

# FISHING, TACKLE AND KITS

Practical Information on Game Fish: How  
to Catch Them; the Correct Tackle  
and How to Use It

Say, fellow, if you are among the lucky ones who have a wife, take her along with you out in the glorious paths of nature, lead her into the walks of the great out-o'-doors, take her along the water trails, the running stream, the placid lake. She will make a pal that is a pal and great will be the joy of the evening campfire with your mate under the starlit blue bowled sky as the moon shoots down its beams o' silver, only to be broken into countless particles by the restless lake waters.

When Mrs. Dixie came trotting up the trail with this nine and a half pound pike after a fifteen minute battle, all by her lonesome, in a cranky canoe, say, fellow, the smile on her face was worth a million. Take friend wife along next time, old timer, make an angler out of her, you'll find her a dead game sport on trail, in camp, rain or shine.

## FOREWORD

*Dear Dixie:*

When the wild and rabid fishing fan secures a toe-hold on one of your books and spreads himself out on the over-stuffed sofa preparatory to a feast of piscatorial reason and flow of soul, he cares little if anything about prefaces, preambles, prologues, introductions, and the like; to him these things are nothing more than the sprigs of parsley ornamenting a sirloin steak. What he wants is the real meat, so he brushes aside all such paltry decorations and immediately plunges into the delights of masticating the substantial food you offer him.

Yet it is possible that, when his appetite is for the moment appeased, and he gives himself up to the languid pleasures of digesting what he has read, he may turn idly to the frothy and frivolous paragraphs of a foreword. It is for this reason that these words are written. It is possible, too, that a natural curiosity causes him to wonder what manner of man it really is that has prepared for him the delicious morsels, the delectable tid-bits on which he has just fed, and he desires a more intimate knowledge of that man's personality. In other words, he

fain would take a peep behind the scenes and see the wheels revolve, as it were. And having played Watson to your Holmes for, lo, these many years, I am, perhaps, not altogether unqualified to guide him.

A word picture of you seems superfluous, since the frontispiece of your last book, "Lake and Stream Game Fishing," carries a smiling, if not speaking likeness of yourself, and I understand that this book has enjoyed a very wide circulation. One of the striking features of this frontispiece, by the way, is the splendid set of teeth you reveal therein, and I trust I am violating no conventionality in stating that I know them to be of original growth and not a factory product.

The smile already referred to would seem to indicate that you are a person of jovial disposition, and I am prepared to take oath that such, indeed, is the case. Only once have I known you to lose your invariable good humor. The occasion was when a certain game-hog wrote you a bragging account of the hundred and odd ducks he had killed in a single morning, winding up his letter with the statement that his gun didn't shoot as close as it used to, and what should he do to keep the shot from scattering?

Never shall I forget the terrible frown that mantled your brow as you dictated the reply: "Use one shot!"

My earliest information concerning your intense interest in all things piscatorial was gained from an incident related by your father. It seems that the cat boat from which the two of you were fishing on Chesapeake Bay overturned and subjected you both to an involuntary cold bath. Then as dad swam ashore, with son perched on his back, you had the sublime nerve to call his attention to a school of fish loafing near by and to remark that if your landing net had not gone down when the boat upset, you would bet you could get a dozen of 'em at one swipe. From that time forward, I am told, you have been fishing or telling other people how to do it.

Coming down to a more personal knowledge of your tastes and habits, it may not be out of place to state that, so far as I have been able to judge, your favorite feed is baked beans, your favorite drink a seltzer lemonade, and your most favored indulgence a cat nap of perhaps a quarter of an hour after a session with the aforesaid beans. One habit of yours alone invites my criticism and, I regret to say, my deep resentment: this is the little trick you have of tossing about in bed like a derelict tramp steamer on a storm-swept sea and planting your icy feet with unerring accuracy in the small of your bunkie's back. But we all have our frailties, and I am not revealing this shortcoming of yours to the world so much with the idea of giving you a

knock as to be accurate and faithful in my rôle of biographer.

As to your knowledge of all that pertains to fish and fishing, and your delight in the great out-of-doors world, your books and articles speak for themselves. But it may be of interest to some to know that in the preparation of these writings your methods are somewhat unique, in that you are just as liable to rouse the rest of the bunch in camp by getting up in the middle of the night, lighting the old oil lamp, and scribbling away on pieces of birch bark until dawn, as to switch on the electric current at home and pound away for interminable hours on the noiseless typewriter which the other member of your firm long ago insisted was a necessary adjunct to her peaceful slumbers.

Having had the privilege of reading the manuscript of your latest book before it went to press, I feel certain that a perusal of it will enable even the oldest hands at the fishing game to fatten their batting averages. Here's hoping that they do so, that they make a lot of home runs, and that their fouls may be few and far between.

Faithfully yours,

ROBERT H. MOULTON.

## PREFACE

There is a reason for everything. The reason for this book, following "Lake and Stream Game Fishing" is that it may be the encouraging of the tyro to follow the call of the out-o'-doors. If it but starts one more fellow to the water trails it will have done some good, if it makes the pleasures of fishing more enjoyable to others it will have done more than its duty.

Fellows of the rod and gun, brothers of the outland trails, men of the quiet camp-fires, hear me now you all who know the teasing whisper of the wind as it soughs through the pines, the laughing voice of the fast-running stream waters, the quiet murmur of the placid lake as the waves kiss the moonbeams sent down from the starlit sky above, the deep silence of the nightlands of the out-o'-doors, you are the chosen children within whose being beats the heart that is true and from within come thoughts that are pure and golden.

No man can commune with nature without being bettered thereby, no man can view the wonderful work of the Great Architect without a keener understanding of his greatness. The out-o'-doors is

a great church, it preaches a sermon to every man every time he has a chance to sit right up in the front row. The follower of the call of the outlands is a man every time and true blue, he is on the square and can look you in the eye without dropping the lids.

Let my prayer be always that my friends may be from the ranks of the keen fellows who know the yearning call of the red gods, from the ranks of the fellows who sneak away every chance they get to whip a lake or stream, or hike along the woodland trails, fellows who give you the glad hand of true friendship with a grip that you feel and know is coming from the heart. Kismet!

*Dixie Carroll*

## INTRODUCTION

It seems funny to introduce Dixie to the anglers. He has been writing outdoor stuff for so long and through so many sources that it seems that all anglers must know him.

As editor of the leading sportsman's magazine, the *National Sportsman*, and fishing editor of the *Chicago Daily News* as well as some fifty other large metropolitan newspapers from coast to coast, Dixie has no doubt developed the fishing bug in more people than all other writers in the past ten years.

The outdoors is a teacher, a leveler. It shows us just what a minute atom we are in the world. Nature is great and wonderful and it brings us back to the cities, cleaner, better citizens. To become one of nature's children is an opportunity that should never be neglected and to follow the teachings of one who has communed with old Dame Nature herself and learned her secrets of forest, lake and stream, will mean much more pleasure to be derived therefrom.

May your old one-lunged typewriter never become rusty, Dixie, and may you pound out many

more breezy, "pal to pal" stories of the outlands along water trails, not only for the enjoyment of the embryo angler, but also for us old-timers.

Sincerely,

DON LEIGH,  
Fishing Editor,

Chicago *Evening Journal*.

Chicago, Nov. 27, 1919.

# FISHING, TACKLE AND KITS

## THROW BACK THE "LITTLE FEL- LERS"

### OUR CREED.

"To encourage the re-stocking of lakes and streams; to advocate the observing of all fishing laws; to throw back uninjured the undersized fish; to catch game fish in a sportsmanlike manner with rod, line and reel, in order to make the sport of fishing better in the years that follow."

It's a great little game, this fishin,' old-timer, and while much has been written for the beginner on the "how" of landing the game fins, little has been written on keeping up the supply. When we lope out to the fishing waters we have the deep-seated desire to come back and dangle a few big fellows before our admiring friends and shoot a line of bull on the wonderful fight the game fin put up in his efforts to outmatch our tackle skill with his wily craftiness and antihook knowledge.

Every keen fellow who answers to the call of the water trails knows that there is more in fishing than

the mere landing of the underwater veterans. In the spring the wonderful greening up of the trees and underbrush strikes a responsive chord in the angler and the budding outdoors shoots a rapid-fire tingling into the jaded nerves, suffering from a long winter's session with the steam radiators, movies, and dodging the high cost of living. Right through until old lady Nature brilliantly mints the leaves in countless tints of gold the pulsebeat of the fisherman throbs in unison with the great spirit of the outdoors. The whispering of the wind in the pines, the laughter of the rushing stream waters, the flash of the dying sun on the quiet lake, the plaintive call of the loon as the moon shoots down its beams amid the silence far greater than you have ever experienced in the walled-up cities builded by man. These are all the heritage of the fisherman and are a few of the wonders that make the sport more than a mere matter of getting the fish.

#### GREAT CHEST DEVELOPER

Of course, old man, regardless of the pleasures of the outdoors, very few if any of the knights of the arching rod and humming reel like to come home without a fair-sized creel or stringer. It is part of the game for the victor to come swaggering in with the spoils of battle, it makes everyone feel better, the pals think you are "some" fisherman, the wife proudly flaunts the string before the neighbors and

you yourself throw another outward and upward angle to the chest when you look 'em over for the last time before they hit the frying pan.

Every true sportsman who angles for the game fins wishes to make the sport better each year so that he can enjoy it and lead his friends into the walks of the outdoors that they may become fellow craftsmen of the cleanest of recreations. And to keep fishing on the up-move there is one little old rule that every fisherman should follow to the last card, and that is to throw the "little fellers" back. These small, inquisitive youngsters have never had the expert training to enable them to evade the barbed hook, and they generally take a wallop at the lure, because they don't know any better. It isn't sport to land 'em, and if you toss the little rascals back into the wet, maybe they will grow up into a sure-enough old "he-whop" with a kick in his tail like a sick mule, and great guns, man, you may be the lucky dog to hook 'im later when he puts up the grand old fight of the foxy underwater warrior, that sets the thrills to racing through the veins and the short jumps climbing up the backbone.

#### NIX ON THE TAPE MEASURE

There sure is no place in the gang for the fisherman who stretches the tail and pulls the mouth of the fish in order to get just enough length to work 'em into the legal limit — the tape-line fisherman is in a

class by himself, and don't ride with the big crowd. There are generally plenty of big ones in waters where the little fellers live, only sometimes it takes a bit keener work to coax them into the air — but when they do strike, old scout, the battle is worth the wait, and perhaps to this plunging, rushing fight you can thank some other fisherman for throwing back the little feller.

Above is the creed of the American Anglers' league, an organization with members all over the country, and this creed is the entire object of this body of followers of the water trails. Any fisherman, anywhere, may become a member by agreeing to hold up the creed and call it to the attention of other anglers he may meet in whipping stream or lake. It carries the fellowship of the outdoors and each member is an advocate of the laws to protect the finny tribe so that their number may increase and their size make 'em fit for the heavy-weight class.

#### MAKE FISHING BETTER

Every fisherman in this neck of the waters should join in this movement to make his favorite sport better in every way. The restocking of lakes and streams, with regularity would make of any "civilized" waters mighty good fishing, and then to follow the American Anglers' league creed would keep those waters in good shape from year to year. The large number of fellows who would get acquainted

with the sport of fishing through this work, would enjoy a close-up of old Dame Nature that would make for better citizens and give them a dash of " pep " that would make them face the daily battle with a flash to the eye and a spring to the step.

As the seasons open, old-timer, the boys will begin their pilgrimages to the waters in quest of the shining golden fleece, and here's hoping they wear as a brassard this clean-cut creed of the true sportsman, and that they have luck on lake and stream and uphold this creed as their creed so that the days of angling may be better now and in the years that follow.

## BASS FISHING O'NIGHTS

Old-timer, have you ever lounged back on the close-packed sod, with your favorite jimmy pipe doing its bit to soothe your nerves, old Dame Nature turning out the lights and closing up things for the day? The camp-fire just hittin' it up on low, with a star shootin' down here and there in the blue-bowled sky and the jeer of an idiot loon breaking the silences of the wonderland; then off to starboard you hear a splash and a flop in the water, then another and many of them. Doesn't it make your sporting blood tingle as the old "he-whops" do their sonata of the evening waters? It's music to your ears, this overture of the flopping bass as they do an "Annette Kellermann" after a fleeing minnow, and it sure is a winning bet that you are overlooking some real sport in the fishing game if you do not slip into your canoe and meet the advancing enemy half way and take a flier at night-casting. For a line of sport that has more thrills tacked onto it than any other angle of the game, night-casting has the rest of the herd eating grass at the starting post.

Many of the clan of the arching rod and the singing reel have overlooked this five-reel thriller and

thereby missed a session with a set of nerves they never knew was a part of their system. If, on your first night-casting expedition, you don't experience a series of jumps and kicks to your vertebra that shoots the tingles and joythrobs racing through your veins, you are of a different make-up than the ordinary old scout who follows the gladsome call of lake and stream.

Pick out a nice little bay where the waters run into shallows shorewards, the kind of a bay where the minnows are at home, and give this little old bay a close once-over, locating a point at which to anchor your craft for your night foray on the playful bass as they gorge on the little "fellers." As the day-shadows begin to lengthen into dusk, quietly work your boat to the anchorage, which should be selected for casting on all sides, drop your anchor and take your time, old scout, slip into an easy position and dream a few dreams of other days. Soon enough you'll hear a splash off to the left near the weed patch, make your cast and zing! he strikes. In the excitement you give him the butt and he breaks water just off there in the distance, and you play him up to the net with a thrill that gives you new life. Take a bit of time now, don't rush the game. As things darken up and you cannot distinguish the shore line nor the windfalls and weed-beds, the mystery of the game begins to work into your system, and at the next splash of the leaping bass your cast goes out,

perhaps a bit short or a little overshot, because of the excitement of the game, but he strikes, and now, with the real simon-pure black night encircling you, you have a real piece of work cut out for your skill in the fishing game. You niggardly give him a bit of line and clamp on the thumb as he steals for the underwater snags, and you reel him in as the cold sweat beads on your forehead at the mystery of the game. As you net this old veteran of the watery recesses, you just about lose all control, as the next flop comes right beside the canoe; then there are flops all around you and the work starts in earnest, as you hope to remember the lay-out of the bay and trust to luck and the nine gods as you swing a cast off into the blackness around you, which is punctured here and there by the splashes of the game fins in their playful feeding.

My first shot at the real dark night-casting was an accident, and the sport was so fine that it made a regular nighter out of me. But I hit the game without any preparation, and the excitement of that night remains as the most thrilling experience of my fishing life. A good old pal and myself were making camp after a fairly fine piece of late-evening fishing. Things had darkened up a bit and we were slowly slipping along the water, trying to pick out our course without hitting more than the usual number of snags and windfalls. Fact is, we had lost our bearings and were trusting to luck and instinct to

make camp without an accidental wetting, when off to the right the big flop of a man-sized fish sent a thrill through our nerve centers. The pal made a cast off in the direction of the splash; the immediate strike came like a battering ram, and as he played him up to the canoe, with a couple of breaks to the air, my own nerves took a few jumps when I slipped the net down under him. And say, old-timer, when we lamped this large-mouth, that tipped the scales at seven and a quarter pounds, and heard his pals doing their jig on the top o' the water, we were both as crazy as loons. Right away we shot two casts that developed as nice a pair of back-lashes as ever fell to the spool of a reel. Plump in the middle of a bass family and the reel tied up with a twisted bunch of line, we both had strikes and pulled them in hand over hand, and the rest of the casts were made by swinging the plug around in a circle and letting it fly out among the floppers. Of course this style of casting was not ethical, as it were, but whoinell can be ethical with the pulse doing about 106 and a bunch of the bass trying to jump into the canoe to bite your fingers off? The canoe was a jumbled-up mess of lines, plugs, nets and fish, but the climax came when a big pike took the pal's plug, and started in on a bunch of fancy tricks right close up to the canoe. For twenty minutes we had a great old time trying to land this "regular" guy without taking a Brodie into the drink. For a bunch of thrills, this

was sure a great producer, and when we finally made camp we were dyed-in-the-wool night-casters, but we were strong for preparedness for that kind of stuff in the future. We decided that the right kind of tackle was the "safety-first" of this night stuff, and that night-casting had more punch to it than all the rest of the game put together.

## NIGHT-CASTING TACKLE

There are two kinds of night-casting, either of which are sure-fire winners. Moonlight night, and the simon-pure black night, both good fishing-time with a winning kick to the inky-black affair as the real thrill producer. For moonlight-casting you can let your canoe glide along the outer edges of most any bay or cove and cast into the shore and cover considerable water, but for the black night, with just the stars burning out here and there, you must select your fishing waters during the day and study them well, because your casting is going to be a bit of judgment on your part without any helpers along the side lines to give you distance and locations.

For night-casting a great deal depends upon the tackle, and it would be simply playing tag with fate to use a nifty bamboo rod for this sport; at times you must give the butt and do a bit of pumping, and who wants to subject a pet split-bamboo to such rough usage? Make the rod a steel one, and one that has plenty of backbone and stiffness. Long casts are not at all necessary, and a good stiff steel rod will tickle a fighting bass behind the gills with more success than any other kind, and do the job

without suffering any during the operation. Should you by any species of luck hook a pike, or, great guns!— a musky, there is quite a bit of satisfaction out there in the black darkness to have your paws wrapped around a good stiff old steel rod, and get the lay right, old-timer, you'll need all the help a good strong rod can give you to bring a life-sized roughneck to gaff when you cannot tell whether he's coming to you or making a drive for the far end of the lake.

In the matter of reels it is a choice between the Anti-back-lash or the level winders, unless, of course, you feel like doing a bit of knitting and cussing in the great old handicap of backlashes. Between the self-thumbng reel and the level-winder there is not much choice, as they both are the real stuff for the night game. The ideal reel, however, for night-casting is the tool that combines both of these features, and two reels in this class that stand out like "four of a kind" are the Beetzsel and the Pflueger-Supreme. Either of these reels makes night-casting a pleasant occupation. The South Bend Anti-back-lash and the Pflueger-Redifor Anti-back-lash are good workers in the self-thumbng line, and the Shakespear level-winder is an excellent tool for night use.

The fifteen-pound test line is plenty strong enough and the soft-braided No. 6 silk casting-line used for general casting is about right, although a line testing

at twenty to twenty-five pounds is not amiss if you are fishing in waters inhabited by the big fellows. And just chalk this up on the score-board, the big fellows are great night feeders. This is especially so in the warm summer nights, at which time some of the larger fish are brought to gaff.

As to the plugs for this end of the game, your selection should be entirely of the surface or semi-surface variety, as the underwater lures are taboo, they have too much of an inclination to slip down to the bottom and lovingly cling to any old thing they can hook onto. And then, again, why use an underwater plug when the fish are all flopping around on the surface? For the real dark nights, the all-white lures are the best, and particularly those coated with the luminous enamel which glows like the dampened head of an old-style parlor match. Let a couple of these luminous plugs lie out in the sunlight for a short time, or expose them to the glow of your camp light before paddling out to your fishing waters, and the glow they shoot off in the darkness will make any flopping bass curious enough to give them a wallop. Not only do they help the bass to become interested, but you can see them yourself at considerable distance and keep in touch with your lure as it wobbles in through the black.

That these luminous plugs are the real stuff was shown to me quite vividly last season when on a little night-casting jaunt. I threw a walloping cast over

towards a fairly loud splash and succeeded in twining my line around the limb of a windfall that stuck up out of the water, the plug dancing in the air about six inches from the surface of the water. This wiggling plug was too much for an over-zealous bass; it sort of got his scales all ruffled up, and he up and strikes that Pflueger-Surprise minnow, hooking himself. He sure cut up a bunch of tricks, half in the water and the rest up in the air. He kicked up such a rough-house that another bass joined him in the fight for the shining plug. I find, also, in the plug line, that the surface bait which kicks up a little ruffle as it reels in makes an added attraction, although most of the strikes are made by the fish as the plug hits the water, or very soon after the splash, in fact, a good-sized splash when the lure strikes the water helps show 'em the way, and how easy it is to locate the bait. A mighty good plan is to either use all weedless hooks on your plugs or to substitute the trebled hooks with the twin hooks which ride points up. In this way you will avoid a lot of trouble, especially if the waters you fish are weedy or full of snags. Of course you may not hook all your fish, but you will not haul in a mess of weeds every shot, and who ever had a fish strike a lure when it was buried in a litter of straggling weeds?

Here are a bunch of spoons and spinners that are all good attractive lures for bait casting. Natural baits such as the minnow, frog, pork rind or chunk are assisted greatly as a lure when used with a spoon or spinner in bait casting.

No. 1 is a Skinner white enameled spoon with tail hook; No. 2 a South Bend Bucktail spinner with a sinker and weedless; No. 3 a Becker-Sheward "Been There" weedless spinner with tying rig for frog and twin trail hooks; No. 4 a Joe Pepper spinner; No. 5 a Jamison Shannon Twin Spinner; No. 6 a Al Foss Pork Rind Minnow; No. 7 a Pflueger Lowe-Star spoon; No. 8 a Hildebrandt Slim Eli Spinner with fly; and No. 9 a Prescott Spinner.

A layout of twirls and spins that ought to attract most any game fish and effective in lake and stream casting. Right for any tackle box and well made stuff.

1. There was a number of small and medium sized  
trapping lines for the evening. Several pairs of the animals  
were seen to be in the traps. The traps were set in the  
usual places and were baited with the usual bait.

## NIGHT WATER WORK

The white plug and the luminous affairs have it all over the other colors, but here is a little tip that is worth trying out on your first moonlight casting trip this season. If you have ever indulged in the pleasure of fly-casting in the evening when the stars were out and the sky clear and fine, you have evidently found that the darker flies were more attractive to the fish than the lighter feathery fancies. This has been the way the cards stack up with me, and I account for it by the fact that the darker fly stands out more clearly against the lighter sky, as it rests on the dark water; in fact, it silhouettes against the sky, while the lighter flies blend in with the reflected light of the sky background, and the fish, looking up from the bottom, see the dark fly more plainly than a lighter one. Having this dope from past performances at tossing the flies in the evening, when the Hildebrandt people brought out the black spinners I tried these out and found them quite effective lures for late afternoon and evening fishing. Mulling this dope around in my think-tank, at the tail end of last season, I darkened up a couple of plugs with black shoe polish and used them for casting in the evening and on one or two moonlight

nights. Say, old top, these black lures made good with a kick, and this season I expect to give the darkies a thorough try-out for the clear evening and moonlight fishing. Therefore, the tip to the live-wires to blacken up a couple of old surface plugs and take a try with them this season. It's a safe bet that some of the tackle people will be putting out dark or black lures when they wise up to the fact that they are good dope for evening fishing.

A part of the kit for night fishing that you should not fail to tote along is an electric flash lamp, one of the pocket variety. There is nothing that will come in more handy than one of these little lights for the moments when you are landing a fighting bass. I use the small, flat light, because it fits well in the hand and can be held along the landing-net staff without any trouble, and is, I think, easier handled than the round-shaped lights. I also slip a small-caliber revolver in my pocket for the shot of grace for one of the big pike or musky, if I am blessed with luck enough to connect up with one of these big fellows during the night. Trying to play a big fin until you can gaff him is somewhat of a risky game in the dark, and I have no desire to take a ducking through a miss-balanced effort to play and land an old he-whop of the watery recesses.

Another thing that will be found mighty valuable is a compass. This little invention of the heathen Chinees will make it easy to steer a clean course back

to camp, and making camp in the dead o' night when you have nothing at all to steer by is no kid's trick. I use one of the luminous kind with the wrist strap, which is plainly visible at night and in a handy position for steering. For a landing net, make it with as large a mouth as possible, and don't try to gaff the fish at night. Although we never have had an accident, there are so many chances to pull a boner at night-fishing during the excitement that a fellow should cut down the possibilities as much as possible and make the percentage lower.

Esepecially in July and August you will find the night-fishing game worthy of your efforts; in these months particularly are the grand old bass feeding at night, and, shucks, there is no better time to catch fish than when they are feeding. In many civilized lakes close in to the large cities, where it is often hard to land even a few bass during the daytime, you will find that a little try at the night-fishing stunt will bring you a fine string of bass. In these waters the bass are pestered to death during the day, and they generally wisely lie in the deep pools and wait until things quiet down a bit at night before they go on the feed.

For the night caster the thrills of fishing are multiplied many times over the usual daylight stuff, and it is sure a cool cuss who can remain calm and collected after the big fins begin their flopping sport. If you have a weak heart, old-timer, stay away from

the great night sport, because you're sure going to find it chock full of excitement from the first cast to the last back-lash.

To really have a successful night-fishing trip, you should go prepared for that kind of fishing. No fellow wishes to subject his fine light tackle to the strenuous work he will surely run into while flirting with the flopping fins of the dark waters.

## HOT-WEATHER BAITs

There is one spot that should never be overlooked in hot-weather fishing, and that is the lone water-soaked log that is usually found more or less in the lake country. This old snag will be found with one end just about sticking out of the water, the other running far down in the water and imbedded in the sand or mud bottom. It's a hundred-to-one shot there are bass down around this veteran of the forest. One of these old snags I remember well; it got to be a regular habit, as we passed it each day, returning from fishing a string of lakes, to stop and let a minnow or frog down along this snag and take out a bass or two before we paddled over to our camp. And the lone little snag sticking up out of the water; it may be only the smallest of branches, but a cast over alongside may mean a fine bass. I have thrown a minnow close in to the smallest of snags and been nearly taken off my feet by the walloping strike of a big fish. When a fellow is out for fish the best place to look for them is in their favorite spots, and the windfalls and logs are sure some regular bass homes, especially in the hot weather.

In fishing a pool in a stream I found a little trick picked up from a Cree Indian a certainty in getting

a fish nearly every time I tried it. This foxy "native son" of the North woods placed a frog on a little piece of birch bark and let it float downstream, just as it passed a boulder and swung into the edge of a fine pool he gave the line a little jerk and off the birch bark hopped the frog and made for land in a natural swim, but he only kicked about a dozen strokes before a big old bass snapped him up for keeps. I have worked this stunt a score of times and it generally ended with a bass on the business end of the line.

