides a good picture gallery in the Ratshof, and the 13th-century church of St John, Yuriev possesses a university, with an observatory, an art museum, a botanical garden and a library of 250,000 volumes, which are housed in a restored portion of the cathedral, burned in 1634. The university was founded by Gustavus Adolphus of Sweden in 1632; but in 1690 teachers and students removed to Pernau on the advance of the Russians, and on the occupation of the country by Peter the Great again took flight to Sweden. In spite of the treaty of 1710 and the efforts of the Livonian nobles, it was not till 1802 that its restoration was effected under the patronage of Alexander I. Down to 1805, in which year it was thoroughly Russified, the university was German in spirit and in sentiment. It is now attended by some 1700 students annually. The astronomical department is famous, owing partly to the labours of F. G. von Struve (1820–39), and partly to Fraunhofer’s great refracting telescope, presented by the emperor Alexander I. There are museums of K. E. von Baer (1866) and Marshal Bexlay de Tolly (1849), and the town is the headquarters of the XVIII. army corps.

The foundation of Dorpat is ascribed to Yaroslav, prince of Kiev, and is dated 1030. In 1224 the town was seized by the Teutonic Knights, and in the following year Bishop Hermann erected a cathedral on the Domberg. From that date till about 1558 the town enjoyed great prosperity, and the population reached 50,000. In 1558 it was captured by the Russians, but in 1582 was yielded to Stephen Bathori, king of Poland. In 1600 it fell into the hands of the Swedes, in 1603 reverted to the Poles, and in 1625 was seized by Gustavus Adolphus of Sweden. The Russians again obtained temporary possession in 1666, but did not effect a permanent occupation till 1704. In 1758 the bulk of the population were removed to the interior of Russia.

YUSAFZAI, a large group of Pathan tribes, originally immigrants from the neighbourhood of Kandahar, which includes those of the Black Mountain, the Bunerwals, the Swatis, the people of Dir and the Panjkora valley, and also the inhabitants of the Yusafzai plain in Peshawar district of the North-West Frontier Province of India. Three sections of the tribe, the Haussanis, Akzais, and Chagharzais, inhabit the W. slopes of the Black Mountain, and the Yusafzai country stretches thence to the Utrman Khel territory. The trans-border Yusafzais are estimated at 65,000 fighting men, giving a total population of about 250,000. The Yusafzais are said to be descended from one Mandai, who had two sons, Umar and Yusaf. Umar died, leaving one son, Mandan; from Mandan and Yusaf come the two primary divisions of the Yusafzais, which are split into numerous subdivisions, including the Isazais, Malizais, Akzais, Rajnizais and Utmanzais.

YUGZAT, the chief town of a sanjak of the same name in the Angora vilayet of Asia Minor, altitude 4380 ft., situated 105 m. E. of Angora, near the head of a narrow valley through which the Angora-Sivas road runs. The town was built largely out of the ruins of Nefez Keui (anc. Tasium), by Chapam Ogolu, the founder of a powerful Dere Bey family. There is a trade in yellow berries and mohair. The sanjak is very fertile, and contains good breeding-grounds, upon which horses, camels and cattle are reared. The population, about 15,000, includes a large Armenian community.

YVETOT, a town of N. France, capital of an arrondissement in the department of Seine-Inférieure, 24 m. N.W. of Rouen on the railway to Havre. Pop. (1906) 6274. Cotton goods of various kinds and hats are made here, and trade is carried on in agricultural products. The church (18th century) contains a marble altar from the Carthusian monastery at Rouen, fine woodwork of the 17th century from the abbey of St Wandrille, and a handsome pulpit. The town is the seat of a sub-prefect and has tribunals of first instance and of commerce, and a chamber of arts and manufactures. The lords of Yvetot bore the title of king from the 15th till the middle of the 16th century, their petty monarchy being popularized in one of Béranger’s songs. In 1592 Henry IV. here defeated the troops of the League.
the twenty-sixth letter of the English alphabet and the last, although till recent times the alphabets used by children terminated not with z but with & or &. For & the English name is *ampersand*, i.e. "and per se and," though the Scottish name *gerosheard*, i.e. "Et, per se and," is more logical and also more clearly shows its origin to be the Latin *et*, of which it is but the manuscript form. To the following of z by & George Eliot refers when she makes Jacob Storey say, "He thought it (z) had only been put to finish off th' alphabet like, though *ampersand* would ha' done as well, for what he could see." Z is put at the end of the alphabet because it occupied that position in the Latin alphabet. In early Latin the sound represented by z passed into r, and consequently the symbol became useless. It was therefore removed from the alphabet and G (q.s.) put in its place. In the 1st century B.C. it was, like y, introduced again at the end, in order to represent more precisely than was before possible the value of the Greek Z, which had been previously spelt with s at the beginning and ss in the middle of words: *sosna* = *soym*, "belt "; *torpesita* = *topy-

**Z—ZACATECAS**

Zeta, TreftTTjj,

Previous, which succeeded the older *dialect*, became a voiced s, like the ordinary use of z in English, as in *sacred, race*. It is probable that in Greek there was a considerable variety of pronunciation from dialect to dialect. In the earlier Greek of Athens, North-west Greece and Lesbos the pronunciation seems to have been zd, in Attic from the 4th century B.C. onwards it seems to have been only a voiced s, and this also was probably the pronunciation of the dialect from which Latin borrowed its Greek words. In other dialects, as Elean and Cretan, the symbol was apparently used for sounds resembling the English voiced and unvoiced th (b, p). In the common dialect (*koufry*) which succeeded the older dialects, th became a voiced s, as it remains in modern Greek. In, Vulgar Latin the Greek Z seems to have been pronounced as dy and later y; dy being found for z in words like *baptisterio* for *baptizare*, "baptize," while conversely z appears for di in forms like *vacuum, sabitus, for diazusus, deacon, dialabitus, devil." Z also is often written as a corresponding digraph. (see Grandgent, *Introduction to Vulgar Latin*, §§ 272, 330). Besides this, however, there was a more cultured pronunciation of z as ds, which passed through French into Middle English. Early English had used z alone for both the unvoiced and the voiced sibulant; the Latin sound imported through French was new and was not written with z but with g or i. The successive changes can be well seen in the double forms from the same original, *jealous and zealous*. Both of these come from a late Latin *zelosus*, derived from the imported Greek υζον. Much the earlier form is *jealous*; its initial sound is the ds which in later French is changed to z (voiced s). It is written *gelos* or *telos* by Wyycliffe and his contemporaries, the form with i is the ancestor of the modern form. The later word *zealous* was borrowed after the French ds had become z. At the end of words this z was pronounced as in the English assets, which comes from a late Latin *ad saitis* through an early French *asen*, "enough." With z also is frequently written sh, the voiced sound of sh, in *azure, saiture*. But it appears even more frequently as s before u, and as si or ti before other vowels in *measure, decision, translation, &c., or in foreign words as g, as in *rubber*. For the 3 representing g and y in Scottish pronunciation see under Y. (P. Gr.)

ZAAANDAM (incorrectly Saarandam), a town of Holland, in the province of North Holland, on the river Zaan, 6½ m. N.W. of Amsterdam, with which it is connected by railway and steamer. Pop. (1905) 25,773. It is of typically Dutch appearance, with low, brightly coloured houses. It has an important trade in timber, and numerous windmills in the vicinity provide power for oil, cement and paper works, timber-sawing and corn-grinding. At Zaandam is preserved the wooden hut which Peter the Great occupied for a week in 1697 while studying shipbuilding and paper-making.

ZABERN (French, Saverne), a town of Germany, in the imperial province of Alsace-Lorraine, district of Lower Alsace, situated on the Rhine-Marne canal at the foot of a pass over the Voges, and 27 m. N.W. of Strasbourg by the railway to Deutsch-Avignoirt. Pop. (1905) 8499. Its principal building, the former episcopal residence, rebuilt by Cardinal de Rohan in 1779, is now used as barracks. There are also a 15th century church and an antiquarian museum. In the vicinity are the ruined castles of Hoch-barr, Grossgeroldseck, Ochsenstein and Greifenstein. Hence a beautiful road, immortalized by Goethe in *Dichtung und Wahrheit*, leads across the Voges to Fulburg.

Zabern (Tres Tabernae) was an important place in the times of the Romans, and, after being destroyed by the Alamanni, was rebuilt by the emperor Julian. During the Peasants' War the town was occupied, in 1525, by the insurgents, who were driven out in their turn by Duke Anton of Lorraine. It was destroyed much from the ravages of the Thirty Years' War, but the episcopal castle, then destroyed, was subsequently rebuilt, and in 1852 was converted by Louis Napoleon into a place of residence for widows of knights of the Legion of Honour.

See Fischer, Geschichte der Stadt Zabern (Zabern, 1824).

ZABRZE, a town of Germany, in the extreme S.E. of Prussian Silesia, on the railway between Gleiwitz and Königshütte. Pop. (1905) 55,634. Like other towns in this populous region, it is an important manufacturing centre, having coal-mines, iron, wire, glass, chemical, and oil works, breweries &c.

ZACATECAS, a state of Mexico, bounded N. by Durango and Coahuila, E. by San Luis Potosí, S. by Aguascalientes and Jalisco, and W. by Jalisco and Durango. Area, 24,757 sq. m. Pop. (1900) 462,100. It belongs wholly to the great central plateau of Mexico, with an average elevation of about 7700 ft. The state is somewhat mountainous, being traversed in the W. by lateral ranges of the Sierra Madre Occidental, and by numerous isolated ranges in other parts—Mazapil, Norillos, Guadalupe and others. There are no large rivers, only the little streams which are cut off from the larger streams by the Guazamota, Bolanos and Juchipila in the W., the last three being tributaries of the Rio Grande de Santiago. As the rainfall is light this lack of streams suitable for irrigation is a drawback to agriculture. The climate is dry and generally healthy, being warm in the valleys and temperate in the mountains. The agricultural products are cereals, sugar and maguey, the first being dependent on the rainfall, often failing altogether, the second on irrigation in the lower valleys, and the latter doing best in a dry climate on a calcareous soil with water not far beneath the surface. There is also a considerable production of peaches, apricots and grapes, the last being made into wine. A few cattle are raised, and considerable attention is given to the rearing of sheep, goats and swine. A natural product is guayule, a shrub from which rubber is extracted. The chief industry of Zacatecas, however, is mining for silver, gold, mercury, copper, iron, zinc, lead, bismuth, antimony and salt. Its mineral wealth was discovered soon after the conquest, and some of its mines are among the most famous of Mexico, dating from 1546. One of the most productive of its silver mines, the Alvarado, has records which show a production of nearly $30,000,000 in silver between 1546 and 1876. A large part of state is traversed by the Mexican Central and the Mexican National railways. Its manufactures are limited chiefly to the
reduction of mineral ores, the extraction of rubber from guayule, the making of sugar, rum, mescal, pulque, woolen and cotton fabrics, and some minor industries of the capital. The capital is Zacatécas, and the other principal towns are Sombrerete (pop. 10,000), an important silver-mining town 70 m. N.W. of the capital (elevation 8,430 ft.); Ciudad García (about 9,500); Guadalupe (9,000); Pinos (8,000), a mining town; San Juan de Mezquital (7,000); and Fresnillo (6,000), an important silver- and copper-mining centre.

ZACATÉCAS, a city of Mexico, capital of the state of Zacatécas, 442 m. by the Mexican Central railway N.W. of Mexico city. Pop. (1900) 30,912. It is built in a deep, narrow ravine, 850 ft. above sea-level, with narrow, crooked streets climbing the steep hillsides, and white, flat-roofed houses of four and five storeys overtopping each other. Its streets are well paved, and are lighted with electricity. The city is well drained and has a fine aqueduct for its water supply. The cathedral is an elaborately carved red-stone structure with unfinished towers and richly decorated interior. Several domed churches occupy prominent sites. The National College and the Colegio de Nuestra Señora de Guadalupe with its fine library may be noticed. Overlooking the city from an elevation of 500 ft. is the Buja Hill, which is crowned by a chapel and is a popular pilgrimage resort. The Guadalupe chapel near the city has elaborate decorations, including frescoes, onyx steps, silver rails and paintings, and a curious tiled dome. The industries comprise carriage building, weaving and the manufacture of coarse pottery. The town is an important commercial centre.

Zacatécas was founded in 1546 and was built over a rich vein of silver discovered by Juan de Tolosa in the same year. This and other mines in the vicinity attracted a large population, and it soon became one of the chief mining centres of Mexico. It was a city in 1585 by Philip II.

ZACH, FRANZ XAVER, BARON VON (1754-1832), German astronomer, was born at Pesth on the 4th of June 1754. He served for some time in the Austrian army, and afterwards lived in London from 1783 to 1786 as tutor in the house of the Saxon minister, Count Brühl. In 1786 he was appointed by Ernest II. of Saxe-Coburg-Gotha director of the new observatory on the Seeborg at Gotha, which was finished in 1791. From 1806 Zach to the end of his life travelled with Gotha's other scientist, and its library was famous. He died in Paris on the 2nd of September 1832.

Zach published Tables of the Sun (Gotha, 1792; new and improved edition, ibid., 1804), and numerous papers on geographical subjects, particularly on the geographical positions of many towns and places in Europe. One of his principal investigations was, however, as editor of three scientific journals of great value: Allgemeine Geographische Ephemeriden (4 vols., Gotha, 1796-99), Monatliche Corresponden sur Beförderung der Erd- und Himmlische-Kunde (28 vols., Gotha, 1800-13, from 1807 edited by B. von Lindenau), and Correspondance astronomique, géographique, hydrographique, et statistique (Genoa, 1818-26, 14 vols., and one number of the 15th suppressed at the instigation of the Jesuits).

ZACHARIAE VON LINGENTHAL, KARL SALOMO (1769-1843), German jurist, was born on the 14th of September 1769 at Meissen in Saxony, the son of a lawyer, and received his early education at the famous public school of St Afra in that town. He afterwards studied philosophy, history, mathematics and law at the university of Leipzig. In 1792 he went to Wittenberg University as tutor to one of the counts of Lippe, and continued his legal studies. In 1794 he became privathoten, lecturing on canon law, in 1798 extraordinary professor, and 1804 ordinary professor at the University of Halle, where he died in 1843, with the exception of a short period in which public affairs occupied him, he poured out a succession of works covering the whole field of jurisprudence, and was a copious contributor to periodicals. In 1807 he received a call to Heidelberg, then beginning its period of splendid as a school of law. There, resisting many calls to Göttingen, Berlin and other universities, he remained until his death. In 1820 he took his seat, as representative of his university, in the upper house of the newly constituted parliament of Baden. Though he himself prepared many reforms—notably in the harsh criminal code—he was, by instinct and conviction, conservative and totally opposed to the violent democratic spirit which dominated the second chamber, and brought it into conflict with the grand-duke and the German federal government. After the remodelling of the constitution in a "reactionary" sense, he was returned, in 1825, by the district of Heidelberg to the second chamber, of which he became the first vice-president, and in which he proved himself more "loyal" than the government itself. With the growth of parliamentary Liberalism, however, he greatly disagreed with politics, from which he retired altogether in 1829. He now devoted himself wholly to juridical work and to the last days of his life toiled with the arduous of a young student. His fame extended beyond Germany. The German universities then enjoyed, in regard to legal questions of international importance, a jurisdiction dating from the middle ages; and Zacharie was often consulted as to questions arising in Germany, France and England. Elaborate "opinions," some of them forming valuable treatises —e.g. on Sir Augustus d'Este's claim to the dukedom of Sussex, Burgundy, and the House of D`Estrées—on an English subject to a share in the French indemnity, the dispute concerning the title of Hesse-Cassel, confiscated by Napoleon, and the constitutional position of the Mecklenburg landowners—were composed by Zacharie. Large fees which he received for these opinions and the great popularity of his lectures made him rich, and he was able to buy several estates; from one of which, Lingenthal, he took his title when, in 1842, he was ennobled by the grand-duke. He died on the 27th of March 1843. He had married in 1811, but his wife died four years later, leaving him a son, Karl Eduard.

Zacharie's true history is in his writings, which are extremely numerous and multiform. They deal with almost every branch of science; they have been translated into other languages, and relate to Roman, Canon, German, French and English law. The first book of much consequence which he published was Die Einheit des Staats und der Kirche mit Recht auf die Deutsche Reichsverfassung (1797), a work on the relations of church and state, with special reference to the constitution of the empire, which displayed the writer's power of analysis and his skill in making a complicated set of facts appear to be deductions from a few principles. In 1805 appeared Versuch einer allgemeinen Hermeneutik des Rechts; and in 1806 Die Wissenschaft der Gesetzgebung, an attempt to find a new theoretical basis for society in place of the old political ideas which had been superseded by the French Revolution. This basis he seemed to discover in something resembling Bentham's utilitarianism. Zacharie's last work of importance was Vie de St. Ouen (1839-42), to which his admirers point as his enduring monument. It is a biography of Montesquieu's L'Esprit des lois, and covers no small part of the field of Buckle's first volume of the History of Civilization. But among certain points of his excellent history the present becomes as to the future of the state and of law, it lacks logical sequence, and is, consequently, full of contradictions. Its fundamental theory is, that the state had its origin, not in a contract (Rousseauist), but in the consciousness of a legal duty. What Machiaveli was to the Italians and Montesquieu to the French, Zacharie aspired to become to the Germans; but he lacked their patriotic inspiration, and so failed to exercise any permanent influence on the constitutional law of his country. Among other important works of Zacharie are his Staatsrecht, and his treatise on the Code Napoleon, of which several French editions were published, and works translated from Zacharie and translated into English by Joseph Muttermayer the Kritische Zeitschrift für Rechtswissenschaft und Gesetzgebung des Auslandes, and the introduction which he wrote illustrates his wide reading and his constant desire for new light upon old problems. As long as they were not superseded, they were in their day epoch-making, and they have been superseded by books which, without them, could not have been written.

For an account of Zacharie and his works, see Robert von Mohl, Geschichte u. Literatur der Staatswissenschaften (1858-59), and Charles Brocher, K. S. Zacharie, sa vie et ses œuvres (1870); a more recent biography in Allgemeiner Biographischer Lexikon, Wilhelm Fischer, and Holtzendorff, Rechts-Lexicon, Zacharia von Lingenthal.

His son, KARL EDUARD ZACHARIE (1812-1894), also an eminent jurist, was born on the 24th of December 1812, and studied philosophy, history, mathematics and languages, as well as jurisprudence, at Leipzig, Berlin and Heidelberg. Having
made Roman and Byzantine law his special study, he visited Paris in 1832 to examine Byzantine MSS., went in 1834 to St Petersburg and Copenhagen for the same purpose, and in 1835 worked in the libraries of Brussels, London, Oxford, Dublin, Edinburgh and Cambridge. After a few months as a practising lawyer and priv CONSTANTINE at Heidelberg, he went in 1837, in search of materials, to Italy and the East, visiting Athens, Constantinople and the monasteries of Mount Athos. Having a taste for a country life, and none for teaching, he gave up his position as extraordinary professor at Heidelberg, and in 1845 bought an estate in the Prussian province of Saxony. Here he lived, engaged in scientific agriculture and interested in Prussian politics, until his death on the 3rd of June 1894.

He produced an enormous mass of works of great importance for students of Byzantine law. The task to which he devoted his life was, to discover and classify the sources of Byzantine law hidden away in the libraries of the East and West; to re-edit, in the light of modern criticism, those sources which had already been published; to write the history of Byzantine law on the basis of this hitherto undiscovered material; and finally, to apply the results to the scientific elucidation of the Justinian law. His Just Graeco-Romana, of which the first part was published in 1856, the last in 1891, is the best and most complete collection of the sources; another and of the empire from the time of Justin II. to 1453. On the general history of the subject he wrote two epoch-making works, the Histori Graeco-Romana juris de-lineationibus, and the Liber ludi histori graecoromanorum, Geschichte des griechisch-romischen Rechts. 1. Personrecht; II. Erbrecht; III. Die Geschichte des Sachenrechts und Obligations-rechts (Leipzig, 1856), the third edition of which appeared under the title Geschichte des griechisch-romischen Rechts (1882). In this last work, which covered ground hitherto unexplored, Byzantine law is treated as a development of Justinian law, and incidentally many obscure points in the economic and agrarian conditions of the Eastern empire are elucidated. For list of Zacharias's other works, see Allgem. Deutsche Biogr., art. by Wilhelm Fischer.

ZACHARIAS, ST, pope from 741 to 752, was a Greek by birth, and appears to have been on intimate terms with Gregory III., whom he succeeded (November 741). Contemporary history dwells chiefly on his great personal influence with the Lombard king Luitprand, and with his successor Raczia; it was largely through his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna was rescued from becoming part of the Lombard kingdom. A correspondence, of considerable extent and of great interest, between Zacharias and St Boniface, the apostle of Germany, is still extant, and shows how great was the influence of this pope on events then passing in France and Germany: he encouraged the deposition of Childeric, and it was with his sanction that Boniface crowned Pippin as king of the Franks at Soissons in 752. Zacharias is stated to have renounced the emperor Constantine Copronymus on the part he had taken in the iconoclasm controversy. He died on the 14th of March 752, and was succeeded by Stephen II.

The letters and decrees of Zacharias are published in Migne, Patrolog. lat. lxxv. p. 917-960.

ZAGAZIG (Zaqazik), a town of Lower Egypt, capital of the province of Sharkia. Pop. (1907) 34,090, including 2617 Copts and 3355 Greeks. It is built on a branch of the Fresh Water or Ismailia canal, and on the Al-Mouizz canal (the ancient Tanitic channel of the Nile), and is 47 m. by rail N.N.E. of Cairo. Situated on the Delta in the midst of a fertile district, Zagazig is a great centre of the cotton and grain trade of Egypt. It has cotton factories and the offices of numerous European merchants. About a mile south of the town are the ruins of Bubastis (q.v.).

Zähringen, the name of an old and influential German family, taken from the castle and village of that name near Freiburg-im-Breisgau. The earliest known member of the family was probably one Bezin, a count in the Breisgau, who was living early in the 11th century. Bezin's son Bertold I. (d. 1078) was count of Zähringen and was related to the Hohenstaufen family. He received a promise of the duchy of Swabia, which he did not fulfill, but which he accepted in the person of Henry IV. in 1073. His son Bertold II. (d. 1111), who like his father fought against Henry IV., inherited the land of the counts of Rheinfelden in 1090 and took the title of duke of Zähringen; he was succeeded in turn by his sons, Bertold III. (d. 1122) and Conrad (d. 1152). In 1127 Conrad inherited some land in Burgundy and about this date he was appointed by the German king, Lothair the Saxon, rector of the kingdom of Burgundy or Arles. This office was held by the Zähringens until 1218 and hence they are sometimes called dukes of Burgundy. Bertold IV. (d. 1280), who followed his father Conrad, spent much of his time in Italy in the train of the emperor Frederick I.; his son and successor, Bertold V., showed his prowess by reducing the Burgundian nobles to order. This latter duke was the founder of the town of Bern, and when he died in February 1218 the main line of the Zähringens family became extinct. By extensive acquisitions of land the Zähringens had become very powerful in the districts now known as Switzerland and Baden, and when their territories were divided in 1218 part of them passed to the counts of Kyburg and thence to the house of Habsburg. The family now ruling in Baden is descended from Hermann, margrave of Verona (d. 1074), a son of duke Bertold I., and the grand-duke is the present representative of the Zähringens.

Zähringen, a village of Germany, in the grand duchy of Baden, situated under the western slope of the Black Forest, 6 m. from Freiburg-im-Breisgau, and on the railway from Heidelberg to Basel. Pop. (1900) 1200. Above the village on a spur of the mountains, 1500 ft. above the sea, lie the ruins of the castle of Zähringen, formerly the stronghold of the ducal line of that name (see above).

ZAILA, or ZELLA; a town on the African coast of the Gulf of Aden, 124 m. S.W. of Aden and 200 m. N.N.E. of Harrar. Zaila is the most western of the ports of the British Somaliland protectorate, being 170 m. N.W. of Berbera by the coast railway track. The town is surrounded on three sides by the sea; landward the country is unbroken desert for some fifty miles. The principal buildings, which date from the days of Egyptian occupation (1875-1884) are of white (coral) stone; the Somali dwellings are made of grass. Zaila has a good sheltered anchorage much frequented by Arab sailing craft, but heavy draught steamers are obliged to anchor a mile and a half from the shore. Small coasting boats lie off the pier and there is no difficulty in loading or discharging cargo. The water supply of the town is drawn from the wells of Takasha, about three miles distant; every morning camels, in charge of old Somali women and bearing goatskins filled with water, come into the town in picturesque procession. The population varies from 3000 to 7000, the natives, who come in the cool season to barter their goods, retiring to the highlands in hot weather. The chief traders are Indians, the smaller dealers Arabs, Greeks and Jews. The imports, which reach Zaila chiefly via Aden, are mainly cotton goods, rice, jowaree, dates and silk; the exports —of which 90 per cent. are from Abyssinia—are principally coffee, skins, ivory, cattle, ghee and mother-of-pearl.

Zaila owed its importance to its proximity to Harrar, the great entrepôt for the trade of southern Abyssinia. The trade of the port received, however, a severe check on the opening (1901-2) of the railway to Harrar from the French port of Jibuti, which is 35 m. N.W. of Zaila. A steamer from Aden to Zaila takes fifteen hours to accomplish the journey; caravans proceeding from Zaila to Harrar occupy from ten days to three weeks on the road.

For history and trade statistics, see SOMALILAND, BRITISH.

ZAIMUKHT, the name of a small Pathan tribe on the Kohat border of the North-West Frontier Province of India. The Zaimukhts inhabit the hills to the south of the Orakzeis
between the Miranzaï and Kurram valleys. Their country may be described as a triangle, with the range of hills known as the Samana as its base, and the village of Thal in the Kurram valley as its apex. This includes a tract on its western side occupied by an Orakzaï clan. The total area is about 400 sq. m., of which the Orakzaïs occupy a fourth. The Zalmukhts are a fine-looking fighting race, with a fighting strength of some 3000 men.

Zaire, a name by which the river Congo was formerly known. Zaire is a Portuguese variant of a Bantu word (nsari) meaning river. In the 16th and 17th centuries the powerful native kingdom of Congo possessed both banks of the lower river, and the name of the country was in time given to the river also. Until, however, the last quarter of the 19th century "Zaire" was frequently used to designate the stream. It is so called by Camoes in the Lusiads. Since H. M. Stanley's discoveries "Congo" has become the general name for the river from its mouth to Stanley Falls, despite an effort on the part of Stanley to have the stream re-named Livingstone. (See Congo, river.)

Zaisan, or Zaisansk, a town of Russian Central Asia, in the province of Semipalatinsk, near the Chinese frontier, at an altitude of 2200 ft. and near the S.E. corner of Lake Zaisan. Pop. (1897) 4471. Lake Zaisan, situated in an open valley between the Altai range on the north-east and the Tarbagatai on the south, lies at an altitude of 1355 ft. It has a length of 65 m., a width of 14 to 30 m., an area of 707 sq. m., and a maximum depth of 50 ft. Its water is fresh, as it receives the Irtish, the main eastern tributary of the Yenisei. Among the small streams from the west, all of which leave the lake at its north-west extremity by the White Irtish. The fisheries, which yield abundantly, are in the hands of the Siberian Cossacks. The lake is generally frozen from the beginning of November to the end of April.

Zaleucus, of Locri Epizephyrii in Magna Graecia, Greek lawyer, is supposed to have flourished about 660 B.C. The statement that he was a pupil of Pythagoras is an anachronism. Little is known of him, and Timaeus even doubted his existence, but it is now generally agreed that this is an error. He is said to have been the author of the first written code of laws amongst the Greeks. According to the common story, the Locrics consulted the Delphic oracle as to a remedy for the disorder and lawlessness that were rife amongst them. Having been ordered to make laws for themselves, they commissioned one Zaleucus, a shepherd and slave (in later tradition, a man of distinguished family) to draw up a code. The laws of Zaleucus, which he declared had been communicated to him in a dream by Athena, the patron goddess of the city, were few and simple, but so severe that, like those of Draco, they became proverbial. They remained essentially unchanged for centuries, and the Locrics subsequently enjoyed a high reputation as upholders of the law. One of the most important provisions was that the punishment for different offences was definitely fixed, instead of being left to the discretion of the judge before whom a case was tried. The penalty for adultery was the loss of the eyes, and in general the application of the lex talionis was enjoined as the punishment for personal injuries. Special enactments concerning the rights of property, the alienation of land, settlement in foreign countries, and various sumptuary laws (e.g. the drinking of pure wine, except when ordered medically, was forbidden) are attributed to him. After the code was firmly established, the Locrics introduced a regulation that, if a citizen interpreted a law differently from the cosmopolis (the chief magistrate), each had to appear before the council of One Thousand with a rope round his neck, and the one against whom the council decided was immediately strangled. Any one who proposed a new law or the alteration of one already existing was subjected to the same test, which continued in force till the 4th century and even later. Zaleucus is often confused with Charchondas, and the same story is told of their death. It is said that one of Zaleucus's laws forbade a citizen, under penalty of death, to enter the senate-house bearing a weapon. During the stress of war, Zaleucus violated this law; and, on its being pointed out to him, he committed suicide by throwing himself upon the point of his sword, declaring that the law must be vindicated.

Schuricht, Suidas, s.v., who makes him a native of Thrulli; Cicero, De Legibus, ii. 6. See also article GREEK LAW.

Zalmoxis, or Zalmolxis, a semi-mythical social and religious reformer, regarded as only the true god by the Thracian Getae. According to Herodotus (iv. 94), the Getae, who believed in the immortality of the soul, looked upon death merely as going to Zalmoxis. Every five years they selected by lot one of the tribesmen as a messenger to the god. The man was thrown into the air and caught upon the points of spears. If he did not die, he was considered unfit to undertake the mission and another was chosen. By the euhemeristic Hellenspontine Greeks Herodotus was told that Zalmoxis was really a man, formerly a slave of Pythagoras at Samos, who, having obtained his freedom and amassed great wealth, returned to Thrace, and instructed his fellow-tribesmen in the doctrines of Pythagoras and the arts of civilization. He taught them that they would pass at death to a certain place, where they would enjoy all possible bliss and immortality, and to convince them of this he had a subterranean chamber constructed, which lasted for about three years. Herodotus, who declines to commit himself as to the existence of Zalmoxis, expresses the opinion that in any case he must have lived long before the time of Pythagoras. It is probable that Zalmoxis is Sabazius, the Thracian Dionysus or Zeus; Mnaseas of Patrae identified him with Cronus. In Plato (Charmides, 158 B) he is mentioned with Abaris as skilled in the arts of incantation. No satisfactory etymology of the name has been suggested.

Zamakhshari [Abu-] Qasim Mahmud ibn 'Umar uz-Zamakhshari (1772-1844). Persian theologian and grammarian, was born at Zamakshar, a village of Khwarizm, studied at Bokhara and Samarkand, and enjoyed the fellowship of the jurists of Bagdad. For many years he stayed at Mecca, from which circumstance he was known as Jar-ul-ullah ("God's client"). Later he returned to Khwarizm, where he died at the capital Jurjanvya. In theology he was a pronounced Mo'tazilite (see MAHOMMEDAN RELIGION: section Sects). Although he used Persian for some of his works he was a strong supporter of the superiorty of the Arabic language and an opponent of the Biharti movement. Zamakhshari's fame as a commentator rests upon his commentary on the Kifah al-Kifah, or the Releaver (. Its spirit of Mo'tazilite theology it was famous among scholars and was the basis of the widely-read commentary of Baidhawi (q.v.). It has been edited by W. Nassau Lees (Calcutta, 1856), and has been printed at Cairo (1890). Various glosses on it have been written by different authors. His chief grammatical work is the Kitab ul-mujazal, written about 1120 and edited by J. P. Broch (2 nd ed., Christiania, 1879). Many commentaries have been written on this work, the fullest being that of Ibn Ya'ish (d. 1243), edited by G. Jahn (2 vols. 1878-80). Of his lexicographical works the Kitab Muqaddimat ul-Adab was edited as Samachshari Lexicon Arab. Pers. (ed. J. G. Wetstein, 2 vols., Leipzig, 1844), and the A'is al-balaghah, a lexicon of choice words and phrases, was printed at Bulâq, 1882. Of his adab works the Nawâshîg ul-kalim, an anthology, was edited by H. A. Schultens (Leiden, 1772), by B. de Meynard in the Journal asiatique, ser. 7, vol. vi., pp. 313 ff. (cf. M. de Goeje in Zeitschr. d. deutsch. morg. Phil., 1872, xxvii. 13, 1878). The A'tah ul-Dhiklah was edited by J. von Hammer-Purgstall (Vienna, 1835); by H. L. Fleischer (Leipzig, 1835); by G. Weil (Stuttgart, 1863); and by B. de Meynard (Paris, 1876; cf. de Goeje as above). (G. L. T.)

Zambezi, the fourth in size of the rivers of Africa, and the largest of those flowing eastwards to the Indian Ocean. Its length (taking all curves into consideration) is about 2200 m. The area of its basin, according to Dr Bludau, is 53,590 sq. m.,
or rather than half that of the Nile. The main channel is clearly marked from beginning to end. The river takes its rise in 11° 31' 5" S., 24° 22' E. The source lies in British territory in a depression of an undulating country 5000 ft. above the sea, covered with bracken and open forest. The river, like that of all the rivers of the neighbourhood, issues from a black marshy basin of gently rolling and well-defined country.

In the first hundred miles of its course the river is known as the Zambeze—in sound almost identical with its name in its lower course, though intervening sections are known as Liami-behe, Liiambai, &c. Eastward of the source the water-parting between the Congo and Zambeze basins is a well-marked belt of high ground, falling abruptly north and south, and running nearly east and west between 11° and 12° S. This distinctly cuts off the basin of the Luapula (the main branch of the upper Congo) from that of the Zambeze. In the neighbourhood of the source, however, the water-parting is not so clear, but the two river systems do not connect.

The Upper River.—The infant Zambeze, after pursuing a south-western course for about 150 m., turns more directly south and, soon after the 12° S. is crossed, is joined by a stream (coming from the south-west) at the mouth of Lake Dilolo, 4000 ft. above sea-level in 11° 50' S., 22° 10' E. Lake Dilolo was at one time believed to communicate with the Kasai river, one of the great affluents of the Congo flowing north-west, but this is not the case. Lake Dilolo was the only Zambeze tributary before the confluence with that river after heavy rain. The Zambeze as it flows southward receives on either side numerous small tributaries. A few miles above the source the Zambeze narrows, picturesque and tortuous, suddenly widens from 100 to 150 yds. at Kakengi a number of rapids ending (13° 7' S.) in the Sapumapata cataracts. At this point the river flows tumultuously through a rocky gorge.

The first of its large tributaries to enter the Zambeze is the Kafukwe, a left-hand affluent. It joins the main stream in 14° 26' S. A little lower down (in 14° 18' S.) the Zambeze receives from the west the waters of a much larger stream than the Kafukwe, namely, the Lungwebunga. (For details concerning these and the other chief tributaries of the Zambeze, see below.) The savannah forest which characterizes the upper course gives place to a more open bushy valley, studded with Borassus palms. Dense vegetation is confined to narrow strips of wooded forest which skirt the first few hundred yards of the sources of the Zambeze and its tributaries during the first 100 m. or so. The land, from 9000 ft. at the source, gradually to 3500 ft. at Kakengi—a distance of 220 m. From this point until the Victoria Falls are reached (500 m.)—the valley of the Zambeze basin is very uniform, the entire course being about 212 m. Twenty miles below the confluence of the Lungwebunga the country becomes flat, and in the rainy seasons is largely covered by floods. Some 50 m. farther on, the river receives a second large tributary from the south-east, draining a large area to the westward, joins the Zambeze. A few miles higher up on the east the main stream is reinforced by the waters of the Luena. On the same (eastern) side a little below the junction of the Luena with the Zambeze, near what is called Barote (q.v.), a branch of the Zambeze, the river which for some distance has had a slight western as well as southern trend, now turns distinctly south-east. Farther downstream the river continues to receive numerous small streams, but on the west is without tributaries for 150 m., when the great river formerly named the Chobe, but known to the natives as Kwando or Linyante, joins it in (17° 47') S. Before this junction is effected, the Congo Falls, the work of erosion (16° 40' S.), offer an interruption to navigation, whilst below the falls are numerous rapids. The western bank of the Zambeze, which in this part of its course is very tortuous, is German territory from 17° 40' south to 18° 15' south, and the Mudimba, a very considerable navigable stream, joins the main stream—int the confluence of the Kafukwe, including the right or northern bank of the lower course of the last-named river; this narrow strip of land, known as the German South-West Africa expressly to allow Germany access to the Zambeze.

Below the junction the river and the Zambeze river bends almost due east. The stream has hitherto flowed, in the main, a gentle steady current, the depth of water, owing to the breadth of the channel, not being great. But its character is about to change. As it flows eastward towards the border of the great salt desert of Africa it reaches a tremendous chasm in the floor of the desert. Here the Victoria Falls (q.v.), the largest waterfalls in the world, are formed.

The Middle Zambeze.—The Victoria Falls are reached some 60 m. after the junction is passed. Below the falls the river continues to flow due east for about 120 m. It then cuts its way through perpendicular walls of basalt from 60 to 100 ft. apart. This scenic canyon, named by Major St Hill Gibbons The Devil’s Gorge, is 8 m. long. Towering over the rocks which form the banks of the river are precipitous hills, 700 to 800 ft. high. The river flows swiftly through the gorge, the current being continually interrupted by reefs. Beyond the gorge are a succession of rapids, engage by the waters of which those cataracts are called the Lower Zambeze or the Lower Falls. In this distance the fall of the river is 500 ft. From the Devil’s Gorge the Zambeze takes a decided trend north whilst still pursuing its general easterly course. For the next 700 m. until the Victoria Falls, the Zambeze is a broad and well-marked river, with well-defined and occasionally rocky banks. Besides the rapids already mentioned there are several others in the middle stretch of the Zambeze, usually with impounding lakes of a low water. One of the most difficult passages is that of a grand gorge, little more than 1 mile across at the mouth of the Luangwa, in about 3° S., named by Major Gibbons Livingston’s Karina, in distinction from a second Karina (18° 20' N.) little less than half a mile across. Between the two gorges the river is generally unobstructed, but at the western end of the second Karina navigation is dangerous at low water, especially of the Shire (q.v.) the Luangwa and the Kafukwe (also called Kafo) are mostly blocked and there are no well-defined and large tributaries of the Zambeze. The Kafukwe joins the main river in 15° 57' S. in a quiet deep stream about 200 yds. wide. From this point the northward end of the Zambeze is checked and the stream continues due east. At the confluence of the Luangwa (18° 37' S.) it enters Portuguese territory, and from this point to the sea both banks of the river belong to that kingdom. At the Kebrabasa Rapids the Zambeze is sharply deflected to the south, the river at this point breaking through the continental escarpment to reach the sea. The Kebrabasa Rapids, which extend about 45 m., are reckoned taking a detour of 70 m.—are absolutely un navigable, and with the exception of the Zambeze as definitely ends as does the upper river at the Victoria Falls.

The Lower Zambeze.—The lower Zambeze—500 m. from Kebrabasa Falls to the sea—proceeds in a north-easterly direction, with a marked shallowness of the stream in many places in the dry season. This shallowness arises from the different character of the river basin. As in the upper and middle Zambeze, flowing mainly through hilly country with well-defined water-partings the river traverses a broad valley and spreads out over a large area. Only at one point, the Lupata Gorge, 200 m. from its mouth, is the river confined between high hills, 600 to 700 ft. high, and the width of the river is from 3 to 5 m. wide, flowing gently in many streams. The riverbed is sandy, the banks are low and reed-fringed. At places, however, and especially in the rainy season, the streams unite into one. One of these swift-flowing streams, the Gonye, 1 m. wide, drains the country to the south of the Zambeze. The Gonye receives the drainage of Lake Nyasa through the river Shiré. Approaching the ocean, which it reaches in 18° 50' S., the Zambeze splits up into a number of branches and forms a wide delta. Each of the four principal mouths—Milambe, Komporo, Luamo and Timbwe—is obstructed by a sand-bar. A more northerly branch, called the Chiune mouth, has a minimum depth at low water of 7 ft. at the entrance, and of 12 ft. farther in, and is the branch used for navigation. Sixty miles farther north is a river called the Qua-Qua or Quilimane, from the town founded by the Portuguese at its mouth. This stream, which is sitting up, receives the drainage of the southernmost branch.

The region drained by the Zambeze may be represented as a vast broken-edged plateau 3000 or 4000 ft. high, composed in the main of rock cut out by the Kebrabasa Falls, and of weathered rocks of the Victoria Falls. At Shupanga, on the lower Zambeze, the sandstone strata of grey and yellow sandstones, with an occasional band of limestone, crop out on the bed of the river in the dry season, and the lower gorges and oxbow lakes, formed by the backwash of the sands of coal. Coal is also found in the district just below the Victoria Falls. Gold-bearing rocks occur in several places.

Four Thousand Miles of Navigable Water.—As a highway into the interior of the continent the Zambeze, like all other large African rivers, in greater or less degree, suffers on account of the bar at its mouth, the shallowness of its stream, and the rapids and cataracts which interrupt its course. Nevertheless its importance to commerce is enormous, and it is likely to assume, as all the other great waterstretches will show, the first place among them.

(1) From the sea to the Kebrabasa Rapids, 400 m. (2) From Chikoa (above Kebrabasa) to within 140 m. of the Victoria Falls, 50 m. (3) From the rapids above the Victoria Falls to the Katimba Molilo Rapids, 10 m. (4) From Kebrabasa Rapids to the Tapuma cataract, 300 m. (5) Above the Tapuma cataract, 120 m. Thus for 1620 m. of its course the Zambeze is navigable, and only for 1790 m. is the obstruction caused by the Kebrabasa Rapids removed, there would be a clear passage from the sea almost to the foot of the cataracts below the Victoria Falls. The difficulty at Kebrabasa was removed either by the building of a dam to convert the gorge into a lake, to be connected with the river below by a lock and weir, or by the removal of the obstruction. The latter is also navigable for many miles. The Lungwebunga, which enters the upper river, is navigable for a long distance, thus supplying communication with the extreme north-west corner of the Zambeze basin. Parts at least of the Lower Zambeze, Kafukwe, Lowerly, and the Kungwe tributaries are also capable of being navigated. The possibility of connecting the
ZAMBOANGA—ZAMINDAWAR

Kwando with the navigable waters of the Okavango, at the point where the overflow mentioned below takes place, has likewise been suggested. The Shirí is also navigable for a considerable distance.

The sum of such navigable reaches within the Zambezi basin as exist, is nearly 4000 m. in extent.

Tributaries.—The tributaries of the Zambezi are very numerous. The course of the most important streams is as follows: The Kabombo, which flows in the east in about 14° 30' S., and from its confluence with the E. Luangwa, forms the eastern watershed between the Zambezi and Congo systems. In 13° 5' S. it receives the right bank a tributary, the Lunga, said to have been named by the Portuguese, which is itself a tributary of a river of the middle Zambezi, which enters the Zambezi from the west in 14° 35' S., is a strong, deep stream 200 yds. wide in its upper course, flowing in a valley bordered by undulation. One of its affluents, the Luanga, is also a good navigable river, its door forming at times an inundated plain 2 to 3 m. wide.

The Kwanza, largest of the western affluents of the Zambezi, formerly known as the Chocal and Chocul, it is spoken of as the Loxa, from ruined capital of the Makoloko, situated on its lower course, rises in about 12° 40' S., 18° 50' E., and flows in a generally straight course south-east to 17° 30' S., at which point it makes a sudden bend to the south, before it enters the Zambezi. In this eastward stretch the Kwando for some 70 m. flows through a vast reedy swamp or lake studded with alluvial islands. Apart from its head-streams, it receives most of its tributaries, and to the east, of its mouth is the great river Magwe'kwanza, which in time of flood receives some of the surplus waters of the Okavango (see Ngami). This surplus water, received above, is one of the most important climbs passed, raises the level of the lake and holds up the waters of the Kwando for some miles above it.

Of the streams which enter the upper Zambezi from the east, the largest is the Lufwanyama which rises in 16° 35' S., 26° E., and flows first north-west, afterwards west-south-west, joining the main river a little north of 15° S. Others are the Njoko, joining in 17° 8' S., the Machili, which enters in about 25° E., the Lumbi, 16° 45' S., and the Ungwezi, 17° 35' S. The largest tributary of the middle Zambezi—the Kafukwe—rises in about 11° 35' S. at an elevation of 4200 ft. in thick forest country. The main head-stream, which flows first south-east, afterwards south-west, is joined in 14° 35' S. by the Lunga or Luanga, an important right-bank tributary, the united stream then flowing south, afterwards due east. The lower Kafukwe is a large navigable river until about 40 m. from its mouth, as it then descends the plateau by a series of falls and cataracts, the drop being over 1000 ft. in 15 m., one very high fall occurring in a stupendous chasm. The next great tributary to the east is the Loangwa (also called Luangwa) which in its upper course runs parallel to the western shores of Lake Nyasa, having its source not far from the north-west corner of the lake. The main stream flows in a generally level valley bordered by low plateaux, and enters the most part shallow and rapid, though fairly wide. In 14° 30' S. however, it passes through narrow gorges with a speed of 8 or 9 m. an hour. In 15° 5' S. it is joined by the Lusnefwa, which, with its tributaries, forms an important part of the western drainage, and in its basin being separated by the Mchinga mountains from that of the Loangwa. The Loangwa joins the Zambezi a little above the town of Zumbo. For some distance prior to its confluence from the south, to Portuguese and British territory. From the south the middle Zambezi receives various rivers which water northern Matabele and Mashona lands—namely, the Shangani, Sanyati, and Hanyavu besides minor streams. The Mazoe, which also rises in Mashonaland, joins the Zambezi below the Kebrabasa Rapids.

Exploration of the River.—The Zambezi region was known to the early geographers as the empire of Mononapata and the course of the river, as well as the position of Lakes Ngami and Nyasa, was filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambezi was David Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he ascended the Zambezi to its mouth and in the course of this journey discovered the Victoria Falls. During 1855-60, accompanied by Dr. (afterwards Sir) John Kirk, Livingstone ascended the middle course of the river, and for several years was tracing the course of its tributary the Shirí and discovering Lake Nyasa. For the next thirty-five years practically no additions were made to our knowledge of the river system. In 1886 the entrance of waters from the sea was much facilitated by the discovery by Mr. D. J. Rankin of the Chinde channel north of the main mouths of the river. Major A. St Hill Gibbons and his assistants, during two expeditions, in 1895-96 and 1898-1900, ably continued the work of exploration begun by Livingstone in the upper basin and central course of the river. Of non-British travellers Major Serpa Pinto examined some of the western steamers of the river and made measurements of the Victoria Falls (1858). Steamers had been used on the lower river—the "Ma-Robert" and the "Pioneer"—by the Livingstone expedition of 1858-61, but the utilization of the Zambezi as a commercial highway was impossible until after the discovery of the Chinde mouth. The first steamer placed on the river above the Kebrabasa Rapids was the "Constance" launched by the Gibbons expedition at Chikoa in September 1858. She steamed to beyond the Guay confluence, and being ultimately stranded, the Government of the Native State of the middle Zambezi. The first steamer placed on the river above the Victoria Falls was the "Livingstone," launched in August 1902.

See David and Charles Livingstone, Narrative of an Expedition to the Zambezi and its Tributaries (1856); A. de Serpa Pinto, How I Crossed Africa (1881); D. J. Rankin in Proc. R. G. S. (March, 1890); A. Sharpe, ibid. (December, 1890); H. S. Bivar, "Curso medio do Zambeze," B. S. G. Lisboa, vol. xxiv. (1906); G. W. Lamplugh in Geo. J., vol. xxxi. (1908); F. Colillard, On the Threshold of Central Africa (London, 1897), and A. St H. Gibbons, Africa from South to North through Mozambique (2 vols., London, 1869), which gives a vivid account of the river and its navigability by the upper Zambezi valley (with map). The last-named author has kindly revised the account given above.

ZAMBOANGA, the capital of the Moro Province, and of the District (or Comandancia) of Zamboanga, and a port on the island of Mindanao, Philippine Islands, at the S. extremity of the western peninsula. Pop. (1903) 3281; of the comandancia, 26,092. Zamboanga has one of the most healthful sites in the islands, its climate being decidedly cooler than that of Manila. Since the American occupation the trade has greatly increased and various improvements have been made, and the city, which has been largely built by the Moros, is of considerable extent.

ZAMINDAWAR, from (Persian zamīn= "land"), an Indian landholder. In official usage the term is applied to any person, whether owner of a large estate or a cultivating member of a village community, who is recognized as possessing some property in the soil, as opposed to the ryot (q.v.), who is regarded as having only a right of occupancy, subject in both cases to payment of the land revenue assessed on his holding. The zamindari system obtains throughout northern and central India, and also in the permanently settled estates of Madras.

The raja of Benares had certain special rights as zamindar, and in 1910 it was arranged to make part of his "family domain" a new native state with an area of 887 sq. m. (pop. 362,000).

ZAMINDAWAR, a district of Afghanistan, situated on the right bank of the Helmund river to the N.W. of Kandahar, bordering the road which leads from Kandahar to Herat via which the southern entrance of the Durain passes. It is a well populated, and fertile valleys watered by important affluents of the Helmund. The principal town is Musa Kala, which stands on the banks of a river of the same name, about 60 m. N. of Girishk. The whole of this region is a well-known hotbed of fanaticism, the headquarters of the Achakzais, the most aggressive of all Durani tribes. It was from Zamindawar that much of the strength of the force which besieged Kandahar under Ayub Khan in 1888 was derived; and it was the Zamindar...
dawar contingent of tribesmen who so nearly defeated Sir Donald Stewart's force at Ahmad Khel previously. The control of Zamindawar may be regarded as the key to the position for safeguarding the route between Herat and Kandahar.

ZAMORA, an inland province of north-western Spain, one of the three into which the former province of Leon has since 1833 been divided; bounded on the W. by Portugal and Orense, N. by Leon, E. by Valladolid, and S. by Salamanca. Pop. (1900) 275,545; area, 4,907 sq. m. Zamora is traversed from east to west by the river Duero or Douro (q.v.), which receives within the province the Valderaduey on the right, and the Guareña on the left; the Turmes also skirts the southwestern boundary for some 25 m. Except in the north-west, where it is entered by two outlying ridges of the Cantabrian Mountains, the Sierra de la Culebra and Sierra de Peña Negra, the surface consists of a level or slightly undulating plateau; its lowest point is 1970 ft. above sea-level. Its plains, especially the valley of the Esla, yield large quantities of grain and pulse; wine and flax also are produced; and on the higher grounds large numbers of merino sheep and goats are reared, chiefly for export to Portugal. The manufactures of Zamora are unimportant, and consist largely of spinning, weaving, and the building of mules' and goats' saddles. The province lies between Salamanca on the S., and Medina del Campo on the E., traversed by the provinces of Zamora; there is a lack of good roads, and it is largely for this reason that the mines and extensive forests are neglected. The only towns with more than 5000 inhabitants are Zamora (pop., 1900, 16,287) and Toro (8379), which are described in separate articles. The people of the province are very poor, badly educated, and lacking in enterprise. (See also Leon.)

ZAMORA, an episcopal city, and the capital of the Spanish province of Zamora; on the right bank of the river Duero (Douro), and at the junction of railways from Salamanca, Medina del Campo and Astorga. Pop. (1900) 16,283. Zamora occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey. The river is crossed by a fine 14th-century bridge of sixteen pointed arches. The citadel of Zamora dates from the 8th century. The small but beautiful cathedral, one of four 12th-century churches in the city, is a Romanesque building, with a square tower, a dome above the crossing, and an elaborately-decorated interior. It was completed about 1175, and contains some interesting medieval tombs, and paintings by Fernando Gallegos (1475-1500). The other principal buildings are the 17th-century town-hall, the palace of the provincial assembly, a hospital with curious Gothic windows, an ecclesiastical seminary, and a school of engineering. The trade is chiefly agricultural, but linen and woollen goods, pottery, hats, leather, and spirits are manufactured in small quantities.

In the early period of the Christian re-conquest Zamora, from its position on the north bank of the Duero, was a place of considerable strategic importance. It was taken from the Moors by Alphonso I. of Leon in 748, but was again held by them for short periods in 813, 930, 963, 984 and 986. It was entirely repaired by Ferdinand I. of Castile and Leon, who in 1061 gave it to his daughter Doña Urraca. After his death in 1065 his son Sancho II. disputed possession with Urraca and laid siege to the city, but without success, although the famous Ruy Diaz de Bivar was among his warriors, and indeed at this time received his title of "The Cid." Zamora became subject to Alphonso VI. in 1073.

ZAMOYSKI, JAN (1547-1609), Polish statesman, was the son of Wladislaw, Count of Chelm, and Anna Herburtowna, who belonged to one of the most ancient and illustrious families in Poland. After completing his education at Paris, Strassburg, and at Padua, where as rector of the academy he composed his celebrated work De senatu romanó (Venice, 1563), he returned home in 1569, one of the most consummate scholars and jurists in Europe. His essentially bold and practical genius sought at once the stormy political arena. He was mainly instrumental, after the death of Sigismund II., in remodelling the Polish constitution and procuring the election of Henry of Valois. After the flight of that prince Zamovsky seems to have aimed at the throne himself, but quickly changed his mind and threw all his abilities into the scale in favour of Stephen Báthory and against the Austrian influence. By his advice, at the beginning of January 1576 a diet was summoned to Jedrzejow to confirm the election of Báthory, and from the time of that monarch's arrival in Poland till his death ten years later Zamovsky was his foremost counsellor. Immediately after the coronation, on the 1st of May 1576, Zamovsky was appointed chancellor, and in 1580 wielki hetman, or commander-in-chief, so that he for a time ranked as the first of all the statesmen of the kingdom. He strenuously supported Stephen during his long struggle with Ivan the Terrible, despite the obstruction and parsimony of the diet. He also enabled the king in 1585 to bring the traitorous Samuel Zborowski to the scaffold in the face of a determined resistance from the nobility. On the death of Stephen, the Zborowski recovered their influence and did their utmost to keep Zamovsky in the background. Their violence prevented "the pasha," as they called him, from attending the convention summoned to Warsaw on the death of Báthory; but at the subsequent election diet, which met at Warsaw on 15th April 1586, and was strongly attended by the Austrians, he entered in person, and intrenched himself with his partisans in what was called "the Black Camp" in contradistinction to "the General Camp" of the Zborowski. Zamovsky was at first in favour of a member of the Bóthory family, with which he was united by ties of amity and mutual interest; but on becoming convinced of the impossibility of any such candidate, he pronounced for a native Pole, or for whichever foreign prince might be found most profitable to Poland. The Habsburgs, already sure of the Zborowski, bid very high for the support of Zamovsky. But though he was offered the title of prince, with a Golden Fleece and 300,000 ducats, he steadily opposed the Austrian faction, even at the imminent risk of a civil war; and on the 19th of August procured the election of Sigismund of Sweden, whose mother was Catherine Jagiellonica. The opposite party immediately elected the Austrian Archduke Maximilian, who thereupon made an attempt upon Cracow. But Zamovsky traversed all the plans of the Austrian faction by routing the archduke at the battle of Byczyna (January 24, 1588) and taking him prisoner. From the first there was a certain coldness between the new king and the chancellor. Each had his own plan for coping with the difficulties of the situation; but while Zamovsky regarded the Habsburgs with suspicion, Sigismund III. was disposed to act in concert with them as being the natural and strongest possible allies for a Catholic power like Poland. Zamovsky feared their influence upon Poland, which he would have made the head of the Slavonic powers by its own endeavours. Zamovsky was undoubtedly most jealous of his dignity; his patriotism was seldom proof against private pique; and he was not always particular in his choice of means. Thus at the diet of 1589 he prevailed over the king by threatening to leave the country defenceless against the Turks, if the Austrians were not excluded from the succession. In general, however, his Turkish policy was sound, as he consistently adopted the Jagiellonic policy of being friendly with so dangerous a neighbour as the Porte. His views on this head are set out with great force in his pamphlet, La deféaute des Tartares et Turcs (Lyons, 1590). The ill-will between the king and the chancellor reached an acute stage when Sigismund appointed an opponent of Zamoyski vice-chancellor, and made other ministerial changes which limited his authority; though ultimately, with the aid of his partisans and the adoption of desperate expedients as the summoning of a confederation to annul the royal decrees in 1592, Zamovsky recovered his full authority. In 1595 Zamoyski, in his capacity of commander-in-chief, at the head of 8000 veterans dethroned the anti-Polish hospodar of Moldavia and installed in his stead a Catholic convert, George Mohila. On his return he successfully sustained in his camp at Cecora a siege by the Tatar khan. Five years later (October 10, 1600) he won his greatest victory at Torgoviste, when with a small well-disciplined army he routed
ZANARDELLI, GIUSEPPE (1826–1903), Italian jurist and statesman, was born at Brezica on the 29th of October 1826. A combatant in the volunteer corps during the war of 1848, he returned to Brezica after the defeat of Novara, and for a time earned a livelihood by teaching law, but was molested by the Austrian police and forbidden to teach in consequence of his refusal to contribute pro-Austrian articles to the press. Elected deputy in 1859, he received various administrative appointments, but only attained a political office in 1876 when the Left, of which he had been a prominent and influential member, came into power. Minister of public works in the first Depretis cabinet of 1876, and minister of the interior in the Cairoli cabinet of 1878, he in the latter capacity drafted the franchise reform, but credited with the obstructionist campaign of his administrative critics, particularly in regard to the Irredentist agitation, and by his theory of repressing and not in any way preventing crime, which led for a time to a perfect epidemic of murders. Overthrown with Cairoli in December 1878, he returned to power as minister of justice in the Depretis cabinet of 1881, and succeeded in completing the commercial code. Abandoned by Depretis in 1883, he remained in opposition until 1887, when he again joined Depretis as minister of justice, retaining his portfolio throughout the ensuing Crispi ministry until the 31st of January 1891. During this period he promulgated the Criminal Code, and began the reform of the magistracy. After the fall of the Giolitti cabinet in 1893, Zanardelli made a strenuous but unsuccessful attempt to form an administration. Elected president of the chamber in 1894 and 1896, he exercised that office with ability until, in December 1897, he accepted the portfolio of justice in the Rudini cabinet, only to resign in the following spring on account of dissensions with his colleague, Visconti-Venosta, over the measures necessary to prevent a recurrence of the tumults of May 1898. Returning to the presidency of the chamber, he again abandoned his post in order to associate himself with the obstructionist campaign against the Public Safety Bill (1899–1900), and was rewarded by being enabled to form an administration with the support of the Extreme Left upon the fall of the Saracco cabinet in February 1901. He was unable to achieve much during his last term of office, as his health was greatly impaired; his Divorce Bill, although voted in the chamber, had to be withdrawn on account of the strong opposition of the country. He retired from the administration on the 2nd of November 1903, and died on the 21st of December following.

ZANELLA, GIACOMO (1820–1888), Italian poet, was born at Chiampo, near Vicenza, on the 9th of September 1820, and was educated for the priesthood. After his ordination he became professor at the lyceum of his native place, but his patriotic sympathies excited the jealousy of the Austrian authorities, and although protected by his diocesan, he was compelled to resign in 1853. After the liberation of Venetia, the Italian government conferred upon him a professorship at Padua, and he achieved distinction as a poet on the publication of his first volume of poems in 1868. In 1872 grief for the death of his mother occasioned a mental malady, which led to the resignation of his professorship. After his complete and permanent recovery he built himself a villa on the bank of his native river, the Astichello, and lived there in tranquillity until his death on the 17th of May 1888. His last published volume contains a series of sonnets of singular beauty, addressed to the river, resembling Wordsworth’s “Sonnets to the Dudlton,” but more perfect in form; and a blank verse idyll, “Il Pettirozzo” (“The Redbreast”), bearing an equally strong, though equally accidental, resemblance to the similar compositions of Coleridge. His “Le Diritto” and “Il Canto del Colombo” are distinguished by great dignity. Of his other compositions, the most individual are those in which, deeply impressed by the problems of his day, he has sought to reconcile science and religion, especially the fine dialogue between Milton and Galileo, where the former, impressed by Galileo’s predictions of the intellectual consequences of scientific progress, resolves “to justify the ways of God to man.” Zanella was a broad-minded and patriotic ecclesiastic, and his character is justly held in equal honour with his poetry, which, if hardly to be termed powerful, wears a stamp of peculiar elegance and finish, and assembles a place of its own in modern Italian literature.

ZANESVILLE, a city and the county-seat of Muskingum county, Ohio, U.S.A., on the Muskingum river, at the mouth of the Licking river, about 60 m. E. of Columbus. Pop. (1890) 21,000; (1900) 23,538, of whom 1435 were foreign-born; (1910) census, 28,026. Zanesville is served by the Baltimore & Ohio, the Pennsylvania, the Cleveland, Akron & Columbus, the Ohio River & Western, the Wheeling & Lake Erie, the Zanesville & Western, and the Ohio & Little Kanawha (B. & O. system) railways, by a belt line around the city, and by the Ohio Electric, and that on 14th-Eyning O of the Scioto Canal. The city is intersected by thoroughfares of various grades, and a series of locks and dams has made navigable for small vessels to the Ohio and above Zanesville to Dresden, where connection is made with the Ohio Canal extending north to Cleveland. Within the city limits the Muskingum is crossed by seven bridges (including a notable concrete Y bridge) and the Licking by two. The business districts of the city lie on both sides of the two rivers; the residential districts being chiefly on the hills to the north and west. Among the principal buildings are the Federal building, the county court-house, the Soldiers and Sailors Monument Building, containing a large auditorium, the Masonic and Oddfellows’ temples, the Market building, containing city offices, a National Guard armoury, the John McIntire public library, the John McIntire Children’s Home (1880), the Helen Purcell home for women, the county infirmary, the Bethesda Hospital (1890), and the Good Samaritan hospital (1902; under the Franciscan Sisters). The John McIntire public library (about 20,000 volumes) is a consolidation of the Zanesville Athenaeum (1837) and the Eunice Buckingham library of the former Putnam Female Seminary (1835) here; Andrew Carnegie contributed $50,000 for the erection of the building. John McIntire (1759–1815), one of the early settlers, provided by will for the maintenance of a school for poor children, and such a school was maintained from 1836 to 1856, when it was transferred to the city school system, annual contributions being made from the fund for poor children; later the McIntire Home was founded, and in 1902 donations to the city school system were discontinued and the entire revenues of the estate devoted to the maintenance of the Home, which is a model of its kind. Zanesville is an important centre for the
manufacture of art and domestic pottery, plain and ornamental tile, building and paving bricks, and other clay products. In 1905 it ranked sixth among the cities of the country in the amount of pottery produced, and third in the degree of the specialization of that industry. In 1905 the value of all factory products was $7,047,637, of which $1,144,384 (16.2 per cent.) represented pottery, terra-cotta, and fireclay products.

Zanesville was first plated in 1807 by Ebenezer Zane (1747–1811) of Wheeling, Virginia, who was a brother of Jonathan and John McIntire, his son-in-law, of Alexandria, Va., who under an act of Congress of 1796 surveyed a road from Wheeling to what is now Maysville, Kentucky, and received for this service three sections of land. Jonathan Zane and McIntire selected the land at the point where the new road crossed the Muskingum river. The settlement was first called Westbourne and later was named Zanesville; a post office was established in 1802. Zanesville became the county-seat upon the creation of Muskingum county in 1804, was the capital of the state from 1810 to 1812, was incorporated as a town in 1814, and was chartered as a city in 1820.

ZANGWILL ISRAEL (1864– ), Jewish man of letters, was born in London on the 4th of February 1864. His early childhood was spent in Plymouth and at Bristol, where he received his first schooling. He was in his ninth year when his parents settled in Spitalfields, and he entered the Jews’ Free School, where eventually he became a teacher. Concurrently with his teaching work he took his degree with honours at London University. He had already written a fantastic tale entitled The Premier and the Paintress in collaboration with Louis Cowen, whose resignation as a doctor owing to differences with the school managers and ventured into journalism. He founded and edited Ariel, The London Puck, and did much miscellaneous work on the London press. He made his literary reputation with a novel, The Children of the Ghetto (1892), which was followed by Ghetto Tragedies (1893); The Master (1893); Dreamers of the Ghetto (1898); The Mantle of Elijah (1901); and other tales and novels of great interest dealing with Jewish life. Children of the Ghetto was produced in a play in New York with success in 1899, and has since been extensively played both in English and Yiddish. Others of his plays are: Merely Mary Ann, played at the Duke of York’s theatre, and The Serio-Comic Governor; Nurse Marjorie; and The Melting Pot, all produced in New York. Mr Zangwill was the founder of the International Jewish Territorial Organization (see Zionism).

ZANTE (anc. Zanciuthus), an island of Greece, one of the Ionian group, in the Ionian Sea, in 37° 40’ N. lat. and 21° E. long., is 25 m. long, about 12 broad, and 64 m. round, with an area of 277 sq. m., and a population in 1907 of 42,502. Zante lies 8 m. S. of Cephalonia, forming with it, Lecunis and Ithaca a crescent-shaped insular group, which represents the crests of a submerged limestone ridge facing the Gulf of Patras. Zante is of somewhat irregular oval shape, with its main axis disposed in the direction from north-west to south-east, and indented by a deep inlet at its southern extremity. The surface is mainly occupied by an extensive and highly productive central plain, skirted on the west side by a range of bare limestone hills from 1000 to 1200 ft. high, which fall gently landwards, but present bold steep cliffs towards the sea, and which culminate northwards in Mount Skopos, the ancient Elatos (1600 ft.), the highest point in the island. On the east side the plain is also limited by a low ridge, which still justifies the epithet of monteoro or the “wood,” applied by Virgil to Zacynthus. These hills are densely clothed to their summits with an exuberant growth of olives, figs, myrtles, laurels, oranges, aloes, vines and other sub-tropical plants. The central plain is highly cultivated, forming an almost continuous stretch of gardens and vineyards, varied here and there with a few patches of cornfields and pasture lands. Here is grown a peculiar dwarf vine, whose fruit, the “currant” (from “Corinth”) of commerce, forms the chief resource and staple export of Zante, as well as of the neighbouring mainland. The vine, which grows to a height of 5 ft., begins to yield in seven years and lasts for over a century. From the grape, which has a pleasant bitter-sweet taste, a wine is also extracted, which is said to excel all others in favour, fire and strength. Besides this species, there are nearly forty different kinds of vine and ten of the olive, including the karodolia, which yields the best edible olive berry. For size, vigorous growth and productiveness the olive tree of Zante is rivalled only by that of Corfu.

The island enjoys a healthy climate; and, although there are no springs, there is an abundant supply of good water obtained from the numerous springs, occurring especially in the eastern and central districts. But earthquakes are frequent and at times disastrous. During recent times the most destructive were those of 1811, 1820, 1840 and 1893; and, although the prevailing geological formations are sedimentary, chiefly calcareous, there seems no doubt that these disturbances are of igneous origin. Other indications of volcanic agency are the oil springs occurring on the coast, and even in the bed of the sea near Cape Skinari on the north side, and especially the famous pitch or bituminous wells already mentioned by Herodotus (II, 11, bk. 5.). These have been productive throughout the historic period and still yield a considerable supply of pitch. They are situated in a swamp near the coast village of Chieri, and comprise two basins, with alternate layers of water and bitumen, the lower sheet of water apparently communicating with the sea.

Zante, capital of the island, is a considerable seaport on the east side, with a population in 1907 of 13,501. It occupies the site of the ancient city of Zacynthus, said to have been founded by Zacynthus, son of a legendary Arcadian chief, Dardanus, to whom was also attributed an abundant supply of gold and copper. But of this, as well as of the temple of Artemis that formerly crowned Mount Skopos, no vestiges can now be discovered.

Traditionally the island formed part of the territory of Ulysses, king of Ithaca. It was peopled in ancient times by settlers variously represented as coming from Achaea or Arcadia. It figures occasionally in history as a base for belligerents in the Ionian Sea. Thus during the Peloponnesian War it served as a naval station for the Athenians, who again in 374 B.C. endeavoured to acquire it for a similar purpose; in 357 it became the headquarters of Dion on his expedition against Syracuse (II, 11, bk. 5.). These have been productive throughout the historic period and still yield a considerable supply of pitch. They are situated in a swamp near the coast village of Chieri, and comprise two basins, with alternate layers of water and bitumen, the lower sheet of water apparently communicating with the sea.

Zano, a folk or silly person. The word came into English in the 16th century from Ital. Zano, mod. Zanini, an abbreviation of the name Giovanni (John). This familiar form of the name was given by Italians to a special type of clown or buffoon who acted as an attendant or follower of the regular
professional clown on the stage and made clumsy and ludicrous attempts to mimic his performance.

ZANZIBAR, a sultanate and British protectorate of East Africa. The sultanate, formerly of much larger extent (see below, History), was reduced in 1890 to the islands of Zanzibar and Pemba, some adjacent islets, the nominal sovereignty of the coast line—for ten miles inland—of the protectorate of British East Africa (q.v.), and the possession, also nominal, of five ports on the Benadir coast, leased to Italy. (In 1905 the sultan of Zanzibar sold his sovereign rights to these ports to Italy. See SOMALILAND: § Italian.) The islands of Pemba and Zanzibar have a collective area of 1,920 sq. m. and an estimated population of 69,000.

Topography, &c.—The political and commercial, as well as the geographical, centre of the state is the fertile and densely peopled island of Zanzibar, which lies at a mean distance of 20 m. from the mainland, between 5° 40' and 6° 30' S. Pemba (q.v.) to the north and the more distant Mafra (to the south) form with Zanzibar an independent geological system, resting on a foundation of coraline reefs, and constituting a sort of outer coast-line, which almost everywhere presents a rocky barrier to the Indian Ocean. All things which are possessed to the north, or which are separated by shallow waters, mostly under thirty fathoms, strewn with numerous reefs dangerous to navigation, especially in the Mafa channel (Rutundu, Mafia, Zuppo, or East Africa). Some 6 m. N. of Zanzibar and forming part of the coral reef is the small, densely wooded island of Tumbatu. Its inhabitants are excellent sailors.

The island of Zanzibar is 40 m. long and 26 broad at its greatest breadth. It has an area of 640 sq. m. The island, called Unguja in Swahili, is not exclusively of coraline formation, several heights of a reddish ferruginous clay rising in gentle slopes 400 to 450 ft. in the centre and double that in the north. There are several tolerable natural harbours, used only by Arab dhows, the port of Zanzibar suffering for the general trade. The forests which formerly covered the island is now largely disappeared; the eastern half is now covered with low scrub. The western part is noted for the luxuriance and variety of its flora, notwithstanding the absence of timber trees. Among fruit-trees the coco-nut palm is conspicuous. Each tree yields 100 or 150 nuts, in a year. These, with the cocoa-groves of these trees, elsewhere the palms grow indiscriminately among other trees, which include the mangrove (in swampy districts), lemons, sugar-apples, longanias, bread fruit, papaw, pomegranate, tamarind, the orange and mango trees. The two last-named and plantains and bananas are abundant. The mango trees attain a great size. Many of the fruit-trees and plants have been introduced from India and Malayasia, such as the mango, guava, durian, cinnamon, nutmeg and cloves, all of which thrive well. The soil seems especially suited for the clove, which, although nearly destroyed by a terrible cyclone in 1872, completely recovered from the disastrous effect.

Although the fauna is almost exclusively continental, Zanzibar till recently possessed a distinct variety of monkey (Colobus kirbi), which is now very distinct. Other Educational uses. are Education and Schools. Among characteristic uses are Education and Schools. The government issues notes of 5, 10, 20, 50 and 100 rupees. British weights and measures are used in wholesale transactions, with the exception of the frasils, which equal 35 lb avoirdupois.

Religion.—Mahomedanism is the dominant religion. Most of the inhabitants are Sunnis of the Shaif school, but the sultan and his relatives are schismatics of the Ibadhi sect. There are several Protestant and Roman Catholic missions with branches on the mainland. These missions maintain schools. The government supports kuttabs in which elementary education is given in Arabic and the vernacular, and more advanced schools in which English, geography and arithmetic are taught. In December 1892 the sultan delegated to the British agent and consul-general his right to try all cases in which a British subject is plaintiff or accused, and the defendant or accused is a Zanzibar subject. The British court also tries all cases in which Europeans and Americans are concerned, the consular jurisdiction exercised by other Powers having been finally abolished in 1907. Cases between natives are tried by Moslem tribunals. There is a military police force under a British officer.

History.—From the earliest times of which there is any record the African seaboard from the Red Sea to an unknown point in South Africa was subject to the Arabian influence and domination. Egyptians, Chinese and Malays have all at various times visited the coast. At a later period the coast towns were founded or conquered by Persian and Arab Mahomedans who, for the most part, fled to East Africa between the 8th and 11th centuries on account of the religious differences of the times, the refugees being schismatic. Various small states thus grew up along the coast, Mombasa seeming to be the most important. These states are sometimes spoken of as the Zenj empire, though they were never, probably, united under one ruler. Kilwa (q.v.) was regarded as the capital of the "empire." The
seaborde itself took the name of Zanquebar (corrupted to Zanzibar by the Banyan traders), the Balid ez-Zenj, or “Land of the Zenj” of the Arabs, a term which corresponds to the Hindoo-bar, or “Land of the Hindu,” formerly applied to the west coast of India. By Ibn Batuta, who visited the coast in 1328, and other Arab writers the Zenj people are referred to in a general way as Mahommedan negroes, and they are no doubt still represented by the semi-civilized Mahometans who are now collectively known as the Swahili or “coast people,” and in whose veins is a large admixture of Asiatic blood. The Zenj “empire” began to decline soon after the appearance of the Portuguese in East African waters at the close of the 15th century. To them fell in rapid succession the great cities of Kilwa with its 300 mosques (1503), Mombasa the “Magnificent” (1505), and soon after Malindi and Mokushido the “Immensse” (Ibn Batuta). The Portuguese rule was troubled by many revolts, and towards the end of the 16th century the chief cities were ravaged by the Turks, who came by sea, and by the Zimbas, a fierce negro tribe, who came overland from south of the Zambezi. On the ruins of the Portuguese power in the 17th century was built up that of the Imams of Muscat. Over their African dominions the Imams placed vassals or viceroyes, who in time became independent of their overlords. In Mombasa power passed into the hands of the Mazrui family. The island of Zanzibar, conquered by the Portuguese in 1502–8, was occupied by the Arabs in 1530, and in 1852 the town of Zanzibar, then a place of no note, was made the capital of his dominions by the Sultan of Muscat, whose descendants were the Sultans of Zanzibar, formerly owning allegiance to the Imame. Mombasa being taken by treachery in 1837. On the death of Said in 1856 his dominions were divided between his two sons, the African section falling to Majid, who was succeeded in 1870 by his younger brother Bargash ibn Said, commonly known as sultan of Zanzibar. Bargash witnessed the dismemberment of his dominions by Great Britain, Germany and Italy (see Artica, § 5), and in March 1888 left to his successor, Sayyid Khalifa, a mere fragment of the territories over which he had once ruled. The Sayyids Majid and Bargash acted largely under the influence of Sir John Kirk (q.v.), who from 1866 to 1872 was consular representative of Great Britain at Zanzibar. By Sir John’s efforts a treaty for the suppression of the slave trade throughout the sultanate had been concluded in 1873.

In the negotiations between the Powers for the partition of Africa the supremacy of British interests in the island was acknowledged by Germany and France, thus rendering a treaty made in 1862 between France and Great Britain recognizing the “independence” of Zanzibar of no effect. On the 4th of November 1890 the sultanate was proclaimed a British protectorate, and with the cession of the islands to Great Britain on her part ceded Heligoland to Germany and renounced all claims to Madagascar in favour of France.1 Sultan (Sayyid) Ali, who had succeeded his brother Sayyid Khalifa in February 1890, in August following issued a decree which resulted in the liberation of large numbers of slaves. Sayyid Ali was succeeded in March 1893 by Hamed bin Thawin, on whose death in August 1896 his cousin, Sayyid Khalid, proclaimed himself sultan, and seized the palace. The British government disapproved, and to compel Khalid’s submission the palace was bombarded by gunboats. Khalid fled to the German consulate, whence he was removed to the mainland, and Hamed bin Mahammed, brother of Hamed bin Thawin, was installed sultan by the British representative (27th of August 1896). The government was reconstituted under British auspices in October 1891, when Sir Lloyd Mathews* was appointed prime minister, and the sultan made virtually a crown pensioner, with a civil list of 120,000 rupees. In 1897 the legal status of slavery was abolished, compensation being given to slave owners. In July 1902 Hamed bin Mahammed died, and was succeeded by his son Ali bin Hamud, born in 1885. The British government is represented by an agent and consul-general, without whose sanction no important steps can be undertaken. This officer also administered the East Africa Protectorate, but the dual appointment was found to hamper the progress of the new protectorates, and in 1904 when Mr Basil S. Cave was given charge of the Zanzibar protectorate another officer was appointed for the mainland. In 1906 the British agent assumed more direct control over the protectorate and again reorganized the administration, Capt. (locally general) A. E. H. Kalkes being appointed prime minister. These changes, together with the abolition of foreign consular jurisdiction, led to many reforms in the government and the increased prosperity of the Zanzibaris.

ZANZIBAR, an East African seaport, capital of the island and sultanate of the same name, in 6°9′ S., 36°15′ E. The town is situated on the western side of the island, 26 m. N.E. of the mainland port of Bagamoyo, which is visible from Zanzibar in very clear weather. Zanzibar is built on a triangular-shaped peninsula about a mile and a half long which runs from east to west, forming a safe and spacious roadstead or bay with a minimum depth of water exceeding five fathoms. Ocean steamers anchor in the roadstead and are loaded and discharged by lighters. The harbour, frequented by British, German and French steamers, warships and Arab dhows, affords a constant scene of animation. Viewed from the sea, the town presents a pleasant prospect with its mosques, white flat-topped houses, barracks, forts, and round towers. The most prominent buildings are the Sultan’s palace and the Government offices (formerly the British consulate), the last-named situated at the Point, the south-west horn of the bay. To the left of the palace—viewed from the sea—is the “stone ship,” a series of water tanks (now disused) the front of which is cleverly curved to resemble a ship. The town consists of two quarters—Shangani, the centre of trade and residence of the sultan, and the eastern suburb, formerly sited far from the rest of the town by the Malagash lagoon, an inlet of the sea. For the most part Zanzibar consists of a labyrinth of narrow and dirty streets, in which live the Banyans, Singalese, the negro porters, fishermen and half-castes. There are numerous markets. In Shangani are the houses of the European merchants and the chief Arabs, and the headquarters of various Protestant and Roman Catholic missions. Characteristic of the streets are the carved and massive wooden doors, whose blackness contrasts with the white stone of the houses, and the bright red of the washing in the garden enclosures. Ndla Kun or Main Road extends from the Sultan’s palace to the (new) British Agency at Mnazi Moja, a castellated building situated in beautiful grounds. Along this thoroughfare are the custom house, the post office buildings (an imposing edifice) and several consulates. In a turning off Main Street is the residence of Tipoo Tib (now an hotel). Next to this house is the English Club, and in the same street are the law courts (built 1909–10). The Anglican cathedral (built 1873–79) a semi-Gothic coral building, occupies the site of the old slave market. The Roman Catholic church in the Renaissance style—is one of the finest buildings in East Africa. On the outskirts of the town at Mnazi Moja is a public park, a golf course and cricket ground. Zanzibar is well supplied with pure water brought from the neighbouring hills.
Submarine cables connect Zanzibar with all parts of the world; while many steamships from Europe and India make it a regular port of call. It was, however, until 1910 that direct steamship communication with London was established. The average annual value of the export trade for the five years 1902–6 was: imports, £1,075,580; exports, £1,084,224. In 1907 the imports were valued at £1,232,957, the exports at £1,070,067. The figures for 1908 were: imports, £969,841; exports, £977,628. Many of the imports brought from the neighbouring mainland also figure as exports. Of these the most important are ivory, and rhinoceros horn, gum copal, hides and skins. Cloves, clove stems and copra are the chief exports, the production of the last-named of the articles, with the exception of copra, are sent to the United Kingdom; India, however, has a larger trade with Zanzibar than any other country. From it are imported food stuffs (rice, grain, flour, ghee, groceries) and piece goods. The copra is sent almost exclusively to Marseilles. The most valuable articles of import are piece goods and rice. The piece goods come chiefly from the United Kingdom, India, America and the Netherlands, the rice entirely from India. Other imports of value are building material, coal, petroleum and sugar.

The international trade of Zanzibar is indicative of the commercial importance of the city. Its geographical position has made it the key of East Africa from Cape Guardafui to Delagoa Bay. “When you play on the flute at Zanzibar” (says an Arab proverb) “all Africa as far as the lakes dances.” From the time (1832) when Seyyid Said of Muscat fixed on the town as the capital of his empire, Zanzibar became the centre of the trade between the African continent, India, Arabia and the Persian Gulf, as well as Madagascar and the Mauritius. It also speedily obtained a large trade with Europe and America. The Americans were the first among white merchants to realize the possibilities of the port, and a United States consulate was established as early as 1836. The name Merikani, applied to cotton goods and blankets on the east coast, is a testimony to the enterprise of the American trader. Zanzibar is to a greater degree than any other city the capital of negro Africa; made so, however, not by the negroes but by Arab conquerors and traders. The aspect of the city has changed since the establishment of the British protectorate, the suppression of the slave market and of slavery itself, and the enforcement of sanitation; but Professor Henry Drummond in his “Tropical Africa” sketched the characteristics of Zanzibar in pre-protectorate days when he wrote of it as a “cesspool of wickedness Oriental in its appearance, Mahommedan in its religion, Arabian in its morals . . . a fit capital for the Dark Continent.” Nevertheless Zanzibar in those days was the focus of all exploring and missionary work for the interior, the portal through which civilizing influences penetrated into the eastern section of equatorial Africa. The growth of the British and German protectorates on the neighbouring shores led in the early years of the 20th century to considerable trade which had hitherto gone through Zanzibar being diverted to Mombasa and Dar-es-Salaam, but Zanzibar maintains its supremacy as the great distributing centre for the eastern seaboard.

ZAPAROS, a tribe or group of tribes of South American Indians of the river Napo. They occupy some 12,000 sq. m. between the Napo and the Pastaza. Their only industries are hammock plaiting and fishing-net weaving. Polygamy is general. They wear a long skirt of bark fibre.

ZARA (Serbo-Croatian Zadar), the capital of Dalmatia, an ancient Roman town, is 32,506; including a garrison of 1330. Zara is situated on the Adriatic Sea, 52 m. S.E. of Trieste, and opposite the islands of Ugljan and Pasman, from which it is separated by the narrow Channel of Zara. It is the meeting-place of the provincial diet, and the seat of a Roman Catholic archbishop and an Orthodox bishop. The promontory on which it stands is separated from the mainland by a deep moat, practically making an island of the city. In 1873 the ramparts of Zara were converted into elevated promenades commanding extensive views to seaward and to landward. Of its four old gates one, the Porta Marina, incorporates the relics of a Roman arch, and another, the Porta di Terraferma, was designed in the 16th century by the Veronese artist Sanmichele. The chief interest of Zara lies in its churches, the most remarkable of which is the cathedral of St Anastasia, a fine Romanesque basilica, built between 1002 and 1005. The churches of St Chrysogonus and St Simeon are also in the Romanesque style, and St Mary's retains a fine Romanesque campanile of 1105. The round church of St Donatus, traditionally but erroneously, said to have been erected in the 9th century on the site of a temple of Juno, is used for secular purposes. The church treasuries contain some of the finest examples of medieval metalwork, especially the silver shrine or reliquary of St Simeon (1350), and the pastoral staff of Bishop Valaresco (1466). Most of the Roman remains were used in the construction of the fortifications. But two squares are embellished with lofty marble columns; a Roman tower stands on the east side of the town; and some remains of a Roman aqueduct may be seen outside the ramparts. Among the other chief buildings are the Loggia del Comune, rebuilt in 1565, and containing a public library; the old palace of the priors, now the governor's residence; and the episcopal palaces. The fortress, to the north-east of the town, is safe and spacious, and it is annually entered by about 2500 small vessels, mainly engaged in the coasting trade. Large quantities of maraschino are distilled in Zara; and the local industries include fishing, glass-blowing, and the preparation of oil, flour and wax.

In the early days of the Roman empire Zara was a flourishing Roman colony under the name of Jadera, subsequently changed to Diadora. It remained united with the eastern empire down to 968, when it sought Venetian protection. For the next four centuries it was always under Venetian or Hungarian rule, changing hands repeatedly. It was occupied by the Hungarians at the end of the 12th century, but was regained by the Venetians in 1202, with the aid of French crusaders on their way to Palestine. In 1400 it was finally purchased from Hungary by Venice for 100,000 ducats. In 1792 it passed into the possession of Austria. From 1809 to 1813 it belonged to France.

About 15 m. S.E. is Zara Vecchia, or Old Zara, an insignificant village on the site of Biograd, the former residence of the Croatian kings, which was destroyed during the wars between Venice and Hungary.

See Angelo Nani, Zara, e suoi Dintorni (Zara, 1878), and Notizie Storiche della Città di Zara, (Zara, 1883).

ZARCILLO Y ALCARAZ, FRANCISCO (1707–1781), Spanish sculptor, was born in Murcia on the 12th of May 1707. At the age of twenty he completed the statue of St Ines of Montepulciano, which had been begun for the Dominicans at Murcia by his father. On the death of the latter the care of the family fell upon Francisco, who with the help of his brothers and sisters organized a workshop. In 1765 he also founded a small academy, which, however, was speedily dissolved owing to disunion among the members. In the Ermita de Jesús in Murcia may be seen Zarcillo's scenes from the Passion of Our Lord, a vast work in which all the sculptor's qualities and defects are revealed. In the church of St Miguel are an Immaculate Conception and a St Francis. Mention should also be made of the Christ at the Well in the church of Santa Maria delas Gracias in Murcia, and of the sculptures in San Pedro and in the Capucine monastery in Murcia. Zarcillo worked in wood, which was coloured. The ascription of the stone sculptures on the façade of the St Nicolas Church in Murcia to him rests on conjecture. He died at Murcia in 1781.

See B. Haendelke, Studien zu Geschichte der spanischen Plastik (Strassburg, 1900).

ZARHÓN, a mountain in Morocco, 93 m. N. of Mequinez, on whose hillsides is the town Mulai Idris Zarhón, so called after Mulai Idris I., the founder of the Moorish empire, who was buried there in A.D. 791. The whole town is considered as a sanctuary, pays no taxes, provides no soldiers and is never visited save by Mahommedans. Near the town are the ruins
of Volubilis—Kasar Fara'on or Pharaoh's Castle, once the Roman capital, and the first home of Idris.

ZARIA, a province of the British protectorate of Northern Nigeria. It lies approximately between 5° 30' and 8° 30' E. and 6° 20' and 11° 30' N. It has an area of 22,000 sq. m. and an estimated population of about 250,000. The province, of which a great portion consists of open rolling plains, is watered by the Kaduna affluent of the Niger and its many tributaries, and is generally healthy and suitable for cultivation. The chief towns are Zaria, the capital of the emirate, 87 m. S.W. of Kano, and Zungeru, the headquarters of the British administration for the whole of Northern Nigeria. The British station at Zaria town, with an elevation of 2150 ft., has so far proved the healthiest and most agreeable point of occupation in the protectorate. The climate here for a great portion of the year is bracing, and in the cold season there is frost at night.

The British capital at Zungeru, in the south-western corner of the province, less fortunate than Zaria, has only an elevation of about 450 ft. above the sea. The climate, though better than that of Lokoja, is still relaxing and trying for Europeans. The site of Zungeru, 6° 40' 40" E. 9° 48' 32" N., was selected in 1901. By the summer of 1902 brick houses for the public departments, a residency, a hospital, barracks and a certain number of houses for the civilian staff had been erected, and the town is now a flourishing settlement, having all the appearance of an English suburban town with shaded avenues and public gardens clustering on either side of the river Dago, over which several bridges have been thrown.

Zaria is not a great grain-producing province. Its principal crop is millet, and the surplus is available for purposes of trade, and among the Mahommadan population there is a growing demand for cloth, agricultural and culinary implements, Birmingham goods, soap, oil, sugar and European provisions. The construction of roads, telegraphs and other public works consequent upon the British occupation of the province makes somewhat heavy calls upon the local labour supply and accentuates to some of the large landowners the inconvenience resulting from the abolition of the slave trade, but the practice of owning domestic slaves is not forbidden, and it is the policy of the administration to render the transition from slave labour to freedom gradual.

The ancient state of Zaria, also called Zeg-Zeg by the geographers and historians of the middle ages, was one of the original seven Hausa states. It suffered all the fluctuations of Hausa history, and in the 13th and early 14th centuries seems to have been the dominating state of Hausaland. At later periods it underwent many conquests and submitted in turn to Kano, Songhoi and Bornu. At the end of the 18th century it was an independent state living under its own Mahommadian rulers; but, like the rest of northern Hausaland, it was conquered in the opening years of the 19th century by the emissaries of the Fula Dan Fodio. It remained a Fulani emirate paying allegiance to Sokoto up to the period of the British occupation of Nigeria, January 1900. Early in 1900 a British garrison was placed at Wushishi, a town in the south-western corner of the emirate which marks the limit of navigation of the Kaduna river.

The emir of Zaria professed friendliness to the British, and at his own request British troops were quartered at his capital, in order to protect him from the threatened attacks of Kontagora. In March 1902 the province was taken under British administrative control. Throughout that year it was found that, notwithstanding his friendly professions, the emir of Zaria was intriguing with Kano and Sokoto, then openly hostile to Great Britain, while at the same time he continued, contrary to his undertaking in return for British protection, to raid for slaves and to perpetrate acts of brutal tyranny and oppression. He was deposed in the autumn of 1902, and after the Sokoto-Kano campaign of 1903, which assured the supremacy of Great Britain in the protectorate, another emir was appointed to Zaria. The new emir, Dari Siyamukan, was of sufficiently college to the British crown and accepted his appointment on the conditions required of all the Nigerian native rulers. He afterwards continued to act in loyal co-operation with the British administration.

The province has been organized for administration on a system similar to that of the rest of the protectorate. It has been divided into four administrative districts, each under a British assistant resident. A good cart road suitable for wheeled traffic has been constructed between Zungeru and Zaria, and the Kaduna has been handsomely bridged at a point near Wushishi, which is the meeting-point of main caravan roads, and whence there is at certain seasons of the year uninterrupted water carriage to the mouth of the Niger. The development of trade was further facilitated in the early days of the British occupation by the building of a light railway from Barjuku, a point on the Kaduna river below Wushishi, to Zungeru. This line was superseded by the construction, in 1907-1908, of a 3 ft. 6 in. railway from Baro, a port on the lower Niger, to Zungeru, whence the line was continued to Zaria.

The taxation scheme introduced by the British administration works satisfactorily, and the revenue shows a regular increase.

