was one of the Children of the Chapel Royal from 1819, held various unimportant posts as organist from the age of fifteen, and in 1832 was appointed to Hereford Cathedral. His career as a composer began with his splendid anthem, "The Wilderness," which was probably written for the opening of the Hereford organ in that year. In 1834 it fell to him to conduct the Festival of the Three Choirs, and in the following year he resigned Hereford for Exeter Cathedral; and during the next six years his name became gradually more and more widely known. In 1842 Dr Hook, afterwards dean of Chichester, offered him a large salary to become organist of Leeds parish church, and at Leeds much of his finest work as a composer was done. In 1849 he quitted this post for Winchester, where he again secured educational advantages for his sons. He was at Winchester until 1865, when he offered himself as a candidate for Gloucester Cathedral, the last of his many posts. He again conducted the Three Choirs Festivals of 1865, 1868, 1871 and 1874. A civil list pension of £10 a year was conferred on him in 1873; he died at Gloucester on the 19th of April 1876, and was buried at Exeter.

Like his father he was a very eccentric man, but his compositions show powers that are found in very few Englishmen of his date. If the form of his masses is small, that of his anthems has been much larger. The work, however, though by far the best that has been composed in association with the Wesleyan Church, must be remembered that his anthems, in which is contained his best work, are far more important and more extensive than most compositions of the kind which have come to the Wesleyan Church. They become sung, but even the selections from them make up anthems of ordinary length. They are masterly in design, fine in inspiration and expression, and noble in character. His "Blessed be the God and Father of our Lord Jesus Christ," "O Father's name," "Ascribe unto the Lord," "O Lord, Thou art my God," and many others, are masterpieces in their way, and in all of these, as in the service in E, published with a rather trenchant preface in 1845, there is a happy combination of the modern resources of harmony with the enriched cathedral style, a combination which naturally alarmed the orthodox party of his time.

WESLEYAN METHODIST CHURCH, one of the chief branches of Methodism (q.v.). On the day of John Wesley's death the preachers in London sent a brief note to those stationed in the country: "Dear Brother, The melancholy period we have so long dreaded is now arrived. Our aged and honoured Father, Mr Wesley, is no more! He was taken to Paradise this morning, in a glorious manner, after a sickness of five days. We have no time to say more at present relative to his Demise. Only what respects out future Oconomy. This injunction he laid upon us, and all our Brethren on his death-bed, That we each continue in our respective Station till the time appointed for the next Conference at Manchester. We have, therefore, no doubt but you will, with us, readily comply with his Dying Request. The more so, as this is consonant with the determination of the Conference held at Bristol when he was supposed to be near death there, and confirmed in succeeding Conferences."

In 1790 there were 294 preachers and 71,658 members in Great Britain, 19 missionaries and 5300 members on the mission stations; 198 preachers and 43,265 members in the United States. The 6th of April was kept as a day of fasting and prayer, and the 1st of July was thus set apart in order to seek divine guidance for the approaching conference. The crisis was serious. The large proportion of Wesley's members had been gathered by the labours of himself and his helpers. They had been taught to observe the sacraments and naturally desired that provision should be made for their administration in their own chapels. Some felt that they could not go to the Lord's Table where the clergyman was a worldly man; others went, but with much fear and doubt. The Church party was influential and resolute to maintain close relations with the Church of England. Their object was to prevent Methodism becoming independent. There was also a small but determined party that leaned to dissent. The struggle between these conflicting tendencies soon began, with the determination to see that the choice of president and other matters that must come before the conference. The first signature to this circular was that of William Thompson who was afterwards elected as the first president. On the 4th of May eighteen laymen met at Hull and expressed their conviction that the usefulness of Methodism would be promoted by its continued connection with the Church of England. They would not consent to the administration of the sacraments by the preachers in Hull, nor to Methodist preaching at the time when others were present in church. A trenchant reply to this circular was prepared by Alexander Kilham (q.v.), one of the younger Methodist preachers.

The conference met in Manchester on the 26th of July 1791. A letter from Wesley (dated Chester, April 7, 1785) was read, beseeching the members of the Legal Conference not to use their powers for selfish ends but to be absolutely impartial in stationing the preachers, selecting boys for education at Kingswood School, and disposing of connexional funds. The conference at once resolved that all privileges conferred by Wesley's Poll Deed should be accorded to any preacher in full connection. To supply the lack of Wesley's supervision the circuits were now grouped together in districts. At first the preachers of the district elected their own chairman, but they were afterwards appointed by the conference. Regulations as to its business were issued in 1812. As to the sacraments and the relations of Methodism to the Church of England the decision was: "We engage to follow strictly the plan which Mr Wesley left us." This was ambiguous and was interpreted variously. Some held that it forbade the administration of the sacraments except by or under the auspices of the Church of England; others that it left Methodism free to follow the leadings of Providence as Wesley had always done. During the year the difficulties of the situation became more apparent. Wesley had given the sacrament to the societies when he visited them and this privilege was greatly missed. The conference of 1792 was so much perplexed that it resorted to the casting of lots. The decision was thus reached that the sacraments should not be administered that year. This was really shelving the question, but it gave time for opinion to ripen, and in 1793 it was resolved by a large majority that: "The societies should have the privilege of the Lord's Supper, in such a way that it cannot be conducted by the preachers unless a majority of the trustees, stewards and leaders of any chapel approved, and assured the conference that no separation was likely to ensue. The consent of conference had to be given before any change was made."

In 1796, Alexander Kilham, who refused to abstain from agitation for further reform, and accused his brethren of priestcraft, was expelled from their ranks and the New Connexion was formed with 5000 members (see METHODIST NEW CONNEXION). The conference of 1797 set itself to remove any ground for distrust among the societies and to enlist their hearty support in all branches of the work. Annual accounts were to be published of various funds. The Circuit Quarterly Meeting had to approve the arrangements for the support of the preachers. The preachers had long been accustomed to consult the leader's meetings of their societies, but it was now clearly decided that stewards and leaders should be appointed in connexion with the leaders' meeting, and certain rights were granted to that meeting as to the admission and expulsion of members. Local preachers had to be accepted by the local preachers' meeting, and the powers of trustees of chapels were considerably extended. The constitution of Methodism that practically took the shape which it retained till the admission of lay representatives to conference in 1878. No period in the history of Methodism was more critical than this, and in none was the prudence and good sense of its leaders more conspicuous. Advance was quietly made along the lines now laid down. The preachers had agreed in 1793 that all distinction between those
WESLEYAN METHODIST CHURCH

whom Wesley had ordained and their brethren should cease. In the minutes of conference for 1818 "Rev." appears before the names of preachers who were members of the Missionary Committee. Jabez Bunting (q.s.), who had become the acknowledged leader of the conference, wished to have its young ministers set apart by the imposition of hands, but this scriptural custom was not introduced till 1836.

Meanwhile, Methodism was growing into a great missionary church. Its work in the West Indies was firmly established in Wesley's lifetime. In 1786 eleven hundred negroes were missioned in the islands. As Wesley had superintended these missions and providing funds for their support rested on Dr Coke, who took his place as the missionary bishop of Methodism. In 1813 he prevailed on the conference to sanction a missionary to Ceylon. He sailed with six missionaries on the 30th of December, but died in the following May in the Indian Ocean. To meet these new responsibilities a branch Missionary Society had been formed in Leeds in October 1813, and others soon sprang up in various parts of the country. The Centenary of the Missionary Society falls in 1913, but Missionary Work really date from 1786 when Dr Coke landed at Antigua. The Methodists, who gradually extended their missions were begun in Madras, at the Cape of Good Hope, in Australia, and on the west coast of Africa. Two missionaries were sent to the Friendly Islands in 1826, and in 1832 a mission was undertaken among the cannibals of Fiji, which spread and deepened till the whole group of islands was transformed. The work in China began in 1851; the Burma mission was established in 1857. The rapid progress of the Transvaal and Swaziland missions has been almost embarrassing. The Missionary Jubilee in 1863-1865 yielded £579,000 for the work abroad. As the growth of these missions permitted conferences have been formed in various countries. Upper Canada had its conference in 1834, France in 1852, Australia in 1855, South Africa in 1882. The missionary revival which marked the Nottingham Conference of 1900 quickened the interest at home and abroad and the Foreign Field (monthly) is prominent among missionary periodicals. The Women's Auxiliary, formed in 1828, kept its jubilee in 1908. It supports schools and medical missions, homes and orphanages. In 1828 the erection of an organ in Brunswick Chapel, Leeds, led to a violent agitation and a small body of Wesleyan Methodists formed a separate district, the dis- able division was led by Dr Warren, a preacher of ability and influence, who was disappointed because no place was found for him in the newly-formed Theological Institution. He tried to awaken general opposition to the Institution scheme, and being suspended from his office as superintendent by a special district meeting, appealed to the law courts, which sustained the action of the district meeting. He was expelled from the conference and joined the Wesleyan Methodist Association in 1836, but shortly afterwards became a clergyman in Manchester. In his first conference in 1744 Wesley asked, "Can we have a seminary for labourers?" The answer was: "If God spare us to another Conference." Next year the subject was broached with the reply: "Not till God give us a proper tutor." The idea was not realized in his lifetime, but Wesley did everything in his power to train his preachers. He gathered them together and read with them as he had done with his pupils at Oxford; he urged them to spend at least five hours a day in reading the best books. He made this challenge, "I will give each of you, as fast as you will read them, books to the value of £5."

In 1844 Huntingdon Academy was taken as a training place for ministers; and in 1839 the students moved to Abney House, Stoke Newington. Didsbury College was opened in 1843, Richmond in 1843. Headingley was added in 1868, Handsworth in 1881.

The Centenary of Methodism was celebrated in 1839 and £227,939 was raised as a thank-offering: £71,609 was devoted to the colleges at Huntingdon and Didsbury; £70,000 was given to the missionary society, which spent £30,000 on a new orphanage and小学 house in Bishopsgate Within; £38,000 was set apart for the removal of chapel debts, &.c.

Methodism was now recognized as one of the great moral and spiritual forces of the world. Its progress was rapid, but in 1849 there came a disastrous check. There was much jealousy of Dr Bunting, the master mind of Methodism, to whose foresight and wisdom large part of its success was due. Fly-sheets were issued attacking him and other eminent ministers. James Everett, Samuel Dunn and William Griffith were expelled from the ministry, and an attempt was made to dismiss the other 7000 members. Those who now led the Connexion joined the reformers of 1838 and 1836 and formed the Methodist Free Churches. In 1852 the Wesleyan Conference, held by the Establishment, was dissolved, and the June Quarterly Meeting obtained the right to approve conference with memorials. Various other provisions were made which increased confidence. It was not till 1856 that the Connexion began to recover ground from the Free Churches.

Methodism began its work for popular education in a very modest way. In 1837 it had nine infant schools and twenty-two schools for children. A grant of £5000 was made from the Centenary Fund for the provision of Wesleyan Sunday schools in the year 1843 directed that greater attention must be given to this department, and a committee met in the following October which raised over 700 subscriptions for the purpose. The next seven years, and an Education Fund raised of £5000 a year. In 1849 the Normal Training College for the education of day-school teachers was opened at Westminster, and in 1872 a second college was opened in Battersea for school-mistresses. Westminster provides for 120 and Southlands for 110 students. They supply teachers not only for Wesleyan, but for council schools all over the country, and have done so for over 80 years. Besides its day-schools, Methodism possesses the Leeds School, Cambridge, Mount at Colwyn Bay and prosperous boarding-schools for boys and girls in many parts of the country.

Methodism has done much work in the army. Dr William Harris Rule (1802-1890), who was appointed chaplain at Gibraltar in 1832, won for it fuller recognition from the authorities. Charles H. Kelly, his colleague at Aldershot, and R. W. Allen had some similar success at Rye in the same year. Miniatures for the army and the navy were developed. Capitation grants have made it possible to organize the work at every station at home and abroad. The regimental chaplains are now paid for by the men. The service done by Methodist chaplains in war time, and especially in the Boer War, won the warmest recognition from the authorities.

Laymen were introduced into the Wesleyan conference. They had been members of the committee appointed in 1803 to "guard our privileges in these perilous times," and had gradually taken their place on the missionary and other committees. Circuit and local meetings and committees selected the laymen. Each year their right to attend was established. The Financial District Meeting of which they were members was created in 1819 and the financial business of each district soon came under its control. Out of the Annual Home Missionary gathering sprang a system of committees of review which, in 1852, James H. Rigg suggested might be enlarged and combined into a kind of diet composed of the representatives of the larger departments. The usefulness of such a body was now felt, and committees were appointed to 300 ministers and 300 laymen. In 1892 the district meeting became known as the District Synod, and in 1893 the circuits began to choose representatives to the Synod in addition to the circuit stewards. The great advance in organization made with such peace and goodwill was commemorated in 1878 by the Thanksgiving Fund which provided £297,500. Dr Rigg, the president of that year, put all his strength into the movement, and every department of Methodist work at home and abroad shared in the benefits of the fund.

The Forward Movement in Methodism dates from that period. A bolder policy won favour. Methodism realized its strength and resources. In 1878 the Rev. Dr Price, of St John's, Manchester and the Rev. Peter Thompson was sent to work in the East End. Next year the Revs. Hugh Price Hughes and Mark Guy Pearse began the West London Mission. Every succeeding year has put on the Missionary Work new developments. Mission stations have been built in the principal towns of England, Scotland and Ireland. Great congregations have been gathered, and the work done for uplifting the fallen and for the spread of the gospel in all parts of the large towns. Chapels which had been closed were reopened; an entrance was found into many new villages. Weak circuits were grouped together and gained in number and power. The Methodists of that of the National Children's Home and Orphanage founded by Dr Bowman Stephenson in 1869. Its headquarters are in Bethnal Green, but it has branches in various parts of the country and an emigration depot in Canada. It cares not only for wails and strays, but for cripples and delicate children. Orphans of respectable parents have a home at Birmingham,
the reformatory school has done splendid service for lads who had committed a first offence. Dr A. E. Gregory, who in 1900 succeeded Dr Stephenson, has seen remarkable progress in all departments of the great institution under his care. Sister J. Telford, the matron, when a training home at Hiley, founded by Dr Stephenson in 1902, has also done much to help in these modern developments of Methodism.

The Chapel Committee, which has its headquarters in Manchester, has been able to do two trusts to property valued at about twenty-five millions. The number of Methodist churches in 1818 was 2000; in 1839, 3500; in 1910, 8606. The sitting increased from a million in 1851 to about 2,375,000 in 1910. The Catholic collection in that period was more than fifteen millions. Debts amounting to £3,266,013 have been paid off since 1854. More than half a million has been advanced in loans and of this nothing has been paid off since 1854. The interest paid on these loans was about £352,144. Of this £352,144 was contributed. London Methodism owes more than can be told to the Metropolitan Chapel Building Fund which was founded in 1861. The names of the Rev. William H. and Sir Francis Lycey, Sir W. M'Arthur, will always be associated with this fund which has promoted the erection of some hundred new chapels. The Extension Fund, established in 1874, largely by the help of Sir Francis Lycey and Mr M'Newburn, has done similar work for country towns and villages. About two thousand chapels have been assisted with grants and loans. Similar work has been done in Scotland by a fund established in 1878. North and South Wales have also had a similar fund. The Methodists of Wales have been generous. A secretary and committee were appointed in 1910 to carry out various developments of work in London. The work of the Metropolitaq Chapel Building Fund and the London Mission is taken over by this new committee.

The Wesleyan Sunday schools which began to spring up all over England in the last years of his life. The first rules for the management of Methodist Sunday schools were issued by the Conference in 1827. In 1837 there were 33,996 schools, ten thousand teachers, and 1,414,439 scholars. A quarter of the preaching places, however, had no schools. The Education Committee was formed in 1838 to take oversight of the work in the Sunday schools. The Wesleyan (Sundav) School Fund, founded in 1873, was formed into a department in 1907 and is doing much to grow and develop the work. The Temperance Committee was formed in 1875; a temperance secretary was set apart in 1907, and the Sunday schools are doing quite well in Westminster. The Wesley Guild Movement, established in 1901, has its headquarters in Leeds and is doing a great work for the young people of Methodism.

The tragic death of his life was kept in 1891. Memorable services were held in City Road Church, which was restored and rendered more worthy of its historic position. Wesley's statue was placed in the forecourt. In 1898 the rooms in Wesley's hougar where he studied and where he died, were set apart as a Methodist Museum. The first Methodist Oecumenical Conference was held in London in 1881, the second in Washington in 1891, the third in London in 1901, the fourth in Cincinnati in 1897, and a fifth in New York in 1910. The Conference was held in August of that year. It was the Rev. Dr. George Smith, who was the last of the eleven secretaries of Wesley's Deed Poll, but some more satisfactory method of dealing with the subject is under consideration.

The great event of recent Methodist history was the Twentieth Congress of Methodists, which were held by Sir Robert W. Perks in 1898. To his unwearying zeal and business ability the triumph secured was chiefly due. The Rev. Albert Clayton, the secretary of the fund, lavished his strength on his vast task and the total income exceeded £1,073,782. The grants were: General Chapel Committee, £290,617; Missionary Society, £102,666; Education Committee, £193,705; Home Missions, £69,872; Children's Home, £48,436. The Royal Buckingham Palace was given to the Institute, and a central and a district church house as the headquarters of Methodism erected. For this object £342,206 was set apart.

WESSEL, JOHAN 1 (c. 1420-1489), Dutch theologian, was born at Groningen. He was educated at the famous school at Deventer, which was under the supervision of the Brothers of Common Life, and in close connexion with the convent of Mount St Agnes at Zwolle, where Thomas à Kempis was then living. At Deventer, where the best traditions of the fourteenth-century, mysticism were still cultivated, Wessel imbued that earnest devotional mysticism which was the basis of his theology and which drew him irresistibly, after a busy life, to spend his last days among the Friends of God. In 1474, Wessel went to the Dominican school at Cologne to be taught the Thomist theology, and came in contact with humanism. He learnt Greek from monks who had been driven out of Greece, and Hebrew from some Jews. The Thomist theology sent him to study Augustine, and his Greek reading led him to Plato, sources which largely enriched his own theological system. Interest in the disputes between the realists and the nominalists in Paris induced him to go to that city, where he remained for sixteen years as scholar and teacher. There he eventually took the nominalist side, prompted as much by his mystical anti-ecclesiastical tendencies as by any metaphysical insight. His sympathies were then the anti-papal party. A desire to know more about humanism sent him to Rome, where in 1470 he was the intimate friend of Italian scholars and under the protection of Cardinals Bessarion, and Francis Della Rovere (general of the Franciscan order and afterwards Pope Sixtus IV.). It is said that Sixtus would have gladly made Wessel a bishop, but that he had no desire for any ecclesiastical preferment. From Rome he returned to Paris, and speedily became a famous teacher, gathering round him a band of enthusiastic young students, among whom were Vesalius and Keuchlin. In 1475 Wessel was at Basel and in 1476 at Heidelberg teaching philosophy in the university. As old age approached he came to have a growing dislike to the worldly theological strife which surrounded him, and turned away from that university discipline, "non studia sacrarum literarum sed studiorum committae corrupiones." After thirty years of academic life he went back to his native Groningen, and spent the rest of his life partly as director in a nuns' cloister there and partly in the convent of St Agnes at Zwolle. He was welcomed as the most renowned scholar of his time, and it was said that he had travelled through all lands, Egypt as well as Gaul, in search of the real sources—"a man of rare erudition," says the title-page of the first edition of his collected works, "who in the shadow of papal darkness was called the light of the world." His remaining years were spent amid a circle of warm admirers, friends and disciples, to whom he imparted the mystical theology, the zeal for higher learning and the deep devotional spirit which characterized his own life. He died on the 4th of October 1489, with the confession on his lips, "I know only Jesus the crucified." He is buried in the middle of the choir of the church of the "Geestlichen Maegden," whose founder he had been.

Wessel has been called one of the "reformers before the Reformation," and the title is justifiable if by it is meant a man of deeply spiritual life, who protested against the growing paganizing of the papal supremacy, against the irreligious character of ecclesiastical tradition, and that tendency in later scholastic theology to lay greater stress, in a doctrine of justification, upon the instrumentality of the sinner than on the objective work of Christ for man's salvation. His own theology was, however, essentially medieval in type, and he never grasped that experimental thought of justification on which Reformation theology rests.

Martin Luther in 1521 published a collection of Wessel's writings which had been preserved as relics by his friends, and said that if he (Luther) had written nothing before he read them, people might well have thought that he had stolen all his ideas from them. The book was of an aphoristical character, and the ideas being remarkably similar to those of the young Lutheran, it was classed in the Index of prohibited books by the Pope's censors, and Wessel's name was added to the Index of prohibited books in 1522.

His correct name was Wessel Harmens Gansfort (or Ganzverdt), the Latin form of the name being Wessel being a corruption of Basilius, and the surname Gansfort being that of a Westphalian village from which his family came.

His works included De providentia, De causis et effectibus incarnationis et passionis, De dignitate et postea ecclesiastica, De sacramentis, poenitentia, Quae sit vera communio sanctorum, De purgatorio and a number of letters.
arranged, so that it is not possible to single out any one as the centre of the whole system. The authority of the Bible Wesselin would support when necessary, not by the priest but by the divinity professor. His views on the sacraments anticipated those of Zwingli rather than of Luther.

See Vita Wesseli Groningensis, by Albert Hardenberg, published in an incomplete form in the preface to Wesselin's collected works (Amsterdam, 1614; this preface also contains extracts from the work of Wessel, who had a number of important works in the Wesselin tradition); W. Muirurling, Com. Hist. Theol. de Wesseli Gansforti vita, &c. (1831); K. Ullmann, Reformers before the Reformation (the second part of a series of papers on the development of the Reformation in Germany), in the enlarged edition of a previous work entitled Johann Wessel, ein Vorgänger Luther's (1834); J. Friedrich, Johann Wessel, ein Bild aus der Kirchengeschichte des 15ten Jahrhunderts (1862); A. Ritschl, History of Early Protestantism and Reconciliation (Edinburgh, 1872); J. J. Doodses, "Hist.-literarisches zur Biographie J. Wesselin in Theol. Studien und Kritiken (1870).

WESSELENYI, MIKLÓS, BARON (1796-1850), Hungarian statesman, son of Baron Miklós Wesselenyi and Illona Cseresi, was born at Zalbó, and was educated at his father's castle by Mózes Pataky in the most liberal and patriotic direction. In 1823 he permanently entered public life and made the acquaintance of Count Stephen Széchenyi whose companion he was on a long educative foreign tour, on his return from which he became one of the leaders of the liberal movement in the Upper House. In 1833 appeared his Balidiletek (Prejudices), which was for long a prohibited book. He was the foremost leader of the Opposition at the diet of 1834, and his freely expressed opinions on land-redemption, together with his efforts to give greater publicity to the debates of the diet by printing them, involved him in two unsuccessful attempts on his life. He was imprisoned at Gräfenberg, whither he had gone to be cured of an eye trouble, and two years later became quite blind. Subsequently he did much for agriculture, children's homes and the introduction and extension of the silk industry in Hungary. The events of 1848 brought him home from a long residence abroad, but he was no longer the man he had been, and soon withdrew again to Gräfenberg. He died on the 21st of April 1850, on his way back to Hungary.

See Pernecz Szilagyi, Life and Career of Baron Nicholas Wesselenyi the Younger (Hung, Budapest, 1876). (R. N. B.)

WESSEX, one of the kingdoms of Anglo-Saxon Britain. The story of its origin is given in the Saxon Chronicle. According to this the the kingdom was founded by two princes, Cerdic, and Cynric his son, who landed in 494 or 495 and were followed by other settlers in 501 and 514. After several successful battles against the Welsh they became kings in 519. Very few of the localities contained in the Chronicle of this period have been found, but with certainty, but such identifications as there are point to the southern part of Hampshire. In 530 Cerdic and Cynric aresaid to have conquered the Isle of Wight, which they gave to two of their relatives, Stuf and Whtgat. Cerdic died in 534. Cynric defeated the Britons at Salisbury in 532 and again in conjunction with his son Cawlin at Beranburch, probably Barbury Hill, in 536. At his death in 560 he was succeeded by Ceawlin, who is mentioned by Bede as the second of the English kings to hold an imperium in Britain. With him we enter upon a period not perhaps of history, but at least of more or less reliable tradition. How far the earlier part of the story deserves credence has been and is still much debated. At all events no value can be attached to the dates given in the Chronicle. The preface to this work places Cerdic's assumption of the sovereignty six years after his landing, that is, in the year 500, and assigns him a reign of sixteen years, which makes his death fall eighteen years before 534, the date recorded in the annals. Again, while the annals record Ceawlin's accession in 560 and his expulsion in 592, the preface with other early authorities assigns him a reign of only some twenty years. Over the longer contests between the Chronicle and elsewhere, represent Cynric as grandson of Cerdic and son of a certain Creoda. Suspension likewise attaches to the name Cerdic, which seems to be Welsh, while we learn from Bede that the Isle of Wight, together with part at least of the Hampshire coast, was colonized by Jutes, who apparently had a kingdom distinct from that of Wessex. For these reasons the story of the foundation of Wessex, though it appears to possess considerable ambiguity, must be regarded as open to grave suspicion. It is worthy of note that the dynasty claimed to be of the same origin as the royal house of Bernicia and that two of Cerdic's ancestors, Freawine and Wig, figure in the story of Wermund, king of Angel.

Whatever may be the truth about the origin of the kingdom, and it is by no means impossible that the invasion really proceeded from a different quarter, we need not doubt that its dimensions were largely increased under Ceawlin. In his reign the Chronicle mentions two great victories over the Welsh, one at a place called Bedeckford in 571, by which Aylesbury and the upper part of the Thames valley fell into the hands of the West Saxons, and another at Deorham in 577, which led to the capture of Gloucester, Bath and Gloucester. Ceawlin is also said to have defeated Æthelberht at a place called Wibbandon (possibly Wilmoton) in 568. In 592 he was expelled and died in the following year. Of his successors Ceol and Cæolwulf we know little though the latter is said to have been engaged in constant warfare. Cæolwulf was succeeded in 611 by Cynegils, whose son Cwichelm provoked a Northumbrian invasion by the attempted murder of Edwin in 626. These kings are also said to have come into collision with the Mercian king Penda, and it is possible that the province of the Hwicce (q.v.) was lost in their favour, but that the death of the Mercian king Cynegils' daughter, to the throne of Northumbria, both Cynegils and Cwichelm were baptized. Cynegils was succeeded in 642 by his son Cenwalh, who married and subsequently divorced Penda's sister and was on that account expelled by that king. After his return he gained a victory over the Welsh near Pen-Selwood, by which a large part of Somerset came into his hands. In 661 he was again attacked by the Mercians under Wulhere. At his death, probably in 673, the throne is said to have been held for a year by his widow Sexburg, who was succeeded by Aescwine, 747-69, and Ceawlin and Cenwalh 696-747. Again, however, the kingdom was in a state of disunion from the death of Cenwalh to the accession of Ceawlwal in 685, who greatly increased its prestige and conquered the Isle of Wight, the inhabitants of which he treated with great barbarity. After a brief reign Ceawalla went to Rome, where he was baptized, and died shortly afterwards, leaving the kingdom to Ine. By the end of the 7th century a considerable part at least of Devonshire as well as the whole of Somerset and Dorset seems to have come into the hands of the West Saxons. On the resignation of Ine, in 726, the throne was obtained by Æthelheard, apparently his brother-in-law, who had to submit to the Mercian king Æthelbert, by whom he seems to have been attacked in 733. Cuthred, who succeeded in 740, at first acted in concert with Æthelbald, but revolted in 752. At his death in 756 Ægbert succeeded. The latter, however, on account of his misgovernment was deserted by most of the leading nobles, and with the exception of Hampshire the whole kingdom came into the hands of Cynwulf. Ægbert, after putting to death the last of the princes who remained faithful to him, was driven into exile and subsequently murdered; but vengeance was afterwards taken on Cynwulf by his brother Cynegils. Cynwulf was succeeded in 786 by Berthric, who married Eadburh, daughter of the Mercian king Offa. Her violent and murderous conduct led to the king's death in 802; and, it is said, caused the title of queen to be denied to the wives of later kings. Berthric was succeeded by Egcbert (q.v.), the chief event of whose reign was the overthrow of the Mercian king Beornwulf in 825, which led to the establishment of West Saxon supremacy and to the annexation by Wessex of Sussex, Surrey, Kent and Essex.

Æthelwulf (q.v.), son of Ægbert, succeeded to the throne of Wessex after a number of years in 839, while the eastern provinces went to his son or brother Æthelstan. A similar division took place on Æthelwulf's death between his two sons Æthelbald and Æthelbert, but on the death of the former in 858 Æthelbert united the whole in his own hands, his younger brothers Æthelred and Alfred renouncing their claims. Æthelbert was succeeded in 865 by Æthelred, and the latter by Alfred in 871. This was the period of the great Danish invasion which culminated
in the submission of Guthrum in 878. Shortly afterwards the kingdom of the Mercians came to an end and their leading earl, Æthelred accepted Alfred's overlordship. By 886 Alfred's authority was admitted in all the provinces of England which were not under Danish rule. From this time onwards the history of Wessex is the history of England.

The dates are those of the annals in the Chronicle, with approximate corrections in brackets.

WEST, BENJAMIN (1738-1820), English historical and portrait-painter, was born on the 10th of October 1738, at Springfield, in the county of Buckinghamshire, near the site of an old Quaker family from that county. When a boy of seven he began to show his inclinations to art. According to a well-known story, he was sitting by the cradle of his sister's child, watching its sleep, when the infant happened to smile in its dreams, and, struck with its beauty, young Benjamin got some paper, and drew its portrait. The career thus begun was prosecuted amid many difficulties; but his perseverance overcame every obstacle, and at the age of eighteen he settled as a young portrait-painter. After two years he removed to New York, where he practised his profession with considerable success. In 1760, through the assistance of some friends, he was enabled to complete his artistic education by a visit to Italy, where he remained nearly three years. Here he acquired reputation, and was elected a member of the principal academies of Italy. On the expiry of his Italian visit he settled in London as an historical painter. His success was not long doubtful. George III. took him under his special patronage; and commissions flowed in upon him from all quarters. The number of his portraits, which he submitted to the king the plan for a royal academy, of which he was one of the earliest members; and in 1772 he was appointed historical painter to the king. He devoted his attention mainly to the painting of large pictures on historical and religious subjects, conceived, as he believed, in the style of the old masters, and executed with great care and much taste. So high did he stand in public favour that on the death of Sir Joshua Reynolds, in 1792, he was elected his successor as president of the Royal Academy, an office which he held for twenty-eight years. In 1800 he took advantage of the opportunity afforded by the peace of Amiens to visit Paris, and inspect the magnificent collection of the masterpieces of art, pillaged from the gallery of almost every capital in Europe, which then adorned the Louvre. On his return to London he devoted himself anew to the labours of his profession, which were, however, somewhat broken in upon by quarrels with some of the members of the Royal Academy. In 1804 he resigned his office, but an all but unanimous request that he should return to the chair induced him to recall his resignation. Time did not at all weaken the energy with which he laboured at his task. Work of the sixty-five he painted one of his largest works, "Christ healing the Sick." This was originally designed to be presented to the Quakers in Philadelphia, to assist in erecting a hospital. On its completion it was exhibited in London to immense crowds, and was purchased by the British Institution for 3000 guineas, West sending a replica to Philadelphia. His subsequent works were nearly all on the same grand scale as the picture which had been so successful, but they did not meet with very ready sale. He died in London on the 11th of March 1820, and was buried in St Paul's.

West's works, which fond criticism ranked during his life with the first productions of the best artists, were portrayed as in general formal, tame, wanting that freedom of nature and that life which genius alone can breathe into the canvass. His "Death of Wolfe," is interesting as introducing modern costume into the classical draperies which had been previously universal in similar subjects by English artists; and his "Battle of La Hogue" is entitled to an honourable place among British historical paintings.

An account of West's life was published by Galt (The Progress of Genius, 1816). See also H. T. Tuckerman, Book of the Artists (N.Y., 1868).

WEST, NICHOLAS (1461-1533), English bishop and diplomatist, was born at Putney, and educated at Eton and at King's College, Cambridge, of which he became a fellow in 1483. He was soon ordained and appointed rector of Eggeshielde, Durham, receiving a little later two other livings and becoming chaplain to King Henry VII. In 1509 Henry VIII. appointed him dean of St George's chapel, Windsor, and in 1515 he was elected bishop of Ely. West's long and successful career as a diplomatist began in 1502 through his friendship with Richard Fox, bishop of Durham. In the interests of Henry VII. he visited the German king Maximilian I. and George, duke of Saxony; in 1519 he negotiated an important commercial treaty with Flanders, to which he attached a cultural character, and which in the same year was signed by the king's daughter Mary and the future emperor Charles V., and between the king himself and Charles's sister Margareti. By Henry VIII. West was sent many times to Scotland and to France. Occupied mainly during the years 1513 and 1514 with journeys to and from Scotland, he visited Louis XII. of France in the autumn of 1514 and his successor Francis I. in 1515. In 1515 also he arranged a defensive treaty between England and France, and he was principally responsible for treaties concluded between the two countries in 1518 and 1525, and at other times in his capacity of envoy on personal matters, by Cardinal Wolsey. He died on the 28th of April 1533. The bishop built two beautiful chapels, one in Putney church and the other in Ely cathedral, where he is buried.

WESTALL, RICHARD (1765-1836), English subject painter, was born in Hartford in 1765, of a Norfolk family. In 1779 he went to London, and was apprenticed to an engraver on silver, and in 1785 he began to study in the schools of the Royal Academy. He painted "Essa seeking Jacob's Blessing," "Mary Queen of Scots going to Execution" and other historical subjects in water-colours. He sent some of his portraits in the same year, but he is mainly known as a book-illustrator. He produced five subjects for the Shakespeare Gallery, illustrated an edition of Milton, executed a very popular series of illustrations to the Bible and the prayer-book, and designed plates for numerous other works. In 1808 he published a poem, A Day in Spring, illustrated by his own pencil. His designs are rather tame, mannered and effeminate. He became an associate of the Royal Academy in 1792, and a full member in 1794; and during his later years he was a pensioner of the Academy. He died on the 4th of December 1836. His brother, William Westall, A. A. (1757-1850), landscape painter, is mainly known by his illustrations to works of travel.

WESTBORO, a township of Worcester county, Massachusetts, U.S.A., about 12 m. E. of Worcester. Pop. (1890) 5105; (1900) 5400 (1127 being foreign-born); (1905, state census) 3278; (1910) 5446. Westboro is served by the Boston & Albany railway and by interurban electric lines. Area, about 22 sq. m. It has a public library, which has belonged to the township since 1857; and here are the Lyman School for Boys, a state industrial institution (opened in 1886 and succeeding a state reform school opened 1850), and the Westboro Insane Hospital (homeopathic 1884), which is under the general supervision of the State Board of Insanity. There are manufactures of boots and shoes, straw and leather goods, carpets, &c. Westboro was the birthplace of Eli Whitney, inventor of the cotton gin. The first settlement here was made about 1655 in a part of Marlboro called Chauncy (because of a grant of 500 acres here to Charles Chauncy, president
of Harvard College, made in 1659 and revoked in 1660 by the General Court of Massachusetts). In 1717 this part of Marlborough, with other lands, was erected into the township of Westboro, to which parts of Sutton (1726), Shrewsbury (1726 and 1729), and Upton (1753) were subsequently annexed, and from which Northboro was separated in 1766.

**WEST BROMWICH—WESTBURY**

of the university. A charter, which Northboro was annexed to the city of Aylesbury, was granted to the town in 1847, and it continued to exist as a separate town until 1893, when it was incorporated as a city. The city hall is a fine example of Gothic architecture, and the public library is well supplied with books. The city has a large number of manufacturing establishments, and the chief industries are those of shoe-making, leather-working, and the manufacture of cotton goods. The population of the city is about 30,000.

**WESTBURY,** a market town and municipal and parliamentary borough of Staffordshire, England, 6 m. N.W. of Birmingham, on the northern line of the Great Western railway. Pop. (1891) 59,358, (1901) 85,175. The appearance of the town, like its growth as an industrial centre of the Black Country, is modern. It is, however, of ancient origin; thus the church of All Saints, formerly St Clement, was given by Henry I. to the convent of Worcester, from which it passed to the priors of Sandwell, who rebuilt it in the Decorated period, the present structure (1872) following their plan. The chief public buildings are the town hall (1875), the Institute (1886), providing instruction in science and art, under the corporation since 1894, the free library (1874) and law-courts (1891). The picturesque Oak House, of the 16th century, was opened as a museum and art gallery in 1898. Among schools is one for pauper children in which engineering, baking, spade-husbandry, &c., are taught. Sandwell Hall, formerly a seat of the earls of Dartmouth, contains a school for daughters of clergymen, &c. The houses, standing in pleasant wooded grounds, is on the site of the Benedictine priory of Sandwell, founded in the time of Henry II. There are charities founded by the families of Stanley and Whorwood (1613 and 1614). Dartmouth Park is a recreation ground of about 60 acres; others are Farley, Kenwick and Hill Top Park. Numerous mines work the extensive coalfields, which include a thirty-foot seam. There are large iron and brass foundries and smelting furnaces, and melting and brickmaking are carried on. The parliamentary borough returns one member. The town is governed by a mayor 6 aldermen and 18 councillors. Area, 3560 acres.

**WESTBROOK,** a city of Cumberland county, Maine, U.S.A., on the Presumpscot river, 5 m. N.W. of Portland. Pop. (1890) 66,532, (1900) 72,823 (1673 foregin-born), (1910) 82,817. It is served by the Maine Central and the Boston & Maine railways. In Westbrook are the Walker Memorial Library (1894) and the Warren Library (1879). The river provides water-power, and among the manufactures are paper, silks, cotton goods, &c. In 1834 Westbrook was separated from Falmouth and incorporated as a township under the name of Westbrook, and in 1853 the present town was adopted in honor of Colonel Thomas Westbrooke, who had distinguished himself in wars with the Indians. In 1871 Deering, now a part of Portland, was taken from the township. A city charter was granted to Westbrook in 1889 and adopted in 1891.

**WESTBURY, RICHARD BETHELL,** 1st Baron (1800–1873), lord chancellor of Great Britain, was the son of Dr Richard Bethell, and was born at Bradford, Wilts. Taking a high degree at Oxford in 1818, he was elected a fellow of Wadham College. In 1823 he was called to the bar at the Middle Temple. Upon attaining the dignity of queen's counsel in 1829 he rapidly took the foremost place at the Chancery bar and was appointed vice-chancellor of the county palatine of Lancaster in 1831. His most important public service was the reform of the then existing mode of legal education, a reform which ensured that students before call to the bar should have at least some acquaintance with the elements of the subject which they were to profess. In 1831 he obtained a seat in the House of Commons, where he continued to sit, first as member for Aylesbury, then as member for Wolverhampton, until he was raised to the peerage in 1872 and appointed to the liberal benches as solicitor-general in 1835 and attorney-general in 1856 and again in 1859. On June 26, 1861, on the death of Lord Campbell, he was created lord high chancellor of Great Britain, with the title of Baron Westbury of Westbury, county Wilts. The ambition of his life was to set on foot the compilation of a digest of the whole law, but for various reasons this became impracticable. The conclusion of his tenure of the chancellorship was unfortunately marked by events which, although they did not render personal corruption imputable to him, made it evident that he had acted with some laxity and want of caution. Owing to the reception by parliament of charges of corruption which had been raised by several members of committees, the appointments of certain members of the Leeds Bankruptcy Court, as well as the granting a pension to a Mr Leonard Edmunds, a clerk in the patent office, and a clerk of the parliamentary, the lord chancellor felt it incumbent upon him to resign his office, which he accordingly did on the 9th of July 1865, and was succeeded by Lord Cranworth. After his resignation he continued to take part in the judicial sittings of the House of Lords and the privy council until his death. In 1872 he was appointed arbitrator under the European Assurance Society Act 1872, and his judgments in that capacity have been collected and published by Mr F. S. Reilly. As a writer on law he made no mark, and few of his decisions take the highest judicial rank. Perhaps the best known is the judgment delivering the opinion of the judicial committee of the privy council in 1863 against the heretical character of certain extracts from the well-known publication *Essays and Reviews.* His principal legislative achievements were the passing of the Divorce Act 1857, and of the Land Registry Act 1862 (generally known as Lord Westbury's Act), the latter of which in practice proved a failure. What chiefly distinguished Lord Westbury was the possession of a certain sarcastic humour, and numerous are the stories, authentic and apocryphal, of his exercise. In fact, he and Mr Justice Maule fill a position analogous to that of Sydney Smith, convenient names to whom "good things" may be attributed. Lord Westbury died on the 20th of July 1873, within a day of the death of Bishop Wilberforce, his special antagonist in debate.

See *Life of Lord Westbury* by T. A. Nash.

**WESTBURY,** an urban district in the Westbury parliamentary division of Wiltshire, England, on the river Biss, a small tributary of the Lower Avon. Pop. (1901) 3925. It is 95½ m. W. by S. of London by the Great Western railway, and lies within 7 miles of the Somerset border, sheltered on the east by the high tableland of Salisbury Plain. All Saints' church is Norman and later, with a magnificent nave. In the south transept stands a monument to Sir James Ley, earl of Marlborough and president of the council in 1620; the "good earl" addressed in a sonnet by Milton. A chained black-letter copy of Erasmus' "Para-phrase of the New Testament" is preserved in the south-chapel. In the suburb of Westbury Leigh is the "Palace Garden," a moated site said to have been a royal residence in Saxton times. Westbury ("Westberie, Westbore") figures in Domesday as a manor held by the king. The manor was granted by Henry II. to Reginald de Pavely in 1172–1173, and from then onwards passed through various families until in 1810 it was purchased by Sir M. M. Lopes from the earl of Abingdon. A post mill was held for Westbury in 1361–1362, but the earliest mention of the town as a borough occurs in 1442–1443. The charter of incorporation is lost (tradition says it was burned), and the town possesses no other charter. The title of the corporation was "Mayors and Burgesses of Westbury," and it consisted of a mayor, recorder and 13 capital burgesses. The borough returned two members to parliament from 1448. In 1832 the number was reduced to one, and in 1885 the representation was merged in that of the county. In 1242 Henry III. granted to Walter de Pavely a yearly fair for three days from October 31, and a weekly market on Friday. Henry VI. in 1466 granted three fairs yearly for three days from April 22, Whit Monday and September 13 respectively, and a market on Thursdays. In 1835 the mayor's fair was held at Whitsuntide, and the lord of the manor's at Easter, and from 1837 a sheep fair took place on the first Tuesday in September and a pleasure fair on Easter and Whit Monday; in 1888 on the first Tuesday in September and on the 24th of that month; the former still exists. In 1673 there was a market on Friday, in 1835 a nominal one on Tuesday and after 1875 it ceased. During the 18th and 19th centuries there was a considerable trade in malt, bricks, tiles and cloth. The last, once the most extensive, has now sunk into insignificance, while the others exist also only on a small scale.
WEST CHESTER—WESTCOTT

WEST CHESTER, a borough and the county-seat of Chester county, Pennsylvania, U.S.A., about 20 m. W. of Philadelphia. Pop. (1890) 8028; (1900) 9224, of whom 566 were foreign-born and 1772 were negroes; (1910) census 11,727. West Chester is served directly by the Pennsylvania and the Philadelphia, Baltimore & Washington railways and by an interurban electric line to Philadelphia; electric lines connect with the Philadelphia & Reading at Lenape, 4 m. to the south-west, and at Coatesville, 10 m. to the west. The borough lies about 450 ft. above sea-level in an undulating country. At West Chester are the West Chester State Normal School (1871), the Darlington Seminary (non-sectarian; for girls), founded in 1851 by Smedley Darlington (1827-1889; principal of the school in 1851-1863), and the Repe- ratory in Congress in 1887-1891, the Friends' Graded School and the Friends' (Orthodox) Select School. There are fine botanical gardens in Marshall Square. Among the public buildings are a county court house (1847-1848), a county jail and a county hospital (1892-1893), the public library and a large Y.M.C.A. building. The colonial Turk's Head Hotel here has been so called since 1768 and was probably first opened in 1762. West Chester is in a farming country with important market-gardens and dairy farms; among its manufactures are dairy implements, foundry and machinery. In courage and zeal, the factory product in 1905 was valued at $2,121,185. There are several large nursery farms here. West Chester was first settled in 1713, succeeded Chester as the county-seat in 1784-1786, and was incorporated as a town in 1788 and as a borough in 1799. During the War of Independence the battle of Brandywine was fought about 7 m. S. of West Chester on the 11th of September 1777, and on the 20th General Anthony Wayne, with a small force, was surprised and routed by the British at Paoli, about 8 m. N.E.

WESTCOTT, BISHOP, FOS (1834-1901), English divine and bishop of Durham, was born on the 12th of January 1835 in the neighbourhood of Birmingham. His father, Frederick Brooke Westcott, was a botanist of some distinction. Westcott was educated at King Edward VI. school, Birmingham, under James Prince Lee, where he formed his friendship with Joseph Barber Lightfoot (q.v.). In 1854 Westcott obtained a scholarship at Trinity College, Cambridge. He took Sir William Browne's medal for a Greek ode in 1846 and 1847, the Members' Prize for a Latin essay in 1847 as an undergraduate and in 1849 as a bacheelor. He took his degree in January 1845, obtaining double firsts in mathematics and divinity, and in the following year he was named the Tatler. In 1846 he won the Bodley prize with the first essays in the 'Elements of the Gospel Harmony.'

The inspiring influence of Westcott's intense enthusiasm left its mark upon these three distinguished men; they regarded him not only as their friend and counsellor, but as in an especial degree their teacher and oracle. He devoted much attention to philosophical, patriotic and historical studies, but it soon became evident that he would throw his strength into New Testament work. In 1851 he published his Norrisian prize essay on the 'Names of the New Testament,' and in 1855 his Essay on the 'Significance of the Greek Verb.'

In 1852 he became an assistant master at Harrow, and soon afterwards he married Miss Whithard. He prosecuted his school work with characteristic vigour, and succeeded in combining with his school duties an enormous amount both of theological research and of literary activity. He worked at Harrow for nearly twenty years under Dr C. J. Vaughan and Dr Montagu Butler, but while he was always conspicuously successful in inspiring a few senior boys with something of his own intellectual and moral enthusiasm, he was never in the same measure capable of maintaining discipline among large numbers. The writings which he produced at this period created a new epoch in the history of modern English theological scholarship. In 1855 he published the first edition of his History of the New Testament Canon, which, frequently revised and expanded, became the standard English work upon the subject. In 1859 there appeared his Characteristics of the Gospel Miracles. In 1860 he expanded his Norrian essay into an Introduction to the Study of the Gospels, a work remarkable for insight and minuteness of study, as well as for reverential treatment combined with considerable freedom from traditional lines. Westcott's work for Smith's Dictionary of the Bible, notably his articles on 'Canon,' 'Maccabees,' was valuable and thorough, and led to the composition of his subsequent valuable popular books, The Bible in the Church (1864) and a History of the English Bible (1866). To the same period belongs The Gospel of the Resurrection (1866). As a piece of consecutive reasoning upon a fundamental Christian doctrine it deservedly attracted great attention. Its width of view and its recognition of the claims of historical science and pure reason were thoroughly characteristic of Westcott's mode of discussing a theological question. At the time when the book appeared his method of apologetic logic and the purity of his scholarship, the excellence of the work is impaired by the difficulty of the style.

In 1865 he took his B.D., and in 1870 his D.D. He received in later years the honorary degrees of D.C.L. from Oxford (1881) and of D.D. from Edinburgh (1883). In 1868 Westcott was appointed examining chaplain by Bishop Connor Magee (of Peterborough); and in the following year he accepted a canonry at Peterborough, which necessitated his leaving Harrow. For a time he contemplated with eagerness the idea of a renovated cathedral life, devoted to the pursuit of learning and to the development of opportunities for the religious and intellectual benefit of the diocese. But the regius professorship of divinity at Cambridge fell vacant, and Lightfoot, who was then Hulsean professor, declining to become a candidate himself, insisted upon Westcott's standing for the post. It was due to Lightfoot's support almost as much as to his own great merits that Westcott was elected to the chair on the 1st of November 1870. This was the turning-point of his life. He now occupied a great position for which he was supremely fitted, and at a juncture in the reform of university studies when a theologian of liberal views, but universally respected for his masterly learning and his devotedness to the cause of scholarship, enjoyed a special eminence for usefulness. Supported by his friends Lightfoot and Hort, he threw himself into the new work with extraordinary energy. He deliberately sacrificed many of the social privileges of a university career in order that his studies might be more continuous and that he might see more of the younger men. His lectures were generally on Biblical subjects. His Commentaries on St John's Gospel (1881), on the Epistle to the Hebrews (1886) and the Epistles of St John (1883) resulted from his public lectures. One of his most valuable works, The Gospel of Life (1862), a study of Christian doctrine, incorporated the materials upon which he was engaged in a series of more private and esoteric lectures delivered on week-day evenings. The work of lecturing was an intense strain to him, but its influence was immense: to attend one of Westcott's lectures—even to watch him lecturing—was an experience which filled and solemnized many a man to whom the references to Origen or Rupert of Deutz were almost ludicrously unintelligible. Between the years 1870 and 1881 Westcott was also continually engaged in work for the revision of the New Testament, and, simultaneously, in the preparation of a new text in conjunction with Hort. The years in which Westcott, Lightfoot and Hort could thus meet frequently and naturally for the discussion of the work in which they were all three so deeply engrossed formed a happy and privileged period in their lives. In the year 1881 there appeared the famous Westcott and Hort text of the New Testament, upon which had been expended nearly thirty years of incessant labour. The reforms in the regulations for degrees in divinity, the formation and first revision of the new theological tripos,
the inauguration of the Cambridge mission to Delhi, the institution of the Church Society (for the discussion of theological and ecclesiastical questions by the younger men), the meetings for the divinity faculty, the organization of the new Divinity School and Library and, later, the institution of the Cambridge Clergy Training School, were all, in a very real degree, the result of Westcott's energy and influence as regius professor. To this list should also be added the Oxford and Cambridge preliminary examination for candidates for holy orders, with which he was from the first most closely identified. The success of this very useful scheme was due chiefly to his sedulous interest and help.

In 1879 Westcott was raised to the prebend of Durham, and was consecrated at Durham Cathedral on 24 May. His early life had fitted him by experience and endowment, and the influence which he had previously been able to exercise in London and abroad, to still further prominence. He was compelled to take the lead in matters where Lightfoot's more practical nature had previously been predominant. In 1883 Westcott was elected to a professorial fellowship at King's. Shortly afterwards, having previously resigned his canonry at Peterborough, he was appointed by the crown to a canonry at Westminster, and accepted the position of examining chaplain to Archbishop Benson. His little edition of the Paragraph Psalter (1879), arranged for the use of choirs, and his admirable lectures on the Apocalypse (1879), show that he was able to command the respect of his vacations spent at Peterborough. He held his canonry at Westminster in conjunction with the regius professorship. The strain of the joint work was very heavy, and the intensity of the interest and study which he brought to bear upon his share in the labours of the Ecclesiastical Courts Commission, of which he had been appointed a member, added to his burden. Preaching at the Abbey gave him a valued opportunity of dealing with social questions. His sermons were generally portions of a series; and to this period belong the volumes Christus Consummator (1886) and Social Aspects of Christianity (1887).

In March 1890 he was nominated to the see of Durham, there to follow in the steps of his beloved friend Lightfoot, who had died in December 1889. He was consecrated on the 1st of May at Westminster Abbey by Archbishop Thompson (of York), Hort being the preacher, and enthroned at Durham cathedral on the 15th of May. The change of work and surroundings could hardly have been greater. But the sudden immersion in the practical administration of a northern diocese gave him new strength. He surprised the world, which had supposed him to be a recluse and a mystic, by the practical interest he took in all matters connected with his diocese. He became a merchant of Durham and in the great shipping and artisan industries of Sunderland and Gateshead. Upon one famous occasion in 1892 he succeeded in bringing to a peaceful solution a long and bitter strike which had divided the masters and men in the Durham collieries; and his success was due to the confidence which he inspired by the extraordinary moral energy of his strangely "prophetic" personality, at once thoughtful, vehement and affectionate. His constant endeavour to call the attention of the Church to the religious aspect of social questions was a special note in his public utterances. He was a staunch supporter of the co-operative movement, He was practically the founder of the Christian Social Union. He continually insisted upon the necessity of promoting the cause of foreign missions, and he gladly gave four of his sons for the work of the Church in India. His energy was remarkable to the very end. But during the last two or three years of his life he aged considerably. His wife, who had been for some years an invalid, died rather suddenly on the 28th of May 1901, and he dedicated to her memory his last book, Lessons from Work (1901). He preached a farewell sermon to the miners in Durham cathedral at their annual festival on the 29th of July. Then came a short, sudden illness, and he passed away on the 27th of July.

Westcott was no narrow specialist. He had the keenest love of poetry, music and art. He was himself no mean draughtsman, and used often to say that if he had not taken orders he would have become an architect. His literary sympathies were wide. He would never tire of praising Euripides, though few men had given such minute study to the writings of Robert Browning. He followed with delight the development of natural science studies at Cambridge. He spared no pains to be accurate, or to widen the basis of his thought. Thus he devoted one summer vacation to the careful analysis of Conybeare's "History of Political Theology." He studied assiduously The Sacred Books of the East, and earnestly contended that no systematic view of Christianity could afford to ignore the philosophy of other religions. The outside world was wont to regard him as a mystic; and the mystical, or sacramental, view of life enters, it is true, very largely into his teaching. He had in this respect many points of similarity with the Cambridge Platonists of the 17th century, and with F. D. Maurice, for whom he had profound regard. But in other respects he was very practical; and his strength of will, his learning and his influence. To his teachings he gave a moral influence wherever the subject under discussion was of serious moment. He was a strong supporter of Church reform, especially in the direction of obtaining larger powers for the laity.

He kept himself aloof from all party strife. He describes himself when he says, "The student of Christian doctrine, because he strives after exactness of phrase, because he is conscious of the inadequacy of any one human formula to exhaust the truth, will be filled with sympathy for every genuine endeavour towards the embodiment of right opinion. Partial views attract his aversion; the principles which are exalted above the rest, but which are due to an individual or to a small—which they include; and it is the work of the theologian to seize this no less than to detect the first spring of error. It is easier and, in one sense, it is more impressive to make a peremptory and exclusive statement, and to refuse to allow any place beside it to divergent expositions; but this show of clearness and power is hardly purchased at the cost of the ennobling conviction that the whole truth is far greater than our individual minds. He who believes that every judgment on the highest matters different from his own is simply a heresy must have a false idea of the faith; and while the qualifications, the reserve, the lingering sympathy which he lets into his words in many cases a poor controversialist, it may be said that a more controversialist cannot be a real theologian" (Lessons from Work, pp. 84-85). His theological work was always distinguished by the place which he assigned to Divine Revelation in Holy Scripture and in the teaching of history. His own studies have largely contributed in England to the better understanding of the doctrines of the Resurrection and the Incarnation. His work in conjunction with Hort upon the Greek text of the New Testament will endure as one of the greatest achievements of English Biblical criticism. The principles which he expounded in an introduction to the text had been arrived at after years of elaborate investigation and continual correspondence and discussion between the two friends. The place which it almost at once took among scientific scholars in Great Britain and throughout Europe was a recognition of the great advance which it represented in the use and classification of ancient authorities. His commentaries rank with Lightfoot's as the best type of Biblical exegesis produced by the English Church in the 19th century. The following is a bibliography of Westcott's more important writings, giving the date of the first editions: Elements of the Gospel Harmony (1831); History of the Canon of the First Four Centuries (1833); Characteristic of Gospel Miracles (1839); Introduction to the Study of the Gospels (1860); The Bible in the Church (1864); The Gospel of the Resurrection (1866); Christ in Life and One (1866); Some Points in the Religious Life of the Universities (1873); Paragraph Psalter for the Use of Chárs (1879); Commentary on the Gospel of St John (1881); Commentary on the Epistle of St John (1885); Revelation of the Risen Lord (1882); Revelation of the Father (1884); Some Thoughts from the Ordinal (1884); Christus Consummator (1886); Social Aspects of Christianity (1887); The Gospel of the Redemption (1892); Manifold and One (1896); Partial Points of the Similarity of the Gospels (1893); Introduction to the Epistle to the Hebrews (1892); From Strength to Strength (1890); Westcott's Life of Our Lord (1892); The Incarnation and Common Life (1893); Some Lessons of the Revised Version of the New Testament (1897); Christian Aspects of Life (1897); Lessons from Work (1901).

WESTERLY, a township of Washington county, Rhode Island, U.S.A., in the extreme S.W. part of the state, about 44 m. S.S.W. of Providence, separated from Connecticut on the W. by the Pawcatuck river, which forms the northern boundary
of the township also. Pop. (1890) 6813, (1900) 7241, (1918) being foreign-born and 185 negroes, (1905, state census) 8383, (1910) 8696. Area, about 32 sq. m. Westerly is served by the New York, New Haven & Hartford railway, and by interurban electric lines connecting with Norwich and New London, Conn. The township includes several small villages, connected by electric railways, the best known being Watch Hill, which has fine sea-bathing. Larger villages are Westerly, in the western part of the township and at the head of navigation (for small vessels) on the Pawcatuck river, and Niantic, in the northwestern part of the township. In Westerly there is a public library (1894), with 23,323 volumes in 1900. Beyond Watch Hill Point on the S.W. point of an L-shaped peninsula, running first W. and then N., is Napatree Point, on which is Fort Mansfield, commanding the N.E. entrance to Long Island Sound. The township is the centre of the granite industry of the state; the quarries are near the villages of Westerly and Niantic. The granite is of three kinds: white statuary granite, a quartz monzonite, with a fine even-grained texture, used extensively for monuments; blue granite, also a quartz monzonite and also much used for monuments; and red granite, a biotite granite, reddish grey in colour and rather coarse in texture, used for buildings. Among the manufactures are cotton and woolen goods, thread and printing presses. The water supply is from artesian wells. The first settlement here was made in 1661, and the township was organized in 1669, when the present name was adopted instead of the Indian Missiquamicut (meaning "salmon") by which it had been called. In 1686 the name was changed to Haversham, but in 1689 the present name was restored.

See Frederic Denison, Westerly and its Witnesses, for Two Hundred and Fifty Years, 1620-1876 (Providence, R.I., 1878).

WESTERMANN, FRANCOIS JOSEPH (d. 1794), French general, was born at Molsheim in Alsace. At an early age he entered a cavalry regiment, but soon left the service and went to Paris. He embraced enthusiastically the ideas of the Revolution, and in 1790 became greffier of the municipality of Haguenau. After a short imprisonment on a charge of inciting émeutes at Haguenau, he returned to Paris, where he joined Danton and played an important part in the attack on the Tuileries on the 10th of August 1792. He accompanied Dumas on his campaign and assisted him in his negotiations with the Austrians, being arrested as an accomplice after the general's defection. He succeeded, however, in proving his innocence, and was sent with the rank of general of brigade into La Vendée, where he distinguished himself by his extraordinary courage, by the audacity of his manoeuvres, and by his severe treatment of the insurgents. After suffering a defeat at Châtillon, he vanquished the Vendéens at Beauvigné, Laval, Granville and Bauge, and in December 1793 annihilated their army at Le Mans and Savenay. He was then summoned to Paris, where he was pro-scribed with the Dantonist party and executed on the 5th of April 1794.

See P. Holl, Nos généraux alsaciens . . . Westermann (Strassburg, 1900).

WESTERN AUSTRALIA, a British colonial state, forming part of the Commonwealth of Australia. (For Map, see Australia.) This portion of Australia lies to the west of 129° E. long., and is 36° or 37° S. of the equator. It has an area of 1,060,000 sq. m., is 1,400 m. in length and 850 m. in breadth, and has a coast-line of 3,500 m. It is divided into five districts—Central, Central Eastern, South-Eastern, North and Kimberley. The Central or settled district, in the south-west, is divided into twenty-six counties. Apart from the coast lands, the map presents almost a blank, as the major portion is practically a dry waste of stone and sand, relieved by a few shallow salt lakes. The rivers of the south are small—the Blackwood being the most considerable. To the north of this are the Murchison and Fitzroy. The Upper Murchison is navigable through the Murchison. The last is 400 m. long. Shark's Bay receives the Gascoyne (200 m. long), with its tributary the Lyons.

1 See T. N. Dale, The Chief Commercial Granites of Massachusetts, New Hampshire and Rhode Island (Washington, 1908), Bulletin 354 of the United States Geological Survey. Still farther north, where the coast trends eastward, the principal rivers are the Ashburton, the Fortescue and the De Grey. Kimberley district to the north-east has some fine streams—the Fitzroy and Ord and their tributaries, on some of which (the Mary, Elvira, &c.) are the goldfields, 250 m. south of Cambridge Gulf. The Darling mountain range is in the south-west, Mount William reaching 3000 ft.; in the same quarter are Toolbrunup (3341 ft.), Ellen's Peak (3420), and the Stirling and Victoria ranges. Gardner and Moresby are flat-topped ranges. Mount Elizabeth rises behind Perth. Hampton tableland overlooks the Swan River. The northern coast of the State is not yet surveyed, but they gradually become narrower to the west; and the Archaean rocks reach the coast at Port Dempster and to the east of Esperance, where the southern boundary of the Archaean rocks extends due west, while the coastal ranges separate the two by a belt of Lower Palaeozoic and Mesozoic deposits; but the reappearence of the granitic rocks at King George Sound and Albany may be considered as the boundary of the Archaean. To the east coast, the scarp of the Archaean plateau forms the Darling Range behind Perth. Further north, behind Shark's Bay, the plateau recedes from the coast, and trends north-westward through the Great Western Range. The Highland of Pillbara, the Archaean rocks underlie the Kimberley Goldfield; but they are separated from the main Archaean plateau to the south by the Lower Palaeozoic rock groups, and a series of the formation of the Fitzroy river and form the King Leopold and Oscar Ranges.

The Archaean rocks are of most interest from the auriferous lodes which occur in them. The Archaean rocks of the area between the Darling Range and the goldfield of Coolgardie were classified by H. P. Woodward into six parallel belts, running northward and southward, but with a slight trend to the west. The westernmost belt consists of clay slates, quartzites and schists, and is traversed by dykes of dolerite and felsite; the belts form the western foot of the Archaean plateau, along the edge of the coastal plain. The second belt consists of gneisses and schists, and forms the western boundary of the Archaean plateau, and includes the Green-bushes tin-field, and various other minerals, such as graphite and asbestos. There follows a wide belt of granitic rocks; it has no permanent surface water and is bare of minerals, and, as it is considered an effective barrier, it is not good for settlement or prospecting of the country to the east. This granitic band ends to the east in the first auriferous belt, which extends from the Philliips river, on the southern coast, to Southern Cross, on the Perth to Kalgoorlie railway; thence it goes through Mount Magnet, Lake Austin and the Murchison Goldfield at Nannine, and through the Peak Goldfield to the heads of the Gascoyne and Ashburton rivers. To the east of this belt is a barren band of granites and gneisses, succeeded again eastward by the second auriferous belt, including the chief goldfields of Westralia. They begin on the south with the Dandaragu Goldfield, and the mining centre of Norseman; then to the north follow the goldfields of Mingenew, Norseman, Boulder, and the now less important field of Coolgardie. This line continues thence through the goldfields of Leonora and Mount Margaret, and reappears behind the western coast in the Pillbara district. The rocks of the Ausralian are gneisses and other basic schists, traversed by dykes of granite, diorite and porphyrite, with some peridoteites. Among the amphibolites there have been crushed and then silicified into jasperoids, so that they much resemble altered sedimentary slates.

The Palaeozoic group is represented by the Cambrian rocks of the Kimberley Goldfield, which have yielded Olenellus fossari. There are no certain Outcrops of Silurian, Devonian or Carboniferous rocks, while the Silurian is represented in the King Leopold Range of Kimberley, and, according to H. P. Woodward, in the contorted, unfossiliferous quartzites and shales of the Stirling Range, north of the Abmer and the Stirling ranges, the Jurassic rocks of the Pilbara district are represented by an area of some 2000 sq. m. of Devonian sedimentary and volcoic rocks in the Kimberley district, and by the Carboniferous system, including limestone. Some of the earlier marine types in the Stirling Range. Carboniferous limestones occur in the Napier, Oscar and Gelkie Ranges of Kimberley, and in the basin of the Gascoyne river, where they contain the glacial deposits discovered by Gabb-Maitland.
between the Wooraaminda and Minaiyu rivers. The upper and terminal types. The Cenozoic, including the Miocene, are represented by Lepidodendron in the Kimberley district, and the coals of the Irwin coalfield, the age of which is proved by the interstratification of the coal seams with beds containing the Tertiary

The Miocene is represented by the lignites of Kalamunda, and by L. subguineanudivisus of the Kimberley. The Mesozoic rocks were discovered in 1861, and their chief outcrop is along the western coast plains of Western Australia. This is the chief area of the subgenus L. subguineanudivisus, and its chief coalfield is in the district of Kalamunda. The fossils indicate a Lower Jurassic age; and, according to Etheridge, some of the fossil plants are Cretaceous. The Collietea, to the east of Bunbury, is generally regarded as Mesozoic. Its coal is influenced by a recent Eocene sea, and in some places, as at Carnarvon, where they appear to be over 1000 ft. in thickness. The coastal region also includes sheets of clay and sandstone, with deposits of brown coal as on the Fitzgerald river on the southern coast, and in the basin of the Gascoyne. The Archean plateau of the interior is covered by wide sheets of sub-aerial and lacustrine deposits, which have accumulated in the basins and valleys, and are also present in the interior, laterite plays in places and conglomerates. In places the materials have been roughly arrowed by river action, and have been divided by native plants of Australia. The great part of the Australian flora is represented by the basalts of Bunbury and Black Point, east of Flinders Bay.

A bibliography of Western geological history was given by Maitland, Bulletin 8, No. 1, 1898. An excellent summary of the mineral wealth of the state has been given by Maitland, Bulletin 8, No. 4, 1900, pp. 7-23, also issued in the Bulletin of the Geological Survey of Western Australia. The main literature of the geology of Western Australia is in the Bulletin of the Geol. Survey, and in the reports of the Mines Department. A general account of the gold-mining has been given by A. G. Collett, 1902; and also by Donald Clark, Western Min. Indus. (1904).

Flora.—Judged by its vegetable forms, Western Australia would seem to be older than eastern Australia, South Australia being of relatively recent origin. The early history of the flora of Western Australia is given by Sir William J. G. Darwin, F.R.S., in his "Flora of Western Australia". The flora of the Western Australian coast consists of the following two types: the coastal and the inland. The coastal flora is divided into two sections: the coastal plain and the coastal plain of the coast. The inland flora is divided into two sections: the inland plain and the inland plain of the coast. The coastal flora is divided into two sections: the coastal plain and the coastal plain of the coast. The inland flora is divided into two sections: the inland plain and the inland plain of the coast.

There are few Antarctic and Polynesian representatives than in the eastern colonies. European forms are extremely scarce. Compared with the other side of Australia, a third of the genera on the south-west is almost wanting in the south-east. In the latter, 55, having more than ten species each, have 1250 species; but the former has as many as 55 of its genera. The northern flora is the most richly developed, and the southern flora is the least richly developed. There are few rare or special orders and genera westward, but more species. Baron von Müller declared that "nearly half of the whole vegetation of the Australian continent has been lost by the burning of the Westralian coast in the course of time, and the coast has become a desert, and the coast has become a desert."

He included 9 Malvaceae, 6 Euphorbiaceae, 2 Rubiaceae, 9 Proteaceae, 47 Leguminosae, 10 Myrtaceae, 12 Compositae, 3 Labiatae, 6 Cyperaceae, 13 Convolvulaceae, 16 Gramineae, 3 Filicales, and 2 Trochodendrales. Some of these families are identified with those of India or Indian islands. While seven-tenths of the orders reach their maximum south-west, three-tenths do so in the east.

The Melaleuca Lecadendron is the paperbark tree of settlers. The rigid-leaved Banksia is known as the honey-suckle. Cassiniae are the name given by the explorers of the Expedition. The Eucalyptus is the most important of the genus. The beautiful flowering shrubs distinguish the south-west; and the deserts are all ablaze with flowers after a fall of rain. Poison plants are generally showy Leguminosae, Sida and the Gastrolobium.

The timber trees of the south-west are almost unequalled. Of the Eucalypts, the jarrah or mahogany, E. marginata, is first for value. It runs over from the western plains to the north-west, and its distribution is the same. Sir Malcolm Fraser assigns 14,000 sq. m. to the jarrah, 10,000 to E. viminalis, 2300 to the karri (E. coloeea or E. diversicolor), 2400 to York gum (E. loxophleba), 800 to the red gum, 400 to the black gum, and 500 to the mallee (Eucalyptus, P. caryophyllaceae). Not much good wood is got within 20 m. of the coast. The south-west forest rises over 300 ft. Morel furnishes good timber and rich oil. An ever-increasing trade is done in the timber of the south-west forests.

Fauna.—Among the mammals are the Macropus giganteus, Myrmecobius irminus, M. limnaeus, M. brachyurus, Lagoracetas fasciatus, Bellonia pentlandi, Pachtrybasus verrucosus, Pseudochirus cohiun, Daycurrus poggio, Tarsipes rostratus, Antechinus opipalis, Perameles obesa, Perameles myotis, Myrmecobius fasciatus. Fossil forms partake of the existing marsupial character. Diprotodon is allied to the modern kangaroo, and Diprotodon antiquus is allied to the modern wallaby. Megaceros, the largest marsupial, is allied to the modern kangaroo. Kerguelen Island is the northernmost part of New Zealand, in the South Pacific. The total length of the country is 4000 miles, from Cape Prince of Wales in the north-east, and Perameles bogoujinvillei at Shark's Bay. The dalyge or Petrogale lagostes is at Swan river and Hypsiprymnodon in the south. There are three kinds of wombat. The Myrmecobius, from Cape Prince of Wales in the north-east, and from Shark's Bay. The Ilulius and Pseudochirus are allied to the modern kangaroo. No other land has a fauna of greater importance. The Hapalolus of the interior has nests in trees. Beaver rats and other small rodents are troublesome pests. The goat and the kangaroo are the most important of the mammals. The platypus (Ornithorhynchus) and the echidna (Tachyglossus) are the only forms of the Monotremata. The seal, whale and dugong occur in the adjacent seas.

The west is not so rich as the east of Australia in birds. Many forms are absent and others but poorly represented, though some are peculiar to the west. The timbered south-west has the greatest variety of birds, which are scarce enough in the dry and treeless interior. Of lizards the west has 12 genera not found in eastern Australia. Of snakes there are but 15 species to 3 in Tasmania and 31 in New South Wales. While the poisonous sorts are 2 to 1 in the east, there are none in the west, and they are an article of food. The freshwater fishes are not all like those of the east. They include the mullet, snapper, ring fish, guard fish, bonita, rock cod, shark, saw fish, parrot fish and cobbler. Under the sea there are the cold-water species which are bred for natives at Shark's Bay; the trepang or bêche-de-mer is also met with in the north. Insects are well represented, especially Coleoptera, Lepidoptera, Hymenoptera, Hemiptera and Diptera.

Climate.—With the exception of the little region over the whole area is considerable. Western Australia differs from the country to the east in having no extensive ranges to collect vapour, while the trade winds blow off the dry land instead of from the ocean; for these two reasons the climate is very dry. Thunderstorms often supply almost the only rainfall in the interior. The south-western corner, the seat of settlements, is the only portion where rain can be relied upon for cultivation; but even there few places have a rainfall of 40 in. As one goes northward the moisture lessen. The north-west and all the coast along to Kimberley, with most of that district, suffer from such dryness as may come in summer within the sphere of the north-west monsoons, though just over the low coast-range few showers are known. The south coast, exposed to polar breezes, with uninterrupted sea, has to endure lengthened droughts. In the Swan river quarter the rainfall is in winter, being brought by north-west winds, and summer days have little moisture. While the south wind cools the settled region, it comes over the perched interior to the southern extremities. The cool wind of St. George's Sound, north of it, is from the south in summer to Kimberley and the north-west. In one season the land is hot: in another, cool; but always dry. There are two distinct seasons. There is the winter and the summer. The winter commences somewhat abruptly, being ushered in by heavy rains; it begins usually not earlier than the middle of April or later, and continues at the rate of its intensity until the middle of October. The winters are, as a rule, very mild, but there is some cold weather in July and August, and though there is little at the coast, there is not uncommon inland. The summer is heralded by an occasional hot day in October, in November the weather becomes settled and continues warm until the end of March. In the four months, December to March, the maximum temperature in the shade generally begins to exceed 74° F. on 37 days, but as a rule the heat does not last long, the evenings and nights being tempered by a cool breeze.

In the interior the climate resembles that of the south-west in regard to the occurrence of two seasons only. The winter, however, has much less rain than on the coast, and is cold, clear and bracing. The summer is, as a rule, hot, but is tempered in the south by occasional cool changes, though unrelied as the tropical is approached. Within the tropics there are two seasons, the wet and the dry. The wet season is usually pleasant, the temperature rarely falling below 60°; the dry season, which lasts from April to October, is hot and uncomfortable. In the south-west, at Perth is 33° in falling on 110 days; the mean maximum temperature is 74°-9° and the minimum 54°-5°; at Coolgardie the mean maximum temperature is 77°-8° and the minimum 47°-4°. The rainfall on the north coast of the coast is the mean maximum is 93°-9° and the minimum 75°-4°.

Population.—Population made very slow increase under the old conditions of settlement, and even when gold was discovered in 1852 at Kimberley, and five years later at Yilgarn, no great impetus was given to the colony, and at the census of 1851 the population was still under 50,000. The sensational gold find is
at Coolgardie in 1892, however, had a most important influence in drawing population, and in a three and a half years the population was doubled; during a portion of this time the rush of miners to the gold-fields was so great as to be reminiscent of the experience of the eastern colonies during the 'fifties. At the end of 1905 the population was 254,770, comprising 150,405 males and 104,284 females. The slowness of the early growth and the more rapid strides of later years will be gathered from the following figures: pop. (1860) 15,227, (1870) 25,084, (1880) 29,019, (1890) 46,290, (1893) 101,238, (1901) 194,889. The chief towns of Western Australia are: Perth—the capital—56,000, Fremantle 23,088, Kalgoorlie 68,760, Boulder 558. The number of towns and villages is very extensive, especially Coolgardie, for example, was returned in July 1894 as having within its municipal boundaries 12,000 people; in 1905 it had only 3830.

The births during 1905 numbered 7582 and the deaths 2790, the rates per thousand of population being respectively 30-30 and 18-83, showing a net increment of 19-47 per 1000. In the period 1861–1865 the birth-rate was 31-07 per 1000. Between 1886 and 1890 it stood at 46-88; then came a rapid decline, and in 1896 was reached the low level of 22-67 per 1000. In 1904 the rate was 30-34 per 1000. The decline in the birth-rates has been a common experience in all civilised and economically progressive regions, and is due in a large degree to the decline in the proportion of females to males. In 1870 the females numbered 62% of the males, and in 1880 75%, while in 1895 the proportion was only 45%. The proportion of the total births by single women, and the death-rate, which in 1897 was 16-99 per 1000, has steadily declined in recent years. The large influx of young unmarried men in the years following the gold rushes, followed by the influx of single women, and the marriage-rates increased from 7 per 1000 in the five years 1891–1895 to 10-7 per 1000 in 1897. In 1905 the rate stood at the more normal level of 8-48. Except for a slight influx of population in the three years 1885–1887, due to the gold discoveries at Kimberley, there was very little immigration to Western Australia prior to 1891; in that year, however, there was a considerable immigration of population from the eastern colonies, notably from Victoria and South Australia, and in the seven years which closed with 1897 the population of the colony gained nearly 110,000 by immigration alone. In 1898 there was still a large inflow of population, but the outflow also was great, and in 1898 and the following year the two streams balanced one another; but 1900 showed an excess of 6000, and 1905 of 7617 gained by immigration.

Western Australia is the most sparsely populated of all the states; only the coastal fringe and the gold-fields show any evidences of settlement, and if the area were divided amongst the population there would be but ten persons to 52 sq. m. The population is almost exclusively of British origin, and only differs from that of the other states in that there is a larger body of Australian-born, who are not natives of the colony itself, but of part of the original settlement of the Church of England; one-fourth belong to other Protestant denominations, and one-fourth are Roman Catholics.

Administration.—In 1890 Western Australia, up to that time a crown colony administered by a governor, was granted responsible government. The legislative authority is vested in a parliament composed of two Houses—a Legislative Council, whose thirty members are elected for six years, and a Legislative Assembly of fifty members, elected by adult suffrage (men and women). As a portion of the Commonwealth, Western Australia sends six members to the federal parliament. In a country so sparsely settled, provincial government has little scope for operation.

So far forty-four municipalities have been gazetted. Besides the municipalities there are district roads boards, elected by the ratepayers of their respective districts to take charge of the formation, construction and maintenance of the public roads throughout their districts. There were in 1905 ninety-four such boards in existence. Some of the districts are of enormous size; For example, has an area of 14,536 sq. m.; Coolgardie North has 7,088 sq. m.; Nullagine 9,438 sq. m., and the Upper Gascoyne 136,000 sq. m. Over a large district little effective work can be accomplished, but where the districts are small the administration is much the same as in the municipalities.

The receipts from rates of all local districts in 1905 was £104,760, and the grants by the government £80,938, making a total of £185,698.

Education.—Attendance at school is compulsory upon all children over six years and under fourteen years of age. Instruction is imparted only in secular subjects, but the law allows special religious teaching to be given during half an hour each day by clergymen of their own denominations. The schools are expected to rely upon the contribution on account of inability to pay fees, of living more than a mile from school, or of having attended school for more than 400 days, and the state granted for these purposes £131,585 on public instruction, the great bulk of which was devoted to primary schools. The number of schools supported by the state in that year was 335, the teachers numbered 688, the establishment of schools £27,078, and the average attendance was 23,703. There were in 1905 99 private schools with 350 teachers and 7353 scholars, the average attendance being 6128. Judged by the number of persons arrested, crime is more prevalent in the other parts of Western Australia, notably in the gold-fields, some of the best and most enterprising of the Australian population; at the same time many undesirable persons flocked to the state in the search of gold, and the old 'forty-niners' toiled a hard life in the gold diggings. These latter form a large part of the criminal population of the state. The arrests in 1905 numbered 14,646, of which 2104 were for serious offences; so that for every thousand of the population 49 were arrested for trivial and 8 for serious crimes.

Finance.—The discovery of gold and the settlement on the gold-fields of a large population, for the most part consumers of durable commodities and manufacturers of the necessities of life, had a most important effect on the revenue of Western Australia. In 1891 the revenue was £97,670, that is, £10,155 per inhabitant; in 1895 it rose to £112,541, or £12,105 per inhabitant; and in 1905 it increased to £164,751, or £18,013 per inhabitant. The total revenue figures were £3,615,340, or £14,188 per inhabitant. The chief sources of revenue in 1905 were: customs and excise, £1,027,858; other taxation, £231,738; railways, £1,685,956; public lands revenue, £1,028,730; and the interest on the public debt, £578,704; mines, £248,496; public works, £149,552. The public debt is of comparatively recent creation. In August 1872 the debt was £7,319, and the principal was increased from £79,382, or £2,557, per head of population, to £5,628,000, or £12,972, per head. The proceeds of the loans were used largely for the purpose of railway extension—the expenditure on this service at the middle of 1906 was £9,618,700; on water supply and sewerage works, £2,892,350; on telegraphs and telephones, £593,058; on harbour and river improvements, £2,182,943. The maintenance of the gold-fields, £573,082; and on development of agriculture, £597,189.

Defence.—The local defence force of Western Australia in 1905 comprised 57 permanent artillerymen, 772 militia, 580 volunteers, and 400 riflemen—a total of 1,593. The defence of the state is undertaken by the federal government.

Minerals.—Gold-mining is the main industry, and in 1905 18,532 men were employed directly in the business, and a large number engaged in the industry. Gold, silver, coal, tin and copper are the chief minerals mined; the mineral production of the state in 1905 was valued at £8,555,811. The value of the gold produced was £5,305,654, a falling off of £18,572 as compared with 1904. The dividends paid by the gold-mining companies for that year amounted to £2,167,639 as against £2,050,547 in 1904. Up to 1905 the total recorded mineral production of Western Australia was valued in 1884 at £55,812,290, representing £35,170,011 of that sum; £13,739,842 had been paid in dividends.

Western Australia ranks as the largest gold producer of the Australian States. Collecting the proceeds of mining operations which had been going on between Greenough and Mulla Mulla on the Geraldton-Cue railway line were discontinued in 1905, the bore hole, carried to a depth of 1418 ft. having failed to find any coal seams. The annual coal production was sold at £16,266; of tin, £8,840; of silver, £44,247. The value of the coal produced in that year was £55,312.

In 1905 the agricultural possibilities of the state are more restricted than those of the eastern states, as the rainfall in the southern and temperate portion does not extend far from the coast, and the land where the fall is satisfactory is only good over small portions of the whole area covered. In 1871 the area covered in wheat was 53,000 acres; in 1891, 64,000 acres; and in 1905, 467,122 acres. The principal crops grown in the year last named were: wheat, 195,671 acres; oats, 15,713 acres; hay, 124,906 acres. The value of the wheat was £149,095, of oats £20,919, and of hay £24,606. In 1905 the number of sheep depastured was 3,120,703; cattle, 631,825; horses, 97,977. These figures show an increase for all classes of stock. There are in the state about 2000 cattle. The number of sheep has increased considerably in late years. In 1871, 2,000,000 lb. of wool were exported; in 1881, 4,100,000 lb.; in
1891, 8,800,000 lb; in 1905, 9,514,000 lb; and in 1905, 17,489,404 lb; the value of the latter being £594,872.

Western Australia has very extensive forests of timber, and it has been estimated that the forest surfaces cover more than 20 million acres, of which 8 million acres are jarrah; 1,200,000 acres, karri; 200,000 acres, tuart; 7 million acres, wandoo; and 4 million acres, York gum, yate, sandalwood and jam. The principal timber-producing areas are near Kalgoorlie and Mandurah, and the exports being about £636,000 annually. There are 30 saw-mills in operation, employing altogether 2750 hands.

Fisheries are taking an important position; they comprise pearl shell, prawn, oyster, crayfish, and smaller fish. The pearl shell fisheries in the north-west and in Shark's Bay have been a considerable source of wealth, the export of pearls and pearl shell being made in 1892, 1893, 1898, 1905, 1906, 1907, 1908, 1909, and 1910. In 1905 the export value was £119,519.

Mandurah, at the mouth of the Murray, and Fremantle have preserving sheds for mullet and snapper. Guano beds are worked to much advantage at the Lacepede Islands. Sait is produced largely at Rottnest Island. Raisins are dried, and the oil of castor trees is expressed. The mulberry tree succeeds well, and sericulture is making progress. Dugong oil is got from Shark's Bay. Honey and wax are becoming valuable exports; from the abundance of flowers the hives can be emptied twice a year. Manna and gums of various kinds are among the resources of the country. Among the wines made are the Riesling, Burgundy, Sweetwater, Rock and Fontainebleau.

Commerce.—All the great lines of steamers trading between Australia and Europe make one of the ports a place of call both on the outward and homeward voyages; this makes the shipping here very large compared with the population. In 1891 the tonnage entered and cleared equalled 21 tons per head, and in 1905 143 tons. The increase is shown by the figures: the shipping in 1881 tonnage entered, 145,048; in 1891, 533,433: 1905, 1,839,227. In 1905 the tonnage entering Fremantle was 1,176,982, and the imports were valued at £6,030,015. The shipping entering Albany has been increasing, and the figures are: 1890, 59,197 tons; 1905, 91,444 tons. The trade of Bunbury was shipping 92,281 tons, imports £59,197; Broome, shipping 32,191 tons, imports £48,653; other ports, shipping 18,306 tons, imports £187,730.

The trade has increased very rapidly under the influence of the gold discoveries, as the following figures show:

About 54% of the trade is with Great Britain and 21% with the other Commonwealths.

Railways.—Western Australia is the only state of Australia in which there is any considerable length of railway lines not owned by the Commonwealth; the Great Southern railway east and west in 1905 was 202 miles, and 655 m. were privately owned. The divergence of the policy of Western Australia from that pursued by other states was caused by the inability of the government to construct lines at a time when the extension of the railway was most urgently required in the interests of settlement. Private enterprise was therefore encouraged by liberal grants of land to undertake the work of construction. Changed conditions have modified the state policy in respect of land grants, and in 1897 the government acquired the Great Southern railway, 243 m. in length, one of the two trunk lines in private hands. The cost of constructing and equipping the state lines open for traffic in 1905 was £806,458; the earnings for that year amounted to £1,610,129, the working expenses were £1,256,003, and the net receipts £354,126; this represents a return of 3.61% upon the capital.

Posts and Telegraphs.—The postal business has grown enormously since the gold discoveries. In 1905 there were 295 post offices as compared with 86 in 1891. In the latter year the letters despatched amounted to 1,300,000 and the newspapers and newspapers to 1,270,000 and the newspapers and newspaper to 1,270,000, and in 1905 the letters and postcards totalled 22,107,000, and the newspapers and papers and newspapers to 14,800,000, being respectively 86 and 59 per head of population. In 1891 there were 245 telegraph stations, 839 m. of line, and 963 m. of telegraph wire in use, while the number of telegrams sent and received was 1,634,597. There were sixteen public telephone exchanges and 4,857 telephones in use at the end of the year.

Banking.—There are six banks of issue, with 109 branches in various parts of the country. The liabilities of these banks in 1904 averaged £2,005,176, and the assets £6,399,305; the note circulation was £2,005,176; the deposits bearing interest £1,475,616; deposits not bearing interest £1,528,304, making the total deposits £4,733,910. The gold and silver held by the banks, including bullion, was £1,239,504. The savings banks are directly controlled by the two large government banks, the Western Australian Bank and the Australian Bank, and in 1904 there were 54,873 depositors in these banks with £2,979,760, an average of £53, 18s. per depositor. In 1891 there were only 3564 depositors and £6,181 at credit.

History.—Both the western and northern coasts of the colony are pretty accurately laid down on maps said to date from 1540 to 1550, where the western side of the continent terminates at Cape Leeuwin. The discovery of the coast may be attributed to Portuguese and Spanish navigators, who were in the seas northward of Australia as early as 1520. The next visitors, nearly a century later, were the Dutch. John Edel explored the north-west coast in 1606, and De Witt in 1628. The "Guido Zee- paard" in 1627 sailed along the south coast, after which the territory being named Nuyt's Land. Tasman made a survey of the north shore in 1644, but did not advance far on the western border. Dampier was off the north-west in 1688 and 1696, naming Shark's Bay. Vancouver entered King George Sound in 1791. The French, under D'Entrecasteaux, were off Western Australia in 1792; and their commodore Baudin, of the "Geographe" and "Naturaliste," in 1801 and 1802 made important discoveries along the western and north-western shores. Captain Flinders about the same time paid a visit to the Sound, and named Nuyt's Land to beyond the South Australian boundary. Freycinet went thither in 1818. Captain King surveyed the northern waters between 1818 and 1822.

The earliest settlement was made from Port Jackson, at the end of 1825. Owing to a fear that the French might occupy King George Sound, Major Lockyer carried thither a party of convicts and soldiers, seventy-five in all, and took formal British possession, though Vancouver had previously done so. Yet the Dutch had long before declared New Holland, which they meant only the western portion of Australia, to be Dutch property. This conviction re-established itself in 1825, and Captain Stirling sent to report upon the Swan river, and his narrative excited such interest in England as to lead to an actual free settlement at the Swan river. Captain Fremantle, R.N., in 1827 took official possession of the whole country. Stirling's account stimulated the emigration ardour of Sir F. Vincent, and Messrs Peel, Macqueen, &c., who formed an association, securing from the British government permission to occupy land in Western Australia proportionate to the capital invested, and the number of emigrants they despatched thither. In this way Mr Peel had a grant of 250,000 acres, and Colonel Latour of 103,000. Captain (afterwards Sir James) Stirling was appointed lieutenant-governor, arriving June 1, 1829. The people were scattered on large grants. The land was poor, and the forests heavy; provisions were at famine prices; and many left for Sydney or Hobart Town. The others struggled on, finding a healthful climate, and a soil favouring fruits and vegetables, whilst their stock grazed in the more open but distant quarters. The overland journey of Eyre from Adelaide to King George Sound in 1829—1840, through a waterless waste, discouraged settlers; but Grey's overland walk in 1838 from Shark's Bay to Perth revealed fine rivers and good land in Victoria district, subsequently occupied by farmers, graziers and miners. The difficulties of the settlers had compelled them to seek help from the British treasury, in the offer to accept convicts. These came in 1850; but transportation ceased in 1868, in consequence of loud protests from the other colonies.

The progressive history of Western Australia may be said to commence in 1870, when its energetic and capable governor, Sir Frederick Weld, began to inaugurate public works on a
large scale. It was still the day of small things, for the colony, though of the enormous area of 1,000,000 sq. m., was practically unknown, its resources were restricted, and its population scanty. However, a beginning was then made, and the first Loan Bill to raise money for pushing on telegraphs, for surveying lines of projected railways, and above all for starting exploring expeditions, passed the Legislative Council. The colony was fortunate in possessing two brothers of the best practical type of explorer, John and Alexander Forrest. The object of their earliest expeditions was to find more land available for pastoral or agricultural settlement. Vast distances in various directions were covered, and severe hardships, chiefly from want of water, made the undertaking hazardous. Perhaps the most famous of these journeys was that accomplished by Mr. (afterwards Sir) John Forrest between Eucla and Adelaide in 1870. Other dauntless explorers—abetted by Mr. Ernest Giles, the Gregories and Mr. Austin—had also contributed to the growing knowledge of the resources of the vast territory, and the state owes and gratefully acknowledges its debt to these stalwart and splendid pioneers. Although, in consequence of the vast amount of gold which had been found in the eastern colonies, principally in Victoria, all these explorations had cast aside a large auriferous district in the Kimberley and the first payable gold-field was shortly afterwards "proclaimed" there. Exploring expeditions in every direction were then started both privately and publicly, and prosecuted with great vigour. Within five years gold-fields were proclaimed at Yilgarn, about 200 m. to the east of Perth, and the discovery of patches of rich alluvial gold in the Pilbara district quickly followed, but the rush for the Coolgardie and Kalgoorlie gold-fields did not begin until 1893.

The year 1889 found the colony on the eve of responsible government. Two years before, a practically unanimous vote of the Legislature had affirmed the principle of autonomy, and the general election in the following year showed still more plainly the desire of the people of Western Australia for the self-government which had enabled the eastern colonies to control their own affairs successfully for thirty years. The new Legislative Council of 1889 therefore drafted a Constitution Bill, which after some discussion was forwarded to Lord Knutsford, the Secretary of State for the Colonies. This Bill was laid before the Imperial Parliament, which was then rejected by that assembly, chiefly owing to the misunderstanding of vital questions, such as the control of crown lands, the scantiness of the scattered population, and other less important details. However, the governor of that day, Sir Frederick Napier Broome, K.C.M.G., having satisfied himself that the constitutional change was necessary not only for the immediate needs of the rapidly growing colony, but in view of the larger question of Imperial Federation, supported the demands of the Legislature in every possible way. A clear and able statement of the colonists' case, which appeared above his signature in The Times in the summer of that year, helped to bring about a better understanding of the subject; and a slightly modified Constitution Bill having been passed by the new Legislative Council, the governor and two members of the Legislature (Sir T. C. Campbell and Mr. S. H. Parker, Q.C.) were selected to proceed to England as delegates to explain and urge the wishes of the colonists upon the Imperial Parliament. A select committee, with Baron de Worms as chairman, was appointed, and the matter was carefully considered; with the satisfactory result that the Bill enabling the Queen's grant of franchise to Western Australia passed its third reading in the House of Commons on 4th July, and received the royal assent on 15th August 1890.

Since then the colony has made great progress. Sir John Forrest, who was for ten years its Premier, brought to its arduous task not only administrative ability of a very high order, but a thorough and intimate knowledge of the needs and resources of the vast colony over so much of which he had travelled.

For a long time the advantages of Federation were not so apparent to the people of Western Australia as to those of the eastern colonies, and although Sir John Forrest consistently and patiently laboured at every opportunity to explain the principles of the Bill framed by the Imperial Convention to the Legislative Council, and although a number of deputations were despatched by the colony, and although a number of resolutions were passed in the Legislative Council bearing the object of federation, it was not until 1899 that a Bill was put through Parliament. It has been said that the colony was not the first to object to Federation, but that it was only the first to object to Federation under British leadership. The colony has always, in the opinion of the colony, been endeavouring to contribute to the federation of the dominions of the British Empire; and although a number of resolutions passed by the Legislative Council have recommended federation, there have been two distinct objections to the scheme. The first was the desire to federate on the lines of the British system, and the second was the desire to federate on the lines of the Australian system. It is not surprising, therefore, that the colony was not the first to object to Federation under British leadership. The colony has always, in the opinion of the colony, been endeavouring to contribute to the federation of the dominions of the British Empire; and although a number of resolutions passed by the Legislative Council have recommended federation, there have been two distinct objections to the scheme. The first was the desire to federate on the lines of the British system, and the second was the desire to federate on the lines of the Australian system. It is not surprising, therefore, that the colony was not the first to object to Federation under British leadership. The colony has always, in the opinion of the colony, been
Perpendicular, with Early English tower, and contains some interesting monuments.

**WEST HAM.** a municipal, county, and parliamentary borough of Essex, England, forming an eastward suburb of London. Pop. (1891) 204,003; (1901) 267,358. The parish stretches north and south from Wanstead and Leyton to the Thames, and east and west from East Ham to the river Lea. It is divided into four wards—Church Street, Stratford-Langthorne, Plaistow and Upton. The church of All Saints has a good Perpendicular tower, but the remainder is extensively restored. There are a number of old monuments. In the restoration of 1866 some early mural painting was discovered. An interesting monument which is generally supposed to be a chantry chapel was discovered, remaining above the later naves. There are several modern churches, and a Franciscan monastery and school (St Bonaventure's). West Ham Park (80 acres) occupies the site of Ham House and park, for many years the residence of Samuel Gurney, the banker and philanthropist. The place was purchased for £25,000, and vested in the corporation of London for the use of the public. Of this amount the Gurney family contributed £10,000 and the corporation the same sum, the remaining £5000 being collected from the inhabitants of West Ham. The park was opened by William de Montfichet, opened in 1874. Mrs Elizabeth Fry lived in a house in Upton Lane, on the confines of her brother's park. In 1762 the number of houses in West Ham parish was stated to be 700, of which "455 are mansions and 245 cottages." Now few large houses remain, but the smaller houses have greatly increased. There are numerous chemical and other manufactures which have been removed from London itself; and the large population can also be traced in part to the foundation of the Victoria and Albert docks at Plaistow. Included within the borough are the extensive railway works of the Great Eastern railway at Stratford. This industrial centre is continued eastward in the urban district of East Ham (pop. 66,918), where the old village church of St Mary Magdalene retains Norman portions. West Ham is governed by a mayor, 12 aldermen and 36 councillors. Area 4,683 acres.

At the time of the Conquest West Ham belonged to Aelstane and Leurved, two freemen, and at Domescadal to Ralph Gernon and Ralph Peverel. West Ham village was included in the part which descended to the Gernons, who took the name of Montfichet. The manor of West Ham was settled upon Stratford-borne Abbey, founded by William de Montfichet in 1135 for monks of the Cistercian order. The abbey stood in the marshes, on a branch of the Lea known as the Abbey Creek, about 3/4 m. south of Stratford Broadway. West Ham received the grant of a market and annual fair in 1253. The lordship was given to the abbey of Stratford, and, passing to the crown at the dissolution, formed part of the dowry of Catherine of Portugal, and was therefore called the Queen's Manor. In 1858 the urban sanitary district was erected into a parliamentary borough, returning two members for the northern and southern divisions respectively. It was incorporated in 1886.

**WEST HAVEN**, a borough of Orange township, New Haven county, Connecticut, U.S.A., on New Haven Harbor and separated from New Haven by the West river. Pop. (1900) 5247 (893 foreign-born); (1910) 8543. West Haven is served by the New York, New Haven, & Hartford railway. It is mainly a residential suburb of New Haven. There is a public park, and Savin Rock, rising from Long Island Sound, is a summer resort. West Haven was set apart from New Haven in 1822 and was united with North Milford to form the township of Orange; it was incorporated as a borough in 1873.

**WEST HOBOKEN**, a town of Hudson county, New Jersey, U.S.A., in the N.E. part of the state, adjoining Hoboken and Jersey City. Pop. (1890) 11,665; (1900) 23,094, of whom 9193 were foreign-born; (1910) census, 35,403. For transportation facilities the town depends upon the railways serving Hoboken and Jersey City. West Hoboken lies about 1/4 m. W. of the Hudson river, occupies a pleasant site somewhat higher than that of its neighbouring municipalities, and commands a fine view of the surrounding country. Among the prominent buildings are a Carnegie library, St Michael's Monastery (containing a theological school), a Dominican Convent, and several fine churches; and there are two Roman Catholic orphanages. The town is an important centre for the manufacture of silk and silk goods; in 1905 the value of these products was $4,211,018. West Hoboken was created a separate township in 1861, from a part of the township of North Bergen, and in 1884 was incorporated as a town.

**WESTHOUGHTON**, an urban district in the Westhoughton parliamentary division of Lancashire, England, 5 m. W.S.W. of Bolton on the Lancashire and Yorkshire railway. Pop. (1901) 14,377. There are coal mines in the neighbourhood, and there are sidings besides the above and cotton mills. Westhoughton before the time of Richard II. was a manor belonging to the abbey of Cockersand. It was confiscated at the Reformation, and since then has been vested in the crown. The army of Prince Rupert assembled on Westhoughton moor before the attack on Bolton.

**WEST INDIES**, THE, sometimes called the Antilles (q.v.), an archipelago stretching in the shape of a rude arc or parabola from Florida in North America and Yucatan in Central America to Venezuela in South America, and enclosing the Caribbean Sea. Geologically the islands fall into three classes. The Lesser Antilles (comprising the remainder) are again divided into the Windward Islands and Leeward Islands. Geographically, the Leeward Islands are those along the coast of St. Lucia, and the Windward, St. Lucia and those to the south of it; but for administrative purposes the British islands in the Lesser Antilles are grouped as is shown in the table given later.

**Geology.**—The West Indies are the remnant of a submergent mountain chain, the continuation of which towards the west must be sought in the mountains of Honduras. In Haiti the chain divides, one branch passing through Jamaica and the other through Cuba, the Cayman Islands and the Mistorious Bank. In **Das Antillen der Erde**, E. Suess divides the Antilles into three zones: (1) The first or interior zone, which is confined to the Lesser Antilles, is entirely of volcanic origin and contains many recent volcanic cones. It is cut by the important line of succession into the islands of St. Kitts to Grenada and the Grenadines. The western part of the deep-cleft island Guadeloupe belongs to this zone. (2) The second zone consists chiefly of Cretaceous and early Tertiary rocks. In the west it is broad, including the islands of the Windward and Leeward Islands; in the east it is restricted to a narrow belt which comprises the Virgin Islands (except Antigua), Anguilla, St Bartholomew, Antigua, the eastern part of Guadeloupe, and part of Barbadoes. (3) The third and outermost zone is formed of Miocene and later beds, and the islands which compose it are flat and low. Like the second zone it is broad in the west and narrow in the east. It includes the Bahamas, Anegada, Sombrero, Barbuda and part of Barbados. Geologically, Florida and the plain of Yucatan may be looked upon as belonging to this zone. Neither Trinidad nor the islands off the Venezuelan coast can be said to belong to any of these three zones. Geologically they are a part of the mainland itself. They consist of gneiss and schists, supposed to be Archaean, eruptive rocks, Cretaceous, Tertiary and Quarternary deposits; and the strike of the older rocks varies from W.S.W. to E.S.E. and W.S.W. There are many volcanic rocks much more nearly allied to the Greater Antilles and to Central America than they are to the Lesser Antilles; and there is accordingly some reason to believe that the arc formed by the West Indian Islands is really a downfolded portion of a chain of islands recognized by Suess as being very nearly defined, the geological history of the Greater Antilles, with which must be included the Virgin Islands, differs considerably from that of the Lesser Antilles. In the third zone there are three essentially connected, and recognized by Suess as being very nearly defined, the geological history of the Greater Antilles, with which must be included the Virgin Islands, differs considerably from that of the Lesser Antilles. In the third zone there are three essentially connected, and the Archipelago the geological succession begins as a rule with volcanic tufts and conglomerates of hornblende-andesite, &c., in the midst of which are intercalated occasional beds of limestone with flints, and Cretaceous fossils. These are overlaid by sediments of terrigenous origin, and the whole series was folded before the deposition of the next succeeding strata. The nature of these Cretaceous deposits clearly indicates the neighbourhood of an extensive area of land;
but during the succeeding Eocene period and the early part of the Oligocene, a profound subsidence led to the deposition of the Globigerina chalks and white Radiolarian earths of Jamaica, Cuba and Haiti. These beds, however, have in many places been almost completely submerged, and the similar deposits of Barbados and Trinidad point to a similar subsidence beyond the Windward Islands. In the middle of the Oligocene period a mighty upheaval, according to the fossil remains of the Antilles in the Pliocene and Pleistocene periods. Moreover, on the evidence of submerged valleys, he concludes that practically the whole of the Caribbean Sea must at this time have been below sea-level, except a few coastal shoals and the Great Antilles and there is no evidence that the area ever sank to abysmal depths.

In the foregoing account the chronology of R. T. Hill has been followed; but there is still considerable difference of opinion as to the ages and correlation of the various Tertiary deposits and consequently as to the dates of the great depression and elevation. The depression, however, was clearly a much more extensive one than that of the West Indian bridge, between North and South America.

The mineral wealth of the islands is not remarkable. Gold, iron, copper, molybdenum, zinc, sulphur, mica, iron pyrites, manganese, molybdenite, and free silver are, however, found in the island of Jamaica, but it is not yet ascertained whether they are of any commercial value.

Climate.—As in most tropical countries where considerable heights are met with—and here over 15,500 sq. m. lie at an elevation of more than 3000 ft.—the climate of the West Indies (in so far as heat and cold are concerned) varies at different altitudes, and on the higher parts of many of the islands a marked degree of coolness may generally be found. With the exception of parts of the Antilles, all the islands lie between the isobaths 30° and 82° F. The extreme heat, however, is greatly tempered by the sea breezes, and by long, cool, refreshing nights. Frost is occasionally formed in the cold season when hail falls, but snow is unknown. The seasons may be divided as follows. The short wet season, or spring, begins in April and lasts from two to six weeks, and is succeeded by the short dry season, when the thermometer rises to an extent well nigh unbearable. No change occurs till after a period varying from the end of July to the beginning of October, when the great rainfall of the year begins, accompanied by tremendous showers and stickless hurricanes. The season is known as the "hurricane months." The annual rainfall averages 63 in. These storms arise in the Atlantic and towards the east. For a day or two they follow a west-easterly course, inclining at some limiting point towards the north, the polar tendency becoming gradually more marked as the distance from the equator increases. When the hurricanes reach latitude 25° N., they curve to the northeast in quick succession, the farthest point being 91° (1901, Oxford, 1904); J. W. Spencer, "Reconstruction of the Antillean Continent," Bull. Geol. Soc. Amer., vol. vi. (1895), p. 193 (Abstract in Bull. Mag., 1843-44, p. 336): see also a series of papers by J. W. Spencer, "On the Antilles," Geol. Soc. Amer. Bull., 1892-1902. R. T. Hill, "The Geology and Physical Geography of Jamaica," Bull. Mus. Comp. Zool. Harvard, vol. xxxiv. (1899).

Flora.—The flora of the islands is of great variety and richness, as well as fertility. The various species of trees flourish, either in a wild state or under cultivation; grain, vegetables, and fruits, generally common in cool climates, may be seen growing in such quantities that it is vain to speak of perfection under the influence of extreme heat, nothing here being required for the successful propagation of both a difference in the height of the lands upon which they grow. The forests, which fully cover one-third of the surface of the earth, are of different kinds and are not merely tropical in character. The woods are of various sorts and are numerous and wide-spreading, produce the most valuable woods and delicious fruits. Palms are in general variety, and there are several species of gum-producing trees. Some locust trees have been estimated to have attained an age of 4000 years, and are of such height and bulk. Pipi'dea, an orchid of the most imperfect character when in the ground, is used as a material for house-building. Xanthoxylon, the admired and valuable satin-wood of common occurrence; Spondias finds a ready market on account of its toughness; crab-wood yields a useful oil and affords reliable timber; and tree ferns of various species are common. Fimoto in particular on Jamaica, is the agricultural need of the islands that the greatest importance attaches. For centuries almost the whole care of the planters was bestowed upon the cultivation of the sugar-cane and tobacco plant, but in modern times, as well as indigo and cotton, their attention has been directed to the production of other and more varying crops. Crops of tobacco, beans, peas, maize, and Guineas corn are popular, and a species of rice, which requires flooding for its successful propagation, is largely produced. 

Hymenocallis striatum covers many of the plains, and affords food for cattle.

Fauna.—The fauna of the region is Neotropical, belonging to that region which includes South and part of Central America, although great numbers of birds from the North-American portion of the Holarctic realm migrate to the islands. The resident birds, however, eighteen genera of which are certainly Neotropical, show beyond doubt a North American fauna of the islands properly belong. Most of the birds are, as in most island groups, rare. The agouti abounds, and wild pigs and dogs are sufficiently numerous to afford good sport to the hunter, as well as smaller game, in the shape of ear-rabbits, agoutis, musk-rats and raccoons. The non-migrating birds include trogons, sugar-birds, chattering, and many parrots and humming birds. Waterfowl and various kinds of pigeons are in abundance. Reptiles are few in number; both the boa and adder—earl indel. while lizards, scorpions, tarantulas and centipedes are everywhere. Insects are in great numbers, and are often annoying. Among domestic animals mules are largely reared, and where the country affords suitable pasture and forage cattle-breeding is practised. Goats abound, and large flocks of sheep are kept for the sake of their fleece alone, as the climate is not adapted for wool-growing.

Area and Population.—The following list of the West Indian islands gives their area and population. Notwithstanding the

1 Estimate, 1905.  2 Estimate, 1906.  3 Estimate, 1905.  4 Population of all Dutch islands for 1908.  5 Estimate, 1910.  6 Estimate, 1907.
operations of educational institutions and of large numbers of missionaries of various religious denominations, the percentage of illegitimate births among the population of the British West Indian islands remains very high—in Barbados about 54; in Jamaica, 63; in Trinidad, 59% of the general births; and 79% of the East Indian.

The population of the West Indies represents many original stocks, the descendants of which have developed variations of habits and customs in their New World environment. They may be divided into six main classes: (1) Europeans—immigrants (British, French, Spanish and in a lesser degree Dutch, Danish and German) and West Indian born; (2) African negroes—(a) a mixture of Europeans and Africans; (4) coolies from India—imported and West Indian born; (g) Chinese; (6) aboriginal Indians of more or less pure descent. Of these, the people of pure African blood are in a large majority, the "coloured" race of mixed European and African blood being next in numerical importance. Under British influence the negroes of the West Indies have become British in thought and habit; and it would seem that the stimulating influence of European direction and encouragement is absolutely necessary for the future development and prosperity of the islands. In Dominica and Haiti the negroes are left to drift along, while the French and Danish islands show no great sign of progress.

British Colonies, Government, &c.—The British West India colonies are either crown colonies—that is to say, their government is absolutely under the control of the British Colonial Office, the official members of their councils predominating, and the unofficial members being nominated by the crown, as in the Windward and Leeward Islands—or they have a measure of representative government, as in the Bahamas, Barbados and Jamaica, in which all or part of the legislature is appointed, and the crown is more or less independent of crown control.

The laws of the various colonies are English, with local statutes to meet local needs. The governors and high officials are appointed by the crown; other officials are appointed by the governor. Each governor acts under the advice of a privy council. In matters of detail the colonies present a variety of forms of government (for which see the separate articles). Federation has been widely discussed and is held desirable by many, but in view of the insular character of the colonies, the considerable distances separating some of them, and in many instances the lack of common interests (apart from certain broad issues), the project appears to be far from realization.

The only fortified places in the British West Indies are Jamaica, Barbados and St Lucia—all of importance as coaling stations. In many of the islands there are local volunteer forces. The police forces of the colonies are in the main in the hands of the British. The police force is usually officered by Europeans.

Economic Conditions.—The West Indian colonies have suffered from periods of severe economic depression, though from the early years of the 20th century there has been good evidence of recovery and development. An obvious reason for temporary depression is the liability of the islands to earthquakes and hurricanes, in addition to eruptions in the volcanic islands, such as those in St Vincent and Martinique in 1902. For example, the great earthquake of January 1907 in Jamaica may be recalled, and hurricanes caused serious damage in Jamaica in August 1903 and November 1909, and in the Bahamas in September and October 1908. A treasury fund has been established in Jamaica as a provision against the effects of such disasters. Since 1903 it is stated that the excessive rainfall which accompanies these storms is of great ultimate benefit to the soil.

The British West Indian colonies do not offer opportunities for ordinary labouring immigrants. Barbados is the only island where the land is entirely settled. But the settlement, planting and development of lands elsewhere involve a considerable amount of capital, and manual labour is provided by the natives or East Indian coolies. Attempts to settle European labourers have been unsuccessful. The West Indian negro, as the labouring class, has frequently been condemned as averse from regular work, avaricious in regard to both his own and his colony's affairs, immoral and dishonest. In so far as these shortcomings exist, they are due to the tendencies inherited from the period of slavery, to the ease with which a bare livelihood may be obtained, and to other such causes. But for the most part the negroes appreciate their advantages under British government and are quick to assimilate British customs and ideas. Advances in the system of peasant proprietorship have brought beneficial results. The drafting of large numbers of labourers from the West Indies to the Panama Canal, though causing a shortage of labour and involving legislation in some of the islands, exercised a moral effect on the natives by enlarging their horizon.

The growth of British West Indies is attributed to "the revival of the sugar industry, to the development of the fruit trade; to the increase in the cultivation of cocoa and cotton; to the volume of tourist travel, which swells year by year; and to such local developments as the 'boom' in Trinidad oil." It was pointed out in the Report of the Royal Commission on Trade Relations between Canada and the West Indies (Cd. 5369, London, 1910) that "the geographical position of the West Indian Islands must always tend to throw them under the influence of the fiscal system either of the United States or of the Dominion of Canada. Attempts have been made from time to time to obtain for these Colonies special advantages in the markets of the United States. The Colonial policy of the United States has now finally stopped..." and the connexion with the Dominion has therefore become of paramount importance. The Dominion government admitted the West Indies to the British preferential tariff (25% under existing duties) in 1898. The percentage was raised to 33½ in 1900. In 1903 the duties imposed on bounty-fed beet sugar in the United States, which had opened the market there to West Indian sugar, were abolished, and a surtax (since removed) was placed on German imports into Canada. Both acts enhanced the value of the Canadian market to the West Indies, while that of the American sugar market was further reduced when in 1901 sugar from Porto Rico began to be admitted thereto free of duty, and when special terms were extended to sugar from the Philippine Islands and Cuba in 1902 and 1903 respectively. The Canadian connexion was thus largely instrumental in saving the sugar industry in the West Indies from severe depression, if not from the actual extinction foreseen by a Royal Commission in 1897. This commission pointed out, in particular, the danger which threatened those colonies where sugar provided practically the sole industrial and commercial interest. On a recommendation of this commission the Imperial Department of Agriculture was established in 1898, its cost being met from imperial funds. It is under a commissioner with headquarters at Barbados. Its functions are to maintain and supervise botanical and experimental stations, to establish agricultural schools, arrange agricultural teaching in other schools, create scholarships, and issue publications. The department has been largely instrumental in establishing new industries and thus relieving many islands from dependence on the sugar industry alone.

The negotiations for commercial relations between the West Indies and Canada began in 1866; in 1872 proposals for steamship subsidies were accepted. The Commission of 1909 recommended that the governments should continue to subsidize a Canadian steamship line. In 1907 the Canadian government established a Canadian steamship line. In 1901 a line of subsidized steamers had been started between Jamaica and England, but this contract expired, and the mail contract was determined in 1910, and recommendations were put forward for a steamship service between Canadian and West Indian ports with improvements additional to those recommended by the Commission. It may be added that the

1 In The Times of May 24, 1910, where, in an imperial supplement, a number of articles on the West Indian colonies appear.
Commission also made recommendations for the reduction of the high cable rates between the West Indies and the United Kingdom.

Besides sugar, the principal products of the islands are cocoa, fruits and cotton. Cotton-growing reached importance in a very short time owing largely to the efforts of the Imperial Department of Agriculture which was established in 1813, and in that island and elsewhere (Antigua, St Kitts, Montserrat) good crops are now obtained. Grenada is almost entirely, and Trinidad, Dominica and Tobago are largely, devoted to sugar. The spice trade is of growing importance, and there is a demand for bottled fruit in Canada and elsewhere. The variety of fruits grown is great; the bananas and oranges of Jamaica, the pineapples of Trinidad, the orange of Barbados, the mango of the Virgin Islands, and the strawberries of the Bahamas may be mentioned as characteristic.

It must be borne in mind, however, that the islands as a whole cannot be said to possess a community of commercial interest. Even the industries already indicated are by no means equally distributed throughout the islands; moreover there are certain local industries of high importance, such as the manufacture of rum in Jamaica, and the oilfields (the development of which was first seriously undertaken about 1800) in Trinidad, and the production of arrow-root in St Vincent. Sponges are an important product of the Bahamas, and salt of the Turks Island. Rubber plantations have been successfully exploited in several islands, such as Trinidad, Dominica and St Lucia. (See further article on the various islands.)

Edification.—In all the British colonies there is full religious toleration. The Church of England Province of the West Indies is divided into the following bishoprics: Jamaica, Nassau (i.e., Bahamas), Trinidad and Tobago, Barbados, Windward Islands, British Guiiana. With the exception of Barbados and British Guiana, the Church of England is disestablished, endowment taking place gradually, the churches thus becoming self-supporting. In Barbados the Church is both established and endowed. In the Bahamas and Jamaica disestablishment is gradually taking place; in Trinidad and British Guiana the Church of England receives endowment concurrently with other religious bodies. The Windward Islands, Leeward Islands and the British Honduras are totally disestablished. In all the islands, except Trinidad, St Lucia, Grenada and Dominica, the Church of England, though no longer the church associated with the majority of the population, is the most numerous of any denomination. There are Roman Catholic bishops at Port-of-Spain (Trinidad), Roseau (Dominica—for the Leeward Islands), Jamaica, British Guiana and Barbados (resident at Georgetown), British Honduras, Guadeloupe, Martinique, Haiti (archbishop and four bishops), Santo Domingo (archbishop), Cuba (archbishop and bishop), Porto Rico and Curaçao. Other religious denominations working actively in the West Indies are Methodists, Wesleyans, Presbyterians, Congregationalists and Moravians.

History.—The archipelago received the name of the West Indies from Columbus, who hoped that, through the islands, he had found a new route to India. The name of Antilles was derived from the fact that Columbus, on his arrival here, was supposed to have reached the fabled land of Antil!a. Columbus first landed on San Salvador, generally identified with Watling Island of the Bahamas, and several voyages to this new land were made in rapid succession by the great discoverer, resulting in the finding of most of the larger islands, and a more intimate knowledge of those already known. The importance of its latest possession was at once recognized by the court of Spain, and, as a first move towards turning the West Indies to profitable account, numbers of the natives, for the most part a harmless and gentle people, were shipped overseas and sold into slavery, others being employed in forced labour in the mines which the Spaniards had opened throughout the archipelago, and from which large returns were expected. Thus early in its history began that traffic in humanity with which the West India plantations are so widely associated, and which endured for so long a time. Great efforts were made to inflect upon these the aborigines at last took arms against their masters, but with the result which might have been expected—their almost utter extermination. Many of the survivors sought refuge from their sufferings in suicide, and numbers of others perished in the mines, so that the native race soon almost ceased to exist. Spain was not long allowed to retain an undisputed hold upon the islands: British and Dutch seamen soon sought the new region, accounts concerning the fabulous wealth and treasure of which stirred all Europe, and a desultory warfare began to be waged amongst the various voyagers who flocked to this El Dorado, in consequence of which the Spaniards found themselves gradually but surely forced from many of their vantage grounds, and compelled very materially to reduce the area over which they had held unchecked sway. The first care of the English settlers was to find out the real agricultural capabilities of the islands, and they diligently set about planting tobacco, cotton and indigo. A French West India Company was incorporated in 1625, and a settlement established on the island of St Christopher, where a small English colony was already engaged in clearing and cultivating the ground; these were driven out by the Spaniards in 1632, but only to reappear again in the West Indies.

About this time, on the celebration of the bountifulness of the islands, Dutch, British and French pirates began to infest the neighbouring seas, doing much damage to legitimate traders, and causing commerce to be carried on only under force of arms, and with much difficulty and danger. Indeed, it was not till the beginning of the 18th century—some time after Spain had, in 1670, given up her claim to the exclusive possession of the archipelago—that these rovers were rendered comparatively harmless; and piracy yet lingered off the coasts down to the early years of the 19th century. In 1640 sugar-cane began to be systematically planted, and the prosperity of the West Indies began; it was not from the gold and precious stones, to which the Spaniards had looked for wealth and power, but from the cane that the fortunes of the West Indies were to spring. The successful propagation of this plant drew to the islands crowds of adventurers, many of them men of considerable wealth. The West Indies were for many years used by the English government as penal settlements, the prisoners working on the plantations as slaves. In 1653 a British force made an unsuccessful attack on Haiti, but a sudden descent on Jamaica was more fortunate in its result, and that island, as the possession of Great Britain. The Portuguese were the first to import negroes as slaves, and their example was followed by other nations having West-Indian colonies, the traffic existing for about 300 years. In 1660 a division of the islands was arranged between England and France, the remaining aborigines being driven to specified localities, but this treaty did not produce the benefits expected from it, and as wars raged in Europe the islands (see separate articles) frequently changed hands.

WESTMACOTT, SIR RICHARD (1775-1850), British sculptor, was born in London, and while yet a boy a learned the rudiments of the plastic art in the studio of his father, who was then a sculptor of some reputation. In 1793, at the age of eighteen, he went to Rome and became a pupil of Canova, then at the height of his fame. Under the prevailing influences of Italy at that time, Westmacott devoted all his energies to the study of classical sculpture, and throughout his life his real sympathies were with pagan rather than with Christian art. Within a year of his arrival in Rome he won the first prize for sculpture offered by the Florentine academy of arts, and in the following year (1795) he gained the papal gold medal awarded by the Roman Academy of St Luke with his bas-relief of Joseph and his brethren. In 1798, on the 20th of February, he married Dorothy Margaret, daughter of Dr Wilkinson of Jamaica. On his return to London Westmacott began to exhibit his works yearly at the Royal Academy, the first work so exhibited being
his bust of Sir William Chambers. In 1805 he was elected an
associate, and in 1811 a full member of the Royal Academy,
his diploma work being a "Ganymede" in high relief; in 1827
he was appointed to succeed Flaxman as Royal Academy
professor of sculpture, and in 1837 he was knighted. A very
large number of important public monuments were executed
by him, including many portrait statues; but little can be said
in praise of such works as the statue of the duke of York's
column (1833), the portrait of Fox in Bloomsbury Square, or
that of the duke of Bedford in Russell Square. Much
admiration was expressed at the time for Westmacott's monu-
cents to Collingwood and Sir Ralph Abercromby in St Paul's
Cathedral, and that of Mrs Warren in Westminster Abbey;
but subjects like these were far less congenial to him than
sculpture of a more classical type, such as the pedimental
figures representing the progress of civilization over the portico
of the British Museum, completed in 1847, and his colossal nude
statue of Achilles in bronze, copied from the original on Monte
Cavalo in Rome, and reared in 1822 by the ladies of England
in Hyde Park as a compliment to the duke of Wellington.
He died on the 1st of September 1856.

WESTMEATH, EARL OF—WESTMEATH

The earldom of Westmeath now passed to a distant cousin,
Anthony Francis Nugent (1805-1870), a descendant of Thomas
Nugent (d. 1735) of Tallin Garry, who was a son of the 2nd
earl. Nugent was chief justice of Ireland from 1787 until
he was outlawed by the government of William III. In 1689
he was created by James II. baron of Riverton, but the validity
of this title has never been admitted. In 1883 his descendant,
Anthony Francis (b. 1870), became the 11th earl.

Cadets of the Nugent family were Nicholas Nugent (d. 1852),
chief justice of the common bench in Ireland, who was hanged
for treason on the 6th of April 1682; William Nugent (d. 1683)
and an Irish rebel during the reign of Elizabeth; Sir George Nugent,
(d. 1575-1849), who, after serving in America and in the
Netherlands and France, became commander-in-chief in Ireland
1711 to 1813 and became a field-marshal in 1849; and Sir Charles
Edmund Nugent (c. 1759-1844), an admiral of the fleet.

The most famous Nugents were Livall, Count Nugent (1777-1862),
who rose to the rank of field-marshal in the Austrian army and
was made a prince of the empire. His long and honourable
military career began in 1793 and sixty-six years later he was present
at the battle of Sollerino. His most distinguished services to
Austria were during the war with France in 1813 and 1814,
and he was also useful in the revolutions in Germany in 1849.

See D'Alton, Pedigree of the Nugent Family; and Historical Sketch
of the Nugent Family, printed by J. C. Lyons (1853).

WESTMEATH, a county of Ireland in the province of Leinster,
bounded N.W. by Longford, N. by Cavan, N.E. and E.
by Meath, S. by King's county, and W. by Roscommon. The area
is 454,104 acres, or about 709 sq. m. The Shannon forms the
western boundary. The average height of the surface of the
county is over 250 ft. above sea-level. The highest summits
are Knocklyde (795 ft.), Hill of Ben (710 ft.) and Knockaon
(707 ft.). A large surface is occupied by bog. A special feature of
Westmeath is the number of large loughs, which have a
combined area of nearly 17,000 acres. In the north, on the
borders of Cavan, is Lough Sheelin, with a length of 5 m.,
and an average breadth of between 2 and 3 m., and adjoining it
is the smaller Lough Kinale. In the centre of the county there
is a group of large loughs, of which Lough Dervereagh is 6 m.
long by 3 broad at its widest part. To the north of it are Loughs
Lene, Gloire, Bawn and others, and to the south Loughs Iron
and Owel. Farther south is Lough Ennell or Belvidere, and in
the south-west Lough Ree, a great expanse of the river Shann-
on, forming part of the boundary with Roscommon. The river
Inny, which rises in Co. Cavan, enters Westmeath from
Lough Sheelin, and, forming for parts of its course the boundary
with Longford, falls into Lough Ree. The Inny has as one of
its tributaries the Gloire, flowing from Lough Lene through
Lough Gloire, a considerable part of its course being under-
ground. From Lough Lene the Dale also flows southwards to
the Boyne and so to the Irish Sea, and thus this lake sends its
waters to the opposite shores of the island. The Broyne flows
from Lough Ennell southwards by King's county's boundary into
the Shannon. The Westmeath loughs have a peculiar fame among
anglers for the excellence of their trout-fishing.

Westmeath is essentially a county of the great Carboniferous
Limestone plain, with numerous lakes occupying the hollows. Two
or three little inlets of Old Red Sandstone, as at Killucan and
Moate, form distinctive hills, about 500 ft. in height. A Hill
near Killucan, a core of Silurian strata appears within the sandstone
dome. A considerable system of eskers, notably north of Tullamore,
dives under the surface of the county.

The soil is generally a rich loam of great depth resting on
limestone, and is well adapted both for tillage and pasturage.
The occupations are almost wholly agricultural, dairy farming
predominating. Potatoes are grown in great quantities. The only
textile manufactures are those of friezes, flannels, and coarse linens
for home use. The only mineral of any value is limestone.

The main line of the Midland Railway enters the county from B. and passes W. by Mullingar and Athlone. From
Mullingar a branch runs N.W. to Inny Junction, where lines
diverge N. to Cavan (county Cavan), and W.N.W. to Longford
(county Longford). The line from Mullingar and Athlone to
Western railway runs from Portarlington (Queen's county) to
Athlone, and this and the Midland Great Western main line are
connected by a short line between Clare and Streamstown, worked
WESTMINSTER, MARQUEESSES OF—WESTMINSTER

by the latter company. Water communication with Dublin is furnished by the Royal Canal, traversing the centre of the county. A branch of the Grand Canal reaches Kilbeggan in the south.

The population (68,611 in 1891; 61,629 in 1901) decreases in excess of the average shown by the Irish counties, and emigration is considerable. About 92% of the total are Roman Catholics, and about 8% constitute the rural population. The principal towns are Athlone (pop. 6,617), of which part formerly in Roscommon was added to Westmeath by the Local Government (Ireland) Act of 1898, and Mullingar (4,500), the county town. Castlepollard and Moate are lesser market towns. By the Redistribution Act of 1885 Westmeath was divided into administrative divisions, North and South, each returning one member, Athlone being included in the county representation. The county is divided into twelve baronies. Assizes are held at Mullingar and quarter sessions at Mullingar and Moate. The county is in the Protestant counties of Dublin, Killaloe and Ossory, and in the Roman Catholic dioceses of Kildare and Leighlin, Killaloe and Ossory.

Westmeath was severed from Meath (q.v.) in 1543. The plan for the insurrection of 1641 was concerted in the abbey of Mullifarnham, and both in the wars of this period and those of 1688 the county was so deeply implicated that the majority of the estates were confiscated. There are a considerable number of raths or encampments: one at Rathconrath is of great extent; another at Ballymore was fortified during the wars of the Cromwellian period and those of 1688, and was afterwards the headquarters of General Ginkel, when preparing to besiege Athlone; and there is a third of considerable size near Lough Lene. The ruins of the Franciscan abbey of Mullifarnham, founded in 1236 by William Delaware, picturesquely situated near Lough Derereagh, include a tower 93 ft. in height.

WESTMINSTER, MARQUEESSES AND DUKES OF.

The title of marquess of Westminster was bestowed in 1831 upon Robert Grosvenor, 2nd Earl Grosvenor (1767-1845), whose grandson, Hugh Lupus Grosvenor (1825-1898), was created duke of Westminster in 1874. The family of Grosvenor is of great antiquity in Cheshire, the existence of a knightly house of this name (Le Grosvenor) in the palatine county being proved by deeds as early as the 12th century (see The Ancestor, vi. 19). The legend of its descent from a nephew of Hugh Lupus, earl of Chester, perpetuated in the name of the first duke, and the still more ancient family of great baronets by the title of Chester, and modern "peerages," of its ancestors, the "grand huntsmen" (gros veneurs) of the dukes of Normandy, have been exploded by the researchers of Mr W. H. B. Bird (see "The Grosvenor Myth" in The Ancestor, vol. i. April 1902). The ancestors of the dukes of Westminster, the Grosvenors of Eaton, near Chester, were cadets of the knightly house mentioned above, and rose to wealth and eminence through a series of fortunate marriages. Their baronetcy dates from 1622.

Sir Thomas Grosvenor, the 3rd baronet (1636-1700), in 1676 married Mary (d. 1720), heiress of Alexander Davies (d. 1665), a scion of an ancient family. This union brought to the Grosvenors of Eaton certain lands, then on the outskirts of London, but now covered by some of the most fashionable quarters of the West End. Sir Thomas's sons, Richard (1689-1732), Thomas (1663-1733) and Robert (d. 1755), succeeded in turn to the baronetcy, Robert being the father of Sir Richard Grosvenor (1731-1802), created Baron Grosvenor in 1761 and Viscount Belgrave and Earl Grosvenor in 1784. The 1st earl, a great breeder of racehorses, was succeeded by his only surviving son Robert (1767-1843), who rebuilt Eaton Hall and developed his London property, which was rapidly increasing in value. In the House of Commons, where he sat from 1788 to 1802, he was a follower of Pitt, who made him a lord of the admiralty and later a commissioner of the board of control, but after 1806 he left the Tories and joined the Whigs. He was created a marquess at the coronation of William IV. in 1831. His son, Richard, the 2nd marquess, (1795-1860), was a member of parliament from 1815 to 1835 and lord steward of the royal household from 1850 to 1852. The latter's son, Hugh Lupus (1825-1898), created a duke in 1874, was from 1847 to 1869 member of parliament for Chester and from 1850 to 1855 master of the horse under Gladstone, but he left the Liberal party when the split came over Home Rule for Ireland. His great wealth made him specially conspicuous; but he was a patron of many progressive movements. His eldest son, Victor Alexander, Earl Grosvenor (1853-1884), predeceased him, and he was succeeded as 2nd duke by his grandson, Hugh Richard Arthur Grosvenor (b. 1879), who in 1901 married Miss Cornwallis-West. Earl Grosvenor's widow, Countess Grosvenor, a daughter of the 9th earl of Scarborough, became the 3rd earl. Her son, Sir Hugh Grosvenor (b. 1893), a grandson of the 1st baron Leconfield, who subsequently became well-known both as a littérateur and as a Unionist cabinet minister.

Two other peerages are held by the Grosvenor family. In 1837 Lord Robert Grosvenor (1801-1893), a younger son of the 1st marquess, after having sat in the House of Commons since 1822, was created Baron Ebury. He was an energetic opponent of ritualism in the Church of England; and he was associated in philanthropic work with the earl of Shaftesbury. On his death his son, Robert Wellesley Grosvenor (b. 1834), became the 2nd baron. In 1886, Lord Richard Grosvenor (b. 1879), a son of the 2nd earl and marquess, the National Gallery; and most of the greatest residences of the wealthy classes. But the name of Grosvenor is more generally associated with a more confined area, namely, the quarter which includes the Abbey, the Houses of Parliament, the government and other buildings in Whitehall, the Roman Catholic Cathedral, and the parts immediately adjacent to these.

Westminster Abbey.—The Abbey of St Peter is the most widely celebrated church in the British empire. The Thames, bordered in early times by a great expanse of fen on either hand from Chelsea and Battersea down ward, took its name from the island where the Abbey stands, on the north shore of a low island perhaps three-quarters of a mile in circumference, known as Thorny or Bramble islet. Tributary streams from the north formed channels through the marsh, flanking the island north and south, and were once connected by a dyke on the west. These channels belonged to the Tyburn, which flowed from the high ground of Hampstead. Relics of the Roman occupation have been excavated in the former island, and it is supposed that traffic on the Watling Street, from Dover to Chester, crossed the Thames and the marshes by way of Thorny before the construction of London Bridge; the road continuing north-west in the line of the modern Park Lane (partly) and Edgware Road. Tradition places on the island a temple of Apollo, which was destroyed by an earthquake in the reign of the emperor Antoninus Pius. On the site King Lucius is said to have founded a church (c. A.D. 170). The Irruption of the Saxons left Thorny desolate. Traditional still, but supported by greater probability, a story states that Sebect,
king of the East Saxons, having taken part in the foundation of St Paul's Cathedral, restored or refounded the church at Thorney "to the honour of God and St Peter, on the west side of the City of London." (St. John the Baptist.) A splendid legend relates the coming of St Peter in person to hallow his new church. The sons of Sebert relapsed into idolatry and left the church to the mercy of the Danes. A charter of Offa, king of Mercia (789), deals with the conveyance of certain land to the monastery of St Peter, and King Edgar restored the church, clearly defining by a charter dated 951 (not certainly genuine) the boundary of Westminster, which may be indicated in modern terms as extending from the Marble Arch south to the Thames and east to the City boundary, the former river Fleet. Westminster was a Benedictine foundation. In 1392 Edward the Confessor laid the first stone of a magnificent new church, cruciform, with a central and two western towers. Its building continued after his death, but it was consecrated on Childermas Day, 28th December 1665; and on the following "twelfth mass eve" the king died, being buried next day in the church. In 1245 Henry III. set about the rebuilding of the church east of the nave, and at this point it becomes necessary to describe the building as it now appears.

Westminster Abbey is a cruciform structure consisting of nave with aisles, transepts with aisles (but in the south transept the aisles are omitted), the western end (eastern cloister walk), and choir of polygonal apsidal form, with six chapels (four polygonal) opening north and south of it, and an eastern Lady Chapel, known as Henry VII.'s chapel. There are two western towers, but in the centre a low square tower hardly rises above the pitch of the roof. The main entrance in common use is that in the north transept. The chapter-house, cloisters and other conventional buildings and remains lie to the south. The total length of the church (external) is 531 ft. and of the transepts 205 ft. in all. The breadth of the nave (eastern) is 80 ft., 7 in. and its height close upon 102 ft. These dimensions are very slightly lessened in the choir. Without, viewed from the open Parliament Square to the north, the beautiful proportions of the building are readily realized, but it is somewhat dwarfed by the absence of a central tower and by the vast adjacent pile of the Houses of Parliament. From this point (considered as a building merely) it appears only as a secondary unit in a magnificent group. Seen from the west, however, it is the dominant unit, but here it is impossible to overlook the imperfect conception of the "muscular" or "plain" work seen in the height (of the west end) manifested by Wren, from whose designs the western towers are said to have been developed in 1740. The north front, called Solomon's Porch from a former porch over the main entrance, is from the designs of Sir G. G. Scott, considerably altered by J. L. Pearson.

Within, the Abbey is a superb example of the pointed style. The body of the church has a remarkable appearance of uniformity, because although the building of the new nave was continued with interruptions from the 14th century until Tudor times, the broad design of the Early English work in the eastern part of the church was carried on throughout. The choir, with its unusual form and radiating chapels, plainly follows French models, but the name of the architect is lost. Exquisite ornament is seen in the triforium arcade, and between some of the arches in the transept are figures, especially finely carved, though much mutilated, known as the censing angels. Henry VII.'s Chapel replaces an earlier Lady Chapel, and is the most remarkable building of its period. It comprises a nave with aisles, and an apsidal eastward end formed of five small radiating chapels. Both within and without it is ornamented with an extraordinary wealth and minuteness of detail. A splendid series of carved oak stalls lines each side of the nave and above them hang the banners of the Knights of the Bath, of whom this was the place of installation when the Order was reconstituted in 1735. The fan-tracery in the clerestory, and the pendants, is the most exquisite architectural feature of the chapel. The choir stalls in the body of the church are modern, as is the organ, a fine instrument with an 'echo' attachment, electrically controlled, and the building of the south transept of the so-called "Little Abbey," by Sir G. G. Scott, with mosaic by Salviati. In Abbot Islip's chapel there is a series of effigies in wax, representing monarchs and others. There are many more, but only a few of them have survived. A series III. of older figures survive. Some of the effigies were carried in funeral processions according to custom, but this was not done later than 1735. There are, however, figures of Lord Chatham and Nelson, set up by the officials who received the fees formerly paid by visitors to the exhibition.

But the peculiar fame of the Abbey lies not in its architecture, nor in connexion with the metropolis alone, but in the fact that it has long been the place of interment of the kings of England and the burial-place of many of them and of their greatest subjects. The original reason for this was the reverence attaching to the memory of the Confessor, whose shrine was one of the central objects of the old church. Norman kings were ready to do honour to his name. From William the Conqueror onward every sovereign has been crowned here excepting Edward V. The coronation chairs stand in the Confessor's chapel. There is a monument by the sculptor of Edward I., and contains beneath its seat the stone of Scone, or stone of destiny, on which the Celtic kings were crowned. It is of Scottish origin, but has been identified with the myth of Arthur. The coronation records are held in the abbey, and are called the "Singletons." The sword and helm of Edward III. are still used in the coronation ceremony. The second chair was made for Mary, consort of William II. Subsequent to the Conquest many kings from Westminster had been interred in the old church, and all the graves are marked, but of those which are the tomb of Henry VII. and his queen, Elizabeth of York, the central object in his own chapel. The splendid recumbent effigies in bronze, of Italian workmanship, rest upon a tomb of black marble, and the whole is enclosed in a magnificent shrine of wrought brass. Monuments, tombs, busts and memorials crowd the choir, its chapels and transepts, and one or two windows are still reserved for the minority of the Gothic period (among which the canopied tombs of Edmund Crouchback and Aymer de Valence, in the sanctuary, are notable) appear incongruous in a Gothic setting. Many of the tombs are not without interest; for instance, on the south side are the subjects they commemorate always worthy to lie here, for the high honour of burial in the Abbey was not always so consistently enjoyed as it is now. Finally, it is quite true that a wonderful range of sculptural art is found. A part of the south transept is famed under the name of the Poet's Corner. The north transept contains many monuments to statesmen.

The monastery was dissolved in 1539, and Westminster was then erected into a bishopric, but only one prelate, Thomas Thurlby, held the office of bishop. In 1553 Mary again appointed an abbot, but Elizabeth reinstated the dean, with twelve prebends. Of the conventional buildings, the cloisters are adorned with effigies of the 13th and 14th centuries. On the south side of the southern walk remains a wall of the refectory are seen from without. From the eastern walk a arch gives entry to the abbey church and the chapel of the Pyx. The first is of the time of Henry III., a fine octagonal building, its vaulted roof supported by a slender clustered column of marble. It was largely restored by Sir Albert Scott. There are mural paintings of the 14th and 15th centuries. The chapel or chamber of the Pyx is part of the undercroft of the original dormitory, and is early Norman work of the best quality. The Pyx was always carried around the church at the time of the coronation, as a symbol of the regalia and other articles of value in early times, and here it was kept. Coins of the realm used in the trial of the pyx now carried out at the Mint. The undercroft is divided into compartments by walls, and the upper floor is covered with a vaulted roof supported by a magnificent series of carved columns and piers.
is a fine panelled hall, bearing on its walls the arms and names of many eminent alumni; it is entered by a gateway attributed to Inigo Jones, also covered with names. Ashburnham House, now containing one of the school houses, the library and class-rooms, is named from the family for whom it was built, traditionally but not certainly, by Inigo Jones. The finest part remaining is the grand staircase. The number of scholars, called King's Scholars, on the foundation is 60, of which 40, who are boarders, represent the original number. The present proportion of the boys are home boarders (Town Boys). In the College dormitory a Latin play is annually presented, in accordance with ancient custom. It is preceded by a prologue, and followed by a humorous epilogue, in Latin adapted to subjects of the moment. Other customs for which the school is noted are the acclamation of the sovereign at coronation in the Abbey, in accordance with a privilege jealously held by the boys; and the "Pancake Grease," a struggle in the Great Schoolroom on Shrove Tuesday to obtain possession of a pancake carrying with it a reward from the Dean. The number of boys is about 250. Valuable close scholarships and exhibitions at Christ Church, Oxford, and Trinity College, Cambridge, are awarded annually.

St Margaret's.—On the north side of the Abbey, close beside it, is the parish church of St Margaret. It was founded in or soon after the time of the Confessor, but the present building is Perpendicular, of greater beauty within than without. St Margaret's is officially the church of the House of Commons. It is frequently the scene of fashionable weddings, which are rarely held in the Abbey. On the south side of Dean's Yard is the Church House, a memorial of Queen Victoria's Jubilee (1887), consisting of a spacious hall of brick and stone, with offices for numerous Church societies.

Westminster Palace: Houses of Parliament.—A royal palace existed at Westminster at least as early as the reign of Canute; but the building spoken of by Fitzstephen as an "incomparable structure furnished with a breastwork and a bastion" is supposed to have been founded by Edward the Confessor and enlarged by William the Conqueror. The Hall, called Westminster Hall, was built by William Rufus and altered by Richard II. In 1512 the palace suffered greatly from fire, and thereafter ceased to be used as a royal residence. St Stephen's Chapel, originally built by King Stephen, was used from 1547 for the meetings of the House of Commons, which had been held previously in the chapter house of the Abbey. The Lords used another apartment of the palace, but on the 16th of October 1834 the whole of the buildings, except the hall, was burnt down. In 1840 the building of the New Palace, or Houses of Parliament, began, and it was completed in 1867, at a cost of about three millions sterling. (For plan, &c., see Architecture: Modern.) It covers an area of about 8 acres, and has a frontage of about 300 yds. to the Thames. The architect was Sir Charles Barry, and the style is late Perpendicular.

Towards the river it presents a rich façade with a terrace rising directly from the water. At the south-west corner rises the vast Victoria tower, above the royal entrance, 340 ft. high, and 75 ft. square. At the north is the clock tower, 320 ft. high, bearing the great clock which is the quarter time the whole day, and strikes the hours on a bell weighing over 13 tons, named Big Ben after Sir Benjamin Hall, First Commissioner of Works at the time when the clock was erected. This building incorporates Westminster Hall, which measures 200 ft. in length, 68 in width, and 90 in height. It has a magnificent open roof of carved wood, and is used as the vestibule of the Houses of Parliament. Of the modern rooms, the House of Peers is a huge dress circle, 97 ft. long, and that of the Commons is 70 ft. long, and less lavishly adorned. The sitting of parliament is signified by a flag on Victoria Tower in daytime and by a light at the summit of the clock tower at night.

Whitehall.—Northward from Parliament Square a broad, slightly curving thoroughfare leads to Trafalgar Square. This is Whitehall, which replaced the narrow King Street. Here, between the Thames and St James's Park, formerly stood York House, a residence of the archbishops of York from 1248. Worsley beautified the mansion and kept high state there, but on his disgrace Henry VIII. acquired and reconstructed it, employed Holbein in its decoration, and made it his principal residence. Inigo Jones designed a magnificent new palace for James I., but only the banqueting hall was completed (1622), and this survived several fires, by one of which (1697) nearly the whole of the rest of the palace was destroyed. The hall, converted into a royal chapel by George I., and now housing the museum of the Royal United Service Institution, the buildings of which adjoin it, is a fine specimen of Palladian architecture, and its ceiling is adorned with allegorical paintings by Rubens, restored and relined in 1909. The museum contains military and naval relics, models and other exhibits. Through this hall Charles I. passed on his way to execution beneath its windows; and the palace was the scene of the death of Henry VIII., Cromwell and Charles II.

The principal government offices are situated in Whitehall. On the left, following the northerly direction, are buildings completed in 1908, from the designs of J. M. Bentley, for the Boards of Education, Trade, Local Government, &c. The Home, Foreign, Colonial and India Offices occupy the next block, a heavy building, adorned with allegorical figures, by Sir G. G. Scott (1873). Downing Street, so named after the Treasury, contains the official residences of the First Lord of the Treasury and the Chancellor of the Exchequer. The Treasury itself dates from 1737, but the façade is by Sir Charles Barry. The Horse Guards, containing the offices of the Secretary of State for War and the War Office, is a building surrounding a court-yard, built in 1753 on the site of a guard-house for the security of Whitehall palace, dating from 1631. On the south side of the grounds is the Royal Hotel, and St James's Palace. The latter, the residence of the Duke of York and Albany, is the scene of the annual groaning of the troops, while the colour is held at the celebration of the sovereign's birthday. The portion of the Admiralty facing Whitehall dates from 1726 and is plain and sombre; but there are handsome new buildings on the Park side. On the right of Whitehall, besides the banqueting hall, are the Fine War Office, completed in 1906, from the designs of W. Young, and Montagu House, the residence of the Duke of Buccleuch. In front of the War Office an equestrian statue of the Duke of Cambridge (1863) was unveiled in 1907.

Trafalgar Square is an open space sloping sharply to the north. On the south side, facing the entrance of Whitehall, is the Nelson column, built by W. Railton, 145 ft. in height, a copy in granite from the temple of Mars Ultor in Rome, crowned with a statue of Nelson by E. H. Bally, and having at its base four colossal lions in bronze modelled by Sir Edwin Landseer. The centre of the square is laid out and paved with asphalte, and contains two fountains. There are statues of George IV., Napier, Havelock and Gordon. Behind the terrace on the north rises the National Gallery (1838), a Cretian building by William Wilkins, subsequently much enlarged, with its splendid collection of paintings. The National Portrait Gallery is contained in a building (1895) on the north-east side of the National Gallery.

Westminster Cathedral.—A short distance from Victoria Street, towards its western end, stands Westminster Cathedral (Roman Catholic). Its foundation was laid in 1866, and its consecration took place on 18 November 1895. Its site is somewhat circumscribed, and this and its great bulk render it not a great general appreciation of its complex outline; but its stately domed campanile, 283 ft. in height, forms a landmark from far over London. The style was described by the architect, J. F. Bentley, as early Christian Byzantine, and the material is mainly red brick. The extreme length is 360 ft., the breadth 150 ft., the breadth of the nave 60 ft., and its height (domes within) 112 ft.

WESTMINSTER, STATUTES OF, two English statutes passed during the reign of Edward I. Parliament having met at Westminster on the 20th of April 1275. Its passage was the consideration of the statute of Westminster I. This was drawn up, not in Latin, but in Norman French, and was passed "par le consentement des eveskes, eveskes, abbes, priurs, contes, barons, et la communautte de la tere ilokes somons." Its provisions can be best summarized in the words of Stubbs (Const. Hist. cap. vii.):—

"This act is almost a code by itself; it contains fifty-one clauses, and covers the whole ground of legislation. Its language now that of Canonists. It is a charter, a law, and a code for all these purposes. A laudable aim is the spirit of the statute; it led to the slow, but inevitable, and insidious accommodement, abuses of warship, irregular demands for feudal aids, are forbidden in the same words by or amended enactment. The inquest system of Henry II., the law of wreck, and
WESTMORLAND, EARLS OF

The institution of coroners, measures of Richard and his ministers, come under review as well as the Provisions of Oxford and the Statute of Marlborough.

The second statute of Westminster was passed in the parliament of 1385. Like the first statute it is a code in itself, and contains the clauses De domo regis, De sancto Albans (q.v.), "one of the fundamental institutes of the mediæval law of England." Stubbs says of it: "The law of dover, of advowson, of appeal for felonies, is largely amended; the institution of justices of assize is remodelled, and the abuses of manorial jurisdiction repressed; the statute De religiosis, the statutes of Merton and Gloucester, are amended and re-enacted. Every clause has a bearing on the growth of the later law."

The synods of Empiores of 1290 is sometimes called the statute of Westminster III.

WESTMINSTER, SYNODS OF. Under this heading are included certain of the more important ecclesiastical councils held within the present bounds of London. Though the precise locality is occasionally uncertain, the majority of the mediæval synods assembled in the chapter-house of old St Paul’s, or the former chapel of St Catherine within the precincts of Westminster Abbey or at Lambeth. The councils were of various types, each with a constitutional history of its own. Before the reign of Edward I., when convocation assumed substantially its present form (see Convocation), there were convened in London various diocesan, provincial, national and legatine synods; during the past six centuries, however, the chief ecclesiastical assemblies held there have been convocations of the province of Canterbury.

The first really notable council at St Paul’s was that of 1075 under the presidency of Lanfranc; it renewed ancient regulations, forbade simony and permitted three bishops to remove from country places to Salisbury, Chichester and Chester respectively. In 1102 a national synod at Westminster under the presidency of Thomas Becket, clerically inclined, met to examine the abuses of the church, and slavery. The councils of 1126, 1127 and 1138 were legatine, that of 1175 provincial; their canons, chiefly re-enactments, throw light on the condition of the clergy at that time. The canons of 1200 are based in large measure on recommendations of the Lateran Council of 1179. At St Paul’s the legatine constitutions of Otto were published in a synod of 1237, those of Octobon in 1268; these were the most important national councils held after the independence of York had been established. A synod at Lambeth in 1251 put forth canons none too welcome to Edward I.; they included a detailed scheme for the religious instruction of the faithful. During the next two centuries the councils devoted much attention to heresy; eight propositions concerning the body of Christ after his death were rejected at St Mary-le-Bow in 1286; the expulsion of the Jews from England was sanctioned by a legatine synod of Westminster in 1291; ten theses of Wiclif’s were condemned at the Dominican friary in 1382, and eighteen articles drawn from his Triadlogus met the same fate at St Paul’s in 1396; and the doom of Sir John Oldcastle was sealed at the latter place in 1413. The 14th-century synods at St Paul’s concerned themselves largely with the financial and moral status of the clergy, and made many quaint regulations regarding their dress and behaviour (1328, 1342, 1343; cf. 1463). From the time of Edward VI. on, many of the most vital changes in ecclesiastical discipline were adopted in convocations at St Paul’s and in the Abbey. To enumerate them would be to give a running commentary on the development of the Church of England; among the most important were those of 1547, 1552, 1554, 1562, 1571, 1604 and 1653. In 1582 there was held the first of a series of synods of the provincial and diocesan Convocation of the archdiocese of Westminster. For the "Pap-Anglican Synods" see LAMBETH CONFERENCES.

WESTMORLAND, EARLS OF. Ralph Neville, 4th Baron Neville of Raby, and 1st earl of Westmorland (1364-1425), eldest son of John, 3rd Baron Neville, and his wife Maud Percy (see Neville, Family), was knighted by Thomas of Woodstock, afterwards duke of Gloucester, during the French expedition of 1380, and succeeded to his father’s barony in 1388. He had been joint warden of the west march in 1386, and was reappointed for a new term in 1396. In 1391 he was put on the commission which was sent to reorganise the duties of constable in place of the duke of Gloucester, and he was repeatedly engaged in negotiations with the Scots. His support of the crown against the lords appellant was rewarded in 1397 by the earldom of Westmorland. He married as his second wife Joan Beaufort, half-sister of Henry of Lancaster, afterwards Henry IV., whom he joined on his landing in Yorkshire in 1399. He already held the castles of Branceton, Raby, Middleham and Sherift Hutton when he received from Henry IV. the honour and lordship of Richmond for life. The only rivals of the Nevilles in the north were the Percies who were broken at Shrewsbury in 1403. Both marches had been in their hands, but the wardenship of the west marches was now assigned to Westmorland, whose influence was also paramount in the east, which was under the nominal wardenship of the young Prince John, afterwards duke of Bedford. Westmorland had prevented Northumberland from marching to reinforce Hotspur in 1403, and before embarking on a new revolt he sought to secure his enemy, surrounding, but too late, one of Sir Ralph Eure’s castles where the earl had been staying. In May the Percies were in revolt, with Thomas Mowbray, earl marshal, and Archbishop Scrope. Westmorland met them on the 20th of May 1405, and suggested a parley between the leaders. By pretending accord with the archbishop, the earl induced him to allow his followers to disperse. Scrope and Mowbray were then seized and handed over to Henry at Pontefract on the 3rd of January. The improbabilities of this narrative have led some writers to think, in face of contemporary authorities, that Scrope and Mowbray must have surrendered voluntarily. If Westmorland betrayed them he at least had no share in their execution. Though he was usually engaged in negotiating with the Scots and keeping the peace on the borders, he did not play the part assigned to him by Shakespeare in Henry V., for during Henry’s absence he remained in charge of the north, and was a member of Bedford’s council. He consolidated the strength of his family by marriage alliances. His daughter Catherine married in 1412 John Mowbray, second duke of Norfolk, brother and heir of the earl marshal, who had been executed after Shipton Moor; Anne married Humphrey, first duke of Buckingham; Eleanor married, after the death of her first husband Richard le Despenser, Henry Percy, and earl of Northumberland; Cicely married Richard, duke of York, and was the mother of Edward IV. and Richard III. The sons by his second marriage were Richard Neville, earl of Salisbury, William, Baron Fauconberg, George, Baron Latimer, Robert, bishop of Salisbury and then of Durham, and Edward, Baron Abergavenny. The earl died on the 21st of October 1425, and a fine alabaster tomb was erected to his memory in Staindrop church close by Raby Castle.

See J. H. Wylie, History of England under Henry IV. (4 vols., 1884-1888). Ralph, 2nd earl of Westmorland (c. 1404-1484), the son of John, Lord Neville (d. 1425), succeeded his grandfather in 1425, and married as his first wife Elizabeth Clifford, daughter of Sir Henry Percy (Hotspur), thus forming further bonds with the Percies. The 3rd earl, Ralph Neville (1456-1500), was his nephew, and the son of John Neville, Lord Neville, who was slain at Towton. His grandson Ralph, 4th earl of Westmorland (1490-1559), was an energetic border warrior, who remained faithful to the royal cause when the other great northern lords
joined the Pilgrimage of Grace. He was succeeded by his son Henry, 5th earl (c. 1525-1563).

Charles, 6th earl (1543-1601), eldest son of the 5th earl by his first wife Jane, daughter of Thomas Manners, 1st earl of Rutland, was brought up a Roman Catholic, and was further attached to the Catholic party by his marriage with Jane, daughter of Henry Howard, earl of Surrey. He was a member of the council of the north in 1559 when he joined Thomas Percy, 7th earl of Northumberland, and his uncle Christopher Neville, in the Catholic rising of the north, which had as its object the liberation of Mary, queen of Scots. On the collapse of the ill-organized insurrection Westmorland fled with his brother earl over the borders, and eventually to the Spanish Netherlands, where he lived in receipt of a pension from Philip II of Spain, until his death on the 16th of November 1601. He left no sons, and his honours were forfeited by his formal attainder in 1571.

Raby Castle remained in the hands of the crown until 1645. The title was revived in 1624 in favour of Sir Francis Fane (c. 1574-1629), whose mother, Mary Neville, was a descendant of a younger son of the first earl. He was created baron of Burghersh and earl of Westmorland in 1624, and became Lord de Despenser on his mother's death in 1626. His son Mildmay Fane, 2nd or 5th earl of Westmorland (c. 1602-1660), at first sided with the king's party, but was afterwards reconciled with the parliament. John Fane, 7th or 13th earl of Westmorland (1662-1763), served under Marlborough, and was made in 1759 lieutenant-general of the British armies. His son, John Fane, 8th or 14th earl (1693-1775), only son of John, 7th earl, was known as Lord Burghersh until he succeeded to the earldom in 1841. He entered the army in 1803, and in 1805 took part in the Hanoverian campaign as aide-de-camp to General Sir George Don. He was assistant adjutant-general in Sicily and Egypt (1806-1807), served in the Peninsula War from 1808 to 1813, was British military commissioner to the allied armies under Schwarzenberg, and marched with the allies to Paris in 1814. He was subsequently promoted major-general (1823), lieutenant-general (1838) and general (1844), although the latter half of his life was given to the diplomatic service. He was British resident at Florence from 1814 to 1839, and British ambassador at Berlin from 1841 to 1851, when he was transferred to Vienna. In Berlin he had mediated in the Schleswig-Holstein question, and in Vienna he was one of the British plenipotentiaries at the congress of 1855. He retired in 1855, and died at Apsworpe House, Northamptonshire, on the 16th of October 1859. Himself a musician of considerable reputation and the composer of several operas, he took a keen interest in the cause of music in England, and in 1822 made proposals which led to the foundation in the next year of the Royal Academy of Music. His wife Priscilla Anne (1793-1879), daughter of William Wellesley-Pole, 3rd earl of Mornington, was a distinguished artist.

His published works include Memoirs of the Early Campaigns of the Duke of Wellington in Portugal and Spain (1820), and Memoir of the Operations of the Allied Armies under Prince Schwarzenberg and Marshal Blucher (1822).

Francis William Henry, 12th or 18th earl (1825-1891), fourth son of the preceding, was also a distinguished soldier. He entered the army in 1843 and served through the Punjaub campaign, and along the aide-de-camp to the governor-general in 1848, and distinguished himself at Gujrat on the 21st of February 1849. He went to the Crimea as aide-de-camp to Lord Raglan, and was promoted lieutenant-colonel in 1855. On his return to England he became aide-de-camp to the duke of Cambridge, and received the Crimean medal. The death of his elder brother in 1851 gave him the style of Lord Burghersh, and after his accession to the earldom in 1859 he retired from the service with the rank of colonel. He died in August 1891 and was succeeded by his son, Anthony Mildmay Julian Fane (c. 1879) in 1891.

WESTMORLAND, a north-western county of England, bounded N.W. by Cumberland, N.E. for a short distance by Durham, E. by Yorkshire, S. and S.W. by Lancashire. It reaches the sea in the Kent estuary in Morecambe Bay. The area is 786-2 sq. m. Physically the county may be roughly divided into four areas. (1) The great upland tract in the north-eastern part, bordering on the western margin of Yorkshire and part of Durham, consists mainly of a wild moorland area, rising to elevations of 750 ft. in Milburn Forest, 2403 in Dufton Fell, 2505 in Cat Gill, 2531 in Wild Boar Fell and 2651 in Swarth Fell. (2) The second area comprises about a third of the Lake District (q.v.), westward from Shap Fells. This area includes High Street (2663 ft.), Helvellyn (3181) and Fairfield (2863), Langdale Pikes (2401) and on the boundary Bow Fell (2960), Crinkle Crags (2816) and Pike o' Blisco (2304). It must also be taken to cover the elevated area on the Yorkshire border which includes the Ravenstone and Langdale Fells to the N. and the Middleton and Barbon Fells to the S., of an intrusive angle of Yorkshire. This area, however, which reaches in some points over 2200 ft. of altitude, is marked off from the Lake District mountains by the Lune valley. All but the lower parts of the valleys within these two areas lie at or above 1000 ft. above Ordnance datum; and more than half the remainder lies between that elevation and 1750 ft., the main mass of high land lying in the area first mentioned. (3) The third area includes the comparatively low country between the northern slopes of that just described and the edge of the uplands to the north-east thereof. This covers the Vale of Eden. About three-fifths of this area lies between the 500 ft. and 1000 ft. contour. (4) The Kendal area consists mainly of undulating lowlands and hills, and comprises in few cases up to 1000 ft. More than half this area lies below the 900 ft. contour. Westmorland may thus be said to be divided in the middle by uplands ranging in a general south-easterly direction, and to be bordered all along its eastern side by the elevated moorlands of the Pennine chain. The principal rivers are—in the northern area the higher part of the Tees, the Eden with its main tributaries, the Lowther and the Eamont, and in the southern area the Lune and the Kent, with their numerous tributary becks and gills. The lakes include Windermere, part of Ullswater, Grasmere, Hawes Water and numerous smaller lakes and tarns, which are chiefly confined to the north-western parts of the county. Amongst the other physical features of more or less interest are numerous crags and scars, chiefly in the neighbourhood of the lakes; others are Mallerstang Edge, Helbeck, above Brough; Haikable or High Cup Gill, near Appleby; Orton Scars; and the limestone crags west of Kirkby Lonsdale. Among the waterfalls are Caldron Snout, on the northern confines of the county, flowing over the Whin Sill, and Stock Gill Force, Rydal Falls, Skelwith Force, and Dungeon Gill Force, all situated amongst the volcanic rocks in the Hell Gill, near the head of the Peculier limestone, near Kirkby Stephen, are conspicuous examples of natural arches eroded by the streams flowing them.

Geology.—The diversity of scenery and physical features in this county are directly traceable to the influence of geological structure. In the mountainous north-western portion, which includes the heights of Helvellyn, Langdale Pikes, and Bow Fell, and the lakes Ullswater, Hawes Water, Grasmere and Esthwaite, we find the great mass of igneous rocks known as the Borrowdale volcanic series—andesites, basalts and tuffs—of Ordovician age. On the northern and north-western sides of these volcanic rocks lies the neighbouring county of Cumberland; their southern boundary runs north-easterly from the upper end of Windermere by Kentmere and past the granitic mass of Shap Fell; thence the boundary turns north-westward through Raspill to the end of Ullswater. Narrow strips of Ordovician Skiddaw slate occur on the south banks of Ullswater and fringe the Borrowdale rocks for some distance east of Buttermere. A large area on the north-western side occupies most of the south-western part of the county from Windermere to Ravenstonedale and southward to Sedbergh, Kendal and Kirkby Lonsdale. The Ordovician and Silurian rocks are bordered on the east and south by Carboniferous limestone which extends from Cartmel through Clifton, Shap, Crosby Garrett and Ravenstonedale; and again south of Kendal, down the Kent valley and eastward to Hawkshead. Outlying patches of limestone rest on the Silurian at Grange, Milnthorpe and Hutton in the Forest; and at Hutton in the Forest, east of the Eden valley in Milburn Forest, Dufton Fell, Steelmore and Winster Fell. Here and there in the south-east corner Millstone Grit and Shales cap the limestone.
and some little distance east of Brough under Stainmore a small patch of Coal Measures remains. At the base of the Carboniferous rocks west of Penrith are red sandstones, the sand of which may be regarded as of Old Red Sandstone age; it may be traced from Ullswater through Butterwick, Rasgill and Tebay, and appears again at Sedbergh, Lowgate and Aireland, near the limestones on the east side of the Eden the Great Whin Sill, a diabase dike, may be followed for a considerable distance. In the Eden valley two sets of red sandstones occur, that on the western side being included within the Carboniferous limestone, the limbstone on the eastern side of the valley the Bunter Sandstone. The sandstone on the eastern side of the valley, that at Sedbergh, is of similar character, and except for the absence of Pliocene and Silurian rocks appears all along the margin of the Carboniferous limestone. Evidences of glaciation are abundant in the form of morainic accumulations and striated boulders.

**Climate and Agriculture.**—The rainfall is very heavy, especially in the western part (see Lake District), whence it diminishes eastward. Thus at Kendal, on the eastern flank of the Lake District, the mean annual rainfall is still as high as 48.71 in., whereas at Appleby in the Eden valley it is only 32.45 in. The greater part of the county may, however, be considered to lie within an area having 40 to 50 in. mean annual fall. The average temperature in January at Appleby is 35.8° F., but at Windermere it is 57.4°. The temperature is mild; thus at the same two points 58.4° and 58.7° are recorded. The principal characteristic of the climate is the preponderance of wet and cold over the dry and hot, especially in winter and spring,—combining to retard the growth of vegetation. The late stay of cold winds in the spring has much to do with the same, especially in the lowlands extending along the foot of the Cross Fell escarpment and to the north-east. The rainfall is again characteristic of this district. Scarcely one-half of the total area of the county is under cultivation, and of this acreage about five-sixths is permanent pasture, but some 70,000 acres are being largely kept. Large portions of the valleys are well wooded. Nearly the whole of the acreage under corn crops is occupied by oats; a little barley is grown, but the wheat crop is insignificant. About three-fourths of the acreage under green crops is occupied by turnips. The meadow-land yields excellent grass. Grass of inferior value characterizes the pasture-lands; while on the fell (or unenclosed) land, except in limestone areas, the herbage consists chiefly of the coarser kinds of grasses, though in the Vale of Glamorgan and near Penrith, however, furnish nourishment for the hardier breeds of sheep, which are pastured there in large numbers. It is from the sale of these, of their stock cattle, horses and pigs, and of their dairy produce that the staple of the farmers' income is derived. A large part of Westmorland was formerly in the hands of "statemen" (see Cumberland) whose holdings were usually of small extent, but were sufficient, with careful management, for the respectable maintenance of themselves and their families. The proportion of landowners of this class has greatly decreased.

**Manufactures.**—The manufacturing industries, owing to the absence of coal, are closely connected with the stone. It is the limestone quarries that are most important. The principal is woolen manufacture in one form or another, and this is chiefly confined to the low country in and near Kendal. Bobbin-making, the manufacture of explosives, fulling, stuffing, woven and un-woven woollen, pipe-making, are amongst the industries carried on. Water-making is available at so many points. Paper-making is also carried on. The quarries occupy a considerable number of hands at various points, as in the case of the green slate quarries which are detrital to the scenery in the lower part of Langdale.

**Communications.**—The main line of the London and North-Western railway from the south serves Oxenhолme (branch to Kendal and Windermere), Low Gill (branch to Ingleton in Yorkshire), and Tebay, leaving the county after surmounting the high gradient at Shap. The Midland main line, with a parallel course, serves Appleby. A branch of the North Eastern system from Darlington serves Kirkby Stephen and Tebay, and another branch connects Kirkby Stephen with Appleby and Penrith.

**Population and Administration.**—The area of the administrative county is 505,330 acres, with a population in 1891 of 66,058 and in 1901 of 64,503. The natives are prevalently tall, wiry, long-armed, big-handed, dark grey-eyed and fresh-coloured. In disposition they are cautious, reserved and unemotional and thrifty and beyond measure. The general character of the dialects of Westmorland is that of a basis of Anglo-Saxon speech, influenced to a certain extent by the speech current amongst the local farmers. There is, however, a very distinct Scandinavian influence, which is most apparent in the northern parts, especially in the区 of Lonsdale and the Barony of Kendal, where there is a much greater though variable extent by the more decidedly Scandinavian forms of speech introduced at various periods between the 10th and the 12th centuries. Three well-marked dialects can be made out.

The area of the administrative county is 505,330 acres. The county contains four wards (corresponding to hundreds). The municipal boroughs are Appleby, the county town (pop. 1764) and Kendal (14,183). The urban districts are Ambleside (3536), Bowness and Windermere (5061), Grasmere (781), Kirkby Lonsdale (1638) and Shap (1226). The county is in the northern part, and is situated at the eastern end of the Lake District. It has one court of quarter sessions, and is divided into five petty sessional divisions. The parliamentary divisions are Lancaster, Ulverston, and Westmorland.

**History.**—The earliest English settlements in the district which is now Westmorland were effected by the Anglian tribes who entered Yorkshire by the Humber in the 6th century and laid the foundations of the kingdom of Deira, which included within its bounds that portion of Westmorland afterwards known as the barony of Kendal. The northern district, corresponding to the later barony of Appleby, meanwhile remained unconquered, and it was not until the close of the 7th century that Egfrith drove out the native Britons and established the Northumbrian supremacy over the whole district. With the Danish invasions of the 9th century the Kendal district was included in the Danelaw, while the barony of Appleby formed a portion of the land of Carlisle. The first mention of Westmorland in the Saxon Chronicle occurs under 966, when it was harried by Thored son of Gunnar, the term here applying only to the barony of Appleby, which at this period was being extensively colonized by Norwegian settlers, traces of whose occupation are especially noticeable in the place-names of the Lake District.

The Domesday Survey describes only the barony of Kendal which appears as part of Amounderness in Yorkshire. Before the Conquest it had formed part of the earldom of Tostig of Northumbria, and had been bestowed by William I. on Roger de Poitou, but, owing to the forfeiture of his estates by the latter, at the time of the survey it was placed in the hands of the English crown.

The annexation of the northern portion of Westmorland to the crown of England was accomplished by William Rufus, who in 1092 drove out Domhn from the land of Carlisle, and fortified Brough-under-Stainmore, Brougham, Appleby and Pendragon.

In the reign of Henry I. the barony of Appleby was included in the grant to Ranulph Meschin of the earldom of Carlisle, but on the accession of Ranulph to the earldom of Chester in 1120 it was surrendered to the crown, and its inclusion in the pipe roll of 1131 shows that Westmorland was now definitely established as the barony of Kendal.

The barony of Kendal was held in the 12th century by the Mowbrays, and from them passed to the family of Lancaster, who held it as of the honour of Westmorland. In the 13th century it was separated into two moieties; the Lindsay moiety which passed from the Lindsays to the Copelands and Coucys and in the reign of Henry VI. to the Beauforts and Richards, whence was derived its later name of Richardon Fee; the Brus moiety, which became subdivided into the Marquis Fee held by the Parr family, ancestors of Katherine Parr, and the Lumley Fee which passed from the Thwengs to the Lumleys and Hothams. The barony of Appleby, with the hereditary shrievalty, was bestowed by King John on the family of Veterinpont, from whom it passed by female descent to the Cliftords in the 13th century, and in the 16th century to the Tuftons, afterwards earls of Thanet, who retained the dignity until their descendant, Mr Barham of Trecawn, yielded his rights to the crown.

The division of Westmorland into wards originated with the system of defence against the inroads of the Scots, each barony being divided into two wards, and each ward divided into a number of quarters. This system was continued into the time of the wars for the preservation of the peace. There are 115 civil parishes. Westmorland is in the diocese of Carlisle, and contains 86 ecclesiastical parishes or districts, wholly or in part. There are two parliamentary divisions, Northern or Appleby and Southern or Kendal, each returning one member.
Lonsdale and Kendal within the archdeaconry of Richmond. The barony of Appleby, which had been bestowed by Henry I. in the see of Carlisle, formed in 1291 the deanery of Westmorland within the archdeaconry and diocese of Carlisle. The barony of Kendal was placed by Henry VIII. in his new diocese of Chester, of which it remained a part until in 1586 it was constituted the archdeaconry of Westmorland within the diocese of Carlisle. In 1859 the Westmorland portion of the archdeaconry of Carlisle was subdivided into the deaneries of Appleby, Kirkby Stephen and Lowther; and the additional deanery of Ambleside was formed within the archdeaconry of Westmorland. The only religious foundation of any importance in Westmorland was the Premonstratensian house at Shap founded by Thomas, son of Gasparic, in the 13th century.

The early political history of Westmorland after the Conquest is a record of continuous raids and devastations from the Scots. In the Scottish invasion of the northern counties which followed the battle of Bannockburn Brough and Appleby were burnt, and the county was twice harried by Robert Bruce in the ensuing years. In 1348 a battle was fought at Hoff near Appleby against the Scots under Earl Douglas, and in 1358, after Otterburn, the Scots sacked Appleby with such effect that nine-tenths of it lay in ruins and was never rebuilt. In the Wars of the Roses, Westmorland, under the Clifford influence, inclined to favour the Lancaster cause, but was not actively concerned in the struggle. In the Civil War of the 17th century the county were royalist, and in 1641 Anne, countess of Pembroke, hereditary high sheriff of the county, garrisoned Appleby Castle for the king, placing it in charge of Sir Philip Musgrave, the colonel of the train-bands of Westmorland and Cumberland. In 1643 a memorial was presented to Charles signed by nearly 5000 of the inhabitants of Westmorland and Cumberland protesting their loyalty and readiness to sacrifice their lives and fortunes in his service. Appleby Castle surrendered in 1648, but the strength of the royalist feeling was shown in the joy which greeted the news of the Restoration, the mayor of Appleby publicly destroying the charter which the town had received from Cromwell. The Jacobite rising of 1745 found many adherents in Westmorland, and a skirmish took place on Clifton Moor between the forces of Lord George Murray and the duke of Cumberland.

The economic development of Westmorland, both on account of natural disadvantages and of the ravages of border strife, has been slow and unimportant; the rugged and barren nature of the ground being unfavourable to agricultural prosperity, while the lack of fuel hindered the growth of manufactures. Shown by the fact that the county was not a market till the 18th century, while in Cumberland there was a weekly market as early as 1480. Under the Union the county was divided into the market towns of Kendal and Penrith, with the additional market towns of Appleby, Brougham and kendal, and the smaller market towns of Kirkby Stephen and Lowther. The population of these market towns, according to the census of 1801, was 10,980. In 1910 the population of the whole county was 66,714, while that of the Kendal division was 21,915, and of the Kendal parliamentary division 17,241.

The county council is an elected body with a chairman and vice-chairman elected annually. There are six rural sanitary districts, and an area of 83 acres is added to the county by an act of 1897. The county is divided into 12 districts for the purpose of education, and the population in 1901 was 76,165. The county hospital is at Kendal, and there is a poor law institution at Kendal, with an asylum at Kendal, and a workhouse at Kendal.

The county is divided into 12 parliamentary divisions, and the members of parliament are: for the town of Kendal, one; for the town of Kendal, one; and for the town of Kendal, one. The county is divided into 12 parliamentary divisions, and the members of parliament are: for the town of Kendal, one; for the town of Kendal, one; and for the town of Kendal, one. WESTPHAL, RUDOLF (1826-1892), German classical scholar, was born at Oberkirchen in Schaumburg on the 3rd of July 1826. He studied at Marburg and Tübingen, and was professor at Breslau (1858-1862) and Moscow (1875-1879). He subsequently lived at Bückeburg, and died at Stadthagen in Schaumburg-Lippe on the 10th of July 1892. Westphal was a man of varied attainments, but his chief claim to remembrance rests upon his contributions on Greek music and metre. His chief work was his Geschichte der Metrik (3rd ed., 1885-1886); System der antiken Rhythmik (1865); Hellenistische Dichtung (1866); Aristoxenus von Tarentum (translation and commentary, 1883-1883, vol. ii. being edited after his death by F. Saran); Die Musik des griechischen Altertums (1883); Allgemeine Metrik der indogermanischen und semitischen Völker (1892). He made translations of Catullus (1870) and of Aristophanes' Acharnians (1889), in which he successfully reproduced the Dorisms in Plattdeutsch.

WESTPHALIA (Ger. Westfalen), a province of the kingdom of Prussia. The ancient duchy and the Napoleonic kingdom of the same name, neither of which was conterminous with the modern province, are dealt with in the historical part of this article. The area of the province is 7803 sq. m., its length both from N. to S. and from E. to W. is about 130 m., and it is bounded N. by Hanover, E. by Schaumburg-Lippe, Hanover, Lippe-Detmold, Brunswick, Hesse-Nassau and Waldeck, S. and S.W. by Hesse-Nassau and the Rhine Province, and N.W. by the kingdom of the Netherlands.

Westphalia is an extensive region, especially in the north and west, of gently undulating country, of great fertility, with rich meadows and grassland. The climate is slightly warmer and dry than in other parts of Prussia, and is very agreeable. The cereal crops include barley, wheat, oats, rye, and flax. Wine is also abundant. The mineral resources are not so great as formerly, but coal, iron, marl for lime, and lapis niger are found. The principal rivers are the Lippe and Ruhr. The Westphalian coal field is broken by extensive outcrops of the underlying cretaceous beds, and is not very fertile, except in the basin of the Ruhr-Hellweg, a zone between the Haarstrang and the Lippe. There the coal is an average 1.6 ft. thick; it is a sandy waste called the Senne. The plain is drained in the N. by the Emms and in the S. by the Lippe, which rise close together in the Ruhr after flowing between the Vechte and other small rivers flowing into the Zuider Zee. The southern portion of Westphalia, most of which is included in Sauerland ("south land"), is a rugged region of slate hills and wooded valleys, drained chiefly by the Ruhr with its affluent the Lenne, Münhe, &c., and in the S. by the Sieg and Erle. The hills rise in the S.E. to the Rottberger or Rothaargebirge, culminating in the Wintersberg and the Halde Asten (2713 ft.), the highest summit in the province. The Rottberger or Rothaargebirge and Teutoburger Wald form with some intermediate ranges the watershed between the basin of the Weser and those of the Rhine and Ems. The chief river of the province is the Wese, which rises in the Wiehengebirge from the Wiehengebirge by the narrow pass called Porta Westfalica.

The climate is temperate except in the south, which is cold in winter and humid in summer. The rainfall is rather heavy, but without the heavy fall of the Ruhr basin. The area 45.8% is occupied by arable land and gardens, 18.9% by meadows and pastures and 28.6% by forests. The best agricultural land is in the Hellweg and the Weser basin. The number of peasant proprietors is proportionately greater than in any other part of Prussia, and as a class they are well-to-do. The crops include grain of all kinds (not sufficient, however, for the needs of the province), peas and beans, buckwheat, potatoes, fruit and hemp. The cultivation of hemp is extremely extensive, especially in the N.E. Swine, which are reared in great numbers in the plains, yield the famous Westphalian hams; and the breeding of maro goats is important. The breeding of horses is fostered by the government.

The mineral wealth is very great, especially in coal and iron. The production of coal is greater than that of any other province of Prussia, and amounted in 1906 to 53,000,000 tons. The coal field extends from the Rhine towards the Ruhr valley, and is worked chiefly in the Ruhr; the Ruhr-Northfield, at Ibbenbüren. The production of iron ore, chiefly S. of the Ruhr, at Wipperfürth, is exceedingly great, though much of it is exported, especially by the Rhine province. After coal and iron the most valuable minerals are zinc, lead, pyrites and copper. Antimony, quicksilver, silver, flint and slate are also worked, and there are brine springs in the Hellweg and mineral springs at Lippspringe, Oynhausen, &c.

The manufacturing industry of the province, which chiefly depends upon its rich agricultural wealth, is still increasing. Principal goods are produced in the so-called "Enneper Strasse," the valley of the Ennepe, a small tributary of the Ruhr with the town of Hagen, and in the neighbouring towns of Bochum, Dortmund, Iserlohn and Altena, and also in the Siegen district. The brass and bronze industries are carried on at Iserlohn and Altena, those of tin and Britannia metal at Lüdenscheid; needles are made at Iserlohn and wire at Altena. The very important linen industry of Biedfeld, Minden and Lippe-Detmold has flourished in this region since the 14th century. Jute is manufactured at Biedfeld and cotton goods in the W. Paper is extensively made on the lower Lenne, and leather around Siegen. Other manufactures are glass, chemicals, and arms. The railway system is very elaborate, and includes several trunk lines of railway which cross the province (total mileage in 1906, 1889 m., exclusive of light railways) and by the navigation of the Rhine (on which Minden has a port), Ems, Ruhr and Lippe. Beverungen is the chief navigable port of the province.

The population in 1905 was 3,618,000, or 464 per sq. m. It is very unevenly distributed, and in the industrial districts is increasing very rapidly. In recent years there has been a great influx of Poles into these parts, attracted by the higher wages. In 1900 they already numbered more than 100,000. Between 1865 and 1900 the mean annual increase of the population was 3.5%, the highest recorded in the German empire, but between 1900 and 1905 it fell to 2.5%. The percentage of illegitimate births (2.6) is the lowest in Germany, 51-5% of the inhabitants are Roman Catholics, 47-9% Protestants. The distribution of the two communions still closely follows the lines of the settlement at the peace of Westphalia. Thus the former duchy of Westphalia and the bishoprics of Münster and Paderborn which remained in ecclesiastical hands are almost entirely Roman Catholic, while the secularized bishopric of Minden and the former counties of Ravensberg and Mark, which fell or had fallen to Brandenburg, and the Siegen district, which belonged to Nassau, are predominantly Protestant.

The province is divided into the three governmental departments (Regierungsbezirke) of Minden, Münster and Arnsberg. Münster is the seat of government and of the provincial university. Westphalia is divided into 22 districts (Kreise) to the Prussian Lower House and seventeen to the Reichstag.

The inhabitants are mainly of the Saxon stock and speak Low German dialects, except in the Upper Frankish district around Siegen, where the German dialect is spoken.

4 Westphalia, "the western plain" (in early records Westfalen), was originally the name of the western province of the early duchy of Saxony, including the western portion of the modern province and extending north to the borders of Friesland. When Duke Henry the Lion of Saxony fell under the ban of the empire in 1180, and his duchy was divided, the bishop of Münster and Paderborn became princes of the empire, and the archbishop of Cologne, Philip of Babenberg, from the emperor Frederick I. the Sauerland and some other districts were added to the duchy of Westphalia. Within the duchy were some independent secular territories, notably the county of Mark, while other districts were held as fiefs from the archbishops, afterwards electors. From 1368 the electors themselves held the county of Arnsberg as an imperial fief. The duchy received a constitution of its own, and was governed for the elector by a marshal (Landmarschall, after 1480 Landdrost) who was also stadholder, and presided over the Westphalian chancellery. This system lasted till 1505. By Maximilian's administrative organization of the empire in 1500 the duchy of Westphalia was included as an appanage of Cologne in the scattered circle of the Lower Rhine. The Westphalian circle which was formed at the same time comprised nearly all the rest of the modern province (including Mark) and the lands north of it between the Weser and the frontier of the Netherlands, also Verden, Schaumburg, Nassau, Wied, Lippe, Berg, Cleves, Jülich, Liège, Bouillon and Cambrai.

Brandenburg laid the foundations of her dominion in Westphalia by obtaining the counties of Mark and Ravensberg in 1614 (confirmed 1666), to which the bishopric of Minden was added by the peace of Westphalia in 1648 and Tecklenburg in 1707. By the settlement of 1803 the church lands were secularized, and Prussia received the bishopric of Paderborn and the eastern part of Münster, while the electoral duchy of Westphalia was given to Hesse-Darmstadt.

After the peace of Tilsit the kingdom of Westphalia was created by Napoleon I. on the 18th of August 1807, and given to his brother Jerome (see Bonaparte). It included the present governmental department of Minden, but by far the larger part of the kingdom lay outside and chiefly to the east of the modern
province, and comprised the Hanoverian department of Hildesheim and in part that of Arensberg, Brunswick, the northern part of the province of Saxony as far as the Elbe, Halle, and most of Hesse-Cassel. The area was 14,627 sq. m., and the population nearly two millions. Cassel was the capital. A constitution on the French imperial pattern granted by the king remained practically inoperative, an arbitrary bureaucratic régime was instituted, the finances were from the beginning in a hopeless condition, and the country was drained of men and money for Napoleon's wars. In January 1810 most of Hanover was added, but at the end of the same year half the latter, together with the city of Hanover, was ceded to Prussia and the French empire. There had already been serious revolts and raids, and after the battle of Leipsic the Russians drove the king from Cassel (October 1813), the kingdom of Westphalia was dissolved and the old order was for a time re-established. At the congress of Vienna (1814) Hesse-Darmstadt surrendered her share of Westphalia to Prussia, and the present province was constituted.

WESTPHALIA, TREATY OF, a collective name given to the two treaties concluded on the 24th of October 1648 by the empire with France at Münster and with Sweden and the Protestant states of the empire at Osnabrück, by which the Thirty Years' War (q.v.) was brought to an end.

As early as 1636 negotiations had been opened at Cologne at the instance of Pope Urban VIII., supported by the seigniory of Venice, but failed owing to the disinclination of Richelieu to stop the progress of the French arms, and to the refusal of Sweden to treat with the papal legate. In 1637 the agents of the emperor began to negotiate at Hamburg with Sweden, though the mediation of Christian IV., king of Denmark, was rejected by Sweden, and the discussions dragged on for years without result. In the meantime the new emperor Ferdinand III. proposed at the diet of Regensburg in 1640 to exchange the peace of Prague for the whole empire, on the basis of an amnesty; from which, however, those Protestant states who were still leagued with foreign powers were to be excluded. His aim was by settling the internal affairs of the empire to exclude the German princes from participation in negotiations with foreign powers; but these efforts had no result.

A more practical suggestion was made by the Comte d'Avaux, the French envoy at Hamburg, who proposed in 1641 that the negotiations at Cologne and Hamburg should be transferred to Münster and Osnabrück, two cities in the Westphalian circle not more than 30 m. apart. A preliminary treaty for the establishment of the peace was concluded between the representatives of the emperor, France and Sweden at Hamburg on the 25th of December 1641. A dispute as to precedence between France and Sweden, and the refusal of the latter power to meet the papal nuncio, made the choice of a single meeting-place impossible. It was arranged, however, that the two assemblies should be regarded as a single congress, and that neither should conclude peace without the other.

The date fixed for the meeting of the two conventions was the 24th of October 1645, but the negotiations were not opened before all the representatives arrived, and the settlement of many questions of precedence and etiquette caused further delays. England, Poland, Muscovy and Turkey were the only European powers represented. The war continued during the deliberations, which were influenced by its fortunes.

The chief representative of the emperor was Count Maximilian von Trautmannsdorff, to whose sagacity the conclusion of peace was largely due. The French envoys were nominally under Henry of Orleans, duke of Longueville, but the marquis de Sablé and the comte d'Avaux were the real agents of France. Sweden was represented by John Oxenstierna, son of the chancellor, and by John Adler Salvius, who had previously acted for Sweden at Hamburg. The papal nuncio was Fabio Chigi, afterwards Pope Alexander VII. Brandenburg, represented by Count Johann von Sayn-Wittgenstein, played the foremost part among the Protestant states of the empire. On the 1st of June 1645 France and Sweden brought forward propositions of peace, which were discussed by the estates of the empire from October 1645 to April 1646. The settlement of religious matters was deferred, and after a dispute between France and the French emperor. There had already been serious revolts and raids, and after the battle of Leipsic the Russians drove the king from Cassel (October 1813), the kingdom of Westphalia was dissolved and the old order was for a time re-established. At the congress of Vienna (1814) Hesse-Darmstadt surrendered her share of Westphalia to Prussia, and the present province was constituted.

The results were determined in the first place by the support given to each other by France and Sweden in their demands for indemnification, the concession of which necessitated compensation to the German states affected, and secondly by the determination of France to weaken the power of the emperor while strengthening the Roman Catholic states, especially Bavaria.

Sweden obtained the recognition of the sovereignty of eastern Pomerania with Rügen and the mouths of the Oder, Wismar and Poel, in Mecklenburg, and the lands of the archbishopric of Bremen and the bishopric of Verden, together with an indemnity of 5,000,000 thalers. The privileges of the Free Towns were preserved. Thus Sweden obtained control of the Baltic and a footing on the North Sea, and became an estate of the empire with three deliberative voices in the diet.

The elector of Brandenburg received the greater part of eastern Pomerania, and, as he had a claim on the whole duchy since the death of the last duke in 1623, he was indemnified by the bishoprics of Halberstadt, Minden and Kammin, and the revision of the archbishopric of Magdeburg, which came to him on the death of the administrator, Prince Augustus of Saxony, in 1680. The elector of Saxony was allowed to retain Lusatia. As compensation for Wismar, Mecklenburg-Schwerin obtained the bishoprics of Schwerin and Ratzeburg and some lands of the Knights of St John. Brunswick-Lüneburg restored Hildesheim to the elector of Cologne, and gave Minden to Brandenburg, but obtained the alternate succession to the bishopric of Osnabrück and the church lands of Walkenried and Gringen. Count Paul of Hessen-Cassel received the prince-abaty of Hersfeld, the county of Schaumburg, &c. The elector of Bavaria was confirmed in his possession of the Upper Palatinate, and in his position as an elector which he had obtained in 1623. Charles Louis, the son and heir of Frederick V., the count palatine of the Rhine, who had been placed under the ban of the empire, received back the Lower Palatinate, and a new electorate, the eighth, was created for him.

France obtained the recognition of the sovereignty (which she had enjoyed de facto since 1552) over the bishoprics and cities of Metz, Toul and Verdun, Pinerolo in Piedmont, the town of Breisach, the landgraviate of Upper and Lower Alsace, the town of Würzburg, the bishopric of Mainz, the county of Salm, the duchy of Cleves, the county of Mark, and the county of Simmern. France also received the lands of the bishops of Metz, Toul and Verdun, and the counties of Burgundy, Anjou, Perigord, Aquitaine and Guienne, and the duchy of Burgundy.

France obtained the recognition of the sovereignty (which she had enjoyed de facto since 1552) over the bishoprics and cities of Metz, Toul and Verdun, Pinerolo in Piedmont, the town of Breisach, the landgraviate of Upper and Lower Alsace, the town of Würzburg, the bishopric of Mainz, the county of Salm, the duchy of Cleves, the county of Mark, and the county of Simmern. France also received the lands of the bishops of Metz, Toul and Verdun, and the counties of Burgundy, Anjou, Perigord, Aquitaine and Guienne, and the duchy of Burgundy.
recognized, as was that of the United Netherlands in a separate treaty signed by Spain at Münster.

Apart from these territorial changes, a universal and unconditional amnesty to all those who had been deprived of their possessions was declared, and it was decreed that all secular lands should be restored to those who had held them in 1618. Some exceptions were made in the case of the hereditary dominions of these princes.

Even more important than the territorial redistribution was the ecclesiastical settlement. By the confirmation of the treaty of Passau of 1552 and the religious peace of Augsburg of 1555, and the extension of their provisions to the Reformed (Calvinist) Church, toleration was secured for the three great religious communities of the empire. Within these limits the governments were bound to allow at least private worship, liberty of conscience and the right of emigration, but these measures of toleration were not extended to the hereditary lands of the house of Habsburg. The Protestant minority in the imperial diet was not to be coerced by the majority, but religious questions were to be decided by amicable agreement. Protestant administrators of church lands obtained seats in the diet. Religious parity was established in the imperial chamber (Reichskammergericht), and in the imperial deputations and commissions.

The difficult question of the ownership of spiritual lands was decided by a compromise. The edict of restitution of 1629 was annulled. In Württemberg, Baden and the Palatinate these lands were restored to the persons who had held them in 1618 or their collation, but for the rest of the empire the possession was determined by the fact of occupation on the ist of January 1624 (bonnus decretorius or normal year). By the provision that a prince should forfeit his lands if he changed his religion an obstacle was placed in the way of a further spread of the Reformation. The declaration that all protests or vetoes by whomsoever pronounced should be null and void dealt a blow at the intervention of the Roman curia in German affairs.

The constitutional changes made by the treaty had far-reaching effects. The territorial sovereignty of the states of the empire was recognized. They were empowered to contract treaties with one another and with foreign powers, provided that the emperor and the empire suffered no prejudice. By this and other changes the princes of the empire became absolute sovereigns in their own dominions. The emperor and the diet were left with a mere shadow of their former power. The emperor could not pronounce the ban of the empire without the consent of the diet. The diet, in which the 61 imperial cities gained the right of voting on all imperial business, and thus were put on an equality with the princes, retained its legislative and fiscal powers in name, but practically lost them by the requirement of unanimity among the three estates. In consequence, the powers, which, moreover, were decentralized, were transferred to the hands of the states, which decided by majorities of their members, but by agreement between them.

Not only was the central authority replaced almost entirely by the sovereignty of about 300 princes, but the power of the empire was materially weakened in other ways. It lost about 40,000 sq. m. of territory, and obtained a frontier against France which was incapable of defence. Sweden and France as guarantors of the peace acquired the right of interference in the affairs of the empire, and the former gained a voice in its councils.

For many years Warburg thus became the central theatre of European diplomacy and war. But if the treaty of Westphalia pronounced the dissolution of the old order in the empire, it facilitated the growth of new powers in its component parts, especially Austria, Bavaria and Brandenburg.

The treaty was recognized as a fundamental law of the German constitution, and formed the basis of all subsequent treaties until the dissolution of the empire.

WEST POINT, a village and military post, in Orange county, New York, U.S.A., on the west bank of the Hudson river, about above New York City. It is served by the West Shore railway, and is connected by ferry with the New York Central railway at Garrison. The United States Military Academy occupies a plateau 180 ft. above the river, reached by a roadway cut into the cliff and commanding a view up and down the river for many miles. Between 1902 and 1908 Congress appropriated about $7,500,000 for the reconstruction of the academy, but most of the old buildings of historic interest have been incorporated. The Headquarters Building and Grant Hall (the mess hall) contain portraits of famous American soldiers. The military library is one of the finest in existence (50,000 volumes in 1790), and its building contains interesting memorials, by Saint Gaudens, to J. McNeill Whistler and Edgar Allan Poe, both former cadets in the academy. Cullum Memorial Hall (1890) was the gift of Major-General George Washington Cullum (1809-1891), superintendent of the academy in 1864-1866. Opposite it is a monument (1843) to Major F. L. Dade's command of 110 men who were ambushed and killed by the Seminole Indians in Florida in December 1835. In the S.E. corner of the parade ground (60 acres) is a granite statue to Colonel Sylvanus Thayer (1790-1877) by MacMonnies, who designed the academy from 1817 to 1833. In the N.W. angle is the bronze statue (1868) of Major-General John Sedgwick, U.S. Volunteers, who was killed by a sharpshooter, on the 9th of May 1864, while making a personal reconnaissance at Spottsylvania. Between Trophy Point and the hotel is the Battle Monument (1874, 78 ft. high, surmounted by a statue of Victory by MacMonnies), a memorial to the soldiers of the regular army who died in the Civil War. Above the cliff towards the N. and E. of the plain is Fort Clinton; in its E. front stands a monument erected in 1828 by the Corps of Cadets to Kosciuszko, who planned the original fortifications here in 1778. About 1 m. N. of the academy is "West Point Cemetery" (about 14 acres) on the E. angle of an elevated plain overlooking the river, formerly known as "German Flats," in which rest the remains of Thayer, Winfield Scott, Robert Anderson and other distinguished soldiers. The Cadet Monument (1817) stands on the E. angle overlooking the river. High above the academy on Mount Independence (400 ft.) still stands old Fort Putnam, commanding a fine view for miles up and down the Hudson. In 1908, as the gift of Mrs. Russell Sage and Miss Anna B. Warner, there was added to the military reservation Constitution Island (about 280 acres). It lies directly opposite West Point, with the remains of two forts built during the War of Independence.

West Point, "the Gibraltar of the Hudson," was first occupied as a military post in January 1778, when a chain of redoubts was erected at various strategic points along the Hudson. At West Point were built a half-dozen earthwork fortifications, of which Fort Putnam on Mt. Independence, Fort Clinton on the extreme of the point (not to be confused with the Fort Clinton captured by the British in 1777 farther down the river, and Battery Knox) were also on the river landing, were the largest. These were the fortifications that Benedict Arnold, their commander, in 1780 agreed to deliver into British hands. After the discovery of his treason, Washington made his headquarters for some time at West Point before removing to Newburgh. Later Washington recommended West Point as a site for a military school. Such an establishment had been suggested by Henry Knox in May 1776; and in October of that year the Continental Congress passed a resolution appointing a committee to draw plans for "a military academy of the army." A Corps of Cadets was established in June 1777, was organized in Philadelphia in July 1777, and was transferred to West Point in 1781; this corps was "to serve as a military school for young gentlemen previously to their being appointed to marching.
regiments.” Three buildings had been erected here to house a library, an engineers’ school, and a laboratory, and practical experiments in gunnery had been begun here in February 1750. In 1753, at Newburgh, Washington laid before his officers the matter of a military academy such as Knox had suggested. A school for artillers, engineers, and cadets of the corps was established here on the president’s recommendation in 1794, and continued until the buildings were destroyed by fire in 1796. In July 1801, Henry Dearborn, Jefferson’s secretary of war, directed that all cadets of the corps of artillers, a subordinate rank which had been established in 1794, should report at West Point for in-struction, and in September of that year a school was opened with five cadets. On 15 March 1816, President Jefferson approved an act establishing a military academy at West Point, and on the 4th of July it was formally opened with ten cadets present. Acts of 1802 and 1808 authorized 40 cadets from the artillery, 100 from the infantry, 16 from the dragoons and 20 from the riflemen. But few of these were actually appointed, and for several years instruction was disorganized and desultory. In 1811–1812 instruction was practically abandoned, and in March 1812 the academy was without a single instructor. Up to this time 88 cadets had been graduated, 101, including two cadets at large (on recommendation of the senators), and 40 from the United States at large, all to be appointed by the president. Four Filipinos may also receive instruction and become eligible on graduation for commissions in the Philippine scouts. The maximum number of cadets under the appointment of the twelfth census was 533. Candidates for admission must be between 17 and 22 years, unmarried, and at least 5 ft. 4 in. high. For entrance there are physical examinations, and examinations in algebra, arithmetic, and composition; in literature, geography and general history. In 1902 the entrance requirements were raised and the actual amount of work done in the academic year increased. The courses are: tactics for all classes; civil and military engineering (first class); military engineering (fourth, third, second and first classes); mechanics and astronomy (third and second classes); mathematics (new cadets, fourth and third classes); chemistry, mineralogy and geology (third and second classes); drawing (third and second classes); modern languages, i.e. French and Spanish (fourth, third, second and first classes); law (first class); ordnance and gunnery (first class); military hygiene (second class); and English and history (new cadets and fourth class). The course is four years, and academic instruction continues from the 1st of September to the 5th of June. The summer months are devoted to field work and encampments. Each cadet while in attendance receives pay at the rate of $600 a year and one ration per day, or commutation thereof at thirty cents per day, amounting to $709.50. The number of graduates is 1,641,746. The superintendent of the academy have been: in 1802-1803 and in 1805-1812, Jonathan Williams; in 1812-1814, Joseph Gardner Swift (1783-1865); in 1815-1817, Alden Fassett (1805-1854); in 1817-1818, Sylvanus Thayer; in 1818-1833, René E. Dehon (1796-1879); in 1833-1838 and in 1836-1846, Richard Delafeld (1798-1873); in 1845-1852, Henry Brewerton (1801-1867); in 1852-1855, Robert E. Lee; in 1855-1860, Joseph E. Johnston (1807-1891); in 1861-1864, P. G. T. Beauregard; in 1865-1864, Alexander Hamilton Bowles (1803-1886); in 1864, Zealous Bates Tower (1819-1890); in 1864-1865, G. W. Cullum; in 1866-1871, Thomas Gamble Pitcher (1822-1895); in 1871-1891, Sylvanus Thayer; in 1854-1856, 1857-1858, 1860-1881, J. M. Schofield; in 1881-1882, O. O. Howard; in 1882-1887, Wesley Merritt; in 1887-1889, John Grubb Park (1827-1919); in 1889-1897, Moultrie Davis (1837-1906); in 1899-1908, Oswald Herbert Ernst (b. 1842); in 1908-1909, Elbert Alberthought (b. 1854); in 1906-1910, H. L. Scott (b. 1853); and, 1910, T. H. Barry (b. 1853).
electric railways to Holyoke and Hartford. The principal villages are Merrick and West Springfield on the Connecticut river and Pittsfield on the Westfield river. West Springfield was originally a part of Springfield. The first settlement was not made, however, until about 1653, and there were few settlers until after King Philip's War (1675). In 1696 West Springfield was organized as a separate parish, and in 1774 was made a separate township. Holyoke was set off from it in 1860, and Agawam in 1855.

Climate.—WEST VIRGINIA, the north-westernmost of the so-called Southern states of the United States of America, lying between latitudes 37° 10' and 40° 40' N., and longitudes 72° 40' and 82° 40' W. It is bounded on the north-west by Ohio, from which it is separated by the Ohio river, on the north by Pennsylvania and Maryland, the Potomac river dividing it from the latter state; on the east and south-east by Pennsylvania, Maryland and Virginia, the boundary lines in the first two cases being meridians, in the last case a very irregular line following the crest of mountain ridges in places; and on the south-west by Virginia and Kentucky, the Big Sandy river separating it from the latter state. The State extends from the Ohio river north to south is about 240 mi., the extreme breadth from east to west about 265 mi. Area, 24,170 sq. m., of which 148 sq. m. is water surface.

Physical Features.—The state is divided into two distinct physiographic provinces; the Allegheny Plateau on the west, comprising part of the western margin of the Appalachian Plateau, and for the most part the southern part of the great Appalachian Plateau Province which extends from New York to Alabama; and the Newer Appalachians or Great Valley Region on the east, being a part of the large province of the same name, the Allegheny Front, or mountainous area between the Allegheny Plateau and the Great Valley Province. The Allegheny Plateau consists of nearly horizontal beds of limestone, sandstone and shales, including important seams of coal; inclines slightly toward the north-west, and is intricately dissected by valley branching streams into a maze of narrow canyons and steep-sided hills. Along the Ohio river, these hills rise to an elevation of 800 to 1000 ft. above sea-level, while toward the south-east the elevation decreases to 500 or 600 ft. over the same old bedrock. The Allegheny Front, the entire plateau area is drained by the Ohio river and its tributaries. Along the flood-plains of the larger rivers are fertile "bottomlands," but the ruggedness of the plateau country as a whole has retarded the development of the state, much of which is still sparsely populated. The coal beds are of enormous extent, and constitute an important element in the wealth of the state.