At times the grasshopper makes a great little stream bait; this is usually so in the afternoon or evening. To work him right get on the side of the stream from which the wind is blowing. If you will just lounge back in a comfy position for a few minutes and watch a pool, you will notice that the wind carries the hoppers out onto the water as they hop around the shore; then, shortly, there will be a little splash and the water rings show where the hopper "ustobe" but is no more. He has made some old bass happy. Catch a few hoppers for bait and use 'em natural. Don't run a hook through them and take all the hop away, but lay the hopper along the shank of the hook and wind a little black thread around his body and the hook and cast him lightly out on the water. Let him kick round himself and don't try to help make him flop naturally by a lot of short jerks that only show the bass that

there is a string to the bait, and they certainly don't want to connect up with no string. This method of handling the hopper is also mighty good for the fast water just as it enters the pools, that is, if you let the water carry the hopper along naturally. When he hits the edge of the quiet water he will do a bunch of kicks that sure will attract some of the game fins that are always hanging around those places.

As a general thing the minnows are more numerous in the warm streams and lakes. The minnow from the river or creek makes the best bait, especially those taken from the swifter water, besides being more vigorous and lively than their brothers from the warmer lakes and ponds, they have a more silvery shine which makes a decidedly attractive lure to the game fins on the lookout for a fancy feed. For bass the silver shiner or dace makes a good bait for most any time or condition of water, and it is particularly good for dark and cloudy days and in rough water. The river or creek chubs are a hardy lot, and they have a tough mouth that holds well on the hook, and the fact that they have a bit more pep than the shiner makes 'em a favorite bait with lots of fishermen. On bright, clean days the chub is a mighty good lure. About the best allround minnow that seems to cheer up the bass into a striking humor is the mud minnow. This minnow is a dark little fellow with yellowish golden sides and belly, and its husky constitution makes it a prime favorite.

He is the liveliest chap in the whole minnow family and he is on the job every minute that he is in the water. There never was a bass that could resist the "Salome" dance of the mud minnow, and I have used the same minnow to land as high as three bass before he lost his kick. The small sucker, redfin, or silver-side, the darter, slender silver-side and the blunt-nose minnow all make good baits. A strange thing in the bass game is that these fish seem to show a preference for minnows from other waters than those in which they live, which may account for the popularity of the minnow from creek and stream.

When you take a flier at the hot-weather stuff, old-timer, just remember to go about the game quietly, let the bait down to where the game fins are, and feed 'em the line of food they have a fancy for. At the same time, of course, you gotta brush up your gray matter and locate the fish in their underwater retreats, where they have gone to enjoy the cool waters in the deep pools. If you go after them in the hot weather you'll get 'em — but you have to rub the bait right against their nose.

## GOING DEEP FOR THEM

There is no time in the fishing season when more skill is needed on the part of the angler than during the hot weather, and that is the time, old scout, when your knowledge of the fish and their habits pays big dividends. The game fins are decidedly particular about their hot-weather menu, and they often pass up a line of feed that would make 'em stretch their skins to get it either early or late in the season. When the mercury is on the high-notch move and the water takes on that glassy surface stuff, the fish are tailing around looking for the cool spring holes in the deep pools and they do the most of their feeding very early in the morning, late in the afternoon and during the evening and night. During the most of the daylight hours they are hugging the bottom, just lying around in a lazy sort of a way digesting their food. At this period you can whip the surface to a foam without coaxing them to a strike; it's a case of sending your bait right down to them if you expect them to give it the double O.

For a few hours in the very early morning you will generally find the bass in the shallows feeding, and at this time you can cast with the semi-surface artificials with fair success, although a nice little piece of pork rind with a weighted red Ibis fly makes

a dandy casting lure for the early a. m. stunt. After their morning feed, back to the deep pools hike the game bass, and you don't see much of them again in the bait-casting game that day, until very late in the afternoon or evening, when another shot at casting usually puts a few on the stringer. In fact, the evening casting is more successful than the early morning.

The real bait that makes 'em nervous and gives 'em enough pep to make a strike is the live natural food of the fish, the minnows, frogs, crawfish, worms and grasshoppers. These baits, if sent down to the game fins, are the one best bet in the hot daytime. If you are after bass, old-timer, locate a spring hole or sand bar anywhere at a depth of from twenty to a hundred feet down, if your fishing waters run that deep, and let your little old live bait settle and you'll get bass while the other fellow gets muscular exercise doing the casting act. Right in midseason, when it was hotter than Billybedamn, I have had some fine bass fishing for small-mouth. Of course some of the fellows will pass the buck that this is nothing but still-fishing, but there is an angle to the game that puts a kick into it that will make it a mighty diverting sort of a stunt if you play it right.

Take your fly-rod, or if you don't cotton to that kind of fishing, get a cheap steel rod about ten or twelve feet long, use your regular bait-casting reel and slip into the game. Hook on a minnow and

give it a short cast, sort of a side swipe and without any more force than to carry the bait out about twenty feet from the boat, so that it lands very lightly on the water. This is necessary, for the reason that a lot of your success depends on the wiggle of the minnow down there in the bass country, and he sure won't have any wiggle if you wallop him out on the water with a smack. When you get your strike way down below and the line telegraphs the short signal to you, don't strike, but give the bass a chance to run with the bait, because he does that every time with the live bait, and striking at once, after his strike, simply means that you will tear the bait out of his mouth or in half. The bass of the hot weather doesn't take much of a hold on your bait at the start, and when he makes his run let him have the line. He may run ten feet or a hundred — there is no rule or reason to the length of the run, it's entirely up to the old he-whop and the humor he is in. When you feel the pull no longer, on the line, dope it out, old man, that he has stopped and is turning the minnow around in his mouth and swallowing it head first, give him about ten seconds to do this stunt and then strike him and set the hook firmly in his tough old mouth.

Now the real sport begins, if you are holding the butt end of a long whippy fly-rod, like old Dan Patch, the bass makes a run that arches your rod from tip to butt and almost makes it a complete cir-

cle, and when you begin to take away that fifty or a hundred feet of line, your work is cut out for you. At times the scrappy rascal will make a direct run to the surface and catch you with a slack line, and making his famous break water will give your hook a shake, and good night! he's gone. It takes speedy work with the reel to save him. At other times he will sulk on the bottom and make you tug and strain your tackle and patience to work him up. Often he will sneak into a crevice in the rocks, if there are any down below, and you can jig-saw quite a bit before you bring him up and he has sense enough to work around the sharp edge of a rock so that you will saw your line in two trying to work him to the net.

Last season, while fishing with Earny Wendt, one of the best little guides that ever dipped a paddle, we would locate a school of small-mouth bass and quietly fish the school until we had the whole outfit. In one pool we took eight bass out of a school of eleven that Earny could count as they lazied around on the sandy bottom. We dropped our mud minnows over the side and let them slowly sink down among the bass, and often two or more bass would make a dart for the minnow, the lucky fellow making a run with his prey until he thought it was safe to stop and swallow it. The run of these bass averaged from forty to ninety feet. This was hot-weather fishing in midday with the thermometer registering about 90 degrees.

## WIGGLE O' THE WORM

A few seasons ago, at a lake that is considered very civilized waters and which has been fished to a fare-you-well and summer-resorted to a finish for the past twenty years, three fishermen landed as nice a bunch of small-mouth bass as you'll meet in many a day's fishing, and on a hot August day with a sun that burned through their shirts. These three old-timers at the bassing game located a spring hole in ninety feet of water and from this cool spot landed forty-eight small-mouth, ten of which ranged from three and one-half to five pounds. And the bait they used in this foray of pleasure was the common, wiggling angleworm. That same day many fishermen were casting along the short line and failed to string enough bass to make a man's-size breakfast.

In the angling derby the little old "fish" worm of our youth has not received half the credit that is due him. This is probably due to the fact that he has been overlooked in the mad rush for the varicolored artificials that have made bait-casting the most popular end of the game. Then again, the fact that fly fishermen generally tilt the nose skyward when the worm is even mentioned probably has given it a black eye with the beginner, who, above all

things, hates "likell" to have the experienced angler think that he is a tyro at the sport. But you can chalk this up in your think tank, old scout, when the fly fisherman fails to coax 'em up to the top with the feathery fancies he tosses to them, he usually takes a look up and down stream to see if anyone is watching him, then with the coast clear he sneaks a bait-box out of his coat pocket and hooks on a worm, or "garden hackle" as he styles it, and takes a little flier at worming, so that he does not come back to camp with an empty creel. 'Tis a great little friend in need, this wiggling angleworm, for the reason that he can wiggle his way into the affections of nearly every fish that swims most any time of the season, and they sure cannot overlook him in the hot weather.

There is a lot in hooking the worm so that he will have a chance to wiggle, and you can take it from Uncle Dixie, the wiggling worm is the one that attracts the fish. Slip the hook through the skin of the worm about an inch from his head, then skip about half way down his body and slip the hook through another little nip of skin, then about an inch from the tail end slip the hook through another little nip of skin. This gives him two dangling ends and a wiggling loop in the center, and in hooking him be sure and only slip the hook through a very little nip of the skin and not through the entire body, which kills 'em and takes their wiggle away from

them. Don't slip the point of the hook into their mouth and slide the worm along the hook, covering it way up to the shaft; it is not at all necessary to hide the hook, what you want to do is preserve the wiggle.

To get the best results from the worm in the hot weather, or in fact any kind of weather, they should be cleaned or scoured. When you dig 'em out of their home grounds they are full of earth and until they are cleaned they do not make the best bait. The attractive pink color of the clean worm is something that makes the wise old fish cross-eyed; it makes them scrape their fins to get to it, and it is a simple matter to give 'em a cleaning. They should be washed as soon as dug up out of the ground. Just drop them in a pan of water and stir them around or shake roughly, then place them in an earthen jar or crock and put in plenty of moss. The big point to remember in the "care of the worm" is to wring the moss thoroughly so that all the water is eliminated. The moss must be kept dry in order to extract the moisture from the worms, as this toughens them for the hook. It takes from three days to a week to clean the worms right. Every day during the cleaning stage change the moss and throw out the dead or sick worms and feed them a slice of bread, broken into small bits, and a couple of spoons of milk or cream poured on the moss will shape 'em up in fine style. Sounds like a joke to

wash and feed your pet worms, but say, old-timer, if you have never offered a wiggling pink home-raised worm to the finny tribe, there's a jolt of surprise due you when you do. While you are shaping the worms up for the hook, keep the crock in a cool place, and if you happen to use an old flower pot, be sure and cork the hole in the bottom or you won't have any worms to raise.

The frog as a bait is a sure-fire winner in some lakes and streams and in others he only shows up with the also-rans. But a good lively frog as a still-fishing bait generally gets the bacon, and you have to keep your eye on the little cuss or he'll sure fool you. After giving him a nice little gentle toss-off into the weed-beds you wait for the strike as you reel in a bit and let him have a little play; all the time, however, he may have been eyeing you from some point of vantage, as he has a habit of crawling up on a lily pad or windfall and resting there while he should be swimming around trying to coax a game fin into striking. 'Course you cannot blame the frog; it's a sort of a safety first with him, the only thing to do is to keep him moving a little, back and forth along the bottom. A little dipsey sinker or a couple split shot help take him down. The smaller, medium-sized frogs, those little white-bellied, green-backed ones, make the most attractive bait.

## HAIL TO THE SPOON

Way back when you and I and most of the gang were kicking around in knee panties and just breaking out of the kilts, our dads who answered to the rollicking call of the lakes and streams were teasing the game fins into striking with the spoon. And many a big fish has answered to the tantalizing flash of the spoon as it glided, darted or revolved on its way through the water.

Most of the spoons of the early days were of the wobbling, darting class; this was just a bit before the advent of the more modern idea of spooning, the revolving type which is so popular today and justly so because these twirling beauties certainly attract fish. However, the old-time darters were standbys in their day, and many game-fish have made their last strike at them. The Old Lobb, shaped a trifle longer than the bowl of an ordinary teaspoon; the Onondaga, a slim-shaped spoon that darted and revolved at will or as the speed of its movement was increased in the water; and the Oneida, a fat-shaped spoon that had an erratic dart which followed no set route or schedule — all were pets and fish-getters.

Many of the old-timers still swear by these old

patterns, but a glance in their tackle-box will generally show up a couple of the modern beauties either fluted, hammered, or plain. The old wobbling, darting spoons have a place in any tackle-box and are great little flashers of light as they dart from side to side. This makes them very attractive to the curious fish, especially the pike, pickerel and musky, as they lie in wait for the passing small fish upon which they gorge their tummies. The larger fish are particularly subject to the fascinating glide of the spoon and strike it with a wallop that often bends it double.

One of the earliest spoons of the darting type was the Buel spoon, following closely the shape of the bowl of the teaspoon, in fact it is claimed that young Buel, while washing his dishes at camp one day, accidentally let a silver teaspoon drop into the water, and as it glided down towards the bottom an overzealous lake trout, that could not resist the scintillating flashes of light reflected from the spoon, made a dart as it and cracked his teeth in the effort. Being of an inventive turn of mind, the youngster filed the handle off the spoon, drilled a hole in one end, to which he attached his line, and in the other end he drilled another hole and eyed in a long-shanked hook. This simple arrangement caught many fish, and for years was the model from which other spoons of the early days were patterned.

A little later, out in the West, an old-time fisher-

man of Delevan lake, puttering around his cabin, doped up the Delevan spoon by hammering a half-dollar piece into a concave shape with a sort of nicked tail at one end and an eyed ring on the other side. This old sport of the southern Wisconsin lake region eyed on two long-shanked hooks and, as minnows and shiners were the accepted bait for bass at that time, he hooked a minnow on each of the hooks. Trolling out into the lake to go to his usual fishing-grounds, he was kept busy hauling in the bass and putting on new bait. The fishing with the new spoon was so good that he did not find it necessary to keep on going until he hit his old spots, and when he flashed his string on the unsuspecting public and then flashed the new lure on the fishing fans he had to cut out fishing himself and hammer out these new spoons for the boys of other days. This was the beginning of the famous old Delevan spoon that has a wonderful string of fish to its credit.

A few years later, over on the fine old St. Lawrence river, G. M. Skinner put a real up-kick into the spoon game when he decided that the spoon which revolved regularly in one direction was what the big fins were really looking for. And to give the spoon this steady revolving movement, G. M. slipped a few flutes on an oval-shaped brass spoon and on the first tryout he hooked up with a walloping big musky that snapped his teeth shut with such force on the strike that Skinner knew he had made

a ten-strike with the new lure and that he had something that would make the real old grand-daddy of the tribe sit up on his tail and take notice. The flutes not only added to the movement of the spoon, but also broke up the flash of light from its surface so that it shot through the water in a dozen different shafts, penetrating the watery recesses in a coaxing way that could not be resisted.

Up to this time most of the spoons were of large size, when along comes John Hildebrandt, one of the best-known old-time fly-casters of Indiana, with an idea that something ought to be done for the fly-fisherman, to add a bit of attractiveness to the fly which a lot of bass were passing up, probably because they were nearsighted and could not see it. Anyway, "Big John," as he was lovingly termed by his angling pals, came through with an idea that helped make the spoon the attractive bait it is. He reduced the size of the spoon greatly, in fact his first spoon was made from a hammered dime and a bent hairpin. One trial with this little spoon and Big John found that the whirling spoon gave an added bit of motion to the fly and also the flash of light seemed to be just what the big fellows were waiting for. The boys of the present day can thank John Hildebrandt for pulling down the size of the spoon which added it to the casting end of the game, where it is just as effective as it ever has been in the trolling end.

## MORE ABOUT THE SPOON

It took the late W. T. J. Lowe of Buffalo to fancy up the spoon in gold and silver, and the famous Star and Buffalo spoons finished in these metals in beaded or plain styles have made a place in spoon line that is second to none. While on a trip for musky a few years ago I had a very accommodating guide whom I wished to remember for his many kindnesses during the trip, so I sent him a couple of the Lowe Star spoons as a little friendly token. Two seasons later, while in the same locality, I met this old guide of former years and was surprised to find him wearing one of the Lowe spoons as a watch charm. He just couldn't toss that gold and silver beauty into the water for ordinary fishing, it looked so darned fine, he said, that he was going to make a musky hop clean out of the water to take it off his watch chain if it came to a showdown.

An interesting bit of information regarding the early use of the spoon hook and artificial bait to coax the finny tribe out of the deep was brought to my attention some time ago by Harry R. Phillips, a well-known and popular angler. It is in regard to a quotation from a book, "A Voyage to the Pacific Ocean for Making Discoveries in the Northern

Hemisphere," written by Capt. James Cook and Capt. James King about the voyages of Captain Cook from 1776 to 1780. The quotation is in regard to the fishing game in the Sandwich islands, and from the dope, those old-timers must have been some fishermen with their hand-made tackle. So that everyone gets a fair chance at the credit for introducing the spoon hook in the sport of fishing, I quote the paragraph from this old book published in 1796:

"Their fishing hooks are of various sizes and figures; but those which are principally made use of are about two or three inches in length and are formed in the shape of a small fish, serving as a bait, with a bunch of feathers fastened to the head or tail. They make these hooks of bone, mother of pearl or wood, pointed and barbed with little bones or tortoise shell. Those with which they fish for sharks are very large, being generally of the length of six or eight inches. Considering the materials of which these hooks are composed, their neatness and strength are amazing; and indeed, upon trial we found them superior to our own." Like all fishermen, it is a ten-to-one shot that the boys of the crew bought up the entire supply of this new-style bait before they left the islands.

The spoon is a very effective bait and can be used with no other adornment than that which the maker has endowed it, or it will be found an added at-

tractiveness when used with any of the natural foods of the game fishes, or the artificial substitutes. The glittering, flashing whirl of the modern spoon in front of a minnow, frog, pork rind or chunk is something that awakens the curiosity or anger of most any of the game boys.

For the big old wolves of the waters, the musky, pike and pickerel, the spoon has always been a favorite lure, and now that casting for these bush-whackers of the weedbeds has become more popular, the smaller-sized fluted, pebbled and plain spoons have ridden to glory through the great granddads they have brought to gaff. About a number three to six makes a good-sized casting-spoon for these fish, and for trolling, which is the method followed by the majority of fishermen in quest of these scrappers, the most popular size is number six or eight. The main thing in the spoon line is to remember that the small-sized spoons have been getting the big fish during the past few years, as they have been used more and more by the clan, and that it is not at all necessary to load up the line with the great big spoons of the African war-shield size.

In using the spoon alone as a casting lure, the average fisherman will find it a bit light with the short bait-casting rod, and to give it a little more heft, tack on a few small split shot or a dipsey sinker. Most any likely looking water makes good casting with the spoon, and for the pike family off the edges

of the weed-beds is a winner. Allow the spoon to sink a bit after casting and reel in slowly, just fast enough to keep the spoon twirling. And the fellow who has a good run of success with the spoon is the old scout who fishes it slowly. That is a point in the correct use of the spoon that only comes with experience, the usual method being to snake it in through the water as fast as possible in order to throw another cast. The most strikes with the spoon alone come when the lure is moving in the water and not when it first strikes the surface. I have watched, many a time, a large pike follow my spoon and then made him come through with a strike by giving the slow-moving spoon a slight sidewise jerk that gave it a wobble that probably gave the fish the impression that he was going to lose something if he did not act quick. Slow reeling in of the spoon on the cast is just as important as slow trolling with the boat.

## PLAYING THE SPOON

More fish are often lost by hurrying the spoon through the water at too great a speed when trolling than through any other method of its use. In the trolling end it is a very easy thing to slip the boat along too fast and rush the spoon right away from a lazy old fish as he lolls around waiting for an easy piece of feed to slowly kick past him, and a good way to keep the speed down is to watch the tip of your rod as you troll along. When the tip is bobbing up and down in a slow regular motion you are hitting the pace about right, and at the same time this is a sure-fire indication that your spoon is revolving, which is what it should be doing to attract game fish. As soon as the rod slips into a steady pull without any bobbing, you will save time and probably fish by reeling in and shaking loose the bunch of weeds picked up by the hook. Weeds are a necessary evil in the spoon-troller's life, because the fish are among the weeds and to get them it is necessary to ride your spoon down deep in the water where the fish are loafing in order to get 'em. The surface troller never has half the chance of the underwater sport when it comes to landing a good-sized string.

In making a selection of spoons, you have a col-

lection of nearly every shape and size to pick from. They come in nickel, brass, copper, aluminum, and pearl. Some are decorated with a dash of red, others jet black or white. I have found the white enameled spoon a very attractive lure and a word in favor of the pearl wobbling spoons is well deserved by that particular spoon. Many fishermen have passed up the pearl spoon, probably because it seems frail and not strong enough to hold a large fish without breaking, and thus have overlooked a good bet in the angling derby. Then again, it may be from the fact that the pearl spoons have not been tooted as much in the present day as in the past. I have never had a pearl spoon break while landing a fish, and have brought to gaff quite a few pike and bass with this old-time bait. In certain waters it has proven a lifesaver, and for evening fishing its blue-white flash has been the last call of quite a few game fins. It is particularly good for the October bass fishing when trolling for these fish is often productive of a fine string.

You will naturally stock up with more of the modern revolving spoons than any other, because they are made right and have a rep for landing the fish, but it is well to shuffle a few of the long-shaped wobbling, darting spoons in the tackle-box, the same old spoons that were favorites with the anglers of other days. These spoons are not only effective because they have an erratic movement in the water and cast

their light shafts to great distance, but they also make a good casting-spoon without much fluttering in the wind. They are good for bass, pike, pickerel and musky and for wall-eyed pike and lake trout they make a humdinger of a bait. They are especially good in stream fishing and on a rough day on lake waters.

As a general thing the condition of the waters you fish will determine the color of spoon you use; however, in an off-hand choice, you could make it a copper spoon on a bright sunny day with a clear calm water, while on a cloudy day, with the surface broken and rough, the brass, nickel or silver spoons are usually more killing. For the dark days and marly waters I have found the white enameled spoon one that makes 'em sit up and take notice. A spoon that is too bright and shiny when used on a clear day will send such a flashing signal through the water that the wise old birds of the underwaters never even give it a thought; in fact, it seems to scare them. In order to make a spoon more attractive I have let them accumulate quite a dirty, tarnished appearance, and then to give them a bit of a fishy look have shined them just a trifle in a striped effect, somewhat like a perch. A spoon used this way will sometimes make a killing on a bright day.

Taken all around, the spoon as a fish attracter stands high in the annals of fishing; some of the largest fish ever landed in the different species have

answered to the luring flash of the twirling teaser. It is a bait that can be used throughout the entire season with good results, and to this old-time member of the tackle-kit we doff the lid, because it will do its share in getting the fish if you give it half a chance.

## FALL FISHIN'

There is no time in the entire fishing season that is more delightful than the fall or autumn, and at that, old-timer, the big game fins have more scrap tied up in their tails in the cool of the fall than they have in the warm summer days.

The early spring fishing is generally on a par with the fall sport. After the water feels the cooling effect of the fall days and the frosty nights, its temperature slips down a bit and the gay tail-kickers become inoculated with a bunch of pep that puts ginger in their fight.

And the woods and all outdoors seem to be doing their best to show off the wonderful beauty of nature, just to slip a fellow the info that it is not all of fishing merely to fish. After the first frost has nipped the leaves and they have changed to countless shades of yellow and orange, with the golden tints and dashes of red standing out in patches against the darker green of the pines, then between casts we can drift along and thank the nine gods that we are on the water trails in the fall.

The hot days of July and August have been shot into the discard, and with them all the thousands of

insect pests that increase the cussin' average of the fishing gentry as they try to interest the lazy fins in a varied assortment of baits and lures.

And another thing in favor of the fall game is that you do not have to arise before the sun in order to get to the fishing water while the fish are still in the shallows feeding, nor do you have to wait until dusk or darker to take a cast at them with some chance of finding them in a striking humor.

The bass and wall-eyed-pike slip into the shallows most any time of the day in the fall to feed on the minnows and frogs, and also to enjoy the warmer water along shore.

And the musky, the old roughneck of the water recesses, has a strong set of teeth in fine shape for striking purposes, while the gums of the pike and pickerel have passed through the sore, swollen stage of August and these fish have an appetite that they are willing to satiate on anything from a spoon to a cedar plug.

In September the game fish come back strong after the dull and sluggish days of summer, when they have been devoting most of the daylight hours to a lazy siesta on the bottom in the deep, cool pools, and with the cooler days of October, and even up into the snows of November, you can select most any kind of a plug or lure and stand a good chance of landing the big ones. The colder waters seem to make 'em want to fight the highly colored artificials

Do you recall a day in camp when the game fish seemed to be off the feed and neither you nor the pals can raise a strike—then you happen to get 'em coming and things brighten up on the instant. But Oh! boy—when you come up the trail with a fair stringer and the pals greet you with smiles, enjoying your triumph even when things broke bad for them—then, fellow, you know the real joys of the water trails. Good pals in the woods and on the waters are jewels to be cherished. Incidentally the large bass in the foreground dangling on the stringer of Don Leigh, Fishing editor of the Chicago Evening Journal, weighed six and a half pounds and was landed by Mr. Leigh with a Pflueger-Surprise Minnow, rainbow color, the rod was a Jim Heddon number 15, one piece construction, long tip and short butt, giving good play without the restraint of a ferrule to cut down the action.

out of pure cussedness, and they wallop the plug with a strike that often sends it high in the air.

At this time casting for the game boys is the real dope. It gets them in the waters close inshore, and the splash of the lure simply makes them more anxious to get to it. The fish are right on edge and keenly alive to what's going on in their home waters. In this nature assists them by keeping the waters clearer than at any other time of the year. The lakes have passed through the blooming stage and all of the underwater vegetation has cast its seed and settled down for the winter, while the rivers and streams are at a flowage that is not subject to the thaws and freshets of the spring and summer. This all assists the fish to the extent that they can see to a greater distance, and more caution and skill is necessary and a longer cast required than earlier in the season.

For an artificial for fall fishing for bass, makes a selection of the standard-sized lures of the minnow shape, and for the small-mouth bass, particularly, the midget-sized plugs sure are killers. In the matter of colors, the all white with a bit of red is fine for the darker days and the rainbow or green-backed, white-bellied lure for the sunny days. Although a fellow does not have to be so finicky as to the color, shape, or style, as the bass have just enough pep and cussedness to take a crack at most anything moving in the water.

The wall-eyed pike are sure fond of the green-backed minnow, and they are in the deeper pools generally, although when they do come into the shallower water you have to send your lure down to them, as they are always bottom feeding, and for that reason the lure should be of the underwater variety and not a surface or semisurface.