ZARLINO, GIOSEFFO (1517-1590), Italian musical theorist, surnamed from his birthplace ZARLINO CLODENSIS, was born at Chioigia, Venetia, in 1517 (not 1540, as Burney and Hawkins say). Studying in his youth for the Church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert, then choirmaster at St Mark's. Willaert, dying in 1562, was succeeded by Cipriano di Rore, on whose removal to Parma in 1565 Zarlino was elected choirmaster. Though now remembered chiefly for invaluable contributions to the theory of music, it is evident that he must have been famous both as a practical musician and as a composer; for, notwithstanding the limited number of his printed works, consisting of a volume entitled Modulazioni Sex Vocum (Venice, 1566), and a few motets and madrigals scattered through the collections of Scotto and other contemporary publishers, he both produced and superintended the public performance of some important pieces in the service of the republic. First among these was the music written to celebrate the battle of Lepanto (on the 7th of October 1571). Again, when Henry III. of France passed through Venice on his return from Poland in 1574, Zarlino directed on board the “Bucentaur” the performance of an ode for which he himself had composed the music, to verses supplied by Rocco Benedetti and Cornello Frangipani. The ode was followed by a solemn service in St Mark's, in which Zarlino's music formed a prominent feature, and the festival concluded with the representation of a dramatic piece entitled Orfeo composed by Zarlino. When the church of Santa Giulia Salute was founded in 1577 to commemorate the plague, he composed a solemn mass for the occasion. No one of these works is now known to be in existence; the only
ZARCKE—ZEALAND 961

example we possess of Zarlino's compositions on a grand scale is a MS. for four voices, in the library of the Philharmonic Lyceum at Bologna. He died in the 14th, or according to some, the 4th, of February 1590.

Zarlino's first theoretical work was the *Istituzioni Armoniche* (Venice, 1558; reprinted 1562 and 1573). This was followed by the *Dimostrazioni Armoniche* (Venice, 1571; reprinted 1573) and by the *Sopplimenti di Musica* (Venice, 1576). The last two editions of his works published shortly before his death Zarlino reprinted these three treatises, accompanied by a *Trattat On Patience*, a *Discourse on the True date of the Crucifixion of Our Lord*, an essay on *The Comparison of Surroundings*, and a *Compendium Concerning the Correction of the Julian Calendar* (Venice, 1589).1

The *Istituzioni e Dimostrazioni Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was handed down by its earlier charmers. Zarlino concisely and chiefly of the arithmetical foundations of the science, differ but little in line of argument from the principles laid down by Pietro Aron, Zacconi, and other early writers of the Boccalini school; but in bk. ii. of the *Istituzioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead. The fact that, so far as can now be ascertained, they were never strictly carried out in the Italian medieval schools, at least after the invention of counterpoint, in no wise diminishes the force of the argument. The large part of Zarlino's book is given to the phenomena of the monody, in which case, whether in the polyphonic school, in which Zarlino was educated, or in the later monodic school, of which his recalcitrant pupil, Vincenzo Galilei, was the most redoubtable champion, could those proportions lead to such an unattractive result as to be ascribed to the theorist in their mathematical aspect. So persistently does the human ear rebel against the division of the tetrachord into two greater and two lesser tones or hemitones, as represented by the fractions 4:3, 3:2, that centuries before the possibility of reconciling the demands of the ear with those of exact science was satisfactorily demonstrated, the Aristoxenian school advocated the use of a greater and a lesser semitone, sounding pleasant to the sense, in preference to an unpleasing tonality founded upon immutable proportions. Didymus, writing in the year 60, made the first step toward establishing this pleasant-sounding scale upon a mathematical basis, by the discovery of the lesser tone; but unquestionably he placed it in a false position below the greater tone. Claudius Ptolemy (190) rectified this error, and in the so-called syntonous or intense diatonic scale reduced the proportions of his tetrachord to 5:4, 4:3, 3:2, i.e. the greater tone, lesser tone, and diatonic semitone of modern music.2 Ptolemy set forth this system as one of eight possible forms of the diatonic scale. But Zarlino uncom- promisingly declared that the syntonous or intense diatonic scale was the only form that could reasonably be sung; and in proof of its perfection he exhibited the exact arrangement of its various diatonic intervals, to the fifth inclusive, in every part of the diapason or to the octave (100, 119). These arrangements are now generally accepted in the system called "just intonation." But this system is practically only by the voice and instruments of the violin class. Every scale as a rule, is inexpressibly pleasant. To meet this exigency, Zarlino proposed that for the lute the octave should be divided into twelve equal semitones; and after centuries of discussion this system of "equal temperament," which has, with only slight modifications, been generally adopted, is considered by many as the best attainable for key instruments of every description.3

Again, Zarlino was in advance of his age in his classification of the ecclesiastical modes. These scales were not, as is vulgarly supposed, wholly abolished in favour of our modern tonality in the 17th century. Eight of them, it is true, fell into disuse; but the medieval Ionian and Hypo-Ionian modes are absolutely identical with the modern natural scale of C; and the Aespalodian and Ascalonian modes differ from our minor scale, not in constitution, but in treatment only. Medieval composers, however, regarded the Ionian mode as the least perfect of the series and placed it last in order of execution among the more perfect modes. We shall not change all the others to accord with it. His numerical table, therefore, differs from all others made before or since, prophetically assigning the place of honour to the one ancient scale now recognized as the modern.4

These innovations were violently opposed by the apostles of the monodic school. Vincenzo Galilei led the attack in a tract entitled

1 Ambros mentions an edition of the *Istituzioni* dated 1557, and one of the *Dimostrazioni* dated 1562. The present writer has never met with either.

2 Zarlino gives the fractions in the order in which they occur in the modern system. Ptolemy, following the Invariable Greek method, placed them thus—[ ]  ½  [ ] . This, however, made no difference in the actual proportions.

3 Again, the Ionian, the organ, in 1835; in England, for the pianoforte in 1846 and for the organ in 1854. Bach had advocated it in Germany a century earlier; but it was not generally adopted.

4 Discoro Intorno alle Opere di Messer Gioseffo Zarlino, and followed it up in his famous Dialogo, defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Sopplimenti*.
12th century, contains the tombs of the poet Holberg (d. 1754) and of some of the Danish kings. Slagelse in the west, an agricultural centre, is an ancient town dating back to the 12th century. Here Hans Christian Andersen, the poet, received part of his education. Korsør is an important seaport. (5) Præstø, the most southerly county. The capital, Præstø, is a small port on the inner lagoon of a bay of this name, on the east coast. In the west is the ancient town of Næstved; in the south, Vordingborg, with a ruined castle and a small harbour. The railway here crosses a great bridge on to the small Masnedø, whence there is a ferry to Orchöved on Falster island, a link in the direct route between Copenhagen and Berlin.

**ZEBRA**, the name used for all the striped members of the horse-tribe, although properly applicable only to the true or mountain zebra. The latter species (*Equus zebra*) inhabits the mountainous regions of the Cape Colony, where, owing to the advances of civilized man into its restricted range it has become very scarce, and is even threatened with extermination, but it exists in the form of a local race in Angola. The second species, Burchell's zebra (*Equus burchelli*), is represented by a large number of local races, ranging from the plains north of the Orange river to north-east Africa.

*Equus zebra* is the smaller of the two (about 4 ft. high at the shoulders), and has longer ears, a tail more scantily clothed with hair, and a shorter mane. The general ground colour is white, and the stripes are black; the lower part of the face is bright brown. With the exception of the abdomen and the inside of the thighs, the whole of the surface is covered with stripes, the legs having narrow transverse bars reaching quite to the hoofs, and the base of the tail being also barred. The outsides of the ears have a white tip and a broad black mark occupying the greater part of the surface, but are white at the base. Perhaps the most constant and obvious distinction between this species and the next is the arrangement of the stripes on the hinder part of the back, where there are a number of short transverse bands reaching to the median longitudinal dorsal stripe, and unconnected with the uppermost of the broad stripes which pass obliquely across the flanks towards the root of the tail. There is often a median longitudinal stripe under the chest.

Typically, Burchell's zebra, or the bonte-quagga (*Equus burchelli*), is a rather larger and more robust animal, with smaller ears, a longer mane, and fuller tail. The general ground-colour of the body is pale yellowish brown, the limbs nearly white, the stripes dark brown or black. In the typical form the stripes do not extend on to the limbs or tail; but there is a great variation in this respect, and as we proceed north the striping increases, till in the north-eastern *E. burchelli granti* the legs are striped to the hoofs. There is a strongly marked median longitudinal ventral black stripe, to which the lower ends of the transverse side stripes are usually united, but the dorsal stripe (also strongly marked) is completely isolated in its posterior half, and the uppermost of the broad haunch stripes runs nearly parallel to it. A much larger proportion of the ears is white than in the other species. In the middle of the wide intervals between the broad black stripes of the flanks and haunches fainter stripes are generally seen. It is closely allied to the quagga, but the typical form, in which the resemblance is closest, is extinct. The Abyssinian and Somali Grévy's zebra (*E. grevyi*) is markedly distinguished by its enormous ears and more numerous and narrower black stripes. The flesh of Burchell's zebra (or quagga, as it is often called) is relished by the natives as food, and its hide is very valuable for leather. Although the many attempts that have been made to break in and train zebras for riding and driving have sometimes been rewarded with partial success, the animal has never been domesticated in the true sense of the word (see *Horse*).

**ZEBULUN**, a tribe of Israel, named after Jacob's sixth "son" by Leah. The narrator of Gen. xxx. 20 offers two etymologies of the name, from the roots *z*-b-*d*, "give," and *z*-b-*l*, "exalt." 1 The country of Zebulun lay in the fertile hilly country to the north of the plain of Jezreel, which forms the first step towards the mountains of Asher and Naphtali, and included the goodly upland plain of el-Bat'tot. The description of its boundaries is obscure, owing in some measure to its position between Issachar and Naphtali, with one or the other of which it is frequently combined. At one point Zebulun, like Dan and Asher (Judges v. 17), would seem to have reached the sea and bordered on Phoenician territory (Gen. xlix. 18, Deut. xxxii. 18 seq.). In the latter passage allusion is made to a feast upon a sacred mountain held by Zebulun and Issachar in common, and to the wealth these tribes derived from commerce by sea. Zebulun had a chief part in the war with Sisera (Judges iv. 6, v. 18; see *Deborah*); it is said to have furnished at least one of the "judges," Elon the Zebulonite (Judges xii. 11 seq.); and the prophet Jonah, who foretold the victories of Jeroboam II., came from the border town of Gath-hepher (probably the modern el-Meshhedh) (2 Kings xiv. 25). The deportation of the northern tribes under Tiglath Pileser IV. (2 Kings xv. 29) appears to have included Zebulun (Isa. ix. 1). Nazareth lay within the territory of Zebulun but is not mentioned in the Old Testament.

**ZECHARIAH,** son of Berechiah, son of Iddo (or by contraction, son "of Iddo"), a prophet of the Old Testament. He appeared in Jerusalem along with Haggai (q.v.), in the second year of Darius Hystaspis (520 B.C.), to warn and encourage the

---

1 A connexion with a divine name (cf. Baal-Zebul) is not improbable; see H. W. Hogg, *Ency. Bib.*, art. "Zebulun."
An appendix follows (vi. 9−15). Jews from Babylon have brought gold and silver to Jerusalem; of these the prophet must not approve. The design of the temple is now described; the house and altar are to be built by the labor of the exiles; the high priest is to sit on the throne, but retain a good understanding with the high priest. Zerubbabel is certainly here meant, and, if the reading of the text names Joshua instead of him (v. 11), this is only a correction, made for reasons easy to understand, which breaks the context and destroys the sense and the reference of "them both" in verse 13.

The third section (chaps. vii.–viii.), dated from the fourth year of Darius, contains an inquiry whether the fast days that arose in the captivity are still to be observed, with a comforting and encouraging reply of the prophet.

Thus throughout the eight chapters the scene is Jerusalem in the early part of the reign of Darius. Zerubbabel and Joshua, the prince and the priest, are the leaders of the community. The great concern of the time and the chief practical theme of these chapters is the building of the temple; but its restoration is only the earnest of greater things to follow, viz., the glorious restoration of David's kingdom. The horizon of these prophecies is everywhere limited by the narrow conditions of the time, and their aim is clearly seen. The visions hardly veil the thought, and the mode of expression is usually simple, except in the Messianic passages, where the tortuousness of thought and phraseology seems to suggest some affinity between some notions evidently not first framed by the prophet himself and the prologue to Job—the heavenly hosts that wander through the earth and bring back their report to Yahweh's throne, the figure of Satan, the idea that suffering and calamity are evidences of guilt and of accusations presented before God.

Passing from chaps. i.–vii. to chaps. ix. sqq., we at once feel ourselves transported into a different world.

(1) Yahweh's word is accomplished on Tyre-Phoenicia and Philistia; and then the Messianic kingdom begins in Zion, and Judah and Jerusalem are set free. Some, however, have pointed to the catastrophe of the "land of the north" as near to come; then the exiles of Zion shall stream back from all quarters, the converted nations and the scattered tribes, and dwell in the midst of the mountain all the time. Hence the destruction of all these others is pointed out as evidence that the jewels of former days, the foundations of the mountain and its temple, shall not be lost, and that Zerubbabel, who in all other places is mentioned along with Joshua, is on the point of ascending the throne of his ancestor David. The jewel with seven facets is already there, the inscription only has still to be engraved on it (iii. 9). The charges brought against the high priest consist simply in the obstacles that have hitherto impeded the restoration of the temple and its service; and when the land (iii. 9) is simply the still continuing domination of foreigners.

iv. 1–14. Beside a lighted candlestick of seven branches stand two olive trees—Zerubbabel and Joshua, the two anointed ones, and for a period of 50 years the shepherd of the sheep of the Lord through the whole earth. This explanation of the vision is separated from the description by an animated dialogue, not quite clear in its expression, in which it is said that the mountain of obstacles shall disappear before Zerubbabel, and that, having begun the building of the temple, he shall also bring it to an end in spite of those who now mock at the day of small beginnings.

v. 1–4. A written roll flies over the Holy Land; this is a concrete representation of the curse which in future will fall of itself on all crime, so that, e.g., no man who has suffered theft will have occasion herself to pronounce a curse against the thief (cf. Judges xii. 2).

v. 5–11. Guilt, personified as a woman, is cast into an ephah—measure with a heavy lid and carried from Judah to Chaldea, where she is put in a corner for the future.

vi. 1–8. The divine teams, four in number, again traverse the world toward the four winds, to execute Yahweh's commands. That which goes northward is charged to wreak His anger on the north country. The series of visions has now reached its close, returning to its starting-point in 1. 7 sqq.

The alleged foundation of the second temple in 536 (Ezra iii. 8−13; cf. iv. 1–5, 24) is open to doubt, because (a) the statements of the compiler of Ezra are not contemporary evidence, (b) the compiler himself admits that this work was first begun in 520 (Hag. ii. 18; Zech. viii. 9; cf. Ezra ii. 21). If on the ground of Ezra v. 16, we accept the truth of an original foundation in 536 (so Driver, Minor Prophets, p. 148), that event would place the beginning of the temple of Zerubbabel and the earlier temple of Haggai in 520, and the second temple does not begin until 516. Hence the foundation of the temple was made in 520. Wellhausen (1sr. und Jiid. Gesch., 3rd ed., p. 160) rejects the earlier foundation; on the other hand, he insists, with the majority of scholars and against Kosters, on the actual return of exiles in 537 to form the nucleus of the post-exilic community (loc. cit., p. 157 n.).
pierced”). It is taken for granted that the readers will know who the
martyr is, and the exegesis of the Church applies the passage to
Zechariah. Chap. xiii. 1-6 is a continuation of chap. xii.: the
dawn of the day of salvation is accompanied by a general purging
away of idolatry and the enthusiasm of false prophets.

The heathen gather against Jerusalem and the city, but do not utterly destroy
the inhabitants. The Yahweh, at a time known only to Himself,
and the inhabitants, with all His saints on Mount Olivet and destruction
of the heathen in battle, while the men of Jerusalem take refuge in their
terror in the great cleft, that opens where Yahweh sets His foot.
Now the new era begins, and even the heathen do homage to Yahweh
in Jerusalem. The foot of the Messiah is solid, and in the city
in Jerusalem is holy down to the bells on the horses and the cook-
ing-pots.

There is a striking contrast between chaps. i.—viii. and chaps.
ix.—xiv. The former prophecy is closely related to the situation
and wants of the community of Jerusalem in the second year of
Darius L., and relates to the restoration of the temple and,
the elevation of Zerubbabel to the throne of David. In chaps.
ix.—xiv., however, there is nothing about the restoration of
the temple, or about Joshua and Zerubbabel; but we read
of the evil rulers, foreign and native alike, who maltreat
their subjects, and enrich themselves at their expense.1 There
are corresponding differences in style and speech, and it is
particularly to be noted that, while the superscriptions in the
first part name the author and give the date of each oracle with precision, those in the second part (ix. i., xii. i.) are with-
out name or date. That both parts do not belong to the same
author is now generally admitted, as is also the fact that
chaps. ix.—xiv. are of much later date.2 The predictions of
these chapters have no affinity either with the prophecy of
Amos, Hosea, and Isaiah, or with that of Jeremiah. The kind
of eschatology which we find in Zech. ix.—xiv. was first intro-
duced by Ezekiel, who in particular is the author of the con-
ception that the time of deliverance is to be preceded by a joint
attack of all nations on Jerusalem, in which they come to final
overthrow (Ezek. xxxvii. seq.; Isa. lxvi. 18, 24; Joel). The
importance attached to the temple service, even in Messianic
times (Zech. xiv.), implies an author who lived in the ideas
of the religious commonwealth of post-exilic times. A future king
is hoped for; but in the present there is no Davidic king, only
a Davidic family standing on the same level with other noble
families in Jerusalem (xii. 7, 12). The “bastard” (mixed race)
of Ashdod reminds us of Neb. xiii. 23 sqq.; and the words of ix.
12 (“to-day, also, do I declare that I will render double
unto thee”) have no sense unless they refer back to the deliver-
ance from Babylonian exile. But the decisive argument is that
in ix. 13 the sons of Javan, i.e., the Greeks, appear as the
representatives of the heathen world-power. “This part of
the prophecy, therefore, is later than Alexander, who overthrew
the Persian empire in 333. Egypt and Assyria (x. 10, 11) must be
taken to represent the Ptolemic and Seleucid kingdoms, which
together made up for the Jews the empire of the sons of Javan.3

The whole prophecy, however, is not a unity. By reference to
the analysis given above, it will be seen that there are four sections in
Zech. ix.—xiv., viz. (1) ix. (x. 1-3?); (2) xi. 4-17, xiiii. 7-9;
(3) xiii. 1-6; (4) xiv., which are more or less independent of
each other. Section (3) is marked by the character of the
prophecy, and shows little connection with the preceding historical events
except xii. 7, which suggests the Maccabean age. On the other
hand (1) implies a period when the Jews were governed by the
Egyptians, and on section (4) the Maccabees. This section may be first directed (ix. 1, 2). This section, therefore, belongs to the
first third of the 2nd century B.C., when the Jews were first held
by the Seleucid rulers. The first reference to the annual feast of the
euphrates of.xi. 15 may be Mendeans; whilst the disinterested
speaker may be Hyrcanus ben Tobias (cf. xi. 13 and II. Macc.
iii. 11).

RECENT criticism (for further details see G. A. Smith, The Book
of the Twelve Prophets, ii. pp. 450 f., and Driver, Minor Prophets,
pp. 232-234) shows some difference of opinion as to the question
of unity, and also of actual dates within the Greek period. Whilst
G. A. Smith (following Stade) and Marti find no adequate ground
for the further division of Zech. ix.—xiv., Driver (following Nowack)
accepts the fourfold division indicated above (Four anonymous
Prophets, perhaps the work of four distinct prophets, op. cit.,
p. 235). In regard to date, G. A. Smith (here also following Stade)
accepts the earlier part of the Greek period (306-275). With this
Driver provisionally agrees, whilst Nowack thinks no more can be
said than that (1) belongs to the Greek and (2) to the post-
exilic period in general. On the other hand, Marti assigns the
whole to 160 B.C. (Maccabean period); a little after Well-
stock’s date, and with the year 162 as the latest possible year of
that age. The chief arguments to be urged against this late date
are the character of the Hebrew style (Driver, op. cit., p. 233) and
the alleged close of the prophetic canon by 200; but perhaps
more significant as these cases are, is the list of the prophet’s
six daughters. (2) (3) (4)

RECENT LITERATURE.—Nowack, Die Kleinen Propheten (1897;
ed. 2, 1903); Wellhausen, Die Kleinen Propheten,3 (1898); G. A.
Smith, The Book of the Twelve Prophets (In The Expositor’s Bible),
(1904); Driver, Minor Prophets, ii. (In The Century Bible, 1906;
the most useful for the general reader). The article in Hastings’s
Dictionary of the Bible (vol. iv., pp. 967-970) (1902), by Nowack,
is a reproduction from his work cited above; the article in the
Encyc. Bibl. by Wellhausen is a revision of his article in the 9th
edition of the Encyc. Brit., and the present independent revision
is in some points indebted to it. (J. W.: H. W. R.)

ZEDEKIAH (Hebrew for “righteousness of Yahweh”), son of
Josiah, and the last king of Judah (2 Kings xxiv. 17 sqq.; 1 Chr.
xxvi. 10 seq.). Previously known as Mattaniah (“gift of Yahweh”), he was appointed king by Nebuchadrezzar
after the capture of Jerusalem (597 B.C.) and his name changed to
Zekeiah. He held his position under an oath of allegiance,
but after three years (cf. Jehoiakim, 2 Kings xxiv. 1) began an
intrigue with Moab, Edom, Ammon, Tyre and Sidon, which
the prophet Jeremiah vigorously denounced (Jer. xxvii. seq.; cf. also
Ezek. xvii. 11-21). It is possible that he was summoned to
Babylon to explain his conduct (Jer. lii. 9; the Septuagint reads
from Zekeiah; see also xxix. 3). Nevertheless, relations
were maintained regarding the stricken land and its future
sufferings. The Babylonian army began to lay siege to Jerusalem
in the ninth year of his reign, and a vain attempt was made by Pharaoh
Hophra to cause a diversion. The headings to the prophecies in
Ezek. xxix. seq. suggest that fuller details of the events
were once preserved, and the narratives in Jer. xxxii.—xxxiv.,
xxxvii. give some account of the internal position in Jerusalem
at the time. After six months a breach was made in the city,
Zekeiah’s flight was cut off in the Jordan Valley and he was
taken to Nebuchadrezzar at Riblah. His sons were killed, and
he himself was blinded and imprisoned (cf. Ezek. xii.
10-14). Vengeance was taken upon Jerusalem, after the
seventh day of the fifth month, 586 B.C., Nebuzaradan sacked
the temple, destroyed the walls and houses, and deported the
subjects, only the poorest peasantry of the land being left behind.
See Jews (History), § 17 seq. (S. A.C.)

ZEKEAH, a town of Montagu county, Tasmania, 225 m.
direct N.W. of Hobart, on the Little Henty river. Pop. (1907)
5044. It is an important railway centre, and from it radiation
lines to Strahan, its port on the Macquarie Harbour, to Dunas,
to Williamsford, and to Burnie, where connexion is made to

1 Driver, op. cit., p. 229, who also refers to the differences of
Messianic outlook, and the substitution of an atmosphere of war
for one of peace.
2 Earlier critics made the second part the older. Chaps. ix.—xii.
were ascribed to a contemporary of Amos and Hosea, about
the time of the Babylonian captivity. They were closely connected
as well as Judah, and Assyria along with Egypt (x. 10), while
the neighbours of Israel appear in ix. 1 sq. in the same way as in
Amos i.—iv. Chaps. xiii.—xiv. were more or less formed at a later
period especially in the attack on idolatry and lying prophecy
(xiii. 1-6); but, as this prophecy speaks only of Judah and Jerusalem, it
was dated after the fall of Samaria, and assigned to the last days of
the prophetic kings on the strength of xii. 11, where an allusion
is seen by some to the mourning for King Josiah, slain in battle
at Megido.

3 What follows is summarized from Wellhausen, Die Kleinen
Propheten, pp. 190, 192, 195-197.
Launceston and Hobart. The town is lighted by electricity and has an academy of music and a state-aided school of mines. It is the principal centre of the silver-lead mining district, and has large smelting works.

**ZEELAND** (or **Zeeland**), a province of Holland, bounded S.E. and S. by Belgium, W. by the North Sea, N. by South Holland, and E. by North Brabant. It has an area of 690 sq. m. and a population (1905) of 227,292. Zeeland consists of the delta islands formed about the estuaries of the Maas and Schelde with its two arms, the Honte and Western Schelde, and the Ooster Schelde, together with a strip of mainland called Zeeland-Flanders. The names of the islands are Schouwen and Duiveland, St Flipsland, Tolen, North Beveland, South Beveland and Walcheren. The history of these islands is in every case one of varying loss and gain in the struggle with the sea. They were built up by the gradual accumulation of mud deposits in a shallow bay, separated by dunes from the North Sea. As late as the 12th and 13th centuries each of these islands consisted of several smaller islands, many of whose names are still preserved in the fertile *polders* which have taken their place. Lying for the most part below sea-level, the islands are protected by a continuous line of artificial dikes, which hide them from view on the seaward side, whence only an occasional church steeple is seen. The islands of Schouwen and Duiveland are united owing to the damming of the Dykwater; St Flipsland, or Phillipisland, and South Beveland are connected with the mainland of North Brabant by naturally formed mud banks.

The soil of Zeeland consists of a fertile sea clay which especially favours the production of wheat; rye, barley (for malting), beans and peas, and flax are also cultivated. Cattle and swine are reared, and dairy produce is largely exported; but the sheep of the province are small and their wool indifferent. The industries (linen, yarn-spinning, distilling, brewing, salt-refining, shipbuilding) are comparatively unimportant. The inhabitants, who retain many quaint and archaic peculiarities of manner and dress, speak the variety of Dutch known as Low Franckish.

The chief towns on the island of Schouwen are the ports of Zierikzee and Brouwershaven. On the well-wooded fringe of the dunes on the west side of the island are the two villages of Renesse and Haamstede, the seats in former days of the two powerful lordships of the same name. St Maartensdyk on the adjoining island of Tolen was formerly the seat of a lordship which belonged successively to the families of Van Borssele, Burren and Orange-Nassau. There is a monument of the Van Borssele family in the little church here. The first half of the 14th century was demolished in 1810. The island of South Beveland frequently suffered from inundations and experienced a particularly disastrous one in 1530. In the same century the flourishing walled town of Reimerswaal and the island of Borsele or Borse beside the waves; but the last-named was gradually recovered during the 17th century. This island gave its name to the powerful lordship of the same name. Goes is the chief town on South Beveland. Oyster-breeding is practised on the north coast of the island, especially at Wemeldinge and Ierseke or Yerseke, where fish are caught in the coasts. Ierseke was once a town of importance and the seat of a lordship, while at Wemeldinge there was formerly an establishment of the Templars. In 1856 South Beveland and Walcheren were joined by a heavy railway dam, a canal being cut through the middle of the former island to restore the connexion between the East and West Schelte. South Beveland is sometimes called the "granary" and Walcheren the "garden" of Zeeland. The principal towns in Walcheren are Middelburg, the chief town of the province, Flushing and Veere; all three connected by a canal (1867–73) which divides the island in two. The fishing village of Arnemuiden flourished as a harbour in the 16th century, but decayed owing to the silting up of the sand. Domburg is pleasantly situated at the foot of the dunes on the west side of the island, and in modern times has become a popular but primitive watering-place. It is a very old town, having received civic rights in the 13th century, and from time to time Roman remains and other antiquities have been dug out of the sands. Between Domburg and the village of Westkapelle there stretches the famous Westkapelle sea-dike. The main island of Zeeland—Flanders was formerly also composed of numerous islands which were gradually united by the accumulation of mud and sand, and in this way many once flourishing commercial towns, such as Sluis and Aardenburg, were reduced in importance. The famous castle of Sluis, built in 1385, was partly blown up by the French in 1794, and totally demolished in 1818. Yzendeijke represents a Hanse town which flourished in the 13th century and was gradually engulfed by the sea. Similarly the original port of Brekens was destroyed by inundations in the 15th and 16th centuries. The modern town rose into importance in the 15th century on account of its good harbour. The old towns of Axel and Halst were formerly important fortresses, and as such were frequently besieged in the 16th, 17th and 18th centuries. Ter Neuzen was strongly fortified in 1833–39, and has a flourishing transit trade, as the port of Ghent, by the canal constructed in 1825–27.

**ZEERUST**, a town of the Transvaal, 140 m. by rail, via Krugersdorp, N.N.W. of Pretoria and 33 m. N.E. of Malekping. Pop. (1904) 1915. It was founded in 1868 and is the chief town of the Marico district, one of the most fertile regions of South Africa. In the neighbourhood are lead, zinc and silver mines, and some 20 m. S. are the Malmuli goldfields. The Marico river was once a flourishing gold mine, but now belongs to the Maures, who had come from Zululand. They were driven out by Boer trekkers in 1837. To Boer cultivation the valley of the Marico river owes its fertility. Wheat and oats are largely cultivated and almost all sub-tropical fruits flourish. Following the relief of Malekping, 17th of May 1900, Zeerust was occupied by the British under General R. S. S. Baden-Powell. Railway connexion with Pretoria was established in 1907.

**ZEISSBERG, HEINRICH**, RITTER VON (1839–1899), Austrian historian, was born in Vienna on the 8th of July 1839, and in 1865 became professor of history at the university of Lemberg. In 1872 he removed to Innsbruck; in 1873 he was appointed professor at the university of Vienna, and here he was historical tutor to the crown prince Rudolph. In 1891 he was made director of the Vienna institute for historical research, and in 1896 director of the imperial court library at Vienna. He resigned his professorial chair in 1897 and died on the 27th of May 1899.

Zeissberg’s writings deal mainly with the history of Austria and of Germany, and among them the following may be mentioned:

- *Die polnische Geschichtsschreibung des Mittelalters* (Leipzig, 1873);

**ZEITUN** (="olive"), the name of several places in Turkey and Egypt, but principally an Armenian town in the Aleppo vilayet, altitude about 4000 ft., situated in the heart of Mt. Taurus, about 20 m. N.N.W. of Marash. The inhabitants, about 10,000, all Christians, are of a singularly fine physical type, though too much inbred, and are interesting from their historical and local position as a remnant of the ancient kingdom of Lesser Armenia. The importance of Zeitun dates from the capture of Leo VI. by the Egyptians in 1375, and it probably became then a refuge for the more active and irreconcilable Armenians; but nothing certain is known of the place till 300 years later. It long maintained practical independence as
a nest of freebooters, and it was only in 1878 that the Turks, after a long conflict, were enabled to station troops in a fort above the town. In 1890 there was a serious revolt, from the worst consequences of which the town was saved by the intervention of the British consul at Aleppo warned in time by the devoted energy of T. Christie, American missionary at Marash; and in 1895, after the Armenian massacres had commenced elsewhere, the people again rose, seized the fort, and, after holding out for more than three months against a large Turkish force, secured honourable terms of peace on the mediation of the consuls of the Powers at Aleppo. The inhabitants seem to be abandoning their robber customs and devoting themselves to oil and silk culture. In consequence transit trade through the passes of eastern Taurus (see Marash), long almost annihilated by fear of the Zeitunli marauders, revived considerably. The governor must be a Christian, and certain other privileges are secured to the Zeitunlis during their good behaviour.

ZEITZ, a town of Germany, in the extreme south of the Prussian province of Saxony, pleasantly situated on a hill on the Weiße (White) Elster, 28 m. by rail S.S.W. of Leipzig on the line to Gera, and with branches to Altenburg and Weissenfels. Pop. (1885) 19,797; (1900) 27,592. The river is here crossed by two iron bridges, and an iron railway bridge, and the upper and lower towns are connected by a funicular railway. The Gothic abbey church dates from the 15th century, but its Romanesque crypt from the 12th. The old Franciscan monastery, now occupied by a seminary, contains a library of 20,000 volumes. Just outside the town rises the Moritzburg, built in 1564 by the dukes of Saxe-Zeitz, on the site of the bishop's palace; it is now a reformatory and poorhouse. Zeitz has manufactures of cloth, cottons and other textiles, machinery, wax-cloth, musical instruments, vinegar, cigars, &c.; and wood-carving, dyeing and calico-printing are carried on. In the neighbourhood there are considerable deposits of lignite, and mineral-oil works.

Zeitz is an ancient place of Slavonic origin. From 968 till 1028 it was the seat of a bishopric, afterwards removed to Naumburg, 13 m. to the N.W., and styled Naumburg-Zeitz. In 1564 the last Roman Catholic bishop died, and his dominions were thenceforward administered by princes of Saxony. From 1563 till 1718 Zeitz was the capital of the dukes of Saxe-Zeitz or Sachsen-Zeitz. It thereafter remained in the possession of the dukes of Saxony until 1811, when it passed to Prussia. It became de facto part of Thuringia in 1861, and in 1862 under the name of Zeitz came under the administration of the kingdom of Saxe-Weimar-Eisenach.

See Rothe, Aus der Geschichte der Stadt Zeitz (Zeitz, 1876); and Lange, Chronik des Bistums Naumburg (Naumburg, 1891).

ZELLER, EDUARD (1814-1908), German philosopher, was born at Kleinbottwar in Württemberg on the 22nd of January 1814, and educated at the university of Tübingen and under the influence of Hegel. In 1840 he wrote Privatdozenten of theology at Tübingen, in 1847 professor of theology at Bern, in 1849 professor of theology at Marburg, migrating soon afterwards to the faculty of philosophy as the result of disputes with the Clerical party. He became professor of philosophy at Heidelberg in 1862, removed to Berlin in 1872, and retired in 1895. His great work is his Philosophie der Griechen (1842-53). This book he continued to amplify and improve in the light of further research; the last edition appeared in 1902. It has been translated into most of the European languages and became the recognized textbook of Greek philosophy. He wrote also on theology, and published three volumes of philosophical essays. He was also one of the founders of the Theologische Jahrbücher, a periodical which acquired great influence.

They exchanged abuse; but the Byzantine does not seem to have witnessed actual fighting. Near the river Oēkh (Syr Daria?) he was sent back to Constantinople with a Turkish embassy and with
envoys from various tribes subject to the Turks. Halting by the "vast, wide lagoon" (of the Aral Sea?), Zenemarchus sent off an express messenger, one George, to announce his return to the emperor. George hurried on by the shortest route, "desert and wasteless" apparently, the steppe north of the Black Sea; while his superior, moving more slowly, marched twelve days by the sandy shores of "the lagoon"; crossed the Emha, Ural, Volga, and Kuban (where 4000 Persians vainly lay in ambush to stop him); and passing round the western end of the Caucasus, arrived safely at Trebizond and Constantinople. For several years this Turkish alliance subsisted, while the intercourse was maintained between Central Asia and Byzantium; when another Roman envoy, one Valentín (OXLXVIXNVS), goes on his embassy in 573 he takes back with him 106 Turks who had been visiting Byzantine lands; but from 579 this friendship rapidly cooled off. The journey between the Bosporus and Transoxiana seems not to have done anything to correct, at least in literature, the widespread misapprehension of the Caspian as a gulf of the Arctic Ocean.

ZENÁGA—ZEND-AVESTA

1. The Yasna, the principal liturgical book of the Parsees, in 72 chapters (hāsti, ḫad), contains the texts that are read by the priests at the solemn yasna (Iṣṭgne) ceremony, or the general sacrifice in honour of all the deities. The arrangement of the Yasna is not merely due to the exigencies of oral recitation; there is nothing to do with the liturgical action. The kernel of the whole book, around which the remaining portions are grouped, is the Yasna (chaps. 28-54), and this is followed by a preliminary section of instructions, written in a metrical style and an archaic language, different in many respects from that ordinarily used in the Yasna. As to the place of these two books in the order in which they are arranged according to the metres in which they are written, fall into five subdivisions (28-34, 43-46, 47-50, 51, 53). Between chap. 37 and chap. 43 is inserted the so-called Seven-Chapter Yasna (Viṣpered), which was not part of the Yasna in antiquity. (b) The so-called Later Yasna (Aparô Yasna) (chaps. 54-72) has contents of considerable variety, but consists mainly of invocations. Special mention ought to be made of the Vispered (Sraosha) Yasht (67), the prayer to fire (62), and the great liturgy for the sacrifice to divinities of the water (63-66).

2. The Vispered, a minor liturgical work in 24 chapters (karde), is alike in form and substance completely dependent on the Yasna, to which it is a liturgical appendix. Its separate chapters are interpolated in the Yasna in order to produce a modified—or expanded—Yasna ceremony. The name Vispered, meaning "all the chiefs" (pastama) of Zoroaster (q.v.), has reference to the spiritual head of the religion of Ormuzd, invocations to whom form the contents of the first chapter of the book.

3. The Vendidad, the priestly code of the Parsees, contains in 22 chapters (fargard) a kind of dualistic account of the creation (chap. 1), the legend of Yima and the golden age (chap. 2), and in the bulk of the remaining chapters the precepts of religion with regard to the care of the earth, the care of animals, the protection of the sacred elements, such as earth, fire and water, the keeping of a man's body from defilement, together with the requisite measures of precaution, elaborate ceremonies of purification, and the like. Various portions of the Vendidad are given in different versions, and the prescribed rites are marked by a conscientious classification based on considerations of material, size and number; but they lose themselves in an exaggerated casuistry. Still the whole of Zoroastrian legislation is subordinate to one great point of view: the war—proached without intermission—against Satān and his noxious creatures, from which the whole book derives its name; for "Vendidād is a modern corruption for 𐭋𐭣𐭥𐭩𐭥𐭩ень "the anti—demonic Law." Fargard 18 treats of the true and false priests, of the value of the house-cock, of the four paramours of the she-devil, and of unlawful lust. Fargard 19 is a fragment of the Zoroastian legislation; Fargard 21 contains the entire Zend; and Fargard 22 is for the revelation of the law. Abhirman and the devils despair, and flee down into hell. The three concluding chapters are devoted to medical science.

The Yasna, Vispered and Vendidad together constitute the Avesta in the stricter sense of the word, and the reading of them appertains to the priest alone. For liturgical purposes the separate chapters of the Vendidad and the Yasna are employed among those of the Yasna and Vispered. The reading of the Vendidad in this case may, when viewed according to the original intention, be taken as corresponding in some sense to the sermon, while that of the Yasna and Vispered is to be said to answer to the hymns and prayers of Christian worship.

4. The Yashts, i.e. "songs of praise," in so far as they have not been previously dealt with, are in the Avesta and the Zend. They contain invocations of separate Izads, or angels, number 21 in all, and are of widely divergent extent and antiquity. The great Yashts—some nine or ten—are impressed with a higher and more spiritual melodic quality, and represent the religious poetry of the ancient Iranians. So far they
may be compared to the Indian Rig-Veda. Several of them may have been cemented together from a number of lesser poems or songs. They are a rich source of mythology and legendary history. Side by side with these extant versions of the Zoroas-
trian deities, they frequently interweave, as epistles, stories from the old heroic fables. The most important of all, the 19th Yashst, gives a consecutive account of the Iranian heroic saga in great breath-taking verses, together with a prophetic presentation of the end of the world.

5. The Khordha Avesta, i.e. the Little Avesta, comprises a collection of shorter prayers designed for all believers—the laity included—and hence presupposed for the various occurrences of ordinary life. In part, these brief petitions serve as convenient substitutes for the more lengthy Yashst—and especially the so-called Nyayas. Over and above the five books just enumerated, there are a considerable number of fragments from other books, e.g. the Nārāngistān, as well as quotations, glosses and glossaries.

The Larger Avesta and the Twenty-One Nasks.—In its present form, however, the Avesta is only a fragmentary remnant of the old priestly literature of Zoroastrism, a fact confessed by the learned tradition of the Parsees themselves, according to which the number of Yashst was originally thirty. The truth is that we possess but a trifling portion of a very much larger Avesta, if we are to believe native tradition, carrying us back to the Sassanian period, which tells of a larger Avesta in twenty-one books called nasks or naskh, as to the names of which we have several more or less detailed accounts, particularly in the Pahlavi Dinkard (9th century A.D.) and in the Razmâyistān (see latter). From these sources we learn that this larger Avesta was only a part of a yet more extensive original Avesta, which is said to have existed before Alexander. We are told that of a number of nasks only a small portion was found to be extant "after Alexander." For example, of the seventh nask, which "before Alexander" had as many as fifty chapters, there then remained only thirteen; and similar allegations are made with regard to the eighth, ninth, tenth and other nasks. The Raviyats state that, when after the calamity of Alexander they sought for the books again, they found a portion of each nask but found no nask in completeness except the Vendidad. But even of the remains of the Avesta, as these lay before the author of the 9th century, only a small residue has survived to our time. Of all the nasks one only, the nineteenth, has come down on us intact—the Vendidad. All else, considered as whole, have vanished in the course of the centuries.

It would be rash summarily to dismiss this old tradition of the twenty-one nasks as pure invention. The number twenty-one, points, indeed, to an artificial arrangement of the material; for twenty-one is a sacred number, and the most sacred prayer of the Parsees is the Sad A Vahram (Vaštı Vahu) which contains twenty-one words; and it is also true that in the enumeration of the nasks we miss the names of the books we know, like the Yasna and the Yashst. But we must assume that these were included in such or such nask, as the Yashst in the seventeenth or Bahūn Yashst; or, it may be that other books, especially the Yasna, are a compilation extracted for liturgical purposes from various, further, the statements of the Dinkard leave on us a very distinct impression that the author actually had before him the text of the nasks, or at all events of a large part of them: for he expressly states that the eleventh nask was entirely lost, so that he is unable to give the slightest account of its contents. And, besides, in other directions there are numerous indications that such books once really existed. In the Khordha Avesta, as we now have it, we find the tenth, or Šaivas; with regard to the first nask, it is expressly stated in old MSS. that it was taken from the Haddišt nask (the twelfth, according to the Dinkard). From the same nask also a considerable fragment (Vis. 21 and 22 in Westergaard) has been taken. So, also, the Nārāngistān is a portion of the seventeenth (or Hāštāberm) nask. Lastly, the numerous other fragments, the quotations in the Pahlavi translation, the many references in the manuscripts of the Bundahish to passages of this Avesta not now known to us, all press in with the weight of the evidence in the favor of the existence of the extensive Avesta literature that the mere prayer-book now in our hands. The existence of a larger Avesta, even as late as the 9th century, is far from being a matter of doubt. It is worth noting that a certain obscurity still hangs undissipated over the chronology of the old Avesta, with its twenty-one nasks, we may well believe the Parsees themselves, when they affirm that their sacred literature is far from being a mere collection of decrepit texts, which is represented by the present Avesta. In fact we can clearly trace this gradual process of decay in certain portions of the Avesta during the last few centuries. The great Yashst are not of very frequent occurrence in the manuscripts: some of them, indeed, are already met with but seldom, and MSS. containing all the Yashst are of extreme rarity. Of the fifteenth, seventeenth and nineteenth Yashst the few useful copies that we possess are derived from a single MS. of the year 1391 A.D.

Origin and History.—While all that Herodotus (l.c.32) has to say is that the Magi sang "the theyogony" at their sacrifices, Pausanias is able to add (v. 27, 3) that they read from a book. Hermentius, in the 3rd century B.C., affirmed that Zoroaster, the founder of the doctrine of the Magi, was the author of twenty books, each containing 100,000 verses. According to the Arab historian, Tabari, these were written on 12,000 cowhides, as compared with the proverbial "ten books" which Zoroaster gave to the Persians the book called Avesta. It consisted of twenty-one parts, each containing 200 leaves. This book, in the writing which Zartush invented and which the Magi called the writing of religion, was written on 12,000 cowhides, bound together by golden bands. Its language was the Old Persian, which now no one understands." These assertions sufficiently establish the existence and great bulk of the sacred writings. Parsee tradition adds a number of interesting statements as to their history. According to the Arda-Viraf-Nama the ancient Avesta was extended to two thousand books by Zoroaster. For 300 years, when Iskander Rumi (Alexander the Great) invaded and devastated Iran, and burned the Avesta which, written on cowhides with golden ink, was preserved in the archives at Persepolis. According to the Dinkard, there were two copies, of which one was burned, while the second came into the hands of the Greeks. One of the Raviyats relates further: "After the villainy of Alexander, an assemblage of several highpriests brought together the Avesta from various places, and made a collection which included the sacred Yasna, Vahram, and other scraps of the Avesta. As to this re-collection and redaction of the Avesta the Dinkard gives various details. One of the Arsacid kings, Vologeses I. (or III.), ordered the scattered remnants of the Avesta to be carefully preserved and recorded. The first of the Sassanian kings, Ardašhr Bābaqān (226-240), caused his high-priest, Tanvavar, to bring together the dispersed portions of the holy book, and to compile from these a new Avesta, which, as far as possible, should be a faithful reproduction of the original. King Shāhpūr I. (241-272) enlarged this re-edited Avesta by the period of Zoroaster and incorporated with it new contributions on medicine, astronomy, geography and philosophy. Under Shāhpūr II. (309-380) the nasks were brought into complete order, and the new redaction of the Avesta reached its definitive conclusion.

Historical criticism may regard this tradition, in many of its features, as mere fiction, or as a perversion of facts made for the purpose of transferring the blame for the loss of a sacred literature to other persons than those actually responsible for it. We may, if we choose, absorb Alexander from the charge of vandalism of which he is accused, but the fact nevertheless remains, that he ordered the palace at Persepolis to be burned (Diod., vii. 72; Curt., v. 7). Even the statement as to the one or two complete copies of the Avesta may be given up as the invention of a later day. Nevertheless the essential elements of the tradition remain unshaken, viz. that the original Avesta, or old sacred literature, divided on account of its great bulk and heterogeneous contents into many portions and a variety of separate works, had an actual existence in numerous copies and also in the memories of priests, that, although gradually diminishing in bulk, it remained extant during the period of Zoroaster and the compilation of the new Avesta. It is far from being a matter of doubt that a certain obscurity still hangs undissipated over the chronology of the old Avesta, with its twenty-one nasks, we may well believe the Parsees themselves, when they affirm that their sacred literature is far from being a mere collection of decrepit texts, which is represented by the present Avesta. In fact we can clearly trace this gradual process of decay in certain portions of the Avesta during the last few centuries. The great Yashst are not of very
ZEND-AVESTA

fragments at their disposal, the dissaeut or dissaeucasts com-posed a new canon—erected a new edifice from the materials of the old. In point of detail, it is now impossible to draw a sharp distinction between that which they found surviving ready to their hand and that which they themselves added, or to define how far they reproduced the traditional fragments with verbal fidelity or indulged in revision and remoulding. It may reasonably be supposed, not only that they constructed the external framework of many chapters, and also made some additions of their own—a necessary process in order to weld their motley collection of fragments into a new and coherent book—but also that they fabricated anew many formulae and imitative passages on the model of the materials at their dis-posal. In this consisted the completion of Tanvasar, expressed most forcibly in the account of the Dinkard. All those texts in which the grammar is handled, not with a want of skill, and again with absolute barbarism, may probably be placed to the account of the Sassanian redactors. All the grammatically correct texts, together with those portions of the Avesta which have intrinsic worth, especially the metrical passages, are indubitably authentic and taken ad verbum from the original Avesta. To this class, above all, belong the Gāthās and the nucleus of the greater Yashts. Opinions differ greatly as to the precise age of the original texts brought together by subsequent redactors; according to some, they are pre-Achaemenian; according to others, they were written in Media under the Achaemenian dynasty; according to some, their source must be sought in the east, according to others, in the west of Iran. But to search for a precise time or an exact locality is to deal with the question too narrowly; it is more correct to say that the Avesta was worked at from the time of Zoroaster down to the Sassanian period. Its oldest portions, the Gāthās, proceed from the prophet himself. This conclusion is inevitable for every one to whom Zoroaster is an historical personality, and who does not shun the labour of an unprejudiced research into the meaning of thought and text. Yezdī Darmesteter, the rest of the Avesta and in spite of the opposite opinion of orthodox Parsees, does not even claim to come from Zoroaster. As the Gāthās now constitute the kernel of the most sacred prayer-book, viz., the Yasna, so they ultimately proved to be the first nucleus of a religious literature in general. The language in which Zoroaster taught, especially a later development of it, remained as the standard with his followers, and became the sacred language of the priesthood of that faith which he had founded; as such it became, so to speak, absorbed from the ordinary conditions of time and space, and was acquired as an ecclesiastical language, it was enabled to live on for ages and to have become extinct as a vernacular—in this respect comparable to the Latin of the middle ages or the Hebrew of the rabbinical schools. The priests, who were the composers and repositories of these texts, succeeded in giving them a perfectly general form. They refrained from practically every allusion to ephemeral or local circumstances. Thus we search vainly in the Avesta itself for any precise data to determine the period of its composition or the place where it arose. The original country of the religion, and the seat of the Avesta language, ought perhaps to be sought rather in the east of the Assa, and the neighbouring districts. But neither the spiritual literature nor the sacred tongue remained limited to the east. The geography of the Avesta points both to the east and the west, particularly the north-west of Iran, but with a decided tendency to gravitate towards the east. The vivid descrip-tion of the basin of the Hilment (Yath 19, 65–66) is peculiarly instructive. The language of the Avesta travelled with the Zoroastrian religion and with the main body of the priesthood, in all probability, that is to say, from east to west; within the limits of Iran it became international.

As has been already stated, the Avesta now in our hands is a small portion of the book as restored and edited under the Sassanians. The larger part perished under the Manichees and under the more barbarous tyranny of the Tatars, when through conversion and extermination the Zoroastrians became a mere sect in the common course of the movement of copying of manuscripts. A most meagre proportion only of the religious and ritual writings, the sacerdotal law and the liturgy, has been preserved to our time. The great bulk—over three-quarters—of these now remains in the form of short versions of the literature collected, has fallen a prey to oblivion. The under-standing of the older Avesta texts began to die away at an early period; in many places the need for translation and interpretation became evident; and under the Later Sassanian dominion of the books, if not the whole of them, were rendered into the current Pahlavi. A thorough use of this translation will not be possible until we find the original manuscripts, or at least a good critical edition of this language ceases to be the monopoly of a few privileged individuals. For the interpretation of the older texts it is of great value where they are concerned with the fixed, formal statutes of the church. The latest passage, the name of the God, leaves no doubt that the Gāthās, the Pahlavi translator becomes a defective and unreliable interpreter. The Parsee priest, Neryosangh, subsequently translated a portion of the Pahlavi version into Sanskrit.

The MSS. of the Avesta are, comparatively speaking, of recent date. The oldest is the Pahlavi Vispered in Cpenhagen, dated 1528. Next comes the four MSS. of the Herba Miahišañ Kai Pakistan, with copies in London and Cpenhagen, and two Yasnas with Pahlavi in Cpenhagen and formerly in Bombay (now Oxford). Generally speaking, the MSS. fail off in quality and carefulness in proportion to their age, though a few exceptions here and there may exhibit of those proceeding from Kirman and Yazd in Persia, mostly dating from the 17th and 18th centuries.

Disputes about attention to the Avesta was Hyde of Oxford, in his Historia Religiosam Veterum Persarum coromique Magnorum (1700), which, however, failed to awake any lasting interest in the sacred writings of the Parsees. The merit belong to the Briand, who published no less than 40 editions of the Zend-Avesta, the fruit of whose prolonged stay in India (1755–1761) and his acquaintance with the Parsee priests was a translation (certainly very defective) of the Zend-Avesta. The foundation of a scientific cresses was laid by Bumal. The interpretation of the Avesta is one of the most difficult problems of oriental philology. To this very day no kind of agreement has been reached by con-flicting scholars, even on points of the most obvious importance. The value of the Pahlavi interpretation was overrated by Spiegel, Darmesteter, but wholly denied by Roth. The truth lies between these two extremes. Opinion is divided also as to the significance of the words of the Zend-Avesta. The exaggerated enthusiasm of Anquetil Duperron has been followed, especially since Spiegel's translation, by an excessive reaction. Upon the whole, the Avesta is a monotonous book. The Yasna and many Yashts in great part consist of formulae of prayer which are as poor in contents as they are rich in verbiage. The book of laws (Vendidad) is characterized by an arid didactic tone; only here and there in this dictionary of legal maxims, the beautiful gracefull dialogue and tales, or poetic descriptions and similitudes, and then the book of laws is transformed into a didactic poem. Nor can we deny to the Yashts, in their depiction of the Zoroastrian world, its place among the immortal works of poetry, and especially its ethical feeling, at times, and a pleasant diction. The Gāthās are quite unique in their kind. As a whole, the Avesta, for profundity of thought and beauty, stands on a lower level than the Old Testament. But as a religious book—the most important document of the Zoroastrian faith, and the sole literary monument of ancient Iran—the Avesta occupies a prominent position in the literature of the world. At the present day its significance is decidedly underrated. The future will doubtless be more just with regard to the importance of the book for the history of religion in general and even of Christianity.

ENRICOZ, Zend-Avesta, ed. by N. L. Westergaard (Copenhagen 1852–54), complete; F. Spiegel, Avesta (Vienna, 1853–58), only Vendidad, Vispered and Yasna, but with the Pahlavi translation, K. Geldner (Stuttgart, 1886–96). Traducitio. Anquetil Duperron (Strassburg, the Avesta, 1827–33, 3 vols. (Leipzig, 1852–63), both completely antiquated. Avesta traduit par C. de Harlez, ed. 2 (Paris, 1881); The Zend-Avesta, Port I., Vendidad, Port II., Sophaz, Yashts and Nystys, tr. by E. W. West, 2 vols. (Copenhagen, 1833); The Zend-Avesta, traduction nouvelle par J. Darmesteter, 3 vols. (Paris, 1892–93) (Annuelles du Musée Guimet)—a most important work.

LITERATURE.—Anquetil Duperron (see above); Haug, Essays on the Zend Language (London, 1883), 4th ed. trans. by E. W. West (London, 1878); De Harlez, Introduction à l'étude de l'Avesta (Paris, 1881); Max Duncker, Geschichte des Altertums, vol. i., (Stuttgart, 1884); P. Darmesteter, Mundarten der Teurop, vol. i. (Stuttgart, 1884); J. Darmesteter, in the Introduction to the Zend-Avesta (see above); K. ZENGG—ZENO OF ELEA

ZENGG (Hungarian, Zengí; Croatian, Senji; Italian, Segno), a royal free town of Hungary, in the county of Lika-Krbava, Croatia-Slavonia, 34 m. S.E. of Fiume, on the Adriatic Sea. Pop. (1900) 3182. Zengg lies at the entrance to a long cleft among the Velbit Mountains, down which the bora, or N.N.E. wind, sweeps with such violence as often to render the harbour unsafe, although the Austrian Lloyd steamers call regularly. Apart from the cathedral of its Roman Catholic bishop, a gymnasium, and some ancient fortifications, the town contains little of interest. It carries on a small trade in tobacco, fish and vegetables and a trade in agricultural products. It has about 25,000 and post and telegraph offices, and was one of the original strongholds of the Bâbi sectarians, who held it against a large Persian force from May 1850 to the end of the year, when most of them were massacred. It has extensive gardens, well watered by the Zanjaneh river, which flows south of it. The well-stocked bazaar supplies the neighbouring districts.

ZENO, East Roman emperor from 474 to 491, was an Isaurian of noble birth, and originally bore the name of Trascalissaeus, which he exchanged for that of Zeno on his marriage with Ariadne, daughter of Leo I., in 468. Of his early life nothing is known; after his marriage (which was designed by Leo to secure the Isaurian support against his ambitious minister Aspar) he became patrician and commander of the imperial guard and of the armies in the East. While on a campaign in Thrace he narrowly escaped assassination; on his return to the capital he avenged himself by compassing the murder of Aspar, who had instigated the attempt. In 474 Leo I. died after appointing as his successor Leo the son of Zeno and Ariadne; Zeno, however, with the help of his mother-in-law Verina, succeeded in getting himself crowned also, and on the death of his brother in June of the year became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favour of her brother Basiliscus, and the antipathy to his Isaurian soldiers and administrators, he was compelled to take refuge in Isauria, where, after sustaining a defeat, he was compelled to shut himself up in a fortress. The growing misgovernment and unpopularity of Basiliscus ultimately enabled Zeno to re-enter Constantinople unopposed (476); his rival was baffled to Phrygia, where he soon afterwards died. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts. Since 472 the aggressions of the two Ostrogoth leaders Theodoric had been a constant source of danger. Though Zeno at times contrived to play them off against each other, they in turn were able to profit by his dynastic rivalries, and it was only by offering them pay and high command that he kept them from attacking Constantinople itself. In 487 he induced Theodoric, son of Theodemir, to invade Italy and establish his new kingdom. Zeno is described as a lax and indolent ruler, but he seems to have husbanded the resources of the empire so as to leave it appreciably stronger at his death than at its foundation. In ecclesiastical history the name of Zeno is associated with the Henotic or instrument of union, promulgated by him and signed by all the Eastern bishops, with the design of terminating the Monophysite controversy.

ZENO OF ELEA, son of Teleutagoras, is supposed to have been born towards the beginning of the 5th century B.C. The pupil and friend of Parmenides, he sought to recommend his master's doctrine of the existence of the One by controverting the popular belief in the existence of the Many. In virtue of this method of indirect argumentation he is regarded as the inventor of "dialecick," that is, to say, disputing having for its end not victory but the discovery or the transmission of truth. He is said to have been concerned in a plot against a tyrant, and on its detection to have borne with exemplary constancy the tortures to which he was subjected; but authorities differ both as to the name and the residence of the tyrant and as to the circumstances and the issue of the enterprise.

In Plato's Parmenides, Socrates, "then very young," meets him, and says to him, "an old man of about forty, tall and personable," and engages them in philosophical discussion. But it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's teaching (Parmenides, 128 seq.) is, however, presumably as accurate as it is precise. In reply to those who thought that Parmenides's theory of the existence of the One involved inconsistencies and absurdities, Zeno tried to show that the assumption of the existence of the Many, that is to say, a plurality of things in time and space, carried with it infinity. The Parmenideans were condemned for their contradictions, because there are as many things as there are, neither more nor less; numerically infinite, because that any two things may be separate, the intervention of a third thing is necessary, and so on ad infinitum. (2) In like manner the Many were condemned for inconsistency and absurdity, because there are as many things as there are, neither more nor less; numerically infinite, because that any two things may be separate, the intervention of a third thing is necessary, and so on ad infinitum. (3) If all that is is in space, space itself must be divided, and so on ad infinitum. (4) If a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so. (5) Before a body in motion can reach a given point, it must first traverse the half of the distance; before it can traverse the half of the distance, it must first traverse the quarter; and so on ad infinitum. Hence, the body which he was seeking to traverse an infinite number of divisions. But an infinite distance (which Zeno fails to distinguish from a finite distance infinitely divided) cannot be traversed in a finite time. Consequently, the goal of motion is unreachable, and it follows that the start of Achilles, Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting-point to the starting-point of the tortoise, the tortoise advances a certain distance, and while Achilles traverses that distance, the tortoise makes a further advance, and so on ad infinitum. Consequently, Achilles may run ad infinitum without overtaking the tortoise. This paradox is virtually identical with (5), the only difference being that, whereas in (5) there is one body, in (6) there are two bodies, moving towards a limit. The "infinity" of the premise is an infinity of subdivisions of a distance which is finite; the "infinity" of the conclusion is an infinity of distances. Thus Zeno again confounds a finite distance infinitely divided with an infinite distance. If the tortoise has a start of 100 ft., Achilles, on the supposition that he has a speed which is greater than that which has the tortoise, must first traverse an infinite number of spaces—1000 ft., 100 ft., 10 ft., &c., and the tortoise must traverse an infinite number of spaces—100 ft., 10 ft., 1 ft., &c.—before they reach the point, distant from their starting-points 111 ft. and 111 ft., respectively, at which the tortoise is overtaken. In a word, 1000 + 100 + 10 + &c., and 111 + 11 + 1 + &c., in (5) are convergent series, and 1111 and 1 are the limits to which they respectively approximate. (7) So long as anything is divided, there is a limit to the series of divisions to which it is divided. At the rest every moment of its flight, and therefore also during the whole of its flight. (8) Two bodies moving with equal speed traverse equal spaces in equal time: when two bodies move with equal speed in opposite directions, the one passes the other in half the time in which it passes it when at rest. These propositions appeared to Zeno to be irreconcilable. In short, the doctrine of motion which he proposed contained fatal inconsistencies, whence he inferred that Parmenides was justified in distinguishing the mutable movable Many from the
immutable immovable One, which alone is really existent. In other words, Zeno re-affirmed the dogma, "The Ent is, the Non-ent is not."

If tradition has not misrepresented these paradoxes of time, space and motion, there is in Zeno's reasoning an element of fallacy. It is indeed difficult to understand how so acute a thinker should confound that which is infinitely divisible with that which is infinitely undivisible, and should regard at once (i) magnitude, and magnitude, as in (j); that he should neglect the imperfection of the organs of sense, as in (4); that he should deny the reality of motion, as in (7); and that he should ignore the relativity of space, as in (8). For a hundred years it has been thought that the conventional statements of the paradoxes, and in particular of those which are more definitely mathematical, namely (5), (6), (7), (8), do less than justice to Zeno's acumen. Thus, several generations of philosophers—Tannery, Reichenbach, Russell—dilemmas advanced, with some measure of success, in refutation of specific doctrines attributed to the Pythagoreans. One of the most notable victims of posterity's lack of judgment," says Bertrand Russell, "is the Eleatic Zeno. Having invented four arguments all immeasurably subtle and profound, the grossness of subsequent philosophers pronounced him to be a mere ingenuous juggler, and his arguments to be one and all sophisms. After two thousand years of continual refutation, these sophisms were reintroduced, and made the foundation of a mathematical renaissance, by a German professor, who probably never dreamed of any connexion with the doctrine of itself and probably abhorring all infinitesimal, has at last shown that we live in an unchanging world, and that the arrow at every moment of its flight is at rest. The refutation of Zeno's last four paradoxes given by Messrs. Noël and Russell," says G. H. Hardy, "may be briefly stated as follows: The notion of time, which seems at first sight to enter into (5) and (6), should be eliminated. The notion of space should be considered as that which is temporally, but logically, subsequent to the part, and that therefore there is an infinite regress in the notion of a whole which is infinitely divisible—a view which at any rate demands a serious refutation. The kernel of the latter lies in the perfectly valid proof which it affords that the torture passes through as many positions as Achilles—a view which embodies an accepted doctrine of modern mathematics. The paradox of the arrow (7) Mr Russell, is a plain statement of a very elementary fact: the arrow is at rest at every moment of its flight: Zeno's only mistake was in inferring (if he did infer) that it was therefore at the same point in space at all times. Finally, the last paradox may be interpreted as a valid refutation of the doctrine that space and time are not infinitely divisible. How far this interpretation of Zeno is historically justifiable, may be doubtful. But one may well believe that there was in his mind at any rate a foreshadowing of some of the ideas by which modern mathematicians have finally laid to rest the traditional difficulties connected with infinity and continuity."

Great as was the importance of these paradoxes of plurality and motion in stimulating speculation about space and time, their direct influence upon Greek thought was less considerable than that of another paradox—strangely neglected by historians of philosophy—the paradox of predication. We learn from Plato (Parmenides, 127 D) that "the first hypothesis of the first argument" of Zeno's book above mentioned ran as follows: "If existences are many, they must be both like and unlike [unlike, inasmuch as they are not one and the same, and like, inasmuch as they agree in not being one and the same, Proclus, On the Parmenides, ii. 143]. But this is impossible, for unlike things cannot be like, nor like things unlike. Therefore existences are not many." That is to say, not perceiving that the same thing may be at once like and unlike in different relations, Zeno regarded the attribution to the same thing of likeness and unlikeness as a violation of what was afterwards known as the principle of contradiction; and, finding that plurality entailed these attributions, he inferred its unreality. Now, when without qualification he affirmed that the unlike thing cannot be, nor the like thing unlike, he was on the heels of a contradiction; a contradiction which a century later by the Cynics, that no predication which is not identified as legitimate. He was not indeed aware how deep or how long he had committed himself; otherwise he would have observed that his argument, if valid against the Many of the vulgar, was valid also against the One of Parmenides, with its plurality of attributes, as well as that, in the absence of a theory of predication, it was useless to speculate about knowledge and being. But others were not slow to draw the obvious conclusions; and it may be conjectured that Gorgias's sceptical development of the Zenonian logic contributed, not less than Protagoras’s sceptical development of the Ionian physics, to the diversion of the intellectual energies of Greece from the pursuit of truth to the pursuit of culture.

For three-quarters of a century, then, philosophy was at a standstill; and, when in the second decade of the 4th century the pursuit of truth was resumed, it was plain that Zeno's paradox of predication must be disposed of before the problems which had occupied the earlier thinkers—the problem of knowledge and the problem of being—could be so much as attempted. Accordingly, in the seventh book of the Republic, where Plato describes his sons' intellectual development, he re-affirmed his attention of studious youth primarily, if not exclusively, to the concurrence of inconsistent attributes; and in the Phaedo, 102 B—103 A, taking as an instance the tallness and the shortness simultaneously discoverable in Simmias, he offers his own theory of the immanent idea as the solution of the paradox. Simmias, he says, has in him the ideas of tall and short. Again, when it presently appeared that the theory of the immanent idea was inconsistent with itself, and moreover inapplicable to explain predication except where the subject was an idea, and therefore a non-sensible thing, Plato, of course, continued to demand and to receive Plato's best attention. Thus, in the Parmenides, with the paradox of likeness and unlikeness for his text, he inquires how far the current theories of being (his own included) are capable of providing, not only for knowledge, but also for predication, and in the concluding sentence he suggests that, as likeness and unlikeness, greatness and smallness, &c., are relations, the initial paradox is no longer paradoxical; while in the Sophist, Zeno's doctrine having been shown to be fatal to reason, thought, speech and utterance, the mutual knowing of éinon is not averted; Plato elaborately demonstrates. It would seem then that, not to Antisthenes only, but to Plato also, Zeno's paradox of predication was a substantial difficulty; and we shall be disposed to give Zeno credit accordingly for his perception of its importance.

In all probability Zeno did not observe that in his controversial defence of Eleaticism he was interpreting Parmenides's teaching anew. But so it was. For, while Parmenides had recognized, together with the One, which is, and is the object of knowledge, a Many, which is not, and therefore is not known, nevertheless he had also the doctrine which he had thereby plainly affirmed that plurality, becoming and opinion are one and all inconceivable. In a word, the fundamental dogma, "The Ent is, the Non-ent is not," which with Parmenides had been an assertion of the necessity of distinguishing between the Ent, which is, and the Non-ent, which is not, but becomes, was with Zeno a declaration of the Non-ent's absolute nullity. Thus, just as Empedocles developed Parmenides's theory of the Many to the neglect of his theory of the One, so Zeno developed the theory of the One to the neglect of the theory of the Many. With the severance of its two members Eleaticism proper, the Eleaticism of Parmenides, ceased to exist.

The first effect of Zeno's teaching was to complete the discomfiture of philosophy. For the paradox of predication, which he had used to disprove the existence of plurality, was virtually a denial of all speech and all thought, and thus led to a more comprehensive scepticism than that which sprang from the contemporary theories of sensation. Nevertheless, he left an enduring mark upon Greek speculation, inasmuch as he not only recognized the need of a logic, and grappled, however unsuccessfully, with one of the main problems of logical problems, but also by the invention of dialectic provided a new and powerful instrument against the time when the One and the Many should be reunited in the philosophy of Plato.

ZENO OF SIDON—ZENODOTUS

Russell, Principles of Mathematics (Cambridge, 1903), pp. 345-354. For histories of philosophy and other works upon Eleaticism see Parmenides. (H. J. A.)

ZENO OF SIDON, Epicurean philosopher of the first century B.C., and contemporary of Cicero. In the De Nature Deorum (i. 34), Cicero states that he was contemptuous of other philosophers and even called Socrates "the Attic Buffoon." Diogenes Laërtius and Cicero both speak of him with respect and describe him as an accurate and polished thinker. He held that happiness includes not merely present enjoyment and prosperity, but also a reasonable expectation of their continuation. His views were made the subject of a special treatise by Posidonius.

ZENO OF TARSUS, Stoic philosopher and pupil of Chrysippus, belonged to the period of the Middle Stoa. He appears to have accepted all the Stoic doctrines except that he denied the final confutation of the universe (see Stoics).

ZENOBIA (Gr. Ζενοβία), queen of Palmyra, one of the heroines of antiquity. Her native name was Septimia Bathsaba, a name also borne by one of her generals, Septimius Zabbiab. This remarkable woman, famed for her beauty, her masculine energy and unusual powers of mind, was well fitted to be the consort of Odaenattis (see OMAENATHUS) in his proud position as Dux Orientis; during his lifetime she actively seconded his policy, and after his death in A.D. 266-7 she not only succeeded to his position but determined to surpass it and make Palmyra mistress of the Roman Empire in the East. Wahab-allath or Aethnodorus (as the name was Graecized), her son by Odaenath, being still a boy, she took the reins of government into her own hands. Under her general-in-chief Zabda, the Palmyrene expedition in A.D. 270, not without a struggle, under the pretext of restoring it to Rome; and Wahab-allath governed Egypt in the reign of Claudius as joint ruler with the title of Basileus (king), while Zenobia herself was styled basileinai (queen). In Asia Minor Palmyrene garrisons were established as far west as Ancyrā in Galatia and Chalcedon opposite Byzantium, and Zenobia still professed to be acting in the interests of the Roman rule. In his coins struck at Alexandria in A.D. 270 Wahab-allath is named along with Aurelian, but the title of Augustus is given only to the latter; a Greek inscription from Byblos, however, mentions Aurelian (or his predecessor Claudius) and Zenobia together as Σεβαστός and Σεβαστή (i.e. Augustus and Augusta, C.I.G. 4503 b). When Aurelian became emperor in 270 he quickly realized that the policy of the Palmyrene queen was endangering the unity of the empire. It was not long before all disguises were thrown off; in Egypt Wahab-allath began to issue coins without the head of Aurelian and bearing the imperial title, and Zenobia’s coins bear the same. The assumption marked the rejection of all allegiance to Rome. Aurelian instantly took measures; Egypt was recovered for the Empire by Probus (close of 270), and the emperor himself prepared a great expedition into Asia Minor and Syria. Towards the end of 271 he marched through Asia Minor and, overthrowing the Palmyrene garrisons in Chalcedon, Ancyrā and Tyana, he reached Antioch, where the main Palmyrene army under Zabda and Zabbiab, with Zenobia herself, attempted to oppose his way. The attempt, however, proved unsuccessful, and after suffering considerable losses the Palmyrenes retired in the direction of Emesa (now Homs), whence the road lay open to their native city. The queen refused to yield to Aurelian’s demand for surrender and drew up her armed forces; the battle which was to decide her fate. In the end she was defeated, and there was nothing for it but to fall back upon Palmyra across the desert. Thither Aurelian followed her in spite of the difficulties of transport, and laid siege to the well-fortified and provisioned city. At the critical moment the queen’s courage seems to have failed her; she and her son fled from the city to seek help from the Persian king; they were captured on the bank of the Euphrates, and the Palmyrenes, losing heart at this disaster, capitulated (A.D. 272). Aurelian seized the wealth of the city but spared the inhabitants; to Zenobia he granted life; while her officers and advisers, among whom was the celebrated scholar Longinus, were put to death. Zenobia figured in the conqueror’s splendid triumph at Rome, and by the most probable account accepted her fall with dignity and closed her days at Tibur, where she lived with her sons the life of a Roman matron. A few months after the fall of Zenobia, Palmyra revolted again; Aurelian unexpectedly returned, destroyed the city, and this time showed no mercy to the population (spring, 272).

Among the traditions relating to Zenobia it may be mentioned that of her discussions with the Archbishop Paul of Samosata on matters of religion. It is probable that she treated the Jews in Palmyra with favour; she is referred to in the Talmud, as protecting Jewish rabbis (Talm. Jer. Ter. viii. 46 b).

The well-known account of Zenobia by Gibbon (Decline and Fall, i. pp. 302-312 Buery’s edition) is based upon the imperial biographers (Historia Augusta) and cannot be regarded as strictly historical in detail. An obscure and distorted tradition of Zenobia as an Arab queen survived in the Arabic story of Zabbād, daughter of Åmm b. Zābir, whose name is associated with Tadmor and with the right bank of the Euphrates, which is no doubt the Zenobia of which Procopius speaks as founded by the famous queen. See C. de Perceval, Essai sur l’histoire des Arabes, ii. 28 f., 197 f.; Tabaři, i. 757 f. See further Palmyra. (G. A. C.)

ZENOBUS, a Greek sophist, who taught rhetoric at Rome during the reign of Hadrian (A.D. 117-138). He was the author of a collection of proverbs in three books, still extant in an abridged form, compiled, according to Suidas, from Didymus of Alexandria and “The Tarrhaean” (Lucillus of Tarra in Crete). Zenobus is also said to have been the author of a Greek translation of Sallust and of a birthday poem (γενέθλια) on Hadrian.

Editions by T. Gasinsel (1836) and E. L. Leutsch-F. W. Schneidewin (1839), and in B. E. Miller, Mélanges de littérature grecque (1868); see also W. Christ, Griechische Literaturgeschichte (1890).

ZENODOCHIUM (Gr. ξενοδοχεῖον, ξένος, stranger, guest, δέος, to receive), the name given by the Greeks to a building erected for the reception of strangers.

ZENODOTUS, Greek grammarian and critic, pupil of Philippos (q.v.) of Cos, was a native of Ephesus. He lived during the reigns of the first two Ptolemies, and was at the height of his power about 250 B.C. It was the first professor of Greek at the library at Alexandria and the first critical editor (ὑποκρίτης) of Homer. His colleagues in the librarianship were Alexander of Aetolia and Lycephon of Chalcis, to whom were allotted the tragic and comic writers respectively, Homer and other epic poets being assigned to Zenodotus. Although he has been reproached with arbitrariness and an insufficient knowledge of Greek, in his recension he undoubtedly laid a sound foundation for future criticism. Having collated the different MSS. in the library, he expunged or obelized doubtful verses, transposed or altered lines, and introduced new readings. He divided the Homeric poems into books (with capitals for the Ηιδια, and small letters for the Οδύσσεις, and small letters for the Οδύσσεις), and possibly was the author of the calculation of the days of the Ηιδια in the Tabula Iliaca. He does not appear to have written any regular commentary on Homer, but his Homeric γιάονα (lists of unusual words) probably formed the source of the explanations of Homer attributed by the grammarians to Zenodotus. He also lectured upon Hesiod, Anacreon and Pindar, if he did not publish editions of them. He is further called an epic poet by Suidas, and three epigrams in the Greek Anthology are assigned to him.

There appear to have been at least two grammarians of the same name: (1) Zenodotus of Alexandria, surnamed 1

1 Whether Shāhpūr or his son Hormuzdi is not certain: Shāhpūr’s death is variously placed in 269 and 272.

2 See the Palmyrene inscriptions given in Vogel, Syrie centrale, Nos. 28, 29 = Cooke, North-Semitic Inscriptions, Nos. 130, 131. Zabbiab, an abbreviation of some such form as Zabbi-ša = domus of God, was a common Palmyrene name; it occurs in the Old Testament, Ezr. x. 28; Neh. iii. 20.
The water they contain is readily lost, and before the blowpipe it is expelled with intumescence; hence the name zeolite, from the Greek ἶελος (to boil) and κάλκης (a stone), given by A. Cronstedt in 1758. In some other characters, as well as in their origin and mode of occurrence, they have points in common. Several species have been distinguished, of which the following are the more important. Apophyllite (p. r.) and pectolite (see Pyroxene) are also sometimes included.

Some of the chemical formulae given above are only approximate, since in some species the composition varies between certain limits and can be best expressed by the isomorphous mixing of different molecules (see, for example, Chabazite). They are all readily decomposed by hydrochloric acid, usually with the separation of gelatinous silica. By the action of various reagents several substitution products have been prepared artificially: thus, crystalized products, in which the alkalis or alkaline earths are replaced by ammonium or silver, &c., have been obtained.

The zeolites are often beautifully crystalized, and belong to several crystal-systems. The crystals usually show evidences of twinning, and when examined in polarized light they frequently exhibit optical anomalies and a complex structure. The hardness (H = 3½–4½) and specific gravity (2.0–2.4) are comparatively low, and so are the indices of refraction and the double refraction.

The water of zeolites presents many points of interest. Launolite loses water on exposure to air and becomes impure powder unless they are kept in a moist atmosphere. All the zeolites lose a portion of their "water of crystallization" in dry air (over sulphuric acid), and a considerable portion at a temperature of 100°C, increasing in amount to 200° or 300°: the actual amount lost depending not only on the temperature, but also on the tension of aqueous vapour in the surrounding atmosphere. In some species the remaining water is expelled only at a red heat, and is therefore to be regarded as "water of combustion." With the progressive loss of water there is a progressive change in the optical characters of the crystals. When a partially dehydrated and opaque crystal is exposed to moist air the water is reabsorbed, the crystal becoming again transparent and regaining its original optical characters. Not only may water be reabsorbed, but such substances as ammonia, hydrogen sulphide and alcohol may be absorbed in definite amounts and with an evolution of heat. The water of zeolites may therefore be partly driven off and reabsorbed or replaced by other substances without destroying the crystalline structure of the material, and it would thus seem identical water of crystallization of most other hydrated salts.

Zeolites are minerals of secondary origin and in most cases have resulted from the decomposition of the felspars of basic igneous rocks, the water of crystallization in the felspars being replaced by water of hydration. By means of water-solutions or most often as a result of reactions with water which may be replaced by water with agate, calcite and some other minerals. Less frequently they occur in cavities in granite and gneiss, and in metalliferous veins (e.g. in the Saxonian Slate-Harz vicinity), with zeolites as enclosing stigmates (e.g. analcite) of igneous rocks. A few species have been observed in the Roman masonry at the hot springs of Bourbonnes-Bains in France: and phillipite has been dredged from the River Clyde and the Dee and Spey.

See Analcite, Chabazite, Harmotome, Heulandite, Natrolite, Phillipite, Scolelite, Stilbite. (L. J. S.)

ZEPHANIAH, the ninth of the minor prophets in the Bible. The name (Yahweh) "hides" or "treasures," there is a similar Phoenician compound of Baal) is borne by various individuals, in Jer. xxix. 25 (cf. lli. 24); Zech. vi. 10, 14; Chron. vi. 36, and among the Jews of the Ostheit in Egypt (5th century B.C.). The prophet's ancestry is traced through Cush (cf. Jer. xxxvi. 14) to his great-grandfather Hezekiah, who may, in spite of 2 Kings xx. 18, xi. 1, be the well-known king of Judah (c. 720–690). This would agree fairly with the title (i. 1) which makes the prophet a contemporary of King Josiah (c. 637), and this in turn appears to agree (a) with the internal conditions (i. 4–6, cf. 2 Kings xxiii. 4, 5, 12) which, he is held, are evidently earlier than Josiah's reforms (620); (b) with the denunciation of the royal household, but not of the (young) king himself (i. 8, iii. 3); (c) with the apparent allusion in ch. i to the invasion of the Scythians (perhaps c. 620), and (d) with the anticipated downfall of Assyria and Nineveh (ii. 13, 607 B.C.). Zephaniah's prophecies are characterized by the denunciation of Judah and Jerusalem and the promise of a peaceful future, and these are interwoven with the idea of a world-wide judgment resulting in the sovereignty of a universally recognized Yahweh. The theme in its main outlines is a popular one in biblical prophecy, but when these 53 verses are carefully examined and compared with prophetic thought elsewhere, several difficult problems arise, an adequate solution of which cannot as yet be offered.

A special title (i. 1) is the poet's statement of the entire destruction of every living thing (2–3), the fate of Judah and Jerusalem is heralded (4–6). The name of Baal (so LXX.; remnant implies a date after Josiah's reforms) and of the idolatrous priests will be cut in pieces. Israel will have the heart to seek the Lord, who has, in view of the condition then in Israel (condemned later than 620 in Jer. xix. 13, cf. xliv. 15–19) and in the Amorite god Milcom (or perhaps for their Moloch: for the persistence of his grim cult, see Moloch). Silence is enjoined at the commencement of the prophet's career (w. 8–9, Zech. xiv. 17) and here (v. 10) there follows a fine description of "the Day of Yahweh" (ve. 7–18). The invertebrate popular belief in the manifestation of the warring deity on behalf of his people (cfr. Isa., xxiv. 8, lxi. 4; Jer. xiv. 10; Obad. 15; Ezek. xxx. 3) is treated (a) ethically, as a day of judgment upon sin and pride (Amos v. 18; Isa. lxxi. 21–28) and (b) apocalyptically, bound up with ideas of a universal doom. Punishment will fall upon an oppressive court, upon those who wear foreign apparel and who "leap over the threshold" (v. 9, cf. Is. v. 5, a Philistine custom)—a protest against heathen intercourse, for which cf. ii. 15, and ii. 8, 14. The city is defiled (pal. north side of Jerusalem) (w. 10 seq., the merchant quarter (?), cf. Zech. xiv. 21); the city will be ransacked and the indifferent or apathetic, who thought that Yahweh could do neither good nor evil (so of the idols, Isa. xii. 23; Jer. x. 15) will be ruined. With v. 13 contrast the promises Is. xvi. 21. "That day is a day of wrath" (v. 15)3 with celestial signs (cf. Amos v. 18, 20, viii. 9; Isa. xiii. 10; Joel ii. 1, 15; war and distress, which shall not be put to flight. v. 16, cf. Hol. 7, 8; Isaiah xxii. 18, cf. Rev. ii. 10, d. 26, Apoc. vii. 17; Ezek. vii. 9), more generally Ezek. vii. 19). Thus Yahweh's jealousy fired by the dishonour shown towards him in Judah will make an end of all sin in the land (xvi. 15, cf. r. 2 seq., and see Isa. x. 23, where a remnant is promised).

1 For "day" (i.e. of battle) cf. the Arab usage, W. R. Smith, Proph. of Israel, p. 398. The victorious and divine kings of Egypt in the XIXth and XXth Dynasties are likened to Baal in his "hour" (J. H. Breasted, Hist. Doc. Eg., iii. §§ 312, 314, 106).

2 The Vulgate Dies trahit diem illa, whence the striking by-pass by Thomas of Celano (c. 1250).
are in large measure associated traditionally with the fall of Jerusalem, and to such a calamity, and not to the inroad of the Scythians, the references to the "remnant" and the "captivity" can only refer. The anticipation of future events is of course conceivable in itself, but the promises (in ch. ii.) presuppose events other and later than those with which the Scythians were connected. With the latter, however, it is entirely intelligible that a prophecy relating to Scythians should have been re-shaped to apply to later conditions, and on this view it is explicable why the indefinite political convulsions should be adjusted to the exile and why the gloom should be relieved by the promise of a territory extending from the Mediterranean to the Syrian desert (ii. 7, 9). After a period of punishment (cf. Lamentations) Yahweh's jealousy against the semi-heathen Judah has become a jealousy for his people, and we appear to move in the thought of Haggai and Zechariah, where the remnant are Yahweh by Yahweh's return and the dispersed exiles are to be brought back (cf. Zech. i. 14-17, vii. 2-17). But in ch. iii. other circles of thought are manifest. Israel's enemies have been destroyed, her own God Yahweh has proved his loyalty and has fulfilled his promises, but the city remains polluted (v. 17, cf. Isa. lii. seq.; Malachi). Once more doom is threatened, and once more we pass over into a later stage where Yahweh has vindicated his supremacy and Zion is glorified. Instead of the realities of history we have the apocalyptic feature of the gathering of the nations (v. 8); the thought may be illustrated from Zech. xii. 1-10, 6, where Jerusalem is attacked from without, and so from Zech. xiv., where the city is actually captured and half the people are removed into captivity (cf. Zeph. iii. 11 purging, 75 removal of the enemy, v. 18-20 return of the captivity). The goal is the vindication of Israel and of Israel's God, and the establishment of universal monotheism (ii. 11, iii. 9 seq.). The foe which threatened Judah has become the chastiser of Ethiopia and Assyria (ii.) and the prelude to the golden age (iii., cf. Ezek. xxxviii. seq.). No longer does Yahweh contend for recognition with Baal and the "host of heaven" (i. 4-6); the convulsions of history are Yahweh for the instruction and amendment of Israel (ii. 6 seq.); the heathen gods prove helpless (ii. 11), but in what manner the conviction of Yahweh's greatness is brought home is not stated.

If Jer. iv. 5-6. 30 originally referred to the Scythians, it has been revised to refer to the Chaldeans; also in Ezek. xxxviii. seq. the northern foe has been associated with the great world-judgment. The replacing of the sequel of Amos (g.v.) by one which presupposes a later historical background, the addendum to the prophecy against Moab (Isa. xvi. 13 seq.), the pessimistic glosses in Isa. xlviii., the variations in the Hebrew and Greek texts, the general treatment of prophecy, the judgment and promise, exercise certain literary processes which illustrate the present form of Zephaniah. In Isaiah and Zechariah, notably, older and later groups of prophecies are preserved, whereas here the new preludes and new sequences suggest that the original nucleus has passed through the hands of writers in touch with those vicissitudes of thought which can be studied more completely elsewhere. It is not to be supposed that the elimination of all later passages and traces of revision will give us Zephaniah's prophecies in their original form. The fact that the divergent religious and social conditions of i. 4-6 or iii. 1-4 do not compel a date before Josiah's reforms. The doom of Chus is still in the future in Ezek. xxx. 4; and if the impending fall of Nineveh (ii. 13) implies an early date, yet it is found in writings which have later additions (Nahum), or which are essentially later (Jon. Tobit xiv. 4 [LXX], 8, 10, 13); cf. also the use of Assyria for Babylon (Ezra vii. 22) or Syria (Zech. x. 10). Historical references in prophecies are

The idea of "righteousness" (Heb. 'idad), or loyalty, appears to have implied the mutual bonds uniting the community and its deity, see Journ. Theol. Stud., 1908, p. 632 n. 1; Expositor, Aug. 1910, p. 120.

Material familiar to contemporary thought is naturally used (see especially H. Greemann, Ursprung d. israel.-jud. Eschatologie; J. M. P. Smith, Biblical World, 1910, pp. 223 seq.).
ZEUS, ST.—ZEUS

not always decisive (Ezek. xxxii., for example, looks upon Edom and Sidon as dead), and while the continued revision of the book allows the presumption that the tradition ascribing its inception to the time of Josiah may be authentic, it is doubtful how much of the original nucleus can be safely recognized. These are problems which concern not only the criticism of biblical prophetic writings as a whole, but also the historical vicissitudes of the period over which they extend (see Jews; PALESTINE: History).

According to late tradition Zephaniah, like Habakkuk, was of the tribe of Simeon (cf. Michal of Marashah and Obadiah of Beth-hacerem, see Cheyne, Ency. Bib., col. 3455). The apocryphal prophecy of Zeph. (Clement of Alex., Strom. v. 11, 271; Gesch. Volk. Ost., iii., 271 seq.) merely illustrates the tendency to idealize older traditions. See further on textual, metrical and literary details, W. R. Smith (note 4, previous page), reprinted in Ency. Bib., with additions by S. R. Driver; J. A. Selbie in Hastingsâ€™ Dict. Bib., i. Lippl in Bibl. Studien (1910), and the commentaries on (or all or portions) of the Minor Prophets by A. B. Davidson (Camb. Bible, 1896); G. A. Smith (1898); W. Nowack (1900). K. Marti (1906; especially valuable); Driver (Cent. Bib., 1906); Von Hoornacker (1908).

ZEPHYRUS, ST, bishop of Rome from about 198 to 217, succeeded Victor I. He is described as a man of little intelligence or strength of character, and the somewhat important controversies on doctrine and discipline that marked his pontificate are far more appropriately associated with the names of Hippolytus and of Calixtus, his principal adviser and afterwards his successor.

ZEPHYRUS, in Greek mythology, the west wind (whence the English “zephyr,” a light breeze), brother of Boreas, the north wind, and son of the Titan Astraus and Eos, the dawn. He was the husband of Chloris, the goddess of flowers, by whom he had a son, Cupid, the god of fruit (Ovid, Fasti, v. 197); by the harpy Podarge he was also the father of Xanthus and Ballis, the horses of Achilles. Being spurred by Hyacinthus (v. 57), he caused his death by accident at the hands of Apollo. He was identified by the Romans with Favonius, and Chloris with Flora.

ZERBST, a town of Germany, in the duchy of Anhalt, situated on the Nuthe, 11 m. N.W. of Dessau and 27 m. S.E. of Magdeburg by the railway Dessau-Leipzig. Pop. (1900) 17,095. It is still surrounded in part by old walls and bastions, while other portions of the whitew fortified have been converted into pleasant promenades. It contains five churches, one of which (St Nicholas), built in 1446–88, is a good example of the late Gothic style as developed in Saxony, with its spacious proportions, gloined vaulting, and bare simple pillars. The town hall dates from about 1450, but was disfigured by additions in the beginning of the 17th century. It contains the minor prophets, among whom are the former Zep. (Clement of Alex., Strom. v. 11, 271 seq.) in the Latin Bible illustrated by Lucas Cranach the younger. The palace (1681–1750) has been used as a depository of archives since 1872. There are several quaint old houses, with high gables, in the market-place, in the middle of which stand a Roland column, of about 1445, and a bronze figure known as the Butterjungfer (butter-girl), of uncertain origin and meaning, but now regarded as the palladium of the town. The old Franciscan monastery, with fine cloisters, founded in 1290, contains the gymnasium; a Cistercian abbey of 1214 has been converted into barracks; and the Augustinian monastery of 1390 has been a hospital since 1525. Gold and silver articles, silk, plush, cloth, leather, soap, starch, chemicals and carriages are among the chief manufactures. Iron-founding is carried on; and several breweries are engaged in the preparation of Zerbst bitter beer, which enjoys considerable repute.

Zerbst is an ancient town, mentioned in 949. In 1397 it came into the possession of the Anhalt family, and from 1603 till 1793, was the capital of the collatoral branch of Anhalt-Zerbst. In 1793 it passed to Anhalt-Dessau.

ZELPHAT, a mediaeval village at the head of the Visp valley and at the intersection of the Matterberge, on the canton of the Valais, Switzerland. It is 274 m. by rail from Visp in the Rhône valley, and there is also a railway from Zermatt past the Rifflins to the very top of the Gornergrat (10,289 ft.). The village is 5315 ft. above the sea, and in 1900 had 741 permanent inhabitants (all Romanists save 9, and all but 12 German-speaking), resident in 73 houses. Formerly Zermatt was called "Pra- borgue," and this name is mentioned in the Swiss census of 1885. Its originally Romance population seems to have been Teutonised in the course of the 19th century; the name "Matt," (now written "Zermatt," i.e. the village on the meadows) first occurring at the very end of that century. Zermatt was long known to botanists and geologists only, and has an interesting though very local history. De Saussure in 1780 was one of the first tourists to visit it. But it was not till the arrival of M. Alexandre Seller in 1854 that its fame as one of the chief tourist resorts in the Alps was laid, for tourists around only where there are good inns. When M. Seller tiled in 1851 he was proprietor of most of the great hotels in and around Zermatt. The Matterhorn, which frowns over the village from which it takes its name, was not conquered till 1865, and its slopes are still one of the most dangerous routes in Switzerland. The easy Italian pass of the St Thodoule (10,899 ft.) leads S. in six hours from the village to the Val Tournanche, a tributary glen of the valley of Aosta.