Foliage and wild fruit are also found in the plateau rocks in great quantities.

In the Newer Appalachian region, the beds which still lie hori-
zontal, though long since thrown into folds and planed off by erosion, alternate belts of hard and soft rock being left exposed. Uplift permitted renewed erosion to wear away the soft beds, leaving mountain ridges of hard rock separated by patterns of the region, which is generally known as the Allegheny, and Valley Belt, the Great Valley Region, or the Folded Appal-
chians. The mountain ridges vary in height up to 4000 ft. and more, the highest point in the state being Spruce Knob (4800 ft.). The parallel valleys are drained by north-east and south-westflowing streams, those in the north-east being tributary to the Potomac, those farther south tributary to the Great Kanawha. Although the valleys between the ridges are not always easy of access, they give broad areas of nearly level agricultural land.

Flora.—The plateau portion of West Virginia is largely covered by forest. All along the Ohio river, and for the most part in the tributaries the valuable timber has been removed and considerable areas have been wholly cleared for farming and pasturage lands. Among the most important trees of this area are the white and chestnut oaks, with the maple, ash and hickory. The southern portion of the state containing the largest reserve supply. In the area of the Newer Appalachian Mountains, the eastern Panhandle region has a forest similar to that of the plateau district; but between these two areas of hardwood there is a long belt where spruce and pine cover the mountain ridges. Other trees common in the state are the persimmon, sassafras, and, in the Creme Peak, the hemlock. The principal medicinal plants are beechn, dogwood, and pawpaw are widely distributed. Among the shrubs and vines are the blackberry, black and red raspberry, gooseberry, salmonberry, hazel and grape. Ginseg is an important

Climate.—Inasmuch as the state has a range of over 4000 ft. in altitude, the climate varies greatly in different districts. The mean annual temperatures for typical sections are as follows: Ohio Valley north of the thirty-ninth parallel, 53° F.; south-western part of state, 56°; central plateau district, 53°; mountainous belt along southern-eastern boundary of state, 48° to 50°. Wellsburg, in the Newer Appalachian province, has a January mean of 24°, a summer mean of 70°. Parkersburg, farther down the Ohio valley, has a winter mean of 24° and a summer mean of 74°. Martinsburg, in the eastern Panhandle, has nearly the same means, 32° and 74°. Terra Haute, in the north-eastern mountains, has a winter mean of 26°, a summer mean of only 67°. The first killing frosts generally occur about the middle of October in the Ohio Valley region, and about the middle of November in the eastern Panhandle. The last killing frosts in the southern-eastern part are in the middle and last of April respectively. In the Ohio Valley and eastern Panhandle the summer mean temperature is 74°, the winter mean temperature 44°. In the north-eastern mountains, the temperature in January is 10°, the lowest 35°. Temperatures above 100° and below-15° are rare. Precipitation is greatest in the mountains, over 50 in.; and least over the Ohio Valley, the eastern Panhandle and the north-eastern mountains. The snow is there a foot thick by the middle of December, and in the winter, and sometimes deep in the higher plateau and mountain districts. The prevailing winds are from south to west.

Agriculture.—The state is primarily agricultural. In general the richer western part is devoted to crops, and the eastern part to raising live-stock. The crop of Indian corn in 1909 was 27,632,000 bushels, and the acreage 880,000. The wheat crop was 4,810,000 bushels, and the acreage 1,000,000. Grains of all kinds, besides oil-seeds, were grown to the value of $11,225,000. Tobacco is grown throughout the state; in 1909 on 12,000 acres was grown a crop of 12,000,000 lb., valued at $825,000.

Stock-raising is an important industry, especially in the eastern part of the state.

Minerals and Quarries.—The state's great mineral wealth is in coal of various kinds, and the bituminous coal.

The coal deposits underlie about 17,000 sq. m. (more than 70% of the total) of the state's area, and bituminous coal has been found in 51 of the 55 counties; this is one of the largest continuous coal fields in the world. The principal districts are the Fairmont (or Upper Monogahela) and the Elk Garden (or Upper Potomac) in the northern, and the Pocahontas (or Flat Top) and the New and Chief (or Middle Potomac) in the southern part. The total output of the state was 44,668 tons in 1865, when the first shipments outside the state were made; and 41,873,843 tons (valued at $40,000,000) in 1905 when the output of West Virginia was 3rd in quantity and in value among the states of the Union, being exceeded only by that of Pennsylvania and of Illinois. The seams are principally above water levels and in many cases have been laid bare by erosion; and the supply is varied—besides a fat coking coal, there are excellent grades of bright coal (first mined in 1864 at Coalburg, Kanawha county) and (except that in Kentucky) the only important supply of cannel coal in the United States. The bituminous coal of West Virginia is a particularly good coking coal, and in 1905, 1906, 1907 and 1908 West Virginia ranked second (to Pennsylvania) among the states of the Union in the amount manufactured; the Flat Top district is the principal cokemaking region.

Petroleum ranks second to coal among the state's mineral re-

sources. In 1877 Thomas Jefferson described a "burning spring" in the Kanawha Valley, and when wells were drilled for salt brine near Charleston petroleum and natural gas were found here before there was any drilling for oil in Pennsylvania. Immediately before the Civil War, petroleum was discovered in shallow wells near Parkersburg, and there was a great rush of prospectors and specu-
lators to the Little Kanawha Valley. But the Civil War interrupted development. After the war, wells were drilled at Burning Springs, and there was considerable production. But before 1880 petroleum was produced in the years 1865-1875, 3,000,000 bbls. of oil, valued at $20,000,000, were taken out of these districts. A successful well in Marion county, near Mannington, far from the region of the earlier wells, was drilled in 1888, and in 1890 there were 2,500 wells, and the output of oil was in 1888 to 544,113 in 1889, and to 2,406,218 in 1901; in 1893 it was already over 1,800,000 bbls.; and in 1900 it was 16,105,675. After 1906 it gradually decreased—although new pools in the Monongahela and Panhandle region were found in 1902—and in 1908 it was 9,522,176 bbls. (valued at $16,911,865).
Lincoln and Wayne counties. Much of the natural gas is piped out of these districts into Pennsylvania and Maryland; within the state has been utilized as a fuel in carbon black and glass factories.

Brine wells have been mentioned above; the salt industry is still of importance along the Ohio, where the manufacture of common salt is prosecuted with a value of $10,481; and there is a small output of bromine. Iron ore is found in the state in the coal hills (especially Laurel Hills and Beaver Lick Mountain), but the deposits have not been worked extensively because of the low price of fuel; in 1907 the value of pig iron manufactured in the state was $6,454,000. There are deposits of copper in the hills about Pendleton; in 1906 $2,155,157 was received for copper. In 1908 ($2,083,821) the state ranked after Ohio and New Jersey in the value of pottery. The total value of all clay products in West Virginia was $3,261,736 in 1908. An excellent glass sand is procured in Allegany and Allego Springs, Berkeley and Morgan counties. Grindstones have been quarried in Wood and Jackson counties. There are black slate deposits near Martinsburg. There are mineral springs, mostly medicinal waters, in Greenbrier, Summers, Webster, Ohio and Preston counties. Among the more noted medicinal springs are: classed as calcareous and earthy, Sweet Springs, 74° F., in Monroe county, diuretic and diaphoretic; and Berkeley Springs, 74° F., in Morgan county, reputed restorative for nervous and neuralgic cases, and as containing sulphur; Salt Sulphur Springs, in Monroe county, of value in scrofula and skin diseases.

Manufactures.—Manufacturing is largely localized in the northwestern and central part of the state. The Kanawha and Baltimore & Ohio railroads have served chiefly the manufacturing districts. The factory product in 1905 was $99,040,676. The principal manufactures are iron and steel: in 1905 the product of steel and rolled mills was $3,434,542. This is exceeded only in the valley of the Ohio, where the first rolling mill west of the Alleghenies was probably one near Morgantown. Next in importance among the state's manufactures are lumber and timber, and flour and grain mills. The principal dairy products are butter and cheese, largely dependent on the plentiful supply of oak and hemlock bark for tanning, is centralized in the northern and eastern parts of the state, near the forests. The glass industry began in Wheeling in 1821; and in 1871 a glass works was opened at Clearwater, Warren county. It was in the valley of the Ohio, at Wheeling, that the iron and steel industries began. The Chesapeake & Ohio traverses the southern part of the state, from White Sulphur Springs in the west, through Charleston to the Ohio, serving the New and Kanawha rivers coal district as a freight carrier; the Southern Railway extends the same service southward along the valley of the Big Sandy, carrying coal both east and west from the Pocahontas coal-field; and the new Virginian railroad entering at the south-east taps the coal-producing region (the Kanawha and Pocahontas districts) at Deepwater, serving in addition to the Norfolk & Western as a carrier of coal to Norfolk on the Virginia coast.

The railway mileage of the state grew with great rapidity in the decade 1880-1890; it was 691 m. in 1880, 1,433-30 in 1890, 2,474-34 in 1900 and 3,215-32 in January 1909. Natural facilities for transportation, afforded by the Ohio river and its branches, the Monongahela, at the northern end of the state, and the Little Kanawha and the Great Kanawha, are of special value for the shipment of lumber and coal. The Monongahela has been improved by locks and dams to Fairmont. It is the carrier of a heavy tonnage of coal to Pittsburgh, Pennsylvania. The Little Kanawha has been improved for the transportation of logs which are floated down to the Ohio.

Population.—The population of West Virginia at the various censuses since its organization as a state has been as follows: 1870, 442,014; 1880, 618,457; 1890, 762,704; 1900, 928,800; 1910, 1,221,119. In 1890-1900 and 1900-1910 the increase in population was more than one fourth. Of the total population in 1900, 67.7% was native-born, 892,854 were native whites, 43,490 were negroes, 56 were Chinese and 12 were Indians. Of the inhabitants born in the United States 61,598 were natives of Virginia, 46,501 of Ohio, 58,027 of Pennsylvania and 7,783 of New York: of the total there were 6532 Germans, 3342 Irish, 2611 Italians and 2622 English. Of the total population 71,388 were of foreign parentage—i.e., either one or both parents were foreign-born, and 18,323 were of German and 10,534 of Irish parentage, on both the father's and the mother's side.

In 1906 there were in the state 301,565 members of religious denominations, of whom 80.2% were Protestants. The Methodist bodies with 115,832 communicants (38.4% of the members), 15,578 Roman Catholics, 7,027 Baptists, 4,037 Disciples of Christ and 6,792 Lutherans. There were 67,044 Baptists (2256 United Baptists, 2019 Primitive Baptists and 1513 Free Baptists); 40,111 Roman Catholics; 19,993 United Brethren, all of the “New Constitution”; 10,668 Presbyterians; 13,333 Disciples of Christ; 6506 Lutherans, and 5230 Protestant Episcopalians. The principal cities of the state are Wheeling, Huntington, Parkersburg, Charleston (the capital), Martinsburg, Fairmont and Grafton.

Administration.—The first constitution of 1863 was superseded by the present instrument which was adopted August 1872 and was amended in 1880, 1883 and 1900. The constitution may be amended by either of two methods. A constitutional convention, a convention of the members elected to each house may submit the question of a majority of the voters to ratification. The votes cast on this amendment of the constitution shall be held, and all acts of the convention must be submitted to the people for ratification or rejection. On the other hand, a two-thirds majority of each house of the legislature may submit an amendment or amendments to the people for ratification on the next general election, when the approval of a majority of the voters carrying the amendment is necessary. All male citizens above twenty-one years of age have the right of suffrage. They are entitled to a residence of one year in the state and sixty days in the county in which they offer to vote. Paupers, insane, and those convicted of treason, felony or bribery in an election are barred, "while the disability continues," and no person in the military, naval or marine service of the United States is deemed a resident of the state by reason of being stationed therein. An official ballot containing the names of the candidates arranged in columns according to party is provided at public expense.

Executive.—The executive department consists of the governor, secretary of state, superintendent of free schools, auditor, treasurer and attorney-general, all elected by the people at the time of the presidential election and serving for four years from the fourth of March following. The governor must have been a citizen for five years preceding this election, must have attained the age of thirty and is ineligible for re-election during the four years succeeding the expiration of his term. In case of his death, resignation or inability to discharge the duties of the office, the president of the Senate acts as governor, and in case of his incapability the Speaker of the House of Delegates acts; and these two failing, the legislature on joint ballot elects an officer to fill the vacancy. A governor may be removed only when the expiration term is less than one year. The governor appoints, subject to the consent of a majority of the members of the Senate, all officers whose appointments are not otherwise provided for. In case of a vacancy in the court of appeals or in the circuit court the governor appoints until the next general election, or if the unexpired term is less than two years, until the end of the term. The governor sends a majority at the beginning of each session of the legislature, and may convene the houses in extraordinary session when he deems it necessary. He may veto a bill, or in case of an appropriation bill, the separate items, but this veto may be overridden by a simple majority of the total membership of each house. Any bill not returned with objections within five days after presentation becomes a law. An appropriation bill cannot become law until the adjournment of the legislature.

Legislative.—The legislature, consisting of the Senate and the House of Delegates, meets at the capital on the first Wednesday in January of the odd years. The Senate is composed (1910) of thirty members chosen from the districts of the state, of whom one half the membership retires biennially. A senator must be twenty-five years of age, and must have been a citizen of the state (total communicants or members) were the voting power preceding his election. The Senate elects a president, confirms or rejects the nominations of the governor, and acts as a court of impeachment for the trial of public officers, besides sharing in legislative functions. The House of Delegates consists of 100 members, elected for two years, of whom each county chooses at least one. A delegate must be a citizen and have resided one year in the county from which he is chosen. No person holding a lucrative office under the state or United States, or being an officer of a railroad company, and no officer of any court of record is eligible for membership in either house. Besides its legislative functions the House prepares and impeaches Proctors of the proceedings before the Senate. The length of the legislative session is fifty-five days,
but it may be extended by a vote of two-thirds of the members elected to each house. No act takes effect until ninety days after its passage unless two-thirds of the members of each house specifically otherwise provide.

Judiciary.—The judicial power is vested in the Supreme Court of Appeals, the Circuit courts, such inferior courts as may be established and the petty courts. The judges of the Circuit Court are appointed by the governor, with the advice and consent of the Senate, to hold office for six years; but they are eligible to reappointment. The judges of the Circuit Court, however, chiefly police and fiscal, and in justices of the peace. The Supreme Court of Appeals, consisting of five judges, elected for terms of twelve years, holds three terms annually, one at Wheeling, one at Charleston, and one at Camden. It has no power of legislation, but may suspend execution in cases of habeas corpus, mandamus and prohibition, and appellate jurisdiction in cases involving a greater amount than one hundred dollars; it may also determine the questions of land titles, with respect to the appointment or qualification of personal representatives, guardians, curators, committees, &c.; concerning a mill, roadway, ferry or landing; the right of a corporation or county to levy tolls or to contested elections for county, and district officers. (See below Local Government.) One or two justices of the peace (depending on population) are elected from each magisterial district; there must be not less than three, nor more than ten, districts in each county.

Local Government.—As in Virginia, the county is the unit of government, though an unsuccessful attempt to introduce the township system was made. The constitution of the state and that of the United States provide for boards of county commissioners, composed of three members, elected for six years, but with terms so arranged that one retires every two years, is the police and fiscal authority. Other officers are the Clerk, the sheriff, the auditor of public accounts, the Register of Deeds, and twelve Justiciars. The justices of the peace are appointed by the governor, to hold office for six years, with the advice and consent of the Senate.

Miscellaneous Laws.—A woman's right to hold, manage and acquire property is as great by marriage as if she were single and separate from her husband, she may not mortgage or convey real estate without his consent. A woman becomes of age at twenty-one. Rights of dower and courtesy both exist. When a husband dies intestate leaving a widow and issue, the widow is entitled to the life use of one-third of the real estate and to one-third of the personal estate absolutely. If there is no issue she takes the whole of the personal estate, while the real estate, subject to her dower, goes first to her husband's father and then to her brothers, brothers and sisters. If the wife dies intestate the husband has a right to the use of her real estate for life, and to one-third of the personal estate if there is issue. A widow of full age, or of a child of full age, will divide the estate of the right of dower or courtesy on the real estate and of the right to one-third of the personal estate. Children may be disinherited with or without cause. Any parent of infant children of deceased parents may set apart personal estate not exceeding $2500 in value, by contract, for their use while such child is under eighteen years of age, and such contract shall be exempt from execution. A homestead not exceeding $1000 in value may be set apart, provided that it is recorded before the death of the owner. It was claimed that contracts made between whites and negroes, or where either party had a wife or husband living, or within the prohibited degrees of consanguinity, or where either was insane or physically incapable of marriage, or where the union of the sexes was never consummated, and female marriages may be nullified. No female or male under twelve may be employed in mines, and no child under twelve may be employed in a factory, and no one under eighteen may be employed in any hazardous occupation. The prohibition of child labor was declared unconstitutional by the Supreme Court of the United States in 1922.

Charities, &c.—The state charitable and penal institutions consist of the West Virginia Insane Hospital for the Insane at Weston, the Second Hospital for the Insane at Spencer, three miners' hospitals—one at Welch, one at McMechen and one at Fairmont; the West Virginia Asylum for Incurables at Huntington, Schools for the Deaf and Blind at Romney, the West Virginia Penitentiary at Moundsville, the Virginia Industrial Home for Girls near Salem. There is also a Board of Charities and Correction in the state, under whose supervision of a state board of control of three members, appointed by the governor, which was created in 1909, and also has the care of the penitentiary and public charity institutions. The revenue from this source is a state humane society, which was organized in 1899 for the protection of children and of the helpless aged, and for the prevention of cruelty to animals. The West Virginia Colored Orphans' Home near Charleston, is an institution of this kind. It has been created by legislative acts, and is not in session that length of time. The county supery of public schools is vested in a county superintendent, who is elected for a term of four years. The state superintendent is elected in a state superintendent, who is selected for a term of four years. A state board of education, consisting of the state superintendent and five other persons appointed by him, constitutes a board of regents of the state (See below Local Government.) One or two justices of the peace (depending on population) are elected from each magisterial district; there must be not less than three, nor more than ten, districts in each county.

Finance.—The state revenue is derived mainly from a general property tax, license taxes levied on various businesses and occupations, a collateral inheritance tax and a capital tax. For the year ending on the 30th of September 1908, the receipts were $3,282,116.60 and the disbursements $3,482,317.03. West Virginia's share of the Virginia debt which existed when West Virginia was set off from Virginia has not yet been determined (see below Local Government.) but other than this the state has no debt, and the contraction of a state debt other than "to meet casual deficits in the revenue, to redeem a previous liability of the state, to suppress insurrection, or to provide for the common defense.

History.—That part of Virginia beyond the Allegheny mountains was a favourite haunt of the Indians before the first coming of the whites, and there are many Indian mounds, indicative of an early and high cultural development, within the present limits of the state, and especially in the neighbourhood of Moundsville (q.v.). The western part of Virginia was not explored until long after considerable settlements had been made in the east. In 1671 General Abram Wood, at the direction of Governor William Berkeley (c. 1610-1677), sent a party which discovered Kanawha Falls, and in 1716, Governor Alexander Spotswood with about thirty horsemen made an excursion into what is now Pendleton county. John Van Metre, an Indian trader, penetrated into the northern portion in 1725, and Morgan a Morgan, a Weahman, built a cabin in the present Berkeley County in 1727, and in 1750-52 the Pennsylvania Company founded New Mecklenburg, the present Shepherdstown, on the Potomac, and others soon followed. Charles II of England, in 1661, granted to a company of gentlemen the land between the Potomac and Rappahannock rivers, commonly known as the "Northern Neck." The grant finally came into the possession of Thomas, Lord Fairfax, and in 1746 a stone was erected at the source of the north branch of the Potomac to mark the western limit of the grant. A considerable part of this land was surveyed by George Washington between 1748 and 1751. The diary kept by the young surveyor indicates that there were already squatters, largely of German origin, along the South Branch of the Potomac.
Francis H. Pierpont was chosen governor of Virginia, other officers were elected and the convention adjourned. The legislature, composed of the members from the western counties who had been elected on the 23rd of May and some of the hold-over senators who had been elected in 1859, met at Wheeling on the 1st of July, filled the remainder of the state offices, organized a state government and elected two United States senators who were recognized at Washington. There were, therefore, two state governments in Virginia, one owning allegiance to the United States and one to the Confederacy. The Convention, which had taken a recess until the 6th of August, then re-assembled and (August 20) adopted an ordinance providing for a new state vote on the question of a new constitution and for a convention to frame a constitution if the vote should be favourable. At the election (October 24, 1861) 18,489 votes were cast for the new state and only 781 against. The convention met on the 26th of November 1861, and finished its work on the 18th of February 1862, and the instrument was ratified by the people (18,162 for and 514 against) on the 11th of April 1862. Next the legislature of the "Reorganized" government on the 13th of May gave its consent to the formation of the new state. Application for admission to the Union was now made to Congress, and on the 31st of December 1862 an enabling act was approved by President Lincoln admitting the state on the condition that a provision for the gradual abolition of slavery be inserted in the Constitution. The Convention was reconvened on the 12th of February 1863, and the demand of Congress was met. The revised instrument was adopted by the people on the 26th of March 1863, and on the 20th of April 1863 President Lincoln issued a proclamation admitting the state at the end of sixty days (June 20, 1863). Meanwhile officers for the new state were chosen, and Governor Pierpont removed his capital to Alexandria where he asserted jurisdiction over the counties of Virginia within the Federal area. The state furnished 7,000 soldiers to the Union army, and the State of West Virginia was recognized by the Federal Government. The United States government had been brought before the Supreme Court of the United States in the following manner. Berkeley and Jefferson counties lying on the Potomac east of the mountains, in 1863, with the consent of the "Reorganized" government of Virginia voted in favour of annexation to West Virginia. Many voters absent in the Confederate army when the vote was taken refused to acknowledge the transfer on their return. The Virginia legislature repealed the act of cession and in 1866 brought suit against West Virginia asking the court to declare the counties a part of Virginia. Meanwhile Congress on the 10th of March 1868 passed a joint resolution recognizing the transfer. The Supreme Court in 1871 decided in favour of West Virginia, and there has been no further question. During the Civil War West Virginia suffered comparatively little. McClellan's forces gained possession of the greater part of the territory in the summer of 1861, and Union control was never seriously threatened, in spite of Lee's attempt in the same year. In 1863 General John D. Imboden, with 5,000 Confederates, overran a considerable portion of the state. Bands of guerrillas burned and plundered in some sections, and were not entirely suppressed until after the war was ended. The state furnished an additional 10,000 soldiers to the Federal armies and some 200 of these were killed or captured.

The absence in the army of the Confederate sympathizers helps to explain the small vote against the formation of the new state. During the war and for years afterwards partisan feeling ran high. The property of Confederates might be confiscated, and in 1866 a constitutional amendment disfranchising all who had given aid and comfort to the Confederacy was adopted. The addition of the Fourteenth and Fifteenth Amendments to the U.S. Constitution caused a reaction, the Democratic party secured control in 1870, and in 1871 the constitutional amendment of 1866 was abrogated. The first steps toward this change had been taken, however, by the Republicans in 1870. In 1872 an entirely new constitution was adopted (August 22).

Though the first constitution provided for the assumption of a part of the Virginia debt, negotiations opened by Virginia in 1870 were fruitless, and in 1872 that state funded two-thirds of the debt and arbitrarily assigned the remainder to West Virginia.

The Potomac. Christopher Gist, a surveyor in the employ of the first Ohio Company (see Ohio Company), which was composed chiefly of Virginians, in 1753-1756 explored the country along the Ohio river north of the mouth of the Kanawha, and the company sought to have a fourteenth colony established with the name "Vandalia." Many settlers crossed the mountains after 1759, though they were somewhat hindered by Indian depredations. Probably no Indians lived within the present limits of the state, but the region was a common hunting ground, crossed also by many war trails, and during the French and Indian war (1754-63) the scattered settlements were almost destroyed. In 1774 the governor of Virginia, Lord Dunmore, himself led a force over the mountains, and a body of militia under General Andrew Lewis dealt the Shawnee Indians under Cornstalk a crushing blow at Point Pleasant (p.347) at the junction of the Kanawha and the Ohio rivers, but Indian attacks continued until after the War of Independence. During the war the settlers in Western Virginia were generally active Whigs and many served in the Continental army.

Social conditions in western Virginia were entirely unlike those existing in the eastern portion of the state. The population was not homogeneous, as a considerable part of the immigration came by way of Pennsylvania and included Germans, the Protestant Scotch-Irish and other mountainous settlers. The ordinance (June 11, 1784) provided a barrier between Virginia and the settlements which were to form West Virginia, and the conditions of the ordinance were carried out when the Virginia convention of 1861, which adopted the Ordinance of Secession, see VIRGINIA. Here it is sufficient to say that only nine of the forty-six delegates from the present state of West Virginia voted to secede. Almost immediately after the adoption of the ordinance a mass meeting at Clarksburg recommended that each county in north-western Virginia send delegates to a convention to meet in Wheeling on the 13th of May 1861. When this 'First Wheeling Convention' met, four hundred and twenty-five delegates from twenty-five counties were present, but soon there was a division of sentiment. Some delegates favoured the immediate formation of a new state, but the more far-sighted members argued that as the ordinance had not yet been voted upon by the people, and Virginia was still in the Union, such action would be revolutionary, since the United States Constitution provides that no state may be divided without its consent. Therefore it was voted that in case the ordinance should be adopted (of which there was little doubt) another convention including the members-elect of the legislature should meet at Wheeling on the 11th of June. At the election (23rd May 1861) the Scotch-Irish and settled majority in the state as a whole, but in the western counties 40,000 votes out of 44,000 were cast against it. The "Second Wheeling Convention" met according to agreement (11th June), and declared that, since the Secession Convention had been called without the consent of the people, all its acts were void, and that all who adhered to it had vacated their offices. An act for the "reorganization" of the government was passed on the 19th of June. The next day
The legislature of the latter state in 1873 adopted a report declaring that between 1822 and 1861, during which period the debt had been incurred, the western counties had paid an excess of taxes, more than equal to the amount which had been expended in the west for the purposes for which the debt had been incurred, and concluded with the statement: "West Virginia owes nothing; has no bonds for sale and asks for none." In 1906 Virginia entered suit in the U.S. Supreme Court to compel West Virginia to assume a portion of the debt. West Virginia demurred, but was overruled, and on the 4th of May 1908 a master was appointed to take testimony. The state rejected decisively the overtures made by Virginia in 1866, looking towards a reunion of the commonwealths.

Fast and Hu Maxwell, History and Government of West Virginia (Morgantown, 1901; new edition, 1908); A. S. Withers, Chronicles of Border Warfare (1831), reprinted Cincinnati, 1899; J. F. Hale, Trans-Alleghany Pioneers (Cincinnati, 1889); W. F. Winkler, History of West Virginia (Wheeling, 1901); and M. F. Callahan, Evolution of the Constitution of West Virginia (Morgantown, 1909).

WESTWARD HO, a small seaside village in the Barnstable parliamentary division of Devonshire, England, on the east of Barnstable Bay, 2½ m. N.W. of Bideford, on the Bideford, Appledore, and Hartland railway and by electric lines to Hartford. Among its old buildings are the house in which in 1751 George Washington and Count Rochambeau met to plan the Yorktown campaign; the First Church of Christ (Congregational), erected in 1761 and remodelled in 1838 and 1882; and the old academy building, which was built in 1812, is now used as a town hall, and houses a public library. There is a giant elm here, 26½ ft. in girth. The Connecticut cut state prison is in Wethersfield. In the township tobacco, vegetables, and dairy products are raised, and dairy interests are of considerable importance; the principal manufactures are small tools and mattresses. Wethersfield is the oldest permanently inhabited township in the state; it was first settled in the winter of 1634–1635 by colonists from Watertown, Massachusetts, and received its present name in 1637. With Hartford and Windsor in 1639 it framed the Fundamental Orders of the Colony of Connecticut. Before 1660 its inhabitants aided in the founding of Stamford and Milford, Connecticut, and of Hadley, Massachusetts.

See H. R. Stiles, History of Ancient Wethersfield (New York, 1900).

WETSTEIN (also WETTSTEIN), JOHANN JAKOB (1693–1754), New Testament critic, was born at Basel on the 4th of March 1693. Among his tutors in theology was Samuel Werenfers (1657–1740), an influential anticipator of modern scientific exegesis. While still a student he began to direct his attention to the special pursuit of his life—the text of the Greek New Testament. A relative, Johann Wetstein, who was the university librarian, gave him permission to examine and collate the principal MSS. of the New Testament in the library, and he copied the various readings which they contained into his copy of Gerard of Maestricht's edition of the Greek text. In 1713 in his public examination he defended a dissertation entitled De varis Novi Testamenti lectionibus, and sought to show that variety of readings did not detract from the authority of the Bible. Wetstein paid great attention also to Aramaic and Talmudic Hebrew. In the spring of 1714 he undertook a learned tour, which led him to Paris and England, the great experience of his inquiry everywhere being manuscripts of the New Testament. In 1717 he returned to Cambridge, who took great interest in his work. The great scholar induced him to return to Paris to collate carefully the Codex Ephraemii, Bentley having then in view a critical edition of the New Testament. In July 1717 Wetstein returned to take the office of a curate at large (diaconus communis) at Basel, a post which he held for three years, at the expiration of which he exchanged it to become his father's colleague and successor in the parish of St Leonard's. At the same time he pursued his favourite study, and gave private lectures on New Testament exegesis. It was then that he decided to prepare a critical edition of the Greek New Testament. He had in the meantime broken with Bentley, whose famous Proposals appeared in 1720. His earlier teachers, however, J. C. Iselin and J. L. Frey, who were engaged upon work similar to his own, became so unfriendly towards him that after a time he was forbidden any further use of the manuscripts in the library. Then a rumour got abroad that his projected text would take the Socinian side in the case of such passages as 1 Timothy iii. 16; and in other ways (e.g. by regarding Jesus' temptation as a subjective experience) by explaining some of the miracles in a natural way he gave occasion for the suspicion of heresy. At length in 1729 the charge of projecting an edition of the Greek Testament savouring of Arius and Socinian views was formally laid against him. The end of the long and unceasing trial was his dismissal, on the 13th of May 1730, from his office of curate of St Leonard's. He then removed from Basel to Amsterdam, where a relative, Johann Heinrich Wetstein, had an important printing and publishing business, from whose office excellent editions of the classics were issued. In 1740 he undertook the issuing of Gerard of Maestricht's edition of the Greek Testament. Wetstein had long been in the habit of speaking of himself as a student, an edition of the Greek Testament, which was suddenly stopped for some unknown reason. As soon as he reached Amsterdam he published anonymously the Prolegomena ad Novi Testamenti Graeci editionem, which he had proposed should accompany his Greek Testament, and which was republished by him, with additions, as part of his great work, 1751. The next year (1731) the Remonstrants offered him the chair of philosophy in their college at Amsterdam, vacated by the illness of Jean le Clerc, on condition that he should clear himself of the suspicion of heresy. He thereupon returned to Basel, and refused a reversal (March 22, 1733) of the previous decision, and re-
WETTLER, a town of Germany, in the Prussian Rhine province, pleasantly situated at the confluence of the Dißl and Lahn, 64 m. N.E. of Coblenz by the railway to Giessen. Pop. (1905) 12,767. The most conspicuous building is the cathedral, dating in part from the 11th, in part from the 14th-16th centuries. The municipal archives contain interesting documents of the whilom imperial chamber (see infra). The town preserves associations of Goethe, who wrote Die Leiden des jungen Werthers, after living here in 1772 as a legal official, and of Charlotte Buff, the Lotte of Werther. Overlooking the town are the ruins of the medieval castle of Kalsumnt. There are iron mines and foundries and optical instrument factories. Wetzlar was originally a royal demesne, and in the 12th century became a free imperial town. It had grown in importance when, in 1603, the imperial chamber (Reichskammergericht) was removed hither from Spires. The town lost its independence in 1803, and passed to the prince-primate Dalberg. Three years later (1806), on the dissolution of the empire, the imperial chamber ceased to exist. The French occupied here in 1813 and 1814, and Saxons under the archduke Charles, 15th June 1796.

WEXFORD, a county of Ireland in the province of Leinster, bounded N. by Wicklow, E. and S. by St George's Channel, and by W. by Waterford, Kilkenny and Carlow. The area is 576,757 acres or about 902 sq. m. The coast-line does not present any striking features, and owing to the number of sandbanks navigation is dangerous near the shore. The only inlet of importance on the east coast and the only safe harbour is Wexford Harbour, which, owing to a bar, is not accessible to large vessels at ebb-tide. The artificial harbour of Rosslare, Wexford Harbour, on the north side of the island, was therefore opened in 1906. On the south coast the great inlet of Waterford Harbour separates the county from Waterford and Kilkenny, and among several inlets Bannow Bay is the largest. Several islets adjoin the coast. South from Crossfarnogue Point are the Saltee Islands, and Coningmore and Coningbeg, beyond the latter of which is the Saltee lightship. South-east from Greencore Point is the Tuskar Rock.

The surface of the county is chiefly a series of verdant low hills, except towards the northern and western boundaries. An elevated ridge on the north-western boundary forms the termination of the granitic range in Wicklow, and in Croghan Kinisha, on the borders of Wicklow, rises to a height of 1085 ft. On the western border, another range, situated chiefly in Carlow, extends from the valley of the Slaney at Newtownbarry to the confluence of the Barrow with the Nore at New Ross, and reaches 2409 ft. in Blackstairs Mountain, and 2610 ft. in Mount Leinster on the border of Co. Carlow. In the southern district, a hilly region, reaching in Forth Mountain a height of 725 ft., forms with Wexford Harbour the northern boundaries of the baronies of Forth and Bargy, a peninsula of flat and fertile land. The river Slaney enters the county at its north-western extremity, and flows south-east to Wexford Harbour. Its chief tributary is the Bann, which flows south-westwards from the borders of Wexford. The Barrow forms the western boundary of the county from the Blackstairs range of mountains till its confluence with the Suir at Waterford Harbour.
Geology.—The Leinster Chain, with its granite core and margin of mica-schist, bounds the county on the west. From this, Silurian greensand becomes sea. In the north, the surface, numerous intrusive and contemporaneous felsitic lavas, and some diorites occurring along the strike in continuation of the Waterford series. A granite outlier rises south-east of Enniscorthy; and granite, in part gneissic, forms Carres P. from Newtown to Bannew Bay, greenish slates like the Oldhamian series of Wicklow form a broad band, with Old Red Sandstone and Carboniferous slates and sandstones near them. The county north of Wexford, and west of Slane, is again towards Carnsore. The surface of the county is much modified by glacial drift, and by the presence of sands and gravels of pre-Glacial and possibly late Pliocene age. These interesting beds are used for liming the fields, under the name of “manure gravels,” on account of the fossil shells that they contain.

Industries.—The soil for the most part is a cold stiff clay resting on clay-and-sandstone rocks. The central districts are more exposed to those round the coasts. In the south-eastern peninsula of Forth and Barray the soil is a rich alluvial mould mixed with coralline sandstone and limestone. The peninsula of Hookhead, owing to the limestone formation, is specially fruitful. In the western districts of the county there are large tracts of turf and peat-moss. The acreage under pasture is a little over twice that of tillage, and figures show a fair maintenance of the principal crops, barley, of which the county produces more than any other Irish county, oats, potatoes and turnips. The numbers also of cattle, sheep, pigs and poultry are large and increasing, or well maintained. Except the county of Wexford the county produces more coals and minerals and has a greater small importance. The town of Wexford is the headquarters of sea and salmon fishing districts, and there are a few fishing villages on the inlets of the south coast.

The line of the Dublin & South-Eastern railway enters the county from N.E., and runs to Wexford by way of Enniscorthy, with a branch W. to New Ross, from Macmine Junction. Connecting with this line at Palace East, a branch of the Great Southern & Western joins the Kilkenny & Kildare line at Bagenalstown, county Carlow. This company also owns the lines from Rosslare harbour to Wexford and across the southern part of the county to Waterford. There is wireless communication for barges by the Slaney to Enniscorthy; by the Barrow for larger vessels to New Ross, and by this river and the Grand Canal for barges to Dublin.

Population and Administration.—The population decreases (112,063 in 1891; 104,104 in 1901), but this decrease and the emigration returns are less serious than the average of Irish counties. Of the total about 91% are Roman Catholics, and about 8% form the rural population. The principal towns are Wexford (pop. 11,768), New Ross (5847), Enniscorthy (3458) and Gorey. Newtownbarry, finely situated on the Slaney below the outliers of Mount Leinster, is a lesser market town. To the Irish parliament, until the Union of 1800, the county returned two members, and the boroughs of Bannow, Clonmel, Enniscorthy, Fethard, Gorey, New Ross, Taghmon and Wexford two each. By the Redistribution Act of 1885 Wexford, which had returned two members since 1800, was divided into two parliamentary divisions, North and South, each returning one member, the borough of Wexford, which formerly returned two, being in both, the county being divided in 1649, on the northern side of the river. The town of Wexford within the county, being merged in the South Division. The county is divided into ten baronies. It is in the Protestant diocese of Dublin, and the Roman Catholic dioceses of Dublin, Ferns, and Kildare and Leighlin. Assizes are held at Wexford, and quarter sessions at Enniscorthy, Gorey, New Ross and Wexford.

History and Antiquities.—The northern portion of Wexford was included in Hy Kinsela, the peculiar territory of the Macmorroughs, overlords of Leinster, who had their chief residence at Ferns. Dermot Macmorrough, having been deposed by the king of Leinster, fled to England, and the king of England, who authorized him to raise forces in England for the assertion of his claim. He secured the aid of Strongbow by promising him the hand of Eva, and in addition obtained assistance from Robert Fitzstephen and Maurice Fitzgerald of Wales. On the 1st of May 1169 Fitzstephen landed at Bagenon on the south side of Fethard, and after four days' siege captured the town of Wexford from its Danish inhabitants. After this Dermot granted the territory of Wexford to Fitzstephen and Fitzgerald and their heirs for ever. Macmorrough having died in 1174, his son inherited the territory, and in 1174 he retained Wexford in his own possession, but in 1174 he committed it to Strongbow. The barony of Firth is almost entirely peopled by the descendants of those who accompanied these English expeditions. Wexford was one of the twelve counties into which the conquered territory in Ireland is generally stated to have been divided by King John, and formed part of the possessions of William Marshal, earl of Pembroke, who had married Strongbow's daughter. Through the female line it ultimately passed to John Talbot, earl of Shrewsbury, who in 1446 was made earl of Waterford and baron of Dunbarvan. In 1744 George Talbot, 1st duke of Shrewsbury, became lord-lieutenant of the county. The district was actively concerned in the rebellion of 1641 and during the Cromwellian campaign the town of Wexford was carried by storm on the 9th of October 1649, and a week later the garrison at New Ross surrendered—a "seasonable mercy," according to Cromwell, as giving him an "opportunity towards Munster." Wexford was the chief seat of the rebellion of 1798, the leaders there being the priests.

Evidences of the Danish occupation are seen in the numerous raths, or encampments, especially at Dunbrody, Enniscorthy and New Ross. Among the monastic ruins special mention may be made of Dunbrody abbey of great extent, founded about 1178 for Cistercian monks by Hervey de Montmorency, marshal of Henry II., Tintern abbey, founded in 1200 by William Marshal, earl of Pembroke, and peopled by monks from Tintern abbey in Monmouthshire; the abbey of St Sepulchre, Wexford, founded shortly after the invasion of William, and the abbey of the libertied Cloister of St. George Macmorrough (with other remains including the modernized cathedral of a former see, and ruins of a church); and the abbey of New Ross, founded by St Alban in the 6th century. There are a considerable number of old castles, including Ferns, dismantled by the parliamentary forces under Sir Charles Coote in 1641, and occupying the site of the old palace of the Macmorroughs; the massive pile of Enniscorthy, founded by Raymond le Gros, Carrick Castle, near Wexford, the first castle built by the English in Ireland; and through the castle of Wexford, a sea-port, town and municipal borough, and the county town of Co. Wexford, Ireland, finely situated on the south side of the Slaney, where it discharges into Wexford Harbour, on the Dublin & South-Eastern railway, 92 m. S. of Dublin. Pop. (1901) 11,168. Wexford Harbour, formed by the estuary of the Slaney, is about 5 m. from N. to S. and about 4 from E. to W. There are quays extending nearly 900 yds., and the harbour affords good accommodation for shipping, but its advantages are in great part lost by a bar at its mouth preventing the entrance of vessels drawing more than 12 ft. An artificial harbour was therefore opened at Rosslare in 1906, outside the southern part of the promontory closing in the harbour, and this is connected with Wexford by a railway (8½ m.) owned by the Great Southern & Western Company, and is served by the passenger steamers of the Great Western railway of England from Fishguard. The town of Wexford consists, for the most part, of extremely narrow streets, of picturesque appearance, but inconvenient to traffic. Some remains exist of the old walls and flanking towers. The Protectors, the late unionists, have their headquarters at the old abbey of St Sepulchre or Selskar, is said to occupy the spot where the treaty was signed between the Irish and the English invaders in 1660. The principal modern buildings are the town-hall, court-house, barracks, occupying the site of the ancient castle, St Peter's College for the education of Catholic clergy, with a striking chapel by A. W. Pugin, and a number of convents. At Carrick: 2 m. W., the Anglo-Normans erected their first castle, and opposite this, across the river, is a modern round tower commemorating the men of Wexford who died in the Crimean War. This round tower is a national monument, and is the help of the Rosscarbery and Hookhead lighthouses. Shipbuilding is carried on, and also tanning, malting, brewing, iron-founding, distilling and the manufacture of artificial manure, flour, agricultural implements, and rope and twine. Wexford is the headquarters of salmon and sea fishery districts. Under the Local Government Act 1898 it retains its mayor and corporation.

Wexford was one of the earliest colonies of the English, having been taken by Fitzstephen. It was the second town that Cromwell besieged in 1649. It was garrisoned for William III. in 1707, and again in 1717. Wexford, however, surrendered it on the 21st of June. In 1378 the town received a charter from Aymar de Valence, which was extended by Henry IV. in 1411, and confirmed by Elizabeth in 1558.
By James I, it was in 1608 made a free borough corporate, by the title of the town and free borough corporate of Wexford. It returned two members to parliament from 1374 till the Union, when they were reduced to one. In 1885 it was included in the south division of the county.

**WOULDINGE**, an urban district in the Chertsey parliamentary division of Surrey, England; 10 m. W.S.W. from London by the London & South-Western railway. Pop. (1901) 5330. It lies in the flat valley of the river Wey, 1 m. above its junction with the Thames. The river is locked up to Godalming, and navigation is assisted by cuts. Weybridge has grown in modern times out of a village into a residential town. The church of St James is modern but contains numerous ancient memorials, and one by Sir F. Chantrey for the duchess of York (d. 1829), daughter of Frederick William II. of Prussia, to whose memory there is also a column on Weybridge Green. The summit of this column is that which formerly stood at Seven Dials, London.

The Roman Catholic chapel of St Charles Borromeo was the burial-place of Louis Philippe, ex-king of the French (d. 1850), who resided at Claremont in the neighbouring parish of Esher, his queen and other members of his family; but their bodies were subsequently removed to Dreux in Normandy. To the east of Weybridge lies Henry VIII.'s park of Oatlands (see WALTON-ON-THAMES). In 1907 the Brooklands racing track for motor-cars was opened near Weybridge. It has a circuit of 2.46 m. round the inner edge, and including the straight finishing track is 3.67 m., and on this track the cars circle the curves it is banked up to a maximum height of 28 ft. 8 in.

**WEYDEN, ROGER VAN DER** [originally ROGER DE LA PASTURE] (c.1400 1464), Flemish painter, was born in Tournai, and there apprenticed in 1427 to Robert Campin. He became a guild master in 1432 and in 1435 removed to Brussels, where he was shortly after appointed town painter. His four historical works in the Hôtel de Ville have perished, but three tapestries in the Bern museum are traditionally based on their designs. In 1449 Rogier went to Italy, visiting Rome, Ferrara (where he painted two pictures for Lionello d'Este), Milan and probably Florence. On returning (1450) he executed for Pierre Bldelin the "Magi" triptych, now in the Berlin gallery, and (1455) an altarpiece for the abbey of Cambrai, which has been identified with a triptych in the Prado Gallery representing the "Crucifixion," "Expulsion from Paradise" and "Last Judgment." Van der Weyden's style, which was in no way modified by his Italian journey, is somewhat dry and severe as compared with the painting of the Van Eycks, whose pupil Vasari erroneously supposed him to be; his colour is less rich than theirs, his brush-work more laborious and inexpressive, and he lacks their sense of texture. On the other hand, he cared more for dramatic expression, particularly of a tragic kind, and his pictures have a deeply religious intention. Comparatively few works are attributed with certainty to this painter; chief among such are two altarpieces at Berlin, besides that mentioned above, "The Joys and Sorrows of Mary," and "Life of St John the Baptist," a "Deposition" and "Crucifixion" in the Escorial, the Prado triptych, another ("Annunciation," "Adoration" and "Presentation") at Munich; a "Madonna," and a "St John the Baptist at Frankfort." The "Seven Sacraments" altarpiece at Antwerp is almost certainly his, likewise the "Dance of the Lute Players" in the triptych of the Beaune hospital, and the "Seven Sorrows" at Brussels. Two pictures of St Luke painting the Virgin, at Brussels and St Petersburg respectively, are attributed to him. None of these is signed or dated. Van der Weyden attracted many foreigners, notably Martin Schongauer, to his studio, and he became one of the main influences in the northern art of the 15th century. He died at Brussels in 1464. His descendant, **ROGER VAN DER WEYDEN** the younger, is known to have entered the Antwerp guild in 1526, but no work of his has yet been satisfactorily authenticated.

See Haase, *Roger van der Weyden und Roger von Brügge* (Strassburg, 1895).

---

**WELHORN** y **NICOLAU, VALERIANO**, Marqués of Tenerife (1839- ), Spanish soldier, was born at Palma de Majorca. His family were originally Prussians, and served in the Spanish army for several generations. He entered at sixteen the military college of infantry at Toledo, and, when he attained the rank of lieutenant, passed into the staff college, from which he came out as the head of his class. Two years afterwards he became captain, and was sent to Cuba at his own request. He distinguished himself in the expedition to Santo Domingo in many fights, and especially in a daring reconnaissance with few men into the heart of the enemy's lines, for which he got the cross with laurels of San Fernando. From 1868 to 1872 he served also brilliantly against the Cuban rebels, and commanded a corps of volunteers specially raised for him in Havana. He returned to Spain in 1873 as brigadier-general, and took an active part against the Carlists in the eastern provinces of the Peninsula in 1875 and 1876, for which he was raised to the rank of general of division. Then he was elected senator and given the title of marquess of Tenerife. He held the post of captain-general in the Canary Isles from 1878 to 1883, and in the Balearic Isles afterwards. In 1888 he was sent out as captain-general to the Philippines, where he dealt very sternly with the native rebels of the Carolines, of Mindanao and other provinces.

On his return to Spain in 1892 he was appointed to the command first of the 6th Army Corps in the Basque Provinces and Navarre, where he suppressed the agitations, and then as captain-general at Barcelona, where he remained until 1894.

In Catalonia, with a state of siege, he made himself the terror of the anarchists and socialists. After Marshal Campos had failed to pacify Cuba, the Conservative government of Canovas del Castillo sent out Weyler, and this selection met the approval of most Spaniards, who thought him the proper man to crush the rebellion. Weyler attempted to do this by a policy of inexorable repression, which raised a storm of indignation, and led to a demand from America for his recall. This recall was granted by the Liberal government of Sagasta, but Weyler afterwards asserted that, had he been left alone, he would have stamped out the rebellion in six months. After his return to Spain his reputation as a strong and ambitious soldier made him one of those who in case of any constitutional disturbance might be expected to play an important rôle, and his political position was nationally affected by this consideration; his appointment in 1900 as captain-general of Madrid resulted indeed in more than one ministerial crisis. He was minister of war for a short time at the end of 1901, and again in 1905. At the end of October 1909 he was appointed captain-general at Madrid.

**WEYMOUTH** and **WEYBRIDGE**, villages, towns or, as the case may be, groups of villages, towns or parts of towns. The present two Weymouths are: the town of Weymouth, in Dorsetshire, and the village of Weymouth in Berkshire, opposite the town.

**Weyman,** STANLEY JOHN (1855-1909), English novelist, was born at Ludlow, Shropshire, on the 7th of August 1855, the son of a solicitor. He was educated at Shrewsbury School, and at Christ Church, Oxford. He took his degree in modern history in 1877, and was called to the bar at the Inner Temple in 1881, joining the Oxford circuit. He had been practising as a barrister for eight years when he made his reputation as a novelist by a series of romances dealing with French history: The House of the Wolf (1883), A Gentleman of France (1883), Under the Red Robe (1884), Memoirs of a Minister of War (1885), &c. Among his later novels were: Shrewsbury (1897), The Castle Inn (1898), Sophia (1900), Count Hannibal (1901), In King's Bayou (1902), The Long Night (1903), The Abbott of Vlase (1904), Stavecross Farm (1905), Chippings (1906).

**Weymouth** is a coastal town of the county of Dorset, on the south coast of England, 19 m. S.E. of Corsham, and 9 m. S.E. of Eastleigh, the main railway junction of the county. The town is situated on the river Rea, which here forms the boundary between Wiltshire and Dorset. The town is connected with Corsham by the Great Western railway. It is also connected by the Bristol and Exeter railway, and is the terminus of the Dorset and Somerset branch of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth. The town is also the terminus of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth. The town is also the terminus of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth. The town is also the terminus of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth. The town is also the terminus of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth. The town is also the terminus of the London and South-Western railway, and is connected with the Somerset and Dorset joint railway, which runs from Templecombe to Bournemouth.

In the town there are several villages, including Weymouth, North Weymouth, East Weymouth and South Weymouth.
WEYMOUTH—WHALE

Weymouth, and the smaller villages of Weymouth Centre, Weymouth Heights, Lovell’s Corner, Nash’s Corner and Old Spain, and there are also four islands, Round, Grape, Slate and Sheep. The mainland itself is largely a peninsula lying between the Weymouth Fore river and the Weymouth Back river, to the west and east respectively. The surface of the country is rough: Great Hill (at one of the narrowest parts of the peninsula) is 145 m., and Weymouth Common is 89 m. In the township are the Fogg Library (1589, in South Weymouth) founded by a bequest of John S. Fogg; and the Tufts Library (1879, in Weymouth village), endowed by Quincy Tufts and his sister Susan Tufts. In 1905 the township’s factory products were valued at $4,021,955, of which $2,588,213, or 52-6% of the total, was the value of boots and shoes. The township owns and operates its water works; the water supply is obtained from Weymouth Great Pond in the village of South Weymouth. Weymouth was first settled in 1624 by Robert Gorges. It was known first as the plantation of Wessagusset or Wessagusset; was incorporated as a township in 1635, and its boundaries have been practically unchanged since 1837, when Round and Grape islands were granted to Weymouth.

See C. F. Adams, Jr., “Wessagusset and Weymouth” in No. 3 (1905) of the Publications of the Weymouth Historical Society (organized in 1879 and incorporated in 1886), and D. H. Hurl, History of Norfolk County (Boston, 1884).

WEYMOUTH and MELCOMBE REGIS, a seaport, watering-place, market town and municipal borough in the Southern parliamentary division of Dorsetshire, England, 142 m. S.W. by W. from London, 74 m. S.W. of Hants, and 9 m. S.S.W. of the Great Western railways. Pop. (1891) 17,160; (1901) 19,843. It is formed of Weymouth, a fishing town and seaport on the south-west of the Wey, and Melcombe Regis on the north-east of the river, the two towns being contiguous. The situation on Weymouth Bay, which is enclosed to the south by the Isle of Portland, and north by the eastward trend of the coast, is picturesque. An esplanade about 1 m. in length fronts the sea. To the south of the esplanade is a pier of stone on wooden piles, and the Alexandra and other public gardens are attractive. The harbour lies between the pier on the north and the spur of land called the Nothe on the south, and is protected by a concrete wall extending 500 ft. northward from the Nothe. The principal buildings are the old town-hall, the market house, the guildhall, the Royal Dorset Yacht Clubhouse, the theatre, the Royal Victoria Jubilee Hall, the Weymouth and Dorset eye infirmary, the Weymouth royal hospital and dispensary and the barracks. Of the numerous churches some dates from before the 19th century. Opposite the Royal Terrace is an equestrian statue of George III., erected in 1809 in commemoration of his jubilee. A line of trees along the sea-front is an avenue planted by Henry VIII. for the protection of the shipping. The principal exports are Portland stone, bricks and tiles and provisions, and the imports are coal, timber, garden and dairy produce and wine. Ship and boat building, rope and sail making, and brewing are carried on. The Great Western railway company maintains a regular service of passenger steamers to Guernsey and Jersey. The municipal borough is under a mayor, 8 aldermen and 24 councillors. Area, 1799 acres.

Although its convenient harbour was probably used before Saxon times, and bronze weapons and Roman interments have been found, there is no evidence that Weymouth (Walunue, Weymouth) was a place of early settlement. The first mention of “that place called Weymouth” occurs in a charter of King Æthelred (866-871), while it is again spoken of in a charter of King Æthelstan (895-940). Edward the Confessor gave the manor to the church of Winchester in 1042, and it remained with the prior and convent of St Swithin until the 13th century, when it passed by exchange to Gilbert de Clare, earl of Gloucester, though the vassals of the prior and convent remained exempt from dues and tonnage in the port. Coming by marriage into the hands of the earls of March and Plantagenets, the manor was finally vested in the crown. The first charter was that granted by the prior and convent in 1257, by which Weymouth was made a free borough and port for all merchants, the burgesses holding their burgages by the same customs as those of Portsmouth and Southampton. The demand of six ships from the town by the king in 1324 shows its importance in the 14th century, but there is no mention of a mayor until 1467. It is probable that the town suffered considerably at the hands of the French at the beginning of the 15th century, though in 1404 the mayor and the burgesses were visited thereon a pain, their dwellings being destroyed in the Isle of Portland. Early in the 16th century the commercial rivalry between Weymouth and the neighbouring borough of Melcombe came to a height. Melcombe had received a charter from Edward I. in 1280 granting to its burgesses half the port and privileges similar to those enjoyed by the citizens of London; Edward II. in 1307-1308 granted that its men might elect for themselves two bailiffs. The date of the grant of the town at an annual fee-farm of 8 marks is uncertain, but in the reign of Henry VI. a commission was appointed to inspect the destruction wrought by the king’s enemies on the town, with the result that the fee-farm was reduced to 20s. The continual disputes between the two boroughs led to the passing of an act of union in 1571, the new borough being incorporated under the title of the “Mayor, Bailiffs and Burgesses” by James I. in 1616; further charters were granted by Charles II. and George II. Melcombe Regis first returned two members to parliament in 1307, and Weymouth in 1319, four members being returned by the united boroughs until 1832, when the representation was reduced to two and ceased in 1885. The mediæval fairs are no longer held. As early as 1257 Weymouth was granted the privilege of the Thames. The town is a fishing port, and the whale fishery, which dates from 1518, is a chief industry. The first whale fishery is mentioned at Weymouth, when wine was imported from Aquitaine. In 1586 sugar is mentioned as an import, and in 1646 deal boards were brought here from Hamburg. The town suffered severely during the Civil War, being garrisoned by the parliamentary troops in 1642, taken by the earl of Carnarvon in 1643, and surrendered in the following year. The town is described as “but little” in 1733, but a few years afterwards it gained a reputation as a watering-place, and the duke of Gloucester built a house here; George III. and the royal family in 1780 paid Weymouth the first of a series of visits which further ensured its popularity.

WHALE, the English name applied to all the larger and some of the smaller representatives of the order CETACEA (q.v.). Although by their mode of life far removed from close observation, whales are in many respects the most interesting and far more numerous than all the rest of the mammals put together. It is the resource and habits of study of one of the first lessons a student of these animals affords is that, in the endeavour to discover what a creature really is, from what others it is descended, and to which it is related, the outward appearance affords little clue, and we must go deep below the surface to find the essential characteristics of its nature. There was once, and may be still, an idea that a whale is a fish. To realize the fallacy of this notion we have only to consider what a fish really is, what under all the diversities of form, size and colour there is common to all fishes, and we see that in everything which characterizes a true fish and separates if from other classes, as reptiles, birds and mammals, the whale resembles the last and differs from the fish. It is as essentially a mammal as a cow or a horse, and simply resembles a fish externally because it is adapted to inhabit the same element; but it is no more on that account a fish than is a bat (because adapted to pass a great part of its existence on the wing) nearly related to a bird. In every part of the structure of a whale we see the result of two principles acting and reacting upon each other—one on the one hand, adherence to type, on the other to fundamental inherited structural conditions, and, on the other, adaptation to the peculiar circumstances under which it lives, and to which it has become gradually fitted. The external fish-like form is perfectly suited for
swimming through the water; the tail, however, is not placed vertically as in fishes, but horizontally, a position which accords better with the constant necessity for rising to the surface for the purpose of breathing. The hairy covering characteristic of all mammals, which if present might interfere with rapidity of movement through the water, is reduced to the merest rudiments—a few short bristles about the chin or upper lip—which are often only present in young animals. The function of keeping the body warm is performed by a thick layer of non-conducting material, the "blubber," a dense kind of fat placed immediately beneath the skin. The fore-limbs, though functionally reduced to mere paddles, with no power of motion except at the shoulder-joint, have beneath their smooth and continuous external covering all the bones, joints and even most of the muscles, nerves and arteries of the human arm and hand; and rudiments even of hind-legs are found buried deep in the interior of the animal, serving no useful purpose, but pointing a lesson to those able to read it.

In the present article attention is directed only to what may be regarded as the typical whales. Of these the Greenland or Arctic right whale (Balaena mysticetus) attains, when full grown, a length of from 45 to 50 ft. In this species (fig. 1) all the peculiarities which distinguish the head and mouth of the whales from those of other mammals have attained their greatest development. The head is of enormous size, exceeding one-third the whole length of the creature. The cavity of the mouth is actually larger than that of the body, thorax and abdomen together. The upper jaw is very narrow, but greatly arched from before backwards, to increase the height of the cavity and allow for the great length of the whalebone-blades; the enormous lateral halves of the lower jaw are widely separated posteriorly, and have a further outward sweep before they meet at the symphysis in front, giving the floor of the mouth the shape of an immense spoon. The whalebone-blades attain the number of 380 or more on each side, and those in the middle of the series have a length of 10 or sometimes 12 ft. They are black in colour, fine and highly elastic in texture, and fray out at the inner edge and ends into long, delicate, soft, almost silky, but tough hairs. The remarkable development of the mouth and of the structures in connexion with it, which distinguishes the right whale from all its allies, is entirely in relation to the nature of its food. By this apparatus the creature is enabled to avail itself of the minute but highly nutritious crustaceans and pteropods which swarm in immense shoals in the seas it frequents. The large mouth enables it to take in at one time a sufficient quantity of water filled with these small organisms, and the length and delicate structure of the whalebone provide an efficient strainer or hair-sieve by which the water can be drained off. If the whalebone were rigid, and only as long as is the aperture between the upper and lower jaws when the mouth is shut, a space would be left beneath it when the jaws were separated, through which the water and the minute particles of food would escape. But instead of this the long, slender, brush-like, elastic ends of the whalebone blades fold back when the mouth is closed, the front ones passing below the hinder ones in a channel lying between the tongue and the lower jaw. When the mouth is opened, their elasticity causes them to straighten out like a bow unbent, so that at whatever distance the jaws are separated the strainer remains in perfect action, filling the whole of the interval. The mechanical perfection of the arrangement is completed by the great development of the lower lip, which rises stiffly above the jaw-bone and prevents the long, slender, flexible ends of the whalebone from being carried outwards by the rush of water from the mouth, while its cavity is being diminished by the closure of the jaws and raising of the tongue.

If, as appears more probably, the "bowhead" of the Okhotsk Sea and Bering Strait belongs to this species, its range is circum-polar. Though found in the seas on both sides of Greenland, and passing freely from one to the other, it is never seen so far south as Cape Farewell; but on the Labrador coast, where a cold stream sets down from the north, its range is somewhat farther. In the Bering Sea, according to Scammon, "it is seldom after fifty feet out, which is about the farthest southern extent of the winter ice, while in the Sea of Okhotsk its southern limit is about the latitude of 54°." Everything tends to prove, Scammon says, "that Balaena mysticetus is truly an 'ice whale,' for among the scattered floes, or about the borders of the ice-fields or barriers, is its home and feeding-ground. It is true that these animals are pursued in the open water during the summer months, but in no instance have we learned of their being captured south of where winter ice-fields are occasionally met with." The occurrence of this species, therefore, on the British or any European coast is unlikely, as when alive and in health the southern limit of its range in the North Sea is from the east coast of Greenland at 64° N. lat. along the north of Iceland towards Spitzbergen, and a glance at a physical chart will show that there are no currents setting southwards which could bear a disabled animal or a floating carcasse to the British shores. To this improbability may be added the fact that no authentic instance has been recorded of the capture or stranding of this species upon any European coast. Still, amongst whalers in the Bering Sea, and the beluga, have in a few instances found their way to British shores, it would be rash to deny the possibility of the Greenland right whale doing the same.

The black whale or southern right whale (B. australis) resembles the preceding in the absence of a dorsal fin and of longitudinal furrows in the skin of the throat and chest, but differs in that it possesses a smaller head in proportion to its body, shorter whalebone, a different-shaped contour of the upper margin of the lower lip, and a greater number of vertebrae. This type inhabits the temperate seas of both southern and northern hemispheres and is divided into several species according to their geographical distribution: B. biscayensis of the North Atlantic, B. japonica of the North Pacific; B. australis of the South Atlantic and B. antarctica of the South Pacific. But the differential characters by which they are separated are slight, and the number of specimens available for comparison is not sufficient to afford the necessary data to determine whether these characters can be regarded as specific or not.

The Biscay right whale was formerly abundant in the North Atlantic, but is now verging on extinction. This was the whale the pursuit of which gave occupation to a numerous population on the shores of the Basque provinces of France and Spain in the middle ages. From the 10th to the 16th centuries Bayonne, Biarritz, St Jean de Luz and San Sebastian were as well as Bayonne and St Jean de Luz, on the north coast of Spain, were the centres of an active whale "fishery," which supplied Europe with oil and whalebone. In later times the whales were pursued as far as the coast of Newfoundland. They were, however, already getting scarce when the voyages undertaken towards the close of the 17th century for the discovery of the north-eastern route to China and India opened the seas round Spitzbergen; then for the first time the existence of the Greenland whale became known, and henceforth the energies of the European whale-fishers became concentrated upon that animal. Among instances of the occurrence of this whale in Europe in modern times...
WHALEBONE: WHALE-FISHERY

WHALEBONE, the inaccurate name under which the baleen plates of the right whale are popularly known; the trade in whalebone, the substance composed of the plates, is in common use and quite misleading. Whalebone is formed in the palate on the roof of the mouth and is an exagerrated portion of the ridges, hoven or horns in character, which are found on the roof of the mouth of all mammals. Three kinds are recognized by traders—the Greenland, yielded by the Greenland whale, *Balaena mysticetus*; the South Sea, the produce of the Antarctic black whale, *B. australis*; and the Pacific or American, which is obtained from *B. japonica*. Very many different names have been given to whales of the *B. australis* group, and it is possible that local races exist, whilst some writers are inclined to regard them as species, or as not specifically distinct from *B. australis*. Of these the Greenland whalebone is the most valuable. It formed the staple trade in earlier times, when the northern whale fishery was a great and productive industry. This whalebone usually comes into the market trimmed and clean, with the hairy fringe which edges the plates removed. To prepare whalebone for its economic applications, the blades or plates are boiled for about twelve hours, till the substance is quite soft, in which state it is cut either into narrow strips or into small bristle-like filaments. Gordon, of London, is the largest firm to which it is devoted.

Whalebone possesses a unique combination of properties that render it peculiarly and almost exclusively suitable for several purposes. It is light, flexible, tough and fibrous, and its fibres run parallel to each other without intertwisting. One of its earliest uses, referred to by Le Breton in the 13th century, was for the plumes of helmets. It has been found practicable to employ flexible steel for several purposes to which whalebone was formerly applied, and, in case the umbrella cord for the differential of the steam-engine, it is now almost exclusively used. Whalebone, is, however, still in large demand among dressmakers and milliners; but it is principally used in the brush trade. In cases where bristles are too soft and weak, and where the available vegetable fibres possess insufficient elasticity and durability, whalebone offers the great advantage of being procurable in strips or filaments, long or short, thick or thin, according to requirement. Hence it is principally used for making brushes for mechanical purposes. The use of whalebone in brush-making was originally patented by Samuel Crackles in 1808, and various special machines have been adapted for cutting the material into the required sizes. In the 17th century it cost at first about 7s. per ton. In the 18th century its price ranged from £3.50 to £5.00 per ton, but early in the 19th century it fell as low as 2s. Later it varied from £2.00 to £2.50; but with the decrease in whaling the article has become very scarce, and upwards of £200 per ton is now paid for Greenland whalebone.

WHALE-FISHERY, or WHALING, the pursuit and capture of the larger species of cetaceans (see Cetacea and Whale). Man, in all probability, first became acquainted with the value of the products yielded by whales from stranded individuals; but at what time he first ventured to hunt and kill these monsters in the open ocean it is now impossible to ascertain. We know, however, from Alfred's account of Otho's voyage to the White Sea that the Norwegians had been fishing with harpoons and lines at least a thousand years ago; and we also know that from the 10th to the 16th centuries the Basques of Bayonne, Biarritz, St Jean-de-Luz, San Sebastian and certain other French and Spanish ports were carrying on a lucrative trade in the products of a whale-fishery conducted by themselves, which supplied Europe with whalebone and oil. In the latter, and not improbably also in the former case, the species hunted was the Atlantic right-whale, or black whale (*Balaena mysticetus*), which the Basques seem to have well-nigh exterminated in their own waters; and it was not till a later epoch that the pursuit of its larger-ranged cousin, the right whale (*Balaena borealis*) was initiated. Hunting the sperm-whale, or cachalot, in the South Sea was a still later development, while roqual-hunting is quite a modern industry.

Of whaling vessels of the old type, a brief notice will suffice. Those engaged in the British South Sea fishery, which was in its prime about the year 1750, were from 300 to 400 tons burden, and equipped for at least a three-years' voyage. They carried from 28 to 33 officers and men, and six whale-boats. Built sharp at both ends, these boats were about 27 ft. long, and were furnished with long frames and a strip of thick blubber cut in a spiral direction. By raising this strip with the aid of proper apparatus, the whale could be turned round and round on its axis, and nearly the whole of the blubber removed in a continuous piece, to be cut, as required, into convenient lengths. Meanwhile the liquid spermaceti, or "head-matter," was laddied out in buckets from the great cavity in the skull and put in casks, where it solidified, to be carried to port and then refined. The blubber was, however, reduced to oil by "try-works" with which the vessel was provided, and stored in barrels. A large male sperm-whale will yield as much as forty barrels, or about 3 tons of oil; while the yield of a small female does not exceed 1 or 2 tons. In the old days the cargo of a successful vessel might include the products of a hundred whales, yielding from 150 to 200 tons of boiled sperm-oil in addition to the spermaceti.

In the old days of the Greenland whale-fishery vessels of about 350 tons burden were deemed the most eligible, these being constructed in such a manner as to resist so far as possible the pressure of the ice. The crew was about fifty in number, and the vessel carried six or seven whale-boats of the same length as those used in the South Sea fishery. The vessels left Peterhead and Dundee (the ports for the Greenland fishery, as was London for the South Sea fishery) about the beginning of April, and, after touching at the Shetlands, reached the whaling-grounds before the end of that month. In approaching a whale, which was effected from behind, silence was essential, and the harpoon had to be delivered within a distance of a few yards. The moment the wounded whale disappeared a flag was hoisted in the boat to give notice that assistance was required. Most of the whalers were expert seamen, from the point of view of the utmost importance, as if it became entangled the boat would be drawn under water by the whale. Sometimes its motion...
was retarded by one or more turns round the “bollard,” a post fixed for this purpose in the boat; when this was done the friction was so great as to produce quantities of smoke, fire being prevented by sluicing the bollard with water. Even with the assistance offered by the bollard, the whale-line might be run out within ten minutes, when the lines of a second or even third whale were hauled on. The inner sounding line of 700 fathoms of line would be taken out; the whale commonly remaining under water when first wounded for about 40 minutes, although a period of an hour is said to be not unfrequent. On rising after its second descent the whale was attacked with lances thrust deep into the body and aimed at the vital parts. The old-fashioned lance was a 6-ft. rod and ½-in. iron, flattened at one end into the form of a lance-head with cutting edges, and at the other expanding into a socket for the reception of a short wooden handle. Torrnts of blood spouted from the blow-holes of the whale denoted the approach of the struggle. So soon as the whale was dead, no time was lost in piercing the tail or “flukes,” and thus making the carcass fast to the boats by means of a cable, and then towing it in the direction of the ship. From fifteen minutes to as much as thirty hours might be occupied in a whale-hunt.

The following account of the operation of “flensing,” or securing the blubber and whalebone of the Greenland whale, is taken from Sir William Jardine’s Naturalist’s Library:—

"The huge carcass is somewhat extended by strong tackles placed at the snout and tail. A band of blubber, two or three feet in width, encircling the whale’s body at what is the neck in other animals, is called the kent, because by means of it the whale is turned over or bented. To this band is fixed the lower extremity of a combination of powerful blocks, called the kent-purchase, by means of which the whole circumference of the animal is, section by section, brought to the surface. The harpooners, having spikes on their feet to prevent their falling from the carcass, then begin with a kind of spade, and with hogn knifes, to make long parallel cuts from end to end, which are divided by cross-cuts into pieces of about a half ton. These are conveyed on deck, and, after being reduced to smaller portions, are stowed in the hold. Finally, being by other operations still further divided, the blubber is put into casks, which is called "making-off," and packed down completely by a suitable instrument."

While this flensing is proceeding, and when it reaches the lips, which contain much oil, the baleen (whalebone) is exposed. This is detached by means of bone-hand-spikes, bone knives and bone spades. The whole whalebone is hoisted on deck in one mass, when it is split by bone wedges into joints, containing five or ten blades each. When the whalebone and blubber are thus secured, the two jaw-bones, from the quantity of oil which they contain, are usually hoisted on deck, and then only the keng remines—the huge carcass of flesh and bone, which is abandoned either to the birds for food or to the bears, which duly attend on such occasions for their share of the prey."

The largest cargo ever secured by a Scotch whaler was that of the "Revolution" of Peterhead in 1814, which comprised the products of no less than forty-four whales. The oil, which amounted to 290 tons, realized £5,686, while the price obtained for the whalebone, added to the government bounty then given to Greenland whales, brought up the total sum to £1,100. Allowing a ton to each whale, the whalebone alone at present prices would have yielded about £10,000.

At a later period, say about 1880, the Greenland whaler had grown to a vessel of from 400 to 500 tons gross register, rigged either as a whaler, or sealership, and provided with auxiliary engines of about 75 horse-power. She would be manned by five officers, 30 hands, and could carry eight boats of the type mentioned above. Below the hold-beams were fitted about fifty iron tanks capable of containing from 200 to 250 tons of oil. Such a vessel would cost about £15,000 to build, and her working expenses, exclusive of interest and insurance, would be about £500 a month. At the period mentioned each whale-boat was armed with a harpoon-gun measuring 4 ft. 6 in. in length, weighing 75 lb; the barrel being 3 ft. long, with 1¾-in. bore, and mounted in a wooden stock, tapering behind into a pistol-handle. The gun-harpoon is used solely for first getting on to the whales; hand-harpoons being employed for getting a hold with other-lines.

Without referring to further improvements in the weapons and vessels employed, it will suffice to state that in the Greenland whale-fishery the whales are still killed from whale-boats. In the rorqual-fishery, as at Newfoundland, on the other hand, the actual attack is made from a steam-vessel of considerable size, as is described in the following quotation from a paper by Mr G. M. Allen in the American Naturalist for 1904, referring to the fishery at Rose-au-Rue, Placentia Bay, Newfoundland:

"The fishery itself, observes the author, "is carried on by means of small and staunchly built iron steamers of something of one hundred tons. A cannon-like gun is mounted on a pivot at the bow, and discharges a 5-ft. harpoon of over 100 lb. weight, which at short range is nearly buried in the body of the whale. A hollow iron cap filled with blasting powder is screwed to the tip of the harpoon, forming its point. A timed fuse discharges the bomb inside the body of the whale. The harpoon carries a stout cable which is handled by a powerful 5-sheet winch on the steamer's deck."

Explosive harpoons of the type referred to were invented by Sverd Foyin, a Norwegian, and used by him about the year 1865 or 1866 in the manner described above, as they still are in various Norwegian rorqual-fisheries.

In fisheries of this type the carcasses of the whales are towed into harbour for flensing; and in place of the "keng" being wasted, the flesh is worked up to form an excellent manure, while the bones are ground up and also used as fertilisers.

A somewhat similar mode of proceeding characterizes the sperm-whale fishery now carried on in the Azores, so far at least as the history of the catch for the purpose of flensing is concerned. According to an account given by Professor E. L. Bouvier in the Bulletin de l'Institut Océanographique for 1907, American whales have observation stations on most of the islands of the Azores group; Horta, in Fajal, being the favourite station. The carcasses of the cachalots are towed for flensing into a small creek adjacent to the port, where, after the removal of the spermaceti and blubber, they are left to rot. Even the teeth have a commercial value, being either sold as curiosities in Horta, or utilized for ivory. Whenever practicable, all the whales caught by the vessels belonging to the great sperm-whaling station at New Bedford are towed into the harbour for flensing.

Passing on to a review of some of the more important whale-fisheries of the world, the Atlantic fishery by the Basques in the 1oth and six succeeding centuries claims first mention. Readers desirous of obtaining further insight into the little that is known about it are referred to an interesting paper by Sir Clements Markham published in the Proceedings of the Zoological Society of London for 1881. Although, as already indicated, the black whale (Balaenoptera borealis) was well-nigh exterminated in the north Atlantic by the April whaling season many years afterwards was excessively rare, yet quite recently several examples have been taken by Scottish whalers off the Hebrides, while the whalebone of others has been received at New Bedford.

The discovery in 1596 by the Dutch navigator Barents of Spitzbergen, followed by the voyage of Hudson in the "Hope well" in 1607, may be said to have inaugurated the second phase in the whaling industry; these adventurous voyages bringing to light for the first time the existence of the Greenland whale (R. mysticetus): a species of much greater value than any that had been previously hunted.

Here it may be well to refer to two common misconceptions regarding this whale. In the first place, it does not appear to be, as commonly supposed, a circum-polar species. There is, for instance, no evidence of its occurrence eastward of Spitzbergen along the Siberian coast between 10° and 170° E.; and it is not till the latter parallel is reached, at Cape Schelagski, that the domain of the so-called bowhead of the American whales is entered.

"On the other side of Bering Strait," writes Mr T. Southwell in the American Naturalist of 1884, "the American whale does not appear to penetrate much farther east than Cape Bathurst, and it seems highly improbable that there is any intercommunication between those at that point and the whales in Baffin Bay. On the other hand, the whales on the east side of
WHALE-FISHERY

Davis Strait do not descend so far south as Cape Farewell, nor are those in the Greenland Sea known to pass westward round that cape. It seems therefore that, although their range as a species is bancally limited, because longitudinally, the localities they inhabit are greatly restricted, each being inhabited by a local race differing from the other in some slight degree.

The second misconception is that the Greenland whale has gradually been driven northward by the whalers. A sufficient proof of the falsity of this idea is afforded by the fact that the minute organisms constituting the food of the species are restricted to the icy seas of the far north. The Greenland whale is, in fact, essentially an ice-whale.

To revert to the history of the fishery, no sooner was the accessibility of the Spitzbergen seas made known than vessels were fitted out for whaling there, at first by the British, and soon after by the Dutch. The seas absolutely swarmed with whales, which showed little fear of vessels and could thus be captured with ease. The first whaling expedition was despatched by the Muscovy Company, under the command of Jonas Poole; and the success of four voyages (1609-1612) soon attracted the attention of other nations. Some indication of the abundance of the whales may be gathered from the fact that in the year 1697 no less than 1599 of these monsters were killed off Spitzbergen by 188 vessels.

The fishery in Davis Strait was begun in 1719 by the Dutch, who at first killed large numbers of whales and were subsequently followed by the British. Although many whales have been seen in recent years, few are taken; and it is the opinion of many that in Greenland waters, at any rate, steam has been fatal to the industry.

A following summary of the rise and fall of the British Greenland whale-fishery is given by Mr Southwell in the article already cited:

"For the first quarter of the 19th century scarcely a seaport of any importance on the east coast of England was unrepresented in the Arctic fisheries, Aberdeen, Kirkwall, Lerwick, Kirkwall, Greenock and for a time Banff and Bo'ness, all took part in the whale-fishery. Gradually, one by one, they fell off, till only Peterhead, which sent out her first whale in 1788, and Dundee (which started in 1789 but left in 1803) Peterhead, which in 1859 sent out 34 vessels, ceased to be represented in the industry, leaving Dundee in possession of the field. Dundee sent out its largest fleet in 1885-186 vessels; in 1903 she was represented by 5 vessels only, one of which was wrecked."

According to Mr Southwell's account of the Arctic fishery (Zoologist, 1906), a Dundee vessel, the "Scotia," visited the east Greenland seas in the summer of 1906, where she took four small right-whales; this visit being the first made to those seas by a British vessel since 1899.

As already mentioned, the British whalers were accustomed to sail for the Arctic Ocean early in April; and if their destination was the east Greenland sea, off the west coast of Spitzbergen, they generally arrived on the grounds about a month later. The whales make their appearance amongst the ice near the sea edge about the 15th of May, but only remain until the opening of the barrier-ice permits them to resume their northward journey; for about the middle of June they suddenly disappear from these grounds, and are last seen going north-west, when the north Greenland whale-fishing is over for the season. If unsuccessful in obtaining a cargo at the northern grounds, the whale-ships were accustomed to proceed southwards as far as lat. 75°; where, if the sea were sufficiently open, they penetrated westwards until the coast of Greenland became visible. There they cruised for a few days before the darkness of the nights put an end to the season's fishing. If the south-west fishery, in Davis Strait, were the first object of the voyage, the vessels arrived at the edge of the ice near Resolution Island in April. If unsuccessful here they proceeded direct to Disco island, where they usually arrived early in May. The whales appear about the middle of May at South East Bay, where a great fishing was once carried on. The dangerous passage of Melville Bay was next performed; the whales entering the north water in June, and pushing on towards the sounds. If there were a "land-floe across," i.e., if the land-ice of the west side were continuous across the entrance of Ponds Bay and Lancaster Sound, whales would be seen in considerable numbers and good cargoes might be obtained; but immediately the land-floe broke up they departed to the westward. When there was no land-floe across, the whales proceeded at once to the secluded waters of Eclipse Sound and Prince Regent Inlet for the summer months. At this season most of the vessels cruised in the sounds, but a few searched the middle ice, until the darkness of the August nights compelled them to seek anchorage in some of the harbours marking the entrance for the west side, to await the return of the whales south. This migration takes place on the formation of young ice in the sounds, usually in the latter part of September. Only the larger whales, most of which are males, come, however, close down along the land of the west side. These the ships sent their boats to intercept; this forming the inshore-fishing, or "rock-nosing," which continued till the formation of young ice drove the vessels out of harbour, usually early in October.

A few vessels, American as well as British, occasionally entered Hudson Bay and prosecuted the fishing in the neighbourhood of Southampton Island, even entering Fox Channel. There were whaling-stations in Cumberland Inlet, and, although it remained throughout the winter, ready to take advantage of the opening of the ice in the following spring. Here both young and old whales made their appearance in May; and the fishing continued till the whales migrated northwards in June.

Of the other nationalities which took part in the Spitzbergen-Greenland fisheries, it may be mentioned that the Dutch had fisheries both at Jan Mayen till 1840 and at Spitzbergen. In the Spitzbergen fishery 10,019 whales were taken by them in the ten years from 1679 to 1688. About 1680, when the fishing was most probably at its height, they had 260 vessels and 14,000 seamen employed. The fishery continued to flourish on an extensive scale till 1770, when it began to decline, and it finally came to a close before the end of the century. At the same time the Germans prosecuted the fishing to a very considerable extent; 79 vessels from Hamburg and Bremen being employed in 1721, while during the fifty years from 1670 to 1719 an average of 45 vessels sailed yearly from Hamburg alone. German vessels continued to engage in the fishery until 1873. The Spaniards, although they at first supplied the harpooners to the crews of the English and Dutch vessels, never seem to have engaged largely in the northern fishery. The Danes, although likewise early appearing on the Spitzbergen fishing-grounds, never pursued the industry on a large scale until after the commencement of the Davis Strait fishing in 1721, in which year they had 90 vessels engaged; but by 1834 the number had fallen to 35.

The continually increasing rarity of the Greenland whale has caused an enormous appreciation in the value of whalebone of recent years, as compared with that of the whales of the last century. For about twenty years preceding the year 1830 the average price of this commodity was about £16 per ton; while in the year 1835 whalebone of the Greenland whale sold at £35 per ton, and that of the south Atlantic black whale (Balaena australis) at £45 per ton. At the present date the price is about £250 per ton, but a few years ago it touched £600, although soon after it fell for a short time to £140. The reason of the fall from £200 to £350 (at which price is sold) is partly believed to be owing to the use of strips of horn for many purposes where whalebone was formerly used, and partly to the fact that the whalebone of the Greenland whale is, as indicated above, far more valuable than that yielded by the northern and southern Atlantic black whales, of which comparatively little generally comes into the market. The best quality of whalebone is known in the trade as "size-bone," and consists of plates not less than 6 ft. in length.

In the twenty years preceding 1810 the average price of whalebone from the northern fisheries was £50 per ton; the actual price in 1835 being £150 per ton. At the close of 1823 £200 per ton. It may be added that in 1835 South Sea oil sold at £60, and sperm-oil at £75 per ton.

A few words will suffice for the American fishery of the so-called bowhead, the western race of the Greenland whale, in Bering Strait. Here the whales are mostly sought for and killed in open water, and the vessels are consequently less adapted for ice-work. For the most part the vessels sail from San Francisco in March, and arrive at the ice-edge off Cape Navarin, where the fishing is begun, in May. The whales
disappear during summer, but return in the autumn, when the "fall-fishing" is carried on in the neighbourhood of Point Barrow; and between the seasons it was customary for the vessels to go south for sperm-whaling. The Hering Strait fishery was begun in 1848, and in the north of May, June, and July, the whales usually disappeared. In 1851 no less than 34 vessels were abandoned in the ice off Cape Belcher, the crews making good their escape to other vessels; while again in 1876 a dozen vessels experienced a similar fate.

The sperm-whale fishery, of which the products are sperm-macte, sperm-oil, ambergris (mostly found floating in masses in the sea) and teeth, appears to have been initiated by the Americans in 1609, who for a considerable period found sufficient occupation in the neighbourhood of their own coasts. The British are, however, stated to have opened up the great whale-hunting-grounds of the Pacific and Indian Oceans, although they did not embark on sperm-whaling till 1775. Within less than twenty years from that date their trade had, however, attained its maximum; no less than 75 British vessels, all from the port of London, being engaged in this industry in the year 1791. After this there was a steady decline till 1830, when only 31 vessels were thus employed; and since 1835 sperm-whaling has ceased to be a British industry.

As regards the American fishery, the island of Nantucket embarked in this trade about the year 1721, and by 1774 there were 360 American ships engaged in whaling, while in 1784 the fishing was about at its zenith, the number was 735, mostly from New Bedford. Between 1857 and 1886 the average number of vessels had sunk to 159. New Bedford, on the Atlantic, and San Francisco, on the Pacific side, are the two great whaling centres; and during the period last mentioned the average imports of whaling products into the United States totalled 5304 tons of sperm-oil, together with 4803 tons of whale-oil and 145 tons of whalebone.

During the first half of the last century the colony of New South Wales was busily engaged in this trade, and in 1835 exported 3080 tons of sperm-oil.

Since the year 1882, when no less than 203 head were taken by the Peterhead whaler "Eclipse," the Norwegians have carried on a fishery for the bottle-nosed whale (Hyperoodon rostratus), a species which although generally inferior in point of size, yields an oil closely akin to sperm-oil, but possessed of even greater lubricating power. An average male bottle-nose will yield about 22 cwt.s, of oil, containing 7% of pure spermaceti. Bottle-nose whaling is chiefly carried on in the neighbourhood of Jan Mayen and Iceland during the months of May, June and July, and it is stated that whaling quite suddenly about the middle of the last-mentioned month. In 1903 about 1600 tons of this oil came on the market, which would imply the destruction of nearly 2000 whales.

The invention by Svend Fovn of the explosive harpoon, already referred to, inaugurated about the year 1866 the Norwegian fin-whale fishery, an industry which has since been taken up by other nationalities. The rorquals or fin-whales (Balaenoptera), which include the largest of all cetaceans, are built for speed, and are much fiercer animals than either the Greenland or the Atlantic right whale; their rush when wounded being of enormous velocity, while their vitality is such that attacking them in the old-fashioned way with the hand-harpoon is practically useless, and at the same time fraught with great danger to the pursuers. To a considerable extent the same may be affirmed of the humpbacked whale (Megaptera). Under these circumstances, previous to the invention of the bomb-harpoon, these whales were left entirely alone by the whalers.

By the year 1885 the Norwegians had a fleet of over 50 vessels engaged in this fishery off the coast of Finnmark, the amount of whose catch comprised 3580 tons in 1885, and 954 in the following year. Gradually the Norwegians have developed and extended the roqual-whale, and they now possess stations in Iceland, the Faroes and Shetlands, and also at Buneveadeer in Harris in the Hebrides. In the Shetlands there are two stations at the head of Ronas Voe on the north-west side of the mainland where operations are carried on from May and June till September, when the whales leave the shore. During the first season (1903) the Norrîna Whaling Company's vessels killed 64 whales, while 62 were accounted for by the Shetland Whaling Company.

In 1898 a successful roqual-fishery was established by the Newfoundland Steam Whaling Company at Rose-au-Rue, Placentia Bay, Newfoundland. Four species of rorquals as well as humpbacks are hunted; and during a portion of the season in 1903 the catch included 174 of the former and 14 of the latter.

In addition to the above-mentioned fisheries for the larger whales, there are considerable local captures of the smaller kinds, commonly known as grampus, or killers, porpoises, and dolphins. Of these, however, very brief mention must suffice. The most valuable of the smaller whale species are the harpooned in the northern seas, the black pilot-whale, or grampus, "Globicephalus melaena," is, for instance, not infrequently taken in large shoals by the Faroese; these whales being driven by boats into the shallows, where they are sometimes slaughtered by hundreds. Much the same may be stated with regard to the grampus or killer (Orca gladiator), of which no less than 47 head were killed at once in January 1904 at Bildöströmren, Norway. Of even more importance is the white-whale or beluga (Delphinapterus leucas), which is hunted for its blubber, hide and flesh; the average yield per head being about 100 gallons of oil. In 1871 the Tromsö whalers captured no less than 2167 individuals; while in 1898 300 out of a school of some 900 were captured on a single occasion at Point Barrow, Alaska. These whales, which are worth about £3 a head, yield the leather known commercially as "porpoise-hide." The narwhal (Monodon monoceros), yielding both blubber and the valuable ivory tusks, is usually captured singly by the Greenlanders in their "kayaks." Local porpoise and dolphin fisheries are carried on by the fishermen in many parts of the world, the natives of the Traveancore coast being noted for their success in this respect; while even the fresh-water susu or Ganges dolphin (Platanista gangetica) and the Rio de la Plata dolphin (Pontoporia blainvillei) are also caught in considerable numbers for the sake of their blubber.

WHALE-OIL, the oil obtained from the blubber of various species of the genus Balaena, as B. mysticetus, Greenland or "right" whale (northern whale-oil), B. borealis (southern whale-oil), Balaenoptera longimana, B. borealis horbillis, and especially the Sperm-Whale (Physeter catodon). The whale-oil is obtained from these whales while they are stranded, or "killed," and is called "whale-oil." The whale-oil is generally used for illuminating purposes, and is valued chiefly for its lighting qualities.

The most important whale-oil is sperm or spermaceti oil, yielded by the sperm-whales.

Whale-oil varies in colour from a bright honey-yellow to a dark brown, according to the condition of the blubber from which it has been extracted. At best it has a rank fishy odour, and the darker the colour the more disagreeable the smell. With lowering of the temperature stearin, accompanied with a small proportion of spermester, separates from the oil, and a little under the freezing point nearly the whole of these constituents may be crystallized out. When separated and pressed, this deposit is known as whale tallow, and the oil from which it is removed is distinguished as "pressed whale-oil;" this, owing to its limpidity, is sometimes passed as sperm-oil. Whale-oil is principally used in oiling woods for combing,
in batching flax and other vegetable fibres, in currying and chamois leather-making, and as a lubricant for machinery. Sperm-oil is obtained from the cavity in the head of the sperm-whale, and from several smaller receptacles throughout the body of the animal. During the life of the whale the contents of these cavities are in a fluid condition, but no sooner is the “head matter” removed than the fluid becomes hard and crystalline. There are accounts which state that when the sperm-oil is boiled it becomes a clear yellow fluid having a fishy odour. Refined sperm-oil is a most valuable lubricant for small and delicate machinery (see OILS).

WHALLEY, EDMUND (c. 1615–c. 1675), English regicide, the exact dates of whose birth and death are unknown, was the second son of Richard Whalley, who had been sheriff of Nottinghamshire in 1595, by his second wife Frances Cromwell, aunt of Oliver. His eldest brother, a great-grandson of Cromwell, was Richard Whalley (1490–1583), a prominent adherent of the protector Somerset and member of parliament. He is said to have started in the trade of a woolen-draper, but on the outbreak of the great rebellion he took up arms for the parliament, became major of Cromwell’s regiment of horse, and greatly distinguished himself in the field. His conduct at Gainsborough fight in 1643 was especially praised by Cromwell; he fought at Marston Moor, commanded one of Cromwell’s two regiments of cavalry at Naseby and at the capture of Bristol, was then sent into Oxfordshire, and was himself one of the most important persons of the Somerset dynasty. He superseded, according to Richard Baxter, the chaplain of his regiment, on account of his religious orthodoxy. He, however, supported his regiment in their grievances against the parliament in 1647. When the king was seized by the army, he was entrusted to the keeping of Whalley and his regiment at Hampton Court. Whalley refused to remove Charles’s chaplains at the bidding of the parliamentary commissioners, and treated his captive with due courtesy, receiving from Charles after his flight a friendly letter of thanks. In the second Civil War, Whalley again distinguished himself for his soldier-like conduct. The king was brought to trial he was chosen to be one of the tribunal and signed his death-warrant. He took part in Cromwell’s Scottish expedition, was wounded at Dunbar, and in the autumn of 1650 was active in dealing with the situation in north Britain. Next year he took part in Cromwell’s pursuit of Charles II. and was in the fight at Worcester. He followed and supported his great kinsman in his political career, presented the army petition to parliament (August 1652), approved of the protectorate, and represented Nottinghamshire in the parliaments of 1654 and 1656, taking an active part in the prosecution of the Whig Quarrel; the President, James Nayler. He was one of the administrative major-generals, and was responsible for Lincoln, Nottingham, Derby, Warwick and Leicester. He supported the “Petition and Advice,” except as regards the proposed assumption of the royal title by Cromwell, and became a member of the newly constituted House of Lords in December 1657. On the protector’s death, at which he was present, he in vain gave his support to Richard; his regiment refused to obey his orders, and the Long Parliament dismissed him from his command as a representative of the army. In November 1659 he undertook an unsuccessful mission to Scotland to arrange terms with Monk. At the Restoration, Whalley, with his son-in-law, General William Goffe, escaped to America, and landed at Boston on the 27th of July 1660, living successively at New Haven and at Hadley, Massachusetts, every attempt on the part of the government at home to procure his arrest meeting with failure. He was alive, but falling in health, in 1674, and probably did not long survive. Whalley was twice married; first to Judith Duffell, by whom, besides other children, he had a son John and a daughter Frances (who married Major-General William Goffe, the regicide); and secondly to Mary Midleton, sister of Sir George Midleton, by whom he had two sons, Henry and Edward.

AUTHORITIES.—An account of Whalley’s life is in Noble’s Lives of the Regicides, and of his family in Noble’s Memoirs of the Protectoral House of Cromwell, vol. ii.; see also Gardiner’s and Claren- ton’s Works, also Maccabees, ii. (1745); Whalley’s account of the king’s flight; Ezra Stiles’s History of the Student of the Judges of Charles I. (1794, &c.). The article by C. H. Firth in the Dict. Nat. Biog. is an admirable summary. Whalley’s sojourn in America is dealt with in numerous papers published by the Massachusetts Historical Society, and in the Hutchinson Papers published (1865) by the Prince Society; see also Atlantic Monthly, vi. 89–93; Pennsylvania Mag. ii. 55–60, 230; F. B. Dexter’s History of the History of the Atlantic City, and Goof, New Haven Col. Hist. Soc. Papers, ii. (1877); Poem commemorative of Goffe, Whalley and Dixwell, with abstract of their history, by Philogathos (Boston, 1793); Fulley’s Hist. of New England, ii. (1866); Annual Register, ii. for 1748, and for two years after.

WHARF, a place for loading or unloading ships or vessels, particularly a platform of timber, stone or other material along the shore of a harbour or along the bank of a navigable river against which vessels may lie and discharge their cargo or be loaded. The O. Eng. word low is meant literally a turning or turning-place (loweofan, to turn, cf. Goth. hwairban, Gr. karpòs, wrist), and was thus used particularly of a bank of earth, a dam for turning the flow of a stream; the cognate word in Dutch, werf, means a wharf, a wharf or a wharf, a dock, a dock, and the current meaning of the word is probably borrowed from Dutch or Scandinavian languages.

In English law all water-borne goods must be landed at specified places, in particular hours and under supervision; wharves, which by the Merchant Shipping Act 1856, § 492, include quays, docks and other premises on which goods may be lawfully landed, are either “suffrance wharves,” authorized by the commissioners of customs under bond, or “legal wharves” specially appointed by treasury warrant and exempted from all wharfages, which are authorized by statute or by preceptive right. The owner or occupier of a wharf is styled a “wharfinger,” properly “wharfinger,” with an intrusive n, as in “message” and “passenger.”

WHARLCIFFE, JAMES ARCHIBALD STUART-WORTLEY-MACKENZIE, 1ST BARON (1776–1843), English statesman, was the son of Colonel Stuart, son of the 3rd earl of Bute and of Mary-wife Mary-Wortley-Montagu (Baroness Montagu, in her own right), whose whose Colonel Stuart added the name of Wortley, taking later also that of Mackenzie (which his son in later life discarded) as heir to his uncle J. S. Mackenzie of Rosedown. He entered the army, becoming colonel in 1797, but retired in 1801 and devoted himself to politics, sitting in parliament as a Tory for Bossiney in Cornwall till 1818, when he was returned for Yorkshire. His attitude on various questions became gradually more Liberal, and his support of Catholic emancipation lost him his seat in 1826. He was then raised to the peerage as Baron Wharncliffe of Wortley, a recognition both of his previous parliamentary activity and of his high position among the country gentlemen. At first opposing the Reform Bill, he gradually came to see the undesirability of a popular conflict, and he separated himself from the Tories and took an important part in modifying the attitude of the peers and helping to pass the bill, though his attempts at amendment only resulted in his pleasing neither party. He became lord privy seal in Peel’s short ministry at the end of 1834, and again joined him in 1835 as lord president of the council. In 1837 he brought out an edition of the writings of his father-in-law, Lord MacKenzie’s Letters, etc. (new ed. 1853). On his death in 1845 he was succeeded as 2nd baron by his eldest son, John Stuart-Wortley (1801–1855), whose son Edward, 3rd baron (1827–1899), best known as chairman of the Manchester, Lincoln & Sheffield railway, converted under him into the Great Central, was created 1st earl of Wharncliffe and Viscount Carlton in 1876; his name was prominently identified with railway enterprise, and became attached to certain features of its nomenclature. He was succeeded as 2nd earl by his nephew Francis (b. 1805).

Among other members of the family, several of whom distinguished themselves in law, politics, art and the army, may be mentioned the 1st baron’s third son, James Archibald Stuart-Wortley (1805–1881), recorder of London and solicitor-general; his son, C. B. Stuart-Wortley, K.C. (b. 1851), became well known in parliament as under-secretary for the home office (1885, and 1886–1892) and deputy-chairman of committees.

WHARTON (FAMILY). The Whartons of Wharton were an old north of England family, and in 1543 THOMAS WHARTON (1495–1559) was created a baron for his services in border warfare. From the latter, descended to the latter, PHILIP WHARTON (1651–1695), was the father of THOMAS WHARTON (1648–1715), who in 1706 was created earl and in
WHARTON, F. - WHATELY

1714 marquess of Wharton. The 1st marquess was one of the chief Whig politicians after the Revolution. He is famous in legal history as the author of the famous political ballad, "Lilliburlero," which "sang James II. out of three Kingdoms." Wharton was lord-lieutenant of Ireland in Anne's reign, and incurred the wrath of Swift, who attacked him as Verres in the "Examiner" (No. 14), and drew a separate "character" of him, which is one of Swift's masterpieces. He was a man of great wit and versatile cleverness, and cynically ostentatious in his immorality, having the reputation of being the greatest rake and the truest Whig of his time. Addison dedicated to him the fifth volume of the "Spectator," giving him a very different "character" of him, in a letter to the Earl of Chatham. Wharton (1634-1686) was an author, whose poems, including an "Elegy on Lord Rochester," were celebrated by Walter and Dryden. His son, Philip Wharton (1669-1731), duke of Wharton, succeeded to his father's marquessate and fortune, and in 1718 was created a duke. But he quickly earned for himself, by his wild and profligate frolics and reckless playing at politics, Pope's satire of him as "the scorn and wonder of our days" ("Moral Essays," i. 170). He spent his large estates in a few years, then went abroad and gave eccentric support to the Old Pretender. There is a lively picture of his residence at Madrid in 1726 in a letter from a British consul, quoted in Stanhope's "History of England" (ii. 149). He was outlawed in 1729, and at his death the titles became extinct. In 1843 a claim was made before the House of Lords for a revival of the barony in favour of Mr Kemy-Tynte, a descendant of the 1st baron in the female line.

For the history of the family see E. R. Wharton's "Whartons of Wharton Hall" (1898).

WHARTON, FRANCIS (1692-1880), American legal writer and educationalist, was born in Philadelphia, Pennsylvania, on the 4th of March 1692. He graduated at Yale in 1719, was admitted to the bar in 1743, became prominent in Pennsylvania politics as a Democrat, and in Philadelphia edited the "North American and United States Gazette." He was professor of English history and literature at Kenyon College, Gambier, Ohio, in 1856-1864. He took orders in the Protestant Episcopal church in 1856 and in 1863-1869 was rector of St. Paul's Church, Brookline, Massachusetts. In 1871-1881 he taught ecclesiastical polity and canon law in the Protestant Episcopal Theological School at Cambridge, Massachusetts, and at this time he lectured on the conflict of laws at Boston University. For two years he travelled in Europe, and after two years in Philadelphia he went to the Washington, D.C., where he lecturer on criminal law (1883-1886) and then professor of criminal law (1886-1888) at Columbian (now George Washington) University; in 1885-1888 he was solicitor (or examiner of claims) of the Department of State, and from 1888 to his death on the 21st of February 1889 was employed on an edition (authorized by Congress) of the Revolutionary Diplomatic Correspondence of the United States (6 vols., 1889, ed. by J. B. Moore), which superseded Sparks's compilation. Wharton was a "broad churchman" and was deeply interested in the hymnology of his church. He received the degree of LL.D. from the university of Edinburgh in 1883, and was the foremost American authority on international law.

He published: "A Treatise on the Criminal Law of the United States" (1846; many times reprinted); "State Trials of the United States during the Administrations of Washington and Adams" (1849); "A Treatise on the Law of Homicide in the United States" (1855); with Moreton Stillé, "A Treatise on Medical Jurisprudence" (1855); "Modern Theism" (1859), in which he applied rules of legal evidence to modern sceptical theories; "A Treatise on the Conflict of Laws" (1872; 3rd ed. 1880); "A Treatise on the Law of Nuisance" (1874); "A Commentary on the Law of Agency and Agents" (1876), "A Commentary on the Law of Evidence in Civil Issues" (1877; 3rd ed. 1888); a companion work on Criminal Law; "A Treatise on the Conflict of Laws" (1884); and "A Digest of the International Law of the United States" (3 vols. 1886).

See the Memoir (Philadelphia, 1891) by his daughter, Mrs Viele, and the preface by J. B. Moore's "Brief Sketch of the Life of Francis Wharton," prefixed to the first volume of the Revolutionary Diplomatic Correspondence.

WHARTON, HENRY (1664-1695), English writer, was descended from Thomas, 2nd Baron Wharton (1520-1572), being a son of the Rev. Edmund Wharton, vicar of Wostead, Norfolk. Born at Wostead on the 9th of November 1664, Wharton was educated by his father, and then at Gonville and Caius College, Cambridge. Both his industry and his talents were exceptional, and his university career was brilliant. In 1686 he entered the service of the ecclesiastical historian, the Rev. William Cave (1637-1713), whom he helped in his literary work; but considering that his assistance was not sufficiently appreciated he soon forsook this employment. In 1687 he was ordained deacon, and in 1688 he made the acquaintance of the archbishop of Canterbury, William Sancroft, under whose patronage he contributed to his literary work for 20 years. The archbishop, who had a very high opinion of Wharton's character and talents, made him one of his chaplains, and presented him to the Kentish living of Sundridge, and afterwards to that of Chatham in the same county. In 1689 he took the oath of allegiance to William and Mary, but he wrote a severe criticism of Bishop Burnet's "History of the Reformation," and it was partly owing to the bishop's hostility that he did not obtain further preferment in the English church. He died on the 5th of March 1695, and was buried in Westminster Abbey.

Wharton's most valuable work is his Anglia sacra, a collection of the lives of English abbots and bishops and bishops, which was published in two volumes in 1691. Some of these were written by Wharton himself; others were borrowed from earlier writers. His other writings include, in addition to his criticism of the History of the Reformation, "A Treatise of the Culpab"y of the Clergy" (1668); "The enthusiasm of the Church of Rome demonstrated in some observations upon the life of Ignatius Loyola" (1668); and "A Defence of pluralities" (1692, new ed. 1703). In the Lambeth Library there are sixteen volumes of Wharton's manuscripts. Describing him as "this wonderful man," Stubbs says that Wharton did for the elucidation of English church history "more than any one before or since."

A life of Wharton is included in George D'Oyley's Life of W. Sancroft (1821).

WHATELY, RICHARD (1757-1865), English logician and theological writer, archbishop of Dublin, was born in London on the 1st of February 1787. He was educated at a private school near Bristol, and at Oriel College, Oxford. He obtained double second-class honours and the prize for the English essay; in 1811 he was elected fellow of Oriel, and in 1814 took orders. During his residence at Oxford he wrote his celebrated tract, "Historic Doubts relative to Napoleon Bonaparte," a very clever jeu d'esprit directed against excessive scepticism as applied to the Gospel history. After his marriage in 1821 he settled in Dublin, and in 1826 he was elected a member of the Royal Irish Academy. His first series of lectures, "On the Use and Abuse of Party Spirit in Matters of Religion," were published in the same year. In August 1823 he removed to Halesworth in Suffolk, but in 1825, having been appointed principal of St Albans Hall, he returned to Oxford. At St Albans Hall Whately found much to reform, and he left it a different place. In 1825 he published a series of "Essays on Some of the Peculiarities of the Christian Religion," followed in 1828 by a second series on some of the difficulties in the Writings of St Paul, and in 1830 by a third on "The Errors of Romanism traced to their Origin in Human Nature." While he was at St Albans Hall (1825) the work appeared which is perhaps most closely associated with his name—his treatise on Logic, originally contributed to the Encyclopedia Metropolitana, in which he raised the study of the subject to a new level. It gave a great impetus to the study of logic throughout Great Britain. A similar treatise on Rhetoric, also contributed to the Encyclopaedia, appeared in 1828. In 1829 Whately was elected to the professorship of political economy at Oxford in succession to Nassau William Senior. This was a subject admirably suited to his lucid, practical intellect; but his tenure of office was cut short by his appointment to the archbishopric of Dublin in 1831. He published only one course of "Introductory Lectures" (1831), but one of his first acts on going to Dublin was to endow a chair of political economy in Trinity College out of his private purse.

Whately's appointment by Lord Grey to the see of Dublin came as a great surprise to everybody, for though a decided Liberal Whately had from the beginning stood aloof from all political parties, and ecclesiastically his position was that of
an Ishmaelite fighting for his own hand. The Evangelicals regarded him as a dangerous latitudinarian on the ground of his views on Catholic emancipation, the Sabbath question, the doctrine of election, and certain quasi-Sabellian opinions he was supposed to hold about the character and attributes of Christ, while his view of the church was diametrically opposed to that of the High Church party, and from the beginning he was the determined opponent of what was afterwards called the Tractarian movement. The appointment was challenged in the House of Lords, but without success. In Ireland it was immensely unpopular among the Protestants, both for the reasons just mentioned and as being the appointment of an Englishman and a Whig. Whately's blunt outspokenness and his "want of conciliating manners," which even his friends admit, prevented him from ever completely eradicating these prejudices, while at the same time he met with determined opposition from his own clergy. He ran counter to their most cherished prejudices from the first by connecting himself prominently with the attempt to establish a national and unsectarian system of education. He enforced strict discipline in his diocese, where it had been long unknown; and he published an unanswerable statement of his views on the Sabbath (Thoughts on the Sabbath, 1832). He took a small country place at Rcedesdale, 4 m. out of Dublin, where he could enjoy his favourite relaxation of gardening. Here his life was one of indefatigable industry. Questions of reform in the Church and of the Irish, Poor Laws, and, in particular, the organization of national education occupied much of his time. But he found leisure for the discussion of other public questions, for example, the subject of transportation and the general question of secondary punishments. In 1837 he wrote his well-known handbook of Christian Evidences, which was translated during his lifetime into more than a dozen languages. At a later period he also wrote, in a similar form, Easy Lessons on Reasoning, on Morals, on Mind and on the British Constitution. Among his other works are Tracts (1836), Essays on Some of the Dangers to Christian Faith (1839), The Kingdom of Christ (1841). He also edited Bacon's Essays, Paley's Evidences and Paley's Moral Philosophy. His cherished scheme of unsectarian religious instruction for Protestants and Catholics alike was carried out for a number of years with a measure of success, but in 1852 the scheme broke down owing to the opposition of the new arch Catholic archbishop of Dublin, and Whately felt himself constrained to withdraw from the Education Board. From the beginning Whately was a keen-sighted observer of the condition of Ireland, and gave much offence by his outspoken attacks on the state of the Catholic clergy as a measure of justice. During the terrible years of 1846 and 1847 the archbishop and his family were unwearyed in their efforts to alleviate the miseries of the people. From 1850 onwards symptoms of decline began to manifest themselves in a paralytic affection of the left side. Still he continued the active discharge of his public duties till the summer of 1863, when he was prostrated by an ulcer in the leg, and after several months of acute suffering he died on the 8th of October 1863.

Whately was a great talker, much addicted in early life to arguing with others on subjects on which to hammer out his own views, and as he advanced in life much given to didactic monologue. He had a keen wit, whose sharp edge often inflicted wounds never deliberately intended by the speaker, and a wholly uncontrollable love of punning. Whately often offended people by the extreme unconventionality of his manners. When at Oxford his white hat, rough white coat, and huge white dog earned for him the sobriquet of the White Bear, and he outraged the conventions of the place by exhibiting the exploits of his climbing dog in Christchurch Meadow. With a remarkably fair and rigid mind, his sympathies were wide, and by his blunt outspokenness on points of difference he alienated many. With no mystical fibre in his own constitution, the Tractarian movement was incomprehensible to him, and was the object of his bitter dislike and contempt. The doctrines of the Low Church party seemed to him to be almost equally tinged with superstition. He took a practical, almost business-like view of Christianity, which seemed to High Churchmen and Evangelicals alike little better than Rationalism. In this they did Whately less than justice, for his religion was very real and genuine. But he may be said to have continued the typical Christianity of the 18th century—that of the theologians who went out to fight the Rationalists with their own weapons. It was to Whately essentially a belief in certain matters of fact, to be accepted or rejected after an examination of "evidences." Hence his endeavour always is to convince the logical faculty, and his Christianity inevitably appears as a thing of the intellect rather than of the heart. Whately's qualities are exhibited at their best in his Logic, which is, as it were, the quintessence of the views which he afterwards applied to different subjects. He wrote nothing better than the luminous Appendix to this work on Ambiguous Terms.

In 1864 his daughter published Miscellaneous Remains from his commonplace book and in 1866 his Life and Correspondence in two volumes. The Aneidotal Memoirs of Archbishop Whately, by W. J. Fitzpatrick (1864), enlivens the picture.

WHAT-NOT, a piece of furniture, derived from the French dispre, which was exceedingly popular in England in the first three-quarters of the 19th century. It usually consists of slender uprights or pillars, supporting a series of shelves for holding china, ornamental or trifles of any kind—hence the name. In its English form, although a convenient drawing-room receptacle, it was rarely beautiful. The early mahogany examples are, however, sometimes graceful in their simplicity.

WHEAT (Triticum), the most important and the most generally diffused of cereal grasses. It is an annual plant, with hollow, erect, knotted stems, and produces, in addition to the direct developments from the seedling plant, secondary roots and secondary shoots, which spring from the base. Its leaves have each a long sheath encircling the stem, and at the junction of the blade or "flag" with the sheath a small whitish outgrowth or "ligula." The inflorescence or ear consists of a central stalk bent zigzag, forming a series of notches (see fig. 1), and bearing a number of flattened spikelets, one of which grows out of each notch and has its inner or upper face pressed up against it. At the base of each spikelet are two empty boat-shaped glumes or "chaff-scales," one to the right, the other to the left, and then a series of flowers, 2 to 8 in number, closely crowded together. The outer flowers are abortive or sterile,—indeed, in some varieties only one or two of the flowers are fertile. Each flower consists of an outer or lower glume, called the flowering glume, of the same shape as the empty glume and terminating in a long, or it may be in a short, awn or "beard." On the other side of the flower is a rather, and at a slightly higher level and of thinner texture than the other glumes, with infolded margins and with two ribs or veins. These several glumes are closely applied one to another so as to conceal and protect the ovary,
and they only separate for a short time when flowering takes place; after fertilization they close again. Within the pale are two minute, ovate, pointed, white membranous scales called "lodicules." These contain three stamens with thread-like filaments and oblong, two-lobed anthers. The stamens are placed round the base of the ovary, which is rounded or oblong, much smaller than the glumes, covered with down, and surmounted by two short styles, extending almost up to the ovary and bearing long stigmas. The ripe fruit or grain, sometimes called the "berry," the matured state of the ovary and its contents, is oblong or ovoid, with a longitudinal furrow on one side. The ovary adheres firmly to the seed in the interior, so that on examining a longitudinal section of the grain by the microscope the outer layer is seen to consist of epidermal cells, of which the uppermost are prolonged into short hairs to cover the apex of the grain.

Two or three layers of cells inside the epidermis constitute the tissue of the ovary, and a few or more somewhat similar layers which form the coats of the seed. Within these is the albumen or endosperm, constituting the floury part of the seed. The outermost layer of the endosperm consists of square cells larger and more regular in form than those on each side; these contain aleurone grains—small particles of gluten or nitrogenous matter. The remaining central mass of the seed is composed of numerous cells of irregular form and size containing many starchy grains as well as gluten grains. The several layers of cells above referred to become more or less dry and insepable one from another, forming the substance known as "bran." At the lower end of the albumen, and placed obliquely, is the minute embryo-plant, which derives its nourishment in the first instance from the albumen; this is destined to form the future plant.

The wheat plant is nowhere found in a wild condition. Some of the species of the genus Aegilops (now generally referred to Triticum by Bentham and Hooker and by Haeckel) may possibly have been the sources of our cultivated forms, as they cross freely with wheats. Haeckel considers that there are three species. (1) Triticum monococcum, which undoubtedly grows wild in Greece and Mesopotamia, is cultivated in Spain and elsewhere, and was also cultivated by the aboriginal Swiss lake-dwellers, as well as at Hissarlik, as is shown by the grain found in those localities. (2) T. sativum is the ordinary cultivated wheat, of which Haeckel recognizes three principal races, spelta, dicoccum and tenax. Spelt wheats (see fig. 2) were cultivated by the aboriginal Swiss, by the ancient Egyptians, and throughout the Roman empire. The variety dicoccum was also cultivated in prehistoric times, and is still grown in Southern Europe as a summer wheat and one suitable for starch-making. The variety tenax includes four sub-races, vulgare (common wheat), compactum, turdium and durum (see below). (3) The third species, T. polonicum, or Polish wheat, is a very distinct-looking form, with long leafy glumes; its origin is not known. As these varieties intercross with each other, the presumption is that they, like the species of Aegilops, which also intercross with wheat, may have all originated from one common stock.

Basing his conclusions upon philological data, such as the names of wheat in the oldest known languages, the writings of the most ancient historians, and the observations of botanical travellers, De Candolle infers that the wheat plant was in Mesopotamia, and that from there it was distributed extensively in early times to the Canaries on the west and to China on the east. In the western hemisphere wheat was not known till the 16th century. Humboldt mentions that it was accidentally introduced into Mexico with rice brought from Spain by a negro slave belonging to Cortez, and the same writer saw at Quito the earthen vase in which a Flemish monk had introduced from Ghent the first wheat grown in South America.

As might be anticipated from the cultivation of the plant from time immemorial and from its wide diffusion throughout the western hemisphere, the varieties of wheat—that is, of T. sativum—is a very numerous and of every grade of intensity. Those cases in which the variation is most extreme some botanists consider it expedient to consider as distinct species, but others, as De Vilmorin, having regard to the general facts of the case and to the numerous intermediate gradations, look upon all the forms as derivatives from one type. In illustration of this latter point it may be mentioned that not only do the several varieties come into the other, but their chemical composition varies likewise according to climate and season. According to Professor Church, even in the present case of a single variety of wheat there are albuminoid matters in some grains than in others; but on the average the proportion of gluten to starch is as 9:11 to 100. From the point of view of agriculture it is generally of no great moment what rank be assigned to the various forms. It is only important to take cognizance of them for purposes of cultivation under varying circumstances. Hence we only allude to some of the principal variations and to the characteristcs which have been given them. (1) Setting aside differences of constitution, such as hardhook, size, and the like, there is relatively little variation in the form of the organs of vegetation. This indicates that less attention has been paid to the straw than to the grain, for it is certain that, were it desirable, a great range of variation might be induced in the foliage and straw. As it is, some varieties are harder and taller than others, and the straw more solid, varying in colour and having less liability to be "laid"; but in the matter of "furbishing" or the production of side-shoots from the base of the stem, there is much difference. Spring wheats procured from northern latitudes mature more rapidly than those from temperate or hot climates, while the reverse is the case with autumn wheats from the same source. The difference is accounted for by the greater amount of light which the plants obtain in northern regions, and, especially, by its comparatively free continuance in the spring for a considerable time. What we obtain into growth later in spring—much later than varieties of southern origin. These latter, accustomed to the mild winters of those latitudes, begin to grow early and are in consequence liable to injury from spring frosts. Wheats of dry countries and of those exposed to severe winds have, says De Vilmorin, narrow leaves, plant straw, bearded ears, and velvety chaff—characters which enable them to resist wind and drought. Wheats of moist climates, on the other hand, have broader leaves, to admit of more rapid transpiration. No doubt careful microscopic scrutiny of the minute and the less of plants grown under various conditions would reveal further analogies and structures of climate. At any rate, it is certain that, as a general rule, the hard wheats are almost exclusively cultivated in hot, dry countries, the soft wheats in mountains, the pale soil turf, soil, hard (durum forms) and common wheats in plains or in valleys—the best races of wheat being found on rich alluvial plains and in fertile valleys. The wheats used in the neighbourhood of Florence for straw-making are the variety with very long glumes, thickly at the beginning of winter and pulled out, not cut, about the end of May, before the ear is ripe. In the United Kingdom ordinary old red, known as "beard," was the staple straw, but the straw-plaiting, the straw being cut some time before the berry ripens. The propensity to "filler" is of the greatest importance, as it multiplies the resources of the farmer. An instance of this is given in the Philosopher (April 1864), which is that the old seedling plant in the Cambridge botanic garden was divided into eighteen parts, each of which was re-planted and subsequently again divided, till it produced sixty-seven plants in one season. In March and April of the following year these were again divided

1 See drawings made to scale by Mr Worthington Smith in the Gardener's Chronicle (25th December 1886).
and produced 500 plants, which in the time yielded 21,109 ears.

(2) The varieties in root-development have not been pursued to, although it would be well to study them in order to ascertain the degree of adaptability to various depths and conditions of soil.

(3) A most important difference is observable in the liability to attacks of rust (Puccinia), some varieties being altogether free, or almost free from it, while others are in particular localities so subject to it as to be not worth cultivating.

(4) The ears vary, not only in size, but also in form, this being characteristic of the degree of closeness with which the spikelets are seated. In such varieties as Talavera the spikelets are loose, while in the club and square-headed varieties they are closely packed. The form of the ear depends on the relative width of the anterior spike, posterior surfaces as compared with that of the lateral surfaces.

In the square-headed varieties the lateral surfaces are nearly as wide as the median ones, owing to the form and arrangement of the spikelets. The number of abortive or sterile spikelets on the top of the ear varies: in some cases nearly all the spikelets are fertile, while in others several of the uppermost ones are barren.

The classification of cultivated varieties of wheat has occupied the attention of many botanists and agriculturists.

**Classification of Cultivated Wheat.**

The classification adopted by Henry de Vilimorin in his *Les Blés meilleurs* (Paris, 1881) is based, in the first instance, on the nature of the ear: when mature its axis or stem remains unbroken, as in the true wheats, or it breaks into a number of joints, as in the spelt wheats.

In the first class the ripe grain readily detaches itself from the chaff-scales, while in the spelt wheats it does not, as in them, or not readily separable from them.

The true wheats are further subdivided into classes according to the nature of the grain (gare), turfing wheats (T. turdium), hard wheats (T. durum) and Polish wheats (T. polantium). The hard and common wheats the chaff-scales are boat-shaped, ovate, or ovate of parchment, and shorter than the spikelet; the seed is usually floury, opaque, white, and easily broken.

In the turfing wheats the glumes have long awns, and the seed is turfing, and floury, as in the common wheats. In the hard wheats the outer glumes are keeled, sharply pointed, awned, and the seed is elongated and of hard glassy texture, somewhat translucent, and nearly always breaks owing to its toughness. These seeds are richer in nitrogen than the hard and common turfing wheats, so that an approximate notion of the richness in albuminoids may be had by simply inspecting the cut surface of the seed. The Polish wheats, rarely if ever cultivated in the United Kingdom, has very large lancelolate glumes, longer than the spikelet, and elongated grassy seeds. Further subdivisions are made, according to the presence or absence of awns (bearded and beardless wheats), the colour of the ears (white, straw, or golden brown), and the character of the seed (smooth or downy).

A. **Epidermal cells.**

B. **Cells containing aleuron or gluten grains.**

C. **Cells of endospore or albumen.**

D. **Embryo cut through the middle, root-end pointing downwards.**

![Fig. 3—Longitudinal Section of a Grain of Wheat: highly magnified.](image)

- A. Epidermal cells.
- B. Cells containing aleuron or gluten grains.
- C. Cells of endospore or albumen, filled with starch.
- D. Embryo cut through the middle, root-end pointing downwards.

Wheat cultivated in the United Kingdom, has very large lancelolate glumes, longer than the spikelet, and elongated grassy seeds. Further subdivisions are made, according to the presence or absence of awns (bearded and beardless wheats), the colour of the ears (white, straw, or golden brown), and the character of the seed (smooth or downy). The division into spring wheat and winter wheat is an agricultural one solely. Any variety may be a spring wheat at one time and a winter wheat at another, and vice versa. The division into spring wheat and winter wheat is not always easy, and it is not always certain whether a given variety will produce ears that will ripen in the spring or in the winter. The two types of wheat are usually distinguished by the time at which they are sown. In the summer wheats it may often be observed that the median florets do not fill out so fully as in the autumn wheats. Among the summer wheats there is a frequent tendency in the spike to branch or become forked, which is manifested to a less degree in other forms. The Egyptian, or so-called "mummy" wheat is of this character, the lower part of the spike branching out into several lateral branches. The production of the seed-bearing branches might at first sight be considered advantageous; but in practice the quality of the grain is found to be inferior, as if the force that should have been devoted to the maturation of the grain were, in a measure, diverted and expended in the production of additional branches to the spike.

With regard to the chemical composition of the ripe grain, the Russian Cereals Commission has found that the most variable condition of manuring, and even where much diversity was apparent in the composition of the straw. A high or low percentage of nitrogen in the grain was also shown to depend on the variety and the nature of the environment with which the character of the season, than on difference in manure; but it depends more upon the variety than upon soil or nutrition.

The morphological interest of these diversities as indications of the faculty of various wheats in particular soils and possibly as a clue to the genealogy and origin of the cultivated plant, their practical importance is very great. Some varieties are better suited for certain uses than others on account of certain characters; and Dehéram and Bles have shown the "infinite superiority" in yield of the ordinary wheats of a particular square-headed variety grown on rich soil in the north of France. A good selection of seed, according to the nature of the soil, demands, says De Vilimorin, intelligence and accurate knowledge on the part of the farmer. If a good variety be grown in poor soil, the result will be unprofitable, while, if bad wheat be grown on good soil, the result may be nil. In botanical collections there exist, it is stated, herbarium specimens or other evidences of plants grown in Norway as far north as lat. 65° (Schulze), in Switzerland at an elevation of 1200 ft. above the valley of the Rhine, and in the interior of Sweden, as well as in Tenerife, the Cape of Good Hope, Abyssinia, Rodriguez, the Philippine Islands and the Malay Archipelago. These widely separated wheats, which are nearly all different, and distinctly possible, and illustrate the powers of adaptation of the plant. The requirements of the consumer have also to be considered: for some purposes the soft floury wheats, with their large relative proportion of starch, are suited for others the harder wheats, with less quantity of gluten.

Some of the modern processes of milling, the harder wheats are preferred, for they make the best flour for bakers' use; some prefer soft wheats, and would regard the former as a rule, harder than the winter wheats. The bearded varieties are supposed to be harder; at any rate they defy the ravages of predatory birds more completely than the unarmored varieties, and they are preferable in countries liable to storms of wind, as less likely to have their seeds detached. The *durum* wheats are specially employed in Italy for the fabrication of macaroni. Polish wheat is used for similar purposes. Spelt wheats are grown in the colder mountainous districts of Europe; their flour is used for pasty-making; but, owing to the construction of the grain, it requires special machinery for grinding (see Flour).

Wheat begins to grow at a temperature of 5° C. (41° F.) and, when the aggregate temperature, as represented by the sum of the daily means, has mounted to 185° F., the germ begins to escape from the husk, if the seed be not deeply buried; but if it is deeply buried, it only escapes from the husk after a longer period, and the depth of the soil is a depth lower than a foot from the surface, it rarely germinates. The seedling plant ceases to grow if the mean daily temperature is below 25° F. If the young plants have been influenced by an aggregate temperature amounting to 1809° F., from the period when sown, or 1715° F. from the period of germination, branching or "tilering" goes on freely, and the young plants are not short in stature. If the aggregate temperature be not over 55° F., or a little above, the flowers are produced. A still higher daily mean is required for the full development and ripening of the grain. The figures here cited are given by Risler and are calculated for the climate of Paris; but, of course, the same principles apply in the case of other countries. The amount of light and of moisture has also to be taken into account. The fact that the wheat plant may grow less water than other cereals, and therefore does not suffer so much from drought, is one of great importance to the cultivator, and furnishes one reason for the greater proportionate culture of wheat in the eastern than in the western counties of England.

The following varieties are only a few of numerous that may give an idea of the nature and amount of the demands made upon the soil by a wheat crop: in order to yield a crop of 441 bushels of wheat, acre of the soil must supply to the crop during its growing round numbers—202 lb. of nitrogen, 81 lb. of phosphoric acid, 55 lb. of lime, 26 lb. of magnesia, and 355 lb. of potash.

The numerous varieties of wheat now in cultivation have been obtained either by natural or artificial selection. In the former field there may be observed on close inspection plants differing in character from the majority. If seeds of these "spor" plants be taken and grown in another locality, they may be propagated by natural selection or by variation. If they do, and the same process of selection be continued, the variation becomes in time "fixed," though it is always more or less liable to extinction. The great advantage of artificial selection is that it is possible to use the special power of the farmer for the systematic selection of the best grains from the best ears. Major Hallett introduced in 1888, 17pedigree wheats of fine quality. But even greater results may be expected from cross-breeding, or
WHEAT 579

The country is a very level one, making it possible to use all kinds of machinery with great success. As there are no mountains or swamps, there is here very little waste land, and every square foot of the vast wheat fields can be made productive.

The first characteristic of a "bonanza" wheat farm is the machinery. The smallest agricultural implement used upon them is a plough, and the largest is the elevator. A bonanza farm is made almost self-supporting, and there are two elevators of machines of all sizes adapted to the needs of the particular work. Let us assume the conditions prevailing upon a bonanza farm of 5000 acres, and briefly describe the process of wheat production from the ploughing of the land to the delivery of the grain in the final market. These great wheat farms were established upon new lands sold directly to capitalists by the railroads. The lands became the property of the railroads largely through government grants, and they attracted capitalists, who bought them in large bodies and at low prices. The improvements made upon them consist of the cheap wooden dwellings for the managers, dormitories and dining-halls for the men, stables for the horses, and sheds and workshops for repairing machinery. Very little of the land is under fence. Since the desirable lands of the country have been occupied, the prices of these lands have advanced slowly, with the result that the big farms are being divided up into small holdings. After a generation or two, if land continues to rise in the market as it has recently, the bonanza farms will become a thing of the past. At present the best of these lands in the valley of the Red River (of the North) are worth from $3 to $4 an acre. The farmers produce more than an acre more. A farm is not considered a big one unless it contains from 2000 to 10,000 acres at least. There are, of course, many small farmers owning from two to five sections (640 acres in each section), but their methods are more like those of the small farmers in the eastern United States or on the continent of Europe. It is necessary to own a large body of land in order to be able to use the machinery and methods here described. It is hard to convey a just notion of the size of these farms. They stretch away as far as the eye can reach in every direction, making it difficult even for the visitor to conceive their size. The distances across wheat fields are so great that even horseback communication is too slow. The farms are separated into divisions, and lodging-houses and dining-halls and barns are scattered over them, so as to keep the workmen and teams near the scene of their labour. The men living at one end of the farm may not see those at the other for months at a time. Even then it is necessary to take the meals to the men in the fields rather than allow them to walk or ride to the dining-halls. It is not an unusual thing for a working crew to find themselves at the dinner hour 2 m. from their hall.

First, after burning the old straw of the previous year—which is real labour in itself, so enormous is its bulk—comes the ploughing. This begins in October. The plough used has a 16-in. share, turns two furrows, and is drawn by five horses. Each plough covers about 250 acres in a season, travelling an average of 20 m. a day. The ploughing begins in October, and continues a month or six weeks, according to the season. The ploughs are driven in "gangs" under the eye of a superintendent, who rides with them. Ten of these gangs follow each other in the field, and are called the "second section." If one stands a few rods ahead of them they seem to be following one another in a line; but, if one stands to the right of the "gang," one sees that the line is broken, and that the second plough is going in another direction in the field. The number of men in the second section. Experience shows that it costs about 70 cents an acre to plough the land in this way. About forty men are employed upon a farm of 5000 acres during the ploughing season. Each ploughman earns about $10 a month, and receives about $25, including their board. They breakfast at five o'clock, take an hour for their dinner at noon—usually in the field—and have their supper at seven. At the end of the ploughing season there is a regular men's ball every two years. Only eight or ten are kept on a farm of this size throughout the year. The other men go back to their homes or to the factories in the cities, where they await the harvesting and threshing season. The eight or ten men who remain on the farm are employed in doing all sorts of work, such as overhauling machinery, or helping the carpenter and blacksmith, or looking after the horses. The wheat region is a country of heavy snows, and of severe, dry cold, but when March comes the snows begin to melt away, and by April the ploughed land is dry enough for

The fertilization of the flowers of one description of wheat by the pollen of another. This has been attempted by Shirlle, Le Couture, Mauve, and others, chiefly by H. de la Héne and Messrs Carter. Under natural circumstances wheat is self-fertilized: that is to say, the pollen of any given flower impregnates the stigmas of the same flower; the glumes and coverings of the flowers being tightly drawn round the stamens in such a way as to prevent the access of insects and to ensure the deposit of the pollen upon the stigmas of the same flower. This process of self-fertilization is the rule; but on closer examination it will be found that the anthers are empty or nearly so, and that they are not prostrated till after they have deposited the pollen upon the stigma. The rule is therefore not so much a case of self-fertilization, and which permits the egress of the useless stamens after that operation, occurs only under certain conditions of temperature, when the heat, in fact, is sufficient to cause the locules of the flower to become turgid and thus to press apart the glumes. A temperature of about 75° F. is found by Messrs Carter to be the most favourable. From what has been said it will be evident that the artificial fertilization of wheat is a very delicate operation. The glumes have to be separated and the anthers cut away before the pollen is fully formed, care being taken at the same time not to injure the stigma, and specially not to introduce, on the scissors or otherwise, pollen of any other specific or variety. Diverse experiments have shown that all the varieties will intercross, and that even such a distinct form as the Polish is no exception. From this it follows that a mixed grain produced from hybridized and are to be comprised within one species. In the progeny of these crossed wheats, especially in the second generation, much variation and difference of character is observable—a phenomenon commonly noticed in the descendants from crosses and hybrids, and styled by Naudin "irregular variation." Sometimes characteristics appear in the crossed wheats which are not found in the parent varieties, although they occur in other wheats. Thus, De Villemor records the presence of turgid wheats among seedlings raised from a common wheat fertilized with the pollen of a hard variety, and spelt wheats among the descendants of a common crossed with a turgid wheat. The yield of wheat bread is increased enormously since the extension of railways has made possible the transportation of grain for great distances (see GRAIN TRADE). Of late years the increase of production has been most notable in southern Russia, Argentina, Australia, India, and with America.

American Wheat-Farming.—That wonderful agricultural region, extending from the international line on the north to the 37th parallel, and from the Atlantic Ocean to the 100th meridian, and comprising 26 states, produces 76% of the American wheat crop. This region, which contains only 30% of the land surface of the country, but embraces 60% of its total farm area and 70% of its improved farm acreage, is the greatest cereal-producing region of the world. Besides wheat, it produces 82% of the total corn crop, 91% of the total oat crop and 83% of the total hay crop of the United States. The methods pursued in the eastern portion of this region are similar to those used in other parts of the world; but in the north-western portion wheat-growing is carried on on a gigantic scale, and by methods almost unknown anywhere else. The best illustration of the great or "bonanza" wheat farms, as they are called, are found along the Red river (of the North), where it flows between the states of North Dakota and Minnesota.

The wheat grown in the United States is of two distinct kinds. One is the large-kernel winter wheat of the Eastern states; the other is the hard spring wheat. The blue stem or "rifle" wheats are native varieties of the latter kind grown in Minnesota and the two Dakotas. For flour-making this wheat is considered the best in the world. During the season of 1890 the product of hard spring wheat amounted to nearly 250,000,000 bushels, or two-fifths of the entire wheat product of the United States. Of this, Minnesota and the two Dakotas alone produced 200,000,000 bushels. Minnesota is the greatest wheat-producing state in the Union. Her fields in 1890 covered 5,000,000 acres, and she produced nearly 80,000,000 bushels, which is twice the entire production of all Australia, and more than that of California. The extension of wheat upon the remains of the prairie in Minnesota and in the Dakotas the farms are devoted almost exclusively to wheat-growing. Many of them contain from 3000 to 10,000 acres.

1 For Canadian Wheat see CANADA Agriculture.
The harrow. The harrowing is done with 25-ft. harrows, drawn by four horses, and operated by a single man. One man can harrow 60 to 70 acres a day.

The seeding follows immediately with four-horse press drills that cover 12 ft. The four-horse drills and ploughs were each. Each drill will go from 20 to 25 m. a day.

Seedling. When the weather is good the seeding upon a 5000-acre farm will be done in twenty or twenty-five days. It is usual to seed a large part of the wheat to the south of the farm whenever the purpose is carefully selected after the harvest of the previous year, and is thoroughly cleaned of foreign seeds. Through years of cultivation, the habit they have been planted while the soil is warm. The soil is prepared and planted the ground. Such seedlings have been very successful, and many farmers are obtained with it. The care of these is necessary, and if it is properly cultured, the crop will be well enough to show the exact product of each division of the farm. After the rush of the threshing is over the farmer studies these books carefully to see what his land is doing, and makes his plans for the next year, so as to rest or strengthen those divisions which are failing. The cost of about $1.50 an acre to thresh the grain and put it into the elevator. This sum, added to the estimated cost of the other processes mentioned above, makes the total cost of growing an acre of grain about $3.80. This includes the cost of labour, seed and waste of machinery, but does not include the interest on land or plant. The taxes on land will average 25 cents an acre. The farmers estimate that the other improvements, the waterworks, elevator, insurance, horse feed, &c., will make this up to $6 an acre. The best of these farms will yield 20 bushels to the acre. This makes the wheat cost 30 cents a bushel. During the last five years the average farming-selling price of wheat in the North-West has been 87 cents. An acre thus produces $11.60, making a gross profit of $5.60. Still to be provided for is the interest on the operating expenses for the next year, the profit from the sale of the grain, the cost of the capital in land, improvements and machinery, at $30 per acre, make $1.80 more, or a total interest charge of $2.88. This is the wheat. The wheat-pits are described as the wheat pits. It is about 7% of the total invested in the land, plant and operating expenses. But we have described the conditions for one farmer and accounted for, and entered upon the books, so as to fully inform as to the drought in India, the hot winds in the Argentine and the floods of the Danube. Any occurrences in these distant parts of the world are known to him in a surprisingly short time. The world's great wheat fields almost lie within his sight, so well does he know the conditions that prevail in them.

Ten days are allowed for delivery, so that he can usually ship the wheat after it is sold. In the early days of wheat-farming the bonanza farmer often speculated, but experience has taught him that he had better leave this to the men in the cities, and content himself with the purchase of wheat. The wheat is harrowed and kept in the wheat. The wheat is harrowed and kept in the wheat. There are 18 grades of this wheat. The best is 'No. 1, hard spring wheat, round, bright and well cleaned, composed mainly of hard Scotch-Fife,' weighing not less than 58 lb. to the measured
WHEAT

581

bushel. The second grade is known as "No. 1, northern spring wheat, sound, and well cleaned, composed of the hard and soft varieties of spring wheat." So the varieties run "No. 2, northern; "No. 3, northern," &c. down to the 18th, which is "no grade." The official inspectors examine, grade and sample the wheat in the cars in which it is received at the great markets or elevators. The cars are sealed at the point of original shipment. The first thing, therefore, is to examine the seals to see that they are unbroken. The inspector then samples and examines the wheat, and enters the grade upon a blank opposite the number and letters of the car. His tag and sample go to the wheat exchange or chamber of commerce, where they are exposed in small tin pans, and form the basis of the trading. A few years ago the wheat received from the north-west was very clean indeed, but since the new land has all been cultivated the fields are growing more weedy, with the result that the wheat brought in is becoming mixed with oats and seeds of weeds, requiring more care in separation and inspection. The inspector has finished his work the cars are resampled with the state seal, and await orders of the purchaser. The delay will not ordinarily be more than one day. The commission keeps complete records and samples of each car until the wheat has passed entirely out of the market. When disputes occur as to the grade they can thus be instantly settled. If the grade is changed after a second examination the state pays the expense of the inspection; if not, it is paid by the agent who raises the objection. Only about 5% of the samples are ever reinspected, and in less than 2% of these is the grade changed. The commission collects the small fee of 20 cents a car for its inspectors, and later weighs all the wheat as it is distributed into the elevators. This small charge pays all the expenses.

The transportation of the wheat from the fields of the north-west to the seaport is a business of tremendous magnitude. Most of this wheat goes by way of the lakes through Sault Sainte Marie canal to Buffalo, where it is shipped by rail or inland canal to New York, Philadelphia or Baltimore. Duluth, on Lake Superior, is, surprising to say, the second port in the United States in point of tonnage. The Sault Sainte Marie canal passes two, and a half times as much tonnage during the eight months it is open as the Suez canal passes in the entire year. The cheapest transportation in the world is found upon these lakes, the rate being only three-fourths of a mill per ton of wheat per mile. The greater lake vessels, called "Whalebacks," carry cargoes up to 250,000 bushels, a bulk difficult to conceive. 700 bushels is a car-load. At that rate the cargo of 250,000 bushels will fill 360 American cars, or 9 trains of 40 cars each. At 20 bushels to the acre, this single cargo would represent the yield of two and a half farms of 5000 acre acreage and the yield. The fact that these States contain, in action, the railways of the north-west have a monopoly of the business of hauling wheat, with the result that it costs 20 cents to ship a bushel of wheat from the Dakota field to Duluth, which is as much as it costs to forward it from Duluth to Liverpool. The bushel of wheat, or an equivalent amount of flour, can be shipped from Minneapolis or Duluth to almost any point in western Europe for from 20 to 25 cents.

What are the prospects of wheat production in the United States? In his presidential address before the British Association for the Advancement of Science (1900), Sir William Crookes painted a rather dark picture of the future of the world's wheat production. Among other things he said, "It is almost a certainty that within generation the ever-increasing population of the United States will consume all the wheat grown within its borders, and will be driven to import grain like ourselves. Americans think that this statement is altogether too pessimistic. But they may turn all the green acres to cultivated land in farms, and of the possibilities of improving the yield, and still further cheapening the product. It is probable that the United States will by 1934 have a population of 133,000,000 people. The population would be maintained with a little less than 100,000,000 bushels for its own use alone. Limiting attention to the great cereal-producing region described above, let us see what the prospects are for increasing the acreage and the yield. The fact is that these States contain, according to the last census, over 100,000,000 acres of unimproved land, already enclosed in farms, suggests at once the great possibilities in wheat. But all this land is not immediately available for cultivation. The availability of the unimproved land in these states is chiefly a question of population and physical features. In New York and Pennsylvania there is a general country of hills and mountains, and have already a large population, it is probable that the land available for wheat cultivation is now nearly all taken up, although they still have 30% of unimproved land in the Dakotas, and 20% in the Dakotas, and 20% in Minnesota and the Dakotas there is still 40% to 50% of unimproved land in farms. There are few mountains and hills in these States, and in the great prairies room is greater for the westward spread of agriculture. But in the States where agriculture is destined to increase greatly. Twelve states, in this vast cereal-growing region—Ohio, Indiana, Illinois, Missouri, Kansas, Nebraska, Michigan, Iowa, Wisconsin, Minnesota, North and South Dakota, Montana, all of these have 50% of unimproved land in farms. The total area of these states is nearly four times that of France. Their soil is primarily as fertile as theirs. If we put the population of France at 40,000,000, the states in the United States have a population of 133,000,000 expected by 1934. This is a great manufacturing as well as a great agricultural region, and it is here, therefore, that a large part of this increase in population will be found.

It is evident that there is great room for improvement also in the matter of yield per acre. The average yield of wheat per acre has increased slowly in recent years. So long as there was so much land available to be brought into cultivation the yield has increased, and is now supposed that the rich new lands are not available the yield has increased at all, since the tendency everywhere is to "skin the rich, new lands first. Mr. B. W. Snow, formerly one of the statisticians of the United States Department of Agriculture (The Forum, vol. xxviii. p. 94) that the producing capacity of the wheat lands, under favorable weather, increased steadily during the period 1880-1899. He distinguishes between the actual yield and the producing capacity, and bases his comparison upon the latter. He takes the average for each year of five years between 1880 and 1899, and shows that the producing capacity per acre increased 0.5 bushel between the second and the third, and 1 bushel between the third and the fourth. In the period 1880-1884, inclusive, the maximum capacity was a little less than 14 bushels, while in the period 1894-1899 the maximum capacity was 17 bushels—an increase of 3.2 bushels per acre, or 23%, in less than twenty years. He says, "To account for this increase in the potential yield in our wheat-fields many factors must be taken into consideration. Among these may be noted improved methods of ploughing, tile drainage, use of the press drill, which results in greater immunity against winter killing, crop rotation, and, to a very small extent, fertilization. An important factor to be mentioned in connection with this is the change in the distribution of the acreage under wheat, consequent upon falling prices. A decline in the price of wheat rendered its production unprofitable where the rate of yield was great, and gradually the acreage produced was reduced. It is interesting to note that from 1894 the acreage of barley was 7,000 acres in 1899, and that of oats, 13,000 acres, and that of wheat, 4,000,000 acres. These changes have been accomplished without any government interference or aid. The results can be attributed to improvements in implements for preparing the soil and planting the seed. Wheat is grown year after year without rotation, except in cases of scarcity of land, and are carried by insects or by the wind to other wheat-plants. If infection takes place, other sorus are formed in ten days or a fortnight under favourable conditions of moisture and warmth.
Towards the end of the summer the uredospores are replaced by the winter resting-spores, called teleutospores, which are larger, thicker-walled and darker in colour. These teleutospores remain inactive on the straw until spring, when they germinate in manure heaps or on moist ground and produce minute sporidia, which are conveyed by air currents to the alternate host, in this case a barley.

In due time the fungus, known as *Aecidium Berberidis*, appears on the barley leaves in the form of small cluster-cups on *Aecidia*, each of which is filled with chains of orange-coloured *acaeidial* spores. Infection of the leaves of the young wheat plants follows on the scattering of the acaeidial spores: a sorus of the rusty uredospores is produced, and the life-cycle is complete.

Though this is the normal and complete development of *Puccinia graminis*, it is not invariably followed. In Australia, for instance, the berberry is an imported plant and of rare occurrence, yet rust is very abundant. Teleutospores of heteroecious rusts never reinfect the host on which they are produced, so that in many cases the other flowering wheat plants. It is impossible to detect the first infection or to cleanse the seed: the only remedy is to procure seed from a smut-free source, and to burn further the straw by which the disease is conveyed, to prevent further dissemination. In some cases the fungus remains in the soil or in manure-heaps until spring, when they germinate and attack the first green leaves of the host plant. The over development is similar to that of smut, and the seed grain becomes a mere mass of fungus spores. Much can be done in this case to clean the seed before sowing by immersing it in hot water or in some solution that will kill the spores without injuring the grain.

Other parasitic fungi of less economic importance occasionally do considerable damage. *Erysiphe graminis* is a midew of wheat that has caused great loss in various countries; *Diplodia graminis* sometimes causes deformities of the leaves and inflorescence; another somewhat similar fungus, *Ophiobolus graminis*, attacks the leaves and stalks near the ground, completely destroying the plants. *Helminthosporium gramineum*, a disease of barley, has also been recorded on wheat; it forms long, narrow, dark-brown streaks on the leaves, which wither and die. The lower leaves are usually the ones only attacked, and the yield of grain has not been seriously affected.

**WHEATEAR**, a bird's name, perhaps of doubtful meaning, though J. Taylor, the "water poet" (d. 1654), in whose writings it seems first to occur, and F. Willughby, explain it (in the words of J. Ray, the latter's translator) as given "because in the time of wheat harvest they wax very fat." The wheatear, *Sturnella magna*, is one of the earliest migrants of its kind to return to its home, often reaching England at the end of February and almost always by the middle of March. The cock bird, with its bluish grey back and light buff breast, is set off by black car- covers, wings, and part of the tail, is rendered still more conspicuous by his white rump as he takes short flights in front of those who disturb him, while his sprightly actions and gay song harmonize so well with his delicately-tinted plumage as to render him a welcome object to all who delight in free and open country. When alarmed, wheatears have a sharp little note that sounds like *chat*; and this has not only entered into some of the local names of this species and of its allies, but has caused all to be frequently spoken of as "chats." The nest is constantly placed under ground; the bird takes advantage of the hole of some other animal, or the shelter of a clod in a fallow-field or a recess beneath a rock. A large amount of soft material is therein collected, and on them from 3 to 8 pale blue eggs are laid.

The wheatear has a very wide range throughout the Old World, extending in summer far within the Arctic Circle, from Norway to the Lena and Yana valleys, while in winter Africa beyond the Equator and in India. But it also breeds regularly in Greenland and some parts of North America. Its reaching the former and the eastern coast of the latter, as well as the Bermudas, may possibly be explained by the drifting of individuals from Iceland; but far more interesting is the fact of its continued seasonal appearance in Alaska without ever showing itself in British Columbia or California, and

---

1 The vulgar supposition of its being an euphemism of an Anglo-Saxon name (cf. Bennett's ed. of White's *Nai. Salborne*, p. 595, note) must be rejected until evidence that such a name ever existed be adduced. It is true that *whitake* (cf. Dutch *Witstaer* and French *Calbain*) is given by Coke in 1611; but the older names, according to Turner, in 1544, of *clouturde* (=clod-bird) and smatch (=chat) do not favour the usual derivation. "Failow-chat" is another old name still locally in use, as is "coyney-check."
WHEATLEY—WHEATSTONE

without ever having been observed in Kamchatka, Japan or China, though it is a summer resident in the Tchuktschi peninsula. Hence it would seem as though its annual flights across Bering’s Strait might be in connection with migratory movements that pass to the north and west of the Stanovoi range of mountains.

Many species more or less allied to the wheatear have been described; some eight are included in the European fauna, but the majority are inhabitants of Africa. Several of them are birds of the desert; and here it may be remarked that, while most of these exhibit the sand-coloured tints so commonly found in animals of like habitat, a few assume a black plumage, which, as explained by H. B. Tristram, is equally protective, since it assimilates them to the deep shadows cast by projecting stones and other inequalities of surface.

Amongst genera closely allied to Saxicola are Pratincola, which comprises among others two well-known British birds, the stonechat and whinchat, P. rubicola and P. rubetra, the latter a summer-brood, the former a winter-plumage, both of them well in range in Europe and several other species, more or less resembling it, inhabit South Africa, Madagascar, Réunion and Asia, from some of the islands of the Indian Archipelago to Japan. The whinchat, on the other hand, much more affects enclosed lands, and with a wide range has no very near ally. The wheatear and its allies belong to the sub-family Turdinae of the thrushes (q.v.).

WHEATLEY, FRANCIS (1747–1801), English portrait and landscape painter, was born in 1747 at Wild Court, Covent Garden, London. He studied at Shipley’s drawing-school and the Royal Academy, and won several prizes from the Society of Arts. He assisted in the decoration of Vauxhall, and sided Mortimer in painting a ceiling for Lord Melbourne at Brocket Hall (Hertfordshire). In youth his life was irregular and dissipated. He eloped to Ireland with the wife of Gresse, a brother artist, and established himself in Dublin as a portrait-painter, executing, among other works, an interior of the Irish House of Commons. His scene from the London Riots of 1780 was admirably engraved by Heath. He painted several subjects for Boydell’s Shakespeare Gallery, designed illustrations to Bell’s edition of the poets, and practised to some small extent as an etcher and mezzotint-engraver. It is, however, as a painter, in both oil and water-colour, of landscapes and rustic subjects that Wheatley is best remembered. He was elected an associate of the Royal Academy in 1790, and an academician in the following year. He died on the 28th of June 1801. His wife, afterwards Mrs Pope, was known as a painter of flowers and portraits.

WHEATON, HENRY (1783–1848), American lawyer and diplomatist, was born at Providence, Rhode Island, on the 27th of November 1783. He graduated at Brown University in 1802, was admitted to the bar in 1805, and, after two years’ study abroad, practised law at Providence (1807) and New York City (1812–1817). He was a justice of the Marine Court of the city of New York from 1815 to 1819, and reporter of the United States Supreme Court from 1816 to 1827, aiding in 1824 in the revision of the laws of New York. His diplomatic career began in 1827, with an appointment to Denmark as chargé d’affaires, followed by that of minister to Prussia, 1837 to 1846. During this period he had published a Digest of the Law of Maritime Captures (1813); twelve volumes of Supreme Court Reports, and a Digest; a great number of historical articles, and some collected works; Elements of International Law (1856), his most important work, of which a 6th edition, with amendments prepared by W. B. Lawrence and an eighth by R. H. Dana (q.v.); Histoire du Progrès du Droit des Gens en Europe, written in 1838 for a prize offered by the French Academy of Moral and Political Science, and translated in 1845 by William B. Lawrence as A History of the Law of Nations in Europe and America; and the Right of Visitation and Search (1842). The History took rank at once as one of the leading works on the subject of which it treats. Wheaton’s general theory is that international law consists of a code of conduct which reason deduces, as consonant to justice, from the nature of the society existing among independent nations, with such definitions and modifications as may be established by general consent.” In 1845 Wheaton was requested to resign by the new president, Polk, who needed his place for another appointment. The request provoked general condemnation; but Wheaton resigned and returned to the United States. He was called at once to the Harvard Law School as lecturer on international law; but he died at Dorchester, Massachusetts, on the 11th of March 1848.

WHEATSTONE, SIR CHARLES (1802–1875), English physicist and the practical founder of modern telegraphy, was born at Elgin on February 24, 1802, and spent his childhood in that city. In 1806 the family removed to London. Wheatstone’s education was carried on in several private schools, at which he appears to have displayed no remarkable attainments, being mainly characterized by a morbid shyness and sensitiveness that prevented him from making friends. About 1816 he was sent to his uncle, a musical instrument maker in the Strand, to learn the trade; but with his father’s countenance he spent more time in reading books of all kinds than at work. For some years he continued making experiments in acoustics, following out his own ideas and devising many beautiful and ingenious arrangements. Of these the “acryclopnone” was one of the most elegant—a light box, shaped like an ancient lyre and suspended by a metallic wire from a piano in the room above. When the instrument was played, the vibrations were transmitted silently, and became audible in the lyre, which thus appeared to play of itself. On the death of his uncle in 1823 Wheatstone and his brother succeeded to the business; but he never seems to have taken a very active part in it, and he virtually retired after six years, devoting himself to experimental research, at first chiefly with regard to sound. Although he occasionally read a paper to electrical societies with the results of his experiments, he never appeared as a lecturer on account of his shyness. Hence many of his investigations were first described by Faraday in his Friday evening discourses at the Royal Institution. By 1834 his originality and resource in experiment were fully recognized, and he was appointed professor of experimental philosophy at King’s College, London, in that year. This appointment was inaugurated by two events—a course of eight lectures on sound, which proved no success and was not repeated, and the determination by means of a revolving mirror of the speed of electric discharge in conductors, a piece of work leading to enormously important results. The great variety of technical transmissions suggested the possibility of utilizing it for sending messages; and, after many experiments and the practical advice and business-like co-operation of William Fothergill Cooke (1806–1879), a patent for an electric telegraph was taken out in their joint names in 1837. Wheatstone’s early training in making musical instruments now bore rich fruit in the continuous designing of new instruments and pieces of mechanism. His life was uneventful except in so far as the variety of his work lent it colour. He became a fellow of the Royal Society in 1837; in 1847 he married; and in 1869, after the completion of his master-piece, the automatic telegraph, he was knighted. While in Paris perfecting a receiving instrument for submarine cables, Sir Charles Wheatstone caught cold, and died on the 19th of October 1875.

Wheatstone’s physical investigations are described in more than thirty-six papers in various scientific journals, the more important being in the Philosophical Transactions of the Royal Society, the Comptes rendus and the British Association Reports. They naturally divide themselves into researches on sound, light and electricity, but extend into other branches of physics as well. But his best work by far was in the invention of complicated and delicate mechanism for various purposes, in the construction of which he employed a staff of workmen trained to the highest degree of perfection. For his first machine, invented in 1816, and over which he was unequalled, except perhaps by Charles Babbage. A cryptographic machine, which changed the cipher automatically and printed a message, entirely unintelligible until translated by a duplicate of the machine, was one of the most perfect. Wheatstone had a great fascination for Wheatstone; he studied it deeply at one time, and deciphered many of the MSS., in the British Museum which had defied all the other interpreters. In acoustics his principal work was a research on the transmission of sound through solids, the explanation of Chladni’s figures of vibrating solids, various investigations of the principles of acoustics and the mechanism of hearing, and the invention of new musical instruments, e.g. the concertina (q.v.).
WHEATSTONE’S BRIDGE

The kaleidophone, intended to present visibly the movements of a sound-wave body, consisted of a vibrating wire or rod carrying a silvered bead reflecting a point of light, the motions of which, by persistence of the successive images on the retina, were thus represented in curves of light. A light-vibrator, to which are a series of papers on the eye, on the physiology of vision, on binocular vision, including the invention of one of the popular scientific instruments, the stereoscope (q.v.), and on colour. The polar clock, devised for use in place of a sun-dial, applies the fact that the phase-decay of sky light is always 90° from the position of the sun; hence by measuring the azimuthal angle of the plane, even when the sun is below the horizon, correct apparent solar time may be obtained. In 1835, in a paper on “The Prismatic Decomposition of Electrical Light,” he proved that sparks from different metals give distinct spectra, which afforded a ready means of discriminating between them. But it is by his electrical work that Wheatstone is best remembered. He not only guided the growth of scientific telegraphy on land wires, but made the earliest experiments with submarine cables, foreseeing the practicability of these means of communication as early as 1840. He devised the “A, B, C” telegraph instrument, the automatic transmitter, by which messages may be sent at the rate of 500 words a minute, printing telegraph receivers of various forms, electrical chronoscopes, and many forms of electrical recording apparatus,—amongst others two sets of registering meteorological instruments, of which the earlier, described in 1842, was afterwards developed by Father A. Secchi and F. van Rysselbergh., but the later, put forward in 1867, included metallic thermometers and sea-temperature successively.

Wheatstone’s Scientific Papers were collected and published by the Physical Society of London in 1879. Biographical notices of him will be found in his Proc. Inst. C.E., xvi. 283, and Proc. Roy. Soc., xxxiv. xvi. For his connection with the growth of telegraphy, see Nature, xi. 510, and xii. 30 sq.

WHEATSTONE’S BRIDGE, an electrical instrument which consists of six conductors, joining four points, of such a character that when an electromotive force is applied in one branch the absence of a current in another branch (called the conjugate branch) establishes a relation between the resistance of the four others by which we can determine the value of the resistance in one of these, that of the others being assumed to be known. This arrangement was not invented by Sir Charles Wheatstone,—although it bears his name and is commonly attributed to him, and was employed by him in some of his electrical researches—but by S. H. Christie, in 1833.

The arrangement of the six conductors is diagrammatically represented in fig. 1. In one of these branches is placed a battery B, and in another a galvanometer G; the four other resistances are denoted by the letters P, Q, R, S. The circuits in which the battery and galvanometer are placed are called conjugate circuits, and the circuits P, Q, R, and S are called the arms of the bridge, the branches P and Q being called the ratio arms and S the measuring arm. The circuit in which the galvanometer is placed is the bridge circuit. Keys are inserted in the battery and galvanometer circuits to open or close them at pleasure. The resistance forming the four arms of the bridge can be so adjusted that if these resistances have values denoted by P, Q, R, and S, then when P: Q :: R: S, the current in the galvanometer circuit will be zero when an electromotive force is applied in the battery circuit.

To prove this statement, let the conductors P, Q, R, S, be arranged in a lozenge shape, as in fig. 1. Let E be the electromotive force in the battery circuit, and let (x+y) be the current through the resistance P, y the current through the resistance Q and z that through B. Then by G. R. Kirchhoff’s laws (see ELECTROKINETICS) we have the current equations:

\[ \begin{align*}
(P+G+R) & \cdot (z+y) - Gy - Rz = 0 \\
(Q+G+S) & \cdot y - G(x+y) - Sz = 0 \\
(R+S+B) & \cdot z - R(x+y) - Sy = E \\
\end{align*} \]

Rearranging the terms and solving for x (the current through the galvanometer), we obtain:

\[ x = (P-S-RQ)E/A, \]

where \( A \) is a complex expression, involving the resistances P, Q, R, S, G, and B, which does not concern us. Hence when \( z = 0 \), \( P : Q :: R : S \) and the value of R can be determined in terms of P, Q, and S.

In the practical instrument the three arms of the bridge P, Q, and S are generally composed of wires of steel contained in a box, whilst R is the resistance of which the value is to be determined. This last resistance is connected to the other three with the addition of a galvanometer and a battery connected up as shown in the diagram. The operation of determining the value of the resistance R therefore consists in altering the ratio of the three resistances P, Q, and S, until the galvanometer indicates no current through it when the battery circuit is completed or closed by the key. In one form of Wheatstone’s Bridge, known as the series pattern plug-resistance bridge, or Post Office pattern, the two ratio arms, P and Q, each consist of a series of coils of wire, viz. two 1-ohm coils, two 10-ohm coils, two 100-ohm coils and two 1000-ohm coils, which are joined up

---

1 See Wheatstone’s Scientific Papers, p. 129.
plug in the measuring arm does not tend to tighten or loosen all the rest of the plugs; moreover, there are fewer plugs to manipulate, and each plug is occupied. The resistance coils themselves are generally wound on brass or copper bobbins, with silk-covered manganine wire, which should first be aged by heating for about ten hours to a temperature sufficient to remove the slight tendency to change in resistivity which would otherwise present itself.

For the accurate comparison of resistance coils it is usual to make use of the Matthiessen and Hockin bridge, and to employ the method of differential comparison due to G. Carey Foster. On a board is stretched a uniform metallic wire $a$ b, generally of platinum silver. The ends of this wire are connected to copper blocks, which themselves are connected to a series of four resistance coils, A, B, and P, Q (fig. 4). A and B are the coils to be compared, P and Q are two other coils of convenient value. Over the stretched wire moves a contact maker $S$, which makes contact with it at any desired point, the position of which can be ascertained by means of an underlying scale. A battery $C$ of two or three cells is connected to the extremities of the slide wire, and the sensitive galvanometer G is connected between the contact-maker and the junction between the coils P and Q. The observer begins by moving the slider until the galvanometer shows no current. The position of the coils A and B is then interchanged, and a fresh balance in position on the bridge is obtained. It is then easily shown that the difference between the resistance of the coils A and B is equal to the resistance of the length of the slide wire intercepted between the two places at which the balance was found in the two observations.

Let the balance be supposed to be attained, and let $x$ be the position of the slider on the wire, so that $x$ and $l-x$ are the two sections of the slide wire, then the relation between the resistance is $(A+x)/(B+(l-x)) = P/Q$.

Next, let the position of A and B be interchanged, and the slide-wire reading be $x'$; then

$$(B+x')/(A+(l-x')) = P/Q.$$  

Hence it follows that $A-B=x'-x$, or the difference of the resistance of the coils A and B is equal to the resistance of that length of the slide wire between the two points where balance is obtained.

Various plans have been suggested for effecting the rapid interchange of the two coils A and B; one of the most convenient was designed by J. A. Fleming in 1880, and has been since used by the British Association Committee on Electrical Units for making comparison between standard coils with great accuracy (see Phil. Mag., 1880, and Proc. Phys. Soc., 1879). In all very exact resistance measurements the chief difficulty, however, is not to determine the resistance of a coil, but to determine the temperature of the coil at the time when the resistance measurement is made. The difficulty is caused by the fact that the coil is heated by the current used to measure its resistance, which thus alters in value. In accurate comparisons, therefore, it is necessary that the coils to be compared should be immersed in melting ice, and that sufficient time should be allowed to elapse between the measurements for the heat generated in the coil to be removed.

The standard resistance coil employed as a means of comparison by which to regulate and check other coils consists of a wire, generally of manganine or platinum silver, insulated with silk and wound on a cylinder of wood or other suitable form (fig. 5). On this cylinder are placed a terminal rod of copper, and the coil is enclosed in a water-tight brass cylinder. That it can be placed in water, or preferably in paraffin oil, and brought to any required temperature. In the form of standard coil recommended by the British Association Committee on Electrical Units, insulation which is kept stirred by means of a small electric motor during the time of making the measurement. The temperature of the coil can be ascertained by means of a platinum resistance thermometer.

For the measurement of low resistances a modification of the Wheatstone's bridge devised by Lord Kelvin is employed. The Kelvin bridge consists of nine connected coils, especially where the practical form is known as a Kelvin and Varley slide. Modifications of the ordinary Wheatstone's bridge for very accurate measurements have been devised by H. L. Callendar and by Callendar and E. H. Griffiths (see G. M. Clark, the Electrician, 35, p. 747). A useful bridge method for measurement of low resistances has been given by R. T. Housman (the Electrician, 40, p. 300, 1897). These and numerous modifications of the Wheatstone's bridge will be found described in J. A. Fleming's Handbook for the Electrical Laboratory and Testing-Room, vol. i. (1903).

in some countries it was upon a frame shaped like st andrew's cross that the sufferer was stretched. the punishment was abolished in france at the revolution. it was employed in germany as late as 1837. a murderer was broken on the wheel or wheel at edinburgh in 1604, and two of the assassins of the regent lennox thus suffered death.

wheeler, joseph (1836-1906), american soldier, was born at augusta, georgia, in 1836, and entered the united states cavalry from west point in 1859. within two years the civil war broke out, and wheeler, as a southerner, resigned to enter the confederate service. in a short time he became colonel of the 19th alabama infantry, with which he went part in the bloody operations of 1861 in kentucky and tennessee. he commanded a brigade at the battle of shiloh, but soon afterwards he returned to the cavalry arm in which he won a reputation second only to stuart's. after the action of ferryville he was promoted brigadier-general, and in january 1863 major-general. thenceforward throughout the campaigns of chickamauga, chattanooga, and atlanta he commanded the cavalry of the confederate army in the west, and when hood embarked upon the tennessean expedition, he left wheeler's cavalry to harass sherman's army during the closing operations of the war, having now the rank of lieutenant-general. he commanded the cavalry of joseph johnston's weak army in north carolina, and was included in its surrender. after this he became a lawyer and a cotton planter and in 1882-83 and 1885-1900 was a representative in congress. at the outbreak of the spanish-american war in 1898, president m'kinley, in pursuance of the policy of waging the north and the south, commissioned two ex-confederate generals—wheeler and fitz Hugh lee—as major-generals of united states volunteers, and in this capacity wheeler was placed in command of the cavalry division of shafter's army in cuba. he commanded guasimas and san juan, was afterwards sent to the philippines in command of a brigade, and in 1900 was commissioned a brigadier-general in the regular army. shortly afterwards he retired. general wheeler died on the 27th of january 1906.

wheeler, william almon (1819-1887), vice-president of the united states from 1877 to 1881, was born at Malone, New York, on the 30th of June 1819. he studied at the university of vermont for two years (1833-35), and in 1845 was admitted to the bar. first as a whig, and then, after 1856, as a republican, he was prominent in many years in state and national politics. he was a member of the state assembly in 1849-1850, a member and president pro tempore of the state senate in 1857-1858, and a member of the national house of representatives in 1861-1863, and again from 1869 until 1877. he was the author of the so-called "wheeler compromise," by which the difficulties between contending political factions in louisiana were adjusted in 1875. nominated for vice-president by the republicans in 1876 on the ticket with president hayes, he was installed in office through the decision of the electoral commission, and at the end of his term he retired from public life. he died at Malone on the 4th of June 1887.

wheeling, a city and the county-seat of ohio county, west virginia, U.S.A., on the east bank of the Ohio river, at the mouth of wheeling creek, 66 m. (by rail) S.W. of Pittsburgh. Pop. (1890) 34,522; (1900) 38,878, of whom 1066 were negroes, and 3461 were foreign-born, including 3106 Germans and 876 Irish; (1910, census) 41,041. area, 3-2 sq. m. wheeling is served by the Baltimore & Ohio, the Pennsylvania and the Wheeling & lake erie railways, by the belt line of the Wheeling terminus, and by a number of canals. it is the largest city in west virginia, and commercially the most important place on the Ohio river between Pittsburgh and Cincinnati. it is built on a narrow strip of bottom land, between the river and steep hills, at an elevation of about 640 ft. above tidewater. between the mainland and Wheeling (formerly Zane's) island, which forms a part of the city, there are a suspension-bridge, which has a span of 1010 ft., and a steel bridge, and from the island across the back river channel there are two bridges to the Ohio shore, one from the middle of the island to bridgeport on which the old national road crosses the river, and the other from the northern end of the island to Martin's Ferry, Ohio. a fifth bridge connects Wheeling with Bellaire, Ohio. Wheeling has a public library, containing 23,261 volumes in 1909. near the city is the mount de chantal academy (roman catholic) for girls, and in Wheeling is Linsly institute, a secondary school for boys. the principal public buildings are the Custom-house and post-office, the City hall, a high school, a y.m.c.a. building and a scottish rite cathedral. in the city are a city hospital (private, 1890) and the wheeling hospital (under the sisters of St Joseph, 1893). on the national road there is a post-office, to which was added in 1858 an office for the sale of stamps. no. 3, market square is a soldiers' monument. by reason of its situation on the Ohio river Wheeling is an important shipping and distributing center, and it has various important manufacturing interests. its factory products were valued in 1905 at $23,297,475. the chief industry is the manufacture of iron and steel, which in 1905 gave employment to more than 34% of the city's wage-earners, and yielded more than 46% of the total value of its products. the manufacture of nails, begun here in 1840, was for many years of great importance. other products in 1905 were slaughtering and meat products, $5,912,348; malt liquors, $1,541,785; tobacco and cigars (especially snows), $1,641,505; foundry and machine-shop products, $709,376; lumber and planing mill products, $685,862; pickles, preserves and sauces, $676,437; glass, $608,145; and pottery. glass was first manufactured here in 1821. coal is found in abundance in the surrounding region, and also natural gas, which is much used as fuel in the manufacture of iron, steel and glass.

the first settlement here was made in 1770 by colonel ebenezer zane (1747-1811), and his brothers, jonathan (one of the founders of Zanesville, Ohio) and Silas, who, in the autumn of that year made their way to this point from their home in Virginia, and took possession of claims at the mouth of Wheeling creek. other settlers came soon afterward, and in 1774 a strong stockade fort was erected within the present limits of Wheeling—at the top of Main street hill. until 1776 this fort was called Fort fincastle in honour of lord dunmore, viscount fincastle, governor of Virginia from 1771 to 1776. after 1776 it was called Fort Henry, in honour of Patrick Henry. during this period the Indians were hostile, and the settlers were frequently forced to take refuge in the stockade. on the 1st of September 1777 the fort was attacked by a large force of Indians and 15 of the whites were killed; during this attack, when the ammunition of the defenders had failed, Elizabeth zane (c. 1759-1847), a sister of Ebenezer, brought under fire a keg of powder from a house sixty yards from the fort. in September 1782 the fort was unsuccessfully besieged for two days by a force of about 40 British regular soldiers and about 250 Indians. the town was laid out by colonel zane in 1793, was incorporated in 1806, and was chartered as a city in 1836. it was designated as the capital of the "restored government of Virginia" in 1861, after the secession of Virginia at the beginning of the civil war, and was the capital of West Virginia from 1863 to 1869, and again from 1875 until May 1885. the name "Wheeling" is a corruption of an Indian word, of uncertain meaning, sometimes translated as "the place of the head."

Whethamsteed, John (d. 1465), English abbot, was a son of Hugh Bostock, and was born at Whethamstead in Hertfordshire, owning his name, the Latin form of which is frumentarius, to this circumstance. in early life he entered St Albans abbey and in 1440 he was chosen abbot of this house. in 1440 he was attached to the papal court at pavia, but in england his time was mainly occupied with lawsuits, several of which he carried on to defend the property and enforce the rights of the abbey. in 1440 he resigned his post, but in 1451, on the death of his successor, John stoke, he became abbot for the second time. he died on the 20th of January 1465, and his tomb may still be seen in the abbey church. Whethamsteed was an energetic and successful abbot. he greatly improved the buildings at St Albans, which suffered somewhat during his later years owing to the wars of the roses; he also did some building at Gloucester.
HEWhstone—WHICHcote

College, Oxford, with which he was connected. He was a friend of Duke Humphrey of Gloucester, whom he helped to gather together his famous collection of books, and was himself a writer, his works including Graniarum de eritis illustribus; Paliorum personam, and Super Valerium in Augustinianum de Ancora. Whetstone’s Crumbe, or the year in which the abbot a Johannis Whetstamsteide, is a register compiled soon after the abbot’s death, which tells the events of his second abacy. It has been edited by H. T. Riley, and is in vol. i. of the Regesta quondam abbatum monasterii S. Albani (London, 1872). The earliest of his first abacy are narrated in the Annales monasterii S. Albani of John Amundes- 
aman, also edited by H. T. Riley (London, 1870-1871).

WHETSTONE, GEORGE (1544-1587), English dramatist and author, was the third son of Robert Whetstone (d. 1557). A member of a wealthy family that owned the manor of Walton at Bernack, near Stamford, he appears to have inherited a small patrimony which he speedily dissipated, and he com- plains bitterly of the failure of a lawsuit to recover an inheritance of which he had been unjustly deprived. In 1572 he joined an English regiment on active service in the Low Countries, where he met George Gascoigne and Thomas Churchyard. Gascoigne was his guest near Stamford when he died in 1577, and Whetstone commemorated his friend in a long elegy. His first volume, the Roce of Regarde (1576), consisted of tales in prose and verse adapted from the Italian, and in 1578 he published The right excellent and famous Historye of Promos and Cassandra, a play in two parts, drawn from the eighty-fifth novel of Giraldus Chirch’s Histoire de la France (1231). In the preface he addressed to William Fleetwood, recorder of London, with whom he claimed kinship, in which he criticises the contemporary drama. In 1582 he published his Heptameron of Civill Discourses, a collection of tales which includes The Rare Historie of Promos and Cassandra. From this prose version apparently Shakespeare drew the plot of Measure for Measure, though he was doubtless familiar with the story in its earlier dramatic form. Whetstone accompanied Sir Humphrey Gilbert on his expedition in 1578- 1579, and the next year found him in Italy. The Puritan spirit was now abroad in England, and Whetstone followed it in his prose tract A Miserure for Magestrates (1584), which, when this second edition was called A Touchstone for the Time. Whetstone did not abuse the stage as some Puritan writers did, but he objected to the performance of plays on Sundays. In 1585 he returned to the army in Holland, and he was present at the battle of Zutphen. His other works are a collection of military anecdotes entitled The Honourable Reputation of a Souldier (1585); a political tract, the English Myrro (1586), numerous elegies on distinguished persons, and The Censure of a Loyal Subject (1587). No information about Whetstone is available after the publication of his last book, and it is conjectured that he died shortly afterwards.

WHewELL, William (1794-1866), British philosopher and historian of science, was born on the 24th of May 1794 at Lancaster. His father, a carpenter, wished him to follow his trade, but his success in mathematics at Lancaster and Heversham grammar-schools enabled him to proceed with an exhibition to Trinity, Cambridge (1812). He was second wrangler in 1816, became fellow and tutor of his college, and, in 1821, succeeded Dr Wordsworth as master. He was known as a mineralogist from his first, and became as an Elements of Mineralogy (1835), to which he added his Elements of Chemical and Casuistical Divinity: 1838 to 1855. He died on the 6th of March 1866 from the effects of a fall from his horse.

Whewell was prominent not only in scientific research and philosophy, but also in university and college administration. His first work, An Elementary Treatise on Mechanics (1810), co-operated with those of Peacock and Herschel in reforming the Cambridge method of mathematical teaching; to him in large measure was due the recognition of the moral and natural sciences as a legal part of the Cambridge curriculum (1830). In general, however, especially in later years, he opposed reform: he defended the tutorial system, and in a controversy with Thirlwall (1834) opposed the admission of Dissenters; he upheld the clerical fellowship system, the privileged class of "fellow-commoners," and the authority of heads of colleges in university affairs. He opposed the appointment of the University Commission (1850), and wrote two pamphlets (Remarks) against the reform of the university (1853). He advocated as the true reform, against the scheme of entrusting elections to the members of the Senate, the use of endowment funds, and the subvention of scientific and professorial work.

In 1826 and 1828, Whewell was engaged with Airy in conducting experiments in Dolcoath mine, Cornwall, in order to determine the density of the earth. Their united labours were unsuccessful, and Whewell did little more in the way of experimental science. He was the author, however, of an Essay on Mineralogical Classification, published in 1828, and contributed various memoirs on the tides to the Philosophical Transactions of the Royal Society between 1833 and 1856. But it is on his History and Philosophy of the Sciences that his claim to an enduring reputation mainly rests. The History of the Inductive Sciences, from the Earliest to the Present Time appeared originally in 1837. Whewell's wide, if superficial, acquaintance with various branches of science enabled him to write a comprehensive account of their development, which is still of the greatest value. In his own opinion, the History was to be regarded as an introduction to the Philosophy of the Inductive Sciences (1840). The latter treatise 1 analyses the method exemplified in the formation of ideas, in the new inductions of science, and in the applications and systematization of these inductions, all exhibited by the History.

In the Philosophy, Whewell endeavours to follow Bacon's plan for discovery of an effectual art of discovery. He examines ideas ("explication of conceptions") and the "colligation of facts that involves the science of the process, and the "succession of facts" that is itself a development. He opposes the idea of discovery as a "succession of facts" that is itself a method of means, the method of least squares and the method of residuals, and special methods depending on resemblance (to which the transition is made through the law of continuity), viz. the method of gradation and the method of natural classification.

Here, as in his ethical doctrine (see ETHICS), Whewell was moved by opposition to contemporary English empiricism. Following Kant, he asserted against J. S. Mill the a priori nature of necessary truth, and the validity of the distinction of conceptions he dispensed with the inductive methods of Mill.

Between 1835 and 1861 Whewell was the author of various works on the philosophy of empirical science. Elements of the Philosophy of Moral Knowledge, including Polity, was published in 1845. The authority of this work—written, of course, from what is known as the intellectual point of view—is a fivefold division of the sciences of action and of their objects, of the primary and universal rights of man (personal security, property, contract, family rights and government), and of the cardinal virtues (benevolence, justice, truth, purity and order). Among Whewell's other works—too numerous to mention—reference must be made to writings popular in their day, such as the Bridgewater Treatise on Astronomy (1833), and the essay, Of the Parity of Worlds (1854), in which he argued against the probability of planetary life, and also to the Platonic Dialogues for English Readers (1859-1861), to the Lectures on the History of Moral Philosophy in England (1852), to the essay, Of a Liberal Education in General, with particular reference to the Leading Studies of the University of Cambridge (1859), and the edition of Grotius, De jure belli et pacis (1853), and to the edition of the Mathematical Works of Isaac Barrow (1860).

For full bibliographical details are given by Isaac Todhunter, W. Whewell: an Account of His Life and Work (2 vols., 1876). See also Life of W. Whewell, by Mrs Stair Douglas (1881).

WHICHcOTE (or WHITcHcOTE), Benjamin (1609-1683), English divine and philosopher, was born at Whichcote Hall, Stoke, Shropshire, and educated at Emmanuel College, Cam- bridge, where he became fellow in 1633. He was ordained in 1636, and appointed shortly afterwards to be Sunday afternoon

1 Afterwards broken up into three parts published separately: (1) the Treatise of Scientific Method, a preliminary reproduction of the first part of the Philosophy; (2) the Novum organum renovatum (1858), containing the second part of the same work, but without the historical review of opinions, which was issued with large additions as (3) the Philosophy of Discovery (1860).
WHICKHAM—WHIG AND TORY

lecturer at Trinity Church, Cambridge. In 1643 he received the rectorcy of North Cadbury, Somerset, and in the following year he was appointed provost of King’s College, Cambridge, in place of Samuel Collins who was ejected. On resigning North Cadbury in 1649 he became rector of Milton, Cambridgeshire. In 1650 he was vice-chancellor of Cambridge University. Cromwell in 1655 consulted him upon the question of extending tolerance to the Jews. His Puritan views lost him the provostship of King’s College at the Restoration of 1660, but on complying with the Act of Uniformity he was appointed to the living of St Luke’s, Blackfriars, London. In 1668 he became vicar of St Lawrence Jewry, London. He is regarded as the founder of the important school of Cambridge Platonists. His works, chiefly theological treatises and sermons, were all published posthumously. He died in May 1683.

See John Tulloch, Rational Theology, ii. 59-84 (1874); and Masters in English Theology, edited by A. Barry (1877).

WHICKHAM, an urban district in the Chester-le-Street parliamentary division of Durham, England, 4 m. S.W. of Newcastle-upon-Tyne, near the river Derwent. Pop. (1901) 16,975. There is a station on a branch (Seaham) of the line from the Northern to the Eastern railway. The church of St Mary has Norman and Transitional portions, and in the neighbourhood is the mansion of Gibside, of the 17th century. The demesne borders the Derwent, and is of great beauty, part being laid out in formal gardens and straight avenues. It contains a lofty Doric column and a detached chapel and banqueting hall, and in the vicinity are picturesque fragments of the monastic church of Friarside, and of the manor house of Holsinlle. Whickham is one of the centres of a coal-mining district, the mines employing the mass of the industrial population; but there are also iron, steel, and chemical works.

WHIG AND TORY, the names associated with two opposing political parties in England. The origin of ‘Whig’ has been much controverted; it has been associated with the Scots for ‘whew,’ as implying a taunt against the ‘sour-milk’ faces of the western Lowlanders, another theory is that it represented the initials of the Scots Covenanters’ motto, ‘We hope in God’; another derives it from the Scots word ‘whigham,’ used by peasants in driving their horses. It was, however, a form of the Scots Gaelic term used to describe cattle and horse thieves, and transferred to the adherents of the Presbyterian cause in Scotland. ‘Tory’ is derived from the Irish ‘Tar a Ri.’ ‘Come, oh king!’ associated with the creed of the Irish native levies enlisted in the civil wars on behalf of the loyalist cause; the outlaws who fought for James in Ireland after the revolution were similarly nicknamed Rapparees or Tories.

Parliamentary parties, as such, came into existence in England as soon as parliament achieved or aimed at predominance in the state. In 1641, shortly after the meeting of the Long Parliament, they were divided on the question of church reform, passing, as soon as political questions were involved, into Cavaliers and Roundheads. After the expulsion of the Cavaliers in 1642 and 1643 the Houses were divided into a peace party and a war party, and these in 1643 took the shape of Presbyterians and Independents. After the Restoration there was a country party and a court party, and to these the names of Whig and Tory were applied in 1669, in the heat of the struggle which preceded the meeting of the first short parliament of Charles II. The words were nicknamed given by the opponents of each party. To call a man a Whig was to compare him with the Presbyterian rebels of the west of Scotland. To call a man a Tory was to compare him with the Papist outlaws of Ireland. In fact, at this time the Whigs were maintainers of parliamentary power over the crown and of toleration for Dissenters, the Tories maintainers of the hereditary indefeasible rights of the wearer of the crown and of the refusal of toleration to Dissenters. The relation between the parties was further qualified by the fact that the heir to the crown was a Roman Catholic, whose claim to succeed was defended by the Tories and assailed by the Whigs.

The persistency of the names of the two parties is mainly owing to their essential unmeaningness. As now questions arose, the names of the old parties were retained, though the objects of contention were no longer the same. The Revolution of 1688-89 made it impossible for the Tories to retain their old attitude of attachment to the hereditary right of the occupant of the throne, with the exception of the extreme wing of the party, which remained Jacobite. They still, however, continued, though accepting the Toleration Act, to oppose the offering of further favours to Dissenters. In Anne’s reign, after the war with France had gone on for some time, they supported a peace policy, whilst the Whigs advocated a continuance of the war. Conscience-whigs, who on the accession of the 17th and the first years of the 18th century the Whigs may be regarded as the party of the great landowners, and of the merchants and tradesmen, the Tories as the party of the smaller landowners and the country clergy. The Whigs established, through their hold upon the boroughs under the influence of the great landowners, a firm government, which could keep in check, and at last practically set aside, the power of the crown. The Tories, distrusting the authority of the ministerial government, and fearing a new despotism based on parliamentary corruption, became, especially after Whig ministers took off the Royalist’s return from exile, almost democratic in their views and in their demands for the purification of the existing system.

With the accession of George III. Toryism took a new form. The struggle about the Dissenters was now a thing of the past, and the king was accepted as a leader in carrying on the attack against the power of the great Whig families. The attack was the easier because the Whig families had split into factions. For some time the dividing line between Whigs and Tories was this: the Tories asserted that the king had a right to choose his ministers and control their policy, subject to the necessity of securing a majority of the House of Commons, whilst the Whigs thought that the choice should lie with leading members of parliament, and that the king should have no controlling power. The Whig view appears to resemble that subsequently adopted; but in the middle of the 19th century the corruption which prevailed rendered the analogy worthless, and the real conflict was between the corrupt influence of the crown and the influence of a clique of great landowners resting on their possession of electoral power through the rotten boroughs. In 1770 the king had his way and established Lord North at the treasury as his nominee. The Whigs, deprived of power, improved their position by the loss of one great instrument of corruption; but they were weakened by the establishment of two distinct currents of opinion in their own ranks. The main body under Rockingham was influenced by Burke to demand practical reforms, but set its face against any popular changes in the constitution. The Whigs who followed Chatham wished to place parliament on a more popular basis by the reform of the House of Commons. When in 1783 Chatham’s son Pitt became prime minister, the Tory party took a new start. It retained the Tory principle of reliance on the crown, and joined to it Chatham’s principle of reliance on the people as opposed to the great Whig families. It also supported Pitt in practical reforms.

All this was changed by the French Revolution. In opposition to the new democracy, the Tories coalesced with a section of the Whig families, the representatives of which entered the ministry in 1794. From this time till 1822, in spite of men like Pitt, and the personal influence of Tory leaders who supported moderate reform, Toryism came to be popularly identified with a desire to retain the existing state of things, however full of abuses it might be. When Canning and Peel entered the ministry in 1822, a gradual change took place, and a tendency to practical reform manifested itself. The refusal of Wellington to listen to any proposal for altering the constitution of the House of Commons threw power once more into the hands of the Whigs in 1830. Shortly afterwards the name Tory gave place to that of Conservative (q.v.), though it was cherished by those Conservatives who wished to assert their power of originating a definite policy, and who disliked to be branded with a purely negative term. In 1832, and it was also retained as a term of opprobrium by the Liberals for those whom they regarded as old-fashioned opponents of
WHIG PARTY

589

reform. The name of Whig was replaced by that of Liberal, being frequently, however, assigned to the less progressive portion of the party, the "moderate Liberals," even to half and half Conservatives, and even to less or less of reform. It ceased to be a name accepted by any definite English political section.

WHIG PARTY, in America, a political party prominent from about 1824 to 1854. The first national party system of the United States came to an end during the second war with Great Britain. The destruction of the Federalist party (q.v.) through a series of suicidal acts which began with the Alien and Sedition laws of 1798, and closed with the Hartford Convention of 1814-1815, left the Jeffersonian Republican (Democratic) party in undisputed control. When, after Waterloo, Napoleon ceased to disturb the relations of the new world with the old, the American people, freed for the first time from all trace of political dependence on Europe, were at liberty to shape their public policy in their own way. During the period of rapid internal development which followed after 1815, the all-inclusive Republican party began gradually to disintegrate and a new party system was evolved, each member of which was the representative of such groups of ideas and interests, class and local, as required the support of a separate party. This work of disintegration and rebuilding proceeded so slowly that for more than a decade after 1824, when its organization began, to make the Union.

The period of sectional agitation, and the growth of sectionalism over the slavery issue, this period was highly critical. In view of these events the most difficult task of the Whigs, clearly discerned and heartily accepted by them, under the patriotic and conservative leadership of Henry Clay and Daniel Webster, was to moderate and enlighten, rather than antagonize, the new democracy; and — what proved to be beyond their powers — to overcome the disrupting influence of the slavery issue.

The inaugural address and the messages to Congress of President J. Q. Adams set forth clearly the nationalizing, broad construction programme of the new party. But his supporters in Congress, imperfectly organized and facing a powerful opposition, accomplished very little in the way of legislation. The election of 1828 gave to Andrew Jackson the presidency, and to the people, in a higher degree than ever before, the control of the government. The president's attack upon the Bank, the introduction of the modern "spoils system" into the Federal civil service, the unprecedented use of the veto power, Jackson's assumption of powers which his opponents deemed unconstitutional, and his personal hostility towards Clay, who had succeeded Adams in the leadership of the party, brought about, under Whig leadership, a coalition of opposition parties which influenced deeply and permanently the character, policy and fortunes of the Whig party. It became the champion of the Bank, of the right of Congress, and of the older and purer form of the civil service. Moreover, for the first time, with their new allies, the Whigs learned to practise a tolerance towards the more extreme, and even the principles of their associates which is exceptional in the history of American political parties. In strict accord with their own principles, however, the Whigs supported the president during the Nullification Controversy (see NullIFICATION). The renown of Webster as the foremost exponent of the national theory of the Union rests largely on his speeches during this controversy, in particular on his celebrated reply to Senator R. Y. Hayne of South Carolina. Nevertheless, after vindicating the rights of the Union, most of the Whigs supported Clay in arranging the compromise tariff of 1833 which enabled the Nullifiers to retreat without acknowledging discomfiture. The majority of the Northern Whigs, with the entire Southern membership of the party, disapproved the propaganda of the Abolitionists on the ground of its tendency to endanger the Union, and many from a like motive voted for the "Gag Rules" of 1835-1844 (see ADAMS, J. Q.), which in spirit, if not in letter, violated the constitutional right of petition. In the election of 1832 Clay was the nominee of the party for the presidency, but in 1836 and 1840, purely on grounds of expediency, the Whig conventions nominated General Winfield Scott of Mexico. During the administration of Martin Van Buren the Whigs tried with success to make party capital out of the panic of 1837, which they ascribed to Jackson, and out of the long depression that followed, for which they held Van Buren responsible. The election of General Harrison in the "log cabin and hard cider" campaign of 1840 proved a fruitless victory: the early death of the president and the anti-Whig politics of his successor, John Tyler (q.e.), whom the Whigs had imprudently chosen as vice-president, shattered their legislative programme.

In 1844 Clay was again the Whig candidate, and the annexation of Texas, involving the risk of a war with Mexico, was the leading issue. The Whigs opposed annexation; and the prospect of success seemed bright, until Clay, in the effort to remove Southern misapprehensions, wrote that he "would be glad" at some future time to see Texas annexed if it could be done "without dishonour, without war, with the common consent of the Union, and upon just and fair terms." It is widely held that this letter turned against Clay the anti-slavery element and lost him the presidency. The triumph of Polk in 1844 was followed by the annexation of Texas and the Mexican war. The Whigs opposed the war, but on patriotic grounds voted supplies for its prosecution. The acquisition of Texas, and the assured prospect of a great territorial enlargement, at the cost of Mexico, brought to the front the question of slavery in the new domain. The agitation that followed continued through the presidential election of 1848 (in which the Whigs elected General Zachary Taylor), and did not subside until the passage of the
"Compromise Measures of 1850" (g.v.). To its authors this compromise seemed essential to the preservation of the Union; but it led directly to the destruction of the Whig party. In the North, where the inhumane Fugitive Slave Law grew daily more odious, the adherence to the Compromise on which Clay and Webster insisted weakened the party fatally. The alternative, namely, a continental or sectional party to the repeal of the odious law, would have driven the Southern Whigs into the camp of the Democrats, leaving the Northern Whigs a sectional party powerless to resist the disruption of the Union. The only weapons that the Whigs knew how to use in defence of the Fugitive Slave Law were appeals to patriotism and sectional bargaining, and these could be employed only so long as the party remained intact.

The National Whig Convention of 1852, the last that represented the party in its entirety, gave to Lincoln not Whigs the naming of the candidate—General Winfield Scott—who was defeated in the ensuing election, and to the Southern the framing of the platform with its "finality" plank, which, as revised by Webster, read as follows: "That the series of acts of the Thirty-second Congress, the act known as the Fugitive Slave Law included, are received and acquiesced in by the Whig party of the United States as a settlement in principle and substance of the dangerous and exciting questions which they embrace"; and we will maintain this system as essential to the nationality of the Whig party and the integrity of the Union. The importance of the Missouri Compromise by the Kansas-Nebraska Act demonstrated that this system could not be maintained, and that in committing the Whig party to the policy of its maintenance the Convention of 1852 had signed the death-warrant of the party.

Among the services of the Whigs the first in importance are these: During the thirty critical years in which under the leadership of Clay and Webster they maintained the national view of the nature of the Union, the Whigs contributed more than all their rivals to impress this view upon the hearts and minds of the people. During this same extended period the Whig makers between the sections they kept North and South together until the North had become strong enough to uphold by force the integrity of the Union. And lastly the bequested to the Republican party the principles on which, and the leader, Abraham Lincoln, through whom the endangered Union was finally saved.

WHIP. In general, an instrument for striking, usually consisting of a handle of a flexible nature with a lash attached (see Whipping, below). In English parliamentary usage, a "whip" is a member (or members) chosen by the leader or leaders of a political party as the special duty of requiring the attendance of the other members of that party on all necessary occasions, the term being abbreviated from the whipper-in of a hunt. The name is also given to the summons urging members of the party to attend. Whips are, of course, always members of parliament, and for the party in power (i.e. the government) their services are very essential, seeing that the fate of an important measure, or even the existence of the government itself, may depend upon the result of a division in the House. Where the majority of the party in power is not large it is very necessary that there should always be at hand a sufficient number of its supporters to make up a majority, and without the assistance of the whips it would be impossible to secure this. The chief whip of the government holds the office of patronage secretary to the treasury, so called because when offices were freely distributed to secure the support of members, it was his chief duty to dispose of the patronage to the best advantage of his party. He is still the channel through which such patronage as is left to the prime minister is dispensed. He is assisted by three junior whips, who are officially appointed as junior lords of the treasury; their salaries are £1000 a year each, while the patronage secretary has a salary of £2000. The parties not in office have whips who are unpaid. Attendance of members is primarily secured by lithographed notices sent by the whips to their following, the urgency or importance of the notice being indicated by the number of lines underscoring the notice, a four-line whip usually signifying the extremest urgency. The whips also arrange for the "pairing" of such of the members of their party who desire to be absent with those members of the opposition party who also desire to be absent. The chief whips of either party arrange in consultation with each other the leading speakers in an important debate, and also length, and give the list of speakers to the speaker or chairman, who usually falls in with the arrangement. They take no part in debate themselves, but are constantly present in the House during its sittings, keeping a finger, as it were, upon the pulse of the House, and constantly informing their leader as to the state of the House. When any division is regarded as a strictly party one, the whips act as tellers in the division.

An interesting account of the office of whip is given in A. L. Bowell's Government of England (1900), v. l. c. xxv.

WHIPPING, or FLOGGING, a method of corporal punishment which in one form or another has been used in all ages and all lands (see Bastinado, Knout, Cat-o'-Nine-Tails). In ancient Rome a citizen could not be scourged, it being considered an infamous punishment. Slaves were beaten with rods. Similarly in early medieval England the whip could not be used on the freeman, but was reserved for the villain. The Anglo-Saxons whipped prisoners with a three-corded knotted lash. It was not uncommon for mistresses to whip or have their servants whipped to death. William of Malmesbury relates that as a child King Ethelred was flogged with candles by his mother, who had no handier weapon, until he was insensible with pain. During the Saxon period whipping was the ordinary punishment for offences, great or small. Payments for whipping figure largely in municipal and parish accounts from an early date. The aboli-

THE WHIPPING-POST.
of shoppe-keepers," the court ordered them to be stripped naked and whipped. The flogging of women was common. Judge Jeffreys, in so sentencing a female prisoner, is reported to have exclaimed, "Hangman, I charge you to pay particular attention to this lady. Scourge her soundly, man; scourge her till her blood runs down! It is Christmas; a cold time for madam to strip. See that you warm her shoulders." Lunaties, too, were whipped, for in the Constable's Accounts of Great Stoughton, Hunts, occurs the entry, "1690-1, Paid in charges taking up a distracted woman, watching her and whipping her next day—8/6." A still more remarkable entry is "1710-1, Pd. Thomas Hawkins for whipping two people yt had smallpox—8d." In 1764 the Public Ledger states that a woman who is described as "an old offender" was taken from the Clerkenwell Bridewell to Enfield and there publicly whipped at the cart's tail by the common hangman for cutting wood in Enfield Chase. A statute of 1791 abolished the whipping of females.

WHISKER, a word chiefly used in the plural in the sense of the hair worn by a man on the cheeks as opposed to the beard on the chin and the moustache on the upper lip. (See Jeffreys, Lym. Dict. s.v.) The liquor known as "usquebaugh" in the 17th and 18th centuries was not, however, of the same character as the whisky of modern times, but was a compound of plain spirit with saffron, nutmegs, sugar and other spices and flavouring matters. Whether the term whisky to denote a plain type of spirit was used concurrently with usquebaugh, or whether the latter name covered both varieties, is not clear. It is certain, however, that an alcoholic liquor, derived mainly from grain, has been prepared for very many centuries in both Ireland and Scotland (see Spiris). There are three main types of whisky, namely, Scotch, Irish and American.

Scotch whiskies may be broadly divided into two main groups, namely (a) pot-still or malt whiskies, and (b) patent-still or grain whiskies; the former are made practically without exception from malted barley only, the latter from a mixture of malted barley and other unmalted cereals, chiefly rye, oats and maize (see Spirits). (a) There are four main varieties of Scotch malt whiskies, namely, Highland Malts, Lowland Malts, Campbeltowns and Islays. The Highland Malts are produced (if we except a few distilleries on the islands in the west and north) in the district on the mainland lying north of an imaginary line drawn through Dundee on the east and Greenock on the west. The largest group of distilleries is in the famous Speyside or Glenlivet district. The Lowland Malts are made south of the imaginary line alluded to. The Campbeltowns are distilled in or near the town of that name at the southern end of the Kintyre peninsula. The Islays are produced in the island of that name. These different varieties of whisky, although made in much the same way, yet possess distinctive characteristics of flavour. The type of barley employed, the quantity of peat employed in curing the malt, the quality of the water, the manner of carrying out the various distillery processes—particularly that of distillation—the shape and size of the stills, &c., all these are factors which affect the flavour of the final product. The Islays, which, as a rule, are considered to be among the most valuable of Scotch whiskies, possess a very full and peaty flavour together with a strong etherial bouquet. For this reason they are much used for blending with whiskies of a lighter type. The Highland Malts proper (Speyside type) are less peaty than the Islays, yet possess a full flavour, although many of them are inclined to be "elegant" rather than "big." The Lowland Malts, again, are, as a class, less peated than the Highland Malts, and indeed, nowadays, but viewed as a more neutral class of beverage, there are some Lowland Malt distilleries which dispense with the use of peat altogether. Many of the Lowland Malts possess considerable body and flavour, but, on the whole, they are lighter and not so fine as those of the Highland variety. Lowland distillers are now running their spirit at much the same strength as their Highland colleagues, whereas formerly it was the custom to work at a far higher strength. The result is that the difference between the two classes of spirit is not so marked as it was. The Campbeltowns, although in some respects similar to the Islays on the one hand, and the Highland Malts on the other, are somewhat rougher and less elegant than these. They usually possess a full peaty flavour. (b) Patent-still or grain whiskies are, as a class, lighter in flavour and "body" than the pot-still types. This is due to the fact that the rectification of these whiskies is carried a good deal further than is the case with the "malt." They are made from a mixture of malted and unmalted cereals, and, as no peat is employed in the curing of the malt, they lack the "smoky" flavour of the other varieties. Some controversy has arisen as to whether these patent-still spirits have a right to the name of "whisky" or "Scotch whisky," but, whether or not this controversy is largely due to conflicting trade interests, it has also, in the author's opinion, been caused by a very general popular misconception as to the true character of these whiskies. The idea that they are true "silent" or "neutral" spirits—i.e. alcohol and water pure and simple—is quite incorrect. They possess a distinct flavour, which varies at different distilleries, and analysis discloses the fact that they contain very appreciable quantities of the "secondary" products which distinguish potable spirits from plain alcohol. Indeed, as a result of an extensive investigation of the question

Composition of Scotch Whiskies.

Note.—The figures below are based on a large number of analyses of typical samples. Cf. Schidrowitz and Kaye, Journal Soc. Chem. Ind. (June 1905). Where two figures are given in the same column, they do not indicate extremes, but merely normal variation. The Islays give similar figures to the Highland Malts except that the Higher Alcohols and Furfurol are slightly higher.

WHISKY INSURRECTION

by the author, it has been shown that the relative proportion of "secondary" products in Highland Malt, Lowland Malt and "grain" whiskies respectively, is roughly as 3:2:1. The figures in the foregoing table illustrate, as far as we are at present able to determine them, the general composition of the various types of Scotch whiskies referred to.

The character of Scotch whisky is much influenced by the manner in which it is matured. Chief among the factors in this connexion is the nature of the cask employed. The main varieties are plain wood, sherry and refill casks. Technically the term "plain" wood is applied to a cask made from seasoned oak which has contained no other liquor than whisky. Similarly the term "sherry" wood is as a rule only applied to a cask the wood of which has become impregnated with sherry by contact with that wine, and which has not been used in any other manner. A sherry cask which has been filled with whisky, then emptied and "refilled" with whisky, is known as a "refill." Brandy and Madeira "wood" are also occasionally employed. The nature of the atmospheric conditions of the cellar is also of importance in determining character and quality (see SPIRITS).