The wall-eye is a mighty hungry fish at all times, and especially in the fall he is on the drive for a feed. Even up into the cooler days of November he makes a conscientious biter.

Although the wall-eye answers to the call of the artificial plug in the fall, don't for a minute overlook his favorite dish, the minnow, and of all the minnow family that tickles his palate, the mud minnow from the small streams is the bait that makes him jump through the hoop to get it.

A small spinner adds to the attractiveness of the minnow, its flash shooting into the far reaches of the underwater nooks and crevices.

## FALL BAITES

The minnow and frog are great little live baits for the fall bass, and when hooked on a weedless hook can be lightly tossed over among the weeds. And take it from Uncle, old-timer, that's where you get 'em.

The spring-raised frog has just about grown up to where he is a fine tender morsel for the bass, and these wily old game fins flirt around among the lily pads and weeds watching for the luckless frog as he kicks his way through the water. Cast the frog with an easy toss, so that he will land lightly and not with the long sweep of the plug cast. A cast of 20 or even 15 feet into the weeds is plenty and keeps the frog lively after he lands.

Let the frog sink a bit, then reel in slowly for a couple of turns of the reel handle, then a slow-up for a few seconds so that it will sink again, and then another slow reeling, and thus work the frog out through the weeds as though he were on his way home for a feed. Don't be afraid to shoot the cast right into the weeds and especially close up along shore, as that is where the bass are generally feeding, particularly in the morning or afternoon. Flirting with the outer edges of the feedbeds will not

bring half as many strikes as going right in for them.

The Shannon twin spinner baited with a pork-rind strip makes a crackerjack fall bass lure for the weedbeds, as it is weedless and at the same time has two spinners that revolve right above the point of the hook, which eliminates all chances of short strikes. You can throw this bait right into a mass of weeds and it rides back free and clear without trailing along a ton of weeds.

As the October days come along there is one dainty of the bass diet that has become scarce and therefore is highly prized as an appetizer by the lucky bass that finds one, and this natural food is the crawfish. The soft-shelled crawfish feels the bite of the frost and digs into the mud and sand bottoms for his winter hibernation, and only a few of the huskier hard-shelled fellows are stirring around. These tough-shelled old crawfish are too hard for any but the largest bass to masticate, and the medium-sized bass are crazy for a bite of the white meat of the food that they have feasted on during the season.

The fact that crawfish have become scarce seems to whet the appetite for them, as is the case with any food that has become scarce. When a natural food becomes scarce, an imitation of that food is, as a rule, more liable to be successful than at any other time. The Heddon's baby crab wiggler, which is an imitation of the crawfish, is a very taking lure for October.

Of all the fish that are on their fighting mettle in the cooler days of the fall, the musky, pike and pickerel are sure there with the kick in their tails, and they seem to be full of the old Nick, the way they range around looking for something to pick a scrap with. And after they do strike, the fight they put up will give you a bit of rapid-fire action that will make the blood tingle and the nerves do a series of jumps that will give you thrills enough to last through the winter until the next season comes around.

There is one lure that makes these old rough-necks see double to get at, and that is the spoon. This is the old reliable standby trolling dope for the fish of this species, and with a good-sized shiner, sucker, or frog hooked on behind a Lowe-Star spoon, it's an easy bet that you can interest the big fellows. Casting with a smaller minnow or shiner and a No. 3 sized Hildebrandt spinner makes a combination that the musky cannot resist.

Troll in water about six to ten feet deep along the edges of the weedbeds and over the underwater weeds, also over the rock bed and points of land that run out into the water, as well as the quiet coves and bays, and keep the boat moving just enough to twirl the spoon. Fast trolling has killed more chances at getting the fish than any other angle of the sport; you don't want to pull the bait away from the fish. Take a slant at the tip of your rod, and if

the tip is bobbing regularly you know that the spoon is turning around in the water. Should the bobbing of the tip stop, you can figure that you have picked up a lay-out of weeds, and the only thing to do is to reel in and take 'em off the hook, as the fish are not going to dig through a bunch of weeds to strike a lure.

## MORE FALL BAITS

Don't overlook the pork-rind strip or chunk in the mad rush for the fall game fins. This is a capital lure for any of the game fish at this time and works well with a weedless hook and spinner. The Al. Foss pork-rind minnow, the Prescott spinner hook and the Becker-Sheward Been-there spinner work well among the weeds for bass.

Tack a little red flannel cloth at the head of the pork-rind strip, or tie a bit of red yarn on it, and the lure will be more effective. It seems that this combination of the wiggling pork rind with a little red to set off the white of the rind has a teasing effect on the humor of the bass.

While the bass come into the shore shallows during September to feed, you will still find them in the deeper pools if the day be one of bright sunlight and warm. If such is the case, seek out the same old holes you fished during the warm days of summer and take a shot at the bass in these waters. Trolling deep through these holes with a minnow and the line weighted with a heavy sinker that will take it away down to the bottom where the fish are, will usually bring a stringer of nice-sized fish.

Trolling for bass on a cloudy day is likely to be

more successful with a small spoon; this is particularly so when the bass are in the shallows, and for the fellow who tires of throwing the festive casts the trolling game is a good bet, especially for September.

The minnow-shaped spoon of either silver or pearl is quite a taking lure for the bass troll, and I favor the pearl under the circumstances, as its greenish blue flash is somewhat similar in tint to the sides of the minnow. These pearl spoons are quite light and ride high in the water, the decided curve to the spoon also keeping it near the surface. To overcome this high-riding, wobbling lure, tack on a keel sinker, which will also keep the line from twisting and kinking.

The ordinary brass or nickled spoons are attractive trollers and I have always found them better if used a bit tarnished and not highly polished. And while shuffling up the spoon deck, don't overlook for a minute, old scout, the Pflueger-Tandem spinner. This finish to the spinner is a winner in most any kind of water and makes a decided hit in waters where the white artificial plugs have been successfully used.

Troll about ten feet under water and most any shore waters are good for trolling for bass in September. A good average depth for trolling is in about 20 feet of water. Real trolling for bass is not merely to drag a bait or lure through the water

at any old speed or depth, but this end of the sport should be given as much attention by the angler as casting or any other style of fishing.

The amount of line out and the speed of the boat controls the depth at which the bait rides, and when you get a strike make it a point to remember the length of line and the speed of the boat and keep about that average, as the strike indicates the depth at which the fish are feeding, and that's the place you are likely to find the next one.

A bit of pep can be added to the trolling game by the use of a steel fly-rod. Of course the rod should be straight out behind the boat to reduce the strain, as it has not enough back-bone to stand the continued pull of the lure. When you get a strike with a fly-rod and about 40 feet of line out, with a husky bronze-backer at the business end of the line, it is sure sport to play him with a whippy, long fly-rod. To the fellow who passes up trolling with the short five-foot rod as a sport without any kick, just take a flier at the game with the fly-rod.

A bait that has been in a way overlooked by a big bunch of fishermen is the Phantom minnow. This lure in the silver or gold color makes a high-class underwater bait. In using it, however, a little above the average speed can be given to the boat, as the Phantom rides very deep in the water.

There is a style of fishing called "jigging" that is practiced by the settlers in the North woods coun-

try when they want to be sure of getting fish for a meal. They cut a pole about fifteen feet long and use a line about five feet longer than the pole and bait up an ordinary sproat hook with a minnow or frog. With this rig they let the boat drift across a weed-bed or along the shore line and across the entrance of a small cove from point to point, keeping the bait about a foot above the bottom, sounding the bottom every now and then so that they are sure of the bait riding at the right depth. This stunt can be worked with the long steel fly-rod and it is even more effective if you put a medium weighted coneshaped sinker on the end of the line and attach a three-foot leader with your bait at the end of the leader. In this way the sinker can ride the bottom all the time and not affect the bait, keeping it at the right depth all the time.

Of the fall fishing time, September is a mighty big improvement over the hot old August days, but, without a doubt, October shines as a month in which the game-fishing is full of dash and pep on the part of the fish, even if the angler does feel like playing close to the cabin fire. To really feel the fight par excellence of the bass, give him the once over after the frost has nipped the leaves and he is on the hurry-up hunt for food to pack away and fatten himself up for the winter's hibernation.

## FALL MUSKY FISHING

Without a doubt, old-timer, the real kicking fight of the musky reaches full development in the fall, and the latter part of September and the entire month of October hold forth great promise for the gay "muskyteer" in his effort to bag this gamest of the game. And besides the fact that the musky is a more consistent striker in the fall, he also is a more strenuous fighter and gives the lucky angler a run for his money that sets the nerves on edge and the jumps on a race up the vertebra with a few extra thrills thrown in when the game cuss stands up on his tail and sends the spoon through the air with a rapid-fire shake of his huge body.

This throwing of the spoon bait by the musky when he breaks water and makes his wonderful shake is not merely an idle tale from the musky waters. All he needs is a bit of slack and a chance to shake and unless the angler is quick to reel in the slack, it is a simple trick for the musky to throw the bait. And by the way it is no disgrace to fall the victim of a wise old bird like the musky and have him disconnect in this manner. I know of one clever caster who can place his cast with a fineness

that makes his casting the envy of many fishermen, and who had a fine old buck musky toss his spoon bait 30 feet through the air with such force that it left a beautiful black and blue bruise on his chest where it happened to land.

#### THE EASY-CHAIR ANGLER

Some of the wise chaps at the fishing game, who never lost a musky after hooking it, to hear them tell it, have a lot to learn from these husky freshwater free-booters. Lying back off the edge of a weed-bed, somewhere, there is an old, long-whiskered musky that has doped out a new trick or two that can probably even make these past masters in fishing talk strip their gears if they connect up with him. Or, old-timer, in other words, when you hook up with a high-volted bushwhacker of the watery recesses, you never know just what he will pull on you in the way of tricky action until the fight is over and the musky either brought to gaff or lost until next time. That's the very reason why some of the boys are confirmed musky fishermen and pass up the fast scrapping bass for a wallop at the big fellows.

As a general thing the musky will make his first run after the strike, on a hunt for the weeds or other underwater refuge where he can hide or tear out the hook with its stinging point. If he has a chance to make deep water he will go down deep and fuss around on the bottom trying to rub out the

bait and in a case of this kind he will seldom break water until you work him towards the surface. In the fall, however, you find him again in the shallower waters and here you can look for a jump up out of the water quickly after the strike. The musky caught in the shallow water, say from five to fifteen feet, may even break water as often as eight or ten times during the fight, and the smaller muskies seem to jump up into the air more often than the real big old-timers. The old fellows are more likely to avoid the jump than the younger musky, as they develop a shyness with age and prefer to stay down out of sight if possible.

#### SMALLER MUSKY SNAPPY FIGHTER

For a rattling good fight, full of action and pep, the smaller musky, say ten to fifteen pounds, puts up a rapid, strenuous battle, some of the boys preferring this game to the larger ones, although they don't make as handsome a mounting, nor give one the opportunity to salve up a story full of thrills like the big roughneck of the tribe. Taken anyway you look at it, the small, powerful musky is a great piece of sport when landed on light bass tackle via the casting route.

One of the largest musky landed this season never broke water during a fight of nearly an hour and a half. Once he did come up to the surface and make a swirling curve in which his dorsal fin and tail

cleared the water. His main fight consisted of long runs of a hundred to a hundred and twenty-five feet, the battle of musky wile vs. tackle skill taking place in water with a depth of 25 feet and over.

#### OFTEN SPRINGS NEW TRICKS

Until you land the musky you hook, you can never know just what line of getaway stuff he pulls. He may corkscrew back on the line, twisting it around his tail and then with a snap of the tail breaking the line with the leverage thus secured; he may make a fast run towards the boat and before you reel in the slack, hit the air and throw the hook; he may shoot under the boat and tear the line on the bottom or there are dozens of little angles to his fight that may give him his liberty and the knowledge that the musky family have a great bunch of tricks tied up in their system should put the musky fisherman on his guard to outpoint the game rascals by clever, quick work from the rod end of the sport.

A favorite casting bait is the sucker, about an eight or ten-inch black sucker sure makes 'em nervous, and you certainly can coax them to strike this lure. Usually the musky gorges a live sucker and when you strike him, the hook is generally well down the gullet and you set it sharply in a tender spot. I think that this pain takes a bit of the kicking fight out of the musky and that they are easier to land than when hooked on the pork chunk or spoon.

The pork chunk for musky casting should be about twice as large as the size on the market for bass casting and also a trifle longer than wide. A pork chunk of this kind, tacked onto a No. 1-0 Lowe-Star spoon makes a cracking good cast for the musky, and when you hook 'em with it the hook generally sets in the front of the mouth, and when hooked this way, they fight like a "helyon" to throw it out. In the matter of plugs for this game fellow, the usual bass lures make more effective baits than the large wooden affairs touted as the best bet in the game. No matter what bait you use, to get musky, you must stick to the game until you locate 'em and not branch off on the bass casting end.

## STREAM-RAISED SMALL-MOUTH BASS

After returning from the last fishing trip, we players of the singing reel and arching rod, followers of the lake and stream water trails, are generally looking ahead to the next one and planning for this foray on the gamy tail kickers and their relatives. While far from the rustle of the gurgling stream and lap of the wind-tossed lake waters, most any kind of fishing looks good to us, and even the pet goldfish in the globe in the sun parlor are sure taking chances of being yanked into the air on a bent pin or a midge trout fly.

We like our bit of bait casting, shooting the plug or natural bait off on its curved flight to the weed bed or pocket in the lily pads where the large mouth lingers and the pike and musky lie in wait for the passing smaller fishes upon which they gorge. We like the bit of stream wading, tossing the live bait here and there among the likely looking brush heaps and windfalls and into the deep pools. We even like to sit out in the sun and take a shot at still fishing with live bait, letting it sink down to the spring holes where the game fins have gone for a rest in the cooler waters.

And we are not ashamed to take a try at the little pan fish with the fly or a gob of worms, especially when all the big fellows seem to be off the feed or in such a humor that they fail to notice the seemingly endless selection of artificial and natural baits we offer them. And from all these varied manners of angling we draw forth the enjoyment and charm of fishing which touches our heart strings, and the thought of these past experiences merely whets our appetite for new lakes and streams to conquer; makes us able to endure the coming winter until spring again floats in with the greening up of the naked trees and opening of the trout streams for our first effort of the new-born season.

Looking back over the entire deck of the fishing game and recalling many pleasant days on lake and stream with the different game fighters that live in the watery recesses of the underlakes and river beds, I feel like passing the blue ribbon to the small-mouth bass fly fishing on the running streams as the snappiest sport in the whole layout. For real fishing, a day on a stream with these little bronze, red-eyed scrappers is a bit of sport to be remembered. And going after him with the fly with its single hook gives him a chance to make full use of his combative power to give you a fight that will teem with thrills before you safely net him or he gives you a saucy kick of the tail as a farewell salute as he makes his getaway.

To tell an old scout of the fly-tossing brigade what

weight and length of fly rod to use is foolhardy; he has his own pet weights and to these he sticks like a "helyon;" but for the beginner at the sport a split bamboo of say nine and a half feet and a weight of five or six ounces is right and will prove effective for small-mouth bass fishing. This weight rod will be good for all-round use, and in the fast streams there are many times when the sheer strength of bamboo and line must be relied upon, although in wading the slower streams no fly rod seems too light, as you have more time to fight the fish, and taking your time, giving the rod a chance to wear down the bronze backer with its pressure, will eventually bring your fish to net after a wonderful fight.

An interesting fact in the fight of the militant bronze-backed warrior is that he has a habit of selecting his own fighting waters, and he will make for them regardless of the chances he runs. He may decide to fight it out in the swiftest part of the stream, or, after walloping the fly, he sometimes makes a drive for the bottom, there to rub the stinging feathery hook from his mouth. Unable to reach the safety refuge of the snags and rocks on the bottom that he knows so well, he will speedily change his tactics for the swifter current, making frantic leaps into the air on the slightest indication of a bit of slack in the line and then lying across the stream, take advantage of the flow of the stream against his curved back. He's playing a game to his liking and

you have your work cut out for you before you land him.

All these joys and thrills of the battle royal can be had in fishing for him with the ordinary wet fly of standard pattern and design, or with the newer hair flies which are particularly killing for the stream-raised small-mouth.

## THE FLOATING BASS BUG

To the keen sport of tossing the feathery fancies to the small-mouth has been added the thrills of dry fly fishing. Not the ordinary cocked feathery winged floating fly of the trout fisherman, but a sure honest-to-goodness floater designed entirely for the bass fisherman. This fly, in reality, is not a fly as one terms the flies of the trouter; it is more of a bug, miller or moth, and it has a cork body that keeps it on the surface at all times while the wings and tail are a combination of feathers and bucktail.

When the bass are on the rise, making the surface for the unlucky hopper or butterfly that happens to misjudge his distances and light on the water, then the floating bass bug certainly shines as the greatest lure that ever helped send the jumps up the backbone. During the past two or three years the bass bug has been given the once over on many streams by some of the best-known fly casters in the game, and the verdict has been unanimous in the judgment that it has added an angle to the bass fly-fishing game that increases the joy of the sport 100 per cent.

These bass bugs are great little workers on fast water, and are generally fished diagonally up and across the stream and then allowed to float down

with the current, and the long streaming tails and hackles of bucktail hair have a wonderfully lively wiggle as they make their way downstream; fact is the bass simply cannot keep from making a rush at these floating bugs.

In a way the floating bass flies are not entirely new, as we have had Jamison's Coaxer Floating Flies for both bass and trout for a number of years, and these old-timers in the floating line are a mighty successful lure for the game bass; however, the bass bugs are different in that the body is smaller and shaped like the body of a bee or bug and tapering down to a point in some cases with the addition of the bucktail hairs, while the Coaxer flies are tailed with feathers exclusively.

As is always the case with something new that has made good with a kick, and particularly when that something has anything to do with the sporting game, who made the first one and who introduced it to the game is a mooted question that is walloped around the ring until the poor cuss goes down, with the count.

Will Dilg of Chicago, a well-known and skillful bass fly-caster, in a recent article in a sporting magazine credits Mr. B. F. Wilder of the Butterick company, New York city, with tying the first dry fly to take bass on the Upper Mississippi, these flies being used with wonderful success by Mr. Dilg in this fly fisherman's paradise in the fall of 1916.

Hon. Carter H. Harrison, former mayor of Chicago, and a noted fly fisherman who has cast his fly in many waters, has this to say about the hair fly in the Wabasha waters of the Upper Mississippi: "For many years I have not been guilty of using bait in fishing, but I am free from conscientious scruples against hitching my fly to a small spinner when fishing for large trout or bass.

"Several years ago a St. Louis fisherman introduced the 'Mississippi bug' to these waters, a good-sized doodle bug tied with deer hair and black thread in imitation of a crawfish. To the simon-pure fly fisherman this critter is an abomination. Hitched to a spinner with a blade the size of a dime, it just about sets the average bass crazy. When the bass refuse to rise to the ordinary fly, I offer them the bug. Naturally I prefer the plain fly; it is a more sportsmanlike lure, and besides there is a rare pleasure in feeling the snap of a bass at a fly of your own tying. For years I have made my own flies. But if the bass show no hankering for flies I use the spinner and bug."

No doubt the St. Louis fisherman referred to by Mr. Harrison was Walter C. Taylor, one of the cleverest stream bass fishermen of the Middle West. In introducing the floating bass fly to the Upper Mississippi waters, Mr. Taylor used a Wyman hair fly which he had paraffined, one somewhat similar to the fly which is credited with over seventy small-

mouth bass in two days from the St. Francis and the Varner rivers in Missouri. Mr. Taylor having landed the seventy fish being a true sportsman, however, it is needless to say that the big majority of these fish were returned to the water uninjured.

## SOME BASS BUGS

Going a little deeper into the floating bass bug matter, I have the following from Mr. Edward Wyman, sportsman, angler, and big-game hunter, who is the real daddy of the modern hair fly.

“The dry fly for taking bass has recently come into high favor in some districts where at times their merit has been established. As a rule of practice, it is probably true that, for consistent results, the wet fly, well sunken, will take more fish, whether it be bass or trout, and one is convinced that the success that some men have with artificial minnows and other engines of warfare, used by bait casters, is due principally to their being taken to the notice of the fish by gravitation.

“The season of the year and the controlling conditions must determine the desirability of surface flies. Some time back, Walter C. Taylor of St. Louis used one of my hair flies on the Upper Mississippi, having paraffined the fly for a floater. On the occasion of its first use he had tried everything he had in his well-stocked kit, without any results, and as a last resort used the paraffined hair fly. With this fly he took seven fine bass in short order. This was at Alma, and Hank Hennings, the famous river guide, was with Mr. Taylor.

“ It has been said, ‘ a bass will take anything,’ but if there is a more capricious fish than the small-mouth bass, one has never heard it named.”

No doubt, the Wyman hair fly should be given some credit for interesting anglers in the dry fly for small-mouth bass, and for which thought the fishing clan can be thankful, as these floaters are certainly winners in enticing the game fins to the surface strike, which is the most thrilling manner in which a fish takes a lure. I recall an experience of some three years ago in which I had eleven surface strikes from husky bass in about forty-five minutes, and all of these bass made a swirling strike, cutting the water with their dorsal fin and hitting the Surprise-Minnow an awful smack. Some of the bass started cutting through the water before the bait hit the surface, and of all the fishing experiences that come back to me in the off days, I figure these rapid-fire actors the most exciting bass that have answered to the call of my bait.

Claude C. Refner, a well-known Chicago bass fisherman, ties a wonderful bass bug, following the coloring of some of the best known standard designs, the most popular of which are the following: Peet's Favorite, white body, brown stripes, white tail and wings; Dilg's Gem, orange, brown body, black stripes, brown and gray tail, brown turkey wings; Clarke's Fancy, white body, red tail and wings; Zane Grey, gray body, striped tail and wings;

Carter Harrison, brown body, yellow stripes, fox squirrel tail and wings; Wilder's Discovery, yellow body, red stripes, red and white tail; Doctor Henshall, brown body, red stripes, brown tail, red and white wings. Dixie Carroll, white body, black stripes, golden pheasant wings and tail. These patterns have been standardized and are recognized as bass bugs that will meet conditions of practically any waters, in addition to which many different color combinations known to be particularly attractive to Mr. Bass are made up. Bill Huston of Mimeiska, Minn., one of the best-known bass fishermen, says that Ref's bugs have the regular flies skinned a mile and that he never had so much sport in all his fishing days as he had when watching the old bass busting the water like a charge of dynamite hitting those bugs.

Call J. McCarty, all round champion caster at the Newark tournament in 1916, ties a bass bug that is a wonderfully good lure and his dragon fly is something that makes a bass stand right up on his toes to get a chance to snap it off the surface.

One of the best all round bugs that I have ever used for bass and rainbow trout is a clever hair bug tied by Orley C. Tuttle, one of the keenest fishermen of the Fulton chain in the Adirondacks. Orley's "Devil Bug," as he calls it, sort of resembles a small mouse and the lively wiggling bucktail hairs from which it is tied, certainly have an enticing

movement in the water that any self-respecting bass cannot resist. What the bass really think this devil bug is, I make no guess, but they have a fatal desire to give it a wallop like the loving kiss of a pile driver. This season I had Orley tie me a larger size for musky, and it proved equally as good for these game huskies. Used, of course, with a spoon as a helper, I had much keen sport with this bug, casting for musky and I am willing to play a stack of whites, that, as the hair fly and bug become better known as a musky bait, many of the clan will find much pleasure from using it for these big rough-necks of the water terrain.

E. H. Peckinpaugh of Chattanooga, Tenn., ties a rattling good bass bug in many of the old line standard patterns that have been so successful heretofore in wet fly fishing for bass, and these bugs certainly are attractive to the game ones. The Coachman, Silver Doctor, Yellow Sally and many others as tied by "Peck" have far more pep in attracting the bass as a floating bass bug than they have had in the past in the old style fly.

All of which goes to show that the floating bass bug is here to stay and that it sure brings home the bacon. And at the same time it seems to make the bass crazy to get at it, just wakens every bit of pep they have and makes 'em charge it like a bull going for a red cloth. They take to it like a duck takes to water, and after they get hooked it makes 'em

sore as the dickens for falling for the bug. Probably that's why they put up such a kicking fight to get loose from it.

## FACTS ABOUT THE BASS

The basses, both large and small-mouth, are without doubt the most voracious of the fresh-water game fins and besides that they have more speed when in search of their prey than any of the other fishes and to satiate an appetite that seems to be unlimited, they are on the forage for food most of the time.

The basses are a hardy race of tailkickers and they are scrappers from the earliest moments of their lives. To these two facts, we tossers of the fly and bait can thank the gods of the great outdoors for the large number of bass that are found all over this little old country.

And to another good point of the basses we can give thanks and that is the family instinct which makes the bass, both the old daddy of the odd thousands of youngsters and the mother, zealously protect the young flappers until they are able to skirmish around and hold up their own end. As long as the little cusses stick together around the home nest in a bunch, the parent fish guard them with a watchful eye and a set of spikes that can cut their way through any enemy, but let the youngsters assert their independence and strike out for themselves,

and it's a ten to one shot that they are more likely to be eaten by their own parents than by any of the waiting enemies in the outside waters.

The spawning season for the bass varies as to different localities and is often affected by the condition of the season. A late cold spring will set it back considerable, while an early warm spring advances it somewhat. In the South the spawning generally begins in March and in the middle and Eastern states it begins about the first week in May and extends into July, as a rule the large-mouth start spawning about two weeks after the small-mouth.