ZERO, the figure 0 in the Arabic notation for numbers, noth, cipher. The Arabic name for the figure was sihr, which meant literally an empty thing. The old Latin writers on arithmetic translated or transliterated the Arabic word as homine or humine in Greek, which is translated as zero, borrowed by F. zeri, whence it came late into English. The Spanish form cifra, more closely resembling the original Arabic, gave O. Fr. cifier, mod. chiffre, also used in the sense of monogram, and English "cipher" which is thus a doublt. In physics, the term is applied to a point with which phenomena are quantitatively compared, especially to a point of a graduated instrument between a positive and negative or ascending and descending scale, as in the scales of temperature.

ZEULENRODA, a town of Germany, in the principality of Reuss-the-Elter, situated on a high plateau in a well-wooded and hilly country, 35 m. N. of Halle by the railway to Werder. Pop. (1900) 9419. The town contains a handsome town hall, several churches and schools, and carries on an active industry in cotton and woollen stocking manufacture. Zeulenroda is mentioned as a village as early as 1390, and it obtained municipal rights in 1438. Since 1500 it has belonged to the Greiz branch of the Reuss line of princes.

ZEUS, the Greek counterpart of the Róman god, Jupiter (q.v.). In the recorded periods of Hellenic history, Zeus was accepted as the chief god of the pantheon of the Greeks; and in religious progress of the people from lower to higher ideas can be well illustrated by the study of his ritual and personality. His name is formed from a root dik, meaning "right," which appears in other Aryan languages as a formative part of divine names, such as the Sanskrit Dikus, "sky"; Latin Divus, Jovis, Diespiter, divus; Old English Tiu; Norse Tyr. The conclusion that has been frequently drawn from these facts, that all the Indo-Germanic stocks before their dispersion worshipped a personal High God, the Sky-Father, has been now seen to be hazardous. Nevertheless, it remains probable that Zeus had already been conceived as a personal and pre-eminent god by the ancestors of the living Hellenic tribes before they entered the peninsula which became their historic home. In the first place, his pre-eminence is obviously pre-Homeric; for Homer was no preacher or innovator in religion, but gives us some at least of the primary facts of the contemporary religious beliefs prevailing about 1000 B.C.; and he attests for us the supremacy of Zeus as a belief which was unquestioned by the average Hellene of the time; and appreciating how slow was the process of religious change in the earlier period, we shall believe that the god had won this position long before the Homeric age. In the next place, we cannot trace the origin of his worship

1 See, however, Schrader, Prehistoric Antiquities of the Aryan People (trans. Jeovus), 416–419.

10
back to any special stock or particular locality; we cannot find a single community that did not possess his worship or that preserved any legend that suggests a late date for its introduction. Doubtless, it has very ancient and close associations with Thessaly; for most of the leading tribes must have entered Hellas by this route, and remembered the mountain Olympus that dominates this region as the earliest home of his cult, and took with them to their most distant settlements the innumerable Zeus worship. Also, the concepts lost in Thessaly, like the Achaean Aeacidae, may have regarded him as specially their ancestor. But to maintain therefore that he originated in Thessaly as the special deity of a single tribe, who were able to impose him upon the whole of Hellas, is against the analogies offered by the study of the special cults of Greek polytheism. But if we assume that he was the aboriginal Hellenic High God, we must be quite ready to admit that the separate communities were always liable to cherish other divinities with a more ardent and closer devotion, whether divinities that they brought with them or divinities that they found powerfully established in the conquered lands, Athena or Hera, for instance, in Attica or Argolis, or Poseidon in the Minyan settlements. This in fact is a frequent fate of a "High God" in polytheistic systems; he is vaguely praised and reverenced, but lower divine powers are nearer to the people's love or fear.

The Cretan legend of his birth and origin, which gave rise to the Cretan cult of Zeus Keraunegos,1 "Zeus born in Crete," may appear evidence against the theory just set forth. But it is not likely that any birth-legend belongs to the earliest stratum of the Zeus-religion. The Aryan Hellenes found in many of the conquered lands the predominant cult of a mother-goddess, to whom they gradually had to affiliate their own High God: and in Crete they found her cult associated with the figure of a male divinity who was believed to be born and to die at certain periods; probably he was an early form of Dionysus, but owing to his prominence in the island the Hellenic settlers may have called him Zeus; and this would explain the markedly Dionysiac character of the later Zeus-religion in Crete.

We can now consider the question how the god was imagined in the popular belief of the earliest and later periods. Homer is our earliest literary witness; and the portrait that he presents of Zeus is too well known to need minute description. To appreciate it, we must distinguish the lower mythologic aspect of him, in which he appears as an amorous and capricious deity lacking often in dignity and real power, and the higher religious aspect, in which he is conceived as the All-Father, the Father of Gods and men in a spiritual or moral sense, as a God omnipotent in heaven and earth, the sea and the realms below, as a God of righteousness and justice and mercy, who regards the sanctity of the oath and hears the voice of the suppliant and sinner, and in whom the pious and the lowly trust. In the fact the later Greek religion did not advance much above the high-water mark of the Homeric, although the poets and philosophers deepened certain of its nobler traits. But Homer we now know to be a relatively late witness in this matter. How much of his sketch is really primitive, and what can we learn or guess concerning the millennium that preceded him? His God is pronouncedly individual and personal, and probably Zeus had reached this stage of character at the dawn of Hellenic history. Yet traces of a pre-deistic and animistic period survived here and there; for instance, the Arcadians still use the thunder itself called Zeus (Zeos Keraunegos) in a Mantinian inscription, 4 and the stone near Gythium in Laconia on which Orestes sat and was cured of his madness, evidently a thunder-stone, was named itself Zeos Keraunegos, which must be interpreted as "Zeus that fell from heaven”; 5 we here observe that the personal God does not yet seem to have emerged from the divine thing or divine phenomenon. Yet the Arcadians, like the other Greeks, had probably long before Homer risen above this stage of thought; for Greek religion was so strongly conservative that it preserved side by side the deposits of different ages of thought surdened perhaps by thousands of years.

Again the Homeric Zeus is fully anthropomorphic; but in many domains of Greek religion we discover the traces of theriomorphism, when the deity was regarded as often incarnate in the form of an animal or the animal might itself be worshipped in its own right. We seem to find it latent in the Arcadian worship of Zeus Akauros and the legend of King Lycaon. The later worship of the animal God, who turns him into a wolf for his sins; and the later Arcadian ritual in honour of this God betrays a hint of lycanthropy; some one who partook of the sacrifice or who swam across a certain lake was supposed to be transformed into a wolf for a certain time. 6 Robertson Smith 8 was the first to propose that we have here the traces of an ancient totemistic sacrifice of a wolf-clan, who offered the "thranthropic" animal "the man-wolf" to the wolf-God. The totemistic theory in its application to Greek religion cannot be here discussed; but we may note that there is a hint in the story that the wolf was offered to Zeus and that the name Akauros could not originally have designated the "wolf"-God: for from the stem λύκως we should get the adjective λύκιος, not λυκεύς; the latter is better derived from a word such as λυκαίας, "light," and may allude to the God of the clear sky; in fact the wolf, which was a necessary animal in the ritual and legend of Apollo Aakis, may have strayed casually into association with Zeus Akauros, attracted by a false etymology. Another ritual, fascinating for the glimpse it affords of very old-world thought, is that of the Dipolia, the yearly sacrifice to Zeus Polieus on the Acropolis at Athens. 7 In this a ox was slaughtered with ceremonies unique in Greece; the priest who slew him fled and remained in exile for a period, and the axe that was used was tried, condemned and flung into the sea; the hide of the slain ox was stuffed with hay, and this effigy of the ox was yoked to the plough and feigned to be alive. Again Robertson Smith saw here the "thranthropic" animal, the Ox-God-man, eaten sacramentally by an ox-tribe, and so sacred that his death is a murder that must be atoned for in other ways and by a feigned resurrection. We recognize indeed the sacramental meal and the sanctity of the ox; but the animal may have acquired this sanctity temporarily through contact with the altar; we need not suppose an ox-clan—the priest was merely Beos "the herdman"— nor assume the permanent sanctity of the ox, nor the belief that the deity was permanently incarnate in the ox: the main parts of the ceremony can be explained as cattle-magic intended to appease the rest of the oxen or to prevent them suffering sympathetically through the death of one. We may indeed with Mr Andrew Lang explain the many myths of the bestial transformations of Zeus on the theory that the God was the tribal ancestor and assumed the shape of the animal-man in order to engender the tribal patriarch; 8 but on the actual cults of Zeus theriomorphism has left less trace than on those of many other Hellenic deities. The animal offered to him may become temporarily sacred; and its skin would have magic properties: this explains his use of the aegis, the goatskin, as a battle-charm; but of a Goat-Zeus, a Ram-Zeus, or a Wolf-Zeus, there is no real trace.

The peculiar characteristic of his earliest ritual was the human sacrifice; besides the legend of King Lycaon, we find it in the story of the house of Athamas and in the worship of Zeus Aaakos of Thessaly; 9 and other examples are recorded. The cruel rite had ceased in the Arcadian worship before Pliny wrote, but seems to have continued in Cyprus till the reign of Hadrian. It was found in the worship of many other divinities of Hellas in early times, and no single explanation can be given that would apply to them all. A hypothesis favoured by Dr Frazer, that the victim is usually a divine man, a priest-king

incarnation of the God, may be well applied to the Athamanid sacrifice and to that of King Lycaon; for he derives his name from the divinity himself, and according to one version he offers his own child; and the Lycaonid legend presents one almost unique feature, which is only found elsewhere in legendary Dionysiac sacrifice, the human flesh is eaten, and the sacrifice is a cannibalistic-sacrament, of which the old Mexican religion offers conspicuous example. Yet it is in this religion of Zeus that we see most clearly the achievement of progressive morality; Zeus himself punishes and abolishes the savage practice; the story of his son Phutaran, how a kid was sacrificed, is doubtless for Helen when she was led to the altar to be offered, is a remarkably close parallel to the biblical legend of Abraham's sacrifice of Isaac.

We can now consider the special attributes of the anthropomorphic God. His character and power as a deity of the sky, who ruled the phenomena of the air, so clearly expressed in Homer, explains the greater part of his cult and cult-titles. More personal than Ouranos and Helios— with whom he has only slight associations— he was worshipped and invoked as the deity of the bright day (Açmepos and twyos, Ausos), who sends the rain, the wind and dew ("Ωμβρος, Ναίως, Τύρεως, Ουρός, Εὐκαίως, Ἱμαντᾶς), and such a primitive adjective as ἀντραπαῖος, applied to things "that fall from heaven," attests the primeval significance of the name of Zeus. But the thunder was his most striking manifestation, and no doubt he was primarily a thunder-God, Ὠρανός, Ὠρανοβόλος, Ἀστραπαῖος. These cult-titles had originally the force of magic invocation, and much of his ritual was weather-magic: the priest of Zeus Æanios, in time of drought, was wont to ascend Mount Lycaenum and dip an oak-bough in a sacred fountain, and by this sympathetic means produce rain. A god of this character would naturally be worshipped on the mountain-tops, and that these were very frequently consecrated to him is shown by the large number of appellatives derived from the names of mountains.1 But probably in his earliest Hellenic period the power of Zeus in the natural world was not limited to the sky. A deity who sent the fertilizing rains would come to be regarded as a god of vegetation, who descended into the earth and whose power worked in the life that wells forth from the earth in plant and tree. Also the close special association of Zeus with the European and Thracian tribes, whose name Zeus recently has been borrowed.2 Homer calls the God of the lower world Ζησὶ Καρακάθθων,3 and the title of Zeus Ὑβόνοις which was known to Hesiod, occurred in the worship of Corinth;4 and there is reason to believe that Euboules of Eleusis and Trophonius of Labadeia are fused forms of the nether Zeus; in the Phrygian religion of Zeus, which no doubt contains primitive Aryan elements, we find the Thunder-God associated also with the nether powers.5

A glimpse into a very old stratum of Hellenic religion is afforded us by the records of Dodona. A Dodonian liturgy has been preserved which, though framed in the form of an invocation and a dogma, has the force of a spell-prayer—"Zeus was and is and will be, oh great Zeus: earth gives forth fruits, therefore call on Mother Earth."9 Zeus the Sky-God is seen here allied to the Earth-Goddess, of whom his feminine counterpart, Dion, may have been the personal form. And it is at Dodona that his association with the oak is of the closest. His prophet-priests the Selloi "with unwashed feet, coughing on the ground," lived about the sacred oak, which may be regarded as the primitive shrine of the Aryan God, and interpreted its oracular voice, which spoke in the rustling of its leaves or the cooing of its doves. Achilles hailed the Dodonian God as Παλαιός, either in the sense of "Thessalian" or "primitive,"11 and Zeus, we may believe, long remained at Dodona such as he was when the Hellenic tribes first brought him down from the Balkans, a high God supreme in heaven and in earth.

We may also believe that in the earliest stages of worship he had already acquired a moral and a social character. The Homeric view of him as the All-Father is a high spiritual concept, but one of which many savage religions of our own time are capable. The family, the tribe, the city, the smaller and more complex organisms of the Hellenic polity, were specially under his care and direction. In spite of the popular stories of his amours and infidelities, he is the patron-God of the monogamic marriage, and his union with Hera remained the divine type of human wedlock. "Reverence Zeus, the Father-God": "all fathers are sacred to Zeus, the Father-God, and all brothers to Zeus the God of the family": these phrases of Aristophanes and Epicetetus express the ideas that engendered his titles Παρσός, Γαμπός, Τελέος, Θυβός. In the Examenides of Aeschylus14 the Erinyes are reproached in that by aiding Clytemnestra, who slew her husband, "they are dishonouring and bringing to naught the pledges of Zeus and Hera, the thrieters goddesses:" and these were the divinities to whom sacrifice was offered before the wedding,15 it may be that some kind of mimetic representation of the "Holy Marriage," the Ιερός γάμος, of Zeus and Hera formed a part of the Attic nuptial ceremonies.16 The "Holy Marriage" was celebrated in many parts of Greece, and certain details of the ritual suggest that it was of great antiquity: here and there it may have had the significance of vegetation-magic,17 like the marriage of the Lord and Lady of May; but generally it seems to have been only regarded as a divine counterpart to the human ceremony. Society may have at one time been more linear in the communities that become the historic Hellenes; but of this there is no trace in the worship of Zeus and Hera.18

In fact, the whole of the family morality in Hellas centred in Zeus, whose altar in the courtyard was the bond of the kinsmen; and sins against the family, such as unnatural vice and the exposure of children, are sometimes spoken of as offences against the High God.19 He was also the tutelary deity of the larger organization of the phratria; and the altar of Zeus Φάραγως was the meeting-point of the phratres, when they were assembled to consider the intimacy of the new applicants for admission into their circle.20 His religious law also came to assist the development of certain legal ideas, for instance, the rights of private or family property in land; he guarded the allotments as Ζήνος Κλάρμος,21 and the Greek commandment "thou shalt not remove thy neighbour's landmark" was maintained by Zeus Λόπος, the god of boundaries, a more personal power than the Latin Jupiter Terminus.22 His highest political functions were summed up in the title Hellenic, the cult-name of a legendary antiquity in Athens, and frequent in the Hellenic world.23 His consort in his political life was not Hera, but his daughter Athena Polias. He sat in her judgment court καὶ Πολλῶις where cases of involuntary homicide were tried.24 With her he shared the chapel in the Council-Hall of Athens dedicated to them under the titles of Βουλανίως and Βουλαία, "the inspirers of counsel," by which they were worshipped in many parts of

ZEUXIS

Greece.1 The political assembly and the law-court were consecrated to Zeus Α'γαρις,2 and being the eternal source of justice he might be invoked as Δυσπροσ "The Just."3 As the god who brought the people under one government he might be worshipped as Πάνινος;4 as the deity of the whole of Hellas, Ἐλλάνων,5 a title that belonged originally to Aegina and to the prehistoric tribe of the Aeacidae, and had once the narrower application to the "Thessalian Hellenes," but acquired the Pan-Hellenic sense, in fact expanded into the form Παναθηναίος, perhaps about the time of the Persian wars, when thanksgiving was due for his victory and the fruits of dedication and sacrifice to Zeus the ruler — "Ελευθερίας.6 Finally, in the formulas adopted for the public oath, where many deities were invoked, the name of Zeus was the masterword.

There is reason for thinking that this political character of Zeus belongs to the earliest period of his religion, and it remained as long as that religion lasted. Yet in one respect Apollo was more dominant in the political life; for Apollo possessed the more powerful oracle of Delphi. Zeus spoke directly to his people at Dodona only,7 and with authority only in ancient times; for owing to historical circumstances and the hierarchic position the Dodonaeion shared the religious functions of a second Delphi.

It remains to consider briefly certain moral aspects of his cult. The morality attaching to the oath, so deeply rooted in the conscience of primitive peoples, was expressed in the cult of Zeus Ὄρκος, the God who punished perjury.8 The whole history of Greek legal and moral conceptions attaching to the guilt of homicide can be studied in relation to the cult-appellatives of Zeus. The Greek consciousness of the sin of murder, only dimly awakened in the Homeric period, and only sensitive at first when a kinsman or a suppliant was slain, gradually expands till the sanctity of all human life becomes recognized by the higher morality of the people: and the names of Ζεὺς Μυλίδος, the dread deity of the ghost-world whom the sinner must make "placeable," of Ζεὺς Ἡδεός and Προσφρονάτος, to whom the conscience-stricken outcast may turn for mercy and pardon, play a guiding-part in this momentous evolution.9

Even this summary reveals the deep indebtedness of early Greek civilization to this cult, which engendered ideas of importance for the higher religious thought of the race, and which might have developed into a monotheistic religion, had a prophet-philosopher arisen powerful enough to combat the polytheistic proclivities of Hellas. Yet the figure of Zeus had almost faded from the religious world of Hellas some time before the end of paganism; and Lucian makes him complain that even the Egyptian Anubis is more popular than he, and that men think they have done the outworn God sufficient honour if they sacrifice to him once in five years at Olympia. The history of religions supplies us with many examples of the High God losing his hold on the people's consciousness and love. In the case of this cult the cause may well have been a certain coldness, a lack of enthusiasm and mystic ardour, in the service. These stimulants were offered rather by Demeter and Dionysus, later by Cybele, Isis and Mithras.

ZEUXIS, a Greek painter, who flourished about 420-390 B.C., and described himself as a native of Hieraclea, meaning probably the town on the Black Sea. He was, according to one...

account, a pupil of Damophilus of Himera in Sicily, the other statement being that he was a pupil of Neson of Thasos. Afterwards he appears to have resided in Ephesus. His known works are—

1. Zeus surrounded by Deities.
2. Eros crowned with Roses.
3. Marsyas bound.
4. Pan.
5. Centaur family.
6. Boreas or Triton.
7. Infant Hercules strangling the serpents in presence of his parents. Alcmena and Amphitryon.
8. Alcmena, possibly another name for 7.
9. Helena at Croton.
10. Penelope.
11. Menelaus.
12. Athlete.
15. Dog.
17. Plastic works in clay.

In ancient records we are told that Zeuxis, following the initiative of Apollodorus, had introduced into the art of painting a method of representing his figures in light and shadow, as opposed to the older method of outline, with large flat masses of colour for draperies, and other details, such as had been practised by Polygnotus and others of the great fresco painters. The new method led to smaller compositions, and spectators admired its novelty and elegance. The illusion was more easy for the painter to demonstrate the combined effect of the various means by which he obtained perfect roundness of form. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew towards it, while Parrhasius painted a curtain which even Zeuxis mistook for real. It is perhaps a variation of this story when we are told (Pliny) that Zeuxis also painted a boy holding grapes towards which birds flew, the artist remarking that if the boy had been as well painted as the grapes the birds would have kept at a distance. But, if the method of Zeuxis led him to real roundness of form, to natural colouring, and to pictures consisting of single figures or nearly so, it was likely to lead him also to search for striking attitudes or motives, which by the obviousness of their meaning should emulate the plain intelligibility of the larger compositions of older times. Lucian, in his Zeuxis, speaks of him as carrying this search to a novel and strange degree, as illustrated in the group of a female Centaur with her young. When the picture was exhibited, the spectators admired its novelty and elegance; the skill of the painter, to the vexation of Zeuxis. The pictures of Hercules strangling the serpents to the astonishment of his father and mother (7), Penelope (10), and Menelaus Weeping (11) are quoted as instances in which strong motives naturally presented themselves to him. But, in spite of the tendency towards realism inherent in the new method of Zeuxis, he is said to have retained the ideality which had characterized his predecessors. Of all his known works it would be expected that this quality would have appeared best in his famous picture of Helena, for this reason, that we cannot conceive any striking or effective incident for him in her career. In addition to this, however, Quintilian states (Inst. Orat. xii. 10, 4) that in respect of robustness of types Zeuxis had followed Homer, while there is the fact that he had inscribed two verses of the Iliad (iii 176 seq.) under his figure of Helena. As models for the picture he was allowed the presence of five of the most beautiful maidens of Croton at his own request, in order that he might be able to "transfer the truth of life to a mute image." Cicero (De Invent. ii. 1, 4) assumed that Zeuxis had found distributed among these five the various elements competent to make up a figure of ideal beauty. It should not, however, be understood that the painter had made up his figure by the process of combining the good points of various models, but rather that he found among those models the points that answered to the ideal Helena in his own mind, and that he merely required the models to guide and correct himself by during the process of transferring his ideal to form and colour. This picture also is said to have been exhibited publicly, with the result that Zeuxis made much profit out of it. By this and other means,
we are told, he became so rich as rather to give away his pictures than to sell them. He presented his Alcmena to the Agridontines, his Pan to King Archelaus of Macedonia, whose palace he is also said to have decorated with paintings. According to Pliny (N.H. xxxv. 62), he made an ostentatious display of his wealth at Olympia in having his name written in letters of gold on his dress. Under his picture of an athlete (12) he wrote that "It is easier to revile than to rival" (μεταφέρει ἵνα μεταφέροι). A contemporary, Isocrates (De Furmul. 2), remarks that no one would say that Zeuxis and Parrhasius had the same profession as those persons who paint pinakia, or tablets of terra-cotta. We possess many examples of the vase-painting of the period circa 400 B.C., and it is noticeable on them that there is great freedom and facility in drawing the human form, besides great carelessness. In the absence of fresco paintings of that date we have only these vases to fall back upon. Yet, with their limited resources of colour and perspective, they in a measure show the influence of Zeuxis, while, as would be expected, they retain perhaps more of the simplicity of older times.

ZHILENOVODSK, a health resort of Russian Caucasia, in the province of Terek, lying at an altitude of 1835 ft. on the S. slope of the Zhlesnaya Gora (2805 ft.), 11 m. by rail N.N.W. from Pyatigorsk. It possesses chalybeate springs of temperature 56°-60° Fahr.; the buildings over the springs were erected in 1893. The season lasts from early in June to the middle of September.

ZHITOMIR, or Jítomir, a town of western Russia, capital of the government of Volhynia, on the Teterev river, 83 m. W.S.W. of Kiev. (1900) 89,675, more than one-third Jew. It is the see of an archbishop of the Orthodox Greek Church and of a Roman Catholic bishop. Two printing offices in Zhitomir issue nearly one-half of all the Hebrew books printed in Russia. The Jewish merchants carry on a considerable export trade in agricultural produce, and in timber and wooden wares from the forests to the north. Kid gloves, tobacco, dyes and spirits are manufactured.

Zhitomir is a very old city, tradition tracing its foundation as far back as the times of the Scandinavian adventurers, Askold and Dir (9th century). The annals, however, mention it chiefly in connexion with the invasions of the Tatars, who plundered it in the 13th, 14th and 17th centuries (1660), or in connexion with destructive conflagrations. It fell under Lithuanian rule in 1320, and during the 15th century was one of the chief cities of the kingdom. Later it became part of Poland, and when the Cossacks rose under their chieftain, Bogdan Chmielnicki (1648), they sacked the town. It was annexed to Russia along with the rest of the Ukraine in 1778.

ZHOB, a valley and river in the N.E. of Baluchistan. The Zhob is a large valley running from the hills near Ziarat first eastward and then northward parallel to the Indus frontier, till it meets the Gomal river at Khajuri Kach. It thus becomes a strategic line of great importance, as being the shortest route between the North-West Frontier Province and Quetta, and dominates all the Pathan tribes of Baluchistan by cutting between them and Afghanistan. Up to the year 1884 it was practically unknown to Europeans, but the Zhob Valley Expedition of that year opened it up, and in 1886 the Zhob Valley and Gomal Pass were taken under the control of the British Government. The Zhob Valley was the scene of punitive British expeditions in 1884 and 1899. In 1890 Zhob was formed into a district or political agency, with its headquarters at Fort Sandeman: pop. (1901) 35,552. As reconstituted in 1903, the district has an area of 9626 sq. m.; pop. (1901) 69,718, mostly Pathans of the Kakar tribe.

See Sir T. H. Holdich's Indian Borderland (1901); Bruce's Forward Policy (1900); McFall's With the Zhob Field Force (1895); and Zhob District Gazetteer (Bombay, 1907).

ZIARAT ("a Mahomedan shrine"), the summer residence of the chief commissioner of Baluchistan, and sanatorium for the European troops at Quetta: 8850 ft. above the sea and 33 m. by cart-road from the railway. There is a good water supply, and the hills around are well-wooded and picturesque.

ZICHY (of Zich and Vásnyék), the name of a noble Magyar family, conspicuous in Hungarian history from the latter part of the 13th century onwards. Its first authentic ancestor bore the name of Zayk, and this was the surname of the family until it came into possession of Zich in the 15th century. It first came into great prominence in the 16th century, being given county rank in 1579 in the person of the imperial general Jellachich (see (d. 1659). His descendants divided first into two branches: those of Zichy-Palota and Zichy-Kárlburg. The Palota line, divided again into three: that of Nagy-Láng, that of Adony and Šzent-Miklós, and that of Palota, which died out in the male line in 1874. The line of Zichy-Kárlburg (since 1811 Zichy-Ferraris) split into four branches: that of Vedrőb, that of Vészony, and those of Daruvár and Csicós, now extinct.

COUNT KÁROLY ZICZY (1753-1826) was Austrian war minister in 1809 and minister of the interior in 1813-1814. His son, COUNT FERDINAND ZICZY (1783-1862) was the Austrian field-marshall commander-in-chief from 1813 to 1814, and for surrendering to the insurgents in 1848 (he was pardoned in 1851). COUNT ÖDÖN [EDMUND] ZICZY (1800-1848), administrator of the county of Veszprém, was hanged on the 30th of September 1848 by order of a Hungarian court-martial, presided over by Görgei, for acting as Jellachich's emissary to the imperial general Roth. COUNT FERENC ZICZY (1811-1900) was secretary of state for commerce in the Széchenyi ministry of 1848, but retired on the outbreak of the revolution, joined the imperial side, and acted as imperial commissary; from 1874 to 1880 he was Austrian ambassador at Constantinople. COUNT ÖDÖN ZICZY (1811-1894) was remarkable for his great activity in promoting art and industry in Austria-Hungary; he founded the Oriental Museum in Vienna. His son, COUNT Eugen ZICZY (b. 1837), inherited his father's notable collections, and followed him in his economic activities; he three times visited the Caucasus and Central Asia to investigate the original seat of the Magyars, publishing as the result Voyages au Caucase (2 vols., Budapest, 1897) and Dritte aostatische Forschungsreise (6 vols., in Magyar and German; Budapest and Leipzig, 1900-1905). COUNT MICHAEL ZICZY (b. 1862) also from 1896 to 1906 a member of the Catholic People's Party in the Lower House, and after 1906 attached to Andrássy's Constitutional Party, was of importance as the confidant of the heir to the throne, the Archduke Francis Ferdinand. COUNT GÉZA ZICZY (b. 1849), nephew of the Count Ferenc mentioned above, studied under Liszt and became a professional pianist; in 1891 he became intendant of the Hungarian national opera-house, a member of the Hungarian Upper House and head of the Conservatoire at Budapest. COUNT Mihaly ZICZY (b. 1839), one of the most conspicuous Hungarian painters, was appointed court painter at St. Peters- burg in 1851 and accomplished the Royal Gallery portraits of various journeys. The National Gallery at Budapest possesses some of his paintings, notably that of "Queen Elizabeth before the coffin of Francis Deák"; but he is best known for his illustrations of the works of the great Magyar writers (Petőfi, Arany, &c.).

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821- ), French painter, was born at Beaune (Côte d'Or) in 1821. Having studied at the art school of Dijon, where he carried off the grand prix for architecture, he went to Rome in 1839 and there continued his studies. The years from 1845 to 1848
were spent in travel in the south of France, Italy and the East, where he found the glowing sunlight and the rich colour peculiarly suited to his temperament. His reputation is, however, not based so much on his orientalist canvases as on his pictures of Venice, which are generally characterized by the intensity of the sunny glow on the red sails and golden-yellow buildings under a deep blue sky. Many of his Venetian pictures are purely imaginative, and their appeal is entirely due to their qualities of colour, his archetypal drawing being frequently faulty and careless. After "Sunrise at Stamboul," which Théodore Gautier called "the finest picture of modern times," he received the Legion of Honour in 1857, and was made an officer in 1878. The majority of his paintings have gone to American private collections, but two of his finest pictures, "The Doge's Palace in Venice" (1852), and a marine-painting, are at the Luxembourg Museum, and a "View of Quai St Jean, Marseilles" at the Marseilles Gallery, whilst many others are to be found in the leading private collections of modern pictures in France, England and Germany. In collaboration with Luc de Vos he illustrated The Death of Paganini.

See Félix Ziem, by L. Roger-Milès (Librairie de l'art, Paris).

ZIERIKSEE, a town in the province of Zeeland, Holland, on the south side of the island of Schouwen. Pop. 6,800. It is a very old town, and formerly flourished exceedingly on account of its trade and fishing, and important salt-making industry, and now is the chief market centre and port in the island. Among the principal buildings are the town-hall (15th century); the Great Church, which was rebuilt after a fire in 1832, but retains the lofty tower (1545) belonging to the earlier building; the Little Church, the prison and the exchange. The chief public square occupies the site of a residence of the counts of Zeeland dating from 1048.

ZIETEN, HANS JOACHIM VON (1660-1786), Prussian general-field-marshals, began his military career as a volunteer in an infantry regiment. He retired after ten years' service, but soon afterwards became a lieutenant of dragoons. Being involved in some trade transactions of his squadron-commander, he was cashiered, but by some means managed to reinstate himself, and was posted to a hussar corps, then a new arm. At that time light cavalry was well known only to the Austrians, and in 1735 Rittmeister von Zieten made the Rhine campaign under the Austrian general Baronay. In 1741, when just promoted lieutenant-colonel, Zieten met his old teacher in battle and defeated him at the action of Rothschloss. The chivalrous Austrian sent him a complimentary letter a few days later, and Winterfeld (who was in command at Rothschloss) reported upon his conduct so favourably that Zieten was at once marked out by Frederick the Great for command. Within the year he was colonel of the newly formed Hussar regiment, and henceforward his promotion was rapid. In the "Moravan Foray" of the following year Zieten and his hussars penetrated almost to Vienna, and in the retreat to Silesia he was constantly employed with the rearguard. Still more distinguished was his part in the Second Silesian War. In the short peace, the hussars, like the rest of the Prussian cavalry, had undergone a complete reformation; to irony discipline they had added the dash and skirmishing qualities of the best irregulars, and the hussars were considered the best of their arm in Europe. Zieten fought the brilliant action of Moldau Teinst almost on the day he received his commission as major-general. In the next campaign he led the famous Zietenritt round the enemy's lines with the object of delivering the king's order to a distant detachment. At Hohenfriedberg-Stieglau and at Katholisch-Hennersdorf the hussars covered themselves with glory. Hennersdorf and Kesselsdorf ended the second war, but the Prussian army did not rest on its laurels, and their training during the ten years' peace was careful and unceasing. When the Seven Years' War broke out in 1756 Zieten had just been made lieutenant-general. At the Reichenberg and at Prag he held important commands, and at the disastrous battle of Kolin (16th June 1757) his left wing of cavalry was the only victorious corps of troops. At Leuthen, the most brilliant battle of the 18th century, Zieten's cavalry began the fighting and completed the rout of the Austrians. He continued, during the whole of the war, to be one of Frederick's most trusted generals. Almost the only error in his career of battles was his misdirection of the frontal attack at Torgau, but he redeemed the mistake by his desperate assault on the Siptitz heights, which eventually decided the day. At the peace, General Zieten went on the retirement of the hero of the army and the people. He died in 1786. Six years later Frederick's successor erected a column to his memory on the Wilhelmsplatz in Berlin.

ZIMBABWE, a Bantu name, probably derived from the two words simba ("houses") and mabati ("stones"), given to certain ruins in South-East Africa. Its use is not confined to Southern Rhodesia and should not properly be restricted to any one particular site. For, as the medieval Portuguese stated, it is merely a generic term for the capital of any considerable chief, and it has been applied even by them to several distinct places. From about 1550 onwards the Zimbabwe generally referred to by Portuguese writers was at a spot a little north of the Afur district, not far from the Zambezi. There is some reason, however, to suppose that before this the capital of the Monomotapa was situated much farther south, and it may plausibly be identified with the most extensive ruins as yet known, viz. those near Victoria (Mashonaland) to which popular usage has now attached par excellence the name of Zimbabwe. These ruins were discovered by Adam Render in 1868 and explored by Karl Mauch in 1871. They became well known to English readers from J. T. Bent's account of the Ruined Cities of Mashonaland, but the popularity of that work disseminated a romance concerning their age and origin which was only dispelled when scientific investigations undertaken in 1903 showed it to be wholly without historical warrant. Even before this it had been clear to archaeologists and ethnologists that there was no evidence to support the popular theory that Zimbabwe had been built in very ancient days by some Oriental people. Swan's measurements, which had misled Bent into accepting a chronology based on a supposed orientation of the "temple," had been shown to be inexact. There was no authentic instance of any inscription having being found there or elsewhere in Rhodesia. Numerous objects had been discovered in the course of excavations, but not one of them could be recognized as more than a few centuries old, while those that were not demonstrably foreign imports were of African type.

The explorations conducted in 1905 added positive evidence. For it was proved that the medieval objects were found in such positions as to be necessarily contemporaneous with the foundation of the buildings, and that there was no superposition of periods of any date whatsoever. Finally from a comparative study of several ruins it was established that the plan and construction of Zimbabwe are by no means unique, and that this site only differs from others in Rhodesia in respect of the great dimensions and the massiveness of its individual buildings. It may confidently be dated to a period not earlier than the 14th or 15th century A.D., and attributed to the same Bantu people the remains of whose stone-fenced kraals are found at so many places between the Limpopo and the Zambezi.

There are three distinct though connected groups of ruins at Zimbabwe, which are commonly known as the "Elliptical Temple," the "Acropolis" and the "Valley Ruins." The most famous is the first, which is doubtfully misnamed, since it is not a temple and its contour is too unsymmetrical to be described properly as elliptical. It is an irregular enclosure over 30 ft. high, 200 ft. across, and a maximum breadth of 220 ft., surrounded by a dry-built wall of extraordinary massiveness. This wall is in places over 30 ft. high and 14 ft. wide, but is very erratic in outline and
variable in thickness. The most carefully executed part is on the south and south-east, where the wall is decorated by a row of granite monoliths beneath which runs a double line of chevron ornament. The interior has been much destroyed by the ravages of gold-seekers and amateur excavators. Enough, however, remains to show that the scheme was a combination of such a stone kread as that at Nanattal with the plan of a fort like those found about Inanya. The only unique feature is the occurrence of a large and a small conical tower at the southern end, which Bent and others considered to be representatives of the human phallus. Their form, however, is not sufficiently characteristic, nor is any other definite identification possible, and it may be noted that the nearest approximation to phallic worship is found amongst the most typical of African peoples, viz. the Ewe-speaking natives of the West Coast. The floor of the enclosure is constituted as in the other Zimbabwe buildings by a thick bed of cement which extends even outside the main wall. This cement mass is heightened at many places so as to make platforms and supports for huts. Groups of these dwellings are enclosed by subsidiary stone walls so as to form distinct units within the larger precinct.

The "cropolls" is in some ways more remarkable than the great kread which has just been described. It is a hill rising 200 to 300 ft. above the valley, fortified with the minutest care and with extraordinary ingenuity. The principles of construction, the use of stone and cement are the same as in the "elliptical" kread; there is no definite plan, the shape and arrangement of the enclosures being determined solely by the natural features of the ground. Between this and the "elliptical" kread are the "Valley Ruins," consisting of smaller buildings which may have been the dwellings of those traders who bartered the gold brought in from distant mines. Zimbabwe was probably the distributing centre for the gold traffic carried on in the middle ages between subjects of the Monomotapa and the Mahomedans of the coast.

Compare also the articles Rhodesia: Archaeology, and Monomotapa.

See D. Randall-Maciver, Medisevoi Rhodesia (London, 1906); Journal of Anthorp. Inst., vol. xxxv; GeoR. Journal (1906); Mauch's report in Ausland (1872) is now only of bibliographical interest, while Bent's Ruined Cities of Mashonaland (1892) and R. N. Hall's Great Zimbabwe (1905) are chiefly valuable for their illustrations.

ZIMMERMANN, JOHANN GEORG, RITTER von (1728–1795), Swiss philosophical writer and physician, was born at Brugg, in the canton of Aargau, on the 6th of December 1728. He studied at Göttingen, where he took the degree of doctor of medicine. He published by subscription the dissertation on frustation, De irritabilitate (1751). After travelling in Holland and France, he practised as a physician in his native place, and here he wrote Üüber die Einsamkeit (1756, emended and enlarged, 1784-83) and Vom Nationalstolz (1758). These books made a great impression in Germany, and were translated into almost every European language. They are now only of historical interest. In Zimmermann's character there was a strange combination of sentimentality, melancholy and enthusiasm; and it was by the free and eccentric expression of these qualities that he excited the interest of his contemporaries. Another book by him, written at Brugg, Von der Erfahrung in der Arzneiwissenschaft (1764), also attracted much attention. In 1768 he settled at Hanover as private physician of George III., with the title of Hofrat. Catherine II. invited him to the court of St Petersburg, but this invitation he declined. He attended Frederick the Great during that monarch's last illness, and afterwards issued various books about him, of which the chief were Üüber Friederich den Grossen und meine Unterredung mit ihm kurz vor seinem Tode (1788) and Fragmente über Friedrich den Grossen (1790). These writings display extraordinary personal vanity, and convey a wholly false impression of Frederick's character. Zimmermann died at Hanover on the 7th of October 1795.

See A. Renger, Zimmermann's Briefe an einige seiner Freunde in der Schweiz (1830); E. Bomdemann, Johann Georg Zimmermann, sein Leben und bisher ungedruckte Briefe an ihn (Hann., 1878); and R. Lecher, Johann Georg Zimmermann's Leben und Werke (Bern, 1893).

ZINC, a metallic chemical element; its symbol is Zn, and atomic weight 65-37 (O=16). Zinc as a component of brass (CuZn, Cu-Zn) has currency in metallurgy long before it became known as an independent metal. It is credited to the ancient Egyptians as the "metal of the Mosynoed," 2 which is produced as a bright and light-coloured CuZn, not by addition of tin, but by fusing up with an earth. Pliny explicitly speaks of a mineral kaluda or cadmia as serving for the conversion of copper into aurichalcum, and says further that the deposit (of zinc oxide) formed in the brass furnaces could be used instead of the mineral. The same process was used for centuries after Pliny, but its rationale was not understood. Stahl, as late as 1702, quoted the formation of brass as a case of the union of a metal with an earth into a metallic compound; but he subsequently adopted the view propounded by Kunkel in 1757, that "cadmania" is a metallic calx, and that it dyes the copper yellow by giving its metal up to it.

The word zinc (in the form zinken) was first used by Paracelsus, who regarded it as a bastard or semi-metal; but the word was subsequently used for both the metal and its ores. Moreover, zinc and bismuth were confused, and the word splier (the modern spelter) was indiscriminately given to both these metals. In 1597 Libavius described a "peculiar kind of tin" which was prepared in India, and of which a friend had given him a quantity. From his account it is quite clear that that metal was zinc, but he did not recognize it as the metal of calamine. It is not known to whom the discovery of isolated zinc is due; but we do know that the art of zinc-smelting was practised in England from about 1730. The first continental zinc-works were erected at Liège in 1807.

Occurrence.—Zinc does not occur free in nature, but in combination it is widely diffused. The chief ore is zinc blende, or sphalerite (see BLENDE), which generally contains, in addition to zinc sulphide, small amounts of the sulphides of iron, silver and cadmium. It may also be accompanied by pyrites, galena, arsenides and antimonides, quartz, calcite, dolomite, etc. It is widely distributed, and is particularly abundant in Germany (the Harz, Silesia), Austro-Hungary, Belgium, the United States and in England (Cumberland, Derbyshire, Cornwall, North Wales). Second in importance is the carbonate, calamine (g.v.) or zinc spar, which at one time was the principal ore; it almost invariably contains the carbonates of cadmium, iron, manganese, magnesium and calcium, and may be contaminated with clay, oxides of iron, galena and calcite; "white calamine" owes its colour to much clay; "red calamine" to admixed iron and manganese oxides. Calamine chiefly occurs in England and in the United States. Of less importance is the silicate, ZnSiO$_3$.H$_2$O, named electric calamine or hemihydrate; this occurs in quantity in Altenburg near Aix-la-Chapelle, Sardinia, Spain and the United States (New Jersey, Pennsylvania, Missouri, Wisconsin). Other zinc minerals are willemite (g.v.), ZnSiO$_4$, hydrozincite or zinc bloom, ZnCO$_3$.Zn(OH)$_2$, zincite (g.v.) or red zinc ore, ZnO, and franklinite, 3(Fe,Cd)O.(Fe,Mn)$_3$.O$_6$.

Production.—Until about 1833 the supply of zinc was almost entirely obtained from Germany, but in this year Russia began to contribute about 2000 tons annually to the 6000 to 7000 derived from Germany. Belgium entered in 1837 with an output of about 2000 tons; England in 1855 with 3000; and the United States in 1873 with 6000 tons. The productions of Germany, the United States, the United States, and that country generally increased; the rise has been most rapid in the United

1 From the name of this tribe the German word Messing, brass, is undoubtedly derived (see K. B. Hoffmann, Zeit. f. Berg. und Hüttenwesen, vol. 41).

2 From the name of this tribe the German word Messing, brass, is undoubtedly derived (see K. B. Hoffmann, Zeit. f. Berg. und Hüttenwesen, vol. 41).
ZINC

England, France, Spain and Austria have been fairly constant producers. Germany produced 155,799 tons in 1900, and 108,208 in 1905; Belgium, 126,000 in 1900 and 143,165 in 1905; the United States, 111,000 in 1900 and 183,014 in 1905. The world's supply was 445,438 tons in 1900, and 554,307 in 1905.

METALLURGY

The principles underlying the extraction of zinc may be summarized as: (1) the ore is first converted into zinc oxide; (2) the oxide is distilled with carbon and the distillate of metallic zinc condensed. Oxide of zinc, like most heavy metallic oxides, is easily reduced by metals, as charcoal, to the metal, except pure zinc ore. Such zinc, however, is very slowly reduced by charcoal; pure red zinc ore may be treated directly; and the same might be done with pure calcine of any kind, as the carbon dioxide of the zinc carbonate goes off below redness and the metal is left undisturbed. It is only recently that the reducing action of the charcoal. Zinc blende, however, being zinc sulphide, is not directly reducible by charcoal; but it is easy to convert it into oxide by roasting: the sulphur goes off as sulphur dioxide whilst the zinc remains in the (insoluble) form of zinc oxide (ZnO). In practice, however, we never have to deal with pure zinc minerals, but with complex mixtures, which must first of all be subjected to mechanical operations, to remove at least part of the gangue, and if possible also of the heavy metallic impurities (see Ore-Dressing).

As ores of zinc are usually shipped before smelting from widely separated localities in Russia, Spain, Italy, China, South Africa, and the Rocky Mountains region of North America—it is important that they be separated from their mixtures at the mines. The difficulty in separating zinc blende from iron pyrites is well known, and various mechanical methods have been invented, but none have been designed with this end in view. The Wetherill system of magnetic concentration has been remarkably successful in separating zinc from iron pyrites, and the Suspect County, Sussex county, N. J. Here very clean non-magnetic concentrate of willemite, which is an anhydrous zinc silicate and a very high-grade zinc ore, is separated from an intimate mixture of willemite, zincite and franklinite, the latter two being non-magnetic. The magnetic concentrates contain enough zinc to be well adapted to the manufacture of zinc oxide. Magnetic concentration is also applied in the removal of an excess of iron from partially roasted blende, a technical non-magnetic process, but it is not a very clean process. The metal is much in the way of separation when, as in many complex ores, carbonates of iron, calcium and magnesium replace the isomorphous zinc carbonate, when some iron sulphide containing less sulphur than pyrites replaces zinc sulphide, and when gold and silver are contained in the zinc ore itself. Hence only in exceptional circumstances is it possible to utilize a large class of widely distributed ores, carrying 10 to 35 per cent, of zinc, in which the zinc alone, estimated at 2d. a pound, is worth from about 3p. to 5p. per ton of ore. The ores of the Joplin district, in the Ozark uplift in the Mississippi Valley, are remarkable in that they are especially admissible to magnetic concentration, and the zinc ore is probably not average over 10 per cent, of zinc, but the dressed zinc ore as sold ranges from 45 to 62 per cent, of zinc. This region now furnishes about four-fifths of the ore required by the smelters of Illinois, Missouri and Kansas.

The ore, even if it is not blende, must be roasted or calcined in order to remove all volatile components as completely as possible, because otherwise zinc will be removed by the distillation of a very low proportion of the zinc vapour during the distillation. If the zinc is present as blende, this operation offers considerable difficulties, because in the roasting process a large proportion of the first instance into sulphate, which demands a high temperature for its conversion into oxide. Another point to be considered in this connexion is the masses of sulphur dioxide evolved, being destructive of vegetable life, are an intolerable nuisance to the neighbourhood in which the operations take place. For the desulphurization of zinc blende where it is not intended to collect and save there are many mechanical kilns, generally classified as horse-kilns and inverted hollowed-out horse-kilns. In the use of these may be made, to do good work on moderately clean ores which do not melt at the temperature of desulphurization. But the complete removal of zinc the is later becoming becomes more important. In roasting a ton of rich blende containing 60 per cent. of zinc enough sulphur is liberated to produce one ton of strong sulphuric acid, and unless this is collected not only are poisonous gases evolved but the waste in the form of such acid or sulphuric acid is to be collected, it is important to keep the fuel gas from admixture with the sulphur gases, and kils for this purpose require some modification. If hot air is introduced into the kiln, the temperature of the fire that develops is greatly increased, and the zinc and the sulphur is required to keep up a part of the reaction; but for the complete expulsion of the sulphur an externally-fired metal kiln or a kiln with an internal wood fire is required. The reason for the use of a bath is to be explained by the fact that the temperature of the gases is not of course the same as that of the kiln. The hot gases are passed through a stack, where a part of the sulphur is precipitated, and then through a stack, where a part of the acid is precipitated. The mixture of ore and charcoal is put into the crucible around the pipe, the crucible closed by a luted-on lid, and placed in a furnace constructed so as to permit of the lower end of the pipe projecting into the ash-pit. The zinc vapour produced descends through the pipe and is collected in a ladle held under the outlet end of the pipe. For manufacturing purposes a furnace similar to that used for the making of glass was employed to heat a circular row of crucibles, each 12 in. dia., through the bottom of which the zinc is collected. This system, however, has long been abandoned.

The modern processes may be primarily divided into two groups according to the process by which zinc oxide is produced; one in which the oxide is collected in a ladle held under the outlet end of the pipe, and the other in which the oxide is collected in a pipe leading to and enclosed in a water-jacket. Vegetables, and as each is also a part of the system has its advantages and disadvantages local conditions determine which is the better.

In the Belgian process, the reduction and distillation are carried out in cylindrical or elliptical retorts of fire-clay, from 3 ft. 3 in. to 4 ft. 9 in. in diameter, and 10 in. in internal diameter. Some forty six or more retorts, arranged in parallel horizontal-rows, are heated in one furnace. The furnaces are square and open in front to allow the outlet ends of the retorts to project; they are grouped in a single and parallel system, and have been designed for easy removal, being surrounded by a cylindrical iron wall, which supports the vessels.Various combinations and modifications of these two types of furnace have given rise to distinctive names, and as each system has its advantages and disadvantages local conditions determine which is the better.
ZINC

Three modes of gas-firing are to be noticed, each of which is adapted to special local conditions. (a) The gas is made from the fuel in a detached fireplace and conducted while hot into the combustion chamber of the furnace, and the air for complete combustion is blown in while being in the combustible gases. (b) Both the producer gas and the air are heated before they enter the combustion chamber, as in the Siemens system of regenerative firing. (c) Natural gas is piped to the furnace, where it meets air before passing into the combustion chamber. The principal advantages of gas-firing are that less fuel is required, that there is better control of the heat in the furnace, and that larger and more accessible furnaces can be built. In Silesia the introduction of gas-firing has been very successful. In the United States, Belgian furnaces of type (a) are built to contain 864 retorts; of type (b), to contain 300 to 400 retorts; and of type (c), preferably 120 retorts. The use of gas simplifies manual labour. On a direct-fired furnace at least one man, the bricklayer, must be an expert in all the operations involved; but with a gas furnace a division of labour is possible. One man who understands the use of gaseous fuel can regulate the heat of a thousand or more retorts. The men who charge and empty the retorts, those who draw and cast the metal, and those who keep the furnace in repair, need not understand anything about the manufacture or using of gas, and the men who make the gas need not know anything about a zinc furnace. Again, in direct-fired furnaces there are commonly seven or eight rows of retorts, one above another and all of equal size, in the upper row, as it were, upon a table, where he is exposed to the full heat of the furnace and requires a helper to wait upon him. With gas-firing the retorts can be arranged in four horizontal rows, all within reach of a man on a single level. Furthermore, the processes in furnaces in which gas-firing makes possible mechanical appliances may be substituted for manual labour in many operations, such as removing and replacing bottom weels, melting and casting, etc.; and it is thus drawn out of casting the metal, charging and emptying the retorts, and removing the residues and products.

Refining.—The specific effects of different impurities on the physical properties of zinc and its alloys are imperfectly studied. Fortunately, however, the small amounts of any of them that are likely to be found in commercial zinc are not for most purposes very deleterious. It is generally recognized that the purest ores produce the most valuable Zinc. Metallurgical zinc is prepared on the ordinary commercial scale from ores based on selected ores, and brands, when they mean anything, usually mean that the metal is made from certain ores. Chemical control of the metal purchased is not nearly as common as it should be, and the refining of zinc is at best an imperfect operation. To obtain the metal chemically pure a specially prepared pure oxide or salt of zinc is distilled. A redistilled zinc, from an ordinarily pure commercial zinc, is often called chemically pure, but redistillation is seldom practised except for the recovery of zinc from galvanizer's dross and from the skimmings and bottoms of the melting furnaces of zinc rolling mills. The only other method of removing impurities from zinc is by electrolysis; zinc being so perfectly impure, is allowed to stand at about the temperature of the melting-point of the metal for forty-eight or more hours, whereupon the zinc sinks, while the impurities rise to the surface. It is then drawn off in the dross at the top, the heavier metals such as lead and iron settling towards the bottom. This method is rarely practised except by the rollers of zinc. A certain amount of refined zinc can be produced from such dross and furnace zinc, if the latter are prepared from iron, can be leached out of the ingots cast from the bottom of the bath in a subsequent slow remelting, and it is sometimes possible to eliminate a zincuriferous lead which collects in the sump of the furnace. Owing to the fact that at temperatures between its melting and boiling point zinc has a strong affinity for iron, it is often contaminated by the scraper while being drawn from the oven, as is shown by the fact that the scraper wears away rapidly. As each retort in a furnace is in all essentials a separate crucible, and as the metal from only a few of them goes into a single ingot, there can be no uniformity either in the ingots made from any one furnace or between furnaces. Innumerable furnaces, several furnaces treating the same ore. Some brassfounders break from a single ingot the quantity of zinc required to produce the amount of brass they wish to cast into ingots, but even when perfect uniformity is desired the importance of remelting the zinc on a large scale cannot be too strongly emphasized.

Electrolytic Separation of Zinc.—The deposition of pure zinc is best done by electrolysis. Zinc is not precipitated with higher tension than nickel, all the heavy metals must be removed before its deposition is attempted. Moreover, unless the conditions are closely watched, it is liable to be thrown down in a spotty form. M. Kekulé found that, by being in a dissolved form of spotty solution, or a low current-density, was used, and that hydrogen was usually evolved simultaneously; sound deposits resulted from the direct current, while a deposit of 90 per cent. of zinc, and strong solutions. The cause of the spongy deposit is variously explained, some (Siemens and Halske) ascribing it to the existence of a compound of zinc and hydrogen, and others, among whom are G. Nahnsohn, F. Mylius and A. Fromm, F. Foerster and W. Borchers, trace it to the presence of oxide, produced, for example, either by the use of a solution containing a trace of basic salt of zinc (to prevent which the bath should be kept just—almost imperceptibly—acid), or by the presence of a more electro-negative anode such as copper or lead, with which hydrogen is combined to form the zinc. Many processes have been patented, the ore being acted upon by acid, and the resulting solution treated, by either chemical or electrolytically, means, for the recovery of the metal. The recovery of zinc is then electrolytically. E. A. Ashcroft patented a process of dealing with complex ores of the well-known Broken Hill type, containing sulphides of silver, copper and zinc, but also containing lead, in the following manner on a practical scale. A full account of the process (Trans. Inst. Min. and Met., 1898, vol. vi. p. 282) has been published by the inventor, describing the practical trial at the Cockle Works. The ore was crushed and roasted, and the roasted ore treated with sulphuric acid (with or without ferric sulphate); the solution was purified and then electrolysed for zinc with lead anodes and with a current-density of 5 amperes per sq. ft. at 2-75 volts when diaphragms were used, or 2-25 volts when they were dispensed with, or with 10 amperes per sq. ft. at 3 or 2-5 volts respectively, the electrolyte containing 1-2 lb. of zinc in the form of sulphate, and 4 oz. of sulphuric acid, per gallon. The current efficiency was at 83 per cent. Canvas diaphragms were used to prevent the acid from becoming electrolysed at the anode and mixing with the cathode liquor, and so hindering deposition. C. Hoepräther has patented a process of electrolyzing for zinc (No. 440,634, 1901). A. G. Siemens, in his early processes, a rotating cathode is used in a chloride solution, a porous portion separating the tank into anode and cathode compartments, and the chlorine generated by electrolysis at the anode being recovered. Furthermore, numerous processes have been patented for the treatment of the spent solutions of zinc obtained in Germany. Nahseen's process, with an electrolyte containing alkali-metal sulphate and zinc sulphate, has been used in Germany, and has been described as being practised in only one country. Siemens and Halske have proposed the addition of oxidizing agents such as free halogens, to prevent the formation of zinc hydride, to which they attribute the formation of zinc metal, Borchers, who, in his English process, has electrolysed zinc, from the latter, have also described the process. In Borchers's process the chlorine is heated partly by external firing, partly by the heat generated owing to the use of a current-density of 90 to 100 amperes per sq. ft.

Properties

Zinc is a bluish-white metal, showing a high lustre when freshly fractured. It fuses at 415° C. and under ordinary atmospheric pressure boils at 960° C. Its vapour density shows that it is monatomic. The molten metal on cooling deposits crystals belonging to the hexagonal system, and freezes into a compact crystal line solid, which may be brittle or ductile according to circumstances. If zinc be cast into a mould at a red heat, the ingot produced is laminar and brittle; if cast at just the freezing-point, after it has attained an ordinary temperature, it is ductile, or, if cast at a slightly lower temperature, it is a mix of the two. According to some authorities, pure zinc always yields ductile ingots. Commercial "spelter" always breaks readily into very thin sheets, which can be rolled into sheets being rolled out into even a very thin sheet. Such a sheet, if once produced, remains flexible when cold. At about 200° C, the metal becomes so brittle that it can be pounded in a mortar. The specific gravity of zinc cannot be expected to vary, except by the ordinary temperature. According to Karsten, that of pure ingot is 6-915, and rises to 7-191 after rolling. The coefficient of linear expansion is 0-002095 for 100° from 0° upwards (Fizeau). The specific heat is 0-99558 (Regnault). Compact zinc is bluish white; it does not tarnish much in the air. It is fairly soft, and clogs the file. If zinc be heated to near its boiling-point, it catches fire and burns with a brilliant light into its powdery white oxide, which forms a reek in the air (luma philosophica, "philosopher's wool"). Boiling water attacks it appreciably, but slightly, with evolution of hydrogen and formation of the hydroxide, Zn(OH). A rod of perfectly pure zinc can be suspended in a sugar solution, but is attacked that there is no visible evolution of gas; but, if a piece of platinum, copper or other more electro-positive metal be brought into contact with the zinc, it dissolves readily, with evolution of hydrogen and formation of a zinc salt. The ordinary metal dissolves at once, the more readily the less pure it is. Cold dilute nitric acid dissolves zinc as nitrate, with evolution of nitrogen and water. Concentrated nitric acid can be used for complete removal of NO, is produced besides or instead of nitrous. Zinc is also soluble in soda and potash solutions, but not in ammonia.

Applications.—Zinc is largely used for "galvanizing" iron, sheets of zinc, etc. Boiling water containing a little nitric acid is electrolyzed, and then removed, so that a coat of zinc remains on the iron, which is thereby protected from atmospheric corrosion. It is also a conductor of electricity by very weak current, with successive removal of zinc, pinchbeck, tombac, are examples. In technological chemistry it finds application as a reducing agent, e.g., in the production of aniline from nitrobenzene, but the use of iron is generally preferable in view of the cheapness of this metal.
ZINCITE

Compounds

Zinc forms only one oxide, ZnO, from which is derived a well-characterized series of salts. It is chemically related to cadmium and mercury, and it is interesting that, whereas the latter two metals being of the same group, are always found occurring together, zinc is less frequently met with. One distinction is that zinc is less basiegetic. Zinc is capable of isomorphously replacing many of the bivalent metals—magnesium, manganese, iron, nickel, cobalt and cadmium.

Zinc is characteristic of the reducing processes—directly from the ore mixed with coal by volatilization on a grate, as in the Wetherill oxide process, and by oxidizing the vapour given off in the retort. The oxide of zinc is the chief product of the latter method. The oxide of zinc, like that of the other metals, is sesquioxide; the latter method has generally a better colour, a finer texture, and a greater covering power. It is also manufactured by the latter process from the metallic zinc liquated out of galvanizer’s dross. It is stated that a yellowish white powder, white at first but becoming yellow, is obtained when zinc is treated with hot water, and on cooling becomes white. This at least is true of the oxide produced from the metal by combustion; that produced from the carburetted oxide forms a yellowish brown, the heat, retains a yellow shade permanently. By heating the mixture it takes on the hemorphous pyramids belonging to the hexagonal system; and by heating the chloride in a current of steam as its prismatic crystals.

The oxide is used in all applications, and in all forms, throughout the whole of a large number of processes, as a dehydrating agent, a drying agent, for the production of different forms of oxide, for preparing the oxide of zinc, and for the production of the oxide of cadmium.

Zinc carbonate, ZnCO3, occurs in nature as the mineral calamine, ZnCO3 • xH2O, where x is variable, being obtained by precipitating a solution of the carbonate or chloride with sodium carbonate. To precipitate carbonate of zinc, by the method described, alkali and the zinc salt must be poured into the hot solution of the carbonate. The precipitate, even after exhaustive washing with hot water, still contains a trace of alkali; but from the oxide, prepared from it, all the alkali can be washed away. The basic carbonate is used as a pigments.

Of zinc phosphates we notice the minerals hopeite, Zn3(PO4)2 • 4H2O, and tetrahedrite, ZnCu3SbS4. Analysis—From neutral solutions of its salts zinc is precipitated by sulphuretted hydrogen as sulphide, ZnS—a white precipitate, soluble but by no means readily, in dilute mineral acids, but insoluble in dilute hydrochloric acid. In the case of acetate the precipitation is quite complete; from a sulphate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficient of free HCl the metal remains dissolved; sulphide of ammonium precipitates the metal completely, even in the presence of ammonium salts and free ammonia. The precipitate, when heated, passes into oxide, which is yellow in the heat and white after cooling. A solution of zinc carbonate dissolves and re-heats, it exhibits a green colour after cooling.

Zinc may be quantitatively estimated by precipitating as basic carbonate, which is dried and ignited to zinc oxide. It may also be estimated as basic carbonate, ZnCO3 • xH2O, which is weighed on a filter tared at 100°. Volumetric methods have also been devised.

Pharmacology and Therapeutics of Zinc Compounds

Zinc chloride is a powerful caustic, and is prepared with plaster of Paris in the form of sticks for destroying warts, &c. Its use for this purpose at the present day is, however, very rare, the knife or galvanocautery being preferred in most cases. The salt is a most poisonous irritant when taken internally. Its treatment is to wash out the stomach or give such an emetic as aipothine, and, when the stomach has been emptied, to administer emetics. In the manufacture of such emetics, the oxide of zinc, used in medicine, are of value as containing this metal.

Certain others are referred to in relation with the important radicle contained in the salt. Those treated here are the sulphate, oxide, carbonate, oleate and acetate. All these salts are mild astringents when applied externally, as they coagulate the albumen of the tissues and of any discharge which may be present. In virtue of this property they are also mild haemostatics, tending to coagulate the thrombocytes of the blood and thereby to arrest haemorrhage.

Lotto Rubra, the familiar "Red Lotion," a solution of zinc sulphate, is widely used in many cutaneous inflammations, as the ear, pruritus, pyodermia etc., is prepared in the form of a 20% solution.

These salts have been extensively employed internally, and indeed they are still largely employed in the treatment of the more severe and difficult cases of nervous disease. The sulphate is a very potent emetic in cases of poisoning, acting rapidly and without much nausea or depression. For these reasons it may also be given with advantage to children suffering from acute bronchitis or acute laryngitis.

ZINCMITE, a mineral consisting of zinc oxide (ZnO), crystallizing in the hemimorphic-hemihedral class of the rhombohedral system. Distinct crystals are of rare occurrence; they have the form of a hexagonal pyramid terminated at one end only by a basal plane. There is a perfect cleavage parallel to the basal plane, and usually the mineral is found as platy foliated masses. The blood-red colour and the orange-yellow streak are characteristic features. The hardness is 4½, and the specific gravity 4.9. The zinc minerals are not very frequent in the rocks. It is found in the zinc mines at Sterling Hill and Franklin Furnace in Sussex county, New Jersey, where it is associated with franklinite and willemite in crystalline limestone, and is mined as an ore of zinc. Artificial crystals of a white or yellowish colour are not infrequently formed by sublimation in zinc furnaces.
ZINDER, a town on the northern margin of the central Sudan. Zinder is a great emporium of the trade across the Sahara between the Hausa states of the south and the Tuareg countries and Tripoli in the north. Its ruler was formerly subordinate to Bornu, but with the decline of that kingdom shook off the yoke of the sultan, and on the conquest of that country by Rabah (q.v.) seems to have maintained his independence. The country of which Zinder is the capital is known as Damergu. It is semi-fertile, and supports considerable numbers of horses and sheep, besides troops of camels. By the Anglo-French agreement of June 1898 it was included in the French sphere, having already been the object of French political action. The explorer Cazemajou was assassinated there in 1897, but the town was occupied in July 1899, after a slight resistance, by Lieutenant Pallier of the reconstructed Voulet-Chanoine mission (see SENEGAL, country). A French post (named Fort Cazemajou) was built outside the town on a mound of huge granite blocks. Zinder was the first point in the Sudan reached by F. Fouere after his great journey across the Sahara via Air in 1899. Subsequently Commandant Gadet, from his headquarters at Zinder, mapped and pacified the surrounding region. The demarcation of mekarios (camel-cors) which occupied the oasis of Air and Bilma in 1906 Zinder is a large and fine town surrounded with high earthen walls, very thick at the base and pierced with seven gates. Its houses, in part built of clay, in part of straw, are interspersed with trees. There is an important colony of Tuareg merchants, who occupy the suburb of Zengu, and who deal in a variety of wares, from cotton, silks, spices, ostrich feathers, &c., to French scent bottles. Salt is a great article of merchandise. A busy market is held outside one of the gates. Administratively Damergu is dependent on the French colony of Upper Senegal and Niger.

ZINGERLE, IGNAZ VICENZ (1825-1892), Austrian poet and scholar, was born, the son of the Roman Catholic theologian and orientalist, Pius Zingerle (1801-1898), at Meran on the 6th of June 1825. He began his studies at Trient, and entered for a while the Benedictine monastery at Marienberg. Abandoning the clerical profession, he returned to Innsbruck, where, in 1848, he became teacher in the gymnasium, and in 1859 professor of German language and literature at the university. He died at Innsbruck on the 17th of September 1892.

Zingerle is known as an author by his Zeitgedichte (Innsbruck, 1848); Von den Alpen (1850); Die Maillerin, a village tale (1853); Der Bauer von Longual (1874); and Erzahlungen aus dem Burgrafenamt (1884). His ethnographical writings and literary studies, dealing especially with the Tirol, have, however, rendered him more famous. Among them may be mentioned his editions of König Laurin (1850), of the legend, Von den heyligen drei Klingen (1855); Sagen aus Tirol (1850, 2nd ed. 1891); Tirol. Natur, Geschichte und Sage im Spiegel deutscher Dichtung (1851); Die Personen- und Taufnamen Tirols (1858); Sitten, Bräuche und Meisungen des Tiroler-Volkes (2nd ed. 1871); Das deutsche Feldgeschichtenspiel im Mittelalter (2nd ed. 1873); Schülereien aus Tirol (1877, new series, 1888). With E. Imama-Sterneg, he edited Tirolische Weisünder (5 vols., 1875-1891).

ZINNIA, in botany, a genus of the natural order Compositae, containing about a dozen species of half-hardy annual or perennial herbs or undershrubs, natives of the southern United States and Mexico. The numerous single and double garden forms are mostly derived from Zinnia elegans, and grow about a 1 ft. high, producing flowers of various colours, the double ones being about the size of asters, and very handsome. The colours include white, yellow, orange, scarlet, crimson and purple. Zinnias do best in a rich deep loamy soil, in a sunny position. They should be sown on a gentle hothed at the end of March or in April and planted out early in June.

ZINZENDORF, NICOLAUS LUDWIG, COUNT OF ZINZENDORF AND POTTFENDORF (1700-1760), German religious and social reformer, was born on the 26th of May 1700 at Dresden. His ancestors belonged to Lower Austria, but had taken the Protestant side in the Reformation struggle, and settled near Nuremberg. Both his parents belonged to the Pietist circle and the lad had Philipp Jakob Spener for his godfather. His father died six weeks after he was born. His mother married again when he was four years old, and he was educated under the charge of his pious and gifted grandmother, Catherine von Gersdorf, who did much to shape his character. His school days were spent at Halle amidst Pietist surroundings, and in 1716 he went to the university of Wittenberg, to study law and fit himself for a diplomatic career. Three years later he was sent to Paris as an envoy of the Elector of Saxony to Germany, where he made the personal acquaintance of men distinguished for practical goodness and belonging to a variety of churches. On his return he visited the branches of his family settled at Obersberg and at Castell. During a lengthened visit at Castell he fell in love with his cousin Theodora; but the widowed countess, her mother, objected to the marriage, and the lady afterwards became the wife of Count Henry of Reuss. Zinzendorf seems to have considered this disappointment to be a call to betake himself to some special work for God. He had seen persecution rage to bloody cruelties, and he wished to become a diplomatist, reject the invitation of August Franske, Duke Baron von Canstein's place in the Halle orphanage; and he now resolved to settle down as a Christian landowner, spending his life on behalf of his tenantry. He bought Berthelsdorf from his grandmother, and selected John Andrew Rothe for pastor and John George Heiz for factor; he married Erdmuthe Dorothea, sister of Count Henry of Reuss, and began living on his estate. His intention was to carry out into practice the Pietist ideas of Spener. He did not mean to found a new church or religious organization distinct from the Lutheranism of the land, but to create a Christian association the members of which by preaching, by tract and book distribution and by practical benevolence might awaken the somewhat torpid religion of the Lutheran Church. The "band of four brothers" (Rothe, pastor at Berthelsdorf; Melchior Schäffer, pastor at Görlitz; Francis von Wattenwille, a friend from boyhood; and himself) set themselves by sermons, books, journeys and correspondence to create a revival of religion, and by frequent meetings for prayer to preserve in their own hearts the warmth of personal trust in Christ. From the printing-house at Ebersdorf large quantities of tracts and tracts, catechisms, collections of hymns and leaftlets were issued; and a translation of Johann Arndt's True Christianity was published for circulation in France. A dislike of the high and dry Lutheran orthodoxy of the period gave Zinzendorf some sympathy with that side of the growing rationalism which was attacking dogma, while at the same time he felt its lack of earnestness, and of a true and deep understanding of religion and of Christianity, and endeavoured to counteract these defects by pointing men to the historical Christ, the revelation of the Father. He seems also to have doubted the wisdom of Spener's plan of not separating from the Lutheran Church, and began to think that true Christianity could be best promoted by free associations of Christians, which in course of time might grow into churches with no state connection. These thoughts took a practical turn from his connexion with the Bohemian or Moravian Brethren. Zinzendorf offered an asylum to a number of persecuted wanderers from Morava (see MORAVIAN BRETHREN), and built for them the village of Herrnhut on a corner of his estate of Berthelsdorf. The refugees who came to this asylum (between 1722 and 1732—the first detachment under Christian David) from various regions where persecution was raging, brought with them more than one Protestant organization. Persecution had made them cling pertinaciously to small peculiarities of creed, organization and worship, and they could scarcely be persuaded to live in peace with each other. Zinzendorf devoted himself to them. He, with his wife and children, lived in Herrnhut and brought Rothe with him. He had hard work to bring order out of the confusion. He had to

1 A volume of Spiritual Songs, written by Zinzendorf's grandmother Catherine, was published in 1729 by Paul Anton.
satisfy the authorities that his religious community could be brought under the conditions of the peace of Augsburg; he had to quiet the suspicions of the Lutheran clergy; and, hardest of all, he had to rule in some fashion men made fanatical by persecution, who, in spite of his unwaried labours for them, on more than one occasion, it is said, combined in his own house to denounce him as the Beast of the Apocalypse, with Rothe as the False Prophet. Patience there had at last its perfect work, and gradually Zinzendorf was able almost to instil into his hearers something like a militia Christi, based not on monastic but on family life. He was able to establish a common order of worship in 1727, and soon afterwards a common organization, which has been described in the article MORAVIAN BRETHREN. Zinzendorf took the deepest interest in the wonderful missionary enterprises of the Brethren, and saw with delight the spread of this Protestant family order in Germany, Denmark, Russia, and England. He travelled widely in its interests, visiting America in 1741–42 and spending a long time in London in 1750. Missionary zeal had by this time been felt in the Brethren (1732), in Greenland (1733), amongst the North American Indians (1735); and before Zinzendorf’s death the Brethren had sent from Herrnhut missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina, to Sarinam, to the Negro slaves in several parts of South America, to Travancore in India, to the Copts in Egypt and to the west coast of South Africa. The community in Herrnhut, from which almost all these colonies had been sent out, had no money of its own, and its expenses had been almost exclusively furnished by Zinzendorf. His frequent journeys from home made it almost impossible for him to look after his property, which was compelled from time to time to raise money by loans, and about 1750 was almost reduced to bankruptcy. This led to the establishment of a financial board among the Brethren, on a plan furnished by a lawyer, John Frederick Köber, which worked well. In 1752 Zinzendorf lost his only son, Christian Renatus, whom he had hoped to make his successor; and four years later he lost his wife Erdmute, who had been his counsellor and confidante in all his work. Zinzendorf remained a widower for one year, and then (June 1751) contracted a second marriage with Anna Nitschmann, on the ground that a man in his official position ought to be married. Three years later, overcome with his labours, he fell ill and died (on the 4th of May 1760), leaving John de Wattewille, who had married his eldest daughter Benigna, to take his place at the head of the community.

Zinzendorf had a naturally alert and active mind, and an enthusiastic temperament that made his life one of ceaseless planning and executing. Like Luther, he was often carried away by strong and vehement feelings, and he was easily upset both by sorrow and joy. He was an eager seeker after truth, and could not understand men who at all costs kept to the opinions they had once formed; yet he had an exceptional talent for talking on religious subjects even with those who differed from him. Few men have been more solicitous for the happiness and comfort of others, even in little things. His activity and varied gifts sometimes landed him in oddities and contradictions that not infrequently looked like equivocation and dissimulation, and the courtly training of his youth made him susceptible about his authority even when no one disputed it. He was a natural orator, and though his dress was simple his personal appearance gave an impression of distinction and fitness. His projects were often misunderstood, and in 1736 he had even vanished from Saxony, but in 1749 the government rescinded the decree and begged him to establish within its jurisdiction more settlements like that at Herrnhut.

He wrote a large number of hymns, of which the best known are: "Jesus, Thy blood and righteousness," and "Jesus, still lead on." A selection of his Sermons was published by G. Clemens in 10 vols., his Diary (1716–1719) by G. Reicher and J. Th. Müller (Herrnhut, 1800), and his Hymns, &c., by H. Bauer and G. Burkhardt (Leipzig, 1890).

See A. G. Spangenberg, Leben der Grafen von Zinzendorf (Barby, 1772–1775); L. von Schrattenbach, Der Graf v. Zinzendorf (Gradam, 1871); written in 1872, and interesting because it gives Zinzendorf’s relations to such Pietist rationalists as J. K. Dippel; F. Bovet, Le Comte de Zinzendorf (Paris, 1860; Eng. tr. A Pioneer of Social Christianity, by T. A. Seed, London, 1869); B. Becker, Zinzendorf’s Eirenologie z. Philosophie (Knesebeck’s soner Zeit (Leipzig, 1886); H. Römer, Zinzendorf’s Leben und Werken (Gnaudau, 1900), and other literature mentioned under MORAVIAN BRETHREN and under "Zinzendorf". M. de Zittler in Hauck-Herzog’s Realencycl. für prot. Theologie u. Kirche.

ZION, or Sion (Heb. שִׁון, perhaps from מַשָּׁמָּה “to be dry,” מַשָּׁמָּה “to set up,” or מַשָּׁמָּה “to protect”; Arabic analogies favour the meaning “hump,” “summit of a ridge,” and so “citadel”), the name of the Jebusite stronghold at Jerusalem captured by David (2 Sam. v.). Zion (which is synonymous with the Ophel) is properly the southern part of the eastern hill on the top of which was built the temple, so that the name came to be given to the whole hill (2 Kings xix. 31, Isaiah xxiv. 23 and throughout *3 Maccabees*), to all Jerusalem (Isaiah i. 27, cf. iv. 11, and even to the nation or its spiritual nucleus. Since the people of Jerusalem are spoken of as "the daughter of Zion" (Isaiah i. 8), the name being often personified and idealized, especially in Isaiah ii., and in the Psalter, e.g. Ps. lxxxvii. 5, "Every one calls Zion his mother."

ZIONISM. One of the most interesting results of the anti-Semitic agitation (see Anti-Semitism) has been a strong revival of the national spirit among the Jews in a political form. To this movement the name Zionism has been given. In the same way that anti-Semitism differs from the Jew-hatred of the early and middle ages, Zionism differs from previous manifestations of the Jewish national spirit. It was originally advocated as an enemy of the nationalism of the Jews. The Zionists’ proposals and proposals have remained almost harshly modern. None the less it is the lineal heir of the attachment to Zion which led the Babylonian exiles under Zerubbabel to rebuild the Temple, and which flamed up in the heroic struggle of the Maccabees against Antiochus Epiphanes. Without this national spirit it could, indeed, never have assumed its present formidable proportions. The idea that it is a set-back of Jewish history, in the sense that it is an unnatural galvanization of hopes long since abandoned for a spiritual and cosmopolitan conception of the mission of Israel, is a controversial fiction. The consciousness of a spiritual mission exists side by side with the national idea. The great bulk of the Jewish people have throughout their history remained faithful to the dream of a restoration of their national life in Judea. Its manifestations have suffered temporary modifications under the influence of changing political conditions, and the intensity with which it has been held by individual Jews has varied according to their social circumstances, but in the main the idea has been passionately clung to.

The contention of some modern rabbis that the national idea is Messianic and hence that its realization should be left to the Divine initiative (e.g. Chief Rabbi Adler, Jewish Chronicle, 25th November 1898), is based on a false analogy between the politics of the Jews and those of other oppressed nationalities. As all Hebrew politics were theocratic, the national hope was necessarily Messianic. It was not on that account less practical or less disposed to express itself in an active political form. The Messianic dreams of the Prophets, which form the framework of the Jewish liturgy to this day, were essentially political-national. They contemplated the redemption of Israel, the gathering of the people in Palestine, the restoration of the Jewish state, the rebuilding of the Temple, and the re-establishment of the Davidic throne in Jerusalem with a prince of the House of David. How little the dispersed Jews regarded this essentially political programme as a mere religious ideal is shown by their attitude towards the pseudo-Messiahs who endeavoured to fulfil it. Bar Cochba (A.D. 117–138) lived at a period when a Jewish national uprising might well have been exclusively political, for the dissolution of the kingdom was 1 Christians of the 4th century removed the name to the S.W. hill, and this tradition has persisted until modern times, when archeological and topographical evidence has re-identified Sion with the E. hill.
ZIONISM

scarce half a century old, and Palestine still had a large Jewish population. None the less Bar Cochba based his right to lead the Jewish revolt on Messianic claims, and throughout the Roman Empire the Jews responded with enthusiasm to his call. Three centuries later Moses of Crete attempted to repeat Bar Cochba's experiment, with the same results. In the 8th century, when the Jews of the West were sufficiently remote from the days of their political independence to have developed an exclusively spiritual conception of their national identity, the Messianic claims of a Syrian Jew named Serene shook the whole of Jewry, and even among the Germans. Spreading his heresies, the Jew of the Rhineland stirred to the right to force the hands of Providence. It was the same with another pseudo-Messian named Abu-Isa Obadia, who unfurled the national banner in Persia some thirty years later. During the middle ages, though the racial character of the Jews was being transformed by their Ghetto seclusion, the national yearning suffered no relaxation. If it expressed itself exclusively in literature, it was not on that account undergoing a process of idealization, (Cf. Abrahams's Jewish Life in the Middle Ages, pp. 24-25.) The truth is that it could not have expressed itself differently. There could have been no abandonment of national hopes in a practical sense, unless the prospect of entering the national life of the peoples among whom they dwelt had presented itself as an alternative. Of this there was not the remotest sign. The absence of militant Zionism during this period is to be accounted for partly by the want of conspicuous pseudo-Messiahs, and partly by the terror of persecution. Unlike the modern Greeks, the medieval Jews could expect no sympathy from their neighbours in an agitation for the recovery of their country. One may imagine what the Crusaders would have thought of an international Jewish conspiracy to recapture Jerusalem. In the 15th century the aversion from political action, even had it been possible, must have been strengthened by the fact that the Grand Signor was the only friend the Jews had in the world. The nationalist spirit of the medieval Jews is sufficiently reflected in their liturgy, and especially in the works of the poet, Jehuda Halevi. It is impossible to read his beautiful Zemiode without feeling that had he lived another twenty years he would have gladly played towards the pseudo-Messiah David Alroy (circa 1160) that part that Abraham played towards Bar Cochba.

The strength of the nationalist feeling was practically tested in the 16th century, when a Jewish impostor, David Reuben (circa 1530), and his disciple, Solomon Molcho (1501-1532), came forward as would-be liberators of their people. Throughout Spain, Italy and Turkey they were received with enthusiasm by the bulk of their brethren. In the following century the influence of the Christian Millenarians gave a fresh impulse to the national idea. Owing to the frenzy of persecution and the apocalyptic teachings of the Chiliasmists, it now appeared in a more mystical form, but a practical bias was not wanting. Menasseh ben Israel (1604-1657) co-operated with English Millenarians to procure the resettlement of the Jews in England as a preliminary to their national return to Palestine, and he regarded his marriage with a scion of the Davidic family of Abharan as justifying the hope that the new Messiah might be found among his offspring. The increasing dispersion of the Marranos or crypto-Jews of Spain and Portugal through the Inquisition, and the persecution of the Jews in Poland, deepened the Jewish sense of homelessness the while the Millenarians encouraged their Zionist dreams. The Habadic and Judeoph tendencies of the Puritan revolution in England still further stirred the prevailing unrest, and some Jewish rabbis are said to have visited England in order to ascertain by genealogical investigations whether a Davidic descent could be ascribed to Oliver Cromwell. It only wanted a leader to produce a national movement on a formidable scale. In 1666 this leader presented himself at Smyrna, in the person of a Jew named Sabbatai Zevi (1626-1676), who proclaimed himself the Messiah. The news spread like wildfire, and despite the opposition of some of the leading rabbis, the Jews everywhere prepared for the journey to Palestine. Not alone was this the case with the poor Jews of Lithuania and Germany, but also with well-to-do communities like those of Venice, Leghorn and Avignon, and with the great Jewish merchants and bankers of Hamburg, Amsterdam and London. Throughout Europe the nationalist excitement was intense. Even the downfall and apostasy of Sabbatai were powerless to stop it. Among the wealthier Jews it partially subsided, but the great bulk of the people refused for a whole century to be disillusioned. A Messianic frenzy seized upon them. Encouraged on the one hand by Christian Millenarians like Oliger Pauli, and Johannes Spee, pandered to by Sabbatici such as Jacob Cardoso, Bonafous, Michael of Eisenstadt, Jacob Querido, Judah Chassid, Nehemiah Chayon and Jacob Franks, and maddened by fresh oppressions, they became fanaticized to the verge of demoralization.

The reaction arrived in 1778 in the shape of the Mendelssohnian movement. The growth of religious toleration, the attempted emancipation of the English Jews in 1753, and the same Judeophilym of men like Lessing and Dohm, showed that at length the dawn of the only possible alternative to nationalism was at hand. Moses Mendelssohn (1729-1786) sought to present the Jewish spirit, as well as the individual Jew, in a new light as an organism in which they dwelt, by emphasizing the spiritual side of Judaism and the necessity of Occidental culture. His efforts were successful. The narrow nationalist spirit everywhere yielded before the hope or the progress of local political emancipation. In 1806 the Jewish Sanhedrin convened by Napoleon virtually repudiated the nationalistic tradition. The new Judaism, however, had not entirely destroyed it. It had only reconstructed it on a wider and more sober foundation. Mendelssohnian culture, by promoting the study of Jewish history, gave a fresh impulse to the racial consciousness of the Jews. The older nationalism had been founded on traditions so remote as to be almost mythical; the new race consciousness was led by a glorious martyr history, which ran side by side with the histories of the newly adopted nationalities of the Jews, and was not unworthy of the companionship. From this race consciousness came a fresh interest in the Holy Land. It was an ideal rather than a politico-nationalist interest—a desire to preserve and cherish the great monument of the departed national glories: It took the practical form of projects for improving the circumstances of the local Jews by means of schools, and for reviving something of the old social condition of Judaism by the establish-ment of agricultural colonies. In this work Sir Moses Montefiore, the Rothschild family, and the Alliance Israelite Universelle were conspicuous. More or less passively, however, the older nationalism still lived on—especially in lands where Jews were persecuted—and it became strengthened by the revived race consciousness and the new interest in the Holy Land. Christian Millenarians also helped to keep it alive. Lord Ashley, afterwards Lord Shaftesbury, Colonel Gawker, Mr Walter Cresson, the United States consul at Jerusalem, Mr James Finn, the British consul, Mr Laurence Oliphant and many others organized and supported schemes for the benefit of the Jews of the Holy Land on avowedly Restoration grounds. Another vivifying element was the opening of the Eastern Question and the championship of oppressed nationalities in the East by the Western Powers. In England political writers were found to urge the re-establishment of a Jewish state under British protection as a means of assuring the overland route to India (Hollingsworth, Jews in Palestine, 1832). Lord Palmerston was not unaffected by this idea (Finn, Stirring Times, vol. i. pp. 109-112), and both Lord Beaconsfield and Lord Salisbury supported Mr Laurence Oliphant in his negotiations with the Porte for a concession which was to pave the way to an auton-omous Jewish state in the Holy Land. In 1854 a London Jew attempted to float a company "for the purpose of enabling the descendants of Israel to obtain and cultivate the Land of Promise" (Hebrew Observer, 12th April). In 1876 the publication of George Eliot's Daniel Deronda gave to the Jewish nationalist spirit the strongest stimulus it had experienced since the appearance of Sabbatai Zevi.
It was not, however, until the spread of anti-Semitic doctrines through Europe made men doubt whether the Mendelssohnian denationalization of Judaism possessed the elements of permanency that the Jewish nationalist spirit reasserted itself in a practical form. As long as the anti-Semites were merely polemical, the nationalists were mute, but when in Russia their agitation took the form of massacres and spoliation, followed by legislative and military harassment, the nationalist remonstrance was offered itself. In 1882 several pamphlets were published by Jews in Russia, advocating the restoration of the Jewish state. They found a powerful echo in the United States, where a young Jewish poetess, Miss Emma Lazarus, passionately championed the Zionist cause in verse not unworthy of Jehuda Halevi. But the movement did not limit itself to literature. A society, "Chovevi Zion," was formed with the object of securing and methodizing the establishment of agricultural colonies in Palestine as to make the eventual acquisition of the country by the Jews possible. From the beginning it was a great success; and branches, or "tents," sprang up. In 1887 they were established all over the world. At the same time two other great schemes for rescuing the Jewish people from oppression were brought before the public. Neither was Zionist, but both served to encourage the Zionist cause. One was due to the initiative of Mr Cazalet, a financier who was interested in the Euphrates Valley Railway project. With the assistance of Mr Laurence Oliphant he proposed that the concession from the Porte should include a band of territory two miles wide on each side of the railway, on which Jewish refugees from Russia should be settled. Unfortunately the scheme failed. The other was a plan of Baron de Hirsch (see HIRSCH, MAURICE DE). This was neither political nor Zionist, but it was supported by a good many members of the "Chovevi Zion," among them Colonel Goldsmid, on the ground that it might result in the training of a large class of Jewish yeomen who would be invaluable in the ultimate settlement of Palestine. (Interview in Daily Graphic, 10th March 1892.)

None of these projects, however, proved sufficiently inspiring to attract the great mass of Jewish nationalists. The Chovevi Zion was too timid and prosaic; the Hirsch scheme did not directly appeal to their strong sympathies. In 1887 a striking change manifested itself. A new Zionist leader arose in the person of a Viennese journalist and playwright, Dr Theodor Herzl (1860-1904). The electoral successes of the anti-Semites in Vienna and Lower Austria in 1895 had impressed him with the belief that the Jews were unassimilable in Europe, and that the time was not far distant when they would be once more submitted to civil and political disabilities. The Hirsch scheme did not, in his view, provide a remedy, as it only transplanted the Jews from one ungenial environment to another. He came to the conclusion that the only solution of the problem was the segregation of the Jews under autonomous political conditions. His first scheme was not essentially Zionist. He merely called for a new exodus, and was ready to accept any grant of land in any part of the world that would secure to the Jews some form of self-government. The idea was not new. In 1866 Don Joseph Nasi had proposed an autonomous settlement of Jews at Tiberias, and had obtained a grant of the city from the Sultan for the purpose. In 1852 the Dutch West India Company in Curacao, in 1843 Oliver Cromwell in Surinam, and in 1859 the French West India Company at Cayenne had attempted similar experiments. Marshal de Saxe in 1740 had projected the establishment of a Jewish kingdom in South America, of which he should be sovereign; and in 1825 Major M. M. Noah purchased Grand Island, in the river Niagara, with a view to founding upon it a Jewish state. All these projects were failures. Dr Herzl was not slow to perceive that without an impulse of real enthusiasm his scheme would share the fate of these predecessors. He accordingly resolved to identify it with the nationalist idea. His plan was set forth in a pamphlet, entitled The Jewish State, which was published in German, French and English in the spring of 1896. It explained in detail how the new exodus was to be organized and how the state was to be managed. It was to be a tribute-paying state under the suzerainty of the Sultan. It was to be settled by a chartered company and governed by an aristocratic republic, tolerant of all religious differences. The Holy Places were to be exteriorized. The pamphlet produced a profound sensation. Dr Herzl was joined by a number of distinguished Jewish literary men, among whom were Dr Max Nordau and Mr Israel Zangwill, and parodies of support and sympathy reached him from corners of the world. The haute finance and the higher rabbinate, however, stood aloof.

The most encouraging feature in Dr Herzl's scheme was that the Sultan of Turkey appeared favourable to it. The motive of his sympathy has not hitherto been made known. The Armenian massacres had inflamed the whole of Europe against him, and for a time the Ottoman Empire was in very serious peril. Dr Herzl's scheme provided him, as he imagined, with a means of securing powerful friends. Through a secret emissary, the Chevalier de Newinsky, whom he sent to London in May 1896, he offered to present the Jews a charter in Palestine provided they used their influence in the press and otherwise to solve the Armenian question on lines which he laid down. The English Jews declined these proposals, and refused to treat in any way with the persecutor of the Armenians. When, in the following July, Dr Herzl himself came to London, the Maccabean Society, though ignorant of the negotiations with the Sultan, declined to support the scheme. None the less, it secured a large amount of popular support throughout Europe, and in 1910 Zionism had a following of over 300,000 Jews divided into a thousand electoral districts. The English membership was 60,000.

Between 1897 and 1910 the Zionist organization held nine international Congresses. At the first, which met at Basel, a political programme was adopted on the following terms:

"Zionism aims at establishing for the Jewish people a publicly and legally assured home in Palestine. For the attainment of this purpose the Congress considers the following means serviceable: (1) the promotion of Jewish colonization in Palestine; (2) the promotion of the development of both the agricultural and industrial departments of the Jews in the Diaspora; (3) the promotion of the establishment of settlements among the Jews in the United States and in other countries; and (4) the promotion of the establishment of permanent Jewish educational and cultural centres in the Diaspora. (2) The federation of all Jews into local or general groups, according to the laws of the various countries. (3) The strengthening of the Jewish feeling and solidarity, by the formation of a Jewish nationality; (4) the promotion of the establishment of settlements among the Jews in the Diaspora."
the Dispersion, and for a moment it seemed as if Zionism were really entering the field of practical politics. Unhappily it only led to bitter controversies, which nearly wrecked the whole movement. The British offer was submitted to the Sixth Congress, which assembled at Basel in August 1903. It was received with consternation and an explosion of wrath by the ultra-nationalist elements, who interpreted it as an abandonment of the Palestine idea. By his personal influence Dr Herzl succeeded in obtaining the appointment of a commission to examine the proposed territory, but its composition was largely nationalist, and in the following year the Congress gladly availed itself of certain critical passages in the report to reject the whole scheme.

Meanwhile Zionism had suffered an irreparable blow by the death of Dr Herzl (1904). He was succeeded by Mr David Wolffsohn, a banker of Cologne, but there was in truth nobody who in ability and personal dignity and magnetism could take his place. The movement was further shaken by the disensions which followed the rejection of the East African project. Mr Israel Zangwill led an influential minority which combined with certain non-Zionist elements to found a rival organization under the name of the ITO (International Zionist Organization), with a view to taking over the East African offer or to establish an autonomous place of refuge elsewhere. Thus freed from all moderating elements the Zionists hardened into an exclusively Palestinian body, and under the auspices of Mr Wolffsohn fresh negotiations were opened with the Porte. These, however, were rendered finally hopeless by the Turkish revolution, which postulated a united Ottoman nationality, and resolutely set its face against any extension of the racial and religious autonomies under which the integrity of the Empire had already severely suffered.