Blending.—Scottish whiskies are, as a general rule, "blended" prior to being put on the public. By "blending" is understood the art of putting together different types and varieties of whisky to form a harmonious combination. The general run of "sell" whiskies—i.e. whiskies made at a single distillery—do not appear to be to the public taste, but by combining different kinds of whisky blenders have succeeded in producing an article the demand for which has increased enormously during the past quarter of a century, and which may now be considered as a staple beverage in all English-speaking countries. The great expansion of the Scotch whisky trade of late years is undoubtedly due mainly to the introduction of blending on scientific lines. There are different types of blends. In some a Highland Malt, in others an Islay, in others again a grain, but generally the aim of the blender is to produce an article in which no single constituent "comes through,"—i.e. is markedly apparent. The whiskies are produced by blending a number of "vatted" whiskies. A "vatt" is produced by blending a number of whiskies of the same style or type, for instance, ten or fifteen Highland Malts from different distilleries. The "vatt" is allowed to mature before being blended with other types to form the final blend. The better-class blends contain, as a general rule, 50 to 60% of Highland and Lowland Malts, 10 to 20% of Islays, and about 20 to 40% of "grain" whiskies.

A typical high-class blend would, on analysis, show figures much as follows: Alcohol, 45 to 48% by vol.; total acid, 30 to 50; non-volatile acid, 20 to 30; esters, 30 to 60; higher alcohols, 120 to 170; aldehydes, 15 to 25; furfural, 2 to 3.

Irish Whisky.—Irish pot-still whisky is sharply differentiated from the Scotch variety in that (a) the raw materials employed are generally composed largely of unmalted grain, (b) the malt is not peat-cured, (c) the process of distillation is entirely different both as regards method and apparatus (see SPIRITS). The result is that whereas Scotch whisky possesses a characteristic dry, clean flavour, Irish whisky is round and sweet, with a full ethereal bouquet. The general run of Irish pot-still whiskies are made with 30 to 50% of malted barley, the balance being rye, oats, unmalted barley and wheat. A few distilleries employ malted barley only, but the product so obtained than whisky. To the different methods employed and the absence of peat curing—is quite different from Scotch malt whisky. The Irish "grain" or "patent still" whiskies are made in a manner practically identical with that employed for Scotch "grain," but as a class they are somewhat lighter as regards flavours and body than the latter. Irish whiskies are not classified territorially, although occasionally the distinction of "Dublin" or "Country makes" is recognized in the trade. Broadly speaking, however, the differences between Irish whiskies are not due to class, but to individual variation.

American Whisky.—There are two main varieties of American whisky, namely, Rye whisky, the predominant raw material in the manufacture of which is rye, and Bourbon or corn whisky, made mainly from Indian corn (maize). Both varieties possess a much higher flavour and greater body than the Scotch or Irish whiskies, due partly to the class of raw material employed, and partly to the method of distillation. Broadly speaking, the American self (so-called "straight") whiskies contain double the quantity of secondary or "by" products present in Scotch or Irish whiskies.

American whiskies are almost invariably stored in very heavily charred barrels, which, while it very appreciably affects the flavour, is necessary, inasmuch as it is doubtful whether it would be possible to mature them excessively heavy whiskies within a commercially reasonable time without the cleansing and purifying effect of the charcoal formed by the burning of the cask. Even with the aid of the charred cask, the average maturation time of the American pot-still whiskies is certainly two or three years longer than that of Scotch and Irish whiskies.

1 Irish whisky is generally distilled at about 50 O.P. and reduced with water to 25 O.P. prior to storage.
2 Nos. 1, 2, 3 and 4 represent different distilleries.

WHISKY INSURRECTION, THE, an uprising in Western Pennsylvania in 1794 against the Federal Government, occasioned by the attempted enforcement of the excise law (enacted by Congress March 1791 on domestic spirits). The common prejudice in America against excise in any form was felt with especial strength in Western Pennsylvania, Virginia and North Carolina, where many small whisky stills existed; and protests were made almost immediately by the Pennsylvanians. Albert Gallatin (q.v.) took a leading part in expressing their resentment in a constitutional manner, but under the agitator David Bradford the movement soon developed into excesses. The attempt to enforce the law led to stormy scenes and riotous violence, the Federal revenue officers in some cases being tarred and feathered; even with the aid of the charred cask, the average maturation time of the American pot-still whiskies is certainly two or three years longer than that of Scotch and Irish whiskies.
WHIST, a game at cards. The etymology of the name is disputed. Possibly it is of imitative origin, from whist (Hist! Hush! Silenced). "It is called Whist from the silence that must be observed in the play" (Cotton, Compleat Gamester).

In the 16th century a card game called triumphi or trump was commonly played in England. A game called triomf is mentioned as early as 1526, and triumphis Hispanicas in 1541. La triomphoe occurs in the list of games played by Gargantua (Rabelais, first half of 16th century). In Giovanni Florio's Worldes Words (1598) triomfo is defined as "the play called trump or ruff." It is probable that the game referred to by the writers quoted is la triomphoe of the early editions of the Académie des jeux.

It is important to note that this game, called by Charles Cotton "French ruff," is similar to écarté. "Every ruff and honour," also described by Cotton, is similar to whist.

If we admit that ruff and trump are convertible terms, of which there is scarcely a doubt, the game of trump was the precursor of whist. A purely English origin may, therefore, be claimed for trump (not la triomphoe). No record is known to exist of the invention of this game, nor of the mode of its growth into ruff-and-honours, and finally into whist. The earliest reference to trump in English is believed to occur in a sermon by Latimer, "On the Card," preached at Cambridge, in Advent, about the year 1529. He says, "The game that we play at shall be the triomph." Indeed, it was played by four players, patterned on the French "four hearts, four trump, on this card." In Gammer Burton's Neale house game, Richard Price or Rice (Inventive against Vices, 1579) observes that "renouncing the trompe and comming in againe" (i.e. revoking intentionally) is a common sharper's trick. Cotton in his Compleat Gamester says, "He that can by craft overlook his adversary's game hath a great advantage."

Thomas Dekker (Beiman of London, 1609) speaks of the deeds practised at "trump and such like games." Trump also occurs in Aisy and Cleftoyer (written about 1607), with other pandemic allusions to card-playing—

"She, Eros, has
Packed cards with Caesar, and false-played my glory
Unto an enemy's triumph."—Act iv.

Ruff-and-honours, if not the same game as trump, was probably the same with the addition of a score for the four highest cards of the trump suit. A description of the game is first met with in The Compleat Gamester (1674) by Cotton. He states that ruff-and-honours (alias slam) and whist are games very commonly known. The winning trump was given to the partner, and it was compulsory to follow suit when able. The cards ranked as at whist, and honours were scored as now. Twelve cards were dealt to each player, four being left in the stock. The top card of the stock was turned up for trumps. The holder of the ace of trumps was allowed to ruff, i.e. to take in the stock and to put out four cards from his hand. The game was played nine up; and at the point of eight honours could be called, as at long whist. Cotton adds that at whist there was no stock. The deuces were put out and the bottom card was turned up for trumps.

It is believed that the earliest mention of whist is by Taylor, the Water Poet (Motto, 1621). He spells the word "whisk." The earliest known use of the present spelling is in Hudibras, the Second Part (spurious), 1663. The word is afterwards spell indifferently whisk or whist for about half a century. Cotton (1674) spells it both ways. Richard Seymour (Court Gamester, 1734) has "whist, vulgarly called whick." While whist was undergoing this change of name, there was associated with it the additional title of swabbers (probably allied to sweep, or sweepstakes). Fielding (History of Mr. Jonathan Wild) says that whist-and-swabbers was "the game then [1683] in chief vogue.

Francis Grose (Classical Dictionary of the Vulgar Tongue, 1785) states that swabbers are "the ace of hearts, knave of trulls, ace and ducie of trumps at whist." The true function of the swabbers is not positively known; it is probable that the holders of these cards were entitled to receive a certain stake from the other players. Swabbers dropped out of general use during the 18th century. The points of the game rose from nine to ten ("nine in all," Cotton, 1725; "nine for," Cott. & Dray, 1734; "rectified according to the present standard of play").

This improvement introduces the odd trick, an element of great importance in modern whist. Early in the 18th century whist was not a fashionable game. The Hon. Dalles Barrington (Archaeologia, vol. viii.) says it was the game of the servants' hall. Contemporary writers refer to it in a disparaging way, as being only fit for hunting men and country squires, and not for fine ladies or people of quality. According to Barrington, whist was first introduced to the nobility by Lord Bury, who frequented the Crown Coffee House in Bedford Row, London, about 1728. They laid down the following rules: "Lead from the strong suit; study your partner's hand; and attend to the score." Shortly afterwards the celebrated Edmond Hoyle (q.v.) published his Short Treatise (1742). It has been surmised by some that Hoyle belonged to the Crown Coffee House party. This, however, is only a conjecture. There is abundant evidence to show that, in the middle of the 18th century, whist was regularly played at the coffee houses of London and in fashionable society. From the time the game went in the general fashion, to increase in public estimation, until the introduction of bridge, it has to a large extent replaced it, but which has much in common with it.

"I will be of interest to mark the successive stages through which whist passed from the time of Cotton. The only suggestions as to how to play in Cotton are that, "thou have but mean cards in your own hand, yet you may play them so suitable to those in your adversary, and found that he may either trump them, or the other suit of that suit;" also that "you ought to have a special eye to what cards are played out, that you may know by that means either to play if you lead or how to trump securely and advantageously." It is from these three that the rules were evolved to change the old rules of winning cards, and to watch the fall of the cards with these objects. In the rules laid down by the Crown Coffee House School a distinct advance is to be noticed. Their first rule, "Lead from the strong suit," shows a sound knowledge of the game. Their second rule, "Study your partner's hand," though sound, is rather vague. Their third rule, "Attend to the score," if amended into "Play to the score," is most valuable. From the Crown Coffee House school to Hoyle is rather a wide jump; but there is no intervening record. Hoyle in his Short Treatise endorses and illustrates the "Crown" rules. He also brought the doctrine of probabilities to bear on the game, and gave a number of cases which show a remarkable insight into the play.

About 1770 was published William Payne's Maxims for Playing the Game of Whist. The advance in this book is decided, as it unifies the rules of leading invariably from five trumps and the return of the highest card from three held originally. Matthew's Advice to the Young Whist-Player ( anon., 1804) repeats the "maxims of the old school," with "observations on those he thinks erroneous and "with several new ones," but some of the maxims which he thinks erroneous are now generally allowed to be correct.

Soon after Matthew's wrote the points of the game were cut down from ten (long whist) to five (short whist). Clay's account of this change is that, about the beginning of the 19th century, Lord Peterborough having lost a large sum of money, the players proposed to make the game five up, in order to give the loser a chance of recovering his loss. The new game, short whist, was found to be so lively that it soon became general, and eventually superseded the long game. "Cocles" (Laws and Practice of Whist, 1831), who accepts the rules formulated by Clay, says that "the calling of the cards first printed in his second edition (1836) an explanation of the call for trumps. Calling for trumps was first recognized as part of the game by the players at Graham's Club about 1840. Long whist may be said to have died about 1850, as a change in the style of the play, as recorded by James Clay in The Laws of Short Whist, and a Treatise on the Game (1864).\n
Whist then travelled, and about 1830 was played in the best French women's salons, with ladies of the best head, modified and improved the old-fashioned system. They were but little influenced by the traditions of long whist, and were not content merely to imitate English. They introduced some rather novel changes, and the old school, who vehemently condemned its rash trump leads; those who adopted the practice of the new school were found to be winning players. The Duke of Wellington (Pole (Philosophy of Whist, 1853) remarks that the early experience of adepts had led to the introduction of many improvements in detail since the time of Hoyle, but that nothing had been
WHIST

done to reduce the various rules of the game to a systematic form until 1766, when a young man, George Whist, published a thorough investigation of whist, and in 1862 Henry Jones, one of the members of this "little whist school," brought out a work, under the pseudonym of "Cavendish," which "gave for the first time the rules of the game in so pure a state that no one could but consider it the modern form of the game." The little school was first brought prominently into notice by an article on whist in the Quarterly Review of January, 1862, which had been treasured and followed with interest, the rules of the game depended on the practice of a number of arbitrary conventions. But it was now shown that all rules of whist-play depend upon and are referable to general principles. Hence, as soon as general rules for tactics and the removal of the popular conventions were argued, players began to discuss and to propose innovations on the previously established rules of play.

A further development was the introduction of the system of discards, or "stigmatizing," protected by patent of invention in 1847 and which the when the adversaries have the command in trumps. Soon after this (1872) followed the "echo" of the call for trumps, and contemporaneously with the echo the lead of the penultimate card from suits of five cards or more, not including the ace, a lead that was so vigorously opposed by some players that "the grand battle of the penultimate ensued. The old players indeed regarded the new system with the same horror as they had formerly displayed with respect to the French school, stigmatizing it not only as an innovation, but as a private understanding, and even as cheating! Even Clay, the greatest player of his day, was at first an opponent of the penultimate lead. In 1875, Mr. Parrott, in "Practical Whist," (1879) was the first to propose an analogous system, namely, that six cards in a suit, not including the ace, could be shown as "pens." He was afterwards led to reduce that system to the theory of a system of pulling, and since then, though it was, did not at first find favour. Before this (1874-1875) leads from high cards, having regard to the number held in the suit, had not escaped attention, several innovations being introduced, but the main point was the idea of the constancy of dealing all leads, and to classify isolated rules so as to render it possible to lay down general principles. This was done in 1853-1854 by Nicholas Browne Ouse of New Orleans, who introduced the system of "American Leads," which system leads from a systematic course of play when opening and continuing the lead from the strong suit. First, with regard to a low card led. When you open a strong suit with a low card, lead your fourth best. When opening a four-card suit with a low card, the lowest, which is the fourth best, is the card selected. When opening a five-card suit with a low card, the penultimate card is selected. Instead of calling it the penultimate, call it the Fourth best. So with a six-card suit; but, instead of antepenultimate, say fourth best. And so on with suits of more than six cards: disregard all the small cards and lead the fourth best. Secondly, with regard to a high card led, followed by a low card, lead your original fourth best. The former rule was to proceed with the lowest. Thus, from ace, nine, eight, seven, two, the leader would expose one card only, instead of waiting to the end to decide. An American leader would lead ace, then eight. Thirdly, with regard to a high card led, followed by a high card. When you remain with two high indifferent cards, lead the higher if you opened a suit with a high card and look for your fourth best. If you opened a suit with a low card, and then to the fourth best. If you adopt this system notifies by it to his partner that, when he originally leads a low card, he holds exactly three cards higher than the suit, and if you originally led a high card, a second best, he holds one, he still holds exactly two cards higher than the second card led; and when he originally leads a high card, and follows it with a high card, he indicates in many cases, to those who know the analysis of leads (as laid down in whist books), whether the strong suit consisted originally of four or of more than four cards. (See Whist Developments, by "Cavendish," 1853.)

These leads led to an overhauling of the play of the second and third hands, which became apparently so complicated as to deter players of moderate ability from plunging into its intricacies. This fact, combined with the introduction of the fascinating and simpler game of Bridge, caused a distinct decline in the popularity of whist during the last decade of the 19th century.

Whist (i.e. modern "short" whist) is played with a full pack of 52 cards. The ace is the highest, except in cutting, when it is the lowest. After the ace rank king, queen, &c., in order, down to the two. Four persons play, but with only three or two players the game can still be played with certain modifications (so-called "rubbers""). Two players each have a dummy, and the player who gets the lowest deals, and has choice of cards and seats. The player who draws the next highest is his partner; if two or more players draw cards of equal value, they cut again, the lowest player playing with the lowest original. The cards are then cut and dealt one by one from left to right. The last card is turned up to show the trump suit. In America the Trump suit is sometimes cut for, the card then being replaced in the pack before shuffling (blind trump). A misdeal passes the deal, and at the end of each hand it passes in any case to the player on the left. At the end of the first trick the dealer takes the turned trump card into his hand. If he fails to do so, the card may be called to any side of the table, and the player on whose left the last card is found is compelled to follow suit if possible, under penalty for "revoke" (by which the adversaries may either add three to their score, deduct three from the default side, or take three of theirs and add them to their own). A player who cannot follow suit may play any card he chooses to the trick unless he has exposed a card and the adversaries call it. The highest card, or trump (if one is played), wins the trick, the winner leading to the next trick. When all the cards have been played the tricks gained by each side are counted, each trick over six counting one. The tricks are called "a book." Honours—ace, king, queen, knave—also count to the score, but a side which has a score of four at the beginning of a hand cannot score for honours. Tricks count before honours; thus if one side has a score of one and holds four honours, while the other has a score of four and makes the odd trick, the latter wins a double, the honours not counting, as the game has already been won by tricks. The score for honours are as follows, but some players halve these scores, or, particularly in America, do not count honours at all. This is a matter of arrangement. If one side holds two to join, the player on whose left leads, then if neither sides hold two there is no score, honours being "divided," or "easy." A rubber consists of the best of three games, unless one side wins the first two games. A game consists of five points. Thus if one side makes nine tricks and holds three honours it scores a game—three points by tricks (or "by cards") and two by honours—but if a revoke has been made, i.e. if a player, holding a card of the suit led, has played a card of another suit, the revoking side cannot score more than four, whatever its score in points may be. The side that wins the rubber scores two points in addition to the points made. If three players score for a "triple," a game in which the adversaries have no score; two points for a "double," i.e. when the adversaries have made one or two; one point for a "single," i.e. when they have made three or four. Thus two trebles and the rubber (or "rub") count eight points; treble, single and the rub count six points. If the losers have won a game, its value is deducted. Sometimes, by arrangement, the rubber points are raised to four. At the end of a rubber, or, by arrangement, of two rubbers, the players cut again for partners. If others wish to join the table the original players cut, the highest cut wins. It is not customary for more than three to join, technically, to "cut in;" hence, if two players vacate at the end of the next rubber, they now take the place of the other original pair, who leave without cutting. When only one player "cuts in," the other three retire by rotation, deci ded by cutting, and come back in their turn. If more than four players wish to form a table, they cut first to see who shall stand out, the highest retiring; they then cut afresh for partners. Dummy Whist is played by three players, two being partners and the other playing with dummy, whose cards, which must be dealt face downwards, are exposed on the table before the play begins. Dummy has the first deal in every rubber. His cards being exposed he is not considered able to revoke; if he does, there is no penalty, nor is his partner liable for any mistake of his own whereby he cannot profit, e.g. by exposing a card; but if he leads from the wrong hand, a suit can be called. At Double Dummy each player has a dummy partner, and there is no misdeal, as the deal is a disadvantage.

The leads and the play of the different hands have been so minutely systematized that some of the various ten-card hands should be played carefully by any one who wishes to become proficient, but some broad general rules may be useful to the beginner. The original leader should lead from his strongest, which is almost always his longest suit, but if his longest suit contains only four cards and is also the trump suit, opinions differ, though most players would observe the general rule. The same rule applies to subsequent first leads of a suit, unless they have to be modified owing to information derived from previous leads. This is a general rule. The third or fourth trick may have to sacrifice his lead of his strongest suit in response to a "call for trumps" by his partner. Such a lead is
called a "forced" lead, and from three cards the highest should invariably be led. If the partner is called for the third card, he is "under" and may only play another "forced" lead. If the partner is "under" on the second lead, but from the fourth lowest should be led. This lead of the highest from three applies to all forced leads, whether they are due to a "call," or to the fall of the cards already played. As a consequence, the play is "forced." Of the cards the honours are led, but if you have the king also, lead it first; from a five suit without the ace lead the worst but one. With ace and two or three small ones, lead a small one; with ace and one small one, the ace. The second highest from three cards is that which the partner knows the ace is led and he holds the ace, he should play the ace; also holding queen and king he should play the queen, or with knave, queen and king, the knave. If the cards are of the same "formula", generally sound play put to the knave on the ten. With king and one other, or queen and one other, most players advocate the play of the small card; some would play the king under these conditions, but not together. If the partner is "under" on a suit out you have, the worst suit of the state of the score may affect the play. If it is important to get the lead, so as to lead trumps, the honour should be played, but as a rule the second hand reserves his strength. The third hand should win the ace if he has knowledge that his partner's card is a winning one; consequently he generally plays his highest card. The fourth hand should win the trick if he can, as a player is justified in passing a trick only if by so doing he is absolutely sure of winning it. Returned Leads.—A partner's lead should be returned at once, unless one has a strong suit of one's own, in which event it is advisable to lead a card of it, to guide one's партнер as to his future policy, and also to try to win the trick before the player has a chance to play false cards. If a player holds three cards originally in his partner's suit he should invariably return the higher of the two left in his hand after the first return. Thus holding three, ace, two, one, he should win with the ace if the suit has failed, and if he wins the two, he holds no more. So, with ace, knave, ten only, win with the ace and return the knave, though from a scoring point of view it is not so good. If the partner holds a knave, too, he should return the lowest, but a winning card should always be led or played in the second round, unless there is any special reason for retaining it. If your partner has called for trumps and you get the lead, with four trumps the lead is almost certain to win, as all players are so bad at this game, bowing with care. If, however, one adversary has obviously played his last trump, a third round is not always advisable, as two trumps will fall from the leader and his partner, and only one from the adversaries. On the other hand it is generally good play to draw two opposing trumps for one, so that they may not make separately.

In the play of a hand never play an unnecessarily high card—unless you are "calling." Thus, having ten and knave, play the ten; if you partner will later that you do not hold the nine, king may hold the knave, and even the queen as well, though all the cards are of equal value for making tricks. Similar inferences should be drawn from the playing of any other suit. A player should be ready at all times to play false cards unless you see your partner is so weak that it can do no harm to deceive him; in such a case, with knave and ten, the knave may be played. It is a maxim that information given by play is more often derived from false cards than from true ones.

Trumping or "Ruffing" and Discarding. The second player should not trump a doubtful card (i.e. a card that his partner might be able to beat), if he is strong in trumps; if weak, he should trump. A winning card from an adversary should be trumped in any case. With weak trumps, it is bad play to "force" one's partner, i.e., invite him to trump; but with strong trumps force him. If your partner refuses to take an adversary's trump lead, you have an opportunity. If you have a "cross-uff" (i.e. if you and your partner can trump different suits), those suits should be led alternately, and not trumps. Force an adversary who is known to be strong in trumps. A weak suit in trumps (three only should be led) if the adversaries have a cross-uff, or if the game is hopeless unless partner is strong, or if winning cards are held in all plain suits, which might be trumps.

The lead of an adversary is not "forced" originally from the weakest suit, but if the adversaries are shown to have strength in trumps, from the strongest, i.e. the longest, so as to guard the weak suits. With absolute command of a suit, if you are compelled to discard from it, discard the winning card to inform your partner that you have command; e. g. with king, knave, ten—ace and queen being out—discard the king. The "call" for trumps, an artifice, which is also known as "ask", to the "forced" lead, is a means of informing your partner of your strength in trumps; it consists in playing an unnecessary high card, followed later by a lower one, e. g. by playing the three before the two, or the ten before the nine. This is an imperious command, equivalent to "sacrifice" everything, particularly for nothing. In this case the trumping lead is only justified by great strength in the trump suit. The "echo": To your partner's call you should "echo," if you hold four or more, by calling his card; if you hold only three, his card, or if your call may be shown in partner's lead of trumps by playing a high card followed by a lower one.

General Maxims. Play to the score. If winning the odd trick saves one from the game, do not try risky combinations for the sake of getting two or three tricks. Count your cards before playing. When asked whether either "remember" or "dare" leads trumps, always ask him if he has a card of the suit led, to save the revoke. Announce the score when you mark it. Watch the fall of every card. Study the rules, especially those about penalties and consultation with the opponents. Never, except in the last two tricks of the game, and you hold the winning card, play it, unless it be the winning trump, which is good at any time. Retain the trump-card if you can play others of equal trick-making value; your partner may do the same. If you have three ten or less, play a lower card than your highest in the third hand) in partner's suit, unless he leads a high card in an obviously forced lead. Lead through a known strong suit on your left, and (especially) up to a known weak suit on your right. Do not play a heart on the trump, especially against a "singleton" (your only card in one suit), in order to be able to trump—sometimes disparagingly called "Whitechappelling"—which is not generally good play, and results badly unless the side is strong in trumps, but in some circumstances it is useful. Do not lead from a "tenace" (i.e. best and third best of a suit) if you have another equally good suit. Remember that whist is a game of combination, and that tricks made by your partner are just as valuable to you as tricks made by yourself. Sort your hand so as to keep the suits separate, red and black alternately, keeping the cards each in order of their value. As the rules and the laws of the game are practically the same as at ordinary or "short" whist, but a more venturesome style of play may be adopted in view of the number of points required, i.e. a certain amount of risk may be taken when the score is low, and the hope certain of winning the game, instead of being forced to hold out. With the score at nine, honours cannot be secured, but at eight a player who holds two honours may ask his partner before playing whether he is "right," that is, does the honours belong to his partner? If the answer is "Yes," the honours are scored and the game ends. There is no "treble" at long whist. A double is scored when the losers are less than five, a single if they have made five or more.

Progressive Whist.—This form of the game is social rather than scientific, but is a pleasant variety on the ordinary round game. The game provides prizes, as a rule—first, second, and "booby" prizes for the ladies and "bourrées" for the gentlemen, to the players who make the fewest points. Any number of tables may be formed. Partners are selected by lot, two ladies and two gentlemen forming a "pair" and the pairs playing against one another. The number of tickets of different colours, numbered identically, No. 1 pairing with No. 1 and so on. After the first round there is no drawing for partners, as will be seen. The holders of all tickets are placed in pairs, and each player has the ticket of one of his partners. Only one pack of cards is needed at each table, but every player should be provided with a scoring card and pencil. The players at all the tables cut for deal, but no dealing is begun until a signal has been given by the master of the table. A "bowler," a "purse" or a "trag" or "trig," is played. Honours are not counted. The score is marked by the number of tricks made, or the winner may mark all tricks above six. The score is placed under your name, which you remain as for all the previous rounds. Thus printed from No. 1 to No. 2, from No. 2 to No. 3 and from the last table to No. 1. Partners are formed afresh, the gentleman who has just won playing with the lady who has just lost, and vice versa. Play may last for one or more complete rounds, or until a give up is indicated by a signal, after which no fresh hand is begun. The scores are then added up and the prizes awarded. In playing the ordinary rules of whist are observed.

A printed existence was first given to the laws of whist by Hoyle in 1743. The fourteen laws then issued were subsequently increased to twenty-four. These laws were the authority until 1760, when the members of White's and Saunders's Chocolate Houses revised them. The revised laws (nearly all Hoyle) were accepted by whist players for over a century, notwithstanding that they were very incomplete. The laws of short whist, a more comprehensive code of rules, was introduced by the Portman Club, the Lord of the Manor, in 1864, and became the accepted standard, small modifications only having been introduced since. The latest edition of the rules should be consulted for what is not indicated in the text below.

See Principles of Whist, Stated and Explained, by "Cavendish" (London, 1902), the most authoritative work.

WHISTLE, the shrill warbling sound made by forcing the breath through the lips, contracted to form a small orifice, or produced by means of an instrument of the whistle type; also, generally, any similar shrill, hissing or warbling sound, as of a bird's note, of wind through trees, ropes, &c. The O. Eng. hvistian, to whistle, and hvistlere, whistler, piper, are closely allied to hvistrian or hvistrian, to whisper, to speak softly or under one's breath; and both are imitative sounds, or, tentatively, the shrill hissing sound, ef. Ger. hieschen, to whisper, Dan. hvistle, to whistle. The instrument known as "whistle" takes many forms, from
the straight flute and flageolet type made of wood or metal and pierced with holes, to the metal signalling pipe used for signalling on board ship or by policemen. Similarly the term is used of the instruments sounded by the escape of steam on a locomotive or other engine and on steamships, &c., as a means of giving signals.

WHISTLER, JAMES ABBOTT McNEILL (1834-1903), American artist, was born at Lowell, Massachusetts, on the 10th of July 1834. His father was Major G. W. Whistler, and his mother one of the Baltimore family of Winans. He was first heard of in Europe in 1857, when he had already been an art student, in Paris, in the studio of Gleyre. His first etchings, those known as "The French Set," were the means of bringing him under the notice of certain people interested in art, but the circulation of these first, like that of his later etchings, has always, of necessity, been more limited than their fame. The impressions from each plate are generally few. It was still in etching that Whistler continued his labours, and, coming to London in 1859, it appears, he almost at once addressed himself to the chronicle of the quaint riverside buildings and the craft of the great stream—the Thames "below Bridge." The "French Set" had included De Hooch-like or Nicholas Maes-like genre pieces, such as "La Vieille aux loques," the "Marchande de moutarde," and "The Kitchen," this last incomparably improved and perfected by the retouching that was accomplished a quarter of a century after the first performance. The Thames series of sixteen etchings, wrought chiefly in 1859, disclosed a new vision of the river, in which there was expressed, with perfect draughtsmanship, with a hitherto unparalleled command of vivacious line, the form of barge and clipper, of warehouse, wharf and waterside tavern, "The Pool," "Thames Police" and "Black Lion, Wharf" are perhaps the finest of this series. Before it was begun, Whistler, ere he left Paris, had proceeded far with a plate, existing only in the state of trial proof, and, in that, of extreme rarity. It is called "Paris, Île de la Cité," and has distinct and curious manifestations of a style to be more generally adopted at a later period. For several years after the completion of the "Sixteen Etchings," Whistler etched comparatively little; but about 1870 we find him entering what has been described as his "Leyland period," on account of his connexion with the wealthy shipowner and art patron, Mr Frederick R. Leyland, of Prince's Gate, whose house became famous for Whistler's Peacock Room, painted in 1877. In that period he worked greatly in dry-point. The "Model Resting," one of the most graceful of his figure pieces, and "Fanny Leyland"—an exquisite instance of girl portraiture—are notable performances of this time. To it also belonged the largely conceived dry-points, so economical of means and endowed with so singular a unity of effect, the "London Bridge" and "Price's Candle-works." A little later came the spirited etchings that were then distinguished. The Battersea and Putney, and the plate "The Adam and Eve," which records the river-front of old Chelsea. This, however, is only seen in perfection in the most rare proofs taken before the publication by the firm of Hogarth. From these plates we pass almost imperceptibly to the period of the Venetian etchings, for in 1879, at the instance of the Fine Art Society, Whistler made a sojourn in Venice, and here he wrought, or, to speak accurately, commenced, not only the set of prints known as the "Venice Set," but also the "Twenty-six Etchings," likewise chiefly, though not wholly, of Venice—issued later by the firm of Dowdeswell. One or two of the minor English subjects of the "Twenty-six Etchings"—those done after the artist's return from Venice—give indications of the phase reached more clearly in certain little prints executed a few years later, and, with perhaps one exception, never formally published. "Fruit Shop," "Old Clothes Shop," and "Fish Shop, busy Chelsea," belong to this time. Later, and bent upon doing justice to quite different themes, which demand different methods, the ever flexible artist again changes his way, and—not to speak of the daintily little records of the places about the Loire, which in method have affinity with the pieces last named—we have

"Steps, Amsterdam," "Nocturne, Dance House," with its magical suggestion of movement and light, and the admirable landscape "Zaandam." With the mention of these things may fitly close a sketch of Whistler's periods in etching; but before proceeding to other branches of his work, the main characteristics of the whole series of etchings (of which, in Wedmore's Whistler's Etchings, nearly 300 examples are described) should be briefly indicated. These main characteristics are precision and vivacity; freedom, flexibility, infinite technical resource, at the service always of the most alert and comprehensive thought; an eye that no picturesqueness of light and shade, no interesting grouping of line, can ever escape—an eye, that is, that is emancipated from conventionality, and sees these things therefore with equal willingness in a cathedral and a mass of scaffolding, in a Chelsea shop and in a suave nude figure, in the façade of a Flemish palace and in a "great wheel" at West Kensington. Mr Whistler's pictures have as a chief source of their attractiveness those mental qualities of alertness and emancipation. Charm of colour and of handling enhance the hold which they obtain upon such people of taste as may be ready to receive them. There are but very few of them, however, at least very few oil pictures, when one considers the number of years since the artist began to labour; and one notable fact must be at once understood—the admitted masterpieces in painting belong almost entirely to the earlier time. "Sarasate" is an exception, and "Lady Archibald Campbell," and in its smaller, but still charming, way "The Little Rose of Lyme Regis"; but even these—save the Little Rose"—are of 1853 or thereabouts. A few years earlier than they are the "Connie Gilchrist," the "Miss Alexander," and the "Rosa Corder," and the Thames "Nocturnes"; but we go farther back to reach the "Portrait of the Painter's Mother," which is now in the Luxembourg; the "Portrait of Carlyle," now at Glasgow; the "Cremorne Gardens," the "Nocturne, Valparaiso Harbour," the "Music Room," with little Miss Annie Haden standing by the piano while her mother plays, and the "White Girl," or "Little White Girl," in which Whistler shows the influence, but never the domination, of the Japanese. Of the slight but always exquisitely harmonious studies in water colour, undertaken by Whistler in his middle period, none call for special notice. To the middle time, too, belong, not perhaps all of his slight but delicately modelled pastels of the figure, but at least his more universally accepted pastels of Venetian scenes, in which he caught the sleepy beauty of the Venetian by-way. In pastel, as in painting, in water colour and in etching, Whistler has never been unmindful of the particular qualities of the medium in which he has worked, nor of the applicability of a given medium to a given subject. The result, accordingly, is not now a victory and now a declension, but a consistent and scientific exploitation, in which the triumphs great and small. One other medium taken up by Whistler must now be mentioned. His lithographs—his drawings on the stone in many instances, and in others his drawings on that "lithographic paper" which with some people is the easy substitute for the stone—to-day are perhaps half as numerous as his etchings. Mr T. R. Way has catalogued about a hundred. Some of the lithographs are of figures slightly draped; two or three of the very finest are of Thames subjects—including a "nocturne" at Limehouse, of unimaginable and poetical mystery; others are bright and dainty indications of quaint prettiness in the old Faubourg St. Germain, and of the sober lines of certain Georgian churches in Soho and Bloomsbury. An initiator in his own generation, and ever tastefully experimental, Whistler no doubt has found enjoyment in the variety of the mediums he has worked in, and in the variety of subjects he has brilliantly tackled. The absence of concentration in the Whistlerian temperament, the lack of great continuity of effort, may probably prove a drawback to his taking exactly the place as a painter of oil pictures, which, in other circumstances, his genius and his taste would most certainly have secured for him. In the future Whistler must be accounted, in oil painting, a master exquisite but rare. But the number and the range of his etched subjects and the extraordinary variety of perception and of skill which
he has brought to bear upon the execution of his nearly three hundred coppers, ensure, and have indeed already compassed, the acceptance of him as a master among masters in that art of etching. Rembrandt's, Van Dyck's, Meryon's, Claude's, are, in fact, the only names which there is full warranty for pronouncing beside his own.

No account of Whistler's career would be complete without a reference to his supremely controversial personality. In 1878 he brought a libel action against Ruskin for his criticisms in *Forl Clavigera* (1877). Ruskin had denounced one of his nocturnes at the Grosvenor Gallery as "a pot of paint flung in the public face." After a long trial, Whistler was awarded a farthing damages. His examination caused much interest, especially in artistic circles, on account of his attitude in vindication of the purely artistic side of art; and it was in the course of it that he answered the question as to how long a certain "impression had taken him to execute by saying, "All my life." His ecen
tricity of pose and dress, combined with his artistic arrogance, sharp tongue, and bitter humour, made him in London talked-about men in London, and his *moti* were quoted every-
where. He followed up his quarrel with Ruskin by publishing a satirical pamphlet, Whistler v. Ruskin: *Art v. Art Critics*. In 1883, he gave his *Ten O'clock Lecture* in London, afterwards embodied in *The Gentle Art of Making Enemies* (1890). The substance of this flippantly written and amusing outburst was an insinuation on the liberty of the artist to do what was right in his artistic eyes, and the inability of the public or the critics to have any ideas about art worth considering at all. In 1895 appeared his *Three Essays*, with Sir William Eden, whose wife's portrait Whistler had painted, but refused to hand over, came into the courts in Paris; and Whistler, though allowed to keep his picture, was condemned in damages. In later years he lived mainly in Paris, but he returned to live in London in 1902; and he died on the 17th of July 1903 at 74 Cheyne Walk, Chelsea. In 1888 he had married Mrs Goodwin, widow of W. W. Goodwin, the architect, and daughter of J. B. Phillip, the sculptor; she died in 1896, leaving no children. In 1886 he became president of the Royal Society of British Artists (a title at which afterwards he scoffed); and he took a leading part later in founding the International Art Society, of which he was the first president. His "Nocturne in blue and silver" was presented to the National Gallery after his death by the National Art Collection Fund.

**WHISTON, WILLIAM** (1667-1752), English divine and mathematician, was born on the 9th of December 1667 at Norton in Leicestershire, of which village his father was rector. He was educated privately, partly on account of the delicacy of his health, and partly that he might act as amanuensis to his father, who had lost his sight. He afterwards entered at Cirencester College, Cambridge, where he applied himself to mathematical study, and obtained a fellowship in 1693. He next became chaplain to John Moore (1646-1714), the learned bishop of Norwich, from whom he received the living of Lowestoft in 1698. He had already given several proofs of his noble but over
curious feeling of scrupulousness, and at the same time, of a great
dependency to paradox. His *New Theory of the Earth* (1698), although destitute of sound scientific foundation, obtained the praise of both Newton and Locke, the latter of whom justly clasped the author among those who, if not adding much to our knowledge, "at least bring some new things to our thoughts." In 1701 he resigned his living to become deputy at Cambridge to Sir Isaac Newton, whom two years later he succeeded as Lucasian professor of mathematics. In 1707 he was Boyle lecturer. For several years Whiston continued to write and preach both on mathematical and theological subjects with consider
able success; but his study of the *Apostolical Constitutions* had convinced him that Arianius was the creed of the primitive church; and with him to form an opinion and to publish it were things almost simultaneous. His heterodoxy soon became notorious, and in 1710 he was deprived of his pro
dessorship and expelled from the university. The rest of his life was spent in incessant controversy—anti-theological, anti-mathematical, chronological and miscellaneous. He vindicated his estimate of the Apostolical Constitution and the whole canon derived from them in his *Primitive Christianity Revisited* (5 vols, 1711-1712). In 1713 he produced a reformed liturgy, and soon afterwards founded a society for promoting primitive Christianity, lecturing in support of his theories at London, Bath and Tunbridge Wells. One of the most valuable of his books, the *Life of Samuel Clarke*, appeared in 1730. While heretical on so many points, he was a firm believer in supernatural Christianity, and frequently took the field in defence of prophecy and miracle, including anonting the sick and touching for the king's evil. His dislike of the Anglican communion for the Baptist, leaving the church literally as well as figuratively by quitting it as the clergyman began to read the Athanasian creed. He died in London, at the house of his son-in-law, on the 22nd of August 1752, leaving a memoir (3 vols, 1749-1750) which deserves more attention than it has received, both for its characteristic individuality and as a storehouse of curious anecdotes and illustrations of the religious and moral tendencies of the age. It does not, however, contain any account of the proceedings taken against him at Cambridge, these having been published separately at the time.

Whiston is a striking example of the association of an entirely paradoxical bent of mind with proficiency in the exact sciences. He also illustrates the possibility of arriving at rationalistic conclu
sions in theology without the slightest tincture of the rationalistic temper. He was not only paradoxical to the verge of craziness, but intolerant to the verge of bigotry. "I had a mind," he says, "to hear Dr (John) Gill preach. But, being informed that he had written a folio book on the Canicules, I declined to go to hear him." Whiston not engaged in controversy he was not devoid of good sense. He often saw men and things very clearly, and some of his *bon mots* are admirable.

**WHITAKER, JOSEPH** (1820-1893), English publisher, was born in London on the 4th of May 1820, and apprenticed to a bookseller at the age of fourteen. After some experience with publishing firms, he began business on his own account as a theological publisher. In January 1858 he started the *Book-
seller*, and for 1860 published the first issue of *Whitaker's Almanack*, the annual work of reference, which also met with immediate success. In 1874 he published the first edition of the *Reference Catalogue of Current Literature*, of which several editions have since appeared. Whitaker died at Enfield on the 15th of May 1893. He had been the father of fifteen children.

**WHITBREAD, SAMUEL** (1759-1815), English politician, came of a Bedfordshire Nonconformist family; his father had made a considerable fortune as owner of the well-known brewery associated with his name. Educated at Eton and St John's College.
Cambridge (after originally going to Christ Church, Oxford), he began by entering the brewing business; but after his marriage with the daughter of the 1st Earl Grey in 1789 he took to politics, and in 1790 was elected for Bedfordshire as a Whig, attaching himself to Fox. He became known as a social and financial reformer and a constant assiduity in parliament of all sorts of abuses. It was on his motion in 1803 that Lord Melville was impeached for financial maladministration of the navy, and he conducted the case for the prosecution. His Poor Law bill in 1807, an elaborate Radical scheme, came to nothing. Whitbread continued to be a constant speaker in parliament, and the principal representative of Liberal criticism, a monument of opposition tactics. He opposed the regency, championed the princess of Wales, and led the peace party; and the caricaturists were busy with his personality. In 1809 he became chairman of the committee for rebuilding Drury Lane theatre, and for some time he was immersed in controversies connected with it, which eventually seem to have unstrung his mind, for he committed suicide on the 6th of July 1815. The Whitbread influence in literature of politics continued to be very strong in London, also in later generations, his son William Henry (from 1818 to 1837) and grandson Samuel (from 1852 to 1855) representing Bedford for many years.

**WHITBY**, a seaport, watering-place and market town in the Whitby parliamentary division of the North Riding of Yorkshire, England, 245 m. N. from London, on the Northeastern railway. Pop. of urban district (1901) 11,755. There are a terminal station in the town and a station at West Cliff on the Saltburn branch. Whitby is beautifully situated at the mouth and on both sides of the River Esk; the old town of wooden buildings and picturesque houses standing on the steep slopes above the river, while the modern residential quarter is mainly on the summit of West Cliff. A long flight of steps leads up to the abbey, the ruins of which gain a wonderful dignity from their commanding position. This was a foundation of Osy, king of Northumbria, in 658, in fulfilment of a vow for a victory over Penda, king of Mercia. It embraced an establishment for monks and (until the Conquest) for nuns of the Benedictine order, and under Hilda, a grand-niece of Edwin, a former king of Northumbria, acquired high celebrity. The existing ruins comprise parts of the Early English choir, the transept, also Early English but of later date, and the rich Decorated nave. The west side of the nave fell in 1763 and the tower in 1830. On the south side are foundations of cloisters and domestic buildings. Adjoining the abbey is Whitby Hall, built by Sir Francis Cholmley about 1580 from the materials of the monastic buildings, and enlarged and fortified by Sir Hugh Cholmley about 1635. A little below the abbey is the parish church of St Mary, originally Norman, and retaining traces of the first building; owing to a variety of alterations at different periods, and the erection of high wooden pews and galleries, its appearance is more remarkable than beautiful. A modern cross in the churchyard commemorates St Caedmon, the Northumbrian poet (c. 670), who was a monk at the abbey and there died. Other features of the town are the pleasant promenades and gardens on West Cliff, the antiquarian and geological museum, and an excellent golf course. The coast is cliff-bound and very beautiful both to the north and to the south, while inland the Esk traverses a lovely wooded vale, surrounded by high, open-lying moors. Whitby is a quiet resort, possessing none of the brilliance of Scarborough on the same coast. A large fishing industry is carried on from the harbour which is formed by the mouth of the river and protected by two piers. The manufacture of ornaments from the jet found in the vicinity forms a considerable industry. The jet is a species of petrified wood found towards the bottom of the Upper Liás, and its use for the purpose of ornament dates from very early times. A former activity in shipbuilding is of interest through the recollection that here were constructed the ships for Captain Cook's voyages. Wooden ships and boats are still built, and rope-making and sail-making are carried on.

Whitby (Streanaweshelch c. 657–579; Prestebi c. 857–1080; Whitby, &c. c. 857 onwards) is first mentioned by Bede, who states that a religious house was established here about A.D. 657. In the 9th century it was destroyed by the Danes, but being refounded became the centre of a Danish colony, and until laid waste by the Conqueror was the most prosperous town in the district. Henry I. made a grant to the abbey and convent of Whitby of a burgage in the vill of Whitby, and Richard de Waterle, abbot 1175–1190, granted the town in free burgage to the burgesses. In 1200 King John, bribed by the burgesses, confirmed this charter, but in 1201, bribed by the successor of Richard de Waterle, quashed it as injurious to the "dignity of the church of Whitby." A bitter struggle went on, however, till the 14th century, when a trial resulted in a judgment against the burgesses. In 1629 Whitby petitioned for incorporation on the ground that the town was in decay through want of good government and received letters patent giving them self-government. However, in 1674–1675, the crown, probably in gratitude for the part played by the Cholmeleys in the Civil War, restored to the lords of the manor all the liberties ever enjoyed by the abbots of Whitby in Whitby and Whitby Strand. Whitby became a parliamentary borough under the Reform Act of 1832, returning one member until it was disfranchised under the Redistribution of Seats Act 1885. At the beginning of the 14th century Sir Alexander Percy claimed the hereditary right of buying and selling in Whitby without payment of toll. The market was held time out of mind on Sunday until the reign of Henry VI., who changed the day to Saturday, still the market day. A fortnightly cattle market was granted by Charles I. Henry I. granted to the abbots of Whitby a fair at the feast of St Hilda and the king's firm promise to all coming to the fair. A second fair was established later, but neither of them is any longer held. There was a port at Whitby in the 13th century and probably before, and though now of importance it has always since been traces of Whitby shipping and merchandise. In medieval times the salting and sale of herrings and the sale of cod, fish and other products of the North Sea fishery were the only industries.

Whale-fishing began in 1753.

See J. C. Atkinson, Memorials of Old Whitby (London, 1894); Lionel Charlton, History of Whitby (York, 1776); George Young, History of Whitby (Whitby, 1877); Victoria County History, Yorkshire, North Riding.

**WHITCHURCH**, a market town in the Newport parliamentary division of Shropshire, England, 171 m. N.W. from London on a joint line of the London & North-Western and Great Western railways, and the terminus of the Cambrian railway. Pop. of urban district (1901) 5221. Malting and cheese-making are the principal industries. The church of St Alkmund, rebuilt in the 18th century, retains the fine tomb of John Talbot, first earl of Shrewsbury, who fell at the battle of Bordeau (1453). The town hall and other public buildings are modern. The grammar school was founded in 1550, and here (c. 1791) Reginald Heber, Bishop of Calcutta, was educated. The parish of Whitchurch extends into Cheshire.

Whitchurch was at first known as *Wethun* and belonged before the Conquest to King Harold, but was afterwards granted to Earl Roger, of whom William de Warenne was holding it at the time of the Domesday Survey. The name is said to have been altered to Whitchurch or Album Monasterium on account of a stone church built there soon after 1086. The manor appears to have been held by a younger branch of the Warenne family, from whom it passed by marriage to the families of Lestrange and Talbot. It was sold by the Talbots to Thomas Egeron, from whom it passed to the earls of Bridgewater and eventually to the present owner, Earl Brownlow. Whitchurch is mentioned as a borough in the 14th century, and was governed by a bailiff, but its privileges, which sprang up with the castle, appear to have disappeared after its decay. The town has never been represented in parliament nor noted for any trade except agriculture. In 1228 John Fitz-Alan received the right of changing the day of the market he held at Whitchurch from Thursday to Monday, and in 1362 a fair lasting three days from the feast of SS. Simon and Jude was granted to John Lesirange. Lord Brownlow granted the market rights to the local authority.
WHITE, ANDREW DICKSON (1832— ), American educationalist, was born in Homer, New York, on the 7th of November 1832. He graduated at Yale (A.B.) in 1853, studied at the Sorbonne in 1854, and at the University of Berlin in 1855-1856, meanwhile serving as attached at the United States Legation in St Petersburg in 1854-1855. He was professor of history and English literature in 1857-1863, and lecturer on history in 1863-1867 at the University of Michigan. In 1864-1867 he was a member of the New York state Senate, and as chairman of the Committee on Education took an active part in formulating the educational features of the bill under which Cornell University (q.v.) was incorporated (1856). At Mr Cornell’s suggestion Mr White drew up a plan of organization for the institution, and in 1867 became its first president, which post he held continuously until 1885, serving there as a member of the board of trustees and of its executive committee. During his administration he greatly strengthened the curriculum of the university, to which he gave his architectural library, and, upon his retirement, his historical and general library of about 20,000 volumes (including bound collections of pamphlets) and about 3000 unbound pamphlets, which was installed in a special room in the main library building of the university. In recognition of this gift the departments of history and political science of the university have been named the President White School of History and Political Science. In 1870 President Grant appointed Benjamin Franklin Wade, then Q.C., as most of the students to visit Santo Domingo and report on the advisability of the president’s project for annexing it to the United States; and in 1893 he was appointed by President Cleveland a member of the commission established to determine the boundary between Venezuela and British Guiana. Dr White was United States minister to Germany in 1879-1881, and to Russia in 1882-1894, and was United States ambassador to Germany in 1897-1903. In 1899 he was president of the American delegation at the Hague Peace Conference. He received the degree of L.L.D. from the University of Michigan (1867); from Cornell (1886); from Yale (1893); from St Andrews, Scotland (1902), from Johns Hopkins (1902), and from Dartmouth (1906); L.H.D. from Columbia (1887) and D.C.L. from Oxford (1902). He was also made an officer of the Legion of Honour, was awarded the royal gold medal of Prussia for arts and sciences in 1902, was president of the American Historical Association, of which he was a founder, in 1884, and was actively identified with various other learned bodies.

His publications include The Greater States of Continental Europe (1874); A History of the Warfare of Science with Theology in Christendom (2 vols. 1895); for his own literary work, his Autobiography (2 vols., New York, 1905) and Seven Great Statesmen (1910).

WHITE, SIR GEORGE STUART (1835— ), British field marshal, the son of an Irish country gentleman, was born in County Antrim on the 6th of July 1835. He was educated at Sandhurst, and in 1853 joined the Inniskilling, with which regiment he served in India during the Mutiny in 1857. In the second Afghan War (1878-80) he was second in command of the Gordon Highlanders, whom he led in their charge at the battle of Charasia. For conspicuous gallantry in this action, and again subsequently at Kandahar, he received the Victoria Cross. In 1881 he assumed command of the Gordon Highlanders, and took part in the Nile Expedition of 1884-85. As brigadier in the Burmese War (1885-87) he rendered distinguished service, for which he was promoted major-general; and when Sir Frederick (afterwards Lord) Roberts returned to India from Burma in 1887, White was left in command of the force charged with the duty of suppressing the dacoities and pacifying the country. This he accomplished with a thoroughness which earned the thanks of the government of India. He was in command at Wade, Mr White and Samuel Flower, and in 1893 he succeeded Lord Roberts as commander-in-chief in India; and during his tenure of this office directed the conduct of the Chitral expedition in 1895 and the Tirah campaign in 1897. In the latter year he was made G.C.B. and in 1898 G.C.S.I. Returning to England in 1898 he became quartermaster-general to the forces; and on the outbreak of the Boer War in 1899 he was given command of the forces in Natal. He defeated the Boers at Elandslaagte on the 21st of October 1899 and at Reitfontein on the 24th; but the superior numbers of the Boers enabled them to invest Ladysmith, which Sir George White defended in a siege lasting 119 days, from the 2nd of November 1899 to the 1st of March 1900, in the course of which he refused to entertain Sir Redvers Buller’s suggestion that he should arrange terms of capitulation with the enemy (see LADYSMITH, SIEGE and RELIEF OF). After the relief of Ladysmith, White, whose health had been impaired by the siege, returned to England, and was appointed governor of Gibraltar (1900-1904). King Edward VII, who visited the fortress in 1903, privately gave him the baton of a field marshal. In 1905 Sir George White was appointed governor of Chelsea Hospital, and in the same year was decorated with the Order of Merit. See T. F. G. Coates, Sir George White (1900).

WHITE, GILBERT (1720-1793), English writer on natural history, was born on the 18th of July 1720 in the little Hampshire village of Selborne, which his writings have rendered so familiar to all lovers of either books or nature. He was educated at Basingstoke under Thomas Warton, father of the poet, and subsequently at Oriel College, Oxford, where in 1744 he was elected to a fellowship. Ordained in 1747, he became curate at Swarrraton, and the same year at Selborne in 1751. In 1752 he was nominated junior proctor of his college. In 1753 he accepted the curacy of Durley, and in 1757 he was a candidate for the provostship of Oriol, but failed to secure election. Soon afterwards he received the college living of Moreton Pinkney, though he did not reside there, and in 1761 he became curate at Farlingdon, near Selborne, a position which he held until in 1784 he again became curate in his native parish. He died in his home, The Wakes, Selborne, on the 26th of June 1793.

Gilbert White’s daily life was practically unbroken by any great changes or incidents; for nearly half a century his pastoral duties, his watchful country walks, the assiduous care of his garden, and the scrupulous posting of his calendar of observations made up the essentials of a full and delightful life, but hardly of a biography. At most we can only fill up the portrait by reference to the tinge of simple old-fashioned scholarship, which on its historic side made him an eager searcher for antiquities and among old records, and on its poetic occasionally stirred him to an excursion as far as that gentlest slope of Tarnassus inhabited by the descriptive muse. Hence we are thrown back upon that correspondence with botanist naturalists which has always marked his life and its influence so far beyond the common naturalist.

His strong naturalist tendencies are not, however, properly to be realized without a glance at the history of his younger brothers. The eldest, Thomas, retired from trade to devote himself to natural and physical science, and contributed many papers to the Royal Society, of which he was a fellow. The next, Benjamin, became the publisher of most of the leading works of natural history which appeared during his lifetime, including that of his brother. The third, John, became chaplain at Gibraltar, where he accumulated much material for a work on the natural history of the shores of Gibraltar, and carried on a scientific correspondence, not only with his eldest brother, but with Linnaeus. The youngest, Henry, was vicar of Fyfield, near Andover. The sister’s son, Samuel Barker, also became in time one of White’s most valued correspondents. With other naturalists, too, he had intimate relations: with Thomas Pennant and Daines Barrington he was in constant correspondence, often too with the botanist John Lightfoot, and sometimes with Sir Joseph Banks and others, while Richard Chandler and other antiquaries kept alive his historic zeal. At first he was content to furnish information from which the works of Pennant and Barrington largely profited; but gradually the ambition of separate authorship developed from a suggestion thrown out by the latter of these writers in 1770. The next year White sketched to Pennant the project of “a natural history of my native parish, an annus historico-naturalis, comprising a journal for a whole
WHITE, HENRY KIRKE—WHITE, J. B.

WHITE, HUGH LAWSON (1773–1840), American statesman, was born in Iredell county, North Carolina, on the 30th of October 1773. In 1787 he crossed the mountains into East Tennessee (then a part of North Carolina) with his father James White (1737–1819), who was subsequently prominent in the early history of Tennessee. Hugh became in 1790 secretary to Governor William Blount, and in 1792–1793 served under John Murray against the Creek and Cherokee Indians and in the battle of Etowah (December 1793), according to the accepted tradition, killed with his own hand the Cherokee chief Kingfisher. He studied in Philadelphia and in 1796 he was admitted to the bar at Knoxville. He was a judge of the Superior Court of Tennessee in 1801–1807, a state senator in 1807–1809, and in 1809–1815 was judge of the newly organized Supreme Court of Errors and Appeals of the state. From 1812 to 1827 he was president of the State Bank of Tennessee at Knoxville, and managed it so well that for several years during this period it was the only western bank that in the trying period during and after the War of 1812 did not suspend specie payments. In 1821–1824 he was a member of the Spanish Claims Commission, and in 1825 succeeded Andrew Jackson in the United States Senate, serving until 1830 and being president pro tem. in 1832–1834. In the Senate he opposed internal improvements by the Federal government and the recharter of the United States Bank, favoured a protective tariff and Jackson's coercive policy in regard to nullification, and in general supported the measures of President Jackson, though his opposition to the latter's indiscriminate appointments led to his resignation, and Jackson, which was increased by White's refusal to vote to suspend the resolutions of a former Senate censuring the president. In 1830, as chairman of the Committee on Indian Affairs, he secured the passage of a bill looking to the removal of the Indians to lands west of the Mississippi. He was opposed to Van Buren, Jackson's candidate for the presidency in 1836, was himself nominated in several states as an independent candidate, and received the twenty-six electoral votes of Tennessee and Georgia, though President Jackson made strong efforts to defeat him in the former state. About 1838 he became a Whig in politics, and when the Democratic legislature of Tennessee instructed him to vote for Van Buren's sub-treasury scheme he objected and resigned (Jan. 1840). His strict principles and his conservatism won for him the sobriquet of "The Cato of the United States Senate." He died at Knoxville on the 10th of April 1840.

WHITE, JOSEPH BLANCO (1775–1841), British theologian and poet, was born at Seville on the 11th of July 1775. He was educated for the Roman Catholic priesthood; but after his ordination (1800) religious doubts led him to escape from Spain to England (1810), where he ultimately entered the Anglican Church, having studied theology at Oxford and made the friendship of Arnold, Newman and Whately. He became tutor in the family of the last-named when he was made archbishop of Dublin (1811). While in this position he embraced Unitarian views; and he found an asylum amongst the Unitarians of Liverpool, where he died on the 20th of May 1841. White edited El Español, a monthly magazine in London, from 1810 to 1814, and afterwards received a civil list pension of £250. His principal writings are Doaldo's Letters from Spain (1822); Evidence against Catholicaism (1823); Second Travels of an Irish Gentleman in Search of a Religion (2 vols., 1834); Observations on Heresy and Orthodoxy (1835). They all show literary ability, and were extensively read in their day. He also translated part of the Book of Common Prayer into Spanish. He is best remembered, however, by his sonnet "Night and Death" ("Mysterious Night when our first parent knew"), which was dedicated to S. T. Coleridge on its appearance in the Bijou for 1828 and has since found its way into several anthologies. Three versions are given in the Academy of the 12th of September 1801.

year, and illustrated with large notes and observations. Such a beginning might induce more able naturalists to write the history of various districts and might in time occasion the production of a work so much to be wished for—a full and complete natural history of these kingdoms." Yet the famous Natural History and Antiquities of Seboune did not appear until 1789. It was well received from the beginning, and has been reprinted time after time.

To be a typical parish natural history so far as completeness or order is concerned, it has of course no pretensions; batches of letters, an essay on antiques, a naturalist's calendar and miscellaneous jottings of all kinds are but the un系统atized material of the book which was the result. Yet it presents such a very piecemeal character that its popularity has been due. The style is simple, yet fresh and graphic, directness of all good letter-writing, and there is no lack of passages of keen observation, and even shrewd interpretation. White was not only not particular in his means and ways, the times and seasons, of plants and animals—comparing, for instance, the different ways in which the squirrel, the field-mouse and the nut-hatch eat their hazel-nuts—or watches the migrations of birds, which were then only beginning to be properly recorded or understood, but he knows more than any other observer until Charles Darwin about the habits and the usefulness of the earthworms, and he knew that they do not necessarily condense the food. The book is also interesting as having appeared on the borderline between the medieval and the modern school of natural history. Scientifically biographical and historical, the old books of natural history are written without entering on the technical and analytical character of the opening age of separate monographs. Moreover, as the first book which raised natural history into the region of literature, much as the Condorcet's Arithmetic that must generally be read without more finished products of later writers like Thoereau or Richard Jefferies. Yet, while these are essential merits of the book, its den Chavez is the greatest charm that is in the sweet and kindly personality of the author, who on his rambles gathers no spoilt, but watches the birds and field-mice without disturbing them from their nests, and quietly plants an acorn where he thinks an oak is wanted, or sows beechnuts in a stately row. His sympathy with the birds and insects, seen in his words is indeed beyond the anecdotal stage, yet from this all study of nature must begin; and he sees everywhere intelligence and beauty, love and sociality, where a later view of nature insists primarily on mere utility, as the interests of the sentient principle in an encyclopaedic interest in nature, although in White's day culminating in the monumental synthesis of Buffon, was also disappearing before the analytic specialization inaugurated by Linnaeus; yet the catholic interests of the simple naturalist of Seboune really reappear a century later in the greater naturalist of Down, Charles Darwin.

The Life and Letters of Gilbert White of Selborne, by his great grandnephew, Rashleigh Holt-White, appeared in 1901.
WHITE, R. G.—WHITE, T.

WHITE, RICHARD GRANT (1822-1885), American Shakespearean scholar, philologist and essayist, was born in New York city, on the 23rd of May 1822. He graduated at the university of the City of New York in 1839, studied medicine and then law, and was admitted to the bar in 1845, but made no serious attempt to practice. He contributed (anonymously) musical criticisms to the New York Courier and Enquirer, of which he was co-editor in 1832-1838, and became a member of the staff of the New York World, when that paper was established in 1860. In 1861-1878 he was chief of the United States Revenue Marine Bureau, for the district of New York. When he was 21 years old he wrote his sonnet, "Washington: Pater Patriae," which, published anonymously, was frequently ascribed to Wordsworth, and by William Cullen Bryant was ascribed to Landor; White did not admit his authorship until 1852. In 1853 he contributed anonymously to Putnam's Magazine (October and November), an acute and destructive criticism of Collier's folio manuscript emendations of Shakespeare; and in the following year this criticism was republished (with other matter) in his Shakespeare's Scholar: being Historical and Critical Studies of his Text, Characters, and Commentators; with an Examination of Mr Collier's Folio of 1623. During the Civil War he contributed to the Spectator, under the pseudonym, "A Yankee," a series of articles which greatly influenced public opinion in favour of the North, while his clever and pungent satire, This Old Earth's Youth and Youth of This Old Earth (1862 and 1865), was also published anonymously—was an effective attack upon "copper-headism" and the advocates of "peace at any price." He died in New York on the 8th of April 1885.

In addition to those mentioned above, his Shakespearean publications include, Essay on the Authorship of the Three Parts of Henry VI. (1853), Memoirs of the Life of William Shakespeare; with an Essay towards the Expression of his Genius, and an account of the Rise and Progress of the English Drama to the Time of Shakespeare (1865); an annotated edition of Shakespeare's works in 3 vols. (1883), and Studies in Shakespeare (1885), pleading for a rational treatment of the plays of Shakespeare. He was an appreciator of "old manuscripts," and in linguistic subjects he wrote Words and their Uses, Past and Present (1870), and a sequel, Every Day English (1880), which without linguistic thoroughness, stimulated interest in the general subject of good use in language. His other publications include National Hymns: How they are Written and How they are Not Written (1861), containing some of the best and worst of 1200 hymns submitted to a committee of the National Society for a patriotic American national; Poetry, Lyrical, Narrative and Satirical, of the Civil War (1866); The Fall of Man; or, The Loves of the Gorillas, By a Learned Gorilla (1871); Chronicles of Gotham. By U. Donogh O'Fally, R.H.A., the Right Hon. G. Cardwell; England Without and Within (1881), and The Fate of Mansfield Humphreys (1884), a novel. For estimates of White's critical writing see the review of Shakespeare's Scholar in the Eclectic Magazine, vol. xxxiv. (1853); and the articles in the Atlantic Monthly, vol. xxxii. (1882) by E. P. Whipple, and vol. ivii. (1886).

His son, STANFORD WHITE (1853-1906), the famous architect, studied under Henry H. Richardson, whom he assisted in the designing of Trinity Church, Boston, and became a member of the New York firm of McKim, Mead & White in 1881. He designed the Madison Square Garden, the Century and Metropolitan Clubs in New York City, the buildings of the New York University and the University of Virginia, and the pedestal for the statue of Augustus St. Gaudens. He was murdered by Harry Thaw in 1906.

WHITE, ROBERT (1645-1704), English engraver and draughtsman, was born in London in 1645. He studied engraving under David Loggan, for whom he executed many architectural subjects; his early works also include landscapes and engraved title-pages for books. He acquired great skill in portraiture, his works of this class being commonly drawn with black-lead pencil upon vellum, and afterwards excellently engraved in line. Portraits executed in this manner he marked off in frames as an advertisement to collectors for their artistic merit and their authenticity. Virtually he engraved 275 portraits by White, including the likenesses of many of the most celebrated personages of his day; and nine portraits engraved in mezzotint are assigned to him by J. Chaloner Smith. White died at Bloomsbury, London, in 1704. His son, George White, who was born about 1671 and died about 1734, is also known as an engraver and portrait painter.

WHITE, SIR THOMAS (1492-1567), founder of St John's College, Oxford, was a son of William White, a clothier, and was born at Reading. At an early age he became a merchant in London and was soon a member, and then master of the Merchant Taylors Company; growing wealthier he became an alderman and sheriff of the city of London. One of the promoters of the Muscovy Company, he was knighted in 1553, and in October of the same year he was chosen lord mayor. His term of office fell in a strenuous time. He had to defend the city against Sir Thomas Wyatt and his followers, and he took part in the trial of the rebels, as just previously he had done in the case of Lady Jane Grey. In 1555 White received a licence to found a college at Oxford, which he endowed with lands in the neighbourhood of the city and which, dedicated to the Virgin Mary and St John Baptist, was opened in 1560. Soon after this event Sir Thomas began to lose money, and he was comparatively poor when he died at Oxford on the 12th of February 1567. His later years were mainly spent in Oxford, and he was buried in the chapel of St John's College. White had some share in founding the Merchant Taylors' School in London. He was twice married, but left no children. A portrait of him hanging in the hall of St John's College and one on glass, painted in the 16th century, is in the old library. Several early lives of him are among the college manuscripts. Sir Thomas must be distinguished from another Sir Thomas White of South Warnborough, Hampshire, some of whose property, by a curious coincidence, passed also into the possession of St John's College.

WHITE, THOMAS (c. 1530-1624), English divine, was born at Bristol about 1530, the son of a clothier. He graduated from Magdalen Hall (now Hertford College), Oxford, in 1570; took holy orders; and, coming to London, was made a fellow of St Gregory by St Paul's and shortly after vicar of St Dunstan's in the West. Several of his sermons, attacking play-going and the vices of the metropolis, were printed. He was a prebendary of St Paul's, treasurer of Salisbury, canon of Christ Church, Oxford, and canon of Windsor. In 1613 he built and endowed an almshouse, called the Temple Hospital, in Bristol. In 1621 he founded what is now known as White's chair of moral philosophy at Oxford, with a salary of £100 per annum for the reader, and several small exhibitions for scholars of Magdalen Hall. He also founded, at the cost of Magdalen Hall, a bequeathing £5000 for the establishment of a college of "all the ministers, parsons, vicars, lecturers and curates in London and its suburbs" (afterwards Sion College (q.v.)), and an almshouse, now abolished, and leaving bequests for lectureships at St Paul's, St Dunstan's and at Newgate.

WHITE, THOMAS (1628-1698), bishop of Peterborough, was born at Aldington in Kent, and educated at St John's College, Cambridge. Having taken holy orders, he became vicar of Newark-on-Trent in 1660, vicar of Allhallows the Great, London, in 1666, and vicar of Bottesford, Leicestershire, in 1679. In 1683 he was appointed chaplain to the princess Anne, and in 1692 he was chosen bishop of Peterborough. In 1688 he joined the archbishop of Canterbury, William Sancroft, and five of his suffragan bishops in petitioning against the declaration of indulgence issued by James II., sharing the trial and the triumphant acquittal of his colleagues. In 1689 he refused to take the oath of allegiance to William and Mary and was deprived of his see, but he did not become very active among the nonjurors. White died on the 30th of May 1698.

The bishop must be distinguished not only from the founder of Sion College, but also from Thomas White (1593-1676), philosopher and controversialist. Educated at St Omer, Valladolid and Douai, the latter was ordained priest in 1617, and taught for many years in the college at Douai. Later he was president of the English college at Lisbon. He died in London on the 6th
of July 1876. White was a voluminous writer; not only did he engage in controversy with Protestants, but he attacked the personal infallibility of the pope.

**WHITE, SIR WILLIAM ARTHUR** (1824-1891), British diplomatist, was born at Pulawy, in Poland, on the 13th of February 1824. He was descended on his father's side from an Irish Roman Catholic family. His mother's family, though of English blood, was of considerable esteem in Poland, where White, though educated at King William's College, Isle of Man, and Trinity College, Cambridge, spent a great part of his early days, and thus gained an intimate knowledge of the Slavonic tongues. From 1843 to 1857 he lived in Poland as a country gentleman, but in the latter year he accepted a post in the British consulate at Warsaw, and had almost at once to perform the duties of acting consul-general. The insurrection of 1863 gave him an opportunity of showing his immense knowledge of Eastern politics and his combination of diplomatic tact with resolute determination. He was promoted in 1864 to the post of consul at Danzig. The Eastern Question was, however, the great passion of his life, and in 1875 he succeeded in getting transferred to Belgrade as consul-general for Servia. In 1879 he was made British Agent at Bucharest. In 1884 he was offered by Lord Granville the choice of the legation at Rio or Buenos Aires, and in 1885 Lord Salisbury, who was then at the Foreign Office, urged him to go to Peking, pointing out the increasing importance of that post. White's devoted friend, Sir Robert Morier, wrote in the same sense. But White, who was already acting as Consul of Canada, declared his reluctance to leave Canada, and during this year he rendered one of his most conspicuous services. It was largely owing to his efforts that the war between Servia and Bulgaria was prevented from spreading into a universal conflagration, and that the union of Bulgaria and eastern Rumelia was accepted by the powers. In the following year he was rewarded with the embassy at Constantinople. He was the first Roman Catholic appointed to a British embassy since the Reformation. He pursued consistently the policy of counteracting Russian influence in the Balkans by erecting a barrier of independent states animated with a healthy spirit of national life, and by supporting Austrian interests in the East.

To the furtherance of this policy he brought an unrivalled knowledge of all the under-currents of Oriental intrigue, which his mastery of languages enabled him to derive not only from the newspapers, of which he was an assiduous reader, but from the obscurest sources. His bluff and straightforward manner, and the knowledge that with him the deed was ready to follow the word, enabled him at once to inspire confidence and to overcome less masterful rivals. The official honours bestowed on him culminated in 1888 with the G.C.B. and a seat on the Privy Council. Like his fellow-ambassador at Constantinople when he was attacked by influenza during a visit to Berlin, where he died on the 28th of December 1891.

**WHITE, SIR WILLIAM HENRY** (1845-1902), English naval architect, was born at Devonport on the 2nd of February 1845, and at the age of fourteen became an apprentice in the dockyard there. In 1864 he took the first place in the scholarship competition at the Royal School of Naval Architecture, which had then just been established by the Admiralty at South Kensington, and in 1869 he gained his diploma as fellow of the school with first-class honours. At once joining the constructive staff of the Admiralty, he acted as confidential assistant to the chief constructor, Sir Edward Reed, until the latter's retirement in 1870. The loss of the "Captain" in that year was followed by an inquiry into designs for ships of war, and in connexion with this White, together with his old fellow-student, William John, worked out a long series of calculations as to the stability and strength of vessels, the results of which were published in an important paper read in 1871 before the Institution of Naval Architects. In 1872 White was appointed secretary to the Council of Construction at the Admiralty, in 1875 assistant constructor, and in 1881 chief constructor. In April 1883 he left the service of the Admiralty, at the invitation of Lord (then Sir W. G.) Armstrong, in order to undertake the difficult task of organizing a department for the construction of warships of the largest size at the Elswick works; but he only remained there for two and a half years, for in October 1885 he returned to the Admiralty in succession to Sir Nathaniel Barnaby as director of naval construction, retaining that post until the beginning of 1902, when ill-health obliged him to relinquish the arduous labours he entailed. During that period, which is one of unprecedented activity in naval shipbuilding, as a result of the awakening of public opinion to the vital importance of sea-power, more than 200 vessels of various types were added to the British navy, at a total cost of something like 100 millions sterling, and for the design of all of these, as well as for the work of their construction, Sir William White was ultimately responsible.

In addition, he did much to further the knowledge of scientific shipbuilding. He was professor of naval architecture at the Royal School from 1879 to 1883, and when in the latter year it was moved to Greenwich to be merged in the Royal Naval College, he reorganized the course of instruction and acted as professor for eight years more. The lectures he gave in that capacity were the foundation of his *Manual of Naval Architecture*, which has been translated into several foreign languages and is recognized as a standard textbook all over the world. Sir William White, who was chosen a fellow of the Royal Society in 1888, also read many professional papers before various learned and engineering societies. He was created K.C.B. in 1895.

**WHITEAVES, JOSEPH FREDERICK** (1835-1902), British palaeontologist, was born at Oxford, on the 26th of December 1835. He was educated at private schools, and afterwards worked under John Phillips at Oxford (1858-1861); he was led to study the Oolitic rocks, and added largely to our knowledge of the fossils of the Great Oolite series, Cornbrash and Corallian (*Rep. Brit. Assoc. 1860*, and *Ann. Nat. Hist.* 1861). In 1861 he visited Canada and made acquaintance with the geology of Quebec and Montreal, and in 1863 he was appointed curator of the museum and secretary of the Natural History Society of Montreal, posts which he occupied until 1875. He studied the land and freshwater mollusca of Lower Canada, and the marine invertebrata of the coasts; and also carried on researches among the older Silurian (or Ordovician) fossils of the neighbourhood of Montreal. In 1875 he joined the palaeontological branch of the Geological Survey of Canada at Montreal; in the following year he became palaeontologist, and in 1877 he was further appointed zoologist and assistant director of the survey. In 1881 the offices of the survey were removed to Ottawa. His publications on Canadian zoology and palaeontology are numerous and important. Dr Whiteaves was one of the original fellows of the Royal Society of Canada, and contributed to its Transactions, as well as to the Canadian Naturalist and other journals. He received the hon. degree of LL.D. in 1900 from McGill University, Montreal.

**WHITEBAIT**, the vernacular name of the small fish which appears in large shoals in the estuary of the Thames during the summer months, and is held in great esteem as a delicacy for the table. Formerly whitebait was supposed to be a distinct species of fish. T. Pennant and G. Shaw believed it to be some kind of Cyprinid fish, similar to the bleak, whilst E. Donovan, in his *Natural History of British Fishes* (1862-1868), misled by specimens sent to him by herring-net fishermen, believed it to be a salmon. In 1862 W. Jarrell proved conclusively that Donovan's opinion was founded upon an error; unfortunately he contented himself with comparing whitebait with the shad only, and in the end adopted the opinion of the Thames fishermen, whose interest it was to represent it as a distinct adult form; thus the whitebait is introduced into Jarrell's *History of British Fishes* (1836) as *Clupea alba*. The French ichthyologist Valenciennes went a step farther, declaring it to be not only specifically but also generically distinct from all other Clupeoids. It is now known to consist of the young fry of herrings and sprats in varying proportions mixed with a few shrimps, gobies, sticklebacks, pope-fishes and young flounders: but these impurities are as far as possible picked out from the whitebait before it is
marked. The fishing is carried on from February to August, and samples taken in the successive months were found to contain the following percentages of herrings, the remainder being sprats: 7, 5, 14, 30, 85, 75, 52. Hence it will be seen that sprats are most abundant in February, March, April and May, herrings in June and July. There is reason to believe that these young herrings are derived from a local “winter” race spawning about February and March, and having nothing to do with the great shoals of the more open sea spawning in the North Sea in November. The Thames being unequal to the supply of the large demand for this delicacy, large quantities of whitebait are now brought to London and other markets from many parts of the coast. In times past whitebait were considered to be peculiar to the estuary of the Thames; and, even after the special identification of Thames whitebait with the young of the herring and sprat, it was still thought that there was a distinctive superiority in its condition and flavour. It is possible that the young fish find in the estuary of the Thames a larger amount of suitable food than on other parts of the coast, where the water may be of greater purity, but possesses less abundance of the minute animal life on which whitebait thrive. Indeed, Thames whitebait which have been compared with that from the mouth of the Exe, the Cornish coast, Menai Strait, and the Firth of Forth seemed to be better fed; but, of course, the specific characteristics of the herring and sprat—into which we do not enter—spontaneously suggest themselves.

The fry of fishes is used as an article of diet in almost every country: in Germany the young of various species of Cyprinoids, in Italy and Japan the young of nearly every fish capable of being readily captured in sufficient numbers, in the South Sea Islands the fry of Tethus, in New Zealand young Galaxias are consumed at certain seasons in large quantities; and, like whitebait, these fry bear distinct names, different from those of the adult fish.

Whitebait are caught on the flood-tide from boats moored in from 3 to 5 fathoms of water. The nets used are a large, somewhat long, narrow and small-mouthed towards the tail end, the mouth being kept open in the direction of the advancing tide by a framework 3 or 4 ft. square. It is placed alongside the boat and sunk to a depth of 4 ft. below the surface; from time to time the end of the bag is lifted into the boat, to empty it of its contents. The “schools” of whitebait advancing and retreating with the tide for days, and probably for weeks, have to run the gauntlet of a dozen of these nets, and therefore get very much thinned by the end of the season. Whew the view commenced to gain ground that whitebait were largely young herring, the question arose whether or not the immense demands from food fishery, fishing injuriously affected the fishery of the mature herring. This was well understood; but, since it has been ascertained that the herring is much more restricted in its migrations than was formerly believed, and that the shoals are not in such a large, local, and limited to the particular district in which the fishing for whitebait is methodically practised. Similar reasoning applies to sprats.

Whitefield, George (1714-1770), English religious leader, was born on the 16th of December 1714 at the Bell Inn, Gloucester, of which his father was landlord. At about twelve years of age he was sent to the school of St Mary de Crypt, Gloucester, where he developed some skill in eloquence and a taste for reading plays, a circumstance which probably had considerable influence on his subsequent career. At the age of fifteen he was taken from school to assist his mother in the public-house, and for a year and a half was a common drawer. He then again returned to school to prepare for the university, and in 1733 entered as a servant at Pembroke College, Oxford, graduating in 1736. There he came under the influence of the Methodists (see Wesley), and entered so enthusiastically into their practices and habits that he was attacked by a severe illness, which compelled him to return to his native town. His enthusiastic piety attracted the notice of Martin Benson, bishop of Carlisle, who ordained him deacon on the 30th of June 1736. He then began an evangelizing tour in Bath, Bristol, and other towns, his eloquence at once attracting immense multitudes.

In 1736 he was invited by Wesley to go out as missionary to Georgia, and went to London to wait on the trustees. Before setting sail he preached in some of the principal London churches, and in order to hear him, crowds assembled at the church doors long before daybreak. On the 28th of December 1737 he embarked for Georgia, which he reached on the 7th of May 1738. After three months’ residence there he returned to England to receive priest’s orders, and to raise contributions for the establishment of an orphanage. As the clergy did not welcome him to their pulpits, he began to preach in the open air. At Kingswood Hill, Bristol, his addresses to the colliers soon attracted crowds, and his voice was so clear and powerful that it could reach 20,000 folk. His fervour and dramatic action held them spell-bound, and his homely pathos soon broke down all barriers of resistance. “The first discovery of their being affected,” he says, “was by seeing the white gutters made by their tears, which plentifully fell down their black cheeks.” In 1738 an account of Whitefield’s voyage from London to Georgia was published without his knowledge. In 1739 he published his Journal from his arrival in Savannah to his return to London, and also his Journal from his arrival in London to his departure thence on his way to Georgia. As his embarkation was further delayed for ten weeks he published A Continuation of the Rev. Mr Whitefield’s Journal during the Time he was delayed in England by the Embargo. His unfavourable reception in England by the clergy led him to make reprisals. To Joseph Trapp’s attack on the Methodists he published in 1739 A Preservation Against Unjust Notions, in which the clergy of the Church of England were denounced with some bitterness; he also published shortly afterwards The Spirit and Doctrine and Lives of our Modern Clergy, and a reply to a pastoral letter of the bishop of London in which he had been attacked. In the same year appeared Sermons on Various Subjects (2 vols.), the Church Companion, or Sermons on Several Subjects, and a recommendatory epistle to the Life of Thomas Halyburton. He again embarked for America in August 1739, and remained there two years, preaching in all the principal towns. Left his wife in Georgia, and returned to Scotland he went to Wales, where on the 14th of November he married a widow named James. The marriage was not a happy one. On his return to London in 1742 he preached to the crowds in Moorfields during the Whitsun holidays with such effect as to attract nearly all the people from the shows. After a second visit to Scotland, June-October 1742 (where at Cambuslang in particular he wielded a great spiritual influence), and a tour through England and Wales, 1742-1744, he embarked in August 1744 for America, where he remained till June 1748. On returning to London he found his congregation at the Tabernacle dispersed; and his circumstances were so depressed that he was obliged to sell his household furniture to pay his orphan-house debts. Relief soon came through his acquaintance with Selina, countess of Huntingdon (q.v.), who appointed him one of her chaplains.
WHITEFISH—WHITEHEAD

The remainder of Whitefield's life was spent chiefly in evangelizing tours in Great Britain, Ireland and America. It has been stated that "in the compass of a single week, and that for years, he spoke in general forty hours, and in very many sixty, and that to thousands." In 1748 the synods of Glasgow, Perth and Lothian passed in resolutions intended to exclude him from the pulpits; in 1753 he compiled his hymn-book, and in 1756 opened the chapel which still bears his name in Tottenham Court Road. On his return from America to England for the last time the change in his appearance forcibly impressed Wesley, who wrote in his Journal: "He seemed to be an old man, being fairly worn out in his Master's service, though he had hardly seen fifty years." When health was failing him he placed himself on what he called "short allowance," preaching only once every week-day and thrice on Sunday. In 1769 he returned to America for the seventh and last time, and arranged for the conversion of his orphanage into Bethesda College, which was burned down in 1773. He was now affected by a severe asthmatic complaint; but to those who advised him to take some rest, he answered, "I had rather wear out than rust out." He died on the 26th of September 1770 at Newburyport, Massachusetts, where he had arrived on the previous evening with the intention of preaching the next day. In accordance with his own desire he was buried before the pulpit in the Presbyterian church of the town where he died.

Whitefield's printed works convey a totally inadequate idea of his oratory. Some of his sermons are all in imitated prose. They appeared in a collected form in 1771-1772 in seven volumes, the last containing Memoirs of his Life, by Dr. John Gillies. His Letters (1734-1770) were comprised in vols. i., ii. and iii. of his Works and are also published separately. His Select Works, with a memoir by J. Smith, appeared in 1850. See Lives by Robert Philip (1837), L. Tyerman (2 vols., 1876-1877), J. P. Gedleston (1871, new ed. 1900), and W. H. Lecky's History of England, vol. ii.

WHITEFISH, a collective name applied in different countries to very different kinds of freshwater fishes. The numerous European species of the Cyprinoid genus Leuciscus are frequently comprised under the name of "Whitefish," but the term is employed here for the various species of the Salmonid genus Coregonus. The Coregonus group are somewhat herring-shaped, silvery salmonids with small, toothless or feebly toothed mouth, and rather large scales. They are distributed over Europe, Asia and North America, some species living in the sea, but most inhabiting clear lakes. The highly esteemed "lavaret" of Savoy, the "fellchen," "kilch," "gangfisch," "palæ," "gravenche," "féa" or Switzerland and southern Germany, the "sik" of Sweden, belong to this genus, which is represented in British and Irish waters by the houting (C. oxyrhhynchus), occasionally found in rivers and lakes, the great white Coregon of Loch Lomond, Haweswater, Ullswater and Bala, the vendace (C. vandusis) of Lochmaben, and its newly described ally (C. gracilis) from Derwentwater and Bassenthwaite lakes in Cumberland. About eight species are distinguished from the northern parts of North America. The Coregonus are mostly of small size, few of them attaining a length of 18 in. Secondary nuptial sexual characters are by no means so well marked as in Salmo, but pearl-like excrescences may appear on the scales during the breeding season, and are more prominent in males than females.

WHITEHALL, a village of Washington county, New York, U.S.A., in a township of the same name on the Poultney river and the Champlain Canal, at the head of Lake Champlain, and 78 m. by rail N. by E. of Albany. Pop. (1890) 4434; (1900) 4377, of whom 547 were foreign-born: (1910) 4148; (1920) 4917. Whitehall is served by the Delaware & Hudson railway, and is the N. terminus of the new barge-canal system of New York state. It is situated in a narrow valley between two hills called West Mountain and Skene's Mountain, and Wood Creek flows through the village and empties into the lake with a fall, from which valuable water-power is derived; there are various manufactures, and the village owns and operates the water works.

In 1759, to strengthen the British hold on Canada, a large tract of land at the S. end of Lake Champlain was granted to Colonel Philip Skene (1725-1810), who fought at Ticonderoga in 1758 and in 1759, and who established here in 1761 a settlement of about thirty families which he called Skenesborough and which was patented in 1765. Skene was a Loyalist, and in May 1775 Skencesborough was seized by a party of American volunteers.

In the War of 1812 Whitehall was fortified and was a base of supplies for American operations against Canada. It was incorporated as a village in 1860.

WHITEHAVEN, a municipal and parliamentary borough, seaport and market town of Cumberland, England, 41 m. S.W. of Carlisle. Pop. (1901) 19,324. It lies mainly in a valley opening upon the Irish Sea, with high ground to north and south, and is served by the London & North-Western, the Cockermouth, Keswick & Penrith and the Furness railways. The harbour is protected by two main piers, of which the western is a fine structure by Sir John Rennie, and divided into four parts by others; it has a wet dock and extensive quayage. Regular passenger communications are maintained with the Isle of Man. The exports are principally coal, pig iron and ore, steel and stone. The port was made subordinate to that of Maryport in 1802. There are collieries near the town, the workings extending between the sea and the town. There is a good supply of water for the town, and several breweries, collieries, brick and earthenware works, and other industrial establishments in and near the town. The parliamentary borough returns one member. The municipal borough is under a mayor, 6 aldermen and 18 councillors. Area 1810 acres.

Whitehaven (Witlofhaeven) was an insignificant possession of the priory of St Bee which became crown property at the dissolution of the religious houses. It was acquired before 1344 by relatives of the earl of Londonderry, who secured the prosperity of the town by building the coal-mines. From 1708 the harbour was governed by twenty-one trustees, whose powers were extended and municipalized by frequent legislation, until in 1885, they were incorpporated. In 1894 this government by incorporated trustees gave place to that of a municipal corporation created by charter in that year. The harbour was entrusted to fifteen commissioners. Since the Reform Act of 1832 Whitehaven has returned one representative to parliament. A weekly market and yearly fairs were granted to Sir John Lowther in 1660; two fairs were held in 1888; and the market days are now Tuesday, Thursday and Saturday. Whitehaven coal was sent chiefly to Ireland; and then the market. Other exports were lime, freestone, and grain; West Indian, American and Baltic produce, Irish flax and Welsh pig iron were imported, and shipbuilding was a growing industry. Paul Jones, the notorious buccaneer, served his apprenticeship at the port, which in 1758 he successfully raided, burning three vessels.

WHITEHEAD, WILLIAM (1715-1785), English poet-laureate, son of a baker, was born at Cambridge, and baptized on the 12th of February 1715. His father had extravagant tastes, and spent large sums in ornamenting a piece of land near Grantchester. The land was afterwards known as "Whitehead's Field," and was his second son, and through the patronage of Henry Bromley, afterwards Lord Montfort, was admitted to Winchester College. In 1735 he entered Clare Hall, Cambridge, as a sizar, and became a fellow in 1742. At Cambridge Whitehead published an epistle "On the Danger of writing Verse" and some other poems, notably an heroic epistle, Ani Boleyn to Henry the Eighth (1743), and a didactic Essay on Ridicule (1743). In 1745 he became tutor to Viscount Villiers, son of the earl of Jersey, and took up his residence in London. He produced two tragedies: The Roman Father (Drury Lane, 24th of February 1750), and Crecua, Queen of Athens (Drury Lane, 20th of April 1751). The plots are based respectively on the Horace of Corinelle, and the Ion of Euripides. In June 1754 he went abroad with Lord Villiers.

1 Printed in A Collection of Poems by several Hands (vol. ii., 1748).
WHITE HORSE, VALE OF—WHITELEY

was formerly made the occasion of a festival. Some of all kinds were held, and keen rivalry was maintained not only between the inhabitants of the local villages, but between local champions and those from distant parts of England. The first of such festivals known took place in 1755, and they died out only subsequently to 1857. A grassy track represents the ancient road or Ridge Way along the crest of the hills continuing Icknield Street, from the Chiltern Hills to the north-east, across the Thames; and other earthworks in addition to those near the White Horse overlook the vale, such as Letcombe Castle above Wantage. At the foot of the hills not far east of the Horse is preserved the so-called Blowing Stone, a mass of sandstone pronounced to have holes in it, whereby that when blown like a trumpet a loud note is produced. It is believed that in the earliest times the stone served the purpose of a bugle. Several of the village churches in the vale are of interest, notably the fine Early English cruciform building at Uffington. The length of the vale is traversed by the main line of the Great Western railway, between Didcot and Swindon.

See Thomas Hughes, The Scouring of the White Horse (1859).

WHITEING, RICHARD (1840— ), English author and journalist, was born in London on the 27th of July 1840, the son of a civil servant. He was a pupil of Benjamin Wyon, medallist sculptor, and subsequently of B. R. West, the historian, and perhaps his most famous work was a series of papers in the Evening Star in 1866, printed separately in the next year as Mr Sprouts, His Opinions. He became leader-writer and correspondent on the Morning Star, and was subsequently on the staff of the Manchester Guardian, the New York World, and for many years the Daily News, resigning from the last-named paper in 1899. His novel The Democracy (3 vols., 1876) was published under the pseudonym of Whyte Thorne. His remarkable story The Island (1888) attracted little attention until, years afterwards, its successor, No. 5 John Street (1890), made him famous; the earlier novel was then republished. Later works were The Fellow Van (1903), Ring in the New (1906), All Moonshine (1907).

WHITELEY, WILLIAM (1831—1907), English "Universal Provider," was born at Agbrig, near Wakefield, Yorkshire, on the 29th of September 1831, the son of a corn-factor. At the age of sixteen he was apprenticed to a firm of drapers at Wakefield. In 1851 he made his first visit to London to see the Great Exhibition, and was so impressed with the size and activity of the metropolis that he determined to settle there as soon as his apprenticeship was over. A year later he obtained a subordinate position in a draper's establishment in the city, and after studying the drapery trade in this and other London establishments for ten years, in 1863 himself opened a small shop for the sale of fancy drapery in Westbourne Grove, Bayswater. His capital amounted to about £700, which he had saved from his salaries and commissions, and he at first employed two young girls and an errand boy. Friends in the trade had assured him that Westbourne Grove was one of the two worst streets in London for his business, but Whiteley had noted the number and quality of the people who passed the premises every afternoon, and relied on his own judgment. Events justified his confidence, and within a year he was employing fifteen hands. He made a consistent practice of marking all goods in plain figures and of "dressing" his shop-window attractively, both unusual features in the retail trading of the time, and to this, coupled with the fact that he was satisfied with small profits, he largely attributed a success in which his own genius for organization and energy played a conspicuous part. In 1866 Whiteley added general drapery to his other business, opening by degrees shop after shop and department after department, till he was finally enabled to call himself the "Universal Provider," a term which was not without some justice. That there was nothing which his stores could not supply.

"Whiteley's was, in fact, the first great instance of a large general goods store in London, held under one man's control. In 1899 the business, of which the profits then averaged over £100,000 per annum, was turned into a limited liability company, Whiteley retaining the bulk of the shares. On the 23rd of January 1907 he was shot dead, after an interview in his private
office, by Horace George Rayner, who claimed (but, as was proved, wrongly) to be his illegitimate son and who had been refused pecuniary assistance. Rayner was found guilty of murder, and sentenced to be hanged; but the home secretary (Mr Herbert Gladstone), in response to an agitation for his reprieve,commuted the sentence to penal servitude for life.

**WHITELOCKE, SIR JAMES (1570-1632), English judge, son of Richard Whitelocke, a London merchant, was born on the 28th of November 1570. Educated at Merchant Taylors' School, London, and at St John's College, Oxford, he became a fellow of his college and a barrister. He was then engaged in managing the estates belonging to St John's College, Eton College and Westminster College, before he became recorder of Woodstock and member of parliament for the borough in 1610. In 1620 Whitelocke was made chief justice of the court of session of the county palatine of Chester, and was knighted; in 1624 he was appointed justice of the court of king's bench. He died at Fawley Court, near Reading, an estate which he had bought in 1616, on the 22nd of June 1632. His wife, Elizabeth, was a daughter of Edward Bulstrode of Hedgerley Bulstrode, Buckinghamshire, and his son was Bulstrode Whitelocke.

Sir James was greatly interested in antiquarian studies, and was the author of several papers which are printed in T. Hearne's *Collectanea*. His influence in his Jacobean fame is shown in the book which is edited and published by the Camden Society in 1858.

Whitelocke's elder brother, EDMUND WHITELOCKE (1565-1608), was a soldier in France and later a courtier in England. He was imprisoned because he was suspected of being concerned in the Gunpowder Plot, and although he was most probably innocent, he remained for some time in the Tower of London.

The soldier JOHN WHITELOCKE (1575-1833) was doubtless a descendant of Sir James Whitelocke. He entered the army in 1775 and served in Jamaica and in San Domingo. In 1785 he was made a lieutenant-general and inspector-general of recruiting, and in 1797 he was appointed to command an expedition sent to Guiana. He was killed at the battle of Brier Gages in the city was stubbornly resisted, and then Whitelocke concluded an arrangement with the opposing general by which he abandoned the undertaking. This proceeding was regarded with great disfavour both by the soldiers and others in South America and in England, and its author was brought before a court-martial in 1808. On all the charges except one he was found guilty and he was dismissed from the service. He lived in retirement until his death on the 23rd of October 1833.

**WHITELOCKE, BULSTRODE (1605-1675), English lawyer and parliamentarian, eldest son of Sir James Whitelocke, was baptized on the 10th of August 1605, and educated at Merchant Taylors' School and at St John's College, Oxford, where he matriculated on the 8th of December 1620. He left Oxford, without a degree, for the Middle Temple, and was called to the bar in 1626 and chosen treasurer in 1628. He was fond of field sports and of music, and in 1633 he had charge of the music in the great masque performed by the inns of court before the king and queen. Meanwhile he had been elected for Stafford in the parliament of 1626 and had been appointed recorder of Abingdon and Henley. In 1640 he was chosen member for Great Marlow in the Long Parliament. He took a prominent part in the proceedings against Strafford, was chairman of the committee of management, and had charge of articles XIX.-XXIV. of the impeachment. He drew up the bill for making parliaments indissoluble except by their own consent, and supported the Grand Remonstrance and the action taken in the Commons against the illegal canons; on the militia question, however, he advocated a joint control by king and parliament. On the outbreak of the Great Rebellion he took the side of the parliament, using his influence in the country as deputy-lieutenant to prevent the king's raising troops in Buckinghamshire and Oxfordshire. He was sent to the king at Oxford both in 1643 and 1644 to negotiate terms, and the secret communications with Charles on the latter occasion were the foundation of a charge of treason brought against Whitelocke and Denzil Holles (q.v.) later. He was again one of the commissioners at Uxbridge in 1645.

Nevertheless he opposed the policy of Holles and the peace party and the proposed disbanding of the army in 1647, and though one of the lay members of the assembly of divines, repudiated the claims of divine authority put forward by the Presbyterians for their church, and approved of religious tolerance. He thus implicitly supported Cromwell and the army party, but he took no part either in the disputes between the army and the parliament or in the trial of the king. On the establishment of the Commonwealth, though out of sympathy with the government, he was nominated to the council of state and a commissioner of the new Great Seal. He urged Cromwell after the battle of Worcester and again in 1652 to recall the royal family, while in 1653 he disapproved of the expulsion of the Long Parliament and was especially marked out for attack by Cromwell in his speech on that occasion. Later in the autumn, and perhaps on consequence, Whitelocke was despatched on a mission to Christina, queen of Sweden, to conclude a treaty of alliance and assure the freedom of the Sound. On his return he resumed his office as commissioner of the Great Seal, was appointed a commissioner of the treasury with a salary of £1,000, and was returned to the parliament of 1654 for each of the four constituencies of Bedford, Exeter, Oxford and Buckinghamshire, electing to sit for the latter constituency.

Whitelocke was a learned and a sound lawyer. He had hitherto shewn himself not unfavourable to reform, having supported the bill introducing new measures of taxation, having drafted a new treason law, and set on foot some alterations in chancery procedure. A tract advocating the registering of title-deeds is attributed to him. But he opposed the revolutionary innovations dictated by ignorant and popular prejudices. He defeated the strange bill which sought to exclude lawyers from parliament; and to the sweeping and ill-considered changes in the court of chancery proposed by Cromwell and the council he offered an unbending and honourable resistance, being dismissed in consequence, together with his colleague Widdrington, from the council on 23 June 1657. His views were that of the Great Seal (see Lenthall, William). He still, however, remained on good terms with Cromwell, by whom he was respected; he took part in public business, acted as Cromwell's adviser on foreign affairs, negotiated the treaty with Sweden of 1656, and, elected again to the parliament of the same year as member for Buckinghamshire, was chairman of the committee which conferred with Cromwell on the subject of the Petition and Advice and urged the protector to assume the title of king. In December 1657 he became a member of the new House of Lords. On Richard Cromwell's accession he was reappointed a commissioner of the Great Seal, and had considerable influence during the former's short tenure of power. He returned to his place in the Long Parliament on its recall, was appointed a member of the council of state on the 14th of May 1659, and became president in August; and subsequently, on the fresh expulsion of the Long Parliament, he was included in the committee of safety which superseded the council. He again received the Great Seal into his keeping on the 1st of November. During the period which immediately preceded the Restoration he endeavoured to oppose Monk's schemes, and desired Fleetwood to forestall him and make terms with Charles, but in vain.

On the failure of his plans he retired to the country and awaited events. Whitelocke's career, however, had been marked by moderation and good sense throughout. The necessity of carrying on the government of the country somehow or other had been the chief motive of his adherence to Cromwell rather than any sympathy for a republic or a military dictatorship, and his advice to Cromwell to accept the title of king was doubtless rendered with the object of giving the administration greater stability and of protecting its adherents under the Stuarts of Henry VII. Nor had he shown himself unduly ambitious or self-seeking in the pursuit of office, and he had proved himself ready to sacrifice high place to the claims of professional honour and duty. These considerations were not without weight with his contemporaries at the Restoration. Accordingly Whitelocke was not excepted from the Act of Indemnity, and after the
payment of various sums to the king and others he was allowed to retain the bulk of his property. He lived henceforth in seclusion at Chilton in Wiltshire, dying on the 28th of July 1675.

Whitelocke married (1) Rebecca, daughter of Thomas Bennet, (2) Frances, daughter of Lord Willoughby of Parham, and (3) Mary Larry, widow of Rowland Whitelocke, and had by her children, the most celebrated of whom was the author of "Memoirs of the English Affairs from the beginning of the reign of Charles I.", published 1682 and reprinted, a work which has obtained greater authority than it deserves, being largely compiled from various sources, composed after the events and abounding in errors. His work of greatest value, his Annals, still remains in MS. in Lord Bute's and Lord de Warr's collections (Hist. Brit. Comm. III. Rep. pp. 202, 217), also Egerton MSS. 4992, 4993; his Journal of the Swedish Embassy... was published 1772 and re-edited by Henry Reeve in 1885 (add. MSS. 4992, 4991 and 4993 and Hist. MSS. Comm. III. Rep. 190, 217); Notes on the King's Writ for choosing Members of Parliament... were published 1786 (see also add. MSS. 4993; Memoirs of English Affairs from the supposed expedition of Bruce to this Island to the end of the Reign of James I., were published 1790; Essays Ecclesiastical and Civil (1706); Quench not the Spirit... (1711); some theological treatises remain in MS., and several others are attributed to him.

WHITE MOUNTAINS—WHITEPLAINS

WHITE MOUNTAINS, the portion of the Appalachian Mountain system which traverses New Hampshire, U.S.A., between the Androscoggin and Upper Ammonoosuc rivers on the north and the lake country on the south. They cover an area of about 3,000 sq. m., are composed of somewhat homogeneous granite rocks, and represent the remnants of long-continued erosion of a range which has been reduced to a chain of more or less elevated summits, cut deep by rivers and streams they rise to rounded summits notably in outline and of greater elevation than elsewhere in the Appalachian system, except in North Carolina, and culminate in Mount Washington, 6,293 ft. above the sea. Thirteen other summits have an elevation exceeding 5,000 ft. The scenery is so beautiful and varied that the region has long been popular as a summer resort. It is traversed by railways, one of which ascends Mount Washington, and contains numerous villages and fine hotels.

See the article New Hampshire; the Guidebook (Part i., Boston, 1907) published by the Appalachian Mountain Club; and Appalachia (ibid., 1876 seq.), a periodical published by the same club.

WHITE PLAINS, a village and the county-seat of Westchester county, New York, U.S.A., about 12 m. N. of New York City on the Bronx river, about midway between the Hudson river and Long Island Sound. Pop. (1890) 4,558; (1900) 7,899, of whom 1,679 were foreign-born and 269 were negroes; (1910 census) 26,425. The village is served by the New York Central and Hudson River railway, and is connected by electric lines with New York City, and with Yonkers, Mount Vernon, New Rochelle, Tarrytown and Mamaroneck. White Plains is a beautiful residential suburb stretching over a considerable area of rolling tree-clad hills and picturesque stretches of meadow lands in the valley of the Bronx and Mamaroneck rivers. Near the village are Silver, Kensico and Rye lakes. Among the public buildings and the institutions here are a fine Public Library building, a town hall, an armory, the Westchester county court house and county jail, several private schools, the White Plains Hospital, St Agnes Hospital, the Presbyterian Convalescent's Sanitarium, the New York Orthopaedic Hospital, Muldoon's Hygienic Institute and Bloomingdale Hospital for Insane (1821). In White Plains are the grounds of the Century Country Club, the Knollwood Golf and Country Club and the Westchester County Fair Association. There are some prosperous farms and small gardens.

When the Dutch first settled Manhattan, the central portion of what is now Westchester county was the granary for part of the Mahican tribe; it was called Quarrapos by the Indians. To the early traders here the region was known as the "White Plains" from the groves of white balsam which covered it. The first organized settlement (November 1863) was by a party of Connecticut Puritans, who had settled at Rye in what was then disputed territory between New York and Connecticut; they moved westward in a body and took up lands the title to which they bought from the Indians. The heirs of John Richbell claimed that White Plains was comprised in a tract extending N. from the Mamaroneck river granted to him by the Dutch and confirmed by the English, and the controversy between these heirs and the settlers from Rye was only settled in 1724 by the grant to Joseph Gridley and six other settlers of a royal patent under which the freeholders chose their local officers and managed their own affairs. In 1759 White Plains succeeded Westchester as the county-seat of Westchester county. In the early summer of 1776 the Third Provincial Congress, having adjourned from New York City, met here in the old court house on South Broadway—the site is now occupied by an armoury and is marked by a monument (1910). From the steps of this building the Declaration of Independence, brought from Philadelphia, was officially read for the first time in New York on the 17th of July 1776. Here Congress adopted formally the name "Convention of Representatives of the State of New York," and from this date the existence of New York as a state. After the British under Lord Howe had effected a landing at Throg's Neck on Long Island Sound, Washington withdrew (October) all his forces from the North end of Manhattan Island except the garrison of Fort Washington, and (21st October) concentrated his army near White Plains. His right rested on the Bronx river here, and there was a small force in rude earthworks on Chatterton's Hill on the W. bank. This point Howe attacked (October 28th), his troops advancing in two columns 4,000 strong, the British under General Alexander Ramsay, the Hessians under Colonel Johann Gottlieb Rall, General Alexander McDougall, in command of the American right wing, reinforced the troops on the hill, making the number of the defenders about 1,600. The attack was stubbornly resisted for some time, after which the Americans retreated in good order across the river. The British had sustained such a severe loss (about 250) that no attempt was made to follow the Americans, who carried their dead and wounded, some 152 in number, away with them. Washington's forces retired three days later to North Castle township, where they occupied a stronger position. The old "Mill House," which still stands in North White Plains, was occupied at intervals by Washington as his headquarters before the battle and again in the summer of 1778. In 1779 a Continental force under Aaron Burr was stationed here for some months, and in 1781 (July) White Plains was occupied by parts of Lausun's and Rochambeau's French force. In 1866 White Plains received a village charter, which it still retains in spite of its large population.

See F. Shonnard and W. W. Spooner, History of Westchester County (N.Y., 1890), and J. T. Schart, History of Westchester County (2 vols., ibid., 1886).

WHITE SIDE, JAMES (1804-1876), Irish judge, son of William Whiteside, a clergyman of the Church of Ireland, was born on the 12th of August 1804, and was educated at Trinity College, Dublin, being called to the Irish bar in 1830. He very rapidly acquired a large practice, and after taking silk in 1842 he gained a reputation for forensic oratory surpassing that of all his contemporaries, and rivalling that of his most famous predecessors of the 18th century. He defended Daniel O'Connell in the state trial of 1843, and William Smith O'Brien in 1848; and his greatest triumph was in the Yelverton case in 1861. He was elected member for Enniskillen in 1851, and in 1852 became solicitor-general for the United Provinces, but he was less successful as a speaker than at the bar, and in 1853 was appointed solicitor-general for Ireland in the first administration of the earl of Derby, becoming attorney-general in 1858, and again in 1866. In the same year he was appointed chief justice of the Queen's Bench; and he died on the 25th of November 1876. Whiteside was a man of handsome presence, attractive personality and cultivated tastes. In 1848, after a visit to Italy, he published Italy in the Nineteenth Century; and in 1870 he collected and republished some papers contributed many years before to periodicals, under the title Early Sketches of Eminent Persons. In 1853 Whiteside married Rosetta, daughter of
WHITETHROAT—WHITGIFT

William Napier, and sister of Sir Joseph Napier (1804-1882), lord chancellor of Ireland.

WHITETHROAT, a name commonly given to two species of little birds, one of which, the *Motacilla Sylvia* of Linnaeus and *Sylvia rubra* or *S. cinerea* of recent authors, is regarded as the type, not only of the genus *Sylvia*, but of the sub-family of thrushes known as *Sylviinae* (cf. Warblers). Very widely spread over Great Britain, in some places tolerably common, and by its gesticulations and song rather conspicuous, it is one of those birds which have gained a familiar nickname, and "peegy whitethroat" is the anthropomorphotropic appellation of schoolboys and milkmaids, though it shares "nettee-creeper" and other homely names with perhaps more than one congener, while to the writers and readers of books it is by way of distinction the greater white-throat. The lesser whitethroat, *Sylvia curruca*, is both in habits and plumage a much less sightly bird; the predominating reddish brown of the upper surface, and especially the raking edge of the wing-feathers, that are so distinct of its larger congener, are wanting, and the whole plumage above is of a smoky-grey, while the bird in its movements is never obtrusive, and it rather shuns than courts observation. The nests of each of these species are very pretty works of art, finely built of bents or other plant-stalks, and usually lined with horsehair; but the sides and bottom are often so finely woven as to be like open basket-work, and the eggs, splashed, spotted or streaked with olive-brown, are frequently visible from beneath through the interstices of the fabric. This simplicity in its nest-building seems to be most to all the species of the genus *Sylvia*, of which, restricted, and in many districts has obtained for the builders the name of "hay-jack," quite without reference to the kind of bird which puts the nests together, and thus is also applied to the blackcap, *S. atricapilla*, and the garden-warbler—this last being merely a book-name—*S. salticaria* (S. hortensis of some writers). The former of these deserves mention as one of the sweetest songsters of Great Britain. The name blackcap is applicable only to the cock bird, who further differs from his brown-capped mate by the purity of his sahy-grey upper plumage; but, notwithstanding the marked sexual difference in appearance, he takes on himself a considerable share of the duties of incubation. All these four birds, as a rule, leave Great Britain at the end of summer to winter in the south. Two other species, one certainly belonging to the same genus, *S. orphea*, and the other, *S. nisoria*, a somehow aberrant form, have occurred two or three times in Great Britain. The curious Dartford warbler of English writers, *Sylvia undata*, is on many accounts a very interesting bird, for it is one of the few of its family that winter in England—a fact the more remarkable when it is known to be migratory in most parts of the continent of Europe. Its distribution in England is very local, and chiefly confined to the southern counties. It is a pretty little dark-coloured bird, which here and there may be seen on furze-grown heaths from Kent to Cornwall. For a species with wings so feebly formed it has a wide range, inhabiting nearly all the countries of the Mediterranean seaboard, from Palestine to the Strait of Gibraltar, and thence along the west coast of Europe to the English Channel; but everywhere else it seems to be very local.

This may be the most convenient place for noticing the small group of warblers belonging to the well-marked genus *Hypolais*, which, though in general appearance and certain habits resembling the *Phylloscopus* (cf. [willow] *Xen*), would seem usually to have little to do with those birds, and to be rather allied to the *Sylvia*. They have a remarkably loud song, and in consequence are highly valued on the continent of Europe, where two species at least spend the summer. One of them, *H. siterina*, has occurred more than once in the Aran Islands and their vicinity. The other, *H. arenaria*, is a charm of song, with a quick, light, calculated warble, and combining warmth with lightness in a way that cannot be fully appreciated by any description. (A. N.)

WHITFIELD, JOHN CLARKE (1770-1836), English organist and composer, was born at Gloucester on the 13th of December 1770, and educated at Oxford under Dr Philip Hayes. In 1789 he was appointed organist of the parish church at Ludlow. Four years later he took the degree of Mus. Bac. at Cambridge, and in 1795 he was chosen organist of Armagh cathedral, whence he removed in the same year to Dublin, with the appointments of organist and master of the children at St Patrick's cathedral and Christchurch. Driven from Ireland by the rebellion of 1798, Whitfield accepted the position of organist of St John's, Cambridge, and about the same time assumed the editorship of the *Cambridge News*. In 1800 he took possession of the vacant organistship at the Church in Cambridge, in addition to that of Clarke, by which he had been previously known. He took the degree of Mus. Doc. at Cambridge in 1799, and in 1810 proceeded to the same grade at Oxford. In 1820 he was elected organist and master of the choristers at Hereford cathedral; and on the death of Dr Haig he was appointed professor of music at Cambridge. Three years afterwards he resigned these appointments in consequence of an attack of paralysis. He died at Hereford, on the 22nd of February 1836.

Whitfield's compositions were very numerous. Among the best of them are four volumes of anthems, published in 1808. He also composed a great number of songs, one of which—"Bird of the Wilderness," written to some well-known verses by James Hogg, the "Ettrick Shepherd"—attained a high degree of popularity. But the great work of his life was the publication, in a popular and eminently useful form, of the oratorios of Handel, which he was the first to present to the public with a complete pianoforte accompaniment.

WHITGIFT, JOHN (c. 1530-1604), English archbishop, was the eldest son of Henry Whitgift, merchant of Great Grimsby, Lincolnshire, where he was born, according to one account in 1535, but according to another account he was born in 1530. At an early age his education was entrusted to his uncle, Robert Whitgift, abbot of the neighbouring monastery of Wellow, by whose advice he was afterwards sent to St Anthony's school, London. In 1549 he matriculated at Queens' College, Cambridge, and in May 1550 he migrated to Pembroke Hall, where he had the martyr John Bradford for a tutor. In May 1555 he became a fellow of Peterhouse. Having taken orders in 1560, he became in the same year chaplain to Richard Cox, bishop of Ely, who installed him to the rectory of Teversham, Cambridgeshire. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, and his lectures gave such satisfaction to the authorities that on the 7th of July 1566 they considerably augmented his stipend. The following year he was appointed regius professor of divinity, and also became master first of Pembroke Hall and then of Trinity. He had a principal share in compiling the statutes of the university, which passed the great seal on the 25th of September 1570, and in November following he was chosen vice-chancellor. Macaulay's description of Whitgift as "a narrow, mean, tyrannical priest, who gained his position by the help of his religious views, and maintained it only by the expenditure of his money" is very exaggerated; but undoubtedly Whitgift's extreme High Church notions led him to treat the Puritans with exceptional intolerance. In a pulpit controversy with Thomas Cartwright, regarding the constitutions and customs of the Church of England, he showed himself Whitgift's inferior in oratorical effectiveness, but the balance was redressed by the exercise of arbitrary authority. Whitgift, with other heads of the university, deprived Cartwright in 1570 of his professorship, and in September 1571 expelled him from Trinity college as master of the middle men to deprive him of his fellowship. In June of the same year Whitgift was elected dean of Lincoln. In the following year he published "An Answer to a Certain Libel intituled an Admonition to the Parliament," which led to further controversy between the two divines. On the 24th of March 1577, Whitgift was appointed bishop of Worcester, and during the absence of Sir Henry Sidney in Ireland (1577) he acted as vice-president of Wales. In August 1583 he was appointed archbishop of Canterbury, and thus was largely instrumental in giving its special complexion to the church of the Reformation. Although he wrote a letter to Queen Elizabeth denouncing against the alienation of church property, Whitgift always retained her special confidence. In his policy against the Puritans, and in his vigorous enforcement of the subscription test, he thoroughly carried out the queen's policy of religious uniformity. He drew up articles aimed at
nonconforming ministers, and obtained increased powers for the Court of High Commission. In 1586 he became a privy councillor. His action gave rise to the Marprelate tracts, in which the bishops and clergy were bitterly attacked. Through Whitgift's vigilance the powers of the judges were increased, discovered and punished; and in order more effectually to check the publication of such opinions he got a law passed in 1593 making Puritanism an offence against the statute law. In the controversy between Walter Travers and Richard Hooker he interposed by prohibiting the preaching of the former; and he moreover presented Hooker with the recorty of Boscombe in Wiltshire, in order to afford him more leisure to complete his Ecclesiastical Polity, a work which, however, cannot be said to represent either Whitgift's theological or his ecclesiastical standpoint. In 1605 he, in conjunction with the bishop of London and other prelates, drew up the Calvinistic instrument known as the Lambeth Articles, which were not accepted by the church. Whitgift attended Elizabeth on her deathbed, and crowned James I. He was present at the Hampton Court Conference in January 1604, and died at Lambeth on the 29th of the following February. He was buried in the church of Croydon, and his monument there with his recumbent effigy was in great part destroyed in the fire by which the church was burnt down in 1687.

Whitgift is described by his biographer, Sir G. Paule, as "middle stature, strong and well shaped, of a great convenience and broad complexion, black hair and eyes, his beard neither long nor thick." He was noted for his hospitality, and was somewhat ostentatious in his habits, sometimes visiting Canterbury and other towns by way of a short cut, and returning by the long round by 500 homestops. He left a number of unpublished works, which are included among the MSS. Angliae. Many of his letters, articles, injunctions, &c. are calendared in the published volumes of the "State Paper" series of the reign of Elizabeth. His Collected Works, edited for the Parker Society by John Ayre (3 vols., Cambridge, 1851-1853), include, besides the controversial tracts already alluded to, two sermons published during his lifetime, a selection from his letters to Cecil and others, and some portions of his unpublished MSS.

A Life of Whitgift by Sir G. Paule appeared in 1612, 2nd ed. 1649. It was embodied by John Strype in his Life and Acts of Whitgift (1716). The life is also a life in C. Wordsworth's Ecclesiastical History (1801), W. F. Hook's Archbishes of Canterbury (1875), and vol. i. of Whitgift's Collected Works. See also C. H. Cooper's Atheneae Cantabrigienses.

WHITHORN, a royal burgh of Wigtownshire, Scotland. Pop. (1901) 1118. It is situated near the southern extremity of the peninsula of Machers, 12½ m. S. of Wigtown by railway. The town consists of one long street running north and south, in which the town-hall is situated. It is famous for its associations with St Ninian or Ringan, the first Christian missionary to the Isle of Whithorn, whose monastery was probably on a promontory about 4½ m. to the S.E. where he built (307) a church of stone and lime, which, out of contrast with the dark mud and wattle huts of the natives, was called Candida Casa, the White House (Anglo-Saxon, Hwitiarn, Whiterine or Whithorn). This he dedicated to his master St Martin of Tours. Ninian died probably in 432 and was buried in the church. A hundred years later the Magnus Monasterium, or monastery of Rosnat, was founded at Whithorn, and became a noted home of learning and, in the 8th century, the seat of the bishopric of Galloway. It was succeeded in the 11th century by St Ninian's Priory, built for the premonstratensian monks by Peter of Galloway, of which only the chancel (used as the parish church till 1822) with a richly decorated late Norman doorway, and fragments of the lady chapel, vaults, cellars, buttresses and tombs remain. The priory church was the cathedral church of the see till the Reformation, when it fell into gradual decay. In Roman times Whithorn belonged to the Novantae, and William Camden, the antiquary, identified it with the Leukophila of Ptolemy. It was made a royal burgh by Robert Bruce.

WHITMAN, city of Lake county, Indiana, U.S.A., on the S.W. shore of Lake Michigan, on S.E. of Chicago. Pop. (1890) 7408; (1900) 3983 (1907 foreign-born); (1910) 6857. It is served by the Baltimore & Ohio, the Lake Shore & Michigan Southern, the Pennsylvania, the Chicago, Indiana & Southern and (for freight only) the Elgin, Joliet & Eastern, the Chicago Terminal Transfer, and the Indiana Harbour Belt railways; and is connected with Chicago and with the surrounding towns by an electric line. The city has a Carnegie library and a public park. Manual training, from the fourth to the twelfth grades, is a feature of the public school system. Whitting adjoins the cities of Hammond and East Chicago, and is practically a part of industrial Chicago, from which it is separar. Whitlow is a state line. It is a shipping point; the Standard Oil Company has a large refinery here, and among its manufactures are asphaltum for street paving, linoleum and men's garments. Whiting was first settled about 1870, was incorporated as a town in 1895, and chartered as a city in 1903.

WHITING (Gadus merlangus), a fish of the family Gadidae, which is abundant on the shores of the German Ocean and all round the coasts of the British Islands; it is distinguished from the other species of the genus by having from 33 to 35 rays in the first anal fin, and by lacking a spine on the cheek. The snout is long, and the upper jaw longer than the lower. A black spot at the root of the pectoral fin is also very characteristic of this species, and but rarely absent. The whiting is one of the most valuable food fishes of northern Europe, and is caught throughout the year by hook and line and by the trawl. It is in better condition at the beginning of winter than after the spawning season, which falls in the months of February and March. Its usual size is from 1 to 1½ lb, but it may attain to twice that weight.

Whitlow is a name applied loosely to any inflammation involving the pulp of the finger, attended by swelling and throbbing pain. In the simplest form, which is apt to occur in sickly children, the inflammation results in a whitish vesicle of the skin, containing watery or bloody fluid. In all such cases, where the deeper structures are not implicated, no radical local treatment is needed, although the illness is an indication for constitutional treatment. The inflammation is not usually spoken of as whitlow unless it involves the deeper structures of the last joint of the finger, in which case it is associated with intense pain. As the result of a scratch or prick of the finger, septic germs enter the skin and give rise to an acute inflammation, with throbbing and bursting pain. If the germs do not spread from that spot, they set up an acute localized attack of erysipelas which may end in a superficial abscess. More often, however, they make their way to the periosteum of the last bone of the finger, and involve it in a devastating inflammation which may end in death (necrosis) of that bone. Sometimes the germs find their way into the tendon-sheath, and, spreading into the palm of the hand, cause a deep abscess with, perhaps, sloughing of the tendon, and leaving a permanently stiffened finger. In some cases the inflammation of the tendon is so severe that the person is especially apt to occur in people who are out of health, as in them the micro-organisms of the disease meet with less resistance. So soon, therefore, as the acute stage of the disease is over, tonic treatment, with quinine and iron, is needed. The local treatment of whitlow demands a free incision into the area in which the germs are undergoing cultivation, and the sooner that this is done the better. It is wrong to wait for an abscess to be formed. A prompt incision may actually prevent the formation of abscess, and the easing of the tension of the inflamed tissue by the incision gives immediate relief. Perhaps, even in the early stage of the disease, a bead or two of pus may find exit, but whether there is abscess or not, the depths of the wound should be swabbed out with some strong carbolic or mercuric lotion in order to destroy the germs. The hand should then be placed upon a splint with antiseptic fomentations around the finger. It should, moreover, be kept well raised, or worn in a sling. (E. O.)

WHITMAN, Marcus (1802-1847), American missionary and pioneer, was born at Rushville, New York, on the 4th of September 1802. He studied medicine at Pittsburg, Massachusetts, and practised in Canada and in Wheelers, Steuben county, New York. In 1834 he was accepted by the American Board of Commissioners for Foreign Missions for missionary work among the American Indians, and was assigned to the Oregon territory, then under the joint occupation of Great Britain and the United States. He set out early in 1835, but returned almost immediately
to secure other workers. In February 1836 he married and in March again crossed the continent, accompanied by his wife, Rev. and Mrs H. H. Spalding and W. H. Gray, and settled at Wailatpu, near the present Walla Walla, Washington. Dissensions which arose among the missionaries and their apparent lack of success led to a resolution (February 1842) of the Prudential Committee of the Board to abandon the southern station. With the consent of his associates, Dr Whitman started from the station (3rd October 1842) on the perilous winter journey over the Rocky Mountains and across the plains for the missionary headquarters at Boston, to urge the revocation of the order. He visited New York and Washington also to enlist help and sympathy. On his return journey he joined a considerable body of emigrants on their way to Oregon and piloted them across the mountains. The mission, however, gained the ill-will of the Indians, and, on the 29th of October 1847 Dr and Mrs Whitman and twelve others were killed, and the station was broken up.

On the 15th of November 1864 the statement was published, on the authority of Mr Spalding, that the purpose of Dr Whitman's ride, twenty-two years before, was to prevent the cession of the territory to Great Britain. The story was amplified by Spalding and Gray in 1865. The State, and in its Senate, which had learned at the British fort Walla Walla in September 1842 that a large number of British settlers were expected, and that it was hoped that the treaty then supposed to be about to be signed with the United States would provide for their removal, were determined to give the territory to the British. Thereupon Whitman made his way to Washington, and with much difficulty convinced Webster and Pinchback of the value of the petition. Possibly, but not more, in the way of change for fishing privileges off Newfoundland. This story has been widely disseminated, but Professor E. G. Bourne and Mr W. I. Marshall independently investigated the whole question, and showed that there is no evidence that Dr Whitman influenced or attempted to influence the State Department. For the pro-Whitman side, see W. H. Gray, Oregon (Portland, 1870); William Barrows, Oregon (Boston, 1889); O. W. Nixon, How Marcus Whitman saved Oregon (Chicago, 1892); W. A. Mowry, Marcus Whitman (New York, 1901); Myron Eells, Marcus Whitman (Seattle, 1903). On the other side see H. H. Bancroft, Oregon (San Francisco, 1886-1888); E. G. Bourne, Essays in Historical Criticism (New York, 1901); W. I. Marshall, History v. The Whitman-saved-Oregon Story (Chicago, 1904).

WHITMAN, WALT (1819-1892), American poet, was born at West Hills, on Long Island, New York, on the 31st of May 1819. His ancestry was mingled English and Holland Dutch, and had flourished upon Long Island more than 150 years—long enough to have taken deep root in the soil and to have developed, in its farmers and sea-faring men, many strong family traits. His father, Walter Whitman, was a farmer and carpenter; his mother, Louisa Van Velsor, was the granddaughter of a sea captain. There do not appear to be any men in his line of descent necessarily associated with the sea. His father moved back to the 17th century, when we come to Abijah Whitman, a dergyman, settled in Connecticut. Later this Abijah moved to Long Island, and from him all the Whitmans on the island descended. Walt was the second of a family of nine children. The parents early moved to Brooklyn, where Whitman spent his youth. His career was a chequered one, like that of so many other self-made American men. First he was an errand boy in a lawyer's office; then he was employed in a printing office; next he became a country school teacher; he founded (1830) and edited a daily paper at Huntington, New York, and later edited a daily paper in Brooklyn (the Eagle, 1846-1847); then he was found in New Orleans, on the editorial staff of the Crescent (1848-1849); afterwards he passed his time carpentering, building and selling small houses in Brooklyn (1851-1854), in the meanwhile writing for the magazines and reviews and turning out several novels, and finally revolving in his mind the scheme of his Leaves of Grass. This scheme was probably gestating in his mind during the years 1853, 1854 and 1855. He frequently stopped his carpentering to work at his poems. His largesse was shown in his numerous manuscript notes, showing the preparatory studies and reflections that preceded the Leaves; many of them, under the title of Notes and Fragments, were privately printed by his literary executor, Dr Richard Maurice Bucke, in 1899. Finally, in the summer of 1855 the first edition of Leaves of Grass appeared—a small quarto of ninety-four pages. The book did not attract the attention of the critics and the reading public till a letter from Emerson to the poet, in which the volume was characterized as "the most extraordinary piece of wit and wisdom that America has yet contributed," was published in the New York Tribune. This created a demand for the book, and started it upon a career that has probably had more vicissitude, more harm and more benefit than any other contemporary literary work. In 1856 a second and much enlarged edition of Leaves of Grass appeared. In 1860 a third edition, with much new matter, was published in Boston. In 1862 Whitman went to Washington to look after his brother, Lieutenant-Colonel George W. Whitman, who was wounded at the battle of Fredericksburg. Henceforth, for more than ten years he remained in and about Washington, acting as a volunteer nurse in the army hospitals as long as the war lasted, and longer, and then finding employment as a clerk in the government departments, in the meantime adding to and revising his Leaves and publishing two or three editions of them, himself his own publisher and bookseller. Out of his war experiences came in 1866 his Drum Taps, subsequently incorporated into the main volume. Early in 1873 he suffered a paralytic stroke which partially disabled him. He then went to Camden, New Jersey, to live and continued to reside in that city till his death on the 27th of March 1892. In 1871 appeared his prose volume called Democratic Vistas. In 1876 he published a thin volume, called Two Rambles, made up of prose and verse. Specimen Days and Collect, also prose, appeared in 1883. new editions of his poems. He was never published more in his life than he was during these years. A final and complete edition of his works, including both prose and verse, was published in Philadelphia in 1889.

Whitman never married, never left America, never laid up, or aimed to lay up, riches: he gave his time and his substance freely to others, belonged to no club nor coterie, associated habitually with the common people—mechanics, coach-drivers, working men of all kinds—was always cheerful and optimistic. He was large and picturesque of figure, slow of movement, tolerant, receptive, democratic and full of charity and goodwill, and brings the reader into intimate and enlarged relations with fundamental human qualities—with sex, manly love, charity, faith, self-esteem, candour, purity of body, sanctity of mind. He was democratic because he was not in any way separated nor detached from the common people by his quality, his culture, or his aspirations. He was bone of their bone and flesh of their flesh. Tried by current standards his poems lack form and structure, but they undoubtedly have in full measure the qualities and merits that the poet sought to give them.

See his Complete Writings (10 vols., New York, 1902), with bibliographical and critical matter by O. L. Triggs. His Poems (1902) has a biographical introduction by John Burroughs, whose Whitman: A Study (Boston, 1896) forms the tenth book of his Leaves and is a" side" edition of the poet's works. See also Walt Whitman's Diary in Canada, with Extracts from other of his Diaries and Literary Notebooks.
WHITNEY, E.—WHITNEY, W. D. 611

WHITNEY, ELI (1765-1825), American inventor, was born on a farm in Westboro, Massachusetts, on the 8th of December 1765. He exhibited unusual mechanical ability at an early age and earned a considerable part of his expenses at Yale College, where he graduated in 1792. He soon went to Savannah, Georgia, expecting to secure a position as a teacher, but was disappointed, and accepted the invitation of Mrs Nathaniel Greene, the widow of the Revolutionary general, to spend some time on her plantation on the Savannah river, while deciding upon his future course. The construction by her of several ingenious household contrivances led Mrs Greene to introduce him to some gentlemen who were discussing the desirability of a machine to separate the short staple upland cotton from its seeds, work which was then done by hand at the rate of a pound of lint a day. In a few weeks Whitney produced a model, consisting of a wooden cylinder enclosed by rows of slender spikes set half an inch apart, which extended between the bars of a grid so closely together that the seeds could not pass, but the lint was pulled through by the revolving spikes; a revolving brush cleaned the spikes, and the seeds were finally forced out. The machine was worked by hand and could clean 50 lb of lint a day. The model seems to have been stolen, but another was constructed and a patent was granted on the 14th of March 1794. Meanwhile Whitney had formed a partnership with Phineas Miller (who afterward married Mrs Greene), and they built at New Haven, Connecticut, a factory (burned in March 1795) for the manufacture of the gins. The partners intended to establish an absolute monopoly and to charge a toll of one-third of the cotton or to buy the whole crop. They were unable to supply the demand, and the Connecticut blacksmiths constructed many machines. A patent, later annulled, was granted May 1795 to Hodge Holmes for a gin which substituted circular saws for the spikes. Whitney spent much time and money prosecuting infringements of his patent, and in 1807 its validity was finally settled. The financial returns in Georgia cannot be ascertained. The legislature of South Carolina voted $50,000 for the rights for that state, while North Carolina levied a tax of five years, from which about $30,000 was realized. Tennessee paid, perhaps, $30,000. Meanwhile Whitney, disguised with the struggle, began the manufacture of fire-arms near New Haven (1798) and secured profitable government contracts. He introduced the division of labour and standardized parts. Although the modern guns have been much enlarged and improved, the essential features are the same as in Whitney's first model, and the invention profoundly influenced American industrial, economic and social history.

WHITNEY, Josiah Dwight (1819-1869), American geologist, was born at Northampton, Massachusetts, on the 3rd of November 1819. He graduated at Yale in 1839, and after two years' work as assistant in the geological survey of New Hampshire, spent a year in Europe in the study of chemistry, mineralogy and geology. Returning to the United States in 1847, he laboured successfully for a time in the copper and iron lands of the Lake Superior region; in 1855 he became State chemist and professor in the Iowa University and took part in the geological survey of the state; he subsequently worked in the lead region of the upper Missouri river, in Wisconsin, and in Illinois, publishing many reports, singly or in collaboration with others. From 1860 to 1874 he was state geologist of California, and issued a comprehensive series of reports on its topography, geology and botany. In 1869, with William H. Brewer, he determined the heights of the principal Rocky Mountain summits; and in recognition of his labours Mount Whitney (14,502 ft, in Inyo county, one of the highest peaks in the United States) received its name from him. In the spring of his death he was professor of geology and director of the school of mining and practical geology at Harvard University, residing in Cambridge save when absent on expeditions of research. The records of his investigations are somewhat dispersed; the most homogeneous of his writings are The Metallic Wealth of the United States, described and compared with that of other Countries (1854), a work of importance at the time of its issue, and Contributions to American Geology (vol. i. only, 1880). He died at a hotel on the 27th of August 1883.

WHITNEY, William Collins (1814-1874), American political leader and financier, was born at Conway, Massachusetts, on the 15th of July 1814, of Puritan stock. He graduated at Yale in 1836, studied law at Harvard, and practised with success in New York City. He was an aggressive opponent of the "Tweed Ring," and was actively allied with the anti-Tammany organizations, the "Irving Hall Democracy" of 1875-1890, and the "County Democracy" of 1880-1890, but upon the dissolution of the latter he became identified with Tammany. In 1875-1876, he was corporation counsel of New York, and as such brought about a codification of the laws relating to the city, and successfully contested a large part of certain claims, largely fraudulent, against the city, amounting to about $20,000,000, and a heritage from the Tweed regime. During President Cleveland's first administration (1885-1889), Whitney was secretary of the navy department and did much to develop the navy, especially by encouraging the domestic manufacture of armour plate. In 1892 he was instrumental in bringing about the third nomination of Mr Cleveland, and took an active part in the ensuing presidential campaign; but in 1896, disappointing the "free-silver" party, he refused to support his party's candidate, Mr W. J. Bryan. Whitney took an active interest in the development of urban transit in New York, and was one of the organizers of the Metropolitan Street Railway Company. He was also interested in horse-racing, and in 1901 won the English Derby with Volodyovski, leased by him from Lady Meux. He died in New York City on the 2nd of February 1904.

WHITNEY, William Dwight (1827-1894), American philologist, was born at Northampton, Massachusetts, on the 9th of February 1827. He was the fourth child and the second surviving son of Josiah Dwight Whitney, a banker, and Sarah Williston, daughter of the Rev. Payson Williston (1763-1836) of Easthampton, Mass., and a sister of Samuel Williston (1795-1874), founder of Williston Seminary at Easthampton. Through both parents he was descended from New England stock remarkable alike for physical and mental vigour; and he inherited all the social and intellectual advantages that were afforded by a community noted, in the history of New England, for the large number of distinguished men whom it produced. At the age of fifteen (1842) he entered the sophomore class at Williams College (at Williamstown, Mass.), where he graduated three years later with the highest honours. His attention was at first directed to natural science, and his interest in it always remained keen, and his knowledge of its principles and methods exerted a noticeable influence upon his philological work. In the summer of 1849 he had charge of the botany, the barometrical observations and the accounts of the United States survey of the Lake Superior region conducted by his brother, Josiah D. Whitney, and in the summer of 1853 assisted in the geographical work of the Hayden expedition in Colorado. His interest in the study of Sanskrit
WHITSTABLE—WHITSUNDAY

was first awakened in 1848, and he at once devoted himself with enthusiasm to this at that time little-explored field of philological labour. After a brief course at Yale with Professor Edward Hitchcock (1814-1901), then the only trained Orientalist in the United States, Whitney went to Germany (1850) and studied for three years atBerlin, under Weber, Bopp and Lepsius, and at Tübingen (two summer semesters) under Roth, returning to the United States in 1853. In the following year he was appointed professor of Sanskrit in Yale, and in 1859 also of comparative philology. He also gave instruction in French and German in the college until 1857, and in the Sheffield scientific school until 1856. An urgent call to a professorship at Harvard was declined in 1856. The importance of his labours was early and widely recognized. He was elected to membership in numerous learned societies in all parts of the world, and received many honorary degrees, the most notable testimonial to his fame being his election on the 31st of May 1851, as foreign knight of the Prussian order for le mérite for science and arts to fill the vacancy caused by the death of Carlyle. In 1870 he received from the Berlin Academy of Sciences the first Bopp prize for the most important contribution to Sanskrit philology during the preceding three years—his edition of the Mahabharata (Journal of the American Oriental Society, vol. ix.). He died at New Haven, Connecticut, on the 7th of June 1894.

As a philologist Whitney is noted especially for his work in Sanskrit, which placed him among the first scholars of his time. He edited (1855-1856), with Professor Roth, the Atharva-Veda-Sanhitā; published (1862) with a translation and notes the Atharva-Veda-Prātiṣṭhākyā; made important contributions to the great Petersburg lexicon; issued an index verborum to the published text of the Atharva-Veda (Journal of the American Oriental Society, 1881); made a translation of the Atharva-Veda, books i.-xix., with a critical commentary, which he did not live to publish (edited by Lanman, 1905); and published a large number of special articles upon various points of Sanskrit philology. His most notable achievement in this field, however, is his Sanskrit Grammar (1879), a work which, as Professor Delbrück has said, not only is "the best book of Sanskrit which we possess," but also places its author, as a scientific grammarian, on the same level with such writers as Madvig and Krüger. To the general public Whitney is best known through his popular works on the uses of the Sanskrit labours as a lexicographer. The former are, perhaps, the most widely read of all English books on the subject, and have merited their popularity through the soundness of the views which they present and the lucidity of their style.1 His most important service to lexicography was his guidance, as editor-in-chief, of the work on The Century Dictionary (1889-1891). Apart from the permanent value of his contributions to philology, Whitney is notable for the great and stimulating influence which he exerted throughout his life upon the development of American scholarship.

The chronological bibliography of Whitney's writings appended to vol. xix. (first half) of the Journal of the American Oriental Society, issued in May 1897, contains 360 numbers. Of these the most important, in addition to those mentioned above, are: Translation of the Ārāma-Rāthuśāhāna, Text-book of Hindu Astronomy (Jour. Am. Oriental Soc., vol. vi., 1860); Language and the Study of Language (1867); A Compendious German Grammar (1869); Oriental and Linguistic Studies (1872; second series, 1874); The Life and Growth of Language (1875); Essentials of English Grammar (1877); A Compendious German and English Dictionary (1877); A Practical French Grammar (1886); Max Müller and the Science of Language (1898) (B. E. S.).

WHITSTABLE, a watering-place in the St Augustine's parliamentary division of Kent, England, on the north coast at the east end of the Swale, 6 m. N.N.W. of Canterbury, on the South Eastern & Chatham railway. Pop. of urban district (1901), 7586.

1 They are particularly important in that they counteracted the popular and interestingly written books of Max Müller: for instance, Max Müller's Three Worlds of Thought, regarded language as an innate faculty and Whitney considered it the product of experience and outward circumstance. See Whitney's article Philology in the present edition of the Encyclopaedia Britannica.

The branch railway connecting Whitstable with Canterbury was one of the earliest in England, opened in 1830. The church of All Saints (Decorated and Perpendicular) possesses some brasses; it was restored in 1795. Whitstable has been famous for its oyster beds from time immemorial. The fisheries were held by the Incorporated Company of Dredgers (incorporated by Act of Parliament in 1793), the affairs being administered by a foreman, deputy foreman and jury of twelve; but in 1896 an Act of Parliament transferred the management of the fishery to a company. The less extensive Seasalter and Harty oyster fishery adjoins. There is also a considerable coasting trade in coal in conjunction with the South-Eastern & Chatham railway company, who are the owners of the harbour, which accommodates vessels of about 400 tons alongside the quay. The urban district consists of parts of the old parishes of Whitstable and Seasalter. In modern times the manor was held by Wynne Ellis (1790-1879), who left a valuable collection of paintings to the nation.

Tankerton, adjoining Whitstable to the N.E., is a newly established seaside resort.

WHITSUNDAY, or PENTECOST (Lat. Pentecoste, Gr. πέντεκται; sc. ἡμέρα, Fr. Pentecôte, Ger. Pfingsttag, it. O. O. G. Pfingsttag), the twenty-first and principal feast of the Christian Church, celebrated on the fiftieth (seventy) day after Easter; it commemorates the descent of the Holy Spirit on the disciples. The day became one of the three baptismal seasons, and the name Whitsunday is now generally attributed to the white garments formerly worn by the candidates for baptism on this feast, as in the case of the Dominica in albis. The festival is the third in importance of the great feasts of the Church and the last of the annual cycle commemorating the Lord. It is connected with the Jewish Pentecost (q.v.), not only in the historical date of its origin (see Deut. 16:15-16), but in idea, the Jewish festival is only thanks for the first-fruits of the earth, the Christian for the first-fruits of the Spirit. In the early Church the name of Pentecost was given to the whole fifty days between Easter and Whitsunday, which were celebrated as a period of rejoicing (Tertullian, De idolatr. c. 12, De bapt. 10, De cor. milit. 3, Apost. Canons, c. 37, Canons of Ancyra, 30). In the narrower sense, as the designation of the fiftieth day of this period, the word Pentecost occurs for the first time in a canon of the council of Elvira (305), which denounces as an heretical abuse the tendency to celebrate the day of Pentecost the istnia of the gospels and trafficking with the autoritatem scripturarum sanctarum, except in Pentecost celebration. There is plentiful evidence that the festival was regarded very early as one of the great feasts; Gregory Nazianzen (Orat. xlv. De Pentec.) calls it the "day of the Spirit" (ἡμέρα τοῦ Ἑνδοξοῦ), and in 385 the Peregriatio Silviae (see Duchesne, Origines, App.) describes its elaborate celebration at Jerusalem. The code of Theodosius (xv. 5, De spectaculis) forbade theatrical performances and the games of the circus during the feast. The custom of hallowing the days immediately surrounding the festival is comparatively late. Thus, among others, the synod of Mainz in 813 ordered the celebration of an octave similar to that at Easter. The custom of celebrating the vigil by fasting had already been introduced. The duration of the festival was however, ultimately fixed at three days. In the Church of England this is still the rule (there are special collects, gospels and epistles for Monday and Tuesday in Whitsun week); in the Lutheran churches two days only are observed.

In the middle ages the Whitsun services were marked by many curious customs. Among these described by Durandus (Rationale Tentituli, 107) is that of putting down a dove from the roof of the church, the dropping of balls of fire, rose-leaves and the like. Whitsun is one of the Scottish quarter-days, and though the Church festival is movable, the legal date was fixed for the 5th of May by an act of 1693. Whitmonday, which, with the Sunday itself, was the occasion for the greatest of all the medieval church ales, was made an English Bank Holiday by an act passed on the 25th of May 1871.

See Duchesne, Origines du culte Chrétien (1886); W. Smith and Cheetham, Dict. of Christian Antiquities (1874-1880); Herzog-Hauck, Encyclopædia Universalis.
WHITTIER

Residencyklöppökite (1904), xv, 254, s.v. "Fifningen." For the many superstitions and observances of the day see F. H. Ditchfield, Old Massachusetts, on the 17th of December 1807. The dwelling was built in the 17th century by his ancestor, the sturdy immigrant, Thomas Whittier, notable through his efforts to secure toleration for the disciples of George Fox in New England. Thomas's son Joseph joined the Society of Friends and bore his share of obloquy. Successive generations obeyed the monitions of the Inner Light. The poet was born in the faith, and adhered to its liberalized tenets, its garb and speech, throughout his lifetime. His father, John, was a farmer of limited means but independent spirit. His mother, Abigail Hussey, whom the poet strongly resembled, was of good stock. The Rev. Hepten, an Oxford man and a Churchman, who became a Nonconformist and emigrated to Boston in 1632, was one of her forebears and also an ancestor of Daniel Webster. The poet and the statesman showed their kinship by the "dark, deep-set and lustrous eyes" that impressed one who met either of these uncommon men. The former's name of Greenleaf is thought to have been derived from the French Feuillevert, and to be of Huguenot origin; and there was Huguenot blood as well in Thomas Whittier, the settler. The poet thus fairly inherited his conscience, religion, and education. As it was, he went no farther than the legislature of his own state (1835-1836), elected by his neighbours in an anti-slavery town. But if Garrison, Phillips and Sumner and Mrs Stowe were to be the rhapsoths of the long emancipation struggle, Whittier was its forerunnerg poems in verse. In 1833 he had issued at his own cost a pamphlet, "Justice and Expediency," that provoked vehement discussion North and South. Later he shared with the agitators their experience of lawlessness, mob-violence and political odium. His sister Elizabeth, who became his life companion, and whose verse is preserved with his own, was president of the Woman's Anti-Slavery Society in Amesbury. It is to be noted that the first collection of Whittier's lyrics was the Poems written during the Progress of the Abolition Question in the United States, issued by a friend in 1837. But Mogge Megone (1836) was his first book, a crude attempt to apply the manner of Scott's romantic cantos to a native theme. Among his other lyrical volumes, of dates earlier than the Civil War, were Lay of my Home (1843), Voices of Freedom (1846), Songs of Labor (1850), The Chapel of the Hermit (1853), The Panorama (1856), Home Ballads (1866), The titles of In War Time (1863) and National Lyric (1865) rightly designate the patriotic rather than romantic contents of these books. The poet was closely affiliated with the Atlantic Monthly from the foundation of that classic magazine in 1857. His fame became national with the welcome awarded to Snow-Bound in 1866, and brought a corresponding material reward. Of his later books of verse may be mentioned The Teut on the Beach (1867), The Pennsylvania Pilgrim (1872), The Vision of Echard (1878), The King's Misde (1881), At Sundown, his last poems (1890). As early as 1849 an illustrated collection of his poems appeared, and his Poetical Works was issued in London in 1850. During the Civil War forty thousand copies of his works appeared. Meanwhile he did much editing and compiling, and produced, among other works in prose, The Stranger in Lowell (1843), Supernaturalism in New England (1847), Leaves from Margaret Smith's Journal (1849), a pleasing treatment in old-style English of an early Colonial theme. When he died, in 1892, in New Hampshire, among the hills he loved and sang so well, he had been an active writer for over sixty years, leaving more than that number of publications that bore his name as author or editor. His body was brought to Amesbury for interment; the funeral services were held in the open air, and conducted after the simple rites of the Friends, in the presence of a large concourse, certain of whom "spake as they were sustained until forced by ill-health, early in his twenty-fifth year, to re-seek the Haverhill farm. There he remained from 1832 to 1836, when the property was sold, and the Whittiers removed to Amesbury in order to be near their meeting-house and to enable the poet to be in touch with affairs. The new home became, as it proved, that of his whole after-life; a dwelling then bought and in time remodelled was the poet's residence for fifty-six years, and from it, after his death on the 7th of September 1892, his remains were borne to the Amesbury graveyard. While in Hartford Whittier issued in prose and verse his first book, Legends of New England (1831), and edited the writings of the poet John Gardiner C. Brainard. Thenceforward he was constantly printing verse, but of the hundred or more pieces composed before his settlement at Amesbury less than fifty are retained in his final collection. Of these none has more significance than the poem to Garrison, which appeared in 1831, and was read (December 1833) at the Philadelphia Convention that formed the Anti-Slavery Society. To that convention, with one-third of its membership composed of friends, Whittier was a delegate, and was appointed one of the committee that drafted the famous Declaration of Sentiments. Although a Quaker, he had a poliomial spirit; men seeing Whittier only in his saintly age knew little of the fire wherewith, setting aside ambition and even love, he maintained his warfare against the "national crime," employing action, argument and lyric scorn. A future was open for him among the Protectionists, who formed the Whig party, and doubtless soon would have carried him to the United States Congress. But the poet was far less than the legislature of his own state (1835-1836), elected by his neighbours in an anti-slavery town. But if Garrison, Phillips and Sumner and Mrs Stowe were to be the rhapsoths of the long emancipation struggle, Whittier was its forerunner
WHITTINGHAM, C.—WHITTINGHAM, W.

moved "in tribute to the bard. The Amesbury house has been acquired by the "Whitier Home Association," so that the building and grounds are guarded as he left them, and form a shrine to which there is a constant pilgrimage. The Haverhill homestead, memorialized in Snow-Bound, is also held by trustees "under prescription" of the "natural features of the landscape," and to keep the buildings and furniture somewhat as they were in their ministrer's boyhood.

It would be unjust to consider Whitier's genius from an academic point of view. British lovers of poetry—except John Bright and others of like faith or spirit—have been slow to comprehend his distinctive rank. As a poet he was essentially a balladist, with the faults of the ballad, but with a sense of proportion, a freedom, a majesty, their undue length, are among the few modern examples of unsoffisticated verse. He returned again and again to their production, such as the ballads of the 15th and 16th centuries, which he valued for melody inferior to his sense of time, but that his over-facility and structural defects were due less to lack of taste than to early habit, Georgian models, disassociation from the schools, is indicated by his work as a writer of prose. In Margaret Smith's Journal an artistic, though suggestive, Colonial style is well maintained.

Whitier became very sensible of his shortcomings; and when at last he wrote his "The Art of Poetry," and to his art he greatly betttered it, giving much of his later work still the charm of construction, as when he followed Longfellow's Tales of a Wayside Inn with his own Tent on the Beach, he failed to rivial his graceful ballad. The first was a powerful, and the second a powerful, effort. He had failed, but he had not yielded. A whole cycle of later work he represented; for in the strains of Whitier, more than in those of any other 19th-century lyric, the saying of Fletcher of Salton as brought him down from a poetic, a historical, he was the national bard of justice, humanity and reform, whose voice went up as a trumpet until the victory was won. Its lapes resembled those of Mrs Browning, who was of his own breed in her following and reaction. To the last of the "pastoral" poets, the verse of Whitier was "out a song," or "perhaps turn out a sermon"; if the latter, it had deep sincerity and was as close to his soul as the other. He began as a liberater, but various causes emrpised until the main current was widened and deepened, his sentiments broadened. He had stood of them he loved a worker, and the Songs of Labor convey the zest of the artisan and pioneer. From 1832 to 1863 no occasion escaped him for inspiring the assailants of slavery, or ensembling pacts of their martyrdom or triumph. No crusade ever had a truer laureate than the author of "The Virginia Slave Mother," "The Pastoral Letter"—one of his singing ballads on a time-serving Church—"The Sabbath Scene," and "The Slaves of Martinique." Rapho's Tangue of a Noakone is one of the most pathetic and most elevated of memorial tributes. "Ichabo" and "The Lost Occasion," both essays in the art of Robert Webster, are Roman in their condemnation and "wild with all regret."

The green rusticity of Whitier's farm and village life imparted a bucolic charm to such lyrics as "In School Days," "The Barefoot Boy," "The Poet's Bed," "The Soul," and "The Baptist's Prayer." His lyric masterpiece is the sustained transcript of winter scenery and home-life, Snow-Bound, which has no equal except Longfellow's "Append," "The Evangeline"— "An American fayour, but, in fact, nothing of its class since "The Cotter's Saturday Night" can justly be compared with it. Along with the Quaker poet's homing sense and passion for liberty of body and soul, religion and patriotism are the dominant notes of his song. His conception of a citizen's prerogative and duty, as set forth in "The Eve of Election," certainly is not that of one whose legend is "our country, right or wrong, Faith, hope and boundless charity pervade the "Questions of Life," "The Question," and "The Two Angels," and are exquisitely blended in "The Eternal Goodness," perhaps the most enduring of his lyrical poems. We can do without a Church," he wrote in a letter; "we cannot do without, or rather do not wish to lose, a Christian."

It was his inspiration, and of all American poets he was the one whose song was most like a prayer. A knightly celibate, his stainless life, his art as a man of the world, he was, a Yankee Galahad; a pure and single heart was bid bare to those who love him in "My Psalm," "My Triumph" and "An Autograph." The spiritual habit abated no wit of his inborn sagacity, and it is said that in his later years political leaders found no shradder sage with whom to take counsel. His question was "What would Whitier do?" and was canvassed by a group of the public men of Lincoln's time, the vote was for Whittier; he was at least one whom they understood, and whom they would feel at home with the President. To the "poet of New England," but as the North and West then were charged with the spirit of the New England states, the two verdicts were much the same. The fact remains that no other poet has had a more constant and yet more personal, a more pitiful, a more legendary, and that Whitier's name, among the patriotic, clean and true, was one with which to conjure. He was revered by the people cleaving to their altars and their fires, and his birthdays were calendared as festivals, on which greetings were sent to him by younger and old.

In his age the poet revised his works, classifying them for a definitive edition, in seven volumes, published at Boston, 1888. Their metrical portion, annotated by Horace E. Scudder, can be secured in a Victorian or "Modern Edition," (Boston, 1893). Whitier's Life and Letters, prepared by his kinsman and literary executor, Samuel T. Pickard, also appeared in 1894.

WHITTINGHAM, CHARLES (1767-1840), English printer, was born on the 16th of June 1767, at Caludon or Calloden, Warwickshire, the son of a farmer, and was apprenticed to a Coventry printer and bookseller. In 1780 he set up a small printing press in a garret off Fleet Street, London, with a loan obtained from the type-foundry firm of William Caslon, and by 1797 his business had so increased that he was enabled to move into larger premises. An edition of Gray's Poems, printed by him in 1799, secured him the patronage of all the leading publishers. Whittingham inaugurated the idea of printing cheap, handy editions of standard authors, and, on the bookselling trade threatening not to sell his productions, took a room at a coffee house and sold them by auction himself. In 1809 he started a paper-pulp factory at Chiswick, near London, and in 1811 founded the Chiswick Press. From 1810 to 1815 he devoted himself to the production of typographical specimens and having been the first to use proper overlays in printing woodcuts, he was the first to print a line, or "Indian Paper" edition. He was one of the first to use a steam-engine in a pulp mill, but his presses he preferred to have worked by hand. He died at Chiswick on the 31st of January 1840.

His nephew, Charles Whittingham (1795-1879), who from 1824 to 1828 had been in partnership with his uncle, in 1838 assumed control of the business. He already had printing works at Tooke's Court, Chancery Lane, London, and had printed a facsimile of the "Bible," full of ornamentation, more than the production of ornamental initial letters, and the artistic arrangement of the printed page. The imprint of the Chiswick press was now placed on the productions of the Tooke's Court as well as of the Chiswick works, and in 1852 the whole business was removed to London. Under the management of the younger Whittingham the Chiswick Press achieved a considerable reputation. He died on the 21st of April 1876.

WHITTINGHAM, WILLIAM (c. 1524-1579), English scholar, who belonged to a Lancashire family, was born at Chester. Educated at Brasenose College, Oxford, he became a fellow of All Souls' College and a senior student of Christ Church, and later he visited several universities in France and Germany. A strong Protestant, he returned to England in 1553, but soon found it expedient to travel again to France. In 1554 he was a leading member of the band of English Protestant exiles who were assembled at Frankfort-on-the-Main, and in the controversies which took place between them concerning the form of service to be adopted, Whittingham strongly supported the Calvinitic views propounded by John Knox. These opinions, however, did not prevail, and soon the Scottish reformer and his followers were found at Geneva; in 1559 Whittingham succeeded Knox as minister of the English congregation in that city, and here he did his most noteworthy work, that of making an English translation of the Bible. He was probably responsible for the English translation of the New Testament which appeared in 1557, and he had certainly a large share in the translation of both the Old and the New Testaments which is called the Geneva or Breeches Bible. This was printed at Geneva in 1560 and enjoyed a great vogue in the English-speaking countries. Whittingham also made a metrical translation of some of the Psalms. Having returned to England in 1560, Whittingham went to France in the train of Francis Russell, 2nd earl of Bedford, and a little later he acted as minister of the English garrison at Havre, being in this place during its siege by the French in 1562. In the following year he was made dean of Durham. He attended well to the duties of his office, but his liking for puritan customs made
WHITTINGTON, R.—WHITTLESEY

certain prelates and others look upon him with suspicion, and in 1576 or 1577 a commission was appointed to inquire into his conduct. This had no result, and another commission was appointed in 1578, one charge against Whittingham being that he had not been duly ordained. The case was still under consideration when the dean died on the 10th of June 1579.

WHITTINGTON, RICHARD (d. 1423), mayor of London, described himself as son of William and Joan (Dugdale, Monasticon Anglicanum, vi. 740). This enables him to be identified as the third son of Sir William Whittington of Pauntley in Gloucestershire, a knight of good family, who married after 1355 Joan, daughter of William Mansel, and widow of Thomas Berkeley of Cubberley. Consequently Richard was a very young man when he is mentioned in 1379 as subscribing five marks to a city loan. He was a mercer by trade, and clearly entered on his commercial career under favourable circumstances. He married Alice, daughter of Sir Ivo Fitzwaryn, a Dorset knight of considerable property. Whittington sat in the common council as a representative of Coleman Street Ward, was elected alderman of Broad Street in March 1393, and served as sheriff in 1393–1394. When Adam Banme, the mayor, died in June 1397, Whittington was appointed by the king to succeed him, and in October was elected mayor for the ensuing year. He had acquired great wealth and much commercial importance, and was mayor of the staple at London and Calais. He made from his foundations was his claim to fame, according to the legend, when he gave a banquet to the latter king and his queen in 1421, completed the entertainment by burning bonds for £60,000, which he had taken up and discharged. Henry V. employed him to superintend the expenditure of money on completing Westminster Abbey. But except as a London commercial magnate Whittington took no great part in public affairs. He was mayor for a third term in 1406–1407, and for a fourth in 1419–1420. He died in March 1423. His wife had predeceased him leaving no children, and Whittington bequeathed the whole of his vast fortune to charitable and public purposes. In his lifetime he had joined in procuring Leadenhall for the city, and had borne nearly all the cost of building the Greyfriars Library. In his last year as mayor he had been shocked by the foul state of Newgate prison, and one of the first works undertaken by his executors was its rebuilding. His executors, chief of whom was John Carpenter, the famous town clerk, also contributed to the cost of glazing and paving the new Guildhall, and paid half the expense of building the library there; they repaired St Bartholomew’s hospital, and provided bosses for water at Billingsgate and Cripplegate. The chief of Whittington’s foundations was his claim to fame, according to the legend, when he gave a banquet to the latter king and his queen in 1421, completed the entertainment by burning bonds for £60,000, which he had taken up and discharged.

WHITTINGTON, an urban district in the north-eastern parliamentary division of Derbyshire, England, 10 m. s. by E. of Sheffield and 2 m. N. of Chesterfield, on the Midland railway. Pop. (1901) 9416. The parish church of St Bartholomew was restored after its destruction by fire, excepting the tower and spire, in 1895. Samuel Pegge, the antiquary (1704–1760), was vicar of Whittington and Heath for many years, and was buried here. Stone bottles and coarse earthenware are manufactured in the town, where there are also large ironworks, collieries and brickworks. A small stone cottage, known as Revolution House, was the meeting-place of John Darcy, the 1st earl of Danby, and Thomas Whittingham, bishop of Lichfield, and living at Ivychurch, Croydon and Cliffe. Later he was appointed vicar-general, and then dean of the court of archbishops by Isip. In 1360 he became bishop of Rochester, and two years later bishop of Worcester. In 1368 Whittlesea was elected archbishop of Canterbury in succession to Simon Langham, but his term of office was very uneventful, a circumstance due partly, but not wholly, to his feeble health. He died at Lambeth on the 5th or 6th of June 1374.

WHITTLESEA, a market town in the Wissbech parliamentary division of Cambridge, England, 53 m. E. of Peterborough, between that city and March, on the Great Eastern railway. Pop. of urban district (1901) 3909. It lies on a gentle eminence in the flat fen country, and the fine Perpendicular tower and spire of the church of St Mary are a landmark from far. A little to the north is the great artificial cut carrying the waters of the
WHITWORTH—WHOOPING-COUGH

The Whitworth family owned large cotton mills and factories at Manchester and Rochdale. The founder of the family, Joseph Whitworth, was a cotton-spinner and an inventor. He was born in 1770 and died in 1843. His inventions included the Whitworth system of screw threads, which is still in use today. Whitworth was also a sculptor and a horticulturist.

The Whitworth family lived in a large house in Manchester, which is now a museum. The museum contains many of the family's inventions and artifacts, including models of steam engines and locomotives.

The Whitworth family was one of the most successful in the early cotton industry, and their factories were some of the largest in the world. They were also one of the first families to use steam power in their factories, and they were instrumental in the development of the cotton mill system.

The Whitworth family are remembered for their contributions to industry and technology, and for their philanthropy. They were generous donors to many charitable organizations, and they left a legacy of success and innovation that continues to this day.
be shorter or longer. It is during this time that complications and disease arise which may become a source of danger greater even than the malady itself. The chief of these is inflammatory affection of the bronchi and lungs and convulsions, any of which may prove fatal.

When, however, the disease progresses favourably, the third or terminal stage is announced by the less frequent paroxysms of the cough, which generally loses in great measure its “whooping” character. The patient’s condition altogether undergoes amendment, and the symptoms disappear in from one to three weeks. It is to be observed, however, that for a long period afterwards in any simple catarrh from which the patient suffers the cough often assumes a spasmodic character, which may suggest the erroneous notion that a relapse of the whooping-cough has occurred.

In severe cases it occasionally happens that the disease leaves behind it such structural changes in the lungs (empysema, &c.), as entail permanent shortness of breathing or a liability to attacks of asthma. Further, whooping-cough is well known to be one of those diseases of early life which are apt to give rise to a weakened and vulnerable state of the general health, or to call into activity any inherited morbid tendency, such as that towards consumption.

In moderate cases of treatment in mild cases, little is necessary beyond keeping the patient warm and carefully attending to the general health. The remedies applicable in the case of catarrh or the milder forms of bronchitis are of service here, while gentle counter-irritation to the chest by stimulating liniments may be employed all through the attack. In mild weather the patient may be in the open air. An abdominal binder should be worn night and day in order to prevent the occurrence of hernia. Systematic disinfection of the sputum by means of a solution of corrosive sublimate or by burning should be practised in order to check the spread of infection. In the more severe forms of catarrh or bronchitis it is employed to modify the severity of the paroxysms. Numerous remedies are recommended, the chief of which are the bromides of ammonium or potassium, chloral, codeine, &c. These can only be safely administered under medical advice, and with due regard to the symptoms in individual cases. During convalescence, where the cough still continues to be troublesome, a change of air will often effect its removal.

WHYMPER, EDWARD (1840— ), British artist, explorer and mountaineer, was born in London on the 27th of April 1840. The death of his mother at an early age trained him to the profession of a wood-engraver. In 1862 he became a companion in the ascent of Mont Pelvoux, at that time believed to be the highest peak of the Dauphine Alps. He successfully accomplished the ascent in 1861—the first of a series of expeditions that threw much light on the topography of a district at that time very imperfectly mapped. From the summit of Mont Pelvoux he discovered that it was overlooked by a neighbouring peak which he named the Pointe des Écrins, which, before the annexation of Savoy added Mont Blanc to the possessions of France, was the highest point in the French Alps. Its ascent by Mr Whymper’s party in 1864 was perhaps the most remarkable feat of mountaineering up to that date. The years 1861 to 1865 are filled with a number of new expeditions in the Mont Blanc group and the Pennine Alps, among them the ascent of the Aiguille Verte and the crossing of the Moening Pass. Professor Tyndall and Mr Whymper emulated each other in fruitless attempts to reach the summit of the Matterhorn by the south-western or Italian ridge. Mr Whymper, six times repulsed, determined to try the eastern face, convinced that its precipitous appearance when viewed from Zermatt was an optical illusion, and that the dip of the strata, which on the Italian side formed a continuous series of overhangs, should make the opposite side a natural staircase. His attempt by what is now the usual route was crowned with success (14th of July 1865); but on the descent four of the party slipped and were killed, and only the breaking of the rope saved Mr Whymper and the remaining guides from the same fate. The account of his attempts on the Matterhorn occupies the greater part of his Scrambles among the Alps (1871), in which the illustrations are engraved by the author himself, and are very beautiful. His campaign of 1865 had been planned to exercise his judgment in the choice of routes as a preparation for an expedition to Greenland (1867). This resulted in an important collection of fossil plants, which were described by Professor Heer and deposited in the British Museum. Mr Whymper’s report was published in the Report of the British Association for the year 1866. Though hampered by want of means and by the prevalence of scepticism among the natives, he proved that the interior could be explored by the use of suitably constructed sledges, and thus contributed an important advance to Arctic exploration. Another expedition followed in 1872, and was devoted to a survey of the coast-line. He next organized an expedition to Ecuador, designed primarily to collect data for the study of mountain-sickness and of the effect of diminished pressure on the human frame. He took as his chief guide Jean-Antoine Carrel, whose subsequent death from exhaustion on the Matterhorn after bringing his employers into safety through a snowstorm forms one of the noblest pages in the history of mountaineering. During 1880 Mr Whymper on two occasions ascended Chimborazo, whose summit, 20,000 ft. above sea-level, had never before been reached; spent a night on the summit of Cotopaxi, and made first ascents of half-a-dozen other great peaks. In 1892 he published the results of his journey in a volume entitled Travels amongst the Great Andes of the Equator. His observations on mountain-sickness led him to conclude that it was caused by “diminution in atmospheric pressure, which operates in at least two ways—namely, (a) by lessening the value of the air that can be inspired in any given time, and (b) by causing the air or gas to rise in the lungs, and become more dense. It is a process of nature, and that “the effects produced by (b) may be temporary and pass away when equilibrium has been restored between the internal and external pressure.” The publication of his work was recognized on the part of the Royal Geographical Society by the award of the Patron’s medal. His experiences in South America having convinced him of certain serious errors in the readings of aneroid barometers at high altitudes, he published a work, entitled How to Use the Aneroid Barometer, and succeeded in introducing important improvements in their construction. He afterwards published two guide-books to Zermatt and Mont Blanc, and an expedition in the region of the Great Divide of the Canadian Rockies.

WHYTE, ALEXANDER (1837— ), Scottish divine, was born at Kirriemuir in Forfarshire on the 13th of January 1837, and was educated at the university of Aberdeen and at New College, Edinburgh. He entered the ministry of the Free Church of Scotland and after serving as colleague in Free St John’s, Glasgow (1866-1870), removed to Edinburgh as colleague and successor to Dr R. S. Candlish at Free St George’s. In 1899 he succeeded Dr Marcus Dodds as principal, and professor of New Testament Literature, at the New College, Edinburgh.

Among his publications are Characters and Characteristics of William Law (1833; Bunyan Characters (3 vols., 1894); Samuel Rutherford (1894); An Appreciation of Jacob Behmen (1895); Lancelot Andrews and his Private Devotions (1896); Bible Characters (7 vols. 1897); Santa Teresa (1897); Father John of Cronstadt (1898); An Appreciation of Browne’s Religio Medici (1898); Cardinal Newman, An Appreciation (1901).

WHYTE-MELVILLE, GEORGE JOHN (1821-1878), English novelist, son of John Whyte-Melville of Strathkinnness, Fifehire, and grandson on his mother’s side of the 5th duke of Leeds, was born on the 9th of June 1821. Whyte-Melville received his education at Eton, entered the army in 1839, became captain in the Coldstream Guards in 1846 and retired in 1849. After translating Horace (1850) in fluent and graceful verse, he published his first novel, Digby Grand, in 1853. The unflagging verve and intimate technical knowledge with which he described sporting scenes and sporting characters at once drew attention to him as a novelist with a new vein. He was the laurate of fox-hunting;
all his most popular and distinctive heroes and heroines, Digby Grand, Tilbury Nogo, the Honourable Crasher, Mr Sawyer, Kate Coventry, Mrs Lascelles, are or would be mighty hunters.

Tilbury Nogo was contributed to the *Sporting Magazine* in 1853 and published separately in 1854. He showed in the adventure of Mr Nogo—and it became more apparent in his later works—that he had a surer hand in humorous narrative than in pathetic description; his pathos is the pathos of the preacher. His next novel, *General Bounce*, appeared in *Fraser’s Magazine* (1854). When the Crimean War broke out Whyte-Melville went out as a volunteer major of Turkish irregular cavalry; but this was the only break in his literary career from the time that he began to write novels till his death. By a strange accident, he lost his life, or rather his character, right after the conclusion of the horse race of many a stiff ride meeting his fate in galloping quietly over an ordinary ploughed field in the Vale of the White Horse.

Twenty-one novels appeared from his pen after his return from the Crimea—Kate Coventry (1856); The Interpreter (1858); Holmy House (1860); Good for Nothing (1861); Market Hardsboro (1861); The Queen’s Maries (1862); The Gladators (1863); Brookes of Bridlemere (1864); Cerise (1866); Bones and I (1868); The White Rose (1868); M or N (1869); Contraband (1870); Sarchon (1871); Satanella (1873); Uncle John (1874); Sister Louise (1875); Kather- dines (1876); Rance (1878); Bagatelle (1878). Several of these novels are historical, *The Gladators* being perhaps the most famous of them. As an historical novelist Whyte- Melville was not merely the annalist of sporting society for his generation, but may also be fairly described as the principal moralist of that society; he exerted a considerable and a wholesome influence on the manners and morals of the gilded youth of his time. *His Songs and Verses* (1865) and *hismetrical Legend of the True Cross* (1873), though respectable in point of verseification, are of no particular merit.

**WICHITA,** a tribe of North American Indians of Caddoan stock. They call themselves Kiltikitish or Tawhahaa. Their former range was between the Red and Washita rivers, Oklahoma, and they are now on a reservation there. They were kinsmen of the Pawnee, and the French called them *Pani Pique* ("Tattooed Pawnee"). They were known to other Indians as the "Tattooed People" in allusion to the extensive tattooing customary among them. They numbered 3000 or in about 1850, but only about 1000 now.

**WICHITA,** a city and the county-seat of Sedgwick county, Kansas, U.S.A., on the Arkansas river, at the mouth of the Little Arkansas, 208 m. (by rail) S.W. of Kansas City. *Pop.* (1880) 4011; (1890) 23,833; (1900) 24,671, of whom 1447 were foreign-born and 1339 were negroes; (1910 census), 52,450. Area, 18-75 sq. m. Wichita is served by the Atchison, Topeka & Santa Fé, the Chicago, Rock Island & Pacific, the Missouri Pacific, the St Louis & San Francisco, and the Kansas City, Mexico & Orient railways. The site of the city is level, about 130 ft. above the sea. The principal public works are the Federal building, the city hall, the county court house, a Y.M.C.A. building, an auditorium and exhibition hall and a Masonic Temple. In Wichita are Fairmount College (Congregational; co-educational; organized as a preparatory school in 1892 and as a college in 1893; Friends’ University (Society of Friends; co-educational; 1898); and Mount Carmel Academy and the Pre-Cathedral School (both Roman Catholic). Among the city’s parks (area in 1909, 325 acres) is one (Riverside) of 140 acres. The city is supplied with natural gas. Wichita is a transportation and railroad center, and is an important market for broom-corn. In 1905 it ranked third among the cities of the state in value of its factory product ($6,359,844). The principal industry is slaughtering and meat-packing. The Kansas City, Mexico & Orient railway has car-shops here. Wichita, named from an Indian tribe, was settled in 1870, and was chartered as a city in 1871. In 1909 the city adopted by popular vote government by commission under a state law of 1907 providing for a mayor and four commissioners, heads of the executive, finance, streets and public improvements, parks, public buildings and health, and water and lights departments, all elected for two years and nominated by primary election or by petition signed by at least 25 voters.

**WICK,** a royal, municipal and police burgh, seaport and county town of Caithness, Scotland. Pop. (1901) 7911. It is situated at the head of Wick Bay, on the North Sea, 327 m. N. of Edinburgh, by the North British and Highland railways. It consists of the old burgh and Louisburgh, its continuation, on the north bank of the river Wick, and of Pulteneytown, the chief seat of commerce and trade, on the south side. Pulteney- town, laid out in 1805 by the British Fishery Society, is built on a regular plan; and Wick proper consists chiefly of the narrow and irregular High Street, with Bridge Street, more recently built, which contains the town hall and the county buildings. In Pulteneytown there are an academy, a chamber of commerce, a naval reserve station and a fish exchange. Among other buildings are the free libraries, the Rhind Charitable Institution and the combination hospital. The port consists of two harbours of fair size, but the entrance is dangerous in stormy weather. The chief exports are fish, cattle and agricultural produce, and the imports include coal, wood and provisions. Steamers from Leith and Aberdeen run twice a week and there is also weekly mail steamer from Stromness. There are also co-operatives, the manufacture of fish-gano and fish products, flour mills, steam saw mills, a rope and a woollen manufacturing, a brewery and a distillery. The town, with Cromarty, Dingwall, Dornoch, Kirkwall and Tain, forms the Wick group of parliamentary burghs. Wick (Vik or "bay") is mentioned as early as 1140. It was constituted a royal burgh by James VI. in 1585, its superrior being then George Sinclair, 5th earl of Caithness. By a parliamentary bounty in 1768 some impetus was given to the herring-fishery, but its real importance dates from the construction of the railway from Wick to Thurso.
WICKLOW—WICKRAM

much of the peculiar charm of Wicklow scenery is to be found, the frequently rugged natural features contrasting finely with the rich and luxuriant foliage of the extensive woods which line their banks. Among the more famous of these glens are Glendaugh, Dargle, Glencree, Glen of the Downs, Devil's Glen, Glencarne and the beautiful vale of Avoca or Ovoca. The principal rivers are the Liffey, on the north-western border; the Vartry, which passes through Devil's Glen to the sea north of Wicklow Head; the Avonmore and the Avonbeg, which unite at the "meeting of the waters" to form the Avoca, which is afterwards joined by the Aughrum and falls into the sea at Arklow; and the Slaney, in the west of the county, passing southwards into Carlow. There are a number of small but finely situated lakes in the valleys, the principal being Loughs Dan, Bray and Tay or Luggelaw, and the loughs of Glendaugh. The trout-fishing is generally fair. Owing to its proximity to Dublin and its accessibility from England, the portions of the county possessing scenic interest have been opened up to great advantage. Bray, in the north, is one of the chief resorts in the country, and Greystones, 5 m. S. S. E., is a smaller one. Of the small towns and villages inland which are much frequented for the beauty of the country in which they lie, are Enniskerry, west of Bray, and near the pass of the Scalp; Laragh, near Glendaugh, from which a great military road runs S.W. across the hills between Lugganquilla and, on the railway south of Wicklow, Rathdrum, a beautifully situated village, Woodenbridge in the Vale of Avoca and Avrugh. Near the village of Shillelagh lies the wood which is said to have given the name of skillilagh to the trees, and it is said that staves used by Irishmen, Ashford and Roundwood on the Vartry river, Delgany near the Glen of the Downs, and Rathnew, a centre of coach routes, especially for the Devil's Glen, must also be mentioned. The beauty of the central district of the Wicklow mountains lies in its wild solitude in contraposition to the more gentle scenery of the populated glens. In the extreme north-west of the county Blessington is a favourite resort from Dublin, served by a steam tramway, which continues up the valley of the Liffey to the waterfalls of Pollaphuca. The climate near the sea is remarkably mild, and permits the myrtle and arbutus to grow. Loughor, just south of and parallel to the R. Liffey, is an extension of county Wexford, the Leinstor chain bounding it on the west, and Silurian foothills sloping down to the sea. The highland of muscovite-granite, with a marginal zone of mica-schist, produced by contact with granite, extends from Shillelagh and Wicklow town north of Bray, its highest point being Lugganquilla. The rounded heather-clad moors give way to more broken country on either side, with coniferous woods already intermixed. The coal supply of Dublin is obtained from an artificial lake on the first plateau of the foothills at Roundwood. From Wicklow town to near Bray, red and greenish slates and yellow-brown quartzites, probably Cambrian, form a hilly country, in which rise Carrick M., the Great Sugarloaf and Bray Head. Oldhamis occurs in this series. Volcanic and intrusive felsites and doliolites abound in the Silurian beds of the south, running along the strike of the strata. A considerable amount of gold has been extracted from the valley-gravels north of Croghan of Kinshea on the Wexford border. Tinstone has also been found in small quantities. Lead-ore is raised west of Laragh, and the mines in the Avoca valley have been worked for copper, lead and sulphur, the last-named being obtained from pyrite. Paving-setts are made from the diorite at Arklow, and granite is extensively quarried at Ballakeenockan on the west side of the mountain-chain. Iron-ore is worked in the lower district on the Meriel; and although the greater part of the higher districts is covered with heath and turf, it affords good pasturage for sheep. There is considerable area of natural timber as well as artificial plantations. The acreage under pasture and rough both increased by 20% between 1841 and 1861, whereas the proportion of crops of oats and potatoes decrease considerably, the numbers of sheep, cattle, pigs and poultry are well maintained. Except in the Avoca, the dairy industry is not important, but the dairy occupations are chiefly agricultural. The port of Wicklow is the headquarters of a sea-fishery district. The Dublin and South-Eastern railway skirts the coast by way of Bray, while the South-Western skirts it at Arklow, leaving a branch line from Woodenbridge junction to Shillelagh. A branch of the Great Southern & Western line from Sallins skirts the west of the county by Baltinglass.

Population and Administration.—The population (64,492 in 1891, 69,524 in 1901) decreases to a less extent than the average of the Irish counties, and emigration is considerable. Of the total about 80% are Roman Catholics, and 18% Protestant Episcopalians; about 80% forms the rural population. Bray (pop. 7,424), Wicklow (the county town, 3,288) and Arklow (4,044) are the principal towns, all on the coast; Wicklow is the only considerable port. Wicklow returned to the Irish parliament, until the Union in 1800, two county members and two each for the boroughs of Baltinglass, Bray, Tinnahely and Arklow; it is now returned into two parliamentary divisions, an eastern and western division, each returning one member. The county is divided into eight baronies. It is nearly entirely in the Protestant diocese of Dublin and in the Roman Catholic dioceses of Dublin, Kildare and Leighlin and Ferns. Assizes are held at Wicklow, and quarter-sessions at Bray, Baltinglass, Tinnahely, Arklow and Wicklow.

History and Antiquities.—Wicklow was not made a county until 1666. It was the last Irish ground shired, for in this mountainous district the Irish were long able to preserve independence. Wicklow sided with the royal cause during the Cromwellian wars, but on Cromwell's advance submitted to him without striking a blow. During the rebellion of 1678 some of the insurgents took refuge within its mountain fastnesses, and an engagement took place near Aughrum between a band of insurgents under Joseph Holt (1756-1826) and the British troops. A second skirmish was fought at Arklow between the rebels and General Needham, the former being defeated.

Of the ancient cromlechs there are three of some interest, one near Enniskerry, another on the summit of Lugnaquilla and a third, with the name of the circle, at the base of it. The most important ecclesiastical remains is that of the old fortalice of Black Castle, near Wicklow, originally founded by the Norman invaders, but taken by the Irish in 1301, and afterwards rebuilt by William Fitzwilliam; the scattered remains of Castle Kevin, the ancient stronghold of the O'Tooles, by whom it was probably originally built in the 12th century; and the ruins of the old castle of the Ormondes at Arklow, founded by Theobald FitzWalter (d. 1285), the scene of frequent conflicts up to the time of Cromwell, by whom it was demolished in 1649, and now containing within the interior of its ruined walls a constabulary barrack. The fine mansion of Courtown occupies the site of an old fortalice founded by De la Poer, one of the rights which lasted by Strongbow; in the reign of Henry VIII. it was taken by the O'Townes and O'Conor.

WICKLOW, a seaport, market town, and the county town of county Wicklow, Ireland, picturesquely situated at the mouth of a lagoon which receives the river Vartry and other streams, 28 m. S. of Dublin by the Dublin & South-Eastern railway. Pop. (1901) 3288. The harbour, which is governed by commissioners and can accommodate vessels of 1500 tons, has two piers, with quayage. There is a considerable import trade in coal, timber, iron and slate; and some exports of grain and metallic ore, but the latter suffers by competition with the Imports to Britain of sulphur ore from Spain. The town has county buildings, a parish church embodying a good Norman door from a previous structure, some ruins of a Franciscan abbey of the 13th century, and remains of Black Castle, on a commanding situation above the sea, founded in Norman times and rebuilt by William Fitzwilliam after capture by the Irish in 1301. The name of the town to have been a settlement of the Norsemen. The cliff scenery to the S. towards Wicklow Head is fine, and the town has some claims as a seaside resort. It is governed by an urban district council.

WICKRAM, JÖRG, or JÖRG (d. c. 1560), German poet and novelist, was a native of Colmar in Alsace; the date of his birth is unknown. He passed the latter part of his life as town clerk of Burghof on the Rhine, and died before 1562. Wickram was a many-sided writer. He founded a Meistersinger school in Colmar in 1549, and has left a number of Meistersanglieder. He edited Albrecht von Hallerström's Middle High German version of Ovid's Metamorphoses (1545), and in 1555 he published Das Räthwagenbüchlein, one of the best of the many German collections of tales and anecdotes which appeared in the 16th century. The title of the book implies its object, namely, to
supply reading for the traveller in the "Rollwagen" or diligences. As a dramatist, Wickram wrote Fastnachtsspiele (Das Narren-
gieszen, 1537; Der treue Ecklar, 1538) and two dramas on biblical subjects, Der verlorene Sohn (1540) and Tobias (1551). A moralizing poem, Der irrezeuete Pilger (1556), is half-satiric, half-didactic. It is, however, as a novelist that Wickram has left the deepest mark on his time, his chief romances being Ritter
Galmey aus Schattland (1550), Gebriotte and Rheinland (1554), Der Knabenpfiege (1554), Von guten und bösen Nachbarn (1556) and Der Goldfaden (1557). These may be regarded as the earliest attempts in German literature to create that modern type of middle-class hero, which ultimately took the place of the decadent medieval romance of chivalry.

Wickram’s works have been edited by J. Bote and W. Scheid for the Stuttgart Literarischer Verein (vols., 222, 223, 229, 230, 1900-1903); Der Ritter Galmy was republished by F. de la Motte Fouqué in 1866; W. Scherer, Die Anfänge des deutschen Prosaens (1877).

WIDDINGTON, BARONS. In November 1643 Sir William Widdington (1610-1651), of Widdington, Northumberland, son and heir of Henry Widdington (d. 1612), was created Baron Widdington, as a reward for his loyalty to Charles I. He had been member for Northumberland in both the Short and the Long Parliaments in 1640, but in August 1642 he was expelled because he had joined the royal standard. He fought for the king chiefly in Yorkshire and Lincolnshire during 1642 and 1643; he was governor of Lincoln in 1643, but in 1644, after helping to defend York, he left England. Although in 1648 he had been condemned to death by the House of Commons, he accompanied Charles II to Scotland in 1650, and he was mortally wounded at Worcester, dying at Verona, during the July 1651. His great-grandson, William, the 4th baron (1672-1743), took part in the Jacobite rising of 1715, and with of two of his brothers was taken prisoner after the fire at Preston. He was convicted of being an exchequer. In 1659 and again in 1660 he was a member of the court of state, and on three occasions he was one of the commissioners of the great seal, but he lost some of his offices when Charles II was restored. However, he remained in parliament until his death on the 13th of May 1664. He left four daughters, but no sons. Widdington, who founded a school at Stamfordford, Northumberland, wrote Aeneologia Eboracense; some Reminiscences of the city of York. This was not published until 1877, when it was edited with introduction and notes by the Rev. Caesar Caite. His younger brother, Ralph Widdington (d. 1688), was educated at Christ's College, Cambridge, where he made the acquaintance of Milton. In 1654 he was appointed reigus professor of Greek at Cambridge, and in 1673 Lady Margaret professor of divinity.

The name of Roger Widdington was taken by Thomas Preston (1653-1640), a Benedictine monk, who wrote several books of a controversial nature, and passed much of his time in prison, being still a captive when he died on the 3rd of April 1640. (See Rev. E. Taunton, The English Black Monks of St Benedict, 1899.) In 1840 the writer, Samuel Edward Cook, took the name of Widdington, his mother being the heiress of some of the estates of this family. Having served in the British navy he lived for some years at Lyme Regis. Sketches during the wars 1820-1832 (London, 1834); and Spain and the Spaniards in 1843 (London, 1844). He died at his residence, Newton Hall, Northumberland, on the 30th of May 1852. He was a man of wealth, the Widdington estates by his nephew, Shackleworth Fitzherbert Jackson, who took the name Widdington. See Rev. John Hodgson, History of Northumberland (1820-1850).

WIDNES, a municipal borough in the Widnes parliamentary division of Lancashire, England, on the Mersey, 12 m. E.S.E. from Liverpool, served by the London & North-Western and Lancashire & Yorkshire railways and the Cheshire Lines. Pop. (1901) 28,580. It is wholly of modern growth, for in 1851 the population was under 2000. There are capacious docks on the river, which is crossed by a wrought-iron bridge, 1000 ft. long, and 95 in height, completed in 1868, and having two lines of railway and a footpath. Widnes is one of the principal seats of the alkaline and soap manufacture, and has also grease-works for locomotives and wagons, copper works, iron-foundries, oil and paint works and sail-cloth manufactories. The barony of Widnes in 1554-1555 was declared to be part of the duchy of Lancaster in England. The town was incorporated in 1892, and the corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 3110 acres.

WIDOR, CHARLES MARIE (1845- ), French composer and organist, was born at Lyons on the 22nd of February 1845. He studied first at Lyons, then at Brussels under Lemmens for the organ and Fétis for composition. In 1870 he became organist of the church of Saint Sulpice in Paris. He succeeded César Franck as professor of the organ at the Paris Conservatoire, where he was also appointed professor of composition, counterpart to the position held byFaure. A prolific composer, he displayed his creative ability in a variety of different styles. His works include an opera, Matthe Arcbros (Opéra Comique, 1867), La Korrigane (ballet, given at the Opéra, 1880), incidental music to Conte d'avril (1885), Les Jacobites (1885) and Jeanne d'Arc (a pantomime play, 1890), three symphonies, The Walpurgs Night and other works for orchestra, a quartet for strings and piano, trio for piano and strings, a mass, psalms and other sacred compositions, symphonies for organ, a large number of piano pieces and many songs.

WIDKIND, Saxion historian, was the author of Res gestae Saxonicae. Nothing is known of his life except that he was a monk at the Benedictine abbey of Corvey, and that he died about 904, although various other conjectures have been formed by students of his work. He is also supposed to have written lives of St Paul and St Thecla, but no traces of these now remain. It is uncertain whether he was a resident at the court of the emperor Otto the Great or not, and also whether he was on intimate terms with Otto's illegitimate son William, archbishop of Mainz. His Res gestae Saxonicæ, dedicated to Matilda, abbess of Quedlinburg, who was a daughter of Otto the Great, is divided into three parts, 66, and the greater part of it was written during the lifetime of the emperor, probably about 968. Starting with certain surmises upon the origin of the Saxons, he deals with the war between Theuderich I, king of Austrasia, and the Thuringians, in which the Saxons played an important part. An allusion to the conversion of the race to Christianity under Charlemagne brings him to the early Saxon dukes and the reign of Henry the Fowler, whose campaigns are referred to in some detail. The second book opens with the election of Otto the Great as German king, and contains the sagas against his authority, and concludes with the death of his wife Edith in 946. In the third book the historian deals with Otto's expedition into France, his troubles with his son Lodolf and his son-in-law, Conrad the Red, duke of Lorraine, and the various wars in Germany; but makes only casual reference to Otto's visits to Italy in 951 and 962. He gives a vivid account of the defeat of the Hungarians on the Lechfeld in August 955, and ends with the death of Otto in 973 and an eulogy on his life. Widkind formed his style upon that of Sallust; he was familiar with the De vitis Caesarum of Suetonius, the Vie de roi mortel by Eneas and, probably with Livy and Varro. Many quotations from the Vulgate are found in his writings, and there are traces of a knowledge of Virgil, Ovid and other Roman poets. His sentences are occasionally abrupt and lacking in clearness, his Latin words are sometimes Germanized, (as when he writes michi for mihi) and grammatical errors are not always absent. The earlier part of his work is taken from tradition, but he wrote the contemporary part as one familiar with court life and the events of the day. He says very little about affairs outside Germany, and although laudatory of
monastic life gives due prominence to secular affairs. He writes as a Saxon, proud of the history of his race and an admirer of Henry the Fowler and Otto the Great.

Three manuscripts exist of the Res gestae, one of which is in the British Museum, and the book was first published at Basle in 1832. The best edition is that edited by G. Widukind in the Monumenta Germaniae historica. Scriptores, Band iii. (Hanover and Berlin, 1886). A good edition published at Hanover and Leipzig in 1894 contains an introduction by K. A. Kehr.

See R. Köpke, Widukind von Corvey (Berlin, 1867); J. Rasse, Widukind von Kroes (Rostock, 1880); and B. Simonson, "Zur Kritik des Widukind" in the Neues Archiv der Gesellschaft für ältere deutsiche Geschichte, Band xii. (Hanover, 1870). (A. W. H.)

WIDUKIND, or Wittekind (d. c. 807), leader of the Saxons during the earlier part of their resistance to Charlemagne, belonged to a noble Westphalian family, and is first mentioned in 777 when his absence from an assembly of the Saxons held by the Frankish king of Paderborn was a matter for remark. It is inferred with considerable probability that he had taken a leading part in the attacks on two Frankish garrisons in 776, and possibly had shared in earlier fights against the Franks, and so feared to meet the king. In 778 he returned from exile in Denmark to lead a fresh rising, and in 782 the Saxons at his instigation drove out the Frankish priests, and plundered the border territories. It is uncertain whether Widukind shared in the second rising; yet it seems probable that part had been taken in the risings of 783 and 784. In 785 Charlemagne, leading an expedition towards the mouth of the Elbe, learned that Widukind was in the land of the Nordalbingians, on the right bank of the river. Negotiations were begun, and the Saxon chief, assured of his personal safety, appeared at the Frankish court at Attigny. There he was baptized, the king acting as his sponsor and loading him with gifts. The details of his later life are unknown. He probably returned to Saxony and occupied there an influential position, as in 922 the inheritance of the "old count of duke Widukind" is referred to. Many legends have gathered round his memory, and he was long regarded as a national hero by the Saxons. He is reported to have been duke of Engria, to have been a devoted Christian and a builder of churches, and to have fallen in battle in 807. Kingly and princely houses have sought to establish their descent from him, but except in the case of Matildia, wife of the German king, Henry I. the Fowler, without any success.

See W. Diekamp, Widukind der Sächsensführung nach Geschichte und Sagen der Ostensischen Dörfer (Münster, 1879-1880), Der Sächsensführer Widukind nach Geschichte und Sage (Würzburg, 1879).

WIEDEMANN, GUSTAV HEINRICH (1826-1889), German physicist, was born at Berlin on the 2nd of October 1826. After attending the Cologne gymnasia, he entered the university of Berlin in 1844, and took his doctor's degree there three years later. His thesis on that occasion was devoted to a question in organic chemistry, for he held the opinion that the study of chemistry is an indispensable preliminary to the pursuit of physics, which was his ultimate aim. In Berlin he made the acquaintance of H. von Helmholtz at the house of H. G. Magnus, and was one of the founders of the Berlin Physical Society. In 1854 he left Berlin to become professor of physics in Basel University, removing nine years afterwards to Brunswick Polytechnic, and in 1866 to Karlsruhe Polytechnic. In 1871 he accepted the chair of physical chemistry at Leipzig. The attention he had paid to chemistry in the earlier part of his career enabled him to hold his own in this position, but he found his work more congenial when in 1887 he was transferred to the professorship of physics. He died at Leipzig on the 24th of March 1889. His name is probably most widely known for his literary work. In 1877 he undertook the editorship of the Annalen der Physik und Chemie in succession to J. C. Poggendorff, thus starting the series of that scientific periodical which is familiarly cited as Wied. Ann. Another monumental work for which he was responsible was Die Lehre von der Elektricität, or, as it was called in the first instance, Lehre von Galvanismus und Elektromagnetismus, a book that is unsurpassed for accuracy and comprehensiveness. He produced the first edition in 1861, and a fourth, revised and enlarged, was only completed a short time before his death. But his original work was also important. His data for the thermal conductivity of various metals were for long the most trustworthy at the disposal of physicists, and his determination of the ohm in terms of the specific resistance of mercury showed remarkable skill in quantitative research. He carried out a number of magnetic investigations which resulted in the discovery of many interesting phenomena, some of which have been rediscovered by others; they related among other things to the effect of mechanical strain on the magnetic properties of the magnetic metals, to the relation between the chemical composition of compound bodies and their magnetic properties, and the parallelism between the laws of torsion and of magnetism. He also investigated electrical endosmosis and the electrical resistance of electrolytes. His eldest son, Eilhard Ernst Gustav, born at Berlin on the 1st of August 1852, became professor of physics at Erlangen in 1886, and his younger son, Alfred, born at Berlin on the 18th of July 1856, was appointed to the extraordinary professorship of Egyptology at Bonn in 1892.

WIELAND, CHRISTOPH MARTIN (1733-1813), German poet and man of letters, was born at Oberholzheim, a village near Biberach, in Württemberg. His father, Johann Baptist Widukind, who was pastor in Oberholzheim, and subsequently in Biberach, took great pains with the child's education, and from the town school of Biberach he passed on, before he had reached his fourteenth year, to the gymnasium at Klosterberge, near Magdeburg. He was a precocious child, and when he left school in 1749 was widely read in the Latin classics and the leading contemporary French writers; amongst German poets his favourites were Brockes and Klopstock. While at home in the summer of 1750, he fell in love with a kinswoman, Sophie Guter-Gutmann, and this love affair seems to have acted as an incentive to poetic composition; under this inspiration he planned his first ambitious work, Die Natur der Dinge (1752), a didactic poem in six books. In 1750 he went to the university of Tübingen, as a student of law, but his time was mainly taken up with literary studies. The poems he wrote at the university—Hermann, an epic (published by F. Muncker, 1886), Zwolf moralische Briefe in Versen (1752), Anti-Ovid (1752)—are pietistic in tone and dominated by the influence of Klopstock. They attracted the attention of the Swiss literary reformer, J. J. Bodmer, who invited Wieland to visit him in Zürich in the summer of 1751. Afterwards, however, Bodmer felt himself as little in sympathy with Wieland as, two years earlier, he had felt himself with Klopstock, and the friends parted; but Wieland remained in Switzerland until 1760, residing, in the last year, at Bern where he obtained a position as private tutor. Here he estabished intimate relations with Rousseau's friend Julie de Bondeli. Meanwhile a change had come over Wieland's tastes; the writings of his early Swiss years—Der geprüfte Abraham (1753), Sympathien (1756), Empfindungen eines Christen (1757)—were still in the manner of his earlier writings, but with the tragedies, Lady Johanna Gray (1758), and Clementina von Porretta (1756)—the latter based on Richardson's Sir Charles Grandison—the epic fragment Cyrus (1759), and the "moral story in dialogues," Arespes und Panthea (1760), Wieland, as Lessing said, "forsook the ethereal spheres to wander again among the sons of men." Wieland's conversion was completed at Biberach, whither he had returned in 1760, as director of the chancery. The dullness and monotony of his life here was relieved by the friendship of a Count Stadion, whose library in the castle of Warthausen, not far from Biberach, was well stocked with French and English literature. Here, too, Wieland met again his early love Sophie Guter-Gutmann, who had meanwhile become the wife of Hofrat La Roche, then manager of Count Stadion's estates. The former poet of an austere Pietism now became the advocate of a light-hearted philosophy, from which frivolity and sensuality were not excluded. In Don Sylvio von Rosalva (1764), a romance in imitation of Don Quixote, he held up to ridicule his earlier faith and in the Komische Erzählungen (1765) he gave his extravagant imagination only too free a rein. More important is the novel Geschichte des Agathon (1766-1767), in which, under the guise of
WIELAND a mining town in Galicia, Austria, 220 m. by rail W. of Lemberg and 9 m. S.E. of Cracow. Pop. (1900) 6012. It is built on the slopes of a hill which half encircles the place, and over the celebrated salt-mines of the same name. These mines are the richest in Austria, and among the most remarkable in the world. They consist of seven different levels, one above the other, and have eleven shafts, two of which are in the town. The legs are connected by flights of steps, and are composed of a labyrinth of chambers and passages, whose length aggregates over 65 m. The length of the mines from E. to W. is 25 m., the breadth from N. to S. is 150 yds. and the depth reaches 980 ft. Many of the old chambers, some of which are of enormous size, are embellished with portals, candleabra, statues, etc., all hewn in rock-salt. There are also two large chapels, containing altars, tombs, etc. In rock-salt, a room called the dancing saloon (Tanssaal), where the objects of interest found in the mines are kept; the Kronleuchtersaal, and the chamber Michatovice are also worth mention. In the interior of the mines are sixteen ponds, of which the large lake of Pryzkos is 105 ft. long, 110 ft. broad, and 10-26 ft. deep. The mines employ over 1000 workers, and yield about 60,000 tons annually. The salt of Wielica is well known for its purity and solidity, but has generally a grey or blackish colour. The date of the Wieland's mining is unknown, but they were already worked in the 11th century, and in 1740 they have belonged entirely to the Austrian government. The mines suffered greatly from inundations in 1865 and 1879, and the soil on which the town is built shows signs of subsidence.

See E. Windakiewicz, Das Steinsalzbergwerk in Wieliczka (Freiberg, 1876).

WIELPOLSKI, ALEKSANDER, Marquis of Gonzaga-Myszkowski (1823-1877), Polish statesman, was educated in Vienna, Warsaw, Paris and Göttingen. In 1830 he was elected a member of the Polish diet on the Conservative side. At the beginning of the Insurrection of 1831 he was sent to London to obtain the assistance, or at least the mediation, of England; but the only result of his mission was the publication of the pamphlet Mémoire présenté à Lord Palmerston (Warsaw, 1831). On the collapse of the insurrection he emigrated, and on his return to Poland devoted himself exclusively to literature and the cultivation of his estates. On the occasion of the Galician outbreak of 1845, when the Russian panegyric massacred some hundreds of Polish landowners, an outbreak generally attributed to the machinations of the Austrian government, Wielopolski wrote his famous Lettre d'un gentilhomme polonais au prince de Metternich (Brussels, 1840), which caused a great sensation at the time, and in which he attempted to prove that the Austrian court was acting in collusion with the Russian in the affair. In 1861, when Alexander II. was benevolently disposed towards the Poles and made certain political and national concessions to them, Wielopolski was appointed president of the commissions of public worship and justice and subsequently president of the council of state. A visit to the Russian capital in November still further established his influence, and in 1862 he was appointed adjutant to the grand-duke Constantine. This office he held till the 12th of September 1863, when finding it impossible to resist the rising current of radicalism and revolution he resigned all his offices, and obtained at his own request unlimited leave of absence. He retired to Dresden, where he died on the 30th of December 1877.

See Henryk Lisicki, Le Marquis Wielopolski, sa vie et son temps (Vienna, 1880); Włodzimierz Spasowicz, The Life and Policy of the Marquis Wielopolski (Rus.), (St Petersburg, 1882).

(R. N. B.)

WIENER-NEUSTADT, a town of Austria, in Lower Austria, 31 m. S. of Vienna by rail. Pop. (1900) 28,438. It is situated between the Fischau and the Leitha and is close to the Hungarian frontier. It was almost entirely rebuilt after a destructive fire in 1834, and ranks among the handsomest provincial towns in Austria. Its ancient gates, walls and towers have disappeared, but it still possesses a few medieval edifices, the most important of which is the old castle of the dukes of Babenberg, founded in the 12th century, and converted by Maria Theresa in 1752 into a military academy. The Gothic chapel contains the remains

a Greek fiction, Wieland described his own spiritual and intellectual growth. This work, which Lessing recommended as "a novel of classic taste," marks an epoch in the development of the modern psychological novel. Of equal importance was Wieland's translation of twenty-two of Shakespeare's plays into prose (8 vols., 1762-1766); it was the first attempt to present the English poet to the German people in something approaching entirety. With the poems Musarion or die Philosophie der Grazen (1768), Idris (1768), Combasus (1770), der neue Amadis (1771), Wieland opened the series of light and graceful romances in verse which appeared so irresistibly to his contemporaries and acted as an antidote to the sentimental excesses of the subsequent Sturm und Drang movement. Wieland married in 1773 H. L. J. von Ofterdinger and in 1776 settled at Erfurt. In the last-mentioned year he published Der goldene Spiegel oder die König von Scheschian, a pedagogic work in the form of oriental stories; this attracted the attention of Anna Amalie of Saxe-Weimar and resulted in his appointment as tutor to her two sons, Karl August and Konstantin, at Weimar. With the exception of some years spent at Ossmannstedt, where in later life he bought an estate, Weimar remained Wieland's home until his death on the 20th of January 1813. Here, in 1773, he founded Der deutsche Merkur, which under his editorship (1773-1813) became a literary periodical of high German quality. Of the writings of his later years the most important are the admirable satire on German provinciality—the most attractive of all his prose writings—Die Abderiten, eine sehr wahrscheinliche Geschichte (1774), and the charming poetic romances, Das Wintermärchen (1775), Das Sommermärchen (1777), Geron der Adelige (1777), Die Wünsche oder Perronze (1778), a series culminating with Wieland's poetic masterpiece, the romantic epic of Oberon (1780). Although belonging to a class of poetry in which modern readers take but little interest, Oberon has still, owing to the facile beauty of its stanzas, the power to charm. In Wieland's later novels, such as the Geheime Geschichte des Philosophen Pellegrinus Pradeus (1791) and Aristipp und einige seiner Zeitgenossen (1800-1802), a didactic and philosophic tendency obscures the small literary interest they possess. He also translated Horace's Satires (1786), Lucian's Works (1788-1789), Cicero's Letters (1808 fl.), and from 1796 to 1803 he edited the Allgemeines Museum which did valuable service in popularising Greek studies.