The small-mouth build their nests in the gravel or rocky bottoms as a preference or on a sandy or clay bottom as a second choice, while the large-mouth prefer to nest on the roots of the under-water plants. These fish bungalows are located in a foot or two of water, because the water in the shallows near shore is warmer than in the deeper pools and the sun gets a chance to shoot some of its heat into the nest. One family of a pair of bass certainly runs up into figures, they are great little anti-race suicide advocates. They average about 7,000 youngsters to the pound weight of the mater bass and at that rate a three-pound female of the species would have a nice little crowd of 21,000 tiny tailkickers starting out in life to make things interesting for the fishermen. Of course the entire outfit never grows up to the point where they pass the legal limit, but

No. 1 a Producer weedless spoon hook with a Booster bait, fine for casting for bass; No. 2 a Silver Soldier spoon for deep trolling for salmon and lake trout; No. 3 an Edgren Minnow for casting and trolling for bass; No. 4 a Pflueger Luminous Tandem Spinner, a rattling good bait for bass when they are down deep during the hot weather and excellent for trolling; No. 5 a Pflueger Porpoise Hide Phantom Minnow, a great bait for wall-eye pike and fine for bass either casting or deep trolling; No. 6 a Pflueger Lowe-Star spoon, fine for casting for bass and pike and the larger sizes a great musky lure; No. 7 a South Bend Weedless bucktail spinner, fine for bass casting in stream fishing and lakes; No. 8 an Archer Spinner, good for casting and trolling for bass and pike; No. 9 Pflueger Lowe Buffalo Bait, the smaller sizes of which are excellent bass and pike casting spoons while the larger are great for big musky, pike and pickerel; No. 10 a Jamison Fly Rod Wiggler, a fine artificial for the fly rod for trout and bass and I have found it very effectively used on the short bait casting rod riding a dipsey sinker ahead of it.

All of these lures are worth while and will help the angler to interest the game fish nearly any time or part of the season.

enough of them do grow up to make things lively in the fishing game.

After hanging around home for about a week or ten days, the roaming instinct asserts itself and the "little fellers" hike out for themselves and swim into the more shallow waters where the under-water weeds are abundant. At the time they leave their home and the protection of their parents they are about an inch in length and they travel in schools, snapping up every kind of insect life and even taking a chance at the small gnats and flies on the surface. When they get a bit older and reach a growth of about four inches they are well able to take care of themselves and they develop their audacity and voracity by making war on the minnow in the near-shore pools, chasing and battling far larger minnows than their own weight and size. This same battling nature and training from the fry stage up is what make 'em such grand old fighters when they get to the fishable size, and it certainly is a fact that the ones which survive the endless fight for existence in the watery recesses have accumulated a bunch of tricks that make them the keen antagonist that they are.

From experiments with the large-mouth bass a few years ago, the United States fish commission gives us a few figures that show up the bass as a sure enough cannibal. Of 100,000 fish raised in the spring in one of the government fish ponds, only

30,000 were left when they were removed in the fall for planting. While the big majority of these fry weighed around two and three ounces, there were over 500 that weighed nearly half a pound each. These latter fish are probably the boys who grow up into the six and seven-pounders we all have a hankering to connect up with on our fishing trips. At the same time one of these little rascals devoured five others nearly as large as himself in one week, when placed in a separate tank with them. With an appetite like that, this husky youngster would probably develop into one of the big old "he-whops" you often hear about, but seldom have the luck to meet up with.

When the little fellows survive long enough to celebrate their second birthday they attain an average length from 8 to 12 inches and sport a weight of about a pound and from that time on, fighting their way through life they add on about a pound a year until they attain their maximum weight unless they decorate the stringer on the way up. The maximum weight of the small-mouth is approximately four to five pounds and that of the large-mouth from six to eight pounds. Those that sneak past these limits are sure some fish, and happy is the mortal who feels the strike of these pastmasters in the art of keeping off the hook.

Food supply and range of water are conditions that govern the growth of the bass, as well as all

other fish and you will often find larger bass in a small deep lake than in the larger shallower waters. In the warmer Southern waters where the bass feed the entire year, their growth is greater than in the Northern waters where they turn into the mud and weeds and hibernate during the winter, but when they get out in the spring, they sure have more pep than their Southern cousins.

## HAIL TO THE SMALL-MOUTH

Of all the varied angles to the great sport of fishing that send the joy jumps through the system, fly fishing for the stream-raised, bronze-backed, red-eyed battler, the small-mouth bass, has the rest of the game panting at the starting point. The big old husky musky will produce a muscular fight that is second to none, the rainbow trout is there with the fast jumping fight, the brown trout prefers to rough it a bit, the brook trout acts similar to the loose end of a live electric wire and the large-mouth bass has a smacking kick like an army mule, but for a real pleasure producer, place your bet on the small-mouth brother of the fast stream.

The rod for the beginner at fly casting for bass should be a bit heftier than the trouting tackle for the reason that you will find it necessary to rough him more than the speckled beauties. He is an adept at finding the snags and rocks of the bottom and he sure knows how to use them to advantage. In deep water he will make a spiral dive in an effort to entangle the line around a root or snag and break it, when it takes a little roughing to bring him up again. The safety first of fighting the small-mouth is to keep him near the surface, to make it a top

o' the water battle; this is particularly so in fast water. This does not mean that the line should be kept so taut that you are in danger of pulling him through the air like a flying fish, but just the happy medium between taut and slack. Let the rod arch, make the spring of the rod be the force that tires the fish. Keeping the line pulled too strong is about as bad as giving the fish too much slack, as he is likely to make a getaway in either case. As the game little sport makes his leap into the air, take away the slack, but give him back a little line as he hits the water, so that he does not land on a taut line and tail off to other waters.

#### THE WET-FLY GETS 'EM

The sunken or drowned fly as a general thing will get more bass than the dry fly, that is, conditions are usually better for the wet fly than the floaters, although on the fast moving unbroken water or the more placid water at the head of a pool, the floating bass bug is a sure killer in the fly game. If you are fishing the fly in fairly deep water it should be allowed to sink quite a bit and the retrieve be made slowly; in pools with a depth of ten or twelve feet give the bass plenty of time to decide whether to take a wallop at your fly or pass it up.

The bronze-backer has a preference to fighting the fast water and he likes the deep spots in the rapids, especially if there be a submerged boulder

or log close by as a handy hiding place in time of need. Some of the largest scrappers of the family have been taken from these snug harbors of the game fins and generally the fellow who hangs out there is a big one who has pre-empted the spot and lords it over that neck of the waters. Toss your fly a trifle below the rock or log and retrieve it slowly with a series of slight jerks to give the fly a trembling, dancing motion in the water to give it a semblance of life, but don't overdo the jerks, just about let the tip of the rod carry the trembling motion of the wrist to the fly. And, by the way, if you watch your fly you will be surprised at the amount of motion it develops from a slight twitch of the wrist, due a lot, no doubt, to the vibration in the well tuned split bamboo fly rod.

#### SPEED ON THE STRIKE

In striking the bass via the fly route, make the strike the instant the fish strikes or you will not find it necessary to strike at all. He never wastes a moment in throwing the fly. In clear fine water you will often see the bass make his dash for the feathery fancy, and if such is the case, strike the moment you first glimpse him and that won't be any too soon. You can afford to set the hook well as the small-mouth bass has a strong, tough mouth and setting the hook right at the start is a little insurance on the rest of the fight.

At times the small-mouth is a trifle capricious and refuses to answer to the luring call of the fly. Often when he is in such a humor the addition of a very small spinner in front of the fly will encourage him to say "howdy," but make the spinner a small light affair, not larger than a dime at the most. As a strike coaxer, the spinner is generally equal to the occasion, but this slight added weight will soon put a kink in the lighter rods, which is another reason for the slightly heavier tackle for the small-mouth game. As to the exact size spinner that you should use on your own particular rod, that all depends upon the rod itself and in a few casts you can easily determine the spinner which best suits your rod and that can be used without subjecting it to strain. The small difference in weight of a spinner may seem of slight importance to the beginner, but with the life of a high-priced rod at stake, the angler can save a healthy nick in his bank-roll by going light on the spinner.

#### KNOWS HIS HOME WATERS

Just paste this fact up in your history of the small-mouth; he knows the waters he lives in and he has a habit of choosing his own battle-ground. He may make a dash for the swiftest part of the stream, or bore down to the bottom, halted in this effort he may strike for a run across the stream making frantic leaps on the slightest indication of a little slack in

the line, or he dotes on curving himself across the stream, making the current help him in his effort to get away. He is playing a game to his liking and he is a past master at making a fisherman the laughing stock of the waterways.

That's the thing that makes the game of tossing the feathers to the small-mouth stream-raised bass the regal sport it really is and the fellow who comes in with a well-filled creel of the bronze-backed scrapers is a wonderfully lucky cuss, so help me Hannah.

## SOME FLY SELECTIONS

Old-timer, since the first trout came up to the surface and said "howdy" to an artificial fly, that particular pattern was a favorite with the angler who happened to attract the attention of the trout with it. And he probably doped up a fine story of just how hard it had been to make that fly in order to get just the colors and style to make it the killer it was. After a few days when the big fins were off the feed and failed to answer to this fly's whistle, the old sport at the husky end of the rod started gluing and tying flies, and he has been at it ever since; that's why we have about 5,000 flies to select from in filling our little old flybook.

Where they ever laid hold of the color combinations for the fly families is beyond me, and what the trout or bass really think these highly colored feathery fancies are, is entirely up to the fish. It is a mighty interesting thing to know, however, that some of the largest fish have come to grief on the gaudiest of the flies. And backed up against this record is the fact that some of the home-tied variety, with no more pedigree than a barnyard rooster, have landed fish equally as large, if not larger.

Taking the fly subject, both ways from the Jack,

I have about come to the conclusion that it is not entirely the fly or its coloration that makes a hit with the game fin, but the way that fly is handled by the fisherman. In fairly civilized trout waters, no matter how well chosen has been your fly, or how well the cast has been made, if you have not placed it in likely spots and then handled it right when dropped, the further selection of flies will not be necessary. In fact you can take most any old ruffled-up, no-account fly, sticking back in the corners of your flybook, and handled right, you can generally catch a few fish. Why, it's often just such an old fly you light onto last when changing 'em for the eagerly sought sure-fire killer you need at that moment, after having whipped everything else up, down and across the stream in an effort to coax the battling brothers out of their home waters.

Of course, seeing these flies through the water as is the case with the fish, we have to give them some credit of knowing what they think they look like, it may be that the water blends the color combinations into a mighty inviting dish to a hungry trout. We do not know, however, that you have to strike 'em with some speed, anyway, as they are quick to know that the feathery fly is not a grub-stake, and cough it out just about as speedily as they strike it.

For night or evening fishing, "after dark" fishing, as most of the boys call it, use a dark-colored

fly, and although this may seem a bit queer to the fellows who have not tried for the big fellows after the stars are out, it sure will come up strong as a creel filler. There is always more light reflected in the sky at night than in the stream, in other words, the waters are darker and the dark bodied fly will show up more against the lighter sky background than will the fly of lighter body. This light-colored fly will blend in more with the sky and be of less prominence to the trout. In tossing 'em something to eat you might as well make it as showy as possible. Never make 'em worry about a piece of fish food on its way past their feeding-grounds. The time to make 'em worry is after you hook and net 'em. Let your dark-colored fly stand out in a silhouette of a good meal.

Taking a slant over some back figures, we find that Mary Orvis Marbury, a daughter of Charles Orvis, a fly-fisherman of nation-wide popularity, collected a list of most popular flies from the many well-known fly casters who followed the call of the rustling stream. The 12 most popular patterns named from all over the country, receiving mention from 58 down to 18 times, were the Coachman, Professor, Moyal Coachman, Brown Hackle, Black Gnat, White Miller, Montreal, Grizzly King, Cowdung, Scarlet Ibis, Queen of Waters and Silver Doctor.

While the above list shows a good variety of patterns and colors, the following selection made from

the lists of well-known fly-fishermen last season will stack you up against a choice that is hard to tear away from. Coachman, Professor, Cahill, Queen of Waters, Royal Coachman, Wickham's Fancy, Stone, Cowdung, McGinty, Brown Hackle, Brown Palmer and Silver Doctor.

After you have fished a bit with all kinds of patterns you will probably settle down to a few tried-and-true "pets," and swear by them, or at them, forever. Thad Morris had four favorites, Coachman, Red Hackle, Red Spinner and Black Gnat, and Seth Green of other days placed his chances on four, the Grizzly King, Lake George, Seth Green and Governor Alvord, but when these old-timers failed to land anything worth while they probably blamed it on the weather, the condition of the water, or that the fish were off the feed.

As a little old surprise party, forget your fly book some day and then try to improvise something you think will look good to the underwater vets. I recall some time ago, while on a nice little piece of trout water without any of the tools of the trade, that a farmer's kiddie and myself had a bully fine time tying a few flies from home-raised materials. We took a bit of bucktail hair from a rug on the floor, braced that with a little stiffener from a "porky" skin on the cabin wall, wrapped it all with the only silk thread the settler's wife had, and that was white cotton. On one we wrapped a bit of red

wool I stole out of the kid's undershirt, and on the other we hooked a couple of beads, and say, old scout, you should have seen the game little rascals crowd those two flies until they came apart from the rushing business and poor workmanship.

Naturally, old-timer, you want as nice a selection of flies to show your friends as any other fishing pal, but take it from your canal boat friend, the way you handle and where you place the fly is the real reason for the bulging creels.

## A BIT ABOUT FLIES

Way back in the early days, old-timer, even way back before Hector was a purp, in fact I think it must have been back about the stone age, one of our ancestors probably was lolling along a gurgling stream, or just loafing away the time, of which he had plenty to spare and nothing else besides his stone ax, waiting for a nice old gran'daddy bass to come along so that he could either spear it or swat it over the head with his ax, when he noticed a feather floating down through the air from a wood duck as it honked its way South to a winter home. The feather wafted through the air and dropped on the water, the wind tossing it lightly with the current. When, with a walloping drive, a nervous wreck in the shape of a man's size rainbow trout struck the feather like a Kansas cyclone and shot back to the bottom.

Now, once or twice, our neolithic forebear had tasted a well-scorched trout, which he had grilled with a forked stick over a fire, but the wily trout were a bit too cautious to fall a victim of his slugging tactics in the fishing game. Mulling the feather idea over in his small amount of gray matter, he doped up the prehistoric fly, probably by tying a

couple of feathers on a sharpened bone for a hook. And after his first try out at tossing the feathers to the game fins he spent the remainders of his days tying new designs in flies for himself and the rest of the anglers of his time.

This is no doubt the reason we have so many patterns in flies at the present time, something over 5,000 different flies to coax the husky tailkickers out of their watery retreats. And about every now and then some fellow ties another style that makes 'em cross-eyed to take a chance at mouthing it. Of course, there are quite a few standard patterns that have made a "rep" for getting the fish, that are hard to beat, yet nearly every angler will swear by some particular pattern as the one best bet, and this fly holds the pet position in his fly book, while his fishing pal may fish the same streams and have, as his killer, a fly of an entirely different style and color.

This brings us to the argument between the ultra-purist in the fly fishing game who claims that the flies used must imitate as closely as possible the natural insects that are on the wing along the stream at the time of fishing, and the ordinary fly caster who tosses a standard tied feathery fancy to the waiting fish, changing to another of the same class until he finds one that seems to tickle their palate at that time, and this selection is not made after catching a few of the flying insects and comparing their Ber-

tillon measurements with the layout in his fly book.

Of course, there is a lot of good common sense in imitating nature as much as possible in the making of flies, but the fly that has been successfully used to a greater extent than any other pattern does not imitate any particular insect that is found along the streams, and this little old winner is the Coachman. This green-bodied, white-winged, red-whiskered old fly has probably caught more fish than all the "close-to-nature" styles, and nearly every fly-fisherman has a few tucked away in his fly book, because he knows that it has a "rep" for getting the fish, and regardless of his pets in the nature line, he has it there for emergency use in order that he can give it a whirl if all others fail.

The Coachman has been a life saver to many a fellow in the stream, and for this fly of varied hue we have to thank the imagination of old Tom Bosworth, royal coachman to three of England's rulers, King George the Fourth, King William the Fourth, and Queen Victoria. Tom sure tied a winner when he doped up the Coachman, and when he had the first one finished he likely hied himself off by his lonesome and gave it a tryout before he passed it around among his cronies of the rod and reel. The Coachman is tied after the conventional standard fly patterns, and fat old Tom Bosworth was about as far away from imitating the natural insects when he mixed the materials and colors for the Coachman

as most of the plugs for bass are away from the natural baits.

I figure just a bit this way, old scout, that if the trout are coming up for the feed, they are tickled to death to vary their menu a trifle and take a chance on a fly that in all probabilities looks different to them from anything that has dropped on their waters before, and that the chances are just as good to interest them in a fly that is different, as they are to interest them in an imitation that probably does not fool them at all. In other words, the "something different" appearance of the old-line conventional flies may look like a juicy dessert after a gorging on their regular line of feed, while the man-made-close-to-nature effect may be passed up because it does not look as good to them as the regular thing, and they also note the deception.

## MORE ABOUT FLIES

In trying to imitate nature along the stream side, in the selection of flies, when we consider the keen sight of the trout, can we really say that we are fooling these game fins into believing that the imitation we toss to them is one of the regular stream insects upon which they have been feeding. May it not be more correct to think that we are tossing an insect to them and that they merely take it for another piece of food coming into their vision. When we consider the many conventional styles of flies that have been stand-bys in the fly game, flies that never have been much of an imitation of natural stream insects and that have been used throughout a season with good results, is it not a squarer deal for the keen-sighted trout to give him the benefit of the doubt, that although we are fooling him to the extent that he thinks our offering is a bit of feed, we are not getting a rise out of him because he takes the fly for a local member of the insect escadrille that flies over his battle front.

Which brings us down to the point that spending half one's time on the stream chasing a bunch of insects and doping out their duplicates from the fly book, is losing a bit of time that could be used in

whipping the stream and filling the creel. When you figure out that the trout has keen enough sight to tail off to the under-water log, rock or washed-out bank when you merely as much as show your arm above the bushes, and that they will continue to feed in plain sight if your dog happens to run down to the water and kick around a little while he laps up a drink, it's good medicine that you are more likely to interest him in something new and different than you are to make him think that your feathery offering is the second course in his regular meal.

Next time you are on a stream, old-timer, toss a few odds and ends into the water, and as they float down around the bowlders or along the edges of the under-washed bank watch the old boys come up and nose these little offerings. I have had them come up and get acquainted with the ends of burnt matches, little wrinkled bits of paper, the colored revenue tax stamp from an old Bull Durham sack, mountain ash berries, gayly-colored flower petals, a twisted cigarette butt, and numerous other things. And it's a ten-to-one shot that they come up to see whether the passing article, with the strange appearance, was a bit of fish food.

A fly that has been making quite a killing among the trout, bass, and musky fishermen during the past year is the all-hair fly and the hair and feather combination fly. These flies are being tied in all kinds of hair, from the regulation bucktail down to albino

squirrel, and although none that I have seen imitate any particular insect or resemble in any way the usual stream-side flies, they certainly have been mighty luring to the game boys. The big point that stands out in their favor is the wonderful wiggling motion of the hairs in the water. It seems that each individual hair has a nervous little twitch of its own, and the combined bunch of twitching hair makes a lifelike movement on and in the water that the trout, bass, and musky seem unable to resist.

Ed Wyman, a fly caster of note and a big game hunter, has been tying hair flies for a number of years, and these flies are certainly killers for bass, salmon, and musky. And the beauty about Ed's hair flies is that they are tied to stay tied and they stand a bunch of rough use that the ordinary fly would go to pieces under. Any fisherman who is fortunate enough to get a hair fly tied by Wyman surely has added a fly to his book that will make him happy for life.

Emerson Hough, the well-known author, who is a fisherman from his shoes up, has been tying a bucktail that will make him as famous as any of his books. The long straggling tail hairs on this fly give it mighty teasing movement in the water. Up to last season, Mr. Hough kept his bucktail fly as a personal affair among his friends, but the requests for them became so numerous, that about all he had time to do was tie flies. So the Emerson Hough

Bucktail Fly is now being made commercially, and has taken its place in the fly family.

Not only in the fly line proper has the hair been used, of late, but also in the tying of bucktail shiners and minnows. The Hildebrandt people, of spinner fame, have a small-sized silver shiner, light enough to be handled on the fly rod and still attractive enough to be effective as a lure for the game fins. These shiners are tied with a streaming hair tail that is a decided killer.

## WIND-UP ON THE FLIES

There is quite an argument among the knights of the arching rod and singing reel as to who really tied the first hair fly, which is a natural consequence when anything starts on the road to popularity. Not wishing to jim the works any, as to who did it, I quote the following from "The Art of Angling," by R. Brookes, M. D., published in London back in 1760. "To make useful artificial Flies, you furnish yourself with a Pocket Case capable of holding the following materials: Bears Hair of divers Colors; as gray, dun, light and dark-colored, bright brown and that which shines: Also Camel's Hair, dark, light and of a color between both: Badgers Hair, or Fur: Spaniels Hair, from behind the ear, light and dark brown, blackish and black: Hogs Down, which can be had, about Christmas, of Butchers, or rather of those that make Brawn; it should be plucked from under the throat and other soft places of the hog, black, red, whitish and sandy. Cows and calves hair in all the different shades, from the lightest to the darkest brown, both of which are harsh, and will never work kindly, nor lie handsomely. Flies made of the hairs of bears, hogs,

squirrel's tail, camels, dogs, foxes, badgers, otters, ferrets, cows, calves' skins, etc., are more natural, lively and keep color better in the water than flies made of crewels and worsted stuffs, unless you mingle hair therewith."

Which goes to show that the hair fly is not a spring chicken and that Old Doc Brookes, peace to his ashes, knew a bit about the hair fly way back in the early stages of the game. Although Doc gave his fishing friends the info on the hair fly, they probably never tied a fly in those days that had the lively crawl and movement of the present-time hair flies, nor were they tied as skillfully as those of today. I have one chewed up Wyman hair fly that has to its credit the landing of 55 small-mouth bass in the St. Francis river in Missouri, and 22 small-mouth in the Varner river in the same state. After all this mauling, the fly is still in shape to land more bass. Here is a fly made entirely of hair, with the exception of two small narrow feathers tailing out behind, that made the bass cross-eyed to get it and yet it does not resemble or imitate anything that ever flew over the Missouri streams. I make it that these bass were attracted by the wonderful movement of the hairs in the fly; that it looked like something to eat that was possibly getting away, and that the fly never for a minute fooled the wily bass that it was something that they had been feeding on as a regular diet.

And the fact that this hair fly stood up under the heavy work of landing such a number of fighting game fins shows up the hair as a mighty durable material for fins. Of course it had to be tied with care and skill to outlast the roughing it received, something that few, if any, of the standard feathery flies would live through.

C. C. Refner of floating bass bug fame ties a bucktail fly that carries an added attraction besides the lively wiggle of the hairs. "Ref" has doped up a prismatic coloring that lets the light shine through the hair in a scintillating way that seems to make the flies quite a bit more lifelike than the darker flies.

It is interesting to note the hair fly, tied on a larger hook, is being used in the quest of the rough-neck musky and that it has been found a good lure for this gay dog of the underwater haunts. The large silver shiner with the hair and a few feathers is, however, a better lure for the musky, and the shiner or fly can be either cast with the fly rod or the shorter bait-casting tool. Unless one is a skillful manipulator of the fly rod, it is folly to subject a clean-cut tool of this class to the kicking fight of the musky, and at that it is some job to land this game cuss with a whippy fly tosser.

As the hair flies and the hair and feathered combination flies become more generally used, their wonderfully effective action in the water will be appreci-

ated by the fishermen who find keen pleasure in whipping a bit of water to coax the game fins up to get acquainted.

## REELSPPOOL TO LURE

The rod and reel are considered such important parts of the bait-casting outfit that they have been touted as the last word in tackle lore, but the little old line, and from that piece of kit down to the lure, is a detail that really handles the brunt of the battle and should be given greater care, or at least as much attention as either the rod or reel. Fish have time and again been landed after a rod has snapped and I know of one 30-pound musky that was safely played last season, after the reel had slipped loose from the reel seat and flopped down into the water and continued on its way to the bottom of the lake. The fact that the line held and that the leader was right is what finally brought this old rascal to gaff. Therefore, I do not think that the rod or reel are of any more importance than the line and leader, for, should either of these pieces of kit give way, no matter how fine the rod or reel, the old "he-whop" is on his way to other waters and you are reelin' in the shattered hopes and a busted line.

In the matter of material for the bait-casting line, we can throw everything into the discard except silk. No other material has ever run even a close third to this product of the silk worm for a material out

of which to produce a line that will hold up under the burning wear of steady casting and at the same time not eat a hole into your thumb.

And the silk line should be braided and not twisted, as the twisted affairs will kink the top of a pickaninny's skypiece, and even at that, at times you will get a kink in the silk lines as every bait caster knows.

Of the braided lines make a choice of the soft-braided ones, for the very good reason that they are easier on the casting thumb and less likely to put that member on the sick list, if you happen to be on a two weeks trip to the fishing waters and have failed to bring along an extra right-handed thumb. Steady casting for a couple of days, by the fellow who has not been doing much casting before the big trip, will soon enough wear on the thumb a bit and as a little old piece of insurance to have the thumb in condition for the rest of the trip — use the soft-braided silk line.

Then another point in its favor is the fact that the soft-braided line spools more evenly on the reel and lies close and smooth, which is an advantage in favor of the next cast and a mighty good anti-back-lash remedy.

It is surely a piece of false economy to buy a cheap line, or to wait until the last minute before your trip to rush in and buy any old line the tackle man has on hand. Many a bunch of joy-jumps have been

turned into gloom clouds by a poor line. Get a line with a good name behind it. A line of soft-braided silk, 50 yards to the spool, and one that you can depend upon costs about a dollar or a bit over that. You'll save fish and money by getting one around this price. Nearly every line maker has a card of sample lines showing sizes and test weights, it's a simple matter to send for one of these cards and make your selection before you stock up.

For all round bait-casting there are two sizes of lines that really cover about everything a fellow needs, these are No. 5 or G size and No. 6 or H size, some makers using letters to designate sizes in place of numbers. The No. 5 size tests out around 20 pounds and the No. 6 tests about 15 pounds, and unless you are in waters in which you expect some of the great old barbarians, the musky or pike, the smaller size No. 6 will be found the most satisfactory for general casting. In fact, the fisherman who has passed a few seasons at the sport alluring, seldom uses a heavier line than the No. 6, as this size is plenty strong enough for the fellow who knows how to play the game fins.

How long a line will last in the casting game, depends entirely upon the care given it. If you allow it to dry out on the reel after the day's fishing, to mildew and become rotten, the life of the line will be short and the end sudden, but if you raise it a pet and dry it out thoroughly after fishing, keeping

it in an air-tight tube during the off season, you can use it when the fever hits you the following season. Turn your line every day or so, in this way the wear is somewhat evened up, otherwise the part next to the reel will be seldom used. Test the end each day, between the hands, not with a sudden jerk, but an even, slow pull and if the line is worn and weakened, cut the dead timber off and save fish and lures later.