During 1905-1910 the Jewish national idea, for all practical purposes, was in a state of suspended animation. The recovery of the Holy Land appeared more distant than ever, while even the establishment of an independent or autonomous Jewish state elsewhere, for which the ITO was labouring, had encountered unexpected difficulties. On the rejection of the British offer by the Zionists Mr Zangwill approached the Colonial Office, but he was too late, as the reserve on the Nasser Ghishlu plateau had already been officially withdrawn. The ITO then turned its attention to Cyrenaica, and an expedition was sent out (1908), but it was not found suitable. A project for combining all the Jewish organizations in an effort to secure an adequate foothold in Mesopotamia in connexion with the scheme for the irradiation of that region was subsequently proposed by Mr Zangwill, but up to January 1911 it had not been found practicable. The ITO, however, did valuable work by organizing an Emigration Regulation Department for deflecting the stream of Jewish emigration from the overcrowded Jewry of New York to the Southern states of the American Union, where there is greater scope for employment under wholesome conditions. For this purpose a fund was formed, to which Mr Jacob Schiff contributed $100,000 and Messrs Rothschild $20,000.

Although the Zionist organization was numerically strong—indeed, the strongest popular movement Jewish history had ever known—it experience from 1897 to 1910 rendered it very doubtful whether its nationalist aspirations could, humanly speaking, ever be fulfilled. From Turkey, either absolutist or democratic, it appeared hopeless to expect any willing relinquishment of the Ottoman hold on Palestine, while in the event of a division of the Empire it was questionable whether Christendom—and especially the Roman and Greek Churches—would permit the Holy Land to pass to the Jews, even though the Holy Places were exterterrialized. Should these obstacles be overcome, still more formidable difficulties would await the Jewish state. The chief of these is the religious question. The state would have to be orthodox or secular. If it were orthodox it would desire to revive the whole Levitical polity, and in these circumstances it would either pass away through internal chaos or would so offend the modern political spirit that it would be soon extinguished from outside. If it were secular it would not be a Jewish state. The great bulk of its supporters would refuse to live in it, and it would ultimately be abandoned to an outlander population consisting of Hebrew Christians and Christian Millennials.

Modern Zionism is vitiated by its erroneous premises. It is based on the idea that anti-Semitism is unconquerable, and thus the whole movement is artificial. Under the influence of religious toleration and the naturalization laws, nationalities are daily losing more of their national character. The coming nationality will be essentially a matter of education and economics, and this will not exclude the Jews as such. With the passing away of anti-Semitism, Jewish nationalism will disappear. If the Jewish people disappear with it, it will only be because either their religious mission in the world has been accomplished or they have proved themselves unworthy of it.

LITERATURE.—A Zionist bibliography has been published by the Federation of American Zionists. Besides the works already cited in the body of this article, see on the early nationalist movement Gernet, Geschichte der Juden, under the heads of the various pseudo-Messiahs and their adherents. Jewish agricultural colonies will be found discussed very fully in The Jewish Encyclopedia, vol. 1, pp. 240-262. For early Zionist projects see Publications of the American Jewish Historical Society, No. 8, pp. 75-118; Laurence Oliphant, Land of Gilead; Mrs Oliphant, Life of Laurence Oliphant, pp. 168 et seq. The Zionist movement since 1895 is fully recorded in its official organ, Die Welt (Vienna). For proceedings of the Congresses see the Official Protocols published for each year by the society "Erez Israel" of Vienna; also Herzl, Der Baseler Congress (Vienna, 1897). On the movement generally, see Herzl's Zionistische Schriften, edited by Dr Leon Kellner; Ten Years of Zionism (Cologne, 1907); Nordau, Zionism, its History and its Aims (London, 1905); J. de Haas, Zionism, Jewish Needs and Jewish Ideals; also articles by I. Zangwill in Cosmopolis (October 1897), Contemporary Review (October 1899) and Forthnightly Review (April 1910); Dr Gaster in Asiatic Quarterly Review (October 1897); H. Bentwich in Nineteenth Century (October 1897), and Forthnightly Review (December 1898); Reiche in Nineteenth Century (August 1897); Lucien Wolf in Jewish Quarterly Review (October 1904; "The Zionist Peril"). On the ITO see pamphlets and leaflets published by the Jewish Territorial Organization; also the Report of the Commission on Cyrenaica (London, 1905).

ZIRCON, a mineral composed of zirconium silicate, sometimes used as a gem-stone. It is believed that the name comes from the Arabic zarqun, and is essentially the same as "jargon," the name given to certain worthless zircon crystals. The mineral crystallizes in the tetragonal system, generally in combinations of square prisms and square pyramids, as in figs. 1 and 2. Zircon is isomorphous with cassiterite and rutile, and like them may occur in geniculated twins. There is no distinct cleavage, and the mineral breaks with a conchoidal fracture. The hardness is about 7-5. It is notable that the specific gravity is very wide ranging, extending from a little below 4 to rather more than 4·7, and being thus greater than that of any other gem-stone.Rarely colourless, zircon is usually brown or red, sometimes orange, yellow or green, and occasionally parti-coloured or zoned. Whilst common zircon is opaque, the gem-varieties are transparent. The dichroism of coloured zircons is always feeble; the double refraction usually strong and of positive sign; and the optical properties of some zircons suggest a biaxial mineral. It was pointed out long ago by Sir A. H. Church that many transparent zircons afford a spectrum.
ZIRCONIUM

marked by certain absorption-bands, a property perhaps due to the presence of uranium.

The effect of heat on zircon is remarkable. Most coloured zircon, exposed to a high temperature, either change or lose their colour, but this loss is attended by a gain in brilliancy.

The "Matura diamonds" of Ceylon are zircon, which have been thus artificially colorized. Certain zircons when heated in a crucible in an oxide or glass incandescent, whilst others may emit an orange glow when ground on a copper-wheel fed with diamond-dust. Even exposure to sunlight will sometimes modify the colour and lustre of a zircon. Some zircons suffer contraction when heated, so that the specific gravity becomes raised; but the behaviour of zircons in this respect shows such anomalies that S. Stevanovic has been led to suggest the existence of three classes of zircon. One group has a specific gravity of 4.0 and another of 4.7, both remaining unchanged in density when heated. L. J. Spencer, who has studied some remarkable zircons from Ceylon, called the former zircon, and the latter β-zircon. A third class has specific gravity between 4.0 and 4.7, and increases in density on heating. These stones consist, according to Spencer, of an intergrowth of α-zircon or β-zircon, with a third unstable modification which he distinguishes as γ-zircon.

Whilst zircon is usually regarded as a zirconium silicate (ZrSiO₄) it is sometimes placed with the oxides as consisting of ZrO₂SiO₂. A small proportion of ferric oxide seems to be always present, and to the this the colour of zircon, according to G. Spezia, may be due. Zircon from Ceylon has been found to contain many elements in its composition; in certain zircons that it was at one time proposed to call the species polycrassilite from the Greek πολύς (many) and κρασίον (mixture). Zircon is used as a source of zirconia in various preparations, for incandescent gas mantles, &c.

Zircon is a mineral consisting of many rocks, especially granite, where it appears to have crystallized at an early stage of consolidation. In microscopic sections, viewed by transmitted light, the zircon by virtue of its high refractive power appears to stand out in relief. It forms an important constituent of many zircons of Norway. Zircon occurs also in many basic eruptive rocks, notably the basalt of the Rhine and Central France. Being but little subject to alteration, it is common in secondary deposits, as in auriferous and other sands, occurring usually in small characteristic crystals, with rounded angles. Fine crystals of zircon are found in the Ilmen Mountains in Russia, and in the New England region of America, where it occurs in crystalline limestone. Many localities in the United States yield zircon, especially in New York state and in North Carolina: it has been largely worked in Henderson co., N.C. Zircon occurs also in Tasmania. Certain varieties of zircon have received distinctive names, such as the azorite, which occurs in sandstone-trachyte in the Azores. Several other minerals seem to be altered zircon, generally hydrated, such as macleon, cyrtolite and oeserolite, the last being a Norwegian mineral containing titanium and magnesium. Auerbachit is a Russian mineral closely related to zircon. (F. W. R.)

ZIRCONIUM [symbol Zr, atomic weight 90.6 (O = 16), a metallic chemical element. Klaproth in 1789 analysed the mineral zircon or hyacinth and found it to contain a new earth, which he called "zirconia." The metal was obtained by fusion with a mixture of fluorine with potassium. The moflous metal also results when the chloride is heated with sodium; the oxide reduced with magnesium; or when fused potassium zircono-

fluoride is electrolysed (Wedekind, Zeit. Elektrochem., 1924, 10, p. 331). Troost produced crystallized zirconium by fusing the double fluoride with aluminium in a graphite crucible at the temperature of melting iron, and extracting the aluminum from the melt with hydrochloric acid. It is more conveniently prepared by heating the oxide with carbon in the electric furnace. The crystals look like antimony, and are brittle, and so hard as to scratch steel. The fine powdery metal burns readily in air; the crystalline metal requires to be heated in an oxyhydrogen flame before it catches fire. Mineral acids generally attack the crystallized metal very little even in the heat; aqua regia, however, dissolves it readily, and so does hydrofluoric acid. In its chemical affinities zirconium resembles titanium, cerium and thorium; it occurs in company with these elements, and is tetravalent in its more important salts.

Zirconium oxide or zirconia, ZrO₂, has become important since its application to the manufacture of mantles for incandescent gas burners. For its extraction from zircon the minerals is heated and quenched in water to render it brittle, and then reduced to a fine powder, which is fused with three to four parts of acid potassium fluoride in a platinum crucible. When the mass is quietly fusing, the oxide is thrown off, but the liquid is heated, and the porcelain-like powder is boiled with water, and acidified with hydrochloric acid, and the residual potassium fluorosilicate is precipitated. To the filtrate is added zirconium hydroxide, K₂ZrF₄, which are purified by crystallization from hot water. The double fluoride is decomposed with hot concentrated sulphuric acid; the mixed sulphate is dissolved in water; and finally fused with hydrochloric acid. The filtrate, if the precipitate, being difficult to wash, is after a preliminary washing re-dissolved in hydrochloric acid and re-precipitated with ammonia. Zirconium hydroxide, Zr(OH)₄, as thus obtained, is quite appreciable soluble in water and easily in mineral acids, with formation of zirconium salts, e.g. ZrCl₄. But, if the hydroxide is precipitated in the heat, it demands concentrated acids for its solution. The hydroxide is readily sublimed from water at a dull red heat, and sublimate is anhydride with vivid incandescence. Zirconia can be obtained crystalline, in a form isomorphous with cassiterite and rutile, by fusing the amorphous modification with borax, and dissolving out the borax in hydrochloric acid. The anhydrous oxide is with difficulty soluble even in hydrofluoric acid; but a mixture of two parts of concentrated sulphuric acid and one of water dissolves it on continued heating as the sulphate, Zr(SO₄)_2. Zirconia, when heated to white heat, remains infusible, and radiates a fine white light, which is suggested its utilization for making incandescent gas mantles; and, in the form of disks, as a substitute for the lime-cylinders ordinarily used in the melting process. Zirconium oxides, unites not only with acids but also with basic oxides. For instance, if it be fused with sodium carbonate, sodium zirconate, Na₂ZrO₃. If the carbonate be in excess, the salt Na₂Zr₂O₄ is formed, which when heated with hydrochloric acid, it separates and sublimate, which crystallizes in hexagonal plates. When heated in a loosely covered crucible with magnesium the nitride ZrN₂ is formed (Winn, Zeit. anorg. Chem., 1891, 38, 474). Zirconium hydroxide, Zr(OH)₄, is supposed to be formed when zirconia is heated with magnesium in an atmosphere of hydrogen. Zirconium fluoride, ZrF₄, is obtained as glittering monoclinic plates (with ZrF₄) by heating zirconia with acid ammonium fluoride. It forms double salts, named zircono-fluorides, which are isomorphous with the stannii- and titanii-fluorides.

Zirconium chloride, ZrCl₄, is prepared as a white sublimate by igniting a mixture of zirconia and chlorinated in a current of chlorine. It has the exact vapour-density corresponding to the formula. It dissolves in water with evolution of heat; on evaporation a basic salt, ZrOCl₂·6H₂O, separates out in the form of sublimated crystals adhering to the crucible. Zirconium fluoride is produced by heating zirconia in a current of fluorine gas, or with sodium fluoride. The fluoride is produced by heating zirconia with carbon to form several carbides. The sulphate, Zr(SO₄)₂·6H₂O, is a white mass obtained by dissolving the oxide or hydroxide in sulphuric acid, evaporating and drying the mass. When the water is removed it forms a series of double sulphates, Ruer (Zeit. anorg. Chem., 1904, 42, p. 87) regards it as a dibasic acid, Zr₂(SO₄)₂·6H₂O, and that the crystalline sulphate is Zr₂(SO₄)₂·6H₂O (not Zr₂(SO₄)₃·7H₂O), which is the type Zr₂O₃·(SO₄)·6H₂O, where M = K, Rb, Cs, and n = 8 for K, 15 for Rb, 11 for Cs (Rosenheim and Frank, Ber., 1905, 38, p. 812). The atomic weight was determined by Manigrac to be 99.33; Bailey (Proc. Roy. Soc., 1896, 45, p. 74) deduced the value 89.95.
ZIRKEL, FERDINAND (1838-1938), German geologist and petrographer, was born at Bonn on the 20th of May 1838. He was educated in his native town, and graduated Ph.D. at the university in 1861. In early years he was engaged in teaching geology and mineralogy in Vienna. He became professor of geology in 1863 in the university of Lemberg, in 1868 at Kiel, and in 1870 professor of mineralogy and geology in the university of Leipzig.

His numerous papers and essays include *Geologische Skizze von der Westkuste Schottlands* (1871); *Die Struktur der Varoiolite* (1875); *Microscopical Petrography*. No. 4 of U.S. Geol. Explor. of 40th Par., vol. vi., 1876; *Limnol aus der Vallee de Lesponne* (1879); *Uber den Zirkon* (1890). His separate works include *Lehrbuch der Petrographie* (1866; 2nd ed. 1893, 1894); *Die mikroskopischen Beschaffenheiten der Mineralien und Gesteine* (1873).

ZITHER (Ger. Zither, Schlagzither, Streichzither, Ital. chitarra), a name applied in modern Germany to the ancient cithara (q.v.), to the cittern (q.v.), and to an instrument which is a kind of psaltery, consisting of a shallow sound-chest with ribs having the outline of a flattened jug (termed in German Flaschenform, bottle-shape). In the centre of the sound-board is a rose sound-hole, and the finger-board with frets lies along the straight side of the zither in front of the performer. The number of the strings varies, but 36, 38 and 42 are the most usual. Over the finger-board are four or five strings known as *violin*, on which the melody is played. These five melody strings are stopped with the thumb and fingers of the left hand and plucked with the thumb of the right hand, which usually has a thumb ring with plectrum. Nos. 1 and 2 are steel strings; Nos. 3, 4, and 5 of spun wire; the bass is played with the fingers of the right hand, and in order to facilitate the fingering the strings are tuned in fourths and fifthths. Most of the other strings from the 6th are of gut. All the strings lie horizontally across the sound-board, being fastened in the usual manner to hitch and wrest pins. The zither is placed on the table in front of the performer, who holds his right arm so that the wrist rests on the side of the zither parallel with the hitch pins, the thumb being over the finger-board.

The foregoing remarks apply to the *discent* and concert zither: the *elegia* or *bass zither* is of similar construction but larger, and is a suspended instrument, having the same notation as the former; the real sounds being a fourth lower. These zithers are the favourite instruments of the peasants in the Swiss and Bavarian highlands, and are sometimes seen in the concert halls of north and western Germany. The *Schlagezither* or bowed zither, having a body of heart- or pear-shape similar to that of the cittern, but without the long neck of the latter. The finger-board covers the whole of the sound-board with the exception of a few inches at the tapering end, which is finished off with a raised nut or bridge, the bow being applied in the centre of this gap. The bowed zither has little feet and is placed on a table when being played. There are four strings corresponding to those of the violin or viola, but the tone is nasal and glassy.

The spelling of the word with a "Z" had already become usual in the early 17th century, for, although the instrument described above did not then exist, Zither was the name which was generally known in Germany, and Michael Praetorius, writing in 1618, spells it with both "C" and "Z."

ZITTEL, a town of Germany, in the kingdom of Saxony, on the left bank of the Mandau, near its confluence with the Neisse, close to the Bohemian and Silesian frontier, 25 m. by rail S.E. of Bautzen, 48 E.E.S. of Dresden and at the junction of lines to Reichenberg (in Bohemia), Eibau and Hermsdorf. Pop. (1905) 34,766. The town hall dates from 1844, and contains a beautiful hall with rich stained glass windows. Among the six Evangelical churches, the following are noticeable: that of St John, rebuilt in 1834-37, with twin spires, and the church of St Paul, with its elegant tower, which formerly belonged to an old Franciscan monastery. The latter was restored in 1882 and part of it fitted up as an historical museum. Another wing of this building contains the municipal library of 40,000 volumes and valuable manuscripts. Zittau is well equipped with schools, including a gymnasium and a commercial school, which are both accommodated in the Johannenm, and several technical institutions. There are also a theatre, well-equipped public baths and a richly endowed hospital. Zittau is one of the chief manufacturing towns of Saxony. The leading branch of industry is linen and damask weaving; but woollen stuffs, trimmings, &c., are also produced in the factories of the town, and in the surrounding weaving villages, sixty-six of which, with 11,445 (1000) inhabitants, are included in the municipal jurisdiction. The corporation owns valuable forests on the mountains of Upper Lusatia and other estates, the annual income of which is about £15,000. There are various steam-mills, iron-foundries, brick-fields and potteries near the town, and extensive deposits of lignite.

Zittau is of Wendish origin (Chytawa is its Wendish name), and was made a town by Ottocar II. of Bohemia. It was one of the six towns of the Lusatian League (1346), at which period it belonged to Bohemia. It suffered severely in the Hussite wars and in the Thirty Years' War, and was bombarded and burnt by the Austrians in 1757, in the Seven Years' War.

The musical composer Moschner (1795-1861) was born at Zittau.

ZITTEL, KARL ALFRED VON (1839-1904), German palaeontologist, was born at Balingen in Baden on the 25th of September 1839. He was educated at Heidelberg, Paris and Vienna. For a short period he served on the Geological Survey of Austria, and as assistant in the mineralogical museum at Vienna. In 1863 he became teacher of geology and mineralogy in the polytechnic at Carlsruhe, and three years later he succeeded Oppel as professor of palaeontology in the university of Munich, with the charge of the state collection of fossils. In 1880 he was appointed to the geological professorship, and eventually to the directorship of the natural history museum of Munich. His earlier work comprised a monograph on the Cretaceous bivalve mollusca of Gossau (1863-66) and an essay on the Tithonian stage (1870), regarded as equivalent to the Purbeck and Wealden formations. In 1873-74 he accompanied the Rohils expedition to the Libyan desert, the principal results of which were published in *Ub den geolischen Bau der libyschen Wiiste* (1880), and further details in the *Palaeontographica*, on the Palaeontology of the Sahara (1883). In 1883 he commenced the publication of his great work, *Handbuch der Palaeontologie*, which was completed in 1893 in five volumes, the fifth volume on palaeobotany being prepared by W. P. Schimper and A. Schenk. To make his work as trustworthy as possible Dr Zittel made special studies of each great group, commencing with the fossil sponges, on which he published a monograph (1877-79). In 1895 he issued a summary of his larger work entitled *Grundriss der Palaeontologie* (ed. 2, part 1, 1902), revised by Dr Zittel in 1903; the American edition of 1900 by C. R. Eastman is so revised, sometimes in opposition to Zittel's views, as to be practically an independent work. He was author of *Aus der Urzeit* (1873, ed. 2, 1873); and *Die Sahara* (1883). In 1889 he published *Geschichte der Geologie und Palaeontologie bis Ende des 10 Jahrhunderts*, a monumental history of the progress of geological science (Eng. trans., Mrs Maria M. Ogilvie-Gordon, 1901). Dr Zittel was from 1899 president of the Royal Bavarian Academy of Sciences, and in 1894 he was awarded the Wollaston medal by the Geological Society of London. He died on the 5th of January 1904.

Obituary with portrait and bibliography, by Dr F. L. Kitchin, *Geol. Mag.* (February 1904).
ZIZKA—ZOEIR RAHAMA

992

ŽIŽKA, JOHN (c. 1376–1424), Bohemian general and Hussite leader, was born at Trocnov in Bohemia, of a family which belonged to the gentry. He took part in the civil wars in Bohemia in the reign of Wenceslaus IV., during which he lost one eye in a skirmish. He was from his youth connected with the continued his campaigns against the colossus of the princes of Poland, had appointed as the Hussites, and, in the end of the 14th century, led the forces of the Brandenburgers and those of the Thurn. In 1420, Žižka's name first became prominent when the Hussite movement began. When in 1419 a Hussite procession was stoned at Prague from the town hall, Žižka headed those who threw the town councillors from its windows. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Žižka marched to Plzeň (Pilsen) with his followers, but soon left that city, and, after defeating at Sudomer the partisans of Sigismund, arrived at Tabor, the newly founded stronghold of the advanced Hussites. Žižka continued his campaigns, the organization of the new military community and became one of the four captains of the people (hejtmane) who were at its head. Meanwhile Sigismund, king of the Germans and king of Hungary, invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus. Menaced by Sigismund, the citizens of Prague entreated the Taborites for assistance. Led by Žižka and their other captains, the Taborites set out to take part in the defence of the capital. At Prague Žižka and his men took up a strong position on the hill then known as the Vitkov, on the spot where Žižko, a suburb of Prague, is now. The next day the enemy arrived at the gates of the city, and, on the 14th of July the armies of Sigismund made a general attack. A strong German force assaulted the position on the Vitkov which secured the Hussite communications with the open country. Mainly through the heroism of Žižka, the attack was repulsed, and the forces of Sigismund abandoned the siege. Shortly afterwards (August 22, 1420) the Taborites left Prague and returned to Tabor. Žižka was now engaged in constant warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. By this struggle, in which Žižka was invariably successful, the Hussites obtained possession of the greatest part of Bohemia, which Sigismund now left for a time. It was proposed to elect a Polish prince to the throne; but meanwhile the estates of Bohemia and Moravia, who met at Časlav on the 1st of June 1421, decided to appoint a provisional government, consisting of twenty members chosen from all the political and religious parties of the country, Žižka, who took part in the deliberations at Časlav, being elected as one of the two representatives of Tabor. He summarily suppressed some disturbances on the part of a fanatical sect called the Adamites. He also dealt harshly with the heretics of Sigismund; and having captured a small castle near Litoměřice (Leitmeritz) he retained possession of it—the only reward for his great services that he ever received or claimed. According to the Hussite custom he gave the biblical name of "Chalice" to this new possession, and henceforth adopted the signature of "Žižka of the Chalice." Later, in 1421, he was severely wounded while besieging the castle of Ráhl, and lost the use of his remaining eye. Though now totally blind, he continued to command the armies of Tabor. At the battle of Lips (1421) Sigismund, king of Bohemia, obtained possession of the important town of Kutna Hora (Kuttenberg). Žižka, who was at the head of the united armies of Tabor and Prague, at first retreated to Kolín; but after having received reinforcements he attacked and defeated Sigismund's army at the village of Nebovíd between Kolín and Kutna Hora (January 6, 1422). Sigismund lost 12,000 men and only escaped himself by rapid flight. Sigismund's forces made a last stand at Německý Brod (Deutschbrod) on the 10th of January, but the city was stormed by the Bohemians, and, contrary to Žižka's orders, its defenders were put to the sword. Early in 1423 internal dissensions among the Hussites led to civil war. Žižka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hörén on the 27th of April; but shortly afterwards the news that a new crusade against Bohemia was being prepared, induced the Hussites to conclude an armistice at Konopist on the 24th of June 1423. As soon as he joined the crusaders had dispersed without even attempting to enter Bohemia, the internal dissensions broke out afresh. During his temporary rule over Bohemia Prince Sigismund KČur, brother of Poland, had appointed as the Hussites, and, in the end of the 14th century, led the forces of the Brandenburgers and those of the Thurn. In 1420, Žižka's name first became prominent when the Hussite movement began. When in 1419 a Hussite procession was stoned at Prague from the town hall, Žižka headed those who threw the town councillors from its windows. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Žižka marched to Plzeň (Pilsen) with his followers, but soon left that city, and, after defeating at Sudomer the partisans of Sigismund, arrived at Tabor, the newly founded stronghold of the advanced Hussites. Žižka continued his campaigns, the organization of the new military community and became one of the four captains of the people (hejtmane) who were at its head. Meanwhile Sigismund, king of the Germans and king of Hungary, invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus. Menaced by Sigismund, the citizens of Prague entreated the Taborites for assistance. Led by Žižka and their other captains, the Taborites set out to take part in the defence of the capital. At Prague Žižka and his men took up a strong position on the hill then known as the Vitkov, on the spot where Žižko, a suburb of Prague, is now. The next day the enemy arrived at the gates of the city, and, on the 14th of July the armies of Sigismund made a general attack. A strong German force assaulted the position on the Vitkov which secured the Hussite communications with the open country. Mainly through the heroism of Žižka, the attack was repulsed, and the forces of Sigismund abandoned the siege. Shortly afterwards (August 22, 1420) the Taborites left Prague and returned to Tabor. Žižka was now engaged in constant warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. By this struggle, in which Žižka was invariably successful, the Hussites obtained possession of the greatest part of Bohemia, which Sigismund now left for a time. It was proposed to elect a Polish prince to the throne; but meanwhile the estates of Bohemia and Moravia, who met at Časlav on the 1st of June 1421, decided to appoint a provisional government, consisting of twenty members chosen from all the political and religious parties of the country, Žižka, who took part in the deliberations at Časlav, being elected as one of the two representatives of Tabor. He summarily suppressed some disturbances on the part of a fanatical sect called the Adamites. He also dealt harshly with the heretics of Sigismund; and having captured a small castle near Litoměřice (Leitmeritz) he retained possession of it—the only reward for his great services that he ever received or claimed. According to the Hussite custom he gave the biblical name of "Chalice" to this new possession, and henceforth adopted the signature of "Žižka of the Chalice." Later, in 1421, he was severely wounded while besieging the castle of Ráhl, and lost the use of his remaining eye. Though now totally blind, he continued to command the armies of Tabor. At the battle of Lips (1421) Sigismund, king of Bohemia, obtained possession of the important town of Kutna Hora (Kuttenberg). Žižka, who was at the head of the united armies of Tabor and Prague, at first retreated to Kolín; but after having received reinforcements he attacked and defeated Sigismund's army at the village of Nebovíd between Kolín and Kutna Hora (January 6, 1422). Sigismund lost 12,000 men and only escaped himself by rapid flight. Sigismund's forces made a last stand at Německý Brod (Deutschbrod) on the 10th of January, but the city was stormed by the Bohemians, and, contrary to Žižka's orders, its defenders were put to the sword. Early in 1423 internal dissensions among the Hussites led to civil war. Žižka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hörén on the 27th of April; but shortly afterwards the news that a new crusade against Bohemia was being prepared, induced the Hussites to conclude an armistice at Konopist on the 24th of June 1423. As soon as he joined the crusaders had dispersed without even attempting to enter Bohemia, the internal dissensions broke out afresh. During his temporary rule over Bohemia Prince Sigismund KČur, brother of Poland, had appointed as
The signs—the Greek ζώδιακά μέρα—are geometrical divisions thirty degrees in extent, counted from the spring equinox in the direction of the sun's progress through them. The whole series accordingly shifts westward through the effect of precession by about the results in seventy-two years. At the moment of crossing the equator towards the north the sun is said to be at the first point of Aries; some thirty days later it enters Taurus, and so on through Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces. The constellations bearing the same names coincided approximately in position, when Hipparchus observed them at Rhodes, with the divisions they designate. The discrepancy now, however, amounts to the entire breadth of a sign, the sun's path in Aries lying among the stars of Pisces, in Taurus among those of Virgo.

Assyria and Babylonia.—The twelfold division of the zodiac was evidently suggested by the occurrence of twelve full moons in successive parts of it in the course of each year. This approximate relation was first systematically developed by the early inhabitants of Mesopotamia, and formed the starting-point for all their divisions of time. As the year separated, as it were of itself, into twelve months, so the day was divided into twelve "double hours," and the great cosmical period of 43,200 years into twelve "suns." Each sar, month and hour was corresponded to by a symbolically by a twelfth part of the "furfur" drawn by the seven Bull across the heavens. The idea of tracing the sun's path among the stars was, when it occurred to Chaldaean astronomers, an original and, relatively to their means, a recondite one. We owe to its realization by them the constitution and nomenclature of the twelve signs of the zodiac. Assyrian cylinders and inscriptions indicate for the familiar series of our text-books an antiquity of some four thousand years. Ages before Assur-bani-bal reigned at Nineveh the eighth month (Marchesvan) was known as "the month of the star of the Scorpion," the tenth (Tebet) belonged to the "star of the Goat," the twelfth (Adar) to the "star of the Fish of Ea." The motive underlying the choice of symbols is in a few cases obvious, but in most remains conjectural. The attributes of the deities appointed to preside over the months and signs were to some extent influential. Two of them, indeed, took direct possession of their respective portions of the sky. The zodiacal Virgo is held to represent the Assyrian Venus, Ishtar, the ruling divinity of the sixth month, and Sagittarius the archer-god Nergal, to whom the ninth month was dedicated. But no uniform system of selection was pursued. The Babylonian, and to some extent the Chaldaean, systems, adopted by various epochs, and under the influence of varying currents, of ideas, became amalgamated in the final series.

This, there is reason to believe, was the upshot of a prehistoric system. So far as positive records go, Aries was always the first sign. But the arrangement is, in the face of it, a comparatively modern one. None of the brighter stars of the constellation could be said even roughly to mark the equinox much before 1800 B.C.; during a long stretch of previous time the leading position belonged to the stars of Taurus. Numerous indications accordingly point to a system representing primitive zodiac. Setting aside as doubtful evidence derived from interpretations of cuneiform inscriptions, we meet, in connexion with Mithraic and Mythlic legends, reminiscences of a zodiac and religious calendar in which the Bull led the way. Virgil's

Candidus auratis aperit cum cornibus annuum
Taurus
perpetuates the tradition. And the Pleiades continued, within historical memory, to be the first asterism of the lunar zodiac.

1 Gordon and Zobeir met in Cairo on the 25th and 26th of January (see Egypt No. 12 of 1884) and Gordon from that time onward asked for Zobeir's help. It was not, however, until the 26th of March that his wish was made public, in a telegram from Khartoum published in The Times.

ZODIAC

Evelyn
In the Chaldaean signs fragments of several distinct strata of thought appear to be embedded. From one point of view they shadow out the great epic of the destinies of the human race; again, the universal solar myth claims a share in them; holy traditions were brought into copy and facto connection with them; or they served to commemorate simple meteorological and astronomical facts.

The first Babylonian month Nisan, dedicated to Anu and Bel, was that of "sacrifice"; and its association with the Ram as the chief primitive object of sacrifice is thus intelligible. According to an alternative explanation, the heavenly Ram, placed as leader in front of the flock of the stars, merely embodied a spontaneous figure of the popular imagination. An antique persuasion, that the grand cycle of creation opened under the first sign, has been transmitted to modern cognizance by Dante (Inf. i. 38). The human race, on the other hand, was supposed to have come into being under Taurus. The solar interpretation of the sign goes back to the far-off time when the year began with Taurus, and the sun was conceived of as a bull entering upon the great furrow of heaven as he ploughed his way among the stars. In the third month and sign the building of the first city and the fratricidal brothers—the Romulus and Remus of Roman legend—were brought to mind. The appropriate symbol was at first indifferently a pile of bricks or two male children, always on early monuments placed feet to feet. "The retrograde movement of a crab typified, by an easy association of ideas, the retreat of the sun from his farthest northern excursion, and Cancer was constituted the sign of the summer solstice. The Lion, as the symbol of fire, represented the culmination of the solar heat. In the sixth month, the descent of Ishtar to Hades in search of her lost husband Tammuz was celebrated, and the sign of the Virgin had thus a purely mythological significance.

The history of the seventh sign is somewhat complicated. The earlier Greek writers—Eudoxus, Eratosthenes, Hipparchus—knew of only eleven zodiacal symbols, but made one do double duty, extending the Scorpion across the seventh and eighth divisions. The Balance, obviously indicating the equality of day and night, is first mentioned as the sign of the autumnal equinox by Geminus and Varro, and obtained, through Sosigenes of Alexandria, official recognition in the Julian calendar. Nevertheless, Virgil (Georg. i. 32) regarded the space it presided over as so much waste land, proposing originally by the name of the Scorpion, but readily available for the apportionment of Augustus. Libra was not of Greek invention. Ptolemy, who himself chiefly used the "Claws" (Ωναδί), speaks of it as a distinctively Chaldaean sign; and it occurs as an extra-zodiacal asterism in the Chinese sphere. An ancient Chinese law, moreover, prescribed the regularization of weights and measures at the spring equinox. No representation of the seventh sign has yet been discovered on any Euphratean monument; but it is noticeable that the eighth is frequently doubled, and it is difficult to avoid seeing in the pair of zodiacal scorpions carved on Assyrian cylinders the prototype of the Greek scorpion and claws. Both Libra and the sign it eventually superseded thus owned a Chaldaean birthplace. The struggle of rival systems of nomenclature, from which our zodiacal series resulted, is plainly visible in their alternations; and the claims of the competing signs were long sought to be conciliated by representing the Balance as held between the claws of the Scorpion.

The definitive decline of the sun's power after the autumnal equinox was typified by placing a Scorpion as the symbol of darkness in the eighth sign. Sagittarius, figured later as a Centaur, stood for the Babylonian Mars. Capricornus the sign of the winter solstice, is plausibly connected with the caprine nurse of the young solar god in Oriental legend, as was that of Zeus and Amalthia in a variant.8 The fish-tailed Goat of the zodiac presents a close analogy with the Mexican calendar sign Cipactli, a kind of marine monster resembling a narwhal. Aquarius is a still more exclusively meteorological sign than Leo. The eleventh month was known in Euphratean regions as that of "want and rain." The deluge was traditionally associated with it. It was represented in zodiacal symbolism by the god Ramman, crowned with a tiara and pouring water from a vase, or more generally by the vase and water without the god. The resumption of agricultural labours after the deluge was commemorated in the twelfth month, and a mystical association of the fishes, which was its sign, with the life after death is evident in a monument of Assyrian origin described by Clermont-Ganneau, showing a corpse guarded by a pair of fish-gods. The doubling of the sign of Pisces still recalls, according to Sayce,9 the arrangement of the Babylonian calendar, in which a year of 360 days was supplemented once in six years by a thirteenth month, a second Adar. To the double month corresponded the double sign of the fishes of Hades.10

Cyclical Meaning of the Succession of Signs.—The cyclical meaning of the succession of zodiacal signs, though now obscured by interpolations and substitutions, was probably once clear and entire. It is curiously reflected in the adventures of the Babylonian Hercules, the solar hero Gilgamesh (see Gilgamesh, Epic 09). They were recorded in the comparatively late surviving version of the 7th century B.C., on twelve tablets, with an obvious design of correlation with the twelve divisions of the sun’s annual course. Gilgamesh’s conquest of the divine bull, Enkidu, placed under the sign of the zodiacal symbol of Eabani, the prototype of Geryon in the fifth month typified the victory of light over darkness, represented in plastic art by the group of a lion killing a bull, which is the form ordinarily given to the sign Leo on Niniveh cylinders.10 The wooing of Ishtar by the hero of the epic falls under Virgo, and his encounter with two scorpion men, guardians of the rising and the setting sun, under Scorpio. The eleventh tablet narrates the deluge; the twelfth associates the apotheosis of Eabani with the zodiacal emblems of the resurrection.

In the formations of the constellations of the zodiac little remains of the formulas past to stellar configurations. The Chaldaean chose three stars in each sign to be the “councillor gods” of the planets.11 These were called by the Greeks “decans,” because ten degrees of the ecliptic and ten days of the year were presided over by each. The college of the decans was conceived as moving, by their annual risings and settings, in an “eternal circuit” between the infernal and superem regions. Modern asterisms first appear in the Phaenomena of Eudoxus about 370 B.C. But Eudoxus, there is reason to believe, consulted, not the heavens, but a celestial globe of an anterior date, in which the signs were formed into unnatural agreement. The representation thus handed down (in the verses of Aratus) has been thought to tally best with the state of the sky about 2000 B.C.;12 and the mention of a polar star, for which Eudoxus was rebuked by Hipparchus, seems, as W. T. Lynn pointed out,13 to refer to the time when a Dracoins

stood near the pole. The data afforded by Eudoxus, however, are far too vague to serve as the basis of any chronological conclusion.

**Egyptian Zodiacal Signs.**—The Egyptians adopted from the Greeks, with considerable modifications of its attendant symbolism, the twelve-fold division of the zodiac. Aries became the Fleece; two Sprouting Plants, typifying equality or resemblance, stood for Gemini; Cancer was re-named Searabaeus; Leo was converted, from the axle-like configuration of its chief stars, into the Knife: Libra into the Mountain of the Sun, a reminiscence, apparently, of the Euphratean association of the seventh month with a "holy mound," designating the biblical tower of Babel. A Serpent was the Egyptian equivalent of Scorpio; the Arrow only of Sagittarius was retained; Capricornus became "Life," or a Mirror as an image of life; Aquarius survived as Water; Taurus, Virgo and Pisces remained unchanged.\(^1\) The motive of some of the substitutions was to avoid the confusion which must have ensued from the duplication of previously existing native asterisms; thus, the Egyptian and Greek Lions were composed of totally different stars. Abstractions in other cases replaced concrete objects, with the general result of effacing the distinctive character of the Greek zodiac as a "circle of living things."

**Spread of Greek System.**—Early zoroastrian writings, though imprecated with star-worship, show no traces of an attempt to organize the heavenly array. In the Bundahish, however (\textit{octh} century), the twelve "Akhtârs,\(^2\) designated by the same names as our signs, lead the array of Ormâz, while the seven "Awkârâts or planets (including a meteor and a comet) fight for Ahriman. The knowledge of the solar zodiac thus turned to account for dualistic purposes was undoubtedly derived from the Greeks. By them, too, it was introduced into Hindustan. Aryabhâta, about the beginning of the Christian era, reckoned by the same signs as Hipparchus. They were transmitted to the Buddhist missionaries to China, but remained in abeyance until the Jesuit reform of Chinese astronomy in the 17th century.

**Chinese Zodiacal Signs.**—The native Chinese zodiacal system was of unexampled complexity. Besides divisions into twenty-eight and twenty-four parts, it included two distinct duodenary series. The \textit{tse} or "stations" were referred by E. C. Biot to the date 1111 B.C. Measured from the winter solstice of that epoch, they corresponded, in conformity with the Chinese method of observation by intervals of what we now call right ascension, to equal portions of the celestial equator.\(^3\) Projected upon the ecliptic, these were considerably unequal, and the \textit{tse} accordingly differed essentially from the Chaldaean and Greek signs. Their use was chiefly astrological, and their highly figurative names—"Great Splendour," "Immensë Void," "Fire of the Phoenix," &c.—had reference to no particular stars. They became virtually merged in the European series, stamped with official recognition over two centuries ago. The twenty-four \textit{tsiel} or \textit{hemi-tse} were probably invented to mark the course of weather changes throughout the year. Their appellations are purely meteorological.

The characteristic Chinese mode of dividing the "yellow road" of the sun was, however, by the twelve "cyclical animals"—Rat, Ox, Tiger, Hare, Dragon or Crocodile, Serpent, Horse, Sheep, Monkey, Hen, Dog, Pig. The opening sign corresponds to our Aquarius, and it is remarkable that the rat is, in the far East, frequently used as an ideograph for "water."\(^4\) Here all the agreement ceases. For the Chinese series has the strange peculiarity of proceeding in a retrograde direction or \textit{against} the course of the sun. Thus, the second sign (of the Ox) occupies the position of Capricorn, the third that of Sagittarius, and so on. The explanation of this seeming anomaly is to be found in the primitive destination of the "animals" to the purposes of an "horary zodiac." Their succession, established to mark the hours of day and night, was not unnaturally associated with the diurnal revolution of the sphere from east to west.\(^1\) They are unquestionably of native origin. Tradition ascribes their invention to Tajao, minister of the emperor Huan, who reigned c. 260 B.C., and it can scarcely be placed later than the 7th century B.C.\(^4\)

The Chinese circle of the "animals" obtained early a wide diffusion. It was adopted by Tatars, Turks and Mongols, in Tibet and Tong-king, Japan and Korea. It is denominated by Humboldt\(^1\) the "zodiac of hunters and shepherds," and he adds that the presence in it of a tiger gives it an exclusively Asiatic character. It appears never to have been designed for astronomical employment. From the first it served to characterize the divisions of time. It appears to have been employed from the 7th century B.C.\(^4\) hence in the Oriental sixty-year cycle, and of the days in the "little cycle" of twelve days. Nor has it yet fallen into desuetude. Years "of the Rat," "of the Tiger," "of the Pig," still figure in the almanacs of Central Asia, Cochín China and Japan.

**Avestic Zodiacal Signs.**—A large detachment of the "cyclical animals" even found its way to the New World. Seven of the twenty days constituting the Avestic month bore names evidently borrowed from those of the Chinese horary signs. The Hare ("Hare-Hare Rabbit"), Monkey, Dog, and Serpent appear repeatedly without change, while the Tiger, Crocodile and Hen, unknown in America, the Ocelot, Lizard and Eagle were substituted as analogous.\(^6\) The Avestic calendar dated from the 7th century; but the zodiacal tradition embodied by it was doubtless much more ancient. Of the zodiac in its true sense of a partitioned belt of the sphere there was no aboriginal knowledge on the American continent. Mexican acquaintance with the signs related only to their secondary function as diës (so to speak) with which to stamp recurring intervals of time.

**Lunar Zodiac.**—The synodical revolution of the moon laid down the rules of the zodiac, its \textit{sidereal} revolution those of the lunar zodiac. The first was a circle of "full moons"; the second marked the diurnal stages of the lunar progress round the sky, from and back again to any selected star. The moon was the earliest "measurer" both of time and space; but its services can scarcely have been rendered available until stellar "milestones" were established at suitable points along its path. Such were the Hindu \textit{naksatra}, a word originally signifying stars in general, but appropriated to designate certain small stellar groups marking the divisions of the lunar track. They exhibit in an exaggerated form the irregularities of distribution visible in our zodiacal constellations, and present the further anomaly of being frequently reckoned as twenty-eight in number, while the ecliptic arcs they characterize are invariably twenty-seven. Now, since the moon revolves round the earth in 27\(\frac{1}{2}\) days, hesitation between the two full numbers might easily arise; yet the real explanation of the difficulty appears to be different. The superfluous asterism, named \textit{Abhijiti}, included the bright star a Lyrae, under whose influence the gods had vanquished the Asuras. Its invocation with the other \textit{naksatras}, remoteness from the ecliptic notwithstanding, was thus due (according to Max Müller's plausible conjecture)\(^7\) to its being regarded as of especially good omen. Acquaintance with foreign systems of twenty-eight lunar divisions tended doubtless to fix its position, which remained, nevertheless, always equivocal.\(^8\) Alternately admitted into or rejected from the series, it was finally, some six or seven centuries ago, eliminated by the effects of precession in reversing the order of culmination of its limiting stars.

The notion of a twenty-four-fold division of the zodiac was deeply rooted in Hindu tradition. The number and the name were in early times almost synonymous. Thus a \textit{naksatra-mâla}\(^9\)

denoted a necklace of twenty-seven pearls; and the fundamental equality of the parts was figured in an ancient legend, by the compulsion laid upon King Soma (the Moon) to share his time impartially between all his wives, the twenty-seven daughters of Prajapati. Everything points to a native origin for the system of nakshatras. Some were named after exclusively Vedic deities; they formed the basis of the sacrificial calendar of the Brahmins; the old Indian names of the months were derived from them; their existence was pre-supposed in the entire structure of Hindu ritual and science. They do not, however, obtain full recognition in Sanskrit literature until the Brāhmaṇa period (7th or 8th century B.C.). The Rig-Veda contains only one allusion to them, where it is said that "Soma is placed in the nakshatras"; and this is in a part including later interpolations.

Positive proof of the high antiquity of the Hindu lunar zodiac is nevertheless afforded by the undoubted fact that the primitive series opened with Krittikā (the Pleiades) as the sign of the vernal equinox. The arrangement would have been correct about 3500 B.C.; it would scarcely have been possible after 1800 B.C. We find nowhere else a well-authenticated zodiacal sequence corresponding to so early a date. The reform by which Krittikā, now relegated to the third place, was superseded as the head of the series by Agni or "Fire" as their presiding deity, continued to be the first sign. Hindu astronomy received its first definite organization in the 6th century, with results embodied in the Sārya-Siddhānta. Here the "signs" and the "constellations" of the lunar zodiac form two essentially distinct systems. The ecliptic is divided into twenty-seven equal parts, called bhogas or arcs, of 800 each. But the nakshatras are twenty-eight, and are represented by as many "junctures" or stars (yogārā), carefully determined by their spatial co-ordinates. The mean position of the moon and planets into the nakshatras (the ascertainment of which was of great astrological importance) were fixed by means of their conjunctions with the yogārā. These, however, soon ceased to be observed, and already in the 11th century, Al-Biruni could meet with no Hindu astronomer capable of pointing out to him the complete series. Their successful identification by Colebrooke in 1807 had a purely archaeological interest. The modern nakshatras are twenty-seven equal ecliptical divisions, the origin of which drifts, like that of the solstices, with the vernal equinox. They are observed under Greek bhogas of the Sārya-Siddhānta. The mean place of the moon in them, published in all Hindu almanacs, is found to serve unusually the ends of astral vacillation.

The system upon which it is founded is of great antiquity. Belief in the power of the nakshatras evidently inspired the invocations of them in the Atharva-Veda. In the Brāhmaṇa period they were distinguished as "deva" and "yama," the fourteen lucky asterisms being probably associated with the waxing, the fourteen unlucky with the waning moon. A special nakshatra was appropriated to every occurrence of life. One was prophetic to marriage, another to entrance upon school-life, a third to the first ploughing, a fourth to laying the foundation of a house. Festivals for the dead were appointed to be held under those that included but one star. Propitiatory abstinences were recommended when the natal asterism was menaced by unfavourable planetary conjunctions. The various members of the body were parcelled out among the nakshatras, and a rotation of food was prescribed as a wholesome accompaniment of the moon's revolution among them.

The nomenclature of the Hindu signs of the zodiac, save as regards a few standard asterisms, such as Aptyina and Krittikā, was far from uniform. Considerable discrepancies occur in the lists given by different authorities. Hence it is not surprising to meet in them evidence of foreign communications. Reminiscences of the Greek signs of Gemini, Leo, Libra, Sagittarius, Capricornus and Pisces are obvious severally in the Hindu Two Faces, Lion's Tail, Beam of a Balance, Arrow, Gazelle's Head (figured as a marine nondescript) and Fish. The correspondence does not, however, extend to the stars; and some coincidences adverted to by Humboldt between the nakshatras and the zodiacal animals of Central Asia are of the same nominal character. Mexican loans are more remarkable. They were appropos of some celestial signs, some identifiable, others which have in the medium of the Tatar zodiac, but likewise straight from the Indian scheme, apart from any known intervention. The "three footprints of Vishnu," for example, unmistakably gave its name to the Mexican day Olín, signifying the "track of the sun"; and both series further contain a "flint weapon," a "stick," and a "house." Several houses and couches were ranged along the Hindu zodiac with the naive idea of providing resting-places for the wandering moon.

Relationship of the Hindu, Chinese and Arabian Systems.—Relationship of a more intimate kind connects the Hindu lunar mansions with those of the Arabs and Chinese. The resemblance between the three systems is indeed so close that it has been assumed, almost as axiomatic, that they must have been framed from a single model. It appears nevertheless to have become tolerably clear that the nakshatras were both native to India, and the sīeu to China, but that the mandżil were mainly of Indian derivation. The assertion, paradoxical at first sight, that the twenty-eight "hostelries" of the Chinese sphere had nothing to do with the moon's daily motion, seems to convey a possible fact. The Chinese system as well as the Indian is described by the quaternary partition of the heavens, fundamental in Chinese astronomy. It was considered by Biot to have been originally twenty-four, but to have been enlarged to twenty-eight about 1100 B.C., by the addition of determinants for the solstices and equinoxes of that period. The essential difference, however, between the nakshatras and the sīeu is that the latter were equatorial, not ecliptical, divisions. They were measured by the meridian-passages of the limiting stars, and varied in amplitude from $^3_4$ to $^5_6$ and $^5_6$ to $^7_8$. The use of the star nakshatras as well as the sīeu was as points of reference for the movements of sun, moon and planets. They served, in fact, and still serve (though with astronomical ends in view), the precise purpose of "fundamental stars" in European astronomy. All that is certainly known about the antiquity of the sīeu is that they were well established in the 3rd century B.C. Their initial point at the autumnal equinox marked by Kio (Spica Virginis) suits a still later date; and there is no valid evidence that the modern series resulted from the rectification of an older superannuated arrangement, analogous to the Krittikā sequence of nakshatras. The Hindu zodiacal constellations belong then to an earlier epoch than the Chinese "stations," such as they have been transmitted to our acquaintance. Yet not only were the latter an independent invention, but it is almost demonstrable that the nakshatras, in their more recent organization, were, as far as possible, assimilated to them. The whole system of junction stars was doubtless an imitation of the sīeu; the choice of them by the Hindu astronomers of the 6th century A.D. was plainly instigated by a consideration of the Chinese list, compiled with a widely diversified intent. The astronomical value of the text is in no In other words, the reason for the different names given to the constellation may be generally assigned for the change. Eight junction stars lie quite close to; seven others are actually identical with Chinese determinants; and many of these coincidences

are between insignificant and, for the purposes of ecliptical division, inconveniently situated objects.  

**Arabian Mansions of the Moon.**—The small stellar groups characterizing the Arab "mansions of the moon" (manazil al-kamār) were more equally distributed than either the Hindu or Chinese series. They presented, nevertheless, striking resemblances to both. Twenty-four out of twenty-eight were formed of less than five stars each; of these, 148 and eight constellations in each were virtually coincident. The model of the sieu was, however, also regarded. Eighteen Chinese determinants were included in the Arab asterisms, and of these five or six were not nakshatra stars; consequently, they must have been taken directly from the Chinese series. Nor were there any indications of the names of the manazil, the late appearance of which, in a complete form, removes all difficulty in accounting for the various foreign influences brought to bear upon them. They were first enumerated by Alfarçhani early in the 9th century, when the Arabs were in astronomy the avowed disciples of the Hindus. But, although they then received perhaps their earliest quasi-scientific organization, the mansions of the moon had for ages previously figured in the popular lore of the Bedouin. A set of twenty-eight rhymes associated their heliacal risings with the changes in the weather. The new signs were of meteorological and astrological import; in the Koran (x. 5) they are regarded as indispensable for the reckoning of time. Yet even this intimate penetration into the modes of thought of the desert may be explained by prehistoric Indian communication. The alternative view, advocated by Weber, that the lunar zodiac was primitive Chaldaean, rests on a very shadowy foundation. It is true that a word radically identical with manazil occurs twice in the Bible, under the form and month (2 Kings xxiii. 5; Job xxxviii. 32); but the heavenly halting-places which it seems to designate may be solar rather than lunar. Euphratean exploration has so far brought to light no traces of ecliptical partition by the moon's diurnal motion, unless, indeed, zodiacal associations be claimed for a set of twenty-eight deprecatory formulæ against evil spirits inscribed on a Ninivite tablet.  

The safest general conclusions regarding this disputed subject appear to be that the sieu, distinctively and unvaryingly Chinese, cannot properly be described as divisions of a lunar zodiac, that the nakshatras, though of purely Indian origin, became modified by the successive adoption of Greek and Chinese rectifications and supposed improvements; while the manazil constituted a frankly eclectic system, in which elements from all quarters were combined. It was adopted by Turks, Tatars and Persians, and forms part of the astronomical paraphernalia of the Bundakhish. The sieu, on the other hand, were early naturalized in Japan.  

**Astrological Systems.**—The refined system of astrological prediction based upon the solar zodiac was invented in Chaldaea, obtained a second home and added elaborations in Egypt; and spread irresistibly. Even the beginning of the Gregorian calendar, which is not astronomical, is based upon the beginning of the solar year as observed from the sun. For the astrological purposes the signs were divided into six solar and six lunar, the former counted onward from Leo, the "house" of the sun and month (manazil and manazil al-mardh, 2 Kings xxiii. 5; Job xxxviii. 32); but the heavenly halting-places which it seems to designate may be solar rather than lunar. Each planet had two houses—a solar and a lunar—distributed according to the order of their revolutions. Thus Mercury, as the planet nearest the sun, obtained Virgo, the sign adjacent to Leo, with the corresponding lunar house in Cancer; Venus (spring) and the solar and Taurus (lunar); and so for the rest. A ram frequently stamped on coins of Antiochus, with head rever.ed toward the moon, may be the reason why this constellation comes to be the lunar house of Mars. With the respective and relative positions in the zodiac of the sun, moon and planets, the character of their action on human destiny varied indefinitely. The influence of the signs, though secondary, was hence overwhelming: Julian called them "potentia logras"; and, according to the notion of the manazil, the zeitgeist of the sign was felt over all mankind. Cities and kingdoms were allotted to their several patronage on a system fully expounded by Manilius:—

 Hos eicit in fines orbis postquem notandas,  
Quem Deus in partes per singula dividit astra,  
Ac sua cura dedit pueblos et urbes per orbem,  
Et proprias gentes atque urbes additus altas,  
In quibus exercit praestantia sidera vires.  

Syria was assigned to Aries, and Syrian coins frequently bear the effigy of a ram; Scythia and Arabia fell to Taurus, India to Gemini. The moon's respective dominion, however, remained unaltered, as the favour of Libra, Zeugma that of Capricorn; Leo protected Mijetos, Sagit- 

tarius Singara. The "power of the signs" was similarly distributed among the parts of the human body:—

Et quanquam communis eat tutela per omne  
Corpus, et in proprium divisus artibus exit:  
Namque aries capiti, taurus cervicis haeret:  
Brachia sub gemenis seminist, pectora cancro.  

Warnings were uttered against surgical treatment of a member through whose sign the moon happened to be passing: and the moon was indisputably an indispensable branch of the healing art in the Middle Ages. Some voluminous manuals of the subject have survived in rings and amulets, engraved with the various signs, and worn as a kind of astral defensive armour. Many such, of a medieval cast, are described by Steuernagel, and fragments of a codex from the Thanes. Individuals, too, adopted zodiacal emblems. Capri- cornus was impressed upon the coins of Augustus, Libra on those of Pythodoris, queen of Pontus; a sultan of Iconium displayed the sign of the zodiac, "horn of the zodiac", as a badge of sovereignty; Stephen of England chose the protection of Sagittarius.  

**Egyptian Astrology.**—In Egypt celestial influences were considered in enumerating mainly from the thirty-six "decans" of the signs. They were called the "manazil of the whole circle of the zodiac"; each ten-day period of the Egyptian year was con- 

cerated to the decanal god whose section of the ecliptic rose at the moment of the decan's passage, an arrangement that was likened to the calendar of the month. The decans were divided into sixteen groups of two each: these figurer.ed the months of the year and seem to have been based upon the days of the month. The signs of the zodiac were regarded as symbols or "deities" or "saviors" or "protections", according to the time. The sign of each month was represented by a figure of a god, emblem of the god, one of the signs, or a symbol, and associated with a name of the god. The signs were attributed to different nations, and especially to different deities, the most important being the Egyptian gods of the earth, the heavens, and the heavenly bodies. Each sign was considered to have a different power of good or evil, and the signs were believed to have the ability to divide the world into smaller parts, or to bring about changes in the world. The signs were used in divination, and were believed to have a direct influence on the lives of individuals.  

**Planispheres.**—An Egyptian-Greek planisphere, first described by Bianchini, resembles in its general plan the circular zodiac of Dendera. The decans are ranged on the outermost of its five concentric zones; the planets and the Greek zodiac in duplicate occupy the next three; while the inner circle is unaccountably reserved for the Chinese cylical animals. The relic was dug up on the Aveld in 1705, and is now in the Louvre. It dates from the 2nd or 3rd century A.D. The Tatar zodiacs are not merely found engraved on Chinese mirrors in polished bronze or steel of the 7th century, and figured on the "plateau of the twelve hours":—

in the treasury of the emperors of the Tang dynasty.1 Probably the most ancient zodiacal representation in existence is a fragment of a painting discovered in the Parma Museum, once inscribed with the names of the twelve months and their governing signs.

Two only now remain.2 A mosaic on the astrological altar of Gabies in the Louvre illustrates the apportionment of the zodiacal signs to the inmates of the Roman Pantheon;3 and they occur as a classical reminiscence in the mosaic pavements of San Miniato and the baptistery at Florence, the church of St. Louis, and the crypt of San Savino.4, 5 Zodiadic symbolism became conspicuous in medieval art. Nearly all the French cathedrals of the 12th and 13th centuries exhibit constellations of the zodiac in the calendar, in which each month and sign has its corresponding labour. The zodiac of Notre Dame of Paris, opening with Aquarius, is a noted instance.6 A similar series, in which sculptured figures of Christ and the Apostles are associated with the zodiac, is to be seen on the chief doorway of the abbey church at Vezelay. The cathedrals of Amiens, Sens and Rheims are decorated in the same way. In Italy the signs and works survive fragmentarily in the baptistery at Parma, completely on the porch of the cathedral of Cremona and on the west doorway of St. Mark's at Venice. They are less common in England; but St. Margaret's, York, and the church of St. Mary the Virgin, in Oxfordshire offer good specimens. In the zodiac at Merton College, Oxford, Libra is represented by a judge in his robes and Pisces by the dolphin of Fitzjames, warden of the college, 1482–1507.4 The great rose-windows of the Early Gothic period were often adorned with zodiacal signs; and some frescoes in the cathedral of Cologne contain the signs, each with an attendant angel, just as they were depicted on the vault of the church at Mount Athos. Giotto's zodiac at Padua was remarkable (in its ultimate form) for the arrangement of the signs so as to be struck in turns, during the corresponding months, by the sun's rays.7 The "zodiac of labours" was replaced in French castles and churches by that in which hunting, hawk- ing, fishing and dancing were substituted for herding, planting, reaping and ploughing.8

It is curious to find the same sequence of symbols employed for the same decorative purposes in India as in Europe. A perfect set of signs was copied in 1764 from a pagoda at Verdadete near Cape Comorin, and one equally complete existed at the same period on the ceiling of a temple near Mindurah.9

The hieroglyphs representing the signs of the zodiac in astronomical works are found in manuscripts of about the 10th century, but in carvings not until the 15th or 16th.10 Their origin is unknown; but they are based on nearer or further developments of the hieroglyph of Leo, for instance, occurs among the symbols of the Mithraic worship.11 See also the article Astrology, and the separate articles on the constellations. The whole subject of the history of the zodiac is very obscure. See generally Franz Boll, Sphaera (Leipzig, 1903); also the bibliographies to Astrology and Babylonian and Assyrian Religion. (A. M. C.)

ZODIACAL LIGHT, a faint illumination of the sky, surrounding the sun and elongated in the direction of the ecliptic on each side of the sun. It is lenticular in form, brightest near the sun, and shades off by imperceptible gradations, generally becoming invisible at a distance of 60° from the sun. There are no constant necessary conditions in which hunting, hawk- ing, fishing and dancing were substitute...
ZODIACAL LIGHT

999

separating a possible effect produced in this way from the zodiacal light proper may seem to offer some difficulty. But few observations made show that, after ordinary twilight has ended in the evening, the northern base of the zodiacal light extends more and more toward the north as the hours pass until, towards midnight, it merges into the light of the sky described by the two observers mentioned. Yet more conclusive are the observations of Maxwell Hall at Jamaica, who reached conclusions identical with those of Barnard and Newcomb, from observations of the base of the light at the close of twilight, which he estimated at 6° in the tropics.

The zodiacal light is the Gegenschein, or counter-glare, a faint illumination of the sky in the region opposite the sun, which may generally be seen by a trained eye when all the conditions are favourable. Unfavourable conditions are moonlight, nearness to the Milky Way, and elevation of the light above the horizon (and therefore a depression of the sun below the horizon) of less than 20°, and the presence in the region of any bright planet. The Milky Way renders the object invisible during the months of June, July, December and January. Its light is so faint and diffuse that it is impossible to assign dimensions to it, except to say it covers a region of several degrees in extent. Barnard, the most successful observer, assigns diameters of 5° or even 10° or more. From what has been said of its position it is evident that the zodiacal band, when seen across the sky, must include it. It may therefore be regarded as an intensification of this band, possibly produced by the increased intensity of the light when reflected nearly back toward the sun, and therefore toward the earth. From the description given of the zodiacal band and the Gegenschein, it is clear that these objects should be best seen at the highest elevation, especially within the tropics. But the only well-authenticated observations we have of this kind show anomalies which have never been cleared up. This is especially the case with those of Chaplin George Jones, who spent eight months at Quito, Peru, at an elevation of more than 9000 ft., for the express purpose of observing the phenomenon in question. He saw the zodiacal band at midnight as a complete arc spanning the sky, agreeing in this point with the observations of Barnard. One anomaly of his observations is his description of the arch as sometimes so bright to the transparency of the atmosphere. Barnard reports it as sometimes best seen when the sky is slightly milky, while during the observations already mentioned from the Rothern the gegenschein was scarcely, if at all, visible, though the conditions were exceptionally favourable. It has even been said that observers at great elevations have failed to see the zodiacal light; but it is scarcely credible that this failure could arise from any other cause than not knowing what it was or where to look for it. Moreover, it has been well seen by Hansky from the observatory on the summit of Mont Blanc.

In studying the causes of the phenomenon we must cleary distinguish between the apparent form of the light, from the earth, and the real form of the lenticular-shaped cloud. The former refers to the earth, which is continually changing the point of view of the observer as he is carried around the sun, while the latter relates to the invariable position of the matter which reflects the light. First in importance is the question of the position of the principal plane, passing through the sun, and containing the circumferential regions of the cloud. This plane must be near, but not coincident with, that of the ecliptic. It has therefore a node and a certain inclination to the ecliptic. The determination of these elements requires that, at some point within the tropics where the atmospheric effects are clear, observations of the position of the axis of the light among the stars should be made from time to time during an entire year. In view of the simplicity of the necessary appliances, and of the small amount of labor that would be required, we find a singular paucity of such observations. The most elaborate attempt in the required direction was made by the American chaplain, George Jones, during a voyage of the "Mississippi" in the Pacific Ocean, in 1852-54. Owing to the varying latitude of the ship, and the fact that the observer attempted to draw curves of equal brilliancy instead of the central line, the required conclusions cannot be drawn with certainty from these observations. More recently Maxwell Hall in Jamaica made a satisfactory determination during the months from January to March, July and October, and carefully discussed his results. But the observations do not extend continuously throughout the year, and do not include a sufficient length of the central line on each evening to enable us to distinguish certainly the heliocentric latitude of the central line, as distinct from its apparent geocentric position. Yet his observations are of the first importance as showing the smallness of the deviation of the central line from the ecliptic. When smoothened out, the observed deviation is less than 3°, which seems to preclude the coincidence of the central plane of the light with that of the sun's equator. Hall also reaches the interesting conclusion that the plane in question seems to lie near the invariable plane of the solar system, a result which might be expected if the light proceeded from a swarm of independent meteoric particles moving around the sun. Chaplin Jones concluded, from his observations at Quito, that the central line of the arch made an angle of 3° 20' with the ecliptic, the ascending node being in Taurus, near longitude 57°. This is about 40' from the ascending node of the invariable plane, so that there is a well-marked deviation of his results from those of Hall.

Yet more divergent are the conclusions of Francis J. Baylton, R.N.R., who made many observations while on voyages through the Pacific Ocean between Australia and the west coast of North America. He places the ascending node at the vernal equinox, and assigns an inclination of 4°. He found that as the observer moved to the north or south the axis of the light appeared to be displaced in the direction of the motion, which is the opposite effect due to parallax, but in the same sense as the effect of the greater atmospheric absorption of the light on the side nearest the horizon. He also observes the moon as adding to the zodiacal light during her first and last quarters, a result so difficult to explain that it needs confirmation. It is noteworthy that he could see the zodiacal band across the entire sky during the whole of every very clear moonless night in tropical regions.

If we accept the general conclusion already drawn as to the

as to resemble the Milky Way, a condition which would make it easily visible at ordinary altitudes. Another anomaly is that he never saw the Gegenschein, but describes the band as equally bright in all its parts, except near the horizon. We are therefore forced to the conclusion that either he must have been a quite untrustworthy observer, or that there are anomalies in the phenomena which are yet to be explained.

The latter possibility is also suggested by the curious fact that the visibility of the light does not seem to be proportional
form and boundary of the region from which the light emanates, the next question is that of the matter sending it forth. The most plausible view is that we have to do with sunlight reflected from meteoric particles moving round the sun within the region of the lens. The polariscope and the spectroscope are the only instruments by the aid of which the nature of the matter can be inferred. The evidence afforded by these instruments is not, however, altogether consistent. At Upsala, in March, 1857, at a sun-spot, ob- served by Mr. Ångström, observing at Upsala in March, obtained the bright auroral line (W.L. 5567), and concluded that in the zodiacal light there was the same material as is found in the aurora and in the solar corona, and probably through all space. Upsala, however, is a place where the auroral spectrum can often be observed in the sky, even when no aurora is visible, and it has generally been believed that what Ångström really saw was an auroral and not a zodiacal spectrum.

Professor A. W. Wright, of New Haven, also made careful observations leading to the conclusion that the spectrum differs from sunlight only in intensity. Some evidence has also been found by the same observer of polarization, showing that a considerable portion of the light must be reflected sunlight. The observations of Maxwell Hall also embraced some made with the spectro scope. He was unable to see any marked deviation of the spectrum from that of the sun; but it does not appear that either he or any other of the observers distinctly saw the dark lines of the solar spectrum. Direct proof that we have to do with reflected sunlight is therefore still incomplete.

The question whether the Gegenschein can be accounted for by the reflection of light from the same matter as the zodiacal band is still unsettled. Taking the general consensus of the observations it would seem that its light must be so much brighter than that of the band as to imply the action of a different cause. In this connexion may be mentioned the ingenious suggestion of S. Arrhenius, that the phenomenon is due to corpuscles sent off by the earth and repelled by the sun in the same way that they are sent off from a comet and form its tail. In other words, the light may be an exceedingly tenuous cometary tail to the earth, visible only because seen through its very great length. The view that no cause intervenes additional to that producing the zodiacal band is strengthened, though not proved, by a theorem due to F. R. Mouton of Chicago. He shows that, supposing the cloud of particles to move around the sun in nearly circular orbits immediately outside the earth, the perturbations by the earth in the motion of the particles will result in their retardation in that part of the orbit nearest the earth, and therefore in their always being more numerous in a given space. And this would explain any part of the system that certainly accounts for some intensification of the light, to which may be added the intensification produced by the vertical reflection of the sunlight.

A new interest was given to the subject by the investigations of H. H. Seeliger, published in 1906, who showed that the observed excess of motion of the perihelion of Mercury may be accounted for by the action of that portion of the matter reflecting the zodiacal light which lies nearest to the sun. Plausible though his result is, the subject still requires investigation. It seems not unlikely that the geophysical conception will be vindicated, and instead of the reflecting matter being composed of solid particles it is an exceedingly tenuous gaseous envelope surrounding the sun and revolving on an axis the mean position of which is between that of the sun’s equator and that of the invariable plane of the solar system.

BIBLIOGRAPHY

ZOFFANY, JOHANN (1733-1810), British painter, whose father was architect to the prince of Thurn and Taxis, was born in Frankfurt-on-Main. He ran away from home at the age of thirteen and went to Rome, where he studied art for nearly twelve years. In 1756 he left for England, and after undergoing some hardships was brought into fashion by his patronage, and in 1759 he was included among the foundation members of the Royal Academy. He went to Florence in 1772 with an introduction from George III. to the grand duke of Tuscany, and did not return until 1779. During this second stay in Italy he met with much success, and was commanded by the empress Maria Theresa to paint a picture of the royal family of Tuscany; this work he executed so much to the satisfaction of the empress that in 1778 he was created a baron of the Austrian empire. He went next to India, where he lived from 1783 to 1790, to which period belong some of his best-known paintings; but the last twenty years of his life were spent in England. He died in 1810 and was buried in Kew churchyard. His portrait groups of dramatic celebrities are, perhaps, the most highly esteemed of his many productions; they have considerable technical merit and show much shrewd insight into character. Several of the best are in the Garrick Club, London.

ZOILUS (c. 400-320 B.C.), Greek grammarian of Amphipolis in Macedonia. According to Vitruvius (vii., pref. c. 1) he lived during the age of Ptolemy Philadephus (285-247 B.C.), by whom he was a teacher of rhetoric. Zoilus was chiefly known for the acerbity of his attacks on Homer (which gained him the name of Homeromastix, " scourge of Homer"), chiefly directed against the fabulous element in the Homeric poems. Zoilus also wrote against Isocrates and Plato, who had attacked the style of Lysias of which he approved. The name Zoilus came to be generally used of a slyfute and malignant critic.

ZOISITE, a rock-forming mineral, consisting of basic calcium and aluminium silicate, Ca(SiO₃)₂, crystallizing in the orthorhombic system. It is closely related to epidote (both in the angles of the crystals and in chemical composition); a zoisite containing some iron replacing aluminium may be identical in composition with an epidote ("clinozoisite") poor in iron. The crystals are prismatic in habit and are deeply furrowed parallel to their length; terminal planes are rare; there is a perfect cleavage parallel to the brachy-pinacoid. Columnar and compact masses are more common. The hardness is 6½ and the specific gravity 3.25-3.37. The colour is often grey; a rose-red variety, known as thulite, is found with a bright vesicular di at Trehard, near Wakefield, and has been used to a limited extent as an ornamental stone. According to differences in the optical characters, two kinds of zoisite have been distinguished. Zoisite is a product of dynamos-metamorphism, and occurs as a constituent of some crystalline
schists, such as amphibolite and eclogite. It was first observed by Baron Jozi (after whom it was named) in the eclogite of Sauer-Alpe in Carinthia; other localities are the Ducktown copper mines in Tennessee, where it occurs embedded in chalcopyrite; Loch Garve in Ross-shire, &c. The "sau-surite" of the Alps and elsewhere, which has resulted from the alteration of the plagioclase felspar of gabbro, consists largely of zoisite with epidote.

ZOLA, ÉMILE ÉDOUARD CHARLES ANTOINE (1840-1902), French novelist, was born in Paris on the 2nd of April 1840, his father being an engineer, part Italian and part Greek, and his mother a Frenchwoman. The father seems to have been an energetic, visionary man, who, dying while his only son was a little lad, left to his family no better provision than a lawsuit against the municipality of the town of Aix It was at Aix, which figures as Flassans in so many of his novels, that the boy received the first part of his education. Thence he proceeded, in 1858, to Paris, where, as later at Marseilles, he failed to obtain his bachelor's degree. Then came a few years of terrible poverty; but at the beginning of 1862 he obtained a clerkship, at the modest salary of a pound a week, in the house of Hachette the publisher. Meanwhile he was writing apace, but nothing of particular merit. His first book, Contes à Ninon, appeared on the 24th of October 1864, and attracted some attention, and in January 1866 he determined to abandon clerking and take to literature. Vigorous and aggressive as a critic, his articles on literature and art in Villemessant's paper L'Événement created a good deal of interest. So did the gruesome but vividly written Les Misérables. Meanwhile, with that characteristic energy, Zola was projecting something more important: the creation of a world of his own, like that of Balzac's Comédie Humaine—the history of a family in its various ramifications during the Second Empire. The history of this family, the Rougon-Macquart, was to be told in a series of novels containing a scientific study of heredity—science was always Zola's ignis fatuus—and a picture of French life and society. The first novel of the series, La Fortune des Rougon, appeared in book form at the end of 1871. It was followed by La Curée (1874), Le Ventre de Paris (1874), La Conquête de Plaisirs (1875), La Faute de l'Abbé Moureaux (1875), Son Excellence Eugène Rougon (1876)—all books unquestionably of immense ability, and in a measure successful, but not great popular successes. Then came L'Assommoir (1879), the epic of drink, and the author's fortune was made. Edition followed edition. He became the most discussed, the most read, the most bought novelist in France—the sale of L'Assommoir being even exceeded by that of Nana (1880) and La Débâcle (1892). From the Fortune des Rougon to the Docteur Proust (1893) there are some twenty novels in the Rougon-Macquart series, the second half of which includes the powerful novels Germinal (1885), Salammbô (1861), and La Terre (1888). In 1888 Zola departed from his usual vein in the idyllic story of Le Rêve. Zola also wrote a series of three romances on cities, Lourdes, Rome, Paris (1894-98), novels on the "gospels" of population (Fécondité) and work (Travail), a volume of plays, and several volumes of criticism, and other things. These books are based on study and observation; the novels are crowded with characters. The whole is a gigantic opus, the fruit of immense labour, of an admirable tenacity—so many pages written, morning after morning, without interruption, for some thirty years. He prided himself on his motto, Nulle dies sine linea. Zola was the apostle of the "realistic" or "naturalistic" school; but he was in truth not a "naturalist" at all, in so far as "naturalism" is to be regarded as a record of fact. He was an idealist, but while other idealists idealize the nobler elements in human nature, so has he, for the most part—the later books, however, show improvement—idealized the elements that are bestial. He saw man's lust, greed, gluttony, as in a vision, magnified, overwhelming, portentous. And what he saw he presented with tremendous power. His style may lack the classic qualities of French prose—lightness, delicacy, sparkle; it certainly has not Daudet's colour and felicity of touch. The first impression it produces may be one of heaviness, and the later "gospels" on population and work are distinctly ponderous. But for rendering the gloomy horror of the subjects in which he most delights—detail on detail being accumulated till the result is overwhelming—Zola has no superior. Some of his descriptions of crowds in movement have never been surpassed.

Zola played a very important part in the Dreyfus affair, which convulsed French politics and social life at the end of the 19th century. At an early stage he came to the conclusion that Dreyfus was the innocent victim of a nefarious conspiracy, and on the 13th of January 1898, with his usual intrepidity, he published in the Au revoir newspaper, in the form of a letter beginning with the words J'accuse, a terrible denunciation of all those who had had a hand in hounding down that unfortunate officer. Zola's object was a prosecution for libel, and a judicial inquiry into the whole affaire, and at the trial, which took place in Paris in February, a fierce flood of light was thrown on the case. The sensational close of Zola's career was the signal, and Zola was condemned. He appealed. On the 2nd of April the Cour de Cassation quashed the proceedings. A second trial took place at Versailles, on the 18th of July, and without waiting the result Zola, by the advice of his counsel and friends, and for reasons of legal strategy, abruptly left France and took refuge in England. Here he remained in hiding, writing Récidiviste, till the 4th of June 1899, when, immediately on hearing that there was to be a revision of the first Dreyfus trial, he returned to Paris. Whatever may be thought of the affaire itself, there can be no question of Zola's superb courage and disinterestedness.

On the morning of the 29th of September 1902 Zola was found dead in the bedroom of his Paris house, having been accidentally asphyxiated by the fumes from a defective flue. He received a public funeral, at which Captain Dreyfus was present. Anatole France delivered an impasioned oration at the grave. At the time of his death Zola had just completed a novel, Vérité, dealing with the incidents of the Dreyfus trial. A sequel, Justice, had been planned, but not executed. After a life of constant struggle and an obloquy which never relaxed, the spiritual close of Zola's career was the signal for an extraordinary burst of eulogy. The verdict of posterity will probably be kinder than the first, and less unmeasured than the second. Zola's literary career would have more than qualified him for the French Academy. He was several times a candidate in vain.

Laporte, Emile Zola, l'homme et l'œuvre (1894-95) with a bibliography. A complete report of the proceedings against Zola is printed in Le Proces Zola (2 vols. 1898, Eng. trans. 1898).

ZOLKIEWSKI, STANISLAUS (1547-1619), the most illustrious member of an ancient Ruthenian family which emigrated to Galicia in the 15th century. During the interregnum in Poland after the death of Henry of Valois, Zolkiewski was an ardent partisan of the chancellor Zamoyski, and supported the candidature of Stephen Báthory, under whose banner he learned the art of war in the Muscovite campaigns. On the death of Stephen, Zolkiewski vigorously supported the policy of Zamoyski, and took an active part in the battle of Byczyna, when the Austrian archduke Maxmillian was defeated by the Polish chancellor. Shortly afterwards Zolkiewski was made castellan of Lemberg and acting commander-in-chief. On the accession of Sigismund III. he retired from court and divided his time between improving his estates, where he built towns and fortresses, and disciplining the Cossacks, with whom he enjoyed great influence. In 1601-2 he served with distinction in the Livonian war against the Swedes, whom he defeated at Reval. During the insurrection of Nicholas Zebryzowski he led the
army which routed the rebels at Guszov in 1607, though pro-
testing against the necessity of shedding "his brothers' blood." For
his services he received the patriciate of Klev. He was
opposed to the expedition sent to place the false Demetrius
on the throne of Moscovy; but nevertheless accompanied the
king to Smolensk, and remained in the town with a handful of
forces against Moscow. On his way thither he defeated and captured
Tsar Vasily Shuiski at the battle of Klushino (July 14, 1610),
and two months later entered the Russian capital in triumph.
His tactful and conciliatory diplomacy speedily won over the
boyars, whom he persuaded to offer the Muscovite crown to the
Polish crown prince, Wladislaus. For a moment it seemed
possible that the Vasa family might occupy the throne of Ivan
the Terrible; but Sigismond III. would not consent to the
taking of his son into the Greek Church, and refused to ratify
the terms made with the boyars. Zolkiewski then returned to
Poland and was received in the Polish camp and assisted in the reduction of Smolensk.

But Moscow in the meantime drove out the Polish garrison and
proclaimed a native dynasty under Michael Romanov. When
Zolkiewski presented his capitvations, Tsar Vasily and his family,
to the Polish diet, he received an ovation and was rewarded with the
dignity of hetman wielki (commander-in-chief). For the next few years he defended the Ukraine against the Tatars and Cossacks,
and in 1617 was involved in a war with the Porte owing to the unauthorized interference of the Polish nobles in the area of Wallachia and Moldavia. Unable to defeat the
turkish army, Zolkiewski turned himself against the Tatars.
Smolensk, and resolutely dealt with them. He concluded with them an advantageous truce at Jaruda (27th of August 1618), by
the terms of which he pledged himself to curb the Cossacks and at the same time renounced all the claims of Poland to the Danubian principalities. Thus he saved the
one army of Poland to guard her southern frontier from appar-
ently inevitable destruction. On his return he was fiercely assailed by the diet for not risking everything in a pitched
battle, but Zolkiewski defended himself with an eloquence which silenced his most venomous opponents. The peace of Jaruda was then confirmed, and the king conferred upon Zolkiewski the grand-chancellorship, an honour he had neither desired nor expected. Fresh attacks were presently made against him
for failing, it was alleged, to prevent the Tatar incursions. So
depressed was the hero by these calumnies that when in 1619 he was sent against the Tatars he publicly declared that he
would never return alive unless victorious. He was as good
as his word. Surrounded near the Dniester by countless hosts of
Turks, Tatars and Janissaries, he retreated through the
Steppes, fighting night and day without food or water, towards Cecora. By the time he reached the Dnieper it was clear that
resistance was impossible, and deliberately determined to die where he
stood. Disguising himself so that his dead body might not be
recognized, he turned upon the pursuers and was slain after
a desperate resistance (6th of October 1620). His head was
cut off, exhibited in the Turkish camp and then sent to Con-
tinople as a present to the sultan, from whom it was subse-
quentlv ransomed at a great price. Zolkiewski is one of the most
heroic figures in Polish history. An accomplished general,
a skillful diplomatist, and a patriot who not only loved his
country above all things, but never feared to tell his countrymen
the truth he exhorted in all private and public virtues. As a
writer he made a name by an important history of his Muscovite campaigns.

See Stanislaw Gabryel Kozlowski, Life of Stanislaus Zolkiewski
(Pol.) (Cracow, 1904). (R. N. B.)

ZÖLLNER, JOHANN KARL FRIEDRICH (1834-1882),
German astronomer and physicist, was born at Berlin on the
8th of November 1834. From 1872 he held the chair of astro-
physics at Leipzig University. He wrote numerous papers on
photometry and spectrum analysis in Poggendorff's Annalen and
Berichte der k. sächsischen Gesellschaft der Wissenschaften,
two works on celestial photometry (Grundzüge einer allgemeinen
Photometrie des Himmels, Berlin, 1861, 4to, and Photometrische
Untersuchungen, Leipzig, 1865, 8vo), and a curious book, Über
die Natur der Cometen (Leipzig, 1872, 3rd ed. 1883). He died at
Leipzig on the 25th of April 1882.

ZÖLLVEREIN (Ger. Zoll, toll, customs, and Verein, union),
a term used generally for a certain form of Customs Union, but
specialiy for the system among the German states which was in
force between 1819 and 1871 (see TARIF, and GERMANY: History).

ZOMBOR, a town of Hungary, capital of the county of Bács
Bodrog, 146 m. S. of Budapest by rail. Pop. (1900) 29,936,
two-thirds Servians. It is situated in a fertile plain near the
Franz Josef canal, which connects the Danube and the Theiss,
and is the centre of the corn and cattle trade of an extensive area.

ZONARAS, JOANNES (John), Byzantine chronicler and theo-
logian, flourished at Constantinople in the 12th century. Under
Alexius I. Comnenus he held the offices of commander of the
bodyguard and private secretary to the emperor, but in the
succeeding reign he retired to Hagia Glykeria (one of the Princes' Islands), where he spent the rest of his life in writing books.
His most important work, Εντονή Ιστορίαι (compendium of
history), in eighteen books, extends from the creation of the
world to the death of Alexius (1118). The earlier part is largely
drawn from Josephus; for Roman history he chiefly followed
Dio Cassius, whose first twenty books are not otherwise known
to us. His history was continued by Nicetas Acominatus.
Various ecclesiastical works have been attributed to Zonaras—com-
mementary to the Annals, the Rhiania, and the poems of Gregory of Naxianus;
lives of Saints; and a visitation on the diocese of Apo-ropous—
and there is no reason to doubt their genuineness. The lexi-
on, however, which has been handed down under his name (ed.
J. A. H. Tittmann 1808) is probably the work of a certain
Antonius Monachus (Stein's Herodotus, ii, 479 f.).

Complete edition in Migne, Patrologia Graeca, cxxxiv, cxxxv,
cxxvii; the Chronicon by M. Pinder and T. Bütter-Wobst in
the Bonn Corpus Scriptorum Hist. Byz. (1841-97) and by L. Dini-
dorf in the Teubner series (1868-76); see bibliography in C. Krum-
bacher, Geschichte der byzantinischen Literatur (2nd ed. 1897).

ZONE (Gr. ζώνη, a girdle, from κοµείων, to gird), a term
for a belt or girdle, now used chiefly in the transferred sense of
a demarcated area. Thus the earth's surface is divided, for
classification of climates, into five climatic zones: the two
temperate and the two frigid zones and the tropical or torrid
zone. (See CLIMATE AND CLIMATOLOGY.)

ZOOLOGICAL DISTRIBUTION (also known as Zood Geography),
the science dealing, in the first place, with the distribution
of living animals on the surface of the globe (both land and
water), and secondly with that of their forerunners (both in time
and in space). The science is thus a side-branch of zoology,1 in-
timately connected on the one hand with geography and on the
other with geology. It is a comparatively modern science,
which dates, at all events in its present form, from the second
half of the 19th century.

Different parts of the land-surface of the globe are inhabited
by different kinds of animals, or, in other words, by different
faunas. These differences, in many cases at any rate, are not
due to differences of temperature or of climate; and they do
not generally hold on the sea-surface and in space from another.
The warm-blooded land-animals of Japan are, for example, very
much more closely related to those of the British Isles than is the
corresponding fauna of Africa to that of Madagascar.
Again, on the hypothesis of the evolution of one species from
another, in the case of land-animals unprovided with the means
of flight such resemblances and differences between the faunas
of different parts of the world depend in a great degree on the
presence or absence of facilities for free communication by
land between the areas in question. Prima facie, therefore, it
is natural to suppose that the faunas of an Island will differ
more from that of the adjacent continent than will those of
different parts of that continent from one another.

To a great extent this is the case; and if the present con-
tinents and Islands had always been in status quo, the proposition

---

1 For the distribution of plants, see PLANTS: Distribution.
would, for the most part at any rate, be universally true. Geology has, however, taught us that many parts of what are now continents formed at earlier periods of the earth's history portions of the ocean-bed, while what are now islands have in some instances been connected with the adjacent mainlands, or even with land-masses the sites of which are now occupied by the open sea.

We can hope, therefore, to understand and explain the present distribution of terrestrial animal life only by taking into account what geology teaches us as to past changes in the configuration of the land-masses of the globe, accompanied by investigations into the past history of animals themselves, as revealed by their fossil remains.

Although to understand the reason of many facts in the present distribution of animals—as, for example, why tarsiers are confined to the Malay countries and South America—it is essential to study fossil faunas, yet it has been found possible from the consideration of existing faunas alone to map out the land-surface of the globe into a number of zoological "regions," or provinces, more or less independent of the ordinary geographical boundaries, and severally characterized by a greater or smaller degree of distinctness in the matter of their faunas. One of the pioneers in this line of research was Dr P. L. Sclater, who, in a paper on the geographical distribution of birds, published in the Journal of the Linnean Society of London for 1858, was enabled to define and name six of such zoological regions; these being mainly based on the distribution of the perching or passerine birds. Two years later Dr A. Russel Wallace, in the same journal, discussed in some detail the problems presented by the distribution of animals in the Malay Archipelago and Australasia. This preliminary essay was followed in 1876 by the appearance of the latter author's Geographical Distribution of Animals, an epoch-making work, which may be said to have first put the study of the distribution of animals generally on a thoroughly firm and scientific basis. With some slight modifications, the names proposed for the six zoological regions by Dr Sclater were adopted by Dr Wallace. Certain changes in regard to the limits and number of the zoological regions adopted by Sclater and Wallace have been proposed; but the original scheme forms the basis of all the later modifications, and these eminent naturalists are entitled to be regarded as the fathers of the study of distributional zoology. T. H. Huxley was also one of those who did much to advance the science in its early days, while among those who have proposed more or less important modifications of the original scheme special mention may be made of Dr W. T. Blanford, Dr A. Helsper, Prof. P. Matschie and Prof. Max Weber.

The zoological regions proposed by Dr Sclater were based mainly on the distribution of the perching birds; but in the writings of Dr Wallace and of later authors mammals were very largely taken into consideration, and in later schemes there has been a similarly extensive use of the evidence afforded by mammalian distribution. That different groups of animals do not agree with another in the matter of geographical distribution will be evident when we reflect that in many instances there are very great differences in the relative ages of such groups, or, at all events, in the dates of their dispersal, or "radiation," over the surface of the earth. The radiation and dominance of reptiles, for example, greatly antedated that of either birds or mammals. Consequently, the zoological regions indicated by the present geographical distribution of the former group are very different from those suggested by the distribution of the two latter. If zoological regions are based on the evidence of the existing distribution of animals, groups with a relatively late radiation are clearly to be preferred to those the dispersal of which was earlier. Mammals and birds, therefore, are of greater value from this point of view than reptiles; while the absence of the power of flight in the great bulk of the class renders the evidence afforded by mammals superior to that derived from birds. The marked general agreement between the geographical distribution of birds on the one hand and of mammals on the other is, however, a fact of the greatest importance in regard to the value of the zoological regions established on their evidence. Further testimony in the same direction is afforded by the distribution of certain other groups, more especially spiders (Arachnida); and it is also noteworthy that the distribution of the three main divisions of the human race accords to a certain extent with the boundaries of some of the zoological regions based on the distribution of the lower animals.

With regard to the theory of the polar origin of life and the gradual dispersal of animals from the arctic regions, it may be briefly stated that the presumed series of radiations of life southward from the northern pole can have nothing to do with the present geographical distribution of animals, since we have abundant evidence that mammals have been spread over the whole of the warmer parts of the globe since, at any rate, the commencement of the Tertiary period, while the radiation of reptiles commenced at a much earlier epoch.

As regards barriers to the free dispersal of nonvolant terrestrial animals these may be grouped under two main heads, namely, climatic and geographical, of which the second is by far the more important. At the present day a certain number of animals are fitted to live respectively only in hot and in cold climates. The man-like apes and elephants among mammals, and trogons and parrots among birds, are, for example, now exclusively dwellers in tropical or sub-tropical climates; whereas the polar bear, the musk-ox and ptarmigan are equally characteristic of the arctic zone. To a great extent this must be regarded as a comparatively modern adaptive feature, since many of these arctic and tropical animals belong to groups the distribution of which, either in the past or the present, is more or less independent of climate. Elephants, for instance, formerly inhabited Siberia at a time when the climate, although probably less cold than at present, was certainly not tropical; while the polar bear is a specialized member of a group some of the representatives of which are denizens of the tropics.

It is true, indeed, that within the limits of the different zoological regions temperature-control has had an important influence on the distribution of animals, and has resulted in certain cases in the formation of life-zones, as in North America. As remarked, however, by H. A. Pilsbry and J. H. Ferris in connexion with the distribution of land-molluscs, the life-zones of the United States as mapped by Dr C. H. Merriam emphasize the secondary and not the primary facts of distribution. The laws of temperature-control do not define trans-continental zones of primary import zoologically. These zones are secondary divisions of vertical life-areas of which the molluscan faunas were evolved in large part independently. And what is true of molluscs will hold good in the case of several other groups.

There is also the phenomenon of vertical temperature-control. On this subject Dr A. R. Wallace has written (Encyc. Brit., 9th ed., art. “Distribution”): “As we ascend lofty mountains, the forms of life change in a manner somewhat analogous to the changes observed in passing from a warm to a cold country. This change is, however, far less observable in animals than in plants; and it is so unequal in its action, and can so frequently be traced to mere change of climate and deficiency of food, that it must rank as a phenomenon of secondary importance.

Vertical distribution among animals will be found in most cases to affect species rather than generic or family groups, and to involve in each case a mass of local details. The same remarks apply to the bathymetrical zones of marine life. Many groups are confined to tidal, or shallow, or deeper waters; but these differences of habit are hardly geographical, but involve details, suited rather to the special study of individual groups.”

Temperature-control is therefore mainly a factor which has acted independently in the different zoological regions of the globe, and as such demands little or no further mention in a general sketch of the present nature.

The same remark will apply in the case of the influence of humidity on distribution, and also as regards “station.” To illustrate the latter we may take the instances of the European squirrel and the chamois, the former of which is found only in wooded districts and is entirely absent from the open plains, while the latter is found only on the mountainous ranges of the Pyrenees, the Alps, the Apennines and the Caucasus.

The distributional areas of both may, however, be regarded as including Europe generally, so that these local restrictions of range have nothing to do with the wider problems of distribution.