Without creating a school in the strict sense of the term, Wieland remained considerably the German literature of his time. The verse-romance and the novel—more especially in Austria—benefited by his example, and even the Romanticists of a later date borrowed many a hint from him in their excursions into the literatures of the south of Europe. The qualities which distinguish his work, his fluent style and light touch, his careless frivolity rather than poetic depth, show him to have been in literary temperament more akin to Arliso and Voltairre than to the more serious and spiritual leaders of German poetry; but these very qualities in Wieland's poetry introduced a balancing element into German classical literature and added materially to its fullness and completeness.

Editions of Wieland's Sämtliche Werke appeared in (1794-1802, 45 vols.), (1818-1825, 53 vols.), (1839-1840, 36 vols.), and (1853-1856, 56 vols.). The centenary edition (40 vols., 1879-1882) and a new critical edition is at present in preparation by the Prussian Academy. There are numerous editions of selected works, notably by H. Fröhle in Kürschner's Deutsche Nationalliteratur (vols. 51-56, 1883-1889); by F. Muncker (6 vols., 1886); by W. Bösehe (4 vols., 1902). Collections of Wieland's letters were edited by his son Ludwig (1815) and by H. Gesner (1815-1816); they are a mine of information for historians, and are supplemented by the following: C. M. Wieland, Leben und Schriften (4 vols., 1827-1828); Döring, C. M. Wieland (1833); J. W. Loebell, C. M. Wieland (1838); H. Fröhle, Lessing, Wieland, Heinze (1876); L. F. Oertling, Wielands Leben und Werke in Schlesien (1877); R. Reu, Wieland und Reinhold (1885); F. Thalmeier, Über Wielands Klassizistische Sprache und Stil (1894); M. Döll, Wieland und die Antike (1896); C. A. Dehmer, Sterne und Wieland (1899); W. Lena, Wielands Verhältnis zu Spenser, Pope und Swift (1901); L. Hirz, Beziehungen zu deutschem Romantikern (1904). See also M. Koch's article in the Allgemeine deutsche Biographie (1897).
of the emperor Maximilian I, who was born here in 1459. The parish church, with its two lofty towers, is substantially a Romanesque building of the 13th century, but the choir and transepts are Gothic additions of a later date. The late Gothic church of the old Cistercian abbey contains a handsome monument in memory of Leonora of Portugal (d. 1467), consort of the emperor Frederick III., and possesses a rich library and an interesting museum. The town-house is also a noteworthy building and contains large and important archives. The chief industrial establishments are a large ammunition factory and an engine factory; but manufactures of cotton, silk, velvet, pottery and enamelware are well-known, and trading is also extensively carried on. Trade is also brisk, and is facilitated by a canal connecting the town with Vienna, and used chiefly for the transport of coal and timber.

Neustadt was founded in 1192, and was a favourite residence of numerous Austrian sovereigns, acquiring the title of the "ever-faithful town" (die allzeit getreue Stadt) from its unflagging loyalty. In 1246 it was the scene of a victory of the Hungarians over the Austrians; and in 1486 it was taken by Matthias Corvinus, king of Hungary, who, however, restored it to Maximilian I. four years later. In 1520 and 1623 it was besieged by the Turks. It was not until 1867, at Neustadt that the emperor Rudolf II. granted to the Bohemian Protestants, in 1609, the "Majestäts-brief," or patent of equal rights, the revocation of which helped to precipitate the Thirty Years' War.

WIENIAWSKI, HENRI (1835–1888), Polish violinist and composer, was born at Lublin, in Poland, on the 10th of July 1835. He was a pupil of the Paris Conservatoire from 1843 to 1846, and again in 1849–1850. Meanwhile he had given concerts in his native country and in Russia, and in 1850 entered upon the career of a travelling virtuoso, together with his brother Joseph, a distinguished pianist. He was appointed solo violinist to the tsar in 1860, and taught in the Conservatoire of St Petersburg from 1862 to 1867. He went on tour again in 1872 with Rubinstein in America, and on his return in 1874 was appointed to succeed Vieuxtemps as professor in the Brussels Conservatoire; but, like his predecessor, he was compelled through ill-health to give up the post after three years, returning to a public career in spite of his illness, until his death, which occurred in a journey to Montreux on the shores of Lake Geneva, in 1880. Several of his compositions were early adopted by the band organizations, and a more ambitious military composition attracted the attention of Gasparo Spontini, at whose house he became an intimate guest. It was now that he began to study acoustics, in order to correct the deficiencies in military musical instruments. As the result, he improved the valves of the brass instruments, and succeeded, by constructing them on sounder acoustic principles, in greatly increasing the volume and purity of their tone. He also invented the bass tuba or bombardon in order to give greater richness and power to the bass parts. In recognition of these inventions he was, in 1835, honoured by the Royal Academy of Berlin. In 1838 he was appointed by the Prussian government director-general of all the guards' bands, and in recognition of the magnificent performance by massed bands on the occasion of the emperor Nicholas I.'s visit the same year, was awarded a special uniform. In 1843 he became director-general of the bands of the 10th Confederate army corps, and from this time exercised a profound influence on the development of military music throughout Europe. He died in 1880, and is said to have been the first to arrange symphonies and overtures of the classical masters for military instruments, and to organize those outdoor performances of concert pieces by military bands which have done so much to popularize good music in Germany and elsewhere. The performance arranged by him of Beethoven's 'Battle of Vittoria,' in which the bugle calls were given by trumpeters stationed in various parts of the garden and the cannon shots were those of real guns, created immense sensation.

See also Spontini, Wiesbaden, and WIESBADEN.

WIESBADEN, a town and watering-place of Germany, in the Prussian province of Hesse-Nassau. Pop. (1905) 100,935. It is delightfully situated in a basin under the well-wooded southwestern spur of the Taunus range, 5 m. N. of Mainz, 3 m. from the right bank of the Rhine (at Biebrich), and 25 m. W. of Frankfort-on-Main by rail. The town is on the whole sumptuously built, with broad and regular streets. Villas and gardens engirdle it on the north and east sides and extend up the hills behind. Its prosperity is mainly due to its hot springs and mild climate, which have rendered it a favourite winter as well as summer resort. The general character of the place, with its numerous hotels, pensions, bathing establishments, villas and places of entertainment, is largely determined by the requirements of visitors, who in 1907 numbered 186,000. The principal buildings are the royal palace, built in 1827–1828, as a residence of the king of Prussia; the Court Theatre (erected 1829–1849); the new Kurhaus, a large and handsome establishment, with colonnades, adjoining a beautiful and shady park; the town-hall, in the German Renaissance style (1884–1888); the government offices and the museum, with a picture gallery, a collection of antiquities, and a library of 150,000 volumes. Among the churches, which are all modern, are the Protestant Marktkirche, in the Gothic style with five towers, built 1555–1862; the Bergkirche; the Roman Catholic church of St Boniface; the Anglican church and the Russian church on the Neroberg. There are two synagogues. Wiesbaden contains numerous scientific and educational institutions, including a chemical laboratory, an agricultural college and two musical conservatories.

The alkaline thermal springs contain 3% of common salt, and smaller quantities of other chlorides; and a great deal of their efficacy is due to their high temperature, which varies from 196° to 147° Fahr. The water is generally cooled to 93° Fahr. for bathing. The principal spring is the Kochbrunnen (156° Fahr.), the water of which is drunk by sufferers from chronic dyspepsia and obesity. There are twenty-eight other springs of nearly identical composition, many of which are used for bathing, and are efficacious in cases of rheumatism, gout, nervous and female disorders and skin diseases. The season lasts from April to October, but the springs are open the whole year through and are also largely attended in winter.

Two miles north-west of the town lies the Neroberg (800 ft.), whence a fine view of the surrounding country is obtained, and which is reached by a funicular railway from Beausite, and 6 m. to the west lies the Hohe Wurzel (1025 ft.) with an outlook tower.
Wiesbaden is one of the oldest watering-places in Germany, and may be regarded as the capital of the Taunus spas. The springs mentioned by Pliny (Hist. nat. xxi. 2) as Fontes Matthiae were known to the Romans, who fortified the place c. 11 b.c. The massive walls of this part of the town known as the Heilenuhr was probably part of the fortifications built under Dios- cletian. The name Wissidoda ("meadow bath") appears in 830. Under the Carolingian monarchs it was the site of a palace, and Otto I. gave it civic rights. In the 11th century the town and district passed to the counts of Nassau, fell to the Walram line in 1255, and in 1355 Wiesbaden became with Idstein capital of the county Nassau-Idstein. It suffered much from the ravages of the Thirty Years' War and was destroyed in 1644. In 1744 it became the seat of government of the principality Nassau-Usingen, and was from 1815 to 1866 the capital of the duchy of Nassau, when it passed with that duchy to Prussia. Though the springs were never quite forgotten, they did not attain their greatest repute until the close of the 18th century. From 1771 to 1873 Wiesbaden was a notorious gambling resort; but in the latter year public gambling was suppressed by the Prussian government.

WIG (short for "periwig," an alternative form of "peruke," Fr. peruvage; cf. Span. peluca; conventionally derived from Lat. pilus), an artificial head of hair, worn as a personal adornment, disguise or symbol of office. The custom of wearing wigs is of great antiquity. If, as seems probable, the curious head-dress of a prehistoric ivory carving of a female head found by M. Piette in the cave of Brassempouy in the Landes represents a wig (see Ray Lankester, Science from an Easy Chair, fig. 7) the fashion is certainly some 100,000 years old. In historic times wigs have been used among different peoples for official head-dress, and specimens of these have been recovered from mummies. In Greece they were used by both men and women, the most common name being περίκεφαλη or ψευδέμα, sometimes πρόδρομος or κώμα προδρόμος. A reference in Xenophon (Cyr. i. 3. 2) to the false hair worn by Cyrus's grandfather "as is customary among the Medes," and also a story in Aristot- le (Deon. 4. 14), would suggest that wigs were introduced from Persia, and were in use in Asia Minor. Another origin is sug- gested by Athenaeus (xii. 523), who says that the Iapygian immigrants into Italy from Crete in the 8th century wore "a kind of wig or wiglet," and the elaborately frizzled hair worn by some of the figures in the frescoes found at Cnossus makes it probable that the wearing of artificial hair was known to the Cretans. Lucian, in the 2nd century, mentions wigs of both men and women as a matter of course (Alex. 59, Dial. mer. 11). The theatrical wig was also in use in Greece, the various comic and tragic masks having hair suited to the character represented. A. E. Haigh (Artic Theatre, pp. 221, 239) refers to the black hair and heard of the tyrant, the fair curls of the youthful hero, and the red hair characteristic of the dishonest slave of comedy. The chief names for wigs were galerus, galereum, coemberum, capilamentum, ciamenti, or even conoe empatue, &c. Galerus meant in the first place a skull-cap, or coif, fastening under the chin, and made of hide or fur, worn by peasants, athletes and flaminies. The first men's wigs then would have been tight-fur caps simulating hair, which would naturally suggest wigs of false hair. Otho wore a wig (Suetonius, Otho § 12), which could not be distinguished from real hair, while Nero (Dio Cass. i. 90) wore a wig as a disguise, and Heliogabalus also wore one at times (Suetonius, Elagabalus § 13). It was under Queen Anne, bowling of different colours as part of their ordinary wardrobe, and Faustina, wife of Marcus Aurelius, is said to have had several hundred. An amusing development of this is occasionally found in portrait busts, e.g. that of Plautilla in the Louvre, in which the hair is made movable, so that by changing the wig of the statue from bust to time it should never be out of fashion.

The Fathers of the Church violently attacked the custom of wearing wigs, Tertullian (De cultu fem. C. 7) being particularly eloquent against them, but that they did not succeed in stamping out the custom was proved by the finding of an Aubigny wig in the grave of a Christian woman in the cemetery of St Cyprian. In 672 a synod of Constantinepolis forbade the wearing of artificial hair.

Artificial hair has presumably always been worn by women when the fashion required abundant locks. Thus, with the development of elaborate coiffures in the 17th century, the wearing of false hair became prevalent among ladies in Europe; Queen Elizabeth had eighty attires of false hair, and Mary queen of Scots was also in the habit of varying the attires of hair she wore. The periwig of the 16th century, however, merely simu- lated real hair, or was an adornment or to supply the defects of nature. It was not till the 17th century that the peruke was worn as a distinctive feature of costume. The fashion started in France. In 1620 the aîné La Rivièrre appeared at the court of Louis XIII. in a periwig made to simulate long fair hair, and four years later the king himself, prematurely bald, also adopted one and thus set the fashion. Louis XIV., who was proud of his abundant hair, did not wear a wig till after 1670. Meanwhile, his courtiers had continued to wear wigs in imitation of the royal hair, and from Versailles the fashion spread through Europe. It was not until the 1740's, when the prince of Wales (Charles I.), while in Paris on his way to Spain, had "shadowed himself the most he could under a burlry perruque, which some in former days but bald-headed people used," he had dropped the fashion on returning to England, and he and his Cavaliers were distinguished from the "Roundheads" only by wearing their own flowing locks. Under Charles II. the wearing of the peruke became general. Pepys records that he parted with his own hair and "paid f3 for a periwigg;" and on going to church in one he says "it did not prove so strange as I was afraid. I had my wig as an adornment or to cover the defects of nature. So the wig attained its maximum development, covering the back and shoulders and floating down over the chest. So far, indeed, whatever the exaggeration of its proportions, the wig had been a "counterfeit hair" intended to produce the illusion of abundant natural locks. But, to quote the inimitable author of Placo- cosmos, "as the perukes became more common, their shape and forms altered. Hence we hear of the clerical, the physical, and the huge tie peruke for the man of law, the brigadier or major for the army and navy; as also the tremendous fox ear, or cluster of temple curls, with a pig-tail behind. The merchant, the man of business and of letters, were distinguished by the grave full bottom, or more moderate tie, neatly curled; the tradesman by the long bob, or natty scratch; the country gentleman by the natural fly and hunting peruke. All conditions of men were distinguished by the cut of the wig, and none more so than the coachman, who wore his, as there does some to this day, in imitation of the curled hair of a water-dog." 1

1 This was cheap. The author of Placocosmos says that when they first were worn, the price was usually one hundred ecus, and the article in Diderot's Encyclopédie says that it sometimes cost as much as 1000 écus.

Placocosmos, p. 203. The writer goes on to describe the fashions on the stage. "So here as King William's reign, in one of Rowe's pieces, Lady Jane Grey, the Lord Guildford Dudley is dressed in all the modern fashion of lace coat, cravat, high peruke, &c., while the innocent shepherdess is simply dressed, and not even saved from a very distressing tale--simply covered with wisps, and her hair plaited negligently on her shoulders... Nearer our time, in the tragedy of Catari. Mr Booth is dressed a-la-mode, with the huge peruke... Mr Quin
This differentiation of wigs according to class and profession explains why, when early in the reign of George III. the general fashion of wearing wigs began to wane and die out, the practice held its own among professional men. It was by slow degrees that doctors, soldiers and clergy, gave up the custom. In the Church it survived longest among the bishops, the wig ultimately becoming a sort of ensign of the episcopal dignity. Wigs were first discarded by the bishops, by permission of the king, at the coronation banquet of William IV., the weather being hot; and Grevelle comments on the odd appearance of the prelates with their cropped polls. At the coronation of Queen Victoria the archbishop of Canterbury, alone of the prelates, still wore a wig. Wigs are now worn as part of official costume only in the United Kingdom and its dependencies, their use being confined, except in the case of the speakers of the house of commons and lords of the lord chancellor, the judges and members of the bar (see ROBES). Wigs of course continue to be worn by many to make up for natural deficiencies; and on the stage the wig is, as in all times, an indispensable adjunct. Many of the modern stage wigs are made of jute, a fibre which lends itself to marvellously perfect imitations of human hair.

See F. W. Fairholt, Costume in England, vols., ed. Dillon (1889); C. Edwards, English theatrical costume (1891); the articles "Coma" and "Perruque" in Dabereine and Saglio's Dictionnaire des antiquités. There is an admirable article on wigs and wig-making in Diderot's Encyclopédie (1765), t. xii., s.v. "Perruquier, par laquelle on fait les coiffures, ou le Whole Art of Hairdressing (London, 1782) also contains rich material.

WIGAN, a market town, and municipal, county and parliamentary borough of Lancashire, England; 104 m. N.W. by N. from London by the London & North-Western railway, served also by the Lancashire & Yorkshire and the Great Central railways. Pop. (1891) 55,013, (1901) 60,704. It lies on the small river Douglas, which flows into the estuary of the Ribble. There is connexion by canal with Liverpool, Manchester, &c. The older portions of the town occupy the north bank of the river, the modern additions being chiefly on the south bank. The church of All Saints, late Perpendicular, consisting of chancel with aisles and two chapels, was restored in 1630 and in modern times. There are numerous modern churches and chapels. The principal public buildings are the Royal Albert Edward Infirmary and Dispensary, the public hall, the borough courts and offices, the arcade, the market hall, the free public library and the county courts and offices (1888). The educational institutions include the free grammar school (founded by James Leigh in 1619 and rebuilt in 1876), the Wigan and District Middle College (built by public subscription and opened in 1903) and the mechanics' institution, also founded in 1834, of Notre Dame (1854), with a college for pupil teachers and a high school for girls, and several Roman Catholic schools. A public park of 27 acres was opened in 1878. The town owes much of its prosperity to its coal mines, which employ a large proportion of the inhabitants and supply the factory furnaces. The chief manufacture is that of cotton fabrics; the town also possesses iron foundries, iron and brass foundries, oil and grease works, railway wagon factories, and bolt, screw and nail works. The parliamentary borough, returning one member since 1855, is within the Wigan division of the county. The county borough was created in 1888. The corporation consists of a mayor, 10 aldermen and 30 councillors. Area 5082 acres, including the former urban district of Pemberton (pop. 21,564 in 1901), which was included with Wigan in 1904.

Roman remains have been found, and it is probable that the town covers the site of a Roman post or fort, Coccium. Wigan, otherwise Wygen and Wingham, is not mentioned in Domesday Book, but three of the townships, Upholland, Dalton and Orrell are named. After the Conquest Wigan was part of the manor of Newton, and the church was endowed with a carucate of land, the origin of the manor. Some time before Henry III.'s reign the baron of Newton granted to the rector of Wigan the manorial privileges. In 1246 Henry III. granted a charter to the famous John Mansel, parson of the church, by which Wigan was constituted a free borough and the burgesses permitted to have a Guild Merchant. In 1249 John Mansel granted by charter to the burgesses that each should have five roods of land to his burage as freehold on payment of 12d. each. Confirmations and extensions of Henry III.'s charter were granted by Edward I. (1294), Edward III. (1340), Richard II. (1358), Henry IV. (1400), Henry V. (1413), Charles II. (1663), James II. (1685) and William IV. (1832 and 1836). In 1258 Henry III. granted by charter to John Mansel a weekly market on Monday and two fairs, each of three days, beginning on the eve of Ascension Day and on the eve of All Saints' Day, October 28th. Edward II. granted a three days' fair from the eve of St. Wilfrid instead of All Saints' fair, but in 1329 Edward III. by charter altered the fair again to its original date. Charles II.'s charter granted, and James II.'s confirmed, a three days' fair beginning on the first Tuesday in June. Potters have been numerous in the place, and abundant trades here, and the manufacture of woollens, especially of blankets, was carried on in the 18th century. The cotton trade developed rapidly after the introduction of the cylindrical carding machine, which was set up here two years before Peel used it at Bolton. During the Civil War the town, from its vicinity to Lathom House and the influence of Lord Derby, adhered staunchly to the king. On the 1st of April 1643 the Parliamentarians under Sir John Seaton captured Wigan after severe fighting. In the following month Lord Derby regained it for the Royalists, but Charles Ashby, his lieutenant, burned the manorial town. In 1651 Lord Derby landed from the Isle of Man and marched through Preston to Wigan on the way to join Charles II. At Wigan Lane on the 25th of August a fierce battle took place between the Royalist forces under Lord Derby and Sir Thomas Tyldesley and the Parliamentarians under Colonel Lilburne, in which the Royalists were defeated, Tyldesley was killed and Lord Derby wounded. During the rebellion of 1745 Prince Charles Edward spent one night (December 10th) here on his return march. In 1793 Wigan returned two members to parliament and again in 1807, the right then remaining in the borough till 1885, except that for the first time during the Commonwealth, the borough returned two members, and since 1885 one member. The church of All Saints is of Saxon origin, and was existing in Edward the Confessor's time. The list of rectors is complete from 1109.

WIGEON, or WIDGEON (Fr. Vigeon, from the Lat. Vippio, also called locally "Whever" and "Whew" (names imitative of the whistling call-note of the male), the Anas penelope of Linnaeus and Motacilla penelope of modern ornithologists, one of the most abundant species of ducks throughout the greater part of Europe and northern Asia, reaching northern Africa and eastwards, and diminishing the works. In 1651 Lord Derby landed from the Isle of Man and marched through Preston to Wigan on the way to join Charles II. At Wigan Lane on the 25th of August a fierce battle took place between the Royalist forces under Lord Derby and Sir Thomas Tyldesley and the Parliamentarians under Colonel Lilburne, in which the Royalists were defeated, Tyldesley was killed and Lord Derby wounded. During the rebellion of 1745 Prince Charles Edward spent one night (December 10th) here on his return march. In 1793 Wigan returned two members to parliament and again in 1807, the right then remaining in the borough till 1885, except that for the first time during the Commonwealth, the borough returned two members, and since 1885 one member. The church of All Saints is of Saxon origin, and was existing in Edward the Confessor's time. The list of rectors is complete from 1109.

The name WIGEON (q.v.) is from Pipio. Other French names, more or less local, are, according to Rolland, Vigneon, Vignon, Wagne, Wagne, Wignet, Wusiol, Vionze and Digeon. In some parts of England the small teazing flies, generally called midges, are known as "wignes." Hence come the additional local names "bald-pate" and "red-head."
conspicuously white, and shows itself again on the flanks. The wings are further ornamented by a glossy green speculum between two bands of black. Cotton Mather noticed and admired it; the rest of the plumage is white. The female has the inconspicuous coloration characteristic of her among most of the duck tribe. In habits the wigeon differs not a little from most of the Anasimae. It greatly affects tidal waters during the season of its southern stay, and becomes the object of slaughter to hundreds of gunners on the coasts of Britain and Holland; but, when it resorts to inland localities, as it also does to some extent, it is more of its kind in granting, especially by day, on the pastures which surround the lakes or moors that it selects.

The wigeon occurs occasionally on the eastern coast of North America, and not uncommonly, it would seem, on the Priehylof Islands in the Pacific. But the New World has two allied species of its own. One of them, M. americana (a freshly killed example of which was once found in a London market), inhabiting the northern part of that continent, and in winter reaching Central America and the West Indian islands as far as Trinidad, wholly resembles its Old-World congener in habits and much in appearance. But in it the chestnut of the head is replaced by a close speckling of black and buff, the white wing-coverts are wanting, and nearly all the plumage is subdued in tone. The other species, M. sibilatrix, inhabits the southern portion of South America and its islands, from Chile on the west to the Falklands on the east, and is easily recognized by its nearly white head, pure glossy with purple and green, and other differences; while the plumage hardly differs sexually at all.

WIGGIN, KATE DOUGLAS (1857- ), American novelist, daughter of Robert N. Smith, a lawyer, was born in Philadelphia, Pennsylvania, on the 26th of September 1857. She was educated at Abbott Academy, Andover, Massachusetts, and married in 1876 to Los Angeles, California. She taught in Santa Barbara College (1877-1878), established in San Francisco the first free kindergarten for poor children on the western coast (1878), and, with the help of her sister, Miss Nora Archibald Smith, and of Mrs Sarah B. Cooper, organized the California Kindergarten Training School (1886). She married, in 1880, Samuel Bradley Wiggins of San Francisco, who died in 1889. In 1895 she married George Christopher Riggs, but continued to write under the name of Wiggins. Her interest in children's education was shown in numerous books, some written in collaboration with her sister, in both prose and verse. But her literary reputation rests rather on her works of prose fiction, which show a real gift for depicting character and an original vein of humour. The best known of these are: The Birds' Christmas Carol (1888); Penelope's English Experiences (1893); Marm Lisa (1896); Penelope's Progress (1898), being Penelope's experiences in Scotland; Penelope's Irish Experiences (1901); The Diary of a Goose-Girl (1903); and Rebecca of Sunnybrook Farm (1903).

WIGGLESWORTH, MICHAEL (1631-1705). American clergyman. He was born in England to parents in Nova Scotia on the 18th of October 1631. His father, Edward (d. 1653), persecuted for his Puritan faith, emigrated with his family to New England in 1638 and settled in New Haven. Michael studied for a time at a school kept by Ezekiel Cheever, and in 1651 graduated at Harvard, where he was a tutor (and a Fellow) in 1652-1654. Having fitted himself for the ministry, he preached at Charlestown in 1653-1654, and was pastor at Malden from 1656 until his death, though for twenty years or more bodily infirmities prevented his regular attendance upon his duties—Cotton Mather described him as "a little feeble shadow of a man." During this interval he studied medicine and began a successful practice. He was again a Fellow of Harvard in 1697-1705. He died at Malden on the 10th of June 1705. Wigglesworth is best known as the author of The Day of Doom; or a Poetical Description of the Great and Last Judgment (1652). At least two English and eight American editions have appeared, notable among them being that of 1697 (New York), edited by W. H. Burr and including other poems of Wigglesworth, a memoir and an autobiography. For a century this realistic and terrible expression of the prevailing Calvinistic theology was by far the most popular work written in America. His other poems include God's Contrivance with New England (revised in 1662), "in the time of the great drought," and first printed in the Proceedings of the Massachusetts Historical Society for 1781, and Meat out of the Eater; or Meditations concerning the Necessity, End and Usefulness of Afflictions unto God's Children (1666; revised in 1703).

His son, SAMUEL (1689-1768), also a clergyman, was the author of several prose works and of one poem of merit, "A Funeral Song" (1758). Another son, Edward (1693-1765), was the first Hollis professor of Divinity at Harvard (1722-1725), and the author of various theological works; and a grandson, Edward (1732-1794), was the second Hollis professor of Divinity (1755-1791), in which position he was succeeded by Michael Wigglesworth's great-grandson, Rev. David Tappan (1752-1803).

See J. W. Deane, Memoir of Rev. Michael Wigglesworth (Boston, 1871).
coast, and may also be studied to great advantage in White Cliff and Alum Bays. In Alum Bay the vertical disposition of the strata is well shown, and the highly-coloured Bagshot sands and clays form a conspicuous feature. From the excellent coast sections many fossils may be obtained. South of the Chalk ridge that rock has been completely removed by denudation so as to expose the underlying Upper Greensand, which has slipped in many places over the underlying Gault (Fig. 1); these fossiliferous strata are also of considerable extent, and in some cases show large and conspicuous formations. The Lower Greensand formation may best be studied in the cliff section from Atherfield Point to Rocken End, and in the chines of Shanklin and Blackgang. Beneath the Greensand the Wealden is exposed in the section from Brook to Atherfield, and also, to a much less extent, in Sandown Bay. The Wealden strata have yielded abundant fossil remains of extinct reptiles (Iguanodon), especially in the neighbourhood of Brook and CowlVENTORY and Freshwater Chine; and at Atherfield Point an entire fossil forest exists, the remains of a great raft of timber floated down and deposited in estuarine mud at the mouth of a great river. At Brook also the characteristic Wealden mollusks, Unio valdensis, occurs abundantly.

**Towns, &c.—** Newport at the head of the Medina estuary is the chief town; Coves at the mouth the chief port. The principal resorts of visitors are Coves (the headquarters of the Royal Yacht Squadron); Ryde on the north-east coast; Sandown, Shanklin and Ventnor on the south-west coast; and Bembridge on the eastern shore of the Solent. Others are Totland Bay near the mouth of the Solent, Gurnard near Coves, and Seaview and Bembridge south of Ryde. The principal lines of communication with the mainland are between Coves and Southamptori, Ryde and Portsmouth, and Yarmouth and Lymington. Newport is the chief railway centre; lines running N. to Coves, W. to Yarmouth and Freshwater, S. to Ventnor, with a branch to Sandown, and E. to Ryde. A direct line connects Ryde, Sandown, Shanklin and Ventnor, and has a branch to St Helen’s and Bembridge. There are few industries in the island. The land is chiefly grazing land, and being drained it is well suited for sheep-grazing. Fishing is carried on to a considerable extent on the south coast—lobsters, crabs and prawns being plentiful. Oyster cultivation has been attempted in the Medina, in Brading Harbour and in the Newtown river. At Coves shipbuilding is carried on, and timber is grown for the British navy in a part of the ancient forest of Parkhurst, between the Medina and the Solent. The general trade of the island centres at Newport, but in the coast towns the chief occupation of the inhabitants consists in providing for visitors. The island shares in the defences of the Solent, Spithead andPortsmouth; and between the Needles and the eastern foreland, and along the west coast between the Needles and Yarmouth. Strong associations connect the Isle of Wight with the British royal family. Osborne House, near Coves, was a residence and the scene of the death of Queen Victoria, and was presented to the nation by King Edward in 1902 (see Coves). Princess Beatrice succeeded her husband Prince Henry of Battenberg as honorary governor of the island in 1896. The island is divided into two liberties, East and West Medina, excluding the boroughs of Newport and Ryde; and it forms one petty and special sessional division of the county. The urban districts are Coves, East Coves, St Helen’s, Sandown, Shanklin and Ventnor. Until 1838 there was one member of parliament for the island and one for the borough of Newport; now, however, there is only one member for the whole island. Episcopally the island has for many centuries belonged to the see of Winchester. Pop. (1891) 78,672; (1901) 82,418.

**History.**—Among the most interesting relics of the Roman occupation of the Isle of Wight following its conquest by Vesuvian in A.D. 43 are the villas at Brading and Carisbrooke, the camps at Wootton, and the Roman stations at Collington, Farm, Gurnard, and between Brixton and Calbourne. Of the settlement of the island by the Jutes no authentic details are preserved, but in 661 it was annexed by Wulfhere to Wessex and subsequently bestowed on his vassal, the king of Sussex. In 968 it was the headquarters of the Danes, who levied their supplies from the opposite coasts of Hampshire and Sussex.

From the 14th to the 16th century the island was continuously under fear of invasion by the French, who in 1377 burnt Yarmouth and Chanuteville (the latter being subsequently rebuilt and known as Newtown), and so devastated Newport that it lay uninhabited for two years. In 1419, on a French force landing in the island and demanding tribute in the name of King Richard and Queen Isabella, the islanders replied that the king was dead and the queen sent home to her parents without any such condition of tribute, “but if the Frenchmen’s minde were to fight, they will let them to come up, and no man should let them for the space of five hours, to refresh themselves, but when that time was expired they should have battley given to them”; a proposition prudently declined by the Frenchmen, who returned to their ships and sailed home again. A more formidable raid was attempted in 1538. From the Cinque Ports, 25 gallyes, and 50 smaller vessels drew up off Brading Harbour, and in spite of the brave defence of the islanders wrought much serious destruction. Wolverton near Brading having lain a ruined site ever since. As a result of this, the last French invasion, an organized system of defence was planned for the island, and forts were constructed at Coves, Sandown, Freshwater and Yarmouth. During the Civil War of the 17th century the island was almost unanimous in support of the parliament, and Carisbrooke Castle was the prison of Charles I. from 1647 to 1648, and in 1650 of the princess Elizabeth and the duke of Gloucester, the former dying there from the effects of a chill after only a few weeks of captivity.

The lordship of the island was granted by William the Conqueror to William Fitz-Osbern, but escheated to the crown by the treason of Roger, son of William, and was bestowed by Henry I. on Baldwin de Redvers, whose descendant Isabella de Fortibus sold it to Edward I. in 1293 for 6000 marks. Henceforth the island was governed by wardens appointed by the crown, who in the reign of Henry VII. were styled captains, a title revived in 1538 in the person of Prince Henry of Battenberg. The ancient place of assembly for the freemen of the island was at Shide Bridge near Newport, and at Newport also was held the Knighten Court, in which cases of small debt and trespasses were judged by those who held a knight’s fee or part of a knight’s fee of Carisbrooke Castle. The feudal tenants held their lands for the service of escorting their lords into and out of the island, and of serving forty days at their own cost in defence of Carisbrooke Castle. In the Domesday Survey twenty-nine mills are mentioned, and salt-works at Boarhurt, Bowcombe, Watchingwell and Whitingfield. The island quarries have been worked from remote times, that of the island itself being the only one. The Alum was collected at Parkhurst Forest in 1579. Alum and sand for glass-making were formerly obtained at Alum Bay. In 1295 the united boroughs of Yarmouth and Newport made an isolated return of two members to parliament. From 1584 the boroughs of Lymington, Newport, Newtown and Yarmouth returned two members each, until under the act of 1832 the two last were disfranchised. By the act of 1868 Lymington and Newport lost one member each, and by the act of 1885 they were disfranchised.

**Antiquities.—** Early antiquities include British pit villages near Rowborough, Celtic tumuli on several of the chalk downs, and the so-called Long Stone at Mottiston, a lofty sandstone monolith. The Roman villa near Brading contains some beautiful and well-preserved examples of tesselated pavements. Carisbrooke Castle is a beautiful ruin built upon the site of an ancient British stronghold. There are slight remains of Quarry Abbey near Ryde, founded for Benedictines (afterwards Cistercians) by Baldwin de Redvers in the first half of the 12th century. The most noteworthy ancient churches are those of Bonchurch (Norman), Brading (transitional Norman and Early English), Shalfleet (Norman and Decorated), and Carisbrooke, of various styles. See Victoria County History, Hampshire; Sir R. Worsley, The History of the Isle of Wight (London, 1781); Richard Warner, The History of the Isle of Wight (Southampton, 1795); B. B. Woodward, Hampshire, including the Isle of Wight (3 vols., London, 1861-1889); Percy Stone, Architectural History of the Isle of Wight (London, 1891).

**Wigtown,** a royal burgh and the county town of Wigtownshire, Scotland. Pop. (1901) 1329. It is situated on the western
shored of Wigton Bay—whence the name, from the Scandinavian *vik*, "bay"—7 m. by S. E. of Newton Stewart by railway. It is built on an eminence around a spacious central area laid out in walks. The two islands lying opposite the present town, and at the opposite side are two crosses, one of 1738 and the other commemorating Waterloo. Some fishing is carried on. In the old churchyard were buried Margaret MacLachlan, a widow aged 63, and Margaret Wilson, a girl of 18, two covenanting martyrs who were tied to stakes in the sands of Wigton Bay and drowned by the rising waters (1658), to whose memory, as well as that of three men who were hanged at the same time without trial, an obelisk surmounted by an urn was erected in 1858 on the top of Windy Hill, outside the town. Wigton was made a royal burgh in 1275.

WIGTOWNSHIRE (sometimes called West Galloway), a south-western county of Scotland, bounded N. by Ayrshire, E. by Kirkcudbrightshire and Wigtown Bay, S. by the Irish Sea and W. and N. by the North Channel. Including the small island of St Helena, at the head of Luce Bay, it covers an area of 311,609 acres, or 487 sq. m. On the eastern boundary the estuary of the Cree expands into Wigtown Bay, between which and Luce Bay, farther west, extends the promontory of the Machars, terminating in Burrow Head. By the indentation of Luce Bay on the south and Loch Ryan on the north the hammer-shaped peninsula of the Rhinns and the Rhinns of Galloway is separated from the west. Galloway, the most southerly point of Scotland, is the southern, and Millre Point the northern extremity. The more or less rugged coast has many small inlets, few of which, owing to hidden rocks, afford secure landing-places. Excepting Loch Ryan, a fine natural harbour of which Stranraer is the port, the harbours are not available for vessels of heavy burden, on account either of the great distance to which the sea retires, or of their exposure to frequent fierce gales. Much of the county has a wild, bleak appearance, the higher land being covered with heather, and while in the lower districts there are long stretches of bog and moss, and in the centre north, a few miles west of Newton Stewart, is a tract known as the Moors. Only towards the Ayrshire border do the hills reach a considerable altitude, Benbreake and Craigairie being each 1000 ft. in height. The chief rivers are the Cree, forming the boundary with Kirkcudbrightshire and flowing past Newton Stewart and Carty into Wigtown Bay; the Bladenoch, issuing from Loch Maberry and falling into Wigtown Bay at Wigton after a course of 22 m., its principal affluents, all on the right, being Black Burn and the Cross Water; and the Mielre, forming the line by which the junction of New Luce of Main Water and Cross Water of Luce, and emptying itself into Luce Bay. Most of the numerous lochs are small, several being situated in private parks, as at the earl of Stair’s estate of Castle Kennedy. Among the larger lakes are Loch Maberry and Loch Dornal, both partly in Ayrshire, and Loch Ochiltree in the north of the shire, Loch Connell in the west. Loch Ronald in the centre and the group of Castle Loch and four others in the parish of Mochnan, towards the south, and Loch Dowalton, at the junction of Kirkinner, Sorbie and Glasserton parishes.

Geology.—A line drawn in a north-easterly direction from the coast about 3 m. below Portpatrick, passing slightly north of the head of Luce Bay by Newton Stewart to the Cairnsmore of Fleet, divides the county so that practically all the rocks on the northern side are of Ordovician age, while those on the south are Silurian. This line coincides with the general direction of the strike of the beds throughout the county. Most of the Ordovician rocks are black shales, in which grauplites may be found, along with greywackes and grits; they include the Glenkil and Hartfell groups of the Moffat district. These rocks may be seen exposed on the coast south of Portpatrick and in the valley of the Cree. The slate quarries of Cairnryan are of Llandovery age. Of the whole area of the county, the Ordovician dark grits, greywackes and shales of Llandovery age, though here and there a small exposure of the underlying black Moffat shales appears on the denuded flows. The Ordovician formations fold into a N. 26° E. in the older, and an E. 58° S. in the younger, and these rocks have been thrown. A series of shales, flags and grey- wackes of Wenlock age is found on the shore between Burrow Head and Whithorn. On the west side of Loch Ryan is a narrow belt of Pennine breccias and thin sandstones about 0.5 m. long and 1 m. wide; in this rests unconformably upon a similar belt of Carboniferous sand- stones, about 8 m. long and 3 m. in width, which lies on the west side of the Permian. A small patch of granite stands out on the coast at Larg, untilloch Head, where there is a small outcrop of Devonian sandstones. There are also a few patches and dikes of diorite and quartz-feldite. Glacial moraines and drumlins are found over much of the older formations, and are well seen between Glenluce and Newton Stewart and south of Wigtown. There are two large Tract, one of which is opposite Stranraer. On the coasts of Luce Bay and Loch Ryan raised beaches are found at levels of 25 ft. and 50 ft. above the sea, and there are blown sand dunes near the shore. There are several peat- covered areas in the county.

Climate and Agriculture.—The mean annual rainfall amounts to 36-5 in., varying from 49-39 in. at Kirkcove, a few miles west of Newton Stewart, to 22-28 in. at Newton Stewart, to 22-28 in. at Newton Stewart, to 22-28 in. at Newton Stewart. In the lochs the average temperature for the year is 48-3°F, for January 40°F and for July 58-4°F. In spite of its humidity the climate is not unfavourable for the ripening of crops, and frosts are rare. Not of long duration. Much of the shire consists of moorland, of which plantation and reclamations are made difficult and in some parts impossible. The gravelly soil along the coasts requires heavy manuring to make it fruitful, and it is in higher arable quarries a rocky soil prevail, better for grass and green crops than for grain. A large extent of the surface is black top reclaimed from the moors, and in some districts loam and clay are formed. By dint of energy, however, and constant resort to scientific agriculture, the farmers have placed half of the shire under cultivation, and the standard of farming is as high as that of any county in Scotland. Oats is the leading crop, barley and wheat occupying only a small area. Turnips and swedes constitute the great bulk of the root crops, potatoes forming rather an insignificant third. Linseed and rotation grasses and in permanent pasture, in consequence of the increasing attention paid to dairy-farming, which is carried on comparatively large farms, where stable yards have been established in the dairy country, cheese being a leading product. Though the size of the herds is surpassed in several other Scottish counties, the number of milk cattle is only exceeded in three (Ayr, Aberdeenshire and Lanark). The large farms are used for dairy purposes, and black polled Galloways are found in the eastern districts. A cross of the two breeds is also maintained. The sheep are principally black-faced on the hill farms, and in other parts Leicester and other long-woolled breeds. The flocks are usually heavy, and great numbers of pigs are kept. The shire has acquired some reputation for its horses, chiefly Clydesdale. The holdings are fairly well cultivated, the area under wheat exceeding that of barley by a third of the area of 800 acres to 300. Most of the park land is finely wooded, and there are a few nurseries, market gardens and orchards.

Other Industries.—There are small manufactures in several of the towns, as woollens at Kirkcove; tweeds, leather and agricultural implements at Newton Stewart; dairy appliances, beer, flour and bricks at Stranraer; and whisky at Bladenoch. Sandstone and slate are quarried, and peat is cut in various places. Fisheries, on a minor scale, are conducted chiefly from Stranraer, certain villages on Loch Ryan and Luce Bay, and Wigton, and the Crees, Bladenoch and Kirkcudbrightshire are noted for salmon catches. In the west, but also from Port William, Portpatrick, Wigtown and Garliestown. The Glasgow & South-Western railway runs to Stranraer via Gallipolis, and towards the south, and from Newton Stewart to Portpatrick via Stranraer, with a branch line from Newton Stewart to Wigton and Whithorn. There are coach services from Stranraer to Ballantrae on the Ayrshire coast and to Ayr (2598), and from PortWilliam to Kirkcudbright; the first line being a rail steamier between Stranraer and Larne in Co. Antrim, Ireland.

**Population and Administration.**—In 1891 the population amounted to 36,602; in 1901 to 32,685 or 65 persons to the sq. m., the decrease for the decade being the third highest in Scotland. In 1901 there were 88 persons speaking Gaelic and English. The principal towns are Stranraer (pop. 6036), Newton Stewart (2598), which, however, standing on both banks of the Cree, extends into Kirkcudbrightshire; Wigtown (1350); and Whithorn (1888). Formerly Wigtown, Stranraer and Whithorn formed with New Galloway, in Kirkcudbrightshire, a group of burghs returning one member, but in 1885 the first three were merged in the county, which returns one member to parliament. Wigtown, the county town, Stranraer and Whithorn are royal burghs. The shire forms part of the sheriffdom of Dumfries and Galloway, and a sheriff-substitute sits at Wigtown and Stranraer. The administrative county is divided into the Lower district, comprising the shire west of the parishes of New Luce and Old Luce, and the Upper district, comprising the shire west of and including these parishes. The county is under school-board jurisdiction, and there are high schools in Newton Stewart and Stranraer. The board-schools in Whithorn and Wigtown have secondary departments, and several of the schools in the shire earn grants for higher education. The county
WIGWAM—WIHTRED

Kennedy was created earl of Cassillis. Gilbert, the 4th earl, so powerful that he was called the "king of Carrick," held the shire for Mary, as "the son of Scots," with the consent of the lords of the Congregation, but could do little for her cause. He profited by the Reformation himself, however, to acquire by fraud and murder the estate of Glenluce Abbey (about 1570). In 1603 James VI. instituted a bishop in the see of Galloway—which had not been filled for twenty years—and otherwise strove to impose epiocacy upon the people, but the inhabitants stood firm for the Covenant. The acts against Nonconformity were stringently enforced and almost every incumbent in Galloway was deprived of his living. Field-preaching was a capital crime and attendance on it was considered a treason. A reign of terror supervised, and numbers of persons emigrated to Ulster in order to escape persecution. John Graham of Claverhouse, Viscount Dundee, having replaced Sir Andrew Agnew, who had refused the Test, as sheriff (1682), goaded the people into rebellion, the drowning of Margaret MacLachlan and Margaret Wilson within flood-mark in Wigtown Bay (1685) being an instance of his ruthless methods. With the Revolution of 1688 Presbyterianism was restored, and John Gordon, recently consecrated bishop of Galloway, retired to France. The Jacobite risings of 1715 and 1745 excited only languid interest, but in 1747 heritable jurisdictions were restored to the crown. The fragments of Longsone, the ancient seat of the MacDonnell, Myvron, the seat of the MacCullochs, in Mochnar parish; and the ruined tower of Sorbie, the ancient keep of the Hannays.

See Sir Herbert Maxwell, History of Dumfries and Galloway (Edinburgh, 1896); Sir Andrew Agnew, The Annals of Lochmuh (Edinburgh, 1853); The Galloway Herb-Book (Dumfries, 1886); Proceedings of the Soc. of Ant. of Scotland, passim; Gordon Fraser, Wigtown and Whithorn (Wigtown, 1877).

WIGWAM, a term loosely adopted as a general name for the houses of North American Indians. It is, however, strictly applied to a particular domed-shaped or conical but made of poles lashed together at the tops and covered with bark. The skin tents of many of the Plains Indians are called tipis. The word "wigwam" represents the Europeanized or Anglicized form of the Algonkian wékou-am-út, i.e., "in his (their) house."

WIHTRED, king of Kent (d. 725), son of Egberht, nephew of Hlothhere and brother of Eadric, came to the Kentish throne in 690 after the period of anarchy which followed the death of the latter king. Bede states that Wihtred and Sweolheard were both kings in Kent in 692, and this statement would appear to imply that Sweolheard was in residence at Duxford when Wihtred was given the crown. There is also evidence of an attack by Wessex. Wihtred, however, seems to have become sole king in 694. At his death, which did not take place until 725, he left the kingdom to his sons Aethelberht, Eadberht and Ailric. After the annals 694 in the Chronicle there is inserted a grant of privileges to the church, which purports to have been issued by Wihtred at a place called Baccancelde. This grant, however, cannot be accepted as genuine and
WILBERFORCE, R. I.—WILBERFORCE, S.

WILBERFORCE, ROBERT ISAAC (1802-1857), English clergyman and writer, second son of William Wilberforce, was born on the 19th of December 1802. He was educated at Oriel College, Oxford, taking a double first in 1823. In 1826 he was chosen fellow of Oriel and was ordained, among his friends and colleagues being Newman, Pusey and Keble. For a few years he was one of the tutors at Oriel, but the provost, Edward Hawkins, disliked his religious views, and in 1831 he resigned and left Oxford. In 1832 he obtained the living of East Farleigh, Kent, which in 1840 he exchanged for that of Burton Agnes, near Hull. In 1841 he was appointed archdeacon of the East Riding. About this time Wilberforce became very intimate with Manning, and many letters on theological and ecclesiastical questions passed between them. In 1851 Manning joined the Church of Rome, and three years later Wilberforce took the same step. He was preparing for his ordination when he died at Albano on the 3rd of February 1857. He left two sons, the younger named Edward (1834), became one of the masters of the Supreme Court of Judicature, and Edward’s son, Lionel Robert Wilberforce (b. 1861), was in 1900 appointed professor of physics in the university of Liverpool.

R. I. Wilberforce assisted his brother Samuel to write the Life and to edit the Correspondence of his father. His other writings include: Church Courts and Church Discipline (1843); Doctrine of the Holy Eucharist (1843); Doctrine of the Incarnation in Relation to Mankind and the Church (1848 and later editions); The Five Empires, a Sketch of Ancient History (1850); A Sketch of the History of Erastianism (1851); An Enquiry into the Principles of Church Authority (1854); and a romance, Batllia and Lucina (1842).

WILBERFORCE, SAMUEL (1802-1873). English bishop, third son of William Wilberforce, was born at Clapham Common, London, on the 7th of September 1805. In 1823 he entered Oriel College, Oxford. In the “United Debating Society,” which afterwards developed into the “Union,” he distinguished himself as a zealous advocate of liberalism. The set of friends with whom he chiefly associated at Oxford were sometimes named, on account of their exceptionally decorous conduct, the “Bethel Union”; but he was by no means averse to amusements, and specially delighted in hurdle jumping and hunting. He graduated in 1826, taking a first class in mathematics and a second in classics. After his marriage on the 11th of June 1828 to Emily Sargent, he was in December ordained and appointed curate-in-charge at Checkenden near Henley-on-Thames. In 1830 he was presented by Bishop Sumner of Winchester to the rectory of Brightstone in the Isle of Wight. In this comparatively retired sphere he soon found scope for that manifold activity which so prominently characterized his subsequent career. In 1837 he published a tract on tithes, “to correct the prejudices of the lower order of farmers,” and in the following year a collection of hymns for use in his parish, which had a large general circulation; a small volume of stories entitled the Note Book of a Country Clergyman; and a sermon, The Apostolical Ministry. At the close of 1837 he published the Letters and Journals of Henry Martyn. Although a High Churchman Wilberforce held aloof from the Oxford movement, and in 1838 his divergence from the “Tract” writers became so marked that J. H. Newman declined further contributions from him to the British Critic, not deeming it advisable that they should longer “co-operate very closely.” In 1838 Wilberforce published, with his elder brother Robert, the Life of his father, and two years later his father’s Correspondence. In 1839 he also published Eucharistica (from the old English divines), to which he wrote an introduction, Agathos and other Sunday Stories, and a volume of University Sermons, and in the following year Rocky Island and other Parables. In November 1839 he was installed archdeacon of Surrey, in August 1840 was collated canon of Winchester and in October he accepted the rectory of Alverstoke.

In 1841 he was chosen Hampton lecturer, and shortly afterwards made chaplain to Prince Albert, an appointment he owed to the impression produced by a speech at an anti-slavery meeting some months previously. In October 1843 he was appointed by the archbishop of York to be sub-almoner to the queen. In 1844 he appeared his History of the American Church. In March of the following year he accepted the deanery of Westminster, and in October the bishopric of Oxford.

The bishop in 1847 became involved in the Hampden controversy, and signed the remonstrance of the thirteen bishops to Lord John Russell against Hampden’s appointment to the bishopric of Hereford. He also endeavoured to obtain satisfactory assurances from Hampden; but, though unsuccessful in this, he withdrew from the suit against him. The publication of a papal bull in 1850 establishing a Roman hierarchy in England brought the High Churchmen of whom Wilberforce was the most prominent member, into temporary disrepute. The secession to the Church of Rome of his brother-in-law, Archdeacon (afterwards Cardinal) Manning, and then of his brothers, as well as his only daughter and his son-in-law, Mr and Mrs J. H. Pye, brought him under further suspicion, and his revival of the powers of convocation lessened his influence at court; but his unfailing tact and wide sympathies, his marvellous energy in church organization, the magnetism of his personality, and his eloquence both on the platform and in the pulpit, gradually won for him recognition as without a rival on the episcopal bench. His diary reveals a tender and devout private life which has been overlooked by those who have only considered the versatile facility and persuasive expediency that marked the successful public career of the bishop, and earned, him the sobriquet of “Soapy Sam.” In the House of Lords he took a prominent part in the discussion of social and ecclesiastical questions. He has been styled the “bishop of society,” but society occupied only a fraction of his time. The great bent of his energies was ceaselessly directed to the better organization of his diocese and to the furtherance of schemes for increasing the influence and efficiency of the church. In 1854 he opened a theological college at Cuddesdon, which was afterwards the subject of some controversy on account of its alleged Romanist tendencies. His attitude towards Essays and Reviews in 1861, against which he wrote an article in the Quarterly, won him the special gratitude of the Low Church party, and latterly he enjoyed the full confidence and esteem of all except the extreme men of either side and party. On the publication of J. W. Colenso’s Commentary on the Romans in 1864, Wilberforce endeavoured to induce the author to hold a private conference with him; but after the publication of the first two parts of the Penateuch Critically Examined he drew up the address of the bishops which called on Colenso to resign his bishopric. In 1867 he framed the first Report of the Ritualistic Commission, in which coercive measures against ritualism were disapproved by the use of the word “restrain” instead of “abolish” or “prohibit.” He also endeavoured to take the sting out of some resolutions of the second Ritualistic Commission in 1868, and was one of the four who signed the Report with qualifications. Though strongly opposed to the disestablishment of the Irish Church, yet, when the constituencies decided for it, he advised that no opposition should be made to it by the House of Lords. After twenty-four years’ labour in the diocese of Oxford, he was translated by Gladstone to the bishopric of Winchester. He was killed on the 20th of July 1873, by the shock of a fall from his horse near Dorking, Surrey.

Wilberforce left three sons. The eldest, Reginald Garton Wilberforce, being the author of An Unrecorded Chapter of the Irish Tract controversy (1864). His two younger sons both attained distinction in the English church. Ernest Roland Wilberforce (1840-1908) was bishop of Newcastle-on-Tyne from 1882 to 1905, and bishop of Chichester from 1895 till his death. Albert Basil Orme Wilberforce (b. 1841) was appointed canon residentiary of Westminster in 1894, chaplain of the House of Commons in 1896 and archdeacon of Westminster in 1900; he has published several volumes of sermons.
WILBERFORCE, W.---WILBRANDT

Besides the works already mentioned, Wilberforce wrote Heroes of Hebrew History (1786), or a Contribution to Good Works, in several volumes of sermons. See Life of Samuel Wilberforce, with Selections from his Diary and Correspondence (1879—1882), vol. 1., ed. by Canon A. R. Ashwell, and vol. ii. and iii., ed. by his son H. C. Wilberforce, with a notice of the Life (1888). One of the volumes of the "English Leaders of Religion" is devoted to him, and he is included in Dean Burgon's Lives of Twelve Good Men (1888).

WILBERFORCE, WILLIAM (1759-1833), English philanthropist whose name is chiefly associated with the abolition of the slave trade, was descended from a Yorkshire family which possessed the manor of Wilberfoss in the East Riding from the time of Henry II. till the middle of the 18th century. He was the only son of Robert Wilberforce, member of a commercial house at Hull, by his wife Elizabeth, daughter of Thomas Bird of Barton, Oxon, and was born at Hull on the 24th of August 1759. It was from his mother that he inherited both his feeble frame and his many rich mental endowments. He was not a diligent scholar, but at the grammar school of Hull his skill in eloquence attracted the attention of the master. Before he had completed his tenth year he lost his father and was transferred to the care of a paternal uncle at Wimbledon; but in his twelfth year he returned to Hull, and soon afterwards was placed under the care of the master of the endowed school of Pocklington. Here his love of social pleasures made him neglectful of his studies, but he entered St John's College, Cambridge, in October 1766. Left by the death of his grandfather and uncle, he enjoyed an independent fortune under his mother's sole guardianship, he was somewhat idle at the university, though he acquitted himself in the examinations with credit; but in his serious he could not look back without unfeigned remorse on the opportunities he had then neglected.

In 1780 he was elected to the House of Commons for his native town, his success being due to his personal popularity and his lavish expenditure. He soon found his way into the fast political society of London, and at the club at Goostrees renewed an acquaintance begun at Cambridge with Pitt, which ripened into a friendship of the closest kind. In the autumn of 1783 he set out with Pitt on a tour in France; and after his return his eloquence proved of great assistance to Pitt in his struggle against the majority of the House of Commons. In 1784 Wilberforce was elected for both Hull and Yorkshire, and took his seat for the latter constituency.

A journey to Nice in the autumn of the same year with his friend Dr Isaac Milner (1750-1830), who had been a master at Hull grammar school when Wilberforce was there as a boy, and had since made a reputation as a mathematician, and afterwards became president of Queens' College of the University of Cambridge, led to his conversion to Evangelical Christianity and the adoption of more serious views of life. The change had a marked effect on his public conduct. In the beginning of 1787 he busied himself with the establishment of a society for the reformation of manners. About the same time he made the acquaintance of Thomas Clarkson, and began the agitation against the slave trade. Pitt entered heartily into their plans, and recommended Wilberforce to undertake the guidance of the project as a subject suited to his character and talents. While Clarkson was engaged in the agitation, Wilberforce took every opportunity in the House of Commons of exposing the evils and horrors of the trade. In 1788, however, a serious illness compelled him to retire for some months from public life, and the introduction of the subject in parliament therefore devolved on Pitt, whose representations were so far successful that an act was passed providing that the number of slaves carried in ships should be in proportion to the tonnage.

On the 12th of May of the following year Wilberforce, in co-operation with Pitt, brought the subject of abolition again before the House of Commons, but the friends of the planters succeeded in getting the matter deferred. On the 27th of January following Wilberforce carried a motion for referring to a special committee the further examination of witnesses, but after full inquiry the motion for abolition in April 1791 was lost by 163 votes to 88. In the following April he carried a motion for gradual abolition by 238 to 85 votes; but in the House of Lords the discussion was finally postponed till the following session. Notwithstanding his unremitting labours in educating public opinion and annual motions in the House of Commons, it was not till the year following Pitt's death, that the first great step towards the abolition of slavery was accomplished. When the anti-slavery society was formed in 1823, Wilberforce and Clarkson became vice-presidents; but before their aim was accomplished Wilberforce had retired from public life, and the Emancipation Bill was not passed till August 1833, a month after his death.

In 1797 Wilberforce published A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this Country Contrasted with Real Christianity, which within half a year went through five editions and was translated into French, Italian, Dutch and German.

In the same year (May 1797) he married Barbara Ann Spooner and took a house at Clapham, where he became one of the leaders of what was known as the "Clapham Sect" of Evangelicals, including Henry Thornton, Charles Grant, E. J. Eliot, Zachary Macaulay and James Stephen. It was in connexion with this group that he then occupied himself with a plan for a religious periodical which should admit "a moderate degree of political and common intelligence," the result being the appearance in January 1821 of the Christian Observer. He himself occupied himself in various ways with the promotion of the social and religious welfare of the community, including the establishment of the Association for the Better Observance of Sunday, the foundation, with Hannah More (q.v.), of schools at Cheddar, Somersetshire, a project for opening a school in every parish for the religious instruction of children, a plan for the education of the children of the lower classes, a bill for securing better salaries to curates, and a method for disseminating, by government help, Christianity in India.

In parliament he was a supporter of parliamentary reform and of Roman Catholic emancipation. In 1829, the failure of falling hack on the support of the Yorkshire county was the result of a constituency which would make less demands on his time, and was returned for Bramber, Sussex. In 1825 he retired from the House of Commons, and the following year settled at Highwood Hill, near Mill Hill, "just beyond the disk of the metropolis." He died at London on the 29th of July 1833, and was buried in Westminster Abbey close to Pitt, Fox and Canning.

In Westminster Abbey a statue was erected to his memory, and in Yorkshire a county asylum for the blind was founded in his honour. A column was also erected to him by his townsmen of Hull and his statue in the representative of Yorkshire house, next to those of Robert and Samuel Isaac, are noticed separately.

The chief authorities of the career of William Wilberforce are his Life (5 vols., 1838) by his sons, Robert Isaac and Samuel, and his Correspondence (1840) also published by his sons. A smaller edition of the Life was published by Samuel Wilberforce in 1868. See also The private papers of William Wilberforce, edited by A. M. Wilberforce (1807); Sir James Stephen, Essays in Ecclesiastical Biography (1849); J. C. Colerounh, Wilberforce and the Times (1866); John Stoughton, William Wilberforce (1880); J. J. Gurney, Familiar Sketch of Wilberforce (1838); and J. S. Hartford, Recollections of W. Wilberforce (1864).

WILBRANDT, ADOLF (1837— ), German novelist and dramatist, was born at Rostock on the 24th of August 1837, the son of a professor at that university. Having received his early education at the gymnasium of his native town, he entered the university and engaged in the study of law. Though scholar, he soon abandoned in favour of philology and the history, and continued these studies in Berlin and Munich. After taking the degree of doctor of philosophy, he joined the staff of the Süddeutsche Zeitung in Munich. He travelled abroad for a time and in 1871 settled in Vienna, where, two years later, he married the actress, Auguste Baudius. In 1881 Wilbrandt was appointed
director of the Hofburg theatre in succession to Franz Dingelstedt, an office he held until 1887. In this year he returned to his native town of Rostock, and remained actively engaged in literary work. Wilbrandt is distinguished both as a dramatist and novelist. His merits were acknowledged by the award of the Grillparzer prize on two occasions—in 1875 for the tragedy Gracchus der Volkstrubun, and in 1890 for his dramatic poem Der Meister von Palmira, while in 1878 he received the Schiller prize for his dramatic productions.

Among his plays may be mentioned the tragedies, Arrigo und Messalina (1874), Nero (1876); Kriemhild (1877); the comedies Unerreichtbar (1870), Die Maler (1872), Jugendliebe (1873) and Der Kampf ums Dasein (1874); and the drama Die Tochter des Herrn Fabritius (1883). Among his novels the following deserve notice:—Meister Amor (1880); Hermann Jninger (1882); Der Dornenweg (1894); Die Osterinsel (1895); Die Rotenburger (1895); and Hildegard Malten (1896). His contributions were numerous and varied, and his life was naturally prolix.

WILDE, JOHN, English 19th century madrigal composer, was born probably at Bury St Edmunds, but the details of his life are obscure. A set of madrigals by him appeared in 1598 and a second in 1608, the two sets containing sixty-four pieces; and from a few contributions known to have been made by him to other contemporary sets, we can infer that he was alive in 1614. He is the most famous of all the English madrigalists; his pieces have long been favourites and are included in modern collections.

WILD, JONATHAN (c. 1682–1729), English criminal, was born about 1682 at Wolverhampton, where his father was a wig-maker. After being apprenticed to a local buckle-maker, he went to London to learn his trade, and, getting into debt, was imprisoned for several years. The acquaintance of many criminals which he made in prison he turned to account after his release by setting up as a receiver of stolen goods. Wild shrewdly realized that it was safer, and in most cases more profitable, to dispose of such property by returning it to its legitimate owners than to sell it, with the attendant risks, in the open market, and he thus built up an immense business, posing as a receiver of stolen goods, the thieves receiving a commission on the price paid for recovery. A special act of parliament was passed by which receivers of stolen property were made accessaries to the theft, but Wild's professed "lost property office" had little difficulty in evading the new law, and became so prosperous that two branch offices were opened. From profiting by robberies in which he had no share, Wild naturally came to arrange robberies himself, and he devised and controlled a huge organization, which plundered London and its approaches wholesale. Such thieves as refused to work with him received short shrift. The notorious Jack Sheppard, wearied of Wild's exactions, at last refused to deal with him, whereupon Wild secured his arrest, and himself arrested Sheppard's confederate, "Blueskin." In return for Wild's services in tracking down such thieves as he did not himself control, the authorities for some time tolerated the offences of his numerous agents, each a specialist in a particular kind of robbery, and so themselves strengthened his position. If an arrest were made, Wild had a plentiful supply of false evidence at hand to establish his agents' alibi, and he did not hesitate to obtain the conviction, by similar means, of such thieves as refused to recognize his authority. Such stolen property as could not be returned to the owners with profit was taken abroad in a sloop purchased for this work. At last either the authorities became more strict or Wild less cautious. He was arrested, tried at the Old Bailey, and after being acquitted on a charge of stealing lace, found guilty of taking a reward for restoring it to the owner without informing the police. He was hanged at Tyburn on the 24th of May 1725.

WILDBAD, a watering-place of Germany, in the kingdom of Württemberg, picturesquely situated 1475 ft. above the sea, in the romantic pine-clad gorge of the Enz in the Black Forest, 28 m. W. of Stuttgart and 14 E. of Baden-Baden by rail. Pop. (1905) 3734. It contains an Evangelical, a Roman Catholic and an English church, and has some small manufactures (cigars, paper and toys). Its thermal alkaline springs have a temperature of 90°-100° Fahr. and are used for bathings in cases of paralysis, rheumatism, gout, neuralgia and similar ailments. The fact that the springs rise within the baths, and are thus used at the fountain-head, is considered to contribute materially to their curative value. The water is used internally for affections of the skin, and externally for those of the mucous and digestive organs, and of the kidneys, bladder, &c. Wildbad possesses all the usual arrangements for the comfort and amusement of the visitors (over 15,000 annually), including large and well-appointed hotels, a Kurhaus, a Trink-Halle and promenades. The neighbourhood is picturesque, the most attractive spot being the Wildsee, of which legends are told.

WILDE, OSCAR F/LAHERTE WILLS (1856–1900), English author, son of Sir William Wilde, a famous Irish surgeon, was born in Dublin on the 15th of October 1856; his mother, Jane Francesca Elgee, was well known in Dublin as a graceful writer of verse and prose, under the pen-name of "Speranza." Having distinguished himself in classics at Trinity College, Dublin, Oscar Wilde went to Magdalen College, Oxford, in 1874, and won the Newdigate prize in 1878 with his poem "Ravenna," besides taking a first-class in classical Moderations and in Literae Humaniores. His talent at Oxford, brilliant intellectually as he showed himself to be, was chiefly signalized by the part he played in what came to be known as the aesthetic movement. He adopted what to undergraduates appeared the effeminate pose of casting scorn on many sports, wearing his hair long, decorating his rooms with peacock's feathers, lilies, sunflowers, blue china and other objets d'art, which he declared his desire "to live up to," affecting a lackadaisical manner, and professing intense emotions on the subject of "art for art's sake"—then a novel-fangled doctrine which J. M. Whistler was bringing into prominence. Wilde made himself the apostle of this new cult. At Oxford his behaviour procured him a dicing in the Cherwell, and a wrecking of his rooms, but the cult spread among certain sections of society to such an extent that languishing attitudes, "too-too" costumes and "aestheticism" generally became a recognized pose. Its affectations were hurled esquised in Gilbert and Sullivan's travesty Patience (1881), which practically killed by ridicule the absurdities to which it had grown. At the same time it cannot be denied that the "aesthetic" movement, in the aspect fundamentally represented by the school of William Morris and Rossetti, had a permanent influence on English decorative art. As the leading "aesthetic," Oscar Wilde became one of the most prominent personalities of the day; apart from the ridicule he encountered, his absurd paradoxes and his witty sayings were quoted on all sides, and in 1882 he went on a lecturing tour in the United States. In 1884 he married Constance Lloyd. He had already published in 1881 a selection of his poems, which, however, only attracted admiration in a limited circle. In 1888 appeared The Happy Prince and Other Tales, illustrated by Walter Crane and Jacob Hood. This charming volume of fairy tales was followed up later by a second collection, The House of Pomegranates (1892), acknowledged by the author to be "intended neither for the British child nor the British public." In much of his writings, and in his general attitude, there was to most people an undertone of rather nasty suggestion which created prejudice against him, and his novel, The Picture of Dorian Gray (1891), with all its sparkle and cleverness, impressed them more from this point of view than from its purely literary brilliance. Wilde contributed some characteristic articles to the reviews, all coloured by his peculiar attitude towards art and life, and in 1891 re-published three of them as a book called Intentions. His first real success on the stage, with which he began as a dramatist with Lady Windermere's Fan at the St James's Theatre in 1892, followed by A Woman of No Importance (1893), An Ideal Husband (1895) and The Importance of Being Earnest (1895). The
WILDENBRUCH—WILDERNESS

633
dramatic and literary ability shown in these plays, all of which were published later in book form, was as undoubted as their
diction and ideas were characteristically paradoxical. In 1893
the licensor of plays refused a licence to Wilde's *Solene*, but it
was produced in French in Paris by Sarah Bernhardt in 1894.
His success as a dramatist had by this time gone some way to
disabuse hostile critics of the suspicions as regards his personal
character which had been excited by the apparent looseness of
morals which since his Oxford days it had always pleased him to
affect; but to the consternation of his friends, who had
deeded to credit the existence of any real moral obliquity, in
1895 came fatal revelations as the result of his bringing a libel
action against the marquis of Queensberry; and at the Old
Bailey, in May, Wilde was sentenced to two years' imprisonment
with hard labour for offences under the Criminal Law Amend-
ment Act. It was a melancholy end to what might have been
a singularly brilliant career. Even after leaving prison he was
necessarily an oasis from decent circles, and he lived mainly
on the Continent, under the name of "Sebastian Melmoth." He
died in Paris on the 30th of October, 1900. In 1877 he
published his powerful *Ballad of Reading Gaol*. His Collected
Poems, containing some beautiful verse, had been issued in
1892. While in prison he wrote an apology for his life which
was placed in the hands of his executer and published in 1905.
The manuscripts of A *Florentine Tragedy* and an essay on
Shakespeare's sonnets were stolen from his house in 1895. In
1904 a five-act tragedy, *The Duchess of Padua*, written by Wilde
about 1883 for Mary Anderson, but not acted by her, was pub-
lished in a German translation (*Die Herrsogin von Padua*, trans-
lated by Max Meyendorff) in Berlin. *It is still impossible to
take a purely objective view of Oscar Wilde's work. The Old
Bailey revelations removed all doubt as to the essential un-
healthiness of his personal influence; but his literary genius was
none the less remarkable, and his plays were perhaps the most
original contributions to English dramatic writing during the
period.

(W. H. C.)

WILDENBRUCH, ERNST VON (1845-1909), German poet and
dramatist, was born on the 3rd of February 1845 at Beyrout
in Syria, the son of the Prussian consul-general. Having passed
his early years at Athens and Constantinople, where his father
was attached to the Prussian legation, he came in 1857 to
Germany, received his early schooling at the Pädagogium at
Halle and the Französisch Gymnasium in Berlin, and, after
passing through the Cadet school, became, in 1863, an officer
in the Prussian army. He abandoned the military career two
years later, but was recalled to the colours in 1866 for the war
with Austria. He next studied law at the university of Berlin,
and again served in the army during the Franco-Prussian War,
1870-71. In 1876 Wildenbruch was attached to the foreign
office, which he finally quitted in 1900 with the title of counsellor
of legation. He achieved his first literary successes with the
epics *Viervahl* (1874) and *Soden* (1875). After publishing
a volume of poems, *Lieder und Balladen* (Berlin, 1877; 7th ed.,
1900), he produced, in 1882, the tragedy, *Die Karelinger. Among
his chief dramas may be mentioned the tragedy *Harold* (1883);
*Die Quitzows* (1888); *Der Generalsföderber* (1886); *Die Hausbe-
nerche* (1891); *Heinrich und Heinrichs Geschlecht* (1895); *Die
Tochter des Eranus* (1900); and *König Laurin* (1902). Wilden-
bruch was twice (in 1884 and 1896) awarded the Schiller prize,
and was, in 1892, created a doctor of philosophy *honoris causa*
by the university of Jena. He also wrote several volumes of short
stories (*Nolletten*, 1883; *Neue Novellen*, 1885; *Die Tief Wasser*, 1897, &c.). He died on the 15th of January 1909.

C. F. Litzmann, *Das deutsche Drama in den Bewegungen der
Gegenwart* (1894; 4th ed., 1897); H. Buthaupt, *Dramaturgie des
Schauspiel*, vol. iv. (1901).

WILDERNESS, a large forest in Spotsylvania county,
Virginia, U.S.A., on the S. bank of the Rapidan, extending
from Mine Run on the E. to Chancellor ville on the W. It
is famous in military history for the battles of Chancellor ville
(1863) and Wilderness (1864) during the American Civil War.

Chancellorsville.—In May 1863 a three days' battle was fought
at Chancellorsville between the Army of the Potomac, under
General J. Hooker, and General Lee's Army of Northern Virginia,
which had subdued the tide of invasion in the East by taking
up a defensive position along the right or south bank of the
Rappahannock. General Burnside had suffered a severe repulse
in front of the Confederate position at Fredericksburg in
December 1862, and his successor resolved to adopt the alterna-
tive plan of turning Lee's flank and so gaining the road to
Richmond. General Lee had meanwhile weakened his forces
by detaching Longstreet's division and the troops of Hampton,
Roberson and Jones. Hooker had now at his disposal 12,000 cavalry,
400 guns and 120,000 infantry and artillery, organized in seven
corps (I. Reynolds, II. Couch, III. Sickles, V. Meade, VI. Sedgwick,
XI. Howard, XII. Slocum). General Lee counted only 45,000 men of all arms effective.

Hooker detached 10,000 cavalry under Stoneman and Sedg-
wick's corps (30,000) to demonstrate on his flanks the Rapidan
and at Fredericksburg, while with the remainder he
moved up the Rappahannock and crossed that river and after-
wards the Rapidan; and on the 9th of April fixed his head-
quarters at Chancellor ville, a farmhouse in the Wilderness.
Lee's cavalry under Stuart had duly reported the Federal
movements and Lee called up "Stonewall" Jackson's four
divisions from below the Massaponax as soon as Sedgwick's
corps crossed the river at Fredericks burg. At Chancellor ville
Anderson's division was in position, and McLaws was sent
without him, while Jackson took three divisions to the same
point, leaving Early's division to observe Sedgwick. Hooker
had cleared and entrenched a position in the forest, inviting
attacking from the E. or S. General Lee, however, discovered a
route by which the Federal lines might be turned from the N.
and W., and Jackson was instructed to execute the turning
movement and fall upon them. As soon as a brigade of cavalry
was placed at his disposal Jackson marched westward with his
corps of 29,000 men and by a détour of 15 m. gained the Federal
right flank, while Anderson and McLaws with 20 guns and 12,000
men demonstrated in front of Hooker's army and so kept
90,000 men idle behind their earthworks. One of Stuart's
cavalry brigades neutralized Stoneman's 10,000 horsemen.
Sedgwick was being contained by Early. Jackson's attack
was carried over the Federals and in the first day's action
of the 4th of May 1863 the British Army had gained a
victory.

(See A. C. Hamlin, *Chancellorsville*; G. R. Henderson, *Stonewall
Jackson*; A. Doubleday, *Chancellorsville and Gettysburg, Battles
and Leaders of the Civil War and Official Records of the War of
Secess.ion*.)

Grant's Campaign of the Wilderness and Cold Harbor.—On
the evening of the 3rd of May 1864, after dark, the Army of the
Potomac, commanded by Maj. Gen. G. G. Meade and consisting
of the II., V. and VI. Corps, and Cavalry corps, left its
winter quarters about Culpeper to maneuver across the Rapidan
with a view to fighting a battle at or near New Hope Church
and Craig's Church. The army, and the IX. corps (Burnside),
which was an independent command, were directed by
Lieutenant-General Grant, the newly appointed commander of
the armies of the United States, who accompanied Meade's head-
quarters. The opposing Army of Northern Virginia under General
R. E. Lee lay in quarters around Orange Court House (A. P.
Hill's corps), Verdiersville (Ewell's corps) and Gordonsville
error of judgment. The reason assigned was the necessity of protecting an enormous wagon train, carrying 15 days' supplies for the whole army, that was crossing after the II. corps at Ely's Ford. Burnside's corps was far to the rear when the advance began, but by making forced marches it was able to reach Germanna Ford during the 5th of May. On that day the manoeuvre towards Craig's Church was resumed at 5 A.M., Wilson's cavalry division moving from Parker's Store southward, the V. corps (Warren) moving from Wilderness Tavern towards Parker's Store, followed by the VI. under Sedgwick, the II. from Chancellorsville by way of Todd's Tavern towards Shady Grove Church. Of the other cavalry divisions, Gregg's went towards Fredericksburg (near where the Confederate cavalry corps had been reported) and Torbert's (which had acted as rearguard and watched the upper Rapidan during the first day's march) was not yet across the river.

Grant's intention of avoiding a battle until he was clear of the Wilderness was not achieved, for Confederate infantry appeared on the Orange Turnpike east of Mine Run, where on his own initiative Warren had posted a division of the V. corps overnight as flank-guard, and some cavalry, judiciously left behind by Wilson at Parker's Store, became engaged a little later with hostile forces on the Orange Plank Road. This led to the suspension of the whole manoeuvre towards Lee's right rear. The first idea of the Union headquarters was that Lee was falling back to the North Anna, covered by a bold rearguard, which Grant and Meade arranged to cut off and destroy by a convergent attack of Warren and Sedgwick. But the appearance of infantry on the Plank Road as well as the Pike had shown that Lee intended to fight in the Wilderness, and Hancock (II. corps) was called in from Todd's Tavern, while one division (Gettys') of the VI. was hurried to the intersection of the Brock and Plank roads to hold that point until Hancock's arrival. Gettys arrived just in time, for Confederate skirmishers were found dead and wounded only 30 yds. from the cross roads. The division then formed up to await Hancock's arrival up the Brock Road, practically unmolested, for Lee had only two of his corps on the ground (Hill on the Plank Road, Ewell on the Pike), and did not desire to force a decision until Longstreet's distant corps should arrive.

Meanwhile Warren had been slowly forming up his attacking line with great difficulty in the woods. Grant appears to have used bitter words to Meade on the subject of Warren's delays,
and Meade passed these on to Warren, who in turn forced his subordinates into premature action. In the end, about noon, Grinnell's division of Warren's corps attacked directly along the Pike and crushed the enemy's first line, but, unsupported by the VI corps on the right and Wadsworth's division (V. corps) on the left, both of which units were still groping their way forward in the woods, was forced back with heavy losses. Wadsworth took a wrong direction in the woods and presented himself as an easy victim to Ewell's right, soon after Grinnell's repulse. The VI corps advanced late in the day on Warren's right, but was only partially engaged. The result of the attack on Longstreet is also a subject of highly conflicting statements. Lee was determined, as always, to have the last word, and about 4.15-4.30 a fierce assault was delivered amidst the burning woods upon Hancock's entrenchments along the Brock Road. For a moment, aided by the dense smoke, the Confederates seized and held the first line of works, but a counter-stroke dislodged them. Burnside, though not expecting to have to attack before 6, put into the fight such of his troops as were ready, and at 5.30 or thereabouts the attacking line reeled into the woods. Grant canceled his order to attack at 6, and at the decisive point the battle was at an end. But on the extreme right of the Union army a sudden attack was delivered at sunset by a corps of the VI corps, under Ewell's division. This carried off two generals and several hundred prisoners, and a panic ensued which affected all the Union forces on the Pike, and was not quieted until after nightfall.

Lee, therefore, had the last word on both flanks, but in spite of this and of the very heavy losses, Grant had already resolved to go on, instead of going back like his various predecessors. To him, indeed, the battle of the Wilderness was a victory, an indiscriminate victory indeed, but one that had given him a moral superiority which he did not intend to forego. His scheme, drafted early on the morning of the 7th, was for the second march to Spotsylvania on the night of the 7th-8th, to assemble there on the 8th, and thence to undertake a fresh manoeuvre against Lee's right rear on the 9th. This movement required the trains with the fighting line to be cleared away from the roads needed for the troops at once, and Lee promptly discovered that a movement was in progress. He mistook its object, however, and assuming that Grant was falling back on Fredericksburg, he prepared to shift his own forces to the south of that place so as to bar the Richmond road. This led to a race for Spotsylvania, which was decided more by accidents to either side than by the measures of the two commanding generals. On the Union side Warren was to move to the line Spotsylvania Court House-Todd's Tavern, followed by Hancock; Sedgwick was to take a roundabout route and to come in between the V. and II. corps; Burnside to follow Sedgwick. The cavalry was ordered to watch the approaches towards the right of the army. The movement began promptly after nightfall on the 7th. But ere long the head of Warren's column, passing in rear of Hancock's line of battle, was blocked by the headquarters escort of Grant and Meade. Next, the head of the V. corps was again checked at Todd's Tavern by two cavalry divisions which had been sent by Sheridan to regain the ground at Todd's Tavern, given up on the 6th, and after fighting the action of Todd's Tavern had received no further orders from him. Meade, greatly irritated, ordered Gregg's division out towards Corbin's Bridge and Merritt's (Torbert's) to Spotsylvania. On the latter road the Union cavalry found themselves opposed by Fitz Lee's cavalry, and after some hours of disheartening work in the woods, Merritt asked Warren to send forward infantry to drive the enemy. This Warren did, although he was just preparing to rest and to feed his men after their exhausting night-march. Robinson's division at the head of the corps deployed and swiftly drove in Fitz Lee. A little beyond Alspop's, however, Robinson found his path barred by entrenched infantry. This was part
of Anderson's (Longstreet's) corps. That officer had been ordered to draw out of his (Wilderness) works, and to bivouac, preparatory to marching at 3 A.M. to the Court House, but, finding no good resting-place, he had moved on at once. His route took him to the Catharpin Road (Hampton's cavalry protecting him to Todd's Tavern) and captured the outworks Bridge to Block House Bridge. At or near Block House Bridge the corps halted to rest, but Stuart (who was with Fitz Lee) called upon Anderson for assistance and the march was resumed at full speed. Sheridan's new orders to Gregg and Merritt did not arrive until Meade had given these officers other instructions, but Wilson's cavalry division, which was out of the line of march of the infantry, acted in accordance with Sheridan's plan of occupying the bridges in front of the army's intended position at Spottsylvania Court House, and seized that place, inflicting a smart blow upon a brigade of Stuart's force that was sent there.

The situation about 9 A.M. on the 8th was therefore curious. Warren, facing E., and opposed by part of Anderson's corps, was seeking to fight his way to Spottsylvania Court House by the Brock Road. Wilson, facing S., was holding the Court House and driving Fitz Lee's cavalry partly westward on to the backs of the infantry opposing Warren, partly towards Block House Bridge, whence the rest of Anderson's infantry was approaching. All the troops were weary and hungry, and Sheridan ordered Wilson to evacuate the Court House and to fall back beyond it. The cavalry was then sent to the Confederate infantry at Spindler's, General Robinson being severely wounded, and his division disorganized. The other divisions came up by degrees, and another attack was made about 11. It was pressed close up to, and in some places over, the Confederate log-works, but it ended in failure like the first. A third attempt in the evening dwindled down to a reconnaissance in force. Anderson was no longer isolated. Early's division observed Hancock's corps at Todd's Tavern, but the rest of Ewell's and all Hill's corps went to Spottsylvania and prolonged Anderson's line northward towards the Ny. Thus the re-grouping of the Union army for manoeuvre, and even the running fight or strategic pursuit imagined by Grant when he found Anderson at Spottsylvania, were given up, and on the 9th both armies rested.

On this day General Sedgwick was killed by a long-range shot from a Confederate rifle. His place was taken by General H. G. Wright. On this day also a violent quarrel between Meade and Sheridan led to the departure of the cavalry corps on an independent mission. This was the so-called Richmond raid, in which Sheridan defeated Stuart at Yellow Tavern (where Stuart was killed) and captured the near-by line of Richmond, but, having started with empty forage wagons, had then to make his way down the Chickahominy to the nearest supply depots of the Army of the James, leaving the Confederate cavalry free to rally and to rejoin Lee.

Finding the enemy thus gathered in his front, Grant decided to fight again on the 10th. While Hancock opposed Early, and Warren and Wright Hill and Anderson, Burnside was ordered by Grant to work his way to the Fredericksburg-Spottsylvania road, thence to attack the enemy's right rear. The first stage of this attack was made by the IX. corps, under Hancock, but not the attack itself, and Burnside was consequently ordered not to go beyond a place called "Gate" on the maps used by the Union staff. This, it turned out, was not the farm of a person called Gate, as headquarters supposed, but a mere gate into a field. Consequently it was missed, and the IX. corps went on to Gale's or Gayle's house, where the enemy's skirmishers were driven in. The news of an enemy opposing Burnside at "Gate," which Grant still supposed to be the position of the IX. corps, at once radically altered the plan of battle. Lee was presumed to be moving north towards Fredericksburg, and Grant saw an opportunity of a great and decisive success. The IX. corps was ordered to hold its position at all costs, and the others were to follow up the enemy as he concentrated upon Burnside. Hancock was called in from Todd's Tavern, sent down to force the fords of the Po and to proceed to a position between Wright and Block House Bridge by an officer of Grant's own staff, while Warren and Wright were held ready. But once more a handful of cavalry in the woods delayed the effective deployment of the moving wing, and by the time that the II. corps was collected opposite Block House Bridge it was already night. Still there was, apparently, no diminution of force opposite Burnside, and Hancock was ordered to resume his advance at early dawn on the 10th.

Meade, however, had little or no cognizance of Grant's orders to the independent IX. corps, and his orders, conflicting with those emanating from the Lieutenant-General's staff, puzzled Hancock and crippled his advance. At 10.00 the whole scheme was given up, and the now widely deployed Union army closed on its centre as best it could for a direct attack on the Spottsylvania position. At 4, before the new concentration was complete, and while Hancock was still engaged in the difficult operation of drawing back over the Po in the face of the enemy, Warren attacked unsupported and was repulsed. In the woods on the left Wright was more successful, and at 6 P.M. a rush of twelve selected regiments under Colonel Emory Upton carried the right of Lee's log-works. But for want of support this attack was fruitless, though Union troops were held to the works for an hour and brought off 1000 prisoners. Burnside, receiving Grant's new orders to attack from Gayle's towards Spottsylvania, sent for further orders as to the method of attack, and his advance was thus made too late in the day to be of use. Lee had again averted disaster, this time by his magnificent handling of his only reserve, Hill's (now Early's) corps, which he used first against Hancock and then against Burnside with the greatest effect.

This was the fourth battle since the evening of the 4th of May. On the morning of the 11th Grant sent his famous message to Washington, "I purpose to fight it out on this line if necessary all summer." The 12th was to be the fifth and, Grant hoped, the decisive battle. A maze of useful and useless entrenchments had been constructed on both sides, especially on the Union side, from mere force of habit. Grant, seeing from the experience of the 10th that his corps commanders were marring these entrenchments so strongly that they had only feeble forces disposable for the attack, ordered all superfluous defences to be given up. Three corps were formed in a connected line (from right to left, V., VI., IX.) during the 11th, and that night the II. corps, which had been detached the previous day, was ordered to move up in the open field at Brown's in an attacking mass of Napoleon density—three lines of divisions, in line and in battalion and brigade columns. Burnside was to attack from Gayle's (Beverly's on the map) towards McCool's. Warren and Wright were to have at least one division each clear of their entrenchments and ready to move.

Up to the 11th Lee's line had extended from the woods in front of Block House Bridge, through Perry's and Spindler's fields to McCool's house, and its right was confused and formed in a loop. The removal of the McCool works and the addition, Burnside's advance had caused Early's corps to entrench Spottsylvania and the church to the south of it, facing E. Between these two sections were woods. The connexion made between these came the loop around McCool's the appearance from which it derives its historic name of The Salient. Upon the northern face of this Salient Hancock's attack was delivered.

On the 11th the abandonment of Burnside's threatening advance on his rear and other indices had disquieted Lee as he left or Block House flank, and he had drawn off practically all Ewell's artillery from the McCool works to aid in that quarter. The infantry that manned the Salient was what remained of Stonewall Jackson's "foot cavalry," veterans of Antietam, Fredericksburg and Chancellorville. But at 4.35, in the mist, Hancock's mass swept over their works at the first rush and swarmed in the interior of the Salient, thousands of
prisoners and seizing the field batteries that Lee had sent back just too late.

The thronging and excited Federals were completely disordered by success, and the counter-attack of one or two Confederate brigades in good order drove them back to the line of the captured works. Then, about 6, there began one of the most remarkable struggles in history. While Early, swiftly drawing back from Block House, checked Burnside's attack from the east, and Anderson, attacked again and again by parts of the V. corps,1 was fully occupied in preserving his own front, Lee, with Ewell's corps and the few thousand men whom the other
time came, Lee succeeded so well that after twenty hours' bitter fighting the new line was ready and the Confederates gave up the barren prize to Hancock. Lee had lost 4,000 prisoners as well as 4,500 killed and wounded, as against 7,000 in the Army of the Potomac and the IX. corps.

There were other battles in front of Spotsylvania, but that of the 13th was the climax. From the 13th to the 20th the Federals gradually worked round from west to east, delivering a few partial attacks in the vain hope of discovering a weak point. Lee's position, now semicircular, enabled him to concentrate on interior lines on each occasion. In the end the
generals could spare, delivered all day a series of fierce counter-strokes against Hancock. Nearly all Wright's corps and even part of Warren's (in the end 45,000 men) were drawn into the fight at the Salient, for Grant and Meade well knew that Lee was struggling to gain time for the construction of a retracement across the base of it. If the counter-attacks failed to gain this respite, the Confederates would have to retreat as best they could, pressed in front and flank. But the initial superiority of the Federals was neutralized by their disorder, and, keeping the fight alive by successive brigade attacks, while the troops not actually employed were held out of danger till their

1 The tension was so great that, after threatening to deprive Warren of his command, Meade sent General Humphreys, his chief of staff, to direct the V. corps' attack.

Federals were entrenched facing E. between Beverly's house (Burnside's old "Gayle") and Quisenberry's, Lee facing W. from the new works south of Harrison's through the Court House to Snell's Bridge on the Po. In the fork of the Po and the Ny, with woods and marshes to obstruct every movement, Grant knew that nothing could be done, and he prepared to execute a new manoeuvre. But here, as in the Wilderness, Lee managed to have the last word. While the Union army was resting in camp for the first time since leaving Culpeper, Ewell's corps suddenly attacked its baggage-train near Harris's house. The Confederates were driven off, but Grant had to defer his intended manoeuvre for two days. When the armies left Spotsylvania, little more than a fortnight after breaking up from winter quarters, the casualties had reached the totals of 35,000 out of
an original total of 120,000 for the Union army, 26,000 out of 70,000 for the Confederates.

The next manœuvre attempted by Grant to bring Lee's army to action "outside works" was of an unusual character, though it had been foreshadowed in the improvised plan of crushing Lee against Burnside's corps on the 9th. Hancock was now (20th) ordered to move off under cover of night to Milford; thence he was to march south-west as far as possible along the Richmond and Fredericksburg railroad, and to attack whatever

force of the enemy he met. It was hoped that this bold stroke by an isolated corps would draw Lee's army upon it, and the rest of the Army of the Potomac would, if this hope were realized, drive down upon Lee's rear while Hancock held him up in front. Supposing, however, that Lee did not take the bait, the manœuvre would resolve itself into a turning movement with the object of compelling Lee to come out of his Spottsylvania lines on pain of being surrounded.

The II. corps started on the night of the 20th-21st. The alarm was soon given. At Milford, where he forced the passage of the Mattaponi, Hancock found himself in the presence of hostile infantry from Richmond and heard that more had

arrived at Hanover Junction, both from Richmond and from the Shenandoah Valley. He therefore suspended his advance and entrenched. The main army began to move off, after giving Lee time to turn against Hancock, at 10 a.m. on the 21st, and marched to Catlett's, a place a few miles S.W. of Guiness's bridge, Warren leading, Burnside and Wright following. But no news came in from Hancock until late in the evening, and the development of the manœuvre was consequently delayed, so that on the night of the 21st-22nd Lee's army slipped across Warren's front en route for Hanover Junction. The other Confederate forces that had opposed Hancock likewise fell back. Grant's manœuvre had failed. Its principal aim was to induce Lee to attack the II. corps at Milford, its secondary and alternative purpose was, by dislodging Lee from Spottsylvania, to force on an encounter battle in open ground. But he was only offered the bait—not compelled to take it, as he would have been if Hancock with two corps had been placed directly athwart the road between Spottsylvania and Hanover Junction—and, having unimpaired freedom of action, he chose to retreat to the Junction. The four Union corps, therefore, could only pursue him to the North Anna, at which river they arrived on the morning of the 23rd, Warren on the right, Hancock on the left, Wright and Burnside being well to the rear in second line. The same afternoon Warren seized Jericho Ford, brought over the V. corps to the south side, and repulsed a very sharp counter-stroke made by one of Lee's corps. Hancock at the same time stormed a Confederate redoubt which covered the Telegraph Road bridge over the river. Wright and Burnside closed up. It seemed as if a battle was at hand, but in the night reports came in that Lee had fallen back to the South Anna, and as these were more or less confirmed by the fact that Warren met with no further opposition, and by the enemy's retirement from the river bank on Hancock's front, the Union generals gave orders, about midday on the 24th, for what was practically a general pursuit. This led incidentally to an attempt to drive Lee's rearguard away from the point of passage, between Warren's and Hancock's, required for Burnside, and in the course of this it became apparent that Lee's army had not fallen back, but was posted in a semicircle to which the North Anna formed a tangent. On the morning of the 25th this position was reconnoitred, and found to be more formidable than that of Spottsylvania. Moreover, it divided the two halves of the Union army that had crossed above and below.

Grant gave up the game as drawn and planned a new move. This had as its objects, first, the seizure of a point of passage
on the Pamunkey; secondly, the deployment of the Army of the Potomac and of a contingent expected from the Army of the James, and thirdly, the prevention of Lee's further retirement, which was not desired by the Union commanders, owing to the proximity of the Richmond defences and the consequent want of room to manoeuvre. On the 27th Sheridan's cavalry and a light division of infantry passed the Pamunkey at Hanover Town, and the two divided wings of the Army of the Potomac were withdrawn over the North Anna without mishap—thanks to exactitude in arrangement and punctuality in execution. On the 28th the Army of the Potomac had arrived near Hanover Town, while at Hawes's Shop, on the road to Richmond, Sheridan and anvil battle was again taken up, the "anvil" being Smith's XVIII. corps, which had come up from the James river to White House on the 30th; but once more the lure failed because it was not made sufficiently tempting.

The last episode of the campaign centred on Cold Harbor, a village close to the Chickahominy, which Sheridan's cavalry seized, on its own initiative, on the 31st. Here, contrary to the expectation of the Union staff, a considerable force of Confederate infantry—new arrivals from the James—was met, and in the hope of bringing on a battle before either side had time to entrench, Grant and Meade ordered Sheridan to hold the village at all costs, and directed Wright's (VI.) corps from the extreme right wing, and Smith's (XVIII.) from Old Church, to march thither with all possible speed, Wright in the night of the 31st of May and Smith on the morning of the 1st of June. Lee had actually ordered his corps commanders to attack, but was too ill to enforce his wishes, and in the evening Wright and Smith themselves assaulted the Confederate front opposite Cold Harbor. The assault, though delivered by tired men, was successful. The enemy's first or skirmish line was everywhere stormed, and parts of the VI. corps even penetrated the main line. Nearly 800 prisoners were taken, and Grant at once prepared to renew the attack, as at Spotsylvania, with larger forces, bringing Hancock over from the right of the line on the night of the 1st, and ordering Hancock, Wright and Smith to
assault on the next morning. But Lee had by now moved more forces down, and his line extended from the Totopotomoy to the Chickahominy. Hancock's corps, very greatly fatigued by its night march, did not form up until after midday, and meanwhile Smith, whose corps, originally but 10,000 strong, had been severely tried by its hard marching and fighting on the 1st, refused to consider the idea of renewing the attack. The passive resistance thus encountered dominated Grant's fighting instinct for a moment. But after reconsidering the problem he again ordered the attack to be made by Wright, Smith, and Hancock at 5 p.m. A last modification was made when, during the afternoon, Lee's far distant left wing attacked Burnside and Warren. This, showing that Lee had still a considerable force to the northward, and being, not very inaccurately, read to mean that the 6 m. of Confederate entrenchments were equally—i.e., equally thinly—guarded at all points, led to the order being given to all five Union corps to attack at 4:30 a.m. on the 3rd of June.

The resolution to make this plain, unvarnished frontal assault on entrenchments has been as severely criticized as any action of any commander in the Civil War, and Grant himself subsequently expressed his regret at having formed it. But such criticisms derive all their force from the event, not from the conditions in which, beforehand, the resolution was made. The risks of failure were deliberately accepted, and the battle—if it can be called a battle—was fought as ordered. The assault was made at the time arranged and was repulsed at all points, with a loss to the assailants of about 8000 men. Thereafter the two armies lay for ten days less than a hundred yards apart. There was more or less severe fighting at times, and an almost ceaselessickering of skirmishers. Owing to Grant's refusal to sue for permission to remove his dead and wounded in the terms demanded, Lee turned back the Federal ambuscade parties, and many wounded were left to die between the lines. It was only on the 7th that Grant pocketed his feelings and the dead were buried.

This is one of the many incidents of Cold Harbor that must always rouse painful memories—though to blame Lee or Grant supposes that these great generals were infinitely more inhuman here than at any other occasion in their lives, and takes no account of the consequences of admitting a defeat at this critical moment, when the causes for which the Union army and people contended were about to be put to the hazard of a presidential election.

The Federal army lost, in this month of almost incessant campaigning, about 59,000 men, the Confederates about 32,000. Though the aggregate of the Union losses awed both contemporaries and historians of a later generation, proportionately the losses of the South were heavier (40% of the original strength as compared with 41% on the Union side), and whereas within a few weeks Grant was able to replace nearly every man he had lost by a new recruit, the Confederate government was almost at the end of its resources.

WILDMAN, SIR JOHN (c. 1621-1693), English agitator, was educated at the university of Cambridge, and during the Civil War served for a short time under Sir Thomas Fairfax. He became prominent, however, not as a soldier but as an agitator, being in 1647 one of the leaders of that section of the army which objected to all compromise with the king. In a pamphlet, Putney Projects, he attacked Cromwell; he was responsible for The Case of the Army stated, and he put the views of his associates before the council of the army at a meeting in Putney church in October 1647. The authorities looked upon him with suspicion, and in January 1648 he and John Lilburne were imprisoned, preparations, says Clarendon, being made "for his trial and towards his execution." However, he was released in the following August, and for a time he associated with the party known as the levellers, but he quickly severed his connexion with them and became an officer in the army. He was a large buyer of the land forfeited by the royalists, and in 1654 he was sent to the House of Commons as member for Scarborough. In the following year he was arrested for conspiring against Cromwell, and after his release four months later he resumed his career of plotting, intriguing alike with royalists and republicans for the overthrow of the existing régime. In 1659 he helped to seize Windsor castle for the Long Parliament, and then in November 1661 he was again a prisoner on some suspicion of participating in republican plots. For six years he was a captive, only regaining his freedom after the fall of Clarendon in October 1667.

In or before 1681 Wildman became prominent among those who were discontented with the rule of Charles II., being especially intimate with Algermon Sydney. He was undoubtedly concerned in the Rye House Plot, and under James II. he was active in the interests of the duke of Monmouth, but owing to some disagreements, or perhaps to his cowardice, he took no part in the rising of 1685. He found it advisable, however, to escape to Holland, and returned to England with the army of William of Orange in 1688. In 1689 he was a member of the convention parliament.

Wildman was postmaster-general from April 1689 to February 1691, when some ugly rumours about his conduct brought about his dismissal. Nevertheless, he was knighted by William III. in 1692, and he died on the 2nd of June 1693. Sir John, who was the author of many political pamphlets, left an only son, John, who died childless in 1710.

WILES, IRVING RAMSAY (1861- ), American artist, was born at Utica, New York, on the 8th of April 1861. He studied under his father, the landscape painter, Lemuel Maynard Wiles (1826-1905), in the Art Students' League, New York, and under Carolus Duran, at Paris. His earlier work was as an illustrator for American magazines, and later he devoted himself with great success to portraiture. He became a full member of the National Academy of Design (1897) and a member of the American Water Color Society.

WILFRID (c. 634-709), English archbishop, was born of good parentage in Northumbria, c. 634. When serving in King Oswio's court, he attracted the notice of the queen, Eanflæd, who, fostering his inclination for a religious life, placed him under the care of an old noble, Cudda, now a monk at Lindisfarne. Later on Eanflæd enabled him to visit Rome in the company of Benedict Bishop. At Lyons Wilfrid's pleasing features and quick intelligence made Annemund, the archbishop, desire to adopt him and marry him to his niece. Resisting his offers, the youth went on to Rome, received the papal benediction, and then, in accordance with his promise, returned to Lyons, where he stayed for three years, till the murder of his patron, whose fate the executioners would not let him share. On his return home, Oswio's son Alchfrid gave him a monastery at Ripon, and, before long, Agilbert, bishop of the Gewissae, or West Saxons, ordained him priest.

He was probably already regarded as the leading exponent of the Roman discipline in England when his speech at the council of Whitby determined the overthrow of the Celtic party (664). About a year later he was consecrated to the see of York, not, however, in England, where perhaps he could not find the fitting number of orthodox prelates, but at Compiègne, Agilbert being now bishop of Paris. On his return journey he narrowly escaped the vengeance of the Saxons, and only reached his own country to find Ceadda (St Chad) installed in his see.

The rest of his life is largely a record of wandering and misfortune. For three years (665-668) he ruled his monastery at Ripon in peace, though acting as bishop in Mercia and Kent during vacancies in sees there. On Archbishop Theodore's arrival (668) he was restored to his see, and spent in it nine years of ceaseless activity, especially in building churches, only to be driven out through the anger of King Ecgfrith's queen (671).
Theodore now divided Wilfrid's large diocese into three; and the aggrieved prelate went to lay his case before the bishop of Rome. On his way a west wind drove him to Friesland, where he evangelized the natives and prepared the way for Willibrord (q.v.). Late in life he ordered his servant bishop of the Frisians. A certain theif named Agatho (680) obtained his restitution; but even this decision could not prevent his being cast into prison on his return home. When released he wandered first to Mercia, then to Wessex and finally to Sussex. Here he rescued the pagan folk from an impending famine, sent preachers to the Isle of Wight and founded a monastery at Selsey. After Egfrith's death (20th May 685) Wilfrid was restored to York (much circumscribed), and Ripon (686–687). He was once more driven out in 691–692, and spent seven years in Mercia. A great council of the English Church held in Northumbria excommunicated him in 702. He again appeared in Rome in person, and obtained another decision in his favour (703–704). Despite the intercession of Brihwald, archbishop of Canterbury, Aldfrith king of Northumbria refused to admit the aged prelate into his kingdom till his last illness (705). This year or the next a council was held near the River Nidd, the papal letters were read, and, despite the opposition of the bishops, Wilfrid once more received the abbey of Ripon and Hexham. Not long after he died at Oundle in Northamptonshire as he was going on a visit to Ceolred, king of Mercia (706). He was buried at Ripon, whence, according to Eadmer, bishop of Hexham (1115–24) the skull and heart were removed. Wilfrid's death in 705 is a memorable name in English history, not only because of the large part he played in supplanting the Celtic discipline and in establishing a precedent of appeal to papal authority, but also by reason of his services to architecture and learning. At York he renewed Paulinus's old church, roofing it with lead and furnishing it with glass windows; at Ripon he built an entirely new basilica with columns and porches; at Hexham in honour of St Andrew he reared a still nobler church which did great bishops subsequent. In days of his bishopric he used to travel about his diocese attended by a little troop of skilled masons. He seems to have also reformed the method of conducting the divine services by the aid of his skilled chanters, Eddie and Zona, and to have established or renewed the rule of St Benedict in the monasteries. On each visit to Rome it was his delight to collect relics for his native land; and to his favourite basilica at Ripon he gave a bookcase wrought in gold and precious stones, besides a splendid copy of the Gospels. Wilfrid's life was written shortly after his death by Eddius at the request of Acca, his successor at Hexham, and Tathert, abbot of Ripon, and Belach, bishop of the Mercian bishops. They were written by Frithgoede in the 10th, by Folcar in the 11th, and by Eadmer early in the 12th century. See also Bede's Hist. Eccl. v. 19, iii. 25, iv. 13, &c. All the lives are printed in J. Raine's Historians of the Early Church (1851). Sec also Eadmer's Historia Edernensis.

**WILHELMINA (WILHELMINA) [WILHELMINA] HELENA PAULINE MARIA of ORANGE-NASSAU** (1850– ), queen of the Netherlands, was born at the Hague on the 31st of August 1850. Her father, William III. (Willem Paul Alexander Frederik Lodewijk), had by his first wife, Sophia Frederika Mathilde of Wurttemberg, three sons, all of whom preceded him. Having been left a widower on the 3rd of June 1857, he married on the 7th of January 1859 Adelheid Emma Wilhelmina Theresia, second daughter of Prince George Victor of Waldeck-Pyrmont, born on the 3rd of August 1835, and Wilhelmina was the only issue of that union. She succeeded to the throne on her father's death, which took place on the 23rd of November 1858, but until her eighteenth year, when she was "inaugurated" at Amsterdam on the 6th of September 1868, the business of the state was carried on under the regency of the queen-mother, in accordance with a law made on the 2nd of August 1854. On the 7th of February 1901 Queen Wilhelmina married Henry William Albert Ernst, duke of Mecklenburg-Schwerin (born on the 19th of April 1876). To the great joy of the Dutch people, Queen Wilhelmina, on the 30th of April 1900, gave birth to a heir to the throne, the Princess Wilhelmina Louise Emma Maria Wilhelmina. (See Holland: History.)

**WILHELMINA** (Sophia Frederika Wilhelmina) (1700–1758), margravine of Baireuth, was born in Berlin on the 3rd of July 1709, the daughter of Frederick William I., crown prince, afterwards king of Prussia, and of Sophia Dorothea, daughter of the elector of Hanover (George I. of England). Wilhelmina shared the unhappy childhood of her brother, Frederick the Great, whose friend and confidante she remained, with the exception of one short interval, all her life. Sophia Dorothea wished to marry her daughter to Frederick, prince of Wales, but on the English side there was no disposition to make the offer except in exchange for substantial concessions, too much the king of Prussia was not prepared to assent. The fruitless intrigues carried on by Sophia Dorothea to bring about this match played a large part in Wilhelmina's early life. After much talk of other matches, which came to nothing, she was eventually married in 1731 to Frederick, hereditary prince of Baireuth. The marriage, only accepted by Wilhelmina under threats from her father and with a view to lightening her brother's disgrace, proved at the outset a happy one, though it was clouded at first by narrow means, and afterwards by the infidelities of the future margrave with Dorothea von Marwitz, whose ascendency at the court of Baireuth was bitterly resented by Frederick the Great, and caused an estrangement of some three years between Wilhelmina and the brother she so devotedly loved. When Wilhelmina's husband came into his inheritance in 1735 the pair set about making Baireuth a miniature Versailles. Their building operations included the rebuilding of their summer residence, the Ermitage, the great Baireuth opera-house, the building of a theatre and the reconstruction of the Baireuth palace and of the new opera house. They also founded the university and other undertakings bringing the court to the verge of bankruptcy.

The margravine made Baireuth one of the intellectual centres of Germany, surrounding herself with a little court of wits and artists which gained added prestige from the occasional visits of Voltaire and Frederick the Great. With the outbreak of the Seven Years' War, Wilhelmina's interests shifted from dilettantism to diplomacy. She acted as eyes and ears for her brother in southern Germany until her death on the 14th of October 1758, the day of Frederick's defeat by the Austrians at Hochkirch. Her only daughter Frederica had contracted in 1748 an unhappy marriage with Charles Eugene, duke of Wurtemberg.

The margravine's memoirs, Mémoires de ma vie, written or revised between 1748 and her death, are preserved in the Royal Library of Berlin. They were first printed in two forms in 1810—a German translation down to the year 1733 from the firm of Cotta of Tübingen; and in French published by Vieweg of Brunswick, and completed by 1742. There have been several subsequent editions, including a German one published at Leipzig in 1808. An English translation was published in Berlin in 1803. For the accuracy and minuteness of these entertaining, though not very trustworthy, memoirs, see G. H. Pertz, Über die Merkwürdigkeiten der Markgräfin (1851), and also Arvedie Barine, Princesses de grandes dames (Paris, 1890); and J. H. J. Dorothea von Wurtemberg, Merkwürdigkeiten von Baireuth (London, 2 vols., 1905); and R. Fester, Die Bayreuther Schwester Friedrichs des Grossen (Berlin, 1902).

**WILHELMSHAVEN, or WILHELMSHAFEN, a town of Germany, and the chief naval station and war harbour of the empire on the North Sea, situated on the north-west shore of the Jade Bussen, a large shallow basin formed by inundations and united with the sea by the Jade, a channel 3 m. long. Pop. (1885), 19,422; (1903), 26,012, of whom 8,257 belonged to the navy or army. The town stands on which the Jaderiver approaches from the mouth of the Weser, and forms on Prussia from the grand-duke of Oldenburg in 1853, when the Prussian navy was being formed. The construction of the harbour and town was begun in 1855, and the former was opened in 1869. Though reckoned a part of the Prussian province of Hanover it is completely surrounded on the landward side by Oldenburg territory. The town is laid out on a regular plan and ample scale, and the streets are wide and shaded with trees. The main thoroughfare is the Roonstrasse, which, running E. and W., passes the market-square, upon which stand the town hall and the post office. There are two Evangelical and two Roman Catholic churches, a gymnasium, schools for warrant officers and engineers and other naval educational institutions. The original harbour, constructed in 1855–1869, consists of an inner and outer basin. To the south-east of the inner harbour a large new harbour has been more recently constructed for war vessels in commission. This so-called new harbour (170
acres in area and 262 ft, deep) is connected by means of a lock (251 ft. long) with the new harbour entrance, which was completed in 1886. On the north it is connected with the fitting-out basin (382 ft. long, 446 ft. wide), which again is connected by a lock (188 ft. long) with the outer basin (617 ft. long, 410 ft. wide), and so with the old harbour entrance. North of this the "third entrance" has been recently constructed, with two enormous locks, one of which in an emergency could be used as an additional dock. On the west side of the fitting-out basin lies the shipbuilding basin (1357 ft. long by 742 ft. wide), with three dry-docks (of which 453 ft. long, 127 ft. wide and more than 30 ft. deep, whilst the third is 394 ft. long), and also with two slips of the largest size. Further new docks (each about 617 ft. by 97 ft.), capable of containing large battle-ships, were completed in 1906. A torpedo harbour lies to the south-east of the new harbour. The three entrances to the old and new harbours are sheltered by long and massive mole; and the whole complex of docks, building slips, machine shops, &c., forms the government dockyard, which is enclosed by a lofty wall with fourteen iron gates. The establishment is defended by strong fortifications. The commercial harbour lies on the south side of the town at the east end of the Ems-Jade canal. The industries of the place are almost exclusively connected with the requirements of the dockyard, and embrace machine shops, iron foundries and boiler works. Wilhelmshaven is visited for its sea-bathing. It possesses deposits for artillery and mines, a meteorological observatory and a signalling station. A battalion of marines is stationed here. Since 1900 the development of the naval establishment and of the town has been exceptionally rapid, coincident with the growth of the German navy, and with the shifting of political and naval activity from the Baltic to the North Sea.

WILKES, CHARLES (1798-1877). American naval officer and explorer, was born in New York City on the 3rd of April 1798. He entered the United States Navy as a midshipman in 1818, and became a lieutenant in 1826. In 1830 he was placed in charge of the division of instruments and charts, and in 1838 he was appointed to command an exploring and surveying expedition in the Southern Seas, authorized by Congress in 1836. The expedition, including naturalists, botanists, a mineralogist, and a marine astronomer, consisted of the sloops-of-war "Vincennes" and "Peacock," the brig "Porpoise," the store-ship "Relief" and two tenders. Leaving Hampton Roads on the 18th of August 1838, it stopped at Madeira and Rio de Janeiro; visited Tierra del Fuego, Chile, Peru, the Patagonian group of the Low Archipelago, the Samoan islands and New South Wales; from Sydney sailed into the Antarctic Ocean in December 1839 and reported the discovery of an Antarctic continent west of the Balleny islands; 1 visited the Fiji and the Hawaiian islands in 1840, explored the west coast of the United States, including the Columbia river, San Francisco Bay and the Sacramento river, in 1841, and returned by way of the Philippine islands, the Sulu archipelago, Borneo, Singapore, Polynesia and the Cape of Good Hope, reaching New York on the 10th of June 1842. He was court-martialled on his return, but was acquitted on all charges except that of illegally punishing men in his squadron. For a short time he was attached to the Coast Survey, but from 1844 to 1851 he was chiefly engaged in preparing the report of the expedition. Twenty-eight volumes were planned but only nineteen were published. Of these Wilkes wrote the "Voyage of the Pomona, 1850-1852" and the "Narrative of..." Hydrography and Meteorology (1851). The Narrative contains much interesting material concerning the manners and customs

1 This discovery was made on the 19th of January 1840, one day before Dumont d'Urville sighted Adélie Land about 400 m. farther. W. That Wilkes discovered an Antarctic continent was long doubted, and cases against him were opened. It was only when it was known that he had fabricated this discovery, but the expedition of Sir Ernest Shackleton in 1908-1909 corroborated Wilkes. That part of the Antarctic continent known as Wilkes Land was named in his honour.

and political and economic conditions in many places then little known. Other valuable contributions were the three reports of James D. Dana on Zoophytes (1846), Geology (1849) and Crustacea (2 vols., 1852-1854). At the outbreak of the Civil War, Wilkes (who had reached the rank of commander in 1843 and that of captain in 1855) was assigned to the command of the "San Jacinto" to search for the Confederate commerce destroyer, "Sumter." On the 8th of November 1861 he stopped the British mail packet "Trent," and took off the Confederate commissioners to Europe, James M. Mason and John Slidell. This was done repeatedly that Congress, his action was later disavowed by President Lincoln. His. was later elected in the James river flotilla, but after reaching the rank of commodore on the 16th of July 1862, he was assigned to duty against blockade runners in the West Indies. He was diratated (becoming a captain on the retired list) in November 1862 on the ground that he had been too old to receive the rank of commodore under the act then governing promotions; and engaged in a long controversy with Gideon Welles, secretary of the navy. This controversy ended in his being court-martialled in 1864 and being found a "vulgar and insolent offender," and sentenced to public reprimand and one year's suspension. But on the 22nd of April 1866 he was promoted to the rank of rear-admiral on the retired list. He died at Washington on the 8th of February 1877.

In addition to many shorter articles, reports, &c., he published Western America, including California and Oregon (1849) and Theory of the Winds (1856).

WILKES, JOHN (1777-1797), English politician, descended from a family long connected with Leighton-Buzzard in Bedfordshire, was born at Clerkenwell, London, on the 17th of October 1777, being the second son of Israel Wilkes, a rich distiller, and the owner, through his wife Sarah, daughter of John Heathon of Hoxton, of considerable house property in its north-eastern suburbs. After some training under private tuition John Wilkes was sent to the university of Leyden, matriculating there on the 8th of September 1744. Several young men of talent from Scotland and England were studying in this Dutch university at that period, and a lively picture of their life, in which Wilkes displays the gaiety of temper which remained faithful to him all his days, is presented to us by Alexander Carlyle (Autobiog., ed. J. H. Burton). With this training he acquired an intimate knowledge of classical literature, and he enlarged his mind by travelling through Holland, Flanders and part of Germany. At the close of 1748 he returned to his native land, and in a few months (October 1749) was drawn by his relations into marrying Mary, sole daughter and heiress of John Mead, citizen and grocer of London, who was ten years his senior. The ill-assorted pair—for she was grave and staid, while he roared in exuberant spirits and love of society—lived together at Aylesbury for some months, when, to make matters worse, they turned to town to dwell with her wife's mother. One child, a daughter, was born to them (5th of August 1750), and then Wilkes left his wife and removed to Westminster, where he kept open house for many young men about town possessing more wit than morals. In 1754 he contested the constituency of Berwick-upon-Tweed, but failed to gain the seat.

Wilkes was now a well-known figure in the life of the west end, and among his associates were Thomas Potter, the son of the archbishop of Canterbury, Sir Francis Dashwood, afterwards Lord le Despencer, and Lord Sandwich, the last of whom in after years showed great animosity towards his old companion in revelry. In July 1757, by a triangular arrangement in which Potter and the first William Pitt played the other parts, Wilkes was elected for Aylesbury, and for this constituency he was again returned at the general election in March 1761. Pitt was his leader in politics; but to Pitt he applied in vain for a seat at the Board of Trade, nor was he successful in his application for the post of ambassador at Constantinople, or for that of governor of Quebec. As he attributed these failures to the opposition of Lord Bute, he established a paper called the North Briton (June 1762), in which he he first attacked the Scotch prime minister with exceeding bitterness, and grew bolder as it
proceeded in its course. One of its articles ridiculed Lord Talbot, the steward of the royal household, and a duel was the result. When Bute resigned, the issue of the journal was suspended; but, when the royal speech followed by George Grenville's ministry showed that the election was one of men only, not of measures, a supplementary number, No. 45, was published, 23rd of April 1763, containing a caustic criticism of the king's message to his parliament. Lord Halifax, the leading secretary of state, issued a general warrant "to search for authors, printers and publishers," and to bring them before him for examination. Charles Churchill, the poet and a coadjutor in this newspaper enterprise, escaped through the good offices of Wilkes; but the chief offender was arrested and thrown into the Tower (30th of April 1763). A week later, however, he was released by order of the Court of Common Pleas on the ground that his privilege as a member of parliament afforded him immunity from arrest. General warrants were afterwards declared illegal, and Halifax himself, after a series of discreditible shifts, was cast in heavy sums, on actions brought against him by the persons whom he had injured—the total expenses incurred by the ministry in these lawless proceedings amounting to at least £100,000. So far Wilkes had triumphed over his enemies, but he gave them cause for rejoicing by an indirect reprint of the obnoxious No. 45, and by striking off at his private press thirteen copies of an obscene Essay on Woman. Written by his friend Potter as a satire on Pope's Essay on Man, one of which got into the hands of Lord Sandwich. Immediately on the meeting of the House of Commons (15th of November 1763) proceedings were taken against him. Lord North moved that No. 45 was "a false, scandalous and seditious libel," and the paper was publicly burnt in Chapside on the 4th of December. The Essay on Woman was on the same day brought before the Upper House by Lord Sandwich, and, on account of the improper use which had been made of Bishop Warburton's name as the author of some coarse notes, the work was voted a breach of privilege, and Wilkes was ordered to be prosecuted in the Court of King's Bench for printing and publishing an impertinent libel. He was expelled from the House of Commons on the 10th of January 1764; and on the 21st of February he was found guilty in the King's Bench of reprinting No. 45 and of printing and publishing the Essay on Woman. Wilkes was on these dates absent from England. Some strong expressions applied to him by Samuel Martin, an ex-secretary of the treasury, had provoked a duel (16th of November 1763), in which Wilkes was severely wounded in the stomach. He withdrew to Paris, and as he did not return to England to receive his sentence in the law courts was permitted to go abroad.

For several years Wilkes remained abroad, receiving £1000 a year from the leading Whigs, and in the course of his travels he visited many parts of Italy. In February 1768 he returned to London and snub the king for pardon, but in vain. His next step was to offer himself as a candidate for the representation of the city of London, when he was the lowest at the poll. Undaunted by this defeat, he solicited the freeholders of Middlesex to return him as their champion, and they placed him at the head of all competitors (28th of March). He appeared before the King's Bench, and on a technical point procured a reversal of his outlawry; but the original verdict was not set aside, and he was sentenced to imprisonment for twenty-two months as well as to a fine of £1000, and he was further ordered to produce securities for good behaviour for seven years after his liberation. His conduct was brought before the House of Commons, with the result that he was expelled from the House on the 3rd of February 1769, and with this proceeding there began a series of contests between the ministry and the electors of Middlesex without parallel in English history. They promptly re-elected him (18th of February), only to find him pronounced incapable of sitting and his election void. Again they returned him (16th of March) and again he was rejected. A fourth election then followed (13th of April), when Colonel Henry Lawes Luttrell, with all the influence of the court and the Fox family in his favour, obtained 296 votes, while 1134 were given for Wilkes, but two days later the House declared that Luttrell had been duly elected. Through these audacious proceedings a storm of fury broke out throughout the country. In the cause of "Wilkes and liberty" high and low enlisted themselves. His prison cell was thronged daily by the chief of the Whigs, and large sums of money were subscribed for his support. So great was the popular sympathy in his favour, that a keen judge of contemporary politics declared that, had George III possessed a bad and Wilkes a good character, the king would have been an outcast from his dominions. At the height of the combat in January 1769 Wilkes was elected alderman for the city of London; in 1771 he served as sheriff for London and Middlesex, and as alderman he took an active part in the struggle between the corporation and the House of Commons by which freedom of publication of the parliamentary debates was obtained. His admirers endeavoured in 1772 to procure his election as lord mayor of London, but he was set aside by the aldermen, some of whom were allied with the ministry of Lord North, while others, as Oliver and Townshend, leant to the Liberalism of Lord Shelburne. In 1774, however, he obtained that dignity, and he retained his seat for Middlesex from the dissolution in 1774 until 1790. He moved in 1776 for leave to bring in a bill "for a just and equal representation of the people of England in parliament"; but attempts at parliamentary reform were premature by at least half a century. After several failures he was finally moved in 1784 to take the attention of the House to the fact that the Speaker, Charles Lawes, had been raised to the peerage without an election. In another direction, for on the 3rd of May 1782 all the declarations and petitions presented to the Commons for his elections in Middlesex were ordered to be expunged from the journals of the House. In 1779 Wilkes was elected chamberlain of the city by a large majority, and the office became his freehold for life. He died at his house in Grosvenor Square, London, on the 26th of December 1797. His daughter Mary, to whom he was tenderly attached, died on the 12th of March 1807.

Wilkes printed editions of Catullus (1788) and Theophrastus (1790), and at the time of his death had made considerable progress with a translation of The works of Petronius, the last book of which was Anacreon and Lucan. He was a man of great literature, of marvellous wit and sarcasm; he was a man of strong natural genius who has sullied his genius by obscenity and profanity; but he knew how to suit his conversation to his company, and his well-known assertion that, in spite of his squat and ugly as he was, with the start of a quarter of an hour he could get the better of any man, however good-looking, in the graces of any lady, shows his confidence in his powers of fascination. The king was obliged to own that he had never met so well-bred a lord scribe; and Dr Johnson, who made his acquaintance at the house of Dilly, the bookseller in the Poultry, confessed that "Jack has great variety of talk, Jack is a scholar, and Jack has the manners of a gentleman." It is doubtful how far he himself believed in the justice of these praises which, being printed in To Catch a Stare, and signed with his real name and the name of his devoted friend and legal adviser, Serjeant Glynn, "Ah sir! he was a Wilkite, which I never was." His writings were marked by that burlesque sarcasm which in the hands of W. P. Cobbett, published, one of Letters to his Daughter, in four volumes in 1804, is the other Correspondence with his Friends, in which are introduced Memoirs of his Life, by John Almon, in five volumes, in 1805. A Life by Percy Fitzgerald was published in 1888. Essays on him are in Historical Gleamings, by E. Thorold Rogers, 2nd ser. (1870); Wilkes and Cobbett, by J. S. Watson (1870); and Wilkes, Sheridan and Fox, by W. H. Roe (1874). His connexion with Bath is set out in John Wilkes, by W. Gregory (1888), and that with the city of London in Modern History of the City, by Charles Welch (1896). A fragment of his autobiography (Br. Museum Addit. MSS. 30685), chiefly devoted to his residence in France and Italy, was printed from a MS. by F. Taylor of Harrow in 1888.

WILKES-BARRÉ, a city and the county-seat of Luzerne county, Pennsylvania, U.S.A., on the north branch of the Susquehanna river, about 100 m. N.N.W. of Philadelphia. Pop. (1890), 37,718; (1900), 51,721, of whom 12,158 were foreign-born, including 2702 Germans, 2083 Welsh, 2034 Irish, 1578 English and 1000 Russian Poles; (1910 census), 67,105. Area, 48-8 sq. m. Wilkes-Barré is served by the Central Railroad of New Jersey, the Lehigh Valley, the Delaware, Lackawanna & Western, the Delaware & Hudson, the New York, Susquehanna & Western and the Pennsylvania railways, and by three interurban electric lines—the Wilkes-Barré & Hazleton, the Scranton with Hazleton, about 20 m. S., the Wilkes-Barré & Wyoming Valley, and the Lackawanna & Wyoming Valley, connecting with Scranton about 17 m. N.E. On the opposite bank of the river (which is here spanned by two iron bridges) lies Kingston.
The city is attractively situated in the historic Wyoming Valley. The principal public buildings include the county court-house, the post office, the city hall, the county gaol and the 9th Regiment Armory. Among the city parks are Hollembak (102 acres) and Riverside (35 acres) parks, the River Common (35 acres) and the Frances Slocum Playground. In the city are the Harry Millman Academy (non-sectarian), a secondary school for boys; the Malinckrodt Convent, the Wilkes-Barré Institute (Presbyterian), a school for girls; St Mary's Academy (Roman Catholic) for girls; the Osterhout Free Library (44,000 vols.), the Library of the Law and Library Association (10,000 vols.) and that of the Wyoming Historical and Geological Society (18,000 vols.), which was founded in 1838. Wilkes-Barré is situated in the centre of the richest anthracite coal region in the United States, Luzerne county ranking first in 1908 in the production of anthracite in Pennsylvania; and the value of the factory products increased from $5,616,766 in 1900 to $17,240,893 in 1905, or 39%. Among important manufactures are foundry and machine-shop products, valued at $7,275,491 in 1905; silk and silk goods ($7,054,863); lace curtains, cotton goods, wirework, &c. The city is governed by a mayor elected for three years, and by a legislative body composed of a select council (one member from each of the 16 wards elected for four years) and of a common council (one member from each ward, elected for two years).

The township of Wilkes-Barré was one of five townships the free grant of which, in December 1768, by the Susquehanna Land Company of Connecticut was intended to encourage settlement and make good the company's claim to the Wyoming Valley (p. 43). In May 1769 more than 100 settlers from New England, in command of Major John Durkee (1728-1782), arrived at this place. With others who came a few days later they erected the necessary log cabins on the river bank, near the present Ross Street, and in June began to enclose these within a stockade, known as Fort Durkee. During the same summer Major Durkee gave the town its present name in honour of John Wilkes (1727-1797) and Colonel Isaac Barré (1726-1802), both stout defenders in parliament of the American colonists' cause before and during the War of Independence, and in the following year the town plat was made. In September 1770, the "First Pennamite-Yankee War," as the conflict between Connecticut and Pennsylvania for the possession of the valley is called, broke out. The Yankees lost Fort Durkee in November, but recovered it in the following February. The Pennamites erected Fort Wyoming on the river bank near the present Northampton Street in January 1771, but the Yankees took it from them in the following August. In the War of Independence, immediately after the battle of Wyoming (July 3, 1778), Wilkes-Barré was burned by the Indians and British Rangers; and again in July 1784, during the "Second Pennamite-Yankee War," twenty-three of the twenty-six buildings were burned. In 1786 the Pennsylvania legislature sent here Colonel Timothy Pickering (q.v.) to organize Luzerne county, and to effect a reconciliation between the Connecticut settlers and the government of Pennsylvania. Colonel John Franklin (1749-1831) led a counter movement, and was imprisoned on a charge of treason in October 1787, but Franklin's followers retaliated by kidnapping Pickering in June 1788, and kept him in the woods for nearly three weeks in a vain effort to make him promise to intercede for Franklin's pardon. Wilkes-Barré was gradually rebuilt after its destruction in 1784, and in 1806 the borough was erected, though it was not separated politically from the township until 1818 (or 1819). A new charter was granted to the borough in 1835, and Wilkes-Barré was chartered as a city in 1871.

WILKIE, SIR DAVID (1785-1841), Scottish painter, was born on the 18th of November 1785, the son of the parish minister of Cults in Fifeshire. He was very early developed an extraordinary love for art. In 1790, after he had attended school at Pitlessie, Kettle and Cupar, his father reluctantly yielded to his desire to become a painter; and through the influence of the earl of Leven Wilkie was admitted to the Trustees' Academy in Edinburgh, and began the study of art under John Graham, the teacher of the school. From William Allan (afterwards Sir William Allan and president of the Royal Scottish Academy) and John Burnet, the engraver of Wilkie's works, we have an interesting account of his early studies, of his indomitable perseverance and power of close application, of his habit of haunting fairs and market-places, and transferring to his sketchbooks what he saw. He was also much interested in figure or incident, and of his admiration for the works of Carse and David Allan, two Scottish painters of scenes from humble life. Among his pictures of this period are mentioned a subject from Macbeth, "Ceres in Search of Prosperine," and "Diana and Calisto," which in 1803 gained a premium of ten guineas at the Trustees' Academy, while his pencil portraits of himself and his mother, dated that year, and now in the possession of the duke of Buccleuch, prove that he had already attained considerable certainty of touch and power of rendering character. A scene from "The Death and Burial of a Rabbit" and a sketch from Macneill's ballad of Scotland's Skait, afterwards developed into the well-known "Village Politicians," are the first subjects in which his true artistic individuality began to assert itself.

In 1804 Wilkie returned to Cults, established himself in the manse, and began his first important subject-picture, "Pitlessie Fair," which includes about 140 figures, and in which he introduced portraits of his neighbours and of several members of his family circle. In addition to this elaborate figure-piece, Wilkie was much employed at the time upon portraits, both at home and in Kinghorn, St Andrews and Aberdeen. In the spring of 1805 he left Scotland for London, carrying with him his "Bounty-Money, or the Village Recruiter," which he soon disposed of for £6, and began to study in the schools of the Royal Academy. One of his first patrons in London was Stodart, a pianoforte maker, a distant connexion of the Wilkie family, who commissioned his portrait and other works and introduced the young artist to the dowager-countess of Mansfield. This lady's son was the purchaser of the "Village Politicians," which attracted great attention when it was exhibited in the Royal Academy of 1806, where it was followed in the succeeding year by "The Blind Fiddler," a commission from the painter's lifelong friend Sir George Beaumont. Wilkie now turned aside into the paths of historical art, and painted his "Alfred in the Neatherd's Cottage," for the gallery illustrative of English history which was being formed by Alexander Davison. After its completion he returned to genre-painting, producing the "Card-Players" and the admirable picture of the "Rent Day," which was composed during recovery from a fever contracted in 1807 on a visit to his native village. His next great success was the "Alice-House Doublin," afterwards entitled the "Village Festival" (now in the National Gallery), which was purchased by J. J. Angerstein for 800 guineas. It was followed in 1813 by the well-known "Blind Man's Buff," a commission from the prince regent, to which a companion picture, the "Penny Wedding," was added in 1818.

Meanwhile Wilkie's eminent success in art had been rewarded by professional honours. In November 1809 he was elected an associate of the Royal Academy, when he had hardly attained the age prescribed by its laws, and in February 1811 he became a full academician. In 1812 he opened an exhibition of his collected works in Pall Mall, but the experiment was unsuccessful, entailing pecuniary loss upon the artist. In 1814 he executed the "Letter of Introduction," one of the most delicately finished and perfect of his cabinet pictures. In the same year he made his first visit to the continent, and at Paris entered upon a profitable and delighted study of the works of art collected in the Louvre. Interesting particulars of the time are preserved in his own matter-of-fact diary, and in the more sprightly and flowing pages of the journal of Haydon, his fellow-traveller. On his return he began "Distrainting for Rent," which was the most popular picture he had yet painted. In 1816 he made a tour through Holland and Belgium in company with Raimbach, the engraver of many of his paintings. The "Sir
WILKINS, SIR C.

Walter Scott and his Family," a cabinet-sized picture with small full-length figures in the dress of Scottish peasants, was the result of a visit to Abbotsford in 1818. "Reading a Will," a commission from the king of Bavaria, now in the Pinkakothek at Munich, was completed in 1820; and two years later the great picture of "Chelsea Pensioners Reading the Gazette of the Battle of Waterloo," commissioned by the duke of Wellington in 1816, at a cost of 1200 guineas, was exhibited at the Royal Academy.

In 1832 Wilkie visited Edinburgh, in order to select from the royal progress of George IV, a sitting subject for a picture. The Reception of the King at the Entrance of Holyrood Palace was the subject chosen; and in the following year, when the artist, upon the death of Raeburn, had been appointed royal limner for Scotland, he received sittings from the monarch, and began to work diligently upon the subject. But several years elapsed before its completion; for, like all such ceremonial works, it proved a harassing commission, uncongenial to the painter while in progress and unsatisfactory when finished. His health suffered from the strain to which he was subjected, and his condition was aggravated by heavy domestic trials and responsibilities. In 1835 he sought relief in foreign travel; after visiting Paris, he passed into Italy, where he remained for the greater part of the year 1836. A list of the exceptionally numerous and excellent engravings from his pictures will be found in the Art Union Journal for January 1840. Apart from his skill as a painter Wilkie was an admirable etcher. The best of his plates, such as the "Gentleman at his Desk" (Laing, VII.), the "Face examining a Censer" (Laing, VIII.), and the "Seal of Hands" (Laing, IV.), are worthy to rank with the work of the greatest figure-etchers. During his lifetime he issued a portfolio of seven plates, and in 1834 Dr. Donald Laing catalogued and published the complete series of his etchings and dry-points, supplying the place of a few copper-plates that had been lost by reproductions, in his Etchings of David Wilkie and Among other subjects.

WILKINS, SIR CHARLES (1749-1836), English Orientalist, was born at Frome, Somersetshire, probably in 1749, and in 1770 he went to India as a writer in the East India Company's service. He was soon attached to the study of Oriental languages, particularly Sanskrit, and did an important work towards facilitating such study by founding a printing press for these languages, taking a large personal share in the practical work of...
preparing the type. He returned to England in 1786, but continued his study of Sanskrit, and he afterwards became librarian to the East India Company, and examiner at Haileybury on the establishment of the college there in 1805. Wilkins was knighted in 1833 in recognition of his services to Oriental scholarship, and he died in London in 1836. He was a pioneer in the department of learning with which his name was associated, being the first Englishman to have mastered Sanskrit, and to make an thorough study of Indian inscriptions in that script. He compiled a Sanskrit grammar and published several translations from the sacred books of the East, besides preparing a new edition of Richardson's Persian and Arabic dictionary, and a catalogue of the manuscripts collected by Sir William Jones, who acknowledged his indebtedness to Wilkins, and whom the latter assisted in founding the Asiatic Society of Bengal.

WILKINS, GEORGE (ll. 1607), English playwright and pamphleteer, is first mentioned as the author of a pamphlet on the Three Miseries of Barbary, which probably dates from 1604. He was associated with the King's Men, and was thus a colleague of Shakespeare. He was chiefly employed in remodelling old plays. He collaborated in 1607 with William Rowley and John Day in The Travail of the Three English Brothers. In the same year a play was produced which was apparently entirely Wilkin's work. It is The Miseries of Infant Marriage, and treats the story of Walter Calverley, whose identity is thinly veiled under the name of Scarborough. This man had killed his two children and had attempted to murder his wife. The play had originally a tragic ending, but as played in 1607 ended in comedy, and the story stopped short before the catastrophe, perhaps because of objections raised by Mrs Calverley's family, the Cobhams. The crime itself is dealt with in A Yorkshire Tragedy, which was originally performed with three other plays under the title of All's One. It was entered on the Stationers' Register in 1608 as "written by William Shakespeare," published with the same ascription in that year, and reprinted in 1619 without contradiction of the statement. Mr Sidney Lee assigns to George Wilkins a share in Shakespeare's Pericles and possibly in Timon of Athens. Delius conjectured that Wilkins was the original author of Pericles and that Shakespeare remodelled it. However that may be, Wilkins published in 1608 a novel entitled The Painful Adventures of Pericles, Prince of Tyre, being the true history of Pericles as it was lately presented by . . . John Gower, which sometimes follows the play very closely.

Mr Fleay (Biog. Chron. of the Drama) says that the external evidence for the claim that the author of the Yorkshire Tragedy cannot be impugned, and in the absence of other authorship cannot be lightly set aside, but he does not abandon the hope of establishing a contrary opinion. Both Mr Fleay and Professor A. W. Ward (Roy. Soc. Proc. 1892) seem to think that the story of Pericles was a complete original play by Shakespeare, and that the remodelling story should be reversed, i.e. that Pericles is a Shakespeare play remodelled by a playwright, possibly Wilkins. Mr Lee (Dict. Nat. Biog., Art. "Wilkins") says the Yorkshire Tragedy was "fraudulently assigned to Shakespeare by Thomas Payvers, the publisher.

WILKINS, JOHN (1614-1672), bishop of Chester, was born at Fawsley, Northamptonshire, and educated at Magdalen Hall, Oxford. He was ordained and became vicar of Fawsley in 1637, but soon resigned and became chaplain successively to Lord Saye and Sele, Lord Berkeley, and Prince Charles Louis, nephew of Charles I., and afterwards elector palatine of the Rhine. In 1648 he became warden of Wadham College, Oxford. Under him the college was extraordinarily prosperous, for, although a supporter of Cromwell, he was in touch with the most cultured royalists, who placed their sons in his charge. In 1659 Richard Cromwell appointed him master of Trinity College, Cambridge. At the Restoration in 1660 he was deprived, but appointed prebendary of York and rector of Cranford, Middlesex. In 1661 he was preacher at Gray's Inn, and in 1662 vicar of St Lawrence Jewry, London. He became vicar of Polebrook, Northamptonshire, in 1666, prebendary of Exeter in 1667, and in the following year prebendary of St Paul's and bishop of Chester. Possessing strong scientific tastes, he was the chief founder of the Royal Society and its first secretary. He died in London on the 19th of November 1672.

The chief of his numerous works is an Essay towards a Real Character and a Philosophical Language (London, 1668), in which he expounds a new universal language for the use of philosophers. He is remembered also for a curious work entitled The Discovery of a World in the Moon (1638, 3rd ed., with an appendix: "The possibility of a passage therethrough," 1640). Other works are A Discourse concerning a New Planet (1640); Mercury, or the Secret and Swift Messenger (1647); and a work of some notoriety: The Uses of Rapid Correspondence; and Mathematical Magick (1648). See P. A. Wright Henderson, The Life and Times of John Wilkins (1910), and also the article AERONAUTICS.

WILKINS, MARY ELEANOR (1826— ), American novelist, was born in Randolph, Massachusetts, on the 7th of January 1862, of Puritan ancestry. Her early education, chiefly from reading and observation, was supplemented by a course at Mount Holyoke Seminary, South Hadley, Mass. Her home was in her native village and in Brattleboro, Vermont, until her marriage in 1902 to Dr Charles M. Freeman of Metuchen, New Jersey. She contributed poems and stories to children's magazines, and published several books for children, including Young Lucretia and other Stories (1892), The Poet of Gold and other Stories (1892), and Once upon a Time and other Child Verses (1897). For older readers she wrote the following volumes of short stories: A Humble Romance and other Stories (1887), A New England Nun and other Stories (1891), Silence and other Stories (1898), three books which gave her a prominent place among American short-story writers: The People of Our Neighborhood (1898), The Love of Parson Lord and other Stories (1900), Understudies (1901) and The Givers (1904); the novels Jane Field (1893), Pembroke (1894), Madelphia (1896), Jerome, a Poor Man (1897), The Janesons (1899), The Portfolio of Labor (1901) and The Debor (1903); and Giles Corey, Yeoman (1893), a prose tragedy founded on incidents from New England history. Her longer novels, though successful in the portrayal of character, lack something of the unity, suggestiveness and charm of her short stories, which are notable contributions to modern American literature. She deals usually with a few traits peculiar to the village and country life of New England, and she gave literary permanence to certain characteristics of New England life which are just disappearing.
WILKINSON, J. J. G.—WILKINSON, J. 647

general's department, and was clothier-general from July 1779 to March 1781.

In common with many other officers Wilkinson now turned toward the West, and in 1784 settled near the Falls of the Ohio (Louisville), where he speedily became a prominent merchant and took a marked influence. He began to take an active part in the movement for separate statehood for Kentucky, and in 1787 he entered into an irregular commercial agreement with the Spanish officials of Louisiana.

At this time, as his own papers in the Spanish archives show, he took an oath of allegiance to Spain and began to intrigue with his fellow-Kentuckians to detach the western settlements from the Union and bring them under the influence of the Louisiana authorities. His commercial connections at New Orleans enabled him to hold out the lure of a ready market at that port for Kentucky products, and this added greatly to the strength of the separatist movement. He neutralized the intrigues of certain British agents who were then working in Kentucky. For these various services he received until 1800 a substantial pension from the Spanish authorities, being officially known in their correspondence as “Number Thirteen.” At the same time he worked actively against the Spanish authorities, especially through Philip Nolan. Wilkinson's ventures were not as lucrative as he hoped for, and in October 1791 he was given a lieut.-colonel's commission in the regular army, possibly, as a contemporary suggested, to keep him out of mischief. During this year he took an active part in the minor campaigns which preceded General Arthur St Clair’s disastrous defeat by the Indians. As brigadier-general (from March 1792) and second in command, he served under General Anthony Wayne in the latter's successful campaign of 1794 against the Indians, and in this campaign he seems to have tried to arouse discontent against his superior among the Kentucky troops, and to have intrigued to supplant him upon the reduction of the army. Upon Wayne's death in 1796, Wilkinson became general in command of the regular army, retaining his rank as brigadier and likewise his Spanish pension. He seems to have tried to stir up both the Indians and the Spaniards to prevent the survey of the southern boundary of the United States in 1797 and 1798, and in delaying Commissioner Andrew Ellicott for several months in this important task. At the same time his protégé, the philibuster Philip Nolan, was engaged in a recognition for him west of the Mississippi. In 1803 Wilkinson was one of the commissioners to receive Louisiana from France, and in 1805 became governor of that portion of the Purchase above the 33rd parallel, with headquarters at St Louis. In his double capacity as governor of the Territory and commandant of the military department, he tried to put down the social discontent among the Indians and the Spanish hold on Jefferson, and favoured the establishment of the frontier remote from the centre of government, he attempted to realize his ambition to conquer the Mexican provinces of Spain. For this purpose in 1805 he entered into some sort of agreement with Aaron Burr, and in 1806 sent Z. M. Pike to explore the most favourable route for the conquest of the south-west. Before his agent returned, however, he had betrayed his colleague's plans to Jefferson, formed the Neutral Ground Agreement with the Spanish commander of the Texas frontier, placed New Orleans under martial law, and apprehended Burr and some of his alleged accomplices. In the ensuing trial at Richmond the prisoners were released for lack of sufficient evidence to convict, and Wilkinson himself emerged with a much damaged reputation. He was then subjected to a series of courts-martial and congressional investigations, but succeeded so well in hiding traces of his duplicity that in 1812 he resumed his military command at New Orleans, and in 1813 was promoted major-general and took possession of Mobile. Later in this year he made a most miserable fiasco of the campaign against Montreal, and this finally brought his military career to a dismal end. For a time he lived upon his plantation near New Orleans, but later appeared in Mexico City as an applicant for a land grant. incidentally acting as agent for the American Bible Society. Here on the 28th of December 1825 he succumbed to the combined effects of climate and of opium.

WILKINSON, JAMES JOHN GARTH (1812-1869), Swedeborgian writer, the son of James John Wilkinson (died 1848), a writer on mercantile law and judge of the County Palatine of Durham, was born in London on the 3rd of June 1812. He studied medicine, and set up as a homoeopathic doctor in Wimpole Street in 1834. He was early attracted by the works of William Blake, whose Songs of Experience he endeavoured to interpret, and of Swedenborg, to the elucidation of whose writings he devoted the best energies of his life. Between 1840 and 1850 he edited Swedenborg's treatises on The Doctrine of Charity, The Animal Kingdom, Outlines of a Philosophical Argument on the Infinite, and Hieroglyphic Key to Natural and Spiritual Mysteries. Wilkinson's preliminary discourses to these translations and his criticisms of Coleridge's comments upon Swedenborg displayed a striking aptitude not only for mystical research, but also for original philosophic debate. The vigour of his thought won admiration from Henry James (father of the novelist) and from Emerson, through whom he became known to Carlyle and Froude; and his speculation further attracted Tennyson, the Ophelians and Edward Maitland. He wrote an able sketch of Swedenborg for the Penny Cyclopaedia, and a standard biography, Emanuel Swedenborg (published in 1849); but interest in this subject fell from exhausted his interest in other kinds of energy and work. He was a traveller, a linguist, well versed in Scandinavian literature and philology, the author of mystical poems entitled Improvisations from the Spirit (1857), a social and medical reformer, and a convinced opponent of vivisection and also of vaccination. He died at Finchley Road, South Hampstead, where he had resided for nearly fifty years, on 18th October 1890. He is commemorated by a bust and portrait in the rooms of the Swedishborgian Society in Bloomsbury Street, London.

WILKINSON, JOHN (1728-1808), "the great Staffordshire iron-master," was born in 1728 at Clifton, Cumberland, where his father had risen from day labourer to be overlooker in an iron furnace. A box-iron, patented by his father, but said to have been invented by the son, helping laundresses to grapple the grated steel of the dandies of the day, was the beginning of his fortunes. This they made at Blackbarrow, near Furness. When he was about twenty, John moved to Staffordshire, and built, at Bilston, the first furnace there, and, after many experiments, succeeded in utilizing coal instead of wood-charcoal in the smelting process. Wilkinson, who now worked at Bersham, near Chester, was again joined by his son, who constructed a new boring machine, of an accuracy heretofore unequalled. James Watt found that the work of this machine exactly filled his requirements for his "fire-engine" for cylinders bored with greater precision. Wilkinson, who now owned the Bersham works, resolved to start the manufacture of wrought iron at Roseley on a larger scale, and the first engine made by Boulton and Watt was for him to blow the bellows there. Herefore bellows were worked by a water wheel or, when power failed, by horses. His neighbours in the borough were contemplating installing Newcomen engines, waited to see how his would turn out. Great care was taken in all its parts, and Watt himself set it up early in 1776. Its success made the reputation of Boulton and Watt in the Midland counties. Wilkinson now found he had the power alike for the nearest and the most stupendous operations. The steam cylinder suggested to him the plan of producing blast now in use. He was near coal; he surrounded himself with capable men, whom he fully trusted; he made a good article, and soon obtained large orders and prospered. In 1786 he was making 24-pounders, howitzers, swivels, mortars and shells for government. The difficulty of getting barges to carry his war material down the Severn led him, in 1787, to construct the first iron barge—creating a wonderful sensation among owners and builders. Wilkinson taught the French the art of boring cannon from the solid, and cast all the
tubes, cylinders and iron work required for the Paris water-works, the most formidable undertaking of the day. He also erected the first steam engine in France, in connexion with these works.

Wilkinson is said to have anticipated by many years the introduction of the hot blast for furnaces, but the leathern pipes, then used, scorched, and it was not a success. His were the first coal-cutting machines. He proposed and cast the first iron bridge. It connected Broseley and Madeley, across the Severn, and its span of 100 ft. 6 in. was considered a triumphal wonder. Wilkinson was now a man of great means and greater influence. He issued tokens of copper, bearing his likeness and on the reverse a forge and tools of the trade, silver coins for 3s. 6d., and also pound notes, as other tradesmen of that day did. He never wrote a letter without using the word iron, indeed he was ironmad, and provided by will that he should be buried in an iron coffin, preferably in his garden at Castle Head, near Lindal. He died on the 14th of July 1808.

Wilkinson was twice married without issue. His very large property was frittered away during a lawsuit brought by a nephew against the illegitimate child of whom he had named as his heir. It was carried from various courts in the kingdom to the House of Lords and then to the Court of Chancery. Here Lord Eldon decided for the defendants, thus reversing all previous decisions taken upon the law of the case.

WILKINSON, SIR JOHN GARDNER. (1797–1873). English traveller and Egyptologist, was born on the 5th of October 1797, the son of the Rev. John Wilkinson, a well-known student of antiquarian subjects. Having inherited a sufficient income from his parents, who died when he was young, he was sent by his guardian to Harrow, in 1813, and to Exeter College, Oxford, in 1816. He took no degree, and, suffering from ill-health, went to Italy, where he met Sir William Gell, and resolved to study Egyptology. Between 1821 and 1833 he travelled widely in the Nile Valley and began to publish the results. He returned to England in 1833 for the sake of his health, was elected fellow of the Royal Society in 1834, published The Topography of Thebes and General Survey of Egypt (1835) and Manners and Customs of the Ancient Egyptians (3 vols., 1837), and on the 26th of August 1839 was knighted by the Melbourne ministry. In 1842 he returned to Egypt and contributed to the Journal of the Geographical Society an article entitled "Survey of the Valley of the Natron Lakes." This appeared in 1843, in which year he also published an enlarged edition of his Topography, entitled Moseiun Egypt and Thebes, a work afterwards reissued in Murray's series. During 1843 he travelled in Montenegro, Bosnia and Herzegovina, an account of his observations being published in 1848 (Dalmatia and Montenegro, 2 vols.). A third visit to Egypt in 1848–1849 resulted in a further article in the Journal, "On the Country between Wady Halfah and Jebel Berkel" (1851); in 1855 he again visited Thebes. Subsequently he investigated Cornish antiquities, and studied zoology. He died at Llandovery on the 29th of October 1875. To his old school, Harrow, he had already in 1864 presented his collections with an elaborate catalogue.

Besides the works mentioned he published Materia Hieroglyphica (Malta, 1828); Extracts from several Hieroglyphical Subjects (1830); Topography of Thebes (1842); Moseiun Egypt and Thebes, first facsimiles of the papyrus (1851), previously edited without the writing on the back of the papyrus by Lepsius; Architecture of Ancient Egypt (1850); A Popular Account of the Ancient Egyptians (1854); important notes in Rawlinson's Herodotus; Colour and Taste (1858); articles in archaeological and scientific periodicals.

WILKINSON, TATE (1730–1803). English actor and manager, was born on the 27th of October 1730, the son of a clergyman. His first attempts at acting were badly received, and it was to his wonderful gift of mimicry that he owed his success. His imitations, however, naturally gave offence to the important actors and managers whose peculiarities he hit off to the life. Garrick, Peg Woffington, Samuel Foote and Sheridan, after being baulked in the imitations, received for some time the most angry, when it came to their turn, and threatened never to forgive him. Garrick never did. As an actor, Wilkinson was most successful in Foote's plays, but his list of parts was a long one. In Shakespearian characters he was very popular in the provinces. In 1766 he became a partner of Joseph Baker in the management of several Yorkshire theatres, and sole manager after his partner's death in 1770 of these and others. In this capacity he was both liberal and successful. He died on the 10th of November 1803. See his Memoirs (4 vols., 1790) and The Wandering Patenter (4 vols., 1795).

WILL in philosophy. The "Problem of Freedom" provides in reality a common title under which are grouped difficulties and questions of varying and divergent interest and character. These difficulties arise quite naturally from the obligation, which metaphysicians, theologians, moral philosophers, men of science, and psychologists alike recognize, to give an account, consistent with their theories, of the relation of man's power of deliberate and purposive activity to the rest of the universe. In the main, no doubt, the problem is a metaphysical problem, and has its origin in the effort to reconcile that belief in man's freedom which is regarded by the unsophisticated moral consciousness as indisputable, with a belief in a universe governed by rational and necessary laws. But the historical origin of the questions at issue is to be sought rather in theology than in metaphysics, while the discovery made from time to time by men of science of the inapplicability of natural laws or modes of operation (which they have been accustomed to regard as of universal range and necessity) to the facts or assumed facts of human activity, is a constant source of fresh discussions of the problem. Similarly the modern attempt upon the part of psychology to analyze (under whatever limitations and with whatever object of inquiry) all the forms and processes of human consciousness has inevitably led to an examination of the consciousness of human freedom: while the postulate of most modern psychologists that conscious processes are not to be considered as removed from the sphere of those necessary causal sequences with which science deals, produces, if the consciousness of freedom be admitted as a fact of mental history, the old metaphysical difficulty in a new and highly specialized form.

There is some ground nevertheless for maintaining, contrary to much modern opinion, that the controversy is fundamentally and in the main a moral controversy. It is true that the precise relation between the activities of human wills and other forms of activity in the natural world is a highly speculative problem and one with which the ordinary man is not immediately concerned. It is true also that the ordinary moral consciousness accepts without hesitation the postulate of freedom, and is unaware of, or imperfectly acquainted with, the speculative difficulties that surround its possibility. Moreover, much work of the highest importance in ethics in modern as well as ancient times has been completed with but scanty, if any, reference to the subject of the freedom of the will, or upon a metaphysical basis compatible with most of the doctrines of both the rival theories. The determinist equally with the libertarian moral philosopher can give an account of morality possessing internal coherence and a certain degree of verisimilitude. Yet it may be doubted (1) whether the problem would ever have arisen at all except for the necessity of reconciling the theological and metaphysical hypotheses of the omnipotence and omnipotence of God with the needs of a moral universe: and (2) whether it would retain its perennial interest if the incursions of modern scientific and psychological inquiry into the domain of human consciousness did not appear to come into conflict from time to time with the presumptions of morality. The arguments proceeding from either of the disputants by means of which the controversy is debated may be largely or almost wholly speculative and philosophical. But that which produces the rival arguments is primarily a moral need. And there are not wanting signs of a revival in recent years of the earlier tendency of philosophical speculation to subordinate the necessities of metaphysical, scientific, and psychological inquiries to the prima facie demands of the moral consciousness.

There is no trace of the emergence of the problem of freedom
WILL

in any intelligible or distinct form in the minds of early Greek physicists or philosophers. Their doctrines were mainly based upon a belief in the government of the universe by some form of physical necessity, and though different opinions might prevail as to the mode of operation of the various forms of physical necessity the occasional recognition of non-material causes voluntary causes were not amounted to a recognition of the independence of human volition or intelligence. Nor can it be seriously maintained that the problem of freedom in the form in which it is presented to the modern mind ever became the subject of debate in the philosophy of Socrates, Plato or Aristotle. It is true that Socrates brought it into prominence the moral importance of rational and intelligent conduct as opposed to action which is the result of unintelligent caprice. Moral conduct was, according to Socrates, the result of knowledge while it is strictly impossible to do wrong knowingly. Vice, therefore, is the result of ignorance and to this extent Socrates is a determinist. But the subsequent speculations of Aristotle upon the extent to which ignorance invalidates responsibility, though they seem to assume man's immediate consciousness of freedom, do not in reality amount to very much more than an analysis of the conditions ordinarily held sufficient to constitute voluntary or involuntary action. The further question whether the voluntary acts for which a man is ordinarily held responsible are really the outcome of his freedom of choice, is barely touched upon, and most of the problems which surround the attempt to distinguish between moral and natural causes or the moral by causation and caprice or chance are left unsolved. For Aristotle remained content with a successful demonstration of the dependence of "voluntariness" as an attribute of conduct upon knowledge and human personality. And though ultimately the attribution of responsibility for conduct is further limited to actions which are the result of purposive choice (προσωπείας), Aristotle appears to waver between a view which regards προσωπείας as involving an ultimate choice between divergent ends of moral action and one which make it consist in the choice of means to an end already determined. A similar absence of discussion of the main problem at issue is noticeable in Plato. It is true that in a famous passage in the tenth book of the Republic (x. 617 ff.) he seems to make human souls responsible through their power of choice for the destitutes which they meet with during their respective lives. But, as with Socrates, their power of making a right choice is limited by their degree of knowledge or of ignorance, and the vexed question of the relation of this determining intelligence to the human will is left unsolved. With the Stoic and Epicurean philosophies the problem as it shapes itself for the consideration of the modern world begins with clearer outlines. Stoic loyalty ever amounted to a recognition of the independence of human volition or intelligence. Nor can it be seriously maintained that the difficulty of reconciling a belief in human freedom with a belief in the Divine government of the world became apparent to its fullest extent. The Christian doctrine of the Creation at once challenges the pantheistic presuppositions of Hellenic thought and reinforced the belief already existing in will as a real cause. At the same time the dualism involved in the simultaneous acceptance of an optimistic account of the origin and nature of the universe (such as is implied in Christian theology) and a belief in the reality of moral evil witnessed to by the Christian doctrine of Redemption, intensified the difficulties already felt concerning man's responsibility and God's omnipotence. Neoplatonic philosophy had been in the main content either to formulate the contradiction or to deny the reality of one of the opposing terms. And traces of Neoplatonic influence, more especially as regards their doctrine of the unreality of the material and sensible world, are to be found everywhere in the Christian philosophers of Alexandria, preventing or impeding their formulation of the problem of freedom in its full scope and urgency. St Augustine was, perhaps, the first thinker to face, though not to solve, the true theological and moral difficulty inherent in Christian thought. Two lines of thought are to be traced in the most implacable hostility and contradiction throughout his system. On the one hand no Divine Grace, which be cause it is in no instance deserved, can be attributed to the reality of individual freedom with humanity's universal need of redemption and with the absolute voluntariness of Divine Grace, he is constrained to contradict most of those postulates of which in his advocacy of libertarianism he was an eager champion. He limits the possession of freedom to Adam, the first man, who, by abusing his prerogative, has corrupted the human race. Man as he now is cannot do otherwise than evil. Inherited incapacity for the choice of good is the punishment for Adam's misuse of freedom. The possibility of redemption depends upon the bestowal of Divine Grace, which be cause it is in no instance deserved, can be awarded or withdrawn without injustice. And because Adam's choice necessitates punishment it follows that in some instances Divine Grace can never be bestowed. Hence arises in Augustine's system the doctrine of Predestination (q.v.). From the theological standpoint every individual is predestined either by his natural birthright to evil or by Divine Grace to good, and the absolute foreknowledge and omnipotence of God excludes even the possibility of any initiative on the part of the individual by means of which he might influence God's timeless choice. The medieval treatment of the problem follows in the main Augustinian or Aristotelian traditional lines of thought, though successive thinkers arrive at very diverse conclusions.

Thomas Aquinas, for example, develops the Platonic argument which proves the dependence of the will upon the intellect and makes the identification of morality with knowledge. Freedom exists for Thomas, if it exists at all, only as the power of choosing what is necessarily determined by the intellect to be choice-worthy, the various possibilities of choice being themselves presented by the understanding to the will. And though in a certain sense Divine foreknowledge is compatible upon his view with human freedom, the freedom with which men act is itself the product of Divine determination. Man is predetermined to act freely, and Divine foreknowledge foresees human actions as contingent. Duns Scotus on the other
hand is the great champion of indeterminism. Upon his view the intellect must always be subordinate to the will, and to the will belongs the power of complete self-determination. Morality in effect—to such an extreme position is he driven in his opposition to the Thomists—becomes the arbitrary creation of the Divine Will and in no sense depends for its authority upon rational principles or is a form of knowledge.

The modern treatment of the problem from Descartes, Hobbes, Spinoza and Leibnitz down to Kant is too much inwoven into the metaphysical systems of individual great philosophers to afford the possibility of detailed treatment in the present article. Reference should be made either to the individual philosophers themselves or to articles on metaphysics or on ethics. Hobbes is the great exponent of materialistic determinism. Ideals and volitions are upon his view ultimately movements of the brain. Will is identified with appetite or fear, the causes of which are to be found only in the external world. Descartes advocates a kind of freedom which is apparently consistent with forms both of determinism and indeterminism. He explains the possibility of evil in the world by the mind possessing the libertas arbitrium indifferen
tiatae and can always refuse to affirm the truth of a conclusion drawn from premises which are not self-evident. And even when the presentations before the mind are so clear that assent to their truth cannot be refused, the possibility of assenting still rests with the will, which can refuse to attend to any presentation, or can refuse assent with the sole motive of proving its freedom. Spinoza is a convinced determinist regarding the will as necessarily determined by ideas.

Extension, i.e. the spatial world, and the world of consciousness are alike attributes of the one substance which can only be called free in the sense of being determined by nothing but itself. Freedom in the moral sphere consists simply in the control of the passions by reason. Leibnitz retains this attenuated belief in moral freedom and combines it with a belief in the spontaneity of moral agents in the sense that they possess the power of acting and need no other principle of action save the laws of their own natures. But inasmuch as the agreement between the acts of Leibnitz's monads is due to a divine pre-established harmony, and the theoretical contingency which in the abstract, i.e. as logically possible in isolation, be predicated of the rage arbitrium indifferentiae, and can always refuse to affirm the truth of a conclusion drawn from premises which are not self-evident. And even when the presentations before the mind are so clear that assent to their truth cannot be refused, the possibility of assenting still rests with the will, which can refuse to attend to any presentation, or can refuse assent with the sole motive of proving its freedom. Spinoza is a convinced determinist regarding the will as necessarily determined by ideas.

many if not most of the assured conclusions of the physical sciences.

As regards the first of these two main contentions, it must suffice here to point out the main difficulties—in which a determinist and especially materialist account of the relation between consciousness and the unconscious processes which accompany it appears to be involved.

The arguments of thorough-going materialism can in most cases be met with a direct negative. No kind of evidence can be adduced sufficient to prove that consciousness is a secretion of the brain, an effect or even a consequent of material processes or modes of motion. No direct causal relationship between a molecular movement and a state of consciousness has ever been established. No physiologist has ever claimed the power to prophesy with any approach to accuracy the future mental states of any individual from an examination of the brain. And, though some kind of correspondence between the physical and conscious series of states has been observed and is commonly taken for granted in a number of instances, proof that entire correspondence exists is still wanting, and the precise kind of correspondence is left undetermined. Nevertheless, the belief that material processes must be held sufficient to account for material changes in the human organism as in all other regions of the material world, can be held quite independently of any particular theory as to the relation between mind and body, and in many of its forms is equally destructive of a belief in the freedom of the will. It is a belief of a truly metaphysical character, and is increasing in vogue in modern science. The theory of psychophysical parallelism involves no doubt in the minds of the majority of its upholders the further assumption of some unity underlying both the physical and psychological series which may one day be discovered to be susceptible of scientific expression and interpretation. Certainly without some such assumption the hypothesis of an exact correspondence between the series described as parallel becomes, as Professor Ward has shown, unmeaning. And many scientific thinkers, while professing allegiance to a theory which insists upon the independence of each parallel series, in reality tacitly assume the superior importance if not the controlling force of the physical over the psychological terms. But a mere insistence upon the complete independence of the physical series coupled with the belief that its changes are wholly explicable as modes of motion, i.e. that the study of molecular physics is competent to explain all the phenomena of life and organic movements, is sufficient to eliminate the possibility of spontaneity and free origination from the universe. For if consciousness be looked upon as simply an epiphenomenon, an accountable appearance accompanying the actual material changes, the possibility either of active interference by human volition at any point within the physical series or of any controlling or directing efficacy of consciousness over the whole set of material changes which accompany its activity becomes unthinkable. There are, nevertheless, serious difficulties involved in the supposition that the changes in the brain with which physiology and the biological sciences deal can be satisfactorily explained by the mechanical and mathematical conceptions common to all these sciences, or, indeed, that any of these organic changes is susceptible in the last resort of explanation derived from purely mechanical premises. The phenomena of life and growth and assimilation have not been satisfactorily explained as mechanical modes of motion, and the fact that identical cerebral movements have not been discovered to recur makes scientific and accurate prediction of future cerebral changes an impossibility. But more convincing than most of the philosophical arguments by which the theories of psychophysical parallelism have been assailed is the fact that it runs counter to the plain evidence of the ordinary consciousness. No matter to what extent the unphilosophical thinker may be under the influence of materialistic presuppositions, he is always recoils from the conclusion that the facts of his mental life have no influence upon his physical movements. Meaning, design and purpose are to him terms far more explanatory of his movements in the outer world than the mechanical and mathematical equivalents to which his actions will ultimately be reduced if the sciences should achieve their avowed purpose. To regard himself as a conscious automaton he can never be persuaded. Further, he finds in the series of antecedents and consequents capable of mathematical and spatial determination, which certain men of science present to him as their final account of his physical and psychological history, no real explanation of the facts: he is far more inclined to look for an explanation of the efficacy of causal changes in the categories of will and purpose for which they are a substitution.

Nor, finally, is the last defensive position of scientific determinism—the theory, namely, that the freedom of the will is incompatible with the doctrine of the conservation of energy—to be accepted without question. That doctrine, if it is to possess cogency as a proof of the impossibility of the libertarian position, must assume that the amount of energy sufficient to account for physical and psychological changes is constant and invariable in quantity, an assumption which no scientific investigator is competent to prove. A regulative principle which may possess great value when applied and confined to the comparatively abstract material of the mathematical and quasi-mathematical sciences is highly dangerous if extended to the investigation of living bodies. "In its present form, and since the development of the mechanical theory of heat, the principle of the conservation of energy certainly seems to apply to the whole range of physico-chemical phenomena. But no one can doubt that in the series of nervous phenomena in particular, will not reveal to us, besides the "vivis" or kinetic energy of which Leibnitz spoke, and the potential energy which was a later and necessary adjunct, some new kind of energy which may differ from the other two by rebelling against calculation" (Bergson, Time and Free Will, Eng. trans. by F. L. Pogson, pp. 151, 152.)

It is, however, from the development of the scientific study of psychology more than from any other region of thought that light has been thrown upon the problem of freedom. The determinists (or the phenomena of decision) have always recoiled from the application of the causal conceptions of modern science to mental phenomena) have in many instances in no way retarded the utilization of new information concerning mental processes in order to prove the reality of freedom. Bergson is perhaps the most notable instance of a philosopher fully conversant with psychological studies and methods who remains a convinced libertarian. But the contribution made by psychology to the solution of the problem has taken the form not so much of a direct reinforcement of the arguments of either of the opponent systems, as of a searching criticism of the false assumptions concerning conative processes and the phenomena of choice common alike to determinists and libertarians. It has already been pointed out that the problem as it presented itself to utilitarian philosophers could lead only to a false solution, depending as it did upon a wholly fictitious theory as to the nature of desire. There are still many traces to be found in modern psychology of a similar unreal identification of desire with will. But, nevertheless, the new light thrown upon the unity of the self and the more careful and accurate scrutiny of certain psychological systems, as of a searching criticism of the false assumptions concerning conative processes and the phenomena of choice common alike to determinists and libertarians. It has already been pointed out that the problem as it presented itself to utilitarian philosophers could lead only to a false solution, depending as it did upon a wholly fictitious theory as to the nature of desire. It has already been pointed out that the problem as it presented itself to utilitarian philosophers could lead only to a false solution, depending as it did upon a wholly fictitious theory as to the nature of desire. There are still many traces to be found in modern psychology of a
supposition that self-conscious moral action could be explained by the use of the same categories and upon the same hypotheses usually considered sufficient to explain the causal sequences observable in the physical world. Conduct was regarded as the result of interaction between character and environment; or it was asserted to be the resultant effect of a struggle between motives in which the strongest prevailed. And the libertarian critic had before him a comparatively easy task when he exhibited the complete interdependence of character and environment, or rather the impossibility of treating either as definite, ever, it be argued by libertarians that no explanation is possible of the manner in which the self or the will makes its decisions and inclines to this motive or to that, while they still assert the independent existence of the self or will, then they are undoubtedly open to the retort of their opponents that upon such a theory no rational explanation of conduct will be possible. For to regard a particular decision as the effect of the "fiat" of a self or will unmotivated and unintentioned by the idea of a future object of attainment seems to be equivalent to the simple statement that the choice was made or the decision taken. Such a theory can prove nothing either for or against the possibility of freedom. Moreover, many of the arguments by which the position of rigid libertarians of the older school has been proved untenable have been advanced by moral philosophers, and by thinkers not always inclined to regard psychology with complete sympathy. The doctrine of self-determination, advocated by T. H. Green and idealist writers of his school, has little or nothing in common with the doctrine that the self manifests its freedom in unmotivated acts of will. The advocates of self-determination maintain that conduct is never determined, in the sense in which, e.g. movements in the physical world are determined, because man in virtue of his self-consciousness has a power of distinguishing himself from, even while he identifies himself with, a purely natural object of desire; and this must always make it impossible to regard him as an object governed by purely natural forces. Consciousness and especially self-consciousness, can never be explained upon hypotheses adequate only to explain the blind working of the unconscious world. But the insistence of idealist writers upon the relation of the world of nature to conscious intelligence, and especially to a universal consciousness realizing itself throughout the history of individuals, rendered it alike impossible to deny altogether some influence of environment upon character, and to regard the history of individual willing selves as consisting in isolated and unconnected acts of choice. Self-consciousness, if it be conceived as distinguishing itself from its past history or from the natural world, must be conceived also as in some sense related to the empirical self which has a history in time and to the natural organism in which it finds a home. It is the precise mode of this relation which idealist philosophers leave obscure.

Nor is that obscurity to any appreciable degree illuminated by the tendency also noticeable in idealist writers to find the true possession of freedom only in a self emancipated from the influence of irrational passion, and liberated by knowledge from the dominion of chance or the despotism of unknown natural forces. Here also psychology, by its elucidation of the important part which instinctive appetites and animal impulses play in the development of intelligence, still more perhaps by arguments (based largely upon the examination of hypnoid subjects or the phenomena of fixed ideas) which show the permanent influence of irrational or semi-rational suggestions or habits upon human conduct, has opened a way to andabet idealists in their contentions. It cannot in fact be denied that from one point of view human freedom is strictly relative, a possession to be won only after painful effort, exhibiting itself in its entirety only in supreme moments when the self is unswayed by habit, and out of full knowledge makes an individual and personal choice. Ideal freedom will be the supreme achievement of a self completely moralized. But the process by which such freedom is eventually to be gained must, if the prize is to be secured, the having itself, exhibit the gradual development of a self which, under whatever limitations, possesses the liberty of choice in its early stages as in its latest. And no theory which limits the exercise of freedom to the choice only of what is strictly good or rational can avoid the imputation of destroying man's responsibility for the choice of evil.

But the most important point at issue between the opposing theories has remained throughout the history of the controversy, the morality or immorality of their respective solutions of the problem. The advocates of either theory must in the last resort appeal to the direct evidence of the moral consciousness. It remains to give a brief sketch of the arguments advanced on either side.

It has always been maintained by convinced libertarians that without a belief in the freedom of the will morality becomes unmeaning (see Determinism). Moreover, without a belief in the freedom of the will the conception of moral obligation upon which the existence of morality depends and from which all other moral terms derive their meaning loses its chief significance. What is opposed to obligation, or at least always distinguished from it, is that very domain of necessity within which determinism would bring the will, for even when the felt obligation is absolute, where the will is completely moralized, where it is inconceivable in the case of a good man that the act which he performs should be other than it is, there the obligation which he recognizes is an obligation to choose autonomously, and as such is distinguished from desire or appetite or any of the other alleged determinants of action. If the question be asked "Where is the evidence for this alleged freedom to choose between alternatives?" the appeal is always made to the witness of the moral consciousness itself. No one, it is said, who ever feels remorse for the commitment of a wrong act can honestly avoid the admission that at the moment when the act was committed he could have acted otherwise. No one at the moment of action is ever aware that his will is being necessitated. What he is clearly conscious of is the power to choose. Any proof, in the scientific sense, that a man's acts are due to his power of free initiative would be from the nature of the case impossible. For, inasmuch as scientific proof depends upon the evidence of causality, such efforts after scientific demonstration would end only by bringing either the man's whole personality or some element in it within the sequence of the chain of natural causes and effects, under the domination of that natural necessity from which as a conscious being he is free. The science of morality must be content in its search for causes to recognize the rationality of choice as a real determining agent in human affairs. And no account of the psychology of human action which regards conduct as due to self-determination, but leaves open the question whether the self is free to choose is, so it is argued, capable of providing an adequate theory of the admitted facts of moral consciousness.

We must now consider the arguments by which determinists
attack the position of their opponents and the evidence which they adduce to show that the freedom of the will is no necessary prerequisite of the development of moral action, and their version of determinism of the older type—the dependence of morality upon freedom did not of necessity prove an obstacle.

Hedonistic psychology denied the libertarian hypothesis, but led also the absoluteness and intuitive character of moral obligation, and attached no validity to the ordinary interpretation of terms like "ought" and "duty." Modern determinists differ from the earlier advocates of their theory in their endeavours to exhibit at least the compatibility of morality with the absence of freedom, if not the enhancement of moral values which, according to some of its advocates, follows upon the acceptance of the deterministic account of conduct.

If a coherent theory capable of giving an explanation of the ordinary facts of morality and not involving too violent a breach with the meaning of moral terms in their accepted usage were all that need be required of determinists in order to reconcile the defenders of the moral consciousness to the loss of their belief in the will's freedom, it would follow without question that the determinists have proved their case. Neither the deterrent nor the reformatory theories of punishment (q.v.) necessitate the presence of certain motives, and that upon the application of certain incentives, whether of pain or pleasure, upon the presence of certain attributes or dispositions of character, which the show that actions of a character will necessarily ensue, would seem to vindicate the rationality of ordinary penal legislation, if its aim be deterrent or reformatory, to a far greater extent than is possible upon the libertarian hypothesis. Humanitarian moralists, who hesitate to believe in the retributive theory of punishment because, as they think, its aim is not the criminal's future well-being but merely the vindication of some moral law or the satisfaction of an individual's need, have never committed, might welcome a theory which urges that the sole aim of punishment should be the exercise of an influence determining the criminal's future conduct for his own or the interests of the community. Moreover, the belief that the justice of punishment depends upon the responsibility of the criminal for his past offences and upon the moral consciousness that his previous wrong-doing was wrong, is a belief which the libertarian moralist might be willing to accept with reluctance. For whatever may have been the character of the individual in the past, it is possible upon the libertarian view that by the exercise of his freedom he has brought about in himself a complete change of character: he may be now the exact opposite in character of what he was then. Upon what grounds, therefore, shall we discriminate between the social value of the punishment and the punishment he received? The libertarian belief in the freedom of the will, the criminal need never have committed, might welcome a theory which urges that the sole aim of punishment should be the exercise of an influence determining the criminal's future conduct for his own or the interests of the community.

Remorse.

It might, however, be thought that whatever be the compatibility of theories of punishment or the activity of the state as a moralizing agency with determinism, to reconcile the denial of freedom with a belief in the reality of remorse or penitence, it is the determinism—its tendency on the part of modern determinists to evade the difficulty. They argue with considerable cogency that determinism is very far from affording any ground for believing in the impunity of will. The belief in the determinism of character in the future may be as yet unanalysed and ununderstood, but the fact can exist introspective analysis the hidden elements in his personality. The existence of the feelings of remorse and penitence testifies to the presence in the man of the same elements of character which, if the determinism was complete and true, would have produced the opposite tendencies which once held sway. They are feelings which are incapable of coming into being at all save when coupled with the judgment: "I ought to have acted otherwise." The same tendency is good concerning our feelings with regard to the justice or injustice of punishing a criminal if we believe that his will was determined. It may be politic or expedient to punish a person, even if in the opinion of his character or to deter him or others from future performance of
acts of a certain character. But even with regard to the expediency of such punishments we may have doubts. For the very argument from the undeveloped possibilities of such man's character by which the determinist proves the compatibility of his theory with the phenomenon of sudden conversion and the like is sufficient also to prove that the state of freedom before punishment have upon the individual will have the effect upon his character and conduct which it desires. It may be replied that experience makes it reasonably certain that the infliction of certain penalties will produce actual and constant modification of the moral character, and that even such inflictions upon conduct may be established as reasonably probable by induction. But when the data are admittedly so uncertain is a valid inductive argument of such a character possible? And even if it were what would be its bearing upon the just or unjust doctrine of inflicting punishments at all? The unsophisticated moral consciousness will still consider it unjust to punish a man for deeds of which he could not avoid the performance, and regard the alleged desire to produce in his future life consequences favourable to himself or society as beside the mark and irrelevant to the question at issue.

At the moment of action the individual invariably regards himself as free to choose between alternatives. This immediate consciousness of freedom persists upon another occasion even though subsequent reflection upon conduct should lead the individual to regard himself as determined at the very moment when he was aware of himself as free. It is this immediate consciousness of the power of choosing between alternatives which the determinist, finds so difficult to explain. He may regard it as an illusion, and attempt to prove the incompatibility of our consciousness of freedom with the facts of existence and the nature of the world. But, in ordinary cases of illusion, once let the reason for the illusion be discovered and there is no longer the possibility of our being longer deceived. The phenomena which deceived us may continue to persist, but they no longer persist as illusion: the appearance which deceived us is seen in its true nature, even though it should still retain those characteristic marks or signs of reality which hitherto we regarded as significant of a nature which we no longer believe it to possess. But can it be maintained that the same truth holds good of our consciousness of freedom? Is it possible to hold that determinist arguments are of so convincing a character as to enable us to perceive at the moment of action the untrustworthy nature of our consciousness of freedom and to grasp beneath the appearance the underlying necessity which rules our wills? Our actual consciousness of freedom is not seriously disputed. And though reflection upon conduct may lead us to suppose that our past acts were determined, that desire of pleasure or the wish to avoid pain controlled our wills, the unphilosophical observer interprets, in offenders against morality, such arguments as a mere excuse. Moreover, remorse and penitence are witnesses in the wrongdoer to the truth of the interpretation. On the other hand we have no such immediate consciousness of the necessity which is said to control our wills. We sharply distinguish that freedom which is the prerogative of human action from the necessary causation discoverable in nature. Within the domain of consciousness introspective analysis is unable to discover those chains of necessary sequences which it is the province of science to investigate in the physical world. And until the determinist can successfully explain to us how in a world obeying throughout its history necessary laws and limited in its nature to the exhibition of causal sequences the consciousness of freedom could ever have arisen, we may be content to trust the immediate affirmation of our moral selves.

WILL

WILL, or Testament, the legal documentary instrument by which a person regulates the rights of others over his property or family after his death. For the devolution of property not disposed of by will, see Inheritance, Intestacy. In strictness "will" is a general term whilst "testament" applies only to dispositions of personalty; but this distinction is seldom observed. The word will applies to any disposition by will, familiar as it is in modern England, is by no means so, in fact, complete freedom is the exception rather than the rule. Legal systems which are based upon Roman law, such as those of Scotland and France, allow the whole property to be alienated only where the deceased leaves no widow or near relatives. In France this restriction has met with condemnation from eminent legal and economical authors. R. T. Troplong, for instance, held that "un peuple n'est pas libre, s'il n'a pas le droit de tester, et la liberté du testament est la plus grande preuve de la liberté civile." 1

History.—The will, if not purely Roman in origin, at least owes to Roman law its complete development—a development which in most European countries was greatly aided at a later period by ecleesiastics versed in Roman law. In India, accordingly, better opinions were discovered, and the alleged desire to produce in his future life consequences favourable to himself or society as beside the mark and irrelevant to the question at issue.

At the moment of action the individual invariably regards himself as free to choose between alternatives. This immediate consciousness of freedom persists upon another occasion even though subsequent reflection upon conduct should lead the individual to regard himself as determined at the very moment when he was aware of himself as free. It is this immediate consciousness of the power of choosing between alternatives which the determinist, finds so difficult to explain. He may regard it as an illusion, and attempt to prove the incompatibility of our consciousness of freedom with the facts of existence and the nature of the world. But, in ordinary cases of illusion, once let the reason for the illusion be discovered and there is no longer the possibility of our being longer deceived. The phenomena which deceived us may continue to persist, but they no longer persist as illusion: the appearance which deceived us is seen in its true nature, even though it should still retain those characteristic marks or signs of reality which hitherto we regarded as significant of a nature which we no longer believe it to possess. But can it be maintained that the same truth holds good of our consciousness of freedom? Is it possible to hold that determinist arguments are of so convincing a character as to enable us to perceive at the moment of action the untrustworthy nature of our consciousness of freedom and to grasp beneath the appearance the underlying necessity which rules our wills? Our actual consciousness of freedom is not seriously disputed. And though reflection upon conduct may lead us to suppose that our past acts were determined, that desire of pleasure or the wish to avoid pain controlled our wills, the unphilosophical observer interprets, in offenders against morality, such arguments as a mere excuse. Moreover, remorse and penitence are witnesses in the wrongdoer to the truth of the interpretation. On the other hand we have no such immediate consciousness of the necessity which is said to control our wills. We sharply distinguish that freedom which is the prerogative of human action from the necessary causation discoverable in nature. Within the domain of consciousness introspective analysis is unable to discover those chains of necessary sequences which it is the province of science to investigate in the physical world. And until the determinist can successfully explain to us how in a world obeying throughout its history necessary laws and limited in its nature to the exhibition of causal sequences the consciousness of freedom could ever have arisen, we may be content to trust the immediate affirmation of our moral selves.

1 This is practically in accordance with the definition of Modestin in Digest xxvii. 1, 1, "voluntas nostrae justa sententia de eo quid post mortem suam fieri velit.

2 Traité des donations entre-vifs et des testaments (1655), pref. p. 2; also Lunn, chap. vi.

ii. 101.
The effect of these acts was to make lands held in fee simple desivable by will in writing, to the extent of two-thirds where the tenure was by knighthood, and to the whole where the tenure was by tenure in capite. A will was not necessarily void if the testator was incapacitated to receive, and married women, infants, idiots and lunatics to devise. An act of 1660, by abolishing tenure by knighthood, made all lands desivable. In the same reign the Statute of Frauds, 23 Eliz. c. 1, dealt with the matters of this nature. Where a party wished to prove that a will was made 1751-1752, making interested witnesses sufficient for the due execution of the will, but declaring gifts to them void. The will of a man was revoked by marriage and the birth of a child, of a woman by marriage only. A will was revoked by a legal and a personal act, and even by a void conveyance in manus only devised by the will made subsequently to the date of the will, which was presumed to be an attempt by the grantor to give legal effect to a change of intention. As in Roman law, a will spoke from the time of the making, so that it could not avail to pass after-acquired property without reprobation, which was equivalent to making a new will. Copious grounds were not devised of 1815, which were surrendered to the use of the will of the copyhold tenant; an act of 1815 made them devisable simply. Devises of lands have gradually been made liable to the claims of creditors by a series of statutes beginning with the 

**WILL**

early as Constantine, and heretics—and mons were placed under a disability to make a will or take gifts left by will. A will was often deposited in a church. The canon law was the groundwork of the Church. No Church property could be bequeathed. Manifest usurers were added to the list of those under disability. For the validity of a will it was generally necessary, according to the law of pius causas. The witnesses, as in Roman law, must be idonei. Gifts to the Church were not subject to the deductions in favour of the heir and administration. There is no distinct. The will must stand or fall as a whole. This is not the case in England. The wills in English to whom the universitas juris of the testator descends as it did to the Roman heres, whose appointment was in the Church. The death of the English heir, executor, administrator, devisee and legatee. The disabilities of testators differed in the two systems. The disability of a slave or a heretic is peculiar to Roman law. The disability of the English heir, executor, administrator, devisee and legatee. The whole property may be disposed of in England; but it was not so at Rome, where, except the wills of soldiers, children could not be disinherited unless for specific acts of negligence. The whole property of Roman law is that of a male heir, and the English inheritance. The he must also have had his Falcidian fourth in order to induce him to accept the inheritance. In English law all wills must be conform to certain statutory requirements; the Romans recognized from the time of Augustus an informal will called *codicilli*. The English codicil has little in common with this but the name. It is not an informal will, but an addition to a will, read as a part of it, and needing the same formalities of execution. The Roman *legatus* applied to both movables and immovables; in England a legacy or bequest is a gift of personality only, a gift of real estate being called a devise. The Roman will spoke from the time of making; the English will speaks from the time of death. The one case becomes in the case of alteration in the position of the testator between the making of the will and his death. As a rule the Roman will would not, the English can, pass after-acquired property. Liberty of alienation by will is found at an early period in England. To follow the words of a law of Canute, intestacy appears to have been the exception at that time. How far the liberty extended is uncertain; generally it is the opinion of some authorities that complete disposition of land and goods was allowed, of others that limited rights of wife and children were recognized. However this may be, after the Conquest a distinction, the distinction of *frontal* and *adjoined*, arose between real and personal property. It will be convenient to treat of the history of the two kinds of will separately.

The law after the Conquest, according to Sir E. Coke, 1 that no estate greater than for a term of years could be disposed of by real. property. will, unless in Kent, where the custom of gavelkind prevailed, and in some manors and boroughs (especially the City of London), where the pre-Conquest law was preserved by special Indulgence. The reason why devise of land was not acknowledged by law was, no doubt, partly to discourage deathbed gifts in mortmain, a view supported by Glanvill, partly because the testator could not give the devisee that seisin which was the principal element in a feudal conveyance. By means of the doctrine of uses, however, the devise of land was secured by a circuitous method. The voluntary committee of the testator in favor of the non-estates, arose between real and personal property. It will be convenient to treat of the history of the two kinds of will separately.

The law after the Conquest, according to Sir E. Coke, 1 that no estate greater than for a term of years could be disposed of by will, unless in Kent, where the custom of gavelkind prevailed, and in some manors and boroughs (especially the City of London), where the pre-Conquest law was preserved by special indulgence. The reason why devise of land was not acknowledged by law was, no doubt, partly to discourage deathbed gifts in mortmain, a view supported by Glanvill, partly because the testator could not give the devisee that seisin which was the principal element in a feudal conveyance. By means of the doctrine of uses, however, the devise of land was secured by a circuitous method. The voluntary committee of the testator in favor of the non-estates, arose between real and personal property. It will be convenient to treat of the history of the two kinds of will separately.

1 Most of the law is contained in *Declarat.,* ill. 26, "De Testamentis," 2 Ancient Law, chap. vi. 3 The distinction between bequest and devise did not always exist. For instance, the Assize of Northampton, c. 4, speaks of a devise (dative) and a bequest (posse). 4 *Secular Laws,* c. 65. 5 *2 Inst. 7.* 6 Many instances of such conveyances occur in Sir Harris Nicolas' *Testamenta rustica* and in *Fifty Earliest English Wills* (1587-1639), edited by Dr. F. J. Furnivall in 1882. 7 The testamentary jurisdiction of the archdeacon's court is alluded to by Chaucer in "The Friar's Tale," but it was afterwards completely superseded by the bishop's court. 8 *Modern English Law.*—Such were the principal stages in the history of the law as it affected wills made before 1838, or proved before 1838. The principal acts now in force are the Wills Act, 1837, the amending act of 1852, the Court of Probate Act 1857, 

*Personal property.*
The earliest on the statute roll is an act of Henry III. (1265), enabling a widow to bequeath the crops of her lands. Before the Wills Act uniformity in the law had been urgently recommended by the Judicial Committee of the Privy Council. In 1870 (6 & 7 Vict. c. 50) the Lord Chancellor’s Committee was appointed; and their report† shows that at the time of its appearance there were ten different ways in which a will might be made under different circumstances.

The act of 1870 affected both the making and the interpretation of wills, and was a better foundation for the present law than anything that had been before these. All property, real and personal, and of whatever tenure, may be disposed of by will. If customary freeholds or copyholds be in the tenure of a tenant-in-chief, he may be disposed of in the court rolls. No will may be made by any person under the age of twenty-one. Every will is to be in writing, signed at the foot or end thereof by the testator or by some person in his presence and by his direction, and such signature is to be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, who are to subscribe the will in the presence of the testator. It is usual for the testator and the witnesses to sign every link of a memorandum which is a necessary proof of the incompetency of a witness. Gifts to a witness or the husband or wife of a witness are void.

Rules of interpretation or construction depend chiefly on decisions of the courts, to a smaller extent on statutory enactment. The law was gradually brought into its present condition through precedent extending back for centuries, especially decisions of the Court of Chancery, the court par excellence of construction, as distinguished from the court of probate. The court of probate did not deal unless incidentally with the meaning of the will; its jurisdiction was limited to the settlement of its terms, as appearing from the present state of the law of interpretation is highly technical. Some phrases have obtained a conventional meaning which the testators who used them probably did not dream of. Many of the judicial precedents which had gradually become established were altered by the Wills Act. These provisions of the act have since that time themselves become the subject of judicial decision. Among other provisions these are, most of them to take effect only in the absence of a contrary intention.

A residuary devise is to include estates comprised in lapsed and void devises. A general gift of the testator’s lands is to include all his lands, so far as they are registered or by construction, to be registered real or personal estate over which the testator had a general power of appointment. A devise without words of limitation is to pass the fee simple. The words “die without issue” are to mean death at any time after the time of the death of the person whose issue was named, not as before the act, an indefinite failure of issue, an estate tail being thus created. Trusts under an unlimited devise are to take the fee simple. Devises of estates tail are not to lapse if the devisee, though he pre-deceased the testator, left issue inheritable under the entail. Gifts to children or other issue leaving issue living at the testator’s death are to lapse. Rules of interpretation founded on principles of equity independent of statute are very numerous, and for them the works devoted to the subject must be consulted. Some of the more important, stated in as general a form as possible, are these. The intention of the testator is to be observed. This rule is explained by Sir E. Coke the pole star to guide the judges. There is a presumption against intestacy, against double portions, against constructing merely personal devises, and against making anything against the best interest of the persons devised, in the execution of which there may be expended another. Interlimitations and alterations are presumed to have been made after, not as in deeds before, execution. Words are supposed to be used in their strict and primary sense. Many words and phrases, however, such as “money,” “residue,” and “issue” and other words of relationship, have become invested with a technical meaning, but there has been a recent tendency to include illegitimate children in a gift to “children.” Evidence is admissible in cases of undue influence in marriage cases and the intestate as to the execution of a will. Unless “void absolute” or “the act of God” is inserted, a will on the terms of a lost will may be given as in the famous case of Sugden v. Lord St Leonards (1876), 1 Prob. Div. 154. A will in whole or in part, for many reasons, which may be divided into two great classes, those arising from extraneous circumstances and those arising from the will itself. The main examples of the former class are revocation by burning, tearing, &c., by a later will, or by marriage of the testator (except as below), incapacity of the testator from insanity, infancy or legal disability (such as being a convict), undue influence and fraud, any one of which may make the will void. A will being ambulatory is always revocable, unless in one or two exceptional instances. Undue influence is a ground upon which the courts are disposed to prevent the making of a will. It is well explained in a judgment of Lord Penzance’s: “Pressure of whatever character, whether acting on the fears or the hopes, if so exerted to overpower the volition without convincing the judgment, is a species of undue influence and may annul the will . . . .” On this point nothing corresponding to the guerella tinocticosi testamenti, but unnatural provisions may be evidence of mental defect. The circumstances appearing on the face of the will which make it open to objections are similar to those which create a presumption of fraud or incapacity, the will remaining good as a whole. Where the will is not duly executed, e.g., if it is a forgery or if it is not signed by the testator or witnesses, a number of grounds may be urged in its absence.

There are some wills of an exceptional kind which demand special notice. The King.—It was resolved in parliament in Richard II’s time, that the king, being a private person, could not be bound by his wills. The Act 1837 provides, that after the 31st of December, 1837, the king may make their testaments. In some later cases parliamentary authority has been given to royal wills, in others not. The executors of Henry IV. were confirmed in their office by letters patent of Henry V., and in a similar way the executors of Henry VI. were allowed to act after the 29th of November, 1833, under the act of 1833. The wills of Henry VIII. by an act of 1533–1534, empowering him to limit and appoint the succession to his son, were confirmed by wills made by him after his death for his future wife. By 39 & 40 Geo. III. c. 88 the king and his successor may devise or bequeath their private property. No court, however, has jurisdiction to grant probate of the will of a king. Guardian-baron.—As a general rule wills deal with property, but even at common law a will simply appointing a guardian was good. The common law was superseded by an act of 1660, under which a father may dispose of the custody of his unmarried infant children by will. The greatest modern development of this right is found in the cases to the mother. Married Woman.—At common law a married woman could not (with a few exceptions) make a will without her husband’s licence and consent, and this disability was specially preserved by the Wills Acts of Henry VIII. and of 1837. A common mode of avoiding this difficulty was for the husband to contract before marriage to permit the wife to make an appointment disposing of personal property, and it was held that such bequests were within the scope of the common law. If the marriage took place during the minority of the husband, and he was a minor at the time of the marriage, the court would decree seduction. In an action by her husband, it was held that the marriage was void or voidable on the ground of seduction. In the Naturalization Act 1870 it is provided that no law or regulation shall affect the status of a naturalized person, and the Act 1882 enables a naturalized person to make a will in England. Wills of soldiers in the service of the king, and of sailors, are subject to special legislation. The act of 1821 regulated the operation of a Wills Act. The privilege only applies to wills of personal estate. Such wills may usually be made when the testator has attained the age of fourteen, and the main conditions are, that the will is signed by the testator in the presence of two witnesses, and that it is written in English. Wills of soldiers on an expedition may be made by unattested writing or by nuncupative testament before two witnesses. Wills of petty officers and seamen in the navy, and of marines, as far as relates to their pay or prize-money, must be attested by an officer, and wills made by a seaman in the merchant service must, if made at sea, be attested by the master or mate, if made on land by a superintendent of a mercantile marine office, a minister of religion, justice of the peace, or otherwise by a person appointed by the Wills Act 1854, s. 177. The wills of prisoners of war are subject to special regulations, and the Admiralty may at its discretion waive

4 Hall v. Hall, L.K. 1 Prob. 481.
6 4 Inst. 335.
7 See the Collection of Royal Wills printed for the Society of Antiquaries by J. Nichols (1786).
the due execution of wills in other instances. The effects of seamen, marines and soldiers, killed or dying in the service, are exempt from probate: but in some provinces depending on England, when employed in the navy may be paid out without probate where the whole assets do not exceed £32. The Board of Trade may at its discretion dispense with probate of the will of a merchant seaman whose effects are left in England, while on board, under the Act of 1839. The existing exemptions are extended to the sum of £100 in the case of civil service pay or annuities, of civil or military allowances chargeable to the army voted from the civil exchequer, and to the payment of any prize money. Will made under power of appointment is revocable by will made under a power of appointment is revoked by marriage when the real or personal estate thereby appointed would not in default of appointment pass to the testator's executor or to the intestate's legal representative. Before the Wills Act 1837, exercising a power of appointment had to conform to any special provisions in the power, but since the act the power is duly exercised if executed and attested like an ordinary will. Regulation of the deceased is made by the law of the domicile of the counties in which the deceased may be registered. Member of friendly society, &c. Members of friendly, industrial and provident societies, depositors in savings banks, and servants in certain public offices, may under the provisions of numerous acts make a nomination to an amount not exceeding £100. Such nomination is practically equivalent to a will, and may be made at the age of sixteen.

At common law there could be no larceny of a will of lands. But now by the Larceny Act of 1861 stealing, injuring or concealing a will, whether of real or personal estate, is punishable with penal servitude for life. Forgery of a will (at one time a capital crime) was punishable with death. Fraudulent concealment of a will material to the title by a vendor or mortgagee of land or chattels is, by the Law of Property Amendment Act 1869, a misrepresentation of title. The service of a power of appointment on a person to whom it is not communicated should be noticed a contract to make a will containing provisions in favour of a certain person or certain persons is valid if it fulfills the requirements of the law regulating a contract. A good example is Syr. v. Syr. (1861).

For death duties see Estate Duty, Legacy, Succession Duty.

The principal authorities for the English law are, for the formalities, Sir E. Holdsworth and Vickers, Law of Succession; J. Williams, Wills and Succession; for the construction, the works of Sir James Wigram and of Messrs Jarman, F. V. Hawkins and Theobald. Precedents will be found in Hayes and Jarman, Practice of Wills; and in the many collections of precedents in conveyancing. For comparative law see E. Lambert, Le Régime successorial (Paris, 1903).

The act of 1857 applies to Ireland. The main difference between the law of the two countries is that Ireland is a trust for masses Ireland for the repose of the testator's soul is valid, provided that the masses be public, in England such a bequest is void as tending to superstition.

Up to 1868 wills of immovables were not allowable in Scotland. The usual means of obtaining disposition of heritage after death was a trust disposition and settlement by deed de praesenti, under which the deceased disposed of the property according to the trusts of the settlor, reserving a life interest. Thus something very similar to a testamentary disposition was secured by means resembling those employed in England before the Wills Act 1837. The main advantage of this disposition was that it was liable to be overthrown by the heir, who could reduce ex capite lecita all voluntary deeds made to his prejudice within one year of the death. On 1st January 1868 the Land Consolidation Act made it competent to any owner of lands to settle the succession to the same in the event of death by testamentary or mortis causa deeds or writings. In 1871 reduction ex capite lecita was abolished. A will of immovables must be executed with the formalities of a deed and registered to give title. The disability of a woman as a witness was removed by the Titles to Land Consolidation Act. As to wills of moveables, there are several important points which they differ from corresponding wills in England, the influence of Roman law being more marked. Males may make a will at fourteen, females at twelve. A nuncupative legacy is made by the law of Scotland (s. 8d.). A holograph testament is good without witnesses, but it must be signed by the testator, differing in this from the old English holograph. By the Conveyancing Act 1874 such a will is presumed to have been executed on the death of the testator. Not all movables can be left, as in England. The movable property of the deceased is subject to just retecias and legitim. See McLaren, Wills and Succession, for the law, and Judicial Styles for styles.

United States.—By the constitutions of many states laws giving effect to informal or invalid wills are forbidden. The age of testamentary capacity varies very much. Eighteen is a common one. Full liberty of disposition is not universal. Homesteads generally, and dower estates frequently, are not devisable. In all states at least the major part of the property is to be left, so that children cannot be disinherited without good cause, and in some children omitted in a will may still take their share. It is frequently provided that a certain amount must be left to the widow. Louisiana follows French law, by which the testator can under no circumstances alienate by will more than half his property if he leave issue or ascendants. In some states a married woman may not leave more than half her property away from her husband. Some require the husband's consent and subscription to make the will of a married woman valid. A nuncupative will is not used in the United States. The testator is formed to personality and must generally be reduced to writing within a short time after the words are spoken. In Louisiana the mystic or sealed will still exists. The number of witnesses necessary for the validity of a will of any kind is usually two, sometimes three. Wills of soldiers and sailors are privileged, as in England. There are several decisions of state courts that belief in spiritualism does not of itself constitute testamentary incapacity.

See Jarman, American edition by Randolph and Talbot.

France.—The law is mainly contained in ss. 567-1274 of the Code Civil. Wills in France may be of three kinds: (1) holo- graphic, which must be wholly written, dated and signed by the testator; (2) made as a public instrument, i.e. received by two witnesses before two witnesses or by one notary before four witnesses; this form of will must be dictated by the testator and written by the notary, must be read over to the testator in the presence of the witnesses and must be signed by the testator and witnesses; (3) mystic, which are signed by the testator, then closed and sealed and delivered by him to a notary before six witnesses; the notary then draws up an account of the property on the instrument mystic in the presence of the testator and witnesses. Legates and their blood relations to the fourth degree may not be witnesses. Nuncupative wills are not recognized. Soldiers' and sailors' wills are subject to special rules as in other countries. Full liberty of disposition only exists where the testator has no ascendants or descendants, in other cases his quæstiti disponibüs is subject to réserve; if the testator has one child he may only dispose of half his estate, if two only one-third, if three or more only one-fourth; if he has no descendants but ascendants in both lines he may dispose of half, if descendants in one line only he may dispose of three-fourths. The full age of testamentary capacity is twenty-one years, but minors over the age of sixteen may dispose by will of half of the estate of which they could dispose had they been of full age. There is no restriction against married women making wills. A contract to dispose of the succession is invalid, s. 701.

The codes of the Latin races in Europe are in general accordance with the French law.