At the bait end of the line you should use a wire leader and either the gimp twisted wire or the straight piano wire leaders are good for the kit. These leaders are supplied with snaps and swivels and there is no more useful and time saving part of the tackle than a leader so arranged. If you get a heavy close-up strike from one of the dagger-toothed villains you will thank your lucky stars that you have a strong wire leader between his teeth and not the bare line. You can loop your line into the end swivel and changing lures will take but a moment's time to loosen the snap on the other end. And the swivel, old-timer, is a mighty small affair, but it sure does keep the line from kinking and snarling. To see just what value it really is, make a few casts without one and then shoot out a few with the swivel in use and you certainly will see the difference.

## WORMING FOR TROUT

In the early season when the trout streams are generally at flood, or at least a bit high, and the waters are roiled or slightly colored with the mud and truck from along the shores, about the best little old bait that keeps you from coming home without a fin in the creel, is the angleworm. That little wiggling cuss you used way back in the knee-pants stage of the game on the sunnies and other panfish.

Some of the most experienced anglers of the fishing clan who, early in the season, carry a fly book filled with flies of every color and hue, are supposed to have passed up the fishworm in their flight to glory, but after giving the stream the once or twice over without coaxing a rise, they generally are able to search around in their hip pockets and locate a little box of worms hidden away for just such an emergency, and, if no one is looking, they hook on a nice, juicy common fishworm and take a shot with it. As the trout are bottom feeding on just such food in the early season and have their lamps peeled for the worms as they are washed downstream, it's a fairly good bet that the angler, with his experience at the game, lands a few nice ones regardless of the murky condition of the stream.

The bait casting rod, that short little joy stick which has made it possible for many, many fellows to get into the angling game. The ease with which it is mastered has opened up the wonders of the water trails to thousands of fellows, who possibly would not have had the nerve to try the sport by mastering the long whippy fly rod at the jump off.

No. 1 shows the long tip of the Jim Heddon rod and No. 2 is the Heddon rod jointed, this rod is a split bamboo and a rattling good one. No. 3 is a light tip for light lures and No. 4 is the complete Horrocks-Ibbotson rod with a medium heavy tip for heavier lures, this rod with a light and heavy tip makes a fine combination and it is an excellent split bamboo affair. Rods No. 5, 6, and 7 are of my own make and range from  $3\frac{1}{2}$  to 5 ounces in weight, they are personal pets of split bamboo which I have used for 12 to 15 years. No. 5 is a two piece, 6 and 7 are one piece with butt.

No. 8 is a Bristol steel rod, a fine one for musky, and No. 9 is a Bristol telescopic steel rod, a mighty handy rod to carry in the woods for all kinds of fishing as it is adjustable to any length from four to six and a half feet. No. 10 is a Bristol steel pocket rod, made with very small joints and a handy rod to pack in small space or slip into the pocket, while No. 11 is a fifteen year old Bristol steel that has been carried on many trips during that time into the hinterlands as a piece of rod insurance. It has traveled many miles on steel, stream and portage as a safety first against breakage of the split bamboos.

1 2 3 4 5 6 7 8 9 10 11

Do not for a minute, old-timer, get the idea that fishing for trout with the worm is an easy proposition. You need just as much stream knowledge, and far more stealth and care in approaching your pools, in early season worming for trout as you do in the fly-casting days when the duns begin to hatch and you match your feathered hooks with the colors of the stream insects that are flitting about.

It is, of course, impossible for anyone to stack up a bunch of set rules on the fishing of all streams. Every stream has its own peculiarities and conditions, but there is one old rule that cannot be broken by the trout fisherman on any stream, and that is, "don't let the trout see you or your shadow." This is one of the standby rules that sure applies to the early season, when the trout are keenly on the lookout for anglers as well as food. If you are wading in the middle of the stream, don't for a minute think that the wise old spotted rascal, who may be hiding a foot or two under an overhanging bank, is asleep on the job; he knows and sees all that is going on right close up and for considerable distance. And if he sees you first, before the worm comes down in a tantalizing wiggle, he'll never slip into your creel on that trip downstream.

As the streams clear up a bit and the waters fall to about normal the trout are more on the feed, and their food at this time consists of worms, leeches, crabs, helgramites and other underwater

forms that are carried down to them by the flowage of the stream, and live worms used with skill and care will get the fish, while you can cast your arm off with a fly and probably get nothing but practice, which is sure not what the average fisherman is looking for.

There is quite a difference between worming for trout and fishing for trout with worms. To merely hook on a couple of worms and throw out your line, letting the current carry it down lickety-split, half the time buried in mud and hidden by debris until a trout happens to nose it out and swallows it, is not worming for trout by any means. That is pure and simple still fishing, about as lively as fishing for sunnies, and neither sportsmanlike nor much fun.

The real early season sport with the worm is to use the same tackle as in fly-casting and to cast into the most likely spots. Covering the swirl of water around the partly submerged bowlders, dropping your worm above the cut-under bank so that it will carry down along that hiding place; around the roots of trees and in the pools formed by the piled-up brush and debris; and, most important of all in the rapids and shallow pools and at the heads of pools where the water is a bit swifter and more active, here you will generally find the big fellows gorging themselves. That's what makes 'em big — always sticking around where the feed is the thickest.

The rigg'in' for worming for trout is a simple af-

fair. Take the ordinary trout gang of two small hooks, about No. 8 size, tied to a looped leader. Tie this on your leader and you can either take one large-sized worm and hook it on the top hook leaving the short end to wiggle, and then hook it down farther on the second hook, allowing the other end of the worm to dangle loosely, or you can take two smaller-sized worms and slip one on each hook, inserting the hooks through the middle of the worms. This later method is usually found more effective, as the worms are far more lively, and the more wiggle to friend worm the greater the interest created among the trout. And in the early season, after a hard winter, and the high cost of trout living setting new altitude records, believe me, there is nothing more alluring to the trout than aforesaid wiggle of the worm.

In making your cast with the worm, go about it gently, as the worm is easier to snap off the hook than it is to snap off a fly in casting. Don't allow the worm to sink to the bottom, but give it a little motion and keep it in about middle depths. Your down-stream worm in middepths is quickly seen by the trout and he will rise to it with the same pugnacity that he shows when taking a wallop at your fly. After the strike, you play him with the same tackle and use the same skill that you do in fly-fishing for him, and far be it from me to cause an argument with any of the fly-purists — but what makes the

game unsportsmanlike is the point that has your uncle fanning the air.

I figure, old-timer, that going after the game fins with what they are feeding on at that time — and playing 'em with light tackle — is playing the game fair, and the devil take the hindmost.

## A BIT ABOUT QUEER BAITs

Regardless, old man, of the great number of baits and lures flaunted before you each season as you make your many pilgrimages to the tackle stores to gloat over the fine stuff lying around those places, there are a few that you have probably never used because you have not been hep to them. And in most cases these baits have been discovered by someone who carelessly left the real stuff lying on the pier or about the camp and little old mother necessity made 'em put on their think-tank and dope up an emergency lure that would induce the big fellows to strike it and eventually land in the spider.

Olaf Hanson, a genial mate on a freighter on the great lakes, a sailorman by instinct and a fisherman for the love of the game, pulled a fine one last season. Olaf had a bit of time on his hands one blustery, cold day in May, while his good ship was tied up in Copper Harbor, Mich., so he ambled off to Tango lake and took a flier at his pet sport. But he forgot his spoon hooks and being an observing fellow with an inventive turn to his gray matter, Olaf doped up a spoon which brought back the bacon to the tune of a 29-pound pike, which is sure no big fin to be sneezed at. And, old-timer, you can figure

it out for yourself the peppery fight this gay rascal made in the cool waters of Tango lake, before becoming doped up with the heat of a lazy summer.

And Olaf's spoon was nothing more nor less than the half of a clam shell, picked from the sands along the shore. Not so bad for a lure at that, the pearly shine of the inside of the shell and the dulled outer side probably made an inviting flash as it wobbled through the water. At least it played the swan song of a big fin of the pike family, fine enough fish for any angler to match wits with. In rigging his tackles, Hanson bored a small hole through the clam shell, passed his line through the hole and let the shell wobble around on the wire leader. Tack this idea on the back walls of your brain cells, old man, so that you can be prepared for the next time you hit a likely looking piece of water and find the spoons among the missing. And even at that, what's the odds, give it a try out anyway some day when the big fins are off the other lures you have tried out and which don't seem to interest them. Here's to the clam shell, long may it wobble, thanks to Olaf Hanson and his keen thinker.

Bob Moulton, another simon-pure fishing fan, who would rather fish than do his knitting, and who has whipped many waters from coast to coast, copped the kitty with a spoon last season that made three muskies sit up on their tails and whistle for the breaks. Bob was out on a mighty inviting piece

of fishing waters with a friend who couldn't tell the difference between a fish hook and an anchor. The only thing on the launch that resembled tackle in the slightest degree was a couple hundred feet of heavy hand line and a few hooks, so Moulton gave the launch the once over again and found a small nickle shoe horn which he pounced on with a yelp of fiendish glee. He bent the small end of the horn on a right angle, passed the line through the hole, knotted it above and below the hole and walloped it out in the water for a ten strike. That the fish fell for this improvised spoon in its skipping glide through the water is shown by a string of three muskies ranging from eleven pounds up to sixteen. Of course, old timer, the moral of this is to always carry a few shoe horns in your off hind pocket, or if you must fish when the kit is back home in the safe, do a little Edison stuff and make up an emergency outfit from what you find lying around.

For a live bait that has everything in the layout beaten at the starting post, you gotta doff the sky-piece to the goldfish. The mud minnow, which is a favorite, the shiner, chub, sucker or anyone of the minnow family don't show up at all when it comes to a bass bait that makes 'em cross-eyed to get at it. I had this tip passed to me last season and hogged it right up to now, because it was a killer and a sure fire bass teaser.

The info on the goldfish was slipped to me by a

friend who got it first hand from a party who has used no other bait for any fishing during the past forty years and he has fished with this bait all over this country, also in Asia and South Africa, in fact, he first learned of it in Siam many years ago. I had a sort of feelin' that my friend was passing me a short line of bull, so I did not try out the goldfish bait until mid-season and on a hot sticky July day when the bass were down below looking for the cool spots. When I let that shining wiggling bait tail its way in among them, they probably thought it was easy money, because they took the bait like hungry wolves. There was simply nothing to it, the bass could not resist the golden lure as it flashed its invitation to them.

A few days later, fishing with a pal on very civilized waters, we caught three to one with the goldfish against the mud minnow and chub. For still fishing for bass, or a light short cast letting the bait sink, when the fish are down deep, the goldfish is certainly some bait. The nearest thing in artificials to the goldfish is a Keeling Minnow. This bait is a two inch minnow of a copper color and a good small-mouth lure, but you have to let it go way down for the fish; it is exceptionally good in the hot weather for deep fishing. Here's a little dope for the tackle makers, the fellow who gets out a minnow of the color of the goldfish and makes it a short-sized plug is sure going to put on the market

a winning lure. But to make it a winner, the plug will have to carry the shining, orange-golden color of the real goldfish.

## ON HANDLING THE PLUG

Old man, when you lope into a tackle store and see the many different artificial plugs for unsuspecting fish, you are sure in a quandary as to a selection of what plugs will really get the fish. Naturally every plug-maker touts his bait up as the one and only sure-shot killer, and at that he is not far wrong — here's a bit of a secret, and one that will be well for you to tack away in your gray matter. Any old plug will get fish if you play it right and keep it moving in the water, but you certainly got to keep it moving. You could throw a plug on the water and let it float around all day, and every old game fin in that neck of the waters would let it float in peace, and about all you might expect would be a couple little minnows, or perhaps a perch to come up and nose it around out of curiosity.

### QUICK TRANSFER OF ROD

Where the beginner at plug casting makes his big mistake, old scout, is in slipping up on an important part of the casting game, and that little old point is the transfer of the rod from the right to the left hand the instant the plug strikes the water. Next to the placing of the plug with accuracy in the weed-

pockets, comes the importance of this transfer of the rod and the starting of the plug on its retrieve to the reel the instant it hits the water. And at that, I believe that it is equally important to start the plug homeward instantly, as it is to place it in just the spot you had aimed at.

A bass is interested in the plug from the moment it strikes the water, and often this interest is awakened while the plug is in the air right above the water. The bass often starts on the move to make the strike before the splash of the plug, but it's a ten-to-one shot that he does speed up the instant of the splash, and he sure loses interest if the plug lies motionless on the water. The splash of the plug is an incentive to make him strike, and the quick move of the plug makes him think he had better get a move on or this choice bit of grub will get out of his bailiwick and be snapped up by his competitor in the weed-beds.

#### TAKE UP THE SLACK

This transfer of the rod from the casting hand to the other one takes practice to get it down to a fine action. As you make the cast on the forward sweep, your arm almost takes a horizontal position at the wind-up, with the elbow slightly forward of the body. As you thumb the reel with the heavy pressure to drop the plug where you want it, thrust your other hand out and grasp the rod grip so that the

instant the plug flops down on the surface you have the rod in position to begin reeling in the line with the casting hand on the reel handle. In order to start the plug immediately, give the rod a horizontal sweep backwards; this gives you a chance to take in any slack and start the line reeling in without leaving the plug motionless on the water for an instant. Do not make this sweep too far back or you will not be in a position to strike your fish the moment he strikes your plug, and with the artificial this is necessary. As you start reeling in the line, let the rod work back in front of you. This takes the strain off the rod, and you are always in a position to strike if necessary. If you get a backlash, however, all your trouble goes to naught, and if you experience a strike with a backlash in full bloom, good-night; you'll swear by every card in the deck that you will reel in the line more carefully next time.

#### FLOATER FOR THE BEGINNER

For a starter in plugs it is well to lay in a supply of floaters, the plug which comes to the surface when you stop reeling in the line. Most of the surface or semi-surface lures are floaters, and the beginner saves quite a bit of money due to this fact, as the underwater plugs have a great little habit of hunting the bottom and lovingly cling to the first snag or rock crevice in the neighborhood. For early season fishing the surface plug is the one that gets the fish,

and in fact it is good right through the season, although about mid-season, when the weather is hot and especially for fishing during the daytime, at that period, you will get better results by using either an underwater plug or sending the surface affair down deeper for the fish. Nearly all of the floaters have eyelets or planes which send the lures down to different depths and you can fish almost any kind of water with them, except the real deep pools or holes. In early morning and late evening fishing, when the bass are in the shallows, feeding, the surface lure is a rattling good bait, and for night fishing no other style plug has a look-in.

#### RIGHT INTO THE WEEDS

Of course, old man, you'll want to cast right into the weeds when you find a likely-looking spot, and it is some job to handle a plug in such places without hooking half the weeds in the lay-out. For work in the weeds, unless you strike a fairly open pocket, the plug with the trebled hooks is bad medicine, and you should either cart a few lures equipped with weedless hooks or one with the twin-hook arrangement with the hooks pointing up. For a regular old-style weed rake, nothing has it on the underwater plug, and the floater is shown up to good advantage in comparison.

And don't be in the least surprised at the odd shapes to some of these little old fish teasers.

Many an old "he-whop," that should have known better, has fallen to the lure of a plug that looks no more like his regular line of eats than "Uncle Tom" looks like Sandy Klaws. And keep in mind that every plug in the deck is a fish-getter, and that, if you give it a good try-out and keep it moving in the water, you are likely to surprise yourself as well as the fish by landing a whopper.

## EARLY SEASON PLUGS

For the early season plug casting, when the bass are in the near shore shallows trying to coax a little warmth out of the low water after a hard winter, the sure-fire winner in the wooden bait line is the surface or semi-surface plug. For this shallow water stuff, you don't find it necessary to go way down for them and most of the floaters wiggle along from a foot to two feet below the surface anyway, which is plenty deep enough to catch the eye of the bass that may be kicking around along the route of the dippy, diving plug. Then again, in the early season the big majority of the strikes come the instant the plug hits the water, or as it starts on the retrieve. For this reason the surface plugs are far better than the underwater variety because they save endless trouble in snagging on the sunken logs and windfalls which, generally, are found in the shore waters selected by the bass as feeding grounds. Windfalls, underwater logs and brush heaps make the natural hiding place for the bass, and when you have to cast in among 'em, without any knowledge as to protruding limbs and snags, the fact that you have a floater will save time, trouble and your sweet disposition. To get a strike and a snag at the same

time is enough to make any fellow toss off a line of "langwedge" equal if not superior to the star outburst of a freshwater sailorman.

As to the color that seems to make the game fins cross-eyed to get at it, the white with a bit of red has it all over the balance of the paint box, and this little line of info is not chalked up from the experience of one person, but from the data jotted down from the fishing experiences of some two hundred Waltons of the water trails. As a good bet on the early season plug, make your favorites the white and red combination. The red may only be a dash on the nose of the lure, along the flutes or on the head or top, but wherever it is, it adds to the attractiveness and seems to make big boys fightin' mad to wallop it. The next best bet in the color line is the green and white, the combination generally being a crackled green back with a white belly. Following this comes the rainbow and perch colors which lope in about neck and neck. With this layout of colors you should be prepared for most any water and weather condition, also for the varied feelings of the big bass as to the color that tickles 'em into a striking humor. And not only for the early season fishing will these colors be useful, but any time later they will be found a fine selection for the kit.

And tucked away in this grab-bag of plug lore garnered from the actual fishing experiences of over

two hundred of the keen fellows who angle for the gamy bass is one big point that stands out like a sore thumb, and that is the fact that the smaller-sized plugs are coming strong as sure-enough interest creators among the game fins. Not so long ago all the plugs were three to five inches long, but some practical chap in the tackle line slipped onto the smaller stuff and believe me, old-timer, there is a surprise in store for you, if you have overlooked the short, stubby "little fellers." They have a mighty nice casting weight and they act up in the water something scandalous, with a jerky, sliding crawl that puts a crick in the back of a bass in his mad rush to give it the double O. And another thing that helps peg up a little more credit for the small-sized plugs, and that is you get very few short strikes with them, which of course means that your strike is more effective.

For the fellows who are not particularly fond of the trebled hooks on the plug, they can be had in most cases with either single hooks attached or with the twin hook. This twin hook is practically weedless, as the hooks ride barbed point up, which also makes them just about snagless; two points in the favor of the twin hooks that should make them very popular in addition to which it is considered by many anglers as a more sportsmanlike lure. However as far as hooking qualities go, I think that the upridding twin hooks are more effective on the strike

even than the trebles, and you are more likely to hook 'em for keeps with either the twin hooks or the singles, as the hook has more chance to work in and stay set than if the fish is hooked on the trebled affairs.

The main howl about the trebled hooks on the plugs is that there are so many of them on a lure, some plugs being armed fore and aft with five trebles, making 15-pointed barbs waiting for the luckless fish, while singles on the same plug would only make five points that the game fin would have to evade in his effort to sink his teeth in the wonderfully colored chunk of red cedar. It is seldom that a fish is hooked at the strike on more than one barb on a plug, and it is a mighty delicate question to answer, whether he would have been hooked or not had the plug been armed with singles. I believe that the single hooks are just as killing as the treble, in fact more so, but that the playing and netting of the fish so hooked, takes just a little keener tackle skill on the part of the angler than if the fish is originally hooked on a treble hook.

Among the plugs that make a taking selection for the early season fishing are the Coaxer, which is a sort of an imitation of a pork chunk tailed with red feathers, it is small and a great little surface agitator, the felt wings and body throwing up quite a swirl as it comes in for the next cast. The Jim Dandy plug which has a staggering, slow crawl

through the water, like a wounded minnow and a "bacon getter." The Baby Crab Wiggler which lives up to its name and wiggles into the affections of the big fins with remarkable ease. It has a backward crawl that would do credit to a live crawfish. The Babe-oreno, the child of the Bass-oreno and the little cuss has inherited all the good points of its dad with the added value of being small. The Tango, Jr. and the Tango Midget, two surface plugs that have the sure-enough minnow crawl of the larger Tangos.

Then there are the Pflueger-Surprise minnow, which is a wooden plug without any hardware tacked on to make it dart, and it sure has a darting motion that gets 'em; the Creek Chub Wiggler with its natural scale finish and a wonderful minnow-like darting swim, and the Wilson Wobbler with the famous flutes that send it through the water with a swimming motion just as natural as the live minnow; the McCormic Mermaid Minnow with its peculiar wiggling swim and the Schoonie Skooter which has a wonderfully developed dart that is quite like the natural minnow, not to forget the Liar Bait which glides along with a motion that is some enticing to the game fish family. Then there is the Getsem Bait, a pork chunk shaped plug that rides along with a wobble that brings 'em right up to the surface.

## HOOKS THAT HOOK'EM AND HOLD'EM

One little part of the outfit about which the average every-now-an'-then fisherman does not bother about, any more than the law allows, is the hook. And the hook, old-timer, is a mighty important piece of the tackle layout. Particularly is this true in still fishing, where a decided strike is given to set the hook and in bait-casting with live bait, the minnow, frog, crawfish and such other natural foods of the game fins. Quite a number of the boys who skip off for a couple of weeks fishing wait until the last minute on the hook question and then generally get a few of this and a few of that and let'ergo at that.

In the making of hooks there are two styles of point and barb which class the hook as a real affair or just an ordinary one. These distinctive styles are the hollow point and the spear point. The hollow point is hand cut and is used on all first-class hooks and on hooks that you can depend on to have strength and staying qualities when you need them, while the spear point is a point and barb made by machinery and used on the hooks that come at about ten cents a hundred. One good hollow point hook

will last practically as long as a hundred of the spear pointers and there is not one hundredth as much chance of it snapping off when the big fellow heads for the weed-bed or the underwater snag.

I recall one experience which brought me up suddenly to a resolve to always test out my hooks before taking them on a fishing trip. A few years ago I had tied a dozen or so flies for a try at the opening of the season and had tied these flies on a bunch of hooks from the same box. Although I had a number of strong strikes I failed to hold any of the large fish and seemed to be able to bring to net only the smallest of the tribe. After a few disappointments, accompanied by the usual vocal explosions, I gave my flies a close once over and found that the hooks upon which they were tied had about the strength of the ordinary copper wire — just a bit harder to bend than lead. This box of hooks had worked through without being tempered and were worthless for fishing. You can stack a nice bunch of whites on it that I thoroughly examined every hook after that and you cannot be too careful, old scout, in testing out your hooks before tying your flies or taking them along in the kit for still or bait fishing.

The hooks most generally used for trout, bass, pike and musky are the Sproat, O'Shaughnessy, Limerick, Cincinnati Bass, Carlisle, Sneck and Aberdeen, by which you will note they are all from the other

side of the water and this includes the Cincinnati Bass, which is an American style but usually made at Redditch, England, which is the home of the fish-hook. All of these hooks have their followers and they have different bends, with either the point paralleling the shaft or with an outward twist which throws the point a trifle off at an angle with the shaft. By some the off-bent point is considered an aid in the strike and to others, who swear by the straight point, it is shuffled into the discard as being N. G. For both fly tying and for bait fishing I like a bit of an off-bend in my hooks but for regular still fishing I use the straight pointer. On this score, old man, the only thing to do is to try both styles and use the one that strikes your fancy as the one best bet; either way from the Jack, both makes are good hooks and you will probably end up the contest by carrying a few of each, which is a wise little move at that.

About the most popular all round hooks are the Sproat and the O'Shaughnessy and these two hooks are almost identical with the exception of the bend to the points. The Sproat being a hook with the point on a line with the shaft commonly called a center draught, and the O'S. having the point twisted a bit to starboard. They are both strong, powerful and with a short shank that makes them equal to the kick of any game fin. These short squatty hooks don't show up very well when laid alongside of the

trim and classy looking, long-shanked Aberdeen, but they are sure built for business and when you strike with them they dig right through the mouth and they are there to stay. Although the Aberdeen is a good looker, and has a fine spring to it, if you are after the big fellows and hope to hold 'em when you hook 'em, save your Aberdeens for the smaller fins and place your bet on the roughnecks, or until you have developed a line of skill in playing your fish that will enable you to land 'em with the least amount of strain on any part of your tackle.

The Limerick or the "Dublin" Limerick is an excellent hook, the bend and form are somewhat similar to the O'Shaughnessy, but the wire used in making this hook is slightly smaller than that of the O'S. The Dublin Limerick is hand forged and a particularly strong hook.

Of the hooks with the point out-bent, about the best is the Cincinnati Bass, which is a short-shank, sturdy looking hook and equal any day in strength to the Sproat or O'S. The Carlisle is of the long-shank variety, with the out bend to the point and although the style of the hook is somewhat on the order of the Aberdeen, with the out bend exception, it is a very good hook and a stronger one than the Aberdeen.

A hook with a bend entirely its own is the Sneck which has almost a square off bend at the lower end. The out bend of this hook throws the point con-

siderably out of line with the shaft, more so in fact than either the Cincinnati or Carlisle. The bend in the latter two hooks being made in such a way as to keep the point even with the shank; this is accomplished by starting the out bend at the base of the shank, while the out-pointing of the Sneck starts after the first bend on the shank.

Taken all the way through, any of these hooks are worthy of a place in the tackle box and after you have passed the "hooks is hooks" end of the game you will probably tie up with a certain style that has been found just the type of a hook to answer to your particular method of playing the game boys, and by that bend and make you will swear as the one best bet in the hookery.

## A BIT ABOUT STEEL RODS

For the beginner at bait-casting, old scout, the steel rod is about the best all-round bet in the rod end of the game, and at that there is no reason why it is not a handy tool for any old bait caster. For the fellow who has sort of post-graduated at the sport, and who loves the feel of the split-bamboo and knows how to treat it, there is still room in his kit for a steel rod for certain kinds of casting, and it's a one-hundred-to-one shot that you will find him armed with one of these husky battlers.

Of course in speaking of the steel rod of the present day one does not refer to the heavy, cumbersome rods first brought into the fishing game, and from which some anglers have based their opinions of the steel rod in general, and by which they have eternally damned it thereafter, but to the whippy, snappy, arching steel rod that has just the amount of resiliency to give to the forceful rush of a fighting bass and to come back to normal without breaking its back. The light-weight steel rod of the five and a half foot length is a casting tool to please the most ultra-conservative highbrow in the casting game, if he would only give it a bit of a trial before shooting the skids under it.