Very different is the case with regard to geographical barriers to the free dispersal of terrestrial animals. It should be observed, however, that even these act with different degrees of intensity in the case of different groups. From the fact that the great majority of them are oviparous, reptiles, whose powers of dispersal in the adult state are generally as restricted as those of mammals, have an advantage over the latter in that their eggs may be carried long distances on floating timber down rivers and thence across the ocean, or may even be occasionally transported by birds. The eggs of batrachians, like those of fresh-water fishes, will in some cases at any rate withstand being frozen, and hence conceivably may be transported by floating ice. Adult insects may be carried in the same manner as the eggs of reptiles. After all, however, such unusual means of transport are probably of no great importance; and it seems most likely that the varying features in the geographical distribution of different groups are due to the dissimilarities in the dates of radiation, or dispersal of those groups, than to varying degrees of facility for overcoming natural geographical barriers to dispersal.

The greatest barriers of all are formed by the ocean and the larger rivers; and from the former factor it follows that zoological regions coincide to a considerable extent—although by no means altogether—with the main geographical (as distinct from political) divisions of the earth’s surface. In the main, mammals and other nonvolant terrestrial animals are debarred from crossing anything more than comparatively narrow channels of the sea, while even these and the larger rivers form a more or less effectual barrier to the dispersal of the great majority of the species. Hence it results that oceanic islands are usually devoid of such forms of life; while it may be laid down, as a general rule, that the existence of nearly allied types of terrestrial animals in countries now separated by stretches of sea implies a former land-connexion between them. There are, however, in many cases great difficulties in determining the nature of such connexions, largely owing to the fact that we are still in the dark as to whether the dispersal of many groups of animals has taken place down the lines of the present continents from north to south or equatorially by means of belts of land long since swallowed up by the ocean. In this connexion it may be remarked, as tending against the old idea of the radiation of all the modern groups of terrestrial animals from the north towards the south, that there is decisive evidence to prove the existence during the Tertiary period (so far at least as mammals are concerned) of certain great centres of development, and in some instances, at all events, also of radiation, in the southern hemisphere; one of these developmental centres was in South Africa a second in South America, and a third in Australia.

To the general law that straits and arms of the sea form an effectual barrier to the dispersal of the larger land-animals, and more especially mammals, certain exceptions may be pleaded. Jaguars have, for instance, been known to cross the Rio de la Plata, while tigers constantly swim from island to island in the delta of the Ganges and probably also in the Malay Archipelago, and a polar bear has been observed swimming twenty miles away from land in Bering Sea. Deer, certain antelopes, pigs and elephants are also good swimmers; while hippopotamuses and crocodiles—especially the latter—can cross channels of considerable width. The great tropical and subtropical rivers also carry down masses of floating soil or large trees upon which mammals and reptiles are borne, and although in many or most instances such are swept out to sea and their occupants drowned, in other instances they may be stranded upon the opposite bank or shore where their living freight can effect a landing. Such instances, however, cannot be very frequent, and they cannot affect widely sunned groups. Moreover, supposing a mammal to have reached a new land, unless it happened to be a pregnant female, or unless another individual of the opposite sex be similarly stranded, it would eventually die without progeny. Even in the case of a pregnant female, there is no certainty that the offspring, if but one, would be a male; and even supposing this to be the case, the progeny might perish from the attacks of other animals or from inbreeding. On the whole, it may be said, that instances of such methods of dispersal must be relatively few and can affect only countries not very widely sunned. The most important case that can be cited is the occurrence of a pig and an extinct hippopotamus in Madagascar, which probably reached that island by swimming from Africa. As a rule, a strait like that separating Ceylon from India may be considered an effectual barrier to the dispersal of large land-animals.

Although the Rio de la Plata has effectually prevented the amphibious carpincho from reaching Argentina, deserts form even more impassable barriers than large rivers, the Sahara having prevented the North African fauna from reaching the heart of that continent. High and continuous mountain-ranges are likewise the most effective in restricting the range of animals; this being more especially the case when, like the Himalaya, their trend is equatorial instead of, as in the case of the Rocky Mountains and the Andes, from north to south in the direction of the main continental extension. Forests also present great obstacles to animal migration, although this is to a great extent of a local nature and comes, in fact, under the category of "station." Indeed, there appears to be no instance of the separation of one zoological region from another by forest alone.

Lastly it should be mentioned that ice may serve as a factor in the dispersal of animals by acting as a bridge between different land-areas; and at some period this means of communication may have aided in the great migrations of animals that have taken place between the Old and the New World by way of what is now Bering Sea.

I. Terrestrial Distribution

The zoological regions recognized by Dr A. R. Wallace in 1876, which are in the main identical with those proposed by Dr P. L. Sclater in 1858, and are chiefly Regions, based on the distribution of birds and mammals, are as follows:

1. Palaeartic, which includes Europe to the Azores and Iceland, temperate Asia from the high Himalaya and west of the Indus, with Japan, and China from Ningpo to the north of the watershed
of the Yang-tze-kiang; also North Africa and Arabia, to about the line of the tropic of Cancer.

2. Nearctic, including Africa south of the tropic of Cancer, as well as the southern part of Arabia, with Madagascar and the adjacent islands.

3. Oriental, or Indo-Malay, comprising India and Ceylon, the Indo-Chinese countries and southern China, and the Malay Archipelago as far as the Philippines, Borneo and Java.

4. Australian, composed of the remainder of the Malay Archipelago, Australia, New Zealand and all the tropical islands of the Pacific from the Philippines to the Marquesas and the Low Archipelago.

5. Neotropical, which comprises South America and the adjacent islands, the West Indies or Antilles, and Central America and Mexico.

6. Neartic, consisting of temperate and arctic North America, with Greenland.

"These six regions," remarks Dr Wallace, "although all of primary importance from their extent, and also marked by their total assemblage of animal forms, vary greatly in their zoological richness, their degree of isolation and their relationship to each other. The Australian regions as the most peculiar and the most isolated, but it is comparatively small and poor in the higher animals. The Neotropical region comes next in peculiarity and isolation, but it is extensive and excessively rich in all forms of life. The Ethiopian and Oriental regions are also very rich, but they have much in common. The Palaearctic and Nearctic regions being wholly temperate are less rich, and they too have many resemblances to each other; but while the Neartic region has many groups in common with the Neotropical, the Palaearctic is closely connected with the Oriental and Ethiopian regions.

In Dr Schlett’s original scheme the first four of these regions were bracketed together under the designation of Palaegaea, and the fifth and sixth, or those belonging to the New World, as Neogaea. T. H. Huxley, in a paper on the distribution of game-birds, published in the Proceedings of the Zoological Society of London for 1868, instead of dividing the world into an eastern and a western division, adopted a northern and a southern division, calling the former Arctogaea, and the latter (which included Australasia and the Neotropical region of Meezar Schlett and Wallace, but not the Ethiopian region) Notogaea.

In 1854 Dr Schlett,1 taking mammals as well as birds into consideration, adopted Huxley’s Arctogaea as the major northern division to include the Neartic, Palaearctic, Oriental and Ethiopian regions; and instead of Huxley’s Notogaea recognized three primary divisions, namely, Dendrogae for the Neotropical region, Antarctogaea for the Australian region (in a somewhat restricted sense), and Ornithogaea for New Zealand and Polynesia.

The tendency of these amendments on the original scheme of a simple division into six regions was to recognize three primary divisions of higher rank than such "regions." This view was adopted in 1890 by Dr W. T. Blanford,2 who proposed to designate these three major divisions of the earth’s land surface respectively the Australian, the South American and the Arctogaea regions. A weak point in this scheme is that, since the term “region” is likewise applied to the subdivisions of Arctogaea, there is a danger of confusion between the primary and secondary divisions. An amendment proposed anonymously3 in 1893 was to substitute the names Notogaea, Neogaea and Arctogaea for the three primary divisions of Dr. Blanford. Yet another emendation, suggested by R. Lydekker4 and subsequently adopted by Prof. H. F. Osborn,5 was to designate these three primary divisions as “realms,” and to reserve the name “region” for their subdivisions.

Emendations on the original scheme also included modifications in the limits of the regions themselves. In 1878, for instance, Dr A. H. Hulison6 (in accordance with a suggestion of Prof. A. Newton) proposed to unite the Neartic with the Palaearctic region under the name of Holarctic; separating at the same time from the former a “transitional” Sonoran, and from the latter a similar Mediterranean, or Tyrrhenian, region, while also recognizing a distinct Polynesian region, distinguished in the main by negative characters. The Sonoran region was subsequently adopted by Dr C. H. Merriam.7 In 1892, and later, however, changed to Medio-Columbian. A most important proposal was also embodied in Dr Blanford’s scheme, namely, the separation from the Ethiopian region of Madagascar and the Comoro islands to form a separate Malagasy region. Another modification of the original scheme was to transfer the island of Celebes, together with Lombok, Flores and Timor, from the Australian to the Oriental region, or to regard them as representing a transitional region between the two.8 The effect of this change was practically to abolish “Wallace’s line” (the deep channel between the islands of Bali and Lombok and thence northward through the Macassar Strait), the deepest channel being really situated to the eastward of Timor.

The later evolution of the scheme, as presented by Dr Max Weber,9 may be tabulated, with some slight alteration, as follows, the “realms” being printed in capitals, the regions and sub-regions in ordinary type, and the transitional regions in italics:

1. Arctogaea

2. Neogaea

In the accompanying map the Sonoran and Mediterranean transitional regions are represented as equivalent in value to the main regions, and the Austro-Malayan transitional region is not indicated. The recognition of a Polynesian and still more of a Hawaiian region is provisional.

The most distinct of the three primary realms is undoubtedly Notogaea, the Australian section of which is the sole habitat of marsupials (Monotremata) and a variety of marsupials, inclusive of the whole of the diprotodonts, with the exception of the few (cuscuses) found in the Austro-Malayan transitional region. Apart from monotremes and marsupials, the only indigenous mammals found in Notogaea are rodents and bats, with perhaps a pig in New Guinea; although it is most probable that the latter is introduced, as is almost certainly the dingo, or native dog of Australia. The rodents are all referable to the family Muridae, and are mostly of peculiar types, such as the golden water-rat (Hydromys) and the jeba-rats (Conilurus, Notomys, &c.); they are, however, in many instances more or less nearly related to species found in Celebes, the mountains of the Philippines and Borneo, and apparently represent an ancient fauna. The mammalian fauna of Notogaea is practically limited to the Australian region, its indigenous representatives in New Zealand being only a couple of bats. The monotremes are in all probability the survivors of a group which was widely spread in Jurassic times; while marsupials, as represented by the American bandicoots (Peramelemorphia), are only in the Oligocene division of the Tertiary period. The diprotodont marsupials may not improbable have originated within the Australian region, or this region conjointly with the Austro-Malayan transitional region.

Notogaea is likewise the home of a number of peculiar types of birds, some of which range, however, into the Austro-Malayan area, that is to say, Celebes and Ceram. In the Australian region the

peculiar avian families include the birds-of-paradise ( Paradisaeidae), the honey-eaters (Meliphagidae) as well as the birds-of-paradise (Cuculidae), the pigeons (Columbidae), and the penguins (Spheniscidae) and the porpoises (Lorididae) among the parrots, the mound-builders, or brush-turkeys ( Megapodiidae) among the game-birds, and the cassowaries and emus (Casuariidae). The Class Aves, or birds, of the South American region, having been separated from the rest of the world by the insolation of New Zealand. This, of course, implies the existence of an extinct southern marsupial fauna of which we have no knowledge except in the case of the Epanorthidae of Patagonia, which are certainly southern in their origin. This southern region, being connected by the existence of the "Gondwana flora." The question is whether such a connexion—either by way of Antarctica or by the passage of the Southern Temperate Zone—can be shown from the Pleistocene to the present day. But the idea of a late connexion between Neogaea and Notogaea has been adopted by L. Rütimeyer (1867), Captain F. W. Hutton (1873), Prof. H. O. Forbes (1893), Mr. C. Helly (1895), Dr. H. von Wissmann (1897), and A. F. Ortmann (1901), the latter median view of the extent of the part played by Antarctica (1900), and by Dr. A. F. Ortmann (1902). On the other hand, Dr. T. Gill (1875) believed in the existence of an "Eogaia" connecting the three great continents exclusive of Antarctica; and in 1884 Capt. Hutton, abandoning his former view, suggested the connexion of Australia and South America by means of a mid-Pacific continent. A strongly disposed to believe in a late connexi, is given by Dr. Ortmann in vol. xxxvii. pp. 139-142 of the American Naturalist (1901).

So far as mammals are concerned, the evidence in favour of a comparatively late land-connexion is weakened by the recent view that Marsupialia and Placentalia (Mammalia), which are regarded as Prohyliacous, are really creodont Carnivora. On the other hand (putting aside these carnivores), Mr. W. J. Sinclair is of opinion that the living South American marsupials do not represent their own family or order, but that they are merely degenerate ancestors of the true mammalian types, and that the tuatara lizard ( Sphenodon) is especially noteworthy on account of its wide spread during Triassic and Jurassic times.

From the Hawaiian area (whether or not there should be regarded as a distinct region), it must suffice to state that it is the sole habitat of the gorgeously coloured birds known as mamos, or sickle-bills (Hemignathus). With regard to the origin of the modern fauna of Notogaea, and more especially the Australian region, as here restricted, we enter extremely debatable ground. Dr. Wallace, who refused to admit the existence of any great inter-continental connexions in the past, was of opinion that Australia received the ancestors of its marsupials and monotremes from Asia by way of the Austro-Malayan area (as it certainly has its rodents) far back in the Secondary period. This view has been endorsed by the present writer who suggested the early Eocene as the most probable date of immigration; and it has also received the assent of Dr Max Weichselbaum, who in his recent monograph on "the Eo-European—times Australia was united by land with Asia. A Euro-Asian fauna inhabited this land, from which the Eocene Australasia was a portion cut off by partial submergence, this southern portion being the modern Australian fauna. The marsupials and monotremes, marsupials and ancient forms of other groups, such as cassowaries and birds-of-paradise, while widely distributed specialized types are wanting. Northwards extended a coral-sea, in which, as in the more isolated parts of the archipelago, great changes of level took place in the archipelago, which, at its present form in the Pleistocene, was insularized early Java later. Intermittent land-connexion took place, which allowed of periodical immigrations of Asian forms from one side and of Australian types from the other. The question is left undecided whether the cuscuses of the Austro-Malayan islands are remnants of the primitive Euro-Asian fauna or later immigrants from Australia. The suggestion is also made that the Australian and Philippine rodents are survivors of the original pre-Tertiary fauna, although the great number of genera and species present against this. The author fails to see any evidence in favour of a former connexion of Australasia with either South America or a former large antarctic continent (Antarctica). While admitting that this may be the true explanation, Mr. B. A. Bensley considers it possible that opossums (Didelphyidae), which he regards as the ancestral stock of the marsupials, may have effected a connexion from Neogaea to Notogaea by oceanic bridges in either event, he would place the date of entry as post-Eocene; but against this view is the occurrence of remains of a diprotodont marsupial (Protodipus) in Tasmanian strata believed to be of Eocene age. Prof. Max Weichert is also of opinion that the peculiarities of the region is also marked by the absence of certain widely spread family groups, such as the barbets (Megalaimidae), the otherwise cosmopolitan woodpeckers (Picidae), the trogons (Trogonidae), and the cacatuid parrots (Cacatuidae). The reptiles, owing probably to their earlier radiation, are much less peculiar, such widely spread types as the monitors (Varanidae) and crocodiles (Crocodylidae) being absent. The former group, including the cassowaries (Casuariidae) and the peculiarly derived Night Parrot (Eneyardius), is an extremely specialized, as is also the Australian bird fauna.

The reptiles of the former group are characterized by the absence of certain zoogeographical regions, such as the barbets (Megalaimidae), the otherwise cosmopolitan woodpeckers (Picidae), the trogons (Trogonidae), and the cacatuid parrots (Cacatuidae). The peculiarity of the region is also marked by the absence of certain widely spread family groups, such as the barbets (Megalaimidae), the otherwise cosmopolitan woodpeckers (Picidae), the trogons (Trogonidae), and the cacatuid parrots (Cacatuidae). The reptiles, owing probably to their earlier radiation, are much less peculiar, such widely spread types as the monitors (Varanidae) and crocodiles (Crocodylidae) being absent. The former group, including the cassowaries (Casuariidae) and the peculiarly derived Night Parrot (Eneyardius), is an extremely specialized, as is also the Australian bird fauna.
ZOOGICAL DISTRIBUTION

1007

TERRESTRIAL]

in favour of a land-connexion between Neogaea and Notogaea cannot be attributed to it by Mr W. J. Sinclair.

The typical Edentata (sloths, anteaters and armadillos) are at the present day practically confined to Neogaea where they have existed from the date of the Santa Cruz beds of Patagonia (west of the Andes) which have penetrated into Texas; and in the Pleistocene epoch several representatives of the extinct ground-sloths (Megatheriidae) and a giant armadillo (Dasypodidae) from Texas, are known. The Edentata, are, however, essentially Neogaeic. Among the monkeys the Cebidae, or American monkeys, and their relatives the Hapalidae, or marmosets, are likewise peculiar to Neogaea, where they date from the Pleistocene epoch. Several of the dimorphic taxa, the Tarsius, are likewise peculiar to this realm, and are doubtless also endemic. With the exception of a few shrew-mice, which have escaped from the north, continental Neogaeic or present-day devils, there are, however, very noteworthy that one peculiar family (Solenodontidae) of the order, apparently nearly allied to the Malagasy Centrildae (tenrecs), occurs in the West Indies, while the extinct Necrolestes, believed to be near akin to the African golden moles (Chrysochloridae), is found in the Santa Cruz beds.

Rodents of more or less peculiar types are highly characteristic of Neogaea and for the most part date from the Santa Cruz epoch. Among these the Caviidae, Chinchillidae and Octodontidae are peculiar to this realm, while the Capromyidae are common to the Ethiopian region of Arctogeic, being otherwise moderately restricted.

The last-named family is, however, eventually confined to Neogaea and include only the llama group (guanaco, &c.), tapirs, and certain small or medium-sized deer related to North American types. The Paramastodontidae, and probably the Megatheriidae, are likely peculiar genera of horses now extinct (such as Hipparion) and mastodonts, were comparatively recent invaders into the realm from the north. On the other hand, Neogaea at the date of the deposition of the Santa Cruz beds is represented by deeply-rooted groups of ungulates, such as the Toxodontia and Litopterna, some of the representatives of which (Toxodon and Macrauchenia) flourished during the Miocene epoch.

Of the Carnivora, the cist group (Viverridae) is absent, and the representatives of the dog tribe (Canidae), bears (Ursidae), of which there is only a single existing representative, cats (Felidae), and probably mectos (Procyonidae), are known to have reached the southern boundary of Neogaea from the north, although several genera of the last-named group are peculiar to the area. In the Santa Cruz epoch the place of the Edentata was taken by marsupial-like creodonts, such as Prohycthyacis.

In birds Neogaea is especially rich and contains more than a score of family groups unknown elsewhere. Several of these, such as the tyrant-birds (Tyrannidnae), manakins (Pipridae), chatters (Cotingidinae), ant-thrashers (Formicaridinae), the oviparous bird group (Dendrocolapidae), plant-cutters (Phytotomidae), and wren-thrashers (Asteropoidea), belong to a low and generalized type of the perching type (Passerinae). The latter is represented by the Parallelophagidae, which are in the main peculiar to this realm, although some of the last-named family wander to the northward in summer. The condors (Cathartidea), form a highly characteristic Neogaeic family; while the tinamous (Cryptidae), and the perching-birds (Passerida), the plumed parrots (Papilinidae), the parrots (Psittacidea), and by far the numerous and variegated thrushes, which are the most bizarre and characteristic of the bird fauna, and the great world of the game-birds and the ostrich group, are exclusively Neogaeic.

The last-named group (Struthionidae) are exclusively Neogaeic. It may be added that the distribution of all the members of the ostrich group affords a strong argument in favour of a former union of the southern continents, especially as their earliest known representative is African.

Among reptiles, the tortoises, with the exception of the terrestrial genus Testudo, all belonging to the terrestrial genus Testudo, and include several peculiar generic types such as Chelys (matamata) and one, Podocnemis, common to Madagascar. The occurrence in the Tertiary period of a species of Testudo in the South Indies, elsewhere known only from the Pleistocene of Queensland, has been already mentioned. A number of snakes of the boa group (Boinae) occur in the realm, to which the genus Eunectes (anacondas) is restricted; but boa itself, Podocnemis among the tortoises, is common to Neogaea and Madagascar.

The blind burrowing-snakes of the family Glomeridae occur throughout the warmer parts of the realm, and are also found in Africa and south-western Asia. The caimans or South American alligators (Caiman) are also Neogaeic; the several genera (Iguanidae) are mainly peculiar to the realm, although a few inhabit North America, and two outlying genera in Madagascar and a third in Fiji. The teju (Tejidae) are wholly Neogaeic. The Xantusidae are exclusively South American, and with the exception of one species, which is practically restricted to Neogaea and Africa. On the other hand, Lacertidea, Varanidae and Agamidae are absent. Tailed amphibians are unknown south of Central America; but the region is the home of a large number of terrestrial species (geckos, lizards, and toad), belonging to an otherwise Ethiopian section, and the majority of the family Cystignathidae, as exemplified by the horned toad Neogaea (Ceratophrys), the remainder of the group being Australian.

Freshwater fishes are very abundant in Neogaea, where they are represented by a number of peculiar generic and certain family types; some of the members have developed the remarkable habit of feeding upon the floating fruits abundant in the rivers of the tropical forest-districts.

The electric eels (Gymnotidae) are peculiar to the waters of Neogaea, as are certain other groups, such as the armoured cat-fishes (Loricariidae), while true cat-fishes (Siluridae) are extremely abundant. Perhaps, however, the most remarkable feature of the fishes of this region is the peculiar diversity of types of the fresh-water characins, which are so marked a feature of the fauna of the Tertiary epoch. Among the lung-fishes the family Lepidosirenidae is, for example, restricted to the two areas, with one genus in each, as is also the family Characidae. Much the same may be said of the Cichlidae, which are represented by a number of genera of tropical fresh-water fishes in the southern fringes of the African and Malagasy sub-regions; and the Cyprinodontidae, which are extremely abundant in Neogaea (where certain of their representative species are separated by some naturalists as a distinct family, Poechiilidae) likewise present a species-value unknown in any other region, as well as extending to the southern fringe of the Palearctic sub-region and a considerable portion of the Oriental region.

As regards the birds of Neogaea, Professor Carl Eigenmann, writing in the Popular Science Monthly for June 1906, observes that "in the earliest Tertiary tropical America consisted of two land-areas, Archiguania and Archamazonia, separated by a broad sea-bridge, the Guiana, which was a land-mass, Hellenis, between Africa and South America, possibly in contact with Guiana and some point in tropical Africa. This land-mass, which was inhabited, among other things, by fishes belonging to the families Argyrodonidae (large-fishes), Poechiilidae (cat-fishes), sank beneath the surface of the ocean, forcing the fauna in two directions, towards Africa and towards South America, exterminating all types not moved to the east or to the west. From these two rudiments have developed the present diverse faunas of Africa and South America, each reinforced by intrusions from the ocean and neighbouring land-belts of the Atlantic.

All this is distinctly paralleled, and nearly the same may be said concerning the fauna of the land-mass, Hellenis, between Africa and South America; the connexion between Africa and South America existed before the origin of present genera, and even before the origin of some of the present families and sub-families, some time during the pre-Cainozoic epoch. Even so, any exchange between Africa and South America since that time, was in the majority of cases only through a small water-route, and even that of the present day did not prevent the deep separation between the two faunas. The diversity and peculiarity of the African and South American species is most marked, particularly as regards the birds and reptiles.

This connexion between Neogaea and Africa was doubtless a cause of the limited development of the South American fauna, and the allusion has been already made; freshwater fishes being probably a group of earlier radiation than mammals. Perhaps the distribution of the reptilian genera common to Neogaea and Madagascar may be explained in the same manner, although tortoises apparently identical with Podocnemis occur in the Eocene of Europe (as well as in that of Africa and India), so that this group may have radiated from that time. Whether the evidence of the Cystignathidae among the amphibians and of the extinct Melanophorus among the reptiles is also evidence of the presence of the Jurassic connexion between Neogaea and Notogaea till a considerably later epoch must, for the present, remain in some degree a question. That the evolution of the last-named group of lizards, the Agamidae, which so abundantly inhabit Madagascar, is, however, not in favour of such a connexion, the Lacertidea and Agamidae being confined to the Old World, inclusive of Australia but exclusive of Madagascar, while the cosmopolitan Crocodylia, so abundant in Notogaea, are extremely scarce in Neogaea.

Reverting to the mammalian fauna, its evidence, combined with that of geology, indicates that during the great part of the Tertiary period South America was isolated from North America, and inhabited by its autochthonous fauna of monkeys, marmosets, sloths, ground-sloths, ant-eaters, armadillos, glyptodonts, toxodonts, elephant-shrews, and marsupials. The fauna of North America is limited to rodents, marsupials and creodonts, as well as by Phororachis, rhesus, tinamous and probably some of the other groups of birds now peculiar to the area. This state of things continued till the Tertiary ended, or perhaps the beginning of the Quaternary epoch, when connexion was established with North America by way of the isthmus of Duran. By means of this new land-bridge a certain proportion of the autochthonous fauna of Neogaea was enabled
to effect an entrance into North America, as is exemplified by the occurrence there of ground-sloths and glyptodonts. Simultaneously a large immigration of northern forms took place into Neogaea; there was a great migration of lions, leopards, rhinoceroses, tigers, bears, fox-like dogs, raccoons, llamas, horses, tapirs, deer, mastodons and perhaps opossums. While representatives of most of these invaders have persisted to the present day, some groups, such as the carnivores, are now represented in Neogaea only by portions of the autochthonous fauna. It may be well to allow for the insulation of Neogaea during a considerable period by processes of drift and the operation of currents between the two oceans, which must have become closed at a period sufficiently remote from the present to have permitted the special differentiation of a large majority of the forms involved. All evidence concurs in showing that this connexion at some time prior to the Pleistocene, probably in the early Miocene. This, it will be observed, agrees almost precisely with the conclusions drawn from the fossil mammalian faunas of North and South America, which indicate that land-communication between those two continents was interrupted during a considerable portion of the Tertiary epoch, and only re-established (or I established for the first time) either towards the close of the Miocene or the early part of the Pliocene epoch.

The South American mammalian fauna, as we now know it, is, therefore, composed of an autochthonous element and of a large foreign infusion from the north. As regards the latter, there is no difficulty; but some degree of obscurity still prevails with regard to the source of the autochthonous fauna. As a single example of the tacts by which the autochthonous fauna was maintained in the fresh-water fishes the early Tertiary Atlantic "Hellenis" may have been in contact with Guiana on the one side and tropical Africa on the other. That such a connexion did really exist in Tertiary times is the conclusion reached by Dr C. W. Andrews, recently as the result of his studies of the Tertiary vertebrate fauna of the Fayum district of Egypt, as expressed in the following passage: "The mass of evidence indicates: (1) Tertiary connexion between Africa and South America, the passage is undoubted; (2) in the Cretaceous period the sea encroached southwards over this land, forming what is now the South Atlantic. How far this depressional history southwards, or the period of the subsequent northwards, is clear, but it appears certain that the final separation of the two continents did not take place till Eocene times, and that there may have been a chain of islands between the northern part of Africa and Brazil which persisted even till the Miocene. By this route, as was suggested considerably earlier by Prof. W. B. Scott and subsequently by the present writer, Neogaea may have received a considerable portion of its autochthonous mammal-fauna. Further reference to this point is made later; but it may be added that the evidence of the land-faunas is supplemented by that of the shallow-water marine faunas on the two sides of the Atlantic, which suggests some land-bridge.

In an address to the British Association at the meeting in 1905 in South Africa Mr G. A. Bouloger expressed himself, however, as having some doubt as to the "Tertiary connexion" between Africa and South America. It is undeniable," he observed, "that the hypothesis of a South Atlantic land-communication in the Eocene has much in its favour, and when this is combined with the evidence of the distribution of the fresh-water fishes of the genus Galaxias; in the fresh-water species of Africa and South America formed a continuous land-mass; (2) in the Cretaceous period the sea encroached southwards over this land, forming what is now the South Atlantic. How far this depression history southwards, or the period of the subsequent northwards, is clear, but it appears certain that the final separation of the two continents did not take place till Eocene times, and that there may have been a chain of islands between the northern part of Africa and Brazil which persisted even till the Miocene. By this route, as was suggested considerably earlier by Prof. W. B. Scott and subsequently by the present writer, Neogaea may have received a considerable portion of its autochthonous mammal-fauna. Further reference to this point is made later; but it may be added that the evidence of the land-faunas is supplemented by that of the shallow-water marine faunas on the two sides of the Atlantic, which suggests some land-bridge.

In an address to the British Association at the meeting in 1905 in South Africa Mr G. A. Bouloger expressed himself, however, as having some doubt as to the "Tertiary connexion" between Africa and South America. It is undeniable," he observed, "that the hypothesis of a South Atlantic land-communication in the Eocene has much in its favour, and when this is combined with the evidence of the distribution of the fresh-water fishes of the genus Galaxias; in the freshwaters of New Zealand, Australia, South America and the Cape. This evidence has been shattered by Mr Bouloger's description (in memoir of the fishes of the Congo) of a marine representative of the genus that occurs in the South Atlantic Ocean.

For the zoological subregions of Neogaea the reader must refer, as in the case of most of the other regions, to special works on zoological distribution.

Arctogaea. — The regions that constitute the whole of the rest of the land-surface of the globe (with the exception of Antarctica) it is almost impossible to give any general diagnosis even of its mammalian inhabitants, as the present day monstrosities are wholly wanting, while marsupials are represented only by one or two species of opossums (Didelphphy) in North America and by cuscuses (Phalanger) in the Austral-Indian regions. Only the great transcontinental dispersal of the Theriacean, and the fact that the present day invaders are not the same as those from Africa, can, with the absence of Marsupialia, except late wanderers from Neogaea into North America, absent from this realm at the present date and during the Pleistocene; the alleged occurrence of a ground-sloth in the Pleistocene of Madagascar being probably due to a misinterpretation. On the other hand, this region, and more especially its eastern half, is the great home of the ungulate mammals. Indeed rhinoceroses may be regarded as a mark of this region, for other than in Borneo or another they have ranged over the whole area, except Madagascar, and are quite unknown elsewhere. The modern land Carnivora are likewise an essentially Arctogean stock, as the Adlerian and modern Dr H. S. Packard¹ has suggested that it should be separated from Arctogaea to form a realm by itself, under the name of Apogaea. This Southern American fauna, exclusive of the Tertiary one of Egypt, does not, however, countenance such a separation. By Starks, and Wallace, Madagascar was included in the Ethiopian region, but that island was subsequently made a region by itself by Dr Blanford. This separation of Madagascar to form a Malagasy region has met with general acceptance; but in the opinion of Mr R. I. Pocock, who bases his conclusion on the distribution of trapdoor-spiders (which in other respects appears curiously well with that of mammals), it is not justified. The mammalian evidence appears, however, to be overwhelmingly strong in its favour; and it also receives support from reptilian and amphibian distributions.

Arctogaea, like Neogaea, is divided into two regions, the one, the Old or Northern, which includes the greater part of the northern hemisphere and Madagascar, and the other, the South or Neotropical, which comprises the Great Southern land-masses of South America, Australia, New Zealand, and the East Indies. The distribution of the land-vertebrates of Arctogaea is more patchy than that of Neogaea, and the more advanced the group the greater the number of genera and species involved. This agrees with the mountainous nature of the majority of the regions, and the number of the animals is in consequence more limited than in the case of Neogaea.

distinct. The Prosimiae, or lemurioids, include the galagos (Galago) and pottos (Perodicticus), of which the latter are akin to the Oriental loris, and the least, which is perhaps the nearest of the former to lemurs. Among the Carnivora, the aard-wolf (Proteles), the hunting-dog (Lycaon) and the long-eared fox (Otocyon) are peculiar generic types, as are several forms of mungos (Herpestidae); we must again observe that the records of the former and the latter are very rare and cannot be regarded as general to the Oriental region; indeed each group is subgenus.
ZOOLOGICAL DISTRIBUTION

[TERRESTRIAL]

appear to be the well-known Indian solenodons. The bats are likewise
differentiated from those of the mainland, a notable feature being the
occurrence of flying-foxes of the Asiatic and Australian genus
Pteropus. Of the countess rodents of Africa, all are wanting;
but while the only members of that group inhabiting the island are
commonly found like animals collectively constituting the family Neso-
myidae.

The birds are scarcely less remarkable than the mammals, such
considerable numbers of terrestrial groups, including indicator
guides (Indicator), wood-hoopoes, horn-bills, ox-peckers, barbets
and glossy starlings being entirely unknown. On the
other hand, the Malagasy region, inclusive of the Mascarene islands,
comprises some of the most distinct groups in the world. The
Tyto, Arantia, Callicieus, Euryceros, Philipei, Aletornis and
Lepidosous; the first of these representing a peculiar family of
game-birds, the second and third of the rail and a type of
rollers (Coraciidae). In the Pleistocene the ostrich
was represented by various species of Aepyornis, probably
one of the legendary roc; while within historic times
the guineafowls, although
of the Eocene, and possibly	ill exist in Africa, in the
Eocene, as well as in India in the Pliocene. The
spider-tortoise (Pyxis) is a peculiar cryptodiran Malagasy genus.
In the matter of batrachians the Malagasy region lacks both
cicellions (Apoda) and toadless toads (Anura), but it has
represented, among the Rhacocephali, the family
of the iguanas, among them the Oriental genus Rhacophorus.
Of fishes, the peculiar Ethiopian types are absent from the present
region, although the community of the Cichlidae to Neogaea and
the Ethiopian region. But it cannot be claimed that the
region, and the iguanas) in Madagascar and not in Africa can be
be held to indicate a late connexion with Neogaea by way of the
Pacific, cannot yet be decided. The occurrence of iguanas in Fiji
is, however, as noteworthy as is the community of Melamia
to Patagonia and Queensland. Moreover, Polynesia is evidently a
subsiding area. In the opinion of Captain F. Hutton the land-
shells of the genus Endodonta, which ranges all the
of Polynesia, New Zealand, eastern Australia, New Guinea and the
Philippines, with an outlier in Ceylon, afford the best evidence in favour
of a Polynesian continent, the Solomotloue outlier pointing to the conclu-
sion that this group of molluscs originally came from the north.
The molluscan evidence will not, however, explain the
South American connexion.

Zoological evidence of the latter connexion, by way of Antarctica,
is afforded by the north-worms of the family Gnathophis, which
are unknown north of the equator, although their occurrence in
Madagascar may point to a northern origin. Additional evidence of
connexion with Patagonia is afforded by the occurrence in the
Tertiary strata of South America and New Zealand of a number of
shallow-water marine invertebrates. Further, the occurrence of
these forms in older strata in South America than in New Zealand
suggests that the migration took place from the south.

The relatively small and wholly tropical or subtropical Oriental
region, includes the group of birds of which an abstract appeared in the
Proceedings of the Royal Society of London for 1900 (vol. lvii. p. 484), Dr Blanford came
to the conclusion that the Punjab differs so remarkably in its
fauna from the rest of India that it cannot be included in the
Oriental region, and must be assigned to the Mediter-
anean region. To the latter belongs also the
Himalayan areas, and the region, together with Ceylon, is regarded as a single
subdivision of the Oriental region, under the title of Cisgangeitic, while the
Himalaya and Burma form a second subdivision, the Transgangeitic,
and the region. A third subdivision, the Malay, includes southern Tenasserim,
the Malay Peninsula, and the Malay Archipelago exclusive of Celebes.
In the map in the present article the last-named subdivision is included
under the title of Elitropius, and the region, according to the
earlier map, is included to an Australo-Malayan transitional region. Wallace
drew the main line dividing the Oriental from the Australian region between
the equator and the southern tip of the Malay Peninsula.

The strait [between Bali and Lombok] is here fifteen miles wide,
so that we may pass in two hours from one great division of the
earth to another, differing as essentially in their animal life as
europe does from America. If we travel from Java or Celebes or the
Mouhcas, the difference is still more striking. The
hydrographic results obtained by the Dutch Siboga Expedition,
however, that although there exists a line of great depth
separating the two regions, this line on no point corresponds
to "Wallace's line." On the contrary, it passes east of Timor and
through the Bandau and Molucca seas, separating Sula from Buri,
and the line of division is therefore parallel to the line of the equator. Dr A. Pelseneer has proposed the name of "Weber's line."
It is this "Weber's line" which marks the real division between the
Aegrotae and the Notogae faunus, although it has been
attempted to make Celebes the centre of an intermediate transi-
tional region.

The Oriental region agrees with the Ethiopian in being inhabited
by elephants, rhinoceroses, buffaloes, several large representative
genera of birds (oileria), and a number of mammals
which are also absent from India
and buffaloes are also widely different from those of Africa. Wild
cattle (of the subgenus Bubos), as represented by the gaur
and the banting, are peculiar to this region; and, with the exception of
gallinaceous, they are represented by genera which are
exclusive to the region. The genera Antilope (blackbuck), Tetracerus (chouingsa), and Trago-
camelus (nilgai) are restricted to the area. Southern India has one
subdivision (Hemitragus) in its mountains, and this genus too occurs
in the Comoro Islands, while the forms (Remerocabus) in Java and Borneo
—goat-like antelopes ranging through the Malay countries—are
also met with. Deer (Cervidae) are abundant, and include the
three peculiar subgenera of Cervus, namely Elvis, Hydropus and
Rucerus, to the exclusion of the typical red deer.

The typical Tragulus represents the chevrotains; and the pigs, unlike
several of those of Asia, belong to the typical section of Sus. In addition
to the usual forms there is the Melanops (of which Melanops typus,
of the Andaman Islands and Malaya, is a representative), while the
elusive species (Tairidae). A notable distinction from Ethiopia is the presence
of bears, which, however, distinct from the typical Ursus arctos
is very remote date, as is exemplified by the fact that the
lories of Ceylon and southern India are quite distinct
from the Malagasy lemons, and much nearer to the African pottos.
While the tropical forests of South America and
(Paradotis, Podocnemis, and iguanas) in Madagascar and not in Africa can be
be held to indicate a late connexion with Neogaea by way of the
Pacific, cannot yet be decided. The occurrence of iguanas in Fiji
is, however, as noteworthy as is the community of Melamia

1 One member of this group has recently been described from the
Shan States.
bullbats (Pycnonotidae) and king-crows (Dieruridae) are also more abundant than elsewhere; while the broad-bills (Eurylaemidae) are peculiar.

Among reptiles, the long-snouted crocodiles of the genera Gavialis and Tomistoma are elsewhere unknown at the present day. The river-tortoises of the family Trionychidae have three peculiar genera; while the chelonians of the genera Batagur and Trionyx to which the tortoises belonging to the genus Astrakhan are peculiar. Among birds, the type of the genus Astrapia, the birds belonging to the genera Hydronis and Herpetotheres are peculiar. Among the mammals, the type of the genus Cynopterus, the bats belonging to the genus Thryonomyus, and the types of the genera Rhabdomyus and Macrotis are peculiar. Among reptiles, the long-snouted crocodiles of the genera Gavialis and Tomistoma are elsewhere unknown at the present day. The river-tortoises of the family Trionychidae have three peculiar genera; while the chelonians of the genera Batagur and Trionyx to which the tortoises belonging to the genus Astrakhan are peculiar. Among birds, the type of the genus Astrapia, the birds belonging to the genera Hydronis and Herpetotheres are peculiar. Among the mammals, the type of the genus Cynopterus, the bats belonging to the genus Thryonomyus, and the types of the genera Rhabdomyus and Macrotis are peculiar.

As we pass along the coast, we shall notice that the true faunas of the adjacent transitional zones to the southward the following may be mentioned: elk (Alces), reindeer (Rangifer), wapiti (Cervus elaphus), oryx (Oryx), musk-ox (Ovibos), bighorn sheep (Ovis canadensis) and its representatives in north-eastern Asia, musk-ox (Ovibos), now extinct in the eastern hemi-

terrestrial zoological distribution

In the Holartic region, which comprises the whole of the land lying northward of the Mediterranean regional boundary, the eastern, and north of the Sonoran zone in the western hemisphere, is the largest of all the zoological provinces of the globe. The whole territory is extra-tropical, and it is inhabited by a great number of plants and animals which are peculiar either by monotypy or by polytypy. These animals are found in the northern Pacific, and it is evident that the main communication took place by way of Bering Strait, although it has been suggested that the passage through the Bering Strait would have been in the case of animals leaving the European continent with Iceland, and thus with Greenland.

Among characteristic groups of mammals common to the two

halves of the Holartic region (or in some instances of portions of the adjacent transitional zones to the southward) the following may be mentioned: elk (Alces), reindeer (Rangifer), wapiti (Cervus elaphus), oryx (Oryx), musk-ox (Ovibos), bighorn sheep (Ovis canadensis) and its representatives in north-eastern Asia, musk-ox (Ovibos), now extinct in the eastern hemi-

1The American form is often separated as Neothrichus, but this does not affect the relationship of the two areas.
coursers (Glaeridolidae), and bustards (Otididae), of which there are numerous genera confined to the area. The two families last named are, however, the most characteristic of the Neotropical terrestrial subregion, in its restricted sense, being characterized by the poverty of its fauna, several of the widely spread families of the Old World, such as the Vaniandae and Agamid, stopping short of its southern limits. It is also true, however, that some families, the so-called "stone-rollers," of the genus Calotesmus, and the presence of loaches (Cobitidae) and barbels (Barbus). As compared with the Palaearctic (and Mediterranean) province of the Holarctic region the Neotropical subregion (together with the Sonoran transitional zone) is characterized by the extreme poverty of its fauna of hollow-horned ruminants. Of these the bison is generally (and subgenerically) identical with its Old World relative, but the deer (Cervidae), apart from the three Old World types alluded to under the heading of the Holarctic region, are altogether peculiar types referable to the genus Mazama (subgenus Dorcaslagelus, Carusias or Odocolius), but after the entry of Elephas, a large type of elephant, certainly of Old World origin. The same may be said of the bears (Ursidae), in which the black bear (Ursa americana) is a peculiar species, although probably allied to the Himalayan U. tauricus. In the brown bear group (U. arctos) it is noteworthy that while the Alaskan forms are very close to those inhabiting Kamchatka and Amurland, the Rocky Mountain grizzly, which has penetrated farther into the continent, is more distinct. The grey-fox (subgenus Urocyon) is a characteristic Neotropical type. Among other groups of mammals, the following generic groups distinguish the Neotropical from the Palaearctic terrestrial subregion, all of which are of Sonoran origin.

In the viverrids we have Brarina, Sclastes, and Scapanus; in the Carnivora Procyn in the raccoons, Meephis among the skunks, and Taxidea among the badgers. Cynomys (Marmota) is the most important and characteristic type. A very important feature is the replacement of all the true rats and mice (Murinae) of the Old World by the deer-mice and their allies belonging to the subfamily Cricetinae, which is but poorly represented in the Neotropical region. One of the more distinctive genera, with forms peculiar to North America, although it appears to have an analogue in the Old World, is that of the form of the single representative of the Persian Calomyscus. The wood-rats of the genus Neotoma and the muskshag (Viperii) are characteristic Neotropical types of the vole-group. More important is the family Haplotomidae, represented only by the weewells (Haplaodon, or Apalodon), all the members of which are exclusively North American, although some are Sonoran. The pocket-gophers (Geomyidae) and kangaroo-rats (Heteromyidae) are also solely American, though more developed in the Sonoran than in the Neotropical area; Geomyo and Thomomys in the former and Perognathus in the latter. Of these genera, the former are widely distributed in the Neotropical area, whilst, among the rodents, we have the Canadian porcupine (Erithizon), typifying the New World family Erethizontidae. Among bats it must suffice to state that the genus Lasiurus (Alaisa) is solely North American.

Reference to the Tertiary mammal-faunas of North America must be of the briefest. It may be mentioned that even in the Pleistocene (at which period the Sonoran zone was occupied by man) the fauna took forms than occurs at the present day; while a notable feature at this epoch is the mingling of Arcto-geaic and Neotropical types, as among the camels and mammoths and ground-sloths (Megalosaurus and Molodon). In the Pliocene and Miocene, the fauna was more of an Old World type, including a great development of camels (Tlyopoda), horses (Equidae), and rhinoceroses, although the latter, be they tusked or not, were of peculiar types, such as the ruminating oedrides (Oedredotidae, or Merycodidae), the perissodactyls Titanotheriidae, and the more generalized Uintheriidae, which typify a subordinal ungulate group by themselves. It has been suggested that some of these are the type of the most widespread of these groups, such as the camels and horses, may have been from the Old World, a suggestion frequently repeated and often with the equal probability that Central Asia—or a land-area common to Asia and America—may have been their birthplace.

But in the Sonoran terrestrial subregion of the lowest, or Puerco, Eocene, which includes a number of mammal families of various types, some of the largest being of the approximate dimensions of a mastiff. Evidently the Puerco epoch was a period of great development of the proto-continent, including primitive creodont Carnivora, amblypodous and condy-larthrous Ungulata, and a number of smaller types, some of which were probably related to the modern Rodentia, Insectivora and Primates. As one passes through the Srerean (i.e. the Eocene-Senonian) the Puerco fauna is found in the under lower Cretaceous Laramie beds, it has been suggested that the fauna was largely of northern origin.

We come to the middle of the Palaeogene, when the generalized types of the Puerco fauna had almost disappeared, although a few cre-donts survived till the Oligocene. It is surmised that the few brain-capacity of the members of this fauna rendered them unfit to cope with the irruption of more highly organized mammals which suddenly appeared on the scene in the Lower Eocene; this new fauna, it is conjectured, may have developed from a side-line of the original Puerco stock which had remained in the old northern home at the time of the earlier radiation.

"Assuming that the Puerco mammals," observes Mr Madison Grant, 1 were driven out of more northerly or boreal lands, where they were supplanted by a fresh wave of more primitive forms, it is conceivable that some animals remained behind and adjusted themselves to the changed conditions, until a still further increase of cold freed them also to follow the path of their predecessors, southward."

"Some of these Lower Eocene types of this second radiation, which are found in the Wasatch beds of Wyoming, have sent down to the Sonoran a few more types, which have survived in the existing animals. At this time first appear the horses, cats, bears, rhinoceroses, camels and dogs (or rather the ancestral stock thereof). Some of these animals, such as the horses and rhinoceroses, are found con-temporaneously in Europe, others, like the (ancestral) camels, are peculiar to America [some of the later types have recently been discovered in Asia]."

"Being more highly organized and better adapted to their environment, these few types entirely supplanted the older fauna, and by the Oligocene this transformation was complete, and the older fauna had disappeared. This Wasatch fauna culminated, and then faded gradually away on this [American] continent, until in the Middle Pleistocene it was largely supplanted by arrivals from Asia."

The relationship of the fauna to that of South America, and the interchanges which took place between the two during the Pleis-tocene and Pliocene epochs, have been already sufficiently discussed when treating of Neogaea.

The limited area of the Neotropical subregion and the adjacent Sonoran zone, there are a very large number of peculiar genera in the late Cainozoic, represented by the species of Neogaea. In the Holarctic we have the well-known genera of the families Lepidostomidae, Trachycidae, and Mesonychidae, which are found in the Pleistocene. Among the game-birds are the turkys (Meleagris), the ruffed grouse (Bonasa), the prairie-grouse (Tympanuchus, or Calidris), the partridges (Alectoris, or Centropus), and the quail (Callipepla), among several genera of the American partridges (Odpontophorinae), such as Lophortyx and Ortys (bob-white), may be cited as characteristic Neotropical groups, although some extend farther south. Turning to reptiles, the presence of rattlesnakes (Crotalus) is a feature broadly distinguishing the Neotropical subregion (together with America generally) from the Palearctic; in the more southern territories we also enter the domain of iguanas; while among chelonians we have the family of snakeheads (Chelydrae), the "stink-pot terrapins" (Cinosternidae), and in the Testudinidae the box-tortoises (Cistudo), and the terrapins of the genera Chrysemys and Malaclemys are to be found.

During the Oligocene, and certainly until the beginning of the Miocene, we have had the introduction of the Crocodilia, which at least while during the Pliocene the snakes were represented in Europe. There are several more or less peculiar types of North American amphibians, but since these are of the most part Sonoran in range, they may be best noted in a later paragraph.

From that of the Palearctic (+Mediterranean) subregion the fish-fauna of the Neotropical subregion, together with that of at least part of the area now occupied by the Sonoran zone, is characterized by the absence of bony-pike (Lepidostomidae), bow-fins (Amiidae), and the members of the family Catostomatidae, for which there appears to be no English name, as well as by the absence of the loach family (Cobitidae) and the carp (Cyprinidae).

The last of the zoological provinces into which the land-surface of the globe is divided on the evidence of the distribution of mammals and birds is the Sonoran, which, although often regarded as an

INDEPENDENT region, is best ranked (on Prof. Max Weber's scheme) as a transitional zone between the Neartic subregion of the Holarctic region of Arctogaea, on the one hand, and Neogaea on the other. Its fauna is essentially a mixture of the Oriental and the Nearctic types, from which it is distinguished, seeing that representatives of all the principal groups occur together in the older Tertiary deposits of Europe. It is, however, of some interest to note that caimans (Caiman) are restricted to Neogaea, while alligators and gavials (Genus Gavialis) and Tomistoma are confined to the Oriental region. An important feature in the present distribution of chelonians is the restriction of the extinct Pleurodira to the southern parts of the region (in places all the three southern subregions as well as Madagascar), and thus in no wise corresponding to the 'bathochran' Notogaea. The value of this feature in chelonian distribution is to some extent destroyed by the parallel distribution of Pleurodira in the northern hemisphere during the Eocene period.

In regard to lizards (Lacertilia), Dr. Gadow remarks that their distribution does not support the division of the land-areas of the globe into a northern and a southern half; the marked distinctness of the lacerian fauna of the New from that of the Old World points in the same direction. On the other hand, lizards countenance the division of the northern and southern parts of the world, and therefore richer continuation of the now impoverished Palaearctic subregion.

The present distribution of snakes, according to the same natural history map, is confined to the Palaearctic and Nearctic regions; it further suggests that some of the divisions adopted in classification are not natural ones. Perhaps the most important fact is that the two families, Boidae (boas and pythons) and Typhlopidae (blind-worms), which are near-imparipartitions, occur all over the tropical zone, while certain allied families are found in portions of the same. The restriction of true vipers (Crotalinae) to the Nearctic and the Palaearctic, however, is a noteworthy fact. The pit-vipers (Crotalinae), however, may perhaps be presumed to have originated in the Palaearctic area, whence they reached and spread all over the earth, although they are confined to the northern and southern parts of Africa and India (Africa). The absence of all venomous snakes (which abound in South America, New Guinea, and Madagascar) from the Palaearctic region is a fact harmonizing with mammalian distribution, so far as the peculiarity of the fauna of Africa, Madagascar, and Australia is concerned.

For a full account of the distribution of fish, both freshwater and marine, see Ichthyology; here it will suffice to refer to a zoographical scheme, based on the present distribution of the freshwater families, adopted by Dr. A. C. L. G. Günther. According to this scheme, the land-surface of the earth is divided into three parallel zones, constituting the Neartic or North American region, the Palaeotropical and Oriental areas of the Southern subregion, and the Southern subregion. The former is characterized by the presence of sturgeons (Acipenseridae), the paucity of cat-fishes (Siluridae), and the abundance of all kinds of fishes (Cyprinidae), the salmon-tribe (Salmonidae), and the cods (Gadidae), to which belong the common salmon, the Atlantic salmon, and the white fish (Gadus). The Southern subregion includes the region of Australia, Polynesia, and the New Zealand Islands, and is characterized by the presence of bony-pikes, bow-fins (Amiidae), and the family Catostomidae, all of which are unknown in the Palaearctic area, while loaches and barbs are well known there.

The Equatorial zone is divisible into two provinces: an Eastern, characterized by the presence of carps and of the family (Anaband) typified by the well-known "climbing-perch," and a Western province, in which these two groups are wanting. The Eastern province includes an Indian (oriental) region, in which lung-fishes (Dipnoi) are absent, while serpent-heads (Urophii) and bony-pikes are numerous; and an African (Ethiopiceo) region, distinguished by the presence of lung-fishes, bichirs (Coryphopterygii), and proboiscis-fishes (Mormyridae), the abundance of characins (Chromidieunci), and the absence of cycliferous fishes altogether. The Euramerican region is divisible into two regions, namely, a Tropical American (Neotropical), distinguished by the possession of lung-fishes and electric eels and the abundance of characins and characins, and a Tropical Pacific subregion, which includes the bichirs (Coryphopterygii), and the absence of other land-areas. The region of Dipnoi (widely different, however, from those of Africa and South America, which are nearly related), and the lack of characins and characins, is characterized by the presence of lung-fishes, barbs, and the scarcity of cat-fishes, while the salmon tribe is replaced by the Salmo and by the Salmo of Europe (Salmi), the latter being the most perfect. The region of Dipnoi is characterized by the presence of lung-fishes, and is divisible into two parts, namely, one for the regions of Africa and South America, and the other for the region of Australia. The former is characterized by the presence of lung-fishes, bichirs, and proboiscis-fishes, while the latter is characterized by the absence of lung-fishes and electric eels, and the abundance of characins and characins.

It will be seen that the present distribution of fishes, although showing certain features, is by no means accord with the whole of shared by members of the mammalian order. Indeed, it is suggestive of the period of the world's history when there was an extensive and more or less continuous belt of equatorial land.
For the distribution of invertebrate animals generally, the reader may be referred to the articles dealing with the various groups of that assemblage. An exception must, however, be made with regard to that group of spiders known as the Mygalomorphae (which includes the trap-door spiders) on account of the remarkable general similarity presented by its distribution to that of mammals. According to Mr R. I. Pocock the distribution of the Mygalomorphae throughout the world into the following zoological regions:—(1) The Holarctic, including Europe north of the southern mountain-chains, North Asia, and North America north of the 45th parallel of latitude. (2) The Mediterranean, including Turkey, Europe, Africa north of the Sahara and the desert-regions of south-western Asia. (3) The Sonoran, comprising the United States of America south of the 45th parallel and the plateau of Mexico. (4) The Ethiopian, embracing Africa south of the Sahara, both Arabia and Madagascar. The last-mentioned island ranks merely as a subregion of the Ethiopian. (5) The Oriental, including India, Ceylon, Burma, Siam, and all the Indo- and Austro-Malayan Islands to Australia. "Wallace's line" being non-existent so far as spiders are concerned. (6) The Australian, containing Australia and New Zealand; the latter being worth of recognition as a subregion. (7) The Neotropical, including Central America from the Mexican plateau, the West Indies and South America.

These spiders furnish, moreover, strong evidence in favour of a former union between Africa and South America, and of a connexion between the western and eastern members of those continents on the one hand and Austro-Australia and the southern extremity of South America on the other. As regards the regions, apart from the affinities, the classification of the distribution of these spiders accords with remarkable closeness to that of mammals, if we except the more intimate connexion indicated between the faunas of Ethiopian Africa and Madagascar.

The fact that the generally accepted scheme of division of the land-surface of the globe into zoological regions is based almost entirely upon the present distribution of mammals and birds has already been emphasized. It is perhaps only fair to quote the views of Dr A. E. Ortmann (who has devoted much study to the distribution of animals), although they do not mean wholly commend themselves to the present writer:—

(1) Any division of the earth's surface into zóo-geographical regions which does not take account of the present distribution of animals, without considering its origin, must be unsatisfactory, since always only certain cases can be taken in, while others remain outside of this scheme. (2) Considering the geological development of the distribution of animals, we must pronounce it impossible to create any scheme whatever that covers all cases. (3) Under these circumstances, it is incorrect to regard the creation of a scheme of animal distribution as an important feature or purpose of zóo-geographical research.

Dr Ortmann adds in a later paragraph, "the chief aim of zóo-geographical study consists—as in any other branch of biology—in the demonstration of its geological development." II. MARINE DISTRIBUTION

That the fauna of the ocean, apart from the influence of temperature, would be much more uniform, and therefore less susceptible of being divided into zoological provinces, or regions, will be apparent from a glance at the map of the world on Mercator's projection, in which the fact that the three great oceans—the Pacific, the Atlantic and the Indian—are in free communication with one another in the southern hemisphere is clearly brought out. There is, however, more than this; for there is evidence that during the early part of the Tertiary period the Pacific and the Atlantic were not separated by the isthmus of Darien; while there is a probability that the Mediterranean was at one time in communication with the Red Sea, and that other connexions of a like nature have existed.

In addition to this general community of the marine fauna of the world, there is the further important fact that such faunas may be divided into three main, and for the most part perfectly distinct, groups: namely, the littoral, or shallow water, fauna, the abyssal, or deep-sea, fauna, and the pelagic, or surface, fauna. Of these three the first alone is really susceptible of division into more or less ill-defined zoological regions, the other two being practically uniform in character. More-
Considerable difficulty exists in determining from what depths fishes are dredged. Although many species display various structural peculiarities, such as a huge head, or an attenuated ribbon-like body, while special phosphorescent organs are very generally present, a number has been grouped as a separate and sectional group by themselves, but are drawn from a number of families, certain members of which have adapted themselves to an abysmal existence. A preponderance of representatives of the families Macruridae, Ophididae and Scopelidae is, however, noticeable.

Whether light or temperature is the prepotent agency in regulating the limits of the deep sea distribution of the pelagic fauna is a question that arose, when it was observed that reef-building corals, which require an average temperature of from 70° to 75°, and one which never falls below 68°, are never found below a depth of 20 fathoms (36.6 meters). Not only is the highest temperature where the nature of from 70° to 77° obtained to depths of between 80 and 100 fathoms. It is further remarkable that well-characterized deep-sea faunas are locally met with in comparatively shallow water. Such one would be the littoral fauna of the Mediterranean, where they live within the 100-fathom zone. Light, which was formerly supposed not to penetrate to a greater depth than the 40 to 50 fathom, has also been regarded as the chief agent controlling vertical distribution. It appears, however, as Prof. Heilprin has remarked, "more than likely that not a single cause, but a combination of causes, is operative in determining the distribution of the deep-sea fauna of darkness must be admitted; but this is so from the nature of the case rather than a matter of choice resting with the animals composing it."

After referring to the fact of the dissimilarity between the faunas of the two poles, Dr. A. E. Ortmann, in a paper on the origin of the deep-sea fauna, observes that we have reason to believe that each of these two great pre-Tertiary faunas, and also the littoral of the post-glacial period, is a derivative of the old Mesozoic Mediterranean, the south-polar fauna of the old Pacific fauna. The first developed along the shores of the northern continents, while the second had its original home on the shores of the Antarctic continent. We know that there is a strange element among the littoral fauna of the southern extremities of the continents, differing entirely from the arctic fauna, and which has not yet attained a full-sea state. This is the Antarctic fauna. The above considerations give us a threefold origin of the present deep-sea fauna:--(1) An ancient Mesozoic (or pre-Tertiary) constituent, derived from a transformed part of the old warm-water fauna of the deep sea, adapted to a changed climatic conditions. It is clearly autochthonous. (2) A more modern, immigrant, Tertiary constituent, which came from the north-polar littoral waters, and immigrated into the deep sea together with the cool water (or after it had cooled). This element goes back to an old pre-Tertiary stock that lived in the warm littoral waters of the old Tethys (Mediterranean Sea), but as a consequence of the drop in temperature and the great rise in the Tertiary element, corresponding to the second one, but belonging to the south pole, which is finally to be traced back to the warm waters of the old Pacific Ocean of pre-Tertiary times. This is the Antarctic fauna. It is the smallest and actually the largest of all living animals, for among its members are included a host of so-called animalcules on one hand, and the whales on the other. The essential characteristics of the deep-sea pelagic animalcule are--(a) An elongated body, of their existence swimming at or near the surface of the ocean, and only by accident touch the shores or the bottom. Much information with regard to the smaller pelagic creatures can be found in the article PLANKTON. Among the groups included in the pelagic fauna may be mentioned the radiolarian animalcules, together with certain representatives of the Forminifera; the siphon-bearing jelly-fishes, such as Physalia (Portuguese man-of-war), Veleda, Porpia, &c.; all the pteropod molluscs, such as Clione, Clione and Cavallina (Hyloidea), together with less abberant gastropods and cephalopods; the small cephalopods molluscs, such as the paper-nautilus (Argonauta) and Spirula; and a number of social ascidians, like Salpa and Pyrosoma. Crustaceans belonging to the entomostracous (shelled) and calanoid divisions abound; and there is a group of insects (Holoabates), belonging to the order Hemiptera, whose home is on the ocean-surface at, practically, any distance from land. Fishes form no incalculable portion of the pelagic fauna, among these being such genera as Dory, and Euthynnus, the mackerel, tunny, flying-sardines (Dortylpterus), sword-fishes (Histio- phorus), sea-horses (Hipocampus), pipe-fishes (Fistulae) and monkey-fishes (Chimaera). Among the few species of fish are included with the few species of the ocean, about which we know almost nothing, the whale, which is not a fish at all, but a cetacean. It is a somewhat intermediate position in regard to habits between cetaceans and seals. While they agree with the former in never (or very rarely) landing and in bringing forth their young at sea, they come inshore to feed. Turtles certainly cannot be considered truly pelagic, since they come ashore to lay their eggs.

A large proportion of the smaller pelagic animals are more or less completely transparent, while others, such as the violet-small, a very small fish which is found in the open ocean, as well as the small bats included as an order, have almost disappeared as possible in the waste of waters. In the case of the larger animals, like mackerel and the whales, the same result is attained by the under surface of the body being silvery white (thus rendering them invisible when below the surface), or to parts above the upper surface olive or blackish green, sometimes, as in the mackerel, mottled to harmonize with the ripple of the waves.

The distribution of the species has been taken by P. L. and W. L. Schlater to some extent as a basis in dividing the ocean into zoological regions. Since, however, such regions were merely defined on the distributional evidence afforded by seals and sea- cows, they are best considered in connexion with the shallow water fauna. The shallow-water, or littoral, fauna includes all marine animals which belong neither to the deep-sea nor to the surface fauna, and is the most important one. The great bulk of marine invertebrates, the littoral fauna may be taken to include the reef-building corals (whose distributional limitations under the influence of temperature-control have already been mentioned) and Likewise seals and sea-cows among mammals, and turtles among reptiles.

The fauna of the coast," observes Prof. H. N. Moseley, "has not yet been truly investigated, and the number of deep-sea forms is at this time, little known. In all probability these pelagic forms will be found to lend new light to an old littoral fauna. It is possible that some of these pelagic forms will again come to form a fresh littoral existence.

The shallow-water fauna has probably been formed almost entirely from the littoral, not in remotest antiquity, but only after food, derived from the debris of the littoral and terrestrial faunas and floras, became abundant in deep water. It was in the littoral region that all the primary branches of the zoological family-tree were derived, and it is possible that the new and advanced forms, a littoral phase, and amongst the representatives of the littoral fauna the recapitulatory history, in the form of series of larval conditions, is most completely retained. From the distribution of certain groups of animals, it has been attempted (as stated) to divide the ocean into a number of zoological provinces, or regions. Among the more important of such schemes, the following may be mentioned.

The surface fauna. Marine Zoological regions.

The coral regions. The shallow-water fauna.

The surface fauna. Coral regions.

Marine Zoological regions.

Coral regions.

The shallow-water fauna. The surface fauna. The shallow-water fauna.

Coral regions.
ZOological DISTRIBUTION

American region; so that the eastern and western shores of the Atlantic appear decidedly more distinct than the eastern and western coasts of America. The extensive Oriental region is by far the richest.

From the distribution of the species (not genera) of barnacles, or cirripeds, which are an aberrant group of Crustacea, Darwin considered that the ocean might be divided into the following regions, viz.—(1) The North Atlantic, comprising North America and Europe down to N. lat. 30°; (2) The West American, from Bering Strait to Tierra del Fuego; (3) The Malay, from India to New Guinea, and (4) The Australian, comprising Australia and New Zealand: the Malay and Australian regions being the richest in cirripeds.

One of the earliest students of the geographical distribution of marine animals was Dr. S. P. Woodward, who, in his Manual of the Molusca, proposed a scheme of zoographical regions. He adopted three main divisions for the warmer parts of the world; namely, the Atlantic, the Indo-Pacific and the Western American; and these Wallace was inclined to regard as the only valid marine molluscan regions. The Indo-Pacific region extends from the Red Sea and the east coast of Africa to the eastern Pacific islands, and corresponds to Prof. Dana's Oriental region for Crustacea, many species ranging over nearly the whole area. The Atlantic region unites the fauna of the east coast of America with that of West Africa and South Europe, but has considerable affinity with that of West America, many genera being common to both areas. Several genera appear restricted to the north temperate zone, which in Wallace's opinion should perhaps form a distinct region. Numerous genera are confined to the Indo-Pacific region. The Atlantic coasts have few peculiar genera of importance, while the west coast of America has hardly any, the difference of its fauna from that of the Atlantic on the one side and the Pacific on the other being chiefly specific. It is stated that while there is not a single species common to the east and west coasts of tropical South America, the corresponding coasts of North America have a large number in common, while others are so closely representative as to be almost identical.

Inclusive of an Arctic province of somewhat doubtful value, Dr. Woodward's three main regions were divided into 18 sub-regions; but, according to a somewhat modified later scheme, these may be arranged in four main groups, as follows:

<table>

Fish Regions.—From the distribution of shore-haunting fishes, Dr. A. C. L. G. Günther suggested the following marine zoological regions, the characteristic family and generic types of which we are prevented by limitations of space from discussing:

I. Arctic Ocean.
II. Northern Temperate Zone.
1. Temperate N. Atlantic.
   1. British district.
   2. Mediterranean district.
   3. N. American district.
2. Temperate N. Pacific.
   1. Kamchatkan district.
   2. Beringian district.
   3. Californian district.
III. Equatorial Zone.
1. Tropical Atlantic.
2. Tropical Indo-Pacific.
C. Pacific Coast of Tropical America.
1. Central American district.
2. Galapagos district.
3. Peruvian district.
IV. Southern Temperate Zone.
1. Cape of Good Hope district.
2. South American district.
3. Chilean district.
4. Patagonian district.
V. Antarctic Ocean.

Mammalian Regions.—The last scheme of marine zoological regions necessary to mention is one proposed by P. L. and W. L. Slater on the distributional evidence afforded by seals, sea-cows and cetaceans. According to this, we have the following six regions, viz.:

(i) Arctoatlantic (North Atlantic), characterized by the occurrence of seals of the subfamily Phocinae, with the genera Halichoerus peculiar to it, and Phoca common to it and No. iv.; the absence of sea-cows; and (it is stated) by the bottle-nosed whales (Hyperoodon) being peculiar to this area.

(ii) Mesatlantic (Mid Atlantic), the sole habitat of the monk-seal (Monachus) and the manatis (Monantus).

(iii) Philopelagica (Indian Ocean) is characterized by the presence of dugongs and the absence of seals.

(iv) Arcticithalia (North Pacific), agreeing with No. i. in the possession of Phoca but distinguished by also having sea-bears and sea-lions (Otaridae); formerly the habitat of the northern sea-cow (Rhytina), and now of the grey whale (Rhinacélotis).

(v) Mesopelagica (Mid Pacific) without Phocaean or sea-cows, but with the elephant-seal (Macrorhinus), from the south, and also Otaridae.

(vi) Notopelagica (Southern Ocean), with four peculiar genera of seals (Phoëcodae), numerous sea-bears and sea-lions, and two peculiar genera of cetaceans, the pigmy-whale (Neoalana) and Arnoux's beaked-whale (Berardius).

To explain the absence of sea-bears and sea-lions from the North Atlantic, and likewise the existence of manatis on both Atlantic coasts, the authors of this scheme call in the aid of a land-connection between Africa and South America, which presented a barrier to the east coast of South America, which the Atlantic to a much later date than is commonly supposed.

III. DISTRIBUTION IN TIME

The subject of the distribution of animals in time, i.e., the relative dates of their first appearance on the earth, and in the case of extinct forms the length of their sojourn there, can be treated but briefly; reference being restricted to the larger groups, and not even all of these being mentioned. The dates of appearance and disappearance of the various groups are only relative, for although many more or less vague attempts have been made to determine the age of the earth, there is no possibility of indicating in years the length of time occupied by the deposition of any one stratum or series of strata. All that can be attempted is to say that one stratum (and consequently the remains of animals that may be entombed in it) is older or younger, as the case may be, than another. For the sequence and names of the various strata, or time-periods of the geological record, see GEOLOGY. An important factor in regard to the past history of animals is the imperfection of the geological record. Recent discoveries have rendered this imperfection much less marked than was formerly the case. There are, however, very extensive gaps, and we have, for instance, no definite information as to where and when the transformation from reptiles into mammals took place.

It may nevertheless be emphatically affirmed that the geological, or rather the palaeontological, record indicates a gradual progression in the status of animals from the lowest to the highest fossiliferous strata. That is to say, the earlier animals were creatures of comparatively low grade (although certain representatives of such groups may have attained a relatively high degree of specialization); and that as we ascend the geological ladder higher and higher types of animals make their appearance, till the series culminates in man himself—the crowning effort of creation, in the modern evolutionary significatio of that term. It is not, indeed, to be supposed that the higher groups made their appearance exactly according to their relative grades (or what we regard as such); all that can be affirmed is that in the main the higher forms have made their appearance later than the lower. The record is thus almost exactly what it might be expected to be on the theory of evolution; while it also accords fairly well, if regarded with sufficient breadth of view—with the Biblical narrative of creation.
As the highest of all vertebrates, it is natural to expect that mammals should be one of the latest groups of that assemblage to make their appearance; and this is as much a matter of fact as are the birds to the reptiles. Only two genera of the class Mammalia are known to commence in the Trias, where they are presumed to be represented by *Microlestes* in Europe and by *Dromatherium* in North America. Even in this fact, however, that the approximately contemporaneous *Trikyodon*, found in South America, in the zone of the former, appears to be in great degree intermediate between reptiles and mammals, it is by no means improbable that none of the Triassic mammals were those of which modern mammals are supposed to be represented by the lower Jurassic Stonesfield Slate, in the upper Jurassic Permian beds, and, very sparingly, in the Wealden of England; while a large fauna has been discovered in the upper Cretaceous of North America. No fossil mammal has been found in the Cretaceous, and all those Mesozoic forms appear, for the most part at any rate, to be referable to the Marsupialia, Insectivora, and, not improbably, the Thylacinidae (or *Thylacinus*). After the lowest Eocene (when the Puerco fauna represented an inferior and apparently non-progressive type; mammals became abundant; and during that epoch most if not all of the existing orders made their appearance. The lower Eocene represents a group of several of the orders, such as the Condylarthra among the Ungulata and the Creadontidae among Carnivora, belonging, however, to lower suborders which disappeared more or less completely by the Oligocene. Several suborders of the Carnivora developed in later Mesozoic periods than the Eocene; but with the exception of the Ancylodon and Tillyodontia (whose right to ordinal distinction is by no means certain) none of the other lower Carnivora are extant. At the present day—as during the greater part of the Tertiary epoch—mammals are the dominant terrestrial representatives of the Vertebrata. We have at present no evidence of the existence of any monotrembs before the Eocene.

Although some of the three-toed bipedal tracks in the Trias of the Connecticut valley were formerly supposed to have been made by birds, there is little doubt that they are really due to dinosaurs. Reptiles of several kinds such as the Condylarthra among the Ungulata and the Creadontidae among Carnivora, belonged, however, to lower suborders which disappeared more or less completely by the Oligocene. Several suborders of the Carnivora developed in later Mesozoic periods than the Eocene; but with the exception of the Ancylodon and Tillyodontia (whose right to ordinal distinction is by no means certain) none of the other lower Carnivora are extant. At the present day—as during the greater part of the Tertiary epoch—mammals are the dominant terrestrial representatives of the Vertebrata. We have at present no evidence of the existence of any monotrembs before the Eocene.

In contradistinction to both the preceding classes, reptiles, which date from the Permian are a living group, at all events so far as both terrestrial and marine forms are concerned. The Permian reptiles were small or medium-sized creatures, few in number, and of generalized character. One of the first representatives was the *Ichthyosaurus* which was represented by *Protosaurus* is the Rhynchocephalia, of which the sole survivor is the New Zealand tuatara (*Sphenodon*). The Mesozoic period, from the Trias to the chalk, is the true age of reptiles. The early forms have been nearly all marine, but none of the Mesozoic marine reptiles have been definitely shown to be referable to the Amniota. Of the land reptiles the Jurassic was the age of the greatest triumphs, especially in the crocodilians and the dinosaurs, the latter belonging to the oldest of the reptilian orders, the Sauria, as demonstrated by their footprints in the sandstone of the Connecticut valley, were represented by species of huge size even in the Trias. The other extinct orders whose distribution was approximately coeval with the Mesozoic period were the ichthyosaurs (Ichthyopterygia), the plesiosaurs (Sauropterygia), and the pterodactyls (Ornithosauria). The Chelonia and crocodilia (if we include the Plesiosauria) date from the Trias, but are also dominant forms at the present day, but the mammal-like Anomodontia (Theromorpha), which ranged from South Africa to India and Russia, were solely Triassic. The Scelidosauria, and Archosauria together with the extinct Cretaceous Pythonormonatha (*Mosaicosauria*), did not come into being till the upper Jurassic, or lower Cretaceous, and constitute the great bulk of the existing members of the class.

Amphibians, carry the origin of vertebrates one stage further back, namely, to the upper Carboniferous. The stegocephalians, which appear to have included the majority of the existing orders, denticles, died out at the close of the Triassic epoch. The existing representatives of the class date, so far as is known, only from the Tertiary, but it is not improbable that the limbless caecilians, which are probably the oldest existing group, may be much older, since they appear to be related to the Stegocephalia.

The class Pisces is the lowest and at the same time the oldest, representing the most ancient vertebrates, dating from the lower Ludlow beds of the upper Silurian, the last to be succeeded by the amphibians. Among the earliest known fish types are the lobe-fins (Dipnoi) which in the order *Cheirolepis* (Dipnoi) are also an ancient group, although surviving in the form of three genera widely sundered in space; the order Arthrodira (as represented by *Coelacanthus* of the Devonian) was solely Palaeozoic. Of the subclass Teleostomi, the fringe-finned group (Crossopterygi) attained its maximum in the Palaeozoic, although it survives in the shape of freshwater forms. True lobe-fins were represented by the enameled, or ganoid, division was abundant during the Palaeozoic and early Mesozoic periods (and still survives in North America), but the modern soft-scaled bony fishes did not make their appearance till the latest periods of the Cretaceous.

Of the class Agnatha, as represented by the modern lampreys, the palaeontological record is very imperfect. There is, however, an order *Lampreys* (*Petromyzontidae*, &c., which was confined to the upper Silurian and Devonian; and *Palaespondylus* of the Devonian has been regarded as an early lamprey (*Cyclostomata*). Whether these were soft-scaled and *Cephalaspis* the earliest existing group, are really teeth of lampreys, has not been definitely ascertained.

The lamp-shells, or Brachiopoda, form a exceedingly ancient group, surviving from the lower Cambrian, as living at the present day, although in greatly diminished numbers compared to the Palaeozoic epoch, when they far surpassed the bivalves in abundance. The group attained its maximum in the Silurian, when, as in the Palaeozoic genera, nearly all the forms belonged to the hingeless section. With the beginning of the Mesozoic period the waning of the brachiopods, which continued till the Tertiary, was general, and was continued throughout the Mesozoic formations. A remarkable feature is the survival to the present day of the Cambrian genus *Trilobites*, *Discorinum*, which attains a large size, while the dominant modern Chilostomata came in with the Tertiary.

The Mollusca, of which the great bulk are marine and the majority of the remainder freshwater, are perhaps the most important of all fossils from the palaeontological point of view. Since the three principal classes (Pelecypoda, Gastropoda and Cephalopoda) are represented in the upper Cambrian, it is evident that the great majority of the Palaeozoic mollusca (the chambered cephalopods of the section Tetrabranchia, now represented by the nautili) were the dominant forms; the bivalves (Pelecypoda) and gastropods showing a relatively poor development. The tetrabranchiate cephalopods continued throughout the Mesozoic, when they were specially represented by the ammonites; but by the Tertiary they had become almost extinct. The section Dipluridae (cuttle-fishes) commenced with the Mesozoic. The bivalve and gastropods have shown a steady increase to the present day, and are now the dominant forms.

Insects date from the Ordovician graptolite-slates of Sweden, when many of the representatives of the class were already being represented by *Palaebolus* of the French upper Silurian. From the Devonian about a dozen forms are known, belonging to several groups; and from the Coal-measures numerous insect-fauna have been discovered and many of the distinctive features by which the modern groups are characterized, the majority of them showing kinship to the cockroach group.

The Myriapoda (centipedes and millipedes) are of comparatively little importance as fossils. The class dates from the Devonian, and is abundant in the Coal-measures; the Palaeozoic forms for the most representing two orders—Archipeda, or Protosynorthynatha—peculiar to that period, of which the second has only a single known species. The modern centipedes (Chilopoda) date mainly from the Tertiary, although several Carboniferous genera have been assigned to the group, Myriapoda, although known from the Cretaceous of Greenland, elsewhere date from the Tertiary.

The class Crustacea—known to include trilobites and king-crabs, as well as scorpions and spiders, is ancient. Scorpions not far removed from existing types—are known in the Silurian, while true spiders occur in the Coal-measures. The great majority of the more typical Palaeozoic arachnids are, however, referred to an order by themselves—the Arachnoidea. King-crabs (*Xiphosura*) date from the Silurian, the existing genus *Lopholithodes* occurring in the Trias; and the great eurypterids (Eurypterygia) and the trilobites (Tribrachidae), of which the Carboniferous, the former dating from the Ordovician, and the latter from the upper Cambrian. Among the existing ordinal groups of the class Crustacea appear to date from the Palaeozoic; the decapods (lobsters and crabs) which represent the highest development of the class, did, however, attain a dominant position till well into the Tertiary. The next highest in the living crustaceans are the Echinodermata, the classes Blastoida and Cystoida are exclusively Palaeozoic, while the stone-likes (Crinoidea) form a
ZOLOGICAL GARDENS

ZOLOGICAL GARDENS, sometimes called ZOOLOGICAL PARKS, institutions in which wild animals are kept in captivity. Their primary object is to gratify the pleasure most persons take in viewing at close range the curious and beautiful living products of nature, but they serve also as means of instruction in natural history, providing material for museums and for investigations in comparative anatomy and pathology, while they may have a commercial value as pleasure resorts, or as show grounds for the display of animals that have been imported or bred for sale.

According to Captain Stanley Flower, director of the Zoological Gardens at Giza, Cairo, Egypt, the ancient Egyptians kept various species of wild animals in captivity, but the first Zoological Garden of which there is definite knowledge was founded in China by the first emperor of the Chou dynasty, who reigned about 1100 B.C. This was called the "Intelligence Park," and appears to have had a scientific and educational object.

The ancient Greeks and Romans kept in captivity large numbers of such animals as leopards, lions, bears, elephants, antelopes, giraffes, camels, and reptiles, such as crocodiles and fish, but strichines and crocodiles, but these were destined for slaughter at the gladiatorial shows. In later times royal persons and great feudal magnates frequently kept menageries of wild animals, aviaries and aquaria, and it is from these that modern public Gardens have taken their origin. Henry I. (1100-1135) established a menagerie at Woodstock, Oxfordshire, England. This was transferred to the Tower of London, apparently in the reign of Henry III., and kept up there until about 1282. Philip VI. had a menagerie in the Louvre at Paris in 1333, Charles V. maintained collections at Conflans, Tournelles and in Paris, and Louis XI. formed a menagerie at Plessis les Tours in Touraine, which after his death was re-established at the Louvre in Paris and enlarged by collections obtained in North Africa. It was destroyed by Henry III. Henry IV. had a small collection, which included an elephant. Louis XIII. kept some animals at Versailles, whilst his son Louis XIV. founded the famous "Menagerie du Parc" at Versailles, which received many animals from Cairo, was maintained for over a century, and furnished much valuable material to French naturalists and anatomists. It gradually decayed, however, and was eventually transferred to the suburban park of St. Cloud in 1789. In 1703 the Paris Museum of Natural History was re-established by law, and Buffon's idea of attaching to it a menagerie was carried out; it is now the collection in the Jardin des Plantes, still survives.

In Germany the elector Augustus I. founded a menagerie at Dresden in 1554. In the New World, according to Prescott, King Nezahualcoyotl had zoological gardens at Tezcuco in Mexico in the middle of the 15th century, whilst in the next century Cortes found aviators and fishponds at Iztapalapan.
and Montezuma II, emperor of Mexico in the beginning of the 16th century, maintained large collections of animals in the gardens of his capital.

Most of the modern zoological gardens date from comparatively recent years, and there are a larger number stocked with a finer collection of animals, more suitably housed, than at any past time in the history of the world. According to a reference list compiled by Captain Stanley Flower, there were 102 actually existing public gardens or parks containing collections of wild animals in 1910, while there are also a considerable number of private collections. It is possible to refer here only to a few.

African.—The Zoological Gardens at Giza, Cairo, are a government institution administered by the Public Works Department. The grounds are beautifully laid out and the collection is particularly rich in African animals, to which the climate is well adapted. The Khartoum Zoological Gardens are free to the public and are under the control of the municipality, but the collection of animals is under the Game Preservation Department. The Transvaal Zoological Gardens at Pretoria are a government institution, and are associated with the Museum.

America, North.—The Zoological Park at Bronx Borough, New York City, opened in 1896, is one of the largest in the world. It is contrived upon a scale suitable for the population of the municipality of the City of New York, and is financed largely out of municipal funds, and is open free to the public five days a week. The Park occupies nearly 300 acres, of great natural beauty, and is managed by a few hands of the most expert landscape gardener. It contains many fine buildings, designed on the most modern lines, but its special feature is a series of spacious enclosures for wild animals, each one adapted as also a national reserve, and has already become an important factor in the preservation of the American bison. The National Zoological Park at Washington, D.C., was founded by Congress in 1888, and is the property of the city of Philadelphia, and is under the control of the Philadelphia Zoological Gardens. The Zoological Gardens at Philadelphia, established in 1874, consists of about 265 acres of land, and is one of the finest collections in the world. It contains a large variety of animals, and has already been an important factor in the preservation of the American bison. The Zoological Gardens in Fairmount Park, Philadelphia, resemble the gardens of the Zoological Society of London, and were organized in 1838. The Society is managed by the Zoological Society of Philadelphia, founded in 1859, and is maintained partly by subscriptions of members, partly by gate-money, and partly by an allowance from the city of Philadelphia. They contain fine buildings, and are arranged in a splendid manner. They present a special interesting feature being the careful quarantine system of new arrivals and the post-mortem examinations of animals that have died. There are many smaller collections in the United States and several in Canada, but none of these present features of special interest.

America, South.—The Zoological Gardens at Buenos Aires are supported by the municipality, and contain many interesting animals, well housed in beautiful surroundings. The director issues a popular illustrated guide and a valuable quarterly scientific journal. At Para, Brazil, is a good collection attached to the Muniz de Souza, and there are unimportant collections at Rio de Janeiro and Bahia.

Asia.—There are many small collections in different parts of Asia, but the only garden of great interest is at Alipore, Calcutta, supported by the municipality of Calcutta. The Garden is well kept, and managed by an honorary committee. It was established in 1875 by the government of Bengal, in co-operation with the Zoological Society of London. The existing collection is maintained, the variety of bird life, both feral and in captivity, being notable.

Australia and New Zealand.—There are Zoological Gardens at Melbourne. The Garden is supported by the municipality of Melbourne, and contains a large and fine collection of animals. The Gardens at Wellington, New Zealand, supported partly by private societies and partly by the municipalities. These collections are not specially rich in the very interesting and peculiar native fauna, but devote themselves preponderantly to imported animals.

Europe.—There are a large number of zoological gardens in Europe, but those of real importance are not numerous. The Imperial Menagerie of the palace of Schönbrunn, Vienna, was founded about 1752. The public are admitted free to the greater part of the grounds, but the gardens and collection are the property of and are supported by the emperor of Austria. The collection is very rich, and was considerably increased by the large and menagerie of the Royal Zoological Society of Antwerp were founded in 1843, and have been maintained at a very high level. The collection is not usually very rich in species, but there have been long-corned and short-horned bison, breeding of large animals such as hippopotamuses, lions and antelopes, and a very large business is done in domesticated birds, waterfowl, and caged animals. The large and well-housed wild animals, held in the Gardens, chiefly surpluss stock from various other Institutions. The Gardens, are famous. The revenue is derived partly from subscriptions, partly from gate-money, from the fine concert-ball and refreshment rooms, and from the sales of the publications of the Zoological Society of London in Regent's Park, founded in 1828, extending to only about 35 acres, but the collection, if species and rare animals are considered rather than the number of individuals, has always been the finest in existence. The Society is not assisted by the state or the municipality, but derives its revenue from the subscriptions of Fellows, gate-money, Garden receipts and so forth. In addition to the museum, there is an infirmary and operating room, an anatomical and pathological laboratory, and the Society holds scientific meetings and publishes stately volumes containing the results of zoological research. Partly because of its long and successful history, and partly because of the existence, in Great Britain throughout the world, the Zoological Society of London has been able to exhibit for the first time in captivity a greater number of species of wild animals than probably the total of all the zoological gardens in the British Islands. The Zoological Society of Ireland, founded in 1830, maintains a fine collection in the Phoenix Park at Dublin, and has been specially successful in the maintenance of Irish and British animals. The Clifton and West of England Zoological Society owns small but extremely well-housed Zoological Gardens, well situated on the edge of Clifton Downs. Messrs. Jennison have maintained since 1831 a Zoological Collection in their gardens, and maintain several large menageries, and a fine collection, with a specially well-designed monkey-house. At Lyons and at Marseilles in France there are beautifully situated Gardens with small collections, in each case owned and controlled by the municipal authorities. In Paris, the famous Jardin des Plantes of the Jardin des Plantes was founded in 1793 and is under the control of the Museum authorities. It is open free to the public and generally contains a good collection of mammals. The larger and better known Jardin d'Acclimatation in the Bois de Boulogne is owned and conducted by a private company. It was founded in 1858 and is beautifully situated and well laid out. In addition to wild animals, and to small prospects and presents of special interest, efforts are being made to revive its prosperity. Germany contained in 1910 nineteen zoological gardens in actual existence, with zoological gardens in process of formation. In most cases they are associated with concert-halls and open-air restaurants, which account for much of the income. The collection is not very rich in species of wild animals, and the increasing scientific and commercial enterprise of the nation have combined to make the collections rich and interesting. The great Gardens at Berlin were founded in 1844, and belong to a private company, but owe much to the interest and beneficence of the Royal House. The collection is extremely good, the houses are well constructed and sumptuously decorated, and the general management is conducted on the most scientific and practical lines. The Zoological Gardens at Hamburg, founded in 1863 and owned by a private company, although not large, contain many fine buildings and are a well-managed business. They present a much longer period than has been done in any other zoological collection. The beautiful Gardens at Cologne, founded in 1860, contain many interesting features and in particular one of the finest aviaries in existence. The Gardens at Munich, founded in 1863, always contain a large and fine collection and display many ingenious devices for the housing of the animals. More recently C. Hagenbeck has constructed a remarkable zoo, at Stellnen, Germany, where the house of one animal of this is a magnificent panorama, from the central point of which large collections of wild animals are visible without any interference. The buildings are covered with a large and powerful cemented over metal gimmel-work, and are arranged to form ledges and boulders, and escarpment and peaks, and faced with coloured tiles. It is made entirely of metal, and any escape of the animals, which are confined within their bounds by undercut overhanging ridges, and by deep and wide ditches, is masked by rockwork. The arrangement is extremely successful from the
spectacular point of view, and very suitable where most of the animals are young and in process of training. The chief gardens in London well bear out the statement in "Artis Magistra." In addition to the menagerie, founded in 1838, and since then remaining one of the chief collections of the world, the Society owns a fine aquarium, and supports a museum and library. The London Zoological Society is the only one of all the zoological collections of other European countries are of little importance.

Certain general remarks may be made on the efficient management of the zoological gardens.

Finance.—Disbursements for rent, rates and taxes naturally vary according to the special conditions; in a large number of cases public land is provided free of cost, and in a smaller number of cases, where few of their useful public functions, are relieved of the ordinary burden of taxation. In London, rent, rates and taxes have all to be paid, precisely as if the gardens were a profit-distributing private institution, the annual expenditure for rent, rates and taxes being largely in excess of all other costs. Over a limited area, and excluding purely scientific departments, costs about £6000 per annum; gardening department, about £1500 per annum; maintenance of buildings, enclosures, paths and so forth, about £4000 per annum; provisions for animals, about £4000 per annum; litter, water, heating and general manegerie expenses about £6000 per annum. These figures are based chiefly on the London expenditure for the year 1900 which is probably more varied than any other, but not specially large in numbers, containing on an average a little over 3000 individuals. The cost of the collection depends on the numbers received by purchase, in exchange, and by other donations of animals of all kinds. In London a collection such as that in London can be adequately maintained. The cost of new buildings varies too much to make any individual figures useful.

The zoological gardens are owned by private companies, and derive their income entirely from gate-money, menagerie sales, rent of refreshment rooms, concert-halls and other auxiliary public attractions. They are being dealt with amongst the members of the company. In other cases the gardens are assisted by public authorities, in return for which a certain number of free days are given. In other cases again, as in the case of London, the income is derived partly from the sale of memorabilia, and members of the company receive privileges as to admission, and partly from gate-money and manegerie receipts, all the income being expended on the maintenance of the institution and on scientific purposes.

This depends entirely on the extent of the object of the institution. The species and varieties of mammals and birds that have a commercial value as farmyard stock or as pets, are for the most part easy to keep, are attractive to the public and may be a source of profit. Some of the smaller gardens in Europe, and perhaps a majority of those in other parts of the world, pay much attention to this side, but the more important collections have possibilities limited to natural species and wild animals. In theory every wild species has its place in a zoological collection, but the actual choice is limited by many practical considerations, that the better-known collections are prohibitively expensive. Birds of the family of the raptors, the large leading collections devote a good deal of attention to reptiles and batrachians; fishes and aquatic invertebrata are most often to be found. There are, however, species of birds and invertebrata that are seldom to be seen and at most of a few moths and butterflies, spiders, scorpions and scorpions, mollusces and crustaceans.

Within these limits, the first choice falls on large and well-known creatures which every one can recognize and desires to see. The large Carnivora, lions, tigers, jaguars and leopards are the first favourites; then follow monkeys, then the large ungulates, elephants, rhinoceroses and hippopotamines, camels and giraffes, deer and antelopes and equine animals, whilst birds are appreciated chiefly for plumage and song. Animals vary very greatly in visibility (see longevity), and practical experience has shown that certain animals, bearers of a special proportion, and with many reasons that appear to be psychological as well as physical quickly succumb. Many animals of great vitality, from their nocturnal habits, or natural disposition, display themselves so select few to allow of the public, whilst closely allied species are not distinguished except by trained observers. If the object of a collection is simply to provide a hardy and popular exhibition, it is neither difficult nor very costly to get together and to maintain. But if the object be, as in the case of the greater zoological institutions, to get together as many species as possible, and to exhibit animals that have a value when they are subjected to it, Protection from violent draughts and shelter from extremes of heat and cold are necessary, but in most cases the choice is best left to the animals themselves, and the most successful arrangements consist of free exposure to the sun and rain and the minimum amount of artificial assistance. Living beings are subject to epidemics, and in an ideal menagerie special precautions should be taken. New arrivals should be quarantined until it is certain that they are in a satisfactory condition of health. Buildings and their menageries are disinfected, and their cages and enclosures disinfected, whilst as a matter of routine the enclosure in which any animal has died should be thoroughly disinfected and sprayed with carbolic acid, any pathological examination which should be made in every case, appropriate measures of disinfection employed.