Germany.—Most of the law will be found in the Bürgerliches Gesetzbuch, ss. 2064-2753. A holograph will, either sing or joint, is allowed. The judge of Erbvertrag will be accepted before a judge or notary or (outside Germany) a consul. Two witnesses are required, unless the witness be a notary or the registrar of the court, who is sufficient alone. The formalities may be relaxed in certain cases, such as imminent death, a state of siege, a prevailing epidemic, &c. Descendants, ascendants and the husband and wife, are entitled to compulsory portions (pflicht- teilsberechtigung). But those prima facie entitled may be deprived of their share for certain specified kinds of misconduct. A contract to make any specified testamentary disposition is inoperative. But a contract of testamentary disposition by direct disposition is valid in certain cases and will operate on the death of the contractor. The modes of revocation are much the same as in England (except marriage). But there is one peculiar to Germany, the inconsistency of a will with an Erbvertrag; in such an event the will is wholly or pro tanto revoked.

International Law.—There are three main directions which the opinion of jurists and the practice of courts have taken: (1) The whole property of the testator may be subjected to the law of his domicil. To this effect is the opinion of Savigny and the German practice. Certain modifications have been made by modern law, thus the new Code Francais (s. 2078). (2) The property may be subjected to the law of the place where it happens to be at the
time of the testator’s death. (3) The movable property may be subject-
ected to the law of the domicil, the immovable (including leaseholds)
to the law of the place where it is situate, the lex loci rei sitae. England and
the United States follow this rule. Testamentary capacity is governed
by the law of the domicile of the testator. The lex loci rei sitae of his
domestic, the form of the instrument in most countries either by
the law of his domicil or the law of the place where the will was made,
at his option. The principle of domicile is the rule of allow the former
assignee to assert his rights only. The law was altered for the in
England by the Wills Act 1827, and in France by the Code Civil
1861 by the Wills Act 1861 (known as Lord Kingsdown’s Act),
by which a will made out of the United Kingdom by a British subject
in another country is governed by the law of the domicile of the
 formas required by the law of the place where it was made, or by
the law of the testator’s domicil at the time of making it, or by the law
of the place of his domicile of origin. Subsequent change of domicil
does not affect the former law. In 1884, by the Act of 1881,
ated that by convention with any foreign govern
domestic with regard to wills could not be acquired by
persons domiciled in or having a legal domicile in or with
the intention of becoming domiciled. By the same act foreign consuls
may by convention have certain authority over the wills and property
of subjects of foreign states dying in England. In the United States
some states have adopted the narrow policy of enacting by statute
the old common law rule, and providing that no will is valid unless
made in the required form the law of the state of the testator’s
domicil. The capacity of the testator, revocation and construc-
tion of a will, are governed by the law of the domicil of the testator at
the time of his death except in cases affected by Lord Kingsdown’s
Act, as he must be supposed to have used language in consonance
with the law of his domicil. Executors and administrators are
otherwise qualified and governed by the law of their domicil.
A good instance is Gross’ Case (1904), Prob. 269, where it was held
that the will of a Dutch woman (at the time of her death domiciled in
England) duly made in Holland was not revolved by the law of
England, the woman being no ground of revocation by the law of
Holland.1 The persons who are to take under a will are deci
ded by different rules according as the property is movable or immov-
able, the former being governed by the law of the domicil, the latter by the
law of the country where it was situate. (J. W.)

WILLARD, FRANCES ELIZABETH (1830–1898), American
reformer, was born at Churchville, Monroe county, New York,
on the 28th of September 1830. She attended the Milwaukee
Female College in 1857 and in 1859 graduated at the North-
western Female College at Evanston, Illinois. She then became
a teacher and held various positions until 1871; she was
president of the North-Western University in 1873. In 1874
she became corresponding secretary and from 1875 until her
death was president of the National Woman’s Christian Temperance
Union, and from 1887 until her death was president of the
World’s Woman’s Christian Temperance Union. She first spoke
in favour of woman’s suffrage in 1877; and in 1884 she
was a member of the Executive Committee of the Prohibition party.
In 1890 she was elected president of the Woman’s National
Governing Board, which represented nearly all of the women’s
societies in the United States. She was one of the founders of Our Union, a New
York publication in the interests of the National Woman’s
Christian Temperance Union, and of the Signal (after 1882 the
Union Signal), which she edited in 1882–1898 and which was
the Illinois organ of the union. She died in New York City
on the 18th of February 1898.

With Mary A. Livermore she edited A Woman of the Century
(Buffalo, N.Y., 1883), which includes a sketch of her life; and she
published Separated Years: The Life of a Married Woman (Hattie
lo Win: A Book for Girls (1886), Glimpses of Fifty Years (1886), and,
in collaboration with H. M. Winslow, Mrs S. J. White and others,
Our Home on the Prairies (1887). She was professor of Fracnes E. Willard (Chicago, 1898), with an introduction by Lady
Henry Somerset, and W. M. Thayer, Women Who Win (New York,
1896).

WILLEMITE, a mineral consisting of zinc orthosilicate,
Zn₂SiO₄, crystallizing in the parallel-faced hemidrical class of
the monoclinal system. Crystals have the form of hexa-
gonal prisms terminated by rhombohedral planes. There
are distinct cleavages parallel to the prism-faces and to the
base. Granular and cleavage masses are of more common occurrence.
The colour varies considerably, being colourless, white, greenish-
yellow, apple-green, flesh-red, &c. The hardness is 5½, and the
specific gravity 3.9–4.2. A variety containing much manganese
replacing zinc is called “roostite.” Willemite occurs at Sterling
Hill, Sussex county, and Franklin Furnace in New Jersey,
where it is associated with other zinc ores (franklinite and
azurite) in crystalline limestone. It has been found at only
a few other localities, such as Willemite, and for this
reason the mineral was named after William L. of the Nether-
lands.

Under the influence of radium radiations, willemite
fluoresces with a brilliant green colour. (L. J. S.)

WILLEMENS, FLORENCE JOSEPH MARIE (1825–1905),
Belgian painter, was born at Liege on the 8th of January 1825. He
had no regular tuition in painting, but learnt by copying and restor-
ing old pictures at Malines, where he lived from 1832. He made
his debut at the Brussels Salon in 1842 with a “Music Party” and
an “Interior of a 17th-century Guard-room” in the style of
Rembrandt and Largilliere in the same year. In 1846 he
settled in Paris, where his pictures enjoyed considerable popularity under
the second empire. Among his most famous works may be men-
grands-parents” (Brussels Gallery), “Le Baise-main” (Mme.
Cardon’s collection, Brussels), “Farewell” (Willems coll.,
Brussels), “The Arches of the Peace” (Delahaye coll., Antwerp)
and “The Widow” (engraved by Desvachers). He died at
Neuilly-sur-Seine on the 23rd of October 1905.

WILLET, JEAN FLORENCE (1787–1846), Flemish writer,
begun life in the office of a notary at Anderlecht. He devoted
his leisure to literature, and in 1810 he gained a prize for poetry
with an ode in celebration of the peace of Tilsit. He hailed
with enthusiasm the constitution of the kingdom of the Nether-
lands, and the revival of Flemish literature; and he published
a number of spirited and eloquent writings in support of the
claims of the native tongue of the Netherlands. His political
views were with the Orange party at the revolution of
1830, and these views led him into trouble with the provisional
government of the Netherlands. Willet was, soon recognised as
the most important of the Flemish period, he had a
platform in his native tongue. He published a number of
books and pamphlets in the Flanders language, and was
noted for his skill in polemic and literary debate.

WILLENDELEN, an urban district in the Harrow
parliamentary division of Middlesex, England, suburban to London, lying
immediately outside the boundary of the county of London
(boroughs of Hammersmith and Kensington). Pop. (1887)
27,453; (1901) 114,811. It has increased greatly as a residential
district, mainly of the working classes. There are, moreover,
considerable railway works attached to Willenden Junction,
where the suburban lines of the London & North Western,
London & Great Western railways connect with the main line
of the first-named company. Remains of Norman building
have been discovered in the church of St Mary, which is of various
dates, and has been much enlarged in modern times. Several
ancient monuments and brasses are retained. There is a Jewish
cemetery in Willenden Lane. The adjoining residential districts
are Harkden on the south, Kilburn and Brondesbury on the
east, Cricklewood and Neasden (with the works of the Metro-
politan railway) on the north.

At Domesday the manor of Willenden and Harkden was
held by the canons of St Paul’s. In the 11th century it was formed
into eight distinct manors, seven of which were held by the same
number of prebendaries. A shrine or image of St Mary (Our
Lady of Willesden) was in the 11th century an object of pilgrimage, but by the middle of the century following the ceremonies had fallen into abuse, and the shrine was suppressed.

**WILLETTE, LEON ADOLPHE** (1857–1923), French painter, illustrator, caricaturist, and lithographer, was born in Chalons-sur-Marne. He studied for four years at the Ecole des Beaux-Arts under Cabanel—a training which gave him a unique position among the graphic humorists of France. Whether comedy or tragedy, dainty triviality or political satire, his work is instinct with the profound sincerity of the artist. He set Pierrot upon a lofty pedestal among the imaginary heroes of France, and established him as a national type, for his face, with its bright eyes, and heart, young but well advanced, in the affections of the nation. Willette is at once the modern Watteau of the pencil, and the exponent of sentiments that move the more emotional section of the public. Always a poet, and usually gay, fresh, and delicate, in his presentation of idylls exquisitely dainty and characteristically Gallic, illustrating the more "charming" side of love, often pure and sometimes unnecessarily materialistic, Willette frequently reveals himself bitter and fierce, even ferocious, in his hatreds, being a violent though at the same time a generous partisan of political ideas, reflecting the close connexion of the French with the English, and whether they be ground down under the heel of political oppression, or are merely the victims of unrequited love, suffering all the pangs of graceful anguish that are born of scornful treatment. There is charm even in his thrilling apotheosis of the guillotine, and in the introduction into his caricatures of the figure of Death itself. The artist was a prolific contributor to the French illustrated press under the pseudonyms "Cémoï", "Pierrot", "Louison", "Bébé", and "Nox", but more often under his own name. He illustrated Mâleand's *Les Pierrots et Les Gobilliés d'avril*, and has published his own *Pauvre Pierrot* and other works, in which he tells his stories in scenes in the manner of Busch. He decorated several "brasseries artistiques" with wall-paintings, stained glass, &c., notably Le Chat noir and La Palette d'or, and he painted the highly imaginative ceiling for La Cigale music hall. His characteristically fantastic "Parce Domine" was shown in the Franco-British Exhibition in 1908. A remarkable collection of his works was exhibited in 1888. His "Valmy" is in the Luxembourg, Paris.

**WILLIAM** (A.S. Wilhelm, O. Norge Vilhilber; O. H. Ger. Wilhelm, Wilhelmsen, Wilhelm, M. H. Ger. Wilhelhelm, Wilhelmsen, Mod. Ger. Vilhelm, O. Fr. Vilhelm, Mod. Fr. Guillaume; from "will," Goth. *wilja*, and "helu," Goth. *hildis*, Old Norse *hildr*, meaning possibly "one who wils to protect"), a masculine proper name borne by many European sovereigns and others, of whom the more important are treated below in the following order:—(1) kings of England and Scotland. (2) Other sovereigns in the alphabetical order of their states. (3) Other ruling princes. (4) Prelates, Chroniclers, &c.

**WILLIAM I.** (1027 or 1028–1087), king of England, surmounted the Conqueror, was born in 1027 or 1028. He was the bastard son of Robert the Devil, duke of Normandy, by Arletta, the daughter of a tanner at Falaise. In 1034 Robert resolved on a pilgrimage to Jerusalem. Having no legitimate son he induced the Norman barons to acknowledge William as his successor. They kept their engagement when Robert died on his journey (1035), though the young duke-elect was a mere boy. But the next twelve years was a period of the wildest anarchy. Three of William's guardians were murdered; and for some time he was kept in strict concealment by his relatives, who feared that he might experience the same fate. Trained in a hard school, William was precociously ambitious and government. He was but twenty years old when he stamped out, with the help of his overlord, Henry I. of France, a serious rising in the districts of the Bessin and Cotentin, the object of which was to put in his place his kinsman, Guy of Brionne. Accompanied by King Henry, he met and overthrew the rebels at Val-des-Dunes near Caen (1047). It was by no means his last encounter with Norman traitors, but for the moment the victory gave him an assured position. Next year he joined Henry in attacking their common enemy, Geoffrey-Martel, count of Anjou. Geoffrey occupied the border fortress of Alençon with the good will of the inhabitants. But the duke recovered the place after a severe siege, and inflicted a terrible vengeance on the defenders, who had taunted him with his base birth; he also captured the castle of Domfront from the Angevins (1049).

In 1051 the duke visited England, and probably received from his kinsman, Edward the Confessor, a promise of the English succession. Two years later he strengthened the claims which he had thus established by marrying Matilda, a daughter of Baldwin V. of Flanders, who traced her descent in the female line from Alfred the Great. This union took place in defiance of a prohibitive papal bull, and had been promulgated, in 1049, by the papal council of Reims. But the affinity of William and Matilda was so remote that political rather than moral considerations may have determined the pope's action. The marriage was zealously opposed by Archbishop Malgrer of Rouen and Lanfranc, the prior of Bec; but Lanfranc was persuaded to intercede with the Curia, and Pope Nicholas II. at length granted the needful dispensation (1059). By way of penance William and his wife founded the abbey of St Stephen and the Holy Trinity at Caen. The political difficulties caused by the marriage were more serious. Alarmed over the details of this story, it seems clear that the earl made a promise to support the claims of his host upon the English succession. This promise he was invited to fulfil in 1066, after the Confessor's death and his own coronation. Harold's perjury formed the chief excuse for the Norman Conquest of England, which in reality was a piratical venture resembling that of the sons of Tancred d'Hauteville in Lower Italy. William had some difficulty in securing the help of his barons. When consulted in a great council at Lilleshonse they returned an unfavourable reply, and it was necessary to convince them individually by threats and persuasions. Otherwise the conditions were favourable. William secured the benevolent neutrality of the emperor Henry IV.; the influence of the archdeacon Hildebrand obtained for the expedition the solemn approval of Pope Alexander II. Philip I. of France was a minor under the guardianship of William's father-in-law, the count of Flanders. With Tostig, the banished brother of Harold, William formed an alliance which proved of the utmost service. The duke and his Normans were enabled, by Tostig's invasion of northern England, to land unmolested at Pevensey on the 28th of September 1066. On the 14th of October a crushing defeat was inflicted on Harold at the battle of Senlac or Hastings; and on Christmas Day William was crowned at Westminster.

Five years more were to elapse before he became master of the west and north. Early in 1067 he made a progress through parts of the south, receiving submissions, disposing of the lands of those who had fought against him, and ordering castles to be built; he then crossed the Channel to celebrate his triumph in Normandy. Disturbances at once occurred in Northumbria, on the Welsh marches and in Kent; and he was compelled to
return in December. The year 1068 was spent in military expeditions against Exeter and York, in both of which the adherents of Harold had found a welcome. In 1069 Robert of Conines, a Norman to whom William had given the earldom of Northumberland, was murdered by the English at Durham; the north declared for Edgar Atheling, the last male representative of the West-Saxon dynasty; and Sweyn Estrithson of Denmark sent a fleet to aid the rebels. Joining forces, the Danes and English captured York, although it was defended by two Norman castles. The position seemed critical; but, fortunately, for the king, the south and west gave no effective support to the rebellion. Marching rapidly on York he drove the Danes to their ships; and the city was then reduced by a blockade. The king ravaged the country as far north as Durham with such completeness that traces of devastation were still to be seen sixty years later. But the English leaders were treated with politic clemency, and the Danish leader, Jarl Oshiborn, was bribed to withdraw his fleet. Early in 1070 the reduction of the north was completed by a march over the moors to Chester, which had not hitherto submitted but was now placed under an earl of William’s choice. From this point we hear no more of general rebellions against the foreign rule. In 1071 a local rising in the fens caused some trouble. An outlawed Englishman, Hereward by name, fortified the Isle of Ely and attracted a number of desperate spirits to his side; amongst others came Morcar, formerly earl of Northumbria, who had been disappointed in the hopes which he based on William’s personal favour. The king in person undertook the march of Ely, which proved unexpectedly difficult. But the failure of the insurgents was a foregone conclusion.

Of the measures which William took to consolidate his authority we have many details; but the chronological order of his proceedings is obscure. The redistribution of land appears to have proceeded pari passu with the reduction of the country; and at every stage of the conquest each important follower received a new reward. Thus were formed the vast but straggling fiefs which are recorded in Domesday. The great earldoms of the West-Saxon period were allowed to lapse; the new earls, for the most part closely connected with William by the ties of blood or friendship, were lords of single shires; and only on the marches of the kingdom was the whole of the royal jurisdiction delegated to such feudatories. William’s writs show not only that he kept intact the old system of governing through the sheriffs and the courts of shire and hundred, but also that he found it highly serviceable. Those whom he enfeoffed with land held it according to the law of Norman feudalism, which was already becoming precise. They were thus brought into close personal relations with the king; but he forced the most powerful of them to acknowledge the jurisdiction of the ancient local courts; and the old fyrd-system was maintained in order that the crown might not be wholly dependent on feudal levies. Though his forest-laws and his heavy taxation caused bitter complaints, William soon won the respect of his English subjects. They appear to have accepted him as the lawful heir of the Confessor; and they regarded him as their natural protector against feudal oppression. This is to be explained by his regard for legal forms, by his contempt of the claims of the ‘old Englishmen,’ and the ‘new laws’ which he received from the church. Domesday Book shows that in his confiscations he can have paid little attention to abstract justice. Almost every English landholder of importance was dispossessed, though only those who had actually borne arms against William should have been so treated. As far as possible Englishmen were excluded from all responsible positions both in church and state. After 1071 our accounts of William’s doings become jene and disconnected. Much of his attention must have been engrossed by the work of administration, carried on without the help of those elaborate institutions, judicial and financial, which were perfected by Henry I. and Henry II. William had few ministers of note. William Fitz Osbern, earl of Hereford, who had been his right-hand man in Normandy, fell in the civil wars of Flanders (1071). Odo, bishop of Bayeux, William’s half-brother, lost favour and was finally thrown into prison on a charge of disloyalty (1082). Another half-brother, Robert of Mortain, earl of Cornwall, showed little capacity. Of the king’s sons Robert, though titular count of Maine, was kept in leading strings; and even William Rufus, who was in constant attendance on his father, never held a public office. The Conqueror reposed much confidence in two prelates, Lanfranc of Canterbury and Geoffrey of Coutances. They took an active part in the civil wars of the ecclesiastical government. But the king himself worked hard in hearing lawsuits, in holding councils and ceremonial courts, in travelling between England and Normandy, and finally in conducting military operations.

In 1072 he undertook an attack against Malcolm, king of Scots, who had married Margaret, the sister of Edgar Atheling, and was inclined to promote English rebellions. When William reached the Forth his adversary submitted, did homage as a vassal, and consented to expel Edgar Atheling, who was subsequently endowed with an English estate and admitted to William’s favour. From Scotland the king turned to Maine, which had profited by the troubles of 1066 to expel the Norman garrisons. Since then the Manceaux had fallen among themselves. The barons supported Azo of Liguria, the lawful successor of Herbert II.; the citizens of Le Mans set up a commune, expelled Azo’s representatives and made war on the barons. William had therefore no difficulty in reducing the country, even though Le Mans was assisted by Fulk of Anjou (1073). In 1075 the king’s attention was claimed by a conspiracy of the earls of Hereford and Norfolk, in which the Englishman Waltheof, earl of Northampton, was implicated to some degree. The rebels were defeated by Lanfranc in the king’s absence; but William returned to settle the difficult question of their punishment, and to stamp out the last sparks of disaffection.

The execution of Waltheof, though strictly in accordance with the English law of treason, was a measure which he sanctioned after long hesitation, and probably from considerations of expediency rather than justice. This severity to a man who was generally thought innocent, is one of the dark stains on his career. In 1076 he invaded Brittany to get possession of the fugitive earl of Norfolk; but Philip of France came to the aid of the Bretons, and William gave way before his suzerain. The next few years were troubled by a quarrel between the king and his eldest son. Robert fled from Normandy and after aimless wanderings obtained from King Philip the castle of Gerberoi, in the Beauvaisis, from which he harassed the Norman marches. William besieged Gerberoi in 1079, and was wounded in single combat by his son. A little later they were reconciled; but the reconciliation was short-lived; to the end of the reign Robert was a source of trouble. In the years 1082–1085 there was a second rising in Maine which was not laid to rest until William had granted liberal terms to the leader, Hubert of Beaumont. In 1085 news arrived that Caut the Saint, king of Denmark, was preparing to assert the claims of his house in England. The project fell through, but gave occasion for the famous moot at Salisbury in which William took an oath of direct allegiance from “all the land-sitting men that were in England” (1086). While the danger was still impending he took in hand the compilation of the ‘Domesday Book,’ which was a source of trouble. In the years 1082–1085 there were orders at the Christmas Council of 1086 and carried out in the following year. It is probable that William never saw the Domesday Book as we possess it, since he left England in the summer of 1086 and never returned. In 1087 he invaded the French Vexin to retaliate on the garrison of Mantes for raids committed on his territory. He sacked and burned the town. But as he rode out to view the ruins his horse plunged on the burning cinders and inflicted on him an internal injury. He was carried in great suffering to Rouen and there died on the 9th of September 1087. He was buried in St Stephen’s at Caen. A plain slab still marks the place of his tomb, before the high altar; but his bones were scattered by the Huguenots in 1562.

In a prolific age William was distinguished by the purity of his married life, by temperate habits and by a sincere piety. His most severe measures were taken in cold blood, as part of
his general policy; but his natural disposition was averse to unnecessary bloodshed or cruelty. His one act of wanton devastation, the clearing of the New Forest, has been grossly exaggerated. He was avaricious, but his church policy (see article English History) shows a disinterestedness as rare as it was honourable. In personal appearance he was tall and corpulent, of a dignified presence and extremely powerful physique, with a bald forehead, close-cropped hair and short moustaches.

By Matilda, who died in Normandy on the 3rd of November 1083, William had four sons, Robert, duke of Normandy, Richard, who was killed whilst hunting, and the future kings, William II, and Henry I, and five daughters, including Ada, who married Stephen, count of Blois.

WILLIAM II. (c. 1056-1100), king of England, surnamed Rufus, was the third son of William I. by his queen Matilda of Flanders. Rufus was born some years before the conquest of England, but his exact date is uncertain. He seems to have borne his father's name in Normandy, where he was commonly known as the Conqueror's son, although like his brothers he was carefully excluded from any share in the government either of England or Normandy. A squabble with Rufus was the immediate cause of Robert's first rupture with the Conqueror; in the ensuing civil war we find Rufus bearing arms on the royal side (1077-1080). On this death-bed the Conqueror was inclined to disinherit his eldest son in favour of Rufus, who, by the early death of Prince Richard, was now left second in the order of succession. The king's advisers, however, used their influence to obtain a postponement of the intended act, and conspired to have him killed while Rufus was designated as the son on whom the Conqueror desired that the kingdom of England should devolve. With the help of Lanfranc the English were easily induced to accept this arrangement. Rufus was crowned at Westminster on the 26th of September 1087, fifteen days after the death of his father.

It may be in part the fault of our authorities that the reign of Rufus presents itself to us as a series of episodes between which the connexion is often of the slightest. In his domestic administration we can trace a certain continuity of purpose, and in his dealings with the Welsh and Scots he proceeded, though intermittently, along the broad lines of policy which his father had marked out. Beyond the Channel he busied himself with schemes, first for the reunion of England and Normandy, then for the aggrandisement of Normandy at the expense of France. But his attention was perpetually distracted by the exigencies of the moment. He threw himself into each particular design with unreflecting impetuosity, but never completed what had been well begun. The violence, the irregularity, the shamelessness of his private life are faithfully reflected in his public career. Even in those where his general purpose could be justified, his methods of execution were crudely conceived, brutal and short-sighted. Rufus may well stand as the typical product of early feudalism. He was not without valour or glimmerings of chivalry, but perfidious to his equals, oppressive to his subjects, contemptuous of religion; with no sense of his responsibilities, and possessed by a fixed determination to exact the last farthing of his rights. The first year of his reign was troubled by a general conspiracy among the baronage, who took up arms for Robert in the name of the hereditary principle, but with the secret design of substituting a weak and indolent for a ruthless and energetic sovereign. Local risings in Norfolk, Somerset and the Welsh marches were easily repressed by the king's lieutenants. The castles of Kent and Sussex offered a more formidable resistance, since their lords were in direct communication with Robert of Normandy, and were led by the able Odo of Bayeux (q.v.), the king's uncle, who had been released from prison at the opening of the reign. Rufus, however, made an earnest appeal to the native English, promising good laws, the abolition of unjust taxes and redress for those who had suffered by the aforesaidments of the late king. These promises, which he never attempted to fulfil, served the purpose of the moment. Followed by large contingents of the national militia he successfully laid siege to the strongholds of the rebels. They were leniently treated, and the arch-conspirator, Odo of Bayeux, left England under a safe-conduct to sow fresh seeds of discord in Normandy. But Rufus resolved to take vengeance on his brother, and two years later invaded eastern Normandy. Encountering little resistance—for under Robert's rule the duchy had relapsed into a state of anarchy—he might have expelled the duke with no great trouble. But in 1091 a treaty was hastily patched up. Rufus reaffirmed the termini of Henry I's claims to Normandy and the Hanseatic custom of the duchy; he also agreed to certain seaports. In return he undertook to aid Robert in reducing the rebellious county of Maine, and in recovering the Cotentin from their younger brother, Henry Beauclerk, to whom it had been pledged by the impetuous duke. The last part of the agreement was duly executed. But Rufus then recrossed the Channel to chastise the Scots who in his absence had raided the north country. By a march to the Firth of Forth he vindicated English honour; Malcolm III. of Scotland prudently purchased his withdrawal, by doing homage (Aug. 1091) on the terms on which William I had imposed similar conditions in 1093. Next year Rufus broke the treaty by seizing the stronghold of Carlisle and the other lands held or claimed by Malcolm in Cumberland and Westmorland. Malcolm in vain demanded satisfaction; while attempting reprisals on Northumberland he was slain in an obscure skirmish (1093). Rufus immediately put forward a candidate for the vacant throne; and this policy, though at first unsuccessful, finally resulted in the accession of Edgar (1097), a son of Malcolm, who had acknowledged the English overlordship. Carlisle remained an English possession; in the next reign Cumberland and Westmorland appear as shires in the Domesday. The Scottish policy of Rufus, though legally unjustifiable, was thus comparatively successful. In dealing with the Welsh he was less fortunate. Three campaigns which he conducted in North Wales, during 1093 and 1097, yielded no tangible result. The expansion of the Welsh marches in this reign was due to the enterprise of individual adventurers.

The affairs of Wales and Scotland did not prevent Rufus from resuming his designs on Normandy at the first opportunity. Robert was rash enough to rephrase his brother with nonfulfilment of the terms arranged in 1093; and Rufus seized the excuse for a second invasion of the duchy (1094). Less prosperous than the first, and interrupted by a baronial conspiracy, which kept Rufus in England for the whole of 1095, this enterprise found an unexpected termination. Robert resolved to go upon Crusade and, to obtain the necessary funds, gave Normandy in pledge to his brother (1096). There can be no doubt that Rufus intended to remain in lasting possession of this rich security. The interests of Normandy at once became the first consideration of his policy. In 1098-1099 he imposed the cost of the Exchequer of the duchy, and also received commenced operations for the recovery of the Vexin. Early in 1100 he accepted a proposal, made by William IX. of Aquitaine, that he should take over that duchy on terms similar to those arranged in the case of Normandy. Contemporaries were startled at the rapid progress of the king's ambitions, and saw the direct imposition of heaven in the late which cut them short. On the 2nd of August 1100 Rufus fell, in the New
WILLIAM III. (ENGLAND)

Forest, the victim of an arrow from an unknown hand. The common story was that Walter Tirel, who was certainly close at hand and fled the country without venturing to abide the issue of a trial. But a certain Ralph of Aix is also accused; and Tirel, from a safe distance, solemnly protested his innocence.

It remains to notice the main features of the domestic administration which made the names of William and his minister, Ralph Flamard, infamous. Respecting the grievances of the laity we have few specific details. But we are told that the "moats" all over England were "driven" in the interests of the king; which perhaps means that aids were extorted from the shire-courts, and that the revenues thus obtained were not scrupulously administered; that the king revived, for certain offences, the death-penalty which his father had abolished; that all men were vexed by unjust gelds and the feudal classes by unscrupulous misinterpretations of the customs relating to the incidents of wardship, marriage and relief. On one occasion the militia were summoned in considerable numbers for a Norman expedition, which was no part of their duty; but when they arrived at the sea-coast they were bidden to hand over their journey money and go home. The incident is not un instructive as a side-light on the king’s finances. As to the amount of money thus transferred from the royal coffers, it is more fully informed after allowing for exaggeration there still remains evidence enough to prove that the ecclesiastical policy of Rufus was unscrupulously venal. Vacant sees and abbacies were either kept for years in the hands of the king, who claimed the right of a feudal guardian to appropriate the revenues so long as the vacancy continued; or they were openly sold to the highest bidder. The history of Anselm’s relations with the king is fully narrated by the biographer Eadmer. Anselm received the see of Canterbury in 1093, after it had been in the king’s hands for upwards of four years. William made the appointment without a moment’s repentence, when sick and at death's door. But he resented Anselm’s demand for full restitution of the temporalities and his refusal to make any payment, in the nature of an aid or relief, which might be construed as simoniacal. Other grounds of quarrel were found in the reproofs which the primate aimed at the vices of the court, and in his requests for leave to hold a church-council and initiate reforms. Finally, in 1095, Anselm exasperated the king by insisting on his right to recognize Urban II. as his lawful pope. By the 20th of Jan. 1095, Conqueror it had been the rule that no pope should be recognised in England without the king’s permission; and Rufus was unwilling that the English Church should be committed to either party in the papal schism which had already lasted fifteen years. Anselm, on the other hand, asserted that he had accepted the primacy on the distinct condition that he should be allowed to acknowledge Urban. The dispute came before a great council which was held at Rockingham (Feb. 25, 1095). The king demanded that the assembly should adjudge Anselm guilty of contumacy, and was supported by the bishops. The lay barons, however, showed their ill-will towards the king’s general policy by taking Anselm’s part. Rufus was forced to give way. He recognized Urban, but entered upon intrigues at Rome to procure the suspension of the archbishop. Finding that Urban would not betray a loyal supporter, the king fell back upon his authority as a feudal suzerain. He taxed Anselm with having failed to provide a satisfactory quota of knights for the Welsh war (1097). The archbishop, seeing that he was never to be left in peace, and despairing of an opportunity to effect the reforms on which his heart was set, demanded urgently that he should be allowed to leave England for the purpose of visiting Urban. Both the king and the barons suspected that this was the first step towards an appeal to the pope’s jurisdiction against that of the royal court. Leave was at first refused; but ultimately, as Anselm continued to press his demand, he was suffered to depart, not without experiencing some petty insults on his way (Oct. 1097). The motive of the king’s apparent clemency was soon revealed. He seized the estates of the archbishopric, and kept them in his own hands for the future. The friends of the archbishop were thus justified in their assertion that the zeal of Rufus for his father’s “customs” was a mere cloak for avarice and tyranny.

In appearance William II. was unattractive; bull-necked, with sloping shoulders, extremely corpulent and awkward in his gait. His long locks and clean-shaven face marked his predilection for the new-fangled fashions which contemporary ecclesiastics were never weary of denouncing. His features were strongly marked and coarse, his eyes grey and deeply set; he owed his nickname to the fiery hue of his complexion. He stuttered violently and in moments of passion was almost inarticulate. His familiar conversation was witty and blustering; he was an ardent Catholic. He died unmercifully castigated, and no semblance of decorum was maintained in his household. His character was assailed by the darkest rumours which he never attempted to confute. He died unmarried and without issue.

of her overseas colonies. But though he was unable to extract the best results from parliament he was always able to avert its worst excesses. In spite of strong personal opinions to the contrary, he accepted the Triennial Act (1694), the vote reducing the army to 10,000 men (1697), the vote disbanding his favourite Dutch Guards (1699) and even (November 1699) a bill rescinding the grants of forfeited Irish estates, which he had made to his favourites. The main cause of the humiliations William suffered from parliament lay in his incapacity to understand the party or cabinet system. In his view the best way to govern was to convince both parties in the ministry, so that, as Whig and Tory fell out, the king came by his own hand. A study of his reign shows that this method was unsuccessful, and that his affairs went most smoothly when the parliamentary majority held the same views as the ministry. It is not often remembered that William possessed an experience of the workings of representative government in Holland, which was remarkably similar to that in England. Hence his mistakes though easy to understand are by no means so pardonable as were, for example, those of the Georges, who had been absolute monarchs in their own country. William’s unpopularity with his new people was not on the whole explained by the fact that his foreign policy was partly darkened by the stain of the “Massacre of Glencoe.” In 1692 he signed an order for the “extirpation” of the Macdonalds, a small clan in the vale of Glencoe. It is improbable that he meant his order to be literally executed, it is not certain that he knew they had taken the oath of allegiance to him. None the less, when the massacre was carried out with circumstances of revolting barbarity, William behaved as he had done after the murder of De Witt. Popular pressure forced him to bring the murderers to justice, to punish them and dismiss his secretary. But shortly afterwards they were all received into favour; “one became a colonel, another a knight, a third a peer.”

These and other actions indicate that William could show on occasion a cold and cynical ruthlessness. But while admit-ting that his means were sometimes unprincipled, it must be recollected that his real ends were high and noble. While he sometimes disregarded the wishes of others, no one was more ready to sacrifice his own feelings for the attainment of the master aim of his life, the restoration of the “Balance of Power,” by the overthrow of the predominance of France. This was the real aim of William in going to England in 1688. He had set off to secure an ally against Louis, and he came back from his expedition with a crown on his head and a new nation at his back, united in its detestation of popery and of France. As king of England he concluded treaties of alliance with the members of the League of Augsburg and sent a large army to oppose the French in Flanders. But his greatest immediate peril during 1689-1690 came from the circumstance that the French disputed the mastery of the seas with the Anglo-Dutch fleet, and that Ireland was strongly for King James. On the 1st of July 1690 the allies were badly beaten at sea off Beachy Head, but on the same day William himself won a decisive victory over James’s army at the Boyne in Ireland. Dublin and Drogheda soon fell and James fled from Ireland. The chances of continued resistance in Ireland, which depended on communication with France, were finally destroyed by the great victory off Cape La Hogue (May 19th, 1692). Ireland was speedily conquered when once the supremacy of England on the sea became assured. Now the French fleet was definitely destroyed, and though a destruc-tive privateering warfare continued, England was no longer in danger of invasion.

The decisive successes for the Alliance were gained by its naval victories, whose importance William somewhat underrated and for whose execution he had only an indirect responsibility. In 1692 he lost Namur and was badly defeated at Steinkirk (August 4th), and in 1693 he was disastrously beaten at Neerwinden or Landen (July 19th). In 1695 he was able to resume the offensive and to retake Namur in a brilliant and, what was more unusual, a successful campaign. William had assumed the duties of commander-in-chief too young to learn the full duties of a professional soldier himself, and his imperious will did not suffer
WILLIAM IV. (ENGLAND)

WILLIAM IV. (1765-1837), king of England, third son of George III., was born at Buckingham Palace on the 21st of August 1765. In 1779 he was sent to sea and became a midshipman under Admiral Digby. Next year he sailed under Rodney and took part in the action off Cape St Vincent (16th of January 1780). During the rest of the war the young prince saw plenty of service, for which he imbued a strong liking, and so laid the foundation of his popularity. On the conclusion of the war he travelled in Germany, visiting Hanover and Berlin, where he was entertained by Frederick the Great. In 1782 he passed for lieutenant; next year he was made captain and stationed in the West Indies. Shortly after 1787, being tired of his station, he sailed home without orders, and was punished for his insubordination by being obliged to stay at Plymouth till his ship was refitted, when he again sailed for the West Indies.

In 1789 he was made duke of Clarence. When war was declared against the French republic in 1793, he strongly supported it and was anxious for active employment; but, though he was made rear-admiral of the red, he could obtain no command. Thus condemned to inactivity, he amused or revenged himself by joining the prince of Wales and the duke of York in their opposition to the king. He threw himself into the dissolutions of society, and his hearty gaiety and bluff, sailor-like manners gained him popularity, though they did not secure him respect. He took his seat in the House of Lords, where he defended the extravagancies of the prince of Wales, spoke on the Dvorce Bill, vehemently opposed the emancipation of slaves and defended slavery on the ground of his experience in the West Indies. Meanwhile he formed a connexion with Mrs Jordan, the actress, with whom he lived on terms of mutual affection and fidelity for nearly twenty years, and the union was only broken off eventually for political reasons. During all this period the prince had lived in comparative obscurity. The death of Princess Charlotte in 1817 brought him forward as in the line of succession to the crown. In 1818 he married Adelaide of Saxe-Meiningen, a lady half his age, without special attractions, but of a strong, self-willed nature, which enabled her subsequently to obtain great influence over her husband. On the death of the duke of York in 1827 the duke of Clarence became heir to the throne, and in the same year he was appointed lord high admiral. In discharging the functions of that office he endeavoured to assume independent control of naval affairs, although his patent precluded him from acting without the advice of two members of his council. This involved him in a quarrel with Sir George Cockburn, in which he had to give way. As he continued to act in defiance of rules, the king was at length obliged to call upon him to resign.

On the 28th of June 1830 the death of George IV. placed him on the throne. The beginning of the twenty years of his reign England underwent an agitation more violent than any from which it had suffered since 1688. William IV. was well-meaning and conscientious; but his timidity and irresolution drove ministers to despair, while his anxiety to avoid extremes and his want of insight into affairs prolonged a dangerous crisis and brought the country to the verge of revolution. Immediately after his accession the revolution of July broke out in France and gave a great impulse to the reform movement in England. The king, though he called himself an old Whig," did not dismiss the Tory ministry which had governed the country during the last two years of his brother's reign; but the elections for the new parliament placed them in a minority. Within a fortnight of the opening of parliament they were beaten on a motion for the reform of the civil list, and resigned. Lord Grey undertook to form a ministry, with the avowed intention of bringing in a large measure of reform. This was not in itself displeasing to the king, who had liberal tendencies, and a few years before had supported Catholic emancipation. But, when the struggle in parliament began, his disinclination to take up a decided attitude soon exposed the government to difficulties. The first Reform Bill was introduced on the 1st of March 1831; the second reading was carried on the 21st of March by a majority of one. Shortly afterwards the government were beaten in committee.
and offered to resign. The king declined to accept their resignation, but at the same time was unwilling to dissolve, although it was obvious that in the existing parliament a ministry pledged to reform could not retain office. From this dilemma William was rescued by the conduct of the opposition, which, anxious to bring on a change of ministry, moved an address against dissolution. Regarding this as an attack on his prerogative, William at once dissolved parliament (April 1831). The elections gave the ministry an overwhelming majority. The second Reform Bill was brought in in June, and passed its third reading (21st of September) by a majority of 109. A fortnight later (8th of October) the Lords threw out the bill by a majority of 41. But after a protracted political crisis (see the article on Grey, Charles Grey, and earl) the king was compelled to consent to create a sufficient number of new peers to carry the bill, and the threat was successful in bringing about the passing of the act in 1832.

During the rest of his reign William IV. had not much opportunity of active political interference, but on one other occasion he made an unjustifiable use of his prerogative. Two years after the passing of the Reform Bill the ministry of Lord Grey had become unpopular. In July 1834 Lord Grey himself retired and Lord Melbourne took the lead. There were divergences of opinion in the cabinet, and the king decided (July 22) that he purposed taking a personal step. He dissolved the ministerial policy respecting the Irish Church. On the shallow pretext that Lord Althorp's removal to the Upper House would weaken the ministry in the House of Commons, where, however, they still had a majority, he suddenly dismissed them and summoned Sir Robert Peel (14th of November). Peel's ministry, containing many members who had been in the government on the king's accession, was called from its short duration "the ministry of the hundred days." Its formation clearly indicated that the Whig proclivities of the king, which had never been more than partial or lukewarm, had wholly disappeared. The step was regarded with general disapprobation. It was immediately followed by a dissolution, and the ministry soon found themselves in a minority. Beaten on Lord John Russell's motion respecting the Irish Church (3rd of April 1835), Peel resigned and Melbourne again came into power. Under him the Whigs retained the lead during the remainder of the reign. This coup d'etat of November 1834 was the last occasion on which the English sovereign has attempted to impose an unpopular ministry on the majority in parliament.

In May 1837 the king began to show signs of debility, and died from a affection of the heart on the 20th of June, leaving behind him the memory of a genial, frank, warm-hearted man, but a blundering, though well-intentioned prince. He was succeeded by his niece Queen Victoria.

WILLIAM (1143-1214), king of Scotland, surnamed the Lion," was the second son of Henry, earl of Huntingdon (d.1152), a son of King David I, and became king of Scotland on the death of his brother, Malcolm IV., in December 1165, being crowned at Scone during the same month. After his accession to the throne William spent some time at the court of the English king, Henry II.; then, quarrelling with Henry, he arranged in 1168 the first definite treaty of alliance between France and Scotland, and with Louis VII. of France assisted Henry's sons in their revolt against their father in 1173. In return for this aid the younger Henry granted to William the earldom of Northumberland, a post, and which the latter had long sought from the English king, and which was possibly the cause of their first estrangement. However, when ravaging the country near Alnwick, William was taken prisoner in July 1174, and after a short captivity at Richmond was carried to Normandy, where he soon purchased his release by assenting in December 1174 to the treaty of Falaise. By this arrangement the king and his subjects, clerical and lay, undertook to do homage to Henry and his son; this and other provisions placing both the church and state of Scotland thoroughly under the suzerainty of England. William's notification was with Pope Alexander III., in the person of a double choice for the vacant bishopric of St Andrews. The king put forward his chaplain, Hugh; the pope supported the archdeacon, John the Scot, who had been canonically elected. The usual interchanges of threats and defiances followed; then after the death of Alexander in 1181 his successor, Lucius III., consented to a compromise by which Hugh got the coveted bishopric and John became bishop of Dunkeld. In 1188 William secured a papal bull which declared that the Church of Scotland was directly subject only to the see of Rome, thus rejecting the claims to supremacy put forward by the English archbishop. This step was followed by the temporal independence of Scotland, which was one result of the continual poverty of Richard I. In December 1189, by the treaty of Canterbury, Richard gave up all claim to suzerainty over Scotland in return for 10,000 marks, the treaty of Falaise being thus definitely annulled.

In 1186 at Woodstock William married Ermengarde de Beaumont, a cousin of Henry II., and peace with England being assured three years later, he turned his arms against the turbulent chiefs in the outlying parts of his kingdom. His authority was recognized in Galloway which, hitherto, had been practically independent. In 1187 two Scottish forces under Sir William Moray and Iverness; and a series of campaigns taught the far north, Caithness and Sutherland, to respect the power of the crown. The story of William's relations with King John is interesting, although the details are somewhat obscure. Soon after John's accession in 1199 the Scottish king asked for the earldom of Northumberland, which Richard I., like his father, had refused to restore to Scotland. John, too, refused this demand, but the threatened war did not take place, and in 1200 William did homage to the English king at Lincoln with the submission of a period of inaction war between the two countries again became imminent in 1203; but a peace was made at Norham, and about three years later another amicable arrangement was reached. Both these treaties seem to have been more favourable to England than to Scotland, and it is possible that William acknowledged John as overlord of his kingdom. William died at Stirling on the 4th of December 1214 and was buried at Arbroath. He left one son, his successor Alexander II., and two daughters, Margaret and Isabella, who were sent to England after the treaty of 1200, and who both married English nobles. Margaret became the wife of Hubert de Burggh. He also left five legitimate children.

William's reign is a very important period in the early history of Scotland, and may almost be said to mark an epoch in every department of public life. The relations of England and Scotland and of Scotland and France; the rise of towns, the development of trade and the establishment of order in Scotland itself; and the attitude of the Scottish Church, both to the papal see and to England, were all vitally affected by the events of this reign. William founded and richly endowed the abbey at Arbroath, and many of the Scottish towns owe their origin to his charters.

WILLIAM I. (1179-1283), king of Prussia and German emperor, was the second son of Frederick William III. of Prussia and Louise, a princess of Mecklenburg-Strelitz. He was born at Berlin on the 22nd of March 1707, and received the names of Wilhelm Friedrich Ludwig. He was a delicate child and had to be carefully nurtured. His constitution, however, was sound, and he became one of the most vigorous men in Germany. After the battle of Dettingen he became an enthusiastic and diligent student. Meanwhile he had given evidence of sterling honesty, a strict love of order, and an almost passionate interest in everything relating to war. On the 1st of January 1787 he received an officer's patent, and on the 30th of October 1813 was appointed a captain. William accompanied his father in the campaign of 1814, and early in the following year received the iron cross for personal bravery shown at Bar-sur-Aube. He took part in the
entry into Paris on the 31st of March 1814, and afterwards visited London. He joined the Prussian army in the final campaign of the Napoleonic wars, and again entered Paris. The prince so naturally formed and so skilful a member of the permanent military commission immediately after his twentieth birthday, and at the age of twenty-one became a major-general. In 1820 he received the command of a division; and during the following nine years he had not only made himself master of the military system of his own country but studied closely those of the other European states. In 1825 he was promoted to the rank of lieutenant-general, and obtained the command of the corps of guards. On the 11th of June 1830 he married Augusta, daughter of Charles Frederick, grand duke of Saxe-Weimar. This lady, who had imbued the liberal tendencies of the court of Weimar and later developed a keen sympathy with Catholicism, exercised afterwards as queen and empress a considerable influence at court, in a sense generally hostile to Bismarck's views. She died on the 7th of January 1890.

On the death of his father in 1840—the new king, Frederick William IV., being childless—Prince William, as heir presumptive to the throne, received the title of prince of Prussia. He was also made lieutenant-governor of Pomerania and appointed a general of infantry. In politics he was decidedly conservative; but at the outbreak of the revolutionary movement of 1848 he saw that some concessions to the popular demand for liberal forms of government were necessary. He urged, however, that order should be restored before the establishment of a constitutional system. At this time he was the best-hated man in Germany, the mass of the Prussian people believing him to be a vehement supporter of an absolutist and reactionary policy. He was even held responsible for the blood shed in Berlin on the 18th of March, and was nicknamed the "Cartridge Prince," although he had been relieved nine days before of his command of the guards. So bitter was the feeling against him that the king entreated him to return to Prussia and reside elsewhere; he went to London, where he formed intimate personal relations with Prince Albert, Sir Robert Peel, Lord John Russell, Lord Palmerston and other English statesmen. On the 8th of June he was back at Berlin, and on the same day he took his seat as member for Wirsitz in the Prussian national assembly, and delivered a speech in which he expressed belief in constitutional principles. In 1849, when the revolutionary party in the grand-duchy of Baden became dangerous, he accepted the command of "the army of operation in Baden and the Palatinate," and his plans were successfully carried out. When, however, he returned to London, he was received with the utmost personal affability. In 1854 the prince was raised to the rank of a field-marshall and made governor of the federal fortress of Mainz. When the king was attacked with a disease of the brain, Prince William assumed the regency (7th October 1858), and on his brother's death, on the 2nd of January 1861, succeeded him as William I.

The political events of William's regency and reign are told elsewhere (see Germany: History: Prussia: History). His personal influence upon these events is, however, of great importance and deserves separate notice. William was not a ruler of the intellectual type of Frederick the Great; but he believed intensely in the "God of battles" and in his own divine right as the viceroy of God so conceived. He believed also in the ultimate union of Germany and in the destiny of Prussia as its instrument; and he held that whoever aspired to rule Germany must seize it for himself (Letter to von Natzmer of the 20th of May 1849, in Natzmer's Unten den Hohensdorren). But an attitude so wholly alien to the Liberal temper of contemporary Germany was tempered by shrewd common sense, and, above all, by a capacity to choose his advisers well and listen to their advice. Thus it came about that the regent, whose reactionary views were feared, called the Liberals into office on Bismarck's advice, though later he did not hesitate to override the constitution when the refusal of the supplies for the new armaments made this course necessary. From September 1862, when Bismarck took office as minister president, William's personality tends to be obscured by that of his masterful servant, who remained beside him till his death. But Bismarck's Rewards and Risks contain plentiful proof that his master was by no means a cipher. His prejudices, indeed, were apt to run athwart the minister's plans; and as in the Schleswig-Holstein question, when the king's conscience in the matter of the claims of the Augusten- burg prince threatened to wreck Bismarck's combinations. But, as Bismarck put it, the annexation of the duchies gave him "a taste for conquest," and in the campaign of 1866 the difficulty was to restrain the king, who wished to enter Vienna in triumph. whatever may have been the feelings of the Prussians before the war, there can be no doubt that it fully justified the king's policy, and on his return to Berlin he was received with unbounded enthusiasm.

In the events immediately preceding the Franco-German War of 1870-71 again it was Bismarck and not the king that gave the determining impulse. In the matter of the Hohenzollern candidature King William's attitude was strictly "correct." He was justified in refusing to discuss further with Benedetti the question of "guarantees," a matter which touched his honour; and if the refusal, courteously framed, was read in Paris as an insult, this was due to Bismarck's "editing" of the Em's telegram (see pp. 773, 778). In the case of the French declaration of war it was all Germany rallied round the king of Prussia, and when, on the 31st of July, he quitted Berlin to join his army, he knew that he had the support of a united nation. He crossed the French frontier on the 11th of August, and personally commanded at the battles of Gravelotte and Sedan. It was during the siege of Paris, at his headquarters in Versailles, that he was proclaimed German emperor on the 18th of January 1871. On the 3rd of March 1871 he signed the prelminaries of peace which had been accepted by the French. As emperor he was the leading spirit, and when the imperial parliament of Germany was opened on the 16th of June he triumphantly entered Berlin at the head of his troops.

After that period the emperor left the destinies of Germany almost entirely in the hands of Bismarck, who held the office of imperial chancellor. In his personal history the most notable events were two attempts upon his life in 1878—one by a working lad called Hödel, another by an educated man, Karl Nobiling. On the first occasion the emperor escaped without injury, but on the second he was seriously wounded. These attacks grew out of the anarchical agitation in Prussia and Germany, for these, passed under anti-Socialist law, were made afterwards from time to time renewed. Until within a few days of his death the emperor's health was remarkably robust; he died at Berlin on the 9th of March 1888.

The reign of William I. marked an era of vast importance in the history of Germany. In his time Prussia became the first power in Germany and Germany the first power in Europe, though these momentous changes were due in a less degree to him than to Bismarck and Moltke; but to him belongs the credit of having recognized the genius of these men, and of having trusted them absolutely. Personally William maintained the best traditions of the Hohenzollerns, not only by the splendour of the achievements with which his name will always be intimately associated, but by the simplicity, manliness and uprightness of his daily life. By his marriage with Augusta of Saxe-Weimar William I. had two children: the crown prince Frederick William (b. 1831), who succeeded him as Frederick III. (q.v.), and the princess Louise (b. 1838), married in 1856 to the grand-duke of Baden.

William I.'s military writings were published in 2 vols. at Berlin in 1879. Of his letters and speeches several collections have appeared: Politische Korrespondenz Kaiser Wilhelms I. (1890); Kaiser Wilhelms des Grossen Briefe von den Reden und Seiner Rede am Konigstag, von Preussen und der Kaisers u. Königs Wilhelm I. Tagebuchblätter (Berlin, 1897); Endlicher, Des Kaisers Wilhelm I. Tagebuchblätter. Blume, Kaiser Wilhelm und... Roon als Bieder des preussisch-deutschen Heeres (Berlin, 1906); E. Marcks, Kaiser...
WILLIAM II. (GERMANY)

WILLIAM II. [FRIEDRICH WILHELM VICTOR ALBERT] (1859- ), king of Prussia and German emperor, was born on the 27th of January 1859 at Berlin, being the eldest child of Prince Frederick of Prussia, afterwards crown prince and second German emperor, and of Victoria, princess royal of Great Britain and Ireland. On his tenth birthday he was appointed second lieutenant in the First Regiment of the Guards. From September 1874 to January 1877 he attended the gymnasion at Cassel; he studied for two years at Bonn, and was then for some time chiefly occupied with his military duties. In 1883 he was appointed colonel of the Hussars of the Guard. He was much influenced by the military atmosphere in which his life was spent, and was more in sympathy with the strongly monarchical feelings of the emperor William and Bismarck than with the more liberal views of his own parents, but until the illness of his father in 1887 he took no part in political life. The death of his father on 18th March 1888 deprived him of his only brother, and on the 15th of June he became ninth king of Prussia and third German emperor. The chief events of his reign up to 1910 are narrated under GERMANY: History, but here it is necessary to dwell rather on the personality of the emperor himself. His first act was an address to the army and navy, while that to his people followed after three days. Throughout his reign, indeed, he repeatedly stated that the army was the true basis of his throne: "The soldier and the army, not parliamentary majorities, have welded together the German Empire. My confidence is placed in the armed forces." From the first he showed his intention to be his own chancellor, and it was this which brought about the quarrel with Bismarck, who could not endure to be less than all-powerful. The dismissal and disgrace of the great statesman first revealed the resolution of the new ruler; but, as regards foreign affairs, the apprehensions felt at his accession were not fulfilled. While he maintained and confirmed the alliance with Austria and Italy, in obedience to the last injunctions of his grandfather, he repeatedly attempted to establish more cordial relations with Russia. His overtures, indeed, were scarcely received with corresponding cordiality. The intimacy of Russia with the German empire was increased, and more than a year passed before the Russian emperor appeared on a short visit to Berlin. In 1890 the emperor again went to Russia, and the last meeting between him and Alexander III. took place at Kiell in the autumn of 1891, but was marked by considerable coolness. By his visit to Copenhagen, as in his treatment of the duke of Cumberland and in his frequent outeures to France, the emperor showed the strong desire, by the exercise of his own great personal charm and ability, to heal the wounds left by the events of a generation before. In the autumn of 1888 he visited not only the courts of the confederate princes, but those of Austria and Italy. While at Rome he went to the Vatican and had a private conversation with Pope Leo XIII., and this visit was repeated in 1895 and again in 1903. In 1889 the marriage of his sister, the Princess Sophie, to the duke of Sparta, took him to Athens, and thence he sailed to Constantinople. It was the first time that one of the great rulers of Christendom had been the guest of the sultan. A more active interest was now taken by Germany in the affairs of the Levant, and the emperor showed that he would not allow his influence to be overlooked, indeed, in the travel of the roads along which Bismarck had so long guided the country. It was not enough that Berlin had become the centre of the European system. The emperor was the apostle of a new Germany, which claimed that her voice should be heard in all political affairs, in whatever quarter of the globe they might rise. Once again, in 1898, he went to Constantinople. It was the time when the Armenian massacres had made the name of Abd-ul Hamid notorious, and the very striking friendliness shown towards him scarcely seemed consistent with the frequent claims made by the emperor to be the leader of Christendom; but any scruples were doubtless outweighed by the great impulse he was able to give to German influence in the East. From Constantinople he passed on to Palestine. He was present at the consecration of the German Protestant church of the Redeemer. By the favour of the sultan he was able to present to the German Catholics a plot of ground, the Dormition de la Sainte Vierge, very near to the Holy Places.

The motive of his frequent travels, which gained for him the nickname of Der Reise-Kaiser, was not solely political, but a keen interest in men and things. His love of the sea was shown in an annual voyage to Norway, and in repeated visits to the Cowes regatta. He was a keen yachtsman and fond of all sorts of sport, and, though deprived of the use of his left arm through an accident when he was a child, he became an excellent shot and rider.

At the time of his accession there was a strong manifestation of anti-British feeling in Berlin, and there seemed reason to suppose that the party from which it proceeded had the patronage of the emperor. Any temporary misunderstanding was removed, however, by his visit to England in 1889. For the next six years Germany and Great Britain, which had been estranged from Germany and Great Britain were close. While the emperor's visits were largely prompted by personal reasons, they had an important political effect; and in 1890, when he was entertained at the Mansion House in London and visited Lord Salisbury at Hatfield, the basis for an entente cordiale seemed to be under discussion. But after 1895 the growth of the colonial spirit in Germany and the strong commercial rivalry with Great Britain, which was creating in Germany a feeling that a navy must be built adequate to protect German interests, made the situation as regards England more difficult. And an unscheduled incident occurred at the end of that year, which brought to a head all the latent feelings of suspicion and jealousy in both countries. On the occasion of the Jameson Raid he despatched to the president of the Transvaal a telegram, in which he congratulated him that "without appealing to the help of friendly powers," he had succeeded in restoring peace and preserving the independence of his country. It was very difficult to regard this merely as an impulsive act of generous sympathy with a weak state unjustly attacked, and though warmly approved in Germany, it caused a loss of esteem from Great Britain. The emperor did not again visit England till the beginning of 1901, when he attended the deathbed and funeral of Queen Victoria. On this occasion he placed himself in strong opposition to the feelings of the large majority of his countrymen by conferring on Lord Roberts the Order of the Black Eagle, the most highly prized of Prussian decorations. He had already refused to receive the ex-president of the Transvaal on his visit to Europe. Meanwhile, with the other great branch of the English-speaking people in the United States, it was the emperor's policy to cultivate more cordial relations. In 1902, on the occasion of the launching of a yacht built for him in America, he sent his brother Prince Henry to the United States as his representative. The occasion was rendered of international importance by his official attitude and by his gifts to the American people, which included a statue of Frederick the Great. The emperor also initiated in 1906 the exchange of professors between German and American universities.

As regards home policy, the most important work to which the emperor turned his attention was the increase of the German naval forces. From the moment of his accession he constantly showed the keenest interest in naval affairs, and the numerous changes made in the organization were due to his personal initiative. It was in January 1895, at an evening reception to members of the Reichstag, that he publicly put himself at the head of the movement for making Germany a sea power. In all the subsequent discussions on the naval bills his influence was decisively used to overcome the resistance of the Reichstag. "Our future," he declared, "is on the water," and in speeches in all parts of the country he combated the indifference of
the inland Germans to the sea. "I will not rest," he telegraphed to his brother, "till I have brought my navy to the same height which my army stands at." The development of "German armaments during the next few years (see NAVY) showed that this was no idle boast. But, while it was inevitable that the inference should be drawn that the increase of the German navy was directed towards eventual hostilities with Great Britain, the emperor himself insisted that the real object was the preservation of peace consistently with the maintenance of Germany's "place in the sun." In March 1905, in a speech at Bremen, he declared the aim of the Hohenzollerns to be "a world-wide dominion founded upon conquests not gained by the sword, but by the tolerance and confidence of peoples that press towards the same goal." "Every German warship launched," he said, "is one guarantee more for peace on earth." In the same spirit he protested later, in an "interview" published in the Daily Telegraph of the 28th of October 1908, that he had always been actuated by the friendliest feelings towards England, but that "Germany must be prepared for any eventualities in the East," and that, in view of the growing naval power of Japan, England should welcome the existence of a German fleet "when they speak together on the same side in the great debates of the future." For to the emperor, who had published a cartoon, drawn by himself, representing the European powers against the Yellow Peril, the Anglo-Japanese alliance seemed a betrayal of the white race, an unnatural league which could not last. The justification of his naval policy so far as European affairs were concerned was revealed in the effective intervention of Germany in regard to France and Morocco in 1905, and in 1909 in the defence of British policy when Austria, backed by Germany, tore up the treaty of Berlin in regard to Bosnia and Herzegovina.

In numerous rhetorical speeches the emperor had impressed the world with his personal conviction of autocratic sovereignty, and his monarchical activity was certain, sooner or later, to bring him into conflict with the constitutional limitations of his position as king of Prussia and German emperor. His imperial style, constitutionally but the honorary title of the primus inter pares in a free confederation of sovereign princes, was invested by him with something of the glamour of that of the Holy Roman emperors, with their shadowy claim to world-dominion. In speech after speech he proclaimed the world-mission of Germany, of which he himself was the divinely appointed instrument; Germany, he said, "spoke in the name of the Hohenzollerns in the work of civilization," and Germanism, like the spirit of imperial Rome, must expand and impose itself. This new imperialism, too, had a religious basis, for "the whole of human life hinges simply and solely on our attitude towards our Lord and Saviour." The emperor's progresses in the East were conceived in the spirit of the new crusade, at once Christian and German; and a solemn service, to which none but the emperor and his train were admitted, was held on the summit of the Mount of Olives. In the same spirit, too, the emperor dispensed the marks of his approval and disapproval beyond the borders of his own jurisdiction, sometimes with results which were open to criticism. The "Kruger telegram" has been mentioned; scarcely less characteristic was the message despatched by him on the 9th of April 1906, after the Algeciras conference, to Count Goluchowski, the Austro-Hungarian foreign minister, congratulating him on having proved "a brilliant second on the duelling-ground." Goluchowski's retirement was mainly due to this compliment. In 1905 he bestowed the order Pour le Mérite not only on the Japanese general Nagai, but also on the Russian general Stöffel, who commanded the Russian troops at Port Arthur, who was afterwards condemned by a Russian court-martial for dereliction of duty. In 1902 his telegram to the regent of Bavaria condemning the refusal of the clerical majority in the diet to vote £5,000 for art purposes, and offering himself to supply the money, was regarded as an unwarrantable interference in the internal affairs of Bavaria and roused strong resentment among the clericals all over Germany.

Owing to the political conditions in Germany it was generally left for the Socialists to attack these excursions on the part of the emperor into fields which lay beyond his strict prerogative. But, apart from the traditional lines of political cleavage, such as the inherited hatred of the Liberal South for the Hohenzollerns "corporal's cane," other centres of dissatisfaction were coming into being. The emperor was isolated in his efforts to impose the old, strenuous, Prussian ideals of "self-denial, discipline, religion, avoidance of foreign contangion." With the growth of wealth German was becoming materialized and to some extent Americanized, partly through the actual reflux of emigrants grown rich in the United States. In this way, far removed from the days, denounced by the historian Gervinus, when the Germans were content to "fiddle and be slaves," the phrases which still woke responsive echoes in the squares of the Old Mark of Brandenburg were apt to create surprise, if not indignation; and in the great industrial classes the principles of Social Democracy spread apace. The emperor himself here and there even yielded a little to the new ideas, as when, in the famous "Babel and Bible" controversy of 1903, arising out of lectures in which Professor Delsart had derived Jewish monotheism from Brahminical polytheism, he publicly accepted the main conclusion of the "higher criticism" of the Old Testament, while maintaining that the kernel and contents, God and His works, remain always the same; or when on the 17th of November 1906, on the 25th anniversary of William I's edict announcing national insurance, he promised further social reforms. But he was impatient of what he considered factious opposition, and was apt to appeal from the nation in parliament to the nation in arms, as when in 1906, at the Silesian manœuvres, he condemned the critical spirit exercised towards the government, and invoked once more the protection of Germany's "Divine Ally." Clearly, this was an attitude which was inconsistent with the development of what prided itself on being a constitutional state; but there were obvious difficulties in the way of controlling the utterances of a ruler, vigorous, self-confident and conscious of the best intentions, who was also the master of many legions, whose military spirit he could evoke at will. In October 1906 the publication of Prince Hohenlohe's Memoirs, containing indirect revelations of the emperor's action in the dismissal of Bismarck, caused a profound sensation. A libel action against the publisher of the Memoirs was brought by the emperor, but the range of the court was further damaged by various libel and invasion revelations, made by Herr Harden in the Zuckschi, as to the character of the "camarilla" by which the emperor was surrounded, and it was affirmed that a connexion could here be traced with the fall of Caprivi in 1894. The long-drawn-out trials and countertrials left the character of the emperor entirely unstained, but they resulted in the disgrace of men who had been his confidants—Prince Philip Eulenburg, Count Kuno Moltke and others. The attitude of the emperor throughout was manly and sensible; and not the least satisfactory outcome of the whole sorry business was the issue, on the 28th of January 1907, of an edict, afterwards embodied in a bill, greatly modifying the law of lèse-majesté, which in the earlier part of the reign had been used to ridiculous excess in the imprisonment of the authors of the slightest reflection on the person of the sovereign.

Anglo-German relations were apparently improved by a visit of the emperor to England in November 1907. But early in 1908 they were again strained by the revelation, made in The Times of the 6th of March, of a correspondence between the emperor and his confidant, Count von Edelstein, which led to a further rift between Russia and Germany. In answer to friendly assurances on the emperor's part, the British secretary of state had communicated to him an outline of the new naval programme before it had even been laid on the table of the House of Commons. The angry controversy to which this gave rise, and the emperor's attempts to allay it, led at the end of the year to a serious crisis in his relations with his subjects. On the 11th of August he had met Edward VII. at Cronberg; on the 30th, in a speech at Strassburg, he reiterated
the intention of Germany to maintain the high level of her armaments; and on the 28th of October there appeared in the Daily Telegraph an extraordinary "interview," authorized by him, in which he expounded his attitude. The document was a résumé of his table-talk during his stay at Highcliffe Castle, on the Hampshire coast opposite the Isle of Wight, in the autumn of 1907. In it he reiterated that his heart was set on peace; he declared that, so far from being hostile to the English, he had offended large sections of his people by his friendship for England. He instanced his refusal to receive the Boer delegates and his rejection of the treaty (He had rejected the peace (November) and acted alone in the resolution to stop the South African War; he also mentioned the curious fact that at an early stage of the war he had himself drawn up a plan of campaign for the British and sent it to Windsor. It was on this occasion, too, that he made the suggestion of an eventual co-operation of the British and German fleets in the Far East. This pronouncement created a profound sensation, not only in Germany, where the indignation was intense, but in Russia, France and Japan, where it was regarded as a Machiavellian attempt to loosen existing alliances. In the German press and parliament a storm of protest arose. Pichigrus, Bührer and more than one responsible minister in Prussian recognition, which was not accepted, and he was forced to make in the Reichstag the best defence that he could for the imperial indiscretion, declaring that henceforward the emperor would show more reserve. The emperor publicly endorsed the chancellor's explanations, and for nearly two years maintained in public an almost unbroken silence. But this came to an end in a speech delivered at Konigsberg, on the 25th of August 1910. In this the emperor again laid special stress upon the divine right by which alone the kings of Prussia rule, adding: "considering myself as the instrument of the Lord, without heeding the views and opinions of the day, I go my way." This speech led to a debate, on a Socialist interpellation, in the Reichstag (November 26). In reply to the enquiry what the government intended to do in fulfilment of the pledge given in 1908, the chancellor denied that the emperor had exceeded his constitutional rights, a view supported by the majority of the House.

The emperor married on the 27th of February 1881 Princess Auguste Victoria, daughter of Frederick, duke of Augustenburg, who in 1863 had come forward as claimant to the duchies of Schleswig-Holstein; the marriage had, therefore, some political importance, for it sealed the reconciliation of one of the dynasties that had suffered by the division of Prussia 1866. The one daughter: (1) Wilhelm, born 6th May 1882, Crown Prince, whose coming of age was celebrated with much ceremony on his eighteenth birthday, and who married on the 6th of June 1905 the duchess Cecilia of Mecklenburg. Their children: (2) August, born on the 4th of June 1906; (2) Eitel Friedrich, born on the 7th of July 1883; (3) Adalbert, born on the 14th of July 1884; (4) August Wilhelm, born on the 20th of August 1887; (5) Oskar, born on the 27th of July 1888; (6) Joachim, born on the 17th of December 1889; and (7) Victoria Luise, born on the 13th of September 1892.

For the emperor's speeches, see, Katersdraden, Reden und Erlasses, Briefe und Telegramme Kaiser Wilhelms II. (Leipzig, 1902); translated by E. Elkind, as The German Emperor's Speeches (London, 1904).

WILLIAM I. (1772–1844), king of the Netherlands, born at the Hague on the 24th of August 1772, was the son of William V, prince of Orange and hereditary stadtholder of the United Netherlands by Sophia Wilhelmina, princess of Prussia. In 1791 he married Frederica Wilhelmina, daughter of Frederick William II., king of Prussia, thus cementing very closely the relations between the houses of Orange-Nassau and Hohenzollern. After the outbreak of the French revolution (1789), he distinguished himself in the struggle against the revolutionary army under Dumouriez by the capture of Landrecies and the relief of Charleroi. By the victories of Pichegru the stadtholder and his family were, however, compelled to leave Holland and seek refuge in England, where the palace of Hampton Court was set apart for their use. He afterwards made Berlin his residence, and took an active part in the unfortunate campaign under the duke of York for the reconquest of the Netherlands. After the peace of Amiens he had an interview with Napoleon at Paris, and received some territory adjoining the hereditary domains of the house of Nassau in Westphalia as a compensation for the abandonment of the stadtholderate and the domains of his house. William refused, however, in 1806, in which year by the death of his father he became prince of Orange, to separate his interests from those of his Prussian relatives, and fought bravely at Jena. He was therefore despoiled by Napoleon of all his possessions. In 1809 he accepted a command in the Austrian army under the archduke Charles and was wounded at the battle of Wagram. When Holland rose in revolt against French domination in 1813, after eighteen years of exile he landed at Scheveningen (on the 19th of October), and on the 22nd of the same month he was acclaimed King of the Netherlands.

William had many excellent qualities, but his long life of exile and hardship had made him niggardly and narrow. He was unable to rise to the great opportunity which lay before him of creating out of the Dutch and Belgian provinces a strong and united state. Two hundred and fifty years of political separation and widely differing experiences had caused the two kindred populations on this and that side of the Scheldt to grow apart in sentiment and tradition. This difference was still further accentuated by strong divergence in religious creed. Further, one-third of the Belgian provinces was inhabited by a Walloon population divided from the Flemings by racial characteristics and their use of a Romance instead of a Teutonic dialect. All these things William was inclined to ignore. He drew up a constitution, which was accepted unanimously by the Dutch, but was rejected by the Belgians, because it contained provisions for liberty of worship. The king, however, by a subterfuge declared that the fundamental law had been approved. The new constitution, therefore, started badly, and it was soon evident that William intended to make his will prevail, and to carry out his projects for what he conceived the social, industrial and educational welfare of his kingdom, regardless of the opposition of Belgian public opinion. The Belgians had grievances. Their representation in the states general was exactly equal to that of the Dutch, though their population was in the proportion of seven to five. With the help of the official vote of ministers the Dutch were thus able to have a perpetual majority. The whole machinery of government was centralized at the Hague, and Dutchmen filled nearly all the principal posts. The attempt of the king to enforce the official use of the Dutch language, and the foundation of the so-called philosophical college at Louvain helped to exacerbate the growing discontent. The rapid advance of Belgium in industrial and manufacturing prosperity, due largely to the stimulus of William's personal initiative, did nothing to bring north and south together, but rather increased their rivalry and jealousy, for the Dutch provinces had neither manufactures nor iron- and coal-mines, but were dependent on agriculture and sea-borne commerce for their welfare. Such clashing of interests was sure to produce alienation, but the king remained apparently blind to the signs of the times, and the severe enforcement of a harsh law restricting freedom of the press led suddenly in 1830 to a revolt (see BELGIUM), which, beginning at Brussels on the 21st of August, rapidly spread over the whole country. The Dutch were almost without striking a blow expelled from the country, the strongly fortified seaport of Antwerp alone remaining in their hands. Had the king consented at once to the administrative autonomy of Belgium, and appointed the prince of Orange governor of the southern Netherlands, it is probable that the revolt might have been appeased. At the first there was undoubtedly a strong body of public opinion in favour of such a compromise, and the house of Orange had many adherents in the country. William,
however, was too proud and too obstinate to lend himself to such a course. He appealed to the powers, who had, in 1815, created and guaranteed the independence of the kingdom of the Netherlands. By the treaty of the eighteen articles, however, concluded at London on the 29th of June 1831, the kingdom of Belgium was recognized, and Leopold of Saxe-Coburg was elected king. William refused his assent, and in August suddenly invaded Belgium. The Belgian forces were dispersed, and the Dutch would have entered Brussels in triumph but for the intervention of the French. Still, however, William declined to recognize the treaty he had signed, and he had behind him the unanimous support of Dutch public opinion. For nine years he maintained this attitude, and resolutely refused to append his signature to the treaty of 1831. His subjects at length grew weary of the heavy expense of maintaining a large military force on the Belgian frontier and in 1839 the king gave way. He did so, however, on favourable terms and was able to insist on the Belgians yielding up their possession of portions of Limburg and Luxembourg, which they had occupied since 1830.

A cry now arose in Holland for the revision of the fundamental law, with its feudal institutions; ministerial responsibility was introduced, and the royal control over finance diminished. William, however, disliked these changes, and finding further that his proposed marriage with the countess d'Oultremont, a Belgian and a Roman Catholic, was very unpopular, he suddenly abdicated on the 7th of October 1840. After his abdication he married the countess and spent the rest of his life in quiet retirement upon his private estate in Silesia. He died in 1844.

Colenbrander, De Belgische Onwetendheid (The Hague, 1836); T. van Boeijen, Le gouvernement de la Hollande entre 1813 et le Consulat de la royauté du pays-Bas (Brussels, 1870); and P. Blok, Geschiedenis der Nederlandsche Volk, vols. vii. and viii. (Leiden, 1907-1908).

WILLIAM II. (1702-1849), king of the Netherlands, son of William I., was born at the Hague on the 6th of December 1702. When he was three years old his family was driven out of Holland by the French republican armies, and lived in exile until 1813. He was educated at the military school at Berlin and afterwards at the university of Oxford. He entered the English army, and in 1811, as aide-de-camp to the duke of Wellington, took part in several campaigns of the Peninsula War. In 1815 he commanded the Dutch and Belgian contingents, and won high commendations for his courage and conduct at the battles of Quatre Bras and Waterloo, at the latter of which he was wounded. The prince of Orange married in 1816 the grand duchess Anna Paulowna, sister of the tsar Alexander I. He enjoyed considerable popularity in Belgium, as well as in Holland for his affability and moderation, and in 1830, on the outbreak of the Belgian revolution, he betook himself to Brussels, and did his utmost by personal conferences with the most influential men in the Belgian capital to bring about a peaceable settlement on the basis of the administrative autonomy of the southern provinces under the house of Orange. His father had given him powers to treat, but afterwards threw him over and rejected the terms of accommodation that he had proposed. He withdrew on this to England and resided there for several months. In April 1831 William took the command of a Dutch army for the invasion of Belgium, and in a ten-days' campaign defeated and dispersed the Belgian forces under Leopold I. after a sharp fight near Louvain. He would have entered Brussels in triumph, but his victorious advance was stayed by the intervention of the French. In 1840, on the abdication of his father, he ascended the throne as William II. The peace of 1830 had settled all differences between Holland and Belgium, and the new king found himself confronted with the task of the reorganization of the finances, and the necessity of meeting the popular demand for a revision of the fundamental law, and the establishment of the electoral franchise on a wider basis. He acted with good sense and moderation, and, although by no means a believer in democratic ideas, he saw the necessity of satisfying public opinion and frankly gave his support to larger measures of reform. The fundamental law was altered in 1848 and the Dutch monarchy, from being autocratic, became henceforth constitutional. The king's attitude secured for him the good will and affection of a people, loyal by tradition to the house of Orange, and the revolutionary disturbances of 1848 found no echo in Holland. William died suddenly on the 17th of March 1849.

See J. J. Abbink, Leven van Koning Willem II. (Amsterdam, 1849); J. Bosscha, Het Leven van Willem de Tweede, Koning der Nederlanden, 1793-1849 (Amsterdam, 1852); P. Blok, Geschiedenis der Nederlandsche Volk (Leiden, 1908).

WILLIAM III. (1817-1890), king of the Netherlands, son of William II., was born at Brussels on the 10th of February 1817. He married in 1839 Sophia, daughter of William I., king of the Netherlands. Sophia was an accomplished woman, of high intelligence, but unfortunately the relations between the royal pair were far from cordial and finally ended in complete disagreement, and the breach between them continued until the death of the queen in 1877. The private life of the king in fact gave rise to much scandal; nevertheless he was an excellent constitutional monarch, and, though he never sought to win popular favour, succeeded in winning and retaining in a remarkable degree his people's affectionate loyalty. He had no sympathy with political liberalism, but throughout his long reign (1849-1890) he was always guided by a sense of statesmanship; and in many ministerial crises, he never had a serious conflict with the states-general, and his ministers could always count upon his fair-mindedness and an earnest desire to help them to further the national welfare. He was economical, and gave up a third of his civil list in order to help forward the task of establishing an equilibrium in the annual budget, and he was always ready from his large private fortune to help forward all schemes for the social or industrial progress of the country. It was largely due to his prudent diplomacy that Holland passed pacifically through the difficult period of the Luxembourg settlement in 1866 and the Franco-German War of 1870.

William III. had two sons by his marriage with Sophia of Württemberg, William (1841-1879), and Alexander (1843-1884). Both of them died unmarried. The decease of Prince Alexander left the house of Orange without a direct heir male, but the prospect of a disputed succession had fortunately been averted by the marriage of the king in 1879 with the princess Emma of Waldeck-Pyrmont. From this union a daughter, Wilhelmina, was born in 1880. On her father's death at the Loo, on the 23rd of November 1890, to which she succeed as queen of the Netherlands under the regency of her mother.

William was grand duke of Luxembourg by a personal title, and his death severed the dynastic relation between the kingdom of the Netherlands and the grand duchy. The sovereignty of the Luxemburg duchy passed to the next heir male of the house of Nassau, Adolphus, ex-duke of Nassau.

See J. A. Bruijning, Geschiedenis van Nederland in eenzijdig (4 vols., Schiedam, 1889-1906); P. Blok, Geschiedenis der Nederlandsche Volk (Leiden, 1906-1914); P. Blok, De regering van Koning Willem III. (Groningen, 1887).

WILLIAM (1227-1256), king of the Romans and count of Holland, was the son of Count Floris IV. and his wife Matilda, daughter of Henry, duke of Brabant. He was about six years of age when his father was killed in a tournament, and the fact that his long minority was peaceful and uneventful speaks well for the good government of his two paternal uncles, who were his guardians. William was, however, suddenly in 1247 to become a prominent figure in the great Guelph-Ghibelline struggle, which at that time was disturbing the peace of Europe. The quarrel between the church and the emperor Frederick II. had now reached an acute stage. Pope Innocent IV., who had failed in repeated efforts to induce various princes to accept the dignity of king of the Romans in place of the excommunicated Frederick, found the youthful William of Holland ready to accept the proffered crown. After a long siege William succeeded in taking the imperial city of Aschaffenburg, where he was crowned on All Saints' Day 1248. As the recognized head of the Guelph party he spared no efforts to win for himself friends
in Germany, but he never really succeeded in forming a party or gaining for himself a footing in the Empire during the lifetime of Frederick. With the extinction of the Hohenstaufen house in 1254 his chances were much improved, but shortly afterwards his death occurred on the 28th of January 1256 through his horse breaking through the ice during an obscure campaign among the Frisian marshes. William was more successful in his struggles with Margaret, countess of Flanders and Hainaut, known as "Black Meg." She wished her succession to pass to the sons of her second marriage with William of Dampierre in preference to those of his first marriage with Bouchard of Avennes. But John of Avennes, her eldest son, had married William's sister Aleidis. William took up arms in defence of his brother-in-law's rights and Margaret was decisively beaten at West Kappel in 1253, and was compelled to acknowledge John of Avennes as her successor to the county of Hainaut.

See A. Ulrich, "Geschichte des römischen Königs, Wilhelm von Hainaut" (Hanover, 1882).

**WILLIAM I. (d. 1166), king of Sicily, son of King Roger II. by Elvira of Castile, succeeded in 1154. His title "the Bad" seems little merited and expresses the bias of the historian Falcandus and the baronial class against the king and the official class by whom he was guided. It is obvious, however, that William was far inferior in character and energy to his father, and Matthew Bonello, leader of the reform party, was able to palm his administration over the Frisian marshes. The real power in the kingdom was at first exercised by Maio of Bari, a man of low birth, whose title *ammirato ammiratorum* was the highest in the realm. Maio continued Roger's policy of excluding the nobles from the administration, and sought also to curtail the liberties of the towns. The barons, always chafing against the royal power, were encouraged to revolt by Pope Adrian IV., whose recognition William had not yet sought, by the Basileus Manuel and the emperor Frederick II.

At the end of 1155 Greek troops recovered Bari and began to harass Brindisi. William, however, was not devoid of craft and energy; landing in Italy he destroyed the Greek fleet and army at Brindisi (28th May 1156) and recovered Bari. Adrian came to terms at Benevento (18th June 1156), abandoned the rebels and confirmed William as king, and in 1158 peace was made with the Greeks. These diplomatic successes were probably due to Maio; on the other hand, the African dominions were lost to the Almohads (1156-1160), and it is possible that he advised their abandonment in face of the danger of threatening the kingdom down from the north. The policy of the minister led to a general conspiracy, and in November 1160 he was murdered in Palermo by Matthew Bonello, leader of the reform party, who was the king in the hands of the conspirators, who purposed murdering or deposing him, but the people and the army rallied round him; he recovered power, crushed the Sicilian rebels, had Bonello blinded, and in a short campaign reduced the rest of the Regno. Thus freed from feudal revolts, William confirmed the government to men trained in Maio's school, such as the grand notary, Matthew d'Agelo. His latter years were peaceful; he was now the champion of the true pope against the emperor, and Alexander III. was installed in the Lateran in November 1165 by a guard of Normans. William died on the 7th of May 1166. (E. C.)

**WILLIAM II. (d. 1189), king of Sicily, was only thirteen years old at the death of his father William I. when he was placed under the regency of his mother, Marguerite of Navarre. Until the king came of age in 1171 the government was controlled first by the chancellor Stephen of Perche, cousin of Marguerite (1166-1168), and then by Walter Ophamil, archbishop of Palermo, and Matthew d'Agelo, the vice-chancellor. William's character is very indistinct. Lacking in military enterprise, secluded and pleasure-loving, he had emerged from his palace life at Palermo. Yet his reign is marked by an ambitious foreign policy and a vigorous diplomacy. Champion of the papacy and in secret league with the Lombard cities he was able to defy the common enemy, Frederick II. In 1174 and 1175 he made treaties with Genoa and Venice and his marriage in February 1177 with Joan, daughter of Henry II. of England, marks his high position in European politics. To secure peace with the emperor he sanctioned the marriage of his aunt Constance, daughter of Roger II., with Frederick's son Henry, afterwards the emperor Henry VI. causing a general oath to be taken to his successor in case of his death without heirs. This step, fatal to the Norman kingdom, was possibly taken that William might devote himself to foreign conquests.1

Unable to revive the African dominion, William directed his attack on Egypt, from which Saladin threatened the Latin kingdom of Jerusalem. In July 1174, 50,000 men were landed before Alexandria, but Saladin's arrival forced the Sicilians to re-embark in disorder. A better prospect opened in the confusion in Byzantine affairs which followed the death of Manuel Comnenus (1180), and William took up the old design and feud against Constantinople. Durazzo was captured (11th June 1182) and in August Thessalonica surrendered to the joint attack of the Sicilian fleet and army. The troops then marched upon the capital, but the troop of the emperor Isaac Angelus overthrew the invaders on the banks of the Strymon (7th Sept. 1182). Thessalonica was at once abandoned and in 1189 William made peace with Isaac, abandoning all the conquests. He was now planning to induce the crusading armies of the West to pass through his territories, and seemed about to play a leading part in the Third Crusade; but George of Antioch, with 6,000 Frankish troops, was in the Mediterranean open for the Franks, and forced the all-victorious Saladin to retire from before Tripoli in the spring of 1188. In November 1189 William died, leaving no children. His title of "the Good" is due perhaps less to his character than to the cessation of internal troubles in his reign. The "Voyage" of Ibn-Globair, a traveller in Sicily in 1183-1185, shows William surrounded by Moslem women and eunuchs, speaking and reading Arabic and living like a Moslem king. (E. C.)

**WILLIAM I. [FRIEDRICH KARL] (1781-1864), king of Württemberg, was born at Lüben in Silesia on the 27th of September 1781. In his early days he was debarred from public life owing to a quarrel with his father, whose time-serving deference to Napoleon was distasteful to him. In 1814-1815 he suddenly rose into prominence through the Wars of Liberation against France, in which he commanded an army corps with no little credit to himself. On his accession to the throne of Württemberg in 1816 he realized the expectations formed of him as a liberal-minded ruler by promulgating a constitution (1819), under which serfdom and obsolete class privileges were swept away, and by issuing edicts which greatly assisted the financial and industrial development and the educational progress of his country. In 1838 he sought to disarm the revolutionary movement by a series of further liberal reforms which removed the restrictions more recently imposed at Metternich's instance by the Germanic diet. But his relations with the legislature, which had from time to time become strained owing to the bureaucratic spirit which he kept alive in the administration, were definitely broken off in consequence of a prolonged conflict on questions of Germanic policy. He cut the knot by repudiating the enactments of 1836-1839 and by summoning a packed parliament (1852), which re-enforced the code of 1819.

The same difficulties which beset William as a constitutional reformer imposed him as a champion of Germanic union. Intent above all on preserving the rights of the Middle Germanic states against encroachments by Austria and Prussia he lapsed into a policy of mere obstruction. The protests which he made in 1820-1823 against Metternich's policy of making the minor German states subservient to Austria met with less success than they perhaps deserved. In 1849-1850 he made a firm stand against the proposals for a Germanic union proposed by the National Parliament at Frankfort, for fear lest the exaltation of Prussia should eclipse the lesser principalities. Though forced to accede to the proffering of the imperial crown to the king of Prussia, he joined heartily in Prince Schwarzenberg's schemes for undoing the work of the National Parliament, and by means of

1 Chalandon, *La Domination normande*, ii. 359.
the coup d’etat described above forced his country into a policy of alliance with Austria against Prussia. Nevertheless, his devotion to the cause of German union is proved by the eagerness with which he helped the formation of the Zollverein (1828-1830), and in spite of his conflicts with his chambers he achieved unusual popularity among his subjects. He died on the 25th of June 1864, and was succeeded by his son Charles.

WILLIAM IV., landgrave of Hesse (1532-1590), was the son and successor of the landgrave Philip the Magnanimous. He took a leading part in safeguarding the results of the Reformation and was indefatigable in his endeavours to unite the different sections of Protestantism for the sake of effective resistance against the Catholic reaction. His counsels were marred by his reluctance to appeal to arms at the critical moments of action, and by the slenderness of his own resources, but they deserve attention for their broad common sense and spirit of tolerance. As an administrator, he perhaps most notably displayed rare energy, issuing numerous ordinances, appointing expert officers, and in particular establishing the finances on a scientific basis. By a law of primogeniture he secured his hand against such statutory divisions as had diminished his own portion of his father’s estate. He not only patronized art and science, but continued as ruler the intercourse with scholars which he had cultivated in his youth.

William was a pioneer in astronomical research and perhaps owes his most lasting fame to his discoveries in this branch of study. Most of the mechanical contrivances which made Tycho Brahe’s instruments so superior to those of his contemporaries were adopted at Cassel about 1584, and from that time the observations made there seem to have been about as accurate as Tycho’s; resulting longitudes were 6° too great in consequence of the adopted solar parallax of 3'. The principal fruit of the observations was a catalogue of about a thousand stars, the places of which were determined by the methods usually employed in the 16th century, connecting a fundamental star by means of Venus with the sun, and thus finding its longitude and latitude, while other stars could at any time be referred to the fundamental star. It should be noticed that clocks, on which Tycho Brahe depended very little, were used at Cassel for finding the difference of right ascension between Venus and the sun before sunset; Tycho preferred observing the angular distance between the sun and Venus when the latter was visible in the daytime. The Hessian star catalogue was published in Lucas Baretz’s Historia coelestis (Augsburg, 1668), and a number of other observations were found in the manuscript De observationibus Hassiacae (Leiden, 1618), edited by Willem de Snell. R. Wolf, in his “Astronomische Mittheilungen,” No. 45 (Vierteljahrschrift der naturforschen Gesellschaft in Zürich, 1870), has given a remarkable list of preserved and published observations Hassiacae.

WILLIAM (1533-1584), surnamed the Silent, prince of Orange and count of Nassau, was born at the castle of Dillenburg in Nassau, on the 25th of April 1533. His grandfather, John, count of Nassau, had left his Netherlands possessions to his elder son Henry, his German to his younger son William. This William of Nassau (d. 1550) had by his wife, Juliana of Stolberg, a family of five sons, of whom the subject of this notice was the eldest, and seven daughters. Henry became the trusted friend and counsellor of Charles V., and married (1515) Claude, sister of Philibert, prince of Orange. Philibert, having no issue, made René, the son of Henry and Claude, his heir. René, at the age of twenty-six, was killed at the siege of St Dié in 1544, and left his titles and great possessions by will to his cousin William, who thus became prince of Orange. William’s parents were both Protestants, and the example of his father, that the dynasty’s surname should be brought up in his court at Brussels, as a Catholic. The remembrance of his ancestors’ services and his own high qualities endeared William to Charles, who secured for him, at the age of seventeen, the hand of Anne of Egmont, heiress of the count of Buren. Anne died in 1558, leaving issue a son Philip William, prince of Orange and count of Buren, and a daughter. It was on the shoulder of the young prince of Orange that Charles V. leant when, in 1555, in the presence of a great assembly at Brussels, he abdicated, in favour of his son Philip, the sovereignty of the Netherlands. William was also selected to carry the insignia of the empire to Ferdinand, king of the Romans, when Charles resigned the imperial crown. He had, at the age of twenty-one, been placed by the emperor, before his abdication, at the head of an army of 20,000 men in the war with France, and he continued to fill that post under Philip in 1556, but without distinction. His services, as a diplomatist, were much more brilliant. He was one of the three plenipotentiaries who negotiated the treaty of Cateau-Cambresis (1559), and was largely responsible for bringing about a settlement so favourable to Spanish interests. After the conclusion of the peace, the prince spent some time at the French court, in the capacity of hostage for the carrying out of the treaty. It was during his sojourn in France that by his discreetness acquired the sobriquet of le Taciturne (the Silent), which has ever since clung to his name. The appellation is in no way expressive of the character of the man, who was fond of conversation, most eloquent in speech, and a master of persuasion. His two great adversities of the decade, which followed the peace of Cateau-Cambresis, were in 1559 closely associated with him; Granvelle as a plenipotentiary, Alva as a fellow-h各省.
August 1564 Philip issued an order for carrying out the decrees of the Council of Trent, and for the strict execution of the placards against heretics. Protests, letters, personal missions were in vain, the king's will was not to be moved from its purpose. The spirit of resistance spread first to the lesser nobles, then to the people. In the memorable year 1566 came the "Compromise," the Request," the banquet at the Hotel Culemborg with its cruet of "Vincent les Gueux" followed by the wild iconoclastic riots and outrages by bodies of fanatical Protestant sectaries at Antwerp and elsewhere. The effect of this last outbreak was disastrous. Philip was filled with anger and vowed vengeance. The national leaders drew back, afraid to identify themselves with revolutionary movements, or the cause of extreme Protestantism. Egmont was a good Catholic, and took active steps to suppress disorder, and Orange himself at the request of the regent betook himself to Antwerp, where the citizens in arms were on the point of engaging in civil strife. At the risk of his life the prince marched in bringing about an accord, and he proclaimed its terms to a stunned and half-hostile crowd he uttered for the last time the words, "Long live the King!" It was his final act of loyal service to a sovereign, who from secret emissaries that he kept at Madrid, he knew to be plotting the destruction of himself and his friends. In vain he endeavoured to rouse Egmont to a sense of his danger, and to induce him and other prominent leaders to take steps, if necessary by armed resistance, to avert their doom. Finding all his efforts fruitless William, after resigning all his posts, left the country (22nd of April 1567), and took up his residence with his eldest son, Philip, William, count of Buren, studying at the university of Louvain. He was seized (February 1568) and carried off to Spain, to be brought up as an enemy to the political and religious principles of his father. He himself was outlawed, and his property confiscated. In March he published a long and pungent defence of his conduct, entitled "Justification of the Prince of Orange against his Calumniators," and meanwhile strained every nerve to enlist an armed force for the invasion of the Netherlands. To raise money his brother, John of Nassau, pledged his estates, William himself sold his plate and jewels. An attack was made in three directions, but with disastrous results. The force under Louis of Nassau indeed gained a victory at Helligerlee in Friesland (May 23rd), but met with a crushing defeat at the hands of Alva in person (July 21st) at Jemmingen. All seemed lost, but William's indomitable spirit did not despair. "With God's help," he wrote to his brother Louis, "I am determined to go on." In September he himself crossed the Meuse at the head of 18,000 infantry and 7000 cavalry. But Alva, while clinging to his steps, refused to fight, and William, through lack of funds, was compelled to disband his mercenaries, and withdraw over the French frontier (November 17th).

Then followed the most miserable period of Orange's life. In fear of assassination, in fear of creditors, he wandered about from place to place, and his misfortunes were aggravated by the bad conduct of his wife, Anne of Saxony, who left him. She was finally, on the ground of insanity, placed in close confinement by her own family, and remained incarcerated until her death six years later. During the years 1569-1572 the brothers William and Louis, the one in Germany, the other in France, were, however, actively preparing for a renewal of the struggle for the freedom of the Netherlands. The barbarities of Alva had caused Spanish rule to be universally hated, and the agents of the Nassaus were busy in the provinces rousing the spirit of resistance and trying to raise funds. In 1569 eighteen vessels provided with letters of marque from the prince of Orange were preying upon Spanish commerce in the narrow seas. Stimulated by the hope of plunder their number rapidly grew, until the wild and fierce corsairs—named "Beggars of the sea" (Gueux de mer)—became a terror to their enemies. The refusal of Queen Elizabeth in 1572 to allow the Beggars to refit in English harbours led to the first success of the patriot cause. On the 1st of April a force under the command of Lumbres and Tresling, being compelled to take refuge in the Maas, seized the town of Brill by surprise. Encouraged by their success they likewise took by assault the important sea-port of Flushing. Like wildfire the revolt spread througholland, Zeeland, Utrecht and Friesland, and in the principal towns, one after the other, submitted themselves to the authority of the prince of Orange as their lawful statholder. Louis of Nassau immediately afterwards dashed with a small force from France into Hainault, and captured Valenciennes and Mons. In Mons, however, Louis was blockaded by a superior Spanish force, and eventually forced to surrender. William crossed the Rhine with 20,000 men to relieve him, but he was out-generalled by Alva, nearly lost his life during a night attack on his camp at Harmignies (September 11th), and retired into Holland. Delft became henceforth his home, and he cast in his lot for good and all with the brave Hollanders and Zeelanders in their struggle for freedom, "being resolved," as he wrote to his brother John, "to maintain the affair there as long as possible and decided to find there my grave." It was his spirit that animated the desperate resistance that was offered to the Spanish arms at Haarlem and Alkmaar, and it was through his personal and unremiting exertions that, despite an attack of fever which kept him to his bed, the relief of Leiden, on the 3rd of October 1574, was effected just as the town had been reduced to the last extremity.

In order to identify himself more closely with the cause for which he was fighting, Orange had, on October 23rd, 1573, made a public profession of the Calvinist religion. But he was never a bigot in religious matters. The three conditions which he laid down as the irreducible minimum on which negotiations could be based, and from which he never departed, were: (1) freedom of worship and liberty to preach the Gospel according to the word of God; (2) the restoration and maintenance of all the ancient charters, privileges and liberties of the land; (3) the withdrawal of all Spaniards and other foreigners from all posts and employments, civil and military. On these points he was inflexible, but he was a thoroughly moderate man. He hated religious tyranny whether it be exercised by Papist or Calvinist, and his political aims were not self-seeking. His object was to prevent the liberties of the Netherlands from being trampled underfoot by a foreign despotism, and he did not counsel the provinces to abjure their allegiance to Philip, until he found the Spanish monarch was intractable. But when the abjuration became a necessity he sought to find in Elizabeth of England or the duke of Anjou, a sovereign possessing sufficient resources to protect the land from the Spaniard.

William (24th of June 1575) took as his third wife, Charlotte de Bourbon, daughter of the duke of Montpensier. This marriage gave great offence to the Catholic party, for Charlotte was a renegade nun, having been abbess of Jouarre, and Anne of Saxony was still alive. In April 1576, an act of Union between Holland and Zeeland was agreed upon and signed at Delft, by which supreme authority was conferred upon the prince, as ad interim ruler. In this year (1576) the outrages of the Spanish troops in the southern Netherlands, who had mutinied for want of pay, caused a revulsion of feeling. The horrors of the "Spanish Fury" at Antwerp (November 4th) led to a definite treaty being concluded, known as the Pacification of Ghent, by which under the leadership of the prince of Orange, the whole seventeen provinces bound themselves together to drive the foreigners out of the country. This was supplemented by the Union of Brussels (January 1577) by which the Southerners pledged themselves to expel the Spaniards, but to maintain the Catholic religion and the king's authority. To these conditions William willingly assented; he desired to force no man's conscience, and as yet he professed to be acting as staitholder under the king's commission. On September 23rd he entered Brussels in triumph as the acknowledged leader of the whole people of the Netherlands, Catholic as well as Protestant, in
their resistance to foreign oppression. At this moment he touched the zenith of his career. It was, however, but a short-lived position of eminence. After the entry into Brussels followed the period of tangled intrigue during which the archduke Matthias, the duke of Anjou, the palatine count John Casimir and Don John of Austria were all striving to secure for themselves a position of supremacy in the land. William had to steer a different path, to find new leaders, and to deliver the world from this nest of brilliant talents as diplomatist and statesman, shine more brightly. But after the sudden death of Don John he found himself face to face with an opponent of abilities equal to his own in the person of Alexander Farnese, prince of Parma, appointed governor general by Philip. Farnese skillfully fomented the jealousy of the Catholic nobles of the south—the Malcontents—against the prince of Orange, and the Pacification of Ghent was henceforth doomed. The Walloon provinces bound themselves together in a defensive league, known as the league of Arras (5th of January 1579) and by the exertions of John of Nassau (at that time governor of Gelderland) Holland, Zeeland, Utrecht, Gelderland and Zutphen replied by signing (20th of January) the compact known as the Union of Utrecht. William still struggled to keep the larger federation together, but in vain. The die was now cast, and the Northern and Southern Netherlands from this time forward had separate histories. On the 25th of March 1581 a ban was promulgated by King Philip against the prince of Orange, in which William was denounced as a traitor and enemy of the human race, and a reward of 25,000 crowns in gold or land with a patent of nobility was offered to any one who should deliver the world from this pest. William replied in a lengthy document, the Apology, in which he defended himself from the accusations brought against him, and on his part charged the Spanish king with a series of misdeeds and crimes. The Apology is valuable for the biographical details which it contains. William now felt that his struggle with Philip was a war d'outrance, and knowing that the United Provinces were too weak to resist the Spanish armies unaided, he endeavoured to secure the powerful aid of France, by making the duke of Anjou sovereign of the Netherlands. Holland and Zeeland were averse to this project, and to conciliate their prejudices Orange, provisionally, and after some demur, accepted from those provinces the offer of the countship (24th of July 1581). Two days later the representatives of Brabant, Flanders, Utrecht, Gelderland, Holland and Zeeland assembled at The Hague, solemnly abjured the sovereignty of Philip, and agreed to accept the French duke as their sovereign in his place. Anjou was solemnly inaugurated by the prince in person at Antwerp, as duke of Brabant, on the 19th of February 1582. While at Antwerp an attempt was made upon William’s life (March 18th) by a Biscayan youth, named Juan Jaureguy. Professing to offer a petition he fired a pistol at the prince’s head, the ball passing in at the right ear and out by the left jaw. After hanging for some time between life and death, William ultimately recovered and was able to attend a thanksgiving service on the 2nd of May. The shock and anxiety proved, however, fatal to his wife, Charlotte de Bourbon. She expired on the 5th of May after a very short illness. The French sovereign soon made himself impossible to his new subjects, and the hopes that William had based upon Anjou were sorely disappointed. The duke was dissatisfied with his position, aimed at being an absolute ruler, and tried to carry his ambitious ideas into effect by the treacherous attack on Antwerp, which bears the name of the “French Fury.” Its failure rendered Anjou at once ridiculous and detested, and his shameless misconduct brought no small share of opprobrium on William himself. The trusty Hollanders and Zeelanders remained, however, staunchly loyal to him, and Orange now fixed his residence permanently in their midst. On the 7th of April 1583 he married in fourth weclok Louise de Coligny, daughter of the famous Huguenot, and widow of the Sieur de Dillens, without, “Father William,” as he was affectionately styled, settled at the Prinsenhof at Delft, and lived like a plain, homely Dutch burgher, quietly and unostentatiously, as became a man who had spent his all in his country’s cause, and whose resources were now one of the most modest description. Ever since the promulgation of the ban and the offer of a reward upon his life, religion and political fanaticism had been continually compassing his assassination, and the free access which the prince gave to his person offered facilities for such a purpose, despite the careful watch and ward kept over him by the men of Delft and his own household. He was shot dead by a Burgundian, Vitalaard, on the 9th of July 1583, as he was leaving his dining hall. Gérard was moved by devoted loyalty to his faith and king, and endured the torments of a barbarous death with supreme courage and resignation. William was buried with great pomp at the public charges in the Neufue Kerk at Delft amidst the tears of a mourning people. William the Silent was tall and well formed, of a dark complexion, with brown hair and eyes. He was the foremost statesman of his time, capable of forming wise and far-reaching plans and of modifying them to suit the changing circumstances in which he found himself. William the Silent, Prince of Orange, the Moderate Man of the Sixteenth Century. William the Silent; Prince of Orange; the Moderate Man of the Sixteenth Century. FRUIN, Het voorspel van den tachtigjarigen oorlog; Motley, Rise of the Dutch Republic; Cambridge Modern History, vol. iii. cc., viii. William II. (1625–1660), prince of Orange, born at The Hague on the 27th of May 1625, was the son of Frederick Henry, prince of Orange, and his wife Amalia von Solms, and grandson of William the Silent. By the act of survivance passed in 1631 the offices and dignities held by Frederick Henry were made hereditary in his family. On the 12th of May 1641 William married, in the royal chapel at Whitehall, Mary, princess royal of England, eldest daughter of King Charles I. At the time of the wedding the bridegroom was not yet fifteen years old, the bride was five years younger. William from his early youth accompanied his father in his campaigns, and already in 1643 highly distinguished himself in the battle of the Neerperke (September 5). On the death of Frederick Henry William succeeded him, not only in the family honours and possessions, but in accordance with the terms of the act of survivance in all his official posts, as stadtholder of Holland, Zeeland, Utrecht, Gelderland, Overyssel and Groningen and captain-general and admiral-general of the Union. At the moment of his accession to power the negotiations for a separate treaty of peace with Spain were almost concluded, and peace was actually signed at Münster on the 30th of January 1648. By this treaty Spain recognized the independence of the United Provinces and made large concessions to the Dutch. William, who had always been bitterly opposed to the policy of abandoning the French alliance in order to gain better terms from Spain, did his utmost to prevent the ratification, but matters were too far
advanced for his interposition to prevail in the face of the determination of the states of Holland to conclude a peace so advantageous to their trade interests. William, however, speedily opened secret negotiations with France in the hope of securing the armed assistance of that power for the carrying out of his ambitious projects of a war of aggrandizement against the Spanish Netherlands and of a restoration of his brother-in-law, Charles IL, to the throne of England. The states of Holland, on the other hand, were determined to thwart any attempts for a renewal of war, and insisted, in defiance of the authority of the captain-general supported by the states-general, in virtue of their claim to be a sovereign province, in disbathing a large part of the regiments in their pay. A prolonged controversy arose, which ended in the states-general in June 1620 commissioning the prince of Orange to visit the towns of Holland and secure a recognition of the authority. The mission was unsuccessful. Amsterdam refused any hearing at all. William resolved therefore to use force and crush resistance. On the 30th of July six leading members of the states of Holland were seized and imprisoned in the castle of Loevestein. On the same day an attempt was made to occupy Amsterdam with troops. The citizens were, however, warned in time, and the gates closed. William's triumph was nevertheless complete. Cowed by the bold seizure of their leaders, the states of Holland submitted. The prince had now obtained that position of supremacy in the republic at which he had been aiming, and could count on his support in any future negotiations for his policy. He lost no time in entering into fresh negotiations with the French government, and a draft treaty was already early in October drawn up in Paris and the Count d'Estrates was commissioned to deliver it in person to the prince of Orange. It was, however, never to reach his hands. William had, on the 8th of October, after his victory was assured, gone to his hunting seat at Diercn. Here on the 27th he became ill and returned to The Hague. The complaint proved to be small-pox, and on the 6th of November he died. William was one of the ablest of a race of great men, and had he lived he would probably have left his mark upon history. A week after his death his widow gave birth to a son, who was one day to become William III., king of England.

WILLIAM THE BRETON—WILLIAM OF MALMESBURY

WILLIAM THE BRETON (c. 1160-c. 1225), French chronicler and poet, was as his name indicates born in Brittany. He was educated at Mantes and at the university of Paris, afterwards becoming chaplain to the French king Philip Augustus, who employed him on diplomatic errands, and entrusted him with the education of his natural son, Pierre Charlo. William is supposed to have been present at the battle of Bouvines (1214). His works are the Philippide and the Gesta Philippi II. regis Francorum. The former, a poem, three versions of which were written by the author, gives some very interesting details about Philip Augustus and his time, including some information about military matters and shows that William was an excellent Latin scholar. In its final form the Gesta is an abbreviation of the work of Rigord (q.v.), who wrote a life of Philip Augustus from 1179 to 1206, and a continuation by William himself from 1207 to 1216. In both works William speaks in very laudatory terms of the king, but his writings are valuable because he had personal knowledge of many of the facts which he relates. He also wrote a poem Karlota, dedicated to Pierre Charlo, which is lost.

William's works have been edited with introduction by H. F. Deharnoorde as Œuvres de Rigord et de Guizot le Breton (Paris, 1882-1888), and have been translated into French by Guizot in Collection des mémoires relatifs à l'histoire de France, tomes xi. and xiii. (1834-1856). Deharnoorde translated them also into Latin as Introductio ad Karlota, Molinier, Les Sources de l'histoire de France, tome iii. (Paris, 1903).

WILLIAM THE CLITO (1101-1128) was the son of Robert, duke of Normandy, by his marriage with Sybilla of Constantinop, and, by his father's defeat and capture by Henry I. of England, was taken captive at the battle of Tinchebrai (1106) the young William fell into the hands of the conqueror. Henry magnanimously placed his nephew in the custody of Helias of Saint Saëns, who had married a natural daughter of Duke Robert. Fearing for the safety of the boy, Helias carried him, in 1111, to the court of Louis VI. of France. That sovereign joined with the discontented Norman barons and others of Henry's enemies in recognizing William as the rightful claimant to the duchy; Robert, a prisoner whom there was no hope of releasing, they appear to have regarded as dead in the eye of the law. William's claims furnished the pretext for two Norman revolts. The first which lasted from 1112 to 1120 was abated by Louis, by Fulk V. of Anjou and by Baldwin VII. of Flanders. In the second, which broke out during 1123, Henry I. had merely to encounter the forces of his own Norman subjects; his diplomatic skill had been successfully employed to paralyse the ill-will of other enemies. In 1122 or 1123 William married Sibylle, daughter of Fulk of Anjou, and with her received the county of Maine; but Henry I. prevailed upon the Curia to annul this union, as being within the forbidden degrees. In 1127, however, the pretender obtained from the hand of Joanna of Montiferret, half-sister of the French queen, and the vacant see of Flanders. His own rigorous government or the intrigues of Henry I. raised up against William a host of rebels; a rival claimant to Flanders appeared in the person of Thierry or Dirk of Alsace. In besieging Alost, one of the strongholds of the rival party, William received a wound which mortified and proved fatal (July 28, 1128). He left no issue; although Duke Robert survived him and only died in 1134, the power of Henry I. was thenceforth undisputed by the Normans.

See Ordericus Vitalis, Hist. ecclesiastica, and Sir James Ramsay's Foundation of England, 1100 to 1199.

WILLIAM OF MALMESBURY (c. 1080-c. 1143), English historian of the 12th century, was born about the year 1080, in the south country. He had French as well as English blood in his veins, but he appears to have spent his whole life in England, and the best years of it as a monk at Malmsbury. His tastes were literary, and the earliest fact which he records of his career is that he assisted Abbot Godfrey (1081-1105) in collecting a library for the use of the community. The education which he received at Malmsbury included a smattering of logic and physics; but moral philosophy and history, especially the latter, were the subjects to which he devoted most attention. Later he made for himself a collection of the histories of foreign countries, from reading which he conceived an ambition to produce a popular account of English history, modelled on the great work of Bede. In fulfilment of this idea, William produced about 1120 the first edition of his Gesta regum, which at once gave him a reputation. It was followed by the first edition of the Gesta pontificum (1125). Subsequently the author turned aside to write on theological subjects. A second edition of the Gesta pontificum (1127) was dedicated to Earl Robert of Gloucester, whose literary tastes made him an appreciative patron. William also formed an acquaintance with Bishop Roger of Salisbury, who had a castle at Malmsbury. It may have been due to these friends that he was offered the abbacy of Malmsbury in 1140. But he preferred to remain a simple bibliothecarius. His one public appearance was made at the council of Winchester (1141), in which the clergy declared for the empress Matilda. About this date he undertook to write the Historia novella, giving an account of events since 1125. This work breaks off abruptly at the end of 1144, with an unfulfilled promise that it will be continued. Presumably William died before he could redeem his pledge.

He is the best English historian of his time. The master of a good Latin style, he shows literary instincts which are, for his time, remarkably sound. But his contempt for the annalistic form makes him at times careless in his chronology and arbitrary in his method of arranging his material; he not infrequently flies off at a tangent to relate stories which have little or no connexion with the main narrative; his critical faculty is too often allowed to lie dormant. His researches were by no means superficial; he gives us less of the history of his own time than we have a right to expect—far less, for example, than Orderic. He is, however, an authority of considerable value from 1066 onwards; many telling anecdotes, many shrewd judgments on persons and events, can be gleaned from his pages.
WILLIAM OF NANGIS—WILLIAM OF ST CALAIS

Printed Works.—The Gesta regum covers, in its final form, the years 449-1127. But the later recensions add little, beyond fulsome dedications to Earl Robert, to the edition of 1120. The sources used are not always easy to trace. But for the pre-Conquest period William of Malmesbury is the key. He derived the account from William of Jumièges; one or more English chronicles similar to the extant "Worcester" and "Peterborough" texts; Asser's life of Alfred, and a metrical biography of Æthelstan; the chronicles of S. Faricus, William of Normandy (who relates the reign of the emperor Henry III.; and the lives of various saints. For the life of William I, he draws on William of Poitiers; for the first crusade on William of Malmesbury, Maurice of Torro; his account of Anselm's primacy comes mainly from Eadmer; and at least up to 1100, he makes use of an English chronicle. The fifth and last book, dealing with the reign of Henry I., is chiefly remarkable for its de- sultory and confused desire to catch the bear of the monarch, whose treatment of Anselm he prudently ascribes to Robert of Meulan (d. 1118). Both in this work and in the Gesta pontificum the later recensions are remarkable for the omission of certain passages which might give offence to those in high places. The deleted sentences usually relate to eminent persons; they sometimes repeat scandal, sometimes give the author's own opinions. The Gesta pontificum gives accounts of the several English sees and their bishops, from the beginning to about 1120; the later recensions continue the work, in part, to 1140. Many saints of the south and midlands are not noticed. This work, like the Gesta regum, contains five parts, three of which complete the History of the Chronicles of St. Stephen, of St. Malmebury, and is based upon the biography by Abbot Faricus; it is less useful than books 1-4v, which are of the greatest value to the student of the annalists. The fourth and fifth parts, prefixed ("Hist. rerum") to the concluding ("Historia nova") is another English Chronicle. It was projected soon after the battle of Lincoln, as an apology for the supporters of the emperor. The author embarks on special pleading in favour of Earl Robert and Bishop Roger of Salisbury, but shows a certain reluctance to give a personal character of Stephen, whose case he states with serious fairness.

The historical works of William of Malmesbury were edited by S. Calvisius (S. Poel) (Bedam: London, 1690); but the text of that edition is full of errors. Sir T. D. Hardy edited the Gesta regum and Historia nova for the English Historical Society in 1840, and put the criticism of the manuscripts on a sound basis. But the standard edition of these works is that of W. Stubbs in the "Rolls series" (1 vol., in 2, 1887-1889); the second part of this edition contains a valuable introduction on the sources and value of the chronicler. The Gesta pontificum has been edited for the "Rolls series" (2 vols., London, 1870) from a manuscript which he was the first to identify as the archetype. Another work, De antiquitate Glastonensi ecclesie (A.D. 63-1126), is printed in Gale's "Scriptores" XV. (Oxford, 1861). Wharton in the second volume of his Anglia sacra (London, 1891) gives considerable portions of a life of Wulfstan which is an amplified translation of an Anglo-Saxon biography. Finally Stubbs in his Memorials of St Dunstan ("Rolls series", London, 1874) prints a Vita S. Dunstani which was written about 1126.

Unprinted Extant Works.—Among these are Miracles of the Virgin; Life of St. Bernard ("Rolls series", London, 1892), an abridgment of Amalarius' De divinis officiis; De dictis et factis memorabilibus philosophorum; an epitome of the Historia of Haymo of Fleury and other works, historical and legal (autograph in the Bodleian Library). There is a MSS. of the Gesta ecclesiastica at the British Museum, partly in the Bodleian. Lost Works.—Vita Sancti Patricii and Miracula Sancti Benigni are mentioned in the prologue to the book on Glastonbury; a metrical life of St. Algygy is quoted in the Gesta pontificum; Chronica trivis libellis are mentioned in the prologue to the Historia nova, and a fragment of them is apparently preserved in the Brit. Mus. Landowske MS. 458. Leland gives extracts from an Itinerarium Johannes abbatis, describing the journey of Abbot John to Rome in 1140 (Leland, Collectanea, iii. 272).

WILLIAM OF NANGIS (d. 1300), French chronicler, was a monk in the abbey of St Denis. About 1285 he was placed in charge of the abbey library as custos cartarum, and he died in June or July 1300. Having doubtless done some work on the Latin manuscripts on which the Grandes Chroniques de France are based, William wrote a long Chronicon, dealing with the history of the world from the creation until 1300. For the period of the papal wars he worked on the account of Sigebert of Gembloux and others; but after this date it contains some new and valuable matter.

William's other writings are: Gesta Ludovic I.; Gesta Philippei III.; rive Audacii; Chronicon abreviatum regum Francorum; and a French translation of the same work written for the laity. Making use of the large store of manuscripts at St Denis, William was a compiler, not an author, and with the exception of the part of the Chronicon his writings do not add materially to our knowledge of the time. Both his chronicles, however, became very popular and found several continuators, Jean de Joinville being among those who made use of the Chronicon. This work from 1113 to 1300, with continuations to 1368, has been edited by H. Géraud for the Société de l'Histoire de France (Paris, 1843), and practically all William's writings are found in tome xx. of Dom Bouquet's Recueil des historiens des Gaules et de la France (Paris, 1773-1796). A French translation of the Chronicon is in tome xiii. of Guizot's Collection des mémoires relatifs à l'histoire de France (Paris, 1823-1853).

WILLIAM OF NEWBURGH (d. c. 1198), or, as he is sometimes styled, Guillelmus Parvus, English ecclesiastical and chronicler, was a canon of the Augustinian priory of Newburgh in the North Riding of Yorkshire. He was born about 1136, and lived at Newburgh from his boyhood. Shortly before 1156 he began his Historia rerum Anglicarum. This work, divided into five books, covers the period 1066-1196. A great part of it is derived from known sources, especially from Henry of Huntingdon, Jordan Pantomene, the Itinerarium regis Ricardi, or its French original, and a lost account, by Anselm the chaplain, of the captivity of Richard I. The value of Newburgh's work lies in his estimates of men and situations. Except for the years 1154-1173 and the reign of Richard he records few facts which cannot be found elsewhere; and in matters of detail he is prone to inaccuracy. But his political insight and his impartiality entitle him to a high place among the historians of the 12th century.

See the editions of the Historia by H. C. Hamilton (2 vols., London, 1849); and by R. Howlett in Chronicles of the Reign of Stephen, 4 vols. ("Rolls series", 1844-1885), vols. i. and ii. In the latter edition a continuation, the Annales Furnesianae (1190-1298), composed by a monk of Furness Abbey, Lancashire, is also given. See also Sir T. D. Hardy, Descriptions de la Catalogue des Rolls de la bibliotheque de l'Est (1847), and H. E. Salter in the English Historical Review, vol. xxi. (1897), and H. W. C. D.

WILLIAM OF POITIERS (c. 1200-c. 1290), Norman chronicler, was born at Préaux, near Pont Audemer, and belonged to an influential Norman family. After serving as a soldier he studied at Poitiers, and then returning to Normandy became chaplain to the bishop of Bayeux, and then bishop of Lisieux. He wrote an eulogistic life of the duke, the earlier and concluding parts of which are lost; and Ordericus Vitalis, who gives a short biography of him in his Historia ecclesiastica, says that he also wrote verses. William's Gesta Guillelmi II. ducis Normannorum, the extant part of which covers the period between 1047 and 1068, is valuable for details of the Conqueror's life, although untrustworthy with regard to affairs in England. According to Freeman, "the work is disfigured by his constant spirit of violent partisanship." It was written between 1271 and 1287, and was used by Froissart and others.

The Gesta was first published by A. Duchesne in the Historiae Normannorum scriptores (Paris, 1619); and it is also found in the Scriptores rerum gestarum Willelmi Conqueroris of J. A. Giles (London, 1849). There is a French translation in tome xxix. of Guizot's Collection des mémoires relatifs à l'histoire de France (Paris, 1826). See G. Körtig, Willehms von Poitiers Gesta Guillelmi ducis (Dresden, 1875); and A. Molinier, Les Sources de l'Histoire de France, tome iii. (Paris, 1903).

WILLIAM OF ST CALAIS (CARILLER) (d. 1096), bishop of Durham and chief counsellor of William Rufus, was a Norman monk and prior of St Calais in Maine, who received the see of Durham from the Conqueror (1081). In Durham annals he is honourably remembered as the prelate who designed the existing cathedral, and also for his reform of ecclesiastical discipline. His political career is less creditable. Honoured with the special confidence of William Rufus he deserted his patron's cause at the first sign of rebellion, and joined with Odo of Bayeux in urging Duke Robert of Normandy to claim the crown (1088). After the collapse of this plot William was put upon his trial before the Great Council. He claimed the right to be judged by his fellow-bishops alone; this claim being rejected he appealed to the see of Rome. This was the first case of an appeal to the pope from an English tribunal which had occurred since the 7th century. Rufus and Lanfranc did not venture to dispute the right of appeal, but contended that the bishop, as a royal vassal, could not appeal against the forfeiture of his temporalities. These were confiscated, and William left the kingdom, but no more was heard of his appeal, and in 1091 he regained the royal
favour and his sec. Thenceforward he showed the utmost subervience. He managed the king's case against Anselm, and at Rockingham (1095) actually claimed the right of appeal, when it was claimed by the archbishop. Notwithstanding his zeal for the royal interests, William was soon afterwards disgraced. He died in January 1096.

See E. A. Freeman, William Rufus (1882), and Symeon of Durham, vol. i. pp. 170-195 (Rolls ed.).

**WILLIAM** (c. 1130- c. 1196), archbishop of Tyre and chronicler, belonged to a noble French family and was probably born in Palestine about 1130. He has left an important account of the history of his country, which was published in the 15th century, and has been restored in modern times. He was the son of Roussell de Lusignan, who was a commended knight of the first crusade, and of Blanche, a sister of Ranulf de Lusignan, the patriarch of Antioch, who died about 1144; that he calls himself a contemporary historian from the accession of Baldwin III. to the throne of Jerusalem, an event which he places in November 1144, and that he remembered the fall of Edessa in 1144. Unfortunately the chapter (xix. 12) which relates to his early life has been excised or omitted from every extant manuscript of his Historia, and this remark holds good, not only for the original Latin, but also for the French translation of the 15th century. William was still pursuing his history in England, and was present at the battle of Evesham in 1265, but he returned to Palestine towards the close of 1166, or early in 1167, and was appointed archdeacon of Tyre at the request of Amalric in August 1167. In 1168 he was sent on an embassy, the forerunner of several others, to the emperor Manuel I. at Constantinople, and in 1169, at the time of the disastrous campaign against Damietta, he was obliged to take refuge in Rome from the “unmerited anger” of his archbishop. But he was soon in Palestine again, and about 1170 he was appointed tutor to Amalric’s son, Baldwin, afterwards King Baldwin IV. Towards the end of 1174, soon after the death of Amalric, he is said to have been the private chaplain of the kingdom of Jerusalem, an office which he held until 1183, and less than a year later (May 1175) he was consecrated archbishop of Tyre. He was one of those who went to negotiate with Philip II., count of Flanders, in 1177, and in 1179 he was one of the bishops who represented the Latin Church of the East at the Lateran council in Rome. On his return to Palestine he stayed seven months at Constantinople with Manuel. This is William’s last appearance in history, but he was writing his history in 1181, and this breaks off abruptly at the end of 1183 or early in 1184. At an interval of about a year, between 1187 and 1189, about five years later one of his continuators accused Heraclius, the patriarch of Jerusalem, of procuring his death by poison at Rome, but this story appears to be legendary. Equally untrustworthy is the theory which identifies William with the archbishop of Tyre sent to Europe to preach a new crusade in 1188. It is true that Matthew Paris speaks of the English king, Henry II., as receiving the cross from the hands of Willelmus episcopus Tyrensis; but more contemporary writers omit the Christian name, while others write it Josce or Joscins.

If not the greatest, William of Tyre is at least among the greatest of medieval historians. His Historia rerum in partibus transmarinis gestarum, or Historia Hierosolymitana or Belli sacri historia covers the period between 1095 and 1184, and is the main authority for the history of the Latin kingdom of Jerusalem between the first and second crusades. It is especially valuable for the information which it contains about the history of the Crusades, which is more or less complete, and the early part of the history of the kingdom. It is a typical example of the work of the chronicler, who describes events as they occurred, and omits the technicalities which are found in the contemporary Arab annals. William of Tyre was a writer of great learning and ability, and his work is characterized by a great deal of exactness and accuracy. He is the chief source of information about the Crusades, and his work is invaluable for the student of the period. He was a devout Christian and a great admirer of the crusaders, and his work is filled with passion and enthusiasm. He was a writer of great learning and ability, and his work is characterized by a great deal of exactness and accuracy. He is the chief source of information about the Crusades, and his work is invaluable for the student of the period. He was a devout Christian and a great admirer of the crusaders, and his work is filled with passion and enthusiasm. He was a writer of great learning and ability, and his work is characterized by a great deal of exactness and accuracy. He is the chief source of information about the Crusades, and his work is invaluable for the student of the period.
author of a Life of Wykeham, published in 1597, taught classics, French and geometry by a learned Frenchman on the site of Winchester College, is a guess due to Wykeham's extant letters being in French and to the assumption that he was an architect. After some unspecified secular employment, Wykeham became "under-notary (vice tabellio) to a certain squire, constable of Winchester Castle," probably Robert of Popham, sheriff of Hampshire; appointed constable on the 29th of April 1346, not as commonly asserted Sir John Scures, the lord of Wykeham, who was not a squire but a knight, and had held the office from 1321, though, from Scures being named as second of his benefactors, Wykeham perhaps owed this appointment to his influence. "Two or three years afterwards, namely after he was twenty," Wykeham "was transferred to the king's court," i.e. c. 1343. Wykeham has been credited (Gent. Mag. lxxv. 186) with the living of Irstead, Norfolk, of the king's gift on the 12th of July 1349. But apart from the fact that this Wykeham is described in the grant as "chaplain," the probate of his will on the 8th of March 1376-1377 (Norwich Reg.Heydon, f. 130) shows that he was a different person (H. Chitty in Notes and Queries, 10th ser. iv. 130). Our Wykeham first appears in the public records in 1350 as keeper of the manor of Rochford, Hants, during the minority of the heir, William Betroaux.

On the 12th of October 1352 Henry Sturmy of Elvetham, sheriff and escheeter of Hants, and frequently a justice in eyre for the forests of Hants and Wilts, at Winchester, describes William of Wykeham as "my clerk" in a power of attorney dated at Winchester, to deliver seisin of lands in Meonstoke Ferramore, which he had purchased from Sir John of the manor of Winchester (Win. Coll. Lib. H. 294). On the 10th of November (not December as Lowth, Life of Wykeham, 14) Edyndon, by a letter dated at London, appointed William of Wykeham, clerk (not "my clerk" as Kirby, Archaeol. 57, ii. 292, where the deed is also misdated 1353), his attorney to take seisin of lands in Meonstoke Township, Hants, which he had bought from Alice de Roche, daughter of William of TOUR (ibid. f. 250).

These lands were afterwards bought by Wykeham and given to Winchester College. On the 14th of April 1353 (Claus. 26 E. III. m. 29 d) Wykeham served as attorney of John of Foxle, of Bratton, Hants, son of Thomas of Foxle, constable of Winchester Castle, in acknowledging payment of a debt due from John of Palton, sheriff of Somerset and of Hants. On the 15th of April 1356 schedules touching the New Forest and other forests in Hants and Wilts were delivered out of the Tower of London to William of Wykeham to touch the justices in eyre (Claus. 30 E. III. m. 19 d). In the same year on the 24th of August Peter atte-Wode and William of Wykeham, clerk, were appointed keepers of the rolls and writs in the eyre for the forests of Hants and Wilts, of which Henry Sturmy was one of the justices. On the 10th of May 1356 Wykeham first appears in the direct employment of the king, being appointed clerk of the king's works in the manors of Henley and Yeshamsted (Easthamsted) to pay all outgoings and expenses, including wages of masons and carpenters and other workmen, the purchase of stone, timber and other materials, and their carriage, under the view of one controller in Henley and two in Easthamsted. On the 8th of June Walter Nuthirst and Wykeham were made commissioners to keep the statute of labourers and servants in the liberty of the Free Chapel (St George's), Windsor. On the 30th of October 1356 Wykeham was appointed public surveyor (superintendant) of the king's works in the castle of Windsor, for the same purposes as at Henley, with power to take workmen everywhere, except in the fee of the church or those employed in the king's works at Westminster, the Tower of Dartford, at the same wages as Robert of Bernham, probably Burnham, Bucks, who had been appointed in 1353, used to have, viz. 1s. a day and 3s. a week for his clerk. He was to do this under supervision of Richard of Teynton, John le Peyntour (the painter) and another. From this appointment it has been inferred that Wykeham was the originator of "Round Table" at Windsor, which has been confused with the Round Tower, and a story which is first told by Archbishop Parker, writing thirty years afterwards (Antiq. Brit. Eccles. ed. 1729, p. 358), relates that Wykeham nearly got into trouble for inscribing on it, "This made Wickam," which he only escaped by explaining that it did not mean that Wykeham made the tower, but that the tower was the making of Wykeham. But Wykeham had nothing to do with building either the Round Tower or the Round Table. The Round Tower, called the High Tower in Wykeham's day, is the Norman Keep. It was being refitted for apartments for the king and queen of Edward II. on the order of the constable of Windsor. Accounts include the last items for its internal decoration, including 28 stained glass windows. The Round Table, a building 200 ft. in diameter for the knights of the Round Table, who preceded the knights of the Garter, had been built in 1344 (Chron. Angil. "Rolls" ser. No. 61, p. 17) when Wykeham had nothing to do with Windsor. The inscription, "This made Wykeham," did exist on a small square tower in the Middle Bailey formerly known as Wykeham Tower, now entirely rebuilt with the inscription recopied and known as Winchester Tower. This, however, has not been sufficient importance to cause Wykeham to play the sphinx, and the story is apparently due to the Elizabthan love of quips. All that was built during the five years, 1356 to 1361, when Wykeham was clerk of the works, were the new royal apartments, two long halls and some chambers in the upper ward, quite unconnected with and east of the Round Tower, and a gateway or two leading to them, the order for building which was given on the 1st of August 1351 (Pipe Roll 30 Ed. III.). The accounts of Robert of Bernham, Wykeham's predecessor, who was a canon of St George's Chapel (Le Neve's Fasti, 357), are extant, and from the payments of 1s. a day to Mr John Spone, master and ordeir or sett-out (ordinarius) of the king's works, and Geoffrey of Carlton "apparreller" of the carpentry work, it is clear that they, and not Bernham, were the architects and builders. Canon Bernham was only the paymaster and overlooker to see that men and materials were provided and to pay for them. While in 1353-1354 £1440 and in 1355-1356 £747 was expended under the supervision of Robert of Bernham, in 1357-1358 £867 was spent by Wykeham, including Winchester Tower. In 1358-1359 the expenditure rose to £1254, while between the 6th of June 1356 and the 12th of April 1356 it only amounted to £281. The chief items were a new Great Gate with two flanking towers, a belfry for St George's Chapel and houses in the Lower Bailey, probably for the canons, and in the Upper Bailey, probably for the royal household.

On the 1st of November 1361 Wykeham was succeeded as clerk of the works by William of Mulsho, another canon of Windsor, who afterwards succeeded him also as dean of St Martin-le-Grand. Under Wykeham, William of Wynford, who appears in 1360 as "apparreller" under Spone, in 1361 became chief mason and ordiror, and he was probably what we should call the "Appraiser of the Great Gate," the title which was always Wykeham's supervision. For wherever we find Wykeham building afterwards, we find Wynford as chief mason. When Wykeham was provost of Wells, Wynford was retained as architect on the 1st of February 1364-1365 at a fee of 40s. a year and 6d. a day when in Wells (Wells, Lib. Abb. f. 253).

He was architect to Abingdon Abbey (at a fee of £3, 6s. 8d. and a furred robe) in 1372-1376 when the existing Outer Gate of the abbey was built (Abingdon Obed. Acc. Cand. Soc., 1852). He was chief mason for Wykeham's works at Winchester Cathedral and for Winchester College, where his portrait may be seen in the east window of the Chapel, and where his contract with the clerk of the works, an ex-scholar of the college, for the building of the outer gate, is still preserved.

The ascription to Wykeham of the invention of the Perpendicular style of medieval architecture is now an abandoned theory. In so far as he gave vogue to that style the credit must be given to William of Wynford, not to William of Wykeham. At all events he had very little to do with building Windsor Castle. How far he really was responsible for the other great castle attributed to him, that of Queenborough Castle in the Isle of Sheppey, cannot be tested, as the building accounts for it are only partially extant. The account from the 1st of
November 1361 to 1362 shows Simon of Bradested, clerk of the works, then expended £1737, of which £100 was received by the hands of William of Wykeham at the exchequer, and that from 1360 shows Bernard Cookes, clerk of the works, expending £2306. The chief evidence cited in support of the theory that Wykeham owed his advancement to his skill as an architect is the remark in a tract Why Poor Priests have no benefits that "Lord will not present a clerk able of cunning of God's law and good life and holy example... but a kitchen clerk or a fancy clerk or wise in building castles or worldly doing, though he cannot well read his psalter." This tract has been attributed to Wykeham, and it is thought to be of later date, and if Wykeham is meant by the castle-building clerk it only shows that popular repute is no guide to fact. That Wykeham, who was clearly an extremely good man of business, should, when clerk of the works, have played a considerable part in determining what works should be done and the general character of the buildings with which he was connected, we may believe; but to think that this attorney and notary, this keeper of the king's dogs (20th Aug. 1356, Devon's Issues of the Exchequer, 163) and of the king's forests, this carrier of the crown money and other exchequer offices, this clerk of Windsor and Queenborough Castles, of Winchester Cathedral and College, is to credit Wykeham with a superhuman combination of knowledge, of training and of functions. That he gave great satisfaction to the king when once he was appointed surveyor at Windsor in 1356 is unquestionable. He first called king's clerk on the 14th of November 1357, when he was given 1s. a day, beyond the wages he was already receiving for his offices at Windsor and elsewhere, "until peacefully advanced to some benefit." Ecclesiastical benefices were the chief means by which, before the Reformation, the civil servants of the crown were paid for services which, being clerical, were also ecclesiastical, and for which the settled stipends were wholly inadequate. In his accumulation of benefices Wykeham seems to have distanced all his predecessors and successors, except perhaps John Maunsell, the chancellor of Henry III., and Thomas Wolsey, the chancellor of Henry VIII., the latter being a pluralist not in canopies and livings but in bishoprics.

Wykeham's first benefice was the rectory of Pulham, the richest in Norfolk, worth £53 a year, or some £600 of our money, to which he was presented on the 30th of November 1357. But this was not a "peaceful" advancement, for it was only in the king's patronage by reason of the temporalities of the see of Ely having been seized into the king's hands the year before, on account of the bishop being implicated in certain murders and robberies, which he denied, contesting the king's action in the papal court. On the 16th of April 1359 the king gave Wykeham a pension of £30 a year from the exchequer until he could obtain peaceful possession of Pulham. On this, and what may have been a similarly contested presentation to the canony and prebend of Flixton in Eichfield cathedral on the 1st of March 1359, repeated on the 22nd of August 1360, and supported by a mandate to the new bishop on the 20th of January 1361, Wykeham's latest biographer (George Herbert Molesly, Life of Wykeham, 1887, 2nd ed., 1893) has built an elaborate story of Wykeham's advancement being opposed by the pope because he was the leader of a national party against papal authority in England. The baselessness of this is clear when we find that Wykeham had obtained from Innocent VI., on the 27th of January 1357, an indulgence to choose his own confessor (Col. Pap. Reg.), and on the 8th of July 1358 (Col. Pap. Pet. i. 331) assenting to a papal ordo, and that he obtained a papal privilege of Pulham on the ground that it had passed to the pope's patronage by the promotion of its former possessor to the see of London. In spite of papal and royal authority, it is doubtful whether Wykeham obtained peaceful possession of Pulham till again presented to it by the king on the 10th of July 1361 after the bishop of Ely's death. The difficulty as to the prebend of Flixton was no doubt something of the same kind. Between bishop, pope and king the next vacant prebend in every great church was generally promised two or three deep before it was vacant, and the episcopal and chapter registers are full of the contests which ensued.

Wykeham's civil offices rapidly increased. On the Ides (15th) of March 1359 a French fleet sacked Winchelsea, carrying off the women and girls. On the 10th of July 1359 Wykeham was made chief keeper and surveyor, not only of Windsor, but of the castles of Dover, Hadley and Leeds (Kent), and of the manors of Follejohn, Eton, Guildford, Kennington, Sheen (now Richmond), Eltham and Langly and their parks, with power to repair them and to pay for workmen and materials. On the 26th of February 1366, when another French invasion was threatened, the king relieved them of £400 of their stipend and he had to Wykeham for the works at Dover. In April the sheriffs of four batches of counties were each ordered to send forty masons to Wykeham at Windsor. This secular activity was rewarded by presentation to the deanery of St Martin-le-Grand, with an order for induction on the 21st of May, on which day he was commissioned to inquire by a jury of men of Kent into the defects of the walls and tower of Dover (Pat. 34 E. iii. pt. 1, m. 12). On the 13th of August he was directed to hand over £40 given him for the purpose, to a successor, the treaty of the king, his his oath of fealty. This was confirmed as well on the 25th of July, when he was presented with Wykeham as one of the witnesses on the 24th of October. In January 1361 building work at Windsor was vigorously resumed, and again the sheriffs were ordered to contribute their quotas of 40 freestone masons and 40 cementarii to Wykeham's charge. On the 13th of February, on the joint petition of the kings of England and of France, the pope "provided" Wykeham to a canonry and dignity at Lincoln, notwithstanding his deanery and a prebend at Llandaff. On the 2nd of April four commissioners were appointed to superintend the construction of the new castle ordered in the Isle of Sheppy, which when finished was called Queenborough, the purchases and payments, not the works, being under the beloved clerk, Wykeham. In this year came the second visitation of the Black Death, the Second Plague, as it was called, and carried off four bishops and several magnates, with many clerics, whose vacated prebents were poured on Wykeham. The bishop of Hereford being dead, on the 12th of July 1361, the king presented Wykeham to a prebend in Hereford cathedral, and on the 24th of July to one in Bromyard collegiate church; the bishop of St David's being dead, prebends in the collegiate churches of Aberwilly and Llandewybrewi were given him on the 16th of July. On the 11th of August the pope, on the king's request, provided him with a prebend in St Andrew's Auckland collegiate church. This Mr Moberly curiously misrepresents as action against Wykeham. He in fact never obtained possession of it, probably because the pope had already "provided" it to Robert of Stretton, a papal chaplain, who, however, asked in January 1362 for a canonry at Lincoln instead, because he was "in fear and terror of a certain William of Wykeham." On the 24th of September 1361 the king gave Wykeham a prebend in Beverley Minster, on the 1st of October the prebend of Ongar in St Paul's (which he exchanged for Tattenhall on the 10th of December), on the 22nd of November a prebend in St David's cathedral, on the 20th of December a prebend in Wherwell Abbey, Hants. So far the Patent Rolls. The Salisbury records show him also admitted to a prebend there on the 10th of August, which he exchanged for other prebends on the 9th and 15th of October. All these clerical prebents Wykeham held when he was a simple clerk, who had no doubt undergone the "first tonsure," but was not even ordained an acolyte till the 5th of October, 1367. He may, this going on, have been doing, during the year that of clerk (officialis clericis) of the exchequer on the 24th of October. On the 9th of October he acted as attorney to the king in the purchase of the manor of Thunderley, Essex. Next year, 1362, he entered holy orders, being ordained subdeacon on the 17th of March and priest on the 12th of June; and adding to his canonries and prebends one in Shaftesbury Abbey on the 15th of July and another in Lincoln cathedral on the 20th of August. Wykeham meanwhile was acting as keeper of the forests south of Trent and as a trustee for Juliana,
countess of Huntingdon. Next year, 1363, he was made a canon of the collegiate church in Hastings Castle on the 3rd of February, and of the royal chapel of St Stephen's, Westminster, then newly founded, or re-founded, on the 21st of April. He obtained the archdeaconry of Northampton on the 26th of April, and resigned it on the 12th of June, having been promoted to that of Lincoln, the richest of all his preferments, on the 23rd of May. On the 31st of October he was made a canon of York, and on the 15th of December provost of the fourteen prebends of Combe in Wells cathedral, while at some date unknown he obtained also prebends in Bridgenorth collegiate church and St Patrick's, Dublin, and the rectory of Menheniot in Cornwall. On the 5th of May 1364 he became privy seal, and in June is addressed by the new pope, Urban V., as king's secretary. On the 14th of March 1365 he was given 20s. a day from the exchequer "notwithstanding that he is living in the household." He was so much the king's factotum that Froissart (i. 249) says "a priest called Sir William de Wican reigned in England ... by him everything was done and he taught them they did nothing." In fact, as privy seal he was practically prime minister, as Thomas Cromwell was afterwards to Henry VIII. On the 7th of October 1366, William Edingdon, the treasurer of England and bishop of Winchester, died; on the 13th of October Wykeham was recommended by the king to the chapter of monks of St Swithin's cathedral priory and elected bishop.

A long story has been made out of Pope Urban V.'s delay in the recognition of Wykeham, which has been conjectured to have been because of his nationalist proclivities. But little more than the ordinary delays took place. On the 1st of December the king, "for a large sum of money paid down," gave Wykeham, not only the custody of the temporalities of the see, but all the profits from the day of Edingdon's death. On the 11th the pope granted him the administration of the spiritualities. The papal court was then moving from Avignon to Rome, and on the 14th of July 1367 the bull of "provision" issued at Viterbo. Wykeham was in no hurry himself, as it was not till the 10th of October 1367 that he was consecrated, nor till the 9th of July 1368, after the war parliament which met on the 3rd of June had been dissolved on the 10th of June, that he was enthroned. Meanwhile he had been made chancellor on the 17th of September 1367—thus at the age of forty-three he held the richest ecclesiastical, and the best-paid civil, office in the kingdom at the same time. The war in France was disastrous, how far through Wykeham's fault we have no means of knowing. When parliament again met in 1371, the blame was laid on the clerical ministers, under the influence of Wycliffe. He had been born in the same year as Wykeham, and like him had profited by papal provisions to prebends in 1365, but had since led a lawyer's life at the bar and in the Exchequer and demanded thatlaymen only should be chancellor, treasurer, privy seal and chamberlain of the exchequer. On the 8th of March 1372 Wykeham resigned the chancellorship, and Bishop Brantingham of Exeter the treasurership, and laymen were appointed in their places, though Sir Robert Thorp, who became chancellor, was master of Pembroke Hall at Cambridge, and as much a cleric as Wykeham had been when he was dean of St Martin-le-Grand and surveyor of Windsor Castle. As soon as he became bishop Wykeham had begun his career as founder. In 1357 (Pat. 41 El. III. pt. 2, m. 5) he purchased the estates of Sir John of Boarhunt, near Southwick, with which he endowed a chantry in Southwick Priory for his parents. Next year he began buying lands in Upomborne, Hants, which he gave to Winchester College, and in Oxford, which he gave to New College. On the 1st of September 1373 he entered into an agreement (Episc. Reg. iii. 98) with Master Richard of Herton "grammaticus" for ten years faithfully to teach and instruct the poor scholars, whom the bishop maintained at his own cost, in the art of grammar, and to provide an usher to help him. Meanwhile the war with France was even more unsuccessful under the lay ministry and John of Gaunt. In the parliament of 1373 Wykeham was named by the Commons as one of the eight peers to treat with them on the state of the realm. In the parliament which met on the 12th of February 1376, Lord Latimer and Alice Perrers, the king's mistress, a lady of good birth, and not (as the mendacious St Albans chronicer alleged) the ugly but persuasive daughter of a tailor, were impeached, and Wykeham took a leading part against Latimer, even to the extent of opposing his being allowed counsel. At the dissolution of parliament a council of nine, of whom Wykeham was one, was appointed to assist the king. But on the 8th of June the Black Prince died. Alice Perrers returned. John of Gaunt called a council on the 16th of October to impeach Wykeham on articles which alleged misapplication of the revenues, oppressive fines on the leaders of the free companies, taking bribes for the release of the royal French prisoners, especially of the duke of Bourbon, who helped to make him bishop, failing to send relief to Ponthieu and making illegal profits by buying up crown debts cheap. He was condemned on one only, that of halving a fine of 320 paid by Sir John Grey of Rotherfield for licence to alienate lands, and tampering with the rolls of chancery to conceal the transaction. Wykeham's answer was that he had reduced the fine because it was too large, and that he had received nothing for doing so. Skipwith, a judge of the common pleas, cited a statute under which for any errasure in the rolls to the deceit of the king 100 marks fine was imposed for every penny, and so Wykeham owed 500,000 marks. Wykeham was convicted, and on the 17th of November his revenues were seized and bestowed on the 1st of March 1377 on the young prince Richard, and he was ordered not to come within 20 m. of the king. He "broke up household ... sending also to Oxford, wear upon almost and for God's sake hath our new college, the king's college, given to their friends for he could no longer help or finde them" (Chron. Angliae, lxx.). But when conviction met in 1377 the bishops refused to proceed to business without Wykeham, and he was fetched back from Waverley Abbey. He was exempted, however, from the general pardon issued on the occasion of Edward III's jubilee. But on the 13th of June the prince restored his temporalities, on condition of his maintaining three galleys with 50 men-at-arms and 50 archers for three months, or providing the wages of 300 men. The St Albans monk says that this was obtained by a bribe to Alice Perrers. Meonstoke Perrers, part of the endowment of Winchester College, was certainly bought on the 12th of June 1380 from Sir William Windsor, his husband, whose name seems to be derived from Windsor, near Southampton water. As Hampshire people they may have helped Wykeham. But as Wykeham was of the party of the Black Prince and his widow Joan of Kent, no dea ex machina was needed.

On the 21st of June 1377 Edward III. died. Wykeham was present at the coronation of Richard II. on the 10th of July. On the 22d of December he was full panet, or chancellor, with the privy seal, which at the request of Richard's first parliament were ratified under the great seal on the 4th of December 1377. Wykeham at once took an active part in the financial affairs of the new king, giving security for his debts and himself lending 500 marks, afterwards secured on the customs (Pat. 4 Rich. II. pt. i. m. 4). He then set to work to buy endowments for Winchester and New Colleges. On the 30th of June he obtained licence in mortmain and on the 26th of November issued his charter of foundation of "Seint Marie College of Wynchestre in Oxenford" for a warden and 70 scholars to study theology, canon and civil law and arts, who were temporarily housed in various old halls. On the 5th of March 1380 the first stone was laid of the present buildings, which were entered on by the college on the 14th of April 1386. The foundation of Winchester was begun with a bull of Pope Urban VI. on the 1st of June 1378, enabling Wykeham to found "a certain college he proposed to establish for 70 poor scholars, clerks, who should live college-wise and study in grammatical near the city of Winchester," and appropriate to it Downton rectorie, one of the richest livings belonging to his bishopric. The bull says that the bishop "had, as he asserts, for several years administered the necessities of life to scholars studying grammar in the same city." On the 6th of October 1382 the crown licence in mortmain was issued, on the 10th-13th
of October the site was conveyed, and on the 20th of October 1382 "Sancte Marie collegium" or in vulgar tongue "Seinte Marie College of Wynchestre by Wykenestre" was founded for a warden and "70 pore and needy scholars studying and becoming proficient in grammaticals or the art and science of grammar."
The first stone of the buildings was laid on the 26th of March 1388, and they were entered on by the scholars on the 28th of March 1394, not, as supposed at the quincentenary celebration in 1893, in 1393. While the new buildings were being erected, the college remained in the parish of "St John the Baptist on the Hill" of St Giles, supplying scholars to New College then as since. A reference to this in a letter of Wykeham's of the 8th of April 1391, shows that the old imaginary college of St John the Baptist at Winchester by the Rev. W. Hunt (Die. Nat. Biog. sub. 'Chicheley'). The foundation was on the model of Merton and Queen's colleges at Oxford, to which grammar schools were attached by their founders, while fellows of Merton were the first wardens of both of Wykeham's colleges. Both were double the size of Merton, and the same size as the Navarre college of the queen of France and Navarre, founded at Paris in 1304, which also contained a school. But each of Wykeham's colleges contained as many members as the French queen's, i.e., seven, of the school which was to feed the college exclusively, placing it not at Oxford, but at Winchester, and constituting it a separate college, was a new departure of great importance in the history of education. Ten fellows and 16 choristers were added in 1394 to the 70 scholars, the choristers attending the school like the scholars, and being generally, during the first three centuries of the foundation, promoted to be scholars. The original statutes have not come down to us. Those which governed the colleges until 1587 were made in 1400. They state that the colleges were provided to repair the ravages caused by the Black Death in the ranks of the clergy, and for the support of those whom the university or church could not maintain them at the universities, and the names of the boys appointed by Wykeham and in his time show that "poor and indigent" meant the younger sons of the gentry, and the sons of yeomen, citizens of Winchester or London, and the middle classes generally, who needed the help of exhibitions.
The time which elapsed between the foundation and completion of the colleges may be attributed to Wykeham's preoccupation with politics in the disturbed state of affairs, due to the papal schism begun in 1379, in which England adhered to Urban V, and the struggle for supremacy between the rival claims of the English and the Commons in 1381, and the wars with France, Scotland and Spain during John of Gaunt's ascendency. Then followed the constitutional revolution of the lords appellant in 1388. When Richard II. took power on himself, on the 3rd of May 1389, he at once made Wykeham chancellor, with Brantinghham of Exeter again as treasurer. Wykeham's business capacity is shown perhaps by the first record of the minutes of the privy council being kept during his term of office, and his promulgation in 1390 of general orders as to its business. At least one occasion is recorded in the minutes on which Wykeham, on behalf of the council, took a firm stand against Richard II. and that in spite of the king's leaving the council in a rage. Peace was made with France in August. On the meeting of parliament in January 1390 Wykeham resigned the great seal; and asked for an inquiry into the conduct of the privy council, and on being assured that all was well resumed it. He now showed that he had not by his charities wronged his relations by settling on his great-nephew and heir Thomas Wykeham, whom he had educated at Winchester and New College, Broughton Castle and estates, still in Twiselton-Wykeham-Fiennes (paroche of Saxe and Sele). In July 1391 he obtained a papal bull enabling him to appoint at pleasure confidants to do his episcopal business.
On the 27th of September 1391, Wykeham finally resigned the chancellorship. For three years after there are no minutes of the Council. On the 24th of November 1394 Wykeham lent the king the sum of £1,000 (some £30,000 of our money), which same sum or another £1,000 he promised on the 21st of February 1395 to repay by midsummer, and did so (Pat. 18, Rich. II. pt. ii. m. 23, 42). The murder of the duke of Gloucester, Richard's uncle, in 1397, was followed next year by the assumption of absolute power by Richard. Wykeham was clearly against these proceedings. He excused himself from convocation in 1397, and from the subservient parliament at Shrewsbury in 1398. The extraordinary comings and goings of strangers to Winchester College, just opposite the gates of the bishop's palace at Wolvesey in 1399, suggest that he took part in the revolution of Henry IV. He appeared in the privy council four times at the beginning of Henry's reign (Proc. P.C. i. 100). On the 23rd of July 1400 he lent Henry IV. £500 for his journey towards Scotland, and in 1402 another £500, while a general loan for the war with France and Scotland on the 1st of April 1403 was headed by Wykeham with £1,000, the bishop of Durham lending 1000 marks (£666, 13s. 4d.), and no one else more than £500. Meanwhile on the 29th of September 1394 he had begun the recasting of the nave of the cathedral with William Winford, the architect of the college, as chief mason, and Simon Membury, an old Wykehamist, as clerk of the works. On the 24th of July 1403, he made his will, giving large bequests amounting to some £11,000 (£500,000 of our money), to friends and relations and every kind of religious house. On the 16th of August 1404, he signed an agreement with the prior and convent for three monks to sing daily three masses in his beautiful chantry chapel in the nave of the cathedral, while the boys of the almonry, the cathedral choir-boys, were to say their evening prayers there for his soul. He died on the 27th of September 1404, aged eighty.
His effigy in the cathedral chantry and a bust on the graving of the monument tower at Winchester college are no doubt authentic portraits. The pictures at Winchester and New College are late 16th-century productions. Three autograph letters of his, all in French, and of the years 1394-1366, are preserved, one at the British Museum, one at the Record Office, a third at New College, Oxford. A fourth letter imputed to Wykeham at the British Museum is shown alike by its contents and its handwriting not to be his.

Kirby, Annals of Winchester College (1892); G. H. Maberty, Life of Wykeham (1885); A. F. Leach, History of Winchester College (1890); and the Calendars of Patent and Close Rolls, Edward III. and Richard II. (A.F.L.)
Williams consistently counselled moderation and compromise between the unqualified assertion of the royal prerogative and the puritan views of popular liberties which were now coming to the front. He warned Buckingham and Prince Charles of the peril of their project for the Spanish marriage, and after their return from Madrid he encountered their resentment by opposing war with Spain. The lord keeper’s counsel of moderation was less pleasing to Charles I. than it had been to his father. The new king was offended by Williams’s advice to proceed with caution in dealing with the parliament, with the result that within a few months of Charles’s accession the Great Seal was taken from him. In the controversy between the House of Commons over the petition of right, Williams took the popular side in condemning arbitrary imprisonment by the sovereign. In the matter of ecclesiastical administration he similarly followed a middle course; but he had now to contend against the growing influence of Laud and the extreme high church party. A case was preferred against him in the Star Chamber of revealing state secrets, to which was added in 1635 a charge of subornation of perjury, of which he had undoubtedly been guilty and for which he was condemned in 1637 to pay a fine of £10,000, to be deprived of the temporalities during his imprisonment, and to lose the king’s pleasure. He was sent to the Tower. In 1639 he was again condemned by the Star Chamber for libelling Laud, a further heavy fine being imposed for this offence. In 1641 he recovered his liberty on the demand of the House of Lords, who maintained that as a peer he was entitled to be summoned to parliament. When the Long Parliament met, Williams was made chairman of a committee of inquiry into innovations in the church; and he was one of the bishops consulted by Charles as to whether he should veto the bill for the attainer of Strafford. In December 1641 the king, anxious to conciliate public opinion, appointed Williams archbishop of York. In the same month he was one of the twelve bishops impeached by the Commons for high treason and committed to the Tower. Released on an undertaking not to go to Yorkshire, a promise which he did not observe, the archbishop was enthroned in York Minster in June 1642. On the outbreak of the Civil War, after visiting Conway in the Royalist interest, he joined the king at Oxford; he returned to Wales, and finding that Sir John Owen, acting on Charles’s orders, had seized certain property in Conway Castle that had been deposited with the archbishop for safe-keeping, he went over to the parliamentary side and assisted in the recapture of Conway Castle in November 1646. Williams, who was a generous benefactor of St John’s College, Cambridge, died on the 25th of March 1650.

WILLIAMS, JOHN (1796-1839), English Nonconformist missionary, was born at Tottenham near London on the 29th of June 1796. He was trained as an ironmonger, and acquired considerable experience in mechanical work. Having offered himself to the London Missionary Society, he was sent, after some training, in 1816 to Elmeo, in the Society Islands, where he rapidly acquired a knowledge of the native language. After staying there for a short time, he finally settled at Raiatea, which became his permanent headquarters. His success as a missionary here and elsewhere was remarkable. The people rapidly became Christianized and adopted many of the habits of civilization. Williams was fairly liberal for his age, and the results of his labours among the Pacific Islands were essentially beneficial. He travelled unceasingly among the various island groups, planting stations and settling native missionaries whom he himself had trained. From the Society Islands he visited the Friendly Islands, before he discovered, and stayed for a considerable time on, the island of Rarotonga. Most of the inhabitants of the group were converted in a remarkably short time, and Williams’s influence over them, as over the people of other groups, was very great. Besides establishing Christianity and civilization among them, he also, at their own request, helped them to draw up a code of laws for civil administration upon the basis of the new religion. While at Rarotonga he, with the help of the natives, built himself a 60-ft. ship, “The Messenger of Peace,” within about four months; with this he returned to Raiatea, and made voyages among other island groups, including Samoa and the neighboring islands. Williams returned to England in 1834 (having previously visited New South Wales in 1821); and during his four years’ stay at home he had the New Testament, which he had translated into Rarotongan, printed. Returning in 1838 to the Pacific, he visited the stations already established by him, as well as several fresh groups. He went as far west as the New Hebrides, and, while visiting Eromanga, one of the group, for the first time, was murdered by cannibal natives on the 20th of November 1839.

His Narrative of Missionary Enterprises in the South Seas was published in 1839, and formed an important contribution to our knowledge of the Pacific islands. See Memoir of John Williams, by Ebenezer Prout (London, 1843); C. S. Horne, The Story of the L.M.S., pp. 41-54.

WILLIAMS, ROGER (c. 1604—1684), founder of the colony of Rhode Island in America and pioneer of religious liberty, son of a merchant tailor, was born (probably) about 1604 in London. It seems reasonably certain that he was educated, under the patronage of Sir Edward Coke, at the Charter House and at Pembroke College, Cambridge, where he received his degree in 1627. According to tradition (probably untrue), he studied law under Edward Coke; he certainly went with Coke in his study of theology, and in 1629 was chaplain to Sir William Masham of Otes, in the parish of High Laver, Essex, but from conscientious scruples, in view of the condition of ecclesiastical affairs in England at the time, refused preferment. He soon decided to emigrate to New England, and, with his wife Mary, arrived at Boston early in February 1631. In April he became teacher of the church at Salem, Mass., as assistant to the Reverend Samuel Skelton. Owing to the opposition of the ecclesiastical authorities at Boston, with whose views his own were not in accord, he removed to Plymouth in the summer, and there remained for two years as assistant pastor. In August 1633 he again became assistant teacher at Salem, and in the following year succeeded Skelton as teacher. Here he incurred the hostility of the authorities of the Massachusetts Bay Colony by asserting, among other things, that the civil power of a state could properly have no jurisdiction over the consciences of men, that the King’s patent conveyed no just title to the land of the colonists, which should be bought from its rightful owners, the Indians, and that a magistrate should not tender an oath to an unregenerate man, an opinion which was not in accord with a majority opinion. For the expression of these opinions he was formally tried in July 1635 by the Massachusetts General Court, and at the next meeting of the General Court in October, he not having taken advantage of the opportunity given to him to recant, a sentence of banishment was passed upon him, and he was ordered to leave the jurisdiction of Massachusetts within six weeks. The time was subsequently extended, conditionally, but in January 1636 an attempt was made to seize him and transport him to England, and he, forewarned, escaped from his home at Salem and proceeded alone to Manton’s Neck, on the east bank of the Seekonk river. At the instance of the authorities at Plymouth, within whose jurisdiction Manton’s Neck was included, Williams, with four companions, who had joined him, founded in June 1636 the first settlement in Rhode Island, to which, in remembrance of “God’s merciful providence to him in his distress,” he gave the name Providence. He immediately established friendly relations with the Indians in the vicinity, whose language he had learned, and, in accordance with his principles, bought the land upon which he had settled from the sachems Miantonomo (c. 1655-1657) and Manton. His influence with the Indians is revealed by the implicit confidence in him, enabled him in 1636, soon after arriving at Providence, to induce the Narragansetts to ally themselves with the Massachusetts colonists at the time of the Pequot War, and thus to render a most effective service to those who had driven him from their community. Williams and his companions founded their new settlement upon the basis of complete religious toleration, with a view to its becoming “a shelter for persons distressed for conscience” (see Rhode Island). Many settlers came from Massachusetts and elsewhere,
among others some Anabaptists, by one of whom in 1630 Williams was baptized, he baptizing others in turn and thus establishing what has been considered the first Baptist church in America. Williams, however, maintained his connexion with this church for only three or four months, and then became what was known as a "Seeker," or Independent, though he continued to preach. In June 1643 he went to England, and there in the following year obtained a charter for Providence, Newport and Portsmouth, under the title "The Providence Plantations in the Narragansett Bay." He returned to Providence in the autumn of 1644, and soon afterwards was instrumental in averting an attack by the Narragansets upon the United Colonies of New England. In 1650 he removed from Providence to a place now known as Wickford, R.I. He was at various times a member of the general assembly of the colony, acted as deputy president for a short time in 1649, was president, or governor, from September 1654 to May 1657, and was an assistant in 1664, 1667 and 1670. In 1651, with John Clarke (1600-1676), he went to England to secure the annulment of a commission which had been obtained by William Coddingdon for the government of Rhode Island (Newport and Portsmouth) and Connecticut, and the issue of a new and more explicit charter, and the following year succeeded in having the Coddington commission vacated. He returned to Rhode Island in the summer, having enjoyed the friendship of Cromwell, Milton and other prominent Puritans; but Clarke remained in England and in 1663 obtained from Charles II, a new charter for "Rhode Island and Providence Plantations." Williams died at Providence in March or April 1684; the exact date is unknown.

Though headstrong, opinionative and rigid in his theological views, he was uniformly tolerant, and he occupies a high place among those who have striven for complete liberty of conscience. He was the first and the foremost exponent in America of the theory of the absolute freedom of the individual in matters of religion; and Rhode Island, of which he was pre-eminently the founder, was the first colony consistently to apply this principle in practice.

Williams was a vigorous controversialist, and published, chiefly during his two visits to England, besides A Key into the Language of the Indians of America (written at sea on his first voyage to England (1643); reprinted in vol. i. of the Collections of the Rhode Island Historical Society (1837), and in series iii. vol. iii. of the Massachusetts Historical Society Collections; Mr Cotton's Letter Examined and Answered (1646); Mr Cotton's Treatise on the Cause of Conscience (1644); Queries of Highest Consideration (1644); The Bloody Tent yet more Bloody (1652); The-Hireling Ministry none of Christ's (1652); Experiments of Spiritual Life and Health (1652); and The Further History of his Death (1670).

His writings have been republished in the Publications of the Narragansett Club (6 vols., Providence, 1866-1874), the last volume containing his extant letters, written between 1632 and 1685. The best biographies are those by Oscar Straus (New York, 1864 and E. J. Carpenter (ibid. 1910). Also see J. D. Knowles, Memoir of Roger Williams (Boston, 1834), and Elton, Life of Roger Williams (London, 1852; Providence, 1853); New England Hist. and Gen. Register, July and October 1899, and January 1899; and M. C. Tyler, History of American Literature, 1607-1705 (New York, 1878). For the best apology of his expulsion from Massachusetts, see Henry M. Dexter's A to Roger Williams and his "Banishment" from the Massachusetts Plantation (Boston, 1876), an unsuccessful attempt to prevent Massachusetts from revoking the order of banishment.

WILLIAMS, ROWLAND—WILLIAMSBURG

WILLIAMS, Rowland (1817-1870), English divine and scholar, was born at Halkyn, Flint, the son of Rowland Williams (d. 1834), canon of St Asaph, and educated at Eton and Cambridge. He was elected fellow of King's College, Cambridge, in 1839, and took orders in 1842. During the next few years he acts as chaplain to the troops of St Asaph and Bangor. In 1850 he became vice-principal and Hebrew master at St David's College, Lampeter, where he introduced much-needed educational and financial reforms. He was appointed select preacher at Cambridge University in 1854, and preached a sermon on inspiration, afterwards published in his Rational Godliness after the Mind of Christ and the Written Voices of the Church (London, 1855). He was charged with heresiody, and Alfred Ollivant (1798-1852), bishop of Landaff, required him to resign his chaplainship, but he remained at the college in spite of these difficulties. His views were further defined in Christi-anity and Hinduism (Cambridge, 1856), an expansion of the Muir prize essay which he had won in 1848. He became vicar in 1858 of Brandebach with Bredenbach and Alvediston, Wiltshire. As a result of his favourable review of Bunyan's "Biblical Researches" contributed to Essays and Reviews (1860) he was prosecuted for heterodoxy. An unfavourable judgment was given by the Canterbury Court of Arches in 1862, but reversed by the Privy Council in 1864. Williams died on the 18th of November 1870.

Besides the above works his most important production was a translation of the Hebrew Prophets with commentary (pt. i. 1866; pt. iii. edited by Mrs Williams (1877); pt.ii., which was never written). See Life and Letters; edited by Mrs Williams (2 vols., 1874); and T. K. Cheyne, Founders of Old Testament Criticism (1893).

WILLIAMS, Sir William Fenwick, Bart. (1800-1883), British general, second son of Commissary-General Thomas Williams, barrack-master at Halifax, Nova Scotia, was born at Annapolis, Nova Scotia, on the 4th of December 1800. He entered the Royal Artillery as second lieutenant in 1815. His services were lent to Turkey in 1841, and he was employed as a captain in the arsenal at Constantinople. He was British com- missioner in the conferences preceding the treaty of Erzerum in 1847, and again in the settlement of the Turko-Persian boundary in 1848 (brevet major and lieutenant-colonel and C.B.). Promoted colonel, he was British commissioner with the Turkish army in Anatolia in the Russian War of 1854-56, and, having been made a major-colonel (lieutenant-general) and a pasha, he practically commanded the Turks during the heroic defence of Kars, repulsed the Russian attacks and severely defeating the Russian general Muraviev in the battle of Kars on 29th September 1855. Cold, cholera, famine and hopelessness of succour from without, however, compelled Williams to make an honourable capitulation on the 28th of November following. A baronetcy with pension for life, the K.C.B., the grand cross of the Legion of Honour and of the Turkish Medjidieh, the freedom of the City of London with a sword of honour, and the honorary degree of D.C.L. of Oxford University, were the distinctions conferred upon him for his valour. Promoted major-general in November 1855 on his return from captivity in Russia, he held the Woolwich command, and represented the borough of Sunderland in Parliament from 1856 to 1859. He became lieutenant-general and colonel-in-chief of the Royal Artillery in 1864, general in 1868, commanded the forces in Canada from 1859 to 1865, held the governorship of Nova Scotia until 1870, and the governorship of Gibraltar until 1876. He was made G.C.B. in 1871, and Constable of the Tower of London in 1881. He died in London on the 26th of July 1883.

WILLIAMSBURG, a city and the county-seat of James City county, Virginia, U.S.A., on a peninsula between the York and James rivers, 48 m. by rail E.S.E. of Richmond. Pop. (1900) 20,000; (1910) 27,174. Williamsburg is served by the Chesapeake & Ohio railway. It is the seat of the Williamsburg Female Institute (Presbyterian), and of the College of William and Mary, chartered by the Crown in 1693 and the second oldest college in the United States. Besides the main building and the president's house, the College of William and Mary has a science hall, a gymnasium, a library building, an infirmary and dormitories; in front of the main building is a statue by Richard Hayward of Norborne Berkeley, Lord Botetourt (1717-1770), the most popular royal governor of Virginia. The college offers a classical course and a scientific course, two-thirds of the work in each being prescribed, and in connexion with the United States Department of Agriculture is the Matthew Whaley Model and Practice School. In 1909 there were ten instructors and 228 students in the college, 6 instructors and 140 pupils in the model school, and 20,000 volumes, many of them rare, in the library. Since 1892 the college has published the William and Mary College Quarterly, an historical magazine.

Here in December 1776 was established the Phi Beta Kappa Society, the first American college "Greek Letter" Society, now an inter-collegiate honorary fraternity. The college suffered heavy losses during the War of Independence and in the Civil War. In June 1781 Lord Cornwallis made the president's house his headquarters, and the institution was closed for a few
months of that year. It was closed in 1861 because of the Civil War, and the main building was occupied in turn by Confederate troops and by Federal troops until some of the latter burned it in 1862. After Union forces repossessed it in 1865, the college was closed again from 1868 to 1888 because of the low state of its finances. In 1888 it was reorganized under an act of the state legislature which provided for the addition of a normal course and an annual appropriation towards its maintenance. By 1871 the Congress appropriated an act indemnifying it for some measure for its losses during the Civil War; and in 1906 its endowment was increased to more than $150,000, and it was a state institution. The college was again closed in 1888 by a board (appointed by the governor and receiving $35,000 annually from the state). Peyton Randolph, Edmund Jefferson, Thomas Jefferson, James Monroe, John Tyler, Chief Justice John Marshall and General Winfield Scott were graduates of the college.

Bruton Parish Church, completed in 1717 and enlarged in 1752 is the second church of a parish dating from 1674. It contains a Bible given by King Edward VII, a lectern given by President Roosevelt, and some old relics. The church itself has been restored (1905-1907) so far as practicable to its original form and appearance. The Association for the Preservation of Virginia Antiquities has preserved a powder magazine, erected in 1714, from which the last royal governor of Virginia, Lord Dunmore, removed the powder on the day after the encounter at Lexington, Massachusetts, and thus occasioned the first armed uprising of the Virginia patriots. The County and City Court House was erected in 1769. The Eastern State Hospital for the Insane was opened here in 1773, but its original building was burned in 1885. Among several colonial residences are the George Wythe House, which was the headquarters of Washington during the siege of Yorktown in 1781, and the Peyton Randolph House. The principal industries are the manufacture of men's winter underwear, hammer and ice, and the shipment of lumber and farm and garden produce.

Williamsburg, originally named Middle Plantation from its position midway between the York and James rivers, was founded in 1632. It was immediately walled in and for several years it served as a refuge from Indian attacks. On the 3rd of August 1676 Nathaniel Bacon held here his "rebel" assembly of the leading men of the province, and in January 1677 two of the "rebels" were hanged here. In 1698 Middle Plantation was made the provincial capitol; and in 1699 the present name was adopted in honour of William III. Williamsburg was chartered as a city in 1722. In 1736 the Virginia Gazette, the oldest newspaper in the South, was established here. In the capitol here Patrick Henry, on the 30th of May 1765, presented his historic resolutions and made his famous speech against the Stamp Act. On the 15th of May 1776, the Virginia Convention in session here passed resolutions urging the Continental Congress to declare for Independence. In 1779 Richmond became the seat of the state government, and in 1832 fire destroyed the last of the old capitol at Williamsburg with the exception of the foundations, which since 1897 have been cared for by the Association for the Preservation of Virginia Antiquities. In the Peninsula campaign of the Civil War the Battle of Williamsburg was fought on the 5th of May 1862 on the south-eastern outskirts of the city. The Confederate army under General J. E. Johnston was retreating from Yorktown toward Richmond and a part of it under General James Longstreet waited here to check the pursuit of the advance portion of the Union army under General E. V. Sumner. A Union division under General J. D. Hooker began a spirited attack at 7.30 a.m., other Union divisions dealt heavy blows, but they failed from lack of co-operation to rout the Confederates and a retreat the latter continued their retreat. The Union loss in killed, wounded and missing was 2228; the Confederate about 560.

See L. G. Tyler, Williamsburg, the Old Colonial Capital (Richmond, 1907), and his "Williamsburg, the Ancient Capital," in L. P. Powell's Historic Towns of the Southern States (New York, 1900).

WILLIAMSON, ALEXANDER WILLIAM (1834-1904), English chemist, was born in Wandsworth, London, on the 1st of May 1834. After working under Lieben at Berlin and Liebig at Giessen, he spent three years in Paris studying the higher mathematics under Comte. In 1849 he was appointed professor of practical chemistry at University College, London, and from 1855 until his retirement in 1887 he also held the professorship of chemistry. He had the credit of being the first to explain the process of etherification and to elucidate the formation of ether by the interaction of sulphuric acid and alcohol. Ether and alcohol he regarded as substances analogous to and built up on the same type as water, and he further introduced the water-type as a widely applicable basis for the classification of chemical compounds. The method of stating the rational constitution of bodies by comparison with water he believed capable of wide extension, and that one type, he thought, would suffice for all inorganic compounds. As for the best-known organic ones, the formula of water being taken in certain cases as doubled or tripled. So far back as 1850 he also suggested a view which, in a modified form, is of fundamental importance in the modern theory of ionic dissociation.

For his work on etherification Williamson in 1862 received a Royal medal from the Royal Society, of which he became a fellow in 1855, and which he served as foreign secretary from 1873 to 1889. He was twice president of the London Chemical Society, in 1865-1865, and again in 1869-1871. His death occurred on the 4th of May 1894, at Hindhead, Surrey, England.

WILLIAMSON, SIR JOSEPH (1633-1701), English politician, was born at Bridkirk, near Cromer, Norfolk, the father, Joseph Williamson, being vicar of this place. He was educated at St Bees, at Westminster school and at Queen's College, Oxford, of which he became a fellow, and in 1660 he entered the service of the secretary of state, Sir Edward Nicholas, retaining his position under the succeeding secretary, Sir Henry Bennet, afterwards earl of Arlington. For his connexion with the foundation of the London Gazette in 1665 see NEWSPAPERS. He entered parliament in 1669, and in 1672 was made one of the clerks of the council and a knight. In 1673 and 1674 he represented his country at the congress of Cologne, and in the latter year he became secretary of state, having practically purchased this position from Arlington for £6000, a sum which he required from his successor when he left office in 1679. Just before his removal he had been arrested on a charge of sharing in the popish plots, but he had been at once released by order of Charles II. After a period of comparative inactivity Sir Joseph represented England at the congress of Nijmegen in 1697, and in 1698 he signed the first treaty for the partition of the Spanish monarchy. He died at Cobham, Kent, on the 3rd of October 1701. Williamson was the second president of the Royal Society, but his main interests, after politics, were rather in antiquarian than in scientific matters. Taking advantage of the many opportunities of making money which his official position gave him, he became very rich. He left £6000 and his library to Queen's College, Oxford; £5000 to found a school at Rochester; and £2000 to Thetford.

A great number of Williamson's letters, despatches, memoranda, &c., are among the English state papers.

WILLIAMSON, WILLIAM CRAWFORD (1816-1895), English naturalist, was born at Scarborough on the 24th of November 1816. His father, John Williamson, after beginning life as a gardener, became a well-known local naturalist, who, in conjunction with William Bean, first explored the rich fossiliferous beds of the Yorkshire coast. He was for many years curator of the Scarborough natural history museum, and the younger Williamson was thus from the first brought up among scientific surroundings and in association with scientific people. William Junior, the "father of English geology," lived for two years in the Williamson family. Young Williamson's grandfather was a lapidary, and from him he learnt the art of cutting stones, an accomplishment which he found of great use.
In later years, when he undertook his work on the structure of fossil plants, Williamson very early made a beginning as an original contributor to science. When little more than sixteen he published a paper on the rare birds of Yorkshire, and a little later (in 1834) presented to the Geological Society of London his first memoir on the Megaloptera, on which his national reputation was founded. In the next year he assisted Lindley and Hutton in the preparation of their well-known Flora of Great Britain. On entering the medical profession he still found time to carry on his scientific work during his student days, and for three years acted as curator of the Natural History Society's museum at Manchester. After completing his medical studies at University College, London, in 1841, he returned to Manchester to practise his profession, in which he met with much success. When Owens College at Manchester was founded in 1851 he became professor of natural history there, was in the early days of teaching geology, zoology and botany. A very necessary division of labour took place as additional professors were appointed, but he retained the chair of botany down to 1892. Shortly afterwards he removed to Clapham, where he died on the 23rd of June 1895. Williamson's teaching work was not confined to his university classes, for he was also a successful popular lecturer, especially for the Gilchrist Trustees. His scientific work, pursued with remarkable energy throughout his life in the midst of official and professional duties, had a wide scope. In geology, his early work on the zones of distribution of fossils was of value in the part played by microscopic organisms in the formation of marine deposits (1845), was of fundamental importance. In zoology, his investigations of the development of the teeth and bones of fishes (1842-1851), and on recent Foraminifera, a group on which he wrote a monograph for the Ray Society in 1857, were no less valuable. In botany, in addition to a remarkable memoir on the minute structure of Voilax (1852), his work on the structure of fossil plants established British palaeobotany on a scientific basis; on the ground of these researches Williamson may rank with A. T. Brongniart as one of the founders of this branch of science. His contributions to fossil botany began in the earliest days of his career, and he returned to the subject from time to time during the period of his geological and zoological activity. His investigation of the Mesozoic cycadoid fossil Zamia (now Williamsonia) gigas was the chief palaeobotanical work of this intermediate period. His long course of researches on the structure of Carboniferous plants belongs mainly to the latter part of his life, and its results are chiefly, though not wholly, embodied in a series of nineteen memoirs, ranging in date from 1871 to 1893, in the pages of the S. of E. of the Palaeontographical Society, and published later as Palaeontographical Monographs, 1896-1898, published elsewhere. Williamson elucidated the structure of every group of Palaeozoic vascular plants. Among the chief results of his researches may be mentioned the discovery of plants intermediate between ferns and cycads, the description of the true structure of the fructification in the extinct cryptogamic family Sphenophyllaeae, and the demonstration of the cryptogamic nature of the dominant Palaeozoic orders Calamariaceae, Lepidodendraceae and Sigillariaceae, plants which on account of the growth of their silicified trunks were long regarded as phanerogams by Brongniart and his followers. After a long controversy the truth of Williamson's views has been fully established, and it is now known that the mode of growth, characteristic in present times, of dicotyledons and gymnosperms prevailed in Palaeozoic ages in every family of vascular cryptogams. Thus, as Count Solms-Laubach has pointed out, palaeobotany for the first time spoke the decisive word in an important question of general botany. Williamson's work in fossil botany was scarcely appreciated at the time as it deserved, for its great merits were somewhat obscured by the author's want of familiarity with the modern technicalities of the science. Since, however, the subject has been seriously taken up by botanists of a newer school, the soundness of the foundation he laid has become fully recognized. It may be added that he was a skilled draughtsman, illustrating all his works by his own drawings, and practising water-colour painting as his favourite recreation.

A full account of Williamson's career will be found in his autobiography, entitled Reminiscences of a Yorkshire Naturalist, edited by his wife (London, 1869). Among obituary notices may be mentioned those by Count Solms-Laubach, Nature (5th September 1893), and by D. H. Scott in Proc. R.S. vol. ix. (1897). [D. H. S.]

WILLIAMSPORT, a city and the county-seat of Lycoming county, Pennsylvania, U.S.A., on the north bank of the west branch of the Susquehanna river, about 70 m. N. by W. of Harrisburg. Pop. (1890) 27,132; (1900) 28,757, of whom 1144 were negroes and 2228 were foreign-born, including 1069 Germans; (1910 census), 37,860. Area, about 7 sq. m. Williamsport is served by the New York Central & Hudson River, the Pennsylvania, the Susquehanna & New York, and the Philadelphia & Reading railways, and by electric lines connecting with the neighbouring towns of Montoursville (pop. in 1900, 1665), South Williamsport (pop. in 1900, 3328), on the S. bank of the river, and Du Boistown (pop. in 1900, 650). The city has an attractive site, on a high plain, nearly surrounded by hills. It has five parks, Brandon (44 acres) within the city limits, and Vallamont, Starr Island, Sylvan Dell and Nippono in its suburbs. Williamsport is the seat of Williamsport Dickinson Seminary (Methodist Episcopal, co-educational, 1848), a secondary school. Among the principal buildings are the county court house, the city hall, the United States Government building, the Scottish Rite Cathedral, the Masonic Temple, a Y.M.C.A. building, and the James V. Brown Memorial Library (1907). In the city are a Boys' Industrial Home (1889), a Girls' Training School (1893), a Florence Crittenton Home (1893), a Home for Aged Coloured Women (1898), a Home for the Friendless (1872), and Williamsport Hospital (1872). There are practically no tenement houses. The value of factory products in 1905 was $11,738,473, 20.7% more than in 1900. Williamsport has the largest lumber market in Pennsylvania; lumber for forty years the most important of its manufactures, and Williamsport was styled the "sawdust city." The decreasing importance of the industry is due to the virtual exhaustion of standing timber in the neighbourhood. Lumber and timber products were valued at $3,101,368 in 1905, and lumber and planing mill products at $729,667. Among other manufactures are silk and silk goods, valued at $1,191,273 in 1905; foundry and machine shop products, $1,104,737; rubber and leather boots and shoes, furniture, &c. The city has a large trade with the surrounding country. The water supply is derived from moun- tain springs and wells, and in 1905 the drinking water was sold at 10c. per thousand gallons. There are good schools and well-trained teachers. It was founded in 1795, in which year Williamsport was founded and became the county-seat, after a bitter contest with Jaysburg, which was then a village of only some half a dozen houses and which subsequently ceased to exist. Williamsport was incorporated as a borough in 1866, and was chartered as a city in 1866.

WILLIAMSTOWN, a town of Bourke county, Victoria, Australia, 9 m. by rail S.W. of Melbourne. Pop. (1901) 14,683. Shipping is the chief business of the place, there being commodious piers, breakwater, also provision for the repair of vessels, patent slips and shipbuilding yards. Several of the most important of its manufactures, and Williamsport was styled the "sawdust city." The decreasing importance of the industry is due to the virtual exhaustion of standing timber in the neighbourhood. Lumber and timber products were valued at $3,101,368 in 1905, and lumber and planing mill products at $729,667. Among other manufactures are silk and silk goods, valued at $1,191,273 in 1905; foundry and machine shop products, $1,104,737; rubber and leather boots and shoes, furniture, &c. The city has a large trade with the surrounding country. The water supply is derived from moun- tain springs and wells, and in 1905 the drinking water was sold at 10c. per thousand gallons. There are good schools and well-trained teachers. It was founded in 1795, in which year Williamsport was founded and became the county-seat, after a bitter contest with Jaysburg, which was then a village of only some half a dozen houses and which subsequently ceased to exist. Williamsport was incorporated as a borough in 1866, and was chartered as a city in 1866.

WILLIAMSTOWN, a town of Berkshire county, Massachusetts, U.S.A., on the Hoosick and Green rivers, in the N.W. corner of the state, and about 20 m. N. of Pittsfield. Pop. (1890) 4221; (1900) 5013, of whom 929 were foreign-born and 178 were negroes; (1910 census), 3708. Williamsport is served by the Boston & Maine railway and by an interurban electric line to North Adams. It covers an area of about 40 sq. m. and contains five villages. Williamsport, the principal village, is a pleasant residential centre on the Green river; it is sur- rounded by beautiful scenery and its streets are shaded by some fine old trees. Mission Park (10 acres) here is adorned by native
and foreign shrubs and by maples, elms, pines and arbor vitae, and "Haystack Monument" in this park marks the place where Samuel John Mills (1753-1818), in 1806, held the prayer meeting which was the forerunner of the American foreign missionary movement. Williamstown village, a seat of Williams College, was chartered in 1703 as a successor to a "free school" in Williamstown (chartered in 1785 and endowed by a bequest of Colonel Ephraim Williams). Besides recitation and residence halls, it has the Lawrence Hall Library (1846), containing (1910) 88,000 volumes, the Thompson Memorial Chapel (1904), the Lasell Gymnasium (1880), an infirmary (1853), the Hopkins Observatory (1837) and the Field Memorial Observatory (1882), the Thompson Chemical Laboratory (1893), the Thompson Biological Laboratory (1893) and the Thompson Physical Laboratory (1893). In 1910 the college had 55 instructors and 537 students. The fourth president of the college was Mark Hopkins (q.v.), and one of its most distinguished alumni was James A. Garfield, president of the United States, whose son, Harry Augustus Garfield (b. 1863), became president of the college in 1908.

The principal manufactures of the township are cotton and woolen goods (especially corduroy), and market gardening is an important industry. The limits of the township, originally called West Hoosac, were determined by a committee of the General Court of Massachusetts in 1749, and two or three years later the village was laid out. Two of the lots were immediately purchased by Captain Ephraim Williams (1715-1755), who was at the time commander of Massachusetts in the vicinity; several other lots were bought by soldiers under him; and in 1753 the proprietors organized a township government. Williams was killed in the battle of Lake George on the 8th of September 1755, but while in camp in Albany, New York, a few days before the battle, he drew a will containing a small bequest for a free school at West Hoosac on condition that the township when incorporated should be called Williamstown. The township was incorporated with that name in 1765.

See A. L. Perry, Origins in Williamstown (New York, 1894; 3rd ed. 1900); and Williamstown and Williams College (Norwood, Mass., 1899).

WILLIAMS-WYNN, SIR WATKIN, BART. (1692-1749), Welsh politician, was the eldest son and heir of Sir William Williams, BART., of Llanfora near Oswestry; his mother, Jane Thelwall, was the daughter of one John Wynn of Cwydhir, Carnarvonshire. Educated at Jesus College, Oxford, Williams succeeded to Wynn-stay near Ruabon and the estates of the Wynn's on the death of a later Sir John Wynn in 1719, and took the name of Williams-Wynn. He was member of parliament for Denbighshire from 1716 to 1741, and was prominent among the opponents of Sir Robert Walpole; as a leading and influential Jacobite he was in communication with the supporters of Prince Charles Edward before the rising of 1745, but his definite offer of help did not reach the prince until the retreat to Scotland had begun. He died on the 26th of September 1749. His first wife, Ann Vaughan (d. 1748), was the heiress of extensive estates in Montgomeryshire which still belong to the family. His son and heir, Sir Watkin Williams-Wynn, BART. (1749-1789), was the father of another Sir Watkin (1772-1842), the 5th baronet. Two other sons attained some measure of distinction: Charles (1775-1850), a prominent Tory politician, and Sir Henry (1783-1869), a diplomatist. A daughter, Frances Williams-Wynn (d. 1887), was the authoress of Diaries of a Lady of Quality, 1777-1844, which were edited with notes by Abraham Hayward in 1894.

See Askew Roberts, Wynn Family, and the Wynn (Oswestry, 1876).

WILLIBROD (or WILIBORD), ST (d. 738), English missionary, "the apostle of the Frisians," was born about 657. His father, Wiligis, an Angle or, as Alcuin styles him, a Saxon, of Northumbria, withdrew from the world and constructed for himself a little oratory dedicated to St Andrew. The king and nobles of the district endowed him with estates till he was at last able to build a church, over which Alcuin afterwards ruled. Willibrod, almost as soon as he was weaned, was sent to be brought up at Ripon, where he must doubtless have come under the influence of Wilfrid. About the age of twenty the desire of increasing his stock of knowledge (c. 679) drew him to Ireland, which had so long been the headquarters of learning in Western Europe. Here he stayed for twelve years, enjoying the society of Bregert and Wibertiad, and in London, and to South Coventry, he received his commission to missionary work among the North-German tribes. In his thirty-third year (c. 690) he started with twelve companions for the mouth of the Rhine. These districts were then occupied by the Frisians under their king, Rathbod, who gave allegiance to Pippin of Herstal. Pippin befriended him and sent him to Rome, where he was consecrated archbishop (with the name Clements) by Pope Sergius on St. Cecilia's Day 696.1 Bede says that when he returned to Frisia his see was fixed in Ultrajectum (Utrecht). He spent several years in founding churches and evangelizing, till his success tempted him to pass into other districts. From Denmark he carried away thirty boys to be brought up among the Franks. On his return he was welcomed on the holy island of Fosite (Heligoland), where his disregard of the pagan superstition nearly cost him his life. When Pippin died, Willibrord found a supporter in his son Charles Martel. He was assisted for three years in his missionary work by St Boniface (719-722), who, however, was not willing to become his successor.

He was still living when Bede wrote in 731. A passage in one of Bede's letters to Stephen III. speaks of his preaching to the Frisians for fifty years, apparently reckoning from the time of his consecration. This would fix the date of his death in 738; and, as Alcuin tells us he was eighty-one years old when he died, it may be inferred that he was born in 657—a theory on which all the dates given above are based, though it must be added that they are substantially confirmed by the incidental notices of Bede. The day of his death was the 6th of November, and his body was buried in the monastery of Echternach, near Trier, where it lay for many years. In 843 Emperor Louis the Great of Germany set up a statue of Willibrord in the church of the village of Wilskirchen in Utrecht, which was later transferred to the church of St. Michael, near Hofheim. It is the best of a State Normal Training School, and has a public library and Dunham Hall Library (1878). The Willimantic river provides good water-power, and there are various manufactures. The total value of the factory product in 1905 was $4,902,447. The township of Willimantic was incorporated in 1692. Willimantic was settled in 1822, incorporated as a borough in 1833, and chartered as a city in 1893. The name is from an Indian word meaning "good look-out" or "good cedar swamps."

WILLIS, NATHANIEL PARKER (1866-1867), American author who lived and wrote almost entirely in England, is described as a "puritan of considerable distinction," who arrived in New England about 1630 and settled in Cambridge, Massachusetts. Nathaniel Parker was the eldest son and second child of Nathaniel Willis, a newspaper proprietor in Boston, and was born in Portland, Maine, on the 20th of January 1866. After attending Boston grammar school and the academy at Andover, he entered Yale College in October 1823. Although he did not specially distinguish himself as a student, university life had considerable influence in the development of his character, and furnished him much of his literary material. Immediately after leaving Yale he published in 1827 a volume of poetical Sketches, which attracted some attention, although the critics found in his verses more to blame than to praise. It was followed by Fugitive Poetry (1829) and another volume of verse (1831). He also

1 He had been consecrated bishop, also by Sergius, on a previous visit in 692.
WILLIS, T.—WILLOBIE

contributed frequently to magazines and periodicals. In 1829 he started the *American Monthly Magazine*, which was continued from April of that year to August 1831, but failed to achieve success. On its discontinuance he went to Europe as foreign editor and correspondent of the *New York Mirror*. To this journal he contributed a series of letters, which, under the title *Pencillings by the Way*, were published at London in 1835 (3 vols.; Philadelphia, 1836, 2 vols.; and first complete edition, New York, 1841). Their vivid and rapid sketches of scenes and modes of life in the old world at once gained them a wide popularity; but he was censured by some critics for indiscretion in reporting conversations in private gatherings. Notwithstanding, his opinions expressed on many subjects were upholding. He was a regular contributor to the *New York Mirror*, and settled at a small estate on Oswego Creek, just above its junction with the Susquehanna. Here he lived off and on from 1837 to 1842, and wrote *Letters from under a Bridge* (London, 1840; first complete edition, New York, 1844), the most charming of all his works. During a short visit to England in 1839—1840 he published *Two Ways of Dying for a Husband*. Returning to New York, he established, along with George P. Morris, a newspaper entitled the *Evening Mirror*. On the death of his wife in 1843 he again visited England. Returning to America in the spring of 1846, he married Cornelia Grinnell, and established the *National Advocate*, afterwards named the *Home Journal*. In 1845 he published *Dashes at Life with a Free Pencil*, in 1846 a collected edition of his *Prose and Poetical Works*, in 1849 *Rural Letters*, and in 1850 *Life Here and There*. In that year he settled at Idlewild on the Hudson river, and on account of failing health spent the remainder of his life chiefly in retirement. Among his later works were *Hurry-Graphs* (1851), *Outdoors at Idlewild* (1854), *Ragbag* (1855), *Paul Jane* (1856), and the *Convalescent* (1859), but he had survived his great reputation. He died on the 20th of January 1867, and was buried in Mount Auburn, Boston.

The best edition of his verse writings is *The Poems, Sacred, Passionate and Humorous, of N. P. Willis* (New York, 1868); 13 volumes of his prose, *Complete Prose Works*, were published at New York (1859), and a *Life of N. P. Willis* was edited by Henry A. Beers (New York, 1885). His life, by Henry A. Beers, appeared in the series of "American Men of Letters" the same year. See also E. P. Whipple, *Essays and Reviews* (vol. i., 1848); M. A. de Wolfe Howe, *American Booksmen* (New York, 1898).

WILLIS, THOMAS (1621-1672), English anatomist and physician, was born at Great Bedwin, Wiltshire, on the 27th of January 1621. He studied at Christ Church, Oxford; and when that city was garrisoned for the king he bore arms for the Royalists. He took the degree of bachelor of medicine in 1646, and applied himself to the practice of his profession. Shortly after the Restoration, he became Sedleian professor of natural philosophy in place of Dr Joshua Cross, who was ejected, and the same year he took the degree of doctor of physic. In 1664 he discovered the medicinal spring at Ape, near Brackley in Northamptonshire. He was one of the first members of the Royal Society, and was elected an honorary fellow of the Royal College of Physicians in 1664. In 1666, after the fire of London, he took a house in St Martin's Lane, and there rapidly acquired an extensive practice, his reputation and skill marking him out as one of the first physicians of his time. He died in St Martin's Lane on the 11th of November 1674 and was buried in Westminster Abbey.

Willis was admired for his pietry and charity, for his deep insight into natural and experimental philosophy, anatomy and chemistry, and for the elegance and purity of his Latin style. Among his writings were *Cerabi anatem nervorumque descriptio et usus* (1664), in which he described what is still known, in the anatomy of the brain, as the circle of Willis, and *Pharmaciae rationalis* (1674), in which he characterized diabetes mellitus. He wrote in English *A Plain and Easy Method of gypsum stones that are Well from the Infection of the Plague*, and *Of Curing such as are Injured*. His Latin works were printed in two vols. 4to at Geneva in 1676, and at Amsterdam in 1682. Browne Willis (1682—1750), the antiquarian, published three volumes of *Survey of the cathedrals of England*, in his grandson.

WILLIS, JAMES TIBBITTS (1800—1863), English line engraver, was born at Bristnall's End, Halesowen near Birmingham, on the 15th of September 1800. At the age of fourteen he was apprenticed to William Radcliffe, a Birmingham engraver, and in 1823 he went to London and was employed for three years by Charles Heath. He was afterwards engaged upon the plates of Brockden's *Passes of the Alps* and Turner's *England and Wales*. He engraved after Chalon, Leitch, Stanfield, Landseer, Eastlake, Creswick and Ansdel, and especially after Turner, from whose "Alnwick Castle by Moonlight," "The Old Téméraire," "Mercury and Argus," "Ancient Rome," and the subjects of France, he executed many admirable plates. He was elected an associate engraver of the Royal Academy in 1843. He died on the 12th of March 1863.

WILLOBIE (or WILLOUGHBY), HENRY (1572—1606), the supposed author of a poem called *Willobie his Avisa*, which derives interest from its possible connexion with Shakespeare's personal history. Henry Willoughby was the second son of a Wiltshire gentleman of the same name, and matriculated from St John's College, Oxford, in December 1591, at the age of sixteen. He is probably identical with the Henry Willoughby who graduated B.A. from Exeter College early in 1595, and he died before the end of June 1596 from a fall. In the poem Hadrian Willoughby added an 'Apologie' in defence of his friend the author "now of late gone to God," and another poem in praise of chastity written by Henry's brother, Thomas Willoughby. *Willobie his Avisa* was licensed for the press on the 3rd of September 1594, four months after the entry of Shakespeare's *Rape of Lucrece*, and printed by John Windet. It is preceded by two commendatory poems, the second of which, signed "Contraria Contrariis; Vigilantius; Dormitanus," contains the earliest known printed allusion to Shakespeare by name:

"...Yet Tarquyne pluckt his glistering grape,
And Shake-speare paints poor Lucrece rape."

In the poem itself, Avisa, whose name is explained in Dorrell's "Epistle to the Reader" as *Amanus Usur Inviolata Semper Amandae*, takes up the parable alternately with her suitor, one of whom is introduced to the reader in a prose interlude signed by the author H. W., as Henrico Willobgo Italio Hispanalis. This passage contains a reference which may fairly be applied to the sonnets of Shakespeare. It runs:

"H. W. being suddenly infected with the contagion of a fantastical fit, at the first sight of A. [be] bewrayeth the secrecy of his disease unto his familiar friend W. S. who not long before had tried the curtesy of the like passion, and was now newly recovered... he told the author of the river which sent it to a happier end for this new actor, then it did for the old player."

Then follows a dialogue between H. W. and W. S., in which W. S., "the old player," a phrase susceptible of a double sense, gives somewhat commonplace advice to the disconsolate wooer.

Dorrell alleges that he found the MS. of *Willobie his Avisa* among his friend's papers left in his charge when Willoughby departed from Oxford on her majesty's service. There is no trace of any Hadrian Dorrell, and the name is probably fictitious; there is, indeed, good reason to think that the pseudonym, if such it is, covers the personality of the real author of the work. *Willobie his Avisa* proved extremely popular, and passed through numerous editions, and Peter Colse produced in 1596 an imitation named *Penelope's Complaint*.

WILLOCK (or Willocks), John (c. 1515-1589), Scottish reformer, was a native of Ayrshire and was educated at the university of Glasgow. After being a monk for a short time he embraced the reformed religion and went to London, where, about 1542, he became chaplain to Henry Grey, afterwards duke of Suffolk, the father of Lady Jane Grey. On the accession of Mary to the English throne in 1553 he went to Emden in Friesland, where he practised as a physician, varying this profession with visits to Scotland. He was associated with the leading Scottish reformers in their opposition to the queen regent, Mary of Lorraine, and the Roman Catholic religion, and in 1558 he returned definitely to his native land. Willock now began to preach and in 1559 was outlawed. Popular sympathy, however, rendered this sentence fruitless, and in the same year, being Knox's deputy as minister of St Gilles' cathedral, Edinburgh, he frustrated the efforts of the regent to restore the Roman Catholic religion, and administered the communion for the first time in accordance with the ideas of the reformers. He was one of the four ministers chosen by the convention of October 1559 to seats on the council of government, and was one of those appointed to compile the first book of discipline. About 1562 he became rector of Loughborough in Leicestershire, but he retained his connexion with the Scottish church and was moderator of the general assembly in 1562, and again in 1564, in 1565 and in 1568. He died at Loughborough on the 4th of December 1585.

WILLOUGHBY, the name of an English family long settled in Nottinghamshire, and now represented by Baron Middleton. Having exchanged his name of Bugge for that of Willoughby, Richard de Willoughby became a judge during the reign of Edward II, and purchased the manors of Wollaton in Nottinghamshire and of Risley in Derbyshire. His son, Richard de Willoughby (d. 1362), was justice of the common pleas under Edward III. Richard's descendant, Dorothy, who became the heiress of the family estates, married Robert Willoughby of Bore Place, Kent, and their descendant, Sir Thomas Willoughby, Bart. (c. 1670-1739), of Wollaton, was created Baron Middleton in 1712. In 1837 his descendant, Digby Wentworth Bayard Willoughby (b. 1844), became the 9th baron. This title must be distinguished from that of Viscount Middleton, borne by the Brodrick family.

Sir Hugh Willoughby, the seaman, was a member of this family. He was a son of Sir Henry Willoughby (d. 1528), and a grandson of Sir Hugh Willoughby of Wollaton. His early services were as a soldier on the Scottish borders, but he soon turned his thoughts to the sea, and was appointed captain of a fleet of three ships which set out in 1553 with the object of discovering a north-eastern passage to Cathay and India. Two of the three ships reached the coast of Lapland, where it was proposed to winter, and here Willoughby and his companions died of cold and starvation soon after January 1554. A few years later their remains were found, and with them Willoughby's Journal, which is printed in vol. i. of R. Hakluyt's Principal Navigations.

Another famous member of this family was Sir Nesbit Josiah Willoughby (1777-1849), who entered the British navy in 1790 and was present at the battle of Copenhagen. In 1800, however, he was dismissed from the service by the sentence of a court-martial for his insolent conduct towards a superior officer, a previous offence of this kind having been punished less severely. In 1803, on the renewal of war, as a volunteer he joined an English squadron bound for the West Indies, and was soon admitted again to the navy; his courage and promptness at Cape François were responsible for saving 900 lives, and he distinguished himself on other occasions, being soon restored to his former rank in the service. After further services in the West Indies, during which he displayed marked gallantry on several occasions, Willoughby was tried by court-martial at Cape Town in 1808 on charges of cruelty; he seems to have taken a great delight in inflicting punishment, but he was acquitted with the advice to be more moderate in future in his language. Again in the West Indies, where he commanded the Néréide, he was responsible for the heroic defence made by his ship against a much stronger French force at Port Louis, Mauritius, in August 1810, when 222 out of his crew of 282 men were disabled before he surrendered. Undeterred by the severe wounds which he had received, and seeing no prospect of active service with the British fleet, Willoughby offered his services in 1812 to the Russian government, and while serving with the Russian army he was captured by the French. He was taken to France, whence he escaped to England. Having seen a little more service in the navy, he was knighted in 1817, was made a rear-admiral in 1847, and died unmarried in London on the 19th of May 1849.