## STEEL ROD IS POPULAR

Take any lake in the North woods country or close-in on "civilized" waters, and you will find that the majority of keen fellows who toss the artificials do their bit of tossing with the steel rod. They are so far ahead in count that you wonder why the other fellow has failed to get one. Naturally there is a reason for this popularity of the steel tool with the fellows who do their fishing on the water and not on the front porch at the club. And this big reason, old-timer, is that the steel rod is a trusty tool, it seldom if ever gets out of order and there is very little chance of breaking it unless you step on it or give it some other wallop for which it never was intended. Even at that you can carefully bend it back into shape and still find it willing to do its share in the casting game.

For the emergency rod when on a fishing trip in the country where rods are limited to what you carry with you, you have to slip the blue ribbon to the steel rod. Break the tip of your favorite split-bamboo while out on the water trails, and you have no recourse but to slow up on the fishing, while if you have a nice little steel rod trotting along as a partner, you cast until your arm drops. Naturally a fellow does not treat his tackle roughly or give it any more hard knocks than possible, but there are times when accidents happen, and about the best

insurance against accidents in the rod line is the steel rod. The fact that it is built strong and sturdy simply means that it will stand up under harder wear than any other kind of a rod and in the pack or on the portage it will get through without damage.

As to the length of the steel rod make it about a five and a half footer, or longer or shorter, if you find that the different length seems to carry the "feel" that you wish in a rod. The five and a half foot casting rod is about the average and in the light steel rod makes an ideal caster.

#### AGATE GUIDES THE BEST

When you consider that a line shoots out thousands of times through the guides in a day's casting, you realize the amount of wear to which the line is subjected. The friction caused by this rubbing of the line on the guides soon frays it, and as lines cost good money, you will find that agate guides on the rod will cut down the upkeep in the line end of the game. This friction is particularly heavy on the tip and the first guide from the reel seat and these at least should be of agate, although it costs but little more to have the entire set of guides of that material. Medium-sized guides are the best. Agate guides add at least three times to the life of the casting line, and that makes 'em a mighty good investment, and tough luck to the linemakers.

In addition to the regular hand grip, the rod fitted

with the forward hand grip above the reel seat are certainly winners. This little old cork affair sure makes the work of reeling in the line a regular dream, makes laying the line evenly on the reel easy and takes away from the game a mighty tiring piece of business. It gives you a firm hold on the rod and adds to your efficiency in playing your fish without unnecessary straining of the finger muscles. And it makes the transfer of the rod from the casting hand to the other hand a faster, steadier proposition so that you can start the bait back quickly after its splash in the water, which is a mighty important thing in the bait-casting stunt. You gotta keep that bait movin' to interest the game fins, and here is a little helper in the movin' operation.

#### FINGER PULL A WINNER

For the beginner at the casting game, get a rod with a finger hook or pull. The finger pull gives you a firm hold on the rod and at the same time keeps the reel from becoming unseated through the reel band working loose as the hook is attached to the reel band. Of course you never intend to have your reel work loose when fishing, but there are few of the clan who can truthfully say that they have never had this happen. Last season I "sat-in" at a finish fight when a friend hooked a 30-pound musky, and during the rumpus kicked up by this old rascal the pal's reel became unhorsed and slipped

into the lake, and you can take it from me, old scout, there was some tall scrambling to get that reel out of the drink and back onto the rod without losing the fish. And he was no amateur at that; it was simply an accident that will happen in the best-regulated fishing parties.

As to price, dollar for dollar, you can get far more value in a steel rod than any other. Putting say five to eight dollars into a steel rod means that you will get a rod that will last for years and all you have to do with it is give it a bit of care and wipe it off occasionally with a little oil. Of course you dry it every night, after using it, before you tuck it away in its trundle bed. And whatever you do to the rod, old top, don't twist it in taking it apart, if it sticks at the ferrules, that's something no rod will stand for.

## A BIT ABOUT REELS

There is a great difference in the use of the reel in the fishing game and what reel to use in the different classes of the angling derby. There are two styles of reels generally used, the single action or click reel for fly-casting, and the quadruple-multiplier for bait-casting, and sometimes the double-multiplier for still fishing or trolling, although most fellows use their quadruple-multiplier for the latter styles of fishing.

The single action or click reel used in fly-fishing is merely a storage place for line, as the line is not cast from the reel as in bait-casting. The line is grasped by the left hand between the reel and the first guide, and any lengthening or shortening of the line is done with this hand. As the slack accumulates, the rod is shifted to the left hand and the slack wound on the reel with the right hand. The reel is neither used in casting or landing the fish.

### ELIMINATE EXCESS WEIGHT

For the reason that the reel in fly-casting is not used in casting nor in killing the fish, the reel for this end of the game is made as simple and light as possible, and yet strong enough to do its share of

The demand for a reel that would do more than merely run out the line and at the same time help the beginner learn the bait casting game in a few hours has brought out the reel that eliminates backlashes, level winds the line and is a free spooler. And these reels certainly do make bait casting easy for the fellow who has not the time to learn the art of thumbing the spinning reel spool.

Illustration No. 1 is the famous Pflueger-Supreme reel, a wonderful tool that does everything a fellow could ask a reel to do and then some. This reel saves the tired fingers due to guiding the line on the spool on the retrieve, throws a perfect cast without retarding the line and it is a hard thing to do to produce a backlash with it.

Illustration No. 2 is the well-known South Bend Antibacklash reel, the antibacklash being prevented by the pressure of the wire bale across the front of the spool which bears directly on the outgoing line. It is a very well made reel and a fine worker.

Illustration No. 3 is a very popular reel, the Pflueger-Redifor Antibacklash reel and this moderate priced tool does the work as well as many higher priced ones, living up to the reputation of the Pflueger reel family. With this reel, an amateur can do clean casting in an hour or so.

Illustration No. 4 is the smooth running Beetzell, a free spool, level winding antibacklash reel that makes bait casting a real joy jaunt. It is a very fine tool and it does everything said about it. It lays an even line, throws a clean cast and reduces backlashes to zero.

the work. The elimination of excess in weight gives balance to the light fly-rod which is necessary to make your casting right. For this reason it is well to have your fly-rod with you when selecting a fly-reel in order to get one that balances well with the weight of the rod. The light feather-weight click reels which have a cutout scrolled frame make a good style reel that balances with nearly any light-weight fly-rod. The correct position of the click reel is underneath the rod, with the handle to the right, the reel, of course, being placed on the reel seat below the grip.

On the stream while fly-casting there are often enough little jinx that lie in wait for the fisherman. Perhaps the back-casts hang up a bit, or the leaders develop a desire to tangle up or you slip on a nice juicy boulder and take a flop into the drink, so why add to the layout by using a quadruple-multiplier and tangle up the line on the projecting reel handle which seems to gather up more loops in the fly-casting line than one could imagine could be bunched together in such a short period. On the click reels the handle revolves within protecting bands, while on some of the reels the handle is entirely eliminated and a revolving disk with a small projecting knob takes the place of the handle. Then again if, at times, you should resort to the reel in playing your trout or bass, the speed at which you would unintentionally reel in the line if using a quadruple-mul-

tiplier would probably mean a damaged piece of tackle, as the lightness of the fly-rod generally used would not stand the strain of the speedy reeling in against the kick of a livewire fin. The single-action reel is equal to any emergency in fly-fishing for trout or bass, although where the bass range to a large size it is sometimes an advantage to have the speed of the double-multiplier, in which case, however, it is well to have tackle somewhat heavier than the light-weight stuff generally used.

#### THE RIGHT SIZE REEL

In selecting a single-action reel make it a point to secure one of one hundred yards capacity, as this size is just about right to take care of twenty-five yards of size E enameled waterproof silk line with a core of old line, say about five yards. This backing or core, being wound onto the spindle to build up the actual casting line so as to increase the speed a bit in retrieving the slack. A mighty good single-action reel can be bought for a dollar, and if you want a real aristocrat in this style of reel, five dollars stakes you to a beauty.

As the click reel stands out the one best bet in the fly-casting end, the quadruple-multiplier is the only thing in the bait-casting line. Wherein the single-action reel plays a small part in the casting, the quadruple with its speed is what makes bait-casting the joy it really is. On the single-action reel the

handle revolves but once with the spool, while on the bait-casting reel the spool revolves four times to the one revolution of the handle, therefore the name quadruple-multiplier. And this speed of the spool is what makes the rapid retrieve of the line possible with little effort on the part of the fisherman. This speed of the bait-casting reel is, however, not only an advantage in retrieving the line, but it is what makes possible the medium long casts necessary in this end of the game. Then again, after you hook a fish, old-timer, you don't speed him into the net as fast as the reel can run. This would not only endanger tackle and the loss of the fish, but you would miss the fine sport of playing the game fins in their effort to make a getaway.

#### REEL POSITION ADDS TO CAST

In using the bait-casting reel it should always be placed on the top of the rod with the handle to the right, and should be kept in this position when casting and playing the fish, with one exception, and that is as the stroke of the cast is made and the line sings out through the guides. At this time the rod should be held so that the reel stands on its end, that is the side or end plates should be parallel with the water when the cast is finished, the rod turned in towards the caster in order to bring the reel to this position. In this way the spindle or spool ends rest in the bearings and the reel spool spins correctly on the

end pinions and not on the side of the spool which would be the case if the cast were made with the reel spool perfectly parallel with the water. It is surprising the additional casting power one will secure with the reel in the correct position and at the same time there is far less line friction when the cast is made this way.

The best bait-casting reels are of the long low spool design, and you can get a good one around six or eight dollars. Of course, if you want to hit the high spots and get a tool built like a watch, you can go as high as the roof and get a reel that will last throughout your fishing days and be an heirloom to hand down to your descendants. The main thing with the bait-casting reel is to give it a show for its life, and not take it apart every now and then to see what makes it run so smoothly.

## BACKLASHES AND THE REASON

There is one little old visitor to the bait-casting end of the game that is generally sneaking in when you least expect him and at times he sticks around until you run out of cuss words. This pal of the high and low among the casters is Mistah Backlash. What makes 'em do it? Three or four good, clean casts, then the piled-up jumble of line on the reel spool and the untangling process that eats at the very soul of the fisherman as he tries to remain perfectly calm while his more fortunate and experienced pal gives him the scornful once-over. But the pal's time will come, shortly, when as he fails to finger the line closely while reeling in and his next cast piles her up, the beginner takes a turn at the once-overing stunt.

Improper thumbing of the line as it leaves the reel on the cast, carelessness in evenly laying the line on the spool in the retrieving and trying to make too much distance in the cast are sure-fire invitations of the backlash. I know one expert at the game, a chap at the casting stunt, in fact, who every now and then sits-in with a backlash. Although he usually looks at his reel in an accusing sort of a way, to shift suspicion to that fine-running tool, it's a ten-

to-one shot that he merely slipped up a bit on his attention to the game and therefore the backlash.

#### THE ORDINARY VARIETY

Probably the most common cause of the backlash is to be found in the thumbing. And the time when the backlash starts on its wicked course is when the plug or bait slows up in its flight through the air and the reel spool spinning fast in fine bearings continues to pass out the line, which having no weight or pull, to take it out through the guides, merely piles up on the spool in the glorious tangles we have all experienced.

To cut down the number of backlashes at this point, the thumbing of the line should be given more attention. The thumb should never be taken entirely off the line on the spool. Keep a bit of pressure on the line all the time, it naturally will be slight when the plug or bait is in full flight, but that slight pressure of the thumb keeps you in control of the line at all times. At the start of the cast the thumb is firmly pressed on the spool, as the rod sweeps to verticle, begin the release of the spool by taking off the thumb pressure and as the rod sweeps out in front of you, continue to release the thumb pressure until the spool spins freely and swiftly, the line barely touching the thumb as it works out.

So far there has been no cause for the backlash that is flirting around your reel, but he is waiting for

a chance to jump in if you fail to clamp the thumb hard and fast on the reel spool when the plug has made its flight and is about to settle on the water. Keep your eyes on the plug and not on the reel — when the plug is about a foot or two above the point on the water where you wish it to fall, press the thumb down hard on the reel spool and stop it. This little point will kill more backlashes than any other angle of the bait-casting game. But don't forget to keep the eyes on the bait and off the reel.

#### ANOTHER REASON FOR 'EM

Of course, backlashes often come to a healthy growth before your cast goes as far as the particular spot at which you are aiming. In fact they will sometimes develop right after the lure starts on its flight, and a backlash of this kind is generally due to the fact that you have lazied a bit in guiding the line evenly on the spool while reeling in. Probably the line has lovingly crawled up on one of the end plates of the spool or developed a wonderful hump in the middle that would make a camel jealous. In either event, old-timer, you are coaxing a backlash on the next cast, and no amount of clever thumbing will save you from piling 'em up before the cast is finished. A heap of time will be saved in casting if care is given the reeling in of the line. Of course a fellow can be excused for piling up the line if he has an old "he-whop" bass on the business end of

the line. The excitement of playing a game fin makes watching the reel a matter of small importance, but when you are reeling in the line, just hopin' for the strike, you are preparing for the next cast and the line should be evenly spooled as an insurance against the backlash.

#### HELPS THE TIRED FINGERS

The level winding reel is a mighty handy tool to eliminate the tiresome finger work in spooling the line, and the fact that the line works through a line carrier is no logical objection to this reel, as the line carrier does not retard the line sufficiently to shorten the cast and it sure does save a lot of trying work on the fingers in a day's casting. And at the same time it speeds up the game so that more actual casting can be done and thus more water will be covered.

Trying to throw your bait way over to "hellen-gone" is another way to encourage the backlash. The beginner at the casting game, somehow gets the idea that unless he can shoot out his hundred feet of line on a cast, the rest of the boys will think that he is an amateur. So he makes a swipe that nearly tears his arm out of the socket and the lure speeds out to nowhere in particular. In order to coax it along a bit he lifts the thumb clean off the spool and, after sorting out the backlash he rows to shore and pulls the plug out of a jack pine. Once in a while you get a squirrel or a pine cone that way, but very

few fish. A 30 to 50-foot cast is plenty distance for most any casting, and a cast of this length means accuracy in placing the lure in the weed pocket or close to the edge of the rushes or windfall, and it certainly is poor encouragement for our old pal, Mistah Backlash.

## A BIT ABOUT TROLLING

Although trolling does not rank way up in the angling art with some of the other methods of hooking the game fins, old-timer, it is deserving of far more credit than it receives. Trolling is not merely dangling a line out behind the boat and hoping for the best, but to troll and troll successfully, requires a keen knowledge of fish and fishing waters. Of course you can troll around all day and get fish, but to make the time pay dividends in fish, means that you troll over waters where the fish are most likely to be and not waste half the time dragging your lure or bait through any old water and think that you are trolling.

Trolling does not take quite the expertness of casting in the initial operation, but after a large-sized bronze-backer has connected up with your trolling lure, it takes a bit keener work to get the hundred feet or more of line in before he wraps it around a snag or windfall, than it does to work in the fifty feet that is generally out when they strike on the cast.

### TROLLING IN BETWEEN TIMES

Then again, after a few hours casting, taking a whirl at trolling, rests up the pitching arm and often

saves you from a "charley horse" for the evening performance with the plugs and live bait. Trolling with the ordinary base tackle makes the game one for the sportsman and there are a bunch of thrills tied up in landing your bass, pike or musky via the trolling route, with just as many jumps to the nerve system as in the casting stunt.

In the trolling stunt, old-timer, you can play a lone hand, while casting at the best is a two-man job, one at the oars and one at the rod. A mighty handy helper in the trolling game is the rod holder, although it is not a necessity. It holds your rod in the correct position, ready for the strike the instant the game fins tickle the lure. At all times the rod should point out behind the boat and not at right angles as the latter method subjects the rod to a continuous strain that any self-respecting rod would resent.

There is one point to the trolling game that generally means success or failure, and that is the speed at which you move along. Troll slowly, very slowly; in fact, more fish are lost by rowing the boat too fast in this method of fishing than any other way. Move the boat along at an easy, slow crawl, just enough to keep the lure moving. This is particularly necessary in trolling with the spoon, the ideal trolling lure. To keep the spoon spinning is all that is needed and if you keep your eye on the tip of the rod you can tell by the trembling bobbing

movement of the tip whether your spoon is spinning or whether you have picked up a trailing bunch of weeds. Weeds are, of course, the greatest pest in this sport, but where there are weeds you usually find the fish, so they are a necessary evil. When you hook up with a nice handful, or snag on the sturdy stem of the water lily, the only thing to do is backup and clean the lure. No fish will plow his way through a bunch of weeds to take a wallow at your lure.

#### TROLL DEEP FOR THEM

In the latter part of July and August the bass are usually in the deep waters and among the underwater weeds and at this time when you have failed to awaken their curiosity with surface casting, you can take a chance at trolling and generally interest them. When the lakes are "working" or "in bloom," and the days are a bit hot, go after them with the trolling layout when they are down among the weeds with no more pep than to grab what food passes their lounging place. They may not be overly hungry but they will answer to the flash of battle shot out by your passing lure and take a strike at it, which is all that a fellow can ask for. Naturally one is willing to unhorse a bunch of weeds every now and then, if he can land a few nice bass, especially if the other fellows are not finding much use for the stringer via the casting method.

Not only will you find the bass interested in the trolled lure, but also the musky and pike seem to be particularly fond of it and some of the largest wall-eyed pike have come to glory that way. In trolling for the musky and pike you will find it well to troll along the edges of the weed-beds as well as over them as they have a habit of lying along such places waiting for the little fellows to pass along. As the wall-eye is naturally a bottom fish, the trolling lure is of interest to them and as they are great feeders, you can count on a few for the stringer. If you land one of them troll around a spell in the same waters as they always travel in schools and where you get one you can figure on a few more from the same locality.

#### USE UNDERWATER PLUGS ONLY

In the matter of artificial plugs you will use the underwater variety altogether and you will not find it necessary to use a sinker because the underwaters are weighted themselves and sink, sometimes too fast and hook up on the bottom. However, if you keep them moving slowly you will have very little trouble with snagging. As to colors of the plugs you will be governed by what has been successful in the waters you fish, but as a general thing, the rainbow, perch, green back and white belly and white and red have been found good colors for most waters.

A single spoon, about a No. 4 to No. 6, makes a good trolling bait or the smaller sizes, say about a No. 2 or No. 3 tandem spoon, is well worth the tryout. You can use the spoon simply with the trebled hook, but I find that the added attraction of a minnow or shiner, a pork-rind or frog hooked onto the spoon is more enticing to the game fins.

Trolling slowly and in the waters where your piscatorial knowledge tells you fish should be is bound to get the fish, and that is what we are usually after when we go a-fishing. When they fail to answer to the coaxing splash of the cast plug, meet 'em half way and go after them with the underwater trolling dope and it's a sure shot that you will find use for the stringer — but troll slowly, that's the big point.

## TACKLE BOX ODDS AND ENDS

The tackle box, the great little ditty box of many a keen fellow who answers to the cheerful call of the lakes and streams, is really a treasure-trove to the owner. And many are the kinks and wrinkles he has worked out for his own use that add to his pleasures in his quest of the game fins. Many tackle boxes are heavy with the accumulation of odds and ends that may not be used very often, but a fellow hates to pass them up so he continues to stuff the old box until the bulge it assumes would do credit to a well-noodled Watertown goose.

The tackle box proper, loaded to the gunwales with this varied assortment, which the outlander terms "junk," is generally used merely as a carryall from the home town to the camp or fishing resort and not toted into the boat each day nor on the trail, but is stationed at the permanent camp and delved into as need be by the happy owner, to make up the selection of lures and baits to be used according to weather and water conditions. It is also a sort of repair kit and is the base from which the tools of the trade are put in shape for the foray on the wily tailkickers.

## SMALL PLIERS ARE USEFUL

A mighty handy tool for the tackle box is a small pair of pliers, ordinary pliers that can be used in many ways when out in the woods far from the repair man. They should have a wire-cutting arrangement on one side, as this feature sure comes in handy many times during the trip. There are so many little repairs that can be made with the aid of the pliers that to leave them out of the kit would handicap the fisherman to a marked degree, while having them on hand at the right time may mean the making of a repair that would keep a favorite piece of the outfit in use for the remainder of the trip.

The file, that rough little rascal with the three sides, is another friend of the tackle box that is of real value. To get the best use out of your hooks, you should keep them sharpened to a fine point, as far more success in setting the hook at the strike will follow if the hook is well pointed and not used continually after being blunted from contact with windfall and snag, not to mention the rocks and boulders that insist in getting in the way of a perfectly well-regulated hook point. Not only in sharpening the hooks will the file be found of real value, but off and on though the trip you will thank your stars that you have one tucked away in the tackle box.

## A LITTLE RED CLOTH

Way down in the bottom of the box and not taking up much room are a small pair of scissors. You can use them in many ways and always find them better than the pocket or belt knife for the cutting you find for them. You'll want to cut out a couple patches of wool cloth, the red stuff that makes the pike and bass cross-eyed to get at, from the little roll tucked away in the box, and nothing does the job better than the little pair of scissors. I have a small chunk of woolen cloth, part of an old switchman's flag, that has been cut down time and again to rig up a special favorite coaxing bait of the pork-rind variety that always seems to make good when given a chance, and I never would feel that the old box was complete without that remnant of glaring red cloth, which is just the color to make 'em hop around in circles as it wiggles through the water. And right snug up to the red cloth is a little ball of red yarn that can be used to add a bit of color to the casting-bait.

Of course we have the small screwdriver hidden away in the off corner, so that it is not too inviting to the itching palm that always seems to want to monkey with the reel and take it apart to see just what makes it run so darned smoothly, anyway. Outside of that, however, the screwdriver has a

place in the kit and will come in for its share of use when on the waters.

For the quick repair of the rod or the loose ferrule you will find use for a tube of ferrule cement, while a tube of anglers' wax will come in handy for doctoring up the flies and snelling hooks. In the matter of oils, we have the one-drop-at-a-time oil can filled with the reel oil for use on the reels and the small can of three-in-one for general use. A bit of three-in-one on a rag and a little elbow grease used in wiping the casting line before the day's fishing will condition it so that it will pick up less water than otherwise, and at the same time cast a trifle smoother with less friction on the guides and tip.

#### SINKERS AND SWIVELS

A box of split-shot sinkers should be in every tackle box; they can be attached so easily and the amount of weight can be judged by adding another shot or two as the lure requires, that to be without them is unfortunate. A few dipsey sinkers with the swivel eye are excellent for casting with the lighter spoons and lures and there is room in the tackle box for a couple of the six-ounce size for the trolling rig for the deep water veterans and the bottom feeders, while the keel or kidney-shaped sinker, which always rides right-side up in the water, will keep any bait in the correct position as it glides through the

water, and it also prevents kinking or twisting of the line when casting or trolling.

A small box of assorted-sized split rings are very useful and in the same box can be carried a few extra box or barrel swivels and the extra cooper snaps with which you can rig up a trolling outfit that will be a "safety-first" against twisting the line.

As a saver of underwater plugs and spoon rigs, the clearing ring or releaser is a right smart tool. When you are far enough away from the source of supply and your favorite lure is snagged down below, just slip on the clearing ring and it goes down on its Annette Kellerman dive and loosens up the snagged lure in short order. It don't take up much room and is sure worth its weight in gold when you do need it.

Most odds and ends of the tackle box are little things and they don't stand out like the rod and reel in the fishing game, but they are an army of willing "fellers," and when you need 'em, you need 'em bad, and they are always on the job, and do their bit to make the trip successful.

## A BIT ABOUT CANOES

There are many models and styles in the canoe game, old-timer, some are designed for river work and the rough water you sometimes meet in the streams and others are shaped so that they ride a rough wind-whipped lake like a seagull. There are others that can be safely used for the sunset spooning stuff of the beaches, but they are not the kind of craft that will stand the gaff of the river or rough lake trip.

As an example, old scout, the canoe with the ends raised and with a bottom curved from bow to stern, is a dinger for river work, especially for rapids and rough water. This style canoe can be instantly swung around on its center without the current getting a chance to grip the ends, but on a windy lake this craft, with its raised ends, is hard to keep straight in the wind for the reason that the exposed ends give surface for the wind to play upon.

### THE RIVER CANOE

The model and style of a canoe should be selected according to the waters in which it is to be used. For the river trip in the North woods for two men for two weeks with an outfit of from 150 to 200

pounds, where some fast water and rapids will be run and some portaged, the canoe built for river work should be used. The ends should be raised higher than the center and the bottom slightly rounded. For length the 16-footer with a beam of not less than 32 inches and a depth of at least 12 inches. The ends should be long and slim for speed and there is no necessity to have much tumble-home or outward bulge. As to weight, 60 to 65 pounds should be about right, making an easy weight to portage, and still be a strong craft. Less weight could probably be used in the canoe but not without sacrificing the strength to stand the buffeting of fast water and the rocks of the rapids. A shoe keel, usually made a half an inch thick and three inches wide in the center, tapering to the ends, will protect the canoe, and although it adds a bit of weight, it is worth it.

#### THE LAKE MODEL

For a trip in the lake country among a chain of lakes where the river run is limited to small connecting streams and where hardly any real fast water is found, the above canoe would not be the "safety first" of the canoeing game. A two weeks' canoe trip for two fellows in this kind of waters would mean broad lakes to cross, heavy seas and various length portages according to depth of the water in some of the connecting outlets. The 16-footer

should be flat-bottomed, straight-keeled with a beam of 34 inches and a depth of at least 13 inches. It is laid with the flat keel so that the ends will not be high enough to catch the wind, while wide outwales turn the combers and a good tumble-home keeps out some of the waves and adds stability to the craft. The weight can range between 65 and 70 pounds which gives it added strength to stand the strain of pitching in the rougher lake swells. The added inches in depth will make the canoe far better rider in the rough heavy seas. The width will be well carried into the bow and stern to assist in riding the waves, although this cuts out a bit of the speed of the craft. But speed in rough water is not as essential as staying on top of the water.

For a trip down civilized waters, or the streams near by, where one will find no portages except a power dam or so, and where enough help is generally lying around sunning itself, so that a portage can be made with their assistance for a couple two-bit pieces, then the lake model of say 17 feet in length is the best bet as it gives enough room to carry all the comforts of a home and still have space enough to loll around on the cushions while the current carries one down stream.