Feeding.—The food must be as varied as possible, and special arrangements should be made for the incoming and outgoing of the supply. It is important that no more should be supplied at a time than is necessary, as much animals rapidly foul their food, and except in a few special cases, wild animals are peculiarly liable to illness from such results. Many of them should be fed from time to time by trained men, either after a rigid examination, which should be made in every case, appropriate measures of disinfection employed.
hours and which in the winter dark of northern latitudes must be lighted up once or twice in the night to have the opportunity of feeding. Knowledge of the habits of animals and experience are the best guides to the nature of food to be supplied, but the keeper should be careful of oddities of diet and to judge from these of the extent to which any particular substances are being digested. The feeding of carnivores is on the whole the most easy; the chief pitfall being the extreme liability of all except the larger forms to get disturbed from food that is not quite fresh. The more powerful creatures in a state of nature are accustomed to kill a prey too large to be devoured at once, and to return to it again and again, long after it has been putrid; the smaller forms, for the most part, devour nothing but small creatures immediately after they have been captured and killed, and consequently in an absolutely fresh condition. The chief difficulty of feeding creatures in captivity is that their constitutions are not adapted to the richness of cultivated fruits and cereals, and, in captivity, they may suffer mechanically from the want of bulk in their food supply, or if they eat a quantity sufficient in bulk, it contains an excess of nutritious material. A minor problem in menagers is injudicious feeding by visitors. Many authorities attempt to restrain visitors from feeding the animals in their charge; but such a restriction, even if practicable, is not all gain, for animals in captivity are less inclined to mope, and are more intelligent and tame, if they become accustomed to regard visitors as pleasant sources of tit-bits.

In 1857 the Zoological Collections visited in Europe in 1907 (Public Works Dept., Cairo): Reference List of the Zoological Gardens of the World (1910); C. A. A. Peck, The Zoological Gardens of Europe (London, 1909); Bulletin of the Zoological Society of Washington (as well as the proceedings of the Societies of parents and children; Annual Reports of the Smithsonian Institution, Washington: G. Loisel, Rapport sur une mission scientifique pour l'exploration de l'Amerique du Sud (1841); and L. de Jouver, Jardins zoologiques de France, par div. (1908); with many photographs and plans. (P. C. M.)

ZOOLOGICAL NOMENCLATURE, the system by which it is attempted to designate, exactly and conveniently, the animals which exist now or are known to have existed. It is, in fact, the grammar of classification, and has the advantage that it is universal. The various forms have been classified from the country to country, but even amongst civilized peoples, and still more amongst unequipped persons and the lower races, the animals denoted by popular names are a very small part of existing forms, whilst the nomenclature of the names is vague and varying. Linnaeus was the first to adopt a precise system, which he explained and applied in 1758 in his Philosophia botanica, and later extended to animals in the tenth edition of his Systema naturae (1758). The foundation of the system was the application of a binomial nomenclature to species (see SARKS). Each species has two synonyms, by the use of which names may be used, contrasting that of the genus to which it belongs, and the second the appellation peculiar to the species. There are many different cat-like animals, such as the common cat, lion, tiger and so forth, more obviously related to one another than they are to dog-like or hyaena-like carnivores. The assemblage of cats constitute the genus Felis, the wild cat being one species, Felis catus, the lion another, Felis leo, the tiger yet another, Felis tigris, and so forth. The various genera were grouped into families, the family taking its designation from the leading genus, as, for instance, the family Felidae for the cats. Families are grouped into orders, of which the Cat order Carnivora, and the orders in Classes. There is still little uniformity in the designation of the assemblages higher than families, and less agreement as to the degree or measure of separation to be indicated by the use of the designations employed. For the system adopted in the present work, see ZOOLOGY.

Linnaeus named very many species and genera, but the number known continues to increase at a prodigious rate, while precision of description has far surpassed his conceptions, with the result that his rules have long ceased to meet the needs of modern science. In 1842 the English ornithologist, H. E. Strickland, assisted by a committee of which Charles Darwin was a member, elaborated rules which became known as the Strickland Code, and were adopted in 1845 by the American Society of Geologists and Naturalists, and in 1846 by the British Association for the Advancement of Science. In 1881, the International Congress of Geology, meeting at Bologna, constructed a code differing in many respects from that of Strickland, and was subsequently applicable to fossil forms. In 1882 the Zoological Society of France agreed on new rules, based on those of Strickland, but formulated by a committee of which Maurice Chaper and R. Blanchard were leading members. In 1885 the American Ornithologists' Union, urged by the needs of the great advance in ornithology in America, adopted rules which were still further modified from the Strickland Code. In 1894 the Zoological Society of Germany framed another set of rules drawn up by J. V. Carus, L. Doderlein and K. Möbius. In 1896 the English entomologist Lord Walsingham devised another modification of the Strickland Code, which became the International Code of Nomenclature of Land and Fresh-water Mollusca. The existence of so many conflicting authorities caused much confusion and an impractical condition of anarchy in which many distinguished and active systematists elaborated practices individual to themselves. When the International Congress of Zoology held its first meeting in Paris in 1889, one of the chief objects submitted to it was the necessity of framing rules which should be uniform in their application to the whole animal kingdom and which might receive international sanction. The discussion was carried over to the second meeting of the Congress, at Madrid, in 1892, and Maurice Carus was authorized to propose a code to be adopted and occasionally adopted, but with one important exception, to be referred to later, fundamental lines of agreement appear to have been reached, and many of the most active workers have accepted the international code as binding. It is possible here to give only a short summary of the more important rules.

The goal to be reached is that the connotation and denotation of every zoological designation should be definite. One name is to signify only one distinct species (by the principle of priority of adoption, this means that the first author, who has published the name, is entitled to use it). When a genus is divided into subgenera, the name of the type sub-genus must be the same as the name of the genus, and when it is desired to cite the name of a sub-genus this name must be placed in parentheses between the generic and the specific names, as, for instance, Vanessa (Venezia) cardui and Vanessa (myraneis) cardui respectively, for the typical sub-genus and another sub-genus of the genus Vanessa. Species names are in italics, although in Latin, with a Latinisation of the generic name, as with a Latinisation of the specific name, as, for instance, FELIS rufus Linnaeus. Names are merely designations, or recognition marks, and not descriptions, and hence a name is not to be rejected or changed if it is otherwise valid, because it gives a wrong description: there is no more reason why Felis rufus should be a ruddy cat than John Black a person of swarthy complexion; nor is a name to be rejected...
because of tautonomy, and thus Apus apus apus may be a valid designation of a sub-species if the names are otherwise valid.

It has happened frequently and continues to happen that a creature is discovered to have been given more than one name. Which of these is valid? The decision of this is one of the most difficult and controverted problems in nomenclature. In the hope of settling it by some system which should be as nearly as possible automatic and should leave the least possible to the inclination or choice of the individual worker, there was formulated what is called the rule of priority. The valid name of a genus or species is the one that was first published, but with the conditions that the name was published and accompanied by an indication, definition or description, and second that the author applied the principles of binary nomenclature. The tenth edition of Linnaeus' Systema naturae (1758) is the work that first consistently applied the binary system to zoology generally and is accepted as the starting-point of zoological nomenclature. Beginning from this the oldest available name is therefore to be retained. The application of the rule of priority is in many cases very difficult, but the labours of zoologists in many groups are rapidly succeeding in making the necessary direct and incidental changes in nomenclature, whilst, with regard to recent work, the rule is invaluable. A special difficulty has, however, arisen and is pressing so acutely that a most important modification is likely to be introduced. To systematists working with a large series of species in a museum or collection, one species is as important as another, and changes of names even of familiar animals are matters of little moment. But a comparatively small number of animals hold a prominent place in the attention of zoologists who are not specially systematists and of the public interested in natural history. It is explained that application of the rules of priority is changing the names of many familiar animals, designations that are sanctioned by long usage in museums and laboratories, in the famous treatises of comparative anatomy, of general biology, of travel, medicine, and the sciences and subjects closely related to zoology. There is being claimed, in fact, protection against the law of priority for a certain number of such familiar and customary appellations. The machinery for drafting such a list of exceptions exists in the permanent nomenclature commission of the International Congress of Zoology, and there is more than a hope that this change will come into operation.

To make the denotation of zoological names precise, exact workers are endeavouring to associate the conception of types with names, a process which can be made simple and definite with new work, but which presents great difficulties in the attempt to apply it to existing terms. Every family should have designated one of its genera as the type genus, every genus a type species and so forth. In the case of species or sub-species the type is a single specimen, either the only one before the author when writing his description, or one definitely selected by him, the others being paratypes. Such type specimens are the keynotes of modern expert systematic work and their careful preservation and registration is of fundamental importance. A co-type is one of several specimens which have together formed the basis of a species, no one of them having been selected by the author as a type. A toptype is a specimen killed at the typical locality.

Zoology (from Gr. ζωologia, a living thing, and μετρος, theory), that portion of biology (q.v.) which relates to animals, as distinguished from that portion (Botany) which is concerned with plants.

History

There is something almost pathetic in the childish wonder and delight with which mankind in its earlier phases of civilization gathered up and treasured stories of strange animals from distant lands or deep seas, such as are recorded in the Physiologus, in Albertus Magnus, and even at the present day in the popular treaties of Japan and China. That omnivorous universally credulous stage, which may be called the "legendary," was succeeded by the age of collectors and travellers, when many of the strange stories believed in were actually demonstrated as true by the living or preserved trophies brought to Europe. The possibility of verification established verification as a habit; and the collecting of things, instead of the accumulating of reports, developed a new faculty of minute observation. The early collectors of natural curiosities were the founders of zoological science, and to this day the naturalist-traveller and his correlative, the museum curator and systematist, play a part in the progress of zoology. Indeed, the historical and present importance of this aspect or branch of zoological science is so great that the name "zoology" has until recently been associated entirely with it, to the exclusion of the study of minute anatomical structure and function which have been distinguished as anatomy and physiology. Anatomy and the study of animal mechanism, animal physics and animal chemistry, all of which form part of a true zoology, were excluded from the usual definition of the word by the mere accident that the zoologist had his museum but the gardener of living specimens as the botanist had, and whilst the zoologist was thus deprived of the zoological and physiological study—only later supplied by the method of preserving animal bodies in alcohol—the demands of medicine for a knowledge of the structure of the human animal brought into existence a separate and special study of human anatomy and physiology.

From these special studies of human structure the knowledge of the anatomy of animals has proceeded, the same investigator who had made himself acquainted with the structure of the human body desiring to compare with the standard given by human anatomy the structures of other animals. Thus comparative anatomy came into existence as a branch of inquiry apart from zoology, and it was only in the latter part of the 19th century that the limitation of the word "zoology" to a knowledge of animals which expressly excludes the consideration of their internal structure was rejected by the general consent of those concerned in the progress of science. It is now generally recognized that it is mere tautology to speak of zoology and comparative anatomy, and that museum naturalists must give attention as well to the inside as to the outside of animals.

Scientific zoology really started in the 16th century with the awakening of the new spirit of observation and exploration, but for a long time ran a separate course uninfluenced by the progress of the medical studies of anatomy and physiology. The active search for knowledge by means of observation and experiment found its natural home in the universities. Owing to the connexion of medicine with these seats of learning, it was natural that the study of the structure and functions of the human body and of the animals nearest to man should take root there; the spirit of inquiry which now for the first time became general showed itself in the anatomical schools of the Italian universities of the 16th century, and spread fifty years later to Oxford.

In the 17th century the lovers of the new philosophy, the investigators of nature by means of observation and experiment, banded themselves into academies or societies for mutual support and intercourse. The first founded of surviving European academies, the Academia Naturae Curiosorum (1651), especially confined itself to the description and illustration of the structure of plants and animals; eleven years later (1662) the Royal Society of London was incorporated by royal charter, having existed without a name or fixed organization for 1 The medieval attitude towards both plants and animals had no relation to real knowledge but was entirely part of the peculiar and in itself highly interesting mysticism. A fantastic and elaborate doctrine of symbolism existed which comprised all nature; witchcraft, alchemy and medicine were its practical expressions. Animals as well as plants were regarded as "simples" and used in medicine, and a knowledge of them was valued from this point of view.

2 The Academia Secretorum Naturae was founded at Naples in 1560, but was suppressed by the ecclesiastical authorities.

Change in the character of the science.
The rest of nature, specially cared for, specially created by a Divine Being. Thus it was that the so-called "Natur-philosophie" of the last decade of the 18th century, and their successors in the first quarter of the 19th, found few adherents among the working zoologists and botanists. Lamarck, Trevisanus, Erasmus Darwin, Goethe, and Saint-Hilaire preached to deaf ears, for they advanced the theory that living beings had developed by a slow process of transmutation in successive generations from simpler ancestors, and in the beginning from simplest formless matter, without being able to demonstrate any existing mechanical causes by which such development must necessarily be brought about. But they were among the first to demand that every feature of a development had taken place; but, as no one could show as a simple fact of observation that it had taken place, nor as a result of legitimate inference that it must have taken place, it was quite as likely that the past and present species of animals and plants had been separately created or individually brought into existence by unknown and inscrutable causes, and (it was held) the truly scientific man would refuse to occupy himself with such fancies, whilst ever continuing to concern himself with the observation and record of indubitable facts. The answer was "to be in the "Natur-philosophie," though right in their main conception, were premature.

It was reserved for Charles Darwin, in the year 1859, to take the whole theory of organic evolution on a new footing, and by his discovery of a mechanical cause actually existing and demonstrable by which organic evolution must be brought about, entirely to change the attitude in regard to it of even the most rigid exponents of the scientific method. Darwin succeeded in establishing the doctrine of organic evolution by the introduction into the web of the zoological and botanical sciences of a new and powerful hypothesis. The subject-matter of this new science, as the genuine science of biological science, had been neglected: it did not form part of the studies of the collector and systematicist, nor was it a branch of anatomy, nor of the physiology pursued by medical men, nor again was it included in the field of microscopy and the cell-theory. The area of biological knowledge which Darwin was the first to subject to scientific method and to render, as it were, contributory to the great stream formed by the union of the various branches, is that which relates to the breeding of animals and plants, their congenital variations, and the transmission and perpetuation of those variations. This branch of biological science may be called the "Physiognomy of the race," and the "Organic Evolution." Outside the scientific world an immense mass of observation and experiment had grown up in relation to this subject. From the earliest times the shepherd, the farmer, the horticulturist, and the "fancier" had for practical purposes made themselves acquainted with a number of biological laws, and successfully applied them without exciting more than an occasional notice from the academic students of biology. It is one of Darwin's great merits to have made use of these observations and to have formulated their results to a large extent as the laws of variation and heredity. As the breeder selects a congenital variation which suits his requirements, and by breeding from the animals (or plants) exhibiting that variation obtains a new breed specially characterized by that variation, so in nature there is a selection amongst all the congenital variations of each generation of a species. This selection depends on the fact that more young are born than the natural provision of food will support. In consequence of this excess of births there is a struggle for existence and a survival of the fittest, and consequently an ever-present necessarily acting selection, which either maintains accurately the form of the species from generation to generation or leads to its modification in correspondence with changes in the surrounding circumstances which have relation to its fitness for success in the struggle for life. Darwin's introduction of the science into the domain of scientific biology was accompanied by a new and special development of a branch of study which had previously been known as teleology, the study of the adaptation of organic
structures to the service of the organisms in which they occur. It cannot be said that previously to Darwin there had been any very profound study of teleology, but it had been the delight of a certain type of mind—that of the lovers of nature or naturalists par excellence, as they were sometimes termed—to watch the habits of living animals and plants, and to point out the remarkable ways in which the structure of each variety of organic life was adapted to the special circumstances of life of the variety or species, living colour, and graceful forms of some animals and plants which the museum zoologists gathered without comment were shown by these observers of living nature to have their significance in the economy of the organism possessing them; and a general doctrine was recognized, to the effect that no part or structure of an organism is without definite use and adaptation, being designed by the Creator for the benefit of the creature to which it belongs, or else for the benefit, amusement or instruction of his highest creature—man. Teleology in this form of the doctrine of design was never very deeply rooted amongst scientific anatomists and physiologists, but it continued to be a material and scientific fact to speculate somewhat vaguely on the subject of the utility of this or that startling variety of structure; but few attempts, though some of great importance, were made systematically to explain by observation and experiment the adaptation of organic structures to particular purposes in the case of the lower animals and plants. Teleology had, indeed, an important part in the development of physiology—the knowledge of the mechanism, the physical and chemical properties, of the parts of the body of man and the higher animals allied to him. But, as applied to lower and more obscure forms of life, teleology presented almost insurmountable difficulties; and consequently, in place of exact experiment and demonstration, the most reckless though ingenious assumptions were made as to the utility of the parts and organs of lower animals. Darwin's theory had as one of its results the reformation and rehabilitation of teleology. According to that theory, every organ, every part, colour and peculiarity of an organism, must either be of benefit to that organism itself or have been so to its ancestors; 1 no peculiarity of structure or general conformation, no habit or instinct in any organism, can be supposed to exist for the benefit or amusement of another organism, not even for the delectation of man himself. Necessarily, according to the theory of natural selection, structures either are present because they are selected as useful or because they are still inherited from ancestors to whom they were useful, though no longer useful to the existing representatives of those ancestors. Structures previously inexplicable were now explained as survivals from a past age, no longer useful though once of value. Every variety of form and colour was urgently and absolutely called upon to produce its title to existence either as an active useful agent or as a survival. Darwin himself spent a large part of the later years of his life in thus extending the new teleology.

The old doctrine of types, which was used by the philosophically minded zoologists (and botanists) of the first half of the 19th century as a ready means of explaining the failures and difficulties of the doctrine of design, fell into its proper place under the new dispensation. The adherence to type, the favourite conception of the transcendental morphologist, was seen to be nothing more than the expression of one of the laws of teleology, the persistence of hereditary transmission of ancestral characters, even when they have ceased to be significant or valuable in the struggle for existence, whilst the so-called evidences of design which was supposed to modify the limitations of types assigned to Himself by the Creator were seen as adaptations due to the selection and intensification by selective breeding of fortuitous congenital variations, which happened to prove more useful than the many thousand other variations which did not survive in the struggle for existence.

Thus not only did Darwin's theory give a new basis to the study of organic structure, but, whilst rendering the general theory of organic evolution equally acceptable and necessary, it explained the existence of low and simple forms of life as survivals of the earliest ancestry of more highly complex forms, and revealed the classificatory systematist as unconscious attempts to construct the genealogical tree or pedigree of plants and animals. Finally, it brought the simplest living matter or formless protoplasm before the mental vision as the starting-point whence, by the operation of necessary mechanical causes, the highest forms have been evolved, and it rendered unavoidable the conclusion that this earliest living material was itself evolved by gradual processes, the result also of the known and recognized laws of physics and chemistry, from material which we should call not living. It abolished the conception of life as an entity above and beyond the common properties of matter, and led to the conviction that the marvellous and exceptional qualities of that which we call 'living' matter are nothing more nor less than an exceptionally complicated development of those chemical and physical properties which we recognize in a gradually ascending scale of evolution in the carbon compounds, containing nitrogen as well as oxygen, sulphur and hydrogen as constituent atoms of their enormous molecules.

Thus mysticism was finally banished from the domain of biology, and zoology became one of the physical sciences—the science which seeks to arrange and discuss the phenomena of animal life and form, as the outcome of the operation of the laws of physics and chemistry.

A subdivision of zoology which was at one time in favour is simply into morphology and physiology, the study of form and structure on the one hand, and the study of the activities and functions of the forms and structures on the other. But a logical division like this is not necessarily conducive to the ascertainment and remembrance of the historical progress and present significance of the science. No such distinction of mental activities as that involved in the division of the study of animal life into morphology and physiology has ever really existed: the investigator of animal forms has never entirely ignored the functions of the forms studied by him, and the experimental inquirer into the functions and properties of animal tissues and organs has always taken very careful account of the forms of those tissues and organs. A more instructive subdivision must be one which corresponds to the separate currents of thought and mental preoccupation which have been historically manifested in western Europe in the gradual evolution of what is to-day the great river of zoological doctrine to which they have all been tributary.

It must recognize the following five branches of zoological study:

1. Morphology.—The work of the collector and systematist: Gall, Linnæus and his predecessors, by Cuvier, Agassiz, Haeckel.

2. Biometrics.—The lore of the farmer, gardener, sportsman, fancier and field-naturalist, including thrematology, or the science of breeding, and the allied teleology, or doctrine of organic adaptations: exemplified by the patriarch Jacob, the poet Virgil, Sprengel, Kirby and Spence, Wallace and Darwin.
1. **Zoo-Dynamics, Zoo-Physics, Zoo-Chemistry.**—The pursuit of the learned physician,—anatomy and physiology: exemplified by Harvey, Haller, Hunter, Johann Müller.

2. **Plasmody.**—The study of the ultimate corpuscles of living matter, their structure, development and properties, by the aid of the microscope: exemplified by Malpighi, Hook, Schwann, Kowalewsky.

3. **Philosophical Zoology.**—General conceptions with regard to the relations of living (animal) to the universe, to mankind, and to the Creator, their origin and significance: exemplified in the writings of the philosophers of classical antiquity, and of Linnaeus, Goethe, Lamarck, Cuvier, Lyell, H. Spencer and Darwin.

It is unnecessary to follow in this article all these subjects, since they are for the most part treated under separate headings, not indeed under these names—which are too comprehensive for that purpose—but under those of the more specific questions which arise under each. Thus **Bionomics** is treated in such articles as Evolution, Heredity, Variation, Mendelism, Reproduction, Sex, &c.; **Zoo-dynamics** under Medicine, Surgery, Physiology, Anatomy, Embryology, and allied articles; **Plasmody** under Cytology, Protoplasm, &c.; and **Philosophical Zoology** under numerous headings, Evolution, Biology, &c. See also Zoological Distribution, Palaeontology, Oceanography, Microtomy, &c.

It will be more appropriate here, without giving what would be a needless repetition of considerations, both historical and theoretical, which appear in other articles, to confine ourselves to two general questions, (1) the history of the various schemes of classification, or Morphography, and (2) the consideration of the main tendencies in the study of zoology since Darwin.

### Systems of Classification

Morphography includes the systematic exploration and tabulation of the facts involved in the recognition of all the recent and extinct kinds of animals and their distribution in space and time. (1) The museum-makers of old days and their modern representatives the curators and describers of zoological collections, (2) early explorers and modern naturalist-travellers and writers on zoography, and (3) collectors of fossils and palaeontologists are the chief varieties of zoological workers coming under this head. Gradually since the time of Hunter and Cuvier, anatomical study has associated itself with the more superficial morphography until to-day no one considers a study of animal form of any value which does not include internal structure, histology and embryology in its scope.

The real dawn of zoology after the legendary period of the middle ages is connected with the name of an Englishman, Edward Wotton. Edward Wotton, born at Oxford in 1492, who practised as a physician in London and died in 1555. He published a work, De Differentiis animalium at Paris in 1552. In many respects Wotton was simply an exponent of Aristotle, whose teaching with various fanciful additions, constituted the real basis of zoological knowledge throughout the middle ages. It was Wotton's merit that he rejected the legendary and fantastic accretions, and returned Aristotle and the observation of nature.

The most ready means of noting the progress of zoology during the 16th, 17th and 18th centuries is to compare the classification of Aristotle with the most able of those who were to be found in the world of zoology itself. Aristotle did not definitely and in tabular form propose a classification of animals, but from a study of his treatises Histria animalium, De generatione animalium, and De partibus animalium the following classification can be arrived at:

A. **Σπάννα,** blood-holding animals ( = Vertebrata).

1. **Ζωοροώδη** (= Mammalia, including the Whale).
2. **Ορνιθῆ** ( = Birds).
3. **Σεραθίων** (= Reptilia, four-footed or legless Euména which lay eggs. Reptiles and Amphibia).
4. **Πυγμα** (= Fishes).

B. **Ενναυα,** bloodless animals ( = Invertebrata).

1. **Μελκόα,** soft-bodied *Anema* ( = Cephalopoda).
2. **Μελακτέρας,** soft-shelled *Anema* ( = Crustacea).
3. **Σιμενικ,** insected *Anema* or Insects ( = Arthropoda, exclusive of Crustacea).

Wotton follows Aristotle in the division of animals into the *Enauma* and the *Anema*, and in fact in the recognition of all the groups above given, adding only one large group to those recognized by Aristotle under the *Anema* modifications—namely, the group of *Zoophyta*, in which Wotton includes the Hololuriae, Star-Fishes, Medusae, Sea-Aenemes and Sponges. Wotton divides the viviparous quadrapeds into the many-toed, double-hoofed and single-hoofed. By the introduction of a method of classification which was due to the superficial Pliny—depending, not on structure, but on the medium inhabited by an animal, whether earth, air or water—Wotton is led to associate Fishes and Whales as aquatic animals. But this is only a momentary lapse, for he broadly distinguishes between the two kinds.

The Swiss professor, Konrad Gesner (1516–1565), is the most voluminous and instructive of these earliest writers on systematic zoology, and was so highly esteemed that his *Historia animalium* was published a hundred years after his death. His great work appeared in successive parts e.g. *Vivipara*, *ovipara*, *aves*, *pisces*, *serpentes* et *scorpios*—and contains descriptions and illustrations of a large number of animal forms with reference to the lands inhabited by them. Gesner's work, like that of John Hunter (b. 1628), who was a wonderful student at St Andrews, and like that of Ulysses Aldrovandi of Bologna (b. 1552), was essentially a compilation, more or less critical, of all such records, pictures and relations concerning beasts, birds, reptiles, fishes and monsters as could be gathered together by one reading in the great libraries of Europe, travelling from city to city, and frequenting the company of those who either had themselves passed into distant lands or possessed the letters written and sometimes the specimens brought home by adventurous persons.

The exploration of parts of the New World next brought to hand descriptions and specimens of many novel forms of animal life, and in the latter part of the 16th century and the beginning of the 17th that careful study by "specialists" of the structure and life-history of particular groups of animals was commenced, which, directed at first to common and familiar kinds, was gradually extended until it formed a sufficient body of knowledge to serve as an anatomical basis for classification. This minuter study had two origins, one in the researches of the medical anatomists, such as Fabricius (1537–1619), Severinus (1580–1608), Harvey (1578–1657), and Tyson (1649–1708), the other in the careful work of the entomologists and first microscopists, such as Malpighi (1628–1694), Swammerdam (1637–1680), and Hook (1635–1702). The commencement of anatomical investigations deserves notice here as influencing the general accuracy and minuteness with which zoological work was prosecuted, but it was not until a late date that their full influence was brought to bear upon systematic zoology by Georges Cuvier (1769–1832).

The most prominent name between that of Gesner and Linnaeus in the history of systematic zoology is that of John Ray (1628–1705). A chief merit of Ray is to have limited the term "species" and to have assigned to it the significance which it bore till the Darwinian era, whereas previously it was loosely and vaguely applied. He also made

If we remember that by "blood" Aristotle understood "red blood" and that he had no knowledge of the existence of colourless blood, his primary division is not a bad one. One can imagine the interest and astonishment with which the great Greek would have been filled had some unduly precocious disciple shown him the red-blood-system of the marine terrestrial Annelids; the red blood of Planorbis, of Apus cancriformis, and of the Mediterranean razor shell, Solen legumen.
considerable use of anatomical characters in his definitions of large groups, and may thus be considered as the father of modern zoology. Associated with Ray in his work, and more especially occupied with the study of the Worms and Motlussa, was Martin Lister (1638-1712), celebrated also as the author of the first geological map.

After Ray's death the progress of anatomical knowledge, and of the discovery and illustration of new forms of animal life from distant lands, continued with increasing vigour. We note the names of Vallsineiri (1661-1730) and Alexander Monro (1697-1767); the travellers Tournefort (1656-1708) and Shaw (1661-1753); the collectors Rumphius (1627-1705) and Hans Sloane (1660-1753); the entomologist Réamur (1683-1757); Lhwyd (1703) and Linck (1674-1734), the students of Star-Fishes; Peysseonel (b. 1694), the investigator of Pelyps and the opponent of Marsigli and Réamur, who held them to be plants; Woodward, the paleontologist (1665-1722)—not to speak of others of less importance.

Two years after Ray's death Carl Linnaeus (1707-1778) was born. Unlike Jakob Theodor Klein (1685-1739), whose careful treatises on various groups of plants and animals were published during the period between Ray and Linnaeus, the latter had his career marked out for him in a university, that of Upsala, where he was first professor of medicine and subsequently of natural history. His lectures formed a new departure in the academic treatment of zoology and botany, which, in direct continuity from the middle ages, had hitherto been subjected to the traditions of the medical profession and regarded as mere branches of "materia medica." Linnaeus taught zoology and botany as branches of knowledge to be studied for their own intrinsic interest. His great work, the Systema naturae, ran through twelve editions during his lifetime (1st ed. 1735, 12th 1768). Apart from his special discoveries in the anatomy of plants and animals, and his descriptions of new species, the great merit of Linnaeus was his introduction of a method of enumeration and classification which may be said to have created systematic zoology and botany in their present form, and establishes his name for ever as the great organizer, the man who recognized a great practical want in the use of language and supplied it. Linnaeus adopted Ray's conception of species, but he made species a practical reality by insisting that every species shall have a double Latin name—the first half to be the name of the genus common to several species, and the second half to be the specific name. Previously to Linnaeus long many-worded names had been used, sometimes with one additional adjective, sometimes with another, so that no true names were fixed and accepted. Linnaeus by his binomial system made it possible to write and speak with accuracy of any given species of plant or animal. He was, in fact, the Adam of zoological science. He proceeded further to introduce into his enumeration of animals and plants a series of groups, viz. genus, order, class, which he compared to the subdivisions of an army or the subdivisions of a territory, the greater containing several of the less, as follows:—

medium. mum. mum. mum. mum. mum.

Linnaeus himself recognized the purely subjective character of his larger groups; for him species were, however, objective: "there are," he said, "just so many species as in the beginning the Infinite Being created." It was reserved for a philosophic zoologist of the 19th century (Agassiz, Essay on Classification, 1859) to maintain that genus, order and class were also objective facts capable of precise estimation and valuation. This climax was reached at the very moment when Darwin was publishing the Origin of Species (1859), by which universal opinion has been brought to the position that species, as well as genera, orders and classes, are the subjective expressions of a vast ramifying pedigree in which the only objective existences are individuals, the apparent species as well as higher groups being marked out, not by any distributive law, but by the interaction of living matter and its physical environment, causing the persistence of some forms and the destruction of vast series of ancestral intermediate kinds.

The classification of Linnaeus (from Syst. Nat., 12th ed., 1765) should be compared with that of Aristotle. It is as follows—the complete list of Linnaean genera being here reproduced:—

Class I. Mammalia.

Order 1. Primates.
Genera: Elephas, Trichecus, Bradypus, Myrmecoses, Manis, Dasypus.
3. Fenni.
Genera: Phoca, Canis, Felis, Vivero, Mustela, Ursus, Didelphys, Talpa, Sorex, Erinaceus.
4. Girea.
Genera: Hystric, Lepus, Canor, Mus, Sciurus, Nocitilo.
5. Pesana.
Genera: Camelus, Moschus, Cereus, Capra, Ovis, Bos.
Genera: Equus, Hippopotamus, Sus, Rhinoceros.
7. Cete.
Genera: Monodon, Balana, Physter, Delphinus.

Class II. Aves.

Order 1. Accipitrès.
Genera: Vultur, Falco, Srix, Lanius.
2. Picae.
Genera: (a) Tichrels, Cettiia, Uupupa, Bupaga, Silta, Orulus, Coracias, Gracula, Corvus, Para-
des; (b) Ramphastos, Tropa, Passaius, Crotophaga, Picus, Ynux, Caculus, Bucco; (c) Buce-
ros, Alcedo, Merops, Tode.

3. Anseres.
Genera: (a) Anas, Merugis, Phaethon, Ploteis; (b) Ryncopes, Diomedea, Alco, Procellaria, 
pelecanus, Larus, Serna, Calomys.
Genera: (a) Phoenicopterus, Plaialea, Palomedea, 
Myldria, Taniulus, Ardea, Recurroreta, Scole-
ops, Tringa, Fulica, Parra, Rallus, Psophia, Cancrena; (b) Hemolapous, Charadris, Otis, Strauis.
5. Gallinae.
Genera: Didus, Pavo, Meleagris, Cream, Phaisanus, 
Numida.
6. Passeres.
Genera: (a) Loez, Fringilla, Emberiza; (b) 
Cettiia, Hirurn, Pipico, (c) Turdus, Aamptes, Tanagra, Muscaeida; (d) Parus, 
Melacilia, Aluada, Sturnus, Calomua.

Class III. Amphibia.

Order 1. Reptilia.

2. Serpentia.
Genera: (a) Testudo, Draco, Laceria, Rana.
3. Anfibien.
Genera: (a) Petromyzon, Raja, Squalus, Chimaera, 
Lophius, Actipenner, Cyclopterus, Balistes, Ot-
surian, Tetrodon, Diedon, Centriticus, Syn-
gnathus, Pegasuus.

Class IV. Pisces.

Order 1. Apodes.
Genera: (a) Muraena, Gymnatus, Trichiurus, Nar-
archichas, Ammodytes, Oxipitum, Stemoleus, 
Xiphius.
2. Jugulares.
Genera: Callorhynchus, Uranoscopus, Trachinus, 
Gados, Blennius.
3. Thoracici.
Genera: Cepola, Echnineis, Coryphaena, Gobius, 
Gobius, Scarpes, Zetes, Ploca, Pimod, Canthod, 
Sporus, Lobius, Sciasena, Perca, Gasteredus, 
Smutheria, Mullus, Triga.
4. Abdominales.
Genera: Cobitis, Amia, Silurus, Zeulis, Loric-
caria, Salmo, Fistularia, Esox, Elops, Exocoet-
a, Anserina, Myg, Mormyry, Esoxaleus, 
Polygnemus, Clupea, Cyprinus.
Between Linnaeus and Cuvier there are no very great names; but under the stimulus given by the admirable method and system of Linnaeus observation and description from new forms of all parts of the world, both recent and fossil, accumulated. We can only cite the names of Charles Bonnet (1720-1793), the entomologist, who described the reproduction of Aphis; Banks and Solander, who accompanied Captain Cook on his first voyage (1768-1771); Thomas Pennant (1726-1798), the describer of the English fauna; Peter Simon Pallas (1741-1811), who specially extended the knowledge of the Linnaean Vermes, and under the patronage of the empress Catherine explored Russia and Siberia; De Geer (1720-1778), the entomologist; Lyonnet (1767-1789), the author of the monograph of the anatomy of the caterpillar of Cossus ligniperdas; Cavolini (1756-1810), the Neapolitan anatomist and founder of Della Chiaje (6, 1828); O. F. Müller (1730-1784), the describer of fresh-water Oligochaeta; Abraham Trembley (1700-1784), the student of Hydra; and O. F. Ledermüller (1719-1769), the inventor of the term In- fusoria. The effect of the Linnaean system upon the general conceptions of zoologists was no less marked than were its results in the way of stimulating the accumulation of accurately observed details. The notion of a scala naturae, which had since the days of classical antiquity been a part of the general philosophy of nature amongst those who occupied themselves with such conceptions; now took a more definite form in the minds of skilled zoologists. The species of Linnaeus were supposed to represent a series of steps in a scale of ascending complexity, and it was thought possible thus to arrange the animal kingdom in a single series—the orders within the classes succeeding one another in regular gradation, and the classes succeeding one another in a similar rectilinear progression. J. B. P. de Lamarck (1744-1829) represents most completely, both by his development theory (to be further Lamark's mentioned below) and by his scheme of classification, the high-water mark of the popular but fallacious conception of a scala naturae. His classification (1801-1812) is as follows:—

Invertebrata.

1. Apathetic Animals.

Class I. INFUSORIA.
Orders: Nuda, Appendiculata.

Class II. POLYP.
Orders: Ciliatæ (Rotifera), Demodatæ (Hydroids), Vaginatæ (Anthozoa and Polyzoa), Natantæ (Cnidaria).

Class III. RADIA.
Orders: Mollia (Acetabulae), Echinodermata (including Actiniae).

Class IV. Tunicata.
Orders: Bothryladia, Ascidia.

Class V. VERMES.
Orders: Oligactides (Tape-Worms and Flukes), Rigidulæ (Nematoda), Histidulæ (Nais, &c.), Episoriae (Lernacea, &c.).

2. Sensitive Animals.

Class VI. INSECTA (Hexapoda).
Orders: Aptera, Diptera, Hemiptera, Lepidoptera, Hymenoptera, Neuroptera, Orthoptera, Coleoptera.

Class VII. ARACHNIDA.
Orders: Antennulato-Trachealia (=Thysanura and Myriapoda), Exantennato-Trachealia, Exantennato-Branchiacla.

Class VIII. CRUSTACEA.
Orders: Heterobranchia (Branchiopoda, Isopoda, Amphipoda, Stomatopoda), Hemobranchia (Decapoda).

Class IX. ANELIDA.
Orders: Anida, Antennulata, Sedentaria.

Class X. CIRRIPEDIA.
Orders: Sessilia, Pedunculata.

Class XI. CONCHIFERA.
Orders: Dicyaria, Monomyparia.

Class XII. MOLLUSCA.
Orders: Pteropoda, Gasteropoda, Tracheipoda, Cephalopoda, Heteropoda.

Vertebrata.

3. Intelligent Animals.

Class XIII. CRUSTACEA.

Class XIV. REPTILES.

Class XV. BIRDS.

Class XVI. MAMMALS.
The enumeration of orders above given will enable the reader to form some conception of the progress of knowledge relating to the lower forms of life during the fifty odd years which intervened between Linnaeus and Lamarck. The number of genera recognized by Lamarck is more than ten times as great as that recorded by Linnaeus.

We have mentioned Lamarck before his great contemporary Cuvier because, in spite of his valuable philosophical doctrine of development, he was, as compared with Cuvier and estimated as a systematic zoologist, a mere enlargement and logical outcome of Linnaeus.

The distinctive merit of G. L. Cuvier (1769-1832) is that he started a new view as to the relationship of animals, which he may be said in a large measure to have demon-

Cuvier.

strated. He opposed the scala naturae theory, and recognized four distinct and divergent branches of embranchemens, as he called them, in each of which he arranged a certain number of the Linnaean classes, or similar classes. The embranchemens were characterized each by a different type of anatomical structure. Cuvier thus laid the foundation of that branching tree-like arrangement of the classes and orders of animals now recognized as being the necessary result of attempts to represent what is practically a genealogical tree or pedigree. Apart from this, Cuvier was a keen-sighted and industry-oriented student of great skill and industry. We cannot astonish how many good observers it requires to dissect and draw and record over and over again the structure of an animal before an approximatively correct account of it is obtained. Cuvier dissected many molluscs and other animals which had not previously been anatomized; of others he gave more correct accounts than had been given by earlier writers.

Another special distinction of Cuvier is his remarkable work in comparing extinct with recent organisms, his descriptions of the fossil Mammalia of the Paris basin, and his general application of the knowledge of recent animals to the study of extinct ones, as indicated by his own anatomical researches.

It was in 1828 that Cuvier communicated to the Academy of Sciences of Paris his views on the classification of animals.

He says—

"Si l'on considère le règne animal d'après les principes que nous venons de poser, en se débarassant des préjugés établis sur les divisions anciennement admises, en n'ayant égard qu'à l'organisation et à la nature des animaux, et non pas à leur grandeur, à leur utilité, au plus ou moins de connaissance que nous en avons, ni à toutes les autres circonstances accessoires, on trouvera qu'il existe quatre formes principales, quatre plans généraux, si l'on peut s'exprimer ainsi, d'après lesquels tous les animaux semblent avoir été modélés et dont les divisions ultérieures, de quelque titre que le naturalistes les aient décrites, ne sont que des modifications assez ou l'addition de quelques parties qui ne changent rien à l'esence du plan."

Cuvier's classification. As elaborated in Le Règne Animal (Paris, 1829) is as follows:

First Branch. Animalia Vertebrata.

Class I. Mamalia.

Orders: Bvina, Quadrumana, Carnivora, Marsupialia, Rodentia, Edentata, Pachyderma, Ruminantia, Cetacea.

Class II. Birds.

Orders: Passeriformes, Passeres, Scansores, Gallinae, Grallae, Palipimdes.

Class III. Reptilia.

Orders: Chelonia, Sauria, Ophidia, Batracia.

Class IV. Fishes.

Orders: (a) Acanthopterygii, Abdominales, Subbranchi, Apodes, Lophobranchi, Pleotognathi; (b) Sturiones, Salachis, Chélatomis.

Class I. Cephalopoda.

Class II. Pteropoda.

Class III. Gastropoda.

Orders: Pulmonata, Nautiloidea, Turboidea, Fossulina, Terentia, Heteropoda, Pectinidae, Tubulipoda, Scutellaria, Cymatolous.

Class IV. Acephala.

Orders: Bivalvula, Tunicata.

Class V. Brachiopoda.

Class VI. Cirripedia.

Third Branch. Animalia Articulata.

Class I. Annelides.

Orders: Tubificoidea, Dorsibrachiata, Aphanidae.

Class II. Crustacea.

Orders: (a) Mollusca: Decapoda, Stomatopoda, Amphiboda, Laemodipoda, Isopoda; (b) Entomostraca: Branchiopoda, Pectuncipoda, Trilobata.

Class III. Arachnidae.

Orders: Portunariae, Tachanres.

Class IV. Insects.

Orders: Myriapoda, Thysanura, Parasita, Scutaria, Coleoptera, Orthoptera, Neuroptera, Hymenoptera, Lepidoptera, Rhiptera, Diperida.

Fourth Branch. Animalia Radiata.

Class I. Echinodermes.

Orders: Pecdilia, Apoda.

Class II. Intestinal Worms.

Orders: Nemartaria, Parnychotama.

Class III. Acalephata.

Orders: Similidae, Hydrostactae.

Class IV. Polypl. (including the Cordenata of later authorities and the Polyzoa).

Orders: Ctenophora, Gelinodendri, Polyplax.

Class V. Infusoria.

Orders: Rotifera, Homogenea (this includes the Protosoa of recent writers and some Protophyla).

The leading idea of Cuvier, his four embranchemens, was confirmed by the Russo-German naturalist Von Baer (1792-1876), who adopted Cuvier's divisions, speaking of them as the peripheric, the longitudinal, the massive, and the verticale types. Like Cuvier, Von Baer, has another place in the history of zoology, being the first and most striking figure in the introduction of embryology into the consideration of the relations of animals to one another.

Cuvier may be regarded as the zoologist by whom anatomy was made the one important guide to the understanding of the relations of animals. But the belief, dating from Malpighi (1661) that there were only two types of animals, was, not merely a haphazard congregation of varieties of structure to be classified, had previously gained ground. Cuvier was familiar with the speculations of the "Natur-philosophen," who held to the doctrine of transmutation and filiation by which they endeavoured to account for existing animal forms. The noble aim of F. W. J. Schelling, "das ganze System der Naturlehre von dem Gesetze der Schwere bis zu den Bildungstrieben der Organismus als ein Organisches Ganze dargestellt," which has ultimately been realized through Darwin, was a general one among the scientific men of the year 1800. Lamarck accepted the development theories, and pushed his speculations far beyond the realm of fact. The more cautious Cuvier adopted a view of the relationships of animals which, whilst denying genetic connection as the explanation, recognized an essential identity of structure throughout the animal kingdom. This identity was held to be due to an ultimate law of nature or the Creator's plan. The tracing out of this identity in diversity, whether regarded as evidence of blood-relationship or as a remarkable display of skill on the part of the Creator, entailing the details whilst retaining the essential, became at this period a special pursuit, to which Goethe, the poet, who himself contributed importantly to it, gave the name "morphology." C. F. Wolff, Goethe and Oken share the credit of having initiated these views, in regard especially to the structure of flowering plants and the Vertebrate skull. Cuvier's doctrine of four plans of structure was essentially a morphological one, and so was the single-scale doctrine of Buffon and Lamarck, to which it was opposed. Cuvier's morphological doctrine received its fullest development in the principle of the "correlation of parts," which he applied to palaeontological investigation, namely, that "every animal is a finite whole, and that no part can be varied without entailing correlated and law-abiding variations in other parts, so that from a fragment it should be possible, had we a full knowledge of the laws of animal structure or morphology, to reconstruct the whole. Here Cuvier was imperfectly formulating, without recognizing the real physical basis of the phenomena, the results of the laws of heredity, which were subsequently investigated and brought to bear on the problems of animal structure by Darwin.

Sir Richard Owen (1804-1892) may be regarded as the foremost of Cuvier's disciples. Owen not only occupied himself with the dissection of rare animals, such as the Pearly Nautilus, Lingula, Limulus, Protocerus, Apteryx, &c., and with the description and reconstruction of extinct reptiles, birds and mammals—following the Cuvierian tradition—but gave precision and currency to the morphological doctrines which had taken their rise in the beginning of the century by
the introduction of two terms, "homology" and "analogy," which were defined so as to express different kinds of agreement in animal structures, which, owing to the want of such "counters of thought," had been hitherto continually confused.

Homologous structures in any two animals compared were by Owen defined so as to express the resemblance of structures, not necessarily derived from the modification of one and the same part in the "plan" or "archetype" according to which the two animals compared were supposed to be constructed. Homologous structures are defined as those greatly differing in appearance and detail from one another, and though performing widely different functions, yet were capable of being shown by adequate study of a series of corresponding structures derived from the same single part or organ of the "plan-form" or "archetype." It is not easy to exaggerate the service rendered by Owen to the study of zoology by the introduction of this apparently small piece of verbal mechanism; it takes place with the classificatory terms of Linnaeus. And, though the conceptions of "archetypal morphology," to which it had reference, are now abandoned in favour of a genetic morphology, yet we should remember, in estimating the value of this and of other speculations which have given place to new views in the history of science, the words of the great reformer himself. "Erroneous observations are in the highest degree injurious to the progress of science, since they often persist for a long time. But erroneous theories, when they are supported by facts, do little harm, since every one takes a healthy pleasure in proving their falsity" (Darwin). Owen's definition of analogous structures was that which still remains good at this day. In Homologous structures are now spoken of as "homogenetic" structures, the idea of community of representation in an archetype giving place to the concept of correspondence of functional equivalent single representatives of the archetype in a common ancestor. Darwinian morphology has further rendered necessary the introduction of the terms "homoplasie" and "homoplastic" (E. Ray Lankester, in Ann. and Mag. Nat. Hist. 1895) to express that close agreement in form which may be attained in the course of evolutionary changes by organs or parts in two animals which have been subjected to similar moulding conditions of the environment, but have not a close genetic community of representation, to account for their similarity in form and structure, although they have a certain identity in primitive quality which is accountable for the agreement of their response to similar moulding conditions.

The classification adopted by Owen in his lectures (1855) does not adequately illustrate the progress of zoological knowledge between Cuvier's death and that date, but, such as it is, it is worth citing here.

Province: Articulata. Classes: Arachnida, Insecta (including Sub-Classes Myriapoda, Hexapoda), Crustacea (including Sub-Classes Entomostraca, Malacostraca), Epizoic (Epizoic Crustacea), Entocephala (Chaeotopods and Leeches), Cirripedia.

Sub-Province: Inusoria. Classes: Rotiferia, Polygastrae (the Protostomia of recent authors).

The real centre of progress of systematic zoology was no longer in France nor with the disciples of Cuvier in England, but after his death moved to Germany. The wave of morphological speculation, with its outcome of new systems and new theories of classification (see Agassiz, Essay on Classification, 1859), which were as numerous as the professors of zoological science, was necessarily succeeded in the true progress of the science by a period of minuter study in which the microscope, the discovery of embryological histories, and the all-important cell-theory came to swell the stream of exact knowledge.

The greatest of the investigators of animal structure in the 19th century was Johann Müller (1828), the son of the great German of the anatomists Rathke (1793-1860) and Meckel (1781-1833). His true greatness can only be estimated by a consideration of the fact that he was a great teacher not only of human and comparative anatomy and zoology but also of physiology, and that nearly all the most distinguished German zoologists and physiologists of the period 1850 to 1870 were his pupils and acknowledged his leadership. The most striking feature about Johann Müller's work, apart from the comprehensiveness of his point of view, in which he added to the anatomical and morphological ideas of Cuvier a consideration of physiology, embryology and microscopic structure, was the extraordinary accuracy, facility and completeness of his recorded observations. He could do more with a single specimen of a rare animal (e.g. in his memoir on Amphioxus, Berlin, 1844) in the way of making out its complete structure than the ablest of his contemporaries or successors could do with a plethora. His power of rapid and exhaustive observation and of accurate pictorial reproduction was phenomenal. His most important memoirs, besides that just mentioned, are those on the anatomy and classification of fishes, on the Caecilians and on the developmental history of the Echinoderms.

A name which is apt to be forgotten in the period between Cuvier and Darwin, because his possessor occupied an isolated position in England and was not borne up by any great school or university, is that of John Vaughan Thompson (1779-1847), an army surgeon, who in 1816 became district medical inspector at Cork, and then took to the study of marine Invertebrata by the aid of the microscope. Thompson made three great discoveries, which seem to have fallen in his way in the most natural and simple manner, but must be regarded really as the outcome of extraneous genius. He showed (1839) that the organisms like Flustra are not hydroid Polyps, but of a more complex structure resembling Molusca, and he gave them the name Polyzoa. He discovered (1832) the Pentacrinus europaeus, and showed that it was the larval form of the Feather-Star Antedon (Comatula). He upset (1830) Cuvier's retention of the Cirripedes among Molusca, and his subsequent treatment of them as an isolated class, by showing that they begin life as free-swimming Crustacea identical with the young forms of other Crustacea. Vaughan Thompson is a type of the marine zoologists, such as Doyell, Michael Sars, P. J. Van Beneden, Claparède, and Allman, who during the 19th century approached the study of the lower marine organisms in the same spirit as that in which Trembley and Schäffer in the 18th century, and Swammerdam in the 17th, gave themselves to the study of the minute fresh-water forms of animal life.

It is impossible to enumerate or to give due consideration to all the names in the army of anatomical and embryological students of the middle third of the 19th century whose labours bore fruit in the modification of zoological theories and in the building up of a true classification of animals. Their results are best summed up in the three schemes of classification which follow:—those of Rudolph Leuckart (1823-1860), Henri Milne-Edwards (1800-1884), and T. H. Huxley (1825-1895), all of whom individually contributed very greatly by their special discoveries and researches to the increase of exact knowledge. Contemporaneous with these were various schemes of classification which were based, not on a consideration of the entire structure of each animal, but on the variations of a single organ, or on the really non-significant fact of the structure of the egg. All such single-fact systems have proved to be anatomically from the outset illogical and growth of the zoological system which was shaping itself year by year—unknown to those who so shaped it—as a genealogical tree. They were attempts to arrive at a true knowledge of the relationships of animals by "royal roads"; their followers were landed in barren wastes.

R. Leuckart's classification (Die Morphologie und Leuckart's Verwandtschaftsverhältnisse der Wirbellosen Thiere, Brunswick, 1848) is as follows:

Type I. Coelenterata.
Class I. Polyzoa.
Orders: Anthozoa and Cypicosa.

II. Acalephae.
Orders: Discophorae and Ctenophorae.
ZOOLOGY

Type 2. Echinodermata.
  Class I. Pelmatozoa.
    Orders: Cystidea and Crinoidea.
  II. Actinocrinoidea.
    Orders: Echinida and Asterida.
  III. Scyphoidea.
    Orders: Holothuriae and Sipunculida.

Type 3. Vermes.
  Class I. Annelatei.
    Orders: Cestodes and Acanthocephalae.
  II. Aporidea.
    Orders: Nemertini, Turbellaria, Trematodes and Hirudinei.
  III. Ciliata.
    Orders: Bryozoa and Rotifera.
  IV. Annelides.
    Orders: Nemertes Lumbricini and Branchiata.

Type 4. Arthropoda.
  Class I. Crustacea.
    Orders: Ectopods and Malacostraca.
  II. Inseta.
    Orders: Myriapoda, Arachnida (Arach., Latr.), and Hexapoda.

Type 5. Mollusca.
  Class I. Tunicata.
    Orders: Ascidiae and Salpae.
  II. Acephala.
    Orders: Lamellibranchiata and Brachiopoda.
  III. Gasteropoda.
    Orders: Heterobranchia, Dermatobranchia, Heteropoda, Ctenobranchia, Pulmonata, and Cyclobranchia.
  IV. Cephalopoda.

Type 6. Vertebrata. (Not specially dealt with.)

The classification given by Henri Milne-Edwards (Cours Élémentaire d'Histoire Naturelle, Paris, 1855) is as follows:

Branch I. Osteozaaria or Vertebrata.
  Sub-Branch 1. Allantodians.
    Class I. Mammalia.
      Orders: (a) Monodelphia: Bimana, Quadrumana, Chiroptera, Insectivora, Rodentia, E dentata, Carnivora, Amphibia, Pachydermata, Rumiantia, Cetacea; (b) Didelphia: Marsupials, Monotremata.
  II. Birds.
    Orders: Rapaces, Passeres, Scansores, Gallinae, Grallae, Palmites.
  III. Reptiles.
    Orders: Chelonia, Sauria, Ophidia.
  Sub-Branch 2. Arachnoidians.
    Class I. Trachichias.
      Orders: Anura, Urodela, Perennibranchia, Coleciida.
  II. Fishes.
    Section I. Ossei.
    Section II. Chondropterygii.
      Orders: Sturiones, D hipno, Cyclostomata.

Branch II. Entomozaaria or Annelata.
  Sub-Branch 1. Arthropoda.
    Class I. Insecta.
      Orders: Coleoptera, Orthoptera, Neuroptera, Hemiptera, Lepidoptera, Homoptera, Diptera, Rhipiptera, Anoploptera, Thysanura.
  II. Myriapoda.
    Orders: Chilognatha and Chilopoda.
  III. Arachnida.
    Orders: Malpighia and Trachearia.
  IV. Crustacea.
    Section I. Pedipodalia.
      Orders: Decapoda and Stomopoda.
    Section II. Eutrephochelida.
      Orders: Amphipoda, Eumalopoda and Isopoda.
    Section III. Branichopoda.
      Orders: Ostracoda, Phyllopod and Trilobita.
    Section IV. Entomostra.
      Orders: Coleoptera, Cladocera, Siphonostoma, Lernaeida, Cirripedia.
    Section V. Xiphosura.
      (The orders of the classes which follow are not given in the work quoted.)

Branch III. Malacozaaria or Mollusca.
  Sub-Branch 1. Mollusca proper.
    Class I. Cephalopoda.
      II. Podophthalmia.
    Class II. Tunicata.
  Sub-Branch 2. Molluscoidea.
    Class I. Tunicata.
  Branch IV. Zoophyes.
  Sub-Branch 1. Radiaria.
    Class I. Echinodermata.
    II. Acalephis.
    Class II. Sarcozaaria.
    Class I. Infusoria.

In England T. H. Huxley adopted in his lectures (1869) a classification which was in many respects similar to both of the foregoing, but embodied improvements of his own. It is as follows:

Sub-Kingdom I. Protozoa.
  Classes: Rhizopoda, Gregarina, Radiolaria, Spongida.
  Sub-Kingdom II. Infusoria.
  Sub-Kingdom III. Codosenterata.
    Classes: Hydrozoa, Anthozoa.
  Sub-Kingdom IV. Anuloida.
    Classes: Scoliidea, Echinodermata.
  Sub-Kingdom V. Anuloida.
    Classes: Cystacea, Arachnida, Myriapoda, Insecta, Chaeognatha,ANNELIDA.
  Sub-Kingdom VI. Molluscoidea.
    Classes: Polyzoa, Brachiopoda, Tunicata.
  Sub-Kingdom VII. Mollusca.
  Sub-Kingdom VIII. Vertebrata.
    Classes: Pisces, Amphibia, Reptilia, Aves, Mammalia.

We now arrive at the period when the doctrine of organic evolution was established by Darwin, and when naturalists, being convinced by him as they had not been by the transmutationalists of fifty years' earlier date, were compelled to take an entirely new view of the significance of all attempts at framing a "natural" classification.

Many zoologists—prominent among them in Great Britain being Huxley—had been repelled by the airy fancies and assumptions of the "philosophical" morphologists. The efforts of the best minds in zoology had been directed for thirty years or more to ascertaining with increased accuracy and minuteness the structure, microscopic and gross, of all possible forms of animals, and not only of the adult structure but of the steps of development of that structure in the growth of each kind of organism from the egg to maturity. Putting aside fantastic theories, these observers endeavoured to give in their classifications a strictly objective representation of the facts of animal structure and of the structural relationships of animals to one another capable of demonstration. The groups within groups adopted for this purpose were necessarily wanting in symmetry: the whole system presented a strangely irregular character. From time to time efforts were made by those who believed that the Creator must have followed a symmetrical system in his production of animals to force one or other artificial, neatly balanced scheme of classification upon the zoological world. The last of these was that of Louis Agassiz (1807-1873), who, whilst surveying all previous classifications, propounded a scheme of his own (Essay on Classification, 1859), in which, as well as in the criticisms he applies to other systems, the leading notion is that sub-kings, classes, orders and families have a real existence, and that it is possible to ascertain and distinguish characters which are of class value, others which are only of ordinal value, and so on, so that the classes of one sub-kingdom should on paper, and in nature actually do, correspond in relative value to those of another sub-kingdom, and the orders of any one class similarly should be so taken as to be of equal
value with those of another class, and have been actually so created.

The whole position was changed by the acquisitiveness, which became universal, in the doctrine of Darwin. That doctrine took some few years to produce its effect, but it became evident at once to those who accepted Dar- winism that the natural classification of animals, as the classification was be- longing to the classification of Ascidians, to which collectors and anatomists, morphologists, zoologists and embryologists had been so long striving, was nothing more nor less than a genealogical tree, with breaks and gaps of various extent in its record. The facts of the relationships of animals to one another, which had been treated as unchangeable and immutable by naturalists and glibly explained by the transcendental morphologists, were amongst the most powerful arguments in support of Darwin's theory, since they, together with all other vital phenomena, received a sufficient explanation through it. It is to be noted that, whilst the zoological system took the form of a genealogical tree, with main stem and numerous diverging branches, the actual form of that tree, its limitation to a certain number of branches corresponding to a limited number of divergences in structure, came to be regarded as the necessary consequence of the operation of the physico-chemical forces of the universe, and it was recognized that the ultimate explanation of that limitation is to be found only in the constitution of matter itself.

The first naturalist to put into practical form the consequences of the new theory, in so far as it affected zoological classification, was Ernst Haeckel of Jena (b. 1834), who in 1866, seven years after the publication of Darwin's Origin of Species, published his suggestive Generelle Morphologie. Haeckel introduced into classification a number of terms intended to indicate the branchings of a genealogical tree. The whole "system" or scheme of classification was termed a genealogical tree (Stammbaum); the main branches were termed "phyla," their branchings "sub-phyla"; the great branches of the sub-phyla were termed "cladis," and the "cladi" divided into "classes," these into sub-classes, these into families, into tribes, families into genera, genera into species. Additional branchings could be indicated by similar terms where necessary. There was no attempt in Haeckel's use of these terms to make them exactly or more truly applicable to the actual results of embryologic research, and although they were clearly futile and unimportant where the purpose was the exhibition of lines of descent, and where no natural equality of groups was to be expected ex hypothesi. Haeckel's classification of 1866 was only a first attempt. In the edition of the Natürliche Schöpfungsgeschichte published in 1868 he made a great advance in his genealogical classification, since he now introduced the results of the extraordinary activity in the study of embryology which followed on the publication of the Origin of Species.

The pre-Darwinian systematists since the time of Von Baer had attached very great importance to embryological facts, holding that the stages in an animal's development were more significant of its true affinities than its adult structure. Von Baer had gained unanimous support for his dictum, "Die Entwicklungsgeschichte ist der wahre Lichtträger für Untersuchungen über organische Körper." Thus J. Müller's studies on the larval forms of Echi- noidea and the discoveries of Vaughan Thompson were appreciated. But it was only after Darwin that the cell-theory of Schwann was extended to the embryology of the animal kingdom generally, and that of Ascherson and Dohrn (1854), Remak (Development of the Frog, 1850), and others had laid the foundations of this knowledge in isolated examples; but it was Kovalevsky, by his accounts of the develop- ment of Acanthomoeba protista (1856), who really made zoologists see that a strict and complete cellularity of animals was as necessary and feasible a factor in the comprehension of their relationships as at the beginning of the century the coarse anatomy had been shown to be by Cuvier. Kovalevsky's work appeared between the dates of the Generelle Morphologie and the

Schöpfungsgeschichte. Haeckel himself, with his pupil Miklucho-Maclay, had in the meantime made studies on the growth from the egg of Sponges—studies which resulted in the complete separation of the unicellular or equinuclear Protoscolex from the Sponges, hitherto confounded with them. It is this introduction of the consideration of cell-structure and cell-development which, subsequently to the establishment of Darwinism, has most profoundly modified the views of systematists, and led to conjunction with the biological doctrine to the greatest activity in research—an activity which culminated in the work (1873-1882) of F. M. Balfour, and produced the profoundest modifications in classification.

Haeckel's second pedigree is as follows:—

Protostomia. 
Cephalochordata. 
Acrorhiza. Gymnophora.
Vertebrata. 
Mammalia. Mammalia.

In representing pictorially the groups of the animal kingdom as the branches of a tree, it becomes obvious that a distinction may be drawn, not merely between the individual main branches, but further as to the level at which they are given off from the main stem, so that one branch or set of branches may be marked off as belonging to an earlier or lower level than another set of branches; and the same plan may be adopted with regard to the clades, classes and smaller branches. The term "grade" was introduced by Ray Lankester ('Notes on Embryology and Classification," in Quart. Journ. Micr. Sci. 1877), to indicate this giving off of branches at a higher or lower, i.e. a later or earlier, level of a main stem.1 The mechanism for the statement of the genealogical relationships of the groups of the animal kingdom was thus completed. Renewed study of every group was the result of the acceptance of the genealogical idea and of the recognition of the importance

1 Sir Edwin Ray Lankester (b. 1847) was the eldest son of Edwin Lankester (1814-1874), a physician and naturalist (F.R.S. 1845), who became well known as a scientific writer and lecturer, editor of the Quarterly Journal of Microscopical Science from 1855 to 1871, and from 1865 to 1875 in succession to Thomas Wakley, M. D., F.R.C.S., of London. From 1874 to 1890 he was professor of zoology and comparative anatomy at University College, London; and from 1891 to 1898 Linacre professor of comparative anatomy at Oxford. From 1898 to 1907 he was director of the Natural History Department of the British Museum. He was made K.C.B. in 1907. [Ed. E.B.].
of cellular embryology. On the one hand, the true method of arriving at a knowledge of the genealogical tree was recognized as lying chiefly in attacking the problem of the genealogical relationships of the smallest twigs of the tree, and proceeding from them to the larger branches. Special studies of small families or orders of animals with this object in view were taken in hand by many zoologists. On the other hand, a survey of the facts of cellular embryology which were accumulated in regard to a variety of classes within a few years of Kowalevsky's work led to a generalization, independently arrived at by Haeckel and Müller, to the effect that post-Darwinian taxonomy may be distinguished, the Protostomata or Plasmodiata, which consist of either of single cells or colonies of equiform cells, and a higher grade, the Metasomata or Enteromora, in which the egg-cell by "cell division" gives rise to two layers of cells, the endoderm and the ectoderm, surrounding a primitive digestive chamber, the archenteron. Of these latter, two grades were further distinguished by Lankester—those which remain possessed of a single archenteric cavity and of two primary cell-layers (the Coelentera or Diploblastica), and those which rip off the archenteron and give rise to two cavities, the coelom or body-cavity and the mesenteron or gut (Coelomata or Triploblastica). To the primitive two-cell-layered form, the hypothetical ancestor of all Metasomata or Enteromora, Haeckel gave the name Gastraea; the embryonic form which represents in the individual growth from the egg this ancestral condition he called a "gastrula." The term "diblastula" was subsequently adopted in England for the gastrula of Haeckel. The tracing of the exact mode of development, cell by cell, of the diblastula, the coelom, and the various tissues of examples of all classes of animals was in later years pursued with immense activity and increasing instrumental facilities.

Two names in connexion with post-Darwinian taxonomy and the ideas connected with it require brief mention here.

Fritz Müller, by his studies on Crustacea (Für Darwin, 1864), showed the way in which genealogical theory may be applied to the minute study of a limited group. He is also responsible for the formulation of an important principle, called by Haeckel "the biogenetic fundamental law," viz. that an animal in its growth from the egg to the adult condition tends to pass through a series of stages which are recapitulative of the stages through which its ancestry has passed in the historical development of the species from a primitive form; or, more shortly, that the development of the individual (ontogeny) is an epitome of the development of the race (phylogeny). Pre-Darwinian zoologists had been aware of the class of facts thus interpreted by Fritz Müller, but the authoritative view on the subject had been that there is a parallelism between (a) the series of forms which occur in individual development, (b) the series of existing forms from lower to higher, and (c) the series of forms which succeed one another in the strata of the earth's crust, whilst an explanation of this parallelism was either not attempted, or was illusively offered in the shape of a doctrine of harmony of plan in creation. It was the application of Fritz Müller's law of recapitulation which gave the chief stimulus to embryological investigations between 1865 and 1890; and, though it is now recognized that "recapitulation" is vastly and bewilderingly modified by special adaptations in every case, yet the principle has served, and still serves, as a guide of great value.

Another important factor in the present condition of zoological knowledge as represented by classification is the doctrine of degeneration propounded by Anton Dohrn. Lamarck believed in a single progressive series of forms, whilst Cuvier introduced the conception of branches. The first post-Darwinian systematists naturally and without reflection accepted the idea that existing simpler forms represent stages in the gradual progress of development—are in fact survivors from past ages which have retained the exact grade of development which their ancestors had reached in past ages. The assumption made was that (with the rare exception of parasites) all the change of structure through which the successive generations of animals have passed has been one of progressive elaboration. It is Dohrn's merit to have pointed out that this assumption is not warranted, and that degeneration or progressive simplification of structure may have, and in many lines certainly has, taken place, as well as progressive elaboration and in other cases continuous maintenance of the status quo.

The introduction of this conception necessarily has had a most important effect in the attempt to unravel the genealogical affinities of animals. It renders the task a more complicated one; at the same time it removes some serious difficulties and throws a flood of light on every group of the animal kingdom.

One result of the introduction of the new conceptions dating from Darwin was a healthy reaction from that attitude of mind which led to the regarding of the classes and orders recognized by authoritative zoologists as sacred institutions which were beyond the criticism of ordinary men. That state of mind was due to the fact that the groupings so recognized did not profess to be simply the result of scientific reasoning, but were necessarily regarded as the expressions of the "insight" of some more or less gifted persons into a plan or system which had been arbitrarily chosen by the Creator. Consequently there was a tinge of theological dogmatism about the whole matter.

A genealogical tree of animal kingdom (Lankester, 1884).

To deny the Linnaean, or later the Cuvierian, classes was very much like denying the Mosaic cosmogony. But systematic zoology is now entirely free from any such prejudices, and the Linnaean tint which is apparent even in Haeckel and Gegenbaur may be considered as finally expunged.

There are, and probably always will be, differences of opinion as to the exact way in which the various kinds of animals may be divided into groups and those groups arranged in such an order as will best exhibit their probable genealogical relationships. The main divisions which, writing in 1910, the present writer prefers, are those adopted in his Treatise on Zoology (Part II. ch. ii.) except that Phylum 17, Diplochorda (a name doubtfully applicable to Phoronis) is replaced by Podaxonim, a term employed by Lankester in the 9th edition of this encyclopaedia and now used to include a number of groups of doubtful but possible affinity. The terms used for indicating groups are "Phylum" for the large diverging branches of the genealogical tree as introduced by Haeckel, each Phylum bears secondary branches which are termed "classes," classes again branch or divide into orders, orders into families, families into genera, genera into species. The general purpose is to give something like an equivalence of importance to divisions or branches indicated by the same term, but it is not intended to imply that every phylum has the

1 Ursprung der Wirbeltiere (Leipzig, 1875); and Lankester, Degeneration (London, 1896).
same range and distinctive character as every other, nor to make such a proposition about classes, orders, families and genera. Where a further subdivision is desirable without descending to the next lower term of grouping, the prefix "sub" is made use of, so that a class may be divided first of all into subclasses each of which is divided into orders, and an order into sub-orders each of which bears a group of families. The term "grade" is also made use of for the purpose of indicating the conclusion that certain branches on a larger or smaller stem of the genealogical tree have been given off at an earlier period in the history of the evolution of the stem in question than have others marked off as forming a higher grade. Thus, to begin with, the animal pedigree is divided into two very distinct grades, the Protozoa and the Metazoa. The Metazoa form two main branches; one, Parazoa, is but a small unproductive stock comprising only the Phylum Porifera or Sponges; the other, the great stem of the animal series Enterozoa, gives rise to a large number of diverging Phyla which it is necessary to assign to two levels or grades—a lower, Enterocoeula (often called Coelentera), and a higher, Coelomocoeula (often called Coelomata). These relations are exhibited by the following diagrams.

### DIAGRAM 1

Diagram showing the primary grades and branches of the Animal Pedigree.

1. **Parazoa**
2. **Branch A. Enterocoeula**
3. **Branch B. Metazoa**
4. **Grade A. Protozoa**
5. **Grade B. Enterocoeula**
6. **Diagram to show the division of the great branch Enterocoeula into two grades and the Phyla given off therefrom.**

The Phylum Vertebrata in the above scheme branches into the sub-phylla Hemichorda, Urochorda, Cephalochorda and Cranlata. The Phylum Appendiculata similarly branches into sub-phylla, viz. the Rotifera, the Chaetopoda and the Arthropoda. Certain additional small groups should probably be recognized as independent lines of descent or phyla, but their relationships are obscure—they are the Mesozoa, the Polyzoa, the Acanthocephala and the Gastrotricha. We may now enumerate these various large groups in tabular form.

### ZOOLOGY

**Branch b. Enterocoeula.**

**Grade i. Enterocoeula.**

**Phylum 2. Hydromedusae.**
1. Scyphomedusae.

**Phylum 3. Anthozoa.**
2. Actinophyra.

**Phylum 4. Ctenophorea.**
3. Enterocoela.

**Phylum 5. Platyeilmia.**

**Phylum 6. Myxosporidia.**
8. CTENOPHORA. 9. NEMERTINA. 10. MOLLUSCA. 11. APPENDICULATA.

**Phylum 7. Enterozoa.**
13. VERTEBRATA. Sub-phylla: Hemichorda, Urochorda, Cephalochorda, Cranlata.

A statement may now be given of the classes and orders in each group, as recognized by the writers of the various special zoological articles in the Eleventh Edition of the Encyclopaedia Britannica. These subdivisions of the larger groups are not necessarily those theoretically approved by the present writer, but they have the valuable sanction of the individual experts who have given special attention to different portions of the vast field represented by the animal kingdom.

### Grade i. Protozoa (q.v.).

**Phylum 1. Sarcoidea (q.v.).**

**Class 1. Proteomyxa (q.v.).**

**Class 2. Rhizopoda (q.v.).**

Orders: Lobosa. Flosas.

Orders: Heliozoa (q.v.).

Orders: Foraminifera (q.v.).

Orders: Nuda, Alliformidae, Ctenophoroidea, Lituolidae, Lecanidae, Tentaculidae, Echinosomatidae, Lagenidae, Glaebigerinae, Rotaliidae, Nummulidae. Insertae sedis. Xenophyophoridae (see Foraminifera).

Orders: Radiolaria. Orders: Spongiopora (= Periploca), Acantharia (= Actinopora), Nasturaria (= Monoploca), Phaeodaria (= Tryphophora).

Orders: Labyrinthulidea (q.v.).

No Orders.

Orders: Myxomycetes. No Orders.

**Phylum 2. Mastigophora (q.v.).**

**Class 1. Flagellata (q.v.).**

**Sub-class A. Rhizoflagellata.**

Orders: Holostomatidae, Psorospermacea.

Orders: Protozoa (q.v.).

Orders: Rhabdomastigata, Cystsorhoda, Cryptomonadaceae, Chromomonadaceae, Euglenidae, Volvocaceae.

**Class 2. Dinoflagellata.**

Orders: Gymnosporiales, Peronosporaceae, Peridinaceae.

**Class 3. Cystoflagellata.**

No Orders.

**Phylum 3. Sporozoa (q.v.).**

**Class 1. Endospora (q.v.).**

Orders: Myxosporidia, Actinomyzidia, Sarcosporidia, Hepatosporidia.

Orders: Ectospora (q.v.).

Orders: Gregarina (see Gregarines), Coccidium (q.v.), Haemoparasida (q.v.).

**Phylum 4. Infusoria (q.v.).**

**Class 1. Chilata.**

Orders: Gymnomastomata, Trichostomatia, Aspidothrichaceae, Spororhiza, Heterostricha, Oligostricha, Heterostricha, Peritrichaceae.

Orders: Suctoria. No Orders.

1 It is to be noted that the terms used for designating categories in the classification are not always identical in this summary and separate articles, as authors differ as to the use of these.

---

**BINTA—PHYSTA, ANIMALIA.**

**Grade A. Protozoa (various groups included).**

**Grade B. Metazoa.**

Branch a. Parazoa.

Phylum 1. Porifera.
ZOLOGY

Grade B. Metazoa.

Branch a. Parazoa.

Phylum 1. Porifera (see Sponges).

Sub-phylum 1. Calcarea.

Class. Calcarea.

Orders: Homocoea, Heterocoea.

Sub-phylum 2. Non-Calcarea.

Class. 1. Ctenodiscopoda.

Order: Myxospongida.

Order 2. Triaxonida (= Hexactinellida).

Order: Amphiidiscophora, Hexasterophora.

Class 3. Tetraxonida.

Sub-Class 1. Tetractinellida.

Orders: Homosclerophora, Astrophora, Signatophora.

Sub-class 2. Lissistida.

No Orders.

Sub-class 3. Monaxonellida.

Orders: Astromonaxellida, Signatomonaxellida.

Class 4. Euceratosa.

Branch b. Enteropods.

Grade 1. Enterocoela (see Coelenterata).

Phylum 2. Hydrodemusae or Hydrozooa (g.v.).

Class. Hydrodemusae, (g.v.).

Orders: Eleutherodidae, Hyroididae seu Leptodinae (Sub-orders: Anthomedusae, Leptomedusae), Hydrocorallinae, Gratiosiluidae Trachylidae (Sub-orders: Trachomedusae, Narcomedusae), Siphonophora.

Phylum 3. Scyphomedusae (g.v.).

Class. Scyphomedusae.

Orders: Ctenidae, Stauromedusae, Coronata, Discephora.

Phylum 4. Anthozoa (g.v.).

Class. Anthozoa.

Sub-class 1. Alcyonaria.

Orders: Steloniida, Alcyonacea, Pseudaxonia, Axifera, Sphirochelacea, Coelothecalia.

Sub-class 2. Zoantharia.

Orders: Zoanthidea, Cereanzaidea, Antipathidea, Actinidea (Sub-orders: Malacactiniae and Scleractiniae or Madreporia).

Phylum 5. Ctenophora.

Class. Ctenophora.

Sub-class 1. Tentaculata.

Orders: Cyanaida, Lobata, Cestoidea.

Sub-class 2. Nuda.

No Orders.

Grade 2. Coelomocoela.

Phylum 6. Platyelmia (g.v.).

Class 1. Planaria (see Planarians).

Order: Turbellaria.

Class 2. Temnocyphaloida (see appendix to Planarians).

No Orders.

Class 3. Trematoda (see Trematodes).

Orders: Heterocotyle, Aspidocotyle, Malacoctyle.

Class 4. Cestoda (see Tapeworms).

Orders: Monoracoa, Merocoa.

Class 1. Nematoidea (see Nematoidea).

No Orders.

Class 2. Chaetosomidae (see Chaetosomatida).

No Orders.

Class 3. Desmoscolecida (g.v.).

No Orders.

Class 4. Nematomorphia (g.v.).

No Orders.

Phylum 8. Chaetognatha (g.v.).

No Orders.

Class. Nemertina (g.v.).

Orders: Protonemertini, Mesonemertini, Metaneemertini, Heteronemertini.

Phylum 10. Mollusca (g.v.).

Grade A. Isoplera.

Class 1. Amphineura (see Clitina).

Orders: Polyplacophora, Aplacophora.

Class B. Prophoripidomorphous.

Class 2. Gastropoda (g.v.).

Sub-class 1. Stirtonia.

Orders: Aspidobranchia, Pectinibranchia.

Sub-class 2. Euthyneura.

Orders: Opisthobranchia, Pulmonata.

Class 3. Scaphopoda (g.v.).

No Orders.

Class 4. Lamellibranchia (q.v.).

Orders: Protobranchia, Filibranchia, Eulamellibranchia, Septibranchia.

Grade C. Siphonophora.

Class 5. Cephalopoda (g.v.).

Orders: Tetrabranchia, Dibranchia.

Phylum 11. Appendicularia.

Sub-phylum 1. Rotifera (g.v.).

Class. Rotifera.

Orders: Asplanchnaceae, Meliceriaceae, Trachophasmaraceae, Placomaeeae, Budellidaceae, Fascularaceae, Pluia, Seisanae.

Sub-phylum 2. Chaetopoda (g.v.).

Class 1. Polychaeta.

Orders: Nereidiformia, Cryptocaephot, Cepitelliiformia, Terebelliforma, Spioniforma, Scolecodormia.

Class 2. Oligochaeta.

Orders: Aphanura, Limicolae, Moniligestas, Terriocolea.

Class 3. Hirudinariae (see Lecith).

Orders: Rhynchobdellidae, Gnathobdellidae, Ancothobdellidae.

Class 4. Myxostomia (g.v.).

No Orders.

Class 5. Saccocirrida.

No Orders.

Class 6. Haplobranchia (g.v.).

No Orders.

Class 7. Echiuroidea (g.v.).

No Orders.

Sub-phylum 3. Anthroidea (g.v.).

Grade 1. Cetopoda.

Class 1. Peripatidea (see Peripatus).

No Orders.

Class 2. Chilopoda (see Centipede).

Sub-class 1. Pleurostigma.

Orders: Geophilomorpha, Scolopendromorpha, Craterostigmomorpha, Lathobiomorpha.

Sub-class 2. Notostigma.

Order: Scutigeromorpha.

Class 3. Dipopoda (see Millipede).

Sub-class 1. Pedaphiony.

Order: Pedicillata.

Sub-class 2. Chilognatha.

Orders: Oniscomorpha, Limacomorpha, Colobognatha, Ascothoracica, Protospermaphora, Merochaeta, Opilionespermaphora.

Class 3. Pauropodae (see Millipede).

No Orders.

Class 4. Symphyla (see Millipede).

No Orders.

Class 5. Hexapoda (g.v.).

Sub-class 1. Apoidea.

Orders: Aplida.

Sub-class 2. Exopoeida.

Orders: Dermoptera, Orthoptera, Plecoptera, Isoptera, Corrodentia, Ephemoptera, Odonate, Thyssoptera, Hemiptera, Anopilia.

Sub-class 3. Endopoeida.

Orders: Neuroptera, Caleoptera, Megaptara, Tricho-ptera, Lepidoptera, Diptera, Siphonaptera, Hymenoptera.

Grade 2. Acera.

Class 1. Crustacea (g.v.).

Sub-class 1. Entomostraca (g.v.).

Orders: Branchiopoda (Sub-orders: Phyllopoda, Cladocera, Branchiura), Ostracoda, Copepoda.

Sub-class 2. Thysanura (g.v.) = (Cirripedia).

No Orders.

Sub-class 3. Leptotrostra.

No Orders.

Sub-class 4. Malacostraca (g.v.).

Orders: Decapoda (Sub-orders: Brachyura, Mecapoda, Schizopodae (including Anaspidae), Stomatopoda, Symphyla (Camae), Isopoda (including Teniidea), Amphipoda.

Class 2. Arachnida (g.v.).

Grade A. Trioblastae (see Triobiite).

(Orders not determined).

Grade B. Nomaneristica.

Sub-class 1. Pantopoda.

Orders: Nymphomorpha, Ascorhynchomorpha, Pyxogonomorpha.

Sub-class 2. Eu-Arachna.

Grade A. Derolabronch (or Hydropeusta).

Orders: Xiphosura, Ogiensstra.
Grade 5. Embolodoranchia (or Aeropneusta).
Section. Pectinifera,
Order. Scorpionidea.
Section. Epectinata.
Orders: Polypulpi, Araneae, Polypigradi, Soli-
lupi, Thaumascorpiotes, Podogama, Opioliones,
Rhynchozetoni (Acari).
Class 3. Tardigrada (g.e.)
No Orders.
Class 4. Lingualatina (see Pentastomidea).
No Orders.

Phylum 12. Echinoderm (see Echinoderm).
Branch A. Pelmatozoa.
Class 1. Cystidea:
Orders: Amphoridea, Carpoidea, Rhamphicer, Apor-
ita, Diplopora.
Class 2. Blastidea.
Divisions: Protoblastidea, Eublastidea.
No Orders.
Class 3. Crinoidea.
Orders: Monocyclica Inadunata, Adunata, Mono-
cyclica Camerata, Dicyclica Inadunata, Flexibilia,
Dicyclica Camerata.
Class 4. Echinoidea.
No Orders.
Branch B. Echinozoa.
Class 1. Holothuroidea.
Orders: Aspidochirota, Dendrochiros.
Class 2. Stelliformia.
Sub-class 1. Asteridea.
Orders: Phaneronesia, Cryptospongia.
Sub-class 2. Ophiuridea.
Orders: Streptophiuriae, Zygophiuriae, Cadinophiuriae.
Class 3. Echinoidae.
Orders: Belhriocirvadoidea, Melonioida, Cyctesid-
raida, Cidaria, Diademia, Holestypoida, Spa-
tangioida, Clypeasteroida.

Phylum 13. Vertebrata (g.e.).
Sub-phylum a. Hemichorda (g.e.).
Class. Enteropneusta (see Balanoglossus).
No Orders.
Sub-phylum b. Urochorda.
Class. Tunicata (g.e.).
Orders: Larvacea, Thaliacea (Sub orders: Cyclo-
myaria, Hemimyaria), Ascidiacea (Sub orders: Ascidiae Simplex, Ascidiaceae Compositae, Ascidi-
cae Luciae).
Sub-class c. Cephalochorda (see Amphioxus).
Class. Cephalochorda.
No Orders.
Sub-phyllum d. Craniata.1
Class 1. Pisces (see Ichthyology).
Sub-class 1. Cyclostomata (g.e.).
Orders: Myxinoides (or Hyperotreti), Petromyzontes
(or Husparottii).
Sub-class 2. Selachiia or Elasmobranchii (see Sel-
chias).
Orders: Pleuropterygii, Acanthodii, Ichthyotomi,
Plagiostomi, Holoccephali.
Sub-class 3. Teleostomi.
Orders: Gnathoidea, Crossopterygii, Dipnoi,
Teleosti.
Class 2. Batrachia (g.e.).
Orders: Stegochoptera, Apoda (or Peromela), Caudata
(or Urodela), Eucaudata (or Anura).
Class 3. Reptilia (see Reptiles).
Orders: Anomodontia, Coleonia, Sauropsyria,
Ichthyopterygia, Rhynchocephalia, Dinosauria,
Crocodilia, Ornithischia, Squamata.
Class 4. Aves (see Bird and Ornithology).
Sub-class 1. Archazornithes.
No Orders.
Sub-class 2. Neornithes.
Division 1. Ratitae.
Orders: Struthiones, Rheae, Casuariaceae, Aptery-
xes, Dinornithes, Aepyornithes.
Division 2. Odontolae.
No Orders.
Division 3. Carinatae.
Orders: Ichthyes, Colymbiformes, Sphenisci-
iformes, Procellariiformes, Ciconiiformes, (Sub-
orders: Steganopodes, Ardeae, Ciconiae, Phoeni-
chopodes). Anseres (Sub-orders: Platypoeida,
Anseres), Falciformes (Sub-orders: Calatrata,

1 Craniata may be usefully divided into 3 grades: (a) Branchiata Heterodactyla, which includes Fishes except Cyclostomes. (b) Branchiata Pentadactyla, which includes Brachiata. (c) Lipobranchia Pentadactyla, which includes Reptiles, Birds and Mammals.

Accipitrés, Tinamiformes, Galliformes (Sub orders: Meleagrides, Turdoidae, Galli, Otidiformes), Gralliformes, Charadriiformes (Sub-orders: Limicolaiae, Laridæ, Pterocetes, Columbæae), Cuculiformes (Sub orders: Cuculæ, Psitacæ), Coraciiformes (Sub-orders: Coraci-
eæ, Steropidae, Cypselæ, Cotingæ, Trogonæ, Picæ), Passeriformes (Sub orders: Passeres Ammodytidae, Passeres Diacromyidae).

Class 4. Mammalia (g.e.).
Sub-class 1. Monotremata (g.e.) (Prototheria).
No Orders.
Sub-class 2. Marsupialia (g.e.) (Metatheria).
One Order: Marsupialia.
Sub-orders: Polyprotodontia, Paucituberculata, Di-
protodontia.
Sub-class 3. Placentia (Monodelphina, g.e.; or Eutheria).
Orders: Insectivora, Chiroptera, Therioptera, Eden-
ta (Sub-orders: Xenarthra, Pholidota, Tubulidenta-
ta), Rodentia (Sub-orders: Duplicidentata, Sim-
pleidentata), Talpidae, Carnivora (Sub orders:
Fissipedia, Pinnipedia, Creodonta), Cetacea (Sub-
orders: Archaeoceti, Odonoceti, Mysticoceti), Sire-
nia, Ungulata (Sub-orders: Probosciidea, Hy-
racoidæ, Borypoda, Toxodontia, Ambylopoda,
Lipotermi, Ancylopoda, Condylarthra, Perissodactyla, Artiodactyla), Primates (Sub orders: Pro-
simiae, Anthropoidea).

Phylum 14. Mesozoa (g.e.).
Class 1. Rhombozoa.
No Orders.
Class 2. Orthoentacta.
No Orders.
Phylum 15. Polyzoa (g.e.).
Class 1. Entoprocta.
No Orders.
Class 2. Ectoprocta.
Orders: Gymnolaemata (Sub-orders: Tripodonta, Gym-
nothoracica, Cyclodonta, Ctenocephalia, Chelon-
idae), Phylumcheleata.
Phylum 16. Acanthoecephala (g.e.).
Class. Acanthoecephala.
No Orders.
Phylum 17. Podaxonia.
Class 1. Spinculoidia (g.e.).
No Orders.
Class 2. Priapuloidia (g.e.).
No Orders.
Class 3. Phoroneida (g.e.).
No Orders.
Class 4. Pterobranchia (g.e.).
No Orders.
Class 5. Brachiopoda (g.e.).
Sub-class 1. Eocrigidina (Inarticulata).
Orders: Atremata, Nectrema.
Sub-class 2. Testicardia (Articulata).
Orders: Protremata, Talotremata.
Phylum 18. Gastrotricha (g.e.).
Class. Gastrotricha.
Sub-orders: Ichthydina, Cepedinea. (Possibly Kin-
rhyncha (g.e.) with only Echinoderes is to be
placed here)."

General Tendencies since Darwin

Darwin may be said to have founded the science of biomics, and at the same time to have given new stimulus and new direction to morpology, physiology, and plasontology, by uniting them as contributory factors to a general biological doctrine—the doctrine of organic evolution—itsel but a part of the wider doctrine of universal evolution based on the laws of physics and chemistry. The immediate result was, as pointed out above, a reconstruction of the classification of animals upon a genealogical basis, and an investigation of the individual development of animals in relation to the steps of their gradual building up by cell-fission, with a view to obtaining evidence of their genetic relationships. On the other hand, the studies which occupied Darwin himself so largely subsequently to the publication of *The Origin of Species*, viz. the explanation of animal (and vegetable) mechanism, colouring, habits, etc., as advantageous to the species or to its ancestors, are only gradually being carried further. The most important work in this direction has been done by Fritz Müller (Für Darwin), by Herman Müller (Fertilisation of Plants by Insects),
by August Weismann (memories translated by Melville by Edward B. Poulton (see his addresses and memoirs published in the Transactions of the Entomological Society and elsewhere), and by Abbot Thayer (Concealing Coloration in the Animal Kingdom, Macmillan & Co. 1910). In the branch of biometrics, however, concerned with the laws of variation and heredity (thermogenesis), there has been considerable progress. In the first place, the continued study of human population has thrown additional light on some of the questions involved, whilst the progress of microscopical research has given us a clearer foundation as to the structural facts connected with the origin of the egg-cell and sperm-cell and the process of fertilization.

Great attention has been given lately to the important experiments upon the results of hybridizing certain cultivated varieties of plants which were published so long ago as 1865, by the Abbé Mendel, but failed to attract notice until thirty-five years later, sixteen years after his death (see MENDELISM). Mendel's object was to gain further knowledge as to the result of mixing by cross-fertilization or interbreeding two strains exhibiting diverse characters or structural features. The whole question as to the mixture of characters in offspring thus produced was—and remains—very imperfectly observed. Mendel made the important attempt to throw light on the matter, and in the opinion of some biologists have led to the discovery of an important principle. Mendel made his chief experiments with cultivated varieties of the self-fertilizing edible pea. He selected a variety with some one marked structural feature and crossed it with another variety in which that feature was absent. Instances of his selected varieties are the tall variety which he hybridized with a dwarf variety, a yellow-seeded variety which he hybridized with a green-seeded variety, and again a smooth-seeded variety which he hybridized with a wrinkled-seeded variety. In each set of experiments he concentrated his attention on the one character selected for observation. Having obtained a first hybrid generation, he allowed the hybrids to self-fertilize, and recorded the result in a large number of instances (a thousand or more) as to the number of individuals in the first, second, third and fourth generations in which the character selected for experiment made its appearance. In the first hybrid generation formed by the union of the reproductive germ of the positive variety (that possessing the structural character selected for observation) with all at the same time, it is not surprising that all or nearly all the individuals were found to exhibit, as a result of the mixture, the positive character. In subsequent generations produced by self-fertilization of the hybrids it was found that the positive character was not present in all the individuals, but that a result was obtained showing that in the formation of the reproductive cells (ova and sperms) of the hybrid, half were endowed with the positive character and half with the negative. Consequently the result of the haphazard pairing of a large number of these two groups of reproductive cells was to yield, according to the regular law of chance combination, the proportion 1P, 2PN, 1NN, where P stands for the positive character and N for its absence or negative character—the positive character being accordingly present in three-fourths of the offspring and absent from one-fourth. The fact that in the formation of the reproductive cells of the hybrid generation the material which carries the positive quality is not subdivided so as to give a half-quantity to each reproductive cell, but on the contrary is apparently distributed as an undivided whole to half only of the reproductive cells and not at all to the remainder, is the important inference from Mendel's experiments. Whether this inference is applicable to other classes of cases than those studied by Mendel and his followers is a question which is still under investigation. The failure of the material carrying a positive character to divide so as to distribute itself among all the reproductive cells of a hybrid individual, and the limitation of its distribution to half only of those cells, must prevent the "swamping" of a newly appearing character in the course of the inter-breeding of those individuals possessed of the character with those which do not possess it. The tendency of the proportions in the offspring of IRR, 2PN, 1NN is to give in a series of generations a regular reversion from the hybrid form PN to the two pure races, viz. the race with the positive character simply and the race with the total absence of it. It has been maintained that this tendency to a severance of the hybrid stock into its components must favour the persistence of a new character of large volume suddenly appearing in a stock, and the observations of Mendel have been held to favour in this way the views of those who hold that the variations upon which natural selection has acted in the production of new species are not small variations but large and "discontinuous." It does not, however, appear that "large" variations have thus be favoured any more than small ones, nor that the eliminating action of natural selection upon an unfavourable variation could be checked.