WILLOW (Salix), a very well-marked genus of plants constituting, with the poplar (Populus), the order Salicaceae. Willows are trees or shrubs, varying in stature from a few inches, like the small British S. herbacea and arctic species generally, to 100 ft., and occurring most abundantly in cold or temperate climates in both hemispheres, and generally in moist situations; a few species occur in the tropical and sub-tropical portions of the three great continents. Their leaves are deciduous, alternate, simple, and generally much longer than broad, whence the term willow-leaved has become proverbial. At their base they are provided with stipules, which are also modified to form the scales investing the winter buds. The flowers are borne in catkins (fig. 1), which are on one tree male (staminate) only, on another female (pistillate). Each male flower consists of a small scale or bract, in the axil of which are usually two, sometimes three, rarely five stamens, and still more rarely a larger number. In addition there is a small glandular disk, which assumes different shapes in different species. The female flowers are equally simple, consisting of a bract, from whose axil arises usually a very short stalk, surmounted by two carpels adherent one to the other for their whole length, except that the upper ends of the styles are separated into two stigmas. When ripe the two carpels separate in the form of two valves and liberate a large number of seeds, each provided at the base with a tuft of silky hairs, and containing a straight embryo without any investing albumen. The flowers appear generally before the leaves and are thus rendered more conspicuous, while passage of pollen by the wind is facilitated. Fertilization is effected by insects, especially by bees, which are directed in their search by the colour and fragrance of the

Fig. 1.—Salix caprea—Common Sallow or Goat Willow. 1. Leaf shoot. 2. Branchlet bearing male catkins. 4. Female catkin. 5. Female flower. 6. Capsule, opened. 7. Seed. 1, 2, 4 reduced; 3, 5, 7 enlarged.
flowers; but some pollen must also be transported by the wind to the female flowers, especially in arctic species which, in spite of the poverty of insect life, set abundant fruit. The tuft of hairs at the base facilitates rapid dispersion of the seed, early germination of which is rendered desirable owing to its tenacity. Although the limitations of the genus are well marked, and its recognition in consequence easy, it is otherwise with regard to the species. The greatest difference of opinion exists among botanists as to their number and the bounds to be assigned to each; and the cross-fertilization that takes place between the species intensifies the difficulty. Anderson, a Swede, spent nearly a quarter of a century in their investigation, and ultimately published a monograph which is the standard authority on the subject. He admits about a hundred species. Professor C. S. Sargent (Silva of North America) suggests 160 to 170 as the number of distinguishable species. Some botanists have enumerated 80 species from Great Britain alone, while others count only 12 or 15. Dr Buchanan White, who made a special study of the British willows, grouped them under 17 species with numerous varieties and hybrids. To illustrate the great perplexity surrounding the subject, we may mention that to one species, *S. nigricans*, one hundred and twenty synonyms have been attached. Some of these are doubtless as no botanist, with adequate material for forming an opinion, would accept; but, after making the necessary deductions for actual mistakes and misstatements, there still remains a large number upon which legitimate differences of opinion prevail. Anderson says that he has rarely seen two specimens of this species which were alike in the collective characters offered by the stature, foliage and catkins. No better example could be found of the almost limitless variation in so-called species.

Few genera have greater claims to notice from an economic point of view. As timber trees many of the species are valuable from their rapidity of growth and for the production of light durable wood, serviceable for many purposes. Among the best trees of this kind are *S. fragilis*, the crack willow (fig. 2), especially the variety known as *S. fragilis*, var. Russelliana, and *S. alba*, the white or Huntingdon willow. These trees are usually found growing by streamers' banks or in other moist situations, and are generally pollarded for the purpose of securing a crop of straight poles. This plan is, however, objectionable, as inducing decay in the centre of the trunk. Where poles are required, it is best to divide the tree, as the best growth is on the new divided trunk. The soil. The wood of *S. fragilis* is used for cricket-bats; there is a great difference in the value for this purpose of timber from different soils; and wood of the female tree is said to be preferable. Of *S. caprea* (fig. 1), a hedgerow tree, generally grows in drier situations. It is a useful timber tree, and its wood, like that of *S. alba*, is prized in the manufacture of charcoal. Its catkins are collected in England in celebration of Palm Sunday, the light-coloured flowers being available in early spring when other decorations of the kind are scarce. Certain sorts of willow are largely used for basket-making and rail-work. They must be grown in a soil free from lime, and should have their branches pruned. The wood is also useful for basketry. It is also well adapted for forming wind-breaks or screens, or for holding the banks of streams and preventing the removal of the soil by the current. *S. virginalis* is one of the best of the green osiers, suitable for hoops and valuable for retaining the soil on sloping embankments. *S. stellina* yields the yellow osiers. *S. acuminata* and other species do well by the seaside, and are useful for wind-screens. Some of the dwarf species, such as *S. repens* and other dwarf kinds are useful for binding heathy or sandy soil. In addition to their use for timber or basket-making, willows contain a large quantity of tannin in their bark. A valuable medicinal glucoside named calich or gallic (g.e.) is also extracted from the bark. The wood, especially of *S. alba*, is used for paper pulp. As ornamental trees some willows also take a high rank. The white willow is a great favourite, while the drooping habit of the weeping willow renders it very attractive. Though named *S. babylonica*, it is really a native of China, from which it has been widely spread by man; the willow of the Euphrates (Ps. cexxvil), is in all probability *Populus eufratica*. *S. babylonica* is sometimes spoken of as Pope's willow, having been cultivated by that poet, or as Napoleon's willow, because his tomb at St Helena is overshadowed by a tree of this species, from which many offsets exist or are reputed to exist in modern gardens. *S. regelii* has very white leaves, and *S. rosmarinifolia* is remarkable for its very narrow leaves—purplish above, silvery beneath. The larvae of several nocturnal Lepadoptera feed upon the leaves of the willows, and the trunk of the sallow is often injured by the perforations of the lunar hornet sphinx (*Trochilium erabroniforme*).

WILLOW-HERB, in botany, the popular name for the species of Epilobium, a genus of often tall herbaceous plants, several of which are natives of Britain. The slender stems bear narrow leaves and pink or purple flowers, which in the rose-bay (E. angustifolium), found by moist river-sides and in copses, are 1 in. in diameter and form showy spikes. *E. hirsutum*, found by sides of ditches and rivers, a tall plant with many large rose-purple flowers, is known popularly as codlins-and-cream.

WILLS, WILLIAM GORMAN (1828-1893), Irish dramatist, was born at Kilmurry, Ireland, on the 28th of January 1828, the son of James Wills (1799-1868), author of *Lives of Illustrious and Distinguished Irishmen* (1839-1847). The son was educated at Waterford Grammar School and Trinity College, Dublin. After several years of journalistic and literary work in Dublin, he settled in London, where he wrote stories for the magazines. In 1868 he determined that he could make a better living at portrait-painting, for which, though his art education had been meagre, he had always had talent. He soon made a fair income, but in 1871 he moved with his family to a long-haired and persistent absent-mindedness, lost him many sisters. Meanwhile he had begun to write for the stage. His first original work was the *Man o'Airlie*, produced at the Princess's theatre, London, in 1867. Early in 1872 he was engaged by Colonel Bateman as "dramatist to the Lyceum" at an annual salary. Under the terms of his agreement he wrote *Medea in Corinth, Charles I.* and *Eugene Aram*, all of which were produced at the Lyceum in 1872-1873. With *Charles I.*, in which Mr (afterwards Sir Henry) Irving confirmed the reputation he had earned by his performances in *The Bella*, Wills made a popular success, which he repeated in *Olivia* (adapted from Goldsmith's *Vicar of Wakefield*) in 1873. From this date onwards Wills wrote continuously, and till 1887 his name was practically never absent from the bill of some London theatre. His work never, however, quite came up to the expectations which were based on his genuine ability,
and much of it is of an inferior quality. In Claudian (Princess's Theatre, 1883) and Faust (Lyceum Theatre, 1885) he merely supplied the text to a variety of dramatic situations. In 1887, his mother, whom he had supported for many years, died, and after her death he seemed to have less incentive for work. Wills was a painter by choice, and never put his whole heart into his dramatic work. He had some skill in ballad-writing, shown in the well-known "I'll sing thee songs of Araby." He died on the 13th of December 1891.

WILLUGHBY, Francis (1655-1672), English ornithologist and lexicographer, was the eldest of Sir Francis Willoughby, 1st Baronet, of Redhouse, Worcestershire, and Alconbury, Huntingdonshire, born Dec. 28, 1655. His biographer, the Rev. James Ray, of Trinity College, Cambridge, and author of the "Oriphologia," which, however, he did not publish, having injured a new and delicate constitution by alternate exposure and over-study. This work was published in 1676, and translated by Ray as the "Oriphologia," in 1678, (fol.); the same friend published his "Historia Piscium" (1686, fol.). Willughby died at Middleden Hall on the 3rd of July 1672.

In Ray's preface to the work he gives Willughby much of the credit usually assigned to himself, both as critic and systematist. Thus, while founding on Gesner and Aldrovandus, he omitted their irrelevancies, being careful to exclude "hieroglyphics, emblems, morals, fables, presages or ouch else pertaining to divinity, ethics, grammar, or any sort of humane learning, and present him (the reader) with what properly belongeth only to natural history." Avoiding, he not only devised artificial keys to his species and genera, but, "that he might clear up all these obscurities [of former writers] and render the knowledge and distinction of species facile to the understanding, he bent his endeavours mightily to find out certain characteristic notes of each kind," while finally, in apologizing for his engravings, he yet unjustly claims that "they are best and truest of any hitherto graven in brass." (See also Ornithology.)

WILMINGTON, a city, a port of entry and the county-seat of New Castle county, Delaware, U.S.A., in the N. part of the state, near the Delaware river, at the mouth of Brandywine and Christiana creeks. Pop. (1800) 61,411; (1800) 76,908, of whom 10,478 were foreign-born (1820 Irish, 1762 German, 998 English) and 9736 were negroes; (1910 census) 87,411. Area, 108 square miles. It is served by the Baltimore & Ohio, the Philadelphia, Baltimore & Washington (Pennsylvania) and the Philadelphia & Reading railways, and by several steamship lines. Wilmington Harbor includes Christiana Creek for 4 miles above its mouth and the navigable parts (2 miles) of the Brandywine, which enters the Christiana about 21 miles above its mouth. By 1881 the channel depth had been increased from 8 to 15 ft., in 1896-1906 it was increased to 21 ft. in the lower part of the channel, and in 1908 the upper part was dredged to 18 or 19 ft. for widths of 100, 200 and 250 ft. Between 1836 and 1909 $904,404 was expended on the improvement of the harbour. Most of the streets which run from E. to W. are numbered; those which run from N. to S. are named, often in honour of prominent American statesmen. The public parks and squares have a total area of 382 acres; the most important parks are Brandywine and Rockford, which lie along and near Brandywine creek, in the northern part of the city. Among the buildings of interest are the Castle Hall (1798); Holy Trinity (Old Swedes) Church (1698), probably the oldest church in the United States which has been in continuous use; the building occupied by the Historical Society of Delaware (organized in 1864), which was the old First Presbyterian Meeting House, built in 1740; the County Court House; and the Federal Building. In Wilmington, besides other educational institutions, is the Wilmington Friends' School (1748), the oldest preparatory school in the state. The Wilmington Institute Free Library (86,000 volumes in 1910) was founded in 1786, and was not made free to the public until 1894. Wilmington is the see of a Roman Catholic bishop, and of a Protestant Episcopal bishop.

The favourable situation, railway facilities and proximity to the coal-fields of Pennsylvania, West Virginia and Virginia, to the sources of supply of raw materials, and the water-power furnished by the Brandywine, combined with the enterprise of its citizens, have made Wilmington the most important manufacturing centre of Delaware. In 1905 the value of the factory product of the city, $30,390,639, was 73.5% of the total product value of the state. The principal manufactures are tanned, leather, and machine-shop products ($4,422,118), paper and wood pulp ($1,904,556), and Shipbuilding ($7,980,704 in 1905) was established as early as 1739, and in 1836 the first iron shipyard and in 1854 the first iron sailing-boat built in the United States were built here. On the Brandywine, near the city, are the works of the Du Pont Powder Company, which extend over nearly 1000 acres, the largest powder plant in the world. The company was founded in 1802 by the French refugee, Eleuthère Irenee du Pont de Nemours (1717-1844), who had left France in honour of the memory of the daughter of Gaspau Adolph. The fort was captured, without bloodshed, by Governor Peter Stuyvesant of New Netherland in 1635, but very few of the Swedes left Christiansham. The Swede language and Swedish customs persisted, and the religion of the Swedes was tolerated. After the English conquest in 1664, especially after the annexation of the Delaware counties to Pennsylvania in 1768, Swedish influence declined. In 1731 a large part of the territory now included in the city was owned by Thomas Wills, who named it Willington. About eight years later, a charter was granted by William Penn, this name was changed to Wilmington, in honour of Spencer Compton, Earl of Wilmington (1673-1743). During the War of Independence the battle of Brandywine was fought 13 m. N.W. of Wilmington. In the first half of the 19th century Wilmington was the centre of a strong anti-slavery sentiment and was a "station" of the "Underground Railroad." In 1809 the borough was enlarged by a new charter; in 1834 Wilmington was chartered as a city. In 1900 the city contained 414% of the total population of the state and, under the state constitution of 1897, it elects five of the thirty-five representatives and two of the seventeen senators in the state legislature.

See Records of Holy Trinity-Old Swedes) Church (Wilmington, 1890); Benjamin Ferris, History of the Original Settlements on the Delaware, part iii. (Wilmington, 1846); and Elizabeth Montgomery, Reminiscences of Wilmington (Philadelphia, 1851).

WILMINGTON, a city, a port of entry and the county-seat of New Hanover county, North Carolina, U.S.A., on the Cape Fear river, about 30 m. from its mouth, 10 m. in direct line from the ocean, and about 145 m. S.S.E. of Raleigh. Pop. (1890) 20,936; (1900) 20,976, of whom 10,477 were negroes and 5,015
were foreign-born: (1910 census) 25,748. It is the largest city and the chief seaport of the state. Wilmington is the Atlantic Coast Line and the Seaboard Air Line railways, and by steamboat lines to New York, Philadelphia and Baltimore and to ports on the Cape Fear and Black rivers, and is connected by an electric line with Wrightsville Beach, a pleasure resort 12 m. distant on the Atlantic Ocean. Below Wilmington the channel of the Cape Fear river is 20 ft. deep throughout and in some parts 22 and 24 ft. deep; the width of the channel is to be made 270 ft. under Federal projects on which, up to the 30th of June 1909, there had been expended $4,344,025. Above Wilmington the Cape Fear river is 40 ft. wide and 10 ft. deep; the tidal excursion is 13 miles; for 115 m. to Fayetteville. The city lies on an elevated sand ridge and extends along the river front for about 23 m. Among its prominent buildings are the United States Government Building, the United States marine hospital, the city and county hospital, the county court house, the city hall (which houses the public library) and the masonic temple. The city is the seat of Cape Fear Academy (1872) for boys, of the Academy of the Incarnation (Roman Catholic) and of the Gregory Normal School (for negroes). The city is the see of a Protestant Episcopal bishop, the Bishop in the Diocese of Whenorth (1828-1905). Wilmington has a large quantity of cotton, lumber, naval stores, rice, market-garden produce and turpentine; in 1909 the value of its exports was $23,310,070, and the value of its imports $1,283,724. The total value of the factory product in 1905 was $3,155,458, of which $893,715 was the value of lumber and timber products.

A settlement was established here in 1730 and was named New Liverpool; about 1732 the town was moved to New Town; in 1739 the town was incorporated, was made the county-seat and was renamed, this time in honour of Spencer Compton, Earl of Wilmington (c. 1673-1743). In 1760 it was incorporated Cape Fearborough in 1815, and was chartered as a city. Some of Wilmington's citizens were among the first to offer armed resistance to the carrying out of the Stamp Act, compelling the stamp-master to take an oath that he would distribute no stamps. During most of 1781 the borough was occupied by the British, and Lord Cornwallis had his headquarters here. Although blockaded by the Union fleet, Wilmington was during the Civil War the centre of an important intercourse between the Confederacy and foreign countries by means of blockade runners, and was the last important port open to the Confederates. It was defended by Fort Fisher a heavy fortwork on the peninsula between the ocean and Cape Fear river, manned by 1400 men under Colonel William Lamb. A federal expedition of 150 vessels under Admiral D. D. Porter and land forces (about 3000) under General B. F. Butler approached the fort on the 20th of December 1864; on the 24th the "Louisiana," loaded with 215 tons of powder, was exploded 400 yds. from the fort without doing any damage; on the 24th and 25th there was a terrific naval bombardment, which General Butler decided had not sufficiently injured the fort to make an assault by land possible; on the 13th and 14th of January there was another bombardment, and on the 15th a combined naval and land attack, in which General A. H. Terry, who had succeeded General Butler in command, stormed the fort with the help of the marines and sailors, and took 2000 prisoners and 169 guns. The Union losses were 266 killed, 57 missing and 1018 wounded. A magazine explosion on the morning of the 16th killed about 100 men in each army. The city was evacuated immediately afterwards.

WILMOT, DAVID (1814-1868), American political leader, was born at Bethany, Pennsylvania, on the 20th of January 1814. He entered politics as a Democrat, served in the National House of Representatives from 1843 to 1851, and although he favoured the Walker Tariff, the Mexican War and other party measures, opposed the extension of slavery. On the 8th of August 1846, when a bill was introduced appropriating $2,000,000 to be used by the president in negotiating a treaty of peace with Mexico, Wilmot immediately offered the following amendment: "Provided, That, as an express and fundamental condition to the acquisition of any territory from the Republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the Executive of the moneys herein appropriated, neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted." The amendment, famous in American history as the "Wilmot Proviso," was adopted by the House, but was defeated, with the original bill, by the Senate's adjournment. A similar measure was brought forward at the next session, the appropriation, however, being increased to $3,000,000, and the amendment further extended to include all territory which might be acquired by the United States; in this form it passed the House by a vote of 115 to 105; but the Senate refused to concur, passed a bill of its own without the amendment; and the House, owing largely to the influence of General Lewis Cass, in March 1847, receded from its position. The amendment was never actually adopted by Congress, and was in fact expressly repudiated in the Compromise of 1850, and its content declared unconstitutional by the Supreme Court in the Dred Scott case. Although known as the Wilmot Proviso it really originated with George Corbin of Ohio, who advocated the amendment in order to present it only because his party standing was more regular. The extension of the principle to territory other than that to be acquired from Mexico was probably due to Preston King (1806-1862) of New York. Wilmot supported Van Buren in 1848 and entered the Republican party at the time of its formation, and was a delegate to the national conventions of 1856 and 1860. He was president judge of the 13th Judicial District of Pennsylvania in 1853-1851, United States senator in 1861-1863 and Judge of the United States Court of Claims in 1863-1868. He died at Towanda, Pennsylvania, on the 16th of March 1868.

WILSON, ALEXANDER (1766-1813), American ornithologist, was born in Paisley, Scotland, on the 6th of July 1766. His father, a handloom weaver, soon removed to the country, and there combined weaving with agriculture, distilling and smuggling—conditions which no doubt helped to develop in the boy that love of rural pursuits and adventure which was to determine his career. At first he was placed with a tutor and destined for the church, but afterwards he was apprenticed as a weaver. Then he became a pedlar and spent a year or two in travelling through Scotland, recording in his journal every matter of natural history or antiquarian interest. Having incurred a short imprisonment for lampooning the master-weavers in a trade dispute, he emigrated to America in 1794. After a few years of weaving, peddling and desultory observation, he became a village schoolmaster, and in 1802 obtained an appointment near Philadelphia, where he formed the acquaintance of William Bartram the naturalist. Under his influence Wilson began to draw birds, having conceived the idea of illustrating the ornithology of the United States; and thenceforward he steadily accumulated materials and made many expeditions. In 1806 he obtained the assistant-editorship of the American edition of Reeve's Encyclopaedia, and thus acquired more means and leisure for his great work. American Ornithology, the first volume of which appeared in the autumn of 1808, after which he spent the winter in a journey "in search of birds and subscribers." By the spring of 1813 seven volumes had appeared; but the earnestness of Wilson was rewarded by the publication of marine waterfowl to which the remaining volume was to be devoted, gave a shock to his already impaired health, and he succumbed to dysentery at Philadelphia on the 23rd of August 1813.

Of his poems, not excepting the Foresters (Philadelphia, 1805), nothing need now be said, save that they no doubt served to develop the poetic powers. The first three and ninth volumes of the American Ornithology were edited after his decease by his friend George Ord, and the work was continued by Lucien Bonaparte (16 vols., Philadelphia, 1828-1838). The work was subsequently published several times, and his Miscellaneous Prose Works and Poems was edited with a memoir by the Rev. A. B. Grosart (Paisley, 1876). A statue was erected to him at Paisley in 1876.
WILSON, SIR DANIEL (1816-1862), archaeologist and Canadian educational reformer, was born in Edinburgh on the 5th of January 1816, the son of Archibald Wilson, a wine-merchant, and Janet Atiken. After studying at the High School and the University of Edinburgh, he spent the next ten years in journalism and in other forms of literary work (London 1837-1842, Edinburgh 1842-1847). In 1845 he became secretary to the Scottish Society of Antiquaries, and in 1846 published "Memorials of Edinburgh in the Olden Time," of which the chief value lies in the numerous illustrations, done by himself. In 1851 appeared his most important work, "Prehistoric Annals of Scotland," which placed him in the front rank of archaeologists. In 1853 he became professor of History and English Literature in the University of Toronto, where his practical ability and energy soon made him the most important member of the staff. While writing extensively on the archaeology and anthropology of Canada, and giving an impetus to the study, he produced nothing of lasting importance. His main work lay in asserting the claims of the University of Toronto, and of University College, the teaching body in connexion with it, against the sectarian universities of the province which denounced the provincial university as godless, and against the private medical schools in Toronto. Largely owing to Wilson's energy in fighting for what he called "the maintenance of a national system of university education in opposition to sectarian or denominational colleges," the provincial university gained the chief position in the intellectual life of Ontario. Two of the sectarian universities, the Methodist and the Anglican, have now been united to the public university, but the first and the Presbyterian (see KINGSTON) still retain a vigorous existence. He was equally successful in his struggle against the rival medical schools in Toronto, the chief of which is now incorporated with Toronto university. In his efforts to escape the control of local politicians he was less successful, and in some cases appointments to the provincial university were made for political rather than for academic reasons. Though seeing that in a young and democratic country the Scotch-American model must be followed rather than the English, and though resisting attempts to follow the practice of Oxford or Cambridge, Wilson was a believer in the merits of a modified form of the residential system. He was one of the first in Canada to cast aside the classical tradition, and as early as 1866 had the courage to say: "It is just because... German and French are now the keys of so much modern philosophy and science that all wise University reformers are learning to give to modern languages the place they justly claim in a liberal education." In 1881 he was made president of Toronto university; and in 1885 president of the literature section of the Canadian Royal Society; in 1888 he was knighted; and in 1890 he was given the freedom of the city of Edinburgh. He died at Toronto on the 6th of August 1892.

(W. L. G.)

WILSON, HENRY (1812-1879), vice-president of the United States from 1873 to 1875, was born at Farmington, New Hampshire, on the 16th of February 1812. His name originally was Jeremiah J. Colbath. His father was a day-labourer and very poor. At ten years of age the son went to work as a farm-labourer. He was found of reading before the close of his apprenticeship had read more than a thousand volumes. At the age of twenty-one, for some unstated reason, he had his name changed by Act of the Legislature to that of Henry Wilson. At Natick, Massachusetts, whither he travelled on foot, he learned the trade of shoemaker, and during his leisure hours studied much and read with avidity. For short periods, also, he studied in the academies of Strafford, N.H., Wolfeborough, N.H., and Concord, N.H. After successfully establishing himself as a shoe manufacturer, he attracted attention as a public speaker in support of William H. Harrison during the presidential campaign of 1840. He was in the state House of Representatives in 1841-42, 1846 and 1850, and in the Senate in 1844-45 and 1851-52. In 1848 he left the Whig party and became one of the chief leaders of the Free Soil party, serving as presiding officer of that party's national convention in 1852, acting as chairman of the Free Soil national committee and editing from 1858 to 1851 the Boston Republican, which he made the chief Free Soil organ. The Free Soil party nominated him for governor of the state in 1853, but he was defeated. For a short time (1855) he identified himself with the American or Know Nothing party, and afterwards acted with the Republican party. In 1855 he was elected to the United States Senate and remained there by re-elections until 1873. His uncompromising opposition to the institution of slavery furnished the keynote of his earlier senatorial career, and he soon took rank as one of the ablest and most effective anti-slavery orators in the United States. He had been deeply interested from 1840 until 1850 in the militia of his state, and had risen through its grades of service to that of brigadier-general. Upon the outbreak of the Civil War he was made chairman of the military committee of the Senate, and in this position performed most laborious and important work for the four years of the war. The Republicans nominated Wilson for the vice-presidency in 1872, and he was elected; but he died on the 22nd of November 1875 before completing his term of office.

He published, besides many orations, a History of the Anti-Slavery Measures of the Thirty-Seventh and Thirty-Eighth United States Congresses (1865); Military Measures of the United States Congresses of 1841 and 1851; the "History of the Twenty-fifth and Forty-first Congresses" (1867) and a History of the Rise and Fall of the State Power in America (3 vols., 1872-1875), his most important work.

The best biography is that by Elias Nason and Thomas Russell, The Life and Public Services of Henry Wilson (Boston, 1876).

WILSON, HORACE HAYMAN (1786-1860), English orientalist, was born in London on the 26th of September 1786. He studied medicine at St Thomas's Hospital, and went out to India in 1808 as assistant-surgeon on the Bengal establishment of the East India Company. His knowledge of metallurgy caused him to be attached to the mint at Calcutta, where he was for a time associated with John Leyden. He became deeply interested in the ancient language and literature of India, and by the recommendation of Henry T. Colebrooke, he was in 1811 appointed secretary to the Asiatic Society of Bengal. In 1813 he published the Sanskrit text—with a graceful, if somewhat free, translation in English rhymed verse—of Kalidasa's charming lyrical poem, the Meghaduta, or Cloud-Messenger. He prepared the first Sanskrit-English Dictionary (1819) from materials compiled by native scholars, supplemented by his own researches. This work was only superseded by the Sanskrit-Wörterbuch (1853-1876) of R. von Roth and Otto Böhtlingk, who expressed their obligations to Wilson in the preface to their great work. Wilson published in 1815 Selected Specimens of the Theatre of the Hindus, which contained a very full survey of the Indian drama, translations of six complete plays and short accounts of twenty-three others. His Mackenzie Collection (1828) is a descriptive catalogue of the extensive collection of Oriental, especially South Indian, MSS. and antiquities made by Colonel Colin Mackenzie, now deposited partly in the India Office, London, and partly at Madras. He also wrote a Historical Sketch of the First Burmese War, with Documents, Political and Geographical (1827), a Review of the External Commerce of Bengal from 1813 to 1828 (1830) and a History of British India from 1805 to 1825, in the Association of Mill's History (1844-1848). He acted for many years as secretary to the committee of public instruction, and superintended the studies of the Sanskrit College in Calcutta. He was one of the staunchest opponents of the proposal that English should be made the sole medium of instruction in native schools, and became for a time the object of bitter attacks. In 1832 the university of Oxford selected Dr Wilson to be the first occupant of the newly founded Boden chair of Sanskrit, and in 1836 he was appointed librarian to the East India Company. He was an original member of the Royal Asiatic Society, of which he was director from 1837 up to the time of his death, which took place in London on the 8th of May 1860.
WILSON, JAMES (1742–1798), American statesman and jurist, was born in or near St Andrews, Scotland, on the 14th of September 1742. He matriculated at the University of St Andrews in 1757 and was subsequently a student at the universities of Glasgow and Edinburgh. In 1765 he emigrated to America. Landing at New York in June, he went to Philadelphia in the following year and in 1766–1767 was instructor of Latin in the college of Philadelphia, later the university of Pennsylvania. Meanwhile he studied law in the office of John Dickinson, who was admitted to the bar in 1767, removed first to Reading and soon afterward to Carlisle, and rapidly rose to prominence. In August 1774 he published a pamphlet Considerations on the Nature and Extent of the Legislative Authority of the British Parliament, in which he argued that parliament had no constitutional power to legislate for the colonies; this pamphlet strongly influenced members of the Continental Congress which met in September. Wilson was a delegate to the Pennsylvania provincial convention in January 1775, and he sustained there the right of Massachusetts to resist the change in its charter, declaring that as the province of Pennsylvania, the following Government was exercising to compel obedience was “force unwarranted by any act of parliament, unsupported by any principle of the common law, unauthorized by any commission from the crown,” resistance was justified by “both the letter and the spirit of the British constitution”; he also, by his speech, led the colonies in shifting the burden of responsibility from parliament or the king’s ministers to the king himself. In May 1775 Wilson became a member of the Continental Congress. When a declaration of independence was first proposed in that body he expressed the belief that a majority of the people of Pennsylvania were disposed of it, but as the instructions of the delegates from Pennsylvania and some of the other colonies opposed such a declaration, he urged postponement of action for the purpose of giving the constituents in those colonies an opportunity of removing such instructions. When independence was finally declared the unanimity of all the colonies except New York had been obtained. Receiving a commission as colonel in May 1775, Wilson raised a battalion of troops in his county of Cumberland, and for a short time in 1776 he took part in the New Jersey campaign, but his principal labours in the 1776 year were in Congress. In January 1776 he was appointed a member of a committee to prepare an address to the colonies, and the address was written by him; he served on a similar committee in May 1777, and wrote the address To the Inhabitants of the United States, urging their firm support of the cause of Independence; he drafted the plan of treaty with France until with instructions for negotiating it; he was a member of the Board of War from its establishment in June 1776 until his retirement from Congress in September 1777; from January to September 1777 he was chairman of the Committee on Appeals, to hear and determine appeals from the courts of admiralty in the several states; and he was a member of many other important committees. In September 1777 the political faction in his state which had opposed Independence again came into power, and Wilson was kept out of Congress until the close of the war; he was back again, however, in 1781, and 1785–1786, and, advocating a sound currency, laboured in co-operation with Robert Morris to direct the financial policy of the Confederation.

Soon after leaving Congress in 1777 Wilson removed to Annapolis, Maryland, to practise law, but he returned to Philadelphia in the following year. In 1779 he was commissioned Advocate-General for France, and in this capacity he represented Louis XVI. in all claims arising out of the French alliance until the close of the war. In 1781–1782 he was the principal counsel for Pennsylvania in the Wyoming Valley dispute with Connecticut, which was decided in favour of Pennsylvania in December 1782 by an arbitration court appointed by Congress. Wilson was closely associated with Robert Morris in organizing the Bank of North America, and in the Act of Congress incorporating it (December 31, 1781) he was made one of the directors. In 1782 he was also on the council of ministers of the state, but three years later it passed an act to repeal it. Wilson responded with a famous constitutional argument in which he sustained the constitutionality of the bank on the basis of the implied powers of Congress.

As a constructive statesman Wilson had no superior in the Federal Convention of 1787. He favoured the independence of the executive, legislative and judicial departments, the supremacy of the Federal government over the state governments, and the election of senators as well as representatives by the people, and argued with the election of the President or the judges by Congress. His political philosophy was based upon implicit confidence in the people, and he strove for such provisions as he thought would best guarantee a government by the people. When the constitution had been framed Wilson pronounced it “the best form of government which has ever been offered to the world,” and he, at least, among the framers regarded it not as a compact but as an ordinance to be established by the people. During the struggle for ratification he made a speech before a mass meeting in Philadelphia which has been characterized by a distinguished historian as “the finest speech delivered in the Pennsylvania ratification convention. (November 21 to December 15, 1787) he was the constitution’s principal defender. Having been appointed professor of law in the university of Pennsylvania in 1779, he delivered at that institution in 1790–1791 a course of lectures on public and private law; some of these lectures, together with his speeches in the Federal convention, before the mass meeting in Philadelphia, and in the Pennsylvania ratification convention, are among the most valuable commentaries on the constitution.

Wilson was a delegate to the state constitutional convention of 1789–1790, and a member of the committee which drafted the new constitution. In 1789 Washington appointed him an associate justice of the United States Supreme Court, and in 1793 he wrote the important decision in the case of Chisolm v. Georgia, the purport of which was that the people of the United States constituted a sovereign nation and that the United States were not a mere confederacy of sovereign states. He continued to serve as associate justice until his death, near Edenton, North Carolina, on the 28th of August 1798.

WILSON, JAMES (1835–1907), American administrator, was born in Ayrshire, Scotland, on the 16th of August 1835. In 1851 he was taken by his parents to America, where they originally settled in Connecticut, but in 1855 removed to Tama county Iowa. He studied at Iowa College, and in 1861 became a farmer. He was a Republican member of the state House of Representatives in 1868–1873, and was its speaker in 1872–1873, and he was a member of the National House of Representatives from 1873 to 1877 and again in 1883–1885. From 1870 to 1874 he was a regent of the State University of Iowa; in 1877–1881 he was a member of the Iowa State Railway Commission, and from 1890 to 1897 was professor of agriculture at the Iowa Agricultural College, at Ames, and director of the State Agricultural Experiment Station. In March 1897 he became Secretary of Agriculture in President McKinley’s Cabinet and served into President Taft’s administration, holding office longer than any other cabinet officer since the organization of the government.
WILSON, JOHN (1627-1686). English playwright, son of Aaron Wilson, a royalist divine, was born in London in 1627. He matriculated from Exeter College, Oxford, in 1644, and entered Lincoln’s Inn two years later, being called to the bar in 1649. His unsparing support of the royal pretensions recommended him to James, duke of York, through whose influence he became Recorder of London after 1681. His Discourse of Monarchy (1684), a tract in favour of the succession of the duke of York, was followed (1685) by a “Findaurique” on his coronation. In 1688 he wrote Jas regnum Corone, a learned defence of James’s action in dispensing with the royal Prerogatives. He died in obscurity, due perhaps to his political opinions, in 1696. Wilson was the author of four plays, showing a vigorous and learned wit, and a power of character-drawing that place him rather among the followers of Ben Jonson than with the Restoration dramatists.

The Cheats (written in 1662, printed 1664, 1671, &c.) was played with great success in 1663. John Lacy found one of his best parts in Scruple, a caricature of a Presbyterian minister of accommodating morality. Andronicus Connemus (1664), a blank verse tragedy, is based on the story of Andronicus Connemus as told by Peter Heylyn in his Cosmography. It contains a scene with the sultan of Alexandria which follows very closely Shakespeare’s treatment of a parallel situation in Richard III. The Projectors (1665), a prose comedy of London life, is, like Molière’s L’Avare, a satire on the popular taste, but there is no evidence that Wilson was acquainted with the French play. Belphegor, or the Marriage of the Devil; a Tragi-comedy (1690), treats of a theme familiar to Elizabethan drama, but Wilson took the subject from the Biblical, and the medieval chronicles also allude to the Blackwood version in the Noli. He also translated into English Erasmus’s Encomium Moriae (1668).

WILSON, JOHN (1785-1854), Scottish writer, the CHRISTOPHER NORTH of Blackwood’s Magazine, was born at Paisley on the 18th of May 1785, the son of a wealthy gauze manufacturer who died when John was eleven years old. He was the fourth child, but the eldest son, and he had nine brothers and sisters.1 He was only twelve when he was first entered at the university of Glasgow, and he continued to attend various classes in that university for six years, being for the most part under the tuition of Professor George Jardine, with whose family he lived. In these six years Wilson “made himself” in all ways, acquiring not inconsiderable scholarship, perfecting himself in all sports and exercises, and falling in love with a certain “Margaret,” who was the object of his affections for several years.

In 1803 Wilson was entered as a gentleman commoder at Magdalen College, Oxford. Few men have felt more than he the charm of Oxford, and in much of his later work, notably in the essay called “Old North and Young North,” he has expressed his feeling. But it does not appear that his Magdalen days were altogether happy, though he perfected himself in “brusling,” pedestrianism and other sports, and read so as to obtain a brilliant first class. His love affairs did not go happily, and he seems to have made no intimate friends at his own college and few in the university. He took his degree in 1807, and found himself at twenty-two his own master, with a good income, no father or guardian to control him, and apparently not under any of the influences which in similar circumstances generally make it necessary for a young man to adopt some profession, if only in name. His profession was an estate on Windermere called Threlkeld, and he spent some time in making it over to his mother. Here he built, boasted, wrestled, shot, fished, walked and otherwise diverted himself for four years, besides composing or collecting from previous compositions a considerable volume of poems, published in 1812 as the Isle of Palms. Here he became intimate with Wordsworth, Coleridge, Southey and De Quincey.

1 His youngest brother was James Wilson "of Woodville" (1795-1856), the zoologist. He purchased, on behalf of Edinburgh University, in Paris, the Dufresne collection of birds, and arranged them with his brother John; the catalogue of the collection with the birds was written by John Wilson. He was editor of The Naturalist’s Magazine and to the North British Quarterly Review, and wrote many of the articles on natural history in the seventh edition of the Encyclopædia Britannica.

He married in 1811 Jane Penny, a Liverpool lady of good family, and four years of happy married life at Elleray succeeded; then came the event which made a working man of letters of Wilson, and without which he would probably have produced a few volumes of verse and nothing more. The major part of his fortune was lost by the dishonest speculations of an uncle, in whose hands Wilson had carelessly left it. But this hard fate was by no means unqualified. His mother had a house in Edinburgh, in which she was able and willing to receive her son and his family; nor had he even to give up Elleray, though in order to reside in it he had to sell his house. He was also willing to get back the Scottish bar, in 1815, still taking many a sporting and pedestrian excursion, and publishing in 1816 a second volume of poems, The City of the Plague. In 1817, soon after the founding of Blackwood’s Magazine, Wilson began his connexion with that great Tory monthly by joining with J. G. Lockhart in the October number, in a satire called the Chaldee Manuscript, in the form of biblical parody, on the rival Edinburgh Review, its publisher and his contributors. From this time he was the principal writer for Blackwood’s, though nominally editor, the publisher retaining a certain supervision even over Lockhart’s and “Christopher North’s” contributions, which were the making of the magazine. In 1822 began the series of Nectes Ambrosianae, after 1825 mostly Wilson’s work. These are discussions in the form of convivial table-talk, giving occasion to wonderfully various digressions of criticism, description and miscellaneous writing. From their origin it necessarily followed that there was much ephemeral, a certain amount purely local, and something wholly trivial in them. But their dramatic force, their incessant flashes of happy truth, their madcap expression, their almost incomparable fulness of life, and their magnificent humour give them all but the highest place among genial and recreative literature.

“The Ettrick Shepherd,” an idealized portrait of James Hogg, one of the talkers, is a most delightful creation. Before this, Wilson had contributed to Blackwood’s prose tales and sketches, and novels, some of which were afterwards published separately in Lights and Shadows of Scottish Life (1832), The Trials of Margaret Lyndsay (1823) and The Forrester (1823); later appeared essays on Spenser, Homer and all sorts of modern subjects and authors.

The chief result of his new occupation on Wilson’s general mode of life was that he left his mother’s house and established himself (1815) in Ann Street, Edinburgh, with his wife and family of five children. The second was much more unlooked for, his election to the chair of moral philosophy in the university of Edinburgh (1820). His qualifications for the post were by no means obvious, even if the fact that the best qualified man in Great Britain, Sir William Hamilton, was also a candidate, be left out of the question. But the matter was made a political one; the Tories still had a majority in the town council; Wilson was powerfully backed by friends, Sir Walter Scott at their head; and his adversaries played into his hands by attacking his moral character, which was not open to any fair reproach. Wilson made a very excellent professor, never perhaps attaining to any great scientific knowledge in his subject or power of expounding it, but acting on generation after generation of students with a stimulating force that is far more valuable than the most exhaustive knowledge of a particular topic. His duties left him plenty of time for magazine work, and for many years his contributions to Blackwood were extraordinarily numerous in one year (1834) amounting to over fifty separate articles. Most of the best and best known of them appeared between 1825 and 1835.

The domestic events of Wilson’s life in the last thirty years of it may be briefly told. He oscillated between Edinburgh and Elleray, with excursions and summer residences elsewhere, a sea trip on board the Experimental Squadron in the Channel during the summer of 1832, and a few other unimportant diversions. The death of his wife in 1837 was an exceedingly severe blow to him, especially as it followed within three years that of his friend Blackwood. For many years after, his literary work...
was intermittent, and, with some exceptions, not up to the level of his earlier years. Late in 1850 his health showed definite signs of breaking up; and in the next year he resigned his professorship, and a Civil List pension of £300 a year was conferred on him. He died at Edinburgh on the 9th of April 1854.

Only a very small part of Wilson's extensive work was published in a collected and generally accessible form during his lifetime, the chief and almost sole exceptions being the two volumes of poems referred to as *The Land of the Shaker* and *The Creation of Christopher North* (1842), a selection from his magazine articles. These volumes, with a selected edition of the *Notes and Queries* series, a posthumous volume of essays, and the poet's imaginative, also in four volumes, were collected and reissued uniformly after his death by his son-in-law, Professor J. F. Ferrier. The collection is very far from exhaustive; and, though it undoubtedly contains most of his best work and comparatively little that is not good, it has been complained, with some justice, that the characteristic, if rather immature, productions of his first eight years on *Blackwood* are almost entirely omitted, that the *Notes* are given but in part, if in their best part, and that at least three long and important series of papers, less desultory than his wont, on "Spenser," on "British Critics" and the set called "Tales of India," have been left out. The volumes, however, uniform enough, and the standard edition exhibits them sufficiently, if not exhaustively. His poems may be dismissed at once as little more than interesting. They would probably not have been written at all but not become author in the time of the full flood of the Lake school influence. His prose tales have in some estimates stood higher, but will hardly survive the tests of universal criticism. It is as an essayist and critic of the most astounding geniality, if not genius, of great acuteness, of extraordinary eloquence and of a fervid and manifold sympathy, in which he has hardly an equal, that Christopher North will live. His defects lay in the directions of measure and of taste properly so called, that is to say, of the modification of capricious likes and dislikes by reason and principle. He is constantly exaggerated, boisterous, wanting in refinement. But these are the almost necessary defects of his quickness, enthusiasm, eloquence, and generous feeling. The well-known adaptation of phrase in which he did not recite but made up for numerous earlier attacks on Leigh Hunt, the Anim osties are mortal, but the Humanities live forever; according to another writer, but not without a little characteristic touch of grandiosity and emphasis. As a literary critic, as a sportsman, as a lover of nature and as a convivial humorist, he is not to be shown at equal advantage in miniature; but almost any volume of his miscellaneous works will exhibit him at full length in one of these capacities, if not in all. See "Christopher North, by Mrs Mary Gordon, his daughter (1862); and *The Complete Works* of a Publishing House; *William Blackwood and his Sons* (1897).

**WILSON, JAMES HARRISON** (1837–1903), American cavalry soldier, was born at Shawneetown, Illinois, in 1837 and entered West Point military academy in 1855, graduating in 1860. He was appointed to the engineer branch of the United States army, served in the Port Royal and Fort Pulaski operations, being brevetted major for his gallant conduct at Pulaski, was on M'Clellan's staff at Antietam as a lieutenant-colonel in 1862, and as a topographical engineer on the headquarters staff of the Army of the Tennessee during the Vicksburg and Chattanooga campaigns. His services in the intricate operations before Vicksburg were rewarded by promotion to brigadier-general U.S.V. In 1864 he was appointed to command a division in Sheridan's cavalry corps, and played a distinguished part in the cavalry operations of the 4th to 6th of May during the battle of the Wilderness (for which he was brevetted colonel U.S.A.), the so-called Richmond Raid, the operations on the Totopotomoy, &c. Later in 1864 he commanded the cavalry of Thomas' army in Tennessee. During the closing operations of the war he led a cavalry expedition on a grand scale through the South-West. He reviewed Sedgwick's Selma, Sherman's Vicksburg and Macon, and capturing at different times nearly 7000 prisoners. He was brevetted major-general shortly before the end of the war. Returning to duty in the regular army as a lieutenant-colonel of infantry for some years, he resigned in 1870 and engaged in engineering and railway construction. In 1898, during the Spanish-American War, he was appointed a major-general in the new volunteer army, and took part in the operations in Porto Rico. He served in the China expedition of 1900 as a brigadier-general and in 1901 was placed on the retired list as a brigadier-general U.S.A.

**WILSON, RICHARD** (1714–1762), English landscape painter, was born at Penegoes, Montgomeryshire, where his father was a clergyman, on the 1st of August 1714. His early taste for art was observed by a relative of his mother, Sir George Wynne, who in 1729 sent him to London to study under Thomas Wright, a little-known portrait painter of the time, by whom he was instructed for six years. He then started on his own account, and was soon in a good practice. Among his commissions was a full-length of the prince of an obscure, half-furnished room in the Garden of York, painted for their tutor, the Bishop of Norwich. Examples of his portraits may be studied in Greenwich Hospital, in the Garrick Club, and in various private collections. In 1740 Wilson visited Italy, where he spent six years. He had previously executed some landscapes, but it was now that the advice of Zuccarelli and Joseph Vernet decided him to adopt this department of art exclusively. He studied Claude and Poussin, but retained his own individuality, and produced some admirable views of Rome and the Campagna. In 1753 he returned to England, and became one of the first of English landscape painters. "Niehe," one of the most powerful works, was exhibited at the Society of Artists in 1760. On the establishment of the Royal Academy in 1768 he was appointed one of the original members, and he was a regular contributor to its exhibitions till 1780. He frequently executed replicas of his more important subjects, repeating some of them several times; in the figures which he introduced in his landscapes he was occasionally assisted by Mortimer and Hayman. During his lifetime his landscapes were never widely popular; his temper was consequently embittered by neglect, and so impoverished was he that he was obliged to seclude himself in an obscure, half-furnished room in Tottenham Court Road, London. In 1776, however, he obtained the post of librarian to the Academy; and by the death of a brother he acquired a small property near Llanferres, Denbighshire, to which he retired to spend his last days, and where he died suddenly in May 1782. After his death his fame increased, and in 1814 about seventy of his works were exhibited in the British Institution. The National Gallery, London, contains nine of his landscapes.

The works of Wilson are skilled and learned compositions rather than direct transcripts from nature. His landscapes are not without much great beauty, and were a point of general estimation which occasionally led to a disregard of detail. They are full of classical feeling and poetic sentiment; they possess noble qualities of colour, and of delicate silver tone; and their handling is vigorous and easy, the work of a painter who was thoroughly master of his materials.

**WILSON, ROBERT** (d. 1660), English actor and playwright, was a comedian in the earl of Leicester's company, beginning with its establishment in 1574, and from 1583 to 1588 in the Queen's and afterwards in Lord Strange's company. He wrote several morality plays. In his *Three Ladies of London* (1583) he has the episode of the attempt of the Jew to recover his debt, afterwards adapted by Shakespeare in *The Merchant of Venice*. Another Robert Wilson (1570–1610), probably his son, was one of Henslowe's dramatic hack-writers.

**WILSON, SIR ROBERT THOMAS** (1777–1849), British general, was the son of the painter Benjamin Wilson (1721–1788), and obtained a commission in the 15th light dragoons in 1794, taking part in the famous charge at Villers-en-Cauchics. He was one of eight officers who received the emperor's commemoration medal (of which only nine were struck), the order of Maria Theresa and the dignity of Freiherr of the Empire. In the campaigns of Tourcoing and Tournay and in the retreat through Holland, Wilson repeatedly distinguished himself. In 1796 he became captain by purchase, in 1798 he served as a
brigade-major during the suppression of the Irish Rebellion, and in 1799 was with the 15th in the Helder expedition. Having in 1800 purchased a majority in a regiment serving in the Mediterranean, he was sent on a military mission to Vienna in that year, but returned to take part in the battle of Alexandria. In 1802 he published an account of the expedition to Egypt, which was shortly afterwards translated into French, and created a considerable impression by its strictures upon French officers' behavior. Wilson shortly afterwards produced a translation of General Regnier's work on the same campaign, with comments. Shortly afterwards Wilson published a work on the defects of the British army system which is remembered as the first protest against flogging. In 1804 he bought the colonelcy of the 19th light dragoons, in 1805 exchanged into the 20th, and in 1806 served with the 20th in the Cape of Good Hope expedition. In 1807 he was employed as military attaché of a mission to the king of Prussia, and so was present at Eylau, Heilsberg and Friedland, of which battles he published an account in 1810.

Returning to England with despatches from St Petersburg he reached London before the Russian declaration of war and so gave the admiral twenty-four hours' start in the operation at sea. In the early part of the Peninsular War Wilson raised and commanded the Lusitanian Legion, an irregular Portuguese corps which did good service in 1808 and 1809 and formed the starting-point of the new Portuguese army organized by Beresford in 1810. His services were rewarded by knighthood, a colonelcy in the British army and the Portuguese order of the Tower and Sword. In 1811, with the rank of brigadier-general, he went to Turkey, and in 1812 he travelled thence to Russia, where he was attached to Kutuzov's headquarters during the pursuit of the retreating French, being present at Malo-Jaroslavetz, Vyazma and Krasnoy. His account of the campaign, published in 1860, is one of the most valuable works on these events. He continued to serve with the Russian army during 1813 and distinguished himself at Lützen and Bautzen, the emperor Alexander decorating him with the knighthood of the St George order on the battlefield. He was promoted major-general in the British army about the same time. He was at Dresden, Kulm and Leipag, and distinguished himself at the last great battle so much that Schwarzenberg writing to the British ambassador at Vienna attributed to Wilson's skill a large part in the successful issue of the battle. But his services in the counsels of the Allies were still more important on account of the confidence reposed in him personally by the allied sovereigns. But Castlecrag, treating Wilson as a political opponent, removed him to the minor theatre of Italy, in spite of the protests of the British ambassador. With the Austrian Army of Italy he served through the campaign of 1814. In 1816 after Waterloo he contrived the escape of Buonaparte's son. His book on Napoleon was condemned by the Restoration government, and was imprisoned for three months with his comrade in this adventure, Captain Hely-Hutchinson (3rd earl of Donoughmore), and censured by the commander-in-chief in a general order. In 1817 he published *The Military and Political Power of Russia*, in 1818 he became member of parliament for Southwark and in 1821 he interposed between the mob and the troops on the occasion of Queen Caroline's funeral, for which his political opponents secured his dismissal from the army, without compensation for the price of his commissions. He took an active part in politics on the opposition side, and also spent some time in Spain during the wars of 1822–23. On the accession of William IV., his political services in the formation of the Canning ministry of 1827 were rewarded by reinstatement in the army with the rank of lieutenant-general. But, disapproving of the Reform bill, he resigned his place in the Commons. He was promoted general in 1841 and appointed governor of Gibraltar in 1842. He died in London on the 6th of May 1849.

Besides the works mentioned above, Wilson left a diary of his travels and experiences in 1812–1814, published in 1861, and an incomplete autobiography, published two years later.

**WILSON, THOMAS** (c. 1525–1581), English statesman and critic, the son of Thomas Wilson of Strubby, in Lincolnshire, was born about 1525. He was educated at Eton and King's College, Cambridge, where he joined the school of Hellenists to which Cheke, Thomas Smith, Walter Haddon and others belonged. He graduated B.A. in 1546 and M.A. in 1549. In 1551 he produced, in conjunction with Walter Haddon, a Latin life of Henry and Charles Brandon, dukes of Suffolk. His earliest work of importance was *The Rule of Reason, conteymynge the Arte of Logique set forth in Englishe* (1552), which was frequently reprinted. It has been maintained that the book on which Wilson's fame mainly rests, *The Arte of Rhetorique*, was printed about the same time, but this is probably an error: the first edition extant is dated January 1553. It is the earliest systematic work of literary criticism existing in the English language. Wilson threw in his lot with the Dudley family, and when they fell, he fled to the Continent. He was with Sir John Cheke in Padua in 1555–1557, and afterwards at Rome, whither in 1558 Queen Mary wrote, ordering him to return to England to stand his trial as a heretic. He refused to come, but was arrested by the Roman Inquisition and tortured. He escaped, and fled to Ferrara, but in 1560 he was once more in London. Wilson became Master of St Katherine's Hospital in the Tower, and entered parliament in January 1563. In 1570 he published a translation, the first attempted in English, of the *Olynthics* and *Philippics* of Demosthenes, on which he had been engaged since 1556. His *Discourse upon Usury* appeared in 1572. From 1574 to 1577, Wilson, who had now become a prominent person in the diplomatic world, was principally engaged on embassies to the Low Countries, and on his return to England he was made a privy councilor and sworn secretary of state. It was at this time that he became acquainted with Sir William Cheke. He wounded the queen and was impeached of treason, but was found not guilty, and was rewarded with the mastership of the Children of the Hospital at the Tower of London. His *Observations Concerning the Arts and Sciences* (1668), was in two volumes, and contained a history of the study and improvement of them from the ancient times down to the author's time. The second volume was published in 1674. Wilson continued to write various other works, and at the end of his life he was almost completely blind. He died at the age of 82, leaving a large estate. The will was read in the Privy Council on Christmas Day, 1701. He was buried in St. Michael's, Southwark, where the memorial stone to him and his wife is to be seen with the inscription: "Here lie Sir William and Lady Erasmus, both physicians, and both judges in equity. He was a captain in Oliver's army, and was employed in the prosecution of the Covenanters. She was also employed as an ambassadress during her husband's absence, and afterwards resided in France. In her old age she wrote and published the life of her husband. In 1713 she gave her estate to Founders' College, where she was elected an honorary fellow. She died at the age of 77 in 1723."
up skin diseases as a special study. The horrible cases of scrofula, anaemia and blood-poisoning which he saw made him set to work to alleviate the sufferings of persons so afflicted, and he quickly established a reputation for treating this class of patient. It was said that he cured the rich by ordering them to give up luxuries; the poor, by prescribing for them proper nourishment; and he then put them to work. In the opinion of one of his biographers, we owe to Wilson in great measure the habit of the daily bath, and he helped very much to bring the Turkish bath into use in Great Britain. He wrote much upon the diseases which specially occupied his attention, and his books, A Healthy Skin and Student's Book of Diseases of the Skin, though they were not received without criticism at the time of their appearance, long remained textbooks of their subject. He visited the East in order to study leprosy, Switzerland that he might investigate the causes of goitre, and Italy with the purpose of adding to his knowledge of the skin diseases affecting an ill-nourished peasantry. He made a large fortune by his successful practice and by skillful investments, and, since he had no family, he devoted a great deal of his money to charitable and educational purposes. He founded in 1869 the chair and museum of dermatology in the Royal College of Surgeons, of which he was chosen president in 1881, and which just before his death awarded him its honorary gold medal, founded in 1800 and only six times previously awarded. He also founded a professorship of pathology at Aberdeen University. After the death of his wife the bulk of his property, some £200,000, was added to the Royal College of Surgeons. In 1878 he earned the thanks of the nation, upon different grounds, by defraying the expense of bringing the Egyptian obelisk called Cleopatra's Needle from Alexandria to London, where it was erected on the Thames Embankment. The British government had not thought it worth the expense of transportation. He was knighted by Queen Victoria in 1881, and died at Westgate-on-Sea on the 7th of August 1884.

WILSON, WOODROW (1856— ), American educationalist, was born in Staunton, Virginia, on the 26th of December 1856. He graduated at Dartmouth College in 1880, and laid at the University of Virginia in 1879-1880, practised law in Atlanta in 1882-1883, and received the degree of Ph.D. at Johns Hopkins University in 1886, his thesis being on Congressional Government (1885; and often reprinted). He was associate professor of history and political economy at Bryn Mawr in 1885-1888 and at Wesleyan University in 1888-1890; professor of jurisprudence and political economy at Princeton in 1890-1895, of jurisprudence in 1895-1897, and subsequently of jurisprudence and politics; and in 1902 he became president of Princeton University. In 1902-1910 he was a layman to hold that of his wife the bulk of his property, some £200,000, was added to the Royal College of Surgeons. In 1878 he earned the thanks of the nation, upon different grounds, by defraying the expense of bringing the Egyptian obelisk called Cleopatra's Needle from Alexandria to London, where it was erected on the Thames Embankment. The British government had not thought it worth the expense of transportation. He was knighted by Queen Victoria in 1881, and died at Westgate-on-Sea on the 7th of August 1884.

WILTON, a market town and municipal borough in the Wilton parliamentary division of Wiltshire, England, 86 m. by S. of London, on the London & South-Western and Great Western railways. Pop. (1901) 2935. It lies among the pastures beside the rivers Nadder and Wyle. The church of St Mary and St Nicholas was built in 1854 by Lord Herbert of Lea, in a Romanesque style, richly adorned with stained glass. The central entrance is upheld by twisted columns based upon stone lions. The belfry is detached. Wilton House, a little to the south, was founded by William Herbert, first earl of Pembroke by the second creation, on the estates of the dissolved convent, which were granted him by Henry VIII.

Tradition says that Shakespeare and his company played here in 1603, and that Philip Sidney the poet and soldier, of the artists Holbein and Vandyck, of the dramatists Jonson and Massinger, whose father was steward here, and of Inigo Jones the architect. The first folio edition of Shakespeare was dedicated. Seventeen years after the poet's death, to the third earl and his brother. In style Wilton House is Italian of the 16th century, with a porch added by Holbein. The garden front was rebuilt and other changes made by the advice of Charles I., a frequent visitor; and many subsequent alterations were made. The art collections include the marbles gathered together by the eighth earl.

Carpet-making forms the main industry of Wilton; the most famous fabrics being those known as Wilton carpets; Saxony carpets made of short-staple wool; and the rich and durable Axminsters, long woven by hand at Axminster in Devonshire. It is also an important centre for the sale of sheep. The town is governed by a mayor, 4 aldermen and 12 councillors.

Area, 1915 acres.

A chantry was founded here about A.D. 800, afterwards changed into a priory of Benedictine sisters, and refounded by Alfrid. In 968 Wulftrude, a mistress of King Edgar, became abbess; and the same office was declined by her daughter Edith, who died at twenty-three. Miracles, it was said, were worked by Edith's remains, and she became patron saint of the convent, which afterwards gave shelter to many noble ladies and survived until the Dissolution. Its library was a baroness's library. An early seat in Wilton the capital of a British kingdom. It was certainly the chief town of the Wisaetans, or men of Wilts, whom Cynric the Saxon leader crushed in 556. It afterwards became a residence of the Wessex kings; and here, in 871, Alfrid was severely defeated by the Danes. Wilton was burned in 1003 by Sweyn, the Danish king. After the Conquest it ranked among the richest of royal boroughs. In 1141 Queen Matilda celebrated Easter here with great pomp, and two years later Stephen, who came to found a castle, was driven off by her adherents. The prosperity of Wilton began to fall when Icknield Street, the great highway of commerce, was diverted to pass through Salisbury in 1224; and its decline was hastened by the plague, by which a third of the townsfolk were swept away in 1349.

Wilton (Wilton, Wilton) was a seat of the West Saxon kings and a prosperous town until the removal thence in 1075 of the seat of the bishop of Sherborne to Sarum. The excessive number of markets held at the latter town in the 13th century caused its further decline into a poor and unimportant place. Sweyn burnt and sacked it in 1003, consequently under Edward the Confessor in 1060, and Henry I., in 1103; and it is now preserved to it as a valuable royal borough, held in farm by the burgesses for £60. From 1204 onwards Wilton figures in various grants. Richard, earl of Cornwall, obtained it from Henry III., and William, earl of Pembroke, finally from Elizabeth. The first charter given by Henry I. (probably in 1103) granted franchises to the burgesses of the merchant guild and company of Wilton as enjoyed by London and Winchester, and was confirmed by succeeding monarchs from Henry II. to Henry VI. The corporation consisted in 1350 of a mayor, recorder, 5 aldermen, 3 capital burgesses, 17 common councilmen and other officers, with very large privileges. The mayor being the returning officer. Two members were returned to parliament from 1203 to 1832 and one from 1832 to 1885, at which date Wilton lost its separate representation.

In 1414 Henry V. granted a fair on July 21 and 22. This was cancelled in 1416 and another substituted on July 22 and the three preceding days. Two yearly fairs were obtained by the burgesses from Henry VII. for four days from April 23 and September 1. In 1792 the fair days were November 13, September 12 and May 4; the two latter are still held, that in September being one of the largest sheep fairs in the west of England. Henry III. granted three markets weekly on Monday, Wednesday and Friday, and Henry VI., in 1433, one on Wednesday. The latter was still held in 1825, but had ceased in 1888.
WILTSHIRE [Wills], a south-western county of England, bounded N.W. and N. by Gloucestershire, N.E. and E. by Berkshire, S.E. by Hampshire, S.W. and S. by Wiltshire, and W. by Somerset. The area is 1,374 sq. m. A great upland covers two-thirds of the county, comprising, in the north-east, Marlborough Downs, with Savenake Forest; in the centre, the broad undulating sweep of Salisbury Plain; and in the south, the more varied hills and dales of the Nadder watershed, the vale of Chalk and Cranborne Chase. Large tracts of the Chalk are over 600 ft. above the sea, rising in many parts into steep and picturesque escarpments. Several peaks attain an altitude of 900 ft., and Inkpen Beacon, on the borders of Berkshire, Wiltshire, and Hampshire, the highest point (880 ft.). Somewhere on the upland is the limestone block of Silica. Tertiary grits, called sarsen stones or grey wethers, were used by the primitive builders of Stonehenge and Avebury. The underlying Greensand is exposed in the deeper valleys of the Chalk, such as the vale of Pewsey, dividing Salisbury Plain from Marlborough Downs, and the vale of Chalk, dividing the Nadder westward from the heights of Cranborne Chase. One of the most charming features of the county is its fertile and well-wooded valleys. Three ancient forests remain: Cranborne Chase, which extends into Dorset, was a royal deer-park as early as the reign of Henry I, and its deer now graze near North Wraxall; and the great woods of the county, with their large oaks and beeches. The main part of the New Forest belongs to Hampshire; but No Man's Land and Hampworth Common, its outlying heaths and coppices, encroach upon the south-eastern corner of Wiltshire. Bentley Wood, 5 m. E. of Salisbury, and the Great Ridge and Grovely Woods between the Nadder and Wylme, are fine uplands parks. There is no great sheet of water, but the reservoir near Swindon, and the Longleat, Stourton and Fonthill in the south-west of Earl Stoke near Westbury, and of Bowood, Corsham and Seagry near Chippenham, are reserve memory for deer. The upper reaches of the Thames skirt the north-eastern border, and three other considerable rivers drain the Wiltshire Downs. The Kennet, rising west of Marlborough, winds eastward into Berkshire and meets the Thames at Reading. The Lower and Bristol Avon flows from its source among the Cotswolds in southern Gloucestershire, past Malmsbury, Chippenham, Melksham and Bradford, where it curves north-eastward into Somerset, finally falling into the Bristol Channel. Besides many lesser tributaries it receives from the south the Frome, which forms for about 15 m. the boundary between Wilt and Somerset. The East or Christchurch Avon, which rises near Bishops Cannings in the centre of the county, flows east and south into Hampshire, and enters the sea at Christchurch. Close to Salisbury it is joined by the united streams of the Nadder and the Wylme; by the Eble, which drains the vale of Chalk; and by the Bourne, which flows south by west from its head near Ludgershall.

Geology.—As has been said, about two-thirds of the surface of Wilt is occupied by a great Chalk upland. Cropping out from beneath the Chalk is a fringe of the Selborne.—Upper Greensand and Gault—the former is well exposed in the vale of Pewsey, west of Devizes, and along the margins of the vale of Wardour; it forms a belt, or 'line of beauty', through Wiltshire to the soothish. The Gault Clay runs regularly at the foot of the Upper Greensand: it is excavated in several places for brick-making. The Lower Greensand, which oversteps the underlying formations, appears from beneath the Gault at Poulsbott and follows the same line of outcrop northwards; a small outlier at Seend is worked for the iron it contains. About one-third of the county lying on the north-west side of the Chalk downs, including a portion of the vale of the White Horse, is occupied by Jurassic rocks. The Upper Lias—the oldest formation in the county—forms the floor of the valley near Box; it is followed by the overlying Inferior Oolite and Fuller's Earth, the two containing Great Corsham clay, the famous building-stones of Bath, quarried at Wilsley Down, near Bradford, and at Box, Corsham Down and other places in the neighbourhood. The Avon, rising in the vale to Bradford comes the Bedfont clay, with the well-known fossil _Aptoceras_ or _pene-encrinite_, followed by the Forest Marble limestones and clays. The rubbly Cornbrash crops at Westwood, Trowbridge, and Malmsbury. Further east lies the outcrop of Oxfordian strata, comprising the sandy Kellaways beds and overlying Oxford Clay, together forming a broad low-lying tract in which stand Trowbridge, Melksham, Chippenham and Cricklade. Rising up from the eastern margin of the Oxfordian vale is the irregular scarp formed by the Corallian oolitic limestones and marls. The iron ores of Westbury are obtained in this formation. Another clay-bottomed vale lies on the eastern side of the county, extending from north-east to west, and between Seend and Tilshead. It is occupied by the small outcrops of Portlandian rocks which yield the familiar building-stones of Tisbury and Chilmark. Limestones and clays of Purbeck age lie in the vale of Wardour about Tettifons. At Dinton in the same vale is Wiltshire's chief source of 'green' stone, used for jewellery. In the south-eastern corner of the county there are tracts of Tertiary Reading Beds and London Clay east of Downton and on the county boundary near Tisbury. The ancient Salterton Hill, on the west of Tisbury and Grinstead, also on Hampsworth Common. Outliers of Reading Beds and London Clay occur about Great Bedwyn; the sarsen stones previously referred to represent the last remnants of a mantle of Tertiary rocks which formerly covered the district. Here and there drift gravels and brick earths, besides low-level river gravels, rest upon the older rocks.

Agriculture.—Some six-tenths of the total area, a high proportion, is under cultivation, but a large amount of this is in permanent pasture. The soil, a heavy reddish loam, with a subsoil of broken stones, in the north-west, but lighter in the chalk region, is essentially a Chalk-with-clay or Gault-with-clay formation. There is a land, suitable for wheat and beans. Oats, however, are the largest grain crop. There is a small acreage classified as hill pasture. The green crops consist mainly of turnips, mangolds and swedes. Bacon, pork and beef are raised on the farms. The dairy trade is carried on the downs, and dairy-farming is practised in the north-west. There are manufactures of condensed milk. An agricultural college is established at Downton.

Manufactures.—A majority of the hands employed in factories and workshops are occupied in the locomotive works of the Great Western railway at Swindon. There are also large engineering works at Devizes. Cloth is still woven, though in greatly diminished quantities, at Trowbridge, Melksham, Chippenham and other places where water-power is available. Carpets are woven at Wilton, and cloth and cozen-curtain at Melksham, silk at Malmesbury, and Mere and Warminster. Portland and Bath stone are quarried for building purposes, while iron ore from mines near Westbury is smelted in that town.

Communications.—Three great railway lines traverse Wiltshire from E. to W., throwing out a number of branch lines to the larger towns. In the N. the Great Western main line passes through Swindon on its way from London to Bath. A second line of the same system runs also to Bath, from Hungerford, by way of Devizes. South of Salisbury Plain the South-Western main line goes through Salisbury and the southern quarter of Wilt's way into Somerset. The chief branch line is that between Salisbury and Westbury on the Great Western. The Midland & South-Western Junction railway runs north from Andover by Swindon, Cricklade and Cirencester. Swindon, Salisbury and Westbury are the three centres of traffic. A branch railway from Midsomer Norton to Bradford-on-Avon (45½ m.), Melksham (24½ m.), Trowbridge (11 m.), Warminster (55½ m.), Westbury (330 m). Other small towns are Cricklade (15½ m.), Downton (17 m.), Highworth (204 m.), Mere (177 m.), Pewsey (172 m.), Wootton Bassett (228 m.). The county is in the western circuit, and assizes are held at Salisbury and Devizes. It has one county court of sessions, and is divided into 16 petty sessional divisions. The boroughs of Devizes and Salisbury have separate courts of quarter sessions and commissions of the peace, and the borough of Marlborough has a separate coronial courts. Under the provisions of the Local Government Act 1888, the county is mainly in the diocese of Salisbury, but a considerable part is in that of Bristol, and small parts in those of Gloucester, Oxford and Winchester. It contains 322 ecclesiastical parishes or districts, wholly or in part. The county is divided into five parliamentary divisions, each returning one member—Northern or Cricklade, North-western or Chippenham, Western or West-
bury, Eastern or of Devizes and Southern or Wilton. It also contains the parliamentary borough of Salisbury, returning one member.

History.—The English conquest of the district now known as Wiltshire began in 552 with the victory of Cynric at Old Sarum, by which way was opened to Salisbury Plain. Four years later, pushing his way through the vale of Pewsey, Cynric extended the limits of the West Saxon kingdom to the Marlborough Downs by a victory at Barbury Hill. At this period the district south of the Avon and the Nadder was occupied by dense woodland, the relics of which survive in Cranborne Chase, and the first wave of West Saxon colonization was chiefly towards the Bruton area. After the Conquest of the south by the Normans, the little township of Wilton which arose in the latter giving the name of Wiltsæatan to the new settlers. By the 9th century the district had acquired a definite administrative and territorial organization, Waltham, ealdorman of the Wiltsæatan, being mentioned as early as 800 as repelling an attempted invasion of the Mercians. Moreover, "Wiltunsceire" is mentioned by Asser in 878, in which year the Danes established their headquarters at Chippenham and remained there a year, plundering the surrounding country. In the time of Æthelstan mints were held in Downton hundred; the abbot of Damerham had Marlborough. Wilton and Salisbury were destroyed by the Danish invaders under Sweyn in 1003, and in 1015 the district was harried by Canute.

With the redistribution of estates after the Conquest more than two-fifths of the county fell into the hands of the church; the possessions of the crown covered one-fifth; while among the chief lay proprietors were Edward of Salisbury, William, count of Ewe, Ralph de Mortimer, Aubrey de Vere, Robert Fitzgerald, Miles Crispin, Robert d'Oily and Osbern Giffard. The first earl of Wiltshire after the Conquest was William le Scrope, who received the honour in 1086. The title subsequently passed to Sir James Butler in 1449, Sir John Stradford in 1470, Sir Thomas Boleyn in 1520, and in 1550 to the Paulet family. The Benedictine foundations at Wilton, Malmesbury and Amesbury existed before the Conquest; the Augustinian house at Bradenstoke was founded by Walter d'Evreux in 1142; that at Lacock by Ela, countess of Salisbury, in 1252; that at Longleat by Sir John Vernon before 1272. The Cluniac priory of Monkton Farleigh was founded by Humphrey de Bohun in 1125; the Cistercian house at Kingswood by William de Berkeley in 1143. The rise and fall of the abbot of Damerham had Marlborough.

Of the forty Wiltshire hundreds mentioned in the Domesday Survey, Selkley, Ramsbury, Bradford, Melksham, Calne, Whorwell'sdown, Westbury, Warminster, Heytesbury, Kinwardstone, Ambresbury, Underditch, Fursfield, Alderbury and Downton remain to the present day practically unaltered in name and extent; Thorngrove, Dunelawe and Cepham hundreds form the modern hundred of Chippenham; Malmesbury hundred represents the Domesday hundreds of Cirecemethorn and Sterchelehe, which were held at farm by the abbot of Malmesbury; Highworth represents the Domesday hundreds of Crecelhelade, Scipe, Wurde and Staple; Kingbridge the hundreds of Chingbridge, Blachegrave and Thornhylle; Swantonian the hundreds of Rugeberge, Stodfæd and Swanebury; Branch the hundreds of Brancherebe and Dolesfeld; Cawdon the hundreds of Cawdon and Cadworthy. A noticeable feature in the 14th century is the aggregation of church mansons into distinct hundreds, at the court of which their ecclesiastical owners required their tenants to do suit and service. Thus the bishop of Winchester had a separate hundred called Kurwel Bishop, afterwards absorbed in and that of Stanley by the Empress Maud in 1154; that of Damerham; and the prior of St Swithin's of that of Elstow, under each of which were included mansons situate in different parts of the county.

The meeting-place of Swanborough hundred was at Swanborough Tump, a hillock in the parish of Manningford Abbots identified as the moot-place mentioned in the will of King Alfred; that of Malmesbury was at Colepark; that of Bradford at Bradford Leigh; that of Warminster at Iley Oak, about 2 m. south of Warminster, near South Leigh Wood. The shire court for Wiltshire was held at Wilton, and until 1246 the shrievalty was exercised ex officio by the castellans of Wilton. Edward of Salisbury was sheriff at the time of the Domesday Survey, and the office remained hereditary in his family, descendents to William Longespee by his marriage with Ela, great-granddaughter of Edward. In the 13th century the assizes were held at Wilton, Malmesbury and New Sarum.

On the division of the West Saxon see in 703 Wiltshire was included in the diocese of Sherborne, but in 905 a separate diocese of Wilton was founded, the see being fixed alternately at Ramsbury, Wilton and Sunning in Berkshire. Shortly thereafter the archdeaconric of Wiltsæatan was formed and in 1075 the see was transferred to Salisbury. The archdeaconrics of Wiltshire and Salisbury are mentioned in 1180; in 1291 the former included the deaneries of Avebury, Malmesbury, Marlborough and Cricklade within this county, and the latter the deaneries of Amesbury, Pottermere, Wilton, Chalke and Wylme. In 1535 the archdeaconry of Salisbury included the additional deaneries of Salisbury, while Pottermere deanery had been transferred to the archdeaconry of Wiltshire. The deaneries of the archdeaconry of Salisbury have been acquired or amalgamated; the deaneries of Avebury, Marlborough and Pottermere, and the deaneries of Chippenham, Cricklade and Malmesbury form part of the archdeaconry and diocese of Bristol.

The inhabitants of Wiltshire have always been addicted to industrial rather than warlike pursuits, and the political history of the county is not remarkable. In 1086, after the completion of the Domesday Survey, Salisbury was the scene of a great council, in which all the landholders took oaths of allegiance to the king, and a council for the same purpose assembled at Salisbury in 1116. At Clarendon in 1166 was drawn up the statute which regulated the provincial administration of justice. Parliaments were held at Marlborough in 1267 and at Salisbury in 1328 and 1384. During the wars of Stephen's reign Salisbury, Devizes and Malmesbury were garrisoned by Roger, bishop of Salisbury, for the empresse, but in 1378 Stephen seized the bishop and captured Devizes Castle. In 1276 Marlborough Castle was surrendered to Louis by Hugh de Neville. Hubert de Burgh escaped in 1253 from Devizes Castle, where he had been imprisoned in the previous year. In the Civil War of the 17th century Wiltshire actively supported the parlia
tmentary cause, displayed a notable anti-Catholicism, and the efforts of the marquess of Hertford and of Lord Seymour to raise a party for the king met with vigorous resistance from the inhabitants. The Royalists, however, made some progress in the early stage of the struggle, Marlborough being captured for the king in 1642, while in 1643 the forces of the earl of Essex were routed by Charles I. and Prince Rupert at Aldbourne, and in the same year Waller, after failing to capture Devizes, was defeated in a skirmish at Roundway Down. The year 1645 saw the rise of the "Clubmen" of Dorset and Wiltshire, whose sole object was peace; they systematically punished any member of either party discovered in acts of plunder. Devizes, the last stronghold of the Royalists, was captured by Cromwell in 1645. In 1655 a rising organized on behalf of the king at Salisbury was dispersed in the same year.

At the time of the Domesday Survey the industrial pursuits of Wiltshire were almost exclusively agricultural; 390 mills are mentioned, and vineyards at Tolland and Lacock. In the succeeding centuries sheep-farming was vigorously pursued, and the Cistercian monasteries of Kingswood and Stanley exported wool to the Florentine and Flemish markets in the 13th and 14th centuries. Wiltshire at this time was already reckoned among the chief of the clothing counties, the principal centres of the industry being Bradford, Malmesbury, Trowbridge, Devizes and Chippenham. In the 16th century Devizes was noted for its blankets, Warminster had a famous corn-market, and cheese was extensively made in north Wiltshire. Amesbury was famous for its tobacco pipes in the 16th century. The clothing trade went through a period of great depression in the
WIMBLEDON

17th century, partly owing to the constant outbreaks of plague. Linen, cotton, gloves and cutlery were also manufactured in the county, silk at Malmesbury and carpets at Wilton.

In 1295 Wiltshire was represented by no less than twenty-eight members in parliament, the shire returning two knights, and the boroughs of Bedwyn, Bradford, Calne, Chippenham, Cricklade, Devizes, Down, Ludgershall, Malmesbury, Marlborough, Old Sarum, Salisbury and Wilton, two burgesses each, but the boroughs for the most part made very irregular returns. Hindon, Heytesbury and Wootton Bassett were disfranchised in the 14th and 15th centuries. By Act of 1832 the county with sixteen boroughs returned a total of twenty-six members. Under the latter act Great Bedwin, Down, Heytesbury, Hindon, Ludgershall, Old Sarum and Wotton Bassett were disfranchised, and Calne, Malmesbury, Westbury and Wilton lost one member each. Under the act of 1868 the county returned two members in two divisions, and Chippenham, Devizes and Marlborough lost one member each. Under the act of 1885 the county returned five members in five divisions; Cricklade, Calne, Chippenham, Devizes, Malmesbury, Marlborough and Wilton were disfranchised; and Salisbury lost one member.

Antiquities.—Wiltshire is extraordinarily rich in prehistoric antiquities. The stone age is represented by a number of flint and stone implements, preserved in the unsurpassed collection at Salisbury Museum. Numerous large stone circles and stone rows, the remains of which still exist, enclose the sites of former settlements. These stone circles, surrounded by an earthwork, and enclosing two lesser circles, are the largest and most famous megalithic works in England. A valley near Avebury is filled with immense sarsen blocks, resembling a river of stone, and perhaps laid there by prehistoric architects. There are also menhirs, dolmens and cromlechs. Surrounding these are forests and marshy hollows, it is clear that the downs were densely peopled at a very early period. Circles, formed by a ditch within a bank, are common, as are grave-mounds or barrows. These have been classified according to their shape and size. The larger barrows, those above five yards in length, tools, weapons and ornaments have been dug up from such mounds, many of which contain kistvavas or chambers of stone. The lynchets or terraces which score some of the hillsides are said to be the work of primitive agriculturists. Ancient strongholds and castles, with their walls and towers, are scattered over the county. Among the most remarkable are Vespasian's Camp, near Amesbury; Silbury Hill, the largest artificial mound in Europe; near Avebury; the mounds of Marlborough and Old Sarum; the camps of Battlebury and Scratchbury, near Warminster; Yarnbury, to the N. of Wilt, in very perfect preservation; Castlely, on a ridgeway about 7 m. E.S.E. of Devizes; Wilt Hill, near Basingstoke, a large camp; Shillingford Park, near Westbury, near Savernake; Sidbury, near Ludgershall; and Figbury Ring, 3 m. N.E. of Salisbury. Ogbury, 6 m. N. of Salisbury, is an undoubted British enclosure. Durrington Walls, N. of Amesbury, and Avebury itself is a large camp, and there are vestiges of others on Salisbury Plain and Marlborough Downs.

There are many signs of the Roman rule. Wans Dyke or Woden's Ditch, a line of wall runs within two to three miles of about 60 m. from a point east of Savernake, nearly as far as the Bristol Channel, and is almost unaltered for several miles along the Marlborough Downs. Its date is uncertain; but the work has been proved, wherever excavated, to be Roman or Romano-British. It consists of a bank, with a trench on the north side, and was clearly meant for defence, not as a boundary. Forts strengthened it at intervals. Bokerly Dyke, which forms a part of the boundary between Wilts and Dorset, is the largest among several similar entrenchments, and has also a ditch north of the rampart. Chief among the few monastic buildings of which any vestiges remain, are the priories of Cheadle and of Melksham. There are some traces of the hospital for leprous women afterwards converted into an Austin priory at Maiden Bradley. Monkton Farleigh, farther north along the Somerset border, had its Cistercian church as a cell of Cirencester in the 13th century, and is represented by some outbuildings of the manor-house. A college for a dean and 12 prebendaries, afterwards a monastery of Bonholors, of which there is a large and complete church, but of which the eastern parts, and Perpendicular, resembles a cathedral in size and stately beauty. The 14th century buildings of Bradenstoke Priory or Cloke Abbey, founded near Chippenham for Austin canons, are incorporated in a house. The finest church building, in the Perpendicular, were built in the districts where good stone could be obtained, while the architecture is more simple in the Chalk region, where the foliage of the trees, and the honeycombs of bees and pyramidal bell-turrets are not uncommon; and the church of 31 m. N.W. of Swindon, and Wanborough, 3 m. S.E., have each two steeples, one in the centre, and one at the west end. St Lawrence's church at Bradford-on-Avon is one of the most perfect Saxon ecclesiastical buildings in England; and elsewhere there are fragments of Saxon work imbedded in later monuments. Three arches in the nave of Britford church, within a mile of Salisbury; the east end of the chancel at Burcombe, near Wilton; and parts of the churches at Avebury, at Bradford Bruce or Brase in the vale of Pewsey. St John's at Devizes is a collection of Norman tower and has Norman masonry in its chancel; while the chancel of St Mary's, in the same town, is also Norman, and the porch is characterised by the church of Freshwater, near Marlborough, Ditteridge or Ditford, and Box, and Nether Avon, near Amesbury, preserve sundry Norman features. The church of St Michael is large, and Salisbury Cathedral, its purest and most beautiful example; and so is the church of St Peter, of which Bishops Cannings, Boyton in the vale of the Wyley, Collingbourne Kingston, east of Salisbury Plain, Downton and Potterne, near the old Sarum, and Bishopsthorpe, with a Decorated church in the county, with a curious external cloister, and a stone south chancel doorway, recessed beneath a stone canopied. Mere, near the borders of Dorset and Somerset, is interesting not only for its Perpendicular chancel, but for the old manor-house, usually converted into a farm, but preserving its flagged roof, stone-mullioned windows, gabled front, twostoreyed porch and oak-panelled interior. Place House, in Tisbury, and Barton Farm, at Bradford, date from the 14th century. Fifteenth-century work is best exemplified in the manor-houses of Nortington, near Frome; the beautiful church of Yarnbury, near Wilt, where the hall of a very beautiful house of the same period is celebrated in local tradition as the spot where tobacco was first cultivated in England by Sir Walter Raleigh and his host, Sir John Law. Later styles are represented by Longford Castle, near Salisbury, where the picture galleries are of great interest; by Heytesbury Park; by Wilton House at Wilton, Kingston House at Bradford, Bowood near Calne, Longleat near Warminster, Comham Court, Littlecote near Ramsbury, Charlton House near Malmesbury, Compton Chamberlayne in the Nadder valley, Grittleton, and the manor-houses near Chippenham and Stourhead, on the borders of Dorset and Somerset, are noteworthy for their architecture, its art treasures or the beauty of its surroundings.

WIMBLEDON, a municipal borough and western residential suburb of London, in the Wiltshire parliamentary division of Surrey, England, adjoining the metropolitan borough of Wandsworth, 8 m. S.W. of Charing Cross. Pop. (1891) 41,652. Wimbledon Common, to the north-west of the district, forms a continuation of Putney Heath and a pleasant recreation ground. It was the meeting-place of the Rifle Association from its foundation in 1860 till 1888. The parish church of St Mary is supposed to date from Saxon times; but, after it had undergone reconstructions, it was rebuilt in 1833 in the Perpendicular style. There are various other churches and chapels, all modern. A free library was established in 1827. Benevolent institutions are numerous. The corporation consists of a mayor, 6 aldermen, and 18 councilors. Area, 3,221 acres.

Wimbledon (Wibbandune) is supposed to have been the scene of a battle in 656 between Cæwin, king of Wessex, and Ædelberht, king of Kent, in which Ædelberht was defeated, and an earthwork which existed on the Common may have marked the site. At
Coombe's Hill and elsewhere British relics have been found. At Domesday Wimbledon formed part of the manor of Mortlake, held by the archbishops of Canterbury. Afterwards the name was sometimes used interchangeably with Mortlake, and in 1357 it is described as a grange or farm belonging to Mortlake. On the impeachment of Arundel, archbishop of Canterbury, in 1398, it was confiscated. In the reign of Henry VIII. Cromwell, earl of Essex, held the manor of Wimbledon, with Bristow Park as an appendage. On the confiscation of Cromwell's estates in 1540 it again fell to the crown, and by Henry VIII. it was settled on Catherine Parr for life. By Queen Mary it was granted to Cardinal Pole. In 1574 Elizabeth bestowed the manor-house, while retaining the manor, on Sir Christopher Hatton, who sold it the same year to Sir Thomas Cecil. In 1588 Elizabeth transferred the manor to his son Sir Edward Cecil, in exchange for an estate in Lincolnshire. At the time of the Civil War the manor was sold to Adam Baynes, a Yorkshireman, who shortly afterwards sold it to General Lambert; and at the Restoration it was granted to the queen dowager, Henrietta Maria, who sold it in 1660 to George Digby, earl of Bristol. On his death in 1676 it was sold by his widow to the lord-treasurer Danby. Some years after Danby's death it was purchased by Sarah, duchess of Marlborough, who bequeathed it to her grandson, John Spencer. It was sold by the fifth Earl Spencer in 1877. Wimborne Manor House in 1760 was replaced by another building in 1735 by the duchess of Marlborough; this was destroyed by fire in 1785, and a new house, called Wimborne Park House, was erected about 1801. Wimborne was incorporated in 1905.

WIMBORNE—WINCHCOMB

WIMBORNE (Wimborne Minster), a market town, in the eastern parliamentary division of Dorsetshire, England, 1113 m. S.W. by W. from London by the London & South-Western railway; served also by the Somerset and Dorset railway. Pop. of urban district (1901) 3696. It is situated on a gentle slope by the River Stour, and has a prominent position with aisles, transepts without aisles, western or bell tower, north and south porches, crypt and vestry or sacristy, with the library over it. It contains a large number of interesting monuments, including a brass with the date 873 (supposed to mark the resting-place of King Æthelred I.), a lunar oratory of the 14th century and an octagonal Norman font of Purbeck marble. There is a church dedicated to St John the Evangelist. The free grammar school consists of the Elizabethian style. Near Wimborne is Canford Manor, the seat of Lord Wimborne, a mansion in the Tudor style, built by Blore in 1826, and improved from designs of Sir Charles Barry. The town depends chiefly on agriculture; but the manufacture of hose is carried on to a small extent, and there are also coachbuilding works.

Although Wimborne (Wimburn) has been identified with the Vinagladia of the Antonine Itinerary, the first undoubted evidence of settlement is the entry of the Anglo-Saxon Chronicle, under the date 718, that Cuthburh, sister of King Ine, founded the abbey here and became the first abbess; the house is also mentioned in a somewhat doubtful epistle of St Aldhelm in 709. The importance of the foundation made it the burial-place of King Æthelred in 871, and of King Siferth in 862. Æthelwald seized and fortified Wimborne in his revolt in 901 against Edward the Elder. The early abbey was probably destroyed by the Danes in the reign of Æthelred the Unready (978-1013), for in 1043 Edward the Confessor founded here a college of secular canons. The college remained unaltered until 1496, when Margaret, countess of Salisbury, at Richard, obtained letters patent from her son, Henry VII., to found a chantry in connexion with which she established a school. The continuance of this was recommended by the commissioners of 1547, and in 1562 Elizabeth vested a great part of the property of the former college in a school corporation of twelve governors, who had charge of the church. New charters for the school were obtained from James I. in 1562 and from Charles I. At the conquest Wimborne was a royal borough, ancient demesne of the crown, and part of the manor of Kingston Lacy, which Henry I. gave to Robert Mleton, earl of Leicester. From him it descended by marriage to the earls of Lincoln, and, then passing by marriage to Earl Thomas of Lancaster, in 1266 to Richard I., and finally in 1461, by the marriage of the duchess of Lancaster; an inquisition of 1532 found that Henry, Duke of Lancaster, had 775. 3d. rent of assize in the borough of Wimborne. The borough is again mentioned in 1487-1488, when John Flemy held six messuages in free burgage of the king as of his borough of Wimborne, but it seems to have been entirely prescriptive, and was never a parliamentary borough. The town was governed until the 19th century by two bailiffs, chosen annually at a court leet of the royal manor of Wimborne borough, part of the manor of Kingston Lacy. The market held here on Friday of each week is not mentioned in Domesday Book, but seems to be of early origin. Wimborne carried on considerable manufactures of linen and woollen goods until the time of Charles II., when they declined, their place being taken by the stocking-knitting industry of the 18th century. See John Hutchins, The History and Antiquities of the County of Dorset (3rd edition, Westminster, 1861); Anon., History of Wimborne Minster (London, 1912).

WINFPENN, EMMANUEL FELIX DE (1811-1884), French soldier. Entering the army from the military school of St Cyr, he saw considerable active service in Algeria, and in 1840 became captain, in 1847 chef de bataillon. He first earned marked distinction in the Crimean War as colonel of a Turco regiment, and his conduct at the storm of the Mamelon won him the grade of general of brigade. In the campaign of 1859 he was with General MacMahon at Magenta at the head of a brigade of Guard Infantry, and again won promotion on the field of battle. Between this campaign and that of 1870 he was mainly employed in Algeria, and was not at first given a command in the ill-fated "Army of the Rhine." But when the earlier battles revealed incapacity in the commander of the 5th corps, De Wimpffen was ordered to take it over, and was given a dormant commission appointing him to command the Army of Châlons in case of Marshal MacMahon's disablement. He only arrived at the front in time to rally the fugitives of the 5th corps, beaten at Beaumont, and to march them to Sedan. In the disastrous battle of the 1st of September, MacMahon was soon wounded, and the senior officer, General Ducrot, assumed the command. Ducrot was beginning to withdraw the troops when Wimpffen produced his commission and countermanded the orders. In consequence it fell to him to negotiate the surrender of the whole French army. After his release from captivity, he lived in retirement at Algiers, and died at Paris in 1884. His later years were occupied with polemical discussions on the surrender of Sedan, the responsibility for which was laid upon him.

WINCHESTER, amongst other works. Sedan (1871), La Situation de la France, et les réformes nécessaires (1873) and La Nation armée (1875).

WINBURG, a town in the Orange Free State, 90 m. N.E. by rail of Bloemfontein. Pop. (1904) 2762, of whom 1003 were whites. It is built by the banks of a tributary of the Vet affluent of the Vaal, and is a trading centre for a large grain and pastoral district. It is the seat of the Transvaal and the Transvaal, a branch line from Middelburg, 28 m. N.W. The town was founded in 1837 by Commandant H. Potgieter, one of the voortrekkers, and was named by him in commemoration of a victory gained over the Matabele chief Mosilikatze. It became the capital of a quasi-independent Boer state, which included considerable areas north of the Vaal. In 1848 the town and district were annexed to Great Britain and thereafter followed the fortunes of the Orange river sovereignty (see Orange Free State). In the Boer War of 1899-1902 Winburg was one of the Boer centres in the guerrilla fighting which followed the fall of Pretoria.

WINCHCOMB, a market town in the northern parliamentary division of Gloucestershire, England, 7 m. N.E. of Cheltenham. Pop. (1901) 2664. It is picturesquely situated among the Cotteswold Hills, in the narrow valley of the Isbourne stream. The Perpendicular church of St Peter, cruciform, with a central
WINCHELSEA, COUNTESS OF WINCHELSEA, R.

Tower, is a good example of its period. In the vicinity is Sudeley Castle, originally built by Thomas Boleter, Lord Sudeley (d. 1398). By gift of Edward VI. it came into the hands of Sir Thomas Seymour, fourth husband of Catherine Parr; this queen died here and was buried in the chapel. The castle suffered severely at the hands of the parliamentarians in 1644, and remained ruinous until 1837, when a careful restoration was begun. There are a tower of the 14th century, and considerable remains of the 15th, the inhabited portion being mainly of Tudor date. There are four mills, paper-works and tanneries at Winchcomb.

Excavations prove that there were both British and Roman settlements at Winchcomb (Winchcombe, Winchelcumbe). It owed its growth to the foundation of religious houses by Offa and Coenwulf of Mercia in the 8th century. Winchelsea became a borough in Saxon times, was the chief town of a shire to which it gave its name, and was the seat of government of the Merkian kings. Witenagemots were held there in 771 and 942. Harold, earl of Wessex, was the first overlord. It had become a royal borough by 1087, and was granted by a charter of 1224 to the abbots of St Mary's to be held of the King by a rent of 50s. Winchelsea was never received a charter and was not incorporated, but as a borough by prescription it was governed by 2 bailiffs and 10 chief burgesses, and the body corporate was dissolved by act of parliament in 1883. It was never represented in parliament except by its mitred abbots before the dissolution of the monasteries. There is no trace of the original grant of a fair on July 17 (now held on July 28), but it is mentioned as already existing in a charter of 1221, which changed the market day from Sunday to Saturday. Elizabeth granted another fair on April 25 by charter in 1575. A Tuesday market was also granted under this charter, but the Saturday market only is now held. Both the modern fairs are horse and cattle fairs, but in the middle ages they were centres of the cloth manufacture. Tanning has been a local industry since the beginning of the 15th century, and paper and silk factories were introduced about 1830. Winchelsea took the side of the king in the Civil War and was twice plundered.

See Victoria County History, Gloucestershire: Emma Dent, Annals of Winchcombe (1877); David Royce, Winchcombe Cartulary (1892).

WINCHELSEA, ANNE FINCH, COUNTESS OF (1661–1720), English author, daughter of Sir William Kingsmill of Sidemonton, near Southampton, was born in April 1661. Five months later her father died, and her mother married in 1662 Sir Thomas Ogle. Lady Ogle died in 1664, and nothing is heard of her daughter Anne until 1683, when she is mentioned as one of the maids of honour of Mary of Modena, duchess of York. She married in May 1684 Colonel Heneage Finch, who was attached to the duke of York's household. To him she addressed poems and versified epistles, in which he figures as Daphnis and she as Ardella. At the Revolution Heneage Finch refused the oath of allegiance to William and Mary, and he and his wife had no fixed home until they were invited in 1696 to Eastwell Park, Kent, by Finch's nephew Charles, 4th earl of Winchelsea, on whose death in 1712 Heneage Finch succeeded to the earldom. The countess of Winchelsea died in London on the 5th of August 1720, leaving no issue, her husband surviving until 1726.

Lady Winchelsea's poems contain many copies of verse addressed to her friends and contemporaries. She was to some extent a follower of the "matchless Orina" in the fervour of her friendships. During her lifetime she published her poem "The Spleen" in Guildon's Miscellany (1701) and a volume of Poems in 1713 which included a tragedy called Aristomenes. With Alexander Pope she was on friendly terms, and one of the seven commendatory poems printed with the 1717 edition of his works was by her. But in the farce Three Hours after Marriage (1747) attributed to Gay, but really the work of Pope, Arbuthnot and Gay, she is ridiculed as the learned lady, Phoebe Clinket, a character assigned to Pope's hand. Lady Winchelsea's poems were almost forgotten when Wordsworth in the "Essay, supplemental to the Preface" of his Poems (1815), drew attention to her nature-poetry, asserting that with the exception of Pope's "Windsor Forest" and her "Nocturnal Reverie," English poetry between Paradise Lost and Thomson's Seasons did not present "a single new image of external nature." Wordsworth sent at Christmas 1819 a MS. of extracts from Lady Winchelsea and other writers to Lady Mary Lowther, and his correspondence with Alexander Dyce contains some minute criticism and appreciation of her poetry.

Mr Edmund Gosse wrote a notice of her poems for T. H. Ward's English Poets (vol. iii., 1880), and in 1884 came into possession of a MS. of her entire ed in the British Museum. The Poems of Anne, Countess of Winchelsea, was edited by Myra Reynolds (Chicago, 1903) with an exhaustive essay. See also E. Gosse, The Life and Letters of a E. Dyce, 1799–1869, Modern and Elizabethan. Wordsworth's anthology for Lady Mary Lowther was first printed in 1805 (Oxford). Some of her work remains in MS. in the possession of Professor Dowden.

WINCHELSEA, ROBERT (d. 1331), archbishop of Canterbury, was probably born at Old Winchelsea. He studied and then taught at the universities of Paris and Oxford, where he attained celebrity as a scholar, and became rector of the former, and subsequently chancellor of the latter university. He held considerable influence in the councils and debates of the university. In 1301 he was made archdeacon of Essex about 1283. In December 1292 John Peckham, archbishop of Canterbury, died, and early in the following year Winchelsea was elected as his successor. His consecration, which took place at Aquila in September 1294, was delayed owing to the vacancy in the papacy, but he found no difficulty in obtaining the temporalities of the see from King Edward I. Winchelsea is chiefly renowned as a strenuous upholder of the privileges of the clergy and the authority of the pope, and as a fearless opponent of Edward I. Strengthened by the issue of the papal bull Clerics Lateran in 1296, he stimulated the clergy to refuse pecuniary assistance to Edward in 1297; but after the king had pronounced sentence of outlawry against the delinquents he instructed each clerk to decide this question for himself. Personally the archbishop still declined to make any contribution towards the expenses of the French war, and his lands were seized and held by Edward until July 1307, when a somewhat ostentatious reconciliation between king and prelate took place at Westminster. He took some part in the movement which led to the confirmation of the charters by the barons; his name in the list of those who signed the petition of the barons for a truce with the king, but the struggle with the king did not exhaust his energies. He asserted his authority over his suffragans to the full; quarrelled with Pope Boniface VIII. over the presentation to a Sussex living, and was excommunicated by one of the pope's minions; and vigorously contested the claim of the archbishop of York to carry his cross erect in the province of Canterbury. Before these events, however, the quarrel with Edward had been renewed, although Winchelsea officiated in 1299 at the king's marriage with Margaret, daughter of Philip III., king of France. Joining the barons in demanding certain reforms from Edward at the parliament of Lincoln in 1301, he compelled the king to give way on the main issues; but the indignation which followed the claim of Pope Boniface to be the protector of Scotland, a claim which was supported by Winchelsea, led to the rupture of this alliance. It is probable that one of the reasons which led the archbishop to join in these proceedings was his hostility to Edward's adviser, Walter Langton, bishop of Lincoln, whom he sought to disgrace both in England and at Rome. The king cherished his indignation until his friend Clement V. became pope in 1305, when he made his final move against Winchelsea. Listening to Edward's envoys, Langton and Henry Lacy, earl of Lincoln, Clement suspended the archbishop, who, after vainly imploring the intercession of the king, left England and journeyed to the papal court at Bordeaux, remaining in exile until Edward's death in July 1307. The new king, Edward II., requested Clement to allow Winchelsea to return to his see. The pope assented, but soon after his return to England early in 1308 the archbishop joined the king's enemies; even demanded the release from prison of his old enemy, Langton, and was one of the "ordainers" appointed in 1310. He assisted the barons in their struggle.
WINCHELSEA—WINCHESTER, EARLS & MARQUESSES OF

with Edward II. by a frequent use of spiritual weapons, and took part in the proceedings against the Templars. He died at Oxford on the 11th of May 1313. Miracles were said to have been worked at his tomb in, Canterbury cathedral, but efforts to procure his canonization were unavailing. Although a secular priest Winchel- sea was somewhat ascetic, and his private life was distinguished for sanctity and generosity. As an ecclesiastical, however, he was haughty and fond of power; and he has been not inappropriately described as "the greatest churchman of the time."

WINCHELSEA, a village in the Rye parliamentary division of Sussex, England, 9 m. N.E. by E. from Hastings by the South Eastern and Chatham railways. Pop. (1901) 670. It stands on an abrupt hill-spraw rising above flat lowlands which form a southward continuation of Romney marsh. This was within historic times a great inlet of the English Channel, and Winchelsea was a famous seaport until the 15th century. Two gates, the one of the time of Edward I., the other erected early in the 15th century, overlook the marshes; a third stands at a considerable distance west of the town, its position pointing the contrast between the extent of the ancient town and that of the shrunken village of to-day. The town was laid out in streets running at right angles; the form is preserved, and in a picturesque open space in the centre stands the church of St Thomas à Becket. This comprises only the chancel and aisles of a building which, if entire, would rank as one of the finest parish churches in England. As it stands it is of the highest interest, showing remarkable Decorated work, with windows of beautiful and unusual design, and a magnificent series of canopied tombs. In the grounds of the residence called the Friars stands the shell of the apsidal choir of a Decorated chapel which belonged to a Franciscan house. Of a Dominican convent and other religious foundations and churches there is no trace.

The town of which the relics have been described was not the first of its name. On a site supposed to be about 3 m. S.E. and now therefore about 1 1/2 m. out in the English Channel, a seaport had grown up on a low peninsula. In 1236 and at various subsequent dates in the same century this town suffered severely from encroachments of the sea, and in 1266 it paid the penalty for its adherence to the cause of Simon de Montfort. The waves finally obliterated the site in 1288, and Edward I. thereafter planted the new town in a safe position. In the 14th and 15th centuries Winchelsea was frequently attacked by the French, and in Edward III. dominated the Spaniards in a naval action close by.

In the time of the Confessor Winchelsea (Winchessionel, Win- chelsee, Wynechse) was included in Rameslie which was granted by him to the abbey of Fécamp. The town remained under the lordship of the abbey until it was resumed by Henry III. Its early importance was due to its harbour, and by 1366 it was probably already a port of some consequence. By the reign of Henry II., if not before, Winchelsea was practically added to the Cinque Ports and shared their liberties.

In the 14th century the town was comparatively prosperous. New Winchelsea, a walled town, flourished for about a hundred years and provided a large proportion of the ships furnished by the Cinque Ports to the crown; but the ravages of the French destroyed it, its walls were broken down, and the decay of the harbour, owing to the recession of the sea, prevented any later return of its prosperity. The corporation, which in 1298 included a mayor, barons and bailiffs, was dissolved by an act of 1883.

Winchelsea as a Cinque Port was summoned to parliament in 1366-1369 and returned two members from 1366 till 1384, when it was disfranchised. The abbé de Fécamp seems to have originally held a market. In 1792 a market was held on Saturdays and a fair on the 14th of May, but no market or fair now exists. Ships building and fishing were carried on in the 13th and 14th centuries. In later years Winchelsea became a great resort for smugglers, and the vaults originally constructed for the Gascon wine trade were used for storing contraband goods.

WINCHESTER, EARLS AND MARQUESSES OF. The title of earl of Winchester was first borne by Saier, or Seer, de Quincy, who was endowed by King John on the 13th of March 1207, with the earldom of Winchester, or the county of Southampton. Saier de Quincy was one of the twenty-five barons named to enforce the observance of the Great Charter, and served in the Crusades at the siege of Damietta in 1219, and died soon afterwards, probably on the 3rd of November of that year. His second son Roger de Quincy (c. 1255-1264), who is said to have usurped the earldom during the absence of his elder brother Robert in the Holy Land, took part in the struggle between Henry III. and the barons. He died without male issue in April 1264, and the earldom reverted to the crown. It was revived in 1322 in favour of Hugh le Despenser, favourite of King Edward II., and was forfeited when he was put to death by the barons as a traitor in 1326. In 1472 the title, together with a pension of £500 a year from the customs of Southampton, but not the right of sitting in parliament, was given by King Edward IV. to a Burgundian, Louis de Bruges, lord of Gruthuyse and prince of Steenhuyse, as a reward for services rendered to himself while an exile on the continent. Louis de Bruges surrendered his patent to Henry VII. in 1499.

The marquessate of Winchester was created in 1551 in favour of William Paulet, or Pawlet, K.G., a successful courtier during four reigns, who died on the 10th of March 1572. It has descended in the male line of his family to the sixteenth possessor. John Paulet, 2nd marquess (c. 1517-1576), discovered the treasure of Edward I., and shared his life of his father, a distinction which was shared by his three immediate successors—William Paulet (c. 1555-1598), William Paulet (c. 1560-1628) and John Paulet (c. 1588-1674). Charles Paulet, son and heir of John Paulet, the eighth marquess, was created duke of Bolton, on the 9th of April 1689, and the marquessate of Winchester remained in connexion with the duchy of Bolton (q.v.) till the death of Harry Paulet, sixth duke and eleventh marquess, without male issue in December 1794. There being no male representative of the dukes of Bolton this title passed, but the marquessate of Winchester was inherited by the late George Paulet (1772-1800), great-grandson of Lord Henry Paulet (d. 1672), second son of William, the fourth marquess. On George's death on the 22nd of April 1800 he was succeeded by his son Charles Ingoldsby Burroughs-Paulet (1764-1843), who, in 1839, prefixed the name of Burroughs to his own by royal licence. Upon his death on the 29th of November 1843, the title passed to his son John Paulet (1801-1887), fourteenth marquess, who was succeeded, on the 4th of July 1887, by his son, Augustus John Henry Beaumont (1858-1899), officer in the Guards, who was killed at Magersfontein during the Boer War on the 11th of December 1889. His son, the 15th marquess, has been created Baron Bolton,
co-operated with the king in carrying out the separation of the Church from Rome between 1520 and 1536. He served on the courts which tried Sir Thomas More and Anne Boleyn, and he was employed to tell Catherine of Aragon that she and her daughter were degraded from their rank. It is characteristic of the type of man that he did his work gently, and with a constant recollection of the changes of fortune. His personal kindness to Anne Boleyn, which she acknowledged, no doubt stood him in good stead on the accession of her daughter Queen Elizabeth. In 1538 he was created Lord St John, and he was enriched by a grant of the lands of Netley Abbey, near Southampton. He was appointed lord steward of the household, and lord chamberlain, and became a knight of the garter in 1543. Henry VIII. named him one of the council, then gave his approval, for it was his wise rule to show just as much independence as enhanced the merit of his obedience. He was lord treasurer under Mary, and kept his place under Elizabeth, to whose ecclesiastical policy he gave his usual discreet opposition and final obedience. Winchester died at his house of Basing on the 10th of March 1572. He had built it on so grand a scale that his descendants are said to have found it necessary to pull down a part. He married, first Elizabeth, daughter of Sir William Capel, Lord Mayor of London, by whom he had four sons and four daughters, and then Winifred, daughter of Sir John Bruges, alderman of London, and widow of Sir Richard Sackville, by whom he had no children. It is said that one hundred and three of his descendants were alive at the date of his death.

His grandson, William Paulet, third marquess (c. 1535-1598) was one of the judges of Mary, queen of Scots, and author of a book called The Lord Marquesses Idleness which contains a Latin acrostic of extreme ingenuity on the words Regina nostra Angliae.

The fifth marquess, John Paulet (1628-1674), was a Roman Catholic. He lived much in retirement in order to be able to pay off debts left by his father. He is remembered by the arduous and sincerity of his loyalty to King Charles I. It is said that he caused the words "Aimez Loyauté" to be engraved on every pane of glass in his house of Basing. During the first Civil War it was fortified for the king, and stood a succession of sieges by the Parliamentary forces between 1643 and 1645. On the 14th of October 1645, it was stormed by Oliver Cromwell. The marquess, who fought valiantly, told Hugh Peters, chaplain of the New Model Army of the parliament, who had the vulgarity to crow over him, "That if the king had no more ground in England but Basing House, he would adventure as he did, and so maintain it to the utmost," for "that Basing House was called Loyalty." The house caught fire during the storm and was burnt down, the very ruins being carried away by order of the parliament. The marquess was imprisoned in the Tower of London, but was finally allowed to compound for his estate; after the restoration of King Charles II. he was promised compensation for his losses, but nothing was given to him. He died in Englefield Park on the 26th of October 1674, and was interred, first to Jane, daughter of Viscount Savage, by whom he had one son; then to Honora de Burgh, daughter of Richard, earl of St Albans and Cranricarde, by whom he had four sons; and then to Isabella Howard, daughter of Viscount Stafford.

WINCHESTER, a city and municipal and parliamentary borough of Hampshire, England, 66½ m. S.W. by W. from London by the London & South-Western railway; served also by the Southampton branch of the Great Western railway, with a separate station. Pop. (1901) 20,932. It occupies a hilly and picturesque site in and above the valley of the Itchen, lying principally on the left bank. The surrounding hills are chalk downs, but the valley is well wooded.

Setting aside for the present the legends which place the foundation of a great Christian church at Winchester in the 2nd century, the erection of Winchester into an episcopal see may be placed early in the second half of the 7th century, though it cannot be dated exactly. The West Saxon see was removed thither from Dorchester on the Thames, and the first bishop of Winchester was Hedda (d. 705). The modern diocese includes nearly the whole of Hampshire, part of Surrey and very small portions of Wiltshire, Dorsetshire and Sussex. St Swithin (822-862), well known through the connexion of his feast day (15th July) with the superstition that weather-conditions thereon determine those of the next forty days, is considered to have enlarged the cathedral, as are Ethelwold (963-984) and Alphege (984-1005). The history of the Saxon building, however, is very slight, and as usual, its place was taken by a Norman one, erected by Bishop Wulstan (1070-1098). The cathedral of St Swithin lies in the lower part of the city in a wide and beautiful walled close. It is not very conspicuous from a distance, a low central tower alone rising above the general level of the roof. It consists of a nave, transepts, choir and retrochoir, all with aisles, and a lady-chapel forms the eastward termination. The work of the exterior, of whatever date, is severely plain. The cathedral, however, is the longest in England, and indeed exceeds any other church of its character in length, which is close upon 556 ft. Within, the effect of this feature is very fine. The magnificent Perpendicular nave is the work of Bishop Edington (1346-1360) and the famous William of Wykeham (1367-1404), by whom only the skeleton of Walkelin's work was retained. The massive Norman work of the original building, however, remains comparatively intact in both transepts. The central tower is Norman, but later than Walkelin's structure, which fell in 1107, a mishap which was readily attributed to divine wrath because King William II., who fell to the arrow in the neighbouring New Forest, had been buried here seven years earlier, in spite of his unchristian life. The tomb believed to be his is in the choir, but its identity has been widely disputed, and even an examination of the remains has failed to establish the truth. The choir is largely Edington's work, though the clerestory is later, and the eastern part of the cathedral shows construction of several dates. Here appears the fine Early English construction of Bishop de Lucy (1189-1204), in the retrochoir and the lady-chapel, though this was considerably altered later. Beneath the cathedral east of the choir there are three crypts, connected together. The western and the central chambers are Norman, and have apsidal terminations, while the eastern is Early English. The cathedral contains many objects of interest. The square font of black marble is a fine example of Norman art, its sides sculptured with scenes from the life of St Nicholas of Myra. The magnificent reredos behind the high altar must have been erected late in the 15th century; it consists of a lofty wall, the full width of the choir, pierced by two processional doors, and covered with tiers of rich canopied niches, the statues of which are modern. A cross of plain aslar stone in the centre shows where an immense silver crucifix was formerly attached; and a plain rectangular recess above the altar contains, instead of a retable, a series of fine niches, each covered with cast and repoussé statuettes and reliefs. A second stone screen, placed at the interval of one bay behind the great reredos, served to enclose the small chapel in which stood the gold shrine, studded with jewels, the gift of King Edgar, which contained the body of St Swithin. Under many of the arches of the nave and choir are a number of very elaborate chantry chapels, each containing the tomb of its founder. Some of these have fine recumbent effigies, noble examples of English medieval sculpture;
the most notable are the monuments of Bishops Edington, Wykeham, Waynflete, Cardinal Beaufort, Langton and Fox. The door of iron grills, of beautiful design, now in the north nave aisle, is considered to be the oldest work of its character in England; its date is placed in the 11th century. The Canterbury chests in the presbytery contain the bones of Saxon kings who were buried here. The remains were collected in this manner by Bishop Henry de Blois (1120-1171), and again after they had been scattered by the soldiers of Cromwell. The choir stalls furnish a magnificent example of Decorated woodwork, and much stained glass of the Decorated and Perpendicular periods remains in fragmentary form. The library contains a Vulgate of the 12th century, a finely ornamented MS. on vellum.

In 1905 serious signs of weakness were manifested in the fabric of the cathedral, and it was found that a large part of the foundation was insecure, being laid on piles, or tree-trunks set flat, in soft and watery soil. Extensive works of restoration, including the underpinning of the foundations with cement concrete (which necessitated the employment of divers), were undertaken under the direction of Mr T. G. Jackson.

Relics of the monastic buildings are present, and there are Early English arches and Perpendicular work in the deanery. Other old houses in the Close are very picturesque. Here formerly stood the house which Charles II. desired for Ken or Nell Gwyn. Ken refused it, but the king bore no malice, setting up Nell Gwyn in another house near by, and afterwards raising Ken to the bishopric of Bath and Wells.

King Alfred founded a minster immediately north of the present site of the cathedral, and here he and other Saxon kings were buried. The house, known as Hyde Abbey, was removed (as was Alfred’s body) to a point outside the walls considerably north of the cathedral, during the reign of Henry I. Here foundations may be traced, and a gateway remains. To the east of the cathedral are ruins of Wolvesey Castle, a foundation of Henry de Blois, where the bishops resided. On the southern outskirts of the city, in a pleasant meadow by the Itchen, is the Hospital of St Cross. This also was founded by Henry de Blois, in 1136, whose wish was to provide board and lodging for 13 poor men and a daily dinner for 100 others. It was reformed by William of Wykeham, and enlarged and mostly rebuilt by Cardinal Beaufort (1405-1447). The buildings form three sides of a quadrangle, with a lawn and sun-dial in its midst; while the fourth side is partly open, and partly formed by the magnificent cruciform church. The earliest parts of this building are late or transitional Norman, while other parts are Early English or Decorated. The work throughout is very rich and massive. St Cross is a unique example of a medieval almshouse, and its picturesqueuess is enhanced by the curious costume of its inmates. It is still customary to provide a loaf of bread and beer to all who desire it. The parish churches of Winchester are not of special interest, but the church of St Swithin is curious as occupying the upper part of the King’s Gate. This gate and the West Gate alone remain of the gates in the walls which formerly surrounded the city. The West Gate is a fine structure of the 13th century. In the High Street stands the graceful Perpendicular city cross. The county hall embodies remains of the Norman castle, and in it is preserved the so-called King Arthur’s round table. This is supposed to date actually from the time of King Stephen, but the painted designs upon it are of the Tudor period.

Winchester is famous as an educational centre, and in addition to Winchester College there are several modern preparatory schools here. The College of St Mary, lying to the south of the cathedral close, is one of the greatest of English public schools. While a monastic school was in existence here from very early times, the college was originated in 1387 by William of Wykeham, whose famous scheme of education embraced this foundation and that of New College, Oxford. The members on the foundation consisted of a warden, 10 fellows, 3 chaplains, 70 scholars and 16 choristers. The buildings were completed about 1395. The quadrangles, with the fine chapel, tower, hall and cloister are noteworthy, and there are extensive modern buildings.

The principal public buildings of the city are the guild-hall, public library and art school, museum, market house, mechanics’ institute, and barracks. The parliamentary borough returns one member and falls within the Andover division of the county. The corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 1931 acres.

History.—The history of the earliest Winchester (Winton, Winton) is lost in legend; tradition ascribes its foundation to Ludor Rous Hudibras and dates it ninety-nine years before the first building of Rome; earthworks and relics show that the Itchen valley was occupied by Celts, and it is certain from its position at the centre of six Roman roads and from the Roman coins found there that the Caer Gubun (Winchester) such as it was, under the name of Venta Belgarum, an important Roman-British country town. Hardly any traces of this survive, but mosaic pavements, coins, &c., have been discovered on the south side of High Street. The name of Winchester is indisputably linked with that of King Arthur and his knights, but its historical greatness begins when, after the conquest of the present Hampshire by the Gewissas, it became the capital of Wessex. Its importance was increased by the introduction of Christianity, though it was not at first the seat of a bishop, because, according to the later Winchester Chronicle, King Cynegils wished to build a worthy church in the royal city, but when Clovis of Senvall is said to have built the old minster. When the kings of Wessex became kings of all England, Winchester became, in a sense, the capital of England, though it always had a formidable rival in London, which was more central in position and possessed greater commercial advantages. The parallel position of the two cities in Anglo-Saxon times is illustrated by the law of Edgar, ordaining that the standard of weights and measures for the whole kingdom should be “such as is observed at London and at Winchester.” Under Alfred it became a centre of learning and education, to which distinguished strangers, such as St. Grimbald and Asser the Welshman, resorted. It was the seat of Canute’s government; many of the kings, including Ethelbert, Alfred, Edward the Elder and Canute, were buried there, and, in 1043, Edward the Confessor was crowned in the old minster. The city was sometimes granted as part of the dowry of a queen consort, and it was the home of Emma, the wife of Athelred the Unready and of Canute, and later of Edith, the wife of the Confessor.

Winchester was very prosperous in the years succeeding the Conquest, and its eminence, together with London, from Domesday Book is probably an indication of its peculiar position and importance; its proximity to the New Forest commended it to the Norman kings, and Southampton, only 12 m. distant, was one of the chief ports for the continent. The Conqueror wore his crown in state at Winchester every Easter, as he wore it at Westminster at Whitsumtide and at Gloucester at Christmas. The royal treasure continued to be stored there as it had been in Anglo-Saxon times, and was there seized by William Rufus, who, after his father’s death, “rode to Winchester and opened the Treasure House.” In the reign of Stephen and again in the reign of Henry II the Court of Exchequer was held at Winchester, and the charters of John promises that the exchequer and the mint shall ever remain in the city; the mint was an important one, and when in 1125 all the coins of England were tried for false coining those of Winchester alone were acquitted with honour.

Under the Norman kings Winchester was of great commercial importance; it was one of the earliest seats of the woolen trade, which in its different branches was the chief industry of the town, although the evidence furnished by the Liber Winton (temp. Henry I. and Stephen) indicates also a varied industrial life. As early as the reign of Henry I. the gild of weavers is mentioned, and the millers at the same date render their account to the exchequer.

The gild merchant of Winchester claims an Anglo-Saxon origin, but the first authentic reference to it is in one of the
WINCHESTER

charters granted to the city by Henry II. The Liber Winon speaks of a "civitas" geld," which certainly existed in the time of the Confessor. The prosperity of Winchester was increased by the St. Giles's Fair, originally granted by Rufus to Bishop Walkelin. It was held on St Giles's Hill up to the 19th century, and in the middle ages was one of the chief commercial events of the year. While it last St Giles's Hill was covered by a busy town, and no trade was permitted to be done outside the fair within seven leagues, or at Southampton; the jurisdiction of the mayor and bailiffs of the city was in abeyance, that of the bishop's officials taking its place.

From the time of the Conqueror until their expulsion by Edward I., the Normans were the last large colony of Jews in England, whose quarter in the city is marked to the present day by Jewry Street; Winchester is called by Richard of Devizes "the Jerusalem of England" on account of its kind treatment of its Jews, and there alone no anti-Jewish riots broke out after the coronation of Richard I. The corporation of Winchester claims to be one of the oldest in England, but the earliest existing charters are two given by Henry II., merely granting to "my citizens of Winchester, who are of the gold merchant with their goods, freedom from toll, passage and custom," the other conferring to them all liberties and customs which they enjoyed in London and the liberties of the two cities, confirmed by succeeding sovereigns, were granted by Richard I. and John. The governing charter till 1835 was that of 1517, incorporating the city under the title of the "Mayor, Bailiffs and Commonalty of the City of Winchester"; this is the first charter which mentions a mayor, but it says that such an officer had existed "time out of mind," and as early as 897 the town was governed by a wicgerfa, by name Beornwulf, whose death is recorded in the Anglo-Saxon Chronicle. There is a doubtful reference to a mayor in 1104, and the office certainly existed early in the 13th century. Until 1283 the liberty of the sole encompassing the city on almost every side was outside the jurisdiction of the city magistrates, being under the seigniority of the bishop of Winchester.

Winchester seems to have reached its zenith of prosperity at the beginning of the 12th century; the first check was given during the civil wars of Stephen's reign, when the city was burned. However, the last entry concerning it in the Anglo-Saxon Chronicle says that Henry Plantagenet, after the treaty of Wallingford, was received with "great worship" in Winchester, and recognizing the equality of the two cities, but the latter was rising at Winchester's expense, and at the second coronation of Richard I. (1204) the citizens of Winchester had the significant mortification of seeing in their own city the citizens of London take their place as cupbearers to the king. The loss of Normandy further favoured the rise of London by depriving Winchester of the advantages it had enjoyed from its convenient position with regard to the continent. Moreover, it suffered severely at the hands of Simon de Montfort the Younger (1263), although it still continued to be an occasional royal residence, and the Statute of Winchester (1285) was passed in a council held there. Meanwhile the woolen trade had drifted in great measure to the east of England; and an attempt made to revive the prosperity of Winchester in the 14th century by making it one of the staple towns proved unsuccessful. The wine trade, which had been considerable, was ruined by the sack of Southampton (1338); a few years later the city was devastated by the black death, and the charter of Elizabeth speaks of "our city of Winchester now fallen into great ruin, decay and poverty." During the Civil War the city suffered much for its loyalty to Charles I. and lost its ancient castle founded by William I. After the Restoration a scheme was started to restore trade by making the Itchen navigable to Southampton, but neither then nor when revived in the 19th century was it successful. Charles II., intending to make Winchester again a royal residence, began a palace there, which being unfinished at his death was used eventually as barracks. It was burnt down in 1804 and rebuilt in 1901. Northgate and Southgate were pulled down in 1781, Eastgate ten years later.

Westgate still stands at the top of the High Street. The guard-room was formerly used as a debtors' prison, now as a museum. The two weekly markets, still held in the Corn Exchange of Wednesday and Saturday, were confirmed by Elizabeth's charter; the latter dates from a grant of Henry VI. abolishing the Sunday market, which had existed from early times. The same grant established three fairs—one on October 13 (the day of the translation of St Edward, king and confessor), one on the Monday and Tuesday of the first week in Lent, and another on St Swithin's day; the former two are still held. Winchester sent two members to parliament from 1295 to 1885, when the representation was reduced to one.

WINCHESTER, a town and the county-seat of Clark county, Kentucky, U.S.A., in the E. part of the Blue Grass region of the state, about 78 m. E. by S. of Lexington. Pop. (1890) 7248, of whom 1968 were foreign-born and 140 were negroes; (1910) 9300. Area, 6 sq. m. Winchester is served by the southern division of the Boston & Maine railway, and is connected with Boston, Arlington, Medford, Stoneham and Woburn by electric lines. It is chiefly a residential suburb of Boston. Through the centre of the township winds the Aberjona River, which empties into Mystic Pond, in Winchester township, both favourite resorts for canoeing, &c. Wedge Pond and Winter Pond, in the centre of the township, are clear and beautiful sheets of water. The streets of Winchester are heavily shaded, the view as presented from the neighbouring hills being that of a continuous forest stretching from the beautiful Mystic Valley (parkway of the Metropolitan park system), of which more than one-half (50-2 acres) is in the southern part of the township, to the Middletex Fells Reservation (another Metropolitan park), of which 261-9 acres are in the eastern part; and there are a number of playgrounds and a recreation ground. Highland Park Mountain and Indian Hill are about 320 ft. above sea-level. One of the pleasantest residential districts is Rangely, a restricted private park. The town-hall and library building is a fine structure; the library contains about 20,000 volumes, and the museum and collections of the Winchester Historical and Genealogical Society. The principal manufactures are leather and felt goods.

Winchester was originally within the limits of Charlestown. In 1638 allotments of land between the Mystic Pond and the present Woburn were made to various Charlestown settlers, including John Harvard and Increase Nowell (1590-1655), secretary of the Massachusetts Bay Colony in 1644-1649, and the new settlement was called Waterfield. Most of this territory in 1642 was incorporated in Woburn and was called South Woburn. In 1850 Winchester was separately incorporated, parts of Arlington (then West Cambridge) and Medford going to make up its area, and was named in honour of Colonel W. P. Winchester of Watertown, who left to the township a legacy for municipal works.

WINCHESTER, independent city and the county-seat of Frederick county, Virginia, U.S.A., 87 m. by rail N.W.N. of Washington. Pop. (1890) 8106; (1910) 5161, including 1105 negroes; (1910) 5864. Winchester is served by the Baltimore & Ohio and the Cumberland Valley railways. It is pleasantly situated in the fertile Shenandoah Valley about 720 ft. above sea-level. Fort Loudoun Seminary for girls occupies the site of old Fort Loudoun, and in the city is the Shenandoah Valley Academy, a military school for boys. The Handley library
WINCKELMANN

(1716-1768), German archaeologist, was born at Stendal in Brandenburg on the 9th of December 1716, the son of a poor shoemaker. He attended a gymnasium at Berlin and the school at Salzwedel, and in 1738 was induced to go as a student of theology to Halle. But he was no theologian, and he soon devoted himself with enthusiasm to Greek art and literature. With the intention of becoming a physician he attended medical classes at Jena; but means were insufficient and he was obliged to accept a tutorship near Magdeburg. From 1743 to 1748 he was associate-rector of a school at Seehausen in the Altmark. He then went to Nöthenitz near Leipzig, where his interest in classical antiquity had wakened a profound interest in the history of the Holy Roman empire he collected materials. The treasures in the Dresden gallery awakened an intense interest in art, which was deepened by association with various artists, and especially with A. F. Oester, who afterwards exercised so powerful an influence over Goethe. Winckelmann's study of ancient literature had inspired him with a desire to visit Rome, and he became librarian to Cardinal Passiono in 1754. This compelled him reluctantly to join the Roman Catholic Church.

In 1755, before leaving for Rome, Winckelmann published his Gedanken über die Nachahmung der griechischen Werke in Malerei und Bildhauerkunst ("Thoughts on the Imitation of Greek Works in Painting and Sculpture"), followed by a pretended attack on the work, and a defence of its principles, nominally by an impartial critic. The Gedanken contains the first statement of the doctrines he afterwards developed, and was warmly admired not only for the ideas it contained but for its style. Augustus III., elector of Saxony and king of Poland, granted him a pension of 200 thalers, that he might prosecute his studies in Rome. He arrived in Rome in November 1755, became librarian at the Cardinal Archivo, and received much kindness from Cardinal Passiono. After their death he was received as librarian and as a friend into the house of Cardinal Albani, who was forming his magnificent collection at Porta Salara. In 1763, while retaining this position, Winckelmann was made prefect of antiquities. He devoted himself earnestly, at first with the aid of his friend A. R. Mengs, to the study of Roman antiquities, and gradually acquired an unrivalled knowledge of ancient art. In 1760 appeared his Description des pierres gravées du feu Baron de Stiegl; in 1762 his Anmerkungen über die Baukunst der Allen ("Observations on the Architecture of the Ancients"), including an account of the temples at Paestum. In 1758 and 1762 he visited Naples, and from his Schilderungen von den herculanischen Entdeckungen (1762) and his Nachricht von den neuesten herculanischen Entdeckungen (1764) scholars obtained their first real information about the treasures excavated at Pompeii and Herculaneum. Winckelmann again visited Naples in 1765 and 1767, and wrote for the use of the electoral prince and princess of Saxony his Briefe an Bianconi, which were published, eleven years after his death, in the Annonologia romana. His masterpiece is the Geschichte der Alten Kunst ("History of Ancient Art"), issued in 1764, with which he made a permanent contribution to European literature. In this work Winckelmann sets forth both the history of Greek art and the principles on which it seemed to him to be based. He also presents a glowing picture of the conditions, political, social and intellectual, which tended to foster creative activity in ancient Greece. The fundamental idea of his theory is that the end of art is beauty, and that this end can be attained only when individual and characteristic features are strictly subordinated to the artist's general spirit. The true artist, selecting from nature the phenomena fitted for his purpose, and combining them through the imagination, creates an ideal type marked in action by "noble simplicity and calm greatness"—an ideal type in which normal proportions are maintained, particular parts, such as muscles and veins, not being permitted to break the harmony of the general outlines. In the historical portion he used not only the works of art he himself had studied but the scattered notices on the subject to be found in ancient writers; and his wide knowledge and active imagination enabled him to give even the slightest suggestions as to periods about which he had little direct information. Many of his conclusions were based on the inadequate evidence of Roman copies which had been modified or reversed by subsequent research, but the fine enthusiasm of the work, its strong and yet graceful style, and its vivid descriptions of works of art give it enduring value and interest. It marked an epoch by indicating the spirit in which the study of Greek art should be approached, and the methods by which investigators might hope to attain to solid results. To Winckelmann's contemporaries it came as a revelation, and exercised a profound influence on the best minds of the age. It was read with enthusiasm even by those who differed most markedly from the views of Winckelmann. The starting-point for the later development of Winckelmann's work is to be found in his Versuch einer Allegorie, which, although containing the results of much thought and reading, is not conceived in a thoroughly critical spirit. Of far greater importance was the splendid work entitled Monumenti antichi inediti (1767-1768), prefaced by a Trattato preliminare, presenting a general sketch of the history of art. The plates in this work are representations of objects which had either been falsely explained or not explained at all. Winckelmann's explanations were of the highest service to archaeology, by showing that in the case of many works of art supposed to be connected with Roman history the ultimate sources of inspiration were to be found in Homer.

In 1768 Winckelmann went to Vienna, where he was received with honour by Maria Theresa. At Trieste on his way back he was murdered in an hotel by a man named Arcangeli to whom he had shown some coins presented by Maria Theresa (June 8th, 1768). He was buried in the churchyard of the cathedral of St Giusto at Trieste.

An edition of his works was begun by Fernow in 1808 and completed by Meyer and Schulze (1808-1820). There are admirable studies of his character and work in Goethe's Winckelmann und sein Jahrhundert (1805), to which contributions were made by Meyer and Wolf, and in Walter Pater's Renaissance (1902). The best biography of Winckelmann is by Justi, Winckelmann und seine Zeitgenossen (2nd ed., 3 vols., Leipzig, 1868). A collection of letters, Briefe an seine Zürcher Freunde, was published by Blümner (Freiburg, 1882). (J. S.; J. M. M.)
WIND

(a common Teut. word, cognate with Skt. vata, Lat. ventus, cf. “weather,” to be of course distinguished from to "wind," to coil or twist, O.Eng. windan, cf. "wander," "wend," &c.), a natural motion of the air, a current of air coming from any particular direction or with any degree of velocity. For the general account of winds, their causes, &c., see METEOROLOGY.

Winds may be classified according to the strength or velocity with which they blow, varying from a calm, a breeze to a gale, storm or hurricane; for the varying scale of velocity per hour of these see BEAUFORT SCALE, and for the measurement ANEMOMETER.

Another classification divides them into "regular" or "constant" winds, such as the "trade winds" (q.v.), and "periodic" winds, such as the "monsoon" (q.v.). There are many special winds, such as the "Fohn," "chinook," "mistral," "harmattan," "sirocco," which are treated under their individual names. For the group of musical instruments known by the generic name of WIND INSTRUMENTS see that heading.

WINDAU (Russian Виндава, Lettish Вентспилс), a seaport and sea-bathing resort of western Russia, in the government of Courland, at the mouth of the Windau, on the Baltic Sea, 110 m. ESE. of Riga, and 120 m. from the head of the Gulf of Finland. The town is built in 1290. The harbour, 20 and 25 fathoms deep, is free from ice all the year round. Timber, grain and other commodities are exported to the annual value of two to three millions sterling; the imports range between three-quarters and one million sterling.

WIND BRACES, in architecture, diagonal braces to tie the rafters of a roof together and prevent "racking." In the better sort of medieval roofs they are arched, and run from the principal rafters to catch the purlins.

WINDHAM, SIR FRANCIS (1585-1646), English secretary of state, was the only son of Sir Thomas Windham of Hougham, Lincs., who owed his advancement to the Cecil family. Francis entered St John's College, Oxford, in 1599, coming there under the influence of Laud. After a few years' continental travel (1605-1608), he was employed for many years in minor public offices, and became clerk of the council. In June 1632 he was appointed by Charles I. secretary of state in succession to Lord Dorchester, his senior colleague being Sir John Coke, and he was knighted. His appointment was mainly due to his Spanish and Roman Catholic sympathies. The first earl of Portland, Francis Willoughby, lord treasurer, and Windham formed an inimical group in the council, and with their aid the king carried on various secret negotiations, especially with Spain. In December 1634 Windham was appointed to discuss with the papal agent Gregorio Panzani the possibility of a union between the Anglican and Roman Churches, and expressed the opinion that the Puritan opposition might be crippled by sending their leaders to the war in the Netherlands. Windham's efforts as treasury commissioner in 1635 to shield some of those guilty of corruption led to a breach with Archbishop Laud, and the next year he was for a time disgraced for issuing an order for the conveyance of Spanish money to pay the Spanish troops in the Netherlands. In July 1638 he urged upon the king instant war with the Scots, and in 1640, when tumults were breaking out in England, he sent an appeal from the queen to the pope for money and men. He was elected in March 1640 member of the Short Parliament for Oxford University, and he entered the Long Parliament in October as member for Corfe. In December the House learnt that he had signed letters of grace to recusant priests and Jesuits, and summoned him to answer the charge, but with the king's command he fled to France. From Calais he wrote to the first Lord Hatton, defending his integrity, and affirming his belief that the church of England was the purest and nearest the primitive Church. He remained in Paris until his death on the 1st of September 1646, shortly after he had been received into the Roman communion.

WINDERMERE, the largest lake in England, in the south-eastern part of the Lake District (q.v.). It is in the county of Westmorland, the boundary with Lancashire running from the head southward along the western shore, round the foot and northward along about one-third of the eastern shore. It forms a narrow trough with a slightly curved axis of 102 m. The width at right angles to the axis never reaches 1 m. The area is 56-60 sq. m. The shores are generally steep, beautifully wooded and fretted with numerous little sheltered bays. The hills immediately surrounding the lake rarely reach 1000 ft., but the distant views of the mountains to the north and west contrast finely with the sylvan beauty of the lake itself. The middle of the lake, immediately opposite Bowness, is especially beautiful, for here a group of islands (Belle Isle, Thompson's Holme, the Lilies and others) divide the lake into two basins, the larger of which is about 50 ft. in depth. On the other hand, the greatest depth sounded in the southern basin is 219 ft., and in the southern 134. The lake receives the Rothay and Brathay streams at the head; Trout Beck also flows into the north basin, and Conusby Beck from Esthwaite into the south. The lake is drained by the Leven. Steamers belonging to the Furness Railway Company ply regularly on Windermere, the chief stations being Lakeide, the terminus of a branch railway, beautifully situated at the foot, Ferry on the west shore below the islands, Bowness on the east and Waterhead, at the head, Ambleside. The lake contains perch, pike, trout and char; there are several large hotels at Bowness and elsewhere on its shores.

The town of Windermere, above the eastern shore adjacent to Bowness (q.v.), is in the Appleby parliamentary division of Westmorland, and is the terminus of a branch of the London and North-Western railway from Oxenholme junction. Numerous mansions and villas have grown up in the vicinity. Here, from Orrest Head, in the grounds of Elleray, where lived Professor Wilson (Christopher North), superb views over the whole lake and its surroundings are obtained. In 1905 Bowness and Windermere were united as a single urban district.

WINDHAM, WILLIAM (1750-1810), English politician, came from an ancient family long resident at Felbrigg, near Cromer in Norfolk. His father, Colonel William Windham (1717-1761), was an adventurous soldier with a taste for languages, both ancient and modern; his son was born in Golden Square, London, on the 3rd of May 1750. He went to Eton, which he quitted in 1766 for the university of Glasgow, where he acquired the taste for mathematics which always distinguished him. In 1767 he matriculated as gentleman commoner at University College, Oxford, and Windham never after remained until 1771. He never took the degree of B.A., but qualified as M.A. on the 9th of October 1782, and received the degree of D.C.L. on the 3rd of July 1793. He made a tour in Norway in 1773 and visited Switzerland and Italy between 1778 and 1780. His maiden speech on the political platform was delivered at Norwich on the 28th of January 1778, when he vehemently opposed the prosecution of the American war. His entrance into public life took place in April 1783, when he went to Ireland as chief secretary to Lord Northington, the lord-lieutenant in the coalition ministry of Fox and Lord North. Windham was his own keenest critic, his distrust in his own powers and his disappointment at his own achievements being conspicuous on every page of his Diary. Sickness compelled his return to England early in July 1783, and he resigned his position in August; but change of scene and constant exercise restored him to health before the end of that year. In April 1784 he was returned to parliament as member for Norwich by a majority of 64 votes, thus scoring one of the few triumphs attained by the adherents of the coalition cabinet. This seat he retained until 1807, when he was beaten on account of his hostility to the peace of that year.

Though he strenuously opposed all proposals for parliamentary reform, to which most of the Whigs were deeply committed, Windham remained in alliance with that party until after the outbreak of the French Revolution, when he and several of his chief allies joined Pitt. The place of secretary-at-war was conferred upon him in July 1794, and he was at the same time created a privy councillor and admitted to a seat in the cabinet. Windham discharged the duties of his office with unfailing zeal, his efforts being particularly directed towards ameliorating the condition of the inferior grades of the army. In the autumn of
1794 he was despatched to the duke of York's camp in Flanders with the views of his ministerial colleagues, but their advice could not counteract the military incapacity of the royal duke. When Pitt was flushed with the triumphal conical pipe was proposed for Windham, who in his intention of freeing the Roman Catholics from their political disabilities, Windham, who in religious matters always inclined to liberal opinions, was one of the ministers who retired from office in February 1801. He was a constant opponent of all negotiations for peace with France, preferring to prosecute the campaign at whatever cost until some decisive victory had been gained, and the temporary peace of Amiens, which was carried through under Addington's administration, did not meet with his approval. When he was ousted from the representation of Norwich in June 1802, a seat for the county of Norfolk was offered to him. He declined a place in Pitt's new cabinet (May 1804) on the ground that the exclusion of Fox prevented the formation of an administration sufficiently strong in parliament and the country to cope with the dangers that threatened the safety of the nation, and he offered a general opposition to the measures which the prime minister proposed.

On Pitt's death in January 1806 the ministry of "All the Talents" was formed under the leadership of Lord Grenville, and Windham accepted the seals as secretary of state for war and the colonies. Fox's death necessitated a change in leadership, and George was proposed for Windham, but he declined the proffered honour, and remained in office as long as the ministry existed. A general election took place in November 1806 and Windham was elected for the county of Norfolk; but the election was declared void on petition, and he was compelled to sit for the borough of New Romney, for which he had also been elected. In 1807, when parliament was dissolved under the influence of the "No Popery" cry of Spencer Perceval, a seat was found for Windham at Highham Ferrers. Liberty of religious opinion he uniformly supported at all periods of his life, and with equal consistency he opposed all outbreaks of religious fanaticism; hence with these convictions in his mind few of the domestic measures of the new ministers met with his approbation.

Moreover, he disapproved of the expedition to the Scheldt, and thought the charges brought against the Duke of York, as commander-in-chief, required his retirement from office. At the same time he actively opposed the bill of Sir Samuel Romilly, his colleague on most political questions, for reducing the number of offences visited with the punishment of death. In July 1808 he received a blow on the hip whilst rendering assistance at a fire, which he thought little at the time, but a humour subsequently formed and an abscess developed on his hip, and an operation became necessary. This brought on a fever, and Windham rapidly sank. He died on the 4th of June 1810, and was buried in the family vault at Felbrigg.

His speeches were published in three volumes in 1806, with a memoir by Thomas Amyot, his private secretary while he was in office in 1806, and his Diary was edited by Mrs Henry Baring in 1866. The passages in the latter work relative to Dr Johnson's declining days have been of considerable use to the later editors of Boswell.

WIND INSTRUMENTS

(Wr. instruments à vent., Ger. Blasinstrumente, Ital. strumenti del vento), a numerous and powerful section of the orchestra classified according to the acoustical properties of the instruments and to certain of their characteristic features. The first great natural subdivision is that of (A) mouth blown, and (B) mechanically blown, instruments.

Section A falls into the classes of (1) wood wind, (2) brass wind, with their numerous subdivisions.

1. (a) Wood Wind.—Pipes without embouchure or mouthpiece, such as the ancient Egyptian ney, a long flute with narrow bore and obliquely, and the syrinx or pan-pipes, both of which are blown by disengaging the lips from the bottom of the mouthpiece, and it impinges against the sharp edge of the rim. (b) Pipes with embouchure but no mouthpiece, such as the transverse flute, piccolo and oboe.

Flutes and Naiad Wind. (c) Pipes with whistle mouthpieces, an ancient contrivance, extensively used by primitive races of all ages, which finds application at the present day in the flageolet, the whistle, and in organ pipes known as the flue-work. A large class of medieval instruments, widely diffused but now obsolete, were known as recorders, beak or flipple-flutes, flûtes à bec, flûtes douces, flûtes anglaises (Fr.), Plock or Blockflöten, Schnabelflöten (Ger.). (d) Reed instruments, by which are to be understood not reed pipes but instruments with reed mouthpiece, divided into two families owing to the very different acoustical conditions produced by the combination of a reed mouthpiece with (1) a cylindrical tune pipe, (2) a cylindrical pipe with a conical hole. The family of the conical hole was preferred by the timbre, but principally the harmonics obtained overblowing were used to supplement the fundamental scale given out as the lateral holes are uncovered one by one; the practical difference to the ear may be summed up in that the conical reed mouthpieces made the organ pipes with cylindrical bore with either single or double reed mouthpiece, such as the clarinet family, the obsolete batyphone (g.v.) and the family of cromornes (g.v.). To these we may add the aulos and the tibia of ancient Greece at one time prevalent; these were single and double reed mouthpieces. These pipes all overblow a twelfth. (d) Pipes with conical bore and either single or double reed mouthpiece, the class comprising the most important members of the oboe family (with double reed) derived from the Schalmei and Pommer of the middle ages, the Scharfani, an instrument which had an ephemeral existence at the end of the 16th century and consisted of an inverted cone with a double reed placed within a πηρουτική or capsule, which had the result of restricting the compass of the instrument to the fundamental scale, for harmonics can only be produced when the reed is controlled by the lips (see Reed Instruments). The modern family of saxophones with single reed mouthpiece, intended to replace the clarinets in military bands, may be classed with the wood wind, although actually made of brass for durability. The invention of the saxophone is attributed to Adolphe Sax who in 1846 invented the double reed, invented by M. Sarrus to replace the oboe in military bands. To these we may add the Cheng (g.v.) or Chinese organ, consisting of a set of pipes arranged in a hollow gourd and sounded by means of a curved mouthpiece, the wind being blown into the mouth by a tube shaped like the spout of a teapot. The Cheng is important, as the instrument of the harmonium.

1. (c) Wooden tubes of conical bore having lateral holes and sometimes a transverse hole. The first is a family consisting of (1) the fife, consisting of a cylindrical mouthpiece, such as the obsolete cornet (g.v.) or Zinke, which enjoyed such widespread popularity during the 16th and 17th centuries, and (2) the cornet, flageolet, or serpent. These are the slender wooden pipes, and are indirectly mouthblown, with the exception of the Union Irish and of the Border bagpipes, and of the French bagpipe known as musette, in which the bag is fed with air by means of bellows, instead of by mouth.

2. The Brass Wind consists of the following classes: (a) Tubes of fixed length, such as the natural trumpet and French horn, all medieval horns and trumpets, including the busine, the tuba, the ophicleide, the hunting horn, the bugle, the serpent and the cornet, litus and tuba. The compass of all these was restricted to the few notes of the harmonic series obtained by overblowing. (b) Tubes of which the length is varied by a slide, such as the sackbut family, the slide trombone and slide trumpet. When the slide is drawn out the column of air is lengthened and the pitch proportionally lowered. Each position or shift of the slide enables the performer to produce a new set of notes, and at the same time the way in which the length is varied by lateral holes and keys. To this class belong the keyed bugle and its bass the ophicleide, the obsolete trumpet and the bass horns and Russian bassoon, which immediately preceded them, and which were produced by means of the air, and sarrusophones might also be classed with these (see above, 1 d2). (c) Tubes of which the length is varied by valves or pistons. This class includes the modern French and German cornets, tubas, horns and trombones, which were invented in 1815, which revolutionized the technique and scoring for brass instruments. A rational subdivision of valve instruments is made in Germany into whole and half instruments (see BOMBARDON and VALVES), according as to whether the whole length of tubing comes into practical use or only half, or from the performer's point of view whether the fundamental note of the harmonic series can be produced, or whether the series begins with the second, membrane, an octave below the first. In each case it is obvious that half the tubing is of no practical value. The principal piston instruments are: the whole instruments—contrabass and bass tubas, bombardons and tubas; the half instruments—saxhorns, Flügelhorns, tenor horns, cornets, the valve trombone, valve trumpet and valve cornet (French horn), and the Wagner tubas, which are really the basses of the French horn and are played with further extended mouthpieces of 18 to 20 inches. This point according to the shape of the mouthpiece used. (a) With funnel-shaped mouthpiece, such as the French horn, tenor horn and Wagner tubas grouped together. (b) With mouthpieces of a different shape excluding all the other brass wind instruments except the bugle, of which the mouthpiece is a hybrid, neither true funnel nor true cup.

Section B: Mechanically Blown Instruments.—This section consists mainly of instruments having the air supply fed by means of bellows; it comprises the two classes: (1) with keyboard, (2) without keyboard.

1. This includes all kinds of organs: the ancient hydraulic organ or hydraulis, differing from the pneumatic only in that water pressure was used to compress the air instead of the bellows.
being weighted by means of the foot and body of the performer at first and later by means of weights, the reed organ, consisting of pipes furnished with beating reeds, known also as the reed work. When incorporated with the large church organ, the reed organ gives, upon them the power of dynamic expression denied to all organs, and fitted with flue pipes or pipes having beating reeds. The complex instruments known as organ pipes also come within this category.

2. This comprises the bagpipes known as musette, and the Union or Irish and the Border bagpipes having a wind supply fed by bellows instead of by the insufflation pipe proper to the bagpipe. The barrel organ having instead of a keyboard a barrel studded with nails, which lift the valves admitting air to the flue pipes generally hidden within the case. (K. S.)

WINDISCHGRÄTZ, PRINCE ALFRED (1787–1862), Austrian field-marshal, entered the Austrian army in 1804, participated in all the wars against Napoleon and fought with distinction at Leipzig and in the campaign of 1814. In the following years of peace he held successive commands in Prague, being appointed head of the army in Bohemia in 1840. Having gained a reputation as a champion of energetic measures against revolution he was called upon to suppress the insurrection of March 1848 in Vienna, but finding himself ill-supported by the ministers he speedily threw up his post. Having returned to Prague he there showed firmness in quelling an armed outbreak of the Czech separatists (June 1848). Upon the recrudescence of revolt in Vienna he was summoned at the head of a large army and reduced the city by a formal siege (Oct. 20–29). Appointed to the chief command against the Hungarian rebels he gained some early successes and reoccupied Budapest (Jan. 1849), but by his slowness in pursuit he allowed the enemy to rally in superior numbers and to prevent an effective concentration of the Austrian forces. In April 1849 he was relieved of his command and henceforth rarely appeared again in public life.

WINDMILL, a term used, in the widest sense, for a machine by which the energy of the wind is applied to useful purposes. Windmills were certainly used as early as the 12th century and are still largely employed in Holland in draining the polders and grinding trass. They are somewhat extensively used in America for pumping and driving agricultural machinery. In spite of the competition of more powerful and tractable motors, they are serviceable, especially in new countries, where fuel is scarce and where work can be done intermittently. An inquiry was made in India in 1879 as to the possibility of using windmills for irrigation (Professional Papers on Irrigation). The windmill, however, is not in any case a very powerful or efficient motor, and its work is variable and intermittent. In favourable positions, it will run on an average for eight hours out of the twenty-four. For pumping on a small scale, the intermittent action is least an objection, because there is generally a tank or storage reservoir regulating the delivery of the water. For driving dynamos windmills are least suitable, on account of the variation of speed, though some attempts to generate electricity by wind power have been made, special arrangements being adopted for automatically regulating the speed.

European Windmills.—In all the older windmills a shaft, called the windshaft, carried four to six arms or whips on which long rectangular narrow sails were spread. The windshaft was placed at an inclination of 10° or 15° with the horizontal, to enable the sails to clear the lower part of the mill. The whip carrying the sail was often 30 to 40 ft. in length, so that the tips of the sails described a circle 60 to 80 ft. in diameter. The sails were rectangular, 5 to 6 ft. wide, and occupying five-sixths of the length of the whip. A triangular leading sail was sometimes fitted upon the mill in the form of a sail-cloth spread in a framework; at other times narrow boards were used. The oldest mill was no doubt the post mill, the whole structure being carried on a post; to bring the sails to face the wind, the structure was turned round by a long lever. The post mill was succeeded by the tower, smock or frock mill, in which the mill itself consisted of a stationary tower, and the wind shaft and sails were carried in a revolving cap rotating on the top of the tower. Andrew Meikle introduced in 1750 an auxiliary rotating fan at right angles to the principal sails, which came into action whenever the wind was against the mills. The sails, automatically veering the sails or placing them normal to the wind. For safety, the sails must be reefed in high winds. In 1827, Sir W. Cubitt introduced automatic reefing arrangements. The sails were made of thin boards held up to the wind by weights. If the force of the wind exceeded a certain value the boards were pressed back and exposed little surface.

American Windmills.—These generally have the sails, 18 or more in number, arranged in an annulus or disk. The sails consist of narrow boards or slats arranged radially, each board having a constant or variable inclination to the wind's direction. An American mill presents a larger surface for a given length of sail than the older type, and consequently the construction is lighter. To turn the mill face to the wind a rudder is sometimes used projecting backward in a plane at right angles to the plane of rotation of the sails. Various arrangements are adopted for reefing the sails automatically. (a) In some an action equivalent to reefing is obtained by turning the sail disk oblique to the wind. The pressure on a side vane in the plane of rotation, controlled by a weight, turns the sail disk edgewise to the wind if the pressure exceeds a safe amount. (b) In centrifugal governor mills the slats forming the sails are connected in sets of six or eight, each set being fixed to a bar at the middle of its length. By rotating this bar the slats are brought end to end to the wind, the action being analogous to shutting an umbrella. The slats are held up to the wind by a weight. A centrifugal governor lifts the weight if the speed becomes excessive and the sails are partially or completely furled. Many of the veering and reefing arrangements are very ingenious and too complicated to be described without detailed drawings. A description of some of these arrangements will be found in a paper by J. A. Griffiths (Proc. Inst. Civ. Eng., 1870, p. 341) and in a "Report on Trials of Wind Pumping Engines at Park Royal in 1903" (Journ. Roy. Agric. Soc., 1902, p. 714).

Warner's Annular Sail Windmill.—Messrs. Warner of London make a windmill somewhat similar to the American mill. The slats of the sails are formed by wires, and the vanes consist of a frame covered with canvas, and these are pivoted between two angle-iron rings so as to form an annular sail. The vanes are connected with spiral springs, which keep them up to the best of the wind for light winds, but as the wind increases, the vanes give to the wind, forcing back the springs, and thus the area upon which the wind acts diminishes. In addition, there is a striking lever and tackle for setting the vanes edgewise to the wind when the mill is stopped or a storm is expected. The
WINDMILL

The wheel is kept face to the wind by a rudder in small mills; in large mills a subsidiary fan and gear are used. Fig. 2 shows a large mill of this kind, erected in a similar manner to a tower mill. The tower is a framework of iron, and carries a revolving cap, on which the wind shaft is fixed. Behind is the subsidiary fan with its gearing acting on a toothed wheel fixed to the cap.

It is important that a wind-mill should control itself so that it works efficiently in moderately strong winds and at the same time runs in very light winds, which are much more prevalent. It should also, by reeking or otherwise, secure safety in storms.

Table I. gives the mean velocity of the wind in miles per hour for an inland station, Kew, and a very exposed station, Scilly, for each month during the period 1890-1899.

The pressure of the wind on a plane normal to its direction, composed partly of an excess front pressure and negative back pressure, is given by the relation

\[ p = 0.003 v^2, \]

where \( p \) is in pounds per square foot and \( v \) the velocity of the wind in miles per hour.

Pressure on Surfaces oblique to the Wind.—Let fig. 3 represent a plane at rest on which a wind current impinges in the direction YY, making an angle \( \theta \) with the normal Ox to the plane. Then the pressure \( n \) normal to the plane is given approximately by Duchemin's rule

\[ n = \frac{2 \cos \theta}{1 + \cos \theta} \rho \text{ lb per sq. ft.} \]

where \( \rho \) is the pressure in pounds per square foot on a plane struck normally by the same wind.

Some data given by Wolff on mills of the American type gave for the same quantity

\[ W = 0.00015 \text{hp}. \]

From some of the data of experiments by Griffiths on mills of the American type used in pumping, the effective work in pumping when the mill was working in the best conditions amounted to from 0.00045 to 0.00098 hp per sec. per sq. ft.

In 1903 trials of wind-pumping engines were carried out at Park Royal by the Royal Agricultural Society (Journ. Roy. Agric. Soc. lxxiv. 174). The mills were run for two months altogether, pumping against a head of 200 ft. The final results on six of the best mills are given in Table II.

A valuable paper by J. A. Griffiths (Proc. Inst. C. Eng. cxix. 321) contains details of a number of windmills of American type used for pumping and the results of a series of trials. Table III. contains an abstract of his observations on six types of windmills used for pumping.

Further information will be found in Rankine, The Steam Engine and other Prime Movers; Weisbach, The Mechanics of Engineering; and Wolff, The Windmill as a Prime Mover. (W. C. U.)

**WINDOW (properly "wind eye"),** the term applied in architecture (Ital. *fenestra*, Fr. *fenêtre*, Span. *ventana*, Ger. *Fenster*) to an aperture or opening in a wall for the admission of light and air to the interior of a hall or room.

The earliest windows are those which constituted the clerestory windows of the Great Hall of Columns at Karnak; they were fitted with vertical slabs of masonry pierced with narrow slits. Other Egyptian temples were lighted in the same way. In one at Der el Medinet at Thebes the window was divided by miniature columns with lotus capitals. Some of the small ivory carvings found at Nimroud by Layard, now in the British Museum, are evidently of Egyptian workmanship, as they have lotus columns forming a balustrade in the lower part of the window; and such features are shown in the Assyrian bas-reliefs as windows in the towers. Dr Arthur Evans's discoveries at Cnossus have revealed, in the eastern portion of the palace, rectangular openings which were certainly windows, with raised sills and stone benches inside, and the representations of the ordinary houses at Cnossus on a series of plaques show that they were in two or three storeys with openings in the upper storeys filled with windows framed in timber with transoms and mullions. It was at one time thought that there were no windows in Greek temples, and those of the west front of the Erechtheum are known now to be later reconstructions of the early period, but the remains of two windows placed on either side of the eastern doorway of the Erechtheum, which formed part of the original building of 430 B.C. have lately been found; they were rectangular windows with moulded and enriched architrave, resting on small crowns with the characteristic moulding. Of late date, at Ephesus, remains of similar windows have been discovered. Of Roman windows many examples have been found, those of the Tabularium being the oldest known. A coin of Tiberius representing a window of the Temple of Concord shows figures in the side window which might be windows, but as statues are shown in them they are possibly only niches. Over the door of the Pantheon is an open bronze grating, which is thought to be the prototype of the windows which lighted the large halls of the Forum; as it was absolutely necessary that these should be closed so as to retain the heat, the openings in the gratings being filled with glass. In some cases window openings were left open with thin slabs of glass placed in them, but these are still existing in the churches of S. Martino and the Quattro Santi Incoronati at Rome. Similar slabs exist in the upper storey of the amphitheatre at Pula; it still remains, however, an open question.

I. Toowoomba; conical sail wheel with reeling vane. II. Stover; solid wheel with rudder; hand control. III. Perkins; solid wheel, automatic rudder. IV. and V. Althouse; folding sail wheel, rudderless. VI. Carlyle; special type, automatic rudder.

Table IV. gives the horse-power which may be expected, according to Wolff, for an average of 8 hours per day for wheels of the American type.
Although the employment of tracery continued long after the classic revival, the examples generally are poor in design, and even in the Renaissance (as of the period of Henry II, in the church at Le Grand Andely) the invention of clastic circular and oval windows in the ordinary and rose windows was of too capricious a character to make them worthy of much attention. The early Renaissance architects sometimes used the apertures of St Pierre at Caen (1520), seemed to feel that the stained glass was too much cut up by the tracery and mullions, and omitted them altogether, trusting to the iron stanchions and cross-bars to carry the weight. This was not the simple mosaic tracery of the large heads of Roman times, retaining only the mouldings of the late Flemish period for the jamb and arch-moulds. Windows of this type were much out of place in domestic architecture, so that the mullion windows of New Haven were retained with two or three transoms, all moulded and with square heads; in the Tudor period casping was introduced in the upper lights and occasionally in those below, and this custom lingered for a long time in the collegiate buildings of Oxford and Cambridge and in various houses throughout England. In France, square-headed windows were almost always employed, owing to the earlier introduction there of the Renaissance style, where the decoration of those windows, generally consisting of classic pilasters, required some kind of architrave, frieze and cornice, to render the order complete; eventually the mullion and transom disappeared, and in the earlier work of the Louvre the windows are simple rectangular openings, fitted with wooden framework, and, like those in Rome, Milan and Genoa, depend for their architectural effect on the moulded classic jamb and the lintel, frieze and cornice. The transom was, however, still required, with small semicircular or pilasters carrying the usual entablature, with small pediments sometimes angular and sometimes round, or semicircular, repeating in fact an ancient Roman design, of which almost all the Japanese is derived. The blank square-headed windows and niches which decorated some of the enclosure walls of the Roman thermes. In Florence and Siena the early windows of the Renaissance are coupled together, there being two lights to the window divided by shafts, thus continuing the tradition of those of the earlier Tuscan palaces; the same treatment was followed in Venice, Verona and other towns in the north-east, where the Gothic influence was strong, and in the palace designed by Sansovino, small windows, each in a semicircular arch, were added to the more pointed windows created a transition; thus the mouldings of the windows of the Vendramini and Corner Spinelli palaces follow closely those of the Ducal Palace. In these arches are semicircular instead of being either pointed or ogee in form. Another type peculiar to Venetian palaces is the lofty window with semicircular head enclosed in a rectangular panel and crowned with a small entablature, and used in the stone mullioned windows.

WINDOW CORNICE—WINDSOR

WINDOW CORNICE, an ornamental framework of wood or composition to which window curtains are attached by rods with rings or hooks. Cornices are of various kinds and of elaborate design, but they are less fashionable in the 19th century than before it had been discovered that elaborate draperies and dressing patterns were more in line with the times. Chippenendale provided a famous series still in situ for the gallery at Harewood House, the valances of which are, like the cornices themselves, of carved wood. (R. P. S.)

WINDOW SEAT, a miniature sofa without a back, intended to fill the recess of a window. In the latter part of the 18th century, when tall narrow sash windows were almost universal, the window seat was in high favour, and was no doubt in keeping with the formalism of Georgian interiors. It differed much in decorative detail, but little in form. It stood as high from the floor as a chair; the two ends were identical, with a roll-over curve, more or less pronounced. The seats and ends were usually upholstered in rich fabrics which in many cases have remained intact. The legs followed the fashion in chairs and were square and tapered, or, somewhat later, round and reeded. Hepplewhite and the brothers Adam designed many graceful window seats, but they were produced by all the cabinet-makers of the period.

WINDOW TAX, a tax first levied in England in the year 1697 for the purpose of defraying the expenses and making up the deficiency arising from clipped and defaced coin in the regnum of silver during the reign of William III. It was an assessed tax on the rental value of the house, levied according to the number of windows and openings on houses having more than six windows and worth more than £5 per annum. Owing to the method of assessment the tax fell with peculiar hardship on the middle classes, and to this day traces of the endeavours to lighten its burden may be seen in numerous bricked-up windows.

The revenue derived from the tax in the first year of its levy amounted to £1,200,000. The tax was increased no fewer than six times between 1747 and 1808, but was reduced in 1822. There was a strong agitation in favour of the abolition of the tax during the last two centuries, but the law was in force in the year 1851, and a tax on inhabited houses substituted. The tax contributed £1,856,000 to the imperial revenue the year before its abolition. There were in England in that year 600,000 houses having fifty windows and upwards; about 275,000 having twenty-five windows and upwards, and about 275,000 having seven windows or less.

In France there is still a tax on doors and windows, and this forms an appreciable amount of the revenue.

WINDPIPE, the trachea (Gr. ῥαχιδα, sc. ῥατηρία, literally, rough artery), the air tube which leads from the larynx to the bronchi and lungs (see Respiratory System).

WINDSOR, a city and port of entry of Essex county, Ontario, Canada, on the left bank of the Detroit river, opposite the city of Detroit. Pop. (1901) 12,155. It is on the Grand Trunk, Canadian Pacific, Pere Marquette and Michigan Central railways, which connect at this point with the railways of the United States by means of large and powerful car-ferries. It is the centre of an important agricultural and fruit-growing district, in which tobacco is also produced. Salt works, flour mills, canning factories, and the manufacture of type-setting machines are the principal industries. During the season of navigation it is the centre of a large coasting trade on the Great Lakes.

WINDSOR, a township of Hartford county, Connecticut, U.S.A., on the Connecticut and Farmington rivers, adjoining the city of Hartford. Pop. (1850) 2945; (1900) 3614, 566 being foreign-born; (1910) 478. About 750 acres are served by the New York, New Haven & Hartford railway and by electric lines to Hartford and to Springfield, Massachusetts. Among the buildings are the Congregational Church, built in 1704 (the church itself was organized in 1630 in England), the Protestant Episcopal Church (1864) and the Roger Ludlow School. In Windsor are the Campbell School (for girls) and a public library (1885). The Loomis Institute (incorporated 1874 and 1905) for the gratuitous education of persons between 12 and 25 years of age has about 750 members, and has been called the Loomis family. Tobacco and market vegetables are raised in Windsor, and among its manufactures are paper, canned goods, knit and woolen goods, cigars and electrical supplies.

In 1633 Captain William Holmes, of the Plymouth Colony, established near the mouth of the Farmington river a trading post, the first settlement by Englishmen in Connecticut; a more important and a permanent settlement (until 1637 called New Dorchester) was made in 1635 by immigrants from Dorchester, Massachusetts, led by the Rev. John Wareham, Roger Ludlow and others. In 1639 representatives from Windsor, with those from Wethersfield and Hartford, organized the Connecticut Colony. Among the original land-holders were Matthew Grant and Thomas Dewey, ancestors respectively of General

1 In the township of Windsor Locks (pop. 1910, 3715), immediately north, cotton yarn and thread, silk, paper, steel and machinery are manufactured.
U. S. Grant and Admiral George Dewey; and Captain John Mason (1600–1672), the friend of Miles Standish, was one of its early citizens. It was the birthplace of Roger Wolcott, of the older Oliver Wolcott (1726–1797), of Oliver Ellsworth (whose home is now a historical museum), and of Edward Rowland Sill. Windsor has been called "The Mother of Towns"; it originally included the territory now constituting the present township, and the townships of East Windsor (1768), Ellington (1786), South Windsor (1843), Simsbury (1870), Granby (1870), East Granby (1859), Bloomfield (1853) and Windsor Locks (1854).

**WINDSOR** (properly **NEW WINDSOR**), a municipal borough of Berkshire, England, and a parliamentary borough extending into Buckinghamshire. Pop. (1901) 14,130. The town, which is famous for its royal castle, lies on the west (right) bank of the Thames, 224 m. W. of London by the Great Western railway, which serves it with a branch line from Slough. It is also the terminus of a branch of the London & South-Western railway. Here the Thames, from an easterly course, sweeps first nearly northward and then south-eastward.

The castle lies at the north-eastern edge of the town, on a slight but commanding eminence, while the massive round tower in the centre, on its artificial mound, is conspicuous from far over the flat land to the east, north and west. The site of the castle is an irregular parallelogram measuring about 650 yds. by 180. On the north, the walls enclosing the "tower ward," with the Clewer, Garter, Salisbury and Henry III. towers, overlook Thames Street and High Street, from which the "hundred steps" give access to the ward on the north, and the Henry VIII. gateway, opening from Castle Hill, on the south. This ward contains St George's Chapel in the centre, with the Albert Memorial Chapel on the east and the Horseshoe Cloisters on the west. To the north are the deanery and the canon's residences, for the foundation attached to the royal chapel has the privileges of a "royal peculiar," the dean being exempt from episcopal jurisdiction. To the south are the guard-room and the houses of the military knights, or pensioners.

The round tower occupies the "middle ward"; on its flag-turret the Union Jack or the Royal Standard is hoisted according as the sovereign is absent or present. The buildings in the "upper ward," east of this, form three sides of a square; the state apartments on the north, the private apartments on the east and the visitors' apartments on the south. Along the north side of the castle extends the north terrace, commanding, from its position above a steep slope, splendid views across the river to Eton on the Buckinghamshire side, and far over the valley, between the river and the downs. In front of the castle are gardens in front of the private apartments, and the south terrace continues farther, as far as the George IV. gateway. The Home Park lies adjacent to the castle on the south, east and north.

The Great Park extends south of Windsor, where the land, rising gently, is magnificently timbered with the remnant of the old royal forest. The village of Old Windsor (in distinction from which the name of New Windsor is given to the borough) lies by the river, south of the Home Park. To the west of Windsor itself the village of Clewer has become a suburb of the town.

As early as the time of the Heptarchy a stronghold of some importance existed at Windsor, the great mound, which is moated, circular and about 125 ft. in diameter, being a remnant of this period. William the Conqueror was attracted by the forest, as a hunting preserve, and obtained the land by exchange from Westminster Abbey, to which Edward the Confessor had given it. Thereafter the castle became what it remains, the chief residence of the English sovereigns. The Conqueror replaced the primitive wooden enclosure by a stone circuit-wall, and the first complete round tower was built by Henry III. about 1272, but Edward III. wholly reconstructed it on a more massive scale, about 1344, to form a meeting-place for his newly established order of Knights of the Garter. He selected this spot because, according to a legend quoted by the chronicler Froissart, it was on the summit of the mound that King Arthur used to sit surrounded by his Knights of the Round Table. The bulk of the existing round tower is of Edward's time, but its walls were heightened and the tall flag-turret added by the court architect, Sir Jeffrey Wyattville, in the reign of George IV. In addition to the Round Tower, Henry III. had constructed long lines of circuit-walls, crowned at intervals with smaller towers. He also built a great hall (the present chapter library) and other apartments, together with a chapter house, which was flanked towards the north to make room for the chapel of St George. The beautiful little dean's cloister preserves a portion of Henry's work in the south wall, a contemporary portrait of the king appearing in dis-temper on one of the arches. Another chapel was built by him and dedicated to his favourite saint, Edward the Confessor. This graceful building, with an eastern apse, is now called the Albert Memorial Chapel; some of Henry III.'s work still exists in the lower part of its walls, but the upper part was rebuilt 1901–1906 by Henry VII., who intended it as a burial-place for himself and his line, before he began the chapel which bears his name and contains his tomb at Westminster Abbey. Some years later the unfinished chapel was given by Henry VIII. to Cardinal Wolsey, and for long after it was known as "Wolsey's tomb-house." Wolsey engaged a Florentine sculptor named Benedetto, probably a son or nephew of Benedetto da Maiano (d. 1497), also a Florentine artist, to make him a costly tomb of marble and gilt bronze, with a recumbent effigy at the top, no doubt similar in design to Torrigiano's tomb of Henry VII. at Westminster. The rich bronze work of Wolsey's tomb was torn off and melted by order of the Commonwealth in 1644, and the metal was sold for the then large sum of £600. In 1805 the black marble sarcophagus, stripped of its bronze ornaments, was moved from Windsor and used as a monument over Nelson's grave in the crypt of St Paul's. Though Wolsey's tomb-house was roofed in and used for mass by James II., the stone vaulting was not completed until the whole chapel was fitted by Sir Gilbert Scott as a memorial to Albert, Prince Consort. Its internal walls were then lined with rich marbles, and decorated with reliefs by Baron Triqueti. The cenotaph of the Prince Consort stands on the altar, with the tombs of Prince Leopold, duke of Albany, and the duke of Clarence; the last erected by King Edward VII., who was himself buried here in May 1910. In a vault beneath the chapel George III. and members of his family are buried.

The chapel of St George is one of the finest examples of Perpendicular architecture in England, comparable with two other royal chapels, that of King's College at Cambridge and that of Henry VII. at Westminster, which are a little later in date. The building was begun by Edward IV., who in 1473 pulled down the whole of the earlier chapel, which had been completed and filled with stained glass by Edward III. in 1365. The nave of St George's was vaulted about the year 1490, but the choir groining was not finished till 1507; the hanging pendants from the fan vaulting of the choir mark a later development of style, which contrasts strongly with the simpler lines of the earlier nave vault. In 1536 the lantern and the rood-screen were completed, but the stalls and other fittings were not finished till after 1579. The chapel ranks next to Westminster Abbey as a royal mausoleum, though no king was buried there before Edward IV., who left directions in his will that his tomb should be erected with an effigy of himself in silver. Nothing remains of this except part of the wrought iron grille which surrounded the tomb, one of the most elaborate and skilfully wrought pieces of ironwork in the world, said to be the work of Quintin Matsys. The next sovereign buried here was Henry VIII., who directed that his body should be laid beside that of Jane Seymour, in a magnificent bronze and marble tomb. The tomb was never completed, and what existed of its metal-work was probably melted down by the Commonwealth. No trace of it remains. Charles I. was buried here without service in 1649. Above the dark oak stalls hang the historic insignia of the Knights of the Garter, their swords, helmets and banners. On the stalls themselves appear a remarkable series of enamelled brass plates commemorating knights of the order. Many tombs and memorials are seen in the chantry chapels.
The deanery, adjoining the dean’s cloister, is dated 1500, but the Winchester tower to the north-east of it is the work of the famous prelate and architect William of Wykeham, who was employed by Edward III. on the greater part of this extension and alteration of Henry III.’s work. The Horseshoe cloisters were restored in Tudor style by Sir Gilbert Scott. The Norman gate on the north side of the round tower was rebuilt by Wykeham.

The site of the upper ward was built upon by Henry II., and, to a greater extent, by Edward III., but only in the foundations and lowest storey are remains of so early a period to be found. The buildings were wanting in homogeneity until their reconstruction was undertaken by Sir Jeffrey Wyatville under the direction of George IV., for Charles II. was unable to carry out a similar intention, perhaps fortunately, as Sir Christopher Wren proposed drastic alterations. Charles, however, completed the so-called Star Building, named from the representation of the star of the Order of the Garter on the north front. Here the state apartments are situated. They include the throne room, St. George’s Hall, where maunets of the Order of the Garter are held, the audience and presence chambers, and the great reception room, adorned with Gobelins tapestries, and the guard-room with armour. All these chambers contain also splendid pictures and other objects of art; but more notable in this connexion are the picture gallery, the Rubens room or king’s drawing-room, and the magnificent Van Dyck room. The ceilings of several of the chambers were decorated by Antonio Verrio, under the direction of Charles II. In the royal library, which is included among the private apartments, is a fine collection of drawings by the old masters, including three volumes from the hand of Leonardo da Vinci. Here is also a magnificent series of eighty-seven portraits by Holbein, highly finished in sepia and chalk, representing the chief personages of the court of Henry VIII. There are, moreover, examples by Michelangelo and Raphael, though the series attributed to these masters are not accepted as genuine in their entirety.

South of the castle, beside the Home Park, is the Royal Mews. Within the bounds of the park is Frogmore (q.v.), with the Royal Mausoleum and that of the duchess of Kent, and the royal gardens. An oak-tree marks the supposed site of Herne’s Oak, said to be haunted by the ghost of “Herne the hunter,” a forest-ranger who hanged himself here, having fallen under the displeasure of Queen Elizabeth (Shakespeare, Merry Wives of Windsor, Act iv. sc. 4). A splendid avenue, the Long Walk, laid out in the time of Charles II. and William III., leads from George IV.’s gate on the south side of the castle straight into the heart of the Great Park, a distance of 3 m. Another fine and still longer straight avenue is Queen Anne’s Ride, planted in 1707. Among various buildings within the park is Cumberland Lodge, built by Charles II. and taking name from the duke of Cumberland, who commanded the victorious royal troops at the battle of Culloden in 1746, and resided here as chief ranger. At the southern boundary of the park is a beautiful artificial lake called Virginia Water, formed by the duke. Windsor Forest formerly extended far over the south of Berkshire, and into the adjacent county of Surrey, and even in 1790 still covered nearly 60,000 acres. It was disafforested by an act of 1813.

A few old houses remain in the town of Windsor, but the greater part is modernized. The church of St John the Baptist was rebuilt in 1822, but contains some fine examples of Grinling Gibbons’s wood-carving. There are statues of Queen Victoria, unveiled in the first Jubilee year, 1887, and of Prince Albert (1890). The town hall was built in 1868 by Sir Christopher Wren, who represented the borough in parliament. The town was formerly celebrated for the number of its inns, of which there were seventy in 1650. The most famous were the “Garter” and the “White Hart,” the first of which was the favourite of Shakespeare’s Sir John Falstaff, and is frequently mentioned in The Merry Wives of Windsor. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 2717 acres.

History.—Windsor (Wyndesbour, Wyndsoare, Windlesore) was probably the site of a Roman settlement, two Roman tombs having been discovered at Tyle-Place Farm in 1865, while a Roman camp and various antiquities were unearthed at St Leonard’s Hill in 1705. The early history of Windsor centres round the now unimportant village of Old Windsor, which was a royal residence under Edward the Confessor; and Robert of Gloucester relates that it was at a fair feast which the king held there in 1053 that Earl Godwin met with his tragic end. By Edward the Confessor it was granted to Westminster Abbey. The manor was recovered in exchange for two other manors by William I., who erected the castle about 2 m. north-west of the village and within the manor of Clewer, round which the later important town of New Windsor was to grow up. The earliest existing charter of New Windsor is that from Edward I. in 1277, which was confirmed by Edward II. in 1315-1316 and by Edward III. in 1328. This constituted it a free borough and granted to it a guild merchant and other privileges. The same king later leased it as fee farm to the burgesses on condition that they did justice to Purchas, denizen of alien and to the poor. The town does not seem to have been well patronized, and the fee farm was reduced by several succeeding sovereigns. In 1430 extensive privileges were accorded to the burgesses by Henry VI., and Edward IV. in 1467 granted a charter of incorporation under the title of the “mayor, bailiffs and burgesses.” Further confirmations of existing privileges were granted by Edward IV. in 1477, by Henry VII. in 1499, by Henry VIII. in 1515 and by Edward VI. in 1549. A fresh charter was granted by James I. in 1603, and the renewal of this by Charles II. in 1664 incorporating the town under the title of the “mayor, bailiffs and burgesses of the borough of Windsor.” It was vested in Westminster Abbey by the charter until 1835. By the charter of Edward I. the county gaol was fixed at Windsor, but on the petition of the men of Berkshire it was removed thence to a more central town in the reign of Edward II. New Windsor sent two members to parliament from 1302 to 1335 and again from 1446 to 1865, omitting the parliaments of 1654 and 1666; by the act of 1867 it lost one member. The market is of ancient date, and in 1273 the abbess of Burnham is said to hold markets at Burnham and Beaconsfield to the prejudice of the market at Windsor. Edward IV. in 1467 removed the feast of St Edward the Confessor, and the charter of 1603 mentions a Saturday market and the three fairs. No fairs are now held, but the Saturday market is still maintained. Windsor bridge is mentioned in the reign of Edward I.; the present structure dates from 1822. The town has never had an important industry, but has depended almost entirely upon the castle and court.

The political history of Windsor centres round the castle, at which the Norman kings held their courts and assembled their witan. Robert Mowbray was imprisoned in its dungeons in 1099, and at the Christmas court celebrated at Windsor in 1127 David of Scotland swore allegiance to the empress Maud. In 1175 it was the scene of the ratification of the treaty of Windsor. The castle was bestowed by Richard I. on Hugh, bishop of Durham, but in the next year was treacherously seized by Prince John and only surrendered after a siege. In 1217 Ingram de Ache with a garrison of sixty men gallantly held the fortress against a French force under the count de Nevers. It was a centre of activity in the Barons’ War, and the meeting-place of the parliament summoned by Henry in 1261 in rivalry to that of the barons at St Albans; two years later, however, it surrendered to Simon de Montfort. The appeal of high treason against Thomas Mowbray, duke of Norfolk, was heard by Richard II. in Windsor Castle in 1398. During the Civil War of the 17th century the castle was garrisoned for the parliament, and in 1648 became the prison of Charles, who spent his last Christmas within its walls.

See J. E. Tighe, Annals of Windsor (1858); Victoria County History: Berkshire.

WINDTHORST, LUDWIG (1812-1891), German politician, was born on the 17th of January 1812 at Kaldenhof, a country house near Osnabrück. He sprang from a Roman Catholic
family which for some generations had held important posts in the Hanoverian civil service. He was educated at the Carolinum, an endowed school at Osnabrück, and studied at the universities of Göttingen and Heidelberg. In 1836 he settled down as an advocate in Osnabrück; his abilities soon procured him a considerable practice, and he was appointed president of the Catholic Consistorium. In 1848 he received an appointment at the supreme court of appeal for the kingdom of Hanover, which sat at Celle. In the next year the revolution opened for him, as for so many of his contemporaries, the way to public life, and he was elected as representative for his native district in the second chamber of the reformed Hanoverian parliament. He belonged to what was called the Great German party, and opposed the project of reconstituting Germany under the leadership of Prussia; he defended the government against the liberal and democratic opposition; at this time he began the struggle against the secularization of schools, which continued throughout his life. In 1851 he was elected president of the chamber, and in the same year minister of justice, being the first Catholic who had held so high an office in Hanover. As minister he carried through an important judicial reform which had been prepared by his predecessor, but had to retire from office because he was opposed to the reactionary measures for restoring the influence and privileges of the nobility. Though he was always an enemy to liberalism, his natural independence of character prevented him from acquiescing in the proposals of the Catholic ministers. In 1856 he resigned as minister, but with others of his colleagues he resigned when the king refused his assent to a measure for extending the franchise. Windthorst took no part in the critical events of 1866; contrary to the opinion of many of his friends, after the annexation of Hanover by Prussia he accepted the form accompli, took the oath of allegiance, and was elected a member both of the Prussian parliament and of the North German diet. At Berlin he found a wider field for his abilities. He acted as representative of his exiled king in the negotiations with the Prussian government concerning his private property and opposed the sequestration, thus for the first time being placed in a position of hostility to Bismarck. He was recognized as the leader of the Hanoverians and of all those who opposed the "revolution from above." He took a leading part in the formation of the party of the Centre in 1870-1871, but he did not become a member of it, fearing that his reputation as a follower of the king of Hanover would injure the party, until he was formally requested to join them by the leaders.

After the death of Hermann von Mallinckrodt (1821-1874) in 1874, Windthorst became leader of the party, and maintained that position till his death. It was chiefly owing to his skill and courage as a parliamentary debater and his tact as a leader that the party held its own and constantly increased in numbers during the great struggle with the Prussian government. He was especially exposed to the attacks of Bismarck, who attempted personally to discredit him and to separate him from the rest of the party. And he was far the ablest and most dangerous critic of Bismarck's policy. The change of policy in 1879 led to a great alteration in his position: he was reconciled to Bismarck, and his party was once more united. In 1888 he retired from the office of his ministerial position, a position of the highest dignity. As such he was one of the four governors-in-chief of the German empire, and as governor he was in charge of the department of the interior.

In 1889 his wife died, and the next year he himself died, on the 14th of March 1891, at Berlin. He was buried in the Marienkirche in Hanover, which had been erected from the money subscribed as a testimonial to himself. His funeral was a most remarkable display of public esteem, in which nearly all the ruling princes of Germany joined, and there was a striking sign of the position to which, after twenty years of incessant struggle, he had raised his party. Windthorst was undoubtedly one of the greatest of German parliamentary leaders: no one equalled him in his readiness as a debater, his effective eloquence compelling him to defend entirely upon his memory. It was his misfortune that nearly all his life was spent in opposition, and he had no opportunity of showing his abilities as an administrator. He enjoyed unbounded popularity and confidence among the German Catholics, but he was in no way an ecclesiastic: he was at first opposed to the Vatican decrees of 1870, but quickly accepted them after they had been proclaimed. He was a very agreeable companion and a thorough man of the world, singularly free from arrogance and pomposity; owing to his small stature, he was often known as "die kleine Excellenz." He married in 1839. Of his three children, two died before him; his wife survived him only a few months.

Windthorst's Ausgewählte Reden were published in three volumes (Osnabrück, 1861-1862). See also J. N. Knopf, Ludwig Windthorst: ein Lebensbild (Dresden, 1898); and Häusgen, Ludwig Windthorst (Copenhagen, 1900).

**WINDWARD ISLANDS,** a group and colony in the West Indies. They consist of the British island of St. Lucia, St. Vincent and Grenada, with a chain of small islands, the Grenadines, between the two latter islands. They are not a single colony, but a confederation of three separate colonies with a common governor-in-chief, who resides at St George's, Grenada. Each island retains its own institutions, and they have neither legislature, laws, revenue nor tariff in common. There is, however, a common court of appeal for the group as well as for Barbados, composed of the chief justices of the respective islands, and there is also a common audit system, while the islands unite in maintaining certain institutions of general utility. The Windward Islands, which, as a geographical division, probably include Barbados, derive their name from the fact that they are the most exposed of the Lesser Antilles to the N.E. Trade, the prevailing wind throughout the West Indies.

**WINE** (Lat. vinum, Gr. ὀίνος), a term which when used in its modern sense without qualification designates the fermented product of grape juice. The fermented juices of other fruits or plants, such as the date, ginger, plum, &c., are also termed wine, but the material from which the wine is derived is in such cases called beer, mead, or mead. The modern term wine, however, is restricted to wine derived from the grape (see VINE).

*Historical.*—The art of viticulture or wine-making is a very ancient one. In the East it dates back almost as far as we have historical records of any kind. In Egypt and in Greece the introduction of wine was ascribed to gods; in Greece to Dionysus; in Egypt to Osiris. The Hebrews ascribed the art of wine-making to Noah. It is probable that the discovery that an intoxicating and pleasant beverage could be made from grape juice was purely accidental, and that it arose from observations made in connexion with crushed or bruised wild grapes, much as the modern process of making a beverage of beer, or in its earliest form, mead, may be traced back to the accidental fermentation of wild honey. In ancient times the cultivation of the vine indicated a relatively settled and stable form of civilization, inasmuch as the vine requires a considerable maturation period. It is probable, therefore, that viticulture was introduced subsequent to the raising of cereal crops. The Nabataeans were forbidden to cultivate the vine, the object being to prevent any departure from their traditional nomadic habits. The earliest examples of specific wines of which we have any record are the Chalybeou wine, produced near Damascus, in which the Phoenicians traded in the time of Ezekiel (xxvii. 18), and which at a later date was much appreciated by the Persian kings; and the wines from the Greek islands (Chios, Lesbos, Cos). With regard to the introduction of the vine into other parts of Europe, it appears that it was brought to Spain
WINE

by the Phoenicians, and to Italy and southern Gaul from Greece. In the earliest Roman times the wine was very little cultivated in Italy, but gradually Rome and Italy generally became a great wine country. At a later date the republic sought to stimulate its home industry by prohibiting the importation of wine, and by restricting its cultivation in the colonies, thus preserving the latter as a useful market for Italian wines. According to Pliny, Spanish, Gallic and Greek wines were all consumed in Rome during the 1st century of the Christian era, but in Gaul the production of wine appears to have been limited to certain districts on the Rhone and Gironde. The cultivation of the wine in more northern parts (i.e. on the Seine and Moselle) was not commenced until after the death of Probus. Owing no doubt to the difficulties of transportation, wine was, in the middle ages, made in the south of England, and in parts of Germany, where it is now no longer produced (cf. Huhn, *Culturfahrzeuge*, &c., and Mommsen, *Römische Geschichte*, v. 98 et seq.). We know very little of the ancient methods of cultivating the vine, but the Romans—no doubt owing to the luxuriant ease with which the vine grows in Italy—appear to have trained it on trees, trellis work, palisades, &c. The dwarf form of cultivation now common in northern Europe does not appear to have obtained to any extent. It seems likely that the quality of the wine produced in the ancient times was as good as the modern product, inasmuch as the addition of salt, spices and spiced wine was a common practice. With regard to the actual making of the wine, this does not appear to have differed very much in principle from the methods obtaining at the present day. Plastering appears to have been known at an early date, and when the juice of the grapes was too thin for the production of a good wine, it was occasionally boiled down with a view to concentration. The first wine receptacles were made of skins or hides, treated with oil or resin to make them impervious. Later, earthenware vessels were employed, but the wooden cask—not to mention the glass bottle—was not generally known until a much later period.

Production.—The total wine production of the world, which, of course, fluctuates considerably from year to year, amounts to roughly 3,000 million gallons. France and Italy are the chief wine-producing countries, the former generally producing rather more than the latter. During the phylloxera period Italy in some years had the greater output (e.g. 1886–1888 and 1890–1892). The average production of the chief wine-producing countries will be gathered from the following table:

Wine Production. Annual Average Production in Millions of Gallons for Quinquennial Periods.

The United States produces roughly 50, Bulgaria and Rumania each 40 and Servia 10 million gallons. The United Kingdom produces no wine, but the Cape and the Australian Commonwealth each produce some 5 million gallons.

The variation from year to year in the quantity of wine produced in individual countries is, of course, far greater than that observed in the case of beer or spirits. Thus, owing to purely climatic vagaries, the total quantity of wine produced in France in 1891 was only 175 million gallons, whereas in 1896 it amounted to 111 millions. Similarly the French production, which was 587 million gallons in 1895, amounted to no less than 1,492 millions in 1900. In the same way the Italian production has varied between 583 million gallons (1895) and 793 millions (1901), and the Spanish between 331 million gallons in 1896 and 636 millions in 1892.

Consumption.—It is only natural that the consumption of wine should be greatest in the countries where it is produced on the largest scale, but the discrepancy between the consumption of different countries is little short of astonishing. Thus, at the present time, the consumption per head in France is practically a hundred times that of the United Kingdom and twenty times that of Germany—the latter, it must be remembered, being itself an important wine-producing area.

The following table will give some idea of the relative consumption of wine in different countries:

1 The quantity of port received was exceptionally large. The average quantity is rather under 3 million gallons and the value about £800,000.

2 A considerable proportion of the German wines come to the United Kingdom via the Netherlands.

Of the wines imported from France, about one-quarter was Champagne and Saumur, the remainder consisting almost entirely of still wines, such as claret and burgundy.

Viticulture and Wine-Making

General Considerations.—Although the wine is cultivated in practically every part of the world possessing an appropriate climate and soil, from California in the West to Persia in the East, and from Germany in the North to the Cape of Good Hope and some of the South American republics in the South, yet, as is the case also with the cereal crops and many fruits and vegetables, the wines produced in countries possessing temperate climates are—when the vintage is successful—finer than those made in hot or semi-tropical regions. Although, for instance, the wines of Italy, Greece, the Cape, &c., possess great body and strength, they cannot compare as regards elegance of flavour and bouquet with the wines of France and Germany. On the other hand, of course, the vagaries of the temperate climate of northern Europe frequently lead to a partial or complete failure of the vintage, whereas the wines produced in relatively hot countries, although they undoubtedly vary in quality from year to year, are rarely, if ever, total failures. The character of a wine depends mainly (a) on the nature of the soil; (b) on the general type of the climate; (c) on the variety of vine cultivated. The quality, as distinct from general character, depends almost entirely on
the vintage, i.e. on the weather conditions preceding and during the gathering of the grapes and the subsequent fermentation. Of all these factors, that of the nature of the soil on which the vine is grown is perhaps the most important. The same vine, exposed to practically identical conditions of climate, will produce markedly different wines if planted in different soils. On the other hand, different varieties of the vine, provided they are otherwise not unsuitable, may, if planted in the same soil, after a time produce wines which may not differ seriously in character. Thus the planting of French and German vines in other countries (e.g. Australia, the Cape) has not led to the production of distinctive wines, although there may at first have been some general resemblance in character. On the other hand, the replanting of some of the French vineyards (after the ravages due to the phylloxera) with American vines, or, as was more generally the case, the grafting of the old French stock on the hardy American roots, resulted, after a time, in many cases, in the production of wines practically indistinguishable from those formerly made.

**Wine-making**—The art of wine-making is, compared with the manufacture of beer or spirits, both in principle and in practice a relatively simple operation. When the grapes have attained to maturity they are collected by hand and then transferred in baskets or carts to the press house. After the stalks have been removed either by hand or by a simple apparatus the juice is expressed either—as is still the case in many quarters—by trampling under foot or by means of a simple lever or screw press or by rollers. In the case of red wines the skins are not removed, inasmuch as it is from the latter that the colour of the wine is derived. The must, as the expressed juice of the grape is termed, is now exposed to the process of fermentation, which consists essentially in the conversion of the sugar of the must into alcohol and various subsidiary products. The fermenting operations in wine-making differ radically from those obtaining in the case of beer or of spirits in that (if we except certain special cases) no yeast is added from without. Fermentation is induced spontaneously by the yeast cells which are always present in large numbers in the grape itself. The result is that—as compared with beer or spirits—the fermentation at first is relatively slow, but it rapidly increases in intensity and continues until practically the whole of the sugar is converted. In the case of the production of certain sweet wines (such as the sweet Sauternes, Port and Tokay) the fermentation only proceeds up to a certain extent. It then either stops naturally, owing to the fact that the yeast cells will not work rapidly in a liquid containing more than a certain percentage of alcohol, or it is stopped artificially either by the addition of spirit or by other means which will be referred to below. As the character of a wine depends to a considerable extent on the nature of the yeast (see Fermentation), many attempts have been made of late years to improve the character of inferior wines by adding to the unfermented must a pure culture of yeast derived from a superior wine. If pure yeast is added in this manner in relatively large quantities, it will tend to predominate, inasmuch as the number of yeast cells derived from the grapes is at the commencement of fermentation relatively small. In this way, by making pure cultures derived from some of the finest French and German wines it has been possible to lend something of their character to the inferior growths of, for instance, California and Australia. It is not possible, however, by this method to entirely reproduce the character of the wine from which the yeast is derived inasmuch as this depends on other factors as well, particularly the constitution of the grape juice, conditions of climate, &c. The other micro-organisms naturally present in the must which is pitched with the pure culture are not without their influence on the result. If it were possible to sterilize the must prior to pitching with pure yeast no doubt better results might be obtained, but this appears to be out of the question inasmuch as the heating of the must which sterilization involves is not a practicable operation. After the main fermentation the wine is transferred to casks for secondary fermentation.

The general method followed is to fill the casks to the bung-hole and to keep them full by an occasional addition of wine. The secondary fermentation proceeds slowly and the carbonic acid formed is allowed to escape by way of the bung-hole, which in order to prevent undue access of air is kept lightly covered or is fitted with a water seal, which permits gas to pass out of the cask, but prevents any return flow of air. During this secondary fermentation the wine gradually throws down a deposit which forms a coherent crust, known as *argol* or *lees*. This consists chiefly of cream of tartar (bitartrate of potash), tartrate of lime, yeast cells and of albuminous and colouring matters. At the end of some four to five months this primary deposit is practically finished and the wine more or less bright. At this stage it receives its first racking. Racking consists merely in separating the bright wine from the deposit. The wine is racked into clean casks, and this operation is repeated at intervals of some months, in all three to four times. As a general rule, it is not possible by racking alone to obtain the wine in an absolutely bright condition. In order to bring this about, a further operation, namely that of *fining*, is necessary. This consists, in most cases, in adding to the wine a proteinid matter in a finely divided state. For this purpose isinglass, gelatin or, in the case of high-class red wines, which are subjected to especial care, a part of the tannin in the wine, forming an insoluble tannate, and this gradually subsides to the bottom of the cask, dragging with it the mechanically suspended matters which are the main cause of the wine's turbidity. In some cases purely mechanical means such as the use of Spanish clay or filtration are employed for fining purposes. Some wines, particularly those which lack acid or tannin, are very difficult to fine. The greatest care is necessary to ensure the cleanliness and asepticity of the casks in which wine is stored or into which it is racked. The most common method of ensuring cask cleanliness is the operation known as sulphuring.* This consists in burning a portion of a sulphur (“match” i.e. a flat wick which has been steeped in melted sulphur, or simply a stick of melted sulphur) in the interior of the cask. The sulphurous acid evolved destroys such micro-organisms as may be in the cask, and in addition, as it reduces the supply of oxygen, renders the wine less prone to acetalous fermentation. Sweet wines, which are liable to fret, are more highly and frequently sulphured than dry wines. After the wine has been sufficiently racked and fined, and when it has reached a certain stage of maturation—varying according to the type of wine from, as a rule, two to four years—the wine is ready for bottling. Certain wines, however, such as some of the varieties of port, are not bottled, but are kept in the wood, at any rate for a considerable number of years. Wines so preserved, however, develop an entirely different character from those placed in bottle.

**CHEMISTRY OF WINE**

**Maturation of the Grape.**—The processes which take place in the grape during its growth and maturation are of considerable interest. E. Mach has made some interesting observations on this point. At first—i.e., at the beginning of July when the berries have attained to an appreciable size—the specific gravity of the juice is very low: it contains very little sugar, but a good deal of acid, chiefly free tartaric acid and malic acid. The juice at this period contains an appreciable amount of tannin. As the amount of sugar gradually increases, and the same up to a certain point applies to the acidity. The character of the acidity, however, changes, the free tartaric acid gradually disappearing, and that of potash and being otherwise broken up. On the other hand, the free malic acid increases and the tannin decreases. When the grape is ripe, the sugar has attained to a maximum and the acidity is very much reduced; the tannin has entirely disappeared.

The following figures obtained by Mach afford an interesting illustration of these processes:

<table>

At first the sugar in the juice consists entirely of dextrose, but later on the (lauruvulose) is added. The sugar in ripe grape juice is practically invert sugar, i.e. consists of practically equal parts of dextrose and fructose. The proportion of sugar present in the juice of ripe grapes varies considerably according to the variety of grape, the season, and the weather. In temperate climates it varies as a rule between 15 and 20%, but in the case of hot climates or where the grapes are treated in a special manner, it may rise as high as 35% to 40%.

**Fermentation.**—The fermentation of grape juice, i.e. the must, is, as we have seen, a relatively simple operation, consisting as it does in exposing it to the spontaneous action of the micro-organisms contained in it. The main products formed are, as in all cases of
The formation of grape juice at various periods of maturation. (E. Mach.)

The tannin is a solid, non-volatile, constituent. The tannins, but is influenced also by the relative proportions in which the various constituents exist. For instance, a wine which under favourable conditions would seem full and round may appear harsh or rough, merely owing to the fact that it contains a small quantity of tannin as an essential constituent. The characteristic esters of these wines do not fall below certain limits, are likely to develop well, whereas wines which, although perfectly sound, show an abnormal constant, will rarely turn out successful. The bouquet of young wines which are unfined or clarified by filtration, or are formed by the primary fermentation. It was at one time thought that the quality of the bouquet was dependent upon the absolute quantity of these compound esters present, but the author and others have placed characteristic esters present in wine is the well-known "oenoanthic ether," which consists principally of ethyl pelargonate. It does not contribute to a pronounced bouquet, but if the bouquet of the wine does not turn out well. On the contrary, it is frequently the case that one of the most successful wines in after years are those which at first show very little bouquet. The maturation of wine, whether it be in bottle or in cask, is an exceedingly interesting operation. The wines which remain for a long period in cask gradually lose alcohol and water by evaporation, and therefore become in time extremely like the solids and relatively non-volatile matters contained in them. As a rule, wines which remain in cask become very dry, and the loss of alcohol by evaporation—particularly in the case of light wines — has as a result the production of a vinegar-like odour, and these wines are at the same time, the creation of wine. The tannin and some of the colouring matter. The mechanism of the development of the secondary bouquet appears to be dependent primarily on the development of the wine and secondly on the activity of certain micro-organisms. L. Pasteur filled glass tubes entirely with new wine and then sealed them up. It was found that wine so treated remained unchanged in the glass tube for a long time. Furthermore, the fact that these other parts partly with wine, the remaining space being occupied by air. In this case the wine gradually matured and acquired the characteristics of the vintage. As regards the third, it is now generally held that it is at its best within a very short period of the vintage, and that when the characteristic "prickling" taste due to carbonic acid derived from the secondary fermentation has disappeared, the wine has lost its "juiciness." Thus the maturation and development of the wine, even for twenty-five to thirty years, and that after this time it will commence to deteriorate. At the same time, the opinions of various experts differ, some cases in which claret may be found in very fine condition after a lapse of as much as forty years, but even in such cases it will be found that for every bottle that is good there may be one which is distinctly inferior.

**Diseases**

*Disseases of the Vine.*—The vine is subject to a number of diseases some of which are due to imperfect sanitation and others to insect life. The most destructive of all these diseases is that of the phylloxera. The *Phylloxera vastatrix* is an insect belonging to the green fly tribe, which destroys the roots and leaves of the growing plant. A returning generation of the phylloxera, which is the growing country has been afflicted with this disease at one time or another.
WINE

The great epidemic in the French vineyards in the years 1882 to 1885 led to a reduction of the yield of about 50%. Many researchers have compared the damage caused by the first submergence of the vineyards, the use of carbon bisulphide for spray-
ing, and of copper salts, but there appears to be little doubt that a really serious epidemic can only be dealt with by systematic destruc-
tion. The method is best carried out in the first days of the flowering season. This, of course, naturally leads to the production of a wine somewhat different in character to that produced before the epidemic, but this difficulty may perhaps be lessened to some extent as it was in the case of vines potted in sandy soil. The first epidemic that this is second in importance to the phylloxera. It is caused by a species of mould which lives on the grape or fruit and the leaves, and the grapes that are formed also shrivel and die. The most effective cure, short of destruction and replantation, appears to be spraying with finely divided sulphur. Another evil which causes a lack of uniformity in the wine is exposure to high spring temperatures and the flowering, as is known as couture. This causes the flowers, or at a later period the young fruit, to fall off the growing plant in large numbers.

Diseases of Wine. — These are numerous, and may be derived either directly from the vine, from an abnormal constitution of the grape juice, or to subsequent infection. Thus the disease known as lourne or cause is generally caused by the wine having been made or partly made from grapes affected by mildew. The micro-organism giving rise to this disease generally appears in the form of small jointed rods and is known as the micro-organism of the nectarine. This disease, caused by this disease loses its colour and flavour. The colour in the case of red wines is first altered from red to brown, and in bad cases disappears altogether, leaving an almost colourless solution. This disease, it is said, is caused by the micro-organism, and to the presence of an excess of albuminous matters.