#### VALUE OF SKILL IN HANDLING

Take the experienced canoeman who can handle the paddle with as much skill as he can his casting

rod and give him a stretch of water made up of large lakes, river and streams with a fair bunch of speedy rapids and a few long tiresome portages and he would select a canoe for general service, depending on his skill with the paddle to handle it right under the different conditions. His selection would no doubt be a 16 footer with a depth of from 13 to 14 inches, a beam of from 30 to 36 inches and a weight of 70 pounds. This canoe would have a decided tumble-home and the width and flat bottom would be carried well into the ends, all of which would add to the capacity, buoyancy and seaworthiness of the craft. This little old ship would ride any gale and stand the rough knocks of the fast stream work and at the same time be a good speedy traveler.

The one-man canoe is generally a 13-footer with a weight of 50 pounds a beam of 34 inches and depth of 13 inches. A flat bottom and tumble-home is necessary in this short craft to give it stability and capacity. This canoe can carry two men but she will sure ship a bunch of water when the going is rough. If three fellows wish to use one canoe the length should be at least 18 feet, although a 17-footer for three people with equipment for two weeks, should be at least 14 inches deep with a beam of 36 or 37 inches, while the 18-footer with a beam of at least 35 inches and a depth of 13 inches would give more room for the duffle and paddlers. For

the party of four on the canoe trip it is far better to use two 16-footers than to get into the heavy-weight freight canoe class.

A few points to remember in selecting the canoe are, for quiet waters a depth of 11 inches is sufficient, for rivers 12 inches, and for lakes 13 inches; the width or beam for quiet waters may be 31 inches, where speed is desired rather than capacity and as greater stability and capacity are required the beam should be increased to 35 or 36 inches with the width well carried into the ends. For river work, the ends raised and the straight keel for the lakes. The round bottom is good for speed, but the flat bottom is there with the capacity and stability.

## CAMP KIT FOR CANOE TRIP

You and the pal are a little party of two who intend to make a bit of a canoe trip, and you have doped up the game to a fare-you-well, but the outfit for the camp equipment has sort of landed you way up in the air. You will probably have a few portages and you want to keep the kit down as light as possible to save the shoulder and back muscles, yet you have a sort of hankering to "smooth it" a bit instead of roughing it altogether.

There is a lot of satisfaction in going right in the matter of camp equipment and there is at the same time a wonderfully big variety of duffle that is just a case of being in the way if toted along on the canoe trip. I recall the first canoe trip at which I officiated, my kit was a regular humdinger, it was all there at the start, but after carrying myself and my share of duffle over the first portage I began discarding things here and there on the way until at the end I had a mighty light pack to tote over the rough spots.

### AS TO THE TENT

In the matter of tents, eliminate the duck or drill tent as they are too heavy and sure soak up the

water. Select rather a tent of balloon silk or waterproofed khaki or tent cloth. The balloon silk is a little heavier than the others but very durable. A 7-by-7 "A" tent of waterproof tent cloth will weigh eight pounds, and the balloon silk affair nine pounds. A Hudson's Bay model 6-by-9 tent weighs seven pounds, and seven and a half pounds in these materials. While the snug little sportsman's compact tent weighs but three and a half and is a trim little affair. All of these models are complete with sod cloth, and when erected are snake and insect proof, although with the "A" style and the Hudson's bay ten, a cheesecloth door should be made to keep the skeeters and flies on the outside.

A pack cloth of waterproofed canvas about 6 by 8 and weighing around three to four pounds makes a fine carryall for the blankets and small things on the portage and as a ground spread and top cover at night, it keeps the dampness and cold from coming up from old Mother Earth. A standard-sized all-wool blanket weighing about six pounds is the real dope for the outdoors and it's plenty warm enough right up to the cold weather. If you carry two pack cloths and feel like sleeping under the stars, you can make a dandy sleeping bag by using the pack cloth and the blanket, doubling them with the pack cloth on the bottom and folded over the top. To make this pack cloth sleeping bag more snug you can pin the end and side with the large blanket

safety pins and you have a regular sure-enough sleeper. One blanket to a fellow is plenty, and if you wish to ease up the bed a bit, cut a bunch of balsam boughs and place them on the ground, bow side up with the twig ends working down towards the feet. The bow side up makes a natural spring, but don't be afraid to cut enough balsam.

#### THE COOKING KIT

For the cooking utensils cut out the enamelware which chips, or the tin and iron which rusts, and stack your cards on the Wear-ever aluminum. You will need one pot with cover  $7\frac{1}{4}$ -by- $5\frac{1}{2}$  capacity, four quarts coffee pot with folding handle and ball  $5$ -by- $7\frac{1}{8}$  capacity, two and a quarter quarts, one pan  $9$ -by- $3$  with folding handle for mixing and serving, one steel frying pan  $10\frac{1}{2}$ -by- $2$  with folding handle, two plates  $9$  inches in diameter, two cups with handles attached only at top so they nest, two each of knives, forks and spoons and a large mixing spoon. You will use your belt knife for the heavy cutting, or a small-sized butcher knife in a leather sheath can be carried. All these utensils will nest and carry in a very small pack and the weight of the outfit with a waterproof canvas covering case is slightly under six pounds. If your cooking skill includes the great American biscuit, an aluminum reflecting baker, about  $16$ -by- $18$  and which folds into a flat little pack will be found a great menu changer

as pies and bread can easily be baked with it. It should have a waterproof canvas case and the weight runs about four pounds. It is a matter of personal choice whether the cooking be done over the campfire alone or with the aid of fire irons or broilers. The Collis folding grate-broiler is a handy affair, as the whole meal can be prepared at one time with a small fire.

#### A MAN'S-SIZED AX

A mighty important feature of the kit is the ax and two can well fit in the outfit. Make one of them a three-quarter size with a handle at least 28 inches long, the other can be the smaller belt style for lighter work. But the longer handled fellow is a real necessity as anyone will soon learn who goes into the woods with only the small tool. Chopping at its best is a helova job and with the small pocket ax, to produce enough wood for the evening campfire is some blistering. The axes should have leather sheaths for safety in packing.

As to the camp light besides the flickering glow of the campfire you can get along very well with a small-sized carbide lamp or what is really better in this line is the carbide lantern. One two-bit can of carbide lantern, on a two weeks' trip will give you plenty of light for a bit of evening fishing, although the Stonebridge army lantern that folds into a compact flat space and burns candles is a fine illuminator

and it never gets out of order. A dozen candles in a tin box will carry you through the trip and the box keeps them from breaking.

Take along a file and whetstone to keep the axes in shape and a ball of strong twine, a handful of nails, and a few feet of copper wire as well as a 50-foot length of good stout clothesline, which will come in right handy in line-running the canoe down a bit of swift water you may not feel quite like running. And don't forget your canoe repair kit which is put up in such shape that you have everything needed to keep her floating after a little rough work. A standard repair outfit will contain everything without any of the useless things a fellow might pick up. Take nothing along you'll toss away later.

## PERSONAL KIT FOR WATER TRAILS

The matter of personal kit and equipment is a sort of touchy proposition. Every fellow who has made his trip into the woods by land or water trails has doped up an outfit that he thinks is the best bet and he sticks to it until by experience he finds an article here and there that can be eliminated for something else that does the trick just a bit better than the last year's favorite wrinkle. However, the first time over the route a little advance dope, old-timer, will save the toting of a lot of unnecessary stuff, which means less hard work on portage or hike.

Richard Harding Davis once passed this out on the subject: "The same article that one declares is the most essential to his comfort, health and happiness is the very first thing that another will throw into the trail. A man's outfit is a matter which seems to touch his private honor. You may attack a man's courage, the flag he serves, the newspaper for which he works, his intelligence or his camp manners, and he will ignore you; but if you criticize his patent waterbottle he will fall upon you with both fists."

Since the advent of the wooden artificial, usually called a plug by the bait caster, thousands of fellows have slipped into the bait casting game and sipped deep of the nectar of the outdoors, for which I say, Bless the Plug, regardless of what some of the angling gentry say about it.

Illustration No. 1 is the Pflueger All-In-One Minnow; No. 2 the Pflueger-Surprise Minnow; No. 3 the Heddens Crab Wiggler; No. 4 the South Bend Bass-Oreno Minnow; No. 5 the Fluted Wilson Wobbler; No. 6 the Creek Chub Wiggler; No. 7 the Wilson Six-In-One Minnow; No. 8 the McCormic Mermaid Minnow. Every one of these plugs are excellent lures for bass and I have had good success with them for musky, pike and pickerel. They all have a little old wiggle, wobble of their own and they certainly interest the game fish.

## THE DUFFLE BAG

For the canoe trip on stream or chain of lakes you should have a duffle bag of waterproof canvas and the most convenient size is one 36 inches deep with a diameter of 12 inches. This will hold all your personal kit, clothing and odds and ends, and it stacks up right for the carry on the portage. For convenience in carrying, the bag should have a handle on the side and one end and if you want to ship it as baggage have it rigged up with a chain and padlock. With everything in the duffle bag it is very easy to pack the canoe and to make camp in the evening and should you take a spill in fast water it will float around until salvaged and everything will be safe and dry.

For the usual two weeks' trip, one extra suit of woolen underwear besides the one worn is sufficient, and it should be woolen because this material takes up the perspiration and moisture and prevents colds, as you will not dry out quickly when overheated, after a husky bit of portaging, if you wear woolen garments next to the covering old Mother Nature gave you. Wool is cool in the summer and warm in the chill of evening. Four pair of rough knit woolen sox will keep the feet in fine shape.

For midsummer ordinary khaki trousers make about the best bet for the canoe trip, while if the trip be made in the fall when it cools up a bit, espe-

cially in the afternoon and evening, the olive drab wool will be better. The regular loose-shaped trousers are O. K., but the style worn by the infantry which lace in front below the knee are mighty handy, and with the socks pulled up over the bottoms makes a very serviceable piece of duds.

#### STAG SHIRT GREAT STUFF

The shirt should be a light-weight woolen or flannel and the regulation army shirt with the two pockets is the real stuff. You can the pipe and tobacco or the "makin's" and a lot of the little stuff that is used often, in these pockets and the buttoned-down flap keeps 'em there. For a coat on the trip I am not very strong, far better than a coat is a stag or cruiser shirt. This is a sure-enough woodsman's favorite, and you slip it on over your regular shirt and let the tail hang outside, although the tail is very short, riding on the hips. The lumber-jacks of the North woods invented this short outside shirt by merely cutting the long tails off with a jack-knife, or stagging it. To stag anything to a lumberman is to cut it off short. The shirt made such a hit and the demand grew so strong that it was soon put on the market. It's a winner for the outdoors, and is wind-proof and warm. A sweater should be carried along for camp use, altogether the stag shirt can be used in the place of either the coat or sweater. A good combination is a vest and sweater, the vest

for general wear and the sweater for the camp or cool of the evening. The vest simply worn over the shirt is the handiest thing in the clothing line, it is never in the way, and the pockets are very useful for carrying a little bit of everything. It does not interfere with paddling nor is it a hindrance to casting, and every way from the Jack it is right for the woods. Any old vests will do, one of those hanging in the clothes-closet, for which the rest of the suit has gone by the board. In the woods or on the trail the sweater is unhandy for the reason that it snags on most every limb or brush that you pass, but for the camp it is right and comfy.

#### WHAT THE FEET NEED

For the feet there is nothing better in the canoe than a pair of light moccasins or low leather or canvas wading shoes. The canvas shoes with rubber soles are not as desirable as the leather, as the continuous wear of the rubber soles is tiring to the feet. For the portaging and trail a pair of army shoes of the Munson last are very good as well as larrigans or shoe-packs. Larrigans have a top of from eight to twelve inches high and the seams are on top of the shoe where the least strain comes and the sole is flexible, giving a sort of grip to the toes when walking under the load of a carry. For the trail a pair of canvas leggings can be used with the army shoe or you can pull the sox over the outside

of the trousers and have a fairly serviceable legging at that. Any old soft slouch hat will cover the hat question, the more comfortable the better, but if you want to look sort of nobby, get a three-inch brim Stetson on the order of the military styles, which will be very popular from now on, and you might as well get used to wearing them now as later.

Always wear a belt in the woods, no matter whether you wear suspenders or not, and on your belt you should carry a short hunting-knife, which will answer for your cooking, table and general handy-man use. In your pockets you should also carry a man's-size jack-knife, a waterproof match-box, and a compass, while a fishing line and a couple of hooks stuck away in a pocket may mean a meal if you ever get a bit off your bearings and cannot get back to camp for a day or so.

## INSIDE THE GRUB SACK

The part of the pack of the canoe trip that makes the beginner at this alluring sport wear the point off the pencil and spoil countless sheets of perfectly good paper is the grub to tote along. As a general thing, on the first time out he will carry a layout containing a bunch of stuff that takes up a lot of room in the pack, adds a big, stiff extra to the weight, and at that does not produce the necessary protein, fats and carbohydrates to keep the human engine going; in other words that don't sound so highbrow, the heat and energy to keep a fellow fit for his turn at the paddle and the portage as well as satisfying the wonderful, husky appetite he develops after the first day out.

To set an iron rule of what to carry in the grub line, with all the varying likes and dislikes, is a little old job that cannot be handled by one person. Many guides in the North woods will not provision the party they are to guide, for the simple reason that they cannot guess what the other fellow likes, so they sit in with the party and get his ideas before taking a hand at the stocking of the grub sack.

## DON'T CARRY WATER

To pack right is to eliminate the foods that contain a great amount of water in their make-up. It is unnecessary to tote along a lot of things that contain the greater part of water, especially when you have so much water along the route. Fresh milk, fruit and vegetables, as well as canned soups, tomatoes and peaches, contain over 75 per cent water, while fresh beef, mutton, poultry, eggs, potatoes, canned corn and beans contain over half water. A few of the things that contain less than one-fifth water are bacon, butter, salt pork, powdered or desiccated eggs, powdered milk, flour, cornmeal, rice, dried beans, hominy, dehydro vegetables, sugar, nuts, dates, figs and raisins.

Looking over the past performance sheets for a number of trips last season, I find the list herewith tallies out for two pals on a two weeks' trip. The dope is taken from three trips made on streams along which few settlers were passed and no opportunities were had to buy vegetables or meats en route. This list, however, was varied and helped by fish and small game and at the end of the trip an average of ten pounds of provisions was on hand. However, it is always better to go a bit over than short, as the appetite is a corker the second week. Then again, the fishing may not come up to expectations, and the game be scarce, which would mean

that the left-over ten pounds would come in mighty handy.

#### THE GRUB LIST

The main thing in the woods is bacon; it carries the blue ribbon at its masthead and deserves it. We start the list with bacon in strips, eight pounds; small ham or butt, five pounds; salt pork, two pounds; butter, four pounds; lard, one pound; egg powder, or desiccated eggs, one pound, equaling four dozen fresh eggs; milk powder, three pounds, equal to three gallons of milk; white flour, 12 pounds; cornmeal, one pound; prepared pancake flour, two pounds; rolled oats, one pound; rice, one pound; dehydro potatoes, riced, two pounds, equaling fourteen pounds of fresh potatoes, and one pound sliced, equaling seven pounds of fresh; dehydro carrots, one-fourth pound, equaling three pounds fresh; dehydro onions, one-fourth pound, equaling four pounds fresh; dehydro cranberries, one-fourth pound, equaling  $2\frac{1}{2}$  quarts fresh fruit; dehydro raspberries, one-half pound, equaling five quarts fresh fruit; dried beans, four pounds; prunes, one pound; dried peaches, one pound; raisins, one pound; sugar, six pounds; coffee, two pounds; tea, one-half pound; cocoa, one-half pound; salt, one pound; pepper, one ounce; baking powder, one-half pound; lemons, one-half dozen; mixed nut kernels, one pound.

The above list runs about 64 pounds, or an average of 16 pounds a week, or about 2 1-3 pounds per day, for each fellow, and when you add to this amount the fish and small game, your average will run about three pounds, which is all the boys from the walled-up cities builded by man can assimilate when flirting with Old Lady Outdoors. The army garrison ration allowance is four pounds two ounces per day, but the mess is given the privilege of varying the amount of staples by substituting luxuries in which it is deficient, thus cutting down the weight of the menu and giving it more variety.

#### ADD A FEW CONDIMENTS

To the general list a fellow usually has some one favorite in the grub line that tickles his particular palate, and this article should be included in the grub list. Condiments vary the taste of the ordinary foods and give a bit of spice to the sauces and gravy. A bottle of Heinz Ketchup and of India Relish should be included, as well as a jar of mustard, the latter being a good medicine for the woods as well as a seasoner. These additions do not add greatly to the weight of the pack, but they give it a variety of taste that will be appreciated, especially about the middle of the second week, when the diet begins to assume a sameness.

The pack can be lightened a bit and the amount of space reduced a little by substituting prepared

coffee and tabloid tea for the regular kind. It is just as good as the latter, and takes but a minute or so to prepare. In fact, for the quick, hot drink and for carrying on the hike, these two prepared articles are hard to beat.

The food should all be packed in small individual waterproof sacks, and these sacks then placed in a duffle bag, so that the commissary is all together. The meats should be wrapped in parchment paper, which is grease proof, and then placed in a cheesecloth bag to keep the flies out, before placing in the waterproof sack; in this way it will keep quite a while. The butter, lard, tea, coffee, etc., can go in the pry-up tins while the salt should be carried in a wooden box, as it draws moisture.

## ON HANDLING THE CANOE

The canoe is a great little craft and for its weight the makers have turned out a wonderfully strong and sturdy affair; naturally, however, it has its weak points, but these weak points need never be subjected to the test if the canoe is correctly handled. A 65-pound canoe will safely carry almost half a ton, but in doing so, with safety to the canoe, the weight should be distributed over the length of 16 feet and the width of three feet and never shot into one end or place. In loading the canoe be sure of one thing, old-timer, and that is that it is floating freely and has space to settle with the added load without grounding. Place the heavier packs in the middle and as flat as possible in the bottom so that when fully loaded the canoe will lie on an even keel. Anything sticking up above the gunwales simply means that much more surface for the wind to strike which makes the canoe top-heavy.

Before starting down stream lash everything fast, particularly so for running fast water or rapids. This can be easily done by tying a rope to the forward thwart and then threading it through the handles of the duffle bags or the straps of the packs and on to the rear thwarts. If you hit a submerged

rock in the white water and go overboard you will find all your kit safely attached to the canoe and waterproof. If the packs are loosely arranged in the canoe, however, you'll probably spend a day trying to locate them down stream and some of the kit you never will find. It's an easy "safety first" in the game and should not be overlooked.

#### LOADING THE OUTFIT

The canoe should always be brought up to shore broadside on and never bow first and it is better dope to step out into the water rather than run up on a rocker gravel bottom. And the canoe should never be hauled up on the shore and then unloaded nor should it be loaded on shore and then pulled into the water. In boarding a canoe let the weight down as lightly as possible and be sure there are no snags or rocks under the canoe upon which your additional weight will crush the bottom.

If part of the equipment is carried in duffle bags and the balance in packs, the portage should be made with one man carrying the duffle bags while the other fellow totes the smallest pack and the canoe, or if the entire kit is carried in pack sacks each can take his share of the packs and the canoe can be carried by the two men, although the man in front will have the most weight of the canoe and his pack should be the lightest. When two men carry the canoe it should be carried bottom side up. The

man at the stern lowers the canoe until the gunwales rest on his shoulders while the man in front allows the front thwart to rest on the back of his neck and shoulders. In this manner both can see the trail and the portage is easy.

For portaging the canoe by the one-man power the two paddles must be secured to the thwarts. A piece of rawhide or strong twine should be attached to the thwarts and adjusted so that the paddles can be slipped in and out with ease and still be securely held when needed. The blades of the paddles rest on the forward thwart with the handles on the rear one and the blades should be far enough apart so that they rest on the shoulders without cramping the tendons of the neck. The front thwart rests on the neck and the head extends up between the ends of the paddles. To ease up the weight a bit you will find that a woollen shirt or sweater padded on the shoulders will take a bit of the curse off of the job.

#### PACKS AND DUFFLE BAGS

For two fellows two weeks in the woods the entire outfit can be carried in two large pack sacks while for the same trip if duffle bags are used, four will be required. The pack sacks of course come with the shoulder straps and the kind best suited for the game also have a head strap. In packing the duffle bags, the tump line or head strap is generally used, two or three of the duffle bags being bunched and

the tump line attached. This carry is entirely made with the head and unless a fellow is experienced in handling the tump line he had better take along a pack harness which is an arrangement of shoulder straps into which the duffle bags are tied and the whole thing swung on the back. One pack sack at least should be carried and the fellow who totes the canoe should carry the pack sack as it is easier to handle the canoe with the pack sack than any other way. It is out of the question to carry the canoe and a tump line pack.

#### RUNNING FAST WATER

In running rapids of fast water the stern man has control of the canoe and the bow man should keep out of the steering game and not try to ward the bow off rocks, unless it is certain that the stern man has lost control. As a general thing, back paddle a bit so that the current runs swifter than the canoe. Keep out of the main current if you can find an easier passage and always give the rapids the once over from the shore before you ride them. Follow the passage the clearest of rocks and in passing one of these innocent looking affairs, the current will usually carry the bow to one side and clear the rock, then it is up to the stern man to back the stern clear. If you find a well-worn trail above a bit of rough water you can figure that many a good fellow at the paddle has portaged and it will probably save you

time and wetting to follow the dope of the gang that have gone before.

In ordinary open water on the lakes the bow should ride about three inches higher than the stern. An awful lot of drag is put on the canoe if the larger part of the load is in the stern, however, in running down a swift stream or running with the wind a canoe should ride on an even keel, while running into a stiff wind the bow should be lightened and ride up a bit. Distribute the load evenly and low as a low load adds to the stability of the canoe.

Keeping a cool head and acting quickly is the whole thing in the canoe game and the standing up stuff and general horseplay is nix in the parlance of the craft. It's a great little pleasure producer and more downright joy can be frisked out of a two weeks river trip via the canoe and portage than any other end of the fishing game.

## THE ONES THAT GET AWAY

“ Yes, sah, old-timer, he was shore a big one; jes’ about that long and so thick, an’ when he kicked up a ruckus along side o’ this yere ol’ scow I sutainly knowed he war a reg’lar gran’-daddy uh the bass family — yeah, jes’ about so long and so thick, but he got away, an — ”

That’s the way many a fish story runs, old scout. He was a big one, but he got away, did a fadeaway, slipped the hooks, and it’s a ten-to-one shot that the fisherman cussed his luck at not handling the fish right, or passed the blame to the tackle for not being as strong as it should have been. And way down deep in the matter, if the fisherman would dope it out, he would probably find that he had overlooked some little detail in rigging his outfit, and these little details overlooked and forgotten have been the real cause of losing a sure enough bunch of “ he-whops ” of the finny tribe.

So far this season I “ sat-in ” at the loss of three very large fish. These fish were hooked by experienced anglers who have fished many waters, and each of these game fins were lost, not through any lack of skill in handling light tackle, but through carelessness.

## LOST HIM IN NETTING

The first of this trio of big ones to slip the "good-by" signal to my fishing pardner was a wall-eye pike, and he was some wall-eye. I have landed a member of the ancient order of wall-eyes up to twelve and a half pounds, and my pard has one of twelve and three quarters to his credit, but the one he hooked on this trip would have pegged down the scales at fifteen pounds — and he lost him. He had worked the old cuss up to the boat and the fish lay in the water a good yard long or better, sure a prize wall-eye, when the pardner tried to head him into a small-sized folding trout net. The big fin's head just about made the net, when he got a leverage on the sides, threw the hook with a shake and disappeared. Can you beat it, trying to daintily land a fifteen-pound wall-eye in a kid's sized landing net? Up at the cabin there were five larger nets hanging on the wall, but the pardner picked up the one nearest to him and lost a prize fish.

If you are fishing in lake waters where you are likely to connect up with a really large fish, although you may be specializing on bass at the time, the landing net with the long handle and a large hoop is the real stuff. And have plenty of net on the hoop so that you can let 'em drop into the net and not hang out over the sides. Or take along a gaff and have that lying in a handy place for the large

fish, and if you do gaff them, don't take a chance on running the gaff through the body of the fish, but slip it under his gills when they open up a bit as he lies in the water. The gaff often slips off the scaly sides when used through the body.

#### IMPORTANCE OF THE LEADER

The second of the fadeaway trio was a pike and he struck the lure as though he needed the feed. The pardner played him a bit and slowly worked him up to the boat. We had just glimmed his size and doped him out at about eighteen pounds when he snapped the line without much effort and kicked back into his home waters. It happened that I had loaned the pard a line that day and he sat there and cussed my lines from the ace to the joker. He made me feel like a regular movie villain, conspiring to make him lose the big fish by giving him a weak old line, while in fact I had reeled on a new fifteen-pound test line not more than an hour before the accident. I couldn't dope out the ease with which the pike snapped the line until I watched the pardner put on another lure and noted that he was tying the lure directly onto the line and not using a wire leader. That may go for bass, old-timer, but not for your Uncle Dixie. I slip on a leader every time, because I take no chances with the pike or musky that may accidentally take a swipe at my lure. If you have ever lamped the sharp dagger-

edged teeth of these old ruffians and the great mouthful that they have, you can readily see that it is no job at all for one of them to saw a line with a cross-swipe of these teeth. Don't overlook the wire leader, old scout, when you are rigging up the casting outfit. It will probably mean the big one is yours when he makes the dash at your plug.

#### RUSHING THE FISH TO NET

The last of the outfit was a pike of possibly fifteen pounds, and he was lost through two reasons. The pardner who had him hooked had a nervous streak and tried to haul him up to the gaff too speedily, probably got a bit of "buck fever" and was afraid of losing him, and he had also failed to break off the worn part of his line before snapping on his lure. When you hook a fish and he wants to take a run of line, give it to him, let him go for a swim, but keep the thumb on the spool of the reel and make him take it. That's part of the sport of fishing, and more fish are lost by trying to drag 'em in in a hurry than through any other way. Play the game fine; give him line and take it away from him; keep the slack out of the line and always have a bend to the rod. It is the spring of the rod that eventually tires out the fish; the constant pull of the rod makes them come, white side up. And as a safety first, old man, be sure and tear off a few feet of worn line from the casting end each day. That is the

part that becomes badly worn by the friction on the guides and tip by the pull of the lure as it first starts through the air on the cast.