A good deal of confusion has arisen in the discussions of this latter topic, owing to defective nomenclature. By some writers the word "mutation," is applied only to large and suddenly appearing variations which are found to be capable of hereditary transmission, whilst the term "fluctuation" is applied to small variations whether capable of transmission or not. Of course, the word "fluctuation" is apparently applied only to those small "acquired" variations due to the direct action of changes in food, moisture and other features of the environment. It is no discovery that this latter kind of variation is not hereditary, and it is not the fact that the small variations, to which Darwin attached great but not exclusive importance as the material upon which natural selection operates, are of this latter kind. The most instructive classification of the "variations" exhibited by fully formed organisms consists in the separation in the first place of those which arise from antecedent congenital, innate, constitutional or germinal variations from those which arise merely from the operation of variation of the environment or the food-supply upon normally constituted individuals. The former are "innate" variations, the latter are "superimposed" variations (so-called "acquired variations"). Both innate and superimposed variations are capable of division into those which are more and those which are less obvious to the human eye. Sarcely perceptible variations of the innate class are regularly and invariably present in every new generation of every species of organic form. The variation which goes not of itself, but of the environment which is suddenly and essentially of new appearance, becomes of much significance; their real importance in regard to the origin of new species depends on whether they are of value to the organism and therefore capable of selection in the struggle for existence. An absolutely imperceptible physiological difference arising as a variation may be of selective value, and it may carry with it correlated variations which appeal to the human eye but are of no selective value themselves. The present writer has, for many years, urged the importance of this consideration. The views of de Vries and others as to the importance of "saltatory variation," the soundness of which was still by no means generally accepted in 1910, may be gathered from the articles MENDELISM and VARIATION. A due appreciation of the far-reaching results of "correlated variation" must, it appears, give a new and distinct explanation to the phenomena which are referred to as "large mutations," "discontinuous variation," and "saltatory evolution." Whatever value is to be attached to Mendel's observation of the breaking up of self-fertilized hybrids of cultivated varieties into the two pure races, the method by which he arrives at the result, IRR, 2PN, 1NN, it cannot be considered as more than a contribution to the extensive investigation of heredity which still remains to be carried out. The analysis of the specific variations of organic form so as to determine what is really the nature and limitation of a single "character" or "individual variation," and whether two such true and strictly defined single variations of a single structural unit can actually" blend" when one is transmitted by the male parent and the other by the female
parent, are matters which have yet to be determined. We do not yet know whether such absolute blending is possible or not, or whether all apparent blending is only a more or less minutely subdivided "mosaic" of non-combinable characters of the parents, in fact whether the combinations due to heredity in reproduction are ever analogous to chemical compounds or are always comparable to particulate mixtures. The attempt to connect Mendel's observations with the structure of the sperm-cells and egg-cells of plants and animals has already been made. The suggestion is obvious that the halving of the number of nuclear threads in the reproductive cells as compared with the number of those present in the ordinary cells of the tissues—a phenomenon which has now been demonstrated as universal—may be directly connected with the facts of segregation of hybrid characters observed by Mendel. The suggestion requires further experimental testing, for which the case of the parthenogenetic production of a portion of the offspring, in such insects as the bee, offers a valuable opportunity for research.

Another important development of Darwin's conclusions deserves special notice here, as it is the most distinct advance in the department of bionomics since Darwin's own writings, and at the same time touches questions of fundamental interest. The matter strictly relates to the consideration of the "causes of variation," and is as follows. The fact of variation is a familiar one. No two animals, even of the same brood, are alike: whilst exhibiting a close similarity to their parents, they yet present differences, sometimes very marked differences, from their parents and from one another. Lamarck had put forward the hypothesis that structural alterations are produced by (that is to say, superimposed upon) a parent in the course of its life are transmitted to the offspring and that, as these structural alterations are acquired by an animal or plant in consequence of the direct action of the environment, the offspring inheriting them would as a consequence not unfrequently start with a greater fitness for those conditions than its parents started with. In its turn, being operated upon by the conditions of life, it would acquire a greater development of the same modification, which it would in turn transmit to its offspring. In the course of several generations, Lamarck supposed, a structural alteration amounting to such difference as we call "specific" might be thus acquired. The familiar illustration of Lamarck's hypothesis is that of the giraffe, whose long neck might, he suggested, have been acquired by the efforts of a primitively short-necked race of herbivores who stretched their necks to reach the foliage of trees in a land where grass was deficient, the effort producing a distinct elongation in the neck of each generation, which was then transmitted to the next. This process is known as "direct adaptation"; and there is no doubt that such structural adaptations are acquired by an animal in the course of its life, though such changes are strictly limited in degree and rare rather than frequent and obvious.

Whether such acquired characters can be transmitted to the next generation is a separate question. It was not proved by Lamarck that they can be, and, indeed, never has been proved by actual observation. Nevertheless it has been assumed, and also indirectly argued, that such acquired characters must be transmitted. Darwin's great merit was that he excluded from his theory of development any necessary assumption of the transmission of acquired characters. He pointed to the admitted fact of congenital variation and he showed that congenital variations are arbitrary and, so to speak, non-significant.

Their causes are extremely difficult to trace in detail, but it appears that they are largely due to a "shaking up" of the living matter which constitutes the fertilized germ or embryo-cell, by the process of mixture in it of the substance of two cells—the germ-cell and the sperm-cell—derived from two different individuals. Other mechanical disturbances may assist in this production of congenital variation. Whatever its causes, Darwin showed that it is all-important. In some cases a pair of animals produce ten million offspring, and in such a number a large range of congenital variation is possible. Since on the average only two of the young survive in the struggle for existence to take the place of their two parents, there is a selection out of the ten million young, none of which are exactly alike, and the selection is determined in nature by the survival of the congenital variety which is fittest to the conditions of life. Hence there is no necessity for an assumption of the perpetuation of direct adaptations. The selection of the fortuitously (fortuitously, that is to say, so far as the conditions of survival are concerned) produced varieties is sufficient, since it is ascertained that they will tend to transmit those characters with which they themselves were born, although it is not ascertained that they could transmit characters acquired on the way through life. A simple illustration of the difference is this: a man born with four fingers only on his right hand is ascertained to be likely to transmit this peculiarity to some at least of his offspring; on the other hand, there is not the slightest ground for supposing that a man who has had one finger chopped off, or has even lost his arm at any period of his life, will produce offspring who are defective in the slightest degree in regard to fingers, hand or arm. Darwin himself, influenced by the consideration of certain classes of facts which seem to favour the Lamarckian hypothesis, was of the opinion that acquired characters are in some cases transmitted. It should be observed, however, that Darwin did not attribute an essential part to this Lamarckian hypothesis of the transmission of acquired characters, but expressly assigned to it an entirely subordinate importance.

The new attitude which has been taken since Darwin's writings on this question is to ask for evidence of the asserted transmission of acquired characters. It is held 1 that the Darwinian doctrine of selection of fortuitous congenital variations is sufficient to account for all cases, that the Lamarckian hypothesis of transmission of acquired characters is not supported by experimental evidence, and that the latter should therefore be dismissed. Weismann has also ingeniously argued from the structure of the egg-cell and sperm-cell, and from the way in which, and the period at which, they are derived in the embryo, and from the fact that the offspring inherit from the fertilized egg-cell—that it is impossible (it would be better to say highly improbable) that an alteration in parental structure could produce any exactly representative change in the substance of the germ or sperm-cells.

The one fact which the Lamarckians can produce in their favour is the account of experiments by Brown-Séquard, in which he produced epilepsy in guinea-pigs by section of the large nerves or spinal cord, and in the course of which he was led to believe that in a few rare instances the artificially produced epilepsy and mutilation of the nerves was transmitted. This instance does not stand the test of criticism. The record of Brown-Séquard's original experiment is not satisfactory, and the subsequent attempts to obtain similar results have not been attended with success. On the other hand, the vast number of experiments in the cropping of the tails and ears of domestic animals, as well as of similar operations on man, are attended with negative results. No case of the transmission of the results of an injury can be produced. Stories of tailless kittens, puppies and calves, born from parents one of whom had been thus injured, are abundant, but they have hitherto entirely failed to stand the test of criticism.

Whilst simple evidence of the fact of the transmission of an acquired character is wanting, the a priori arguments in its favour break down one after another when discussed. The very cases which are advanced as only to be explained on the Lamarckian assumption are found on examination and experiment to be better explained, or only to be explained, by the Darwinian principle. Thus the occurrence of blind animals in caves and in the deep sea was a fact which Darwin himself regarded as best explained by the atrophy of the organ of vision in successive generations through the absence of light and

1 Weismann, Vererbung, &c. (1886).
consequent disuse, and the transmission (as Lamarck would have supposed) of a more and more weakened and structurally impaired eye to the offspring in successive generations, until the eye finally disappeared. But this instance is really fully explained (as the present writer has shown) by the theory of natural selection, which is an improvement and refinement of the old Lamarckian hypothesis. It is definitely ascertained that many animals are thus born with distorted or defective eyes whose parents have not had their eyes submitted to any peculiar conditions. Supposing a number of some species of arthropod or fish to be swept into a cavern or to be carried from less to greater depths in the sea, those individuals with perfect eyes would follow the glimmer of light and eventually escape to the outer air or the shallower depths, leaving behind those with imperfect eyes to breed in the dark place. A natural selection would thus be effected. In every succeeding generation this would be the case, and even those with weak but still seeing eyes would in the course of time escape, until only a pure race of eyeless or blind animals would be left in the cavern or deep sea.

It is a remarkable fact that it was overlooked alike by the supporters and opponents of Lamarck's views until pointed out by the present writer (Nature, 1894, p. 127), that the two statements called by Lamarck his first and second laws are contradictory one of the other. Lamarck's first law asserts that a past history of indefinite duration is powerless to create a bias by which the present can be controlled. He has therefore left us to the mercy of the contingencies. If we assert that these new characters will resist the action of yet newer conditions or a reversion to the old conditions and be maintained by heredity. If the earlier characters were not maintained by heredity why should the later be? If a character of much longer standing (certain properties of height, length, breadth, colour, &c.) had not become fixed and congenital after many thousands of successive generations of individuals had developed it in response to environment, but gave place to a new character when new moulding conditions operated on an individual (Lamarck's first law), why should we suppose that the new character is likely to become fixed and transmitted by mere heredity after a much shorter time of existence in response to environmental stimulus? Why should we assume that it will be able to escape the moulding by environment (once its evoking cause is removed) to which, according to Lamarck's first law, all parts of organisms are subject? Clearly Lamarck gives us no reason for any such assumption, and his followers or latter-day adherents have not attempted to do so.

The transmission of characters is a very important point in establishing the theory of natural selection. The transmission is directly traceable to the-change of the nervous system which are the corporeal correlates of complicated instincts must have been slowly built up by the transmission of offspring of acquired experience, that is to say, of acquired brain structure. At first sight it appears difficult to understand how the complicated series of actions which are definitely exhibited as so-called "instincts" by a variety of animals can have been due to the selection of congenital variations, or can be otherwise explained than by the transmission of habits acquired by the parent as the result of experience, and continuously elaborated and added to in successive generations. It is, however, to be noted, in the first place, that the imitation of the parent by the young possibly accounts for some part of these complicated动作, and, secondly, that there are cases in which curiously elaborate actions are performed by animals as a characteristic of the species, and as subverting the general advantage of the race or species, which, nevertheless, can be explained as resulting from the transmission of acquired experience, and must be supposed to be due to the natural selection of a fortuitously developed habit which, like fortuitous colour or form variation, happens to prove beneficial. Such cases are the habits of "shamming dead" and the combined posturing and colour peculiarities of certain caterpillars (Lepidopterous larvae) which cause them to resemble dead twigs or similar surrounding objects. The advantage to the animal of this imitation of surrounding objects is that it escapes the pursuit of (say) a bird which would, were it not deceived by the resemblance, attack and eat the caterpillar. Now it is clear that preceding generations of caterpillars cannot have acquired this habit of posturing by experience. Either the caterpillar postures and escapes, or it does not posture and is eaten; it is not half eaten and allowed to profit by experience. We seem to be justified in assuming that there are many movements of stretching and posturing possible to caterpillars, and that some caterpillars have a congenital fortuitous tendency to one position, others to another, and that among all the variety of habitual movements thus exhibited one has been selected and perpetuated because it coincided with the necessary conditions of safety, since it happened to give the caterpillar an increased resemblance to a twig.

The view that Instinct is the hereditarily fixed result of habit derived from experience long dominated all inquiry into the subject, but we may now expect to see a renewed and careful study of animal instincts carried out with the view of testing the applicability to each instance of the law of Darwinian theory without the aid of Lamarckism.

Nothing can be further from the truth than the once favourite theory that instincts are the survivals of lapsed reasoning processes. Instincts, or the inherited structural mechanisms of the nervous centres, are in antagonism to the results of the reasoning process, which are not capable of hereditary transmission. Every higher vertebrate animal possesses the power of forming for itself a series of cerebral mechanisms or reasoned conclusions based on its own experience, in proportion as it has a large cerebrum and has got rid of or has acquired the power of controlling its inherent instincts. Man, compared with other animals, has the fewest inherited mental mechanisms or instincts and at the same time the largest cerebrum in proportion to the size of his body. He builds up, from birth onwards, his own mental mechanisms, and forms more of them, that is to say, is more "educable," and takes longer in doing so, that is to say, in growing up and mastering his experience, than any other animal.

The later stages of evolution leading from his ape-like ancestors to man have consisted definitely in the acquirement of a larger and more powerful brain as the result of the increased extent of that brain. A new and most important feature in organic development makes its appearance when we set out the facts of man's evolutionary history. It amounts to a new and unprecedented factor in organic development, external to the organism and yet produced by the activity of the organism upon which it permanently reacts. This factor is the Record of the Past, which grows and develops by laws other than those affecting the perishable bodies of successive generations of mankind, and exerts an incomparable influence upon the educable brain, so that man, by the interaction of the Record and his educability, is removed to a large extent from the status of the organic world and placed in a new and unique position, subject to new laws and new methods of development unlike those by which the rest of the living world is governed. That which we term the Record of the Past comprises the "taboos,"
the customs, the traditions, the beliefs, the knowledge which are handed on by one generation to another independently of organic propagation. By it a new heredity, free from the limitations of protoplasmic continuity, is established. Its first beginnings are seen in the imitative tendencies of animals by which the young of one generation acquire some of the habits of their parents, and by which gregarious and social animals acquire a community of procedure ensuring the advantage of the group. "Taboo," the systematic imposition by the community of restrictions upon the conduct of the individual, is one of its earliest manifestations in primitive man and can be observed even in animal communities. But with the development of the power of inter-communication by the use of language, the Record rapidly acquired an increased development, which was enormously extended by the continuous growth in mankind of the faculty of memory. To the mere tradition preserved by memory and handed on by speech was then added the written record and its later multiplication by the mechanical arts of printing, by which it acquired permanence and universal distribution. The result is the creation of an almost inconceivably vast body of traditional custom, law and knowledge into which every human being is born, less in the more isolated and barbarous communities, but large everywhere. Education is not in its essential nature a training administered to the young by an older generation, but is the natural and unaided assimilation of the Record of the Past by the automatically educable brain—an assimilation which is always in all races very large but becomes far larger in civilized communities. It is among them so important whilst the Record in all its details is so far beyond the receptive capacity of the brain, that selection and guidance are employed by the elders in order to enable the younger generation to benefit to the utmost by the absorption (so to speak) in the limited span of a lifetime of the most valuable influences to be acquired from this prodigious envelope of Recorded Experience. The imperishable Record invests the human race like a protective atmosphere, a new and yet a natural dispensation, giving to man, as compared with his animal ancestry, a new heaven and a new earth!

A result of the very greatest importance arising from the application of the generalizations of Darwinism to human development and to the actual phase of existing human population is that education has no direct effect upon the mental or physical features of the race or stock: it can only affect those of the individual. Educability, defects or excellences, or peculiarities of mind or body, can be handed on from parent to offspring by protoplasmic continuity in reproduction. But the results of education cannot be so handed on. The educated man who has acquired new experiences, new knowledge, can place them on the record for the benefit of others. But the acquirements of men, but he cannot bodily transmit his acquirements to his offspring. Were acquired (superimposed) characters really transmissible by breeding, then every child born would inherit, more or less completely, the knowledge acquired by both its parents. But we know this is not the case: the child has to begin with a clean slate and learn for itself. Aptitudes and want of aptitude, which are innate and constitutional, are transmitted to offspring, but not the results of experience, education and training. Elements in the stock, defects of mind or body, though they may be to some extent corrected in the individual by training, cannot be got rid of from the stock by any such process. A defective stock, if allowed to breed, will perpetuate its defects, in spite of the concealment of those defects in an individual by training or other treatment. Equally it must be concluded that the weakness and degradation produced by semi-starvation and insanitary conditions of life are only an effect on the individual and cannot affect the stock. The stock may be destroyed, killed out by adverse conditions, but its quality is not directly affected, and if exposed to more favourable conditions it will show no hereditary results of the previous adversity; indeed it will probably have been strengthened in some ways by the destruction in severe conditions of its weaker members and the survival of the stronger individuals. Such considerations have very the greatest importance for the guidance of the action of civilized man in seeking the health and happiness of the community. But it must not be forgotten that the problems presented by human communities are extremely complex, and that the absence of any selection of healthy or desirable stock in the breeding of human communities leads to undesirable consequences. The most thrifty and capable members of the population at the present day are not (as has been shown) in overcrowded areas, producing offspring at such a rate as to contribute to the increase of the population. That increase, it has been shown, is due to the early marriage and excessive reproduction of the reckless and hopeless, the poorest, least capable, least desirable members of the community. The questions raised by these considerations have attracted much public attention under the newly invented name of "eugenics," but they are of an exceedingly difficult and delicate nature.

ZORILLA, MANUEL RUIZ, DON (1834-1895), Spanish politician, was born at Burgos de Osma in 1834. He began his education at Valladolid, and studied law afterwards at Madrid University, where he leaned towards Radicalism in politics. In 1856 he was elected deputy, and soon attracted notice among the most advanced Progressists and Democrats. He took part in the revolutionary propaganda that led to the military movement in Madrid on the 22nd of June 1866. He had to take refuge in France for two years, like his fellow-conspirators, and only returned to Spain when the revolution of 1868 took place. He was one of the members of the first cabinet after the revolution, and in 1869, under the presidency of Marshal Serrano, he became minister of grace and justice. In 1870 he was elected president of the House of Deputies, and seconded Prim in offering the throne to Amadeus of Savoy. He went to Italy as president of the commission, carrying to the prince at Florence the official news of his election. On the arrival of Amadeus in Spain, Ruiz Zorilla became minister of public works for a short time, and resigned by way of protesting against Serrano and Topete entering the councils of the new king. Six months later, in 1871, he was invited by Amadeus to form a cabinet, and he continued to be the principal councillor of the king until February 1873, when the monarch abdicated in disgust at the resistance he met with in the army, and at the lack of sincerity on the part of the very politicians and generals who had asked him to ascend the throne. After the departure of Amadeus, Ruiz Zorilla advocated the establishment of a republic. Notwithstanding this, he was not called upon either by the Federal Republicans to help them during the year 1873, or by Marshal Serrano during 1874 to join Martos and Sagasta in his cabinet. Immediately after the restoration of the Monarchy in 1875, Ruiz Zorilla went to France. He was for nearly eighteen years the soul of the republican conspiracies, the prompter of revolutionary propaganda, the chief inspirer of intrigues concerted by discontented military men of all ranks. He gave so much trouble to the Madrid governments that they organized a watch over him with the assistance of the French government and police, especially when it was discovered that the two military movements of August 1883 and September 1886 had been prepared and assisted by him. During the last two years of his life Ruiz Zorilla became less active; failing health and the loss of his wife had decreased his energies, and the Madrid government allowed him to return to Spain some months before he died at Burgos, on the 15th of June 1895, of heart disease.

ZORNDORF, a village of Prussia, in the Oder valley, northeast of Cüstrin. It is famous as the scene of a battle in which the Prussians under Frederick the Great defeated the Russians commanded by Fennor, on the 29th of August 1758 (see Seven Years' War).

ZOZOATER, one of the great teachers of the East, the founder of what was the national religion of the Perso-Iranian people from the time of the Achaemenids to the close of the Sassanian period. The name (Zorâzōaster) is the corrupt Greek form of the old Iranian Zarathustra (new Persian, Šāhrūn Zārāvšānī, and hence also known as Šāhrūn Zārāvšānī).
Zoroaster

It is the magic, as it were, of the Zoroastrian religion, a religion essentially psychological in its effect. The one thing that Zoroaster, with a less vivid imagination, might have done to stay in the world after the close of his lifetime—it is likely that he could have done it—was to recite his Gathas over and over again to his immediate friends, not in the present tense, but in the past, and so make it appear as if he had actually lived and died. But the Gathas are in the present tense, and the Gathas were written for the most part in the present tense, and the Gathas were written by a man who was already dead when he wrote them. So Zoroaster, the first great prophet of the Western world and the father of all those who have followed him, died in the wildness upon the mountains of Persia in the 4th century B.C. (see also Numa, 23, 4a.) From this time on, the Zoroastrianism that is still in existence is no more than a memory of the Zoroastrianism that was.

The person of the Zoroastrian whom we meet with in these hymns differs from the Zoroastrian of the Gathas in being the exact opposite of the miraculous personage of later legend—a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies. At times he possesses a poetical gift, but at the same time he is a man who is capable of strong and unsentimental feeling. In the Gathas he has to face, not merely all forms of outward opposition and the belief and lukewarmness of adherents, but also the inward resistance of his own spirit. To this truth and final victory of his cause. At one time hope, at another constancy, now assured confidence, now doubt and despair, here a firm faith in the speedy coming of the kingdom of heaven, there the thought of the long period of time, and of the range of the emotions which find their immediate expression in these hymns. And the whole breathes such a genuine originality, all is psychologically so accurate and just, the earliest beginnings of the new religious movement, the chiefest, he of a new community of faith, not reflected of their prophet, but rather so, to say, versus memoriales, which recapitulate the main points of interest, often again in brief outlines. These are more than mere survivals of pre-Zoroastrian prophecies, sometimes directed to the faithful flock or to the princes, but generally cast in the form of dialogues with God and the angels, whom he repeatedly invokes as witnesses to his veracity. Moreover, they cannot be regarded as mere formulas, for all later generations have forgotten.

The Person of the Prophet.—As to his birthplace the traditions are conflicting. According to the Yasnain (Yasn 9, 17), Airyanem Vaéjó, on the river Dārīyā, the old sacred city of the gods, was the home of Zoroaster, and the scene of his first appearance. There, on the river Darayjā, assuming that the passage (Vend. 19, 4) is correctly interpreted, on the banks of the house of his father; and the Bundakih (29, 32, 24, 15) says expressly that the river Darājā lay in Airān Vēj, on its bank was the dwelling of his father, and that there Zoroaster was born. Now, according to the Bundakih (29, 12), Airān Vēj was situated in the direction of Artatapāne, and consequently Airyanem Vajjō is for the most part identified with the district of Arān in the river Aras (Araxes), close by the north-western frontier of Media. Other traditions, however, make him a native of Rağha (Ragha, 'Pēyār). According to Yasnain 19, 18, the saraznhvātēnas, or supreme head of the yaznavend, and the Bundakih (29, 32), the chief contributors to the religious and moral life of Persia, which are in the possession of the gods, and are in the possession of the king of the king of the king of the kingdom of heaven. If, then, it is true that the person of Zoroaster is an historical personage, it is also true that he is a religious personage, and a religious personage in the highest degree, for he is the religious personage of a new religion—he appears at the court of King Vishtaspā.
he is spoken of as a pioneer of the doctrine revealed by Ormazd. In the relation between Zoroaster and Vishňča already lies the germ of the state church which afterwards became completely subservient to the interests of the dynasty and sought its protection from it.

Among the grandees of the court of Vishňča mention is made of two brothers, Frasaĥtahr and Jâmáspta; both were, according to the later legend, vizirs of Vishňča. Zoroaster was nearly related to both: his wife, Hvôši, was the daughter of Frasaĥtahr, and the husband of his daughter, Pourucista, was Jâmáspta. The actual rôle of intermediary was played by the pious queen Hvutaosa. Apart from this connexion, the new prophet relieves especially upon his own kindred (avótišč). His first disciple, Maidhyôdīmôngha, was his cousin: his father was, according to the later Avesta, Pourushashpa, his mother Dughôvò, his great-grandfather Hâcetaspâ, and the ancestor of the whole family Spitama, for which reason Zarathushtra usually bears this surname. His sons and daughters are repeatedly spoken of. His death is, for reasons easily intelligible, nowhere mentioned in the Avesta; in the Shêkânâma he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

We are quite ignorant as to the date of Zoroaster; King Vishňča does not seem to have any place in any historical chronology, and the Gathás give no hint on the subject. In former times the assertion was, and even now is often put forward, that Vishňča was one and the same person with the said a伏šč, father of Darius I. This identification can only be purchased at the cost of a complete renunciation of the Avestan genealogy. Hutaosa is the same name as Atossa: but in history Atossa was the wife of Cambyses and Darius. Otherwise, not one single name in the entourage of our Vishňča can be brought into harmony with historical nomenclature. According to the Arda Virâf, 1, 2, Zoroaster taught, in round numbers, some 300 years before the invasion of Alexander. The testimony of Assyrian inscriptions relegates him to a far more ancient period. If these prove the name Mazdaka to have formed part of Median proper names in the year 715 B.C., Eduard Meyer (v. Ancient Persia) is justified in maintaining that the Zoroastrian religion must even then have been predominant in Media. Meyer, therefore, conjecturally puts the date of Zoroaster at 1000 B.C., as had already been done by Duncker (Geschichte des Alterthums, 4, 5, 78). This, in its turn, may be too high: but, in any case, Zoroaster belongs to a prehistoric era. Probably he emigrated from the old school of Median Magi, and appeared first in Media as the prophet of a new faith, but met with sacerdotal opposition, and turned his steps eastward. In the east of Iran the novel creed first acquired a solid footing, and subsequently reacted with success upon the West.

Zoroastrianism.—Zoroaster taught a new religion; but this must not be taken as meaning that everything he taught was, so to say, out of his own head. His doctrine was rooted in the old Iranian—or Aryan—folk-religion, of which we can only form an approximate representation by comparison with the religion of the Veda. The newly discovered Hititite inscriptions have now thrown a welcome ray of light on the primitive Iranian creed (Ed. Meyer, Sitüungenberichte der Preuss. Akademie, 1908). In the inscriptions of Miletus and Nineveh the priests are mentioned as deities of the Iranian kings of Mitanni at the beginning of the 14th century—all of them names with which we are familiar from the Indian pantheon. The Aryan folk-religion was polytheistic. Worship was paid to popular divinities, such as the war-god and dragon-slayer Indra, to natural forces and elements such as fire, but the Aryans also believed in the ruling of moral powers and of an eternal law in nature (v. Ed. Meyer in the article Persia: History, § Ancient). On solemn occasions the inspiring drink soma (haoma) ministered to the welfare of the divinities. Numerous coincidences with the Indian religion survive in Zoroastrianism, side by side with astonishing diversities.

The most striking difference between Zoroaster’s doctrine of God and the old religion of India lies in this, that while in the Avesta the evil spirits are called daērô (Modern Persian dīv), the Aryans of India, in common with the Italians, Celts and Latins, gave the name of dēva to their good spirits, the spirits of light. An alternative designation for deity in the Rig-Veda is asura. In the more recent hymns of the Rig-Veda and in later India, on the other hand, only evil spirits are understood by asuras, while in Iran the corresponding word ahūra was, and ever has continued to be, the designation of God the Lord. Thus ahurâ-daērô, dēva-asmrá in Zoroastrian and in later Brahman theology are in their meanings diametrically opposed. Asura-daērô represent originally two distinct races of gods (like the Northern Aser and Vaner)—two different aspects of the conception of deity, comparable to dēlμve and bōs. Asura indicates the more sublime and awful divine character, for which man entertains the greater reverence and fear: daērô denotes the kind of gods of light, the vulgar—more sensuous and anthropomorphic—deities. This twofold development of the idea of God formed the point of leverage for Zoroaster’s reformation. While in India the conception of the asura had veered more and more towards the dreadful and the dreaded, Zoroaster elevated it again—at the cost, indeed, of the daivas (daēnus), whom he degraded to the rank of malicious powers and devils. In one Asura, whose Aryan original was Varuna, he concentrated the whole of the divine character, and conferred upon it the epithet of “the wise” (mazdâ). This culminating stage in the asura-conception is the work of Zoroaster. The spirit (Ahurâ-mazdâ) is the arch-enemy of all spiritual being, the All-father, who was existent before ever the world arose. From him that world has emanated, and its course is governed by his foreseeing eye. His guiding spirit is the Holy Spirit, which wills the good: yet it is not free, but restricted, in this temporal epoch, by its antagonist and own twin-brother (Visna, 30, 3), the Evil Spirit (anôrd mâihyvush, Ahriman), who in the beginning was banished by the Good Spirit by means of the famous ban contained in Visna, 45, 2, and since then drags out his existence in the darkness of Hell as the principle of ill—the arch-enemy. In the Gathás the Good Spirit of Mazdâ and the Evil Spirit are the two great opposing forces in the world, and Ormazd himself is to a certain extent placed above them both. Later the Holy Spirit is made directly equivalent to Ormazd; and then the great watchword is: “Here Ormazd, there Ahriman!” The very daēnas are only the inferior instruments, the corrupted children of Ahriman, from whom come all that is evil in the world. The daēnas, unmasked and attacked by Zoroaster as the true enemies of mankind, are still, in the Gathás, without doubt the perfectly definite gods of old popular belief—the idols of the people. For Zoroaster they sink to the rank of servile deities, and in his eyes the priests and votaries are idolators and heretics. In the later, developed system the daēnas are the evil spirits in general, and their number has increased to millions. Some few of these have names; and among those names of the old Aryan divinities emerge here and there, e.g. Indra and Nāthonhaitya. With some, of course—such as the god of fire—the connexion with the good deity was a priori indissoluble. Other powers of light, such as Mitra the god of day (Iranian Mithra), survived unforfeited in popular belief till the later system incorporated them in the divine system. This authentic doctrine of the Gathás had no room either for the cult of Mithra or for that of the Haoma.

Beyond the Lord and his Fire, the Gathás only recognize the archangels and certain ministers of Ormazd, who are, without exception, personifications of abstract ideas. This hypo-stasization and all-egotization is especially characteristic of the Zoroastrian religion. The essence of Ormazd is Truth and Law aša=Vedic rta): this quality he embodies, and its personification (though conceived as sexless) is always by his side, a constant companion and intimate. The essence of the wicked spirit is falsehood and falsehood, as the embodiment of the evil principle, is much more frequently mentioned in the Gathás than Ahriman himself.

Zoroaster says of himself that he had received from God a
commission to purify religion (Yasna, 44, 9). He purified it from the grossly sensual elements of daeva worship, and uplifted the idea of religion to a higher and purer sphere. The motley body of Aryan folk-belief, when subjected to the unifying thought of a speculative brain, was transformed to a self-contained theory of the universe and a logical dualistic principle. But this dualism is a temporally limited dualism, and is less than an epic. In the world-picture it is destined to terminate in monothecism. Later sects sought to rise from it to a higher unity in other ways. Thus the Zarvanites represented Ormazd and Ahriman as twin sons proceeding from the fundamental principle of all—Zrvana Akarana,—or limitless time.

Ethically, too, the new doctrine stands on a higher plane, and represents, in its moral laws, a superior civilization. The devil-worshippers, at their sacrifices, slay the ox; and this the daeva favour, for they are foes to the cattle and to cattle-breeding, and friends to those who work ill to the cow. In Zoroaster's eyes this is an abomination: for the cow is a god to Ormazd, and the religion of Mazda protects the sacred animal. It is the religion of the settled grazier and the peasant, while the ruder daeva-cult holds its ground among the uncivilized nomadic tribes. In an old confession of faith, the convert is pledged to abjure the theft and robbery of cattle and the ravaging of villages inhabited by worshippers of Mazda (Yasna, 12, 2).

Zoroaster's teachings show him to have been a man of a highly speculative turn, faithful, however, with all his originality, to the Iranian national character. With his genius for faith, and energy, he combined a diplomatic skill in his dealings with his exalted protectors. His thinking is consecutive, self-restrained, practical, devoid of everything that might be called fantastic or excessive. But, on the other hand, his power of expression, his talent for exposition, is combined with a system constructed on a clearly conceived plan and stands on a high moral level; for its time it was a great advance in civilization. The doctrine of Zoroaster and the Zoroastrian Church may be summed up as follows:

1. As to the beginning of things, there existed the two spirits which represented good and evil (Yasna, 30, 3). The existence of evil in the world is thus presupposed from the beginning. Both spirits possess creative power, which manifests itself positively in the one and negatively in the other. Ormazd is light and life, and creates all that is pure and good—in the ethical world of law, order and truth. His antithesis is darkness, faith, death, and produces all that is evil in the world. Until then the two spirits had counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of Zoroaster's teaching. The evil spirit with his wicked hosts appears in the Gathas much less endowed with the attributes of personality and individuality than does Ahura Mazda. Within the world of the good Ormazd in Zoroaster's thought is God alone. In this sense Zarosianism is often referred to as the faith of Ormazd or as Mazdaism. Ormazd in his exalted majesty is the ideal figure of an Oriental king. He is not alone in his dealings with the outward world, but is supported by his angelic legions. And the Gathas are full of his angelic name (Yima, the equivalent of the Sanskrit Yama)—the name of a legent (Vd., 2, 1). Ormazd at first wished to entrust this task to Yima (Jemshid), the ideal of an Iranian king. But Yima, the secular man, felt himself unfitted for it and declined it. He condescended to lead his own people, and to himself as the king of the heavenly kingdom in miniature, to serve at the same time as a pattern for the heavenly kingdom that was to come. Zoroaster was professed to be a mystic in touch with the world of the holy, and had experienced within himself the inward call to seek the amelioration of mankind and their deliverance from ruin, and regarded this inner impulse, intensified as it was by long, contemplative solitude and by visions, as being the call addressed to him by God Himself. Like Mahomed after him he often speaks of his conversations with God and the archangels. He calls himself most frequently manushya ("prophet"); pātu ("spiritual authority"), and asuamhīt ("the coming helper")—that is to say, when men come to be judged according to their deeds).

2. The full contents of his dogmatic and ethical teaching we cannot gather from the Gathas. There are only general references of the divine commands and of good and evil works. Among the former those most inculcated are renunciation of Satan, adoration of Ormazd, purity of soul and body, and care for the poor. Among the latter are the rules against the use of certain foods (bees, etc.), and the animal sacrifices. The divine, terecundia, spoken of as daughter of Ormazd and regarded as having her abode upon the earth: (5) Haurvatāt (sphōrito), perfect happiness, and (6) armaiti, spiritual regeneration. (7) The two wings of the gāthās are the themes continually dwelt on with endless variations.

It was not without special reason—so Zoroaster believed—that the calling of a prophet should have taken place precisely when the human race was at its lowest ebb. He knew of a "great mankind at large." Like John the Baptist and the Apostles of Jesus, Zoroaster also believed that the fulness of time was near, that the kingdom of heaven was at hand. Through the whole of the Gāthās runs

In the centre of battle is man: his soul is the object of the war. Man is a creation of Ormazd, who therefore has the right to call and create everything for himself. But he has placed his determination and in his actions, wherefore he is accessible to the influences of the evil powers. This freedom of the will is clearly expressed in the Vd.: "Sukra 3, 2: 11: "Sukra: "Man is his own lawgiver."

The being and our consciences in accordance with thy mind, and didst create our understanding and our life together with the body, and works and words in which man according to his own will can freely act; and his will is the foundation of his activity; truly the word, the knowing and the ignorant each after his own heart and understanding. Armaiti searches, following thy spirit, where errors are found." Man takes part in this conflict by all his life and activities. He is free to work evil, but at his falls finally the power of Satan, and the pains of hell are his portion for ever. Should the evil and the good be equally balanced, the soul passes into a intermediary stage of existence (the Hambāštērī of the Pahlavi Gathas). His life does not end in death but in a last judgment. This court of reckoning, the judicium particular, is called āśa. The course of inexorable law cannot be turned aside by any sacrifice or offering, nor yet even by the free grace of God. The struggle for victory is as a rule a matter of personal conflict. It is the need for salvation in the future, not for sins of the past. Man who has been smitten with blindness and ignorance: he knows neither the eternal law nor the things which await him after death. He allows himself too easily to be ensnared by the craft of the evil powers who seek to ruin his future existence. He worships and serves false gods, being unable to distinguish between truth and lies. Therefore it is that Ormazd in his grace determined to open the eyes of mankind by sending a prophet to lead them to the right. The first of the sacred scriptures (the Gathas) is the legend (Vd., 2, 1). Ormazd at first wished to entrust this task to Yima (Jemshid), the ideal of an Iranian king. But Yima, the secular man, felt himself unfitted for it and declined it. He condescended to lead his own people, and to himself as the king of the heavenly kingdom in miniature, to serve at the same time as a pattern for the heavenly kingdom that was to come. Zoroaster was professed to be a mystic in touch with the world of the holy, and had experienced within himself the inward call to seek the amelioration of mankind and their deliverance from ruin, and regarded this inner impulse, intensified as it was by long, contemplative solitude and by visions, as being the call addressed to him by God Himself. Like Mahomed after him he often speaks of his conversations with God and the archangels. He calls himself most frequently manushya ("prophet"); pātu ("spiritual authority"), and asuamhīt ("the coming helper")—that is to say, when men come to be judged according to their deeds).

The full contents of his dogmatic and ethical teaching we cannot gather from the Gathas. There are only general references of the divine commands and of good and evil works. Among the former those most inculcated are renunciation of Satan, adoration of Ormazd, purity of soul and body, and care for the poor. Among the latter are the rules against the use of certain foods (bees, etc.), and the animal sacrifices. The divine, terecundia, spoken of as daughter of Ormazd and regarded as having her abode upon the earth: (5) Haurvatāt (sphōrito), perfect happiness, and (6) armaiti, spiritual regeneration. (7) The two wings of the gāthās are the themes continually dwelt on with endless variations.

It was not without special reason—so Zoroaster believed—that the calling of a prophet should have taken place precisely when the human race was at its lowest ebb. He knew of a "great mankind at large." Like John the Baptist and the Apostles of Jesus, Zoroaster also believed that the fulness of time was near, that the kingdom of heaven was at hand. Through the whole of the Gāthās runs
the pious hope that the end of the present world is not far distant. He himself hopes, with his followers, to live to see the decisive turn of events. The doctrine of the "innocent" and "innocent" of Ormond will summon together all his powers for a final decisive struggle and break the power of evil for ever; by his help the faithful will achieve the victory over their detected enemies, the "dawi" worshipers, and render them impotent. Therefore Ormond will have a "judicium universale", in the form of a general ordeal, a great test of all mankind by fire and molten metal, and will judge strictly according to the just reward of God in heaven or the beloved underworld in the hope of a reward. Satan will be cast, along with all those who have been delivered over to him to suffer the pains of hell, into the abyss, where he will henceforward lie powerless. Forthwith begins the reign of the God incarnate, and the kingdom of God is established on earth. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will forever shine, and all the pious and faithful will live a happy life, which no evil power can disturb, in the presence of the omnipotent God and His royal household. They will receive as his groom the inexhaustible cow and the gracious gifts of the Vohu manah. The prophet and his princely patrons will be accorded special honour.

History and Later Development.—For the great mass of the people Zoroaster's doctrine was too abstract and spiritualistic. The vulgar fancy requires sensuous, plastic dettles, which admit of vivid action and a plausible end. Such a reward was not in orde of Zoroaster, but he received another
again and new gods won acceptance. They are the angels (yazata) of New Zoroastrianism. Thus, in the later Avesta, we find not only Mithra but also purely popular divinities such as the angel of victory, Verehradhna, Anahita (Anaitis), the goddess of the water, Tishrya (Sirius), and other heavenly bodies, invoked with special preference. The Gathas know nothing of a new belief which afterwards arose in the Fravashi, or guardian angels of the faithful. Fravashi properly means "confession of faith," and when personified comes to be regarded as a protecting spirit. Unbelievers have no fravashi.

On the basis of the new teaching arose a widely spread priestly society. In the Aramaic, Owerkans, and carried on its worship, and laid down the minutely elaborated laws for the purifying and keeping clean of soul and body, which are met with in the Vendidad. To these ecclesiastical precepts and observances was added a particular canon of ascetical chastiments, love of truth, beneficial works, support of comrades in the faith, alms, chastity, improvement of the land, arboriculture, breeding of cattle, agriculture, protection of useful animals, as the dog, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. These are to be left on the appointed places (dakhmas) and exposed to the vultures and wild dogs. In the South the material temple of Yazata, the Zoroastrian temple plant had a prominent place. Worship in the Zoroastrian Church was devoid of pomp; it was independent of temples. Its centre was the holy fire on the altar. The fire alters afterwards developed to a certain extent into sanctuaries. The ashes of Zoroastrian sacrifices and high and low masses were celebrated. As offerings meat, milk, show-bread, fruits, flowers and consecrated water were used. The Zoroastrians were not pietistic and rigid in their religion. They only performed the sacrifices (Herodotus, i., 132), educated the young clergy, imposed the penances; they in person executed the circumstantial ceremonies of purification and exercised a spiritual guardianship and pastoral care of the laymen. Every young believer in Mazda, after having been received into the religious community by being girt with the holy lace, had to choose a confessor and a spiritual guide (reza). Also in eschatology, as may be expected, a change took place. The last things and the end of the world are relegated to the close of a long period of time (3000 years after Zoroaster), when a new Zoroastrian prophet, in the end, brings to the world, to the material, the dead are to come to life, and a new incorruptible world to begin.

Zoroastrianism was the national religion of Iran, but it was not permanently restricted to the Iranians, being professed by Turanians and Persians. When the Fravashi became identified with Zoroaster, the religion and long-lasting sway to the Church. Protected by this dynasty, the priesthood developed into a completely organized state church, which was able to employ the power of the state in support of its cause, and to work with the royal assistance. It was enjoined by their unaided efforts only. The head of the Church (Zara-Shushtromena) had his seat at Rul in Media and was the first person in the state next to the king. The formation of sects was at this period not infrequent (cf. Manichaeeism). The Mohammedan invasion (636), with the terrible persecutions of the following centuries, was the death-blow of Zoroastrianism. In Persia itself, only a few followers of Zoroaster are now found (in Kurdistan and Yezd). The Parsiiee, as in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine has reached the stage of a pure monothelism. ZORRILLA Y MORAL, JOSÉ (1817-1893). Spanish poet and dramatist, son of a magistrate in whom Ferdinand VII placed special confidence, was born at Valladolid on the 21st of February 1817. He was educated by the Jesuits at the Real Seminario de Nobles in Madrid, wrote verses when he was twelve, became an enthusiastic admirer of Scott and Chateaubriand, and took part in the school performances of plays by Lope de Vega and Calderon. In 1833 he was sent to read law at the University of Toledo, but, after a year of idleness, he fled to Madrid, where he befriended the friends of his absolutist father by making violent speeches and by founding a newspaper which was promptly suppressed by the authorities. He narrowly escaped transportation to the Philippines, and passed the next few years in poverty. The death of the satirist Larra brought Zorrilla into notice. His elegiac poem, declaimed at Larra's funeral in February 1837, served as an introduction to the leading men of letters. In 1837 he published a book of verses, mostly imitations of Lamartine and Hugo, which was so favourably received that he printed six more volumes within three years. His subjects are treated with fluency and grace, but the cleverness which disfigures much of his work is prominent in these juvenile poems. After collaborating with Garcia Gutierrez, in a piece entitled Juan Dandé (1839) Zorrilla began his individual career as a dramatist with Cada cual con su razón (1840), and during the following five years he wrote twenty-two plays, many of them extremely successful. His Cantos del trovador (1841), a collection of national legends versified with infinite spirit, showed a decided advance in skill, and secured for the authour the place next to Espronceda in popular esteem. National legends also supply the themes of his dramas, though, in this department Zorrilla somewhat comprehends himself from the original. His dramatic works, which had fallen out of fashion. For example, in El Zapatero y el Rey he recasts El montañés Juan Pascual by Juan de la Hoz y Mota; In mejor razón la espara he borrows from Moreto's Travesuras del estudiante Pantoja; in Don Juan Tenorio he adapts from Tirso de Molina's Burlador de Sevilla and from the elder Dumas's Don Juan de Marana (which itself derives from Les Ames du purgatoire or Prosper Mérimée). But his rearrangements usually contain original elements, and in Sancho Garcia, El Rey loco, and El Alcaide Reguillu he apparently owes little to any predecessor. The last and (as he himself believed) the best of his plays is Traidor (1841) and mœrdir (1845). Upon the death of his mother in 1847 Zorrilla left Spain, resided for a while at Bordeaux, and settled in Paris, where his incomplete Granada, a striking poem of gorgeous local colour, was published in 1852. In a fit of depression, the causes of which are not known, he emigrated to America three years later, hoping, as he says, that yellow fever or small-pox would carry him off. During eleven years spent in America he produced little, and that little was of no merit. He returned in 1868, to find himself a half-forgotten classic. His old fertility was gone, and new inspiration was forever denied him. A small post, obtained for him through the influence of Jovellar and Cánovas del Castillo, was abolished by the republican
The birds of this group are mostly of unpretending appearance, the plumage above being generally either mouse-coloured or greenish olive; but some are varied by the white or bright yellow of their throat, breast or lower parts, and several have the flanks of a more or less lively bay. Several islands are inhabited by two perfectly distinct species, one belonging to the brown group, the other to the green. The former type is more insular. The greater number of species seem to be confined to single islands, often of very small area, but others have a very wide distribution, and the type-species, Z. caerulescens, has largely extended its range. First described from New South Wales, where it is very plentiful, it had been long known to inhabit all the eastern part of Australia. In 1836 it was found in the South Island of New Zealand, where it became known to the Maoris by a name signifying 'Stranger,' and to the British as the Blight-bird; from its clearing the fruit-trees of a blight. It soon after appeared in the North Island, where it speedily became common, and thence not only spread to the Chatham Islands, but was met with in considerable numbers 300 miles from land, as though in search of new countries to colonize. In any case it is obvious that this Zosterops must be a comparatively modern settler in New Zealand.

All the species of Zosterops are sociable, consorting in large flocks, which only separate on the approach of the pairing season. They build nests—sometimes suspended from a horizontal fork and sometimes fixed in an upright crutch—and lay (so far as is known) of blue, though usually variegated with brown, from several of the groups of birds to which they have been thought allied. Though mainly insectivorous, they eat fruits of various kinds. The habits of Z. caerulescens have been well described by Sir W. Buller (Birds of New Zealand), and those of a species peculiar to Ceylon, Z. ceylonensis, by Col. Legge (B. Ceylon), while those of the widely ranging Indian Z. ptelebrosus and of the South African Z. capensis have been succinctly treated by Jordon (B. India, ii.) and Layard (B. South Africa) respectively.

It is remarkable that the largest known species of the genus, Z. albogularis, measuring nearly 6 in. in length, is confined to so limited a range as Northern New Guinea. Z. leucosticta, not much less in size, occurs; while a third, of intermediate stature, Z. strenua, inhabits the still smaller Lord Howe's Island. A fourth, Z. xanthoptera, but little inferior in bulk, is found on one of the Nei Hebrides; the rest are from one-fifth to one-third less in length, and some of the smaller species hardly exceed ¾ in.

Placed by some writers, if not systematists, with the Paridae (see Titmouses), by others among the Meliphagidae (see Honey-eaters), and again by others with the Nectariniidae (see Sunbirds), the structure of the tongue, as shown by H. F. Gadow (Proc. Zool. Soc., 1883, pp. 63, 66, pl. xvi. fig. 2), entirely removes it from these families, and places it, as a third, and from most of its features, isolated among the second. It seems safest to regard the genus, at least provisionally, as the type of a distinct family—Zosteropidae—as families go among Passerine birds.

ZOUAVE, the name given to certain infantry regiments in the French army. The corps was first raised in Algeria in 1831 with one and later two battalions, and recruited solely from the Zouaves, a tribe of Berbers, dwelling in the mountains of the Jurjura range (see Kabyles). In 1838 a third battalion was raised, and the regiment thus formed was commanded by Lamoricère. Shortly afterwards the formation of the Tirailleurs algériens, the Turcos, as the corps for natives, changed the enlistment for the Zouave battalions, and they became, as they now remain, a purely French body. Three regiments were formed in 1852, and a fourth, the Zouaves of the Imperial Guard, in 1854. The Crimean War was the first service which the regiments saw outside Algeria. There are now four regiments, of five battalions each, four of which are permanently in Africa, the fifth being stationed in France as a depot regiment. For the peculiarly picturesque uniform of these see Uniform.

The Papal Zouaves were formed in defence of the Papal states by Lamoricère in 1860. After the occupation of Rome by Victor Emmanuel in 1870, the Papal Zouaves served the government of National Defence in France during the Franco-Prussian war, and were disbanded after the entrance of the German troops into Paris.

1 By most English-speaking people the prevalent species of Zosterops is commonly called "White-eye" or "Silver-eye."
ZOUCH, RICHARD (c. 1500–1661), English jurist, was born at Anstey, Wiltshire, and educated at Winchester and afterwards at Oxford, where he became a fellow of New College in 1590. He was admitted at Doctor's Commons in January 1618, and was appointed regius professor of law at Oxford in 1620.

In 1625 he became principal of St Alban Hall and chancellor of the diocese of Oxford; in 1641 he was made judge of the High Court of Admiralty. Under the Commonwealth, having submitted to the parliamentary visitors, he retained his university appointments, though not his judicial post; this last he resumed at the Restoration, dying soon afterwards at his apartments in Doctor's Commons, London, on the 1st of March 1661.

He published *Elementa jurisprudentiae* (1629), *Descripition juris et judicis feudalis, secundum consuetudines Mediolani et Normanniae*, pro introductione ad jurisprudentiam Anglicam (1634), *Descripition juris et judicii temporalis, secundum consuetudines feudales et Normannicas* (1636). *Descripition juris et judicii ecclesiastici, secundum canones et consuetudines Anglicas* (1636). *Descripitiones juris et judicii scribendi, militari, ... maritimis* (1640). *Juris et judicii specialis sive juris inter gentes ... explicatio* (1650), and *Solvuntur questiones de legatis delinquentibus judice competente* (1657). In virtue of the last two he has the distinction of being one of the earliest systems of international law. He was also the author of a poem, *The Dove, or Passages of Cosmography* (1613).

ZOUCHE, or Zouche, the name of an English family descended from Alan la Zouche, a Breton, who is sometimes called Alan de Porrochet. Having settled in England during the reign of Henry II., Alan obtained by marriage Ashby in Leicestershire (called after him Ashby de la Zouche) and other lands. His grandson, another Alan la Zouche, was justice of Chester and justice of Ireland under Henry III.; he was loyal to the king during the struggle with the barons, fought at Lewes and helped to arrange the peace of Kenilworth. As a result of a quarrel over some lands with John, Earl Warenne, he was seriously injured in Westminster Hall by the earl and his retainers, and died on the 10th of August 1270. Alan’s eldest son Roger (d. 1285) had a son Alan la Zouche, who was summoned to parliament as a baron about 1298. He died without sons, and this barony fell into abeyance between his daughters and has never been revived.

The elder Alan’s younger son, Eades or Ivo, had a son William (c. 1276–1352), who was summoned to parliament as a baron in 1308, and this barony, which is still in existence, is known as that of Zouche of Hargrave. John la Zouche, the other son (c. 1262–1362), was attainted in 1485 as a supporter of Richard III., but was restored to his honours in 1495. His descendant, Edward, the 11th baron (c. 1556–1625), was one of the peers who tried Mary, queen of Scots, and was sent by Elizabeth as ambassador to Scotland and to Denmark. He was president of Wales from 1602 to 1615 and lord warden of the Cinque Ports from 1615 to 1624. He was a member of the council of the Virginia Company and of the New England council. He had many literary friends, among them being Ben Jonson and Sir Henry Wotton. Zouche left no sons, and the barony remained in abeyance among the descendants of his two daughters until 1815, when the abeyance was terminated in favour of Sir Cecil Bishopp, Bart. (1753–1828), who became the 12th baron. He died without sons, a second abeyance being terminated in 1829 in favour of his daughter Harriet Anne (1787–1870), wife of the Hon. Robert Curzon (1771–1863). In 1873 her grandson, Robert Nathaniel Curzon (b. 1851), became the 15th baron.

Two antiquaries, Henry Zouche (c. 1725–1795) and his brother, Thomas Zouche (1737–1815), claimed descent from the family of Zouche. Both were voluminous writers. Thomas’s works included a *Life of Isaiah Walton* (1823) and *Memoirs of Sir Philip Sidney* (1808).

ZOUTPANSBERG, the north-eastern division of the Transvaal. This was the district to which Louis Trichard and Jan van Rensburg, the forerunners of the Great Trek, journeyed in 1832. In 1843 Hendrik Potgieter, a prominent leader of the Trek Boers, removed thither. The Zoutpansberg Boers formed a semi-independent community, and in 1857 Stephanus Schoeman, their commandant-general, sided against Marthinus Pretorius and Paul Kruger when they invaded the Orange Free State. It was not until 1864 that Zoutpansberg was definitely incorporated in the South African Republic. Trichard and his companions had been shown gold workings by the natives, and it was in this district in 1867–70, and in the neighbouring region of Lydenburg, that gold mines were first worked by Europeans south of the Limpopo. The white settlers in Zoutpansberg had for many years a reputation for lawlessness, and were later regarded as typical of "South African Boers." Zoutpansberg contains in this late period a population than any other region of the Transvaal.

It is highly mineralized, next to gold, copper, found near the Limpopo (where is the Messina mine) being the chief metal worked. The district long suffered from lack of railway communications, but in 1916 the completion of the Selati line giving it direct access to Delagoa Bay was begun. The chief towns are Pietersburg and Leysdorp.

ZRNJI, MIKLÓS, COUNT (1595–1666), Hungarian hero, was a son of Miklós Zrnji and Ilona Karlovics. He distinguished himself at the siege of Vienna in 1599, and in 1642 saved the imperial army from defeat before Pest by intervening with 400 Croats, for which service he was appointed ban of Croatia. In 1542 he routed the Turks at Somlyo. In 1543 he married Catherine Frangipani, who placed the whole of her vast estates at his disposal. The Emperor Ferdinand also gave him large possessions in Hungary, and henceforth the Zrnjits became as much Magyar as Croatian magnates. In 1556 Zrnji won a series of victories over the Turks, culminating in the battle of Babocsa. The Croatians, however, overwhelmed their ban with reproaches for neglecting them to fight for the Magyars, and the emperor simultaneously deprived him of the capitaneo of Upper Croatia and sent 10,000 men to aid the Croats, while the Magyars were left without any help, whereupon Zrnji resigned the banship (1651). In 1653, on the coronation of the Emperor Maximilian as king of Hungary, Zrnji attended the ceremony at the head of 3000 Croatian and Magyar mounted noblemen, in the vain hope of obtaining the dignity of palatine, vacant by the death of Thomas Nadasdy. Shortly after marrying (in 1564) his second wife, Eva Rosenberg, a great Bohemian heiress, he hastened southwards to defend the frontier, defeated the Turks at Segesd, and in 1656 from the 5th of August to the 7th of September heroically defended the little fortress of Szigetvár against the whole Turkish host, led by Suleiman the Magnificent in person, perishing with every member of the garrison in a last desperate sortie.

See F. Salamon, *Ungarn im Zeitalter der Türkenherrschaft* (Leipzig, 1887); J. Cruday, *The Zrnjits in Hungarian History* (London, 1892); Rombach, *1884, 5vo.*

ZRNJI, MIKLÓS, COUNT (1620–1669), Hungarian warrior, statesman and poet, the son of George Zrnji and Magdalena Széchény was born at Cakóvár. At the court of Péter Pázmány the youth conceived a burning enthusiasm for his native language and literature, although he always placed arms before arts. From 1635 to 1637 he accompanied Szekveczy, one of the canons of Esztergom, on a long educational tour through Italy. During the next few years he learnt the art of war in defending the Croatian frontier against the Turks, and approved himself one of the first captains of the age. In 1643 he acted against the Swedes in Moravia, equipping an army corps at his own expense. He later went to Galicia where the emperor had been invaded and took 2000 prisoners. At Eger he saved the emperor, who had been surprised at night in his camp by Wrangel. Subsequently he routed the army of Rákóczy on the Upper Theiss. For his services the emperor appointed him captain of Croatia. On his return from the war he married the wealthy Eusebia Draskovic. In 1646 he distinguished himself in the Turkish war. At the coronation of Ferdinand IV. he carried the sword of state, and was made ban and captain-general of Croatia. In this double capacity he presided over many Croatian diets, always strenuously defending the political rights of the Croats.
and steadfastly maintaining that as regarded Hungary they were to be looked upon not as partis annexae but as a regnum. During 1622–53 he was continually fighting against the Turks, yet from his castle at Csákortnya he was in constant communication with the learned world; the Dutch scholar, Jacobus Tollius, even visited him, and has left in his Epistola itinerariae a lively account of his experiences. Tollius was amazed at the linguistic resources of Zrínyi, who spoke German, Croatian, Hungarian, Turkish and Latin with equal facility. Zrínyi’s Latin letters (from which we learn that he was married a second time, to Sophia Löbel) are fluent and agreeable, but largely interspersed with Croatian and Magyar expressions. The last year of his life was also its most glorious one. He set out to destroy the strongly fortified Turkish bridge at Esseg, and thus cut off the retreat of the Turkish army, re-capturing all the strong fortresses on his way. He destroyed the bridge, but the further pursuance of the campaign was frustrated by the refusal of the imperial generals to co-operate. Still the expedition had covered him with glory. All Europe rang with the stories of the glorious siege. It was said that only the Zrínyis had the secret of conquering the Turks.

The emperor offered him the title of prince. The pope struck a commemorative medal with the effigy of Zrínyi as a field-marshall. The Spanish king sent him the Golden Fleece. The French king created him a peer of France. The Turks, too, gave out the disgrace of the Esseg affair, now laid siege to Uj-Zerín, a fortress which Zrínyi had built, and the imperial troops under Montecuculi looked on while he hastened to relieve it, refusing all assistance, with the result that the fortress fell. It was at a time when the Austrian and the Hungarian parliaments were no more—of Vásár was concluded. Zrínyi hastened to Vienna to protest against it, but in vain. Zrínyi quitte Vienna in disgust, after assuring the Venetian minister, Sagadrino, that he was willing at any moment to assist the Republic against the Turks with 6000 men. He then returned to Csákortnya, and there, on the 18th of November, was killed by a wild boar which he had twice wounded and mercilessly pursued to its lair in the forest swamps, armed only with his hunting-knife.

His poetical works first appeared at Vienna in 1651, under the title of The Siren of the Adriatic (Hung.); but his principal work, Christer Széktanya, the epopee of the Zrínyis, is a self-sacrifice of his heroic ancestor of the same name, only appeared in fragments in Magyar literature till Arany took it in hand. It was evidently written under the influence of both Virgil and Tasso, though the author had no time to polish and correct its rough and occasionally somewhat wooden, versification. But the fundamental idea—the duty of Hungarian valour to shake off the Turkish yoke, with the help of God—is sublime, and the whole work is intense with martial and religious enthusiasm. It is no unworthy companion of the other epics of the Renaissance period, and has many admirers. When, first, in 1848, began to recast the Zrínyiad, as he called it, on modern lines, and the work was completed by Antal Vékőy in 1892.

See J. Arany and Kazmir Grekza, Zrínyi and Tasso (Hung.), Eger, 1892; Karoly Széchy; Life of Count Nicholas Zrínyi, the poet (Hung.), Budapest, 1896; Sándor Körösi, Zrínyi and Macchiavelli (Hung.), Budapest, 1893. (R. N. B.)

**ZSCHOKKE, JOHANN HEINRICH DANIEL (1771–1848), German author, was born at Magdeburg on the 22nd of March 1771. He was educated at the monasterial (kloster) school and at the Altdöbelin gymnasium of his native place. He spent some time as playwright with a company of strolling actors, but afterwards studied philosophy, theology and history at the university of Frankfort-on-the-Oder, where in 1792 he established himself as Privatdozent. He created much sensation by an extravagant novel, Abällino, der grosse Bandit (1793; subsequently also dramatized), modelled on Schiller’s Räuber, and the melodramatic tragedy, Julius von Sasson (1796). The Prussian government having declined to make him a full professor, Zschokke turned Latin writer in Switzerland, where he conducted an educational institution in the castle of Reichenau. The authorities of the Grisons admitted him to the rights of a citizen, and in 1798 he published his Geschichte des Freistaats der drei Bünde im hohen Rätien. The political disturbances of this year compelled him to close his institution. He was, however, sent as a deputy to Aarau, where he was made president of the educational department, and afterwards as government commissioner to Unterwalden, his authority being ultimately extended over the cantons of Uri, Schwyz and Zug. Zschokke distinguished himself by the vigour of his administration and the benevolent and truly philanthropic character of his legislation. In 1810 he reorganized the institutions of the Italian cantons and was appointed lieutenant-governor of the canton of Basel. Zschokke retired from public life when the central government at Bern proposed to re-establish the federal system, but after the changes effected by Bonaparte he entered the service of the canton of Aargau, with which he remained connected. In 1821 he attracted attention by his Geschichte vom Kampfe und Unterdage der schweizerischen Berg- und Wald-Kantonen. Through his Schweizerloth, the publication of which began in 1824, he exercised a wholesome influence on public affairs; and the like may be said of his Miscellen für die neueste Weltkunde, issued from 1827 to 1831. In 1831 he also started a monthly periodical, der Erleuterungen. He wrote various historical works, the most important of which is Des Schweizerlandes Geschichte für das Schweizervolk (1825, 8th ed. 1849). Zschokke’s tales, on which his literary reputation rests, are collected in several series, Bilder aus der Schweiz (5 vols., 1824–25), Ausgewählte Novellen und Dichtungen (16 vols., 1838–39). The best known are: Adacli (1823); Der Mahler (1824); Die überraschenden Abenteuer des Cöltner (1794); Alamentade (1802); Der Creole (1830); Das Goldnadeln (1817); and Meister Jordan (1845). In Stunden der Andacht (1809–1816; 27 editions in Zschokke’s lifetime), which was widely read, he expounded in a rationalistic spirit the fundamental principles of religion and morality. Eine Selbstschau (1842) is a kind of autobiography. Zschokke was not a great original writer, but he secured an eminent place in the literature of his time by his enthusiasm for modern ideas in politics and religion, by the sound, practical judgment displayed in his works, and by the energy and lucidity of his style. He died at his residence house of Blumenhalde on the Aar on the 27th of June 1848.

An edition of Zschokke’s selected works, in forty volumes, was issued in 1824–28. In 1851–54 an edition in thirty-five volumes was published. A new edition of the Novellen was published by E. D. Hack (5 vols., 1840); a new edition of the Dichtungen by Zschokke by E. Münch (1831); Emil Zschokke (3rd ed. 1876); R. Sauerländer (Aarau, 1884); and R. Wernly (Aarau, 1894). See also M. Schneiderreit, Zschokke, seine Weltanschauung und Lebensanstalt (1904).

**ZSCHOPAU, a town in the kingdom of Saxony, on the left bank of the Zschopau, 18 m. S.E. from Chemnitz by the railway to Annaberg. Pop. (1900) 6748. It contains a handsome parish church dedicated to St Martin, a town hall and a castle (Wildkeck), built by the Emperor Henry I. in 932. The industries include ironfoundry, cotton and thread-spinning, cloth-weaving and furniture making.**

**ZUCARELLI, FRANCESCO (1702–1788), Italian painter, was born at Pitigliano in Tuscany, and studied in Rome under Onesti, Morandi, and Nelli. At Rome, and later in Venice, he became famous as one of the best landscape painters of the classicizing 18th century. Having visited England on a previous occasion, he was induced by some patrons to return thither in 1755, remaining until 1773, when he settled in Florence, dying there in 1788. Zuccarelli, who was one of the foundation members of the Royal Academy, enjoyed the patronage of royalty and of many wealthy English collectors, for whom he executed his principal works—generally landscapes with classic ruins and small figures. A large number of them are at Windsor Castle, and of the seven examples which formed part of the John Samuel collection two are now at the National Gallery. The royal palace in Venice contains as many as twenty-one, and the academy four. Others are at the Vienna Gallery, and at the Louvre in Paris. His work was very unequal, but at his
ZUCCARO—ZUG

1047

best he rivals the leading landscape painters of his time. His paintings often bear a mark representing a pumpkin, a pictorial representation of his name, which signifies "little pumpkin." 

ZUCCARO, or ZUCCHERO,1 the name of two Italian painters.

I. TADDEO ZUCCARO (1520–1560), one of the most popular painters of the so-called Roman mannerist school, was the son of Ottaviano Zuccaro, an almost unknown painter at St Angelo in Vado, where he was born in 1529. Taddeo found his way to Rome, and he succeeded at an early age in gaining a knowledge of painting and in finding patrons to employ him. When he was seventeen a pupil of Correggio, named Daniele da Parma, engaged him to assist in painting a series of frescoes in a chapel at Vitto near Sora, on the borders of Tuscany. Nearly a hundred of these frescoes were completed in Rome in 1548; this was the beginning of his career as a fresco painter, by executing a series of scenes in monochrome from the life of Furius Camillus on the front of the palace of a wealthy Roman named Jacopo Mattei. From that time his success was assured, and he was largely employed by the popes Julius III. and Paul IV., by Della Rovere, duke of Urbino, and by other rich patrons. His best frescoes were a historical series painted on the walls of a new palace at Caprarola, built for Cardinal Alessandro Farnese, for which Taddeo also designed a great quantity of rich decors in stucco relief after the style of Giulio Romano and other painters of the Roman school. The decoration of a ball hall in his native town of Zug was a further proof of his success. Taddeo's easel pictures are less common than his decorative frescoes. A small painting on copper of the Adoration of the Shepherds, formerly in the collection of James II., is now at Hampton Court; it is a work of very small merit. The Caprarola frescoes were engraved and published by Prenner, Illustri Fatti Fornarini Coloriti nel Real Palazzo di Caprarola (Rome, 1749–50).

II. FEDERIGO ZUCCARO (1543–1609) was in 1550 placed under his brother Taddeo's charge in Rome, and worked as his assistant; he completed the Caprarola frescoes. Federigo attained an eminence far beyond his very limited merits as a painter, and was perhaps the most original of his generation. Probably no other painter has ever produced so many enormous frescoes crowded with figures on the most colossal scale, all executed under the unfortunate delusion that grandeur of effect could be attained merely by very large size combined with extravagance of attitude and exaggeration of every kind. Federigo's finest work was the decoration of the dome of the cathedral of Florence; the work had been begun by the art-historian Vasari, who wrote in the most generous language about his more successful rival. Regardless of the injury to the apparent scale of the interior of the church, Federigo painted about 300 figures, each nearly 50 ft. high, sprawling with violent contortions all over the surface. Happily age has so dimmed these pictures that their presence is now almost harmless. Federigo was recalled to Rome by Gregory XIII. to continue in the Pauline chapel of the Vatican the scheme of decoration begun by Michelangelo during his failing years, but a quarrel between the painter and members of the papal court led to his departure from Italy. He visited Brussels, and there made a series of cartoons for the tapestry-weavers. In 1574 he passed over to England, where he received commissions to paint the portraits of Queen Elizabeth, Mary, queen of Scots, Sir Nicholas Bacon, Sir Francis Walsingham, Lord High Admiral Howard, and others. A curious full-length portrait of Elizabeth in fancy dress, now at Hampton Court, is attributed to this painter, though very doubtfully. Another picture in the same collection appears to be a replica of his painting of the "Allegory of Calabria," as suggested by Lucian's description of a celebrated work by Apelles; the satire in the original painting, directed against some of his courtier enemies, was the immediate cause of Federigo's temporary exile from his native land. The success of his "pictorial method" is shown by the fact that in oil was more than reasonable than the admiration expressed for his colossal frescoes. A portrait of a "Man with Two Dogs," in the Pitti Palace at Florence, is a work of some real merit, as is also the "Dead Christ and Angels" in the Borghese Gallery in Rome. Federigo was soon recalled to Rome to finish his work on the vault of the Pauline chapel. In 1585 he accepted an offer by Philip II. of Spain to decorate the new Escorial at a yearly salary of 2000 crowns, and worked at the Escorial from January 1596 to the end of 1598, when he returned to Rome, where he spent his remaining years. His most characteristic work was done under the patronage of Sixtus V., the Academy of St Luke, of which he was the first president. His organization suggested to Sir Joshua Reynolds his scheme for founding the English Royal Academy.

Like his contemporary Giorgio Vasari, Federigo aimed at being an art critic and historian, but with very different success. His chief book, L'Idea de' Pittori, Scultori, ed Architetti (Turin, 1607), is a senseless mass of the most turgid bombast. Little can be said in praise of his smaller works, consisting of two volumes printed at Bologna in 1608, describing his visit to Parma and a journey through central Italy. Federigo was raised to the dignity of a cardinal not long before his death, which took place at Ancona in 1609.

For both Taddeo and Federigo Zuccaro, see Vasari, pt. iii., and Lanz, Storia Pittorica, Roman School, epoch iii. (J. H. M.)

ZUG (Fr. Züeg), a canton of central Switzerland. It is the smallest undivided canton, both as regards area and as regards population. Its total area is but 92-3 sq. m., of which, however, no fewer than 75-7 sq. m. are reckoned as "productive," forests covering 19-9 sq. m. Of the rest 10 sq. m. are occupied by the cantonal share of the lake of Zug (q.v.), and 24 sq. m. by the lake of Aegeri, which is wholly within the canton.

It includes the fertile strips on the eastern and western shores of the lower portion of the lake of Zug, together with the alluvial plain at its northern extremity. The lower range, culminating in the Zugberg (3525 ft.), and the Wildspitz (5194 ft.), the highest summit of the Rossberg, that rises east of the lake of Zug, separates it from the basin and lake of Aegeri, as well as from the hilly district of Menzingen. The Lorze issues from the lake of Aegeri, forces its way through moraine deposits in a deep gorge with fine staitlace caverns and falls into the lake of Zug, issuing from it very soon to flow into the Reuss. The canton thus belongs to the hilly, not to the mountainous, Swiss. Structurally it is more elevated than the higher ground it has a certain strategical position. Railways connect it both with Lucerne and with Zürich, while lines running through the eastern shore of the lake of Aegeri border on the eastern side of the St Gotthard railway. On the eastern shore of the lake of Aegeri, and within the territory of the canton, is the true site of the famous battle of Morgarten (q.v.) won by the Swiss in 1315.

Till 1814 Zug was in the diocese of Constance, but on the reconstruction of the diocese of Basel in 1828 it was assigned to it. In 1800 the population of the canton was 25,093, of whom 24,042 were German-speaking, 919 Italian-speaking, and 157 French-speaking, while 22,326 were Romanists, 1701 Protestants, and 19 Jews. Its capital is Zug, while the manufacturing village of Baar, 2 m. N., had 4494 inhabitants, and the village of Cham, 3 m. N.W., 3025 inhabitants. In both cases the environs of the villages are included, and this is even more the case with the wide-spreadings parishes of Unter Aegeri with 2593 inhabitants, of Menzingen with 2393 inhabitants, and the great school for girls and female teachers, founded in owner by the district of Zug, of which the district of Zug, 3 m. E., had 1891 inhabitants.

In the higher regions of the canton, the population is mainly engaged in pastoral pursuits and cattle-breeding. There are 61 "alps," or high pastures, in the canton. At Cham is a well-known factory of condensed milk, now united with that of Nestlé de Vevy. At Baar there are extensive cotton-spinning mills and calico printing works. Around the canton extend vast forests of fruit trees, and "Kirschweisser" (cherry-water) and cider are largely manufactured. Apiculture too flourishes greatly. A number of factories have sprung up in the new quarter of the town, but the silk-weaving industry has all but disappeared. The canton forms a single administrative district, which comprises eleven communes. The legislative, or Kantonsrat, has one member to every 1000 inhabitants; the presiding officer is the Regierungsrat, elected directly by popular vote, proportional representation obtaining in both cases if more than two members are to be elected in the same electoral district to posts in the same
authority. The term of office in both cases is four years. Besides the "facultative Referendum" by which, in case of a demand by one-third of the members of the legislative assembly, or by 500 citizens, any law, and any resolution involving a capital expenditure of 30,000 francs, must be submitted to a direct popular vote, and the "initiative" at the demand of 1000 citizens in case of amendments to the cantonal constitution; there is also the "initiative" case to be examined at the demand of 500 citizens. The two members of the Federal Ständerat, as well as the one member of the Federal Nationalrat, are also elected by a popular vote.

The earlier history of the canton is practically identical with that of its capital Zug (see below). From 1278 to 1738 it was distracted by violent disputes about the distribution of the land; in 1381 the parishes of Zug and the canton formed part of the Tellgau, and later of one of the districts of the huge canton of the Waldstätten in the Helvetic republic. In 1803 it regained its independence as a separate canton, and by the constitution of 1814 the "Landsgemeinde," or assembly of all the citizens, which had existed for both districts since 1376, became a body of electors to choose a cantonal council. The reform movement of 1850 did not affect the canton, which in 1845 was a member of the Sonderbund and shared in the war of 1847. In 1848 the remaining functions of the Landsgemeinde were abolished. Both in 1814 and 1850, the canton had absolute possession of the federal constitutions. The constitution of 1875–76 was amended in 1881, and was replaced by a new one in 1894.

ZUG, capital of the Swiss canton of that name, a picturesque little town at the N.E. corner of the lake of Zug, and at the foot of the Zugberg (3255 ft.), which rises gradually, its lower slopes thickly covered with fruit trees. Pop. (1900) 6508, mainly German-speaking and Romanist. The lake shore has been embellished and forms a promenade, whence glorious views of the snowy peaks of the Bernese Oberland, as well as of the Rigi and Pilatus, are gained. Towards its northerly end and near the foot of the Zugberg, a spot where a part of the shore slipped into the lake in 1887, the other part of the town is rather crowded together, though only four of the tower walls and a small part of the town walls still survive. The most striking old building in the town is the parish church of St Oswald (late 15th century), dedicated to St Oswald, king of Northumbria (d. 642), one of whose arms was brought to Zug in 1435. The town hall, also a 15th-century building, now houses the Historical and Antiquarian Museum. There are some quaint old painted houses close by. A little higher up the hill-side is a Capuchin convent in a striking position, close to the town wall and leaning against it. Still higher, and outside the old town, is the fine new parish church of St Michael, consecrated in 1902. The business quarter is on the rising ground north of the old town, near the railway station. Several fine modern buildings rise on or close to the shore in the town and to its south, whilst to the south-west is a convent of Capuchin nuns, who manage a large girls' school, and several other educational establishments.

The town, first mentioned in 1240, is called an "oppidum" in 1242, and a "castrium" in 1255. In 1273 it was bought by Rudolph of Habsburg from Amo, the heretex of Kyburg and with it the castle of Eibach, head of the lake line of Habsburg, and in 1278 part of its territory, the valley of Aegeri, was pledged by Rudolph as security for a portion of the marriage gift he promised to Joanna, daughter of Edward I. of England, who was betrothed to his son Hartmann, whose death in 1281 prevented the marriage from taking place. The town of Zug was governed by a bailiff, appointed by the Habsburgs, and a council, and was much favoured by that family. Several country districts (Bara, Menzingen, and Aegeri) had each its own "Landsgemeinde" but were governed by one bailiff, also appointed by the Habsburgs; these were known as the "Aeusser Amt," and were always favourably disposed to the Confederates. On the 27th of June 1352 both the town of Zug and the Aeusser Amt entered the Swiss Confederation, the latter being received on exactly the same terms as the town, and not, as was usual in the case of country districts, as a subject land; but in September 1352 Zug had to acknowledge its own lords again, and in 1355 to break off its connexion with the league. About 1365 the town and the Aeusser Amt were recovered for the league by the men of Zug and for the first time Zug was a member of the league in all the acts of the league. In 1379 the German king Wenceslaus exempted Zug from all external jurisdictions, and in 1380 the Habsburgs renounced their claims, reserving only an annual payment of twenty silver marks, and this came to an end in 1415. In 1400 Wenceslaus gave all criminal jurisdiction to the town only. The Aeusser Amt then, in 1404, claimed that the banner and seal of Zug should be kept in one of the country districts, and were supported in this claim by Schwyz. The matter was finally settled in 1414 by arbitration and the banner was to be kept in the town. Finally in 1415 the right of electing their landammann was given to Zug by the Confederales, and a share in the criminal jurisdiction was granted to the Aeusser Amt by the German king Sigismund. In 1385 Zug joined the league of the Swabian cities against Leopold of Habsburg and shared in the victory of Sempach, as well as in the various Argovian (1415) and Thurgovian (1460) conquests of the Confederates, and later in those in Italy (1512), having already taken part in the occupation of the Val d'Ossaia. Between 1376 (Walchwil) and 1477 (Cham) Zug had acquired various districts in her own neighbourhood, principally to the northwest of the town, which were ruled till 1798 by the town alone as subject lands. At the time of the Reformations Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1586 it became a member of the Golden League.

ZUG, LAKE OF, one of the minor Swiss lakes, on the outskirts of the Alps and N. of that of Lucerne. Probably at some former date it was connected by means of the Lake of Lowerz and the plain of Brunnen with the Lake of Lucerne. At present it is formed by the Aa, which descends from the Rigi and enters the southern extremity of the lake. The Lorze pours its waters into the lake at its northern end, while W. issues from the lake to pursue its course towards the Reuss. The Lake of Zug has an area of about 15 sq. m., is about 9 m. in length, 24 m. in breadth, and has a maximum depth of 650 ft., while its surface is 1368 ft. above sea-level. For the most part the lake is in the Canton of Zug, but the southern end is, to the extent of 3½ sq. m., in that of Schwyz, while the Canton of Lucerne claims about 2 sq. m., to the N. of Immensee. Toward the S.W. extremity of the lake the Rigi descends rather steeply to the water's edge, while part of its east shore forms a narrow level band at the foot of the Rossberg (5904 ft.) and the Zugberg. At its northern end is a small island which, at its northeastern extremity, separates the wooded promontory of Buonas (with its castles, old and new) projects Picturesquely into the waters. The principal place on the lake is the town of Zug, whence a railway (formerly part of the St Gotthard main route) runs along its eastern shore past Walchwil to Arth at its south end, which is connected by a steam tramway with the Arth-Goldau station of the St Gotthard line. This line runs from Arth along the western shore to Immensee, where it bears S.W. to Lucerne, while from Immensee another railway lines (at first some way from the shore) to Cham, 3 m. W. of Zug. The first steamer was placed on the lake in 1832. Many fish (including pike and carp of considerable weights) are taken in the lake, which is especially famous by reason of a peculiar kind of trout (Salmo salvelinus), locally called Rötheli.

ZUHAIR [Zuhair ibn Abi Sulmā Rabi` al-Muzan] (6th century), one of the six great Arabian pre-Islamic poets. Of his life practically nothing is known save that he belonged to
a family of poetic power; his stepfather, As ibn Hajjar, his
sister, Khansâ, and his son, Ka'b ibn Zuhair, were all poets of
eminence. He is said to have lived long, and at the age of
one hundred to have met Mahomet. His home was in the land
of the Quraizah. His poems are characterized by a
peaceful nature and a sententious moralizing. One of them
is contained in the Moolablâb.

As a whole his poems have been published by W. Ahlwardt in his
The Divans of the six Ancient Arabic Poets (London, 1870); and
with the commentary of al-‘Alâm (died 1083) by Count Landberg
in the second part of his Primeurs arabes (Leiden, 1886). Some
supplementary poems are contained in Fritz Schimdt’s Zul-Quan
der Uberlieferung des ZulQuanidivans (Munich, 1892).

ZUIDER ZEE, or ZUDEER ZEE, a land-locked inlet on the
cost of Holland, bounded N. by the chain of the Frisian Islands,
and W., S., and E. by the provinces of North Holland, Utrecht,
Gelderland, Overysel, and Friesland. It is about 85 m. long
N. to S., and from 10 to 45 m. broad, with an area of 2027 sq.
m., and contains the islands of Marken, Schokland, Urk, Wienerg,
and Greend. In the early centuries of the Christian era the
Zuiderzee was a small inland lake situated in the
region of Drente called by Tacitus, Pliny, and other early writers. It was separated from the sea by a belt of marsh and fen uniting Friesland and North Holland, the original coast-line being still indicated by the line of the Frisian Islands. Numerous streams, including the Vecht, Eem, and Ysel, discharged their waters into this lake and issued thence as the Lute (Latin Luteus), which reached the North Sea by the Vliet between the islands of Vlieland and Terschelling. In the Lex Frisorum the Vlei (Fili, or Fliei) is accepted as the boundary between the territory of the East and West Frisians. In time, however, and long after the
13th century, high tides and north-west storms swept away the
western banks of the Vlei and submerged great tracts of land.
In 1170 the land between Stavoren, Texel, and Medemblick
was washed away, and a century later the Zuider Zee was formed.

The open waterway between Stavoren and Enkhuizen, however,
as it now exists, dates from 1400. In the south and east the destruction was arrested by the high sandy shores of Gool,
Veluwe, Voorst, and Gasterland in the provinces of Utrecht,
Gelderland, Overysel, and Friesland respectively.

The mean depth of the Zuider Zee is 11-48 ft.; depth in the
southern basin of the former lake, 19 ft.; at Val van Urk (deep
water) the breadth of the island of Urk is 81 ft. If a Burggraven from the island of Urk to Marken, and thence westwards to Hoorn (North Holland) and N.N.E. to Lemmer (Friesland), these lines will connect parts of the Zuider Zee, forming a length of about
101 m. The width of the Zuider Zee on the coast are on the average 3 ft. deep or less. This shallowness of its waters served to protect the Zuider Zee from the invasion of large ships of war. It also explains how many old references, improvements, introduction of communication
between Enkhuizen, Hoorn, Monnikendam, decided to the rank of provincial
trading and fishing ports. The fisheries of the Zuider Zee are of
colourable importance. Eighty per cent. of the bottom consists of
sea clay and the more recent silt of the Ysel; 20 per cent. of
sand, partly in the north about Urk and Enkhuizen, partly in
the south along the high shores of Gool, Veluwe, &c. The
shallowness of the sea and the character of its bottom, promising fertile soil,
occasioned various projects of drainage. The scheme recommended
by the Zuider Zee Vereeniging (1886) formed the subject of a report in
1894 by a state commission. The principal feature in the
scheme was the building of a dyke (Zuider Dike), Amsterdam, and, by sluices near Wieringen, to the northern
part of the sea. The four polders with their areas of fertile soil
would be:

<table>
<thead>
<tr>
<th>Region</th>
<th>Area</th>
<th>Acres (A)</th>
<th>Acres of Fertile Soil</th>
</tr>
</thead>
<tbody>
<tr>
<td>North-west</td>
<td>53,599</td>

</tr>
</tbody>
</table>

The Lake Yselmeer would have an area of 360 sq. m. The gain
would be the addition to the kingdom of a new and fertile pro-
vince of the area of North Brabant, a saving of expenses on
dikes, discharge of old improvements, introduction of communication
between the south and the north of the kingdom, protection of isles
in the sea. &c. The costs were calculated as follows: (1) enclosing

dike, sluices, and construction of the Zuider Dike, £1,750,000; (2) reclama-
tions of dikes and polders, £5,200,000; (3) silting up of works, £400,000;
(4) indemnity to fishermen, £180,000; total, £7,540,000.

In 1901 the government introduced a bill in the States General,
which was based on the recommendations of the commission, but was
repealed. In 1895 the Zuider Zee was drained as a protectory
coast, through the Amsteldiep to Wieringen and from that island
to the Friesland coast at Haam; and further providing for the
drainage of the Zuider Zee into the enclosed area, namely the N.W.
and the S.W. polders shown in the table. The entire work was
to be completed in 18 years at an estimated cost of £7,916,000.

The bill failed to become law and in consequence of financial dif-
ficulties the project had not, up to 1910, advanced beyond the stage of
consideration.

With the exception of Friend and Scholdand, the islands of the
Zuider Zee are inhabited by small fishing communities, who retain
ancient customs and a picturesque dress. The Zuider Zee is
mentioned as an island in 966. The inhabitants of Scholand were
compelled to leave the island by order of the state in 1830, it being
considered insecure from inundation. The island (or Grind) once boasted a walled town, which was destroyed by flood
at the end of the 13th century. But the island continued for centuries to serve as a pasturage for cattle, giving its name to a
well-known description of cheese. Like some of the other islands, sheep are still brought to graze upon it in summer, and a large
number of birds’ eggs are collected upon it in spring.

Several of the islands were once the property of religious houses on the
mainland.

The British Foreign Office report, Draining of the Zuiderzee (1901),
gives full particulars of the Dutch government’s scheme and a
full formal proposal. See also D economische betrekkin van de afstijving en drooglegging der Zuiderzee vom Zuideer-Vereen
de Zuiderzee (Haarlem, 1910).

ZULA, a small town near the head of Annesley Bay on the
African coast of the Red Sea. It derives its chief interest from
ruins in its vicinity which are generally supposed to mark the
site of an ancient emporium of Axum (Alexandria, in Arabic,)
from which Axum (q.v.) and chief outlet in the early centuries of
the Christian era for the ivory, hides, slaves and other exports
of the interior. Cosmas Indicopleustes saw here an inscription
of Ptolemy Euergetes (247-222 B.C.); and hence, as the earliest
mention of Adulis is found in the geographers of the first century A.D.,
it is conjectured that the town must have previously existed under another name and may have been the Berenice
Panchrysos of the Ptolemies. Described by a Greek merchant of the
time of Vespasian as “a well-market’d, the place has been for centuries buried under sand. The ruins visible include the temple, obelisks and numerous fragments of columns.

In 1857 an agreement was entered into by Dejan Nepuys, a
chief of the tribe in remuneration of Nepuys, to cede Zula to the
British. Nepuys was defeated by Theodore, and the commander of a French cruiser sent to Annesley Bay
founded a new town on the coast of the island. The town was
were taken by France to assert its sovereignty, and Zula with the
neighbouring coast passed, nominally, to Egypt in 1866. Zula
was the place where the British expedition of 1867-68 against
Theodore disembarked, Annesley Bay affording safe and ample
anchorage for the largest ocean-going vessels. The road made
by the British from Zula to Senafe on the Abyssinian plateau
was the limit of the authority of Egypt having lapsed, an Italian
protectorate over the coast of Zula was established in 1888, and in
1890 it was incorporated in the colony of Eritrea (q.v.).

See Eduard Rüppell, Reise in Abyssinien, i. 266 (1838); G. Rohlfis in Eidgenössische Gesellschaft, Zentralbl., i. 166 (1847). For further references, the editions of the Periplus by C. Müller (Geog. Gr. Min., i. 259) and Fabricius (1883) consult also ETHIOPIA:
The Axumite Kingdom.

ZULOAGA, IGNACIO (1870- ), Spanish painter, was born
at Ibar, in the Basque country, the son of the metal-
worker and damascener Placidio Zuloaga, and grandson of
the organizer and director of the royal armoury in Madrid.
The career chosen for him by his father was that of an architect,
and for the Zuider Zee he prepared the strong impulse that led him to pain-
ting. After only six months' work he completed his first picture,
which was exhibited at the Paris Salon of 1890. Continuing
his studies in Paris, he was strongly influenced by Gauguin
and Toulouse Lautrec. Only on his return to his native soil he
found his true style, which is based on the national Spanish
ZULULAND

A fully illustrated account of the artist and his work, by M. Utrillo, was published in a special number of Forma (Barcelona, 1907).

ZULULAND, a country of south-east Africa, forming the N.E. part of the province of Natal in the Union of South Africa. The "Province of Zululand," as it was officially styled from 1898 to 1910, lies between 26° 50' and 29° 15' S. and 30° 40' and 33° E., and has an area of 10,450 sq. m. It includes in the north the country of the Ama Tonga, Zambanland, and other small territories not part of the former Zululand kingdom and similar in mountain and river to the southern and eastern parts of Portuguese East Africa. Bounded S.E. by the Indian Ocean, it has a coast line of 210 m. North and north-west it is bounded by the Utrecht and Vryheid districts of Natal and by Swaziland. Its greatest length in a direct line is 185 m., its greatest breadth 105 m. (For map see SOUTH AFRICA.)

Physical Features.—Zululand is part of the region of hills and plateaux which descend seaward from the Drakensberg—the great mountain range which separates the Transvaal and Natal provinces from the Transvaal plain. The coast, which curves to the N.E., is marked by a line of sandhills covered with thick bush and rising in places to a height of 500 ft. There are occasional outcrops of rock and low perpendicular cliffs. Behind the sandhills is a low-lying plain in a number of which are shallow lagoons. Of these St Lucia Lake and Kosi Lake are of considerable size and communicate with the sea by estuaries. St Lucia, the larger of the two, is some 35 m. long by 10 m. broad, with a depth of 9 to 10 ft. It runs parallel to the ocean, from which it is separated by sandhills. The opening to the sea, St Lucia river, is at the south end. Kosi Lake lies further inland. It is 30 m. broad, and the only outlet of St Lucia and its opening to the sea is northward. Between Kosi and St Lucia lakes lies Lake Sibayi, close to the coast but not communicating with the sea. The coast plain extends inland from these lakes, the land in the west being lower than the coast. The rest of the country is occupied by ranges of hills and plateaux from 2000 to 4000 ft. above sea level. Behind Esikhawini Mts. stretches a considerable range which stretches the Nkanhla uplands (rising to 4300 ft.) densely wooded in parts and abounding in flat-topped hills with precipitous sides. Westward of the uplands are the Kyudenihills (5000 ft.), also densely wooded, situated near the junction of the Buffalo and Tugela rivers. Further north, along the S.W. frontier, are Isandhlwana and the Ngwbu hills. To the N.W. the Lebombo Mts. (3800 to 2000 ft.), which separate the coast plains from the interior, mark the frontier between Swaziland and Zululand. On their eastern (Zululand) side the slope of the Lebombo mountains is gentle, but on the west they fall abruptly to the plain.