The most common disease to which wine is subject by infection is that caused by a micro-organism termed mycoderma vinif (French flowers de vin). This micro-organism, which resembles ordinary yeast cells in appearance, forms a pellicle on the surface of the wine, particularly when the latter is exposed to the air more than it should be, and its develop-
ment is favoured by lack of alcohol. The micro-organism, the yeast or micro-organism of yeast fermentation, differs from the disease caused by M. vinif in that the alcohol is transformed into acetic acid. It is caused by a micro-
organism termed Lactobacillus casei, and appears in small, round, or oval, and eventually sees round of molecules. It is principally due to the lack of alcohol in the wine or to lack of acidity in the must. The micro-
organism which causes the disease of bitterness (amer) forms longish branched filaments in the wine. Hand in hand with the development of a disagreeable bitter taste there is a precipitation of colouring matter and the formation of certain disagreeable secondary con-
stituents. This disease is generally caused by infection and is favored by lack of alcohol, acid, and cold weather, which generally occurs only in white wines is that which converts the wine into a thick syrupy liquid. It is the viscous or grasse disease. It is due to the development of tartaric acid to a more frequent occurrence in white wines). The mannetic disease, which is due to high temperatures during fermentation and lack of acid in the must, is rarely of serious consequence in temperate countries. The organism responsible is forming mannitol and different acids, particularly volatile acid.

The wine becomes turbid and acquires a peculiarly bitter sweet taste, and if the disease goes further becomes quite undrinkable. It should appear from the researches of the author and others that the mannetic ferment is more generally present in wines than is supposed to be the case. Thus the author found in some very old and fine wines very appreciable quantities of mannitol. In these cases the mannetic fermentation had obviously not developed to any extent, and small quantities of mannitol appear to exercise no prejudicial effect on flavour.

The natural process was discovered by Pasteur that by heating wine out of contact with air to about 66° C. any of the various germs causing wine maladies could be checked in their action or, destroyed. The one disadvantage of this method is that unless very carefully applied the normal development of the wine may be seriously retarded. In the case of cheap wines or of wines which are already more or less mature, this is not a matter of any great importance, but in the case of good wines it is a serious matter. Pasteurizing, alone, will only avail in cases where the disease has not gone beyond the initial stages, inasmuch as it cannot restore colour, taste or flavour which have already been affected. In such cases, it should be noted that where Pasteurizing is not applicable, some direct treatment with a view to eliminating or adding con-
stituents which are in excess or lacking is indicated. In this regard it may be added that the results of treatment by Pasteurizing are rational and scientific method for preventing waste of good material and sophistication pure and simple. It appears to the author, how-
ever, that where such methods are employed merely with a view to overcoming a specific malady and there is no intention of increasing the quality of the wine for purposes of gain, or if giving it a fictitious appearance of quality, these operations are perfectly justifiable and should be employed by the brewer or distiller, who has to deal with somewhat abnormal raw material. It has been found, for instance, that in the case of the mannetic disease the action of the micro-organism may be prevented by the addition of a small quantity of tartaric acid. Again, it is well known that in the case of the viscous disease the addition of sulphite to the wine serves to prevent the deposition of tannin. In the same way the disease caused by the mildew-
organism may be counteracted by a slight addition of alcohol and tannin. One method of assisting nature in wine-making, which is, in the opinion of those who profess to be scientific plant breeders, to be successful, is the use of alcohol as a substitute in the wine.

Plastering. — In some countries, particularly in Italy, Spain and Portugal, it has been found that a common practice to add a small quantity of gum as the fermenting must or to dust it over the grapes prior to pressing is that wines treated in this manner appear more quickly, and that they are more stable and of better colour. It certainly appears to be the case that musts which are plastered seldom suffer from abnormal fermentation, and that the wines which result very rarely turn acid. The main result of plastering is that the soluble tartrates in the wine are decomposed, forming insoluble tartrate of lime and soluble sulphate of potassium. It is thus to better effect that plastered wines are undrinkable, unless the quantity appreciably exceeds two grams per litre, no reasonable objection can be raised.

Acetification. — When wines which have not been made from fresh grape juice but from raisins or concentrated must, or similar material, are gener-
ally termed basis wines. They are prepared by adding water to the concentrated saccharine matter and subsequently pitching with wine yeast at an appropriate temperature. Frequently alcohol, tannin, glycerin, and similar wine constituents are also added. If carefully prepared there is no objection to these basis wines from a hygienic point of view, although they have not the delicate qualities and drinking capacity of those wines that proceed from natural grapes, having been made from concentrated grape which is in these wines have in the past been vended on a large scale in a manner calculated to deceive the consumer as to their real nature, but end up as a very considerable quantity of wine that has been added to

Wines of France. — It may be safely said that there is no other country in which the general conditions are so favourable for the production of wine of high quality and on a large scale as is the case in France. The climate is essentially of a moderate character; the winters are rarely very cold, and the summers are seldom of the intensely hot and dry nature which is characteristic of most southerly wine countries. There are large tracts of gently undulating or relatively flat country which is, inasmuch as it ensures effective exposure of the vines to the sun, of a type particularly suited to viticulture. There is almost everywhere an efficient supply of water, and usually the character of the soil is in many parts an ideal one for the production of the highest quality and abundant in quantity. It may here be stated that a rich soil such as is suitable for the growth of cereal crops or vegetables is not, as a rule, an ideal one for the production of fine wines. The ideal soil for vine-
growing is that which possesses a sufficiency, but not an excess, of nutrient for the plant, and which is so constituted that it will afford good drainage. The most important qualification, however, is that it should be so constituted as to preserve and store up during the relatively cold weather the heat which it has derived from the sun during the summer season. The famous Bordeaux or Gironde district is, perhaps, more fortunate than any other part of the world. The thirsty and methodical
WINE

Wines of France

Habits of the French peasantry, and also the system of small holdings which prevails in France, have, there is little doubt, done much to raise the French wine industry to the pre-eminent position which it holds. There is perhaps no branch of agriculture which requires more minute attention or for which a system of small holdings is more suitable than wine culture. At the present day, wine is produced in no less than 77 departments in France, the average total yield during the past ten years being roughly 1000 million gallons. This is considerably more than the average produced previous to the phylloxera period (1882–1887). The highest production on record was in the year 1882, when roughly 1460 million gallons were produced. Altogether, France produces such enormous quantities of wine it is a remarkable fact that more wine is imported into France than is exported from that country. The average imports are in the neighbourhood of 120 million gallons, of which rather more than one-half comes from Algeria. The exports amount to roughly 40 million gallons. Of recent years (1896–1907) the only vintages which have been deficient as regards quantity are those of 1897, 1898, 1902 and 1903, but even in the most unfavourable of these years (1898) the quantity exceeded 700 million gallons. The greatest yield, however, was in the year 1882, when over 1400 million gallons were produced. The number of different varieties of wines produced in France is remarkable. The red wines include the elegant and delicate (though not unstable) wines of the Girondes, and again the full, though not coarse, wines of the Burqundy district. Among the white wines we have the full sweet Sauternes, the relatively dry and elegant Graves and Chablis, and the light white wines which produce champagne and brandy.

Gironde (Bordeaux) Wines.—If France is the wine-growing country, par excellence, the Bordeaux district may be regarded as the heart and centre of the French wine industry. Although other parts of France produce excellent wines, the Gironde is first in quality and stable character, elegance and delicacy, variety and quantity are produced together. The total area of the departments of the Gironde is about 23 million acres, and roughly one-fifth of this is under the vine. It forms a tract of country some 90 m. broad, in which the chief watersheds are those of the Garonne, Dordogne, and their confluence the Gironde. The soil varies very considerably in its character, and it is due to these variations that so many different types of wine are produced in this district. It generally consists of limestone, or of mixed limestone and clay, or of sand and clay, or of gravel, with here and there a flint and rolled quartz. The subsoil is either of clay, of limestone, or of mixed sand and clay, gravel, or of a peculiar kind of pudding stone which exists in a hard and stable character. It is formed of sand or fine gravel converted into the infiltrated oxide of iron. This stone is known locally under the name of olivis. It is generally found at a depth of about 2 ft. under the better vineyards of the Médoc and Graves. The subsoils of the other districts (Côtes and St Emilion) contain much stone in the shape of flint and quartz. The finest wines of the Médoc and Graves are largely grown on a mixture of gravel, quartz and sand with a subsoil of olivis or clay. The Gironde viticultural region is divided into six main districts, namely, Médoc, Sauternes, Graves, Côtes, Entre-deux-Mers and Palus. Although properly belonging to the Côtes, the St Emilion district is sometimes classified separately, as indeed, having regard to the excellence and variety of its wines, it has a right to be.

Médoc.—The most important subdivision of the Gironde district is that of the Médoc. It is here that the wine which is known to us as claret is produced in greatest excellence and variety. The Médoc consists of a tongue of land to the north of Bordeaux, bounded by the Garonne and Gironde on the east, and by the sea on the west and north. It is, roughly, 90 m. broad. The soil varies considerably in nature, but consists mostly of gravel, quartz, limestone and sand on the surface, and of clay and olivis beneath. The principal wines grown in the Médoc are the Cabernet-Sauvignon, which is the most important, the Gros Cabernet, the Merlot, the Carmenère, the Malbec, and the Verdot. All these produce red wines. Very light white wine is made in the Médoc proper. The method of wine cultivation is peculiar and characteristic. The vines are kept very low, and as a rule only two branches or arms, which are trained at right angles to the stem, are permitted to form. This dwarf system of culture gives the Médoc vineyards at a distance the appearance of a sea of small bushes, thereby producing an effect entirely different from, for instance, that seen on the Rhine with its high basket-shaped plants. The methods of making the wine in the Médoc are described in the following. The vintage generally takes place towards the end of September or the beginning of October. The grapes from which the stalks are partly or wholly (and occasionally not at all) removed are crushed by treading or some other simple method, but sometimes even this is omitted, the juice being expressed by the weight of the grapes themselves, or by the pressure caused by incipient fermentation. Presses are not used in the case of red wines until after fermentation, when they are employed in order to separate the wine from the marc. As a rule the fermentation occupies from 6 to 10 days; by this time the must has practically lost the whole of its sugar, and the young wine is drawn off and filled into hogsheads. The fermentation proper is generally finished at the end of about six weeks to two months, and the first racking takes place, as a rule, in February or March. Subsequent rackings are made about June and November of the same year, but in the following years, until bottling, two rackings a year suffice.

The Médoc is divided into a number of communes (such as St Julien, Margaux, Pauillic, &c.), and in these communes are situated the different vineyards from which the actual vine of the wine is derived. Unlike the products of the different vineyards of most other districts, which are purchased by the merchants and bottled to supply a general wine for commerce, the yield of the principal estates of the Médoc are kept distinct and reach the consumer as the products of a particular growth and of a particular year. This practice is almost without exception resorted to with what are known as the "classe growths" and the superior "bourgeois" wines, whilst in seasons in which the wines are of good quality it is continued down to the lower grades. This classification of the Médoc growths became necessary owing to the great variety of qualities produced according to the different characteristic excellence of the individual vintages. There are four main classes or crus (literally, growths, but more correctly types or qualities), namely, the "grands crus classés" or "classified" wines, and the bourgeois, artistic, and peasant growths. The "classe growths," which include all the most famous wines of the Médoc, are themselves subdivided into five sections or growths. This general classification, which was made by a conference in 1855, as a result of many years of observation dating back to the 18th century, is still very fairly descriptive of the average merit of the wines classified. The following is a list of the best classified red wines of the Médoc (i.e. claret) together with the names of the communes in which they are situated.

**Classed Growth of the Médoc (Claret)**

**First Growth**

Château Lafite, Pauillac.

" Margaux, Margaux.

" Latour, Pauillac.

**Second Growth**

Château Mouton-Rothschild, Pauillac.

" Rauzan-Ségla, Margaux.

" Rauzan-Cassies, Margaux.

" Thélus, Margaux.

" Léoville-Lascases, St Julien.

" Léoville-Poyferré, St Julien.

" Léoville-Barton, St Julien.

" Durfort-Vivens, Margaux.

" Léoville-Barton, St Julien.

" Gruaud-Larose-Sargent, St Julien.

" Gruaud Larose, St Julien.

" Brane-Cantenac, Cantenac.

" Pichon-Longueville, St Julien.

" Pichon-Longueville-Lalande, Pauillac.

" Ducru-Beaucaillou, St Julien.

" Cos d'Estournel, St Esthèphe.

Château Montrose, St Esthèphe.

**Third Growth**

Château Kirwan, Cantenac.

" D'Issan, Cantenac.

" Lagrange, St Julien.

" Lango, St Julien.

" Giscours, Labarde.

" Malescot, Margaux.

" Brown Cantenac, Cantenac.

" Palmer, St Julien.

" La Lagune, Ludon.

" Desmirail, Margaux.

" Calon-Ségur, St Esthèphe.

" Ferrère, Margaux, St Julien.

" Becker, Margaux.

**Fourth Growth**

Château Saint-Pierre, St Julien.

" Branaire-Dubreuil, St Julien.

" Talbot, St Julien.

" Duhart-Milon, Pauillac.

" Pouget, Cantenac.

" La Tour Carnet, St Laurent.

" Roche-Bailly, St Julien.

" Beychevelle, St Julien.

Le Frieuré, Cantenac.

Marquis de Terme, Margaux.
Fifth Growth.

Château Pontet-Canet, Pauillac.
Batailley, Pauillac.
Grand-Puy-Lacoste, Pauillac.
Ducasse-Grand-Puy, Pauillac.
Château Lynch-Bages, Pauillac.
Lynch-Moussas, Pauillac.
Ducasse, Labarde.
Mouton d’Armailhacq, Pauillac.
Le Tertre, Arsac.
Haut-Bages, Pauillac.
Pédescaux, Pauillac.
Belgrave, St. Laurent.
Camensac, St. Laurent.
Cos-Labory, St. Estèphe.

Château Clerc-Milon, Pauillac.
Croizet-Bages, Pauillac.
Cantemerle, Macau.

The quality of the Médoc red wines (and this applies also to some of the finer growths of the other Bordeaux districts) is radically different from that of wines similar in type grown in other parts of the world. The Gironde red wines have sufficient body and alcohol to ensure stability without being heavy or fiery. At the same time, their acidity is very low and their bouquet characteristically delicate and elegant. It is to this relatively large amount of body and absence of an excess of acid and of tannin that the peculiarly soft effect of the Bordeaux wines on the palate is due. It has been said that chemistry is of little avail in determining the value of a wine, and this is undoubtedly true as regards the bouquet and flavour, but there is no gainsaying the fact that many hundreds of analyses of the wines of the Gironde have shown that they are, as a class, distinctly different in the particulars referred to from wines of the claret type produced, for instance, in Spain, Australia or the Cape. The quality of the wines naturally varies considerably with the vintage; but it is almost invariably the case that the wines of successful vintages will contain practically the same relative proportions of their various constituents, although the absolute amounts present of these constituents may differ widely. It is the author’s experience also that where a wine displays some abnormality as regards one or more constituents, that although it may be sound, it is rarely a wine of the highest class. The tables below will give a fair idea of the variations which occur in the same wine as a result of different vintages, and the variations due to differences of “growth” in the same vintage. These figures are selected from among a number published by the author in the Journal of the Institute of Brewing, April 1907.

Analyses of Château Lafite of Different Vintages.

1 Results (excepting alcohol) are expressed in grams per litre, i.e. roughly parts per thousand.

The annual output of the Gironde during the last few years has been roughly 70 to 100 million gallons. In the decade 1876 to 1886 the average amount was barely 30 million gallons owing to the small yields of the years 1881 to 1885. In the years 1874 and 1875 the yield exceeded 100 million gallons. The output of the classified growths varies considerably according to the vintage, but is on the average, owing to the great care exercised in the vineyards, greater than that of the lower-grade areas. Thus within recent years the output of the Château Lafite was at a minimum in 1903 when only 239 hogheads (the hoghead of claret—40 gallons) were produced, and at a maximum in 1907, when close on 1000 hogheads were obtained. Similarly, the Château Margaux, which yielded 1120 hogheads in 1900, produced 280 hogheads in 1903. The vintages of the wines also are subject to great fluctuation, but in fair years will vary, according to class and quality, from £10 to £30 per hoghead for a given growth.

The principal claret vintages of modern times have been those of 1855, 1864, 1869, 1870, 1874, 1875, 1877, 1878, 1888, 1893, 1896, 1899 and 1900, while it was thought probable that many of the wines of 1907 inclusive would turn out well. From 1882 to 1886 inclusive, the vintages were almost total failures owing to mildew. In 1887 to 1895 a number of fair wines were produced in each year, and the first really good vintage of the post-mildew-phylloxera period was that of 1888.

Most of the wines grown on a purely gravelly soil are termed "Graves," but there is a specific district of Graves which lies south of St. Emilion and west of the Garonne, and extends for a distance of 10 miles to Langon. The soil is almost a pure sandy gravel with a subsoil of varied nature, but principally alluv. gravel, clay or sand. This district produces both red and white wines. The vines, the methods of viticulture and vinification as regards the red wines of the Graves district, are similar to those of the Médoc. The wines are, if anything, slightly fuller in body and more alcoholic than those of the latter region. They possess a characteristic flavour which differentiates them somewhat sharply from the Médoc wines.

The Graves contains one vineyard, namely Château Haut-Brion, which ranks in quality together with the three first growths of the Médoc. The remainder of the red and Graves wines, although among the more important wines may be mentioned the following: in the commune of Pessac, Château La Mission and Château Pape-Clement; in the commune of Villenave-d’Ornon, Château La Fleur. In Léognan, Château Haut-Bailly, Château Haut-Brion-Larrivet and Château Branon-Literie; in Martillac, Château Smith-Haut-Lafite.

The district of Sauternes produces the finest white wines of the Gironde, one might say of the whole of France. Whereas the white wines of the Graves are on the whole fairly dry and light in character, the white wines of Sauternes are full and sweet, with a very fine characteristic bouquet. The district of Sauternes covers the communes of Sauternes, Bommes and a part of Barsac, Preignac, Fargues and St. Pierre-de-Mons. The general configuration of the country is markedly different from that of the Médoc, consisting of hills rising easily from the river. The soil consists chiefly of mixed clay and gravel, or clay and limestone, and the vines chiefly used are the Sauvignon, the Semillon and the Muscatel. The wines are made entirely from white grapes, and the methods of collecting the latter, and of working them up into wine, are entirely different from those prevalent in the red wine districts. The grapes are allowed to remain on the vines some three to four weeks longer than is the case in the Médoc, and the fermentation, which is slower and occurs in open vats, is not carried, as in the Médoc, to its completion.

Similarly, the Château Margaux, which yielded 1120 hogheads in 1900, produced 280 hogheads in 1903. The vintages of the wines also are subject to great fluctuation, but in fair years will vary, according to class and quality, from £10 to £30 per hoghead for a given growth.
in the wines. When the grapes have attained the proper degree of ripeness, or rather, softness, they are gathered with the greatest care, the berries being frequently cut off from the branches singly, and sorted according to their appearance. The grapes are then not crushed, but are immediately pressed, and the juice alone is subjected to fermentation. The juice which the skins are not cut from the principal vineyards in three successive periods. The first wine, which is termed the vin de tête, is generally the sweetest and finest, the next (called the milieu) being somewhat drier and the last the vin de queue being the least valuable, or for some meaning these wines are shipped separately, for others they are blended according to the prevalent taste. The musts from which the Sauternes wines are made are so concentrated that, as a part of the sugar is transformed into alcohol, an appreciable portion remaining unfermented. These wines; therefore, require very careful handling in order to prevent undesirable secondary fermentations taking place at a later period. This is necessary, not only to prevent fermentation recommencing, but also in order to preserve the light golden colour of the wine, which, if left to ferment with an excess of air, rapidly assumes an unsightly brown shade.

The Sauternes generally are full-bodied wines, very luscious and yet delicate; they possess a special zézé, or, in other words, that special taste which, while it remains in the mouth, leaves the palate perfectly fresh.

The finer growths of the Sauternes are classified in much the same way as the red wines of the Médoc. There are two main growths, the wines being as follows:

### Classification of Sauternes

#### Grand First Growth.

- Château Yquem, Sauternes.

#### First Growth.

- Château La Tour Blanche, Bommes.
- Peyraguey, Bommes.
- Vigneau, Bommes.
- Suduiraut, Preignac.
- Coutet, Barsac.
- Climens, Barsac.
- Bayle (Guiraud), Sauternes.
- Rieussec, Fargues.
- Rabaud, Bommes.

#### Second Growth.

- Château Mirat, Barsac.
- Doley, Barsac.
- Peyxotto, Bommes.
- d'Arche, Sauternes.
- Filhot, Sauternes.
- Broustet-Nérac, Barsac.
- Caillou, Barsac.
- Suau, Barsac.
- Malle, Preignac.
- Romer, Preignac.
- Lamothe, Sauternes.

The production of the Sauternes vineyards is, as a rule, smaller than that of the chief red growths, and in consequence of this, and that the district is a relatively small one, the prices of the finer growths are very high.

### St Emilion

The best of the Côtes wines are grown in the St Emilion region. This region consists of the commune of St Emilion, which consists of a distinct geologic formation. As the district is very small, produces wines of a decidedly bigger type than those of the Médoc, and is frequently called the Burgundy of the Bordeaux district. The classification of the St Emilion wines is very complicated, but in principle is similar to that of the Médoc wines, and includes the best known wines of the first growths are the following:

- Château Ausone, Château Belair, Château Clos Fourtet, Château Favie, Château Coulon, Château Chevaillac, and others.

The average quality is, in the most valuable, inasmuch as it is here that the poet Ausonius possessed a magnificent villa and cultivated a vineyard (A.D. 300).

### Bordering the Garonne-Mer.

The above wines are grown in the marshy regions in the immediate neighbourhood of the Garonne and Dordogne. They produce useful but rather rough wines. The Entre-deux-Mers district forms a peninsula between the Garonne and Dordogne rivers. On the left bank of the Garonne, and east of Bordeaux. This district produces both red and white wines, but their character is not comparable to that of the Médoc or of the Côtes. They are generally employed for local consumption and blending.

The sparkling wine known to us as champagne takes its name from the district of Reims, now replaced by the department of Marne, Haute-Marne, Aube and Ardennes. The best wines, however, are grown almost exclusively in the Marne district.

The cultivation of the vine in the Champagne is of very ancient date. The first sparkling wines were produced there in the reign of the Roman emperor, Probus (in the 3rd century A.D.), and according to Victor Rendu the gueuse date farther back. They were already well known in the time of Probus, and in 1694, attained to the value of 1000 livres. It was at about the latter date that sparkling or effervescent wine was first made, for, according to M. Perrier, a publication of the year 1718 refers to the fact that wine of this description had then been known for some twenty years. The actual discovery of this type of wine is ascribed to Dom Pérignon, a monk who managed the cellars of the abbey of Haut Villers between 1670 to 1715. It appears also that it was Dom Pérignon who first used the method of closing bottle wines. Up till then such primitive means as pads of hemp or cloth steeped in oil had been employed. It is very likely that the discovery of the method of making the wine was kept secret for some time, and many mysterious fables were circulated concerning it; inter alia it was believed that the monks who had a habit of drinking this wine, appeared, however, to have become popular or consumed on a large scale until the end of the 18th century.

The district producing the finest champagne is divided into two distinct regions, popularly known as the riper and the cooler, respectively. The former consists of the vineyards situated on or in the neighbourhood of the banks of the Marne. The principal vineyards in the valley, on the right bank of the river, are those at Ay, Dizy, Hautvillers and Mareuil; on the left bank, on the slopes of Epernay and parallel with the river, those at Priéry and Moussy: in the district towards the south-east, on the slopes of Avize, those of Avize, Cramant, Vertus and Mailly-Champagne; the "mountain" district are at Versy, Verzenay, Sillery, Rilly and Bouzy.

The soil in the champagne district consists on the slopes largely of chalk, marl and the plain consists of chalk and clay. The chief red wines of the champagne district are the Plant-doré, Franc-Pineau and the Plant vert doré. The Plant gris, or Meunier, yields grapes of a somewhat inferior quality. The chief white wine is the Muscat. It is also known as Charmagne, and the qualities of wine are made almost exclusively from the black grapes. For this reason it is necessary that the process of collection, separation and pressing should proceed as quickly as possible at vintage time in order that the juice may not, through incipient fermentation, dissolve any of the colouring matter from the skins. For the same reason the grapes are collected in baskets in order to avoid excessive pressing. They are transported to the press house without crushing the grapes, and the juice isextracted by pressing. There is no preliminary crushing, the presses used for extracting the juice have to be of a powerful character. As a rule, three qualities of wine are made from one batch of grapes, the first pressing yielding the first quality, whilst the second and third are reserved for the third pressing. After the must has been allowed to rest for some hours in order to effect a partial clearing, it is drawn off into barrels and fermented in that barrel. The first red wine takes place in a few days after the must is mature, and the wine is allowed to remain in the barrels for about nine months. The wine is allowed to rest for a further short period, and if not bright again racked and fined. It is then ready for bottling, but previous to this operation it is necessary to ascertain whether the wine contains sufficient resident sugar to develop the "gas" necessary for effervescence. If this is not the case, sugar is added, generally in the form of fine cane or candied sugar. The bottles employed have to be of very fine quality, as the pressure which they have to sustain may be as much as 7 to 8 atmospheres more. Formerly the loss through breakage was very great, but the art of making and selecting these bottles has greatly improved, and the loss now amounts to less than 5%, which is a very considerable reduction. It is not an uncommon figure. In the spring-time, shortly after bottling, the rise in temperature produces a secondary fermentation, and this converts the sugar into alcohol and carbonic acid. This fermentation takes place in the spare quantity, and continues throughout the winter months, and results in a sediment which adheres to the side of the bottle is gradually formed. The bottles, which up till now have been in a horizontal position, are now reversed in order to bring the sediment to the top, that known as disgorging; placed in a slanting position, neck downwards, and are daily shaken very slightly, so that by degrees the sediment works its way up to the cork. This process, which takes place slowly, is a very laborious and time-consuming part of the workman. When the whole of the sediment is on the cork, the iron clip, with which the latter is kept in position, is removed for a moment, and the force of the wine ejects the sediment and cork into the bottle with a considerable amount of noise. The cork is removed in order to avoid an excessive escape of wine. An ingenious modification has of modern times been introduced, which consists in freezing part of the wine in the neck of the cork before it is popped off and withdrawn and the sediment removed without any wine being lost.
WINE

After the sediment has been removed the wine is subjected to dosage, or liqueuring. It is by this process that the degree of sweetness required to suit the particular class of wine being made is attained. For wines of England and a liqueur wine like Montrachet (in the case of some wines, known as Brul or Nature, none at all is added. Wines intended for consumption in France receive a moderate quantity of liqueur, but those for the Russian and South American markets a larger proportion. The liqueur is made of fine wine, brandy and candied sugar. The liqueuring is nowadays generally carried out by means of a machine which regulates the requisite acidity to a sufficient degree of uniformity. As in the case of Champagne, the quantity of the liqueur varies with the variations of the weather, and the liqueur used is the product of the Gironde, a product of a single vineyard. The bulk of the wine is made in vineyards belonging to small peasant proprietors, who sell their produce to the cooperatives. The latter either blend the wine from the various proprietors, and the chief aim in this blending is to maintain the character of the wine which is sold under a particular trade mark or brand. Similarly, it has been said that, strictly speaking, there is no such thing as vintage Champagne, for in order to maintain the general character of a specific brand, to blend the new wines with some old wine or wines which have been vatted for this particular purpose. These vattings, and indeed all blendings of any particular batch of wines, are termed cuvées. The vintage date, therefore, which is borne by "vintage champagne," refers rather to the date of vintage prior to blending than to the date on which the wine was bottled. The vintage of a certain "vintage" will actually have been made in the year indicated. It is not unusual in the case of Champagne to add some sugar to the must in the years in which the latter is deficient in this respect. There is objection to be raised to this practice inasmuch as champagne in any case must be regarded in the light of a manufactured article rather than as a natural product. The principal centres of the champagne trade are at Reims, Epernay, Ay and Avize. The total output of the Marne district has for the past three years averaged about 9 million gallons, but it occasionally runs as high as 20 million gallons. A great part of this wine, however, is not suitable for making high-class champagne. As a rule, the supply considerably exceeds the demand, and the stock in hand at the present time amounts to roughly four years' consumption of finished wine, but to this must be added the stock existing in case which is considerable. For the period 1906-1907 the total number of bottles in stock amounted to over 121 millions, the bottles exported to over 23 millions, and the bottles required for internal commerce in France to something over 10 millions. There is no doubt that the annual production presents a total annual consumption of rather over 30 millions of bottles. The chief trade in champagne is with the United Kingdom, to which the finest vattings are exported. In the year 1906, of access and of remarkably even temperature, at a very small cost. The method of manufacture is similar to that followed in the Champagne.

The vineyards of France, not far from the Jura, lies the oldest viticultural district of Europe, namely that of Burgundy. It is still so called, after the old French provinces, Upper and Lower Burgundy. It comprises the departments of the Yonne on the north-west, the Côte d'Or in the centre and the Saône-et-Loire on the south. In the Yonne are made chiefly the white wines known as Burgundy, thoseus as Chablis; in the Saône-et-Loire are made the red and white wines of Mâcon, and there is also, stretching into the department of the Yonne, the district producing the Beaujolais wines. The most important wines, however, the Burgundy wines proper, are made in the centre of this region on the range of low hills running north-east by south-west of the Côte d'Or, or the golden slope. The soil of the Côte d'Or is chiefly limestone, with a little clay and sand. The vineyards producing the best wines are situated about half-way up the slopes, those at the top producing somewhat inferior, and those at the foot and in the plain ordinary grapes. Practically all the best vineyards (which are grown on flat terraces on the slopes, and not on the slopes themselves) face south-west and so get the full benefit of the sun's rays. The most important vineyards in fact on the slopes of the Côte d'Or practically the only vine—ises the Pineau or Noirier, but in the plain and in the districts of Mâcon and Beaujolais the Gamay is much cultivated. The influence of the soil on the one and the same Gamay, as illustrated by the different character of the vines grown in those districts, the Beaujolais wines having far greater distinction than those of Mâcon. The commune of Beaune must be regarded as the centre of the Burgundy district, and possesses numerous vineyards of the highest class. To the north of Beaune lie the famous vineyards of Chambertin, Clos Vougeot, Romanée, Richebourg, Nuits St Georges and Corton; to the south those of Pommard, Volnay, Montlêché and Meursault with its famous white wines. The vinification of the Burgundy wines takes place in coves of 500 to 2000 gallons capacity, and it has for very many years been the common practice in vattings in which the must is deficient in saccharine to ensure the stability of the wine by the addition of some sugar in the cove. The first rackings generally take place in February or March, and in July. The practice of sugaring has ensured great stability and keeping power to the wines, which formerly were frequently irregular in character and difficult to preserve.

There is no official classification of the Burgundy wines, but the following is a list comprising some of the finest growths in geographical order, from north to south, together with the localities in or near which they are situated.

* Results, excepting alcohol, are in grams per litre.

1.611,539 gallons of champagne, to the value of £1,679,611, were imported into the United Kingdom. The general composition of high-class champagnes, as supplied to the English market, will be gathered from the preceding table, which is taken from a large number of analyses published by the author and a collaborator in the Analyst for January 1900. It will be seen that, compared with the dry, light red wines, the proportion of sugar and alcohol is comparatively high in champagne, and the extract (solid matter) rather low.

The fruitful departments watered by the Loire and its tributaries produce considerable quantities of wine. The white growths of the Loire have been known for many centuries, but up to the time of the Revolution they were little known. In 1834 they were used only as still wines. At that date, however, it was found that the wines of Saumur (situated in the department of the Maine-et-Loire) could be successfully converted in sparkling wines, and since then a considerable trade in this class of wine has developed. At first it was chiefly used for blending with the wines of the Champagne when the vintage in this district was insufficient, but at present time it is largely used on its own. The imports of sparkling Saumur into the United Kingdom in 1906 amounted to 114,234 gallons, valued at £7,598. Although the average wholesale value of Saumur is considerably less than that of the wines of Champagne, it compares favourably with the lower grades of that article, and in flavour and character is similar to the latter. The successful evolution of the Saumur sparkling wine industry is largely due to the fact that the raw hills, at the foot of which the town is situated, afford by excavation illimitable cellarage, easy
An interesting feature of the Côte d’Or is the Hospice de Beaune, a celebrated charitable institution and hospital, the revenue of which is derived from vineyards in Beaune, Corton, Volnay and Pommard. The wines of these vineyards are sold every year by auction early in November, and the prices they make set new records every year. They are so popular in other countries.

To the south of Lyons, in the department of the Drôme, are made in the district of Valence the celebrated Hermitage red and white wines. The quality of some of these, particularly of the Hermitages, is so excellent as to command very high prices. The finest producers of these wines are located in the small town of Tain-l’Hermitage. The first impetus to this department was given by the destruction of the vines in Algeria. The wines of the Midi.

Wines of Spain.

The wines of Spain may be regarded as second in importance to those of France. Although the quantity produced is not so large as in Italy, the quality on the whole is decidedly superior to that of the latter country. There are three main types of wines consumed in the United Kingdom and are familiar, namely Sherry, Tarragona (Spanish Port or Spanish Red) and wines of a claret type. The trade with the United Kingdom is of considerable proportions, the total quantity of Spanish wines imported in 1906 amounted to 1,659,649 gallons of red wine (to the value of £54,065) and 139,981 white wines to the extent of 1,198,792 gallons (to the value of £243,877).

The most important wine produced in the province of Andalusia, which is the chief vine-growing district of Spain, is that known to us as sherry, so called from the town of Jerez de la Frontera, and produced in a small district bounded by San Lucar in the north-east, Jerez in the east and Port St Mary on the south. The total viticultural area amounts to about 20,000 acres. The soil is of very varied nature, and consists in some districts of the so-called albariza (mainly chalk with some sand and clay), in others of barros, which is mainly sand cemented together with chalk and clay, and of arenas, which consists of nearly pure sand. The vineyards in the three main districts are upon albariza soil, those to the north and north-east are mainly of barros, and those close to the seashore of arenas. The dominating wine is known as seco, and produces a very different kind of wine from the sweet one called manzanilla. Other important wines are the Ferrum and the Mantúas Castellana. There is also a variety of Pedro-Ximenes, which, however, is not used for making ordinary wine, but for the purpose of producing sweet sherry. Malaga is the name of a district, which produces wines made from over-ripe grapes, which, after fermentation with spirit, is employed for sweetening other wines. The process of vinification is comparatively simple. The grapes, after gathering, dusted over with yeast, are put into a rectangular vessel termed the lagar. The juice, which is so obtained together with that which results from the pressing of the murk, is left in a stone tank called bodega, and this process is repeated in all countries. There are two main types of sherry known in the United Kingdom, namely, those of the amontillado and those of the manzanilla classes. The former are generally sweet and full-bodied, the latter light and dry. The manzanillas are mostly shipped in the natural state, except for the addition of a small quantity of spirit. The amontillados may be again divided into the finoes and the olorosos, which differ in color and flavor, and which are made in the same way. According to Thudicum, the regular heavy sherry from albariza soil remains immature for a much longer time than the lighter kind, and if it is left in cask and allowed to develop, it will, after it attains an age of nine to fourteen years, become an oloroso, and still later it may become a seco. In Jerez itself, these wines are termed amontillados, but according to some they never become olorosos. Then there are varieties known as double and treble palma, and single, double and treble palo, the latter being the finest form of oloroso. Then there is the quality of wine termed yerro, which produces a great form of the sherry exported to the United Kingdom. The sweetness of the sherry is partly due to an inherent property of the wine (apart from any sugar they may contain) and partly to added sugar. In some cases the fermentation of the must is stopped by the addition of spirit before the whole of the saccharine is converted, and the wines so prepared retain a proportion of the sugar naturally present in the must. In other cases dry wines are prepared and sugar is added to them in the form of dulce (see above). In order to prevent fermentation it is then necessary to fortify these wines with spirit. The standard of colour required for certain wines varies considerably, and the quality of the wine made by boiling down until it attains the consistency of a liqueur. The great bulk of sherry shipped to the United Kingdom is by the system of blending sherry in some respects recalls that of the Scotch whisky by the system of blending. The wines of these various types are stored in vats or soleras, and the contents of the soleras are kept as far as possible up to a particular style of colour, flavour and sweetness prior to shipment. The blending of various soleras is done according to the nature of the material required.

In addition to the wines described above, there are others of a similar nature grown in the vicinity, such as mantilla (made in Cordova) and manque (produced on the right bank of the Guadalquivir). The bulk of the sherry imported into the United Kingdom still consists of the heavier, fortified wines, varying in strength from 17 to 21% of absolute alcohol, although the fiscal change introduced in 1886, whereby wines not exceeding 10% proof (i.e., 5% alcohol) were admitted at a duty of 1s. 3d., as against 35s. for heavier wines, naturally tended to promote the shipment of the lighter dry wines. This change has had the effect of increasing the importance of sherry into the United Kingdom on a considerable scale commenced in the 15th century, and that the wine shipped at that time was of the dry variety. It seems possible that sherry was the first wine known as such in this country, but it is at least doubtful whether this word is, as some contend, derived from seck or sec, i.e., dry. According to Morewood it is more likely to have come from the Japanese sake or Saki (see Sake), derived in turn from the Sanskrit of the same name.

Chemically the sweet sherry differs from the natural dry light wines in that it contains relatively high proportions of alcohol, sugars, and alcohol-sugar and small quantities of acid and glycine, and this is well illustrated by the following analyses:

Malaga is a sweet wine (produced in the province of that name) which is little known in England, but enjoys considerable favour on the Continent. It is generally, as already explained, made from vino dulce and vino seco, together with varying quantities of vino maestro, vino tierno, arrope and color. The vino maestro consists of wines of varying ages and the vino tierno represents the youngest and includes the grapes (white) grape, the former in much the same way as the dulce which is employed in the sherry industry, the latter by permitting fermentation to take its normal course. The vino maestro consists of must which has been fermented only fermenting but not fully, and the vino dulce, being the one which has undergone the greatest change, is termed "killed" by the addition of about 17% of alcohol. The vino tierno is made by mashing raising (6 parts) with water (2 parts) pressing, and then adding alcohol to the pomace as a rule (for the Palomino femenino) vino dulce to the second, and color by concentrating the arrope over a naked fire. Malaga is therefore an interesting example of a composite wine. Besides the sweet variety, a coarse dry wine is also made, but this is of little importance.

Another well-known wine district in the south of Spain is that of Rota, where a sweet red wine, known in England as tint (tinto), chiefly used for ecclesiastical purposes, is produced.

Wines of the Centre and North.—While the most important Spanish wines are those grown in the southern province of Andalusia, the
central and northern districts also produce wine in considerable quantity, and much of this is of very fair quality. Thus in the central district of Val de Paços and in the Rioja region (situated between Porto and Oporto) north-east of Coimbra, are red wines which in regard to viscosity, body and in some other respects resemble the heavier clarets or burgundies of France—although not possessing the delicacy and elegance of the latter. They are shipped in barrels to the United Kingdom. The Spanish-Spanish district is the "Port" is produced. The finest Tawny this much resembles port is made in the Priorato region, about 15 m. inland.

Wines of Portugal

In the north-east of Portugal, not far from the town of Oporto—where it takes its name and whence it is exported—there is produced a wine, unique in its full-bodied and generous character, known as Port.

Port is grown in the Alto Douro district, a rugged tract of land some 30 to 40 m. long by 10 m. wide, which commences at a point on the river Douro some 60 m. above Oporto. The character of the Alto Douro is extremely mountainous and rugged. J. L. W. Thudichum, in his Treatise on Wines, gives a striking and almost poetical description of it as compared with Jerez. He says: "The vineyards of Jerez are so beautiful and picturesque, that the want of them is not felt. The vineyards of Porto are, on the contrary, undulating hills, easily accessible from all sides, are covered with a luxuriant growth of vine..." Very different is the aspect of the Alto Douro. The vineyards, large, almost inaccessible, on the mountain precipice and torrent, while overlooking all these rugged hills, are drawn countless lines of stone walls by which man makes or supports the soil in which the vines find their subsistence... I thought to myself when I was on the vineyard of Vouga, this Alto Douro vineyard must be termed the vineyard of Hercules." The vineyards are, in fact, situated on artificially made terraces, supported by walls on the mountain sides. If this were not the case the heavy winter floods would have swept all the grapes away. The Alto Douro is variable. Intense heat in summer is followed by severe cold in winter. The soil is a peculiar clay-chest, or on analysis, a granite, sand and argillite, with a peculiar climate and soil that port owes its remarkable qualities of colour, body and high flavour. There appears to be no predominant and distinct type of vine, such as is the case in other viticultural districts, but a number of varieties, mostly yielding grapes of a medium size are common to the Douro vineyards. The method of cultivation is generally that of a rational low culture, and in this respect differs from that employed in other parts of the country, where the vines are either trained on trees or over trellis-work at some height from the ground.

Vinification.—The process of converting the Alto Douro grapes into alcoholic material is different from that used in Lissabon elsewhere. The grapes are cut and then conveyed in baskets by the Gallegos (as the labourers who come specially from Galicia in Spain for this purpose are termed) to the winery. Here the stalks are removed, the clusters are placed in the French foretop, and the grapes then placed in the lagar. This is a square stone vessel of considerable size made to hold up to fifteen pipes (the pipe equals 100 gallons). It is only a little less than 9 ft. deep and 10 yds. wide. The grapes are first trodden for a period varying from twenty-four hours upwards, and are then allowed to ferment in the lagar itself. When the fermentation has reached a certain point it is generally the custom to again tread the must in order to extract as much colour as possible from the skins. In order to preserve the sweet quality of the wine, fermentation is not permitted to continue beyond a certain point. When this is reached the wine is drawn from the lagar over a strainer or some similar arrangement into vats yielding from five to thirty pipes. The marc remaining in the lagar is then pressed by means of a lever or beam press with which a press is furnished. In order to keep the lagar empty, placing further and so becoming dry, from 4 to 5 volumes of brandy are added to every 100 volumes of wine in the vats. The alcohol employed for this purpose is as a rule of high quality and made solely from wine. When, after the approach of the cold weather, the fey have dropped, the wines are racked and a further addition of brandy is made. The second racking takes place in March or April. The wine is then sent to the cooperage, where it is stored in large over-ground buildings termed lodges. A further addition of brandy is generally added before shipment. The great bulk of the wine is stored for many years before shipping, but this does not apply to the commoner varieties, nor to the finest wines, which, being the produce of a specific year, are shipped unblended and as a vintage wine. The most famous vintages of recent times were 1843, 1847, 1861, 1863, 1865, 1870, 1874, and 1887. A white port is also made in the Alto Douro, and this although little known in England, is exported in considerable quantities to Germany and Russia. The white port is grown in vineyards which are not so quite so favour as regards position as the red port growths. White port is made from white grapes, and a peculiarity of its manufacture is that the must is frequently fermented in the presence of the skins, which is most unusual in the case of white wines. This gives a certain stringency to white port, which is characteristic of it.

Distillates.—The Alto Douro has from time to time been sadly ravaged by the oidium and phylloxera. The former first made its appearance in 1868, when the vineyards of the 1860s, and, and reached a climax in 1865, when only about 15,000 pipes, that is, about one-sixth of the usual quantity, was vintaged. In consequence of this, the exportation of port dropped from over 40,000 pipes in 1865 to about 16,000 pipes in 1885. Since then oidium has disappeared from time to time, but the remedy of spraying with finely divided sulphur, which was discovered at the time of the epidemic, has enabled the wine factories to keep up their output. The phylloxera, which appeared in Alto Douro in about 1877, did not do much damage, and at one time reduced the yield to about one-half of the norm. At one time the position appeared to be desperate, particularly in view of the fact that the farmers refused to believe that the trouble was due to anything other than the continuous drought of successive dry seasons, but at the present time, after much expenditure of energy and capital, the condition of affairs is once more fairly satisfactory.

Port Wine Trade.—The port wine trade is of considerable importance to the United Kingdom not only because the chief trade in this country is with the United Kingdom, but also because a very large proportion of the capital invested in the port industry is from the United Kingdom. This is probably the English capital locked up in the port industry amounts to some 2 millions sterling. In the period preceding the 'seventies of the last century the wine exported from Oporto came to Great Britain. Thus in the year 1864 there were exported to Great Britain 29,942 pipes and to the rest of the world 5677 pipes. The trade with the rest of the world, however, has gradually grown since then, the figures being as follows:—

The growth of the export trade from Oporto with the rest of the world is principally due to the enormous increase in the quantity of wine sent to South America, chiefy Brazil, but only a small proportion of this (probably one-eighth) is port wine proper. The bulk of it consists of wine from the Minho and Beira districts. The facts also account for the increase of wine sent from Oporto are much higher than the total production of the wine in the Alto Douro. At the present time the average production of the Alto Douro is about 50,000 pipes. During the last decade it was at a maximum in 1873 and a minimum in 1882, and between these years, when only 18,000 pipes were obtained. The value of the port taken by the United Kingdom was in the year 1906 over one million sterling, also in 1906 two-thirds of the port produced in Oporto was exported, but more than double the value of the total of Spanish wines.

The chemical features of interest in port are the relatively high proportions of alcohol (the bulk of the wine imported into the United Kingdom containing some 18 to 22% of alcohol), sugar and tannin. The sugar varies considerably according to the vintage, but as a rule amounts to from 7% to 15%.

Other Portuguese Wines.—The wines of the Alto Douro only form a small proportion of the total quantity of wine produced in Portugal. The main wine-growing district outside that of Oporto is in the neighbourhood of Lisbon, where the chief varieties of wine, those grown at Torres Vedras, which are of a coarse claret type; at Colares, where a wine of a somewhat higher quality is produced; at Carcavelos, at the mouth of the Tagus; and at Bucelas. In the latter district is the vineyard known as the 'appellation of Bucelas Hock.'

As far as the United Kingdom is concerned, the Madeira wine imported amounts to about the middle of the 19th century, developed by and is chiefly in the hands of British merchants. The shipments to the United Kingdom, however, which reached a maximum in 1826, when over half a million gallons were imported, fell off to a low point of that amount, and the consumption in these islands was barely 20,000 gallons in 1906. This falling away in the taste for Madeira is partly ascribable to fashion, and partly to the fact that in the middle of the 18th century, the oidium and phylloxera, in the middle of last century. The re-establishment of the vineyards and the consequent development of the industry did not, however, lead to a renewal of the trade on the former scale with this country. The output in 1906 amounted to 10,000 pipes (Madeira...

WINE

727

pipe—92 gallons) and the export to 6010 pipes, of which quantity 1951. But the wine to Germany, 1660 pipes to the U.S., 792 to Russia, and 755 pipes to the United Kingdom. Madeira, like sherry and port, is a fortified wine. The method of vinifaction is similar to that employed for Porto, but the method employed for imparting the characteristic flavour of Madeira is due to this practice, which hastens the mellowing of the wine and also tends to check secondary fermentation inasmuch as it is, in effect, a mild kind of pasteurization.

WINES OF GERMANY

Although the quantity of wine produced in Germany is comparatively small and subject to great variations, the quality of the finer wines is, in successful years, of a very high order. In fact Germany is the only country which produces natural (i.e. unfortified) wines of so high a class as to be comparable with—although of an entirely different character from—the wines of France. The finer wines possess great breed and distinction, coupled with a very fine and pronounced bouquet, and in addition they are characterised by the presence of natural sugars. Much of the characteristic flavour of Madeira is due to this practice, which hastens the mellowing of the wine and also tends to check secondary fermentation inasmuch as it is, in effect, a mild kind of pasteurization.

The wines grown in the Rheingau, Rhénhessen and in parts of the Palatinate are generally known by the name of Rhine wines, although many of these are actually produced on tributaries of the Rhine, such as the Moselle, which the curious generic term “hock” employed in England for Rhine wines is derived, is made in the vicinity of the little village of that name situated on the Main, a number of miles above the junction of the Danube and the continuous district proper stretches along the north bank of the Rhine from Bingen on the west to Mainz on the east. The most important wines are produced by the so-called method of the Rhine 

The vineyards of the farmers are said to have been planted originally in the 11th century, but were destroyed during the Thirty Years' War. They were replanted by the abbot of Fulda in the 18th century. During the French Revolution, the noble proprietors of the Schloss Johannisberg, owners of the first vineyards on the Rhine, took the hands of the prince of Orange, but after the battle of Jena, Napoleon deprived him of it and presented it to Marshal Kellermann. On the fall of Napoleon, the emperor of Austria took possession of the vineyard and gave it to Prince Metternich. At the present time, the property still belongs to the descendants of the latter. The vineyards of Steinberg belong to the state of Prussia. The vineyards of these two properties are considered by the wine writers as producing the best Rhine wines of the district proper. The wines, from which several qualities are made in each case, fetch exceedingly high prices. The finest wines are produced in a manner somewhat similar to that employed for making the Sauternes. The grapes are allowed to become overripe and are then selected by hand. This process produces the so-called Auslese wines, which, frequently fetch as much as 30s. or 40s. a bottle. The other most important wines produced in the Rheingau and its extensions are those of Markobrunn, Geisenheim and Deidesheim.

The best wines produced in Rheinhessen (on the left bank of the Rhine and south of the Rheingau) are those of Liebfraumilch, Nierstein, Heppenheim, Laubenheim and Scharlachberg. In the Palatinate the most important wines are those of Deidesheim and Dürkheim.

The Moselle wines are divided into two classes: those of the Rhineland-Palatinate and those of the Moselle. The Moselle wines are slightly less light and of a somewhat delicate nature. While the Rhine wines generally improve in bottle for a longer period, the Moselle wines are essentially fresh. Indeed, many connoisseurs hold that when a Moselle ceases to show signs of the somewhat prolonged secondary fermentation on which the wine's characteristic flavour is based, it has passed its best. The best-known growths of the Moselle are those of Brauneberg, Bernkastel, Piesport and Zeltingen. Some of the Moselle also produce wines which in quality approach those of the parent river. Among these may be cited the growths of Scharzhofberg, Geisberg and Bockstein.

Large quantities of wine are produced in Alsace-Lorraine, Baden and Württemberg, but the majority of these have little interest, inasmuch as they are used only for home consumption. Among the best known of these are the so-called deckelkasten, or decanters, a fact which the celebrated Stein wine, which is grown at the foot of the citadel of the town of Würzburg, and in the grand duchy of Baden the celebrated growths of Affental (region of Durbach). Practically all the important wines of Germany are white, although there are a few red growths of some quality, for instance that of the Moselle. Wines are grown in the Mosel Valley, in the black Burgundy vine, the Pinot. In the Rheingau the predominant wine is the Riesling. This plant appears to be indigenous to the Rhine valley, and the finest wines are made exclusively from its grapes. In the hope of reproducing the characteristic of the Rhine wines, the Riesling has been planted in many young wine-producing countries, such as Australia, California and the Cape, and not entirely successfully. The vine is not at home on rocky mountain slopes freely exposed to the sun, and requires a sheltered position to reach perfect maturity. In the lower lands, therefore, it is customary to plant, in addition to the Riesling, vines such as Österreicher and Grauburgunder, which can develop better. Varieties, such as the Orkans and the Traminer, are also found in small quantities in the Rheingau. On the Moselle the Riesling and the Kleinerberger are the chief growths. The vintage on the Rhine is, in order to permit the grapes to acquire the "over-maturity" to the peculiar character of the wines, generally very late, rarely taking place before the end of October. The process of vinification is peculiar in that fermentation takes place in relatively small casks, the result being that wine is frequently marked differences in the produce of the same growth and vintage.

The very great variations which are shown by the same growths of different vintages are the result of the fact that comparatively few white wines to give representative analyses of them. Comparing the fine wines of the better vintages with, for instance, the red wines of the Gironde, the main features of interest are the relatively high proportion of alcohol, of acid and glycérin and the low proportion of tannin which they contain.

WINES OF ITALY

Italy ranks second to France as regards the quantity of wine produced, but in respect to quality a comparison is scarcely possible, inasmuch as the Italian wines are on the whole of a poor character. They display many of the features characteristic of southern wines, which is not surprising in an extensive country mostly producing a somewhat crude bouquet, or where the alcoholic strength is not high, and consequently lacking in body and richness. The reason for this is to be sought partly in the unsatisfactory methods of cultivation, and partly, in many districts, in the absence of suitable methods of ripening, inasmuch as a general extent still trains on trees or trellis-work, or allowed to grow among the rest of the vegetation in the most casual manner. It must be stated, nevertheless, that of recent years a decided improvement has set in in the more important districts, the lively interest which the Italian government has taken in the subject, principally owing to the important export trade to America, Switzerland and other countries. The trade with the United States, which in 1897 amounted to little over 120,000 gallons, has risen to considerably over a million gallons. The exports to the Argentine Republic amount to roughly 4 million gallons, and to Switzerland from 4 to 8 million gallons. The free growths of Italy are considered as amounting to little over a quarter of a million gallons annually, and of a value rather less than £50,000. The total exports of Italy are on the average not far from 40 million gallons. The wines of northern Italy are on the whole of good colour, but somewhat harsh. Among the best-known wines in Piedmont are the Barolos and the wines of Asti, which are made from a species of muscatel grapes. They are of an agreeable flavour, and this especially so in the case of sparkling wines. The wines of Lombardy are the Passellas wines of Valtellina. In central Italy the best growths are those of Chianti, of Montepulciano, and the wines of Toscana. The wines of Chianti, near Siena, are often described as being of the claret type, but actually they are somewhat similar to the growths of Beaujolais. The best Italian wines, however, are the red wines of the Venetian districts. The best of these is the celebrated Lacrima Christi, which is grown on the slopes of
Vesuvius from a vine bearing the same name. It has a fine red color, and unites delicacy and a high bouquet with a sweet elegant taste. The white muscat wines of Vesuvius are also of good quality, and with the 1901-1903 being the two best years for the production of some excellent wine. Perhaps the best known of Italian wines in the United Kingdom is that produced in the neighbourhood of Marsala in the island of Sicily, which bears the name of the district on which it is produced. For centuries it has formed the chief wine which is grown and made with considerable care. It is somewhat similar in character to the wines of Madeira, but its character also recalls some of the sherry types. It is vatted and bottled in exactly the same way as the sherry, and as a matter of fact is produced in the same trade with this in the United Kingdom. In the neighbourhood of Palermo, Muscat and Malvosie wines of very fair quality are made. The islands of Sardinia and Elba produce considerable quantities of wine, some of which is exported.

Wines of Austria-Hungary

In point of quantity Austria-Hungary takes the fourth place among the wine-producing nations. The average production for the period 1901-1903 was 176 million gallons. Of this quantity Austria is responsible for roughly two-thirds and Hungary for the remaining one-third. The character of the Hungarian wine is, however, much higher than that of the Austrian growths. The quality of the bulk of the Austro-Hungarian wines has been improved of late years, principally owing to the endeavours of the respective governments to introduce scientific and modern methods among the wine-growers. Since the recovery of the Hungarian vineyards from the phylloxera considerable efforts have been made to develop an export trade, but so far without much success. Vienna is now the most important wine port in the kingdom. Nevertheless, Hungary produces at least one class of wine which may be considered of international importance, namely, the famous Tokay which is produced in the mountainous Hegyalja district in a region which has the town of Tokay for its centre. The vine from which Tokay is made is the Furmint. The finest varieties of Tokay are made entirely or mainly from Furmint grapes which have been allowed to become overripe, or to be dried, so that the sun is said to be almost the same as that obtaining in the Sauternes districts. In the case of Tokay the juice into which the wine is pressed is not brought into contact with the particular micro-organisms. The sun is sufficiently powerful to cause the evaporation of the water in the grape through the skin without any preliminary loosening of the latter by the action of the botrytis cinerea, so that the resulting wine, known as the Tokay is the so-called essence. This is produced by placing the finest grapes in casks and drawing off the juice which exudes naturally as a result of the weight of the material. The Tokay essence is, even after many years, still partly fermentable, rarely containing more than 7% to 9% of alcohol. Indeed, it may be said that the main fermentation rarely, if ever, reaches a climax. Another variety of Tokay is the so-called szamorod. This is produced by pressing a mixture of dried grapes and full ripe grapes and fermenting the must so obtained. It contains up to about 14% of alcohol and relatively little sugar. The most common kind of Tokay is the so-called szamorod, which is obtained from grapes dried on the vine, with the must of ordinary grapes. According to the amount of dried grapes (szibels) employed, the wine is termed 1 to 5" buttik." The Austrohugarian wines take from three to four years to ripen, and they may remain alcoholic for a lifetime. They may be sweet or dry, but in quantity of sugar, these factors varying according to the vintage and the number of "butts" of szibels employed. Another variety of Tokay is the Falstaff or "mátrai", which is a mixture of various varieties of wines according to the district, but in the neighbourhood of Tokay it generally refers to wines obtained by treating szamorod or Austrohugarian residues with dry wine. In the neighbourhood of Ménes sweet red wines produced by the Austrohugarian system are also termed m sídás. Hungary produces a variety of other wines both strong, such as those of central Hungary, and relatively light, such as those of Transylvania and Transylvania. The wines produced at Carlowitz (on the Danube), some 40 m. north-west of Belgrade, are somewhat stronger. They have a flavour somewhat resembling port, but are coarser, and lack the fine bouquet of the latter. The other chief vine districts are the eastern parts of Hungary, Transylvania, and Styria. Some of the Dalmatian wines are of fair quality, and somewhat resemble Burgundy.

Wines of the United States

The cultivation of the vine has made very rapid strides in the United States during the past two decades, and the 1901-1903 production was estimated to little more than 30 million gallons, the output to-day is, in good years, not far short of 50 million gallons. The result has been that the domestic wines have now very largely displaced the foreign wines. However, for a long time, there is no reason to believe that the finer European wines will be entirely displaced, inasmuch as these are characterized by qualities of delicacy and breed which cannot be reproduced at will. The American wines have been, however, the受害者 of the world. In the United States is of very fair quality, and this is largely due to the fact that the Americans have been at great pains to introduce the latest scientific methods in regard to the vine and wine-making. Thus in parts of California, where high temperatures are liable to prevail during the vintage, the system—first employed in Algeria—of cooling the must during fermentation to the proper temperature by means of a series of pipes in which iced water circulated. This is at present adopted in almost every European wine-growing centre, and the produce of these wines is the Riesling, Hermitage, Sauternes, Chianti, &c., in accordance with the district of origin of the wine. California is the largest wine-producing state of the United States, and there is a considerable trade in this wine with the United Kingdom. In the case of Tokay is the name.

Wines of the British Empire

The production of the British empire is very small, amounting to some 40 million gallons in 1905 and 1906. Wines of the Cape of Good Hope and in the Australian Commonwealth. At present the average vintage of the Cape and of Australia is in each case roughly 5 to 6 million gallons. In 1905 New South Wales produced 75,000,000 gallons, the latter of which is the most powerful of the wines. The trade of Australia with the United Kingdom is now considerable, having increased from 168,188 gallons in 1887 to 622,836 gallons in 1906. It is possible that the trade would grow much more rapidly than it has done if we were practicable to ship the lighter varieties of wines. These, which would be suitable for ordinary beverage purposes, cannot as a rule stand the passage through the Red Sea, and it is therefore only possible to ship the heavier or fortified wines. It is doubtful, therefore, whether the products of the British Empire will ever displace European wines in the United Kingdom on a really large scale, for they cannot compete with the lighter varieties. The most important country, for the reason stated, with the lighter beverage wines. The quality of the wine produced in the Cape and in Australia has improved very much of recent years, chiefly owing to the introduction of modernmethods, but they are still 15 or 20% behind the more than the same manner as has been the case in California. The red wines of Australia, particularly those of South Australia, some- what resemble the wines of the Rhine. These wines are not at all resembles the wines of the Rhine. These wines are not at all
defective, and are therefore very popular in the Cape and Australia, and are regarded as a curiosity. There are several types of white wines, some resembling French Sauternes and Chablis and others the wines of the Rhine. They have been recog- nized, however, that it is impossible to actually reproduce the character of the European wines, and it is now generally held to be desirable to recognize the fact that Australian and Cape wines represent distinct types, and to sell them as such without any reference to the European parent types from which they have been derived.

Other Countries

Considerable quantities of wine are produced in the Balkan states, but the bulk of this is of a coarse description and only fit for local consumption. The average yield of Bulgaria and Roumania is probably about 20 to 40 million gallons, and in the case of Roumania it is much larger. In 1866 Roumania produced no less than 101 million gallons and Bulgaria 81 million gallons. The wine industry in Roumania is chiefly devoted to the cultivation of the currant vine (Vitis corinthisica). Roumania produces about 800,000 gallons of these unpopular non-fermentative wines, which the Roumanians call "Vins de pays." The quality is not so good, and the wines are not at all suitable for the modern European taste. In Asia wine is produced, according to Thudichum, principally in Caucasia and Armenia. In Persia, also, wines are made, especially in the Shiraz district. Russia also produces a small quantity of wine, principally in the Crimea. (P.S.)
WINEBRENNER—WINGATE

WINEBRENNER, JOHN (1797-1860), American clergyman, founder of the "Church of God," was born in Glade Valley, Frederick county, Maryland, on the 25th of March 1797. He studied at Dickinson College, Carlisle, Pennsylvania, and was ordained in the German Reformed Church in 1820 and became a pastor at Harrisburg, Pennsylvania, where his revival preaching and his Revolt Hymn-Book (1852) brought about a break between his followers and the Reformed Church. In 1830 he founded the Church of God (whose members are commonly called Winebrennerians); he was speaker of its conference and edited its organ, The Church Advocate, until his death in Harrisburg on the 12th of September 1860. He wrote Brief Views of the Church of God (1834); A Treatise on Repentation (1844); Doctrinal and Practical Sermons (1860); and with I. B. Rupp, The History of all the Religious Denominations in the United States (1844).

The Church of God has three sacraments: baptism (by immersion), feet washing and the Lord's Supper (administered to Christians only, in a sitting posture, and in the evening); it is generally Amishian and pre-millennialist, and in government has local elders and deacons, an annual eldership composed of pastors and lay elders, and, chosen (by and from) the annual elderships, a general eldership which meets once a year in the denominational center in Franklin County, number 518 organizations and 24,356 communicants, in the following states: Pennsylvania (11,157), Ohio (2980), Indiana (1992), Illinois (1552), Maryland (1204), Missouri (105), Iowa, West Virginia, Missouri, Arkansas, Nevada, and Kentucky. Minnesota, Oregon and Arizona. Under the general eldership are: Findlay College, Findlay, Ohio; Fort Scott College Institute, Fort Scott, Kansas; and an academy at Barkeyville, Pennsylvania. Some form of mission work is done in Bengal.

WINER, GEORG BENEDIKT (1789-1858), German Protestant theologian, was born at Leipzig on the 13th of April 1789. He studied theology at Leipzig, where eventually (1832) he became professor ordinarius. From 1824 to 1830 he edited with J. G. V. Engelhardt the Neues britisches Journal der theologischen Literatur, and alone from 1830 to 1832 the Zeitschrift für wissenschaftliche Theologie. He is well known as a translator of the works of Lessing and other German authors.

His other works include: Komparative Darstellung der Lehrbegriffe der verschiedenen christlichen Kirchenpartieen (1824; 4th ed. by P. Ewald, 1882; Eng. trans., 1873), Biblical Reuelorber, (1820; 3rd ed. 1847), Die ursprünglichen biblischen und lutherischen Chaldaismum (1825; 3rd ed. by B. Fischer, Chaldaische Grammatik für Bibel und Talmud, 1826; Eng. trans. 1845) and a useful Handbuch der theologischen Literatur (1820; 3rd ed. 1836-1840. 2 vols.; supp. by Dr. Edmund Slatin and Dr. G. B. Winters," in the Beiträge zur sächsischen Kirchengeschichte.

WINE-TABLE, a late 18th-century device for facilitating after-dinner drinking—the cabinetmakers called it a "Gentleman's Social Table." It was always narrow and of semicircular or horseshoe form, and the guests sat round the outer circumference. In the earlier and simpler shapes metal wells for bottles and ice were sunk in the surface of the table; they were fitted with brass lids. In later and more elaborate examples the tables were fitted with a revolving wine-carriage, bottle-holder, or tray working upon a balanced arm which enabled the bottles to be passed to any guest without shaking. The side opposite the guests was often fitted with a network bag. It has been conjectured that this bag was intended to hold biscuits, but it is much more likely that its function was to prevent glasses and bottles which might be upset from falling to the floor. That the wine-table might be drawn up to the fire in cold weather without inconvenience from the heat it was fitted with curtains hung upon a brass frame and running upon rings. Sometimes the table was accompanied by a circular bottle-cabinet supported on a tripod into which the bottles were deeply sunk to preserve them from the heat of the fire. Yet another form was circular with a socket in the centre for the bottle. Wine-tables followed the fashion of other tables and were often inlaid with wood or brass. They are now exceedingly scarce.

WINFIELD, a city and the county-seat of Cowley county, Kansas, U.S.A., in the S. part of the state, on the Walnut river, about 40 m. S.S.E. of Wichita. Pop. (1850) 3184; (1900) 5554, of whom 203 were foreign born and 282 were negroes; (1910) 7650. It is served by the Atchison, Topeka & Santa Fe, the Missouri Pacific, and the St. Louis & San Francisco railways, and is connected by electric line with Arkansas City, Arkansas. In the city are St. John's Lutheran College (1893), the South-west Kansas College (Methodist Episcopal, opened in 1886, St. Mary's Hospital and Training School (1898), Winfield Hospital (1900), a Lutheran orphan's home and a State School for Feeble-minded Youth. Island Park (50 acres) is the meeting-place of a summer Chautauqua. Winfield is a supply and distributing point for a rich farming country, in which large quantities of wheat and alfalfa are raised. Limestone is quarried near the city, and natural gas is found in the vicinity, and piped in from eastern fields for general use in the city. The municipality owns and operates the waterworks and the electric-lighting plant. Winfield was settled in 1870 and incorporated in 1871.

WINGATE, SIR FRANCIS REGINALD (1861—_), British general and administrator in the Sudan, was born at Broadfield, Renfrewshire, on the 25th of June 1861, being the seventh son of Andrew Wingate of Glasgow and Elizabeth, daughter of Richard Turner of Dublin. He was educated at the Royal Military Academy, Woolwich, and became a lieutenant in the Royal Artillery in 1882. He served in India and Aden, 1881-1883, and in the Zulus and Zambesian campaigns, during which he helped to secure the reorganization by Sir Evelyn Wood, and in the Gordon Relief Expedition of 1884-1885 was A.D.C. and military secretary to Sir Evelyn. For his services he received the brevet rank of major. After holding an appointment in England for a brief period he rejoined the Egyptian army in 1886. He took part in the operations on the Sudan frontier in 1889, including the engagement at Toski and in the further operations in 1891, being present at the capture of Tokar. In 1894 he was governor of Suakin. His principal work was in the Intelligence branch of the army, of which he became commander in 1898. An expert on Arabic, his knowledge of the country, the examination of prisoners, refugees and others from the Sudan, and the study of documents captured from the Dervishes enabled him to publish in 1891 Mahdism and the Egyptian Sudan, an authoritative account of the rise of the Mahdi and of subsequent events in the Sudan up to that date. Largely through his instrumentality Father Ohrwalder and two nuns escaped from Omdurman in 1891. Wingate also made the arrangements which led to the escape of Slatin Pasha in 1895. The English versions of Father Ohrwalder's narrative and A.D.C. Wingate's account of the Camp, 1892) and part of Slatin's book (Fire and Sword in the Sudan, 1896) were from Wingate's pen, being rewritten from a rough translation of the original German.

As director of military intelligence he served in the campaigns of 1896-1898 which resulted in the reconquest of the Sudan, including the engagement at Firket, the battles of the Atbara and Omdurman and the expedition to Fashoda. In an interval (March-June 1897) he went to Abyssinia as second in command of the Rennell Rodd mission. For his services he was made colonel, an extra A.D.C. to Queen Victoria, received the thanks of parliament and was created K.C.M.G. Wingate was in command of an expeditionary force which in November 1899 defeated the remnant of the Dervish host at Om Debrekhat, Kordofan, the khilifa being among the slain. For this achievement he was made K.C.B. In December of the same year, on Lord Kitchener being summoned to South Africa, Sir Reginald Wingate succeeded him as governor-general of the Sudan and sirdar of the Egyptian army. His administration of the Anglo-Egyptian Sudan was conspicuously successful, the country, after the desolation of the Mahdi, rapidly regaining a measure of prosperity. In 1903 he was raised to the rank of major-general and in 1908 became lieutenant-general. He was also created a pasha and in 1905 received the honorary degree of D.C.L. from Oxford University. In 1909, at the request of the British government, Wingate undertook a special mission to Somaliland to report on the military situation in connexion with the proposed evacuation of the interior of the protectorate.
WINGFIELD, EDWARD MARIA (c. 1560–c. 1614), English colonist in America, was born at Stoneley, Huntingdonshire, about 1560. He served as a soldier both in Ireland and the Low Countries, was one of the patentees of Virginia in 1606, and in 1607 accompanied the first colonists to Jamestown. He was elected president of the Council (15 May 1607), but his arbitrary manners, the fact that he was a Roman Catholic, and the suspicion that he was friendly toward Spain led to his deposition in September. He returned to England in April 1608, and died after 1613.

His amplified diary, entitled "A Discourse of Virginia," was published in Archaeologia Americana, vol. iv. (Worcester, 1860), with introduction and notes by Charles Deane.

WINGFIELD, SIR RICHARD (c. 1450–1525), English diplomatist, was one of the twelve or thirteen sons of Sir John Wingfield (d. 1481) of Letheringham, Suffolk. He became a courtier during the reign of Henry VII. and was made marshal of Calais in 1512.

With Sir Edward Poyning and others he was sent in 1512 to arrange a holy league between the pope, the English king and other sovereigns, and in 1514 he went to the Netherlands to try and arrange a marriage between the archduke Charles, afterwards the emperor Charles V., and Henry VIII.'s daughter Mary. In the intervals between these and similar errands Wingfield was occupied in discharging his duties at Calais, but in 1519 he resigned his post there and returned to England. In 1520 Sir Richard was appointed ambassador to the French court, but in his absence the prince of Wales married Margaret of Austria.

Sir Richard was successively ambassador at Lille and Antwerp, and in 1526 he was made a knight and privy councillor of King Henry VIII. He was also one of the Knights of the Garter from 1524 to 1525. He died in London on 22 July 1525. In 1524 he had been made chancellor of the duchy of Lancaster. For his services Wingfield received lands in various parts of England, including Kimbolton in Huntingdonshire, where he enlarged the castle.

Sir Richard had two brothers who attained some celebrity: Sir Robert (c. 1464–1539), a diplomatist, and Sir Humphrey (d. 1541), the speaker of the House of Commons from 1531 to 1536. An elder brother, Sir John, sheriff of Norfolk and Suffolk in 1483, had a son Sir Anthony (c. 1458–1552), who was present at the Field of the Cloth of Gold. Twice during 1521 he visited Charles V., his object being to deter him from making war on France, and he was on an errand to Spain when he died at Toledo on the 22nd of July 1525.

In 1524 he had been made chancellor of the duchy of Lancaster. For his services Wingfield received lands in various parts of England, including Kimbolton in Huntingdonshire, where he enlarged the castle.

WINKELRIED, ARNOLD VON. The incident with which this name is connected is, after the feat of William Tell, the best known and most popular in the early history of the Swiss Confederation. We are told how, at a critical moment in the great battle of Sempach, when the Swiss had failed to break the serried ranks of the Austrian knights, a man of Unterwalden, Arnold von Winkelried by name, came to the rescue. Commending his wife and children to the care of his comrades, he rushed towards the Austrians, gathered a number of their spears together against his breast, and fell pierced through and through, having opened way into the hostile ranks for his fellow-countrymen, though at the price of his own life. But the Tell and Winkelried stories stand in a very different position when looked at in the dry light of history, for, while in the former case imaginary and impossible men (bearing now and then a real historical name) do imaginary and impossible deeds at a very uncertain time and place, the last of the 14th century, Winkelried's act might very well have been performed, though, as yet, the amount of genuine and early evidence in support of it is very far from being sufficient.

The history of the Winkelrieds of Stans from 1248 to 1354 has been minutely worked out from the original documents by Hermann von Liebenau, in a paper published in 1854, and reprinted at Aarau in 1862, with much other matter, in his book, Arnold von Winkelried, seine Zeit und seine That. They were a knightly family when we first hear of them about 1250, and though towards the end of the 14th century they seem to have been but simple men without the honours of knighthood, and not always using their prefix "von." Among its members we find an Erni Winkelried acting as a witness to a contract of sale on the 1st of May 1367, while the same man, or perhaps another member of the family, Erni von Winkelried, is plaintiff in a suit at Stans on the 29th of September 1389, and in 1417 is the landman (or head man) of Unterwalden, being then called Arnold Winkelriet. We have, therefore, a real man named Arnold Winkelried living at Stans about the time of the battle of Sempach.

The last of the family, Arnold von Winkelried, is said to have fought at the battle, and did he then perform the deed commonly attributed to him? This involves a minute investigation of the history of that battle, to ascertain if there are any authentic traces of this incident, or any opportunity for it to have taken place.

1. Evidence of Chronicles.—The earliest known mention of the incident is found in a Zürich chronicle (discovered in 1862 by G. von Wyss), which is a copy, made in 1476, of a chronicle written at any rate not earlier than 1483, though it is wanting in the 16th-century transcript of another chronicle written in 1466, which up to 1389 closely agrees with the former. It appears in the well-known form, but the name is, as usual, changed to Edelried. The date is given as 1389, and the name being given, and it seems clear that his death did not take place at that time. No other mention has been found in any of the numerous Swiss or Austrian chronicles till we come to the book De Historia origine, written in 1538 by Rudolph Gwalther (Zwingli's son-in-law), where the hero is still nameless, being compared to Decius or Cosmus, but is said to have been killed by his brave act. Finally, we read the full story in the first official draft of the Zürich chronicle, where the hero is described as "a man of Unterwalden, of the Winkelried family," this being expanded in the final recension of the chronicle (1584) into the story of Unterwalden, and allowed a brief knight," while he is entered (in the same book, on the authority of the "Anniversary Book" of Stans, now lost) on the list of those who fell at Sempach at the head of the Nidwalden (or Stans) men as "Arnold von Winkelriet, Ritter," this being in the first draft "Arnold Winckelriet."
Winkler and his deed. This is a long ballad of 67 four-line stanzas, part of which (including the Winkleried section) is found in the additions made between 1531 and 1545 to Etterlin's chronicle by 1580. Schweizer, however, has stated that he was not the author of the Winkleried, but that he was joined by a younger author, possibly the son of the first author. (The authorship of the Winkleried, of course, is a matter of dispute, and the dating of it is uncertain, but the best guess is that it was written 1532.) It is agreed on all sides that the last stanza, attributing the authorship to Halbser or Lucerne, "as he came back from the battle," is a very late addition. Many authorities regard it as spurious, and Schweizer was one of the first to indicate that the author of the Winkleried, possibly put together by the younger Halbser (citizen of Lucerne in 1435, died between 1470 and 1480), others consider it a genuine work that clearly arose from the period when the battle was still regarded as a recent event, having been composed after the Reformation began, that is, about 1520 or 1530. Some recent discoveries have proved that certain statements in the song usually regarded as anachronisms are quite accurate, and Schweizer has shown that they may have been based on events that were still in the minds of the men who were present. This is confirmed by the fact that the ballad was frequently performed at Sempach, in the courts of the Swiss, pointing out an interesting link between the chronicle of 1476 and other later accounts attribute to the Austrian court. The long spear and the long spears were the special characteristics of Swiss soldiers, and that if Winkleried were a knight (as is asserted by Schweizer) it would have had a shield, or at least a breastplate, neither of which could have been pierced by hostile lances.

If it is possible to think of this daring theory, it seems clear that, while there is some doubt as to whether such an act as Winkleried's possible was done at Sempach, taking into account the known details of the battle, there can be none as to the utter lack of any historical evidence for it, and that of Winkleried having performed that act in that battle. It is quite conceivable that such evidence may later come to light; for the present it is wanting.

AUTHORITIES.—See in particular Theodor von Liebmann's Die Schlacht bei Sempach—Gedenkbuch zur fünfzigjährigen Säcularfeier (1862); published at the expense of the government of Lucerne. This contains every mention or description of the battle or of anything relating to it, published or unpublished, in prose or in verse, composed within 300 years after the battle, and is a most marvellous and invaluable collection of original materials, in which all the evidence for Winkleried's deed has been brought together in a handy package. The work is divided into three main sections: the Winkleried by W. Oechsli in vol. iii. of the Allgemeine deutsche Biographie, the following are the most noteworthy publications relating to this controversy. In support of Winkleried's act: G. v. Schweizer, Die Schlacht bei Sempach (Zürich, 1860); A. Daguett, "La Question de Winkleried," in the Musée Neuchâtelois für December 1883; G. H. Oechsli, "Die Winkleried," in the Sonder-Mitteilung der Bunngszeitung für January and February 1879; A. Beutin, Die Vahl (Basel, 1886); W. Oechsli, Zur Sempacher Schlachtfeier (Zürich, 1886); E. Secretan, Sempach im Winkleried (Lausanne, 1886); and the summary in K. Dindler's larger Geschichte der Schweiz, i. 550-559 (3rd ed., Zürich, 1893). Against Winkleried's claims we have the remarkable study of O. Kleissler, Die Quellen der Sempacher Schlacht und die Winkleriedsaga (Göttingen, 1873); O. Hartmann, The Winkleried in the Biographie (Frauenfeld, 1886); and the complete summary of the evidence given by M. v. Stürlin (the first to suspect the story) in the Anzeiger für Schweiz. Geschichte (1881), 393-394.

WINNIPEG, the capital of Manitoba, and chief city of Western Canada. It is situated at the junction of the Assiniboine and Red rivers in the middle of a wide plain. The river valley, being of exceptional richness, early attracted the traders, and so in the beginning of the 19th century gained the attention of Lord Selkirk, a benevolent Scottish nobleman who sent out in 1811-1815 several hundreds of Highland settlers. On the site at the junction of the two rivers where Verandreyre, the first white explorer to visit the Red river, had three-quarters of a century before this valuable region, Fort Rouge, and where some ten years earlier in the century the Nor'-Westers Company, under the command of the gallant Major General Francis de L'Islet, captured Fort Gibraltar, the Hudson's Bay Company, which at the time Lord Selkirk and his friends controlled, erected Fort Douglas, bearing the family name of the colonizer. After bloodshed between the rival fur companies, and their union in 1821, Fort Garry was erected, as a trading post and settlers' depot, and with somewhat elaborate structure, with stone walls, bastions and portholes. Fort Garry (2) was erected at a considerable cost in 1835. A short distance north of this fort, about the year 1860, the first house on the plain was erected, and to the hamlet there was given the name of the river, the Red River of the North. Fort Garry (3), situated on a point of land, or peninsula, between the river and the bay, was named in honour of Lord Selkirk (Cree, Wis, mucky, nip, water), the name referring to its setting between its water and that of the transparent lakes to the east. For ten years the hamlet grew—though very slowly, it being more than four hundred miles from St Paul, the nearest town in Minnesota, to the south. The fur-traders did not seek to increase its size. When the transfer of Rupert's Land took place to Canada in 1870, the governor of Assiniboia had his residence at Fort Garry, and here was the centre of government for the settlers over the area surrounding Fort Garry. Its acquisition by Canada and the influx of settlers from Eastern Canada led to the growth and development of this little town which was now generally called. The establishment of Dominion government agencies, the formation of a local government, the machinery required for the government of the province, the influx of a small army of surveyors who mapped out and surveyed wide districts of the country, and the taking up of
WINNIPEG—WINONA

free lands in all directions by Canadian settlers, all tended to build up the hamlet of Winnipeg into a considerable town.

The following figures of population show the remarkable increase of Winnipeg: (1870) 215; (1874) 1,869; (1885) 19,574; (1898) 39,384; (1901) 42,340; (1903) 75,975; (1906) 96,153; (1907) 100,000 (estimated). The rapid growth of the city, the character of the soil, and the high prices of material for street and bridges, have led to a large and expensive civic organization. The city is governed by a mayor, four controllers, and twelve aldermen. The city possesses the public utility of water, but the city street car system, gas, and private electric lighting are in the hands of a private company. The city has decided to introduce electric power from Winnipeg river, at a point some 50 miles distant. The streets are in some cases macadamized and in other cases block paved, and in still others asphalted. The Parks Board is a board appointed by the city council, and has the complete administration of a fixed percentage of the city taxes. The streets are boulevarded, trees planted on them, and both of these kept by the Parks Board. A number of well-kept small parks are found throughout the city, and a large park—the Assiniboine—is being prepared and beautified. The greatest business street is Main Street, on which (north) is the Great Canadian Pacific railway station and Royal Alexandra Hotel are situated, and (south) the Union station of the Canadian Northern and Grand Trunk Pacific railways are found. On or near this street (132 ft. wide) are placed the great financial institutions of the city, including eighteen chartered banks, mutual building and fire insurance, and real estate buildings and offices. The department stores and offices of the Hudson's Bay Company and its Fort Garry court, which stand on Main Street South, are worthy of that ancient city. The city hall, with park and volunteers' monument, are on the same street, while the lofty Union Bank, McIntyre, and Bon Accord blocks are here wildnesses of offices of every description. The second great street, Portage Avenue, of the same width as Main Street, runs at right angles to Main Street, and is the mercantile street of the city. On this are the post office, Free Press office, Y.M.C.A. building, Aikins Block, T. Eaton & Co.'s enormous departmental shop, and the Ideal Building, which are worthy of note. The wholesale business street of the city is Princess, running parallel to Main Street; and the two most beautiful residential streets are Broadway and Assiniboine Avenues. All parts of the city are reached by the Winnipeg electric street railway, which runs north for 25 m. on the continuation of Main Street to the town of Selkirk, west along Portage Avenue for 12 m. to St James, Silver Heights, St Charles and Headingly, and south through Fort Rouge to River Park. At the north of the city are St John's episcopal church and St John's Grammar School. In the central part of the city are the parliament building, governor's residence, barracks, law courts, university, Manitoba College and Wesley College buildings. More than eighty churches, many of them of architectural value, are found scattered over the city, while the General Hospital, Women's Home, Children's Home, Children's Aid Shelter and Deaf and Dumb Institute speak of the benevolence of the citizens. One of the most striking features of Winnipeg is seen in the elaborate system of public schools. The buildings are not exceed for beauty of design or for completeness of finish by any Canadian city and by few American cities.

The geographical position of Winnipeg is unique for the purposes of trade. Like Chicago it stands on the eastern border of the prairies. All western trade in Canada of the vast provinces of Manitoba, Saskatchewan, Alberta and British Columbia, must pass through the narrow belt of 100 m., lying between the international boundary line and Lake Winnipeg. Midway in this belt stands Winnipeg. The trade from the wide extent of three-quarters of a million of square miles of prairie and woodland, becoming more populous every year, must flow as through a narrow spout at Winnipeg; every railway must pass through Winnipeg. In consequence Winnipeg is already a considerable manufacturing centre. Its lumber and flour mills are its largest industries, but the following are found: aerated waters and breweries, tent makers, baking-powder manufactories, box manufactories, brick makers, broom, brushes and carriage makers, cement blocks, manufacturing chemists, chocolate and cigar manufactories, confectionery, copper plate, corncake makers, engine builders, gas fitters, ink manufactories, jewelry makers, lime makers, milliners, opticians, paint makers, paper makers, photographers, pickle makers, planing mills, pork packers, publishers, pump makers, rubber-stamp makers, sash, door and blind factories, upholsterers, ventilating manufactories, vinegar factories, foundries, wire and fence manufactories. The area of the city is 12,700 acres.

WINNIPEG, a lake and river of Canada. The lake is in Saskatchewan, Manitoba and Keewatin, and is situated between 50° 20' and 53° 50' N. and 96° 20' and 99° 15' W. It covers an area of 8555 sq. m., is at an altitude of 710 ft. above the sea, is 260 m. long, 25 to 60 m. wide, and contains several large islands, including Reindeer (70 sq. m.) and Big Island (60 sq. m.). It is shallow, being nowhere more than 70 ft. in depth, and in consequence extremely stormy and dangerous. It abounds in fish, its white fish being especially celebrated. Its shores are low and on the south extremely marshy. The principal affluent rivers are: Red river, from the south; Winnipeg, Bloodvein, Berens and Poplar from the east; and the Dauphin and Saskatchewan from the west. It receives the surplus waters of lakes Manitoba and Winneposis, and discharges by the river Nelson and South Saskatchewan north to the Bay of the Woods. The deepest is 200 ft. in 48° 47' N. and 89° 57' W., and flows in a westward direction under the names of Savanne, Seine, and Rainy rivers to the Lake of the Woods; issuing thence as the Winnipeg, it flows N.W. with an exceedingly tortuous and turbulent course to the lake of the same name. It is navigable from the foot of the Lake of the Woods to the head of Rainy lake—with a short portage at Fort Frances—a distance of 208 m. Its principal tributary is English river.

WINNIPEGOSIS, a lake of Manitoba and Saskatchewan, Canada, between 51° 34' and 53° 11' N. and 95° 37' and 101° 56' W. Its greatest length is 122 m.; greatest width 17 m.; shore line 570 m.; and area, exclusive of islands, 2000 sq. m. Its greatest ascertainment depth is 38 ft., and mean altitude 828 ft. above the sea. Mossy river from the south, draining Lake Dauphin, Swan, and Red Deer rivers are the only considerable streams that fall into it. It drains by the Waterhen river through Waterhen lake into Lake Manitoba, and thence by the Little Saskatchewan into Lake Winnipeg. It was discovered by the chevalier de la Verendrye in 1739.

WINONA, a city, the county-seat of Winona county, Minnesota, U.S.A., about 95 m. S.E. of St Paul, on the W. bank of the Mississippi river, here crossed by three steel bridges. Pop. (1880) 16,268; (1890) 18,282; (1900) 19,714, of whom 5000 were foreign-born and 30 negroes; (1910 census) 18,983. There are large German and Polish elements in the population; and German and Polish journals, besides two dailies in English, are published here. Winona is served by the Chicago, Burlington & Quincy, the Chicago Great Western, the Chicago, Milwaukee & St Paul, the Green Bay & Western, and the Chicago & North Western railways, and by river steamboat lines. It is picturesque in appearance, located on a broad, level terrace, slightly elevated above the river, and surrounded by steep bluffs rising to 400-500 ft. At Winona are the Winona General Hospital (1854), to which is attached a Nurses' Training School; the first State Normal School (opened in 1860), and Winona Seminary (1894) for girls, conducted by the Sisters of St Francis. The city has a public library (about 30,000 vols.), with a mural decoration by Kenyon Cox; a Federal building; a Masonic Temple; and several parks; and it owns its own water supply (operated by the Holly system). In 1905 the total value of the factory products was $2,800,000 (70 per cent. more than in 1900). The site of the city was frequently used as a landing place in the old fur-trading days, but was not permanently settled until about 1853. Winona was first chartered as a city in 1857. A large part of it was destroyed

1 Incorporated in this year as a city.
by fire in 1860. The name Winona is said to be a Sioux word meaning “first-born daughter.”

WINSFORD, an urban district in the Northwich parliamentary division of Cheshire, England, on the river Weaver, 6 m. S. of Northwich, on the London & North-Western railway and the Cheshire lines. Pop. (1901) 10,382. In the town, which is only second to Northwich in this respect, large quantities of salt are raised and conveyed to Liverpool for exportation; being shipped in flats down the Weaver, which has been rendered navigable by an elaborate system of locks. Rock-salt is procured, as well as that obtained from the brine-pools. Boat-building is an important industry, and more than a million tons of salt are shipped annually. Owing to the pumping of the brine, large tracts of land have been submerged, and there is thus a constant danger to houses. The iron bridge across the Weaver, which was built in 1856, had to be raised thrice in the following twenty-six years. The town has received much benefit from philanthropists, Sir Joseph Verdin providing a technical school, and Sir John Brunner a guildhall and other buildings.

WINSLOW, EDWARD (1605–1653), one of the founders of the Plymouth colony in America, was born in Dreethwick, Worcestershire, England, on the 16th of October 1595. In 1617 he removed to Leiden, united with John Robinson’s church there, and in 1620 was one of the “pilgrims” who emigrated to New England on the “Mayflower” and founded the Plymouth colony. His wife, Elizabeth (Barker) Winslow, whom he had married in May 1618 at Leiden, having died soon after their arrival, he married, in May 1621, Mrs Susannah White, the mother of Peregrine White (1620–1704), the first white child born in New England. This was the first marriage in the New England colonies. Winslow was delegated by his associates to treat with the Indians in the vicinity and succeeded in winning the friendship of their chief, Massasoit (c. 1580–1661). He was one of the assistants from 1624 to 1647, except in 1633–1634, 1636–1637 and 1644–1645, when he was governor of the colony. He was also, in 1643, one of the commissioners of the United Colonies of New England. On several occasions he was sent to England to look after the interests of Plymouth and Massachusetts Bay, and defend these colonies from the attacks of such men as John Lyford, Thomas Morton (q.v.) and Samuel Gorton (q.v.). He left on his last mission as the agent of Massachusetts Bay, in October 1642, generally known as the “Witchcraft Case,” where he had been in an office under Cromwell, and in 1654 was made a member of the commission appointed to determine the value of certain English ships destroyed by Denmark. In 1655 he was the chief of the three English commissioners whom Cromwell sent on his expedition against the West Indies to advise with its leaders Admiral Venables and Admiral William Penn, but died near Jamaica on the 8th of May 1655, and was buried at sea. Winslow’s portrait, the only authentic likeness of any of the “Mayflower” “pilgrims,” is in the gallery of the Pilgrim Society at Plymouth, Mass.

His writings, though fragmentary, are of the greatest value to the historian of the Plymouth colony. They include: Good News from New England: An Exposition of Things There Remarkable at the Plantation of Plimoth in New England (1624); Hypocrisie Unmask’d; by a True Relation of the Governor and Company of Massachusetts against Samuel Gorton, a Notorious Disturber of the Peace (1646), to which was added a chapter entitled “A Brief Narrative of the True Grounds or Cause of the First Plantation of New England”; New England’s Salamander (1647); and The Glorious Progress of the Gospel amongst the Indians in New England (1649). With William Bradford he also is supposed to have prepared a Journal of the Beginning and Proceeding of the English Plantation settled at Plymouth in New England (1650). For a list of Edward Winslow’s known manuscripts, to its preface having been signed by “G. Mourt.” Some of his writings may be found reprinted in Alexander Young’s Chronicles of the Pilgrims (Boston, 1841).

His son, Josiah Winslow (1620–1680), was educated at Harvard College. He was elected a deputy to the General Court in 1653, was an “assistant” from 1657 to 1673, and governor from June 1673 until his death. From 1658 to 1672 he was one of the commissioners of the United Colonies of New England, and in 1675, during King Philip’s War, he was commander-in-chief of the united forces of New England.

WINSOR, JUSTIN (1831–1897), American writer and librarian, was born in Boston, Massachusetts, on the 2nd of January 1831. At the age of nineteen he printed a History of Duxbury, Mass., the home of his ancestors. He left Harvard before he had an opportunity to study in Paris and Heidelberg, but not until he had planned an extended memoir of Garrick and his Contemporaries, the manuscript of which, in ten folio volumes with a mass of notes, is in the library of Harvard University. In 1866 Winsor was appointed a trustee of the Boston public library, and in 1868 its superintendent. In 1877 he became librarian of Harvard University, a position he retained until his death. He greatly popularized the use of both these great collections of books. While at the Boston public library he edited a most useful catalogue of books in history, biography and travel, and compiled the list of a series of the rarest and grammatical books. In 1876 he began a series of monumental publications. The first was a Bibliography of the Original Quotations and Fables of Shakespeare with Particular Reference to Copies in America. Unfortunately, all except about a hundred copies of this work were destroyed by fire. A small volume entitled The Reader’s Handbook of the American Revolution (1879) is the model of a reasonable bibliography. In 1880 he began the editing of the Memorial History of Boston (4 vols., 410), with the co-operation of seventy writers. He so manipulated the contributions and supplemented them with notes as to give an air of unity to the whole work, and completed it in twenty-three months. He then set to work on a still larger co-operative book, The Narrative and Critical History of America, which was completed (1889) in eight royal octavo volumes. These great tasks had compelled Winsor to make a careful and systematic study of historical problems with the aid of contemporaneous cartography. Among the early results of this study were the Bibliography of Pidley’s Geography (1884), and the Catalogue of the Kohl Collection of Maps relating to America (1886), published in the Harvard Library Bulletins. His vast knowledge took the final form of two volumes of Historical Essays (1901), on Frontenac (1894), The Mississippi Basin (1895), and The Westward Movement (1897). Besides great stores of information hitherto accessible only to the specialist, these contain many strong expressions of dissent from currently received views. Winsor served for many years on the Massachusetts Archives Commission. His careful Report on the Maps of the Orinoco-Essequibo Region was prepared at the request of the Venezuela Boundary Commission. He was one of the founders of both the American Library Association and the American Historical Association, and was president of both—of the former for ten years, 1876–1885, and the latter in 1886–1887. He died in Cambridge on the 22nd of October 1897.

See Horace E. Scudder’s “Memoir of Justin Winsor” in the Proceedings of the Massachusetts Historical Society (2nd series), vol. xii. (1897). Winsor’s bibliography of his writings is in Harvard College Library, Bibliographical Contributions, No. 54.

WINSTED, a borough in the township of Winchester, Litchfield county, Connecticut, U.S.A., on the Mad and Still rivers, in the N.W. part of the state, about 26 m. N.W. of Hartford. Pop. of the township (1890) 6183; (1900) 7760; of the borough (1900) 6804, of whom 2113 were born abroad. The borough is served by the New York, New Haven & Hartford and the Central New England railways, and by electric railway to Torrington. Among the public institutions are the William L. Gilbert Home for friendless children and the Gilbert free high school, each endowed with more than $600,000 by William L. Gilbert, a prominent citizen; the Beardsley public library (1874), the Convent of Saint Margaret of Cortona, a Franciscan monastery, and the Litchfield County Hospital. In a park in
the central part of the borough there is a tower (60 ft. high) to
the memory of the soldiers of Winsted who fell in the Civil War,
and another park contains a soldiers' monument and a memorial
fountain. Water power is derived from the Mad river and High-
land lake, which is west of the borough and is encircled by the
Waklefeeld boulevard, a seven-mile drive, along which there are
many summer cottages. The manufactures include cutlery and
edge tools, clocks, silk twist, hosery, leather &c. Winsted was
settled in 1756 and chartered as a borough in 1838. The name
Winsted was coined from Winchester and Barkhamsted, the
latter being the name of the township immediately east of
Winchester. The borough of Winchester was incorporated in
1771.

WINSTON-SALEM, two contiguous cities of Forsyth county,
North Carolina, U.S.A., about 115 m. N.W. of Raleigh. Pop. of
Winston (1880) 2854; (1890) 8018; (1900) 10,008 (5943 negroes);
(1910) 17,167. Pop. of Salem (1890) 2711; (1900) 3642 (488 being
negroes); (1910) 5535. Both cities are served by the Southern
and the Norfolk & Western railways. Since July 1879, when the
post office in Salem was made a sub-station of that of Winston,
the cities (officially two independent municipalities) have been
known by postal and railway authorities as Winston-Salem. Winston
is the county-seat and a manufacturing centre. Salem is
largely a residential and educational city, with many old-
fashioned dwellings, but there are some important manufactories
here also; it is the seat of the Salem Academy and College
(Moravian) for women, opened as a boarding-school in 1803;
and of the Slater Normal and Industrial School (non-sectarian)
for negroes, founded from the Slater Fund in 1892. The surround-
ing country produces tobacco of a very superior quality, and to
the tobacco industry, introduced in 1872, the growth of Winston
is chiefly due; the manufacture of flat plug tobacco here is
especially important. The total value of Winston's factory
products increased from $4,887,649 in 1900 to $11,353,296 in
1905, or 132.3%.

Salem was founded in 1766 by Friedrich Wilhelm von Marschall
(1721-1802), a friend of Zinzendorf, and the financial manager of
the board controlling the Moravian purchase made in North
Carolina in 1753, consisting of 100,000 acres, and called Wachovia.
The town was to be the centre of this colony, where missionary
work and religious liberty were to be promoted, and it remained
the home of the governing board of the Moravian Church in
the South. In 1849 exclusive Moravian control of Salem's
industries and trades was abolished; in 1856 land was first
sold to others than Moravians, and in the same year the town
was incorporated. Winston was founded in 1851 as the county-
seat and was named in honour of Major Joseph Winston (1746-
1815), a famous Indian fighter, a soldier during the War of
Independence and a representative in Congress, 1793-1797 and
1803-1807. The growth of the two cities has been rapid
since 1900.

See J. H. Clewell, History of Wachovia in North Carolina (New
York, 1902).

WINTER, JOHN STRANGE, the pen-name of Henrietta
Eliza Vaughan Stannard (1836— ), English novelist, who was
born on the 15th of January 1836, the daughter of Rev. H. V.
Palmer, rector of St Margaret's, York. She early began to
write for different magazines, producing sentimental
stories, chiefly of army life. Two of these, Boots' Baby and
House-a-Go, which appeared originally in The Graphic in 1885,
established her reputation, and she became a prolific novelist,
producing some sixty other light and amusing books, the best
of which deal with military life. An indefatigable journalist
on matters affecting women, she was the first president of the
Writers' Club (1892), and presided from 1901 to 1903 over the
Society of Women Journalists. She married in 1884 Arthur
Stannard, a civil engineer.

WINTER, PETER (c. 1755-1825), German dramatic composer,
was born at Mannheim about 1755. He received some instruc-
tion from the Abt Vogler, but was practically self-taught.
After playing in the Kapelle of the Elector Karl Theodor, at
Munich, he became in 1776 director of the court theatre. When
Mozart produced his Idomeneo at Munich in 1781, Winter,
annoyed at his success, conceived a violent hatred for him;
yet of more than thirty operas written by Winter between 1778
and 1820 very few were unsuccessful. His most popular work,
Das unterbrochene Opeferst, was produced in 1796 at Vienna,
where in 1797-1798 he composed Die Pyramiden von Babylon
and Das Labyrinth, both written for him by Schickaneder in
lyrics, and an actual scene of Mozart's Zauberflöte. He was
employed at Munich in 1798. Five years later he visited London,
where he produced Calypso in 1803, Prasertina in 1804, and Zaira
in 1805, with great success. His last opera, Sänger und Schneider,
was produced in 1820 at Munich, where he died on the 17th of
October 1825. Besides his dramatic works he composed some
effective sacred music, including twenty-six masses.

WINTERFELDT, HANS KARL VON (1707—1757), Prussian
general, was born on the 4th of April 1707 at Vanselow in
Pomerania. His education was imperfect, and in later life he
always regretted the want of familiarity with the French language.
He entered the cuirassier regiment of his uncle, Major-General
von Winterfeldt (now the 12th) in 1720, and was promoted
cornet after two years' service. But he was fortunate enough,
by his stature and soldierly bearing, to attract the notice of
Frederick William I., who transferred him to the so-called
general regiment of grenadiers as a lieutenant. Before long he became
a personal aide-de-camp to the king, and in 1732 he was sent
with a party of selected non-commissioned officers to assist in
the organization of the Russian army. While the guest of
Marshall Münich at St Petersburg, Winterfeldt fell in love with
and married his cousin Julie von Malitzki, who was the king's
stepdaughter and a maid-of-honour to the grand-duchess
Elizabeth. On returning to Prussia he became intimate with the
crown prince, afterwards Frederick the Great, whom he
accompanied in the Rhine campaign of 1734. This intimacy,
in view of his personal relations with the king, made Winter-
feldt's position very delicate and difficult, for Frederick William
and his son were so far estranged that, as every one knows,
the prince was sent before a court-martial by his father, on
the charge of attempting to desert, and was condemned to
death. Winterfeldt was the prince's constant friend through all
these troubles, and on Frederick II.'s accession he was promoted
major and appointed aide-de-camp to the new sovereign.

When the first Silesian War broke out Winterfeldt was sent
on a mission to St Petersburg, which, however, failed. He then
commanded a grenadier battalion with great distinction at Moll-
itz, and won further glory in the celebrated minor combat of
Rothschloss, where the Prussian hussars defeated the Austrians
(May 17, 1741). One month from this day Winterfeldt was
made a colonel, as also was Zieten (q.v.), the cavalry leader who
marched his cousin Julie von Malitzki, who was the king's
stepdaughter and a maid-of-honour to the grand-duchess
Elizabeth. On returning to Prussia he became intimate with
the crown prince, afterwards Frederick the Great, whom he
accompanied in the Rhine campaign of 1734. This intimacy,
in view of his personal relations with the king, made Winter-
feldt's position very delicate and difficult, for Frederick William
and his son were so far estranged that, as every one knows,
the prince was sent before a court-martial by his father, on
the charge of attempting to desert, and was condemned to
death. Winterfeldt was the prince's constant friend through all
these troubles, and on Frederick II.'s accession he was promoted
major and appointed aide-de-camp to the new sovereign.

In the short peace before the outbreak of the second war he
was constantly in attendance upon the king, who employed him
again, when the war was resumed, in the same capacity as before,
and, after he had been instrumental in winning a series of success-
ful minor engagements, promoted him (1745) major-general,
to date from January 1743.

For his great services at Hohenfriedberg Frederick gave him
the captaincy of Tatiau, which carried with it a salary of 500
thalers a year. At Katholisch-Hennersdorf, where the sudden
and unexpected invasion of the Austro-Saxons was checked by
the vigour of Zieten, Winterfeldt arrived on the field in time to
take a decisive share. Once again the rivals had to share their
laurels, and Zieten actually wrote to the king in disparagement
of Winterfeldt, receiving in reply a full and generous recognition
of his own worth and services, coupled with the curt remark that
the king intended to employ General von Winterfeldt in any way
that he thought fit. During the ten years' peace that preceded
the next great war, Winterfeldt was in constant attendance upon the king, except when employed on confidential missions in the provinces or abroad. In 1736 he was made a lieutenant-general and appointed commander of the Black Eagle.

In this year he was feverishly active in collecting information as to the coalition that was secretly preparing to crush Prussia, and in preparing for the war. He took a leading part in the discussions which eventuated in Frederick's decision to strike the first blow. He was at Potsdam with the king, and advised him against absorbing the Saxon prisoners into his own army. He accompanied Schwerin in the advance on Prague in 1757 and took a conspicuous part in the battle there. After the defeat of Kolín, however, Winterfeldt, whom Frederick seems to have regarded as the only man of character whom he could trust to conduct the more delicate and difficult operations of the retreat, found himself obliged to work in close contact with the king's brother, Prince William, the duke of Brunswick-Bevern, Zieten and others of his enemies. The operations which followed may be summarized by the phrase "everything went wrong"; after an angry scene with his brother, the prince of Prussia retired from the army, and when Frederick gave Winterfeldt renewed marks of his confidence, the general animosity reached its height. As it chanced, however, Winterfeldt fell a victim to his own bravery in the skirmish of Mös at Görlitz on the 7th of September. His wound, the first serious wound he had ever received, proved fatal and he died on the 8th. The court enmities provoked by his twenty years' unbroken intimacy and influence with the king, and the denigration of less gifted or less fortunate soldiers, followed him beyond death. Prince William expressed the bitterness of his hatred in almost his last words, and Prince Henry's memoirs give a wholly incredible portrait of Winterfeldt's arrogance, dishonesty, immorality and incapacity. Frederick, however, was not apt to encourage incompetence in his most trusted officers, and as for the rest, Winterfeldt stood first amongst the very few to whom the king gave his friendship and his entire confidence. On hearing of Winterfeldt's death he said, "Einen Winterfeld finde ich nie wieder," and a little later, "Er war ein guter Mensch, ein Seelenmensch, er war mein Freund." Winterfeldt was buried at his estate of Barschau, whence, a hundred years later, his body was transferred to the Invaliden Kirchhof at Berlin. A statue was erected to his memory, which stands in the Wilhelmsplatz there, and another forms part of the memorial to Frederick the Great in Unter den Linden.

**WINDBLOCK**

Winterfeldt und der Tag von Mös (Görriz, 1857); and K. W. v. Schöning, Winterfeldts Beispielaue; eine biographische Skizze (Berlin, 1857).

**WINDBLOCK**, known botanically as Gaultheria procumbens, a member of the heath family (Ericaceae), is a small creeping, evergreen shrub with numerous short erect branches bearing in the upper part shortly-stalked oval, thick, smooth shining leaves with sharp-toothed edge. The flowers are borne singly in the leaf axils and are pendulous, with a pale pink waxy-looking urn-shaped corolla. The bright crimson-red sub-globular, berry-like fruit consists of the much-enlarged fleshy calyx which surrounds the small thin-walled many-seeded capsule. The plant is a native of shady woods on sandy soil, especially in mountainous districts, in southern Canada and the northern United States; it is quite hardy in England. The leaves are sharply astringent and have a peculiar aromatic smell and taste due to a volatile oil known as oil of winter green, used in medicine in the treatment of muscular rheumatism (for the therapeutic action see Salicylic Acid). An infusion of the leaves is used, under the name mountain or Salvador tea, in some parts of North America as a substitute for tea; and the fruits are eaten under the name of partridge or deer berries. Other names for the plant are tea-berry, checker-berry, box-berry, Jersey tea, spice-berry and ground holly.

See Bentley and Trimen, Medicinal Plants, t. 164.

**WINDBLOCK'S BARK**, the bark of Drimys Winteri, an evergreen tree belonging to the Magnolia family. It was formerly official in Europe, and is still held in esteem in Brazil and other parts of South America as a popular remedy for scurvy and other diseases. The plant is a native of the mountains and highlands from Mexico to the Straits of Magellan.

**WINTERTHUR**, a flourishing industrial town in the Töss valley, canton of Zürich, Switzerland, and by rail 17 m. N.E. of Zürich. It is 1450 ft. above sea-level, and has a rapidly increasing population (in 1870, 9317; in 1880, 13,502; in 1888, 15,805; and in 1900, 22,335), all German-speaking and nearly all Protestants. It is the point of junction of seven lines of railway, and is therefore of considerable commercial importance. Its main industries are cambic-weaving, cotton-printing, the manufacture of machinery, and wine-growing; Stadtborg being the best variety of wine grown in the neighborhood of the town. It is a modern, well-built town, with a fine town-hall and well-planned school buildings. It suffered severely from the disastrous financial crisis of the National Railway of Switzerland which it promoted. In 1878 it had to sell its property in that line, and from 1881 to 1885 it was in great difficulties in the matter of a loan of nine million francs guaranteed in 1874 by the town, together with three others in Aargau, to that ill-fated railway. As the three co-guarantor towns were unable to pay their share, the whole burden fell on Winterthur, which struggled valiantly to meet its liabilities, and was helped by large loans from the central Swiss and federal governments. In 1891 Winterthur, which, however, on the whole very successfully maintained its ancient rights and liberties against the encroachments of Zürich.

The Roman settlement of Vitidurum [Celtic dur, water] was a little north-east of the present town, at the place now known as Ober Winterthur. It was there that in 910 Burkhard II., duke of Alamannia, defeated Rudolf II., king of Transjurian Burgundy. It was refounded in the valley in 1180 by the counts of Kyburg (their castle rises on a hill, 4 m. to the south of the town), who granted it great liberties and privileges, making it the seat of their district court for the Thurgau. In 1264 the town passed with the rest of the Kyburg inheritance to the House of Habsburg, who showed great favour to the town, and thus secured its unswerving loyalty. In 1292 the men of Zürich were beaten back in an attempt to take the town. For a short time after the outlay of Duke Frederick of Austria, it became a free imperial city (1435-1442); but after the conquest of the Thurgau by the Swiss Confederates (1460-1461) Winterthur, which had gallantly stood a nine-weeks' siege, was isolated in the midst of non-Austrian territory. Hence it was sold by the duke to the town of Zürich in 1467, its rights and liberties being reserved, and its history since then has been that of the other lands ruled by Zürich. In 1717-1726 Zürich tried hard by means of heavy duties to crush the town and its industries. In 1800 Winterthur, which, however, on the whole very successfully maintained its ancient rights and liberties against the encroachments of Zürich.

See H. Glitsch, Beiträge z. älteren Winterthurer Verfassungsgeschichte (Winterthu, 1896); J. C. Troll, Geschichte d. Stadt Winterthur (8 vols., 1840-1850).

(W. A. B. C.)

**WINDBLOCK, CHRISTIAN** (1766-1876), Danish lyrical poet, was born on the 29th of July 1796 at Fensmark, in the province of Praestø, where his father was priest. He went to the university of Copenhagen in 1815, and studied theology, taking his degree in 1824. He began to publish verses in 1810, but no collected volume appeared until 1828. Meanwhile, from 1824 to 1830, Winther was supporting himself as a tutor, and with so much success that in the latter year he was able to go to Italy on his savings. In 1835 a second volume of lyrics appeared, and in 1838 a third. In 1841 King Christian VIII. appointed Winther to travel to Mecklenburg to instruct the princess Caroline, on the occasion of her betrothal to the Crown Prince of Denmark, in the Danish language. Further collections of lyrics appeared in 1842, 1848, 1850, 1853, 1863 and 1872. When he was past the rival silk and cotton industries in Winterthur, he received a pension from the state as a poet, and for the next quarter of a century he resided mainly in Paris. Besides the nine or ten volumes of lyrical verse mentioned above, Winther published The Stag's Flight, an epical romance in verse (1853); In the Year of Grace, a novel (1874); and other works in prose. He died in Paris on the 30th of December 1876, but the body was brought to Denmark, and was buried in the heart of the woods. In the verse of
WINTHROP, J.—WINTHROP, R. C.

Christian Winthrop the scenery of Denmark, its beechnwoods, lakes and meadows, its violet-scented dinges, its bowers perfumed by wild strawberries, found such a loving and masterly painter as they are never likely to find again. He is the most spontaneous of lyricists; his little poems are steeped in the dew and light and odour of a cool, sunny morning in May. His melodies are artless, but full of variety and delicate harmony. When he was forty-seven he fell ill in love, and at that mature age startled his admirers by publishing for the first time a cycle of love-songs, of which he could not have expected from a spirit so unmeasured; they still stand alone for ten years, bearing simple sweetness of passion. The technical perfection of Winthor's verse, in its extreme pithiness, makes him the first song-writer of New England.

WINTHROP, JOHN (1588–1649), a Puritan leader and governor of Massachusetts, was born in Edwardston, Suffolk, on the 14th of January (O.S.) 1588, the son of Adam Winthrop of Groton Manor, and Anne (Browne) Winthrop. In December 1602 he matriculated at Trinity College, Cambridge, but he did not graduate. The years after his brief course at the university were devoted to the practice of law, in which he acquired considerable success, being appointed, about 1623, an attorney in the Court of Wards and Liveries, and also being engaged in the drafting of parliamentary bills. Though his residence was at Groton Manor, much of his time was spent in London. Meanwhile he passed through the deep spiritual experiences characteristic of Puritanism, and made wide acquaintance among the leaders of the Puritan party. On the 26th of August 1629 he joined in the "Cambridge Agreement," by which he, and his associates, pledged themselves to remove to New England, provided the government and patent of the Massachusetts colony should be removed thither. On the 20th of October following he was chosen governor of the "Governor and Company of the Massachusetts Bay in New England," and sailed in the "Arbella" in March 1630, reaching Salem (Mass.) on the 12th of June (O.S.), accompanied by a large party of Puritan immigrants. After a brief sojourn in Charlestown, Winthrop and many of his immediate associates settled in Boston in the autumn of 1630. He shared in the formation of a church at Charlestown (afterwards the First Church in Boston) on the 30th of July 1630, of which he was the first pastor. At Boston he erected a large house, and there he lived till his death on the 26th of March (O.S.) 1649.

Winthrop's history in New England was very largely that of the Massachusetts colony, of which he was twice times chosen governor by annual election, serving in 1629–1634, 1634–1636, in 1642–1644, and in 1646–1649, and dying in office. To the service of the colony he gave not merely unwearied devotion; but in its interests consumed strength and fortune. His own temper of mind was conservative and somewhat aristocratic, but he guided political development, often under circumstances of great difficulty, with singular fairness and conspicuous magnanimity. In 1634–1635 he was a leader in putting the colony in a state of defence against possible coercion by the English government. He opposed the majority of his fellow-townsmen in the so-called "Antinomian controversy" of 1635–1637, taking a strongly conservative attitude towards the questions in dispute. He was the first president of the Commissioners of the United Colonies of New England, organized in 1633. He defended Massachusetts against threatened parliamentary interference once more in 1645–1646. That the colony successfully weathered its early perils was due more to Winthrop's skill and wisdom than to the services of any other of its citizens.

Winthrop was five times married. His first wife, to whom he was united on the 16th of April 1609, was Mary Forth, daughter of John Forth, of Great Stambridge, Essex. She bore him six children, of whom the eldest was John Winthrop, Jr. (q.v.). She was buried in Groton on the 26th of June 1615. On the 6th of December 1615 he married Thomasine Clapton, daughter of William Clapton of Castiles, near Groton. She died in childbirth about a year later. He married on the 29th of April 1618, Margaret Tyndal, daughter of Sir John Tyndal, of Great Maplested, Essex. She followed him to New England in 1631, bore him eight children, and died on the 14th of June 1647. Late in 1647 or early in 1648 he married Mrs Martha Coytmore, widow of Thomas Coytmore, who survived him, and by whom he had one son.

Winthrop's Journal, an invaluable record of early Massachusetts history, was printed in part in Hartford in 1790; the whole in Boston, edited by James Savage, as The History of New England from 1630 to 1649, in 1825–1826, and again in 1853; and in New York, edited by James K. Hosmer, in 1908. His biography has been written by Robert C. Winthrop, Life and Letters of John Winthrop (2 vols., Boston, 1847–1849); and by Joseph H. Twichell, John Winthrop (New York, 1891). See also Mrs Alice M. Earle, Margaret Winthrop (New York, 1895).

WINTHROP, JOHN (1606–1676), generally known as John Winthrop the Younger, son of the preceding, born at Groton, England, on the 12th of February 1606. He was educated at the Bury St Edmunds grammar school and at Trinity College, Dublin, studied law, for a short time after 1634 at the Inner Temple, London, accompanied the ill-fated expedition of the duke of Buckingham for the relief of the Protestants of La Rochelle, and then travelled in Italy and the Levant, returning to England in 1639. In 1631 he followed his father to Massachusetts, and was one of the "assistants" in 1635, 1640 and 1641, and from 1644 to 1649. He was the chief founder of Agawam (now Ipswich), Mass., in 1633, went to England in 1634, and in the following year returned as governor, for one year, of Connecticut, under the Saye and Sele patent, sending out the party that built the fort at Saybrook, at the mouth of the Connecticut river. He then lived for a time in Massachusetts, where he devoted himself to the study of science and attempted to interest the settlers in the development of the colony's mineral resources. He was again in England in 1641–1643, and on his return established iron-works at Lynn and Braintree, Mass. In 1645 he obtained a title to lands in south-eastern Connecticut, and founded there in 1646 what is now New London, whither he removed in 1650. He became one of the magistrates of Connecticut in 1651; in 1657–1658 was governor of the colony; and in 1659 again became governor, being annually re-elected until his death. In 1662 he obtained in England the charter by which the colonies of Connecticut and New Haven were united. Besides being governor of Connecticut, he was also in 1675 one of the commissioners of the United Colonies of New England. While in England he was elected to membership in the newly organized Royal Society, to whose Philosophical Transactions he contributed two papers, "Some Natural Curiosities from New England," and "Description, Culture and Use of Maize." He died on the 5th of April 1676 in Boston, whither he had gone to attend a meeting of the commissioners of the United Colonies of New England.

His correspondence with the Royal Society was published in series 1, vol. xvi. of the Massachusetts Historical Society's Proceedings. See T. F. Waters's Sketch of the Life of John Winthrop the Younger (Ipswich, Mass., 1899).

Winthrop's son, Fitz-John Winthrop (1638–1707), was educated at Harvard, though he did not take a degree; served in the parliamentary army in Scotland under Monck, whom he accompanied on his march to London, and returned to Connecticut in 1663. As major-general he commanded the unsuccessful expedition of the New York and Connecticut forces against Canada in 1690; from 1693 to 1697 he was the agent of Connecticut in London; and from 1698 until his death he was governor of Connecticut.

WINTHROP, ROBERT CHARLES (1809–1844), American orator and statesman, a descendant of Governor John Winthrop (1608–1649), was born in Boston, Massachusetts, on the 12th of May 1809. He graduated at Harvard in 1828, studied law with Daniel Webster and in 1831 was admitted to the bar. He was a member of the Massachusetts House of Representatives in 1834–1840—for the last three years as speaker,—and in 1840 was elected to the national House of Representatives as a Whig, serving from December 1840 to 1850 (with a short intermission, April–December 1842). He soon became prominent and was speaker of the Thirtieth Congress (1847–1849), though his
conservatism on slavery and kindred questions displeased extremists, North and South, who prevented his re-election as speaker of the Thirty-first Congress. On the designation of Daniel Webster to become secretary of state, Winthrop was appointed to the Senate (July 1850), but was defeated in the Massachusetts legislative care for his short term (Jan. 30, 1851), and for the longe, in (April 14, 1851) by a coalition of Democrats and Free Soilers and served only until February 1851. In the same year he received a plurality of the votes cast for governor, but as the constitution required a majority vote, the election was thrown into the legislature, where he was defeated by the same coalition. Thereafter, he was never a candidate for political office. With the breaking up of the Whig party he became an independent and supported Millard Fillmore in 1856, John Bell in 1860, and General G. B. McClellan in 1864. He was president of the Massachusetts Historical Society from 1855 to 1885, and for the last twenty-seven years of his life was president of the Peabody Trust for the advancement of education in the Southern States. Among his noteworthy orations of a patriotic character were those delivered at Boston in 1876, at Yorktown in 1881, and in Washington on the completion of the Washington Monument in 1885. He died in Boston on the 16th of November 1894.

Among his publications were Addresses and Speeches (Boston, 1854-1860); Life of John Winthrop (2 vols., Boston, 1864-1867); and Washington, Borrowed and Franklin (Boston, 1876). See R. C. Winthrop, Jr., Memoir of R. C. Winthrop (Boston, 1895).

WINZET, a township and a summer resort of Suffolk county, Massachusetts, U.S.A., occupying a peninsula jutting out into Massachusetts Bay about 5 m. N.E. of Boston and 3 m. S.E. of Chelsea, and forming part of the north-eastern boundary of Boston Harbour. Pop. (1900) 6038, of whom 1437 were foreign-born and 43 were negroes; (1910, U.S. census) 10,132. Between May and October the population is estimated to be between 14,000 and 16,000. Area, 1-6 sq. m. Winthrop is served by the Winthrop branch of the Boston, Revere Beach & Lynn railway, and by electric railway from Orient Heights to Revere, Chelsea, East Boston, Lynn and Boston. The township contains several villages connected by a railway loop; there are nine stations in its 6.3 m. of track. The peninsula has about 8 m. of water front on the ocean and the harbour. The northern part nearest the narrow neck connecting with the mainland is a high bluff, known as Winthrop Highlands, having its north-eastern terminus in Grover's Cliff, a bold headland which forms the north-easternmost point of the peninsula. On Grover's Cliff is Fort Heath, a battery of three powerful long-range guns. At the western end of the Highlands is Fort Banks (a part of Boston's harbour defence), consisting of a line of gunboats begun in 1768. It is each able to drop a 600 lb shell on a ship 6 m. at sea. From Grover's Cliff a fine sandy beach facing the open ocean leads to Great Head, the highest elevation on the peninsula. Winthrop Shore Drive (16-73 acres), one of the reservations of the Metropolitan park system, is a public parkway along the shore. From Great Head, a long sandy spit curves away southward, ending in Point Shirley, a hillock and flat sandy plain, separated by Shirley Gut, a narrow channel of deep water, from Deer Island, on which are the Boston House ofCorrection and City Prison. At Point Shirley is the Point Shirley Club house, a depot of the Boston and Crystal Bay, is the Winthrop Yacht Club house and anchorage; and at Winthrop Center on the west side are the Town Hall, the High School, the Public Library, the Masonic Hall, College Park Yacht Club and Ingleside Park. There are several large summer hotels.

Winthrop, first known as "Pulling Poynt" (Pulling Point) because the tide made hard pulling here for boaters, was originally a part of Boston; it was part of Chelsea from 1639 until 1846, when with Rummey Marsh it was separately incorporated as North Chelsea, from which it was set off as a township in 1852 under its present name, in honour of Dr. John Winthrop, who was a son of Governor John Winthrop, the elder, and whose house is still standing. Point Shirley takes its name from Governor William Shirley who helped to establish a cod fishery there in 1753. Before and after the War of Independence Winthrop was a favourite seaside home for Bostonians, many prominent families, including the Gibbons, Hancock's, Bartletts, Emersons, Lounges and Lowells, having country-seats here. The community was a secluded rural retreat until the construction of the railway in 1876 converted it into a watering-place.

See C. W. Hall, Historic Winthrop, 1636-1902 (Boston, 1902).

WINZET, WINZET, c. 1563-1617), English politician, was born at Aynhoe in Northamptonshire and educated at St John's College, Oxford. In 1599 he became secretary to Sir Henry Neville (c. 1554-1615), the English ambassador in France, and he succeeded Neville in this position two years later, retaining it until 1603. In this year Winzetz was sent to The Hague as agent to the States-General of the United Provinces, and according to custom he became a member of the Dutch council of state. His hearty dislike of Spain coloured all his actions in Holland; he was anxious to see a continuance of the war between Spain and the United Netherlands, and he expressed both his own views and those of the English government at the time when he wrote, "how convenient this war would be for the good of His Majesty's realms, if it might be maintained without his charge." In June 1605 Winzetz signed the league between England and the United Provinces, and he was in Holland when the trouble over the succession to the duchies of Jülich and Cleves threatened to cause a European war. In this matter he negotiated with the Protestant princes of Germany on behalf of James I. He returned to England later in the year, and was re-elected to the council of state in March 1614 and a member of parliament. In the House of Commons he defended the king's right to levy impositions, and other events of his secretaryship were the inquiry into the murder of Sir Thomas Overbury and the release of Raleigh in 1616. Raleigh was urged by Winzetz to attack the Spanish fleet and the Spanish settlements in South America, and the secretary's share in this undertaking was the subject of complaints on the part of the representatives of Spain. In the midst of this he died in London on the 27th of October 1617. "It can hardly be doubted," says Gardiner, "that he had lived till the following summer, he would have shared in Raleigh's ruin. One of Winzetz's daughters, Anne (d. 1643), married Edward Montagu, 2nd Baron Montagu of Boughton, and their son was Ralph Montagu, 1st Duke of Montagu.

Winzetz's official correspondence and other papers passed to the duke of Montagu, and are now in the possession of the duke of Rutland. They are contained in the Record Office of the University of Glasgow. See the Introduction to this Report (1899), and also S. R. Gardiner, History of England, vols. ii. and iii. (1904-1907).

WINZET, NINIAN (1559-1592), Scottish poetical writer, was the son of John Winzetz, and was sent to return to the University of Glasgow. He was ordained priest in 1560, and in 1552 was appointed master of the grammar school of Linlithgow, from which town he was later "expelit and schott out" by the partisans of Dean Patrick Kinkloch, "preacher" there. He had also enjoyed the office of Provost of the Collegiate Church of St Michael in that town. He retired to Edinburgh, where the return of Queen Mary had given heart to the Catholics. There he took part in the pamphlet war which then raged, and entered into conflict with Knox and other leading reformers. He appears to have acted "in some way as a commentator. In July 1562, when engaged in the printing of his Last Blast, he narrowly escaped the vengeance of his opponents, who had by that time gained the upper hand in the capital, and he fled, on the 3rd of September, with the nuncio Gouda to Louvain. He reached Paris in 1565 and became a member of the "German Nation" of the university. At Queen Mary's request he joined Bishop Leslie on his embassy to Queen Elizabeth in 1571, and remained with the bishop after his removal by Elizabeth's orders to ward at Fenny Staunton, Huntingdonshire. When further suspicion fell on Leslie and he was committed to the Tower, Winzetz was persuaded to return to Scotland. He continued his studies, and in 1574 left for Douai, where in the following year he became a licentiate. He was in residence at Rome from 1575 to 1577, and was then appointed to Pope
WIRE

Gregory XIII, abbot of the Benedictine monastery of St James, Regensburg. There he died on the 21st of September 1592.

Winzet's views are essentially controversial. He justified his literary activity on the side of Catholicism on the double plea of conscience and the inability of the bishops and theologians to supply the necessary arguments (First Tractate, ed. S.T.S., i. p. 10). "We may naturally suppose," he says, "besides, on all sides, as we think, referring our judgment to the holy Catholic Kirk."

In his first work, Certaine Tractates (three in number), printed in 1562, he rates his fellow clergy for negligence and sin, invites them from Knaps regarding his authority as minister and his share in the new ecclesiastical constitution, and protests against the interference with Catholic burgesesses by the magistrates of Edinburgh. The Last Blast, which was interrupted in publication, is an onslaught on heretics and a falsely ordained clergy. In his Book of Four Scott Thre Questions (1563), addressed to the "Calviniane Precheours," in which he treats of church doctrine, sacraments, priesthood, obedience to rulers, free-will and other matters, he is dogmatic rather than polemical. He translated the Commonloriorium of Vincentius Liriensis (1563), and wrote, in Latin, a Flagellum sectarionum and a Velitatio in Georgiun Buchanum (1882).

Winzet's vernacular writings have been edited by J. Hewison for the S.T.S. (vols. 1888, 1890). The Tractates were printed, with a preface by David Laing, by the Mainland Club (1858). For Winzet's career see Delicious de vestris historiae rebus literariae (S.T.S. or iii., Mackenzie Lives, iii., and the Introduction to S.T.S., edit. u.s.)

WIRE (A.S. wir, a wire; cf. Swed. wire, to twist, M.H.G. wire, a gold ornament, Lat. viriae, armlets, ultimately from the root w, to twist, bind), a thin long rod of metal, generally round in section. The uses of wire are multifarious and diverse beyond all enumeration. It forms the raw material of important manufactures, such as the wire-net industry, wire-cloth making and wire-rope spinning, in which it occupies a place analogous to a textile fibre. Wire-cloth of all degrees of strength and fineness of mesh is used for sifting and screening the pottery, for draining paper pulp, for window screens, and for many other purposes. Vast quantities of copper and iron wire are employed for telegraph and telephone wires, and as conductors in electric lighting. It is no less demand for fencing, and much is consumed in the construction of suspension bridges, and cages, &c.

In the manufacture of stringed musical instruments and philosophical apparatus wire is again largely used. Among its other sources of consumption it is sufficient to mention pin and hair-pin making, the needle and fish-hook industries, nail, peg and rivet making, and carding machinery; indeed there are few industries where iron, steel, and almost no less enter.

The physical properties requisite to make useful wire are possessed by only a limited number of metals and metallic alloys. The metals must in the first place be ductile; and, further, the wire when drawn out must possess a certain amount of tenacity, the quality on which the utility of wire principally depends. The metals suitable for wire, possessing almost equal ductility, are platinum, silver, iron, copper, aluminium and gold; and it is only from these and certain of their alloys with other metals, principally brass and bronze, that wire is prepared.

Careful treatment wire of excessive tenacity can be produced.

Dr W. H. Wollaston first succeeded in drawing a platinum wire \( \frac{2}{3} \) inch in diameter by encasing a fine platinum wire within silver to ten times its diameter. The cored wire he then reduced to \( \frac{1}{8} \) inch, and by dissolving away the silver coating the platinum wire \( \frac{2}{3} \) inch thick only remained. By continued treatment in this way wires of platinum for spider-lines of telescopes have been obtained of such extreme tenuity that a mile length of the wire weighs not more than a grain; and it is said that platinum wire has been made which measures not more than \( \frac{1}{72} \) mm., equal to less than the fifty-thousandth part of an inch. The accompanying table shows the comparative tenacity of the wire of different metals and alloys.

Wire was originally made by beating the metal out into plates, which were then cut into continuous strips, and afterwards rounded by beating. The art of wire-drawing does not appear to have been known until the 14th century, and was practised in Europe before the second half of the 17th century. Wire is usually drawn of cylindrical form; but it may be made of any desired section by varying the outline of the holes in the draw-plate through which it is drawn in the process of manufacture. The draw-rod or the die is a piece of hard cast-iron or hard steel, or for fine work it may be a diamond or ruby. The object of utilizing precious stones is to enable the dies to be used for a considerable time without losing their size, and so producing wire of incorrect diameter. Diamond dies must be reforred when they have lost their original diameter of hole, but the metal dies are brought down to size again by hammering-

\[ \text{FIG. 1.} \]

Another method is to immerse the wire in a sulphate of copper solution, so that a film of copper is deposited which forms a better coating on the iron or steel wire and improves its conductivity. In some cases wire the copper is left after the final drawing to serve as a preventin of rust.

The wire-drawing machine includes means for holding the dies accurately in position and for drawing the wire steadily through the holes. The usual design consists of a cast-iron bench or table having a bracket standing up to hold the die, and a vertical drum which rotates and by calling the wire around its surface pulls it through the die. The coil of wire being stored upon another drum or "swift" which lies behind the die and reeds off the wire as fast as required. The wire drum or "block" is provided with means for rapidly making, unmaking or uncoiling it to its vertical shaft, so that the motion of the wire may be stopped or started instantly. The block is also tapered, so that the coil of wire may be easily slipped off upwards when finished. Before the wire can be attached to the block, a section of wire of the length of it is twisted with the material by a pair of gripping pincers on the end of a chain which is wound around a revolving drum, so drawing the pincers along, and with the chain, to the tube, until the length of wire is wound on three times or on the block, where the end is secured by a small screw clamp or vice ready for the drawing operation. Wire has to be pointed or made smaller in diameter at the end before it can be passed through the die; the pointing is done by hammering, filing, rolling or swaging in dies, which effect a reduction in diameter. When the wire is on the block the latter is set in motion and the wire is drawn steadily through the die; it is very important that the shaft should rotate evenly and that it shall run true and pull the wire in an even manner, otherwise the "snatching" which occurs will break the wire, or at least weaken it in spots.

Continuous wire-drawing machines differ from the single-block machines in having a series of dies through which the wire passes in a continuous manner. The difficulty of feeding between each die is solved by introducing a block between each, so that as the wire issues it coils around the block and is so held on to the next die. The speeds of the blocks are increased successively, so that the elongation due to drawing is taken up and slip compensated for. The operation of the wire-drawing machines differs from the single-block machine in that the blocks are termed "stringing-up." The arrangement for lubrication include a pump which floods the dies, and in many cases also the bottom portions of the blocks run in lubricant. The wires in such machines which the wire levels vary greatly depending on the size and the amount of reduction effected; rates from 100 ft. up to 900 ft. are possible, the higher speeds being those of continuous machines.

Wires and cables for electrical purposes possess various insulating materials, such as cotton, silk, jute and paper, wrapped in spiral fashion and further protected with substances such as paraffin, some kind of preservative compound, bitumen or lead sheathing of
steel tapping. The stranding or covering machines employed in this work are composed of a series of rolls and guides which guide the wire which is passing through at a rapid rate. Some of the smallest machines for cotton covering have a large drum, which grips the wire and moves it through toothed gears at a definite speed and guides it through the spirals. The steam heated large rolls and the long guides and the series of guides to which the latter are revolved so that as many as sixty spools may be carried, the second set of strands being laid over the first. For the heavier cables, used for electric light and power, and submarine cables, and the like, 200 spools or more of the same wire is carried. The wire is still carried through a hollow shaft, but the bobbins or spools of covering material are set with their spindles at right angles to the axis of the wire, and they lie in a circular cage which rotates on rollers below. The various strands coming from the spools at various parts of the circumference of the cage all lead to a disk at the end of the hollow shaft. This disk has perforations through which each of the strands pass, then being immediately wrapped on the cage, which slides through a bearing at this point. Toothed gears having certain definite ratios are used to cause the winding drum for the cable and the cage to rotate at suitable relative speeds which depend upon the material, and the number of strands. The large number of tapes or strands, so that a machine may have six bobbins on one cage and twelve on the other. In the case of submarine cables, coverings of jute-served gutta-percha are employed, upon which the entire covering is built. The finished cables are treated with jute yarns or tapes and protected with coatings of compound. Messrs Johnson & Phillips, Ltd., of Charlton, Kent, maintain machines that use the die process, that is, the die is carried on the circumference of the disk and cover with the preservative compound, in one continuous operation. The wire is carried on bobbins in two rotating cages, having twelve bobbins each, and the jute bobbins, seventy-two in number, are mounted on disks, while the compound is supplied from steam-heated tanks, through which the cable is passed by rollers. A machine of this class will turn out as much as 8 m. of finishing cable in 24 hours. When a supply of steel wire has been used up, the next portion of the cable is started. Tapes of paper, rubber or jute are served from bobbins on disks and also in some designs from independent bobbins, each mounted on a separate shaft. A small disk, or ring, is mounted on the cable, the cable is thoroughly dry a quantity of compound is admitted to the tank and so permeates the insulation. Lead is put on the outer surface, and the whole passes through an oven, where the cable passes, and is covered with a uniform coating or tube of lead, forced into the dies and around the cable by hydraulic pressure. Steel tapes are in some cases used to armour cables and protect them from strain. In this way the cable is wound in a similar manner to the other materials already described. Rubber covering of wires and cables is done by passing them through grooved rollers simultaneously with rubber strips and below, so that the rubber is drawn on to the wires, the latter emerging as a wide band. The separate wires are parted forcibly, each retaining its rubber sheathing. Vulcanizing is afterwards done in steam-heaters. Many auxiliary machines are necessary in connexion with wire- and cable-covering, as plant for preparing the rubber and paper, &c., cutting it into strips, winding it, measuring lengths, &c. Wire Gauges.—In commerce, the sizes of wire are estimated by gauges which consist of plates of circular or oblong form having notches of different widths round their edges to receive wire and show the gauge. Each notch is stamped with a number, and the wire or sheets which exactly fit its given notch is stated to be of, say, No. 10, 11, 12, &c., of the wire gauge. But it is always necessary to state what particular gauge is used, since, unfortunately, uniformity is wanting. Holtzapffel investigated the subject, and published a valuable collection of facts relating thereto in 1846. A more exhaustive report was published by a committee of the Society of Telegraph Engineers in 1879 (Journ. Soc. Tel. Eng., Vol. 88, p. 187), which was afterwards adapted to British Trade, in 1884, of the New Imperial Standard Wire Gauge. That report stated: "The different gauges in use might be counted by bundles, and these bundles have been adjusted to special objects. When competition is keen, wire is commonly drawn by one gauge and sold by another; half sizes and quarter sizes are in constant use among the dealers, the wire being sold as whole sizes. Sometimes, when the market is firm, a wire having been drawn by one maker—some by which the workmen are paid, and others by which the wire is sold—... the whole system is in confusion, and lends itself to those who desire to use fraudulent practices." Thomas Hughes (The Ensign Wire Gauge, London, 1879) stated that, "In the same town some use Stubbs, some the Warrington, some the Birmingham, some the Yorkshire, some the Birmingham (B.W.G.) and the Lancashire or Stubs. The origin of the B.W.G. is lost in obscurity. The numbers of wire were in common use earlier than 1735. It is believed that they originally were based on the thickness of the wire, being the weight of a thousand numbers corresponding with each draw, so that No. 10, for example, would have passed ten times through the draw plate. The Birmingham and the Lancashire gauge, the latter being based on the averaging of the dimensions collected from a large number of the former in the possession of Peter Stubbs of Warrington, have long held the leading position, and are still retained and used in various forms, though the dimensions are different. There is no need, therefore, to give an account of the other and less known gauges which have been used by manufacturers. In no case is there any regular increment of dimensions from which a regular curve could be drawn. The first attempt to adopt a geometrical system was made by Messrs Brown & Sharpe in 1855. They established a regular progression of thirty-nine steps between the English sizes, 0.006 in. (460 mils) and No. 36 (5 mils). Each diameter was multiplied by 0.890522 to give the lower size. This is now the American gauge, and is used to a considerable extent in the U.S.A. The British Wire Gauge, which is sanctioned by the British Board of Trade, is one that was formulated by J. Latimer Clark. Incidentally, one of its recommendations is that it differs from pre-existing gauges scarcely more than they differ from each other. A wire of the Birmingham gauge is being the mil. No. 7/0, the largest size, is 0.50 in. (500 mils) in diameter, and the smallest, No. 50, is 0.001 in. (1 mil) in diameter. The wire increases in thickness, diminishes by 10-5574%, and the weight diminishes by 20%. But the fact remains that a large number of gauges are still in common use, and that gauges of the same name differ and are therefore not authoritative. Sheet iron wire gauge differs from Stubbs's steel wire gauge. Gauges for wire and plate differ. Accuracy can only be secured by specifying precisely the name of the gauge intended, or, what is generally better, the dimensions in decimals, which can always be tested with a micrometer. A decimal wire gauge has been proposed. Tables of decimal equivalents of the wire gauges have been prepared, and are helpful. Parallel forms of wire are circular, oval, and are generally 1\frac{1}{4} in. in diameter, with thirty-six notches; many have the decimal equivalents of the sizes stamped on the back. Oblong plates are similarly notched. Rolling mill gauges are also oblong in form. Wire gauge is laid on a disk, which is shot into, which the wire is thrust; one edge being graduated, the point at which the movement of the wire is arrested gives its size. The graduations are those of standard wire, or in thousands of an inch. In some cases both have been graduated differently for different systems of measurement. A few gauges are made with holes into which the wire has to be thrust. All gauges are hardened and ground to dimensions. Wireworm, a popular name for the slender, hard-skinned grubs or larvae of the click-beetles or *Elateridae*, a family of the Coleoptera (p.297). These larvae pass a long life (two or three years) in the soil, feeding on the roots of plants, and they often cause much damage to farm crops of all kinds, but especially to cereals. A wireworm may be known by its broad, quadrilateral head and cylindrical or somewhat flattened body, all of whose segments are protected by a firm, chitinous cuticle. The three pairs of legs on the thoracic segments are short and the last abdominal segment is, as is frequently the case in beetle grubs, directed downwards to serve as a terminal pro-leg. The hinder end of the body is acutely pointed in the larvae of the species of Agriotes (*A. obscurus* and *A. lineatus*) that are the best known of the wireworms, but in another common form (the grub of *Athous haemorrhoidalis*) the tail is bifid and beset with sharp processes. The subterranean habits of wireworms make it hard to exterminate them when they have once begun to attack a crop, and the most hopeful practice is, by rotation and by proper treatment of the land, to clear it of the insects before the seed be sown. Passing easily through the soil on account of their shape, wireworms travel from plant to plant and thus injure the roots of a large number in a short time. (See ECONOMIC ENTOMOLOGY.) Other subterranean creatures—such as the "leather-jacket" grub of crane-flies—which have no legs, and which feed on the roots of plants, and which may have over two hundred, are often confounded with the six-legged wireworms.
Wirksworth, a market town in the western parliamentary division of Derbyshire, England, 14 m. N.N.W. of Derby, on a branch of the Midland railway. Pop. of urban district (1901) 3807. It is picturesquely situated at the head of the valley of a small tributary of the Derwent, at an elevation exceeding 500 ft., and is almost encircled by sharply rising hills. The cruciform church of St. Mary, with a central tower and short spire, is in great part Early English, with Perpendicular additions; but considerable traces of a Norman building were revealed during a modern restoration. There is a manufacture of tape in the town, and lead-mining and stone-quarrying are carried on in the neighbourhood; relics of the Roman working of the lead mines have been discovered. A large brass vessel used as a standard measure for the lead ore, and dating from the time of Henry VIII., is preserved.

WISBECH, a municipal borough, market town, and port in the Wisbech parliamentary division of Cambridgeshire, England, 38 m. N. by W. of Cambridge, on the Great Eastern and the Great Northern and Midland joint railways. It lies in the flat fen country, on the river Nene (mainly on the east bank), 11 m. from its outlet on the Wash. By the Wisbech canal it has communication with the Ouse. The church of St Peter and St Paul has a double nave, with aisles, the north arcade being Norman; but the rest of the building is mainly Decorated and Perpendicular. There are remains of a Norman west tower, the Perpendicular tower on the north side. The town contains a valuable library and various collections, including antiquities and objects of art and natural history. Other institutions include a grammar school founded in the middle of the 16th century and provided for by a charter of Edward VI., the Cambridgeshire hospital, a custom-house, a cattle-market, and an important corn-exchange, for Wisbech has a large trade in grain. A Gothic monument commemorates Thomas Clarkson (1760–1846), a powerful opponent of the slave-trade, and a native of the town. The shipping trade is carried on both at the town itself and at Sutton Bridge, 8 m. lower down the river. The chief imports are coal, timber and iron, and the exports grain and other agricultural products and salt. Foreign trade is chiefly with the Russian Baltic ports. In the neighbourhood large quantities of fruit are grown, including apples, pears, plums, gooseberries, and strawberries. Potatoes, asparagus, and other vegetables are also grown for the London market. The town possesses agricultural implement works, coach-building works, breweries, rope works, planing and sawing mills, and corn and oil-cake mills. The borough is under a mayor, 6 aldermen, and 18 councillors. Area, 6476 acres.

OLEUS, i.e. Ouiebus, a Roman embankment and tumuli. About 940 the manor is said to have been given to the abbey of Ely by Osywy and Leofeuta; the abbot held it in 1086; and it became attached to the see of Ely with the other possessions of the monastery. The castle is alleged to have been built by William I., and was converted from a fortress in the tens into an episcopal palace between 1471 and 1473. The growth of Wisbech depended on its position and episcopal patronage. In 1190 tenants of Wisbech Barton acquired an exemption from tolls throughout England, confirmed by John, Henry IV., and Henry V. The Gild of the Holy Trinity is mentioned in 1379, and grew rich and powerful. After its dissolution the townsmen became, in 1540, a corporation holding of the king, by a charter which transferred to them the property and duties of the gild, and was renewed in 1610 and 1669. By the Municipal Corporations Act of 1835 a mayor, aldermen and a council replaced the capital burgesses, the older governing body. The borough returned a member only to the parliament of 1558; its elected member, Secretary Thurlow, chose then to represent another constituency. A fair of twenty days from the vigil of Holy Trinity was granted to the bishop of Ely in 1147. The manor still occupies by custom the interval between Lynn mart, of which it is probably an offshoot, and Stamford fair in mid-Lent. A pleasure fair, called the Statute Fair, takes place shortly before Michaelmas. Importance attaches to the horse fair, held in 1827 in the week before Whitsuntide and now on the second Thursday in May and on July 25, and to the cattle fair in the beginning of August. Saturday was market day in 1792; a corn market is now held on Saturday, a cattle market on Thursday and Saturday. In 1868 cattle were prolific in Wisbech water. The port was noteworthy until a diversion of the Ouse, and the cutting of a channel, rendered it less accessible. Drainage restored trade before 1634, and the act of 1704 which protected the Cut was the beginning of prosperity. From 1783 to 1825 agricultural produce was exported and coal imported. Hemp and flax had an importance, lost between 1827 and 1849, but responsible in 1702 for fairs on Saturday and Monday before Palm Sunday. See W. Watson, History of Wisbech (Wisbech, 1827); N. Walker and F. Thomas, Domesday Book (Wisbech, 1849); History of Wisbech (Wisbech and London, 1833).

Wisconsin (known as "the Badger State"), one of the North Central states of the United States of America. It is bounded on the E. by Lake Michigan, on the N. by the Upper Peninsula of Michigan and Lake Superior, on the W. by Minnesota and Iowa, and on the S. by Illinois. Its greatest length is from N. to S. (42° 30' N. Lat. to 47° 3' N. Lat.) is 500 m., and its greatest breadth (86° 46' 10" Long. to 94° 15' 43" Long.) is 250 m. The greater part of the western boundary separating the state from Minnesota and Iowa consists of the Mississippi and St. Croix rivers flowing into Lake Superior. The Menominee and Montreal rivers form a considerable part of the boundary line on the N. and E., separating it from the Upper Peninsula of Michigan. The state's lake shore boundary is more than 550 m. long. Included in Wisconsin are the Apostle Islands in Lake Superior, and Washington Island and a group of smaller islands at the entrance to Green Bay on the Lake Michigan side. The state occupies a total area of 56,666 sq. m., of which are water surface. Roughly speaking, it divides the Great Lakes region from the upper valley of the Mississippi.

Physical Features.—Wisconsin forms part of the inner margin of an ancient coastal plain and the oldland of crystalline rocks about which the plain sediments were deposited. The plain and the oldland were well worn down by erosion and then were uplifted; were dissected by stream valleys, and were glaciated. The surface is generally rolling and undulating, comprising, with the Upper Peninsula of Michigan, a swelling elevation of land between the three depressions represented by Lakes Michigan and Superior and the Mississippi and the St Croix rivers. The lowest elevations are in the southern and central portions of the state, where the altitude is sometimes less than 500 ft. above sea-level. These points in the state are residual masses of relatively resistant rock rising above the erosion surface; such are: Rib Hill (1930 ft.) in Marathon county, in the north-central part, and some of the peaks of the Chicago Range, about 1800 ft. high. From the N. highland two heights of land (1200 to 1600 ft.) extend southward well into the central portions of the state, dividing the greater part of its area into two natural drainage basins. The westernmost of these elevations separates the valleys of the Mississippi, and the St Croix from that of the Wisconsin river. The eastern elevation is a ridge or cuesta formed by an outcropping hard layer of the ancient coastal plain; and it separates the Wisconsin river basin from the Fox River Valley and the streams flowing into Lake Michigan. Along the Mississippi and the Wisconsin runs a chain of bluffs varying in height from 200 to 500 ft., and in the E. a rocky limestone ridge or cuesta some 50 m. back from Lake Michigan extends from the Door county peninsula, E. of Lake Winnebago and as far south as the Illinois line. There are no large rivers flowing into Lake Michigan, but the upper parts of the many tributaries extend from a point some 30 m. S. of the lake all the streams flow in a southerly direction. The Wisconsin is the drainage basin for a greater part of the state. The St Croix river rises in the S.W. part of the Penokee Range and flows W. and S., forming the western boundary of the state for 135 m. before it joins the Mississippi 20 m. below St Paul. Before it is joined by the Wisconsin, the Mississippi

1 The badger is not found in the state, and the name probably originated as a nickname for those lead miners N. of Wisconsin, who came from the northern mountains and dug burrows like the badger, and who did not go home in winter like the miners from southern Illinois and farther south, who were called "suckers," a name borrowed from the migrating fish in the Rock, Illinois, region. The name "bogus" was applied generally to all the people of Illinois, and the name "bogus" to the people of Wisconsin and "badger state" to the state.

2 Besides the area as given here, the state has a badge of approximately 7500 sq. m. of Lake Michigan and 2378 sq. m. of Lake Superior.
receives several rivers of considerable length, the most important of which are the Chippewa and the Black. The Wisconsin river rises on Lake Winnebago, between which and Lake Michigan, joining the Mississippi near Prairie du Chien. It is navigable as far as Portage, some 200 m. from its mouth. The Fox river (more than 260 m. long) rises in the south central portion of the state, flows N. and W. through Marquette and Outagamie counties, turning N. into Green Bay, and is the longest and most important stream draining into Lake Michigan. The Wolf river is its most important tributary, joining the Fox near Conover, and another stream drains into the Lake Michigan basin. Among these are the Menominee and Oconto, which flow into Green Bay; an arm of Lake Michigan, and the Sheboygan and Milwaukee rivers, which empty into Lake Michigan between Green Bay and the lake. Wisconsin is drained by several streams flowing across the Illinois boundary and finding their way eventually through other rivers into the Mississippi. The largest of these are the Rock, Des Plaines, Fox, of the Illinois and the Kankakee. Small streams flow through the outer and lower portions of the state, and many of these streams have well-drained, fertile soil, with some of the most beautiful scenery in the state.

Flora and Fauna.—Wisconsin is originally the native home of the greater part of the wild fowl and animals found in the other North Central states. Deer were found in large numbers in all sections of the state, bear were common in the central and northern parts, bison were found in the western part of the state, lynx and marten are still abundant, and other smaller animals particularly of fur-bearing varieties. The streams abound in fish. The abundance of game made the region the favorite hunting ground of the early red men. At present the state gives little attention to the game and fish and the principal interest is in the furbearing animals. The principal animal of this class is the muskrat, followed by the mink, otter, and beaver. Bear, deer and lynx are still to be found in the less settled forest regions of the N. and E. parts, and the fisheries are still important.

The anti-saloon law of Wisconsin is exceedingly varied; C. B. Cory (see Wisconsin, 1910) states that 1910, when the laws of Wisconsin, Illinois, and of these probably not less than 350 occur in Wisconsin. The more characteristic and useful birds include many species of the sparrow, such as the song, swamp, Lincoln's chipping and field sparrow; the bank, barn, cliff, white-bellied and rough-winged swallow, as well as the purple martin and the chimney swift; ten or more species of fly-catchers, including the least, arcadian, phoebe, wood, and yellow bird; the king bird; the herons and egrets; and about thirty species of warblers, including the parula, cerulean, Blackbournian, prothonotary, yellow, Nashville; of finches, 25; of sparrows, 25; of titmice, 20; and of species of vireos. The song-birds are well represented in the hermit thrush, wood thrush, Wilson's thrush (or veery), brown thrasher, robin, blue bird, bobolink, meadow lark, and the black grove swallow (partridge), quail, prairie hen and wild turkey. The birds of prey include the red-headed, red-tailed, broad-winged, Cooper's, sharp-shinned, and sharp hawk and the bald eagle; the great horned, barred, barn, snow, short-eared and screech owls. The ducks include the mallard, black duck, canvas-back and red-head; the Canadian goose, the snowy goose, and the whooper, and the greater and lesser snow geese also appear in the wintering months.

Originally the greater portion of what is now Wisconsin was covered with forests, although in the S. and W. there were considerable tracts of rolling prairie lands. In the S. portion the predominating trees are the oak and hickory, in the central region, the hickory and the elm, while in the W. an enormous and unbroken forest of pines, hemlocks and spruce.

Climate.—The climate of the whole state is influenced by the Great Lakes, the lower Mississippi, and the geographic latitude, those which move northward through the Mississippi Valley, and that of the eastern and northern sections is moderated by the Great Lakes. The winters, especially in the central and north-western sections, are long, cold and generally snowy, while the summers are comparatively short and warm. Those who move northward through the state are 44° F. July, with an average temperature for the state of 70°, is the warmest month, and February, with an average of 15°, is the coldest. Within a period of thirty-eight years, from 1870 to 1908, extremes at Milwaukee ranged from 100° to -25°, while at

WISCONSIN
furniture in Wisconsin is centralized especially in Sheboygan, where in 1908 was manufactured about one-third of the furniture made in the state.

Mines and Quarries.—The lead mines of south-western Wisconsin produced $958,395 in 1899, in the quantity of 742,732 tons, chiefly zinc, constituting about 56% of the total production of the state. The output of the foreign countries was valued at $4,541,709, and the production from the foreign countries was valued at $904,142.

There are large deposits of sandstone in the county of Milwaukee, from which is made a cream-coloured brick, so largely used in Milwaukee that this city has been called the "cream city.

The total value of the granite in 1907 was $1,413,107, and the value of the sandstone was $9,000,000. The industry began in 1888, when the first quarry (at Granite Heights, Marquette county) was opened. The principal quarries are near Milwaukee, in the county of Milwaukee, and in the county of Racine.

Wisconsin is the largest producer of sandstone in the United States, and the output is valued at $904,142.

The limestone is extensively used for building purposes, and the value of the limestone quarried in 1907 was $2,850,920, valued in the quantity of 6,300,000 tons, mostly in the counties of Milwaukee, Rock, and Door.

The chief minerals are lead, zinc, silver, copper, and iron ore, with a few other minerals. The iron ore is found in the counties of Iron, Ashland, and Bayfield.

Population.—The population of Wisconsin in 1890 was 1,686,880 (exclusive of 6,459 persons specially enumerated); in 1900 the total was 2,066,042—an increase of 22.2% on the basis of the total at the census of 1890 of 1,686,880.

The density of the population in 1910 was 42.2 to the square mile. Of the total population in 1900, 1,535,071, or 75.1%, were native-born, the increase in native-born since 1890 being 32.3%, while there was a decrease of foreign-born of 0.6%. The falling off in foreign immigration in the decade 1890-1900 contrasts strongly with the increase of 28.1% in the number of foreign-born in 1880-1890.

Population of Native-Born and Foreign-Born, 1899.

The native-born is of 42.2 to the square mile. Of the total population in 1900, 1,535,071, or 75.1%, were native-born, the increase in native-born since 1890 being 32.3, while there was a decrease of foreign-born of 0.6%. The falling off in foreign immigration in the decade 1890-1900 contrasts strongly with the increase of 28.1% in the number of foreign-born in 1880-1890.

Population of Native-Born and Foreign-Born, 1899.

The native-born is of 42.2 to the square mile. Of the total population in 1900, 1,535,071, or 75.1%, were native-born, the increase in native-born since 1890 being 32.3, while there was a decrease of foreign-born of 0.6%. School, Winnebago (1904) under the Wittenberg School and Potawatomi (440) not under an agent. The civilized Brotherton and Stockbridge Indians live principally in Calumet county. Among religious denominations the Roman Catholics, with 905,264 members in 1906, had 50.5% of the total communicants or church members in the state. The Lutheran bodies ranked next with 284,286 members (including 153,690 of the Evangelical church, 49,535 of the United Norwegian Evangelical church, 57,473 of the Evangelical Lutheran church of Wisconsin, 15,421 of the Evangelical Lutheran Synod of Iowa and 8695 of the General Council). Only one other state (Pennsylvania) had as large a percentage of its population as Wisconsin in 1906. There were $74,247 Methodists (chiefly of the Methodist Episcopal Church), 26,163 Congregationalists and 21,716 Baptists.

Government.—The original constitution of the state, adopted in 1848, and amended in 1869, 1870, 1874, 1877, 1881, 1882, 1902 and 1908, is still in force. An amendment may be proposed by either house of the legislature, and if passed by two successive legislatures by a majority of the members elected to each house must be submitted to the people for ratification by a majority vote. A constitutional convention may be called on the recommendation of a majority of the Senate and Assembly if this proposal receives a majority vote at the next election for members of the legislature. Suffrage was originally granted to every male twenty-one years of age or upwards resident in the state for one year preceding any election—if he were a white citizen of the United States, or a white of foreign birth who had declared his intention to be naturalized, or an Indian declared by Congress a citizen of the United States. Since the Indian laws of 1867 have made all Indians citizens of the United States, the common law, as declared by the Supreme Court, was adopted by the legislature in 1881; and the constitution provided that the legislature might by law give suffrage to others than those enumerated if such an act of legislature were approved by a majority of the popular vote at a general election. By an amendment of 1882 the word “white” was omitted and by an amendment of 1908 it was provided that those foreign-born and unnaturalized in order to become electors must have declared their intentions to become citizens before the 1st of December 1886, and that “the rights hereby granted to such persons shall cease on the first day of December A.D. 1912.” The amendment of 1908 also permits the legislature to provide for the registration of electors in incorporated cities and villages.

The official ballot is of the blanket type, with names of candidates in party columns, but with no candidate’s name repeated on the ballot and with no emblems to mark the party columns. In 1909 an act was passed permitting county boards to adopt a “coupon” ballot. Since 1905 there has been a direct nomination system of primaries for all officers except delegates to national nominating conventions.

Executive power is vested in a governor and a lieutenant-governor elected for four years. The governor’s salary (1897) is $5000 a year and the lieutenant-governor’s $1000. Candidates for either office must be citizens of the United States and qualified electors of the state. The lieutenant-governor is president of the Senate with a casting vote only. A bill vetoed by the governor becomes a law if it is approved by two-thirds of the members present in each house; and a bill not returned by the governor within six days (excepting Sunday; before 1908 the constitutional limit was three days) after its presentation to him becomes a law unless the return of the bill is prevented by the joint action of two-thirds of both houses. The governor has power to grant reprieves, commutations and pardons, except for treason, leases and rescripts; he may suspend execution of sentence for treason until action is taken by the legislature—and in cases of impeachment.

The administrative officers, a secretary of state, a treasurer and an attorney-general, are elected for two years and act as commissioners of public lands. The secretary of state is ex-officio auditor; and he acts as governor if the regularly elected governor and lieutenant-governor die, are removed from office or are absent from the state. A state superintendent of public instruction is chosen by popular vote for a four-year term. Other administrative officers are a commissioner of insurance (from 1867 to 1878 the secretary of state was commissioner of insurance; the office became elective in 1881); a commissioner of labour and industrial statistics; three railroad commissioners, who have jurisdiction over all public utilities, including telegraph and telephone; a commissioner of banking; a dairy and food commissioner; a state superintendent of public property; three tax commissioners who act (since 1901) as a state board of assessment; commissioners of fisheries (established 1874); a state board of agriculture (1897); and a state board of forestry (created 1899 preceding a department of agriculture established 1903).

The legislature consists of a Senate and Assembly and meets biennially, and when called in special session by the governor to transact special business definitely named in the governor’s call. The number of assemblymen cannot be less than 54 or more than 100, and the number of senators must be not more than one-third or less than one-fourth the number of members of the Assembly. In 1910 there were 33 senators and 100 assemblymen. Elections to the Senate and Assembly are biennial and the term of members of the Assembly is two years, but the senatorial terms are of two years and the members are elected each two years. A candidate for either house must have resided in the state at least one year, must be a qualified elector in the district from which he is chosen, and may not be a member of Congress or hold any military or civil office under the United States. Since 1853 a state census has been taken every ten years, and on the basis of these censuses the legislature re-apportions the Senate and Assembly districts. Each member of the legislature receives $300 a year and 10 cents a mile for mileage. Any bill may originate in either house, and either house may amend or reject a bill passed by the other. Special legislation of several kinds is forbidden, especially by amendments of 1871 and 1892; and the constitution as adopted in 1848 prohibited the legislature’s authorizing any lottery or granting any divorce. The Assembly may impeach civil officers by a majority of all elected members, and the Senate to try impeachments; for conviction a two-thirds vote of all members present is required. The judicial power of the state is vested in a supreme court of seven members (salary $6000 a year; elected for a term of ten years; the senior justice is chief justice) with appellate jurisdiction throughout the state, general superintendence of inferior courts to define, hear and determine writs of habeas corpus, mandamus, injunction, prohibition, certiorari and other original and remedial writs; nineteen (only five under the constitution of 1848) circuit courts, of one judge each except in the second circuit (including Milwaukee) in which there are four judges, elected (at a spring election, and not at the general state election) by the voters of the circuit district; probate judges, one elected (for two years) in each county, except where the legislature confers probate powers on inferior courts; and in townships, cities and villages, justices of the peace, elected for two years.

Local Government.—Wisconsin has the mixed or township-county system of local government. Each township (or “town,” as it is commonly called) elects at its annual town meeting on the first Tuesday in April three supervisors, a clerk, a treasurer, one or more assessors, two justices of the peace, from one to three constables, and, if the town has a library, a librarian. Justices of the peace hold office for two years, other town officers for one year only, except that in a county having a population of 100,000 or more (Milwaukee county), town meetings are biennial and all officers are elected for two years. For other than school purposes rates must not exceed 2% of the assessed valuation of the taxable property in the town. The chairman of the several town boards of supervisors, with the

The office of railroad commissioner was created in 1874, became elective in 1881 and was abolished under an act of 1905 by a commission of three members, which received jurisdiction over other public service corporations in 1907.

Until 1881 elections to the legislature were held annually, and the term of assemblymen was one year and of senators two years.

Not separately organized until 1853; the judges of the circuit court acted as justices of the supreme court.
supervisor of each ward of a city and the supervisor of each village in the county, constitute the county board of supervisors, and each county ^1^ is thereby, at the election in which the mayor, a clerk, a treasurer, a sheriff, a coroner, a clerk of the circuit court, a district-attorney, a register of deeds and a surveyor. The county board represents the county, is entrusted with the care of the county property, supervises the management of the county court, supervises assessments and levies the taxes necessary to defray the county expenses. The county board also elects a county highway commissioner. By term of three years, is required to designate a one-seventh of the respective county highway districts, and may authorize a tax and borrow money for the development of the system. Cities are chartered according to population,^2^ with a mayor, a single legislative council and a board of aldermen, and the city clerk, the city treasurer, comptroller, justices of the peace and supervisors must be elected by the people, but the other offices are filled as the council of each city directs. The city or town is the highest administrative unit in the commission in any city of the second, third or fourth class which votes for this form of government at an election called by a petition signed by 25 % of the voters at the preceding election for mayor. 

Miscellaneous Laws.—A married woman may manage her separate property as if she were single. A widow is entitled to a dower in one-third of her husband’s real estate, and a widower is life tenant by courtesy of all the real estate of which his wife died seized and not disposed of by her last will, unless she leaves issue by a former husband, to whom the estate might descend, in which case her estate passes immediately to such issue. If either husband or wife dies intestate and there are no children of the marriage, the surviving spouse is entitled to the entire estate of the deceased, both real and personal. The causes for an absolute divorce are adultery, impotency, sentence to imprisonment for life or for terms of years or more, extreme cruelty, abandonment or cruel or inhuman treatment, habitual drunkenness and voluntary separation for five years. For any other cause than adultery an action for a divorce cannot be brought unless one of the parties has been absent from the state for two years immediately preceding the filing of the complaint. Neither party is permitted to marry a third party until one year after the divorce has been obtained. Adultery is punishable by imprisonment in the state prison for not more than three years nor less than one year, or by a fine not exceeding $500 nor less than $200. A husband who wilfully abandons his wife, leaving her destitute, or who refuses to support her when he is able to do so, may be imprisoned in the state prison for not more than one year or in the county jail or workhouse not more than six months nor less than fifteen days, and for ten days, in the discretion of the judge, he may be kept on a bread and water diet. A homestead owned and occupied by any resident of the state and consisting of not more than 40 acres of agricultural land outside the limits of a city or village, or one-fourth of an acre within a city or village, together with the dwelling-house and other appurtenances, is exempt from liability for debts other than labourers’, mechanics’ and purchase-money liens, mortgages and taxes. If the homestead is sold the proceeds from the sale, to the amount not exceeding $500, are likewise exempt from execution and period of two years is provided for the purpose of procuring another homestead. If the owner is a married man his homestead cannot be sold or mortgaged without his wife’s consent. The employment of children under fourteen years of age in factories, workshops, workrooms, work-stations or gardens is forbidden, and their employment at any gainful occupation is permitted only during the vacation of the public school. A child between the ages of sixteen and eighteen years may engage in a gainful occupation only upon the recommendation of the school principal or clerk of the board of education. No child under sixteen years of age may be employed longer than fifty-five hours in any one week, more than ten hours in any one day, more than six days in any one week, or between 6-0 p.m. and 7-a.m. Other radical legislation, especially in regard to railways, has included: the Porter Law, regulating rates, which was enacted in 1874 during the "Granger Movement," was modified from time to time, and was displaced by a law of 1905 (in 1908 declared constitutional) so long as stockholders receive a "reasonable compensation" on their investment. The state railway commission, a separate corporation with both passenger and non-participating business; and an eight-hour labour law in effect on the 1st of January 1908. 

Public schools. The state is derived principally from taxes on corporations, from an inheritance tax and from departmental and institutional fees and charges; and that for counties, towns, villages and cities from a general property tax. The general property tax had been abandoned by almost wholeness for educational purposes only. The state tax on railways and other public service corporations is levied on an ad valorem basis; but telephone companies are taxed by collecting a percentage of the gross receipts. Insurance companies are taxed by the value of their business on hand, and banks were in 1903 amended to permit a graduated tax on incomes, privileges and occupations. A poll tax is levied for highway purposes in towns and villages, but the general charter law does not provide for the collection of this tax by the county, but leaves it to the town or village. The tax on bank capital was increased from $1,711,387 in 1899 to $3,669,771 in 1908. The state receipts from all sources increased from $4,070,316 for the year ending September 30, 1899, to $8,299,958 for the year ending June 30, 1908; while the state expenditures for the latter year were $7,760,771 or $537,711 less than the receipts. As a result of the failure of "wildcat" banks during the Territorial period, a law was passed in the state legislature forbidding the legislature to charter a bank or pass a general banking law until the people voted in favor of banks, and providing further that no bank charter or general banking law should be of any force until a majority of the people voted for its adoption. The people gave their approval to a general banking law in 1852, and state banks were incorporated under it. Private banks and one savings bank are also chartered. In 1903 a state banking department was created under the management of a commissioner of banking appointed by the governor with the concurrence of the Senate for a term of five years. Under this law private banks became state banks, and all except national banks are examined by the commissioner, his deputy or some person appointed by the commissioner, at least once a year. When satisfied that a bank has become insolvent, the commissioner may take possession of it and sell for its assets. The net proceeds are divided among the depositors and 3 savings banks with total resources amounting to $140,155,455. To prevent such extravagant expenditures for internal improvements as were incurred in the early years of statehood, the framers of the constitution of Wisconsin inserted a clause limiting its aggregate indebtedness to $100,000 for all purposes other than to repel an invasion, to suppress an insurrection or for defence in time of war, and the state is free from debt with the exception of that contracted on account of the Civil War. This war debt, although amounting to $2,251,000, is held by four state educational funds. A constitutional amendment, adopted in 1874, limits the indebtedness of each county, city, town, village and school district to 5% of the value of its taxable property. 

Education.—Wisconsin has an excellent free public school system, which was established in 1848 and which provides a graded system of instruction in county district and city schools, high schools and normal schools and the University of Wisconsin (incorporated 1848; see WISCONSIN, Universities and Colleges). By a law of 1907 school attendance (24 weeks per annum in the country—a law of 1903 had required only 20 weeks—32 weeks in cities) was made compulsory for children between seven and fourteen years of age who do not live more than 2 m. from school by the nearest travelled public highway. In 1907–1908 27.2% of those between seven and fourteen years of age in the state attended no school. The total school population in 1907–1910 was 366,554. In 1901 a law was enacted providing for state graded schools of two classes, which must be opened for at least nine months in each school year. Each town or city, or two cities (of three or more departments) receive $500 a year each from the state, and graded schools of the second class (of two departments only) receive $200 a year each from the state. About 1906 rural graded schools, outside of villages, were first organized. There are twenty-two day schools for the deaf. There are a few township high schools (28 out of 285 in 1900), and these receive from the state one-half of the total annually paid for teachers’ salaries; for free high schools the first state provision was made in 1875. There are special kindergarten training departments in Wisconson. The state maintains and subsidizes depart-ments for manual training at Oshkosh and Platteville, and a training department in domestic science at the Stevens Point school. The first kindergarten officially connected with any American state normal school was opened at Oshkosh in 1888. The state normal schools are supported largely from the interest ($59,137 in 1908) of a fund ($1,957,250 in 1908) created in 1865 from the sale of swamp and overflowed lands, and from an annual state tax ($230,000 in 1908). In addition to the state university the state maintains at Platteville a school of mines, opened in 1908. Under state control there is a system of teachers’ and farmers’ institutes. A Free Library Commission of five members created in 1895 maintains about 650 circulating free public libraries comprising more than 40,000 volumes. In 1907 there were about 960,000 volumes in public township
libraries for which a law of 1887 had made provision; since 1895 the formation of such libraries has been mandatory, and books, chosen by the county superintendent, are bought from a fund of 10 cents for every person of school age in towns, villages, and cities of the fourth class. An act of 1901 permits county boards to establish county systems of travelling libraries. In 1906 the total expenditure for public education in the state was $12,547,574; of this sum $10,604,294 was spent for common schools, high schools and graded schools, $1,901,135 for the university, and $547,661 for normal schools. The total income for schools in 1906 was $1,173,659, of which $1,379,410 was from the seven-tenths-of-a-mill tax, $200,000 was from licence fees and taxes upon corporations (for salaries of rural school inspectors) and $104,249 the income from the common school fund which in that year amounted to $3,845,629.

Normal institutions of collegiate rank are Beloit College (1846; originally Congregational, now denominational) at Beloit; Carroll College (1846, Presbyterian), at Waukesha; Lawrence College (1847; Methodist Episcopal), at Appleton; Concordia College (1881; Lutheran), Marquette University (1884, Roman Catholic), and Milwaukee-Downer College (1895; non-sectarian, for women; an outgrowth of Downer College, Congregational and Presbyterian, founded at Fox Lake in 1853), all at Milwaukee; Milton College (1867; Seventh Day Adventist), at Milton; North-Western University (1865; Lutheran) at Watertown; Ripon College (1847; originally under Presbyterian and Methodist auspices), at Ripon and for Boys (1875), at Oshkosh; and Wayland University (1855; co-educational; Baptist), at Beaver Dam; and the following Roman Catholic schools: St Clara Academy (1847; Dominican) at Sinsinawa, St Francis Seminary (1853) at St Francis, and St Lawrence University (1861, Capuchins) at Mt Calvary. There are also many private academies and trade or technical schools, and six industrial schools for Indians.

Charitable and Penal Institutions.—In the number and equipment of public and private institutions of this kind Wisconsin stands high. These institutions are under the general direction of a state board of control (established in 1905) of five members (one a woman), appointed by the governor for a term of five years. This board has charge of the following institutions: a State Hospital for the Insane (1860) at Mendota; the Northern Hospital for the Insane (1873) at Winnebago, 4 m. N. of Oshkosh; a School for the Deaf (1852) at Delavan, Walworth county, in which the teaching is partly in sign language; a School for the Blind (1849; taken over by the state in 1850) at Janesville; an Industrial School for Boys (opened in 1860, as a House of Refuge) at Waukesha; the State Prison for Women at Waupun; State Public School for Dependent and Neglected Children (1886) at Sparta, with a farm of 234 acres; Wisconsin Home for Feeble Minded (1896) at Chippewa Falls; Wisconsin State Reformatory at Reform, 10 m. N.W. of Madison; St Mary's Sanatorium (1907) at Wales, Waukesha county. In addition the board has partial control over the Wisconsin Workshop for the Blind (1905) at Milwaukee, where there is a willow ware factory, and the Wisconsin Industrial School for Girls (1875) also at Mil-

waukee. Its powers of inspection extend over 5 semi-state institutions; 33 county insane asylums, 69 garls, 48 poor-houses, 50 private benevolent institutions and 206 police stations and lockups. The board has also power of visitation and inspection over the Wisconsin Veterans' Home at Watapacu, founded in 1887 by the state department of the Grand Army of the Republic. In the state prison a high school is maintained, which separates a high school from the county asylums. The labour of convicts in the state prison is leased; until 1878 the state itself supervised manufacturing in the state prisons; since then the business has been conducted in making shoes for a Chicago firm; and since 1903 the state has received 65 cents a day for the labour of each convict, and at least 300 convicts are employed in the manufacture of socks and stockings, from which in 1906-1908 (two years) the income to the state was $156,890. In 1910 a binding twine factory was established in the prison. In the state reformatory the labour of some inmates is leased to tailor's, and the others make brooms or bricks, or work in some other trade or industry. Since 1896 the law has been in force for prisoners with a good record at the state prison. By a law of 1900 certain offenders are placed under probation under the supervision of the state board of control.

History.—Politically Wisconsin has been under French domination (from 1634 to 1760); under British domination (from 1760, formally 1763, to 1813); and under that of the United States since 1813. But the British influence on the community was negligible, and British rule was never more than nominal and was confined to the military posts. When American troops occupied the posts at Green Bay and Prairie du Chien in 1816, thirty-three years after it had become a part of the territory of the United States, the region was still almost exclusively French in manners, customs and population; and so it remained for nearly two decades.

The region comprised in the present state of Wisconsin, when first explored by Europeans, was a favourite hunting-ground for the Indians who constantly crossed this region between the Great Lakes and the upper Mississippi. The Indian population of Wisconsin in the first half of the 18th century was probably larger than that of any region of similar size east of the Mississippi. Among the many different tribes were the Sioux, Chippewa, Kickapoo, Menominee, Mascouten, Potawatomi, Winnebago, and Sauk and Foxes. In the eastern and southern portions of the region there are still numerous mounds, the relics of an earlier Indian civilization. 1 In the lead regions in the S.W., with the help of Pawnee slaves, the Indians worked the lead diggings in a rough way. The whole course of the early history of Wisconsin was profoundly influenced by these racial and geographic considerations. The French adventurers, bent on finding either a "North-west passage" or some land route to the Pacific (which they believed to be no farther west than the Mississippi), naturally went west by the water routes of Wisconsin; as a fine field for their bartering and trading with water-courses by which they could convey their pelts and skins back to Montreal, the region attracted the commerce of the French. The first missionary entered the region, the French missions, and the rivalry between the French and the zealous French Catholic missionaries. The opposing influences on the French settlement of the region were the love of exploration and adventure, the commercial instinct and religious zeal.

Jean Nicolet, an experienced explorer, was sent west by Samuel de Champlain, the governor-general of New France, in the summer of 1634 to investigate mysterious rumours of a people known as "the men of the sea" who were thought by some to be Tatars or Chinese. 2 After a long and difficult journey into a region which he seems to have been the first white man to enter, Nicolet landed on the soil of Wisconsin at a point on Green Bay about 10 m. below the present city of Green Bay. Near what is now known as Red Banks there was a populous village of Winnebago, which welcomed and entertained him. He made a treaty with the Indians, went up the Fox river to a point somewhere near the present city of Berlin (Green Lake county) where he found another large village, and returned to Green Bay and thence to his post on Lake Huron.

Twenty years later Pierre Esprit, Sieur de Radisson, and Medard Chouart, Sieur des Groseilliers, started (1654) from Quebec, crossed Lakes Huron and Michigan, wintered in Wisconsin, ascended the Fox, crossed to the Wisconsin and possibly reached the Mississippi river eighteen years before Jacques Marquette and Louis Joliet. In 1659-1660 they were again in the West, but the opposition of the French authorities prevented their further explorations.

The first of the missionary pioneers was the Jesuit, Father René Ménard, who in 1661 lost his life on the upper Wisconsin river. In 1665 Father Claude Allouez established the first permanent mission in Wisconsin on the shores of Chequamegon Bay, near the first trading post established by Radisson and Groseilliers.

In 1673 the post was succeeded by Father Jacques Marquette (q.q.v.) and went to the Fox River Valley; there he established the mission of St Francis Xavier at the first rapids 3 on the Fox river near a popular Indian village. About this mission, one

1 One of the most famous of these mounds is the so-called Elephant Mound, 4 m. S. of Wyalusing, in Grant county in the S.W. corner of the state, near the Mississippi river; it is an effigy mound, and a drizzling of earth changes indicated that it had been partially dug away, so that it seemed an intelligent animal; see pp. 91-93 of the Twelfth Annual Report (1894), Bureau of American Ethnology.

2 These "gens de mer" were the Winnebago Indians; the name "compelled" to meaning, from the French, was interpreted by the French to apply to salt water, whereas it probably referred to sulphur springs near Lake Winnipeg, from which the Winnebago came to Green Bay.

3 From these "rapides des pères" (rapids of the fathers) that De Pere was named.
of the most successful established by the Jesuits in the West, gathered a group of traders who formed a settlement that for many years existed as a transient post and storehouse for trappers. Father Marquette, forced in 1671 by Indian wars to abandon his post on Chequamegon Bay, settled with the Huron at the Straits of Mackinac, whence in May 1673 accompanied by Louis Joliet he set out for the Mississippi river. They halted at De Pere, set off down the Fox-Wisconsin route, followed the Wisconsin to its mouth and came out upon the Mississippi near the site of the present city of Prairie du Chien, on July 17th, exactly two months after they left St Ignace mission on Mackinac Island. After descending the Mississippi to the mouth of the Arkansas they returned by way of the Des Plaines portage, paddled along the western shore of Lake Michigan, and arrived at De Pere. In September 1679 Robert Cavelier, Sieur de la Salle, and Henri de Tonty entered the mouth of the Fox river in the "Griffon," the first ship to sail the Great Lakes. In the same year Daniel Greysolon Du Luth, a coureur de bois, explored the upper Mississippi and the Wisconsin and Black rivers. In 1680 Father Louis Hennepin, a Recollect Franciscan who had accompanied La Salle, followed the Fox through the Bay of Green Bay to the Pecatonica river, the Illinois river, and the Wisconsin river, and finally reached the Green Bay of the Illinois tribe on the western border of Wisconsin to the site of the present city of St Paul. The same course was followed by the fur-trader, Pierre Charles Le Sueur, in 1683.

In 1671 Simon François Daumont Saint-Lusson at Sault Ste Marie had taken formal possession of the region in the name of the king of France; in 1685 Nicolas Perrot (1641-1700), a trader who had first visited the wilds of Wisconsin probably as early as 1665, was appointed "commandant of the West," and this event closes the period of exploration and begins that of actual occupation. Traders had begun to swarm into the country in increasing numbers, and to protect them from the Indians and to control properly the licensed fur-trade a military force was necessary. Perrot built a chain of forts along the Mississippi and a post (the present Galena, Illinois) near the southern boundary of the state, where he discovered and worked a lead mine. In 1712 the slaughter of a band of Foxes near Detroit was the signal for hostilities which lasted almost continuously until 1740, and in which every tribe in the Wisconsin country was sooner or later involved either in alliance with the Foxes or with the French; the Chippewa, always hostile to the Foxes, the Potawatomi and the Menominee sided with the French. This war seriously interfered with the French plans of trade development and exploitation, and by rendering difficult the maintenance of a chain of settlements which might have connected Canada and Louisiana was a contributing cause of the final overthrow of French dominion. In this period permanent military posts were established at Green Bay and Chequamegon (1718); in 1716 it was reported that traders had settled at Green Bay and De Pere; in 1727 a post was established on Lake Pepin.

Wisconsin was little disturbed by the Seven Years' War. Yet the French and Indians of Wisconsin contributed their quota to the French armies—a force of half-breeds and Indians under a half-breed, Charles Michel de Langlade (1729-1800). After the fall of Montreal (Sept. 1760) Robert Rogers, who had been sent to Detroit to occupy the French posts in the West, dispatched Captain Henry Balfour with a force of British and Colonial troops to garrison Mackinac and the Wisconsin posts which had been dismantled and were almost deserted. He arrived at La Baye (Green Bay) in October 1761, and left there a garrison under Lieut. James Gorrell of the 60th (Royal American Foot) Regiment. The traders who accompanied them were the nucleus of the first English-speaking colony on Wisconsin soil. The French fort was rechristened Fort Edward Augustus. The period of British occupation was brief. On the outbreak of the conspiracy of Pontiac Lieut. Gorrell was compelled (in July 1763) to evacuate the fort, and make his way to Montreal.1 When the conspiracy was crushed in 1765, Wisconsin was reopened for traders, and not only French but American merchants and travellers flocked into the region. Among these were Alexander Henry (1730-1824), who as early as 1760 had visited the site of Milwaukee, and who now obtained a monopoly of the Lake Superior trade, and Jonathan Carver (q.v.), who in 1766 reached Green Bay on his way to the Mississippi. In 1774 was passed the Quebec Act for the government of the Province of Quebec into which the Wisconsin region was incorporated by this act, but it had little effect on the French cultural life. In 1779 the British took the whole west of Lake Michigan, which remained throughout the entire British period a group of detached and periodically self-governing communities. Little as they cared for their British rulers the Wisconsin voyageurs and habitants, influenced probably by their cupidity and by actual money payments, for the most part adhered to the British cause during the War of Independence. De Langlade led his French and Indian forces against the American frontier communities west of the Alleghenies. This pro-British spirit, however, did not dominate the whole Wisconsin region, and while De Langlade was harassing the American frontier, and in 1782 advancing southward to Peoria, the Foxes, under a trader of Prairie du Chien, acting as agent for George Rogers Clark, detached several western tribes from the British adherence, and personally led a band of French settlers to his aid. The close of the war, although it conveyed the region to the sovereignty of the United States, was not followed by American occupation. In this period, however, the fur-trade assumed proportions of greater importance, and trading posts were established by the North-west Company (Canadian). In 1786 a more systematic attempt was made to work the lead mines by Julien Dubuque, who obtained the privilege from the Indians. In 1873 Wisconsin became part of the North-west Territory, but it was not until after the ratification of Jay's treaty that in 1796 the western posts were evacuated by the British. Before the actual military occupation (1816) by the United States, American traders had begun to enter into a sharp rivalry for the Indian trade. In 1800 Wisconsin was included in the newly organized Indiana Territory; and in 1809 on the admission of Indiana as a state it was attached to Illinois. During the second war with Great Britain, the Wisconsin Indians and French settlers generally sided with the British, and in 1814 many of them participated in Major William McKay's expedition against Fort Shelby at Prairie du Chien. In 1816 Fort Howard was built at Green Bay, and Fort Crawford at Prairie du Chien. In the same year was confirmed the treaty negotiated in 1804 by William Henry Harrison, by the terms of which the Indian title to the lead region was extinguished. In 1810 the product of lead had been about 400,000 lb, largely mined and smelted by Indians, but the output was now increased enormously by the American miners who introduced new machinery and new methods, and by 1820 there were several thousand miners in the region, including negro slaves who had been brought north by Southern prospectors from Kentucky and Missouri. In 1818 Illinois was admitted to the Union and Wisconsin was incorporated in Michigan Territory, and at that time American civil government in the Wisconsin region was first established on an orderly and permanent basis. Wisconsin then comprised two counties, Brown (east) and Crawford (west), with county seats at Green Bay and Prairie du Chien. Until 1830 the fur-trade, controlled largely by John Jacob Astor's American Fur Company, continued to be the predominating interest in the Wisconsin region, but then the growing lead mining industry began to overshadow the fur-trade, and in the mining region towns and smelting furnaces were rapidly built. Indian miners were soon driven out of business and were nearly crowded out of their homes. Friction between the settlers and the Indians could not long be avoided, and in 1827 Red Bird and his band of Winnebago attacked the whites, but after some bloodshed they were defeated by Major William Whistler (1780-1863) of Fort Howard. Five years later occurred a more serious revolt, the Black Hawk War (see Black Hawks), which also grew out of the dispute over the mineral lands.

1 In that year the Foxes were scattered or forced to surrender by Pierre Paul le Perrière, sieur Marin, who had been appointed commandant of the West in 1729.

2 It was not until 1814 that a British force again occupied a Wisconsin post.
The Black Hawk War not merely settled the Indian question so far as Wisconsin was concerned, but made the region better known, and gave an appreciable impetus to its growth. A series of Indian treaties in 1829, 1831, 1832 and 1833 extinguished the Indian titles and opened up to settlement a vast area of new land. The first newspaper, the Green Bay Intelligencer, began publication in 1833. In 1834 two land offices were opened, and by 1836, 878,014 acres of land had been sold to settlers and speculators. A special census showed a population of more than 11,000 in 1836. The new growth started a movement for a separate Territorial organization for that part of Michigan lying west of Lake Michigan, but this was not finally accomplished until 1836, when Michigan entered the Union. The new Territory of Wisconsin comprised not only the area included in the present state, but the present Iowa and Minnesota and a considerable portion of North and South Dakota.  

1 Henry Dodge (1782-1867) was appointed its first governor by President Jackson. The first Territorial Council met in 1836 at Old Belmont, now Leslie, Lafayette county, but in December of that year Madison was selected as the capital, after a contest in which Fond du Lac, Milwaukee, Racine, Green Bay, Portage and other places were considered, and in which James Duane Doty, later governor, owner of the Madison town plat, was charged with bribing legislators with town lots in Madison. In 1838 the Territory of Iowa was erected out of all that part of Wisconsin lying west of the Mississippi. The movement for the admission of Wisconsin to the Union was taken up in earnest soon after 1840, and after several years' agitation, in which Governor Doty took a leading part, on the 10th of August 1846 an Enabling Act introduced in Congress by Morgan L. Martin, the Territorial delegate, received the approval of President Polk. Meanwhile the Territorial legislature had passed favourably on the matter, and in April the act was ratified by a popular vote of 17,334 to 2487. The first constitution drafted was rejected (5th April 1847) owing to the articles relating to the rights of married women, exemptions, the elective judiciary, &c. A second convention, thought to be more conservative than the first, drafted another constitution, which on the 13th of March 1848 was adopted by 16,799 ayes and 6304 noes. The constitution was approved by Congress and signed by the president on the 20th of May 1848; the first state election had already been held on the 8th of May, and Governor Nelson Dewey and other state officers were sworn into office on the 7th of June. In the same year the free public school system was established, and the great stream of German immigration set in.  

Railway construction began in 1851. Wisconsin was a strong anti-slavery state. In 1854 one of the first steps in the organization of the Republican party (q.v.) was taken at Ripon. In the same year a fugitive slave named Glover was seized at Racine and was afterward rescued by an anti-slavery mob from Milwaukee; the State Supreme Court rendered a decision which declared the Fugitive Slave Law to be null and void in Wisconsin. In 1856 a contested election for the governorship between Governor William A. Barstow (1813-1865), a candidate for re-election, and his Republican opponent, Coles Bashford (1816-1878), threatened to result in civil war. But the courts threw out "supplementary returns" (possibly forged by the canvassers) and decided in favour of Bashford, who was the first Republican to hold an office; with two exceptions Wisconsin has elected Republican governors ever since. The state gave its electoral vote for Lincoln in 1860 and supported the administration during the Civil War. The policy of the state to keep its regiments full rather than send new regiments to the front made the strength of a Wisconsin regiment, according to General W. T. Sherman, frequently equal to a brigade. The whole number of troops furnished by Wisconsin during the war was 91,379. In January 1874 a Democratic Liberal Reform administration came into power in the state with William R. Taylor as governor. At the legislative session which followed, the Potter law, one of the first attempts to control the railway rates, was passed. The railways determined to evade the law, but Taylor promptly brought suit in the State Supreme Court and an injunction was issued restraining the companies from disobedience. In 1876, however, the Republicans regained control of the state government and the law was modified. In 1880 the passage of the Bennett law, providing for the enforcement of the teaching of English in all public and parochial schools, had a wide political effect. The Germans, usually Republicans, roused for the defense of their schools, voted the Democratic state ticket at the next state election with the result that George Wilbur Peck, 2 the Democratic nominee, was chosen governor by 30,000 popular majority. The Bennett law was at once repealed, but not until 1895 did the Republicans regain control of the administration. It was accomplished then after a Democratic gerrymander had been twice overthrown in the courts. Since that time, however, the Republican party has grown more secure, and it has placed on the statute books a series of radical and progressive enactments in regard to railway rate legislation and taxation, publicity of campaign expenditures and a state-wide direct primary law (1905). In all these reforms a leading part was taken by Governor Robert M. La Follette (b. 1855), who was elected to the United States Senate in 1905. Opposition to his political programme resulted in a serious split in the Republican ranks, the opposition taking the old name of "Stalwarts" and its followers came to be known as "Halfbreeds." Governor La Follette, however, could draw enough support from the Democrats to maintain the control of the state by the Republicans. Wisconsin had several times been visited by disastrous forest fires. One in the north-eastern counties (Oconto, Brown, Door, Shawano, Manitowoc and Kewaunee) in 1871 resulted in the loss of 30,000 acres, and a thousand lives. Another serious fire occurred in the north-west in July 1884.

1 Peck (b. 1840) was a printer and then a journalist, founded in 1873 at La Crosse the Jeun, which in 1878 he removed to Milwaukee, and was the author of many humorous sketches, notably a series of volumes of which the hero is "Peck's Bad Boy."  

2 Governor; succeeded Barstow, who resigned during a contest with Bashford.  

3 Resigned to become a member of the United States Senate.  

4 Lieut.-Governor: elected governor in 1906 and 1908.
WISCONSIN, UNIVERSITY OF

BIBLIOGRAPHY.—For physical description and natural resources see the Reports (biennial) of the Commissioner of Agriculture and the Agricultural and Mineral Resources of the United States, published annually by the U.S. Geological Survey. A good school manual is E. C. Case's Wisconsin, its Geology and Agricultural Geography (Milwaukee, 1905). The Birds of Illinois and Wisconsin (Madison, 1899), and the Museum of Natural History, Publication No. 131 (Chicago, 1909), and L. Kumlien and N. Hollister, "The Birds of Wisconsin," in vol. iii of the Wisconsin Academy of Arts and Sciences (Madison, 1909), and the Wisconsin Historical Society, are valuable. On state government see The Blue Book of the State of Wisconsin (Madison), published under the direction of the commissioner of labour and industrial statistics and D. E. Spencer, The History of Wisconsin (1908). An addition to the list of works on the history of the state see D. S. Durrie's "Bibliography of Wisconsin" in vol. vii, new series, Historical Magazine.

The Soil Survey of Wisconsin, done by L. G. Thomas, Wisconsin (Boston, 1908), in the "American Commonwealths" series. The same author's Story of Wisconsin (Ib. 1890) in the "Story of the States" series, and H. E. Legler's Leading Events in Wisconsin History (Milwaukee, 1898), a good brief summary, are other single-volume works covering the entire period of the state's history. One of the best accounts of the state's early history is E. H. Neville and D. B. Martin's Historic Green Bay (Green Bay, 1893). S. S. Hebbard's Wisconsin university Census of the State (Madison, 1873) carries an account of the earlier period written, however, before much recent material was brought to light. Much material of value is contained in the Historical Collections of the Red Men, vol. 1 (Chicago, 1885), and the Historical Society of Wisconsin (1846; reorganized, 1849), and in the Bulletins of Information, Proceedings and Draper Series of the same society are many valuable historical papers and monographs.

See also J. F. L. Smith, The History of Milwaukee (Madison, 1895 sqq.), and A. L. V. Vahle, History of the University of Wisconsin (Chapel Hill, 1909). The Parkman Society Papers (Milwaukee, 1895-1899) provide a collection of good articles on special topics of Wisconsin history, and the Original Narratives and Reprints published by the Wisconsin History Commission (created by an act of 1905) deal with Wisconsin in the Civil War. See also Auguste Gosselin, Jean Nicolet, 1618-1642 (1893); B. A. Hinsdale, The Old North-West (New York, 1888); Charles Brown, History of the Wisconsin State Historical Society (Madison, 1891), and R. V. Phelan, Financial History of Wisconsin (Madison, 1908); F. J. Turner, Character and Influence of the Indian Trade in Wisconsin, vol. i. of Johns Hopkins University Studies (Baltimore, 1884); F. Parkman, The Jesuits in North America (Boston, 1870), and the volumes of the Jesuit Relations, edited by R. G. Thwaites.

WISCONSIN, UNIVERSITY OF, a coeducational institution of higher learning at Madison, Wisconsin, the capital of the state, established in 1848 under state control, supported largely by the state, and a part of the state educational system. The university occupies a picturesque and beautiful site on an irregular tract (600 acres), including both wooded hills and undulating meadow lands, stretching along both sides of the course of Lake Mendota. The Main building, University Hall (1857; enlarged 1897, and 1905-1906), which crowns University Hill, is exactly 1 m. from the state capitol. The other buildings include North Hall (1850), South Hall (1854), Science Hall (1887), the Biological Building (1911), the Chemical Building (1904-1905), the Hydraulic Laboratory (1905), the Engineering Building (1900), the Law School (1864), Chadbourne Hall (1870; remodelled in 1896) for women, Lathrop Hall (1910) for women, Assembly Hall (1887), the Chemical Engineering Building (1885), Machine Shops (1883), the Armoury and gymnasium (1894), a group of half a dozen buildings belonging to the College of Agriculture, and the Washburn Observatory (1878: a gift of Governor C. C. Washburn). On the lower campus is the building of the Wisconsin State Historical Society.

The university includes a college of letters and science, with general courses in liberal arts and special courses in chemistry, commerce, arts and science, agriculture and home economics, engineering, teaching and library work; a college of engineering, with courses in civil, mechanical, electrical, chemical and mining engineering, and an applied electro-chemistry course; a college of agriculture, with a graduate school; a school of mines and mining engineering; a school of art and design; a department of home economics, a dairy course and study of home managing; a college of law (3 years' course); a college of medicine, giving the first two years of a medical course; a graduate school of arts and sciences; a school of education; and the Supervision of the schools; instruction is offered to artisans and apprentices and in library training. The college of agriculture, one of the largest and best equipped in the country, provides also briefer courses of practical training for farmers and farmers' wives. In connection with the school of mines and mining engineering, on the prevention and treatment of tuberculosis is provided, exhibits and instructors or demonstrators being sent to every part of the state. The state hygienic laboratory is located in the building of the School of Mines and Mining Engineering. The University farm is the forest products laboratory (1910) of the United States Department of Agriculture. At Milwaukee there is a university settlement associated with the social work of the university.

The degree of examination or certificate from accredited high schools or academies. Tuition is free for residents of the state. Courses in the first two years are largely prescribed, with a good elective "subject" under a definite system. In 1910 there were 396 instructors, 127 professors, 467 teaching assistants, and 177 women. The university library proper, of 163,000 volumes and 40,000 pamphlets, is housed in the Historical Society's building, in connection with the library of the Historical Society and that of the Wisconsin Academy of Arts and Sciences—a total in 1910 of 404,000 books and 202,000 pamphlets.

The grounds, buildings and equipments of the university are valued at $2,000,000. The income of the university, including income from the Federal land grants, from invested productive funds and from state tax levies, exceeds one million dollars annually. Since 1905 the state legislature has appropriated for the current expenses of the university a $1 mill tax. More than $2,000,000 was left to the university in 1908 for a memorial theatre, research professorships and graduate fellowships by William Freeman Vilas (1840-1908), president of the University from 1874 to 1908. The Secretary of the Interior of the United States in 1885-1888, secretary of the Interior in 1888-1889 and U.S. senator from Wisconsin in 1891-1897. An act for the creation of a university to be supported by the Territory was passed by the first session of the Territorial legislature in 1836, but except for the naming of a board of trustees the plan was never put into operation. A similar act for the establishment of a university at Green Bay had no more result. In 1858 a university of the Territory of Wisconsin was created by act of the Territorial legislature and was endowed with two townships of land. This was, however, largely the dream of the state university, and the provision for which was made in the state constitution adopted in 1848. The university was incorporated by act of the legislature in that year with a board of regents as the governing body, chosen by the legislature. A preparatory department was opened in the autumn of that year, and John H. Lathrop (1799-1866), a graduate of Yale, then president of the university of Missouri, was chosen as the first chancellor of the new institution. He was inaugurated in 1850, and in that year North Hall, the first building, was erected. The first academic class graduated in 1854. In the same year the Federal Government agreed to pay to the state seventy-two sections of salt-land farms, and as no such lands were found in the state, had been petitioned to change the nature of the grant) granted seventy-two sections to be "sold in such manner as the legislature may direct for the benefit and aid of the university." The Federal land grants, however, which ought to have supported the university, were sacrificed to a desire to attract immigrants, and the institution for many years was compelled to get along on a small margin which rendered extension difficult; and the permanent fund was soon impaired for the construction of buildings. Henry Barnard in 1859 succeeded Lathrop as chancellor, but resigned in 1861. After the Civil War, the office of chancellor was displaced by that of president. Paul Ansel Chadbourne (1823-1883), a graduate (and afterwards president) of Williams College, became president in 1867, and in his presidency (1867-1870) the university was reorganized, a college of law was founded, co-education was established and the agricultural college was consolidated with the university, a radical departure from the plan adopted by the Wisconsin legislature when the state was organized. In 1871-1874 John Hanson Twombly, a graduate of Wesleyan University, was president, and the legislature first provided for an annual state tax of $10,000 for the university. With the coming to the presidency (1874) of John Bascom (b. 1827), another graduate of Williams, the university began a new period of development; the preparatory department was

The university is now governed by regents, of whom two—the president of the university and the state superintendent of public instruction—are ex officio, and the others are appointed by the governor for a term of three years, two from the state at large and one from each congressional district.
abolished in 1880, and the finances of the university were put on a firm basis by the grant of a state tax of one-tenth of a mill. Under the presidency (1887-1892) of Thomas Chamberlin (b. 1843), a graduate of Beloit College and a member of the U.S. Geological Survey, the university attendance geographic distribution of the student body changed and the educational programs were expanded. In 1892 to 1900, the growth of the graduate school was particularly notable. Under President Charles Kendall Adams (1835-1902), who was a graduate of the University of Michigan, where as professor of history he had graduated in 1860-1870 the German method of “seminary” study and research, and who had just resigned the presidency (1858-1892) of Cornell University, the enrolment of the university increased from 13,000 in 1892 to 2000 in 1901, and the growth of the graduate school was particularly notable. Under Charles Richard Van Hise,1 who was the first alumnus to become president and who succeeded President Adams in 1900, the growth of the university continued, and its activities were constantly enlarged and the scope of its work was widened.

See S. H. Carpenter, A Historical Sketch of the University of Wisconsin from 1845 to 1876 (Madison, 1876), and R. G. Thwaites, The University of Wisconsin, Its History and Its Alumni (Ibid, 1900).

WISDOM, BOOK OF

Wisdom of Solomon (Sopherim: = Lat. Vulg. Liber sapienciae), an apocryphal book of the “Wisdom Literature” (q.v.), the most brilliant production of pre-Christian Hebrew philosophical thought, remarkable both for the elevation of its ideas and for the splendour of its diction. It divides itself naturally, by its contents, into two parts, in one of which the theme is righteousness and wisdom, in the other the early fortunates of the Israelite people considered as a righteous nation beloved by God.

The story (i.x-xii), falls also into two divisions, the first (i.-v) dwelling on the contrast between the righteous and the wicked, the second (vi.-ix) setting forth the glories of wisdom. After an exhortation to the judges of the earth to put away evil counsels and that righteous path, it declares that God has made no kingdom of death on the earth, but ungodly men have made a covenant with it: certain sceptics (probably both Gentile and Jewish) holding this life to be brief and without a future, give themselves up to sensuality and obedience to the poor and the righteous; but the righteous are to be immortal (ii. 23), and there will be compensation and retribution in the future: the good will rule on earth, the wicked will be hurled down to destruction, though they seem now to flourish with life and abundance of children (ii.-v). At this point Solomon is introduced, and from the following section (vi.-ix) the book seems to have taken its title. Solomon reminds kings and rulers that they will be held accountable for their actions and will be called to give an account of their deeds. From his words, proceeds to give his own experience: devoting himself from his youth to the pursuit of wisdom he had found her to be a treasure that never failed, and his glory and beauty so great that the whole earth would be filled with her. Through her he looks to obtain influence over men and immortality, and he concludes with a prayer that God would send her out of his holy heavens to be his messenger of love and wisdom.