Climate.—The climate of the coast belt is semi-tropical and malaria is prevalent; that of the highlands temperate. The rains vary with the rainy season, but in the higher country snow and sleet are not unknown. Between December and July, the coast area of about 40 in. of rain fall in the summer months and about 7 in. in the winter months. A fresh S.E. wind is fairly constant in the inland regions during the middle of the day. A hot wind from the N.W. is occasionally experienced in the highlands.

Inhabitants.—The population in 1904 was estimated at 239,000. Of these only 5635 lived outside the area devoted to native locations. The white population numbered 1693. The Nguni of the Zululand, comprising the Zulus, Xhosa, and Basutos, is a settlement of some 2000 Basutos in the Ngunu district. After the establishment of the Zulu military ascendency early in the 19th century various Zulu hordes successively invaded and overran a great part of east-central Africa, as far as and even beyond the Lake Nyasa district. Throughout these regions they are variously known as Ma-Zitu, Ma-Ravi, Wa-Ngoni (Angoni), Matabele (Ame-Ndebeli), Ma-Viti, and Aba-Zanzi. Such was the terror inspired by these fierce warriors that many of the tribes, such as the Wa-Nindi of Mozambique, adopted the tactics of their conquerors or oppressors. Hence the impression that the true Zulu are far more numerous north of the Limpopo than has ever been the case. In most places they have become extinct or absorbed in the surrounding populations owing to their habit of incorporating prisoners in the tribe. But they still hold their ground as the ruling element in the region between the Limpopo and the middle Zambesi, which from them takes the name of Matabeleland. The circumstances and history of the two chief migrations of Zulu peoples northward are well known; the Matabele were led by Musilikatze (Smaligaza), and the Angoni by Sungandaba, both chiefs of Chilibwana, which was revolted from him in the early 19th century.

The Zulu possess an elaborate system of laws regulating the inheritance of property and the disposal of cattle, the complexity arising from the practice of polygamy and the exchange of cattle made upon marriage. The giving of cattle in the latter case is generally referred to as a barter and sale of the bride, from which indeed it is not easily distinguishable. But it is regarded in a different light by the natives. The kraal is
ZULULAND

1051

under the immediate rule of its headman, who is a patriarch respon-
sible for the welfare of its members. Over the headman, whose
authority may extend to regulate kraals, marriages, and settle-
ment of disputes, and above the tribal chief, was the king, whose
authority is now exercised by a British commissioner. By the cus-
tom of Zulu there is no distinction as to rank in the community
or the utterance of any word which occurs in the names of the
principal members of her husband's family: e.g., if she has a
brother-in-law named U'Nkomo, she would not use the Zulu for
"brother-in-law," but would invent some other word for it. The
husband observes the same custom with regard to his mother-in-
law. The employment of "witch doctors" for "smelling out"
crimes, and their official dealings with the headman and other
villagers or dwellers of any kind, such as poisons), once common in Zul-
unland, as in neighbouring countries, was discouraged by Cetywayo,
who established kraals of refuge for the reception of persons
ruled over by the headman or from Boers. Some of the institutions of
the Natal government were finally suppressed by the British in the early years of
the 20th century. (For the Zulu speech, see BANTU LANGUAGES.)

The Zulu live in kraals, circular enclosures with
a ring fence inside forming a D-shaped pen. Between this
fence and the outer fencing are the huts of the inhabitants.
The kraal for a considerable period was at Ulundi, in the valley
of the White Umfolozi. The last king to occupy it was Dinizulu; his kraal was farther north near the Ndwanqwa magistracy.
The chief white settlements are Eshowe and Melmoth. Eshowe
(pop. 1904, 1853 of whom 570 were whites) is about 95 m. N.E.
of Durban. Its original name is always reserved and Eshowe
is 2 m. W. of the mission station of the same name in
which Col. Pearson was besieged by the Zulus in 1879, and was
laid waste by them. The town is picturesquely situated on a
plateau and has a bracing climate. Two hundred acres of forest
land in the centre of the town have been reserved as a natural
park. Melmoth, 25 m. N.E. of Eshowe, lies in the centre of a
district, of the name of a small well-known forest, the
St Lucia coafields district. Nkandla is a small settlement in
the south-west of the country.

Communications.—Notwithstanding its 210 m. of coast-line Zu-
uland possesses no railways. Of its mouths, the largest is that of
the Tugela; there is, however, fairly safe anchorage, except in
S.S.W. or W. winds, from about 1500 yds. from the shore.
The landing-place is on the open sandy beach, where a small stream enters the sea and supplies fresh water. The town is situated on a
plateau and has a bracing climate. Two hundred acres of forest
land in the centre of the town have been reserved as a natural
park. Melmoth, 25 m. N.E. of Eshowe, lies in the centre of a
district, of the name of a small well-known forest, the
St Lucia coafields district. Nkandla is a small settlement in
the south-west of the country.

Industries.—The Zulu gives little attention to the cultivation of
the soil. Their main wealth consists in their herds of cattle and
flocks of sheep. They raise, however, crops of maize, millet, sweet
potatoes and tobacco. Sugar, tea and coffee are grown in the coastal
districts. A valuable feature of the Zulu's life is their love of
change which results in the continual movement of their herds.
Zululand is divided into eleven magistracies, and the
magistracy —167 m. from Durban, of which 98 are in Zululand.

There is telegraphic communication between the magistracies and
towns, and mail is delivered by native carriers.

Administration.—Zululand for provincial purposes is governed
by the provincial council of Natal; otherwise it is subject to the
House of Assembly, to which it returns one member of the
Parliament. It is represented in the Natal government by two
members in the Legislative Council, and is represented in the
Executive Council, and two being elected to the Legislative Assembly, one
each for the districts of Eshowe and Melmoth. Their selection
and election were governed by the same laws as in Natal proper,
and by the same franchise qualifications—which practically exclude natives—remained unaltered. The
parliamentary voters in 1910 numbered 1442. The executive
powers were exercised by a council whose members were chosen
at Eshowe. Zululand is divided into eleven magistracies, and the
district of Tongaland (also called Mputa or Amapataland).
In the magistracies the authority of the chiefs and
sanduma (headmen) is considerable.

Zululand is divided into eleven magistracies, and the
district of Tongaland, formed the part of the dominion of the
Zulus, but was ruled by independent chiefs until its annexa-
tion by Great Britain in 1899.

With the exception of the townships and a district of Emt-
jamini known as "Proviso B," mainly occupied by
Boers, all the land was vested in the crown and very little
has been parted with to Europeans. The crown lands are, in
effect, native reserves. A hut tax of 1½. per annum is levied on
all. The tax has been paid in cash. If a native does not posses,
whether or not each wife has a separate hut. Since 1906 a poll tax
of £1, a head is also levied on all males over eighteen.

European or native.

History.—At what period the Zulu (one of a number of
closely allied septs) first reached the country to which they have
been given the name is uncertain; they were probably settled
in their present location by the end of the 17th century, and they take their name from a chief who flourished about that time. The earliest record of contact
between Europeans and the Zulu race is believed to be the
account of the wreck of the "Doddington" in 1756. The
survivors met with hospitable treatment at the hands of the
natives of Natal, and afterwards proceeded up the coast
to St Lucia Bay. They describe the natives as "very proud
and haughty, and not so accommodating as those lately left.”
They differed from the other natives in the superior neatness
of their food of preparing their food, and were more cleanly
in their persons than the other groups. The tribal system,
their chief pride seemed to be to keep their hair in
order. It is added that they watched strictly over their
women.

At the close of the 18th century the Zulu were an unimportant
tribe numbering a few thousands only. At that time the most
powerful of the neighbouring tribes was the Umthwala (mTetwa
or Afa-Tetwa) which dwelt in the country north-east of the
Tugela. The ruler of the Umthwala was a chief who had had
an easy life an adventurous career and was known as Dingiswayo
(the Warrior). Cetywayo, and Dingiswayo, as is supposed, had observed the manner in
which the whites formed their soldiers into disciplined
regiments. He too divided the young men of his
tribe into impis (regiments), and the Umthweta became a formidable
military power. Dingiswayo also encouraged trade
and opened relations with the Portuguese at Delagoa Bay, bartering
ivory and oxen for brass and beads. In 1805 he was joined by
Chaka, otherwise Tshaka (born c. 1783), the son of the Zulu
chief Senzangakona; on the latter's death in 1810 Chaka,
the indefatigable Dingiswayo, was chosen as ruler of the
Ama-Zulu, though not the right of the Ama-Zulu to
the patron's raids, and in 1812 the Umthweta and Zulu drove
the Amangwana across the Buffalo river. About this time Dingis-
wayo was captured and put to death by Zwede, chief of the
Undwandle clan, with whom he had waged constant war.
The Umthweta army then placed themselves under Chaka, who not
long afterwards conquered the Undwandle. By the incorpora-
tion of these tribes Chaka made of the Zulu a powerful
nation. He strengthened the regimental system
adopted by Dingiswayo and perfected the discipline of his army.
A new order of battle was adopted—the troops being massed
in crescent formation, with a reserve in the shape of a parallelo-
gram ready to strengthen the weakest point. 2 Probably Chaka's
greatest innovation was the introduction of the stabbing assegai.
The breaking short of the shaft of the assegai when the weapon
was used at close quarters was already a common practice among
the Ama-Zulu, but Chaka had the shaft of the assegais made
short, and their blades longer and heavier, so that they could be
used for cutting or piercing. At the same time the size of the
shield was increased, the more completely to cover the body of
the warrior. The shield was of a double hump shape, and the
military kraals were formed in which the warriors

1 The Boers claimed the right to settle in this district in virtue of
Proviso B of an agreement made, on the 23rd of October 1886.

2 Between the settlers in the "New Republic" and Sir A. E. Have-
lock, governor of Natal.

The Call of Duty, issued in 1832, states that the ancestors of the tribes
living in what is now Natal and Zululand were acquainted with
the regimental system and the method of attack in crescent shape
formation in the 17th century. Memories of these customs lingered
very long after the practice had died out. Among the ama-Xosa section of
Kaffirs they appear to have been quite unknown.
were kept apart. Members of a regiment were of much the same age, and the young warriors were forbidden to marry until they had distinguished themselves in battle.

Chaka had but two ways of dealing with the tribes with whom he came in contact; either they received permission to be incorporated in the Zulu nation or they were practically exterminated. In the latter case the only persons spared were young girls and growing lads who could serve as carriers for the army. No tribe against which he waged war was able successfully to oppose the Zulu arms. At first Chaka turned his attention northward. Those who could flee before him, the first of importance so to do being a chief named Swangendaba (Sungandaba), whose tribe, of the same stock as the Zulu, was known as Angoni. He was followed by another tribe, which under Manikusa for many years ravaged the district around and north of Delagoa Bay (see GAELAND). Chaka next attacked the tribes on his southern border, and by 1826 had made himself master of Natal, which he swept almost clear of inhabitants. It was about 1829 that Mosilikatze (properly Umsilikazi), a general in the Zulu army, having incurred Chaka’s wrath by keeping back part of the booty taken in an expedition, fled with a large following across the Drakensberg and began to lay waste a great part of the country between the Vaal and Limpopo rivers. Mosilikatze was not of the Zulu tribe proper, and he and his followers styled themselves Abaka-Zulu. Chaka’s own dominions, despite his conquests, were not very extensive. He ruled from the Pongolo river on the north to the Umlomanzzi river on the south, and his independent power was cut off from the Black valley of the Drakensberg; thus his territory coincided almost exactly with the limits of Zululand and Natal as constituted in 1903. His influence, however, extended from the Limpopo to the borders of Cape Colony, and through the ravages of Swangendaba and Mosilikatze the terror of the Zulu arms was carried far and wide into the interior of the continent.

Chaka seems to have first come into contact with Europeans in 1824. In that year (see Natal) he was visited by F. G. Farewell and a few companions, and to them he made a grant of the district of Port Natal. Farewell found the king at Umngungmilou, the royal kraal on the White Umfoshani, “surrounded by a large number of chiefs and about 8000 or 9000 armed men, observing a state and ceremony in our introduction little expected.” At this time an attempt was made to murder Chaka; but the wound he received was cured by one of Farewell’s companions, a circumstance which made the king very friendly to Europeans. Anxious to open a political connexion with the Cape and British governments, Chaka entertained early in 1828 one of his principal chiefs, Sotobi, and a companion to the care of J. S. King, one of the Natal settlers, to be conducted on an embassy to Cape Town, Sotobi being commissioned to proceed to the king of England. But they were not allowed to proceed beyond Port Elizabeth, and three months later were sent back to Zululand. In July of the same year Chaka sent an army westward which laid waste the Pondi country. The Zulu force did not come into contact with the British troops guarding the Cape frontier, but much alarm was caused by the invasion. In November envoy from Chaka reached Cape Town, and it was determined to send a British officer to Zululand to confer with him. Before this embassy arrived, news came that Chaka had been murdered (23rd of September 1828) at a military kraal on the Umvote about fifty miles from Port Natal. Chaka was a victim to a conspiracy by his half brothers Dingaan and Umthlangana, while a short time afterwards Dingaan murdered Umthlangana, overcame the opposition of a third brother, and made himself king of the Zulu.

Bloodstained as had been Chaka’s rule, that of Dingaan appears to have exceeded it in wanton cruelty, as is attested by several trustworthy European travellers and determined men who frequented Zululand. The British settlers at Port Natal were alternately terrorized and conciliated. In 1835 Dingaan gave permission to the British settlers at Port Natal to establish missionary stations in the country, in return for a promise made by the settlers not to harbour fugitives from his dominions. In 1836 American missionaries were also allowed to open stations; in 1837 he permitted the Rev. F. Owen, of the Church Missionary Society, to reside at his great kraal, and Owen was with the king when in November 1837 he received Pieter Retief, the leader of the first party of Boer immigrants to enter Natal, many great German contact; was continuously.”

Arrival of the Boers. The British were permitted to reside here in the colony, and the Boers were allowed to follow the occupation of farming.

Coming over the Drakensberg in considerable numbers during 1837, the Boers found the land stretching south from the mountains almost deserted, and Retief went to Dingaan to obtain a formal cession of the country west of the Tugela, which river the Zulu recognized as the boundary of Zululand proper. After agreeing to Retief’s request Dingaan caused the Boer leader and his companions to be murdered (6th of February 1838), following up their treachery by slaying as many as possible of the other Boers who had entered Natal. After two unsuccessful attempts to avenge their slain, in which the Boers were aided by the British settlers at Port Natal, Dingaan’s army was totally defeated on the 16th of December 1838, by a Boer force under Andries Pretorius. Operating in open country, mounted on horseback, and with rifles in their hands, the Boer farmers were able to inflict fearful losses on their enemy, while their own casualties were few. On “Dingaan’s day” the Boer force received the attack of the Zulu while in laager; the enemy charged in dense masses, being met both by cannon shot and rifle fire, and were presently attacked in the rear by mounted Boers. After the defeat Dingaan set up a warlike terror in Natal, and made himself master of the coast, at the head of the Drakensberg, with a force of 3000 men. The Boers were, however, too well armed and too many in number to be able to withstand them. In order to escape the Boers they fled into the bush; on the Boers crossing the Tugela he established himself at Ulundi at a little distance from his former capital. His power was greatly weakened and a year later was overthrown, the Boers in Natal (January 1840) supporting his brother Msanda (usually called Panda) in rebellion against him. The movement was completely successful, several of Dingaan’s regiments going over to Panda. Dingaan passed into Swaziland in advance of his retreating forces, and was there murdered, while Panda was crowned king of Zululand by the Boers. When in 1843 the British succeeded the Boers as masters of Natal they entered into a treaty with Panda, who gave up to the British the country between the upper Tugela and the Buffalo rivers, and also the district of St Lucia Bay. (The bay was not then occupied by the British, whose object in obtaining the cession was to prevent its acquisition by the Boers. Long afterwards the treaty with Panda was successfully invoked to prevent a German occupation of the bay.) No sooner had the British become possessed of Natal than there was a large immigration into it of Zulu fleeing from the misgovernment of Panda. That chief was not, however, as warlike as his brothers Chaka and Dingaan; and he remained throughout his reign at peace with the government of Natal.

With the Boers who had settled in the Transvaal, however, he was involved in various frontier disputes. He had wars with the Swazis, who in 1855 ceded to the Boers of Lydenburg a tract of land on the north side of the Pongolo in order to place Europeans between themselves and the Zulu. In 1856 a civil war broke out between two of Panda’s sons, Cetywayo and Umbulazi, who were rival claimants for the succession. A battle was fought between them on the banks of the Tugela in December 1856, in which Umbulazi and many of his followers were slain. The Zulu country continued, however, excited and disturbed until the government of Natal in 1861 obtained the formal nomination of a successor to Panda; and Cetywayo was appointed. The agent chosen to preside at the nomination ceremony was Mr (afterwards Sir) Theophilus Shepstone, who was in charge of native affairs in Natal and had won in a

1 Bishop Schreuder, a Norwegian missionary long resident in Zululand, gave Sir Bartle Frere the following estimate of the three brothers who successively reigned over the Zulu:—Chaka was a really great man, cruel but not rapacious; Dingaan was a good man, but an unwise and indecisive leader; and Panda was simply a beast on two legs. Panda was a weaker and less able man, but kindly and really grateful, a very rare quality among Zulu. He used to kill sometimes, but never wantonly or continuously.
remarkable degree the respect and liking of the Zulu. Pandan died in October 1872, but practically the government of Zululand had been in Cetywayo's hands since the victory of 1856, owing both to political circumstances and the failing health of his father. In 1873 the Zulu nation appealed to the Natal government to preside over the installation of Cetywayo as king; and this request was acceded to, Shepstone being again chosen as British representative. During the whole of Pandora's reign the condition of Zululand showed little improvement. Bishop Coelenzo visited him in 1873 and obtained a grant of land for a mission station, which was opened in 1880, by the Rev. R. Robertson, who laboured in the country for many years, gaining the confidence both of Panda and Cetywayo. German, Norwegian and other missions were also founded. The number of converts was few, but the missionaries exercised a very wholesome influence and to them in measure was due the comparative mildness of Panda's later years.

The frontier disputes between the Zulu and the Transvaal Boers ultimately involved the British government and were one of the causes of the war which broke out in 1879. They concerned, chiefly, territory which in 1854 was proclaimed the republic of Utrecht, the Boers who had settled there having in that year obtained a deed of cession from Panda. In 1860 a Boer commission was appointed to beacon the boundary, and to obtain, if possible, from the Zulu a road to the sea at St Lucia Bay. The commission, however, effected nothing. In 1861 Umntonga, a large herd of cattle belonging to the Transvaal district, was assembled an army on that frontier. According to evidence brought forward later by the Boers, Cetywayo offered the farmers a strip of land along the border if they would surrender his brother. This they did on the condition thatUmntonga's life was spared, and in 1861 Panda signed a deed making over the land to the Boers. The southern boundary of the strip added to Utrecht ran from Rorke's Drift on the Buffalo to a point on the Pongolo. The boundary was beaconed in 1884, but when in 1885 Umntonga fled from Zululand to Natal, Cetywayo refused to return to the Transvaal; and when the Transvaal forces came to the Utrecht district, they were defeated in a battle at the Pongolo and lost 2500 men. Cetywayo, however, was not defeated, and the Transvaal people were eventually to find the Transvaal Boers defeated in 1881. The war ended with the capture of Isandhlwana and Cetywayo was restored to the throne under the protection of the British government.

Disputes with the Transvaal.

In 1856, Cetywayo was appointed by the lieut.-governor of Natal in February 1878 to report on the boundary question. The commission reported in July, and found almost entirely in favour of the contention of the Zulu. Sir Bartle Frere, then High Commissioner, who thought the award "one-sided and unfair to the Boers" (Martineau, Life of Frere, ii. xii.), stipulated that on the land being given to the Zulu, the Boers living on it should be compensated if they left, or protected if they remained. Cetywayo (who now found no defender in Natal save Bishop Coelenzo) was in a defiant humour, and permitted outrages by Zulu both on the Transvaal and Natal borders. Frere was convinced that the peace of South Africa could be preserved only if the power of Cetywayo was curtailed. Therefore in forwarding his award on the boundary dispute the High Commissioner demanded that the military system should be remodelled. The youths were to be allowed to marry as they came to man's estate, and the remittances not to be called up except with the consent of the Council of the nation and also of the British government. Moreover, the missionaries were to be unmolested and a British resident was to be accepted. These demands were made to Zulu deputations on the 11th of December 1878, a definite reply being required by the 31st of that month.

Cetywayo returned no answer, and in January 1879 a British force under General Thesiger (Lord Chelmsford) invaded Zululand. Lord Chelmsford had under him a force of 5000 Europeans and 8000 natives; 3000 of the latter were employed as porters and drivers. All the Zulu population south of the Umgeni river were divided into four divisions, and the force of 4000 Europeans and 4000 natives were stationed in the Utrecht district. Three columns were to invade Zululand, from the Lower Tugela, Rorke's Drift, and Utrecht respectively, their objective being Ulundi, the royal kraal. Cetywayo's army numbered fully 40,000 men. The entry of all three columns was unopposed. On the 22nd of January the centre column (1600 Europeans, 2500 natives), which had advanced from Rorke's Drift, was encamped near Isandhlwana; on the morning of that day Lord Chelmsford moved out with a small force to support a reconnoitring party. After he had left, the camp, in charge of Col. Durnford, was surprised by a Zulu army nearly 10,000 strong. The British were overwhelmed and almost every man killed, the casualties being 800 Europeans (more than half belonging to the 24th regiment) and 471 natives. All the transport was also lost. Lord Chelmsford and the reconnoitring party returned to find the camp deserted; next day they retreated to Rorke's Drift, which had been the scene of an heroic and successful defence. After the victory at Isandhlwana several imps of the Zulu army had moved to the Drift. The garrison stationed there, under Lieuts. Chard and Bromhead, numbered about 80 men of the 24th regiment, and they had in hospital between 30 and 40 men. Late in the afternoon they were attacked by about 4000 Zulu. On six occasions, the Zulu got within the entrenchments, to be driven back each time at the bayonet's point. At dawn the Zulu withdrew, leaving 350 dead. The British loss was 17 killed and 10 wounded.

In the meantime the right column under Colonel Pearson had reached Isanwala from the Tugela; on receipt of the news of Isandhlwana most of the mounted men and the native troops were sent back to the Natal, leaving at Isanwala a garrison of 1500 Europeans and 65 natives. This force was hemmed in by the enemy. The left column under Colonel (afterwards Sir) Evelyn Wood, which had done excellent work, found itself obliged to act on the defensive after the disaster to the centre column.1 For a time an invasion of Natal was feared. The Zulu, however, made no attempt to enter Natal, while Lord Chelmsford awaited reinforcements before resuming his advance. During this time (March the 12th) an escort of stores marching to Luneberg, the headquarters of the Utrecht force, was attacked when encamped on both sides of the Intombe river. The camp was surprised, 82 out of 106 men were killed, and all the stores were

1 With the column were 40 Boers, the Uys clan, under Piet Uys, whose father had been killed in 1838 in the war with Dingaan.
lost. News of Isandhlwana reached England on the 11th of February, and on the same day about 10,000 men were ordered out to South Africa. The first troops arrived at Durban on the 17th of March. On the 29th a column, under Lord Chelmsford, consisting of 3400 Europeans and 2300 natives, marched to the relief of Ulundi, en route the Zulu being formed each night. On the 2nd of April the camp was attacked at Ginginholu, the Zulu being repulsed. Their loss was estimated at 1200 while the British had only two killed and 52 wounded. The next day Eshowe was relieved. Wood, who had been given leave to make a diversion in northern Zululand, on the 28th of March occupied Hlchane (Inhlobane) mountain. The force was, however, compelled to retreat owing to the unexpected appearance of the main Zulu army, which nearly outflanked the British. Besides the loss of the native contingent (those not killed deserted) there were 100 casualties among the 400 Europeans engaged. 1 At mid-day next day the Zulu army made a desperate attack, lasting over four hours, on Wood’s camp at Kamzamba; the enemy—over 20,000 strong—was driven off, losing fully 1000 men, while the British casualties were 18 killed and 65 wounded.

By the middle of April nearly all the reinforcements had reached Natal, and Lord Chelmsford reorganized his forces. The 1st division, under major-general Crealock, advanced along the coast belt and was destined to act as a support to the 2nd division, under major-general Newdigate, which was to march on Ulundi from Rorke’s Drift and Kamzamba. Owing to difficulties of transport it was the beginning of June before Newdigate was ready to advance. On the 1st of that month the prince imperial of France (Louis Napoleon), who had been allowed to accompany the British troops, was killed while out with a reconnoitring party. On the 1st of July Newdigate and Wood had reached the White Umfolozi, in the heart of the enemy’s country. During their advance messengers were sent by Cetywayo to treat for peace, but he did not accept the terms offered. Meantime Sir Garnet (afterwards Lord) Wolseley had been sent out to supercede Lord Chelmsford, and on the 7th of July he reached Crealock’s headquarters at Port Durnford. But by that time the campaign was practically over. The 2nd division (with which was Lord Chelmsford) and Wood’s column crossed the White Umfolozi on the 4th of July—the force numbering 4200 Europeans and 1000 natives. Within a mile of Ulundi the British force, formed in a hollow square, was attacked by a Zulu army numbering 12,000 to 15,000. The battle ended in a decisive victory for the British, whose losses were about 250, while of the Zulu some 1500 men were killed (see Ulundi). 2

After this battle the Zulu army dispersed, most of the leading chiefs tendered their submission, and Cetywayo became a fugitive. On the 27th of August the king was captured and sent to Cape Town. His deposition was formally announced to the Zulu, and Wolseley drew up a new scheme for the government of the country. The Chaka dynasty was deposed, and the Zulu country portioned among eleven Zulu chiefs, John Dunn, 3 a white adventurer, and His Majesty’s friends who had been in the service of the ex-king. A Resident, was appointed who was to be the channel of communication between the chiefs and the British government. This arrangement was productive of much bloodshed and disturbance, and in 1882 the British government determined to restore Cetywayo to power. In the meantime, however, blood feuds had been engendered between the chiefs Usibepu (Zibebo) and Hamu 4 on the one side and the tribes who supported the ex-king and his family on the other. Cetywayo’s party (who now became known as Usutus) suffered severely at the hands of the two chiefs, who were aided by a band of white freebooters. When Cetywayo was restored Usibepu was left in possession of his territory, while Dunn’s land and that of the Basuto chief (the country between the Tugela and the Umlhlatuzi, i.e. adjoining Natal) was constituted a reserve, in which locations were to be provided for Zulu unwilling to serve the restored king. This new arrangement proved as futile as had Wolseley’s. Usibepu, having created a formidable force of well-armed and trained warriors, and being left in independence on the borders of Cetywayo’s territory, viewed with displeasure the re-installation of his former king, and Cetywayo was desirous of humbling his relative. A collision very soon took place. Usibepu fought bravely, and on the 22nd of July 1883, led by a troop of mounted whites, he made a sudden descent upon Cetywayo’s kraal at Ulundi, which he destroyed, massacring such of the inmates of both sexes as could not save themselves by flight. The king escaped, though wounded, into the Reserve; there he died in February 1884.

Cetywayo left a son, Dinizulu, who sought the assistance of some of the Transvaal Boers against Usibepu, whom he defeated and drove into the Reserve. These Boers, led by Lukas Meyer (1842-1902), claimed as a stipulated reward for their services the cession of the country between the Tugela and the Tugela, and the kraal of central Zululand. On the 21st of May the Boer adventurers had proclaimed Dinizulu king of Zululand; in August following they founded the “New Republic,” carved out of Zululand, and sought its recognition by the British government. The Usutu party now repented of their bad bargain, for by the end of 1883 they found the Boers claiming some three-fourths of their country. The British government intervened, took formal possession of St Lucia Bay (to which Germany as well as the Transvaal advanced claims), caused the Boers to reduce their demands, and within boundaries agreed to recognize the New Republic—whose territory was in 1888 incorporated in the Transvaal and has since 1903 formed the Vryheid division of Natal.

Seeing that peace could be maintained between the Zulu chiefs only by the direct exercise of authority, the British government annexed Zululand (minus the New Republic) in 1887, and placed it under a commissioner responsible to the governor of Natal. In the following year Dinizulu, who continued his feud with Usibepu, rebelled against the British. After a sharp campaign (June to August 1888), the Usutu losing 30 killed in one encounter, Dinizulu fled into the Transvaal. He surrendered himself to the British in November; in April 1889 he and two of his uncles (under whose influence he chiefly acted) were found guilty of high treason and were exiled to St Helena.

Under the wise administration of Sir Melmoth Osborn, the commissioner, whose headquarters were at Eshowe, and the district magistrates, the Zulu became reconciled to British rule, especially as European settlers were excluded from the greater part of the country. Large numbers of natives sought employment in Natal and at the Rand gold mines, and Zululand enjoyed a period of prosperity hitherto unknown. Order was maintained by a mounted native police force.

At the end of 1888 and at the beginning of 1889 some small tracts of territory lying between Zululand and Tongaland, under the rule of petty semi-independent chiefs, were added to Zululand; and in 1895 the territories of the chiefs Zamba (Sambana) and Umgtegii, 689 sq. m. in extent, lying between the Portuguese territories, Swaziland, Zululand and Tongaland, were also added. In the same year a British protectorate was declared over Tongaland. The coast-line was thus secured for Great Britain up to the boundary of the Portuguese territory at

1 For his action on this occasion Colonel (afterwards General Sir) Redvers Buller, who was Wood’s principal assistant, received the V.C. Piet Uys was among the slain.
2 Dunn was a son of one of the early settlers in Natal and had largely identified himself with the Zulu. In 1856 with Wood’s Umbulazali against Cetywayo, but was high in that monarch’s favour at the time of his coronation in 1873. When Frere’s ultimatum was delivered to Cetywayo, Dunn, with 2000 followers, crossed the Tugela into Natal (10th of January 1879). In 1888 he fought against Dinizulu.
3 Both these chiefs were members of the royal family.
Delagoa Bay. At that time the Transvaal government—which had been the first to reap the benefit of Great Britain's defeat of the Zulu by acquiring the "New Republic"—was endeavouring to obtain the territories of Zambaan and Umotgosa, hoping also to secure a route through Tongaland to Kosi Bay. President Kruger protested in vain against this annexation, Great Britain being determined to prevent another Power establishing itself on the south-east African seaboard.

In 1893 Sir M. Osborn was succeeded as resident commissioner by Sir Marshal Clarke, who gained the confidence and good will of the Zulu. At the close of 1897 Zululand, in which Tongaland had been incorporated, was handed over by the imperial government to Natal, and Sir (then Mr) C. J. R. Saunders was appointed civil commissioner of the Zulu nation. Both commissioners had been associated since 1887. In 1898 Dinizulu was allowed to return and was made a "government induna." Officially one of several chiefs subject to the control of the resident magistrate, he was, in fact, regarded by most of the Zulu as the head of their nation. His influence appeared to be in the main exercised on the side of order. During the war of 1896-1897 there was some fighting between the Zulu and the Boers, provoked by the Boers entering Zulu territory. A Zulu kraal having been raided, the Zulu retaliated and, surrounding a small Boer commando, succeeded in killing every member of it.

In September, 1896, the British troops were withdrawn, and Natal by way of Zululand, but the stubborn defence made by the small posts at Itala and Prospect Hill, both within the Zulu border, caused him to give up the project. Throughout the war the Zulu showed marked partiality for the British side.

At the close of the war the Natal government decided to allow white settlers in certain districts of Zululand, and a Lands Delimitation Commission was appointed. The commission, however, reported (1903) that four-fifths of Zululand was unfit for European habitation, and the remaining fifth already densely populated. The commissioners urged that the tribal system should be maintained. Meantime the coal mines near St. Lucia Bay were opened up and connected with Durban by railway. At this time rumours were current of disaffection among the Zulu, but this was regarded as the effervescence natural after the war. In 1903 a poll tax of £1 on all adult males was imposed by the Natal legislature; this tax was the ostensible cause of a revolt in 1906 among the natives of Natal, who were largely of Zulu origin. Bambaata, the leader of the revolt, fled to Zululand. He took refuge in the dense bush in the KwaBamba area, where Cetewayo's grave became the rallying-point of the rebels, who in April were joined by an aged chief named Sigananda and his tribe. After an arduous campaign, the Natal force (about 3000 strong) being commanded by Col. Sir Duncan McKenzie, the rebellion was crushed by July 1906, without the aid of imperial troops. Bambaata was killed in battle (June roth); his head was cut off for purposes of identification, but afterwards buried with the body. Sigananda surrendered. In all some 3500 Zulus were killed and about 3000 taken prisoners, the majority of the prisoners being reduced to slavery. Sir Harry Smith, the British commissioner, remained, however, in a disturbed condition, and a number of white traders and officials were murdered. Dinizulu had been accused of harbouring Bambaata, and in December 1907 the Natal government felt justified in charging him with high treason, murder and other crimes. A military force entered Zululand, and Dinizulu surrendered without opposition. He was brought to trial in November 1908, and in March 1909 was found guilty of harbouring rebels. The more serious charges against him were not proved. He was sentenced to four years' imprisonment and deprived of his position as a government induna. Other Zulu chiefs were convicted of various offences and sentenced to imprisonment for a shorter period. The commission was presided over by W. P. Schreiner, ex-premier of Cape Colony, while Miss H. E. Colenso (a daughter of Bishop Colenso) constituted herself his champion in the press of Natal and Great Britain. On the day that the Union of South Africa was established (31st of May 1910), the Botha ministry released Dinizulu from prison. He was subsequently settled on a farm in the Transvaal and given a pension of £50 a year.

ZUMALACARRPEGUI, THOMAS (1788-1835), Spanish Carlist general, was born at Ormaiztegui in Navarre on the 29th of October 1788. His father was a Royalist. He attracted no attention at headquarters; and was still a captain when the revolution of 1820 broke out. His brother officers, whose leanings were liberal, denounced him to the revolutionary government, and asked that he might be removed. The recommendation was not acted on, but Zumalacáregui knew of it, and laid up the
offence in his mind. Finding that he was suspected (probably with truth) of an intention to bring the soldiers over to the royalist side, he escaped to France. In 1825 he returned as an officer in one of the royalist regiments which had been organized on French soil by the consent of the government. He was now known as a thoroughly trustworthy servant of the despotic royalty, but he was too proud to be a courtier. For some years he was employed in bringing regiments which the government distrusted to order. He became lieutenant-colonel in 1825 and colonel in 1829. In 1832 he was named military governor of Ferrol. Before Ferdinand VII. died in 1833, Zumalacárrégui was marked out as a natural supporter of the absolutist party which favoured the king's brother, Don Carlos. The proclamation of the king's daughter Isabella as heiress was almost the occasion of an armed conflict between him and the naval authorities at Ferrol, who were partisans of the constitutional cause. He was put on half pay by the new authorities and ordered to live under police observation at Pamplona. When the Carlist rising began on the death of Ferdinand he is said to have held back because he knew that the first leaders would be politicians and talkers. He did not take the field till the Carlist cause appeared to be at a very low ebb, and until he had received a commission from Don Carlos as commander-in-chief in Navarre. The whole force under his orders when he escaped from Pamplona on the night of the 20th of October, 1833, and had been organized next day in the Val de Araquil, was a few hundred ill-armed and dispirited guerrilleros. In a few months Zumalacárrégui had organized the Carlist forces into a regular army. The difficulty he found in obtaining supplies was very great, for the coast towns—and notably Bilbao—were constitutional in politics. It was mainly by captures from the government troops that he equipped his forces. He gradually obtained full possession of Navarre and the Basque provinces, outside of the fortresses, which he had not the means to besiege. Whether at Astorga or at his most regular position, in the mountains, he proved unconquerable. By July 1834 he had made it safe for Don Carlos to join his headquarters. The pretender was, however, a narrow-minded, bigoted man, who regarded Zumalacárrégui with suspicion, and was afraid of his immense personal influence with the soldiers. Zumalacárrégui had therefore to drag behind him the whole weight of the distrust and intrigues of the court. Yet by the beginning of June 1835 he had made the Carlist cause triumphant to the north of the Ebro, and had formed an army of more than 30,000 men, of much better quality than the constitutional forces. If Zumalacárrégui had not been ordered to follow Don Carlos, who were to concentrate his forces and march on Madrid, he might well have put Don Carlos in possession of the capital. But the court was eager to obtain command of a seaport, and Zumalacárrégui was ordered to besiege Bilbao. He obeyed reluctantly, and on the 14th of June 1835 was wounded by a musket bullet in the call of the leg. The wound was trifling and would probably have been cured with ease if he had been allowed to employ an English doctor whom he trusted. But Don Carlos insisted on sending his own physicians, and in their hands the general died on the 24th of June 1835—not without suspicion of poison. Zumalacárrégui was a fine type of the old royalist and religious principles of his people. The ferocity with which he conducted the war was forced on him by the government generals, who refused quarter.

An engaging account of Zumalacárrégui will be found in The Most Splendid Events of a Twelve-month Campaign with Zumalacárrégui in Navarre and the Basque Provinces, by C. F. Henningsen (London, 1836). A sketch-book collected Vida politica y militar de Don Tomas Zumalacarregui, which gives the facts of his life with fair accuracy, is still very popular in Spain.

(D. H.)

ZUMPT, the name of two German classical scholars. KARL GOTTLIEB ZUMPT (1792-1854), who was educated at Heidelberg and Berlin, was from 1812 to 1827 a schoolmaster in Berlin, and in 1827 became professor of Latin literature at the university. His chief work was his Lateinische Grammatik (1818), which stood as a standard work until superseded by Madvig's in 1844.

He edited Quintilian's Institutio oratoria (1831), Cicero's Ver- rines and De officiis (1837), and Curtius. Otherwise he devoted himself mainly to Roman history, publishing Annales veterum regnum regorum de populorum (3rd ed. 1869), a work in chronology down to a.D. 476, and other antiquarian studies. His nephew, AUGUST WILHELM ZUMPT (1815-1877), studied in Berlin, and in 1851 became professor in the Friedrich Wilhelm Gymnasium. He is known chiefly in connexion with Latin epigraphy, his papers on which (collected in Commentationes epigraphicae, 2 vols., 1850-54) brought him into conflict with Mommsen in connexion with the preparation of the Corpus inscriptionum Latinorum, a scheme for which, drawn up by Mommsen, was approved in 1847. His works include Monumentum Anycrano (with Franck, 1847) and De monumento Anycrano supplelente (1869); Studia Romana (1859); Das Kriminalrecht der röm. Republik (1865-69); Der Kriminalprozess der röm. Republik (1871); editions of Namatianus (1840), Cicero's Pro Munera (1859) and De lege agraria (1861). These incorporated materials left by him in the 7th and 8th vols. of his Römische Geschichte (1840).

ZUNZ, LEOPOLD (1794-1880), Jewish scholar, was born at Detmold in 1794, and died in Berlin in 1866. He was the founder of what has been termed the "science of Judaism," the critical investigation of Jewish literature, hymnology and ritual. Throughout his life he continued to write articles in the current German periodicals. For a time he was editor of the first German periodical in which a modern Jewish name appeared, Moser and Heine in an association which the last named called "Young Palestine." The ideals of this Verein were not destined to bear religious fruit, but the "science of Judaism" survived. Zunz took no large share in Jewish reform, but never lost faith in the regenerating power of "science" as applied to the traditions and literary legacies of the ages. He had thoughts of becoming a preacher, but found the career uncongenial. He influenced Judaism from the study rather than from the pulpit. In 1832 appeared what E. H. Hirsch rightly termed his most "decisive work of the century." This was Zunz's Gottesdienstliche Vorträge der Juden, i.e. a history of the Synagogue. It lays down principles for the investigation of the Rabbinic exegesis (Midrash, q.v.) and of the prayer-book of the synagogue. This book raised Zunz to the supreme position among Jewish scholars. In 1840 he was appointed director of a Lehrerseminar, a post which relieved him from pecuniary troubles. In 1845 appeared his Zur Geschichte und Literatur, in which he threw light on the literary and social history of the Jews. Zunz was always interested in politics, and in 1848 and again in 1850 pubished meeting books. In 1856 he retired from the leadership of the Teachers' Seminaries, and was awarded a pension. He visited the British Museum in 1846, and this confirmed him in his plan for his third book, Synagogale Poesie des Mittelalters (1855). It was from this book that George Eliot translated the following opening of a chapter of Daniel Deronda: "If there are ranks in suffering, Israel takes precedence of all the nations" ... &c. After its publication Zunz again visited England, and in 1859 issued his Rituë. In this he gives a masterly survey of synagogal rites. His last great work was his Literaturgeschichte der synagogalen Poesie (1865). A supplement appeared in 1878. Besides these works, Zunz published a new translation of the Bible, and wrote many essays which were afterwards collected as Gesammelte Schriften. Throughout his early and married life he was the champion of Jewish rights, and he did not withdraw from public affairs until 1874, the year of the death of his wife Adelhein Beermann, whom he had married in 1822. See Emil G. Hirsch, in Jewish Encyclopedia, xii. 699-704 (I. A.)

ZURBARAN, FRANCISCO (1598-1664), Spanish painter, was born at Fuente de Cantos in Estremadura on the 7th of November 1598. His father was Luis Zurbaran, a country labourer, his mother Isabel Marquet. In childhood he set about imitating objects with charcoal; and his father sent him, still young, to the school of Juan de Roelas in Seville. Francisco soon became the best pupil in the studio of Roelas, surpassing the master himself; and before leaving him he had achieved a
solid reputation, full though Seville then was of able painters. He may have had here the opportunity of copying some of the paintings of Michelangelo da Caravaggio; at any rate he gained the name of "the Spanish Caravaggio," owing to the forcible realistic style in which he excelled. He constantly painted direct from nature, following but occasionally improving on his model; and he made great use of the lay-figure in the study of draperies, in which he was peculiarly proficient. He had a special gift for white draperies; and, as a consequence, Carthusian houses are abundant in his paintings. To these rigid methods Zurbaran is said to have adhered throughout his career, which was prosperous, wholly confined to Spain, and varied by few incidents beyond those of his daily labour. His subjects were mostly of a severe and ascetic kind—religious vigils, the flesh chastised into subjection to the spirit—the compositions seldom throned, and often reduced to a single figure. The style is more reserved and chastened than Caravaggio's, the tone of colour often bluish to excess. Exceptional effects are attained by the precise finish of foregrounds, largely massed out in light and shade. Zurbaran married in Seville Leonor de Jordera, by whom he had several children. At one time he was appointed painter to Philip IV.; and there is a story that on one occasion the sovereign laid his hand on the artist's shoulder, saying, "Painter to the king, king of painters." It was only late in life that Zurbaran made a prolonged stay in Madrid, Seville being the chief scene of his operations. He died, probably in 1662, in Madrid.

In 1627 he painted the great altarpiece of St Thomas Aquinas, now in the Seville museum; it was executed for the church of the college of that saint there. This is Zurbaran's largest composition, containing figures of Christ and the Madonna, various saints, Charles V. with knights, and Archbishop Deza (founder of the college). The monks and servants, all the principal personages, are beyond the size of life. It had been preceded by the numerous pictures of the screen of St Peter Nolasco in the cathedral. In the church of Guadalupe he painted various large pictures, eight of which relate to the history of the saint, and one, of St Paul, Seville, a famous figure of the Crucified Saviour, in grisaille, presenting an illusive effect of marble. In 1633 he finished the paintings of the high altar of the Carthusians in Jerez. In the palace of Buenretiro, Madrid, are four large canvases representing the Labours of Hercules, an unusual instance of non-Christian subjects from the hand of Zurbaran. A fine specimen is in the National Gallery, London, a whole-length, life-sized figure of a kneeling Franciscan holding a skull. It seems probable that another picture in the same gallery, the "Dead Roland," which used to be ascribed to Velazquez, is really by Zurbaran. His principal scholastic works are: the monographs: that of his master, Caravaggio's, were Bernabe de Ayala and the brothers Polanco.

ZÜRICH (Fr. Zürich; Ital. Zurigo), one of the cantons of north-eastern Switzerland, ranking officially as the first in the Confederation. Its total area is 665½ sq. m., of which 625½ sq. m. are reckoned as "productive" (forests covering 188-8 sq. m., and vineyards 169 sq. m., the most extensive Swiss wine district save in Vaud and Ticino). Of the rest, 21 sq. m. are occupied by the cantonal share of the lake of Zürich, while wholly within the canton are the smaller lakes of Greifensee (33 sq. m.) and Pfäffikon (13 sq. m.). The canton is of irregular shape, consisting simply of the acquisitions made in the course of years by the town. Of these the most important were the whole of the lower part of the lake (1362), Küsnacht (1384), Thalwil (1385), Errenbach (1400), Greifensee (1402), Horgen (1460), Grünening und Stäfa (1468), Bülach and Regensberg (1499), Wald (1425), Kyburg (1452), Winterthur (1467), Eglisau (1496), Knonau (1512), and Widenswil (1540)—Stettbach from 1543 to 1578, and finally in 1803 Rheinau, were added to the canton. In 1798 the town ruled nineteen "inner" bailiwicks and nine rural bailiwicks, besides the towns of Stein and of Winterthur. The canton at present extends from the left bank of the Rhine (including also Eglisau on the right bank) to the region west of the lake of Zürich. It is bounded on the E. and W. by low hills that divide it respectively from the valleys of the Thur, and from those of the Reuss and of the Aar. In itself the canton consists of four shallow river valleys, separated by low ranges, all running from S.E. to N.W. The most important of these is that of the Linth (q.v.), which forms the lake of Zürich. To the east are the valleys of the Glatt (forming lake Greifensee) and of the Töss (forming lake Pfäffikon), both sending their streams direct to the Rhine. The highest point in the canton is the Albishorn (3012 ft.) in the Albis range, which limits the Sihl valley to the west. All the valleys named are traversed by railway lines, while many lines branch off in every direction from the town of Zürich. The first railway line opened (1847) in Switzerland was that from Zürich to Baden in Aargau (14 m.). The town of Zürich mountain railways lead S.W. to near the summit of the Uetliberg (2864 ft.) and N.E. towards the Zürichberg (2884 ft.).

In 1900 the population was 431,036, of whom 413,141 were German-speaking, 11,192 Italian speaking, 3894 French-speaking, and 610 Romisch-speaking, while there were 345,446 Protestants, 60,752 Catholics (Roman of the "Old") and 2933 Jews. The capital of the canton is Zürich (q.v.), but Winterthur (q.v.) is the only other considerable town. Of the 7623 inhabitants, and Horgen (6883 inhabitants) being rather large manufacturing villages. The land in the canton is highly cultivated and much subdivided. But the canton is above all a great manufacturing district, especially of machinery and railway-rolling-stock, while both silk weaving and cotton weaving are widely spread. It is divided into 11 administrative districts, each containing between 186 and 18,000. In 1861 the cantonal constitution was revised in a democratic sense, and with the exception of a few changes made later, it is the existing constitution. There is an executive or Regierungsrat of seven persons, and a legislature or Kantonsrat (one member to every 1500 resident Swiss citizens or a fraction over 750), each holding office for three years and elected at the same time directly by the vote of the people. The referendum exists in both (as compulsory and optional: all laws and all money grants of a total sum over 250,000 francs, or an annual sum of 20,000 must be submitted to a popular vote, the people meeting for that purpose at least twice in each year, while the executive may submit to a popular vote any other matter, though it fall within its powers as defined by law. One-third of the members of the legislature or 5000 legally qualified citizens are chosen by the people from three classes, and one-half from whatever whatsoever (initiative). Both members of the Federal Ständerat and the 22 members of the Federal Nationalrat are elected simultaneously by a popular vote and hold office for three years. The canton is represented at the Federal Diet by seven members. The progressive income tax. In 1885 the penalty of death was abolished in the canton.

ZÜRICH (Fr. Zürich; Ital. Zurigo), the capital of the Swiss canton of the same name. It is the most populous, the most important, and on the whole the finest town in Switzerland, and till 1848 was practically the capital of the Swiss Confederation. It is built on both banks of the Limmat (higher up called the river of the Glimmer, and lower down the river of the Glitter) to the Sihl, that joins it just below the town. That portion of the town which lies on the right bank of the Limmat is called the "Grosse Stadt" and that on the left bank the "Kleine Stadt." Till 1803 the central portion of the town on either bank of the Limmat formed the "city" and ruled the outlying communes or townships that had sprung up around it. But at that time the eleven outer districts (including Aushersiel, the workmen's quarter on the left bank of the Sihl) or suburbs were incorporated with the town, which is now formed by a tongue of 344 sq. m. (or inhabitants, and an executive of 9 members, both chosen direct by a popular vote. Much land has been rescued from the lake, and is the site of fine quays, stately public buildings, and splendid private villas. The older quarters are still crowded. But the newer quarters stretch up the slope of the Zürichberg (above the right bank of the Limmat) while the fine Bahnhofstrasse (extending from the railway station to the lake) has the best shops and is in the neighbourhood of the more important public buildings.

Zürich has always been wealthy and prosperous. It has increased enormously as is shown by the following figures: its population in 1900 (including the eleven suburbs above named) was 150,705, while (without these) in 1888 it was 94,129; in 1880, 78,345; in 1870, 58,657; in 1860, 44,978; and in 1850 only 35,483. Of the population as a whole (in 1900, 421,040 inhabitants, in 1888 and 1835 in 1850 were not Swiss citizens, Germans numbering 31,125, Austrians 5350, Russians 4210, French 683, French 621, British subjects 157, and citizens of the United States 232. In
1058  ZURICH  

1800 there were in the town 140,803 German-speaking persons, 5100 Italian-speaking, 2836 French-speaking, and 415 Romansch-speaking. In 1888 the corresponding figures were 90,500, 1335, 1319 and 385. In the city proper, 1888, 102,708 inhabitants. The provincial 43,655 " Catholics " (Roman or " Old ") and 2712 Jews. In 1888 the religious figures were 70,970, 26,571 and 1221 respectively, while in 1913 59,953 were Roman Catholics, 24,022 Evangelical, 10,129 Catholic (Roman or " Old ") and 2,956 Jews. The extraterritorial national character of the town has thus become much more marked. This is partly due to the immigration of many foreign workmen, and partly to the arrival of Russian and Polish exiles. Both have added a turbid cosmopolitan element to the town, in which the Socialist party is strong, and is increasing in power and influence, even in matters concerned with civic government.

Of the old buildings the finest and most important is the Gross Münster (or Propstel), on the right bank of the Limmat. This was originally the church of the king's tenants, and in one of the chapels the bodies of Felix, Regula and Exuperantius, the patron saints of the city, were buried, the town treasury being formerly kept above this chapel. The present building was erected at two periods (c. 1090–1150 and c. 1225–1300), the high altar having been consecrated in 1278. The towers were raised above the roof at the end of the 15th century and took their present form in 1779. The chapter consisted of twenty-four secular canons; it was reorganized at the Reformation (1526), and suppressed in 1832. On the site of the canons' houses stands a girls' school (opened 1853), but the fine Romanesque cloisters (12th and 13th centuries) still remain. There is a curious figure of Charlemagne in a niche on one of the towers; to him is attributed the founding or reform of the chapter. On the left bank of the Limmat stands the other great church of Zürich, the Gross Münster (or Münster), erected by Louis the German. The high altar was consecrated in 1170, but the greater part of the buildings are of the 13th and 14th centuries. It was in this church that the relics of three of the three patron saints of the town were preserved till the Reformation, and it was here that the burgomaster Waldmann was buried in 1490. There were only twelve nuns of noble family, comparatively free from the severer monastic vows; the convent was suppressed in 1524. Of the other old churches may be mentioned St Peter's, the oldest parish church, though the present buildings date in part from the 13th century only (mainly the 16th century), and formerly the meeting-place of the citizens; the Dominican church (13th century), in the choir of which the cantonal library of 80,000 volumes has been stored since 1873; the church of the Austin friars (14th century), now used by the Old Catholics, and the Wasserkirche. The last-named church is on the site of a pagan holy place, where the patron saints of the city were worshiped; since 1631 it has housed the Town Library, the largest in Switzerland, which contains 170,000 printed volumes and 4000 MSS. (among these being letters of Zwingli, Bullinger and Jane Grey), as well as a splendid collection of objects from the lake dwellings of Switzerland. The building itself was erected from 1479 to 1484, and near it is a statue of Zwingli, erected in 1885. The existing town-hall dates from 1668, while the gild houses were mostly rebuilt in the 18th century. One of the most magnificent of the newer buildings is the Swiss National Museum, behind the railway station. This museum, which was opened in 1898, contains a wonderful collection of Swiss antiquities (especially medieval) and art treasures of all kinds, some of which are placed in rooms of the actual date, removed from various ancient buildings. There are some fine old fountains (the oldest dating back to 1568). There are several good bridges, Roman traces being seen in the case of the Nieder- brücke (now called the Rathausbrücke). The mound of the Lindenhof was formerly crowned by the king's house, which disappeared in the 13th century, and the hillock was planted with vines as early as 1422.

The town is noted for its numerous clubs and societies, and is the intellectual capital of German-speaking Switzerland. Cotton-spinning and the manufacture of machinery are two leading industries, but by far the most important is the silk-weaving industry. This flourishing in Zürich in the 12th and 13th centuries, but disappeared about 1426; it was revived by the Protestant exiles (such as the Muralti and Orelli families) from Locarno (1553) and by the Huguenot refugees from France (1682 and 1685). The value of the silk annually exported (mainly to France, the United States and England) is estimated at over three millions sterling. Zürich is the banking centre of Switzerland, and besides the excellent primary and secondary schools, there are the Cantonal School, including a gymnasium and a technical side (opened 1842), and a high school for girls (opened 1875). The Cantonal University and the Federal Polytechnic School are housed in the same building, but have no other connexion. The university was opened in 1833, no doubt as a successor to the ancient chapter school at the Gross Münster, said to date back to Charlemagne's time—hence its name, the Carolinum—reorganized at the Reformation, and suppressed in 1832. The Polytechnic School, opened in 1855, includes seven main sections (industrial chemistry, industrial mechanics, engineering, training of scientific and mathematical teachers, architecture, forestry and agriculture, and the military sciences), besides a general philosophical and political science department. The Polytechnic School has good collections of botanical specimens and of the local fauna. Near it is the Landesmuseum, opened in 1853.

There are also in Zürich many institutions for special branches of education—e.g. veterinary surgery, music, industrial art, silk-weaving, &c.

The earliest inhabitants of the future site of Zürich were the lake dwellers. The Celtic Helvetians had a settlement on the Lindenhof when they were succeeded by the Romans, who established a custom station here for goods going to and coming from Italy; during their rule Christianity was introduced early in the 3rd century by Felix and Regula, with whom Exuperantius was afterwards associated. The district was later occupied by the Alamanni, who were conquered by the Franks.

The name Zürich is possibly derived from the Celtic dur (water). It is first mentioned in 607 under the form "Turigus," then in 853 as "Turgis." The true Latinized form is "Urnica," which is generally preserved in modern times. The town is sometimes called "Urnica" in the Salic law, from the fact that a man of the name of Ulricus, conscripted by Charlemagne in 813, opened his ground from 1312 to 1478. It is not till the 9th century that we find the beginnings of the Teutonic town of Zürich, which arose from the union of four elements: (1) the royal house and castle on the Lindenhof, with the king's tenants around, (2) the Gross Münster, (3) the Frauen Münster, (4) the community of "free men" (of Alamannian origin) on the Zürichberg. Similarly we can distinguish four stages in the constitutional development of the town: (i.) the gradual replacing (c. 1250) of the power of the abbess by that (real, though not nominal) of the patricians, (ii.) the admittance of burghers (i.e. tradesmen) to a share with the patricians in the government of the town, (iii.) the granting of equal political rights (1311) to the country districts, hitherto ruled as subject lands by the burghers, and (iv.) the reception as burghers of the numerous immigrants who had settled in the town (town schools opened in 1860, full incorporation in 1893).

The Frankish kings had special rights over their tenants, were the protectors of the two churches, and had jurisdiction over the free community. In 870 the sovereign placed his powers over all four in the hands of a single official (the Reichsvogt), and the town was still further strengthened by the wall built in 1321, and the four settlements in the 15th century as a safeguard against Saracen marauders and feudal barons. The "Reichsvogt" passed to the counts of Lenzburg (1063–1173), and then to the dukes of Zähringen (extinct 1218). Meanwhile the abbess of the Benedictine Frau Münster had been acquiring extensive rights and privileges over all the inhabitants, though she never obtained the criminal jurisdiction. The town flourished greatly in the 12th and 13th centuries, the silk trade being introduced from Italy. In 1218 the "Reichsvogt" passed back into the hands of the king, who appointed one of the burghers as his deputy, the town was becoming a free imperial city under the nominal rule of a distant sovereign. The abbess in 1234 became a princess of the empire, but power rapidly passed from her to the council which she had originally named to look after police, &c., but which came to be elected by the burghers, though the abbess was still "the lady of Zürich." This council (all powerful since 1304) was made up of the representatives of certain knightly and rich mercantile families (the "patricians"), who excluded the craftsmen from all share in the government, though it was to these last that the town was largely indebted for its rising wealth and importance.

In October 1291 the town made an alliance with Uri and
Schwyz, and in 1302 failed in a desperate attempt to seize the Habsburg town of Winterthur. After that Zürich began to display strong Austrian leanings, which characterize much of its later history. In 1315 the men of Zürich fought against the Swiss Confederates at Morgarten. The year 1336 marks the admission of the craftsmen to a share in the town government, which was brought about by Rudolf Brün, a patrician. Under the new constitution (the main features of which lasted till 1798) the Little Council was made up of the burgomaster and thirteen members from the "Constatel" (which included the old patricians and the wealthiest burghers) and the thirteen masters of the craft gilds, each of the twenty-six holding office for six months. The Great Council of 200 (really 212) members consisted of the Little Council, plus 78 representatives each of the Constatel and of the gilds, besides 3 members named by the burgomaster. The office of burgomaster was created and given to Brün for life. Out of this change arose a quarell with one of the branches of the Habsburg family, in consequence of which Brün was induced to throw in the lot of Zürich with the Swiss Confederation (1st May 1331). The double position of Zürich as a free imperial city and a canton of the Empire. Early in 1336 the Council of the League was soon found to be embarrassing to both parties (see Switzerland). In 1373 and again in 1393 the powers of the Constatel were limited and the majority in the executive secured to the craftsmen, who could then aspire to the burgomastership. Meanwhile the town had been extending its rule far beyond its walls—a process which began in the 14th, and attained its height in the 15th century (1362-1467). This thirst for territorial aggrandizement brought about the first civil war in the Confederation (the "Old Zürich War," 1436-50), in which, at the fight of St. Jacob on the Sihl (1443), under the walls of Zürich, the men of Zürich were completely beaten and their burgomaster Stüssi slain. The purchase of the town of Winterthur from the Habsburgs (1467) marks the culmination of the territorial power of the city. It was to the men of Zürich and their leader Hans Waldmann that the victory of Morat (1476) was due in the Burgundian war; and Zürich took a leading part in the Italian campaign of 1512-15, the burgomaster Schmidt naming the new duke of Milan (1512). No doubt her trade connexions with Italy led her to pursue a southern policy, traces of which are seen as early as 1331 in an attack on the Val Leventina and in 1478, when Zürich men were in the van at the fight of Giornico, won by a handful of Confederates over 12,000 Milanese troops.

In 1400 the town obtained from the Emperor Wenceslaus the Reichsvogtei, which carried with it complete immunity from the empire and the right of criminal jurisdiction. As early as 1393 the chief power had practically fallen into the hands of the Great Council, and in 1408 this change was formally recognized. This transfer of all power to the gilds had been one of the aims of the burgomaster Hans Waldmann (1483-80), who wished to make Zürich a great commercial centre. He also introduced many financial and moral reforms, and subordinated the interests of the country districts to those of the town. He practically ruled the Confederation, and under him Zürich became the real capital of the League. But such great changes excited opposition, and he was overthrown and executed. His main ideas were embodied, however, in the constitution of 1408, by which the patricians became the first of the gilds, and which remained in force till 1708; some special rights were also given to the subjects in country districts. It was the prominent part taken by Zürich in adopting and propagating (against the strenuous opposition of the Constatel) the principles of the Reformation (the Frau Münster being suppressed in 1524) which finally secured for it the lead in the Confederation (see Switzerland and Zwingli).

The environs of Zürich are famous in military history on account of the two battles of 1799. In the first battle (4th June) the French under Masséna, on the defensive, were attacked by the Austrians under the Archduke Charles, Masséna retiring behind the Limmat before the engagement had reached a decisive stage. The second and far more important battle took place on the 25th and 26th of September. Masséna, having forced the passage of the Limmat, attacked and totally defeated the Russians and their Austrian allies under Korsakov's command. (See French Revolutionary Wars.)

In the 17th and 18th centuries a distinct tendency becomes observable in the town government to limit power to the actual holders. Thus the country districts were consulted for the last time in 1626 and 1640; and a similar breach of the charters of 1450 and 1531 (by which the country districts were entitled to the conclusion of important alliances, war, peace, and might be asked for as to other matters) occasioned disturbances in 1777. The council of 200 came to be largely chosen by a small committee of the members of the gilds actually sitting in the council—by the constitution of 1713 it consisted of 50 members of the Little Council (named for a fixed term by the Great Council), 18 members named by the Constatel, and 144 selected by the 12 gilds, these 162 (forming the majority) being co-opted for life by those members of the two councils who belonged to the gild to which the deceased member had belonged, and this effort was made to crush by means of heavy duties the flourishing silk trade in Winterthur. It was reckoned that about 1650 the number of privileged burghers was 9000, while their rule extended over 170,000 persons. The first symptoms of active discontent appeared later among the dwellers by the lake, who founded in 1704 a club at Stäfa and claimed the restoration of the liberties of 1489 and 1531, a movement which was put down by force of arms in 1705. The old system of government perished in Zürich, as elsewhere in Switzerland, in February 1798, and under the Helvetic constitution the country districts obtained political liberty. The cantonal constitution was rather complicated, and under it the patrician party obtained a small working majority. That constitution was meant to favour the town as against the country districts. But under the cantonal constitution of 1814 matters were worse still, for the town (10,000 inhab.) had 130 representatives in the Great Council, while the country districts (200,000 inhab.) had only 82. A great meeting at Uster on the 22nd of November 1830 demanded that two-thirds of the members in the Great Council should be chosen by the country districts; and in 1833 a new constitution was drawn up on these lines, the town getting 71 representatives as against 141 allotted to the country districts, though it was not till 1837-38 that the town finally lost the last relics of the privileges which it had so long enjoyed as compared with the country districts. From 1863 to 1814 Zürich was one of the six "directorial cantons," its chief magistrate becoming for a year the chief magistrate of the Confederation, while in 1851 it was one of the three cantons, the government of which acted for two years as the Federal government when the diet was not sitting. In 1833 Zürich tried hard to secure a revision of the Federal constitution and a strong central government. The town was the Federal capital for 1839-40, and consequently the victory of the Conservative party there in 1839 (due to indigation at the nomination by the Radical government to a theological chair in the university of D. F. Strauss, the author of the famous Life of Jesus) caused a great stir throughout Switzerland. But when in 1845 the Radicals regained power at Zürich, which was again the Federal capital for 1845-46, that town took the lead in opposing the Sonderbund cantons. It of course voted in favour of the Federal constitutions of 1848 and of 1874, while the cantonal constitution of 1860 was remarkably advanced for the time. The enormous immigration from the country districts into the town from the "thirties" onwards created an industrial class which, though "settled" in the town, did not possess the privileges of burghership, and consequently had no share in the municipal government. First of all in 1860 the town schools, hitherto open to "settlers" only on paying high fees, were made accessible to all, next in 1875 ten years' residence by acto facto conferred the right of burguership, while in 1883 the eleven outlying districts (largely peopled by working folk) were incorporated with the
ZÜRICH, LAKE OF—ZWEIBRÜCKEN

ZÜRICH, LAKE OF. A Swiss lake, extending S.E. of the town of Zürich. It is formed by the river Linth, which, rising in the glaciers of the Tödi range in Grarus, was diverted by the Escher canal (completed in 1811) into the Walensee, whence, by means of the Linth canal (completed in 1816), its waters are carried to the east end of the lake of Zürich. This river issues from the lake at its north-west end, passing through the town of Zürich, but is then called the Limmat. No streams of importance flow into the lake. Its area is about 34 sq. m., its extreme length 25 m., its greatest breadth 33 m., and its greatest depth 460 ft., while its surface is 1342 ft. above sea-level. It is included, or the greater portion, in the Canton of Zürich, but at its east end 23 sq. m. towards the southern shore are in that of Schwyz, and 4 sq. m. towards the northern shore in that of St. Gall. The great dam of masonry, carrying the railway line and carriage road from Rapperswil to Pfäffikon, which cuts off the extreme eastern part of the lake from the rest, is passed only by small boats; steamers (of which the first was placed on the lake in 1841) draw in the port of Zürich, the principal town. The middle of the lake is the principal place on it. On the west shore (which gradually becomes the south shore) are Thalwil, Horgen, Widenswil, Richterswil, Pfäffikon, and Lachen. On the opposite shore are Meilen (near which the first lake dwellings were discovered in 1853-54), Stäfa, and the quaint town of Rapperswil, the castle of which shelters a Polish museum, where is the heart of Kosciusko, and Schindelen is close to the east end of the lake, and a little beyond is the more important town of Uznach.

ZURITA Y CASTRO, JERÓNIMO (1512-1580), Spanish historian, was born at Saragosse, and studied at Alcalá de Henares under the celebrated Hellenist, Hernán Nuñez. Through the influence of his father, Miguel de Zurita, physician to Charles V., he entered the public service as magistrate at Barbastro, and in 1537 was appointed assistant-secretary of the Inquisition. In 1548 Zurita was nominated official chronicler of the kingdom of Aragon, and in 1560 Philip II. attached him as secretary to the council of the Inquisition, delegating to him the conduct of all matters sufficiently important to require the king's signature. Zurita resigned these posts on the 21st of January 1571, obtained a sinecure at Saragosse, and dedicated himself wholly to the composition of his Annales de la corona de Aragón, the first part of which had appeared in 1562; he lived to see the last volume printed at Saragosse on the 22nd of April 1586, and died on the 3rd of November following. Zurita's style is somewhat crabbed and dry, but his authority is unquestionable; he displayed a new conception of an historian's duties, and, not content with the ample materials stored in the archives of Aragon, continued his researches in the libraries of Rome, Naples and Sicily; he founded the school of historical scholarship in Spain.

ZUTPHEN, or ZUTPHEN, a town in the province of Gelderland, Holland, on the right bank of the Yssel at the influx of the Berkel, and a junction station 18 m. by rail N.N.E. of Arnhem. Pop. 19,000. It is a picturesque old town with several brick houses of the 16th and 17th centuries. The most important building is the Grote Kerk, of St. Walpurgis, which dates from the 12th century and contains monuments of the former counts of Zutphen, a 13th-century candelabrum, an elaborate copper font (1527), and a fine modern monument to the van Heeckeren family. The chapter-house contains a pre-Reformation library which includes some valuable MSS. and incunabula. There are some remains of the old town walls. The place has an active trade, especially in grain and in the timber floated down from the Black Forest by the Rhine and the Yssel; the industries include tanning, weaving, and oil and paper manufactures. Not far from Zutphen on the west at Monnikhoven once stood the Carthusian convent founded by Reinald III., duke of Gelderland, in 1342 and dissolved in 1572. About 3 m. to the north of Zutphen is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor friendless boys in 1851, and since that date largely extended.

In the middle ages Zutphen was the seat of a line of counts, which became extinct in the 12th century. Having been fortified the town stood several sieges, especially during the wars of freedom waged by the Dutch against the Spanish under its walls, Zutphen being the one in September 1586 when Sir Philip Sidney was mortally wounded. Taken by the Spaniards in 1587 Zutphen was recovered by Maurice, prince of Orange, in 1591, and except for two short periods, one in 1672 and the other during the French Revolutionary Wars, it has since then remained a part of the United Netherlands. Its fortifications were dismantled in 1874.

ZWEIBRÜCKEN, a town of Germany, in the Palatinate, on the Schwarzbach, and on the railway between Germersheim and Saarbrücken. Pop. (1905) 14,711. The town was the capital of the former duchy of Zweibrücken, and the Alexander-Kirche contains the tombs of the dukes. The ducal castle is now occupied by the chief court of the Palatinate. There is a large factory for the manufacture of machinery, chicory, cigar, malt, boots, furniture, and soap are the chief industries.
Zwickau—Zwingli

1061

Zweibrücken (“two bridges”) is the Latin Bipontium; it appears in early documents also as Geminus Pons, and was called by the French Deux-Ponts. The independent territory was at first a countship, the counts being descended from Henry I., youngest son of Simon I., count of Saarbrücken (d. 1780). This line became extinct on the death of Count Karl (1535), 1530 in 1535 had sold half his territory to the count palatine of the Rhine, and held the other half as his fiefedom. Louis (d. 1498), son of Stephen, count palatine of Zimmern-Veldenz, founded the line of the dukes of Zweibrücken, which became extinct in 1731, when the duchy passed to the Birkenfeld branch, whence it came under the sway of Bavaria in 1790. At the peace of Lunéville Zweibrücken was ceded to France; on its reunion with Germany in 1814 the greater part of the territory was given to Bavaria, the remainder to Oldenburg and Prussia. At the ducal printing office at Zweibrücken the fine editions of the classics known as the Bipontia Editiones was published (1799 sqq.). See Lehmann, Geschichte des Herzogtums Zweibrücken (Zwickau, 1867).

Zwickau, a town of Germany, in the kingdom of Saxony, situated in a pleasant valley at the foot of the Erzgebirge, on the left bank of the Zwickauer Mulde, 41 m. S. of Leipzig and 20 m. S.W. of Chemnitz on the main line of railway Dresden-Hof and at the junction of several other lines. Pop. (1834) 6,701; (1856) 35,005; (1860) 44,458; (1905) 65,502. Among the Zwickauer churches, the fine Gothic church of St. Anna (1311-15, and restored 1885-91), with a spire 25 ft. high and a bell weighing 5½ tons, is remarkable. The church contains an altar with wood-carving and eight pictures by Michael Wahlgemuth and a remarkable Pietà in carved and painted wood, probably by Veit Stoss. The late Gothic church of St. Katharina (restored 1893-94) has an altarpiece ascribed to Lucas Cranach the Elder, and is memorable for the pastorate (1520-22) of Thomas Münzer. Of the secular buildings the most noteworthy are the town-hall of 1581, with the municipal archives, including documents dating back to the 13th century and an autograph MS. of the works of Hans Sachs, and the late Gothic Gewandhaus (cloth merchants’ hall), built 1522-24 and now in part converted into a theatre. The manufactures of Zwickau include spinning and weaving, machinery, motor-cars, chemicals, porcelain, paper, glass, dyestuffs, wire goods, tinware, stocks, and currying. There are also steam saw-mills, diamond and glass polishing works, iron-foundries, and breweries. Though no longer relatively so important as when it lay on the chief trade route from Saxony to Bohemia and the Danube, Zwickau carries on considerable commerce in grain, linen, and manufactured goods, and is a centre of communication. In the 19th century Zwickau was a notable coal-mining centre, the Zwickauer Steinkohlenbaue (Dresden, 1883); Zwickau, however, is famous for its woolens, including cloth and sheeting, and for its tinware, known as Zwickauer Schloßtöpfen. Zwickau is a noted handloom town, and manufactures lace, flax, and linen. Zwickau is an important railway junction, and is the head-quarters of the Zwickauer Eisenbahn-Gesellschaft (1838). The Zwickau Railways include the line 174 km. to Freiberg, and the line 183 km. to Dresden. The railway from Zwickau to Dresden, the famous Zwickau Raadweg, was opened to traffic on the 14th of April 1845. He studied at the university of Gratz, where he became a professor in 1885, and died at Gratz on the 22nd of November 1906.

Südhorst’s principal writings are Dorfllein im 18. Jahrhundert (Vienna, 1866); Hans Ulrich von Zwingli, der Politiker der Republik Venedig während des dreißigjährigen Krieges (Stuttgart, 1882-85); Venedig als Weltmacht und Weltstadt (Bielefeld, 1899 and 1906); Kriegsbilder aus der Zeit der Landsknechtzeit (Stuttgart, 1883); Geschichte der öffentlichen Meinung in Deutschland im Zeitalter Ludwigs XIV. 1650-1700 (Stuttgart, 1888); Erzherzog Johann im Feldzuge von 1690 (Gratz, 1892); and Maria Theresa (Bielefeld, 1905). He edited the Bibliothek deutscher Geschichte, herausgegeben von I. Spruner, as well as numerous works on the early period of the German Empire. He completed A. Wolf’s Oesterreich unter Maria Theresia, Josef II. und Leopold II. (Berlin, 1882-84), and edited the Zeitschrift für allgemeine Geschichte (Stuttgart, 1884-88).

Zwingli, Huldreich (1484-1531), Swiss reformer, was born on the 1st of January 1484, at Wildhaus in the Tobingen valley, in the canton of St Gall, Switzerland. He came of a free peasant stock, his father being amtmann of the village; his mother, Margaret Meli, was the sister of the abbot of Fischingen in Thurgau. His uncle, Bartholomew Zwingli, afterwards dekan or superintendent of Wesen, had been elected parish priest of Wildhaus. As he was keen at books and fond of music he was destined for the Church, and when eight years old was sent to the gymnasium of Constance. Two years later he was sent to a school in Basel, where he remained three years, passing thence to the high school at Bern, where his master, Heinrich Wölflin, inspired him with an enthusiasm for the classics. After some two years there the boy took up his abode in the Dominican monastery. But his father had no thoughts of letting him become a monk, and in 1500 he was sent to the university of Vienna, where he remained for another two years and “included in his studies all that philosophy embraces. He then returned to Basel, where he graduated in the university and became a teacher of the classics in the school of St Martin’s church.

The circumstances and surroundings of Zwingli’s early life were thus dissimilar from those of his contemporary, Martin Luther. Zwingli, moreover, never knew anything of those spiritual experiences which drove Luther into a cloister and goaded him to a feverish “searching of the Scriptures” in the hope of finding spiritual peace. Zwingli was a humanist, a type abhorred of Luther; and he was far more ready for the polite Erasmian society of Basel than for a monastery. Luther never became a cantor, and Zwingli remained a teacher; he was well acquainted with the views of Erasmus and the learning of Dr Thomas Wyttenbach where the time was at hand when scholastic theology must give place to the purer and more rational theology of the early Fathers and to a fearless study of the New Testament. He heard from this same teacher bold criticisms of Romish teaching concerning the sacraments, monastic vows and papal indulgences, and unconsciously he was thus trained for the great remonstrance of his maturer life.

At the age of twenty-two Zwingli was ordained by the bishop of Vitznau (1500), preached his first sermon at Rapperswil, and said his first mass among his own people at Wildhaus. In the same year he was elected parish priest of Grals, in spite of the pope’s nomination of Heinrich Goldi, an influential pluralist of Zürich, whom Zwingli found it necessary to buy off at an expense of more than a hundred gulden. The Holy See, much dependent at that time on its Swiss mercenaries in the pursuit of its secular ends, expressed no resentment on this occasion. Zwingli indeed seemed still to be devoted to the pope, whom he styled “beatusissimus Christi vicarius,” and he publicly proclaimed the mercenary aid given by the Swiss to the papal cause as a much graver sin. See, however, the Pope’s claim to Zwingli’s obedience in the case of the Church of Cats. The Curia, following its accustomed policy, rewarded his zeal with a pension of 50 gulden.

The ten years which Zwingli spent at Grals laid the foundations of his work as a reformer. He there began the study of
Greek that he might "learn the teaching of Christ from the original sources." and gave some attention to Hebrew. He also read the older Church Fathers and soon won for himself fame as a student, whilst his skill in the classics led his friends to hail him as "the undoubted Cicero of our age." He had an unbounded admiration for Erasmus, with whom he entered into correspondence, and from whom he received a somewhat chilling patronage; whilst the brilliant humanist, Pico della Mirandola (1463-1494), taught him to criticize, in a rationalizing way, the medieval doctrines of Rome. His first publications, which appeared as rhymed allegories, were political rather than religious, being aimed at what he deemed the degrading Swiss practice of indulgences and the vices in the monasteries and cities of Switzerland. The attacks on these vices on this matter were so much intensified by his later experiences as army chaplain that in 1521 he prevailed upon the authorities of the canton of Zurich to renounce the practice altogether. Especially did he oppose alliances with France; but the French party in Glarus was strong, and it retaliated so fiercely that in 1516 Zwingli was glad to accept the post of people's priest at Einsiedeln. He always in later days dated his arrival at evangelical truth from the three years (1516-19) which he spent in this place. There he studied the New Testament editions of Erasmus and began to found his preaching on "the Gospel," which he declared to be simple and easy to understand. He held that the Bible was the sufficient revelation of the will of God, and he threw away the philosophy and theology of the later Roman Church, whereas he declared that the early Church Fathers were helpful, though still fallible, interpreters of the Word. In his definite recognition of the theological place of Scripture he showed, says Dr T. M. Lindsay (History of the Reformation), dearer insight than the Lutherans, and Zwingli rather than Luther was in this matter Calvin's guide, and the guide of the reformed churches of Switzerland, France, England, and the Netherlands. All these set forth in their symbolical books the supreme place of Scripture, accepting the position which Zwingli laid down in 1536 in The First Helvetic Confession, namely, that "Canonic Scripture, the Word of God, given by the Holy Spirit and set forth to the world by the Prophets and Apostles, the most perfect and ancient of all philosophies, alone contains perfectly all piety and the whole rule of life." 

Zwingli began to preach "the Gospel" in 1516, but a contemporary says that he did it so cunningly (listiglich) that none could take him in. He showed himself a man of learning by a new exposition on to "the old doctrines, however much they at times pained me, rather than on to the purer and clearer"; for he hoped that the reformation of the Church would proceed quietly and from within. The papal curia had no wish to bring things to a quarrel with him. The Swiss, who furnished them with troops, were to be treated with consideration; and the pope sought to silence the reformer by offers of promotion, which he refused. He held himself, as did the Swiss in general, very free of papal control. They had long been used, in their orderly democratic life, to manage their own ecclesiastical affairs. Church property paid its share of the communal taxes, and religious houses were subject to civil inspection. Zwingli looked rather to the City Fathers than to the pope, and as long as he had them with him he moved confidently and labour for reforms which were as much political and moral in character as religious. He had none of Luther's distrust of "the common man" and fear of popular government, and this fact won for his teaching the favour of the towns of South Germany not less than of Switzerland. 

Zwingli came to preach his Gospel without saying much about corruptions in the Roman Church, and it was his political denunciation of the fratricidal wars into which the pope, not less than others, was drawing his fellow-countrymen, that first led to rupture with the papal see. Three visits which he had made to Italy in his capacity of army chaplain had done much to open his eyes to the worldly character of the papal rule, and it was not long before he began to attack at Einsiedeln the superstitions which attended the great pilgrimages made to that place. Zwingli denounced the publication of plenary indulgence to all visitors to the shrine, and his sermons in the Swiss vernacular drew great crowds and attracted the attention of Rome. His quarrel was turned more immediately against the pope himself when in August 1518 the Franciscan monk Bernardin Samson, a pardon-seller like Johann Tetzel, made his appearance in Switzerland as the papally commissioned seller of indulgences. Zwingli prevailed on the council to forbid his entrance into Zurich; and even then the pope argued that, so long as the preacher was still receiving a papal pension, he could not be a formidable adversary, and he gave him a further sop in the form of an acolyte charge. 

Zwingli had never meant to remain at Einsiedeln long, and he now threw himself into a competition for the place of people's priest at the Great Minster of Zurich, and obtained it (1518) after some opposition. He stipulated that his liberty to preach the truth should be respected. In the beginning of 1519 he began a series of discourses on St Matthew's Gospel, the Acts of the Apostles, and the Pauline epistles; and with these it may be said that the Reformation was fairly begun in Zurich. He made a copy of St Paul's epistles and committed them to memory, and from this arsenal of Scripture he attacked the corruption and unrighteousness of the state no less than the superstition of the Church. His correspondence of this year shows him jealous of the growing influence of Luther. It was his claim that he had discovered the Gospel before ever Luther was heard of in Switzerland, and he was as anxious as Erasmus to make it clear that he was not Luther's disciple. Towards the end of September he fell a victim to the plague which was ravaging the land, and his illness sobered his spirit and brought into his message a deeper note than that merely moral and common-sense one with which, as a polite humanist, he had hitherto been content. He began to preach against fasting, saint worship and the celibacy of priests; and some of his hearers began to put his teachings into practice. The monasteries raised an outcry when people were found eating flesh in Lent, and the bishop of Constance accused them before the council of Zurich. Zwingli was heard in their defence and the accusation was abandoned. His first Reformation tract, April 1522, dealt with this subject: "Von Erkiessen und Fryheyt der Spysen." The matter of the celibacy of the clergy was more serious. Zwingli had joined in an address to the bishop of Constance calling on him no longer to protect the monasteries, and him himself as the bishop's own emissary and brother in Christ. He offered to defend the monasteries, and the bishop was pleased to accept the offer. He and his co-signatories declared that they had lived chastely, and opposed that priests could not be expected to do otherwise, seeing that God had not seen fit to give the gift of continence. Pope Adrian VI. interfered and asked the Zürichers to abandon Zwingli, but the reformer persuaded the council to allow a public disputation (1523), when he produced sixty-seven theses and vindicated his position so strongly that the council decided to uphold their preacher and to separate the canton from the bishopric of Constance. Thus legal sanction was given in Zurich to the Reformation. In 1522 Zwingli produced his first considerable writing, the Architeche, "the beginning and the end," in which he sought by a single blow to win his spiritual freedom from the control of the bishops, and in a sermon of that year he contended that only the Holy Spirit is requisite to make the Word intelligible, and that there is no need of Church council, or pope in the matter. The progress of the Reformation attracted the attention of all Switzerland, but there was a strong opposition to it, especially in the Five Forest Cantons: Lucerne, Zug, Schwyz, Uri, and Unterwalden; and the Zürichers felt it necessary to form a league in its defence. They were especially anxious to gain Bern, and Zwingli challenged the Romanists to a public disputation in that city. No less than 350 ecclesiastics came to Bern from the various cantons to hear the pleadings, which began on the 2nd of January 1523 and lasted nineteen days. Zwingli 1 Cf. P. Schaff, Creeds of the Evangelical Protestant Churches, p. 197.
and his companions undertook to defend the following propositions:

1. That the Holy Christian Church, of which Christ is the only Head, is born of the Word of God, abides therein, and does not昕 to the voice of a stranger; (2) that this Church imposes no laws on the conscience of private men; (3) that the same laws as those of the Church are binding only in so far as they agree with the Word; (4) that Christ alone is our righteousness and our salvation, and that to trust to any other means of salvation is to deny Him; (5) that it cannot be proved from the Holy Scripture that the body and blood of Christ are corporeally present in the bread and in the wine of the Lord’s Supper; (6) that the mass, in which Christ is offered to God the Father Christ, was the living and of the dead, is contrary to Scripture and a gross affront to the sacrifice and death of the Saviour; (7) that we should not pray to dead mediators and intercessors, but to Jesus Christ alone; (8) that there is no profit in images and pictures and to adore them is also contrary to Scripture, and that images and pictures ought to be destroyed where there is danger of giving them adora-

(9) that marriage is lawful to all, to the clergy as well as to the laity; (10) that shameful living is more disgraceful among the clergy than among the laity.

The result of the discussion was that Bern was won over to the side of the reformer, who apprehended the whole struggle of Protestantism as turning directly on the political decisions of the various units of the Confederation. He had enunciated in his theses the far-reaching new principle that the congregation, and not the hierarchy, was the representative of the Church; and he sought henceforward to reorganize the Swiss constitution on the principles of representative democracy so as to reduce the wholly disproportionate voting power which, till then, the Federal States had enjoyed. He declared that the administration of the Church belongs, like all administration, to the state authorities, and that if these go wrong it then lies with Christian people to depose them.

On the 2nd of April 1524 the marriage of Zwingli with Anna Reinhard was publicly celebrated in the cathedral, though for some two years already he had had her to wife. Many of his colleagues followed his example and openly made profession of marriage. In the August of that year Zwingli printed a pamphlet in which he set forth his views of the Lord’s Supper. They proved the occasion of a conflict with Luther which was never settled, but in the meantime more attention was attracted by Zwingli’s denunciation of the worship of images and of the Roman doctrine of the mass. These points were discussed at a fresh congress where about 900 persons were present, and where Vadian (Joachim von Watt, the reformer of St Gall) presided. It was decided that images are forbidden by Scripture and that the mass is not a sacrifice. Shortly afterwards the images were removed from the churches, and many ceremonies and festivals were abolished. When a solemn embassy of rebuke was sent to Zürich from a diet held at Lucerne, on the 26th of January 1524, the city replied that in matters relating to the Word of God and the salvation of souls she would brook no interference. When a new embassy threatened Zürich with exclusion from the union she began to make preparations for war.

It was at this moment that the controversy between Luther and Zwingli took on a deeper significance. In March 1525 the latter brought out his long Commentary on the True and False Religion, in which he goes over all the topics of practical theology. Like others of the Reformers he had been led independently to preach justification by faith and to declare that Jesus Christ was the only mediator between man and God; but his construction rested upon what he regarded as biblical conceptions of the nature of God and man rather than upon such personal experiences as those which Luther had made basical. In this Commentary there appear the mature views of Zwingli on the subject of the Elements of the Lord’s Supper. He was as clear as Luther in repudiating the medieval doctrine of transubstantiation, but he declined to accept Luther’s teaching that Christ’s words of institution required the belief that the real flesh and blood of Christ co-exist in and with the natural elements. He declared that Luther was in a fog, and that Christ had warned His disciples against all such notions, and had proclaimed that by faith alone could His presence be received in a feast which He designed to be commemorative and symbolical. Efforts to reach agreement failed. The landgrave of Hesse brought the two Reformers together in vain at Marburg in October 1526, and the whole Protestant movement broke into two camps, with the result that the attempt made at Schmalkalden in 1530 to form a comprehensive league of defence against all foes of the Reformation was a failure.

But the close of Zwingli’s life was brought about by trouble nearer home. The long-felt strain between opposing cantons led at last to civil war. In February 1531 Zwingli himself urged the Evangelical Swiss to attack the Five Cantons, and on the roth of October there was fought at Kappel a battle, disastrous to the Protestant cause and fatal to its leader. Zwingli, who as chaplain was carrying the banner, was struck to the ground, and was later despatched in cold blood. His corpse, after suffering every indignity, was quartered by the public hangman, and burnt with dung by the Romish soldiers. A great border, roughly squared, standing a little way off the road, marks the place where Zwingli fell. It is inscribed, "They may kill the body but not the soul!" so spoke on this spot Ulrich Zwingli, who for truth and the freedom of the Christian Church died a hero’s death. Oct. 11, 1531."

Zwingli’s theological views are expressed succinctly in the sixty-seven theses published at Zürich in 1523, and at greater length in the First Helvetic Confession, compiled in 1536 by a number of his assistants. They cover all the points of difference between the Reformed and Catholic Churches. Zwingli aimed at a reformation of government and discipline as well as of theology. Zwingli never faltered in his trust in the Word; he was convinced that no man, however learned, could be called spiritual simply because they were selected to perform certain functions. He thoroughly believed also that it was the duty of all in authority to rule in Christ’s name and to obey His laws. He was led from these ideas to think that there should be no government in the Church separate from the civil government which ruled the commonwealth. All rules and regulations about the public worship, doctrines and Discipline of the Church were made in Zwingli’s time, and with his consent, by the council of Zürich, which was the supreme civil authority in the state. This was the ground of his quarrel with the Swiss Anabaptists, for the Anabaptists did not admit the modern thought of a free Church in a free state. Like all the Reformers, he was strictly Augustinian in theology, but he dwelt chiefly on the positive side of predestination—the election to salvation. He insisted on the salvific nature of the elect and of the just. His most distinctive doctrine is perhaps his theory of the sacrament, which involved him and his followers in a long and, on Luther’s part, an acrimonious dispute. His most striking achievement was that the sacrament of the Lord’s Supper was not the repetition of the sacrifice of Christ, but the faithful remembrance that that sacrifice had been made once for all; and his deeper idea of faith, which included in the act of faith a real union and communion of the faithful soul with Christ, really preserved what was also most valuable in the distinctively Lutheran doctrine. His peculiar theological opinions were at the same time for the present over the wordviews of Calvin. The publication of the Zürich Consensus (Consensus Tigurinum) in 1549 marks the adherence of the Swiss to Calvinist theology.

Zwingli’s most important writings are: Die religiösen Freuden und Freiheit des Christlichen Glaubens (1508); De Canone Missae Episcopis (September 1522); Commentarius de vera et falsa religione (1525); Von dem Wiederauf und vom Kindermothen (1525); Ein kurze Unterrichtung des Nächsten (1526); De Provinciae Drei (1530); and Christianae Fidei Expostul (1531). For a full bibliography see G. Finsler, Zwingli-Bibliographie (Zürich, 1897).

Works.—Collected editions, 4 vols. (Zürich, 1548; 1581); by M. Fries, 2 vols. and J. Brugger, 2 vols. (1842-44, with supplementum fasciculus, 1861); by E. Egli and G. Finsler in "Corpus Reformatorum" (Berlin, 1905 seqq.).

ZWOLLE—ZYMOTIC DISEASES

published twice a year since 1897 at Zürich. S. M. Jackson's book gives a chapter on Zwingli's Theology by Prof. F. H. Foster, and full details of further information on the subject, together with a list of modern English translations of Zwingli's works.

(E. Ar. *)

ZWOLLE, the capital of the province of Overysel, Holland, on the Zwarte Water, and a junction station 24½ m. N.E. of Harderwyk. Pop. (1905) 23,773. It is the centre of the whole northern and eastern canal systems, and by means of the short canal, the Willemsvaart, which joins the Zwarte Water and the Yssel, has regular steamboat communication with Kampen and Amsterdam. The Grote Kerk, of St Michael (first half of the 15th century) occupies the site of an earlier church of which an interesting 11th-century bas-relief remains. The church contains a richly carved pulpit, the work of Adam Straes van Weilborch about 1620, and there is besides some good carving and a fine organ (1721). The Roman Catholic church, also dedicated to St Michael, dates from the end of the 14th century. The modernized town hall was originally built in 1448. Mention should also be made of the Sassen Poort, one of the old city gates; a gild-house (1571); the provincial government offices, containing the archives; and a museum of antiquities and natural history. Three miles from Zwolle, on a slight eminence called the Agnietenberg, or hill of St Agnes, once stood the Augustinian convent in which Thomas à Kempis spent the greatest part of his life and died in 1471. Zwolle has a considerable trade by river, a large fish market, and the most important cattle market in Holland after Rotterdam. The more important industries comprise cotton manufactures, iron works, boat-building, dyeing and bleaching, tanning, rope-making and salt-making.

ZYMOTIC DISEASES (Gr. Zymon, ferment), a term in medicine, formerly applied to the class of acute infectious maladies. As originally employed by Dr W. Farr, of the British Registrar-General's department, the term included the diseases which were "epidemic, endemic and contagious," and were regarded as owing their origin to the presence of a morbid principle in the system, acting in a manner analogous to, although not identical with, the process of fermentation. A large number of diseases were accordingly included under this designation. The term, however, came to be restricted in medical nomenclature to the chief fevers and contagious diseases (e.g. typhus and typhoid fevers, smallpox, scarlet fever, measles, erysipelas, cholera, whooping-cough, diphtheria, &c.). The science of bacteriology has displaced the old fermentation theory, and the term has practically dropped out of use.