The second part of the book (x-xix) connects itself formally with the first by a summary description of the rôles of wisdom in the early times: she directed and preserved the fathers from Adam to Moses (x. 1). From this point, however, nothing is said of wisdom; the rest of the book is a philosophical and imaginative narrative of Israelite affairs from the Egyptian oppression to the settlement in Canaan. A brief description of how the Egyptians were vanquished through the very things with which they sinned (though the punishment was not fatal, for God loves all things that exist, and shows his power in various forms, absurdity and results of polytheism and idolatry (xii.-xv): the worship of natural objects is said to be less blame-worthy than the worship of images—this latter, arising from the desire to dominate nature (the Egyptians were fond of magic), is inherently absurd, and led to all sorts of moral depravity. In the four last chapters the author, returning to the history, gives a detailed account of the provisions made for the Israelites in the wilderness and of the pains and terrors with which the Egyptians were plagued.

1 President Van Hise (b. 1857) graduated at the university of Wisconsin in 1879, became instructor in geology there in 1883, in 1887 became consulting geologist of the Wisconsin Geological and Natural History Survey, and in 1890 was appointed editor of the Division of Pre-Cambrian and Metamorphic Geology, U.S. Geological Survey. He wrote Correlation Papers—Archaean and Alleghanian, ( topped by “The Poor People’s Creed”) and Correlation of the Depositions of Ores (1901). A Treatise on Metamorphism (1903) and works with other authors on the different iron regions of Michigan.
Wisdom literature

Wisdom books did not arise till a chance had come over the national fortunes and life. The firm establishment of the doctrine of practical mischief happened to coincide in time with the destruction of the national political life (the 6th century B.C.). At the moment when this doctrine had come to be generally accepted by the thinking part of the nation, the Jews found themselves dispersed among foreign communities, and from that time were a subject people enviromed by aliens, Babylonian, Persian and Greek. The prophetic office ceased to exist when its work was done, and part of the intellectual energy of the people was thus set free for other tasks than the establishment of theistic dogma. The ritual law was substantially completed by the end of the 5th century B.C.; it became the object of actual use by the mass of the nation, and the ethical conception of the future life points to a time not earlier than the 1st century B.C., while the fact that the history is not allegorized suggests priority to Philo; probably the work was composed late in the 1st century B.C. (this date would agree with the social situation described). Its exclusion from the Jewish Canon of Scripture resulted naturally from its Alexandrian thought and from the fact that it was written in Greek. It was used, however, by New Testament writers (vii. 22 f., Jas. i. 17, vii. 26; Heb. 2 i., ix. 15; 2 Cor. v. 1-4.; xi. 23; Acts xvii. 30, xii. 1-5; xiv. 22 f., 25 f.; Rev. 1 i., 24). It is quoted by Patristic and later authors, generally as inspired. It was recognized as canonical by the council of Trent, but is not so recognized by Protestants.

Wisdom literature, the name applied to the body of Old Testament and Apocryphal writings that contain the philosophical thought of the later pre-Christian Judaism. Old Semitic philosophy was a science not of ontology in the modern sense of the word, but of practical life. For the Greeks, "love of wisdom" involved inquiry into the basis and origin of things; the Hebrew "wisdom" was the capacity so to order life as to get out of it the greatest possible good. Though the early Hebrews (of the time before the 5th century B.C.) must have reflected on life, there is no trace of such reflection, of a systematic sort, in their extant literature. "Wise men" are distrusted and opposed by the prophets. The latter were concerned only with the maintenance of the sacerdotal worship of Yahweh and of social morality. This was the task of the early Hebrew thinkers, and to it a large part of the higher energy of the nation was devoted. The external law given, as was believed, by the God of Israel, was held to be the sufficient guide of life, and everything that looked like reliance on human wisdom was regarded as disloyalty to the Divine Lawgiver. While the priests developed the sacrificial ritual, it was the prophets that represented the theocratic element of the national life—they devoted themselves to their task with noteworthy persistence and ability, and their efforts were crowned with success; but their virtue of singlemindedness carried with it the defect of narrowness—they despised all peoples and all conditions of life outside of that of their fellow-countrymen, that is, they were not in harmony with their own principles.

The reports of the earlier wise men, men of practical sagacity in political and social affairs, have come to us from unfriendly sources; it is quite possible that among them were some who took interest in life for its own sake, and reflected on its human moral basis. But, if this was so, no record of their reflections has been preserved. The class of sages to whom we owe the
not are interested in the question and ignore it; Agur's agnosticism is in Job directed against the "un-wise" of his day. Kohleth's scepticism (in the original form of Ecclesiastes) is deep-seated and far-reaching: though he is a theist, he sees no justice in the world, and looks on human life as meaningless and ruthless. For his death is the end-all, and it is against some such view as this that the argument in Wisd. of Sol. ii.-v. is directed. With the establishment of a universal religion, its pantheon of scepticism vanished from the Jewish world, not, however, without leaving behind it works of enduring value.

In all the Wisdom books virtue is conceived of as conterminous with knowledge. Salvation is attained not by believing but by the perception of what is right; wisdom is resident in the soul and identical with the thought of man. Yet, with this adoption of the Greek point of view, the tone and spirit of this literature remain those of the Jews.

The writings of the sages are all anonymous. No single man appears as creator of the tendency of thought they represent; they are the product of a period extending over several centuries, but they form an intellectual unity, and presuppose a great body of thinkers. The sages may be regarded as the beginners of a universal religion: they felt the need of permanent principles of life, and were able to set aside to some extent the local features of the current creed. That they did not find a universal religion was due, in part at least, to the fact that they were not ripe for such a faith; but they left material that was taken up into later systems.

LITERATURE. K. Siegfried, Philo von Alexandria (1875); J. Drummond, Philo Judaeus (1888); H. Bois, Origines d. i. phil. (1890); T. Cheyne, Job and Sol. (1861); The Jewish Qum. Relig. Life, &c. (1898).

WISE, HENRY ALEXANDER (1866-1876), American politician and soldier, was born at Drummondton (or Accomac), Accomack county, Virginia, on the 3rd of December 1866. He graduated from Washington (now Washington and Jefferson) College, Pennsylvania, in 1882, and began to practise law in Nashville, Tennessee, in 1882. He returned to Accomack county, Va., in 1890, and served in the National House of Representatives in 1893-1897 as an anti-nullification Democrat, but broke with the party on the withdrawal of the deposits from the United States Bank, and was re-elected to Congress in 1897, 1899 and 1901 as a Whig, and in 1903 as a Tyler Democrat. From 1844 to 1847 he was minister to Brazil. In 1850-1851 he was a member of the convention to revise the Virginia constitution, and advocated white manhood suffrage, internal improvements, and the abolition of imprisonment for debt. In 1855 he was elected governor of the state (1856-1860) as a Democrat. John Brown's raid occurred during his term, and Wise refused to reprieve Brown after sentence had been passed. He strongly opposed secession, but voted for the organization of the Confederate army and served throughout the war. He died at Richmond, Va., on the 12th of September 1876. He wrote Seven Decades of the Union 1790-1860 (1872).

His son, JOHN SERGEANT WISE (b. 1840), United States attorney for the Eastern District of Virginia in 1881-1883, and a member of the National House of Representatives in 1883-1885, wrote The End of an Era (1899) and Recollections of Thirteen Presidents (1906).

WISE, ISAAC MAYER (1810-1900), American Jewish theologian, was born in Bohemia, but his career is associated with the organization of the Jewish reform movement in the United States. From the moment of his arrival in America (1846) his influence made itself felt. In 1854 he was appointed rabbi at Cincinnati. Some of his actions roused considerable opposition. Thus he was instrumental in compiling a new prayer-book, which he designed as the "American Rite." (Minhag America). He was opposed to political Zionism, and the Montreal Conference (1897), at his instigation, passed resolutions disapproving of the attempt to establish a Jewish state, and affirming that the Jewish Messianic hope pointed to a great universal brotherhood. In keeping with this denial of a Jewish nationality, Wise believed in national varieties of Judaism, and strove to harmonize the synagogue with local circumstances and sympathies. In 1848...
he conceived the idea of a union, and after a campaign lasting a quarter of a century the Union of American Hebrew Congregations was founded (1873) in Cincinnati. As a corollary of this he founded in 1875 the "Hebrew Union College" in the same city, and this institution has since trained a large number of the rabbis of America. Wise also organized various general assemblies of rabbis, and in 1889 established the Central Conference of American Rabbis. He was the first to introduce family pews in synagogues, and in many other ways "occidentalized" Jewish worship.

See D. P. Philipon, Reform Movement in Judaism (1907). (L. A.)

WISEMAN, NICHOLS PATRICK STEPHEN (1802-1865), English cardinal, was born in Seville on the 2nd of August 1802, the child of Anglo-Irish parents recently settled in Spain for business purposes. On his father's death in 1805 he was brought to Waterford, and in 1810 he was sent to Ushaw College, near Durham, where he was educated until the age of sixteen, when he proceeded to the English College in Rome, reopened in 1818 after having been closed by the Revolution for twenty years. He graduated doctor of theology with distinction in 1825, and was ordained priest in the following year. He was appointed vicar-apostolic of the Irish Catholics, 1836, and died here when not yet twenty-six years of age. This office he held until 1840. From the first a devoted student and antiquary, he devoted much time to the examination of oriental MSS. in the Vatican library, and a first volume, entitled Horae Syriacae, published in 1827, gave promise of a great scholar. Leo XII. appointed him curator of the Arabic MSS. in the Vatican, and professor of oriental languages in the Roman university. At this date he had close relations, personal and by correspondence, with Mai, Bunsen, Burgess (bishop of Salisbury), Tholck and Kluge. His student life was, however, broken by the pope's command to preach to the English in Rome; and a course of his lectures, On the Connexion between Science and Revealed Religion, deservedly attracted much attention, his general thesis being that whereas scientific teaching has repeatedly been thought to disprove Christian doctrine, further investigation has shown that a reconstruction is possible. He visited England in 1835-1836, and delivered lectures on the principles and main doctrines of Roman Catholicism in the Sardinian Chapel, Lincoln's Inn Fields, and in the church at Moorfields, now pulled down. Their effect was considerable; and it is Pusey's request Newman reviewed them in the British Critic (December 1836), treating them for the most part with sympathy as a triumph over political Protestantism. To another critic, who had taken occasion to point out the resemblance between Catholic and pagan cermomies, Wiseman replied, boldly admitting the likeness, and maintaining that it could be shown equally well to exist between Christian and heathen doctrines. In 1836 he founded the Dublin Review, partly to insinuate into the lethargic English Catholics higher ideals of their own religion and some enthusiasm for the papacy, and partly to enable him to deal with the progress of the Oxford Movement, in which he was keenly interested. At this date he was already distinguished as an accomplished scholar and critic, able to converse fluently in half-a-dozen languages, and well informed on most questions of scientific, artistic or antiquarian interest. In the winter of 1838 he was visited in Rome by Macaulay, Manning and Gladstone. An article by him on the Donatist schism appearing in the Dublin Review in July 1839 made a great impression in Oxford, Newman and others seeing the force of the analogy between Donatists and Anglicans. Some words he quoted from St Augustine influenced Newman profoundly: "Quapropter securus judicat orbis terrarum bonos non esse qui se divident ab orbe terrarum." And preaching at the opening of St Mary's church, Derby, in the same year, he anticipated Newman's argument on religious development, published six years later. In 1840 he was consecrated bishop, and sent to England as coadjutor to Bishop Walsh, vicar-apostolic of the Central district, and was also appointed president of Oscott College near Birmingham. Oscott, under his presidency, became a centre for English Catholics, where he was also visited by many distinguished men, including foreigners and non-Catholics. The Oxford converts (1845 and later) added considerably to Wiseman's responsibilities, as many of them found themselves wholly without means, while the old Catholic body looked on the newcomers with distrust. It was by his advice that Newman and his companions spent some time in Rome before undertaking clerical work in England. Shortly after the accession of Pius IX. Wiseman was appointed temporarily vicar-apostolic of the London district, the appointment becoming permanent in February 1849. On his arrival from Rome in 1847 he acted as informal diplomatic envoy from the pope, to ascertain from the government what support England was likely to give in the future to the liberal policy with which Pius inaugurated his reign. In response Lord Minto was sent to Rome as "an authentic organ of the British Government," but the policy in question proved abortive. Residing in London in Golden Square, Wiseman threw himself into his new duties with many-sided activity, working especially for the reclamation of Catholic criminals and for the restoration of the lapse of poor to the practice of their religion. He was zealous for the establishment of religious communities, both of men and women, and for the holding of retreats and missions. He preached (4th July 1849) at the opening of the Catholic chapel in London, and was present when England since the Restoration, 14 bishops and 240 priests being present, and six religious orders of men being represented. The progress of Catholicism was undeniable, but yet Wiseman found himself steadily opposed by a minority among his own clergy, who disliked his Ultramontane ideas, his "Romanizing and innovating zeal," especially in regard to the introduction of sacred images into the churches and the use of devotions to the Blessed Virgin and the Blessed Sacrament, hitherto unknown among English Catholics. In July 1850 he heard of the pope's intention to create him a cardinal, and he took this to mean that he was to be permanently recalled to Rome. But on his arrival there he ascertained that a part of the pope's plan for restoring a diocesan hierarchy in England was that he himself should return to England as cardinal and archbishop of Westminster. The papal brief establishing the hierarchy was dated 29th September 1850, and on 7th October Wiseman wrote a pastoral, dated "from out of the Flaminian Gate"—a form diplomatically correct, but of bombastic tone for Protestant ears—in which he spoke enthusiastically, if also a little pompously, of the "restoration of Catholic England to its orbit in the ecclesiastical firmament." Wiseman travelled slowly to England, round by Vienna; and when he reached London (11th November) the whole country was a blaze with indignation at the "papal aggression," which was misunderstood to imply a new and unjustifiable claim to territorial rule. Some indeed feared that his life was endangered by the violence of popular feeling. But Wiseman displayed calmness and courage, and immediately penned an admirable Appeal to the English People (a pamphlet of over 30 pages), in which he explained the nature of the pope's action, and argued that the admitted principle of toleration included leave to establish a diocesan hierarchy; and in his concluding paragraphs he effectively contrasted that dominion over Westminster, which he was taunted with claiming, with his duties towards the poor Catholics resident there, with which alone he was really concerned. A course of lectures at St George's, Southwark, further moderated the storm. In July 1852 he presided at Oscott over the first provincial synod of Westminster, at which Newman preached his sermon on the "Second Spring"; and at this date Wiseman's dream of the rapid conversion of England to the ancient faith seemed not incapable of realization. But many difficulties with his own people shortly beset his path, due largely to the suspicions aroused by his evident preference for the ardent Roman zeal of the converts, and especially of Manning, to the dull and cautious formalism of the old Catholics. The year 1854 was marked by his presence in Rome at the definition of the dogma of the immaculate conception of the Blessed Virgin (8th December), and by the publication of his historical romance, Fabiola, a tale of the Church of the Catacombs, which had a very wide circulation and was translated into ten languages. In 1855 Wiseman applied for a coadjutor, and
George Errington, bishop of Plymouth, his friend by birth, was appointed, with the title of archbishop of Trebizond. Two years later Manning was appointed provost of Westminster and he established in Bayswater his community of the "Oblates of St Charles." All Wiseman's later years were darkened by Errington's conscientious but impious and hostile influence on Manning, and to himself in so far as he was supposed to be acting under Manning's influence. The story of the estrangement, which was largely a matter of temperament, is fully told in Ward's biography. Ultimately, in July 1860, Errington was deprived by the pope of his coadjutorship with right of succession, and he retired to Prior Park, near Bath, where he died in 1886. In the summer of 1858 Wiseman paid a visit to Ireland, where, as a cardinal of Irish race, he was received with enthusiasm. His speeches, sermons and lectures, delivered during his tour, were printed in a volume of 300 pages, and show an extraordinary power of rising to the occasion and of speaking with sympathy and tact. Wiseman was able to use considerable influence with English politicians, partly because in his day English Catholics were wavering in their historical allegiance to the Liberal party. As the director of votes thus doubtful, he was in a position to secure concessions that bettered the position of Catholics in regard to poor schools, reformatory and workhouses, and in the status of their army chaplains. In 1863, addressing the Catholic Congress at Malines, he stated that since 1850 the number of priests in England had increased from 1,454 to 2,145; and of converts of women from 16 to 152, while there were 175 religious houses and men. Nothing could be done, he said, and so none in 1850. The last two years of his life were troubled by illness and by controversies in which he found himself, under Manning's influence, compelled to adopt a policy less liberal than that which had been his in earlier years. Thus he had to condemn the Association for the Promotion of the Unity of Christendom, with which he had shown some sympathy in its inception in 1857; and to forbid Catholic parents to send their sons to Oxford or Cambridge, though at an earlier date he had hoped (with Newman) that at Oxford at least a college or hall might be established for them. But in others respects his last years were cheered by marks of general regard and admiration, in which non-Catholics joined; and after his death (16th February 1862) there was an extraordinary demonstration of popular respect as his body was taken from St Mary's, Moorfields, to the cemetery at Kensal Green, where it was intended that it should rest only until a more fitting place could be found in a Roman Catholic cathedral church of Westminster. On the 30th of January 1897 the body was removed with great ceremony from Kensal Green and reburied in the crypt of the new cathedral, where it lies beneath a Gothic altar tomb, with a recumbent effigy of the archbishop in full pontificals.

Wiseman was undoubtedly an eminent Englishman, and one of the most learned men of his time. He was the friend and correspondent of many foreigners of distinction, among whom may be named Dollinger, Lamennais, Montalembert and Napoleon I. Wiseman was a writer he was apt to be turgid and prolix, and there was a somewhat un-English element of ostentation in his manner. But his accomplishments and ability were such as would have secured for him influence and prominence in any age of the Church; and besides being highly gifted intellectually and morally, he was marked by those specially human qualities which command the interest and regard of all and characterize the wise. He combined with the principles known as Ultramontane a little liberality in matters ecclesiastical. He insisted on a poetical interpretation of the Church's liturgy; and while strenuously maintaining her Divine communion to teach faith and morals, he regarded the Church as in other respects a learner: and he advocated a policy of conciliation with the world, and an alliance with the best tendencies of contemporary thought. It was, in his judgment, quite in accordance with the spirit of Catholic Church that she should conti-

WISHAW—WISLICENUS

WISHART, GEORGE (c. 1513–1546), Scottish reformer, born about 1513, belonged to a younger branch of the Wisharts of Fitarow. His early life has been the subject of many conjectures, but apparently he graduated M.A., probably at King's College, Aberdeen, and taught as a schoolmaster at Montrose. Accused of heresy in 1538, he fled to England, where a similar charge was brought against him at Bristol in the following year. In 1539 or 1540 he started for Germany and Switzerland, and returning to England became a member of Corpus Christi College, Cambridge. In 1543 he went to Scotland in the train of a Scottish priest, Robert Wishart, who had come to London to consider the treaty of marriage between Prince Edward and Mary of Hungary. There was much controversy whether he was the Wishart who in April 1544 approached the English government with a proposal for getting rid of Cardinal Beaton. Roman Catholic historians such as Bellesheim, and Anglicans like Canon Dixon, have accepted the identification, while Froude does not dispute it and Dr Gairdner avoids committing himself (Letters and Papers of Henry VIII. vol. xix. pt. i., Intro. pp. xxvii–xxviii). There was another George Wishart, bailie of Dundee, who allied himself with Beaton's murderers; and Sir John Wishart (d. 1576), afterwards a Scottish judge, has also claims to the doubtful distinction. Sir John was certainly a friend of Creighton, laird of Branstoun, who was deeply implicated in the plot, but Creighton also befriended the reformer during his evangelical labours in Midlothian. The case against the reformer is not proven and is not probable.

His career as a preacher began in 1544, and the story has been told in glowing colours by his disciple John Knox. He went from place to place in peril of his life denouncing the errors of Rome and the abuses in the church at Montrose, Dundee, Ayr, in the Borders, Edinburgh, Leith, Haddington and elsewhere. At Ormiston, in December 1545, he was ordained by George Grant, Bishop of Berwick, and transferred by order of the privy council to Edinburgh castle on January 19, 1546. Thence he was handed over to Cardinal Beaton, who had him burnt at St Andrews on March 1.

WISHAW, a municipal and police burgh of Lanarkshire, Scotland. Pop. (1901) 20,873. It occupies the face of a hill a short distance south of the South Calder and about 2 m. N. of the Clyde, 15 m. E.S.E. of Glasgow by the Caledonian railway. It owes its importance to the development of the coal and iron industries, and was a civil burgh in 1836. It was extended to include the villages of Cambusnethan and Craigpark in 1874. The chief public buildings are the town-hall, Victoria hall, the public library and the parish hall, and there is also a public church.

WISLICENUS, JOHANNES (1835–1902), German chemist, was born on the 24th of June 1835 at Klein-Eichstedt, in Thueringia. In 1853 he entered Halle University, but in a few months emigrated to America with his father. For a time he acted as assistant to Professor E. N. Horsford at Harvard, and in 1855 was appointed lecturer at the Mechanics' Institute in New York. Returning to Europe in 1856, he continued his studies at Zurich University, where nine years later he became professor of chemistry. This post he held till 1872. He then succeeded A. F. L. Streecker in the chair of chemistry at Würzburg, and in 1885, on the death of A. W. H. Kolbe, was appointed to the same professorship at Leipzig, where he died on the 6th of December 1902. As an original investigator he devoted himself almost exclusively to organic chemistry, and especially to stereochemistry. His work on the lactic acids cleared up many difficult questions relating to the combination of acid and alcoholic properties in one single compound, and presented the basis of two substances differing in physical properties though possessing a structure of proved chemical identity. To this phenomenon, then noticed for the first time, he gave the name of "geometrical isomerism." So far back as 1869, before the publication of the doctrine of J. H. van't Hoff and J. A. Le Bel, he expressed the opinion that the ordinary constitutional formulae did not afford an adequate explanation of certain carbon compounds, and
suggested that account must be taken of the various lagerung ihrer Atome in Atome. Later (see Die räumliche Anordnung der Atome in organischen Molekülent, 1887) he extended the application of the van't Hoff-Le Bel theory, believing that it, together with the supposition that there are "specially directed forces, the affinity-energies," which determine the relative position of atoms in the molecule, afforded a method by which the spatial arrangement of atoms in particular cases may be ascertained by experiment. Wislicenus is also known for his work on aceto-acetic ester and its application as a synthetic agent. He was awarded the Davy medal by the Royal Society in 1898.

WISMAR, a seaport town of Germany, in the grand-duchy of Mecklenburg-Strelitz, on the Bay of Lübeck, is one of the best harbours on the Baltic, 20 m. by rail N. of Schwerin. Pop. (1905) 21,902. The town is well and regularly built, with broad and straight streets, and contains numerous handsome and quaint buildings in the northern Gothic style. The church of St Mary, a Gothic edifice of the 13th and 14th centuries, with a tower 260 ft. high, and the church of St Nicholas (1381-1460), with very lofty vaulting, are regarded as good examples of the influence exercised in these northern provinces by the large church of St Mary in Lübeck. The elegant residence of the archbishop of Schwerin dates from the 13th and 15th centuries. The Furstenhof, at one time a ducal residence, but now occupied by the municipal authorities, is a richly decorated specimen of the Italian early Renaissance style. Built in 1552-1556, it was restored in 1877-1879. The "Old School," dating from about 1300, has been restored, and is now occupied as a museum. The town hall (rebuilt in 1829) contains a collection of pictures. Among the manufactures of Wismar are iron, machinery, paper, roofing-felt and asphalt. There is a considerable trade, especially by sea, the exports including grain, oil-seeds and butter, and the imports coal, timber, and iron. The harbour is deep enough to admit vessels of 176-180

 draught, and permits large steamers to unload along its quays. Two miles from Wismar lies the watering-place of Wendorf.

Wismar is said to have received civic rights in 1229, and came into the possession of Mecklenburg in 1301. In the 13th and 14th centuries it was a flourishing Hanse town, with important woolen factories. Though a plague carried off 10,000 of the inhabitants in 1376, the town seems to have remained tolerably prosperous until the 16th century. By the peace of Westphalia in 1648 it passed to Sweden, with a lordship to which it gives its name. In 1803 Sweden pledged both town and lordship to Mecklenburg for 1,288,000 thalers, reserving, however, the right of redemption after 100 years. In view of this contingent right of Sweden, Wismar was not represented in the diet of Mecklenburg until 1897. In 1903 Sweden finally renounced its claims. Wismar still retains a few relics of its old liberties, including the right to fly its own flag.

See Burmeister, Geschichte von Wismar (Wismar, 1857); Illiger, Geschichte der Stadt Wismar, pt. I (Wismar, 1868); and Bruno Schmidt, Der Schlesisch-mecklenbureische Pfandvertrag über Stadt und Herrschaft Wismar (Leipzig, 1901).

WITAN, or WITENAGEMOT (from O. Eng. wita, pl. witan, a wise man, and gemeldi, a meeting, from O. Eng. meten, to meet), the national council in England in Anglo-Saxon times. Its origin is obscure. There is some resemblance between it and the two assemblies mentioned by Tacitus in the Germania, a larger and a smaller one, but this analogy must not be pressed too far. In Anglo-Saxon England in the 7th and 8th centuries it seems certain that each of the larger kingdoms, Kent, Wessex, Mercia and Northumbria, had its separate witan, or council, but there is no certain evidence that any of these was identical with, or distinct from, the folk-moot, in which, theoretically at least, all freemen had the right to appear. H. R. von Gneist (History of the English Constitution) agrees that the two assemblies were identical, and a somewhat similar view is put forward by J. M. Kemble (Saxons in England) and E. A. Freeman (History of the Norman Conquest). Freeman advances the theory that the right of all the freemen to attend the gemeldi had for practical purposes fallen into disuse, and thus the assembly had come to be confined to the wise men. In other words, the folk-moot had become the witan. Evidence in support of this view is sought for in the accounts in the Anglo-Saxon Chronicle and elsewhere, where the decisions of the witan were received with loud expressions of approval or of disapproval by an assembled crowd, and it is argued that this is a survival from an earlier age, when all the freemen attended the witan. But the attendance of the crowd can be otherwise explained. The meetings referred to were probably those of exceptional interest, such as the election or the coronation of a king, and people from the neighbourhood were there merely as interested, and sometimes excited, spectators. The view is also held, that the two assemblies were distinct, is held, although with qualifications, by Stubbs (Const. Hist. vol. i). He thinks that on the union of the kingdoms the witan were merged into one another, while the folk-moot became the shiremoot. As the number of kings decreased the number of witanes decreased, until early in the 9th century there was one king and one witan in all England.

The power of the witan varied according to the personality of the reigning king, being considerable under a weak ruler, but inconsiderable under a strong one. Generally speaking, it diminished as the years went by, and from a necessary companion of the crown to be an advisory council. Its duties are shown by the preamble to the laws of Ine, king of Wessex, and 200 years later by the preamble to those of Alfred the Great, while several similar cases could be instanced. Ine legislates "with the counsel and with the teaching of Cenred my father and of Healdred my bishop, and of Eorenwald my bishop, with all my ealdormen and the most distinguished witan of my people" (Stubbs, Select Charters), and Alfred issues his code of laws "with the counsel and consent of his witan." Thus the members of the witan were primarily counsellors. With their consent the king promulgated laws, made grants of land, appointed bishops and ealdormen, and discharged the other duties of government. The witan was also a court of justice, Earl Godwine and many other offenders receiving sentence of outlawry therein. Its members had the power of electing a new king, although the area of their choice was strictly limited by custom and also the right of deposing a king, although this seems to have been infrequently exercised.

Its members signed the charters by which the king conveyed grants of land to churches and to individuals, and it is from the extant charters that we mainly derive our knowledge about the composition of the witan. It consisted, in addition to the king, his sons and other relatives, of the bishops and later some abbots, of some under-kings and the ealdormen of the shires or provinces, and of a number of ministri, or king's thegns. These ministri were nominees of the king; they included the important members of his household, and their number gradually increased until it outnumbered that of all the other members. The witan appears probably to have had no fixed place of meeting, and to have assembled around the person of the king, wherever he might be. In the latter years of its existence, at least, it met three times a year, at Easter, Whitsuntide and Christmas. The number of counsellors attending the meetings of the witan varied considerably from time to time. "In a witenagemot held at Luton in November A.D. 931 were the two archbishops, two Welsh princes, seventeen ealdormen, five ealdormen, and ninety-nine ministri. In another, that of Winchester of A.D. 934, were present the two archbishops, four Welsh kings, seventeen bishops, four abbots, twelve ealdormen, and twenty-two ministri. These are perhaps the fullest extant lists. Of Edgar's witenagemots, the one of A.D. 966 contained the king's mother, two archbishops, seven bishops, seven ealdormen, and fifteen ministri; and this is a fair specimen of the usual proportion" (Stubbs, Const. Hist. ch. vi.). Almost immediately after the Norman Conquest the word fell into disuse.

WITCH and WIZARD. These two words are now generally used of an adept of the black art, a sorcerer, magician, female
and male respectively (see Magic and Witchcraft). "Witch," formerly of common gender, represents O. Eng. wicca (masc.), wice (fem.), agent-nouns to wician, to practise sorcery, probably a causative verb from O. Eng. wican, to give way (cf. "weak"), and therefore signifying to avert (evil), conjure away. So Norwegian, vikja means (1) to turn aside, (2) to excercise. The participle "wicked" means witch-like. "Wizard" is formed from Welsh, with the slightly contemptuous Anglo-French suffix -ard, as in drunkard, laggard, slaggard, &c.

Witch Brooms, or "Birds' Nests," in botany, peculiar broom-like growths often seen on the branches of many trees. They are a dense development of branching twigs formed at one place on a branch as the result of the irritation set up by the presence of a mite or a fungus.

Witchcraft, a term often used of magical practices of all sorts, but here confined to the malevolent ("black") magic of women. It should, however, be noted that the male witch occasionally appears in folklore, while "white witchcraft" is common; the practices of the witch of Endor are akin rather to spirituality than witchcraft. The German term hexe was not originally applied to human beings at all, but to child-devouring demons, corresponding to the Roman lamia; and it is used in this sense till the 14th century, it does not appear in literature in its present sense till some time in the 13th century.

The modern European conception of the witch is perhaps the result of the fusion of several originally discrete ideas. In some countries we find the distinction made between conjurers, witches and sorcerers; the former were supposed to raise the devil by means of spells and force him to do their will; the witch proceeded by way of friendly pact with an evil spirit; a third class produced strange effects, without the aid of spirits (see Magic), by means of images or forms of words. We also find a distinction drawn between diviners, mathematici (=astrologers), crystal-gazers, necromancers and others; but it must be remembered that our knowledge for the earlier period is rather of learned ideas than of the actual popular beliefs, and for the later period of the popular belief sophisticated by ecclesiastical subtleties. In present-day belief the witch is, like the savage magician, initiated by another or himself performs ceremonies believed to give her magical powers. She possesses a familiar (see Lycanthropy; Magic), whose form she can assume; she can ride through the air in some cases and is equally adept at all kinds of magic. Sir A. C. Lyall maintains that the witch is a person who works magic by her own powers, not by the aid and counsel of supernatural beings; but this view, though it may be true of poisoning and similar features formerly reckoned a part of witchcraft, does not apply to the European witch. Witchcraft and possession are found in close connexion with the psychical epidemics of the middle ages, but are otherwise unrelated.

Witchcraft among Primitive Peoples.—Although magical powers are everywhere attributed to women, witchcraft as here defined is by no means universal; in Europe alone is the woman the almost exclusive repository of magical powers; in the Congo the muntu ndongo may be either a man or a woman, and in fact the sexes are said to be engaged in magical pursuits in approximately equal numbers; in Australia men are much more concerned with magic than women, but the latter have certain forms peculiar to themselves in the central area, and, as in medieval Europe, it is largely concerned with sexual matters. At the present day the European witch is almost invariably old, but this is not characteristic of the female magician of primitive peoples, or not to the same extent; it must be remembered that the modern idea of witchcraft is largely a learned product—the result of scholastic and inquisitorial ingenuity, mingled to a greater or less extent with genuine folk beliefs. In India, among the Agarias of Bengal, the instruction in witchcraft is given by the old women; but the pupils are young girls. The Indian witch is believed to have a cat familiar; there, as in Europe, many tests are applied to witches; they may be thrown into water, or their identity discovered by various forms of divination; or they may be known by the fact that beating them with the castor oil plant makes them cry out. As a punishment the witch may be shaved, made to drink dirty water, or otherwise ill-used.

Witchcraft in Classical Times.—Our knowledge of witchcraft in pagan antiquity is slight, but Horace has left us an elaborate description of the proceedings of two witches in the Esquiline cemetery. At the new moon they steal into it to gather herbs and monstrous herbs, their feet bare, their hair long, and their robes tuckèd up. So far from aiming at secrecy, however, they alarm their neighbours with their cries. Making a hollow in the ground they rend a black lamb over it to summon the dead. Then taking two images, one of wool representing a witch, one of wax representing the man whose infidelity she wishes to punish, a witch performs magical ceremonies; the moon turns red, hell hounds and snakes glide over the spot. Then they bury the muzzle of a wolf and burn the waxen image; as it melts, so fades the life of its prototype. In Greece Thessalian women had the reputation of being specially powerful witches; their poisons were famous and they were said to be able to make the moon descend from the sky.

Medieval Witchcraft.—We know less of early and medieval witchcraft than of modern 'savage' and popular beliefs; our knowledge of it is drawn partly from secular sources—the laws against, and in later times the trials for the offence—partly from ecclesiastical sources; but in each case the popular creed is filtered through the mind of a writer who did not necessarily understand or share the belief. For the earlier period we have penticitals, decisions of councils, discussions on to the bonâ fide or pertinacious kinds of witchcraft, as to their exact relation to the sin of heresy or as to the mechanism by which the supposed results were achieved; at a later period the trials of witches before the Inquisition are of great importance; but the beliefs of this period must be sharply distinguished from those of the earlier one. Finally we have a great mass of material in the secular trials of the 16th and two following centuries.

There are marked differences in the character of the witchcraft beliefs of different countries, due perhaps in part to the influence of the Inquisition, which reacted on the popular conceptions, in part to real differences in the original folk beliefs. In northern countries the witches' Sabbath never seems to assume any importance; in Germany, in the form of the Brocken assembly on May Eve, it is a prominent feature, and in England we may bring it into relation with the belief that at certain periods of the year demons and spirits are abroad and have special powers; in south Europe the idea of the Sabbath seems to owe much of its prominence to the association of witchcraft with heresy and the assemblies of the Waldenses and others. Again, the "evil eye" (q.v.) is especially associated with the south of Europe; and the "ligature" (questions as to the bonus magical means, often only with reference to a specified individual) has always played a far larger part in the conception of witchcraft than it has in the less amorous northern climes, and it is doubtless due to this in great part that woman in this part of Europe is so prominent in magic; in the north, on the other hand, we find the storm-raising woman, hardly yet extinct in the north of Scotland, already famous in pre-Christian times; we may perhaps connect the importance of woman in Germany in part with the conception of the Wild Hunt and the spirits who fly by night, though doubtless other factors played their part.

Development of Ideas.—The history of European witchcraft we may distinguish three periods: (1) down to A.D. 1350, in which the real existence of some or even all kinds of magic is doubted, and the various species are clearly held asunder in secular and ecclesiastical writings; (2) from 1350 to 1450, during which, under the influence of scholasticism, the doubts as to the possibility and reality of witchcraft gradually vanish, while side by side with this theoretical development the practice of the Inquisition instills the new conception into the popular mind and produces the impression that a great recrudescence of witchcraft was in progress; (3) from 1450 onwards the previously bilious conceptions became fused, at any rate in literature, and we reach the period of witch persecution, which did not come to an end till the 17th or even the 18th century.
In the first of these three periods we find (1) the conception of the maleficium, who, in common with her male counterpart, uses poison, spells and waxen images, produces tempests, works by means of the evil eye and is regarded as the cause of impotence, a feature which continually called the attention of theologians and jurists to the question of magic by the problem raised by the subordinate nullity of marriage. (2) Side by side with her, we find, this time without a male counterpart, the striga, frequently embodying also the ideas of the lamia and larva; originally she is a female demon, in bird form (and in many parts of the world female demons are specially malignant), who flies by night, kills children or even handsome young men, in order to eat them, assumes animal form, sometimes by means of an ointment, or has an animal familiar, rides on a besom, a piece of wood or an animal, and is sometimes brought into connexion with the souls of the dead. This latter feature arises from the gradual fusion of the belief in the striga, the Unholde, with the kindly suite of Frau Holde, the souls for whom the tabulae fortunae were spread. The flight through the air is so common a feature in the savage creed that the demon-idea of the striga in Europe can hardly be a genuine folk-belief; or, if it is, it must have existed side by side with a similar witch-belief, of which no traces seem to exist in the earlier literature. The same remark applies to belief in transformation. Although the development of the sexual element is mainly of later date and contemporaneous with the evolution of the Sabbath idea, the concubitus daemonum (certainly a pact with the devil) was before 8oo. This intrusion of the incubus in the domain of witchcraft was probably due to the attitude of the church towards magic.

Ecclesiastical and Civil Law.—For the attitude of the church to witchcraft there are three factors to be considered: (1) the Biblical recognition of its reality; (2) the universal belief in demons and magic; and (3) the identification of these demons with heathen deities. The orthodox view fluctuates between the theory that witchcraft is idolatry, a recognition of real powers, and that it is disobedience, a superstition following of nominalism. The real conception of a witch is a person who deals with familiar spirits (Lev. xx. 20), and the express provision that a witch should not be suffered to live (Ex. xxii. 18) could have left no doubt that the crime was a real one in the Mosaic law. Although the familiar plays but a small part in this early period, we find that the church early came to the conclusion that witchcraft depended on a compact with demons; in the synod of Elvira (a.d. 306) it was pronounced to be one of the three canonical sins—apostasy, and punished by the refusal of communion, even on the death-bed. Augustine lays down (Contra Faustum, i. 15) that the pact is one which is sworn to the devil; at Worms in a.D. 829 the Frankish bishops declared that the devil aided both sexes to prepare Love potions, to cause storms and to abstract milk, fruits of the field, &c.

It must not, however, be supposed that all kinds of witchcraft were equally recognized. The inimissores temperament and the poisoners by magical means were commonly recognized as real; but the striga was usually regarded as a mere superstition. An Irish synod (c. A.D. 800) pronounces a Christian to be anathema, who ventures to believe in the possibility of flight through the air and blood-sucking; Stephen of Tournai (c. 830) decries the maleficio from the striga; Regino of Prüm (c. 906) concludes that the flight by night with the devil and the goddess Diana is a delusion, the work of the devil. Burchard of Worms (d. 1025) prescribes two years' penance for the belief that the Unholde kill Christians, to keep them and eat their hearts, which they replace by a piece of wood, and then wake them. Agobard and others even express doubts as to the reality of weather-making. For those who took this view, and even for others who, like John of Damascus, accepted the striga, a mild attitude, in strict contrast to the later persecutions, was the accepted policy. The Synod of Reimsch (799) demands penance for witchcraft, but no punishment in this life. John of Damascus, Agobard, John of Salisbury and Burchard are equally mild.

For the church witchcraft was a canonical sin, or superstition; for the civil law it was a violation of the civil rights of others, so far as real results were produced. Consequently we find the legal distinction between the maleficio and the striga is equally marked. The Frankish and Alemannish laws of A.D. 500-600 except the striga from their laws and regard the latter as mere superstition. The Lex Salica indeed punished the striga as a murderess, but only exacted Wereld. Rothar forbade judges to kill the striga, and Charlemagne even punished the belief in them. The Alemanni (A.D. 600) forbade private tortue of women suspected of witchcraft or strigism. But although witchcraft was criminal, and we find occasional laws against sortiarii (Westfranks, A.D. 873), or expulsions (from Pomerania, 1124, &c.), in this period the crime is unimportant save where maleficium is combined with treason and the person of the king is aimed at.

From the 12th Century. In the second period (1230-1430) we have to deal with two factors of fundamental importance: (1) the elaboration of demonology and allied ideas by the scholastics, and (2) the institution of the Inquisition to deal with the rising flood of heresy. At the beginning of this era the prevalent view of the striga seems to have been that she really existed; Caesar of Heisterbach (c. 1225) recognizes the female monster, who kills children; William of Paris (c. 1230) agrees that lamiae and strigae eat children, but are allied to the dominie nocturnae; that they are real women is a foolish belief. Scholastic ingenuity, however, soon disposed of rationalistic objections five years later the Inquisition took a firm hold before 800. This intrusion of the incubus in the domain of witchcraft was probably due to the attitude of the church towards magic.

In the first half of this second period, witchcraft was still superstition for the canon law, a civil wrong for the secular law; later, although these ideas still persisted, all magic was held to be heresy; its reality and heretical nature was expressly maintained by Thomas Aquinas. Already in 1258 the inquisitors took cognizance of magic as heresy, and from 1320 onwards there was a great increase in the number of cases. At first the woman was punished to the secular arm for expressing herself as an obstinate heretic or as the worker of evil magic; later it was found necessary to make provision for the numerous cases in which the offender abjured; it was decided that repentance due to fear did not release the witch from the consequences of her heresy.

Towards the end of the second period the jurisdiction passed in France from the spiritual to the secular courts by a decision of the parlement of Paris in 1391. The inquisitors did not, however, resign their work, but extended their sphere of operation, the great European period; the rise from 1425 to 1447 was ecclesiastical as well as secular. In the third period (1450 onwards) the opening of which is marked by this attempt to root out witchcraft, we find that the work of the scholastics and inquisitors has resulted in the complete fusion of originally
WITCHCRAFT

James I., who had himself replied to it in his * Daemonologie* (1597), Balthasar Bekker's * Betoverde Wereld* (1601), which, though it went farther in the direction of scepticism, had less influence than Friedrich v. Spee's * Cautio Criminalis* (1631). In France Jean Uvier defended the rationalistic view, and Jean Bodin demanded that he should be sent to the stake for his tenets.

Psychology of Witchcraft.—Although at the height of the witch persecution torture wrung from innocent victims valueless confessions which at best evidence that long-continued agony of body may be instrumental in provoking hallucinations, there can be no doubt that witches commonly, like the magician in lower planes of culture, firmly believe in their own powers, and the causes of this seem to be not merely subjective. (1) Ignorance of the effects of suggestion leads both the witch and others to regard as supernormal effects which are really due to the victim's belief in the possibility of witchcraft. This applies especially to cases of "ligature." (2) Telepathy (q.v.) seems in some cases to play a part in establishing the witch's reputation; some evidence has been produced that hypnotism at a distance is possible, and an account of her powers given by a French witch to Dr Gibotteau suggests that this element cannot be neglected in appraising the evidence for witchcraft. (3) Whatever be the real explanation of the belief in poltergeists (q.v.) and "physical phenomena" (q.v.), the belief in them rests on a very different basis from that of the belief in lycanthropy; exaggeration and credulity on a cosmological and especially supernormal basis is associated with witchcraft. On the other hand, subjective causes played their part in causing the witch to believe in herself. (4) Auto-suggestion may produce hallucinations and delusions in otherwise sane subjects; and for those who do not question the reality of witchcraft this must operate powerfully. (5) The descriptions of witches show that in many cases their sanity was more than questionable; trance and hysteria also played their part. (6) It is uncertain to what extent drugs and salves have helped to cause hallucination; but that they had some share seems certain, though modern experimenters have been led to throw doubt on the alleged efficacy of some of the drugs; here too, however, the effects of suggestion must be reckoned with; we do not associate the use of tobacco with hallucinations, but it was employed to produce them in Haiti in the same way as hemp among the Bantu of the present day. (7) Hallucinations occurring under torture must have tended to convince bystanders and victims alike, no less than the acceptance of suggestions, positive and negative.

As regards the nature of the ideas accepted as a result of suggestion or auto-suggestion, they were on the one hand derived, as is still seen, from ecclesiastical and especially supernormal sources; but beneath these elements is a stratum of popular belief, derived in the main perhaps from pagan sources, for to this day in Italy witchcraft is known as *la vecchia religione,* and has been handed down in an unbroken tradition for countless generations.

Bastian, Der Mensch in der Geschichte. On witchcraft and insanity, see Hack-Tuke, History of Insanity; O. Snell, Hexenprocesse und Geisterhandlungen; for the religious influence of witchcraft, see E. Gurney, Phantoms of the Living, vol. i.; F. Podmore, Modern Spiritualism, l. 13. (N. W. T.)

WITCH-HAZEL, in botany, the common name for a North American shrub, Hamamelis virginica, known in gardens. The clusters of rich yellow flowers begin to expand in the autumn before the leaves fall and continue, without the aid of frost, till the seeds and twigs are edible. The name is derived from the use of the twigs as divining rods, just as hazel twigs were used in England.

Britten and Holland (Dictionary of English Plant Names, p. 247) quote three British plants under this name: (1) Wych elm (Ulmus montana), which, according to Parkinson (Theatr. 1640), was called "Witch hazel," and was the least "like an honest man" and the "best for the Hazel nut;" (2) Hornbeam (Carpinus Betulus), which, according to Gerard, was so called in some places from its likeness to the elm or "Witch Hazel tree;" and (3) Mountain ash (Pyrus Aucuparia).

Witch of Agnesi, in geometry, a cubic curve invented by Maria Gaetana Agnesi. It is constructed by the following method: Let AQB be a semicircle of diameter AB, produce MQ the ordinate of Q to P so that MQ: MP = AM: AB. Then the locus of P is the witch. The cartesian equation, if A be taken as origin and AB(=2a) for the axis of x, is

\[ y^2 = 4ax(x - 2a). \]

The curve consists of one branch entirely to the left of the line x = 2a and having the axis, y = 0, as an asymptote of the line x = 2a.

Witham, an urban district in the Maldon parliamentary division of Essex, England, 39 m. N.E. by E. from London by the Great Eastern railway. Pop. (1901) 3454. It lies on the River Brain, an affluent of the Blackwater, also known as the Guith, a form connected with the name Witham. The church of St Nicholas is principally Decorated, but retains earlier portions. Roman bricks appear in its fabric, and premises a Roman station in the vicinity. Surrounding the church (which stands in a highlying portion of the town known as Clipping Hill) there are earthworks, possibly the remains of a fortification recorded as made by order of Edward the Elder in 913, but perhaps of British origin.

Wither, George (1588–1667), English poet and satirist, son of George Wither, of Hampshire, was born at Bentworth, near Alton, on the 11th of June 1588. He was sent to Magdalen College, Oxford, at the age of fifteen, and remained at the university for two years. His neighbours appear to have had no great opinion of him, for they advised his father to put him to some mechanic trade. He was, however, an asymptote of the Inns of Chancery, eventually obtaining an introduction at court. He wrote an elegy (1612) on the death of Prince Henry, and a volume of gratulatory poems (1613) on the marriage of the Princess Elizabeth, but his uncompromising character soon prepared trouble for him. In 1611 he published Abuses Stript and Whipt, twenty satires of general application directed against Revenge, Ambition, Lust and other abstractions. The volume included a poem called "The Scourge," in which the lord chancellor was attacked, and a series of epigrams. No copy of this edition is known, and it was perhaps suppressed; but in 1613 five editions appeared, and the author was lodged in the Marshalsea prison. The influence of the Princess Elizabeth, supported by a loyal "Satyre" to the king, in which he hints that an enemy at court had fitted personal meanings to his general invective, secured his release at the end of a few months. He had figured as one of the interlocutors, "Roget," in his friend William Browne's Shepherd's Pipe, with which were bound up eclogues by other poets, among them one by Wither, and during his imprisonment he wrote what may be regarded as a continuation of Browne's work, The Shepherd's Hunting (printed 1615), eclogues in which the two poets appear as "Wille" and "Roget" (in later editions "Philarete"). The fourth of these eclogues contains a famous passage in praise of poetry. After his release he was admitted (1615) to Lincoln's Inn, and in the same year he printed privately Fidelia, a love elegy, of which there is a unique copy in the Bodleian. Other editions of this book, which contained the lyric "Shall I, wasting in despair," appeared in 1617 and 1619. In 1621 he returned to the satiric vein with Wither's Motto, Nec habeo, nec careo, nec caro. Over 30,000 copies of this poem were sold, according to his own account, within a few months. Like his earlier invective, it was said to be libellous, and Wither was again imprisoned, but shortly afterwards released without formal trial on the plea that the book had been duly licensed. In 1622 appeared his Faire-Virtue, The Mistrstresses of Phel' Arte, a long panegyric of a mistress, partly real, partly allegorical, written chiefly in the seven-syllabled verse of which he was a master.

Wither began as a moderate in politics and religion, but from this time his Puritan leanings became more and more pronounced, and his later work consists of religious poetry, and of controversial and political tracts. His Hymnes and Songs of the Church (1622–1623) were issued under a patent of King James I. ordaining that they should be bound up with every copy of the authorized metrical psalms offered for sale (see HYMNS). This patent was opposed, as inconsistent with their privilege to print the "singing-psalms," by the Stationers' Company, to Wither's great mortification and loss, and a second similar patent was finally disallowed by the House of Lords. Wither was in London during the plague of 1625, and in 1628 published Britain's Remembrancer, a voluminous poem on the subject, interspersed with denunciations of the wickedness of the times, and prophecies of the disasters about to fall upon England. He also incidentally avenged Ben Jonson's attack on his "Verses" of Time Vindicated, by a reference to Ben's "drunken concave." This book he was obliged to print with his own hand in consequence of his quarrel with the Stationers' Company. In 1635 he was employed by Henry Taunt, a London publisher, to write English verses illustrative of the allegorical plates of Crispin van Passen, originally designed for Gabriel Rollenhagen's Nucleus emblematum selectissimorum (1610–1613). The book was published as a Collection of Emblems, Ancient and Modern, of which the only perfect copy known is in the British Museum. The best of Wither's religious poetry is contained in Helvetia: or Britain's Second Remembrancer, which was printed in Holland in 1641. Many of the poems rise to a high point of excellence. Besides those properly entitled to the designation of hymns, the book contains songs of singular beauty, especially the Cradle-song ("Sleep, baby, sleep, what all my dear"). The Anniversary Marriage Song ("Lord, living here are we"), the Perambulation Song ("Lord, it hath pleased Thee to say"), the Song for Lovers ("Come, sweet heart, come, let us prove"); the Song for the Happily Married ("We call them in singing take delight") and that for a Shepherd ("Roget, my love, let's keep")—(Nos. 50 in the first part, 17 and 24 in the second, and 20, 21 and 47 in the third). There is also in the second part a fine song (No. 59), full of historical as well as poetical interest, upon the evil times in which the poet lived, beginning—

"Now are the times, these are the days
Which will those men approve
Who take delight in honest ways
And pious courses love;
Now to the world it will appear
That innocence of heart
Will keep us far more free from fear
Than helmet, shield or dart.
"

Wither wrote, generally, in a pure nervous English idiom, and preferred the reputation of "rusticity" (an epithet applied to him even by Baxter) to the tricks and artifices of poetical style which were then in favour. It may be partly on that account that he was better appreciated by posterity than by his contemporaries.

Wither had served as captain of horse in 1659 in the expedition of Charles I. against the Scottish Covenanters, and his religious rather than his political convictions must be accepted as the explanation of the fact that, three years after the Scottish expedition, at the outbreak of the Great Rebellion, he is found definitely siding with the parliament. He sold his estate to raise a troop of horse, and was placed by a parliamentary committee in command of Farnham Castle. After a few days' occupation he left the place undefended, and marched to London. His own
house near Farnham was plundered, and he himself was captured by a troop of Royalist horse, owing his life to the intervention of Sir John Denham on the ground that so long as Withers lived he himself could not be accounted the worst poet in England. After this episode he was promoted to the rank of major. He was present at the siege of Gloucester (1643) and at Naseby (1645). He had been deprived in 1643 of his nominal command, and of his commission as justice of the peace, in consequence of an attack upon Sir Richard Onslow, who was, he maintained, responsible for the Farnham disaster. In the same year parliament made him a grant of £2000 for the loss of his property, but he apparently never received the full amount, and complained from time to time of his embarrassments and of the slight rewards he received for his services. An order was made to settle a yearly income of £150 on Wither, chargeable on Sir John Denham's sequestered estate, but there is no evidence that he ever received it. A small place given him by the Protector was forfeited "by declaring unto him (Cromwell) those truths which he was not willing to hear of." At the Restoration he was arrested, and remained in prison for three years. He died in London on the 2nd of May 1667.

His extant writings, catalogued in Park's British Bibliographer, numbered over a hundred. Sir S. E. Brydges published The Shepherd's Hunting (1814), Fidelia (1815) and Fair Virtue (1818), and a selection appeared in the 1st vol. of British Poets, vol. ii. (1819). Most of Wither's works were edited in twenty volumes for the Spenser Society (1871-1882); a selection was included by Henry Morley in his Companion Poets (1891); Fidelia and Fair Virtue are included by W. D. Talkington, English Poets (1893), and an excellent edition of The Poetry of George Wither was edited by F. Sidgwick in 1902. Among A. C. Swinburne's Miscellaneous there is an amusing account of a copy of a selection from Wither's poems annotated by Lamb, then by Dr Nott, whose notes were the subject of further ruthless comment from Lamb.

WITHERITE, a mineral consisting of barium carbonate (BaCO₃), crystallizing in the orthorhombic system. The crystals are invariably twinned together in groups of three, giving rise to pseudo-hexagonal forms somewhat resembling bipyramidal crystals of quartz, the faces are usually rough and striated horizontally. The colour is dull white or sometimes greyish, the hardness is 3 and the specific gravity 4-3. The mineral is named after W. Withering, who in 1784 recognized it to be chemically distinct from barytes. It occurs in veins of lead ore at Hexham in Northumberland, Alston in Cumberland, Angle-zark, near Chorley in Lancashire, and a few other localities. Witherite is readily altered to barium sulphate by the action of water containing calcium sulphate in solution, and crystals are therefore frequently encrusted with barytes. It is the chief source of barium salts, and is mined in considerable amounts in Northumberland. It is used for the preparation of rat poison, in the manufacture of glass and porcelain, and formerly for refining sugar.

WITHERSPOON, JOHN (1723-1794), Scottish-American divine and educationalist, was born at Gifford, Yester parish, East Lothian, Scotland, on the 5th of February 1723/1724, the son of a minister of the Scotch Established Church, James Witherspoon (d. 1759), and a descendant on the distaff side from John Welch and John Knox. He studied at Haddington, and graduated in 1739 at the university of Edinburgh, where he completed a divinity course in 1743. He was licensed to preach by the Haddington presbytery in 1743, and after two years as a probationer was ordained (1745) minister of the parish of Beltie Hill, His Ecclesiastical Characteristics (1753), Serious Apology (1754), and History of a Corporation of Servants discovered a few years ago in the Interior Parts of South America (1765), attacked various abuses in the church and satirized the "moderate" party. In 1757 he had become pastor at Paisley; and in 1760 he received the degree of D.D. from Aberdeen. He was sued for libel for printing a rebuke to some of his parishioners who had travestied the sacrament of the Lord's Supper; and after several years in the courts he was ordered to pay damages of £150, which was raised by his parishioners. He refused calls to churches in Dublin and Rotterdam, and in 1766 declined an invitation brought him by Richard Stockton to go to America as president of the College of New Jersey (now Princeton University); but he accepted a second invitation and left Paisley in May 1768. His close relation with the Scotch Church secured important material assistance for the college of which he now became president, and he toured New England to collect contributions. He secured an excellent set of scientific apparatus and improved the instruction in the natural sciences; he introduced courses in Hebrew and French about 1772; and he did a large part of the actual teaching, having courses in languages, divinity, moral philosophy and elementary science. In the American Presbyterian church he was a prominent figure; he worked for union with the Congregationalists and with the Dutch Reformed body; and at the synod of 1786 he was one of the committee which reported in favour of the formation of a General Assembly and which drafted "a system of general rules for... government." In politics he did much to influence Irish and Scotch-Irish Presbyterians to support the Whig party. He was a member of the provincial congress which met at New Brunswick in July 1774; presided over the Somerset county committee of corre-
correspondence, were edited by Dr Ashbel Green (New York, 1774-1775), and a member of the New Jersey constitutional convention in the spring of 1776; and from June 1776 to the autumn of 1779 and in 1780-1783 he was a member of the Continental Congress, where he urged the adoption of the Declaration of Independence, being the only clergyman to sign it. He became a member of the secret committee of corre-
correspondence in October 1776, of the Board of War in October 1777, and of the committee on finance in 1778. He opposed the issue of paper money, supported Robert Morris's plan for a national bank, and was prominently connected with all Congres-
sional action in regard to the peace with Great Britain. He had lost the sight of one eye in 1784, and in 1791 became quite blind. He died on his farm, Tusculum, near Princeton, on the 15th of November 1794.

There is a statue of Witherspoon in Fairmount Park, Philadelphia, and another on the University Library at Princeton. His Essay on the Communication between the Doctrine of Justification by the Imputed Righteousness of Christ and Holiness of Life (1756) was his principal theological work. He also published several sermons, and Con-
siderations on the Nature and Extent of the Legislative Authority of the British Parliament (1774), sometimes attributed to Benjamin Franklin. His collected works, with a memoir by his son-in-law, Samuel Stanhope Smith (who succeeded him as president of the college), were edited by Dr Ashbel Green (New York, 1801-1802). See also David Walker Woods, John Witherspoon (New York, 1806); and M. C. Tyler, Literary History of the American Revolution, vol. ii. (1897).

WITNESS (from O. Eng. witnes, to know), in law, a person who is able from his knowledge or experience to make statements relevant to matters of fact in dispute in a court of justice. The relevancy and probative effect of the statements which he makes belong to the law of evidence (q.v.). In the present article it is only proposed to deal with matters concerning the position of the witness himself. In England, in the earlier stages of the common law, the jurors seem to have been the witnesses, for they were originally chosen for their knowledge or presumed knowledge of the facts in dispute, and they could (and can) be challenged and excluded from the jury if related to the parties or otherwise involved. No legal bias (such as the Scotch jurors' oath contains the words "and no truth conceal," an obvious survival from the time when a juror was a witness.

Modern views as to the persons competent to give evidence are very different from those of Roman law and the systems derived therefrom. In Roman law the testimony of one unaided or unaided witness was not admissible without the application of torture; and a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and witnesses were not allowed to give evidence which had become known to them before they took an oath. The persons excluded included "idonei, or duly qualified, Minors, certain heretics, infamous persons (such as women convicted of adultery), and those interested in the result of the trial were inadmissible. Parents and children could not testify against one another, nor could slaves against their masters, nor those at enmity with the party against whom their evidence was offered. Women and slaves could not act as witnesses, and were liable to severe penalties for perjury. Seven witnesses were necessary for a will, five for a mancipatio or manumission, or to determine the question whether a person were free or a slave. As under the Mosaic law, two witnesses were gen-
ernally necessary as a minimum number to prove any fact. Untis
In criminal cases an accused person could not formerly be sworn as a witness or examined by the court, though he was free to testify against his accusers. The provisions of a second clause of the maxi

mum tenetur proderre seipsum, by other witnesses. This exclusion was in accord with the disqualification of an accused party, or of any person in interest with the accused, in civil suits against him, or to testify as a witness in his own behalf. In England many statutes have been passed rendering accused persons and their husbands or wives competent witnesses on charges of particular offences. Most of these acts do not make them compellable witnesses.

[Note: The text continues discussing various legal and historical aspects of criminal proceedings, including the role of witnesses, the nature of perjury, and the evolution of legal procedures.]

In criminal cases an accused person could not formerly be sworn as a witness or examined by the court, though he was free to testify against his accusers. The provisions of a second clause of the maxim

mum tenetur proderre seipsum, by other witnesses. This exclusion was in accord with the disqualification of an accused party, or of any person in interest with the accused, in civil suits against him, or to testify as a witness in his own behalf. In England many statutes have been passed rendering accused persons and their husbands or wives competent witnesses on charges of particular offences. Most of these acts do not make them compellable witnesses.
In case the witness has been called by either party, or to examine witnesses on questions not inquired into by the accused, or to inform him of his right to be present in the case in which he is a party.

The examination of a witness by the advocate of the side for which he is called is termed "examination-in-chief"; when by the advocate of the other party it is called "cross-examination." The judge, and by his peremptory direction, may suspend the main duty of the judge is not himself to interrogate the witness but to see that neither side asks irrelevant or vexatious questions (see R.S.C. 1893, order 36, rule 38).

The main rules for witnesses are also compulsory, except the king; i.e. they can be required to attend the court and to take the oath and to answer all relevant questions. But by the proceedings of the court, the witness may refuse to be examined in any criminal cases he is not a compulsory witness, nor in many specified cases is the husband or wife of the accused. The attendance of witnesses is secured in the following manner: In civil actions in the High Court of Justice by writ of subpoena personally served with tender of the necessary journey money (see Writs); in civil actions in county courts by witness summons; in criminal proceedings before the High Court of Justice or a court of assize or quarter sessions by order of the court or judge when the accused was committed for trial. In proceedings before justices out of quarter sessions the attendance of a witness is secured by his being summoned to appear and may be by others who are to answer for him. In criminal cases tender of expenses is not essential. Where a witness refuses to attend or to be sworn or to answer, he is summarily punishable for contempt if the court is one of record, and liable to imprisonment by contempt proceedings. The judge may also make a judicial order to prevent the witness from leaving the jurisdiction. Various acts of parliament deal with compelling appearance before committees of parliament, courts martial and other tribunals of a special nature. The attendance of a witness who is in custody is secured by writ of habeas corpus ad testificandum or by judge's order in certain cases, or by order of the home secretary under the Prison Act 1898. A witness's expenses in a civil case are paid out of court; in criminal cases the expenses do not exceed the sum fixed by the home secretary (see Costs).

A witness is privileged from arrest on civil process while he is in attendance on a court of justice or on his way to or from the court (except in contempt of court proceedings). The privilege of witnesses from arrest does not extend to arrest on a criminal charge. All witnesses except the defendant in a criminal case are entitled to object to answer any question put to them in court on the ground that the answer might tend to criminate him. If the objector is wrong it is as to the sufficiency of the evidence. The defendant in a criminal case if sworn as a witness is not entitled to refuse to answer questions put to him to disclose his guilt. He may in fact be bound to answer questions put to him being tried, and a witness cannot refuse to answer a question on the ground that the answer might involve admission of a debt or subject him to a civil action (1806, c. 37).

Witnesses are also privileged from making disclosure of matters known to them in the following cases: (1) Public officials, as to matters coming within their official cognizance if they can swear that it is inconsistent with the public service to disclose them. This applies to state secrets, and extends to jurors as to what passed among them, and the public prosecutor; and the police on this ground refuse to disclose the sources of information leading to prosecutions for treason, piracy, and other offences committed on them, and their clients, unless the communications are in themselves part of a criminal or unlawful enterprise. English law declines to extend professional privilege to communications between doctor and patient or between any member of the legal profession, and patient or client. But the doctor is bound to disclose any illegal, or crime, or the patient's name, or any other matter coming within his professional capacity (see also solicitor). It is also preserved by modern legislation (1853, c. 83, s. 3; 1898, c. 36, s. 1 d.).

It is correlative to the obligation of a witness to testify that no action may be brought against him under English law for any statement made in the course of his examination, true or malicious, made by him in the course of his testimony in judicial proceedings (Seaman v. Netherfield, 1876, 1 C.P.D. 540; Hudson v. Pare, 1899, 1 B. 455). The remedy in the statement is deliberate false, is to prosecute him for perjury.

1 In ecclesiastical courts the punishment was by excommunication.
Curbridge. Witowt is the head of an old-established industry in blanket-making, and gloves and other woollens are also made. The broad main street contains several picturesque houses of the 17th century and later, and in it stands the Butter Cross, supported on columns and dating from 1683. The grammar school was founded in 1683, and a Blue Coat School in 1723. The great church of St Mary is one of the finest in the county. It is cruciform with a lofty central tower and spire, the latter considered to be a direct development of the early spire of the cathedral at Oxford. The tower is Early English, but the church exhibits other styles, including a remarkable Norman porch. At Cogges, in the water-meadows bordering the river immediately afterwards, there was an inn where William the Conqueror was welcomed by the Lord of Fécamp, and of this there are Early English remains in the parish church, while the church is mainly Decorated. The foundation, however, dates from the 11th century.

The manor of Witney (Wytnay, Wytna, Wyney) was held by the see of Winchester before the Conquest. It was sold in 1640, but was given back to the bishopric at the Restoration. In the middle of the 18th century it was leased by the bishop of Winchester to the duke of Marlborough. Witowt was a borough by prescription at least as early as 1278, and sent representatives to Parliament or less regularly from 1304 to 1320. The government was by the steward and bailiffs of the bishop of Winchester, assisted by constables, wardmen and other officers. A woollen industry was probably established at an early date, for there is evidence for a fulling mill in a charter of King Edgar dated 909. In 1641 the blanket-makers petitioned the crown against vexatious trade regulations; in 1673 the town is described as a 'driving a good trade for blankets and rugs.' In 1711 the blanket-makers obtained a charter making them into a company, consisting of a master, assistant, two wardens and two commonalty. In 1731 the bishop of Winchester received a grant of a five days' fair at Witney at the feast of St Leonard. In 1728 the bishop declared to have at Witney a weekly market on Thursday and two fairs on the day of Ascension and on St Leonard's day. A further grant of two yearly fairs was made in 1444 to the bishop of Winchester at his manor of Witney, namely, on the vigil and day of St Clement the Pope, and at the feast of St Barnabas.

WITLOW, or WITLOW (1340–1430), grand-duke of Lithuania, second son of Kieštut, prince of Samogitia, first appears prominently in 1382, when the Teutonic Order set him up as a candidate for the throne of Lithuania in opposition to his cousin Jagiello (see Władysław), who had treacherously murdered Witowt's father and seized his estates. Witowt, however, convinced himself that the German knights were far more dangerous than his Lithuanian rival; he accepted pacific overtures from Jagiello and became his ally. When Jagiello ascended the throne of Poland as Władysław II. In 1386, Witowt was at first content with the principality of Grodno; but jealously of Skirgiel, one of Jagiello's brothers, to whom Jagiello had committed the government of Lithuania, induced Witowt to ally himself once more with the Teutonic Order (treaty of Königsberg, 24th of May 1390). He strengthened his position by giving his daughter Sophia in marriage to Vasily, grand-duke of Muscovy; but he never felt secure beneath the wing of the Teutonic Order, and when Jagiello removed Skirgiel from the government of Lithuania and offered it to Witowt, the compact of Ostrow (3th of August 1392) settled all differences between them. Nevertheless, Witowt's attempts on the part of Poland to subordinate Lithuania drove Witowt for the third time into the arms of the Order, and by the treaty of Salin in 1398, Witowt, who now styled himself Supremus Dux Lithuanien, even went so far as to cede his ancestral province of Samogitia to the knights, and to form an alliance with them for the conquest and partition of Pskov and Great Novgorod. His ambition and self-confidence at this period knew no bounds. He nourished the grandiose idea of driving out the hordes of Tamerlane, freeing all Russia from the Tatar yoke, and proclaiming himself emperor of the North and East. This dream of empire was dissipated by his terrible defeat at the Tower of Dnepr by the Tatars on the 12th of August 1399. He was now convinced that the true policy of Lithuania was the closest possible alliance with Poland. A union between the two countries was effected at Vilna on the 18th of January 1401, and was confirmed and extended by subsequent treaties. Witowt was to reign over Lithuania as an independent grand-duke, but the two states were to be indissolubly united by a common policy. The result was a whole series of wars with the Teutonic Order, which now acknowledged Swidrygiello, another brother of Jagiello, as grand-duke of Lithuania; and though Swidrygiello was defeated and driven from the throne by Witowt, the Prince of Samogitia and his barbarous methods of 'converting,' the wretched inhabitants finally induced Witowt to rescue his fellow-countrymen at any cost from the tender mercies of the knights. In the beginning of 1409 he concluded a treaty with Jagiello at Novogrudok for the purpose, and on the 9th of July 1410 the combined Polish-Lithuanian forces, reinforced by Hussite auxiliaries, crossed the Prussian border. The rival forces encountered at Grünwald, or Tannenberg, and there on the 14th or 15th July 1410 was fought one of the decisive battles of the world, which not only decided the future of Lithuania, but which also showed that the Teutonic Order could not always be depended upon when they never recovered. After this battle Poland-Lithuania began to be regarded in the west as a great power, and Witowt stood in high favour with the Roman curia. In 1429, instigated by the emperor Sigismund, whom he magnificently entertained at his court at Lutsk, Witowt revived his claim to a kingly crown, and Jagiello reluctantly consented to his cousin's coronation; but before it could be accomplished Witowt died at Troki, on the 27th of October 1430. He was certainly the most imposing personality of his day in eastern Europe, and his martial valour was combined with statesmanlike foresight.

See Jozef Ignac Kraszewski, Lithuania under Witowt (Pol.) (Wilna, 1850); Augustin Theiner, Veterea Monumenta Polonisse (Rome, 1860-1864); Karol Szumlocha, Jadwiga i Jagiello (Pol.) (Lwow, 1860-1862); Teodor Grudko, Urodzenie i posiadanie Witek (Pol.) (Wilna, 1835-1836); Codex epistolarius Witaedi Magni (ed. Prochaska, Cracow, 1882).

WITSIUS, HERMANN (1636-1708), Dutch theologian, was born at Enkhuysen, North Holland, and studied at Groningen, Leiden and Utrecht. He was ordained to the ministry, becoming pastor at Westwoud in 1656 and afterwards at Wormeren, Goesen and Leemwarden, and became professor of divinity at Leiden in 1677 and 1680. In 1686 he went to Leiden as the successor of Friedrich Spanheim the younger (1653-1701). He died at Leiden on the 22nd of October 1708.

Witowt tried to mediate between the orthodox theology and the "federal" system of Johannes Cocceius, but did not succeed in pleasing either party. The more important of his works were: Judaean christiansam—circa principi fidei et SS. Trinitatem (Utrecht, 1664); De oeconomia foederum Dei cum hominibus (1676), still regarded as one of the clearest and most suggestive expositions of the so-called "federal" theology; Diatessar epistolarius apocalypcrium sensu historico ac apothecos (Franeker, 1678); Exercitationes sacrae in symbolum quod apothecos dicitur et in gregem Dominicum (Franeker, 1681); Miscellanea sacra (Utrecht, 1692-1700, 2 vols.).

WITTE, SERGE JULIEVICH, COUNT (1849— ), Russian statesman, was born at Tiflis, where his father (of Dutch extraction) was a member of the Viceregal Council of the Caucasus. His mother was a lady of the Fadyev family, by whom he was brought up as a member of the Eastern Orthodox Church and thoroughly imbued with nationalist feeling in the Russian sense of the term. After completing his studies at Odessa University, in the field of history and physical science, and devoting some time to journalism in close relations with the Slavophils and M. Katkov, he entered in 1877 the service of the Odessa State railway, and so distinguished himself in the transport operations necessitated by the Turkish campaign of 1877-1878, that he was soon afterwards appointed general traffic manager of the South-Western railway of Russia and member of an Imperial commission which had to study the whole question of railway construction and management throughout...
the empire. His speciality was an intimate acquaintance with the problem of railway rates in connexion with the general economic development of the country, and in 1884 he published a work on the subject which attracted some attention in the country. He had been virtually prime minister, but, before his death, had, owing to various differences of opinion and to his disinclination to face the difficulties involved, resigned his position.

Bertold I., with greatly reduced privileges. Arnulf's younger son, Arnulf II., continued the struggle against Otto I., and some time before his death in 934 was made count palatine in Bavaria. This office did not become hereditary, however, and his descend-ants bore simply the title of counts of Scheyern until about 1116, when the emperor Henry V. recognized Count Otto V. as count palatine in Bavaria. His son, Count Otto VI., who succeeded his father in 1155, accompanied the German king, Frederick I., to Italy in 1154, where he distinguished himself by his courage, and later rendered valuable assistance to Frederick in Germany. When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto's services were rewarded by the investiture of the dukedom of Bavaria at Altenburg.

Some time in Otto I. Bavaria has been ruled by the Wettelsbachs.

Otto died at Pfullendorf in 1153, and was succeeded in the duchy by his son, Louis I. (1174-1231), but the dignity of count palatine in Bavaria passed to his brother Otto, whose son Otto, succeeding in 1189, murdered the German king Phillip at Bamberg on the 21st of June 1208. He was placed under the ban by the emperor Otto IV., and was killed at Obersdorf, near Regensburg, by Henry of Kalden, marshal of the empire, in March 1209. His lands passed to his son Louis, then only nine years old, who began his rule in 1192. In 1208 he destroyed the ancestral castle of Wettelsbach, the site of which is now marked by a church and an obelisk.

At first Louis supported Otto IV. in his struggle with Frederick of Hohenstaufen (the emperor Frederick II.), but deserted his cause when Frederick invested his son, Otto, with the Palatinate of the Rhine in 1214. Louis appears to have been previously promised this succession, and to strengthen his claim married his son, Otto, to Agnes, the sister of Henry, the count palatine, who died without heirs in 1214. Louis accompanied the Crusaders to Damietta in 1221, and governed Germany as regent from 1225 until 1238, when he deserted Frederick II. at the instigation of Pope Gregory IX. He was murdered at the bridge of Kelheim on the 15th of September 1231, and the emperor was generally suspected of complicity in the deed. Louis' son, Otto the Illustrious (1206-1253), undertook the government of the Palatinate in 1228, and became duke of Bavaria in 1231. He was attached to the Hohenstaufen by the marriage of his daughter, Elizabeth, with Conrad, son of Frederick II. in 1246. He supported Frederick in his struggle with the anti-Kings, Henry Rappe, landgrave of Thuringia, and William II., count of Holland, and was put under the papal ban by Pope Innocent IV., who in 1248 deposed him, when he went to Italy in 1251. Otto remained as his representative in Germany, until his death on the 20th of November 1253. He left two sons, Louis and Henry, who reigned jointly until 1255, when a division of the lands was made, by which Louis II. (1228-1294) received upper Bavaria and the Palatinate of the Rhine, and Henry I. (d. 1290) lower Bavaria. Louis, who soon became the most powerful prince in southern Germany, was called "the Stern," because in a fit of jealousy he caused his first wife, Maria of Brabant, to be executed in 1256. He was the uncle and guardian of Conradin of Hohenstaufen, whom he assisted to make his journey to Italy in 1267, and accompanied as far as Verona. When Conradin was executed in 1268 Louis inherited his lands in Germany, sharing them with his brother Henry. In 1273 he was a candidate for the German crown, but was in-duced to support Rudolph, count of Habsburg, whose eldest daughter, Matilda, he married in this year. He was a great source of strength to the Habsburgs until his death in 1294. Lower Bavaria was ruled by the descendants of Henry I. until the death of his great-grandson, John I., in 1340, when it was again united with upper Bavaria. The sons of Louis, Rudolph I. (d. 1310) and Louis, who became German king as Louis IV. in 1314, ruled their lands in common, but after some trouble between them Rudolph abdicated in 1317.

In 1320 the most important division of the Wettelsbach lands took place. By the treaty of Pavia in this year, Louis granted the Palatinate of the Rhine and the upper Palatinate of Bavaria.
to his brother's sons, Rudolph II. (d. 1532) and Rupert I. Rupert, who from 1553 to 1590 was sole ruler, gained the electoral dignity for the Palatinate of the Rhine in 1556 by a grant of some lands in upper Bavaria to the younger Joseph, Charles' kid. It had been exercised from the division of 1320 by both branches in turn. The descendants of Louis IV. retained the rest of Bavaria, but made several divisions of their territory, the most important of which was in 1392, when the branches of Ingoldstadt, Munich, and Landshut were founded. These were reunited under Albert IV., duke of Bavaria-Munich (1447-1508) and the upper Palatinate was added to them in 1628. Albert's descendants ruled over a united Bavaria, until the death of Duke Maximilian III. in 1777, when it passed to the Elector Palatine, Charles Theodore. The Palatinate of the Rhine, after the death of Rupert I. in 1590, passed to his nephew, Rupert II., and in 1598 to his son, Rupert III., who was German king from 1400 to 1410. On his death it was divided into four branches. Three of these had died out by 1550, and their possessions were inherited by the fourth or Simmern line, among whom the Palatinate was again divided (see Palatinate).

In 1742, after the extinction of the two senior lines of this family, the Sulzbach branch became the senior line, and its head, the elector Charles Theodore, inherited Bavaria in 1777. He died in 1799 and was succeeded by his brother Joseph, Charles' kid. It had been exercised from the division of 1320 by both branches in turn, inherited Bavaria and the Palatinate. He took the title of king as Maximilian I.

In 1623, when the elector Frederick V. (the "Winter King") was driven from his dominions, the electoral privilege was transferred to Bavaria, and in 1648, by the Peace of Westphalia, an eighth electorate was created for the Wittelsbachs of the Palatinate, and was exercised by the senior branch of the family.

The Wittelsbachs gave three kings to Germany, Louis IV., Rupert and Charles VII. Members of the family were also margraves of Brandenburg from 1323 to 1733, and kings of Sweden from 1664 to 1718.

**WITTENBERG**, a town of Germany, in the Prussian province of Westphalia, favourably situated among the coal-fields of the Ruhr, 14 m. E. of Essen and 15 m. N.E. of Elberfeld by rail. Pop. (1905) 35,841. It is an important seat of the steel industry. Other industries are the making of soap, chemicals and beer. Witten was made a town in 1825. See Hassel, *Wittener Ortskunde und Ortsgesetz* (Witten, 1903).

**WITTENBERG**, a town of Germany, in the Prussian province of Saxony, situated on the Elbe, 59 m. by rail S.W. of Berlin, on the main line to Halle and at the junction of railways to Falkenberg, Torgau and Rosslau. Pop. (1905) 20,332. The three suburbs which adjoin the town are not older than 1617. Wittenberg is interesting chiefly on account of its close connexion with Luther and the dawn of the Reformation; and several of its buildings are associated with the events of that time. Part of the Augustinian monastery in which Luther dwelt, at first as a monk and in later life as owner with his wife and family, is still preserved, and has been fitted up as a Luther museum. It contains numerous relics of Luther and portraits and other paintings by the Cranachs. The Augusteum, built in 1556-1583 on the site of the monastery, is now a theological seminary. The Schlosskirche, to the doors of which Luther nailed his famous ninety-five theses in 1517, dates from 1439-1490; it was, however, seriously damaged by fire during the bombardment of 1529, and subsequently restored as late as 1845; it has been restored. The old wooden doors, burnt in 1760, were replaced in 1858 by bronze doors, bearing the Latin text of the theses. In the interior of the church are the tombs of Luther and Melanchthon, and of the electors Frederick the Wise, by Peter Vischer the elder (1527), and John the Constant, by Hans Vischer; also portraits of the reformers by Lucas Cranach the younger.

The parish church, in which Luther often preached, was built in the 14th century, but has been much altered since Luther's time. It contains a magnificent painting by Lucas Cranach the elder, representing the Lord's Supper, Baptism and Confession, also a font by Hermann Vischer (1457). The present infantry barracks were at one time occupied by the university of Wittenberg, founded in 1502, but merged in the university of Halle in 1813. Luther was appointed professor of philosophy here in 1508; and the new university rapidly acquired a considerable reputation from its connexion with the early Reformers. In opposition to the strict Lutheran orthodoxy of Jean it represented the more moderate doctrines of Melanchthon. In the Wittenberg Concord (1536) the reformers agreed to a settlement of the eucharistic controversy. Shakespeare made Wittenberg a visits, and Horatio study at Wittenberg. The ancient electoral palace is another of the buildings that suffered severely in 1760; it now contains archives. Melanchthon's house and the house of Lucas Cranach the elder (1472-1553), who was burgomaster of Wittenberg, are also pointed out. Statues of Luther (by Schadow), Melanchthon and Bugenhagen embellish the town. The spot, outside the Elster Gate, where Luther publicly burned the papal bull in 1520, is marked by an oak tree. Floriculture, iron-founding, distilling and brewing are carried on. The extensive metal manufacture of the heavier kinds of cloth has died out.

Wittenberg is mentioned as early as 1810. It was the capital of the little duchy of Saxe-Wittenberg, the rulers of which afterwards became electors of Saxony; and it continued to be a Saxon residence under the Ernestine electors. The Capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the Saxon family. In 1760 the town was bombarded and set on fire by the French under William of Orange, and refortified in 1813 by command of Napoleon; but in 1814 it was stormed by the Prussians under Tauentzien, who received the title of "von Wittenberg" as a reward. Wittenberg continued to be a fortress of the third class until the reorganization of the German defences after the foundation of the new empire led to its being dismantled in 1873.

See Meyert, *Geschichte der Stadt Wittenberg* (Dessau, 1855); Sitz., *Die Schlosskirche zu Wittenberg* (Wittenberg, 1860); Zittlow, *Die Begräbnisstätten Wittenbergs und ihre Denkmäler* (Wittenberg, 1897); and Gurlitt, "Die Lutherstadt Wittenberg," in *Muther's* *Die Kunst* (Berlin, 1902).

**WITTENBERG**, a town of Germany, in the Prussian province of Brandenburg, on the Elbe, near the influx of the Stepnitz into that river, 77 m. N.W. from Berlin by the main line of railway to Hamburgh, and at the junction of railways to Stendal, Lüneburg and Perleberg. Pop. (1902) 18,501. The magnificent bridge here spanning the Elbe, one mile in length, was built in 1851 at a cost of £237,500. The chief industries are the manufacture of railway plant, cloth, wool, soap, shoddy, furniture, bricks and cement.

**WITTGENSTEIN, LUDWIG ADOLF PETER, COUNT,** prince of Sayn-Wittgenstein-Ludwigsburg (1769-1843), Russian soldier, was the son of the former, a member of the Brandenburg-Prussian branch of the Wittgenstein family. His father had settled in Russia, and he entered the army, distinguishing himself in the Polish War of 1794-95, and then serving in the Caucasus. In 1805 he fought at Austeritz, in 1806 against the Turks and in 1807 against Napoleon at Friedland and against the Swedes in Finland. In the war of 1812 he commanded the right wing army of the Russians. In the campaign of 1813 in January he took over the command of the Russian army after Kutuzov's death. But after the defeat of the Spring campaign he laid down his command and led a Russian division during the Dresden and Leipzig campaigns, and at Bar-sur-Aube in the 1814 campaign he was severely wounded. In 1823 he was promoted field-marshall, and in 1828 he was appointed to command the Russian army in the war against Turkey. But ill health soon obliged him to retire. In 1834 the king of Prussia gave him the title of prince. He died on the 11th of June 1843.
WITTINGAU—WLDALUS

WITTINGAU (Czech, Treboh), a town of Bohemia, 95 m. S. of Prague by rail. Pop. (1900) 547, mostly Czech. The parish church is a Gothic edifice, the大部分 為 繡 紙 密 鐘 有 錫 條，and the Libeších gate, once belonging to the family of Rosenberg, and now to Prince Schwarzenberg, dating from the 15th century, is reputed to contain the most extensive and valuable archives in Bohemia. The artificial cultivation of fish, now chiefly carp, in the numerous ponds that surround the town dates from the 14th century.

WITU, or WITU, a sultanate of East Africa included in the Takandian province of the British East Africa protectorate. It extends along the coast from the town of Kipini at the mouth of the Dzo river (8° 30' S. lat.) to the coast of Zanzibar (8° S. lat.). The chief town, Witu, is 16 m. N. of Kipini. The state was founded by Ahmed-bin-Fumo Luti, the last Nahabh sultan of Patta (an island off the coast), who was conquered by Scyryd Majid of Zanzibar. Ahmed, about 1860, took refuge in the forest district, and made himself an independent chief, acquiring the title of Simba or the Lion. In 1885 Ahmed was induced to place his country under German protection, and in 1887 the limits of Witu were fixed by international agreement. In 1890 Germany transferred her protectorate to Great Britain. In the 19th century this year was made a naval port, and a town was built there. In 1891 Sir E. Frewen was sent against the sultan Bakari, who had succeeded Ahmed in 1887 and by whose orders nine German traders and settlers had been murdered. Disorders continued until 1894, and in the following year Omar-bin-Hamed of the Nahhad dynasty—an ancient race of Asiatic origin—was recognized as sultan. The sultan is guided by a British resident, and the state since the accession of Sultan Omar has been both peaceful and prosperous. The population of the sultanate is over 15,000; of the town of Witu 6000, chiefly Swahilis. The port of Witu is Mombouri (pop. 3500), being Wilscomb, a market town in the western parliamentary division of Somerserthshire, England, 95 m. W. of Taunton by the Great Western railway. Pop. (1901), 2246. It stands on a picturesque sloping site in a hilly district, and has some agricultural trade and a brewing industry, while in the neighbourhood are slate quarries.

Traces of a large Roman camp may still be seen to the south-east of Wiveliscombe (Wellescombe, Wilscombe, Wivoscombe), which is near the line of a Roman road, and hoards of Roman coins have been discovered in the neighbourhood. The town probably dates from its origin to the 14th century and was a market town at the time of the Danish siege of 1217. It was the site of a Danish fort, later replaced by a saxon settlement. The overlords were the bishops of Bath and Wells, who had a palace and park here. They obtained a grant of freewarren in 1257. No charter granting self-government to Wiveliscombe has been found, and the only evidence for the traditional existence of a borough is that part of the town is called the "brough," and that until the middle of the 19th century a bollif and a portreeve were annually chosen by the court leet. A weekly market on Tuesdays, granted to the bishop of Bath and Wells in 1284, is still held. During the 17th and 18th centuries the town was a centre of the woollen manufacture.

WLDALUS (Wladislaus), the name of four kings of Poland and two Polish kings of Hungary.1

WLDALUS I. (1260–1333), king of Poland, called Lokietek, or "Span-long," from his diminutive stature, was the re-creator of the Polish realm, which in consequence of internal quarrels had been split up into fourteen independent principalities, and became an easy prey to her neighbours, Bohemia, Lithuania, and, most dangerous of all, the Teutonic Order. In 1296 the gentry of Great Poland elected Wladislaus, then prince of Cujavia, to reign over them; but distrusting the capacity of the taciturn little man, they changed their minds and placed themselves under the protection of the powerful Wenceslaus, king of Bohemia, who was crowned at Graslin in 1300. Wladislaus thereupon went to Rome, where Pope Boniface VIII., jealous of the growing influence of Bohemia, adopted his cause; and on the death of Wenceslaus in 1305 Wladislaus succeeded in uniting beneath his sway the principalities of Little and Great Poland. From the first he was beset with great difficulties. The towns, mostly of German origin, and the prelates headed by Muskata, bishop of Cracow, were against him because he endeavoured to make use of their riches for the defence of the sorely pressed state. The rebellious mob, however, crowning him himself, and having thus become king, he had to invoke the aid of the Teutonic Order to save Danzig from the maraudings of Brandenburg, thus saddling Poland with a far more dangerous enemy; for the Order not only proceeded to treat Danzig as a conquered city, but claimed possession of the whole of Pomerania. Wladislaus thereupon (1317) appealed to Pope John XXII., and a tribunal of local prelates appointed by the holy see ultimately (Feb. 9, 1321) pronounced judgment in favour of Wladislaus, and condemned the Order not only to restore Pomerania but also to pay heavy damages. But the king was again in danger in 1324, when he was defeated by Simba of Kipini (1324), who availed himself of the open rebellion of the Kujaws, of which he was the leader, to take the town of Wolow and to attack the Polish army, which was retreating from it with difficulty. From the very beginning of his reign Wladislaus was involved in disputes with the Teutonic Order, and with his uncle, the valiant Kiejstut, who ruled Samogitia independently. By the treaty of Dawidyszew (June 1, 1380) he contracted an alliance with the knights, and two years later, acting on the advice of his evil counsellor, Wojdylo, enticed Kiejstut and his consort to Krewo and there treacherously murdered them (Aug. 15, 1382). This foul deed naturally drove Witowt (w.o.), the son of Kiejstut, into the arms of the Order; but both princes speedily recognized that the knights were the real enemies of Lithuania, and prudently composing their differences they endeavoured to regain their lost territory. This was the beginning of the fifty years' struggle with the Teutonic Order which was to make the reign of Jagiello so memorable. He looked about him betimes for allies against the common enemy of the Slavonic races, and fortune singularly favoured him. The Poles had brought their young queen Jadwiga home from Hungary, and in 1354 Jagiello sent a magnificent embassy to Cracow offering her his hand on condition that they shared the Polish crown. Jadwiga had long been betrothed to William of Austria; but she sacrificed her preconditions for her country's good. On the 15th of February 1386 Jagiello, who had previously been elected king of Poland under the title of Wladislaus II., accepted the Roman faith in the cathedral of Cracow, and on the 18th his espousals with Queen Jadwiga were solemnized.

Jagiello's first political act after his coronation was the conversion of Lithuania to the true religion. This solemn act was accomplished at Vilna, the Lithuanian capital, on the 17th of February 1387, when a stately concourse of nobles and prelates,
headed by the king, proceeded to the grove of secular oaks beneath which stood the statue of Perkunas and other idols, and in the presence of an immense multitude hewed down the oaks, destroyed the idols, extinguished the sacred fire and elevated the cross on the desecrated heathen altars, 30,000 Lithuanians receiving Christian baptism. A Catholic hierarchy was immediately set up. A Polish Franciscan, Andrew Wassilo, was consecrated as the first Catholic bishop of Vilna, and Lithuania was divided ecclesiastically into seven dioceses. Mainly on the initiative of Queen Jadwiga, Red Russia with its capital the great trading city of Lemberg was persuaded to acknowledge the dominion of Poland; and there on the 27th of September 1387 the hospodars of Walachia and Moldavia for the first time voluntarily enrolled themselves among the vassals of Poland.

With savage Lithuania converted and in close alliance with Catholic Poland, the Teutonic Order was seriously threatened. The knights endeavoured to re-establish their position by sowing dissensions between Poland and Lithuania. In this for a time they succeeded (see Wrotts); but in 1401 Jagiello recognized Witowt as independent grand-duke of Lithuania (union of Vilna, Jagiello's 1381-1401), and their union was cemented in the battle of Grunewald, which shook the whole fabric of the Teutonic Order to its very foundations. Henceforth a remarkable change in the whole policy of the Order was apparent. The struggle was no longer for dominion but for existence. Fortune for them, in Jagiello they possessed an equally cautious and pacific opponent. Wladislaus II., in sharp contrast to Witowt, was of anything but a martial temperament. He never swerved from his main object, to unite Poland and Lithuania against the dangerous denationalizing German influences which environed him. But he would take no risks and always preferred craft to violence. Hence his leaning upon the holy see in all his disputes with his neighbours. Hence, too, his moderation at the peace of Thorn (1st of February 1411), when the knights skilfully extricated themselves from their difficulties by renouncing their pretensions to Samogitia, restoring Dobrzyn and paying a war indemnity; Jagiello was content to discredit them rather than provoke them to a war à outrance. Equally skilful was Jagiello's long diplomatic duel with the emperor Sigismund, then the disturbing element of Central Europe, who aimed at the remodelling of the whole continent and was responsible for the first projected partition of Poland.

Jagiello was married four times. At the dying request of the childless Jadwiga he espoused a Syrian lady, Maria Cilel, who bore him a daughter, also called Jadwiga. His third wife, Elizabeth Grabowska, died without issue, and the question of the succession then became so serious that Jagiello's advisers counselled him to betroth his daughter to Frederick of Hohenzollern, who was to be educated in Poland as the heir to the throne. But in 1422 Jagiello himself solved the difficulty by wedding Sonia, princess of Vyazma, a Russian lady rechristened Sophia, who bore him two sons, Wladislaus and Casimir, both of whom ultimately succeeded him. Jagiello died at Grodko near Lemberg in 1434. During his reign of half a century Poland had risen to the rank of a great power, a position she was to retain for nearly two hundred years under the dynasty which Jagiello had founded.

Sokolowski, *History of Poland, jubilee edition* (Cracow, 1866); and *Sokolowski's History of Poland*, vol. ii. (Pol.) (Vienna, 1866); Ignacz A. A. Sokolowski, *History of the Hungarian Realm*, vol. i. (Hun.) (Budapest, 1905).

**Wladislaus III.** (1424–1444). King of Poland and Hungary, the eldest son of Wladislaus II. Jagiello, by his fourth wife, Sophia of Vyazma, was born at Cracow on the 3rd of October 1424, succeeding to the throne in his tenth year. The domestic troubles which occurred during his minority had an important influence on the development of the Polish constitution; but under the wise administration of Zbigniew Olesnicki Poland suffered far less from her rebels than might have been anticipated, and Wladislaus gave the first proof of his manhood by defeating the arch-traitor Spytek of Melzyn in his camp at Grotnik on the 4th of May 1439. On the sudden death of the emperor Albert, who was also king of Bohemia and Hungary, the Hungarians elected Wladislaus as their king, despite the opposition of the widowed empress Elizabeth, already big with the child who subsequently ascended the Hungarian throne as Wladislaus V. But Wladislaus III., who was solemnly crowned king of Hungary at Buda by the Magyar primates in July 1440, had to fight against the partisans of the empress for three years till Pope Eugenius IV. mediated between them so as to enable Wladislaus to lead a crusade against the Turks. War was proclaimed against Sultan Murad II. at the diet of Buda on Palm Sunday 1443, and with an army of 40,000 men, mostly Magyars, the young monarch set forth with Hungary and Poland united. On 21 May he crossed the Danube, took Nish and Sofsa, and advancing to the slope of the Balkans, returned to Hungary covered with glory. Europe resounded with the praises of the youthful hero, and the Venetians, the Genoese, the duke of Burgundy and the pope encouraged Wladislaus to continue the war by offering him every assistance. But at this juncture the sultan offered terms to Wladislaus through George Brankovic, despot of Servia, and, by the peace of Szeged (July 1, 1444), Murad engaged to surrender Servia, Albania and whatever territory the Ottomans had ever conquered to the king of Hungary by an indemnity of 100,000 florins in gold. Unfortunately, Wladislaus listened to the representations of the papal legate, Cardinal Julian Cesarini, who urged him in the name of religion to break the peace of Szeged and resume the war. Despite the representations of the Poles and of the majority of the Magyars, the king, only two days after solemnly swearing to observe the terms of the treaty, crossed the Danube a second time to cooperate with a fleet from the West which was to join hands with the land army at Gallipoli, whither also the Greeks and the Balkan Slavs were to direct their auxiliaries. But the Walachians were the sole allies of Hungary who kept faith with him, and on the bloody field of Varna, November the 10th, 1444, Wladislaus lost his life—and more than a fourth of his army.

See Julian Bartoszewicz, *View of the Relations of Poland with the Turks and Tatars* (Pol.) (Warsaw, 1866); August Sokołowski, *History of Poland*, vol. ii. (Pol.) (Vienna, 1866); Ignacz A. A. Sokolowski, *History of the Hungarian Realm*, vol. i. (Hun.) (Budapest, 1905).

**Wladislaus IV.** (1495–1548), king of Poland, son of Sigismund III., king of Poland, and Anne of Austria, succeeded his father on the throne in 1632. From his early youth he gave promise of great military talent, and served his apprenticeship in the science of war under Zolkiewski in the Muscovite campaigns of 1610–1612, and under Chodkiewicz in 1617–1618. Wladislaus's first official act was to make war against the Magyars, who had declared war against Poland immediately after the death of Sigismund, and were besieging Smolensk, the key of Poland's eastern frontier. After a series of bloody engagements (Aug. 7–22, 1632) Wladislaus compelled the tsar's general to abandon the siege, and eventually to surrender (March 1, 1634) with his whole army. Meanwhile the Turks were threatening in the south, and Wladislaus found it expedient to secure his Muscovite conquests. Peace was concluded at the river Polyankova on the 28th of May 1634, the Poles conceding the title of tsar to Michael Romanov, who renounced all his claims upon Livonia, Estonia and Courland, besides paying a war indemnity of 200,000 rubles. These tidings profoundly impressed Sultan Murad, and when the victorious Wladislaus appeared at Lemberg, the usual starting-point for Turkish expeditions, the Porte offered terms which were accepted in October, each power engaging to keep their borderers, the Cossacks and Tatars, in order, and divide between them the suzerainty of Moldavia and Walachia, the sultan binding himself always to place philo-Polish hospodars on those slippery thrones. In the following year the longer war began against the Swedes, who were much to the advantage of Poland, by the truce of Sturondheim, which was to last for twenty-six years from the 12th September 1635. Thus externally Poland was everywhere triumphant. Internally, however, things were in their usually deplorable state owing to the suspicion, jealousy and parsimony of the estates of the realm. They had double reason to be grateful to Wladislaus for defending the enemies of the republic, for he had also paid for the expenses of his campaigns out of his own pocket.
yet he could not obtain payment of the debt due to him from the state till 1643. He was bound by the *pacta conventa* which he signed on his accession to maintain a fleet on the Baltic. He proposed to do so by levying tolls on all imports and exports passing through the Prussian ports which had been regained by the truce of Stumdorf. Sweden during her temporary occupation of these ports had derived from them an annual income of 3,600,000 gulden. But when Wladislaus, their lawful possessor, imposed similar tolls in the interests of the republic, Danzig protested and appealed to the Scandinavian powers. Wladislaus's little fleet attempted to blockade the port of the rebellious city, whereupon a Danish admiral broke the blockade and practically destroyed it. Wladislaus's truce, which was to send a new state, failed, and the king himself entered into a treaty with the Barons. He was unable to impose his own privileges, allowed the insult to the king and the injury to the state to pass unnoticed, conviving at the destruction of the national navy and the depletion of the treasury, "lest warships should make the crown too powerful." For some years after this humiliation, Wladislaus became indifferent to affairs and sank into a sort of apathy; but the birth of his son Sigismund (by his first wife, Cecilia Renata of Austria, in 1640) gave him fresh hopes, and he began with renewed energy to labour for the dynasty as well as for the nation. He saw that Poland, with her existing constitution, could not hope for a long future, and that the best way of ensuring a lasting peace was to reform along with it by every means in his power. He began by founding the Order of the Immaculate Conception, consisting of 72 young noblemen who swore a special oath of allegiance to the crown, and were to form the nucleus of a patriotic movement antagonistic to the constant usurpations of the diet, but the *sejm* promptly intervened and quashed the attempt. Then he conceived the idea of using the Cossacks, who were deeply attached to him, as a means of chastising the *szlachta*, and at the same time forcing a war with Turkey, which would make his military genius indispensable to the republic, and enable him if successful to carry out domestic reforms by force of arms. His chief confidant in this still mysterious affair was the veteran grand hetman of the crown, Stanislaw Koniecpolski, who understood the Cossacks better than any man then living, but differed from the king in preferring the conquest of the Crimea to an open war with Turkey. Simultaneously Wladislaus contracted an offensive and defensive alliance with Venice against the Porte, a treaty directly contrary indeed to the *pacta conventa* he had sworn to observe, but excusable in the desperate circumstances. The Cossacks were for the most part preserved by the crown preserved by the crown, but after 1638 Koniecpolski published his intentions, and partly to the careful avoidance by the Porte of the slightest occasion of a rupture. Frustrated in all his plans, broken-hearted by the death of his son (by his second wife, Marie Ludwika of Angoulême, Wladislaus had no issue), the king, worn out and disillusioned, died at Merecz on the 20th of May 1648, in his 52nd year. After his cousin Gustavus Adolphus, whom in many respects he strikingly resembled, he was indubitably the most amiable and brilliant of all the princes of the House of Vasa.

See Wiktor Czermak, *The Plans for the Turkish War of Wladislaus IV* (Warsaw, 1930); W. V. Volk-Karachevsky, *The Struggle of Poland with the Cossacks* (Russ.) (Kiev, 1899); *Letters and Other Writings of Wladislaus IV* (Pol.) (Cracow, 1845).

**WOAD,** a herbaceous plant, known botanically as *Isatis tinctoria* (natural order Cruciferae), which occurs sporadically in England in fields, on banks and chalk-pits. The erect branched stem, 1 to 3 ft. in height, bears sessile leaves and terminal clusters of small yellow flowers; the brown pendulous pods are ½ in. long. The ancient Britons stained themselves with this plant. It is still cultivated in Lincolnshire.

**WOBURN,** a market town in the northern parliamentary division of Bedfordshire, England, with a station (Woburn Sands), on a branch of the London & North-Western Railway, 2 m. from the town and 51 m. N.W. by N. from London. Pop. (1901) 1129. It lies in a hollow of a northern spur of the Chiltern Hills, in a finely wooded locality. There is some agricultural trade, and a little straw-plaiting and lace-making are carried on. To the west of the town lies Woburn Park, the demesne of Woburn Abbey, the seat of the dukes of Bedford. The abbey was a Cistercian foundation (1145), but only scanty remains of the buildings are seen in the mansion which rose on its site. This, with most of the abbey lands, was granted by Henry VII. to John, Lord Russell, in 1547, who was created earl of Bedford in 1550 (the dukedom dating from 1694). The mansion was begun in 1744; it contains a magnificent collection of paintings and other objects of art.

**WOBURN,** a city of Middlesex county, Massachusetts, U.S.A., 10 m. W. by N.W. of Boston. Pop. (1890) 3,490; (1900) 14,244, of whom 3,840 were foreign-born and 261 were negroes; (1910) 19,762, of whom 6,508 were foreign-born; served by the southern division of the Boston & Maine railway, and is connected with Burlington, Lexington, Reading, Stoneham, Wilmington, Winchester, Arlington, Boston and Lowell by electric railways. In the city area are several villages, including Woburn proper, known as "the Centre," North Woburn, Woburn Highlands, Cummingsville (in the western part), Mishawum (in the north-east), Montvale (in the east) and Walnut Hill (also in the east). There are two ancient burying-grounds; the oldest, on Park Street, dates from about 1642 and contains the graves of ancestors of prominent Cleveland, Benjamin Franklin Pierce and Garfield—and a granite obelisk to the memory of Loammi Baldwin (1744-1807). On Academy Hill is the Warren Academy building used by a Free School. Forest Park (53 acres) is a fine stretch of natural woods, and there are several small parks and squares; on Woburn Common is the Public Library, by Dr. H. Richardson, the gift of Charles Winn. The museum houses an art gallery and historical museum, and a library of about 50,000 volumes especially rich in Americana. Among colonial houses still standing are the birthplace of Count Rumford (in North Woburn), of Dr. S. W. Drake of Lynn, and the Barons. The Baldwin mansion (built partly in 1660 and later enlarged), the home of Loammi Baldwin (1780-1838), known as "the father of civil engineering in America." Woburn's manufactures are concentrated within a small area. The city is the most important leather manufacturing centre of New England: in 1905 the value of the leather product was $2,851,554, being 61.3% of the value of all factory products ($4,654,867); other manufactures are chemicals, leather-working machinery, boots and shoes, glue and cardboard; market gardening is an important industry. Woburn, first settled about 1638-1640, was incorporated as a township under its present name in 1642, and was the first township set off from Charlestown. It then included a large part of the present Winchester and the greater part of the present Wilmington and Burlington, separately organized in 1730 and 1799 respectively. It was named after Woburn in Bedfordshire by its chief founder, Edward Johnson (1599-1672), whose work, *The Wonder-Working Providence of Zion's Saviour* (1654; latest ed. 1910), was one of the earliest historical accounts of the Massachusetts Bay Colony. The leather industry was aided by David Cummings at Cummingsville shortly before the War of Independence. Woburn's industrial growth dates from the construction through the township of the old Middlesex Canal. The city was chartered in 1888.

**WOCHA (Acroa),** a pygmy people of Africa, living in the forests of the Masobe district, south of the Welle. They were described (1880-1881) by Dr. W. Junker, who described them as "well proportioned, though the oval-shaped head seemed somewhat too large for the size of the body." Some are of light complexion, like the Akka and Batwa, but as a general rule they belong to the darker, crisper-haired, more genuine negro stock.

**WODEN,** a deity of the Anglo-Saxons, the name being the Anglo-Saxon counterpart of the Scandinavian Odin (q.v.). In German the same god was called Woden or Wotan. Owing
to the very small amount of information which has come down to us regarding the gods of ancient England and Germany, it cannot be determined how far the character and adventures attributed to Odin in Scandinavian mythology were known to other Teutonic peoples. It is clear, however, that the god was credited with special skill in magic, both in England and Germany, while the story of the Langobardic migration (see Lombards) represents him as the dispenser of victory. From Woden also most of the anglo-Saxon royal families traced their descent. By the Romans he was identified at an early date with Mercurius, whence our name "Wednesday" (Woden's day) as a translation of dies Mercurii. Tacitus states that the ancient Germans worshipped Mercurius more than any other god, and that they offered him human sacrifices. Many scholars connect the origin of the deity with the popular German and Swedish belief in a raging host (in Germany called das wütende Heer or Wates Heer, but in Sweden Odens Jagt), which passes through the forests on stormy nights. There is evidence, however, that deities similar to Woden were known to some of the ancient peoples of central Europe, e.g. the Gauls and Thracians. See TEUTONIC PEOPLES, ad fin. (H. M. C.)

WOROW, ROBERT (1679-1734), Scottish historian, was born at Glasgow, being a son of James Wodrow, professor of divinity, and educated at the university and casualty schools from 1697 to 1701. From 1703 till his death, on the 21st of March 1734, he was parish minister at Eastwood, near Glasgow. He had sixteen children, his son Patrick being the "auld Wodrow" of Burns's poem "Two Herds." His great work, The History of the sufferings of the Church of Scotland from the Restoration to the Revolution, was published in two volumes in 1721-1722 (new ed. with a life of Wodrow by Robert Burns, D.D., 1807-1808). Wodrow also wrote a Life (1828) of his father. He left two other works in MS., Memoirs of Reformers and Ministers of the Church of Scotland, and Anecdotes or Materials for a History of Remarkable Providences, mostly relating to Scotch Ministers and Christians. Of the former, two volumes were published by the Maitland Club in 1834-1845 and one volume by the New Spalding Club in 1890; the latter was published in four volumes by the Maitland Club in 1842-1843.

Wodrow left a great mass of correspondence, three volumes of which, edited by T. McCrie, appeared in 1843-1844. The Wodrow Society, founded in Edinburgh to perpetuate his memory, was in existence from 1841 to 1847, several works being published under its auspices.

WOELFL, JOSEPH (1772-1812), Austrian pianist and composer, was born in 1772 at Salzburg, where he studied music under Leopold Mozart and Michael Haydn. After a short residence at Warsaw he produced his first opera, Der Hölleberg, with some success at Vienna, where it was soon followed by Das schöne Milchmädchen and some other dramatic pieces. His fame now rests upon his compositions for the pianoforte, and the skill with which he is said to have met their formidable demands upon his power as an executant. The perfection of his technique was immeasurably enhanced by the enormous stretch of his fingers (his hand could strike a thirteenth with ease); and to his wide grasp of the keyboard he owed a facility of execution which he turned to excellent account, especially in his extempore performances. His technique was superior even to that of the young Beethoven, who played in company with him at the house of Count Wetzlar, and in memory of this exhibition of good-humoured rivalry he dedicated to Beethoven his "Three Sonatas," Op. 6. Quitting Vienna in 1798, he exhibited his skill in most of the great European capitals, and, after spending some years in Paris, made his first appearance in London on the 27th of May 1805. Here he enjoyed a long term of popularity, crowned about 1808 by the publication of his sonata, Op. 41, containing some variations on "Life let us cherish." This, on account of its technical difficulty, he entitled Non Plus Ultra; and, in reply to the challenge, Dussek's London publishers reprinted a sonata by that composer, originally called Le Retour à Paris, with the title Plus Ultra, and an ironical dedication to Non Plus Ultra. Woelfl died in Great Marylebone Street, London, on the 21st of May 1812.

WOFFINGTON, MARGARET [PEG] (c. 1714-1760), English actress, was born at Dublin, of poor parents. As a child of ten she played Polly Peacum in a ill-put and presentation of The Beggar's Opera, and at various Dublin theatres until 1740, when her success as Sir Harry Wildair in The Constant Couple secured her a London engagement. In this, and as Sylvia in The Recruiting Officer, she had a pronounced success; and at Drury Lane and Covent Garden, as well as in Dublin, she appeared in all the plays of the day to ever growing popularity. Among her best impersonations were the elegant women of fashion, like Lady Betty Modish and Lady Towney, and in "brechee parts" she was unapproachable. She lived openly with Garrick, and her other love affairs were numerous and exciting. The story of her alleged beauty and kindness of heart were equally well known. She educated her sister Mary, and, after she had pensioned her mother. She built and endowed by will some almshouses at Teddington, where she lived quietly after her retirement in 1757. See Austin Dobson's introduction to Charles Reade's novel Peg Woffington (London, 1899), and Augustin Daly's Woffington: a Tribute to the Actress and the Woman (1888).

WOHLER, FRIEDRICH (1800-1882), German chemist, was born at Eschersheim, near Frankfurt-on-the-Main, on the 31st of July 1800. In 1814 he began to attend the gymnasium at Frankfort, where he carried out experiments with his friend Dr. J. C. Buch. In 1820 he entered Marburg University, and next year removed to Helderberg, where he worked in Leopold Gmelin's laboratory. Intending to practise as a physician, he took his degree in medicine and surgery (1823), but was persuaded by Gmelin to devote himself to chemistry. He studied in Berezia's laboratory at Stockholm, and there began a lifelong friendship with the Swedish chemist. On his return he had proposed to settle as a Privatdozent at Heidelberg, but accepted the post of teacher of chemistry in the newly established technical school (Gewerbeschule) in Berlin (1825), where he remained till 1831. Private affairs then called him to Cassel, where he soon became professor at the higher technical school. In 1836 he was appointed to the chair of chemistry in the medical faculty at Göttingen, holding also the office of inspector-general of pharmacies in the kingdom of Hanover. This professorship he held until his death on the 23rd of September 1882.

Wöhler had made the acquaintance of Liebig, his junior by three years, in 1825, and the two men remained close friends and allies for the rest of their lives. Together they carried out a number of joint researches. One of the earliest, the isolation of allantoin, published in 1830, which proved the polymorphism of cyanic and cyanic acid, but the most famous were those on the synthesis of urea (he used ammonia and carbonic acid, and on uric acid (1837), which are of fundamental importance in the history of organic chemistry. But it was the achievement of Wöhler alone, in 1828, to break down the barrier held to exist between organic and inorganic chemistry by artificially preparing urea, one of those substances which up to that time it had been thought could only be produced through the agency of "vital force." Most of his work, however, lay in the domain of inorganic chemistry. The isolation of the elementary bodies and the investigation of their properties was one of his favourite pursuits. In 1827 he obtained metallic aluminium as a fine powder, and in 1845 improved methods enabled him to get the metal in large globules. Nine years afterwards H. E. Sainte-Claire Deville, ignorant of what he had done, adopted the same methods in his efforts to prepare the metal on an industrial scale; the result of Wöhler's claim of priority was that the two became good friends and joined in a research, published in 1856-1857, which yielded "adamantine boron." By the same method as had succeeded with aluminium (reduction of the chloride with metallic sodium) Wöhler in 1828 obtained metallic beryllium and yttrium. Later, in 1849, titanium engaged his attention, and, proving that what had up to that time passed as the metal was not pure titanium, he showed how the true metal was to be obtained. He also worked out the methods of preparation of borax, an inquiry into the compounds of silicon in which they prepared the previously unknown gas, silicon hydride or silicuric acid. A problem that Wöhler had attempted was that of separating nickel and cobalt from their ores and freeing them from arsenic; and in the course of his long laboratory practice he worked out numerous processes for the preparation of pure chemicals and methods of exact analysis.

The Royal Society's Catalogue enumerates 276 separate memoirs written by him, apart from 43 in which he collaborated with others.
WOHLGEMUTH—WOLCOT

WOHINGHAM, a market town and municipal borough in the Wokingham parliamentary division of Berkshire, England, 36 m. N. by S. of London by the South-Western railway, served also by the South-Eastern and Chatham railway. Pop. (1901) 3557. It lies on a slight eminence above a valley tributary to that of the river Loddon, in a well-wooded district on the outskirts of the former royal forest of Windsor. The church of St Laurence is Perpendicular, greatly altered by restoration. Two miles west of the town is the village of Bearwood. The trade of Wokingham is principally agricultural. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 557 acres.

Wokingham (Wokingham, Ockingham, Ockingham), which was within a mile of Limits of Wokingham, was in Berkshire and partly in a detached piece of Wiltshire, which is now annexed to Berkshire; the Berkshire portion of the town was in the manor of Sonning, which was held by the bishops of Salisbury from before the Conquest until the reign of Elizabeth. The earliest existing charter to Wokingham is that of Elizabeth (1583), which rectifies and confirms some ancient customary privileges respecting the election of an alderman and other corporate officers. The governing charter for more than 250 years was that of James I. (1612), incorporating it as a free town under the title of the "Alderman and Burgess of the Town of Wokingham in the Counties of Berkshire and Surrey." Under the provisions of the Municipal Corporations Act of 1882 a new charter of incorporation was granted, instituting a municipal body to consist of a mayor, 4 aldermen and 12 councillors. Wokingham was assessed at £50 for ship-money, but the assessment being assessed and for a large part of the manufacture of silk stockings, which flourished as early as 1625, and survived up to the 19th century. The town shared in the benefactions of Lord Thistle, which was box in the Thames market, which is still held and which, during the first half of the 19th century, the revenue from which for poultry, was granted to the bishop of Salisbury by Henry III. (1219), who also granted (1258) two annual fairs to be held on the 1st Sunday after Whitsuntide and the 3rd Sunday in September, the latter is still kept up, and the former appears in the list of fairs held in 1792.

WOLCOT, JOHN (1735–1810), English satirist and poet, known under the pseudonym of PETER PINDER, was the son of Alexander Wolcot, surgeon at Dodbrooke, adjoining Kingsbridge, in Devonshire, and was baptized there on the 9th of May 1738. He was educated at Kingsbridge free school, at the Bodmin and Exeter grammar schools, and at Oxford. For seven years he was apprenticed to his uncle, John Wolcot, a surgeon at Fowey, and he took his degree of M.D. at Aberdeen in 1767. In 1760 he was ordained, and went to Jamaica with his uncle's patient, Sir William Trelawny, the new governor. In 1772 he became incumbent of Vere, Jamaica, but on the death of his patron (11th of December 1772) he returned to England, and settled as a physician at Truro. In 1781 Wolcot went to London, and took with him the young Cornish artist, John Opie, whose talents in painting he had been the first to recognize. Before the death of the Norwich painter, he had frequently made a rash engagement to share his profits with Wolcot, but a breach from painting occurred soon after they settled in London. Wolcot had already achieved some success in a Supplicating Epistle to the Reviewers (1778), and after his settlement in London he threw off with marvellous rapidity a succession of pungent satires. George III. was his favourite subject of ridicule, and his peculiarities were described or distorted in The Lousiad (1785), Peeps at St James's (1787) and The Royal Visit to Exeter. Two of Wolcot's happiest satires on the "farmer king " depicted the royal survey of Whitbread's brewery, and the king's naive wonder how the farmers lived at the high prices. In England's Beauties (1789) he eulogized the prince of Wales. Boswell's biography of Johnson was ridiculed in An Epistle to James Boswell (1786), and in the same year followed another piece, called Bemz and Pioszi. Other satires were found in Sir Joseph Banks and the Emperor of Morocco (1790), and a Complimentary Epistle to James Bruce (1790). Among his early satires were Lyric Odes to the Academicians (1782), and another series on the same subject. Farewell Odes (1786). He specially attacked Benjamin West, but expressed great admiration for the landscapes of Gains- tories, and Richard Wilson, and accused himself of being of a mean artist, and in 1797 appeared Six Picturesque Views in Painting by Peter Pinder, engraved by Aiken. In 1795 he disposed of his works to the booksellers for an annuity of £250. His

XXVIII. 25
various pieces were published in 1796 in four octavo volumes and often reprinted. Wolcott cared little whether he hit above or below the belt, and the gross vituperation he indulged in generally for political purposes, was not produced by a broad sense of humour, a keen eye for the ridiculous, and great felicity of imagery and expression. Some of his serious pieces—his rendering of Thomas Warton's epigram on Sleep and his Lord Gregory, for example—reveal an unexpected fund of genuine tenderness.

In William Gifford, who attacked him in the Epistle to P. Pindar, he for once met with more than his match. Wolcott made a personal assault on his enemy in Wright's shop in Piccadilly, but Gifford was too quick for him, and Wolcott was soundly thrashed. He died at Latham Place, Somers Town, London, on the 14th of January 1819, and seven days later was buried, as he had desired, near Samuel Butler, the author of Hudibras, in St. Paul's, Covent Garden.

Polwhele, the Cornish historian, was well acquainted with Wolcott in his early life, and the best account of his residence in the west is found in vol. i. of Polwhele's Traditions and in Polwhele's Biographical Sketches, vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcott's last days in his Past Characters, vol. i., and his Fifty Years' Recollections, vol. i.

WOLCOTT, ROGER (1679-1767), American administrator, was born in Windsor, Connecticut, on the 4th of January 1679, the son of Simon Wolcott (d. 1687). He was a grandson of Henry Wolcott (1575-1655) of Galdon Manor, Tolland, Somerset, who emigrated to New England in 1628, assisted John Mason and others to found Windsor, Conn., in 1635, and was a member of the first General Assembly of Connecticut in 1637 and of the House of Magistrates from 1643 to his death. 1 Roger Wolcott was early apprenticed to a weaver and throve at this trade; he was a member of the Connecticut General Assembly in 1709, one of the Bench of Justices in 1710, commissary of the Connecticut forces in the expedition of 1711 against Canada, a member of the Council in 1714, judge of the county court in 1721 and of the superior court in 1732, and deputy-governor and chief-justice of the superior court in 1741. He was second in command to Sir William Pepperrell, with rank of major-general in the expedition (1745) against Louisbourg, and was governor of Connecticut in 1751-1754. He died in what is now East Windsor, on the 17th of May 1757.

He wrote Poetical Meditations (1752), an epic on The Agency of the Honourable John Winthrop in the Court of King Charles the Second (printed in pp. 263-395 of vol. iv., series 1, Collections of Massachusetts Historical Society); and a pamphlet on the then "superior" Congregational churches are and always have been consociated churches. His Journal at the Siege of Louisbourg is printed in pp. 161-167 of vol. i. (1860) of the Collections of the Connecticut Historical Society.

His son, ERASTUS WOLCOTT (1722-1793) was a member of the Connecticut General Assembly and its speaker; he was a brigadier-general of Connecticut militia in the War of Independence, and afterwards a judge of the Superior Court of Connecticut.

Another son, OLIVER WOLCOTT (1726-1797), graduated at Yale in 1747 and studied medicine with his brother Alexander (1712-1793). In 1751 he was made sheriff of the newly established Litchfield county and settled in Litchfield, where he practised law. He was a member of the Council in 1774-1786 and of the Continental Congress in 1775-1776, 1778 and 1780-1784. Congress made him a commissioner of Indian affairs for the Northern Department in 1775, and during the early years of the War of Independence he was active in raising militia in Connecticut. He was one of the signers of the Declaration of Independence; commanded Connecticut militia that helped to defend New London, Conn., in August 1776; in 1777 organized more Connecticut volunteers and furnished troops in the last few days of the campaign against General John Burgoyne; and in 1779 commanded the militia during the British invasion of Connecticut. In 1784, as one of the commissioners of Indian affairs for the Northern Department, he negotiated the treaty of Fort Stanwix (22nd Oct.) settling the boundaries of the Six Nations.

1 Henry Wolcott the younger (d. 1680) was one of the patentees of Connecticut under the charter of 1662.

In 1786-1796 he was lieutenant-governor of Connecticut, and in November 1787 was a member of the Connecticut Convention which ratified the Federal Constitution; he became governor in 1796 and was re-elected in 1798. He served until his death on the 1st of December 1797.

See the sketch by his son Oliver in Sanderson's Biography of the Signers of the Declaration of Independence (Philadelphia, 1820-1827).

Oliver's son, OLIVER WOLCOTT, jun. (1760-1833), graduated at Yale in 1778, studied law in Litchfield under Judge Tapping Revington and was admitted to the bar in 1781. With Oliver Ellsworth he was appointed (May 1784) a commissioner to adjust the claims of Connecticut against the United States. In 1788 he was made comptroller of public accounts of Connecticut; in the next year was appointed auditor of the Federal Treasury; in June 1791 became comptroller of the Treasury, and in February 1795 succeeded Alexander Hamilton as Secretary of the Treasury. At the end of 1800 he resigned after a bitter attack by the Democratic-Republican press, against which he defended himself in an Address to the People of the United States. In 1801-1802 he was judge of the District Court of the Second District (Connecticut, Vermont and New York), and then entered business in New York City, where he was president of the short-lived Merchants' Bank (1803) and president (1812-1814) of the Bank of North America. With a brother he then founded factories at Wolcottville (near Litchfield). He re-entered politics as a leader of the "Toleration Republicans," attempting to oust the Congregational clergy from power by adopting a more liberal constitution in place of the charter; he was defeated for governor in 1815, but in 1817 presided over the state convention which adopted a new constitution, and in the same year was elected governor, serving until 1827. He died in New York City on the 1st of June 1833.

A grandson of the second Oliver's brother Frederick was ROGER WOLCOTT (1847-1901), who graduated at Harvard in 1869, and was admitted to the Suffolk bar in 1874. He practised law in Boston, and served in the Massachusetts House of Representatives in 1882-1884, as a Republican. In 1892 he was elected lieutenant-governor (re-elected 1893 and 1895), and in 1896 became acting-governor upon the death (5th March) of Governor Frederick T. Greenhalge. He was elected governor in 1896 and served until 1900. He died on the 21st of December 1901.

EDWARD OLIVER WOLCOTT (1848-1903), a member of the same family, went to Colorado, became interested in silver mining there, was a U.S. Senator in 1889-1901, and was a prominent Republican bimetallist.

See William Lawrence, Roger Wolcott (1847-1901) (Boston, 1902), and for all the family, Samuel Wolcott, Memorial of Henry Wolcott, one of the first Settlers of Windsor, Connecticut, and of some of his Descendants (New York, 1881).

WOLF, FREDRICH AUGUST (1759-1824), German philologist and critic, was born on the 15th of February 1759 at Hainrode, a little village not far from Nordhausen, in the province of Hanover. His father was the village schoolmaster and organist. In time the family removed to Nordhausen, and there young Wolf went to the grammar school, where he soon acquired all the Latin and Greek that the masters could teach him, besides learning French, Italian, Spanish and music. The precocity of his attainments was only equalled by the force of will and self-confidence in his own powers which characterized him throughout life. After two years of solitary study, at the age of seventeen, Wolf went (1777) to the university of Göttingen. His first act there was a prophecy—one of those prophecies which spring from the conscious power to bring about their fulfilment. He had to choose his "faculty," and chose one which then existed only in his own mind, the faculty of "philology." What is even more remarkable, the omen was accepted. He carried his point, and was enrolled as he desired. C. G. Heyne was then the chief ornament of Göttingen, and Wolf and he were not on good terms. Heyne excluded him from his lectures, and briskly condemned
WOLF, H. 771

Wolf's views on Homer. Wolf, however, pursued his studies in the university library, from which he borrowed with his old aversion. During 1779-1783 Wolf was a schoolmaster, first at Helf, then at Os. He became too a teacher was striking and he found time to publish an edition of the Symposium of Plato, which excited notice, and led to his promotion (1783) to a chair in the Prussian university of Halle. The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1783-1807), by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas and found the science of philology. Wolf defined philology broadly as "knowledge of human nature as exhibited in antiquity." The matter of such a science, he held, must be sought in the history and education of some highly cultivated nation, to be studied in written remains, works of art, and whatever else bears the stamp of national thought or skill. It has therefore to do with both history and language, but primarily as a science of interpretation, in which historical facts and linguistic facts take their place in an organic unity. It was the task of which Wolf had in mind when he established the philological seminariurn at Halle.

Wolf's writings make little show in a library, and were always subordinate to his teaching. During his time at Halle he published his commentary on the Leptines of Demosthenes (1790)—which suggested to his pupil, Aug. Boecchi, the Public Economy of Athens—and a little later the celebrated Prolegomena to Homer (1793). This book, the work with which his name is chiefly associated, was thrown off in comparative haste to meet an immediate need. It has all the merits of a great piece of oral lecture, a talk-woven of method, suggestiveness, breadth of view. The reader does not feel that he has to do with a theory, but with great ideas, which are left to bear fruit in his mind (see Homer). The publication led to an unpleasant polemic with Heyne, who absurdly accused him of reproducing what he had heard from him at Göttingen.

The Halle professorship ended tragically, and with it the happy and productive period of Wolf's life. He was swept away, and his university with him, by the deluge of the French invasion. A painful gloom oppressed his remaining years (1807-1824), which then at Os. They were a tale of随着 of method, suggestiveness, breadth of view. The reader does not feel that he has to do with a theory, but with great ideas, which are left to bear fruit in his mind (see Homer). No other composer has exhibited so scrupulous a reverence for the poems which he set. To displace an accent for him was as
heinous an act of sacrilege as to misinterpret a conception or to
ignore an essential suggestion. His art is never more than a
higher point than in Wolf's songs. Expression
should be also laid upon the objective and dramatic attitude
of his mind. He preferred to make himself the mouthpiece of the
poetry rather than to use his art for purposes of self-revelation,
avoiding for his songs the works of those whom with healthy
Scrn he termed the Ic-Posten. Hence the men and women
characterized in his songs are living realities, forming a veritable
portrait gallery, of which the figures, though unmistakably,
the work of a single hand, yet maintain their own separate identity.
These statements can be verified as well by a reference to
the simpler and more melodious of his songs, as to those which are
of extreme elaboration and difficulty. Among the former may
be named Das verlassene Mägdlein in der Frühe and Der Gärtnar
(Mörke), Verschwiegene Liebe and Der Musikant (Eichendorff),
Anabroses Grab (Goethe), Alle gingen, Herr, zur Ruht' and Hera,
was fragst (Spanisches Liederspiel, Nos. 1 and 4 of the Italienisches
Liederbuch, and among the latter Aeolsharfe and Der Feuerreiter
(Mörke), Ganymed and Prometheus (Goethe). (W. A. J. F.)

WOLF, JOSEPH (1820-1859), Anglo-German artist, the son
of a German farmer, was born in 1820 at Münstermilfeld, on the
river Moselle, in the Rhine Province. In his boyhood he was an
assiduous student of bird and animal life, and showed a remark-
able capacity as a draughtsman of natural history subjects. His
powers were first recognized by Professor Schlegel of the Leiden
museum, who gave him employment as an illustrator. In 1848
he settled in London, where he remained till his death on the
20th of April 1859. He made many drawings for the Zoological
Society, and a very large number of illustrations for books on
natural history and on travel in various countries; but he also
won a considerable success as an illustrator.

WOLF (Canis lupus), the common English name for any wild
member of the typical section of the genus Canis (see Carnivora).
Excluding some varieties of domestic dogs, wolves are the largest
members of the genus, and have a wide geographical range,
extending over nearly the whole of Europe and Asia, and North
America from Greenland to Mexico, but are not found in South
America or Africa, where they are replaced by other members of
the genus, with less diversity of size, length and thickness of fur,
and coloration, although resembling each other in all important structural characters. These
differences have given rise to a supposed multiplicity of species, expressed by
the names C. lycaon (Central Europe), C. laniger and C. niger
(Thet), the C. occidentalis, C. nubilus, C. mexicanus, &c.,
of North America, and the great black-brown Alaskan C. pambasileus,
the largest of them all. But it is doubtful whether these
should be regarded as more than local varieties. In North
America there is a second distinct smaller species, called the
coyote or prairie-wolf (Canis latrans), and perhaps the Japanese
wolf (C. hodophylax) may be distinct, although, except for its
smaller size and shorter legs, it is scarcely distinguishable from
the common species. The wolf enters the N.W. corner of India,
but in the peninsula is replaced by the more jackal-like C. pallipes,
which is probably a member of the jackal group, and not a wolf at
all.

The ordinary colour of the wolf is yellowish or fulvous grey,
but almost pure white and entirely black wolves are known.
In northern countries the fur is longer and thicker, and the animal
generally larger and more powerful than in the southern portion
of its range. Its habits are similar everywhere and it is still,
and has been from time immemorial, especially known to man
in all the countries it inhabits as the devastator of sheep flocks.
Wolves do not catch their prey by lying in ambush, or stealing up
close and making a sudden spring, but by fairly running it down
in open chase, which their speed and remarkable endurance
enable them to do. Except during summer when the young
families of cubs are being separately provided for by their parents,
they assemble in troops or packs, often in relays, and by their
combined and persevering efforts are able to overpower and kill
deer, antelopes and wounded animals of all sizes. It is singular
that such closely allied species as the domestic dog and the
wolf have never revealed any decided and permanent difference
well known, children and even full-grown people are not in-
frequently the objects of their attack when pressed by hunger.
Notwithstanding the proverbial ferocity of the wolf in a wild
state, many instances are recorded of animals taken when quite
young becoming tame and attached to the person who has
brought them up, when they exhibit many of the ways of a dog.
They can, however, rarely be trusted by strangers.
The history of the British wolf is one of gradual extir-
ation, has been thoroughly investigated by Mr. J. E. Harting in
his work on Extinct British Animals, from which the following account
is abridged. To judge by the osteological remains which the re-
sult is owning of the ancient Britons as well as of the Anglo-Saxons,
In Athelstan's reign these animals abounded to such an extent in York-
shire that a retreat was built by one Acehorn, at Flixton, near Filey,
wherein travellers might seek refuge if attacked by them. As is well
known, the efforts of King Henry VII. to exterminate the wolf in the
country, but notwithstanding the annual tribute of 300 skins paid to him during several years by the king of Wales,
he was brought to an end long before, and altogether as commonly imagined.
In the reign of Henry III. wolves were sufficiently numerous to
enable parts of the country to induce the king to make grants of land
to various individuals upon the express condition of their taking
measures to destroy these animals wherever they could be found.
In Edward II.'s time, the king's forest of the Peak, in Derbyshire,
WOLF,
WOLFF, C.—WOLFF, C. F.

N. America as a brigadier-general in the Louisburg expedition under Amherst and Boscawen. The landing was effectuated in the face of strenuous opposition, Wolfe leading the foremost troops. On the 27th of July the place surrendered after an obstinate defence; during the siege Wolfe had had charge of a most important section of the attack, and on his lines the fiercest fighting took place. Soon afterwards he returned to England to recruit his shattered health, but on learning that Pitt desired him to continue in America he at once offered to return. It was now that the famous expedition against Quebec was decided upon, Wolfe to be in command, with the local rank of major-general. In a brief holiday before his departure he met at Bath Miss Lowther, to whom he became engaged. Very shortly afterwards he sailed, and on the 1st of June 1759 the Quebec expedition sailed from Louisburg (see QUEBEC). After wearisome and disheartening failures, Wolfe, who had been hurried by the call of patriotic duty, crowned his work by the decisive victory on the Plains of Abraham (13th of September 1759) by which the French permanently lost Quebec. Twice wounded earlier in the fight, he had refused to leave the field, and a third bullet passing through his lungs inflicted a mortal injury. While he was lying in a swoon some one near him exclaimed, "They run; see how they run!" "Who run?" demanded Wolfe, as one roused from sleep. "The enemy," was the answer; "they give way everywhere." Wolfe rallied for a moment, gave a last order for cutting off the retreat, and expired murmuring, "Give me my coat." Wolfe's monument a tall column bears the words, "Here died Wolfe victorious on the 13th of September 1759." In the governor's garden, in Quebec, there is also a monument to the memory of Wolfe and his gallant opponent Montcalm, who survived him only a few hours, with the inscription "Wolfe and Montcalm. Mortem virtus communem, famam historica, monumentum posteritis dedi." In Westminster Abbey a public memorial to Wolfe was unveiled on the 4th of October 1773.

WOLFENBÜTTEL, a town of Germany, in the duchy of Brunswick, situated on both banks of the Oker, 7 m. S. of Brunswick on the railway to Harzburg. Pop. (1905) 19,083. Lessing was ducal librarian here, and the old library building, designed in 1723 in imitation of the Pantheon at Rome, contains a marble statue of him. The library, including 300,000 printed books and 10,000 MSS., was, however, transferred to a large and new Renaissance edifice in 1887. It is especially rich in Bibles, incunabula and books of the early Reformation period, and contains some fragments of the Gothic bible of Ulfilas. Opposite the old library is the palace, now churched as an orphan asylum. The ducal burial vault is in the church of St. Mary. A castle is said to have been founded on the site of Wolfenbüttel by a margrave of Meissen about 1046. When this began in 1267 to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it. In 1542 it was taken by the Saxons and Hessians, who, however, evacuated it five years later after the battle of Mühlberg. In the Thirty Years' War, in June 1641, the Swedes, under Wrangel and Königsmark, defeated the Austrians under the archduke Leopold of Wolfenbüttel, who virtually unchained himself wholly into the possession of the Brunswick-Wolfenbüttel family in 1671, and for nearly one hundred years enjoyed the distinction of being the ducal capital. In 1754, however, Duke Charles transferred the ducal residence to Brunswick.

See Voges, Erzählungen aus der Geschichte der Stadt Wolfenbüttel (Wolfenbüttel, 1869); von Heinemann, Die herzogliche Bibliothek Wolfenbüttel (2d ed., 1900) for "the Wolfenbüttel fragments"; see Lessing and Reimar.

WOLFF, CASPAR FRIEDRICH (1733—1794). German anatomist and physiologist, justly reckoned the founder of modern embryology, was born in 1733 at Berlin, where he studied anatomy and physiology under the elder J. F. Meckel. He
graduated in medicine at Halle in 1759, his thesis being his famous *Theoria generationis*. After serving as a surgeon in the Seven Years' War, he wished to lecture on anatomy and physiology in Berlin, but being refused promotion, he returned to his seat in the electorate of Bavaria, became professor of those subjects at the academy of St Petersburg, and acted in this capacity until his death there in 1794.

While the theory of "evolution" in the crude sense—i.e., a simple growth in size and unfolding of organs all previously existent in the germ—is an old doctrine of the field of biology, Wolff's development of the alimentary canal in the chick first clearly established the converse view, that of *epigenesis*, i.e., of progressive formation and differentiation of organs from a germ primogenitively homogeneous. His theory was abandoned for a time by embryological layers, and is said even to have foreshadowed the cell theory.

**WOLFF** (less correctly Wolf), **CHRISTIAN** (1679-1754), German philosopher and mathematician, the son of a Tanner, was born at Breslau on the 24th of January 1679. At the university of Jena he studied first mathematics and physics, to which he soon added philosophy. In 1703 he qualified as Privatdozent in the university of Leipzig, where he lectured till 1708, when he was called professor of mathematics and natural philosophy to Halle. Before this time he had made the acquaintance of Leibnitz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but on the departure of a colleague he added physics, and presently included all the main philosophical disciplines. But the claims which Wolff advanced on behalf of the philosophic reason (see Rationalism) appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against Lutheran dogmatism, had itself assumed the character of a sect of a new orthodoxy. Wolff's professed ideal was to base theoretical truths on evidence of mathematical certitude, and to wipe the Pietists out openly in 1721, when Wolff, on the occasion of laying down the office of pro-rector, delivered an oration "On the Practical Philosophy of the Chinese" (Eng. tr. 1730), in which he praised the purity of the moral precepts of Confucius, pointing to them as an evidence of the power of human reason to attain by its own efforts to moral truth. For ten years Wolff was subjected to attack, until in a fit of exasperation he appealed to the court for protection. His enemies, however, gained the ear of the King Frederick and represented to him that, if Wolff's determinism were recognized, no soldier who deserted could be punished, since he would only have acted as it was necessarily predetermined that he should. So enraged the king that he at once deprived Wolff of his office, and commanded him to leave Prussian territory within forty-eight hours on pain of a halter. The same day Wolff passed into Saxony, and presently proceeded to Marburg, to which university he had received a call before this crisis. The landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his philosophy. It was everywhere discussed, and over two hundred books and pamphlets appeared for or against it before 1737, not reckoning the systematic treatises of Wolff and his followers. In 1740 Frederick William, who had already made overtures to Wolff to return, died suddenly, and one of the first acts of his successor, Frederick the Great, was to recall him to Halle. His entry into the town on the 6th of December 1740 partook of the nature of a triumphal procession. In 1743 he became chancellor of the university, and in 1745 he received the title of Freiherr from the elector of Bavaria. But his matter was no longer fresh, he had outlived his power of attracting students, and his class-rooms remained empty. He died on the 6th of April 1754.

The Wolffian philosophy held almost undisputed sway in Germany till it was displaced by the Kantian revolution. It is essentially a common-sense adaptation or watering-down of the Leibnitzian system. It was particularly strong in connection with Leibnitz, Wolff may be said to have methodized and reduced to dogmatic form the thoughts of his great predecessor, which often, however, lost the greater part of their suggestiveness in the process. Since his philosophy disappeared before the influx of new ideas and the appearance of more speculative minds, it has been customary to dwell almost exclusively on its defects—the want of depth or freshness of insight, and the aridity of its neo-scholastic formalism, which tended to slip into verbiage platitude. But this is to do injustice to Wolff's real merits. These are mainly his comprehensive view of philosophy, as embracing in its survey the whole field of human knowledge. His philosophy has long been respected for its intellectual position, and his confidence in the power of reason to reduce all subjects to this form. To these must be added that he was practically the first to "teach philosophy to speak German." The Wolffian system professed to determine the limits and outline the significance, and the principle of sufficient reason introduced by Leibnitz is once more discarded in favour of a principle of contradiction which Wolff seeks to make the fundamental principle of his philosophy. They combined the vital optimism of Leibnitz and the mechanical character of Newton as a basis for the science of the possible, and divided, according to the two faculties of the human individual, into a theoretical and a practical part. Logic, sometimes called *philosophia rationalis*, forms the introduction to Wolff's works. He speaks of these as parts *ontology* or *philosophia prima*, cosmology, rational psychology and natural theology; ontology treats of the existence and attributes of God. These are best known to philosophico-students by Kant's treatment of them in the *Critique of Pure Reason*. Wolff's philosophy also contributed much to politics, economics and politics. Wolff's moral principle is the realization of human perfection.

Some important works are as follows: *Anfangsgründe aller mathematischen Wissenschaften* (1710; in Latin, *Elemenno matheseos universae, 1713-1715*); *Vermuthige Gedanken von den Kräften des menschlichen Verstandes* (1712; Eng. trans. 1770); *Vern. Ged. von der Lehre von der menschlichen Verthunien und Lassen* (1720); *Vern. Ged. von dem gesellschaftlichen Leben der Menschen* (1721); *Vern. Ged. von den Wirkungen der Natur* (1723); *Vern. Ged. von den Absichten der natürlichen Dinge* (1719); *Die Welt* (1733); *Philosophia moralis* (1749-1750); *Philosophia naturalis* (1736-1737); *Philosophia practica universalia* (1731-1735); *Philosophie der menschlichen Nations* (1740-1749); *Philosophia moralis* (1750-1753). His *Kleine philosophische Schriften* have been collected and edited by G. F. Hagen (1736-1740). In addition to Wolff's autobiography (Engene Lebensbeschreibung, ed. H. Wurtte, 1841) and the usual histories of philosophy, see W. Schrader in Allgemeine deutsche Biographie, xlvii.; C. G. Ludovici, Ausführlicher Entwurf einer vollständigen Geschichte der Philosophie, herausgegeben von Deschamps, Cours abrégé de la philosophie wolffienne (1743); F. W. Kluge, Christian von Wolff der Philosoph (1831); W. Arnapperger, Christian Wolff's Verhältniss zu Leibnis (1897). (A. S. P.-P.-X.)

**WOLFF, JOSEPH** (1795-1862), Jewish Christian missionary, was born at Wellersbach, near Bamberg, Germany, in 1795. His father became rabbi at Württemberg in 1806, and sent his son to the Protestant lyceum at Stuttgart. He was converted to Christianity through reading the books of Johann Michael von Saller, bishop of Regensburg, and was baptized in 1818 by the Benedictine abbot of Emaus, near Prague. Wolff was a keen Oriental scholar and pursued his studies at Tübingen and at Rome, where he was expelled from the Collegio di Propaganda in 1818 for attacking the doctrine of infallibility and criticizing his tutors. After a short stay in the monastery of the Redemptorists at Val Sainte near Fribourg, he went to London, entered the Anglican Church, and resumed his Oriental and theological studies at Cambridge. In 1821 he began his missionary wanderings in the East by visiting Egypt, the Sinaiic peninsula, Jerusalem, Aleppo, Mesopotamia, Persia, Turkey, Greece and the Balkan peninsula. In 1827, when Edward Irving introduced him to Lady Georgina Walpole, 6th daughter of Horatio Walpole, earl of Orford, whom he married in February 1827. In 1828 Wolff set out to search for the ten tribes, travelling through Anatolia, Armenia, Turkestan and Afghanistan to Simla and Calcutta, suffering many hardships but preaching with enthusiasm. He visited Madras, Pondicherry, Goan and Bombay, travelling home by Egypt and Malta. In 1836 he found Samuel Gobat in Abyssinia, took him to Jiddah, and himself visited Yemen and Bombay, going on to the United States, where he was ordained deacon in 1837, and priest in 1838
In the same year he was given the rectorcy of Linthwaite in Yorkshire. In 1843 he went to Bokhara to seek two British officers, Lieut.-Colonel C. Stoddart and Captain A. Conolly, who narrowly escaped the death that had overtaken them; his Narrative of this expedition is a lurid magnetic saga between 1845 and 1852. In 1845 he was presented to the vicarage of Ile Brewers, Somerset, and was planning another great missionary tour when he died on the 2nd of May 1862.

His son, Sir Henry Drummond Wolff (1832-1908), was a well-known English diplomatist and Conservative politician, who started as a clerk in the foreign office and was appointed K.C.G.M. in 1892 for various services abroad. In 1874-1880 he sat in parliament for Christchurch, and in 1880-1885 for Portsmouth, being one of the group known as the "Fourth Party." In 1885 he went on a special mission to Constantinople in connection with the Egyptian question, and as the result various awkward difficulties, hanging on the sultan's sutoriality, were got over. In 1888 he was sent as minister to Teheran, and from 1892 to 1900 was ambassador at Madrid. He died on the 11th of October 1908. Sir Henry was a notable raconiteur, and he did good service to the Conservative party by helping to found the Prozine League. He was created G.C.M.G. in 1878 and G.C.B. in 1880.

WOLFRAMITE, or WOLFRAM, a mineral consisting of iron-manganese tungstate, (Fe, Mn)WO4. The name is of doubtful origin, but it has been assumed that it is derived from the German Wolf and Rahm (roth), corresponding with the spuma lupi of old writers, a term hardly appropriate, however, to the mineral in question. Wolframate crystallizes in the monoclinic system, with approximation to an orthorhombic type; and the crystals offer perfect pinacoidal cleavage. The colour of wolframate is generally a white, or white and lustre metallic or adamantine, the hardness 5 to 5.5, and the specific gravity 7.1 to 7.5. Wolframate may be regarded as an isomorphous mixture, in variable ratio, of iron and manganese tungstates, sometimes with a small proportion of niobic and tantalic acids. It was in wolframate that the metal tungsten was first recognized in 1785 by two brothers, J. J. and F. d’Elhuyar. At the present time the mineral is used in the manufacture of tungsten-steel and in the preparation of certain tungstates.

Wolframate is commonly associated with tin-ores, as in many parts of Cornwall, Saxony and Bohemia. In consequence of the two minerals, cassiterite and wolframate, having nearly the same density, their separation becomes difficult by the ordinary processes of ore-dressing, but may be effected by means of wolframate being attracted by powerful magnets. A process introduced many years ago by R. Oxland consisted in roasting the mixed ore, the wolframate being converted into wolframite, and the sodium tungstate, which was easily removed as a soluble salt. Wolframate occurs at many localities in the United States, notably at Triumph, Conn., where it has been mined, and at Monroe, Conn., where it accompanies bismuth ores. Other localities are in Mecklenburg county, N.C., and in the Mammoth mining district, Nevada. Wolframate has in some cases resulted from the alteration of scheelite (CaWO4), though on the contrary pseudomorphs are known in which scheelite has taken the form of wolframate. By oxidation wolframate may become encrusted with tungstic ochre, or tungsite, sometimes known as wolframe, a name to be carefully distinguished from wolframate.

As the relative proportions of iron and manganese vary in wolframate, the composition tends towards that of other minerals. Thus there is a manganese tungstate (MnWO4) known as hübnerite, a name given by E. N. Riette, in 1865, in compliment to Adolph Hübner, a Saxan mineralogist. There is also a mineral which contains little more than ferrous tungstate (Fe₂WO₄), and is known as green hübnerite, or green hewettite. When hübnerite was converted into sodium tungstate, which was easily removed as a soluble salt. Wolframate occurs at many localities in the United States, notably at Triumph, Conn., where it has been mined, and at Monroe, Conn., where it accompanies bismuth ores. Other localities are in Mecklenburg county, N.C., and in the Mammoth mining district, Nevada. Wolframate has in some cases resulted from the alteration of scheelite (CaWO₄), though on the contrary pseudomorphs are known in which scheelite has taken the form of wolframate. By oxidation wolframate may become encrusted with tungstic ochre, or tungsite, sometimes known as wolframe, a name to be carefully distinguished from wolframate.

Wolfram von Eschenbach, the most important and individual poet of medieval Germany, flourished during the end of the 12th and beginning of the 13th century. He was one of the brilliant group of Minnesingers whom the Landgrave Herrmann of Thuringia gathered round him at the historic castle of the Wartburg. We know by his own statement that he was a Bavarian, and came of a knightly race, counting his achievements with spear and shield far above his poetical gifts. The Eschenbach from which he derived his name was most probably Ober-Eschenbach, not far from Pleinfeld and Nuremberg; there is no doubt that this was the place of his burial, and so late as the 17th century his tomb was to be seen in the church of Ober-Eschenbach, which was then the burial place of the Teutonic knights. Wolfram probably belonged to the small nobility, for he alludes to men of importance, such as the counts of Abenberg, and of Wertheim, as if he had been in their service. Certainly he was a poor man, for he makes frequent and jesting allusions to his poverty. Bartsch concludes that he was a young son, and that the family seat was at Eschenbach. Wolfram's home was the insignificant estate of Wildenberg (to which he alludes), now the village of Wehlenberg. Wolfram seems to have disdained all literary accomplishments, and in fact insists on his unlettered condition both in Parzival and in Wolfram von Eschenbach. He saw little of the world, and his poems are beyond all doubt renderings of French originals. Were the poems read to him, and did he dictate his translation to a scribe? The date of Wolfram's death is uncertain. We know that he was alive in 1216, as in Wolfram in the lamentation of the Landgrave Herrmann, which took place in that year, but how long he survived is uncertain. The most common name for him is given him in the two books, Wolfram, or Parzival, living in, and is revealed by, his work, which shows him to have been a man of remarkable force and personality. He has left two long epic poems, Parzival and Wolfran in the act of Tristan. But the principal interest of Wolfram's work lies in his Parzival, immeasurably the finest and most spiritual rendering of the Perceval-Grail story.

The problem of the source of the Parzival is the crux of medieval literary criticism (see Perceval). These are the leading points. The poem is divided into sixteen books. From lii. to xii., inclusive, the story marches pari passu with the Perceval of Chrétien de Troyes. The story of the Provençal (whom he has before named as his source), and that of Wolfram, or Wichter-Lieder, are both of Old German folk-poetry, of which Wagner has preserved the tradition in the warning cry of Brangane in the second act of Tristan. But the principal interest of Wolfram's work lies in his Parzival, immeasurably the finest and most spiritual rendering of the Perceval-Grail story.

The problem of the source of the Parzival is the crux of medieval literary criticism (see Perceval). These are the leading points. The poem is divided into sixteen books. From lii. to xii., inclusive, the story marches pari passu with the Perceval of Chrétien de Troyes. The story of the Provençal (whom he has before named as his source), and that of Wolfram, or Wichter-Lieder, are both of Old German folk-poetry, of which Wagner has preserved the tradition in the warning cry of Brangane in the second act of Tristan. But the principal interest of Wolfram's work lies in his Parzival, immeasurably the finest and most spiritual rendering of the Perceval-Grail story.
is the goal he marks out for attainment. Whether views so large, so sane and so wholesome are to be placed to the credit of the German poet, or of his French source (and modern criticism is leaning more and more to a belief in the existence of Kiot), the Parsival is the work of a remarkable personality, and, given the age and the environment, a unique literary achievement.

Wolfram has moments of the highest poetical inspiration, but his meaning, even for his compatriots, is often obscure. He is in no sense a master of language, as was Gottfried von Strassbourg. This latter, in a very interesting passage of the Tristan, passes in review the poet's day, awarding to the majority praise for the excellence of their style, but one he does not hold for Wolfram, as being so obscure and involved that none can tell what his meaning may be; this un-named poet has always been understood to be Wolfram von Eschenbach, and in a passage of Wilhelm the author refers to the unfavourable criticisms passed on Parsival. Wolfram and Gottfried were both true poets, but of widely differing style. Wolfram was, above all, a man of deeply religious character (witness his introduction to Willehalm), and it seems to have been this which specially impressed the mind of his compatriots; in the 13th-century poem of Der Wartburg-Kriegen it is Wolfram who is characterized as being a Christian, to show the enchanter Klingsor von Ungerland.

WOLGAST, a seaport town of Germany, in the Prussian province of Pomerania, situated on the river Peene, which separates it from the island of Usedom, 30 m. by rail E. of Greifswald. Pop. (1905) 8346. There are various manufactures. Wolgast became a town in 1247, and after being the residence of the duke of Pomerania-Wolgast, it was ceded to Sweden in 1648. It was captured four times during the Thirty Years’ War, and in 1675 by Frederick William, elector of Brandenburg. It was repossessed by Germany in 1815.

See B. Heberlein, Beitrag zur Geschichte der Burg und Stadt Wolgast (Wolgast, 1892).

WOLLASTON, WILLIAM (1675-1724), English philosophical writer, was born at Coton-Clanford, on the 26th of March 1675. On leaving Sidney Sussex College, Cambridge, in 1681, he became an assistant master at the Birmingham grammar school, and took holy orders. In 1688 an uncle left him a fortune. He then moved to London, married a lady of wealth, and devoted himself to learning and philosophy. He embodied his views in the one book by which he is remembered, The Religion of Nature Demonstrated (1st ed. 1722; 2nd ed. 1724). He died in October 1722.

Wollaston’s Religion of Nature, which falls between Clarke’s Discourse of the Unchangeable Obligations of Natural Religion and Butler’s Sacred Plain Dealer, was one of the most popular philosophical works of its day. To the 8th edition (1750) was added a life of the author. The book was designed to be an answer to two questions: Is there such a thing as natural religion? and, If there is, what is it? Wollaston starts with the assumption that religion and morality are identical, and labours to show that religion is "the pursuit of happiness by the practice of truth and reason." He claims originality for his theory that the moral evil is the practical denial of a true proposition and moral good the affirmation of it (see ETHICS). Wollaston also published anonymously a small book, On the Design of the Book of Ecclesiastes, or the Unreasonableness of Men's Restless Contention for the Present Enjoyments, represented in an English Fable (London, 1691). See John Clarke, Examination of the Notion of Moral Good and Evil advanced in a late book entitled The Religion of Nature Demonstrated (London, 1725); Drechsler, Uber Wollastons Moral-Philosophie (Erlangen, 1802); Sir Leslie Stephen’s History of English Thought in the Eighteenth Century (London, 1876), ch. iii. and ch. ix.; H. Sidgwick’s History of Ethics (1902), pp. 198 sq.

WOLLASTON, WILLIAM HYDE (1736-1828), English chemist and natural philosopher, was born at East Dereham, Norfolk, on the 13th of April 1736, the sixth child. His father, the Rev. Francis Wollaston (1731-1815), rector of Chislehurst, grandson of the William Wollaston noticed above, was an enthusiastic astronomer. Wollaston was educated at Charterhouse, and afterwards at Caius College, Cambridge, of which he became a fellow. He took the degrees of M.B. (1787) and M.D. (1793), starting to practise medicine in 1789 at Bury St Edmunds, whence he soon removed to London. But he made little way, and failed to obtain a vacant physicianship at St George’s hospital; the result was that he abandoned medicine and took up researches into science. Noted much attention to the affairs of the Royal Society, of which he was elected a fellow in 1753 and made secretary in 1806. He was elected interim president in June 1820, on the death of Sir Joseph Banks; but he did not care to enter into competition with Sir Humphry Davy, and the latter was elected president at the anniversary meeting in November 1820. Wollaston became a member of the Geological Society of London in 1812, and served frequently on the Council and for some time as a vice-president. Beyond appearing at the meetings of learned societies he took little part in public affairs; but he always had a strong interest in scientific matters, and was a careful and exhaustive manner, but in the most rigid sections of the Society being admitted to his laboratory on any pretext. Towards the close of 1828 he felt the approach of a fatal malady—a tumour in the brain—and devoted his last days to a careful revision of his unpublished researches and industrial processes, dictating several papers on these subjects, which were afterwards published in the Philosophical Transactions. He died in London on the 22nd of December 1828.

Wollaston’s original work deals more or less directly with chemical subjects, but diverges on all sides into optics, acoustics, mineralogy, astronomy, physiology, botany and even art. In chemistry he made a specialty of the platinum metals. Platinum had heretofore been considered an alloy, and Wollaston pressed the claim to have made a fortune from the secret, which, however, he disclosed in a posthumous paper (1829); and he was the first to detect the metals palladium (1804) and rhodium (1805) in crude platinum. In regard to paladium his conduct was critically condemned. He anonymously offered a quantity of the metal for sale at an instrument-maker’s shop, issuing an advertisement in which some of its properties were set forth. Wollaston was a chemist, having bought some of the substance, decided after experiment that it was not a simple body as claimed, but an alloy of mercury with platinum, and in 1803 presented a paper to the Royal Society which put the matter right. As secretary, Wollaston saw this paper when it was sent in, and is said to have tried to persuade the author to withdraw it. But having failed, he allowed the paper, and also a second by Chevrené to be published, and the public were warned off avoiding that it was he himself who had originally detected the metal, although he had an excellent opportunity of stating the fact in 1804 when he discussed the substance in the paper which announced the discovery of rhodium. In 1809 he proved the elementary character of columbium (niobium) and titanium. In optics he was the first, in 1820, to observe the dark lines in the solar spectrum. Of the seven lines he saw, he regarded the five most prominent as the true lines, and the other two as the result of simple colours of the prismatic spectrum, which he supposed to have four primary divisions. He described the reflecting goniometer in 1814, and the compound microscope with the "Wollaston doublet," and applied concavo-convex lenses to the purposes of the oculist. His cryphoroscope was described in 1813, in a paper "On a method of freezing at a distance." In 1821, after the discovery of platinum, he removed the symbol Pt to the new metal, the symbol Pd to the old, and the symbol Os to the new. He determined the refractive index of each substance, and the angle of refraction at the critical angle. Wollaston’s early work was made in 1831. The medal is the highest honour bestowed by the society; it was originally made of palladium, but is now made of gold.

An appreciative essay on Wollaston will be found in George Wilson’s Religo Chemios (1862).

WOLLASTONITE, a rock-forming mineral consisting of calcium metasilicate, CaSiO₃, crystallizing in the monoclinic system and belonging to the pyroxene (q.t.) group. It differs, however, from other members of this group in having cleavages, not parallel to the prism-faces, but in two directions perpendicular to the
plane of symmetry. Crystals are usually elongated parallel to the axis of symmetry and flattened parallel to the ortho-pyroxanoid, hence the early name "tabular spar"; the name wollastonite is after W. H. Wollaston. The mineral usually occurs in white cleavage masses. The hardness is 5, and the specific gravity 3.5. It is a characteristic product of contact-metamorphism occurring especially, with garnets, diopside, &c., in crystalline limestones.

Crystals are found in the cavities of the ejected limestone blocks of Monte Somma, Vesuvius. At Santa F6 in the State of Chiapas, Mexico, a large rock-mass of wollastonite carries ores of gold and copper: here are found large pink crystals which are often partially or wholly altered to opal. (L. J. S.)

WOLLIN, an island of Germany, in the Prussian province of Pomerania, the more easterly of the islands at the mouth of the Oder which separate the Stettiner Haff from the Baltic Sea. It is divided from the mainland on the E. by the Dievenow Channel, and from Usedom on the W. by the Swine. It is roughly triangular in shape, and has an area of 95 sq. m. Heath and sand alternate with swamps, lakes and forest on its surface, which is flat, except towards the south-west, where the low hills of Lebbin rise. Cattle-rearing and fishing are the chief resources of the inhabitants, who number about 14,000. Misdray, on the N.W. coast, is a favourite sea-bathing resort, and some of the other villages, as Ostswine, opposite Swinemunde, Pritter, famous for its oels, and Lebbin, are also visited in summer. Wollin, the only town, is situated on the Dievenow, and is connected with the mainland by three bridges. It carries on the industries of a small seaport and fishing village. (Pop. 1875, 2125.)

Near the modern town once stood the ancient and opulent Wendish city of Wollin or Junme, called Julin by the Danes, and Winetha or Vineta (i.e. Wendish town) by the Germans. In the 10th and 11th centuries it was the centre of an active and extensive trade. Adam of Bremen (d. 1076) extols its size and wealth, and mentions that Greeks and other foreigners frequented it, and that Saxons were permitted to settle there on equal terms with the Wends, so long as they did not obtrude the fact of their Christianity. The Northmen made a settlement here about 970, and built a fortress on the "silver hill," called Jomsborg, which is often mentioned in the sagas. Its foundation was attributed to a legendary Viking exiled from Denmark, called Pálnote or Palnatoki. The stronghold of Jomsburg was destroyed in 1098 by King Magnus Barof of Norway. This is probably the origin of the legend that Vineta was overthrown by a storm or earthquake and overwhelmed by the sea. Some submarine granite rocks near Damerow in Usedom are still popularly regarded as its ruins. The town of Wollin became in 1140 the seat of the Pomeranian bishopric, which was transferred to Kammin about 1170. Wollin was burnt by Žanute VI. of Denmark in 1183, and was taken by the Swedes in 1659 and 1759, and by the Brandenburgers in 1659 and 1765.

See Khull, Die Geschichte Pálnotabis und der Jomsburger (Graz, 1892); Koch, Vineta in Prosa und Poesie (Stettin, 1905); W. von Raumer, Die Insel Wollin (Berlin, 1861); Haas, Sagen und Erzählungen von den Inseln Usedom und Wollin (Stettin, 1904).

WOLLONGONG, a seaport of Camden county, New South Wales, Australia, 49 m. by rail S. of Sydney, the third port and chief harbour on the S. coast of the colony. Pop. (1901) 3545. Its harbour, known as Belmont Basin, is excavated out of the rock, and is protected by a breakwater and a lighthouse. A breakwater protects its mouth; it has a lighthouse, and is defended by a fort on Signal Hill. It is the port for the Osborne-Wollongong & Mount Pleasant collieries, which are connected with it by rail. It lies at the foot of Mount Keira, amid fine mountain and coast scenery.

WOLOF (Woloff, Woloff), a Negroid people of Senegal, French West Africa. They occupy the seaboard between St Louis and Cape Verde and the south bank of the Senegal from its mouth to Dagassu. Farther inland the districts of the Walo, Cayor Baykal and Jolof (the last, the name of a chief division of the Wolof, being sometimes used as the national name) are almost exclusively peopled by Wolof. The cities of St Louis and Dakar are both in the Wolof country, and throughout the French Sudan

no military station is without a Wolof colony, preserving national speech and usages. The name is variously explained as meaning "speaker" or "black." The Wolof justify both meanings, for they are at once far the blackest and among the most garrulous of all African peoples. They are a very tall race, and unusually proportioned, the males having unproportioned legs and flat feet.

The Wolof language is spoken throughout Senegambia, and numerous grammars, dictionaries and vocabularies have appeared since 1825. There is, however, no written literature. The Wolof preserve their national songs, legends and proverbs by memory, but have little knowledge of letters beyond the Arabic characters on their paper spells and amulets. Wolof, a typical agglutinating language, differs from all other African forms of speech. The roots, and all monosyllabic endings in nouns, are combined by means of suffixes, and coalesce while remaining invariable in their various meanings. By these suffixes the meaning of the words is endlessly modified.

Most Wolof are nominally Mahomedans, and some near the Christian missions profess Christianity, but many pagan rites are still observed. Animal worship is prevalent. The capture of a shark is hailed with delight, and family genei have offerings made to them, the most popular of these household deities, the lizard, having in many houses a bowl of milk set aside for it daily. The Wolof have three hereditary castes, the nobles, the tradesmen and musicians (who are despised), and the slaves. These latter are kindly treated. Polygyny is customary.

The old kingdom of Cayor, the largest of Wolof states, has been preserved by the French. The king is elected, but always from among the nobility, and his sons bear the same name as their father. He is numbered in his reign, but his successors take no number. When elected the king receives a vase said to contain the seeds of all plants growing in Cayor, and he is thus made lord of the land. In earlier days there was the Bur or Great Wolof, to whose duty chief religious rites belonged. The Wolof are very loyal to the French, and have constantly proved themselves courageous soldiers.

WOŁOSKI, LOUIS FRANÇOIS MICHEL RAYMOND (1810-1876), French economist and politician, was born in Warsaw and educated in Paris, but returned to Warsaw and took part in the revolution of 1830. Sent to Paris as secretary to the legation by the provisional government, he settled there on the suppression of the Polish rebellion and was naturalized in 1834. In 1833 he founded the Revue de législation et de jurisprudence, and wrote voluminously on economic and financial subjects. He established the first Crédit Foncier in France in 1835, and in 1864 became professor of political economy at the Conservatoire in succession to J. A. Blanqui. He was a member of the national assembly from 1848 to 1851, and again from 1871 till his election as a senator in 1876. He was a strong free-trader and an ardent bimetallist.

Of his works the following are the more important: Mobilisation du crédit foncier (1839); De l'organisation industrielle de la France avant Colbert (1842); Les Finances de la Russie (1864); La Question des banques (1864); La Liberté commerciale (1865); L' Or et l'argent (1870).

WOLESLEY, GARNET JOSEPH, Viscount (majority, received the earl's m歇iall, eldest son of Major Garnet Joseph Wolseley of the King's Own Borderers (29th Foot), was born at Golden Bridge, Co. Dublin, on the 4th of June 1833. Educated at Dublin, he obtained a commission as ensign in the 12th Foot in March 1852, and was transferred to the 80th Foot, with which he served in the second Burmese War. He was severely wounded on the 19th of March 1853 in the attack of Donabû, was mentioned in despatches, and received the war medal. Promoted to be lieutenant and invalided home, he exchanged into the 90th Light Infantry, then in Dublin. He accompanied the regiment to the Crimea, and landed at Balaklava in December 1854. He was selected to be an assistant engineer, and did duty with the Royal Engineers in the trenches before Sebastopol. He was promoted to be captain in January 1855, after less than three years' service, and served throughout the siege, was wounded at the Quaries on the 7th of June, and again in the trenches on the 30th of August. After the fall of Sebastopol Wolseley was employed on the quartermaster-general's staff, assisted in the embarkation of the troops and stores, and was one of the last to leave the Crimea in July 1856. For his services he was twice mentioned in despatches, and was awarded the clasp to the Military Cross for his services with the 70th, and the 1st class of the French Legion of Honour, the 5th class of the Turkish Mejidie and the Turkish medal. After six months' duty with the 90th
Foot at Aldershot, he went with it again, in March 1857, to join the expedition to China under Major-General the Hon. T. Ashburnham. Wolseley embarked in command of three companies in the transport "Transit," which was wrecked in the Strait of Sunda. The troops were all saved, but with only their arms and a few rounds of ammunition, and were taken to Singapore, whence, on account of the Indian Mutiny, they were despatched with all haste to Calcutta. Wolseley distinguished himself at the relief of Lucknow under Sir Colin Campbell in November, and in the defence of the Alambagh position under Outram, taking part in the actions of the 22nd of December 1857, the 12th and 16th of January 1858, and the repulse of the grand attack of the 21st of February. In March he served at the final siege and capture of Lucknow. He was then appointed deputy-assistant quartermaster-general on the staff of Sir Hope Grant's Oudh division, and was engaged in all the operations of the campaign, including the actions of Bari, Sarsi, Nawabganj, the capture of Faizabad, the passage of the Gumti and the action of Sultanpur. In the autumn and winter of 1858 he took part in the Baiswara, trans-Gogra and trans-Rapti campaigns, ending with the complete suppression of the rebellion. For his services he was frequently mentioned in despatches, and, having received his Crimean majority in March 1858, was in April 1859 promoted to be lieutenant-colonel, and received the Mutiny medal and clasp.

Wolseley continued in the service on Sir Hope Grant's Staff until 1860, and Sir Hope Grant was nominated to the command of the British troops in the Anglo-French expedition to China in 1860, accompanied him as deputy-assistant quartermaster-general. He was present at the action at Sin-ho, the capture of Tang-ku, the storming of the Taku Forts, the occupation of Tientsin, the battle of Pa-le-chau and the entry into Peking. He assisted in the re-embarkation of the troops before the winter set in. He was mentioned in despatches, and for his services received the medal and two clasps. On his return home he published the Narrative of the South China Campaign. In November 1861 Wolseley was one of the special service officers sent to Canada to make arrangements for the reception of troops in case of war with the United States in connexion with the mail steamer "Trent" incident, and when the matter was amicably settled he remained on the headquarters staff in Canada as assistant quartermaster-general. In 1865 he received a brevet colonel, was actively employed the following year in connexion with the Fenian raids from the United States, and in 1867 was appointed deputy quartermaster-general in Canada. In 1869 his Soldier's Pocket Book for Field Service was published, and his book ran through many editions. In 1870 he successfully commanded the Red river expedition to put down a rising under Louis Riel at Fort Garry, now the city of Winnipeg, the capital of Manitoba, then an outpost in the wilderness, which could only be reached through a network of rivers and lakes extending for 600 m. from Lake Superior, traversed only by Indians, and where no supplies were obtainable. The admirable arrangements made and the careful organization of the transport reflected great credit on the commander, who on his return home was made K.C.M.G. and C.B.

Appointed assistant adjutant-general at the war office in 1871 he worked hard in furthering the Cardwell schemes of army reform, was a member of the localization committee, and a keen advocate of short service, territorial régiments and linked battalions. From this time till he became commander-in-chief Wolseley was the prime mover and the deciding influence in practically all the steps taken at the war office for promoting the efficiency of the army under the altered conditions of the day. In 1873 he commanded the expedition to Ashanti, and, having made all his arrangements, retired to the Gold Coast before the arrival of the white troops in January 1874, was able to complete the campaign in two months, and re-embark them for home before the unhealthy season began. This was the campaign which made his name a household word in England. He fought the battle of Amoafu on the 31st of January, and, after five days' fighting, ending with the battle of Onduaso, entered Kumasi, which he burned. He received the thanks of both Houses of Parliament and a grant of £25,000, was promoted to be major-general for distinguished service in the field, received the medal and clasp and was made G.C.M.G. and K.C.B. The freedom of the city of London was conferred upon him with a sword of honour, and he was made marshal D.C.O. of Oxford and LL.D. of Cambridge universities. On his return home he was appointed inspector-general of auxiliary forces, but had not held the post for a year when, in consequence of the native unrest in Natal, he was sent to that colony as governor and general commanding. In November 1876 he accepted a seat on the council of India, from which in 1878, having been promoted lieutenant-general, he went as high commissioner to the newly acquired possession of Cyprus, and in the following year to South Africa to supersede Lord Chelmsford in command of the forces in the Zulu War, and as governor of Natal and the Transvaal and high commissioner of South-East Africa. But on his arrival at Durban in July he found that the war in Zululand was practically over, and after effecting a temporary settlement he went to the Transvaal. Having reorganized the administration there and reduced the powerful chief Sikukuni to submission, he returned home in May 1880 and was appointed quartermaster-general to the forces. For his services in South Africa he received the Zulu medal with clasp, and was made G.C.B.

In 1882 he was appointed adjutant-general to the forces, and in 1883 he received that year was given the command of the British forces in Egypt in support of the rebellion of Arabi Pasha (see Egypt: Military Operations). Having seized the Suez Canal, he disembarked his troops at Ismailia, and after a very short and brilliant campaign completely defeated Arabi Pasha at Tel-el-Kebir, and suppressed the rebellion. For his services he received the thanks of parliament, the medal with clasp, the bronze star, was promoted general for distinguished service in the field, raised to the peerage as Baron Wolseley of Cairo and Wolseley, and received, from the Khedive the 1st class of the Order of Ismail. In 1884 he was again called away from his duties as adjutant-general to command the Nile expedition for the relief of General Gordon and the besieged garrison of Khartum. The expedition arrived too late: Khartum had fallen, and Gordon was dead; and in the spring of 1885 complications with Russia over the Penjdeh incident occurred, and the withdrawal of the expedition followed. For his services he received two clasps to his Egyptian medal, the thanks of parliament, and was created a viscount and a knight of St Patrick. He continued at the war office as adjutant-general to the forces until 1889. He was then given the command in Ireland. He was promoted to be field-marshall in 1890, and in the same year was appointed colonel of the Royal Horse Guards in 1895, in which year he was appointed by the Unionist government to succeed the duke of Cambridge as commander-in-chief of the forces. This was the position to which his great experience in the field and his previous signal success at the war office itself had fully entitled him. His powers were, however, limited by a new order in council, and after holding the appointment for over five years, he handed over the command-in-chief to Earl Roberts at the commencement of 1901. The fact that the unexpectedly large force required for South Africa was mainly furnished by means of the system of reserves which Lord Wolseley had originated was in itself a high tribute to his foresight and sagacity; but the new conditions at the war office had never been to his liking, and on being released from responsibility he brought the whole subject before the House of Lords in a speech which resulted in some remarkable disclosures.

Lord Wolseley had been appointed colonel-in-chief of the Royal Irish Regiment in 1858, and in 1901 was made gold- stick in waiting. He was married in 1867 to Louisa, daughter of Mr. A. Erskine, his only child, Frances, being heiress to the viscountcy under special remainder. A frequent contributor to periodicals, he also published The Decline and Fall of Napoleon (1859), The Life of John Churchill, Duke of Marlborough, to the Accession of Queen Anne (1894), and The Story of a Soldier's Life (1903), giving in the last-named work an account of his career down to the close of the Ashanti War.
WOLSEY, THOMAS (c. 1475-1530), English cardinal and statesman, born at Ipswich about 1475, was son of Robert Wolsey (or Wulcy, as his name was always spelt) by his wife Joan. His father is generally described as a butcher, but died in other things than meat; and although they were of a mean property and a churchwarden of St Nicholas, Ipswich, his character seems to have borne a striking resemblance to that of Thomas Cromwell's father. He was continually being fined for allowing his pigs to stray in the street, selling bad meat, letting his house to doubtful characters for illegal purposes, and generally infringing the by-laws respecting weights and measures (extracts from the Ipswich records, printed in the Atheneaum, 1900, i. 400). He died in September 1496, and his will, which has been preserved, was proved a few days later.

Thomas was educated at Magdalen College, Oxford; but the details of his university career are doubtful owing to the neglectfulness of the university and college registers. He is said to have graduated B.A. at the age of fifteen (i.e. about 1490); but his earliest definite appearance in the records is as junior bursar of Magdalen College in 1498-1499, and senior bursar in 1499-1500, an office he was compelled to resign for applying funds to the completion of the great tower without sufficient authority (W. D. Macray, Reg. of Magdalen College, i. 29-30, 133-134). He must have been elected fellow of Magdalen some years before; and certainly in 1500, when Wolsey married the daughter of some Thomas of Grey, first marquess of Dorset, Dorset's beneficent intentions for his sons' pedagogue probably suggested Wolsey's ordination as priest at Marlborough on March 10, 1498, and on October 10, 1500, he was instituted, on Dorset's presentation, to the rectory of Limington in Somerset. His connexion with Magdalen had perhaps terminated with his resignation of the bursariah, though he supplicated for the degrees of B.D. and D.D. in 1510; and the college appears to have derived no advantage from Wolsey's subsequent greatness. At Limington he came into conflict with law and order as represented by the sheriff, Sir Amias Paulet, who is said by Cavendish to have placed Wolsey in the stocks; Wolsey retaliated long afterwards by confining Paulet to his chambers in the Temple for five or six years. Dorset died in 1501, but Wolsey found other patrons in his pursuit of wealth and fame. Before the end of that year he obtained from the pope a dispensation to hold two livings in conjunction with Limington, and Archbishop Deane of Canterbury also appointed him his domestic chaplain. Deane, however, died in 1503, and Wolsey became chaplain to Sir Richard Nanan, deputy of Calais, who apparently recommended him to the court of St James, and Wolsey was created bishop of London in 1505, his appointment being formally confirmed on him by papal bull in September, and the cardinalate which he had sent Polydore Vergil to beg from Leo X. in May 1514, but did not receive till the following year. Nevertheless, when Francis I. in 1515 succeeded Louis XII. and won the battle of Marignano, Wolsey took the lead in assisting the emperor Maximilian to oppose him; and this revival of warlike designs was resented by Fox and Warham, who retired from the government, leaving Wolsey supreme. Maximilian proved a broken reed, and in 1518 Wolsey brought about a general pacification, securing at the same time his appointment as legate à latere in England. He thus superseded Warham, who was legatus nullus, in ecclesiastical authority; and though legates à latere were supposed to exercise only special and temporary powers, Wolsey secured the practical permanence of his office.

The election of Charles V. as emperor in 1519 brought the rivalry between him and Francis I. to a head, and Wolsey was mainly responsible for the attitude adopted by the English government. Both monarchs were eager for England's alliance, and their suit enabled Wolsey to appear for the moment as the arbiter of Europe. England's commercial relations with Charles V.'s subjects in the Netherlands put war with the emperor almost out of the question; and cool observers thought that England's obvious policy was to stand by while the two rivals enfeebled each other, and then make her own profit out of their weakness. But, although a gorgeous show of friendship for Charles V. was kept up at the Field of Cloth of Gold in 1520, it had been determined before the conference of Calais in 1521, at which Wolsey pretended to adjudicate on the merits of the dispute, to side actively with Charles V. Wolsey had vested interests in such a policy. Parliament had in 1513-1515 showed signs of strong anti-clerical feeling; Wolsey had in the latter year urged its speedy dissolution, and had not called another; and he probably hoped to distract attention from the church by a spirited foreign policy, as Henry V. had done a century before. He had, moreover, received a handsome fee for his part in the negociations with Charles V. with a view to his further Wolsey's candidature for the papacy; and although he protested to Henry VIII. that he would rather continue in his service than be ten popes, that did not prevent him from secretly instructing his agents at Rome to press his claims to the utmost. Charles, however, paid Wolsey the sincere compliment of thinking that he would not be sufficiently subservient on the papal throne; while he wrote letters in Wolsey's favour, he took care that they should not reach their destination in time; and Wolsey failed to secure election both in 1521 and 1524. This ambition distinguishes his foreign policy from that of Henry VII., to which it has been likened. Henry VII. cared only for England; for France Wolsey's object was to play a great part on the European stage. The aim of the one was national, that of the other was occumencical.

In any case the decision taken in 1521 was a blunder. Wolsey's assistance helped Charles V. to that position of predominance which was strikingly illustrated by the defeat and capture of Francis I. at Pavia in 1525; and the balance of power upon which England's influence rested was destroyed. Her efforts to restore it in 1526-1528 were ineffectual; her prestige had depended upon her reputation for wealth derived from the fact that she had acted in recent years as the paymaster of Europe. But Henry VII.'s accumulations had disappeared; parliament resisted in 1523 the imposition of new taxation; and the attempts to raise forced loans and benevolences in 1526-1528 created a storm of opposition. Still more unpopular was the brief war with Charles V., in which Wolsey involved England in 1528. The sack of Rome in 1527 and the defeat of the French before Naples in 1528 confirmed Charles V.'s supremacy. Peace was made in 1529 between the two rivals without England being consulted, and her influence at Wolsey's fall was less than it had been at his admission to power.

This failure reacted upon Wolsey's position at home. His domestic was sounder than his foreign policy: by his development of the star chamber, by his firm administration of justice and maintenance of order, and by his repression of feudal jurisdiction, he rendered great services to the monarchy. But the inevitable opposition of the nobility to this policy was not
mitigated by the fact that it was carried out by a churchman; the result was to embarrass the antagonism of the secular party to the church and to concentrate it upon Wolsey's head. The control of the papacy by Charles V., moreover, made it impossible for Wolsey to succeed in his efforts to obtain from Clement VII. the divorce which Henry VIII. was seeking from Charles V.'s aunt, Catherine of Aragon. An inscription on a contemporary portrait of Wolsey at Aras calls him the author of the divorce, and Roman Catholic historians from Sanders downwards have generally adopted the view that Wolsey advocated this measure merely as a means to break England's alliance with Spain and confirm its alliance with France. This view is unblushing, and the whole nature of the ecclesiastical and national motives which lay behind that movement. There is no evidence that Wolsey first suggested the divorce, though when he found that Henry was bent upon it, he pressed for two points: (i.) that an application should be made to Rome, instead of deciding the matter in England, and (ii.) that Henry, when divorced, should marry a French princess.

The appeal to Rome was a natural course to be advocated by Wolsey, whose despotism over the English church depended upon an authority derived from Rome; but it was probably a mistake. It is said that when it was suggested in 1528, on the capture of Henry VIII. by Charles V., that England and France should set up independent patriarchates; and its success depended upon the problematical destruction of Charles V.'s power in Italy. At first this seemed not improbable; French armies marched south on Naples, and the pope sent Campeggio with full powers to pronounce the divorce in England. But he had hardly started when the French were defeated in 1528; their ruin was completed in 1529, and Clement VII. was obliged to come to terms with Charles V., which included Campeggio's recall in August 1529.

Wolsey clearly foresaw his own fall, the consequent attack on the church and the triumph of the secular party. Parliament, which he had kept at arm's length, was hostile; he was hated by the nobility, and his general unpopularity is reflected in Skelton's satires and in Hall's Chronicle. Even churchmen had been alienated by his suppression of monasteries and by his monopoly of ecclesiastical power; and his only support was the king, who had now developed a determination to rule himself. He surrendered all his offices and all his preferments except the archbishopric of York, receiving in return a pension of 100 marks (equal to six or seven hundred pounds in modern currency) from the bishopric of Winchester, and retired to his see, which he had never before visited. A bill of attainder, passed by the Lords, was rejected at Cromwell's instigation and probably with Henry's goodwill by the Commons. The last few months of his life were spent in the exemplary discharge of his archiepiscopal duties; but a not altogether unfounded suspicion that he had invoked the assistance of Francis I., if not of Charles V., and the pope, to prevent his fall involved him in a charge of treason. He was summoned to London, but died on his way at Leicester abbey on November 30, and was buried there on the following day.

The completeness of Wolsey's fall enhanced his former appearance of greatness, and, indeed, he is one of the outstanding figures in English history. His qualities and his defects were alike exhibited on a generous scale; and if his greed and arrogance were colossal, so were his administrative capacity and his appetite for work. "He is," wrote the Venetian ambassador Giustiniani, "very handsome, learned, extremely eloquent, of vast ability and indefatigable. He alone transacts the business which occupies the ambassadors and envoys of Venice, both civil and criminal; and all state affairs are managed by him, let their nature be what it may. He is grave, and has the reputation of being extremely just; he favours the people exceedingly, and especially the poor, hearing their suits and seeking to despatch them instantly." As a diplomatist he has had few rivals and perhaps no superiors. But his pride was equal to his abilities.

The familiar charge, repeated in Shakespeare, of having written *Ego et meus rex*, while true in fact, is false in intention, because no Latin scholar could put the words in any other order; but it reflects faithfully enough Wolsey's mental attitude. Giustiniani explains that he had to make pretend to the cardinal before he broached them to Henry, lest Wolsey "should resent the precedence conceded to the king." "He is," wrote another diplomatist, "the proudest prelate that ever breathed." He arrogated to himself the privileges of royalty, made servants attend him upon their knees, compelled bishops to tie his shoe-latches and dukes to hold the basin while he washed his hands, and considered it condescension when he allowed ambassadors to kiss his fingers; he paid little heed to their sacrosanct character, and himself laid violent hands on a papal nuncio. His egoism equaled Henry VIII.'s; his jealousy and ill-treatment of Ralegh, Pace, and other of his own adherents, are not without some failure, but vehemently denied by Dr. Brewer, has been proved by the publication of the Spanish state papers, and Polydore Vergil, the historian, and Sir R. Sheffield, speaker of the House of Commons, were both sent to the Tower for complaining of his conduct. His morals were of the lowest description, and he had as many illegitimate children as Henry VIII. himself. For his son, before he was eighteen years old, he procured a deanery, four archdeaconries, five prebends and a chancellorship, and he sought to thrust him into the bishopric of Durham. For himself he obtained, in addition to the archbishopric of England, a bishopric, the abbey of St. Albans, reputed to be the richest in England, and the bishopric first of Bath and Wells, then of Durham, and finally that of Winchester. He also used his power to extort enormous pensions from Charles V. and Francis I. and lavish gifts from English suitors. His New Year's presents were reckoned by Giustiniani at 15,000 ducats, and the emperor paid—or owed—him 18,000 livres a year. His palace outshone those of his king, and few monarchs could afford such a display of plate as commonly graced the cardinal's table. His foundations at Oxford and Ipswich were, nevertheless, not made out of his superabundant revenues, but out of the proceeds of the dissolution of monasteries, not all of which were devoted to those laudable objects.

That such a man would ever have used the unparalleled powers of ecclesiastical jurisdiction with which he had been entrusted for a genuine reformation of the church is only a pious opinion cherished by those who regret that the Reformation was left for the secular arm to achieve; and it is useless to plead lack of opportunity on behalf of a man who for sixteen years had enjoyed an authority never before or since wielded by an English subject. Wolsey must be judged by his deeds and not by doubtful intentions. During the first half of his government he materially strengthened the Tudor monarchy by the vigorous administration of justice at home and by the brilliance of his foreign policy abroad. But the prestige he secured by 1521 was delusive; its decline was as rapid as its growth, and the expense of the policy involved taxation which seriously weakened the loyalty of the people. The concentration of civil and ecclesiastical power by Wolsey in the hands of a churchman provided a precedent for its concentration by Henry VIII. in the hands of the crown; and the personal example of lavish ostentation and loose morals which the cardinal-archbishop exhibited cannot have been without influence on the king, who grew to maturity under Wolsey's guidance.

The Letters and Papers of Henry VIII., vols. i.-iv., supplemented by the Spanish and Venetian Calendars, contain almost all that is known of Wolsey's public career, though additional light on the divorce has been thrown by Stephen Eves' *Römische Dokumente* (1893). Cavendish's brief *Life*, which is almost contemporary, has been often edited. Fidele's huge tome (1724) is fairly exhaustive. Bredekamp, in his claim to the editorship of the *Chronicles* as *his History of the Reign of Henry VIII*., originated modern admiration for Wolsey; and his views are reflected in Creighton's *Wolsey*. See also the "Twenty architectural and historical articles" in Dr. Gardiner's careful articles in the *Dict. Nat. Biog., and Cambridge Modern History*. A less enthusiastic view is adopted in H. A. L. Fisher's volume (v.) in Longmans' *Political History* (1906) and in E. A. Pollard's *Henry VIII*.(1902 and 1905).

WOLTER, CHARLOTTE (1834-1897), Austrian actress, was born at Cologne on the 1st of March 1834, and began her artistic career at Budapest in 1857. She played minor parts at the Karl
WOLVERHAMPTON, VISCOUNT—WOMBAT

781

theatre in Vienna, and soon obtained an engagement at the Victoria theatre in Berlin, where she remained until 1861. Her performance of Hermione in the Winter's Tale took the playgoing world by storm, and she was given in 1862 an appointment at the Vienna Hofburg theatre, to which she remained faithful until her death on the 14th of June 1897. According to her wish, she was buried in the costume of Iphigenia, in which role she had achieved her most brilliant success. Charlotte Wolter was one of the most successful of steam engines. Her principal views included Medea, Sappho, Lady Macbeth, Mary Stuart, Preciosa, Phèdre, Adrienne Lecouvreur, Jane Eyer and Messala, in which character she was immortalized by the painter Hans Makart. She was also an inimitable exponent of the heroines in plays by Grillparzer, Hebbel, Dumas and Sardou.

See Ehrenfeld, Charlotte Wolter (Vienna, 1887); Hirschfeld, Charlotte Wolter, ein Erinnerungsbuch (1897).

WOLVERHAMPTON, HENRY HARLEY FOWLER, VISCOUNT (1830— ), English statesman, was born at Durham on the 16th of May 1830. He held the office of mayor of Wolverhampton, and coming of a Liberal nonconformist family took a prominent part in politics. In 1858 he was elected Liberal member of parliament for Wolverhampton, and was re-elected for the east division at successive contests. In 1884—1885 he was under-secretary for the Home Office, and in 1886 financial secretary to the treasury. In Mr Gladstone's 1892—1894 ministry he was president of the local government board, and in Lord Rosebery's cabinet, 1894—1895, secretary of state for India. In these and the succeeding years of opposition he was recognized as a sound economist and a honest administrator, as well as a universally respected representative of nonconformist views. In Sir Henry Campbell-Bannerman's cabinet, 1905—1906, he was chancellor of the duchy of Lancaster, and he retained this office in Mr Asquith's ministry, but was transferred to the House of Lords with a viscountcy (April 1908). He retired in 1910. His daughter, Ellen Thorneycroft Fowler, who married Mr A. L. Felkin in 1903, became well known as a novelist with her Concerning Isabel Carnaby (1898) and other books.

WOLVERHAMPTON, a market town, and municipal, county and parliamentary borough of Staffordshire, England, 195 m. N.W. from London by the London & North-Western railway, served also by the northern line of the Great Western and by a branch of the Midland railway. Pop. (1891) 82,622; (1901) 94,187. It lies at the north-western edge of the group of great manufacturing towns extending S.E. to Birmingham, but there are pleasant residential suburbs to the west, where the country is rich and well wooded. The situation is elevated and healthy. The church of St Peter is a fine cruciform building, with S. porch and central tower. The lower part of the tower and the S. transept date from the 13th century; the nave, clerestory, upper part of the tower and N. transept from the 13th; the chancel was rebuilt in the restoration, completed in 1865, with an apsidal termination. The chief public buildings are the town hall (1871), exchange, agricultural hall, free library and theatres. A large free grammar school, founded in 1542 by Sir Stephen Jermys, a native of the town and alderman of London, occupies modern buildings (1876). There are a Blue Coat school (1710) and a school of art. The benevolent institutions include a general hospital, the eye infirmary, orphan asylum, nursing institution and institute of the society for outdoor blind. In Queen Square is an equestrian statue of Albert, Prince Consort, unveiled by Queen Victoria in 1866, and on Snow Hill a statue (1879) of Charles Pelham Villiers. There are parks on the east and west of the town, and a new racecourse (1887) replaces that formerly on the site of the west park. In the district S. and E. of Wolverhampton (the Black Country) coal and ironstone are mined. Ironmongery and steel goods of all kinds, especially locks, machinery, tools and cycles, are produced; there are also tin and zinc works. Large agricultural markets are supplied from the districts W. and N. of the town. An annual fair is held at Whit Sunday. In 1902 an industrial and art exhibition was held. The parliamentary borough of Wolverhampton has three divisions, each returning one member. The town is governed by a mayor, 12 aldermen and 36 councillors. Area, 3525 acres. Wednesfield (pop. 4883), Heath Town or Wednesfield Heath (9441) and Wilhenhall (18,545) are neighbouring urban districts, with populations employed in the manufacture of locks, keys and small iron goods, in iron and brass foundries, varnish works, &c.

The town of Wolverhampton (Handone, Wolverhampstone, Wolverhampton) seems to have grown up round the church of St Mary, afterwards the royal free chapel of Wolverhampton, probably founded in 906 by Wulftruna, widow of the earl of Northampton, who in that year endowed it with extensive lands. The estates of the clerks of Handone are enumerated in Domesday. In 1204 John granted the manor of Wolverhampton to the church, and at the Reformation it was held by the dean of the collegiate body; in 1553 Edward VI. granted the college and manor to Dudley, duke of Northumberland, but Mary, at the beginning of her reign, refounded the college and restored to it its property, and this arrangement was confirmed by Elizabeth. Henry III. (1279) granted the Wednesday market, which is still held, and a fair for eight days, beginning on the eve of the feast of SS. Peter and Paul (June 29). During the Great Rebellion the sympathies of Wolverhampton were royalist. In 1645 it was for a time the headquarters of Prince Rupert, while Charles I. lay at Bushbury to the north. At the end of the 17th century the market was esteemed the second market in the county. An account of Wolverhampton published in 1751 stated that the chief manufacture was locks, "here being the most ingenious locksmiths in England," and attributed the slow growth of the town to the fact that most of the land was church property. Wolverhampton was incorporated in 1848 as a municipal borough. It was not represented in parliament until after the passing of the Reform Bill (1832), under which it returned two members until in 1885 the representation was increased to three. The county borough dates from 1888.

WOLVERTON, a town in the Buckingham parliamentary division of Buckinghamshire, England, near the river Ouse, 524 m. N.W. by N. of London by the London & North-Western railway. Pop. (1901) 5331. Its modern growth and importance are the result of the establishment of carriage works by the railway company. There are also printing works. A steam tramway connects the town with the old market town of Stony Stratford on the Ouse, 2 m. W.

WOMBAT, the title of the typical representatives of the marsupial family Phascolomyidae (see Marsupialia). They have the dental formula: i, 1, c, 0, p, 2, m, 3; = 24. All the teeth are of continuous growth, having persistent pulps. The incisors are large and chisel-like, much as in rodents. The body is broad and depressed, the neck short, the head large and flat, the eyes small and the tail rudimentary and hidden in the fur. The

Tasmanian Wombat (Phascolomys urinans).
limbs are equal, stout and short. The feet have broad, naked, tuberculated soles; the forefeet with five distinct toes, each furnished with a long, strong and slightly curved nail, the first and fifth considerably shorter than the other three. The hindfeet have a very short nailless first toe; the second, third and fourth toes partially united by integument, of nearly equal length; the fifth distinct and rather shorter; these four are provided with long and curved nails. In the typical group of the genus Phascolomys we find the following characters: fur rough and coarse; ears short and rounded; muzzle naked; postorbital process of the frontal bone obsolete; ribs fifteen pairs. Vertebræ: C. 7, D. 15, L. 4, S. 4, Ca. 10-12. The wombat of Tasmania and the islands of Bass's Straits (P. urinus), and the closely similar but larger P. platyrhinus of the southern portion of the mainland of Australia, belong to this group. On the other hand, in the hairy-nosed wombat (P. latifrons) of Southern Australia, the fur is smooth and silky; the ears are large and more pointed; the muzzle is hairy; the frontal region of the skull is broader than in the other section, with well-marked postorbital processes; and there are thirteen ribs. Vertebræ: C. 7, D. 13, L. 6, S. 4, Ca. 15-16.

In general form and action wombats resemble small bears, having a somewhat similar shuffling manner of walking, but they are still shorter in the legs, and have a broader and flatter back. They live entirely on the ground, or in burrows or holes among rocks, and feed on grass, roots and other vegetable substances. They sleep during the day, but wander forth at night in search of food, and are shy and gentle, though they can bite strongly when provoked. The only noise the Tasmanian wombat makes is a low hissing, but the hairy-nosed wombat is said to emit a short quick grunt when annoyed. The prevailing colour of the last-named species, as well as P. urinus of Tasmania, is brownish grey. The large wombat of the mainland is variable in colour, some individuals being pale yellowish brown, others dark grey and some black. The length of the head and body is about 3 ft. Fossil remains of wombats, some of larger size than any now existing, have been found in caves and Pleistocene deposits in Australia.

WOMBWELL, an urban district in the Barnsley parliamentary division of the West Riding of Yorkshire, England, 4 m. S.E. of Barnsley, on the Great Central and Midland railways. The inhabitants are chiefly employed in the extensive collieries. Pop. (1901) 13,252.

WOMEN. The very word "woman" (O. Eng. wifmann), etymologically meaning a wife (or the wife division of the human race, the female of the species Homo), sums up a long history of dependence and subordination, from which the women of to-day have only gradually emancipated themselves in such parts of the world as come under "Western civilization." Though married life and its duties necessarily form a predominant element in the woman's sphere, they are not necessarily the whole of it; and the "woman's movement" is essentially a struggle for the recognition of equality of opportunity with men, and for equal rights irrespective of sex, even if special relations and conditions are willingly incurred under the form of partnership involved in marriage. The difficulties of obtaining this recognition are obviously due to historical causes combined with the habits and customs which history has produced.

The dependence position of women in early law is proved by the evidence of most ancient systems which have in whole or in part descended to us. In the Mosaic law divorce was a privilege of the husband only; the vow of a woman might be disallowed by her father or husband, and daughters could inherit only in the absence of sons, and then they must marry in their tribe. The guilt or innocence of a wife accused of adultery might be tried by the ordeal of the bitter water. Besides these instances, which illustrate the subordination of women, there was much legislation dealing with, inter alia, offences against chastity, and marriage of a man with a captive heathen woman or with a purchased slave. So far from second marriages being restrained, as they were by Christian legislation, it was the duty of a childless widow to marry her deceased husband's brother. In India subjection was a cardinal principle. "Day and night must women be held by their protectors in a state of dependence," says Manu. The rule of inheritance was similar, that is, descent traced through mother to the exclusion of females. The gradual growth of stridhana, or property of a woman given by the husband before or after marriage, or by the wife's family, may have led to the suite, for both the family of the widow and the Brahmands had an interest in getting the life estate of a woman out of the way. Women in Hindu law had only limited rights of inheritance, and were disqualified as witnesses.

In Roman law a woman was even in historic times completely dependent. If married she and her property passed into the power of her husband; if unmarried she was (unless a vestal virgin) under the perpetual tutelage of her father during his life, and after his death of her agnates, that is, of those her kinsmen by blood or adoption who would have been under the power of the common ancestor had he lived. Failing agnates, the tutelage probably passed to the gens. The wife was the purchased property of her husband, and, like a slave, acquired only for his benefit. A woman could not exercise any civil or public office. In the words of Ulpiian, "feminae ab omnibus officiis civilibus vel publicis remotae sunt." A woman could not own property in her own name, for she was "capitalis familiae," and a wife could not be a witness, surety, tutor, or curator; she could not adopt or be adopted, or make a will or contract. She could not succeed ab intestato as an agnate, if further removed than a sister. A daughter might be disinherited by a general clause, a son only by name. On the other hand, a woman was privileged in some matters, but rather from a feeling of pity for her bodily weakness and presumed mental incapacity than for any more worthy reason. Thus she could plead ignorance of law as a ground for dissolving an obligation, which a man could not as a rule do; she could accuse only in cases of treason and witchcraft, and she was in certain cases exempt from torture. In succession ab intestato to immovable property Roman law did not, as does English, recognize any privilege of males over females.

Legal disabilities were gradually mitigated by the influence of fictions, the praetor's equity and legislation. An example of the first was the mode by which a woman freed herself from the authority of her tutor by fictitious cession into the authority of a tutor nominated by herself, or by sale of herself into the power of a nominal husband on the understanding that he was to come to her as a free person, who then manumitted her. The action of equity is illustrated by the recognition by the praetor of cognatic or natural as distinguished from agnatic or artificial relationship, and of a widow's claim to succeed on the death of her husband intestate and without relations. Legislation, beginning as early as the Twelve Tables, which forbade excessive mourning for the dead by female mourners, did not progress uniformly towards enfranchisement of women. For instance, the Lex Voconia (about 169 B.C.), called by St Augustine the most unjust of all laws, provided that a woman could only be instituted heir to a man who was registered as owner of a fortune of 100,000 asses. A constitution of Valentinian I forbade bequests by women to ecclesiastics. But the tendency

1 But in the earliest extant code, however, that of Khammurabi, the position of women was free and dignified. See Babylonian Law.

4 Numb. xxvii., xxxvi.
5 Ch. ix. 2 (Sir W. Jones's translation).
6 Whether this was the oldest rule of inheritance has been much debated. That birth of a child gave the mother certain legal rights in a primitive stage of society is the view of many writers. See especially Das Mutterrecht of J. J. Bachofen (Budapest, 1880).

9 Ibid.
10 Imbecillitas is the term used more than once in the texts of Roman law.
11 The way in which this law was evaded was by non-enrolment of the testator in the census (see Montesquieu, Esprit des lois, bk. xxvii.). Another way was by leaving her the inheritance by fiduciario-missum (see Trust).
of legislation was undoubtedly in the direction indicated. Adoption of women was allowed by Diocletian and Maximian in 291. The tutelage of women of full age was removed by Claudius, and, though afterwards in part revived, has disappeared by the time of Justinian. This implied full testamentary and contractual liberty. In regard to the separate property of the married woman, the period of dux had by the time of Justinian long superseded the period of manus. The result was that, in spite of a large number of legal provisions intended to be protective or restitutive to a will or contract, of a wife to make a gift to her husband, of a widow to marry within a year of her husband's death, the position of women had become, in the words of Sir H. Maine, "one of great personal and proprietary independence." For this improvement in their position they were largely indebted to the legislation of the Christian emperors, especially of Justinian, who prided himself on being a protector of women.

The following are a few of the matters in which Christianity appears to have made alterations, generally but perhaps not always improvements, in the law. As a rule the influence of the church was exercised in favour of the abolition of the disabilities imposed by the older law upon women. In many cases, the increased facilities for entering a profession religious life, and of due provision for the wife. The church also supported the political power of those who were her best friends. The Church of Palmyra supported the clergy who rendered the Jewish worship illegal. The law had long endured in the days of the pagan empire. Other cases in which Christianity probably exercised influence may be briefly stated.

1. All differences in the law of succession ab intestato of males and females were abolished by Justinian. (Cod. 1, 2.)
2. The right of widows and their grandmothers as tutors was sanctioned by the same emperor. (5. 3. 1.)
3. He extended to all cases the principle established by the Senatus Consultum Taurullianum (158), enabling the mother of three (if a freewoman four) children to succeed to the property of her children who died intestate, and gave increased rights of succession to a widow. (5. 4.)
4. The restrictions on the marriage of senators and other men of high rank with women of low rank were extended by Constantine, but almost entirely removed by Justinian. (5. 2. 1.)
5. Second marriages were discouraged (especially by making it legal to impose a condition that a widow's right to property should cease on re-marriage), and the Lex Hierosolymitana (157) prohibited marriages for the second time in a century, marriage, punishable. (6. The same constitutions made the bar to marriage a necessary part of the ceremony of marriage. 4)