Incidentally, I lost a fine bass myself on this trip. He hit the pull to about four and a half to five pounds and with about fifty feet of line out slipped me the good-by stuff. I lost him because I failed to keep my mind on the game. I was alone in the canoe and had set the hooks well, when I turned around and called to a pardner, casting a nearby weed-bed, too watch my tame bass break water. Just about that time he did break on a bit of slack and I was in no position, in a cranky canoe, to take it away from him. He made a beautiful shake of his entire body, waved a fond farewell and my pard had me for the smokes. You simply gotta keep your mind on the game to land 'em.

## THE MUD MINNOW, HERE'S TO 'IM

Of all the minnow family who have ever kicked their way into the fancy of the game fish and also kicked their way to safety, the mud minnow stands out like the fourth ace in a two-card draw, as the hardiest, liveliest wiggling minnow in the entire deck of something like one hundred and thirty different species.

And take it from me, old-timer, the mud minnow is as attractive a lure to the dyspeptic "he-whop" bass, most any time in the season, as any of the natural baits that tickle his palate. And you don't have to be finicky about handling him in order to get him to the fishing grounds without passing in his checks. This little old wiggling delight of the bass, wall-eye pike, and even the musky can stand more rough handling and less attention than the rest of the minnow outfit, and still be lively enough when you want to use him, to make it an interesting job to hook him up for bait.

You don't have to aerate the water every half an hour to keep him alive, nor is it necessary to liven him up with a salt bath during the day. You can crowd them into a small bucket so thick that you can scarcely see the water, with hardly room enough

to kick his tail without getting into a fight with the minnows near him and he's lively and ready for the game when you get to the fishing waters the next day.

#### SEND 'EM BY EXPRESS

During the past season I have shipped them by express to pals in the North woods country, sending five dozen in a half-gallon bucket, and they have gone through the trip without one ending the journey, white side up.

For this hardy nature we sure gotta thank the husky little cuss of darkish brown with a bit of gold and a yellowish-tinted tummy which makes him good to look upon as bass feed. As a bass bait he is a hundred times winner and every second he is in the water he is working his head off to attract a game fin to your hook. I know of mud minnows that have landed five small-mouth bass and still had a lively kick in their tails at that.

As an example of what some of these little fellows can stand and still kick around, here is the history of one of them that reads like a five-reel thriller. A few weeks ago, I shipped five dozen to a fishing friend in a city a bit over two hundred miles away. They left by express at 2 p. m. and arrived at their destination about eleven the next morning, which was Saturday, the day they were to do their darndest to entice the wily bass.

## SOME HUSKY, THIS MINNOW

Before starting to the fishing waters, my friend, who is an engineer, changed the water in the blue-print room, thinking they needed a little fresh water to give 'em pep. The following Tuesday I received this interesting bit of information from the engineer: "Must tell you a funny thing about those mud minnows. When they arrived Saturday, I took them into the blue-printing room and put them under the faucet in the blue-print tank. Somehow one of them got out, but we did not discover it. Monday morning the chap in that department decided to clean out the tank, so he let all the water out. He discovered something kicking over in one corner and found it was one of those minnows. It had been living in that rotten water, full of peroxide and acids all that time. He left it lay on the bottom until he had cleaned the tank and then turned in the fresh water. It is still alive and about as lively as anything you ever saw. We are going to see how long it will live there."

Which is sure going some for any kind of a fish, to stick it out in a tank of peroxide and acids and still be lively and on the job some forty hours later. Probably if this minnow had hair instead of scales it would have been a decided blond at least, after the peroxide bath. If you want to be sure of having bait, that is good live bait when you get to the fishing

waters, just take along a bunch of these little rascals and the live-bait question is a settled thing.

#### OTHER MINNOWS AS BAIT

Of course, there are other members of the minnow family that are lively, sturdy little fellows, but they are not as husky as the mud minnow. The river or creek chub is a tough minnow with a mouth that is strong and holds the hook well. They are livelier than the rest of the minnows and when taken from the swifter, cooler waters they are more vigorous than those from the warmer streams; at the same time they have a brighter, silvery shine which makes an attractive lure for the bass and wall-eye. On bright and clear days when the water is still and "fine," the chub is second only to the mud minnow as a popular bait.

The silver shiner or dace is another minnow that makes the bass happy, and its silver sides send out a shining lure that is hard to resist. It is particularly good in rough water or on cloudy and dark days, but it is a tender cuss and don't stand for any rough handling. A good way to get them is with a short line and a small hook, but you must handle them gently and raise 'em like a pet or they kick in before you can use them for a bait.

For musky, pike or pickerel, the larger-sized minnows make the best bait and it's about even money between the black sucker, silver shiner, river or creek

chub, and the fallfish with the odds in favor of the sucker. The minnows from 6 to 10 inches, are about right for the musky, pike and pickerel, while the 4 and 5 inches make a fine size for the wall-eye pike and bass. A minnow of this growth is livelier and will stand the gaff better than a smaller one. As a natural thing the bass like a good mouthful, and you seldom get a minnow that they cannot handle.

## WHAT HO! THE PIKE FAMILY

Old-timer, the greatest little jinx that bobs up in the fishing game to cause an argument and an endless amount of discussion both ways from the Jack, is the question as to the correct identification of the pike outfit; the muskallunge, pike and pickerel. Which is which, and why, makes the life of a fishing editor one glorious nightmare. The fellow who has landed a walloping fighting pike is darned sure that it was a musky, while his friend puts the skids under him by calling it a pickerel, and from that time on they don't even speak when they pass a coaling station. If it hadn't been for the pike, pickerel, musky chewing fest, these former pals would likely be hanging over the rail planning their next fishing trip.

The entire pike family are a savage bunch of rustlers and they all make a fight to stay in the wet. Of course the musky kicks up more "hullabaloo" than the pike and pickerel, but at that there is a bit of a fight in the pike and pickerel. Of course there are a lot of highbrow anglers who snort with contempt, in fact they fairly bristle with snorts when a feller even mentions pike and pickerel within the glow of their halo, but you can plaster this up in your think-tank for keeps, these self same chaps don't

land everyone they hook. Many a well-developed pike has thrown a farewell kiss to the fisherman and at the same time carried away his spoon as a souvenir.

#### WHAT THE DOCTOR SAYS

That the boys of the trusty rod may have a sure enough scientific opinion on the true records of the pike family to which the musky, pike and pickerel belong, I give you here a copy of a letter written by Dr. Barton Warren Everman, one of the best known piscatorial scientists and who collaborated with David Starr Jordan in the writing of "American Food and Game Fishes."

"In the first place, let me say, all the species under consideration belong to one and the same genus, namely *Esox* (or *Lucius*, of some authors).

"There are at present recognized in American seven species of this genus. They are: The banded pickerel (*Esox americanus*), the little pickerel or grass pike (*Esox vermiculatus*), the common eastern pickerel, green pike, or jack (*Esox reticulatus*), the common pike, Great Lakes pike, or pickerel (*Esox lucius*), the muskallunge (*Esox masquinongy*), the Chautauqua or Ohio muskallunge (*Esox ohioensis*), and the great northern pike or unspotted muskallunge (*Esox immaculatus*).

"These various species may be readily differentiated by means of the following 'key':

“(a) Cheek entirely scaled; (b) Opercles (gill-covers) entirely scaled; (c) Branchiostegals (the bony rays under or behind the lower jaw, supporting the thin membrane), usually 12, (11 to 13); (d) Color dark greenish, about 20 distinct curved blackish bars on side — Banded Pickerel.

“(dd) Color light greenish, side with many narrow curved streaks of darker, these usually distinct, irregular, and much reticulated — Grass Pike.

“(cc) Branchiostegals 14 to 16 — Green Pike.

“(bb) Opercles without scales — Common Pike.

“(aa) Cheeks as well as opercles with lower half-naked; branchiostegals 17 to 19.

“(d) Sides grayish, with round or squarish black spots, not coalescing to form bands — Muskallunge.

“(dd) Sides brassy, with narrow dark cross shades which break up into vaguely outlined dark spots — Ohio Muskallunge.

“(ddd) Sides grayish, unspotted or with very vague dark cross shades — Unspotted Muskallunge.

“The Banded Pickerel is found only east of the Alleghenies, from Massachusetts to Florida. It is a small fish, rarely exceeding a foot in length.

“The Grass Pike occurs abundantly throughout the upper and middle Mississippi valley and in streams tributary to Lake Erie and Lake Michigan. It does not occur east of the Alleghenies. It rarely exceeds a foot in length.

“The Common Eastern Pickerel is found from

Maine to Florida, Louisiana, Arkansas and Tennessee. It is a common angler's fish in New England where it attains a weight of several pounds.

"The Common Pike is widely distributed all over Northern America, Europe and Asia. It reaches a weight of 40 pounds or even more, and is often mistaken for a Muskallunge.

"The Muskallunge inhabits the Great Lakes, the upper St. Lawrence, some streams tributary to the Great Lakes and some in the upper Mississippi Valley. This is the largest fish of the family. It attains a length of 8 feet or more and a great weight.

"The Ohio Muskallunge is found in Lake Chautauqua and certain streams in Ohio including the Ohio. It is now rare except in Chautauqua Lake, where it is propagated by the State of New York. It attains a great size.

"The Unspotted or Plain Muskallunge is known only from Eagle Lake and certain other small lakes in northern Wisconsin and Minnesota. Not much is known about it. It may not be a good species.

"The Eastern Pickerel or Chain Pickerel is not found in the Middle West; the species there is the Little Pickerel or Grass Pike.

"The chief reason for all the confusion is the loose use of the term 'pickerel.' Some mean one species by that term, while others mean another.

"Color in fishes is not always a reliable character; it is thus in these fishes. The safest course is to

depend on the scaling of the cheeks and opercles.

“ In both *Esox reticulatus* and *Esox vermiculatus* both the cheek and opercle are entirely scaled, but in the former there are 14 to 16 branchiostegals while in *Esox vermiculatus* there are only 11 to 13.

“ In *Esox lucius* the cheek is entirely scaled but the lower half of the opercle is naked. This will always distinguish *Esox lucius* (Common Pike; Pickerel) from *Esox vermiculatus* (Grass Pike or Little Pickerel) found in the same waters. And the Muskallunges can always be distinguished from the Pickerels in that both the cheek and opercle are naked on their lower half.”

Which only goes to show you, old-timer, that the Pike outfit, have a family tree and the branches are distinct and easily recognized.

## AMONG THE JUMPERS

There are many angles to the fishing game that stand the nerves on edge and shoot the thrills through the system. Some of the gang crediting the strike with being the real thrill producer while others place their small change on the jump up out of the water as the ultimate in climaxes. On the jumper, I'll stack a bit of change — what has more kick to it, than the sudden, unexpected leap into the air by the game fin? The flash of the glistening rascal, his shake of the body and the drop back into the water. You are thrilled for the moment wondering if you still have him or whether he has started for other waters.

The leap into the ether of the small-mouth bass is one of his stock tricks and at that little move he is a pastmaster. Up clear of the water with a graceful curve to his body and then a shake of the entire body to throw the stinging hook or to spit out the tickling feathery fly. This shake has often been termed a shake of the head but in fact as the bass has no neck it is in reality a shake of the entire body and it is surprising the rattling good shake they can produce at that. Let the small-mouth catch you

Illustration No. 1 is the Pflueger Golden West fly reel, an aristocrat among reels of this kind and one that is equally as fine a running tool as it is good looking. This reel, of course, is a single action or click reel, and it is a pleasure to use it on a well balanced fly rod.

Illustration No. 2 is an automatic reel, the popular "Y & E" reel that takes care of the slack in the line by merely applying slight pressure of the little finger. For handling big trout and bass via the fly rod it is sure a great worker.

Illustration No. 3 is a very popular reel, the Meisselbach "Featherweight" a light single action fly reel that works fine and balances well with most any rod.

Illustration No. 4 is a nifty aluminum takapart fly reel that is an excellent tool and one that looks the part as well as acts like a thoroughbred. This reel, the famous Meisselbach "Rainbow." is excellent in every way.

with just the semblance of slack in the line and up he comes and if you are slow in taking away the slack, just dope it up as a good-by bass. And if you try to pull him off his legs, he stands about as good a chance to make a getaway. As he drops back on the water have just enough slack in the line so that it will not be taut or have too much pull to it, then let the arch of the rod make him take the line as he starts on another run.

#### HIGH LEAPING RAINBOW

The leap of the rainbow trout is a thing of beauty, way up out of the water with plenty of kick to it and he often makes a leap the very first thing on being hooked, throwing the fly as he curves in the air. There is nothing slow about the leap of the rainbow and he makes at times a continuous series of leaps in his dashing fight to make a getaway.

I know of one two-pounder that makes his home in the Marquette river in Michigan, that made a leap of over eight feet almost the instant he was hooked from the fast shallows under an overhanging bush and then repeated the jump as soon as he hit the water again. On the second jump, which came rather unexpectedly so soon after the first leap, he kept right on going and is probably still going. But the thrills from those jumps, old-timer, set the blood to tingling and the nerves on edge.

## MUSKY A STURDY JUMPER

The heavy-weight among the jumpers is the musky and when a big old " villyun " of this tribe decides to hit the air he causes a commotion on the surface that stirs up things a bit. And what a thrill he gives you when he makes the jump and you get a glimpse of what a large fish you are really connected with. Often at this point as he flashes a threatening glance in your direction you wonder whether it is not the safest thing to cut the line and start fishing for pan-fish. This, however, is merely a flash of musky fever and as he makes another plunge with a run of line you instantly decide to land that fish or sink the boat in the effort.

After you have witnessed the rough old shake of a big musky as he tries to throw your spoon, the shake of the small-mouth bass seems like a tremble in comparison. The beauty of the leap of the musky is that you never know how he will end it. He may drop back on the water like a ton of rocks and then dash away for a long run or again he may swirl around on the line in an effort to corkscrew it around his tail and thrash it apart or pull the hook loose with the leverage. He has dozens of ways to end the jump and the fact that you have to keep your eyes on the game for the unexpected is one of the thrill producers in this end of the sport.

## WHAT ABOUT THE PICKEREL?

Although some of the boys credit the pike or pickerel with the same game jump of the musky and bass and the shake of the body in an effort to throw the hook, from my own experience with these fish and from the experiences of many fishermen and guides I cannot class 'em up with the jumpers. It may be that in certain waters and localities the pike and pickerel do jump up out of the water and shake the spoon with a walloping kick with the same game-ness of the musky and bass; these pike, however, I have never met personally. The usual fight of the pike and pickerel is to make long straight runs in an effort to snag the line among the weeds and twist the hook loose with the leverage thus gained. Usually I have never lamped the pike or pickerel until he was brought close up to the boat and then he generally makes a swirling fight and rush to get away, throwing a bit of water in your face in the effort.

## JUMP MORE IN SHALLOW WATER

The depth of water has a lot to do with the leap of the game fins, especially so with the musky. In nearly every case the musky caught in the shallow water, ranging from five to fifteen feet, will break water. The tendency of the big fish is to go down, to hunt the refuge of the snags and weeds of the

bottom and when he finds that going down is a short shift, he turns and makes a leap above the surface. One of the largest muskies caught this season, in fact, two very large muskies never broke water during fights that lasted in each case over an hour and a half. One of these game fins, hooked in about twenty feet of water and swiftly worked out to a depth of forty to fifty feet, away from his home waters off the edge of the weed beds, could not be coaxed near the surface until after thirty minutes of playing and the other one came up to where he could swirl back with a kick that made his tail clear the water.

Had either one of these game fins been played in the shallower water no doubt they would have hopped around in the air like a couple of kittens. The best all round leaper in the musky family is the smaller fellow and when you hook up with say a 25-pounder and he cannot loosen the hook down below, you can expect a fine "top-o'-the-water" fight if you keep connected with him long enough to give him a chance to show just what he can do in the jumping line.

## LUCK AND SKILL

“ Take it from me, old scout, he’s a lucky dog; just lamp the size of that old fish.” You’ll hear someone chirp those words about every time a fellow brings in a good-sized fish or a heavy string, not that the speaker is jealous or anything like that, but it seems to be the habit to throw all the blame on the double horseshoe when a fisherman succeeds in playing a wild child of nature one trick better than it knows itself.

Of course there is a bit of luck in locating a big husky tailkicker and throwing a shot in his direction, but landing this old he-whop after the strike is generally a matter of skill, or in the case of a rank “ ameteur ” having sense enough to follow the dope your guide hands out in the course of the battle royal.

Many big musky have struck the lure of a fisherman on his first try at the big fellows and then tarried only for a moment and as a matter of fact many of the largest have come to gaff at the hands of these scouts new at the fishing game. Looking over records of big fish caught during the past three years it is surprising to note the great number that have been landed by the fellow just breaking into the

game. This large number landed by inexperienced fishermen must surely show that a great number have also gotten away.

#### AMATEURS LAND BIG ONES

When you read over the dope on the fight of these gray-whiskered members of the fin family one naturally wonders at the success crowning the efforts of the new members of the fishing clan. And when a fellow knows that the first instinct of the average fisherman and also in a great many cases with the expert at the game, is to horse the old roughnecks in with a bit of speed, one has a helova time trying to dope out the answer. It's a case of usually arriving at the conclusion that quite a streak of luck runs through the game and a toss-up whether to carry a horseshoe in the tackle box or rub a black cat's back before starting on a fishing trip.

When a fisherman hooks up with a big fish he can generally count on a fight of some length and a scrap worth while or one of short duration ending in a defiant swish of the tail as the old villyun makes his getaway. No matter how strong your line, you have to play them in a coaxing manner without trying to speed up the game or they throw the hook and tail off to other waters. When he starts on a run give him line, but make him pull a little for it; you don't have to give him a free spool, but keep just enough pressure of the thumb to make him take it

and to give the rod a bit of an arch so that this pulling spring of the rod will help tire the fish. Very few rods will stand a direct pull of five or six pounds without breaking and to try to stop the run of a high volted heavy fish by pumping the rod or making a derrick of it simply means a busted rod and the sign of very poor skill on the part of the fisherman. In most cases where a rod is broken in playing a fish it is damaged not by the husky fight of the underwater veteran, but because the fisherman failed to use it right.

#### GIVE AND TAKE THE LINE

After a run of the game fin, when he takes a long stretch of line, start reeling in so that he does not find a bunch of slack and come to the top to throw the hook. And this game of give and take is the real way to play your fish. By keeping your mind on the game and your eye towards the fish you can tire out most any fish by this simple way of making him say uncle.

And to the guide who sits at the oars while you play your first big fish should be given a lot of credit for his landing, if you land him. From this old-timer who lives fish and fishing five or six months of the year, and sits around the cabin-fire dreaming of it during the rest of the time, you get a post graduate course in landing a fish, during the fight, which will be worth many fish to you in the future.

So to the success of landing the big fish by the beginner it's a hundred to one shot that the credit should go to a bit of luck, skill and brains. Luck because you located the big one and skill acquired because you had brains enough to take a little advice from the keen fellow handling the oars. And at that the fellow at the oars is an important end of the team. The way he handles the boat means a lot in the successful ending of the battle. It's up to him to snake you away from the weed-beds and shallows in quick order and maneuver the boat so that you can follow the turns and dashes of the game fin without taking a header out of the craft in the excitement of frisking him out of his home waters.

Last season I sat in with a keen young chap when he landed a five and a half pound small-mouth bass. He had never enjoyed the thrills of a fight with a rollicking game fin on the business end of a line; in fact, this trip was his first one for anything more than a few chubs and sunfish. The winter before I had sent him a number of fishing books to help pass the time and he had become so interested in the sport that he had to let off steam somehow. Feeling a bit guilty, I slipped him an invitation for a week in the North woods.

The first day he became quite a fair caster with the aid of a Pflueger anti-backlash reel and the second day he shot a cast near a likely looking wind-fall. The lure had hardly hit the water when the

big one took it and started south. Here's where the kid threw the real dope, stuff that he had acquired from his books. Right off the pan he yelled for me to row out into deep water away from the winfalls and he handled that fish like a veteran until it made a wonderful leap into the air. The sight of that old hoss standing on his tail threw the kid into high and he tried to jerk the game fin off his legs. Buck fever of a high degree was developing fast, but he quieted down in a minute and landed that man's-sized fish with skill by following the dope he had learned the winter before in his den at home. Luck and skill, but with about 75 per cent of the latter was the reason this big bass found his master in a youngster with two days' experience at the fishing game.

## TACKLE IN THE OFF-SEASON

After the last trip of the season most of the gang stand the rod in a corner of a closet, skid the tackle box in after it and then sink into an easy chair for the winter. Outside of digging the kit out a few times during the season of steam heat, movies and newfangled breakfast foods, in order to show a pal what's right in the tackle outfit or to browse over a bit when the fever gets you, the lay-out usually receives no attention until the budding trees and the whiff in the air brings the fishing fever to a malignant stage. Then, of course, you have a feelin' that you just simply have to wrap your fingers around the butt of a rod and hear the purr of the singing reel, and you gather the stuff together and sneak out in the back yard to tune 'er up for a few casts. Here is where the careless angler, who has just tucked his tackle away in the shape it was in at the end of the trip finds everything out of gear and in need of a few nights overhauling before he can give it a whirl.

Perhaps the silk wrappings of the split-bamboo have loosened and are unraveled and the varnish cracked, which will take a good week or two to shape up, or there may be a set in the tip that gives

the rod a twist, or the ferrules have become loosened by the heat during the closed-up season. Any way you look at it the rod is in no shape for immediate use, and a little care during the winter with a bit of renovating before you put the rod away to hibernate would have given you a ship-shape piece of tackle ready for use anytime.

An overhauling of the rods before you put them to sleep for the winter will add greatly to their life, and in this period of the high cost of existing, a rod that has nicked the slim old bank roll a nice little dent should be handled with kid gloves. If the ferrules or tip have become loosened, remove them and scrape off the old cement and cement them on again. A couple of coats of varnish will keep the water out next season. After the first coat let the rod dry for six or eight days before giving it the next coat. Whether you keep the rod in a form or hang it up by the tip, the best place is a room that is not heated. For the fly rod it is a good plan to put it together and hang it up by the tip. Drive a small brad in the wall molding in a corner somewhere out of the way and hang it up by slipping the tip over the brad. Or if this is not possible, hang the rod by each joint by tying a piece of cord around the small ends. To remove a set in the tip or a joint of the rod, tie a small weight at the bottom at the thicker end. The rod will then be straight and right when you wish to use it on the opening line-wetting rush of the fish-

ing fans. The steel rod is not as sickly as the split-bamboo and needs only a little oil to keep it from developing a rusty nature. Rub it all over with an oiled rag, put it in its little bag and lay it away out of harm's way and next season it will be right on the job as usual.

The reel, upon which so much depends in the bait-casting game, should be thoroughly cleaned and oiled. If you have one of the "take-aparts" it is simple to wipe out the old caked oil and the little pieces of grinding sand that cut a reel bearing quite a bit if you let them collect in the reel innards. Of course, if you are a tinkerer and know how to handle a screw driver, you can take apart most any reel and put it together again, but, as the reel is a finely set tool it should be sent to a real reel doctor for a once over and cleaning if you don't happen to be one of the tinkering clan. Oil the reel well with a light oil and a little vaseline on the cogs will help keep it in good shape until needed. Take off the old casting line before you wrap the reel in a slightly oiled rag and put it away in its case. And, by the way, there is no better insurance against bumps and jams to a reel than a little old leather reel case. It's a fine protector for this valuable asset in the bait-caster's outfit and pays for itself many times during the life of a reel.

The little old bait-casting line that you wind off the reel is usually worth saving for next season. If

you have dried it out each evening after the day's fishing and reversed it every day or so during the casting you can figure that it will stand quite a bit of usage during the following season. Although a fellow will nearly always start off the game each year with a couple of new lines it is worth the small amount of trouble necessary in order to have the old lines with us. I have had lines with which I ended the season stand up well for casting on the early trips and later used the same line in the trolling end, which is the logical wind-up of the casting line.

When you remove the line from the reel, rewind it on the original spool and wind it as carefully and evenly as possible. If fly-casting is your pet hobby, remove your oiled or enameled line and coil it in loose coils, first pulling the line through a soft rag or chamois to take away all dirt and kinks. Coil the line in a pile on an even surface of a table and not wrap after wrap around the hand, as the latter method is a great producer of kinks and twists. Place the coiled line in a fruit jar, covering the top with a paper cap and set it away in a dark, dry, cool place, as moisture, light and heat are bad medicine for enameled or waterproofed lines.

Of course the old tackle box is likely jammed to the bursting point with the season's accumulation of wobblers, wigglers, spoons and odds and ends that a fellow picks up in his effort to locate the "killer" he always hopes to find, just around the corner.

Sort out the stuff that is at the junking-off stage and put it in the reserves, arranging everything else in good order in the box so that you can find it easily when showing the kit to the fellow next door. At the same time you will be able to paw over it yourself at odd times when the call gets you, and thus be successful in lifting a plug without pulling up other ones in a jumbled mess with it. Wipe the spoons, rub a little three-in-one over the metal parts and place the box where it is handy for instant reference.

## FIFTY WALL-EYE PIKE AND HOW THEY CAME TO GAFF

A REVIEW OF THE BAITS, THE TIME AND  
THE CONDITION OF THE WEATHER WHEN  
THESE WALL-EYE WERE LANDED

For an accommodating cuss we gotta tip the kelly to the wall-eye pike; when most of the other game fins are off the feed and hard to coax with any old bait, the wall-eye is on the job being a good fellow and taking the bait or lure with a wallop. During July and August we find him over-anxious to come in out of the wet, and for that one little thing we thank him. Although he does not make the spectacular racehorse fight of the trout nor the snappy, swishing, leaping fight of the bass, he has enough kick in his makeup to give us a good run for our money. He is naturally a bottom fish and you have to go down to that region to get him. If you hook a good-sized wall-eye, you cannot work him in fast, as he has a series of tugs and pulls that sure put a strain on the tackle. His greatest little trick is to make a straight run to the bottom when hooked and after you bring him to boatside and think you about have him ready for the net, he makes another

grand-stand play and goes right down to the bottom again. He will repeat this trick a number of times and all you can do, old man, is work him up to the surface again, and you can figure that he will make a pulling fight on the way up.

The wall-eye is found in nearly all waters and is a great old breeder, but he's traveling under an assumed name, as his right moniker is pike-perch; however, he has been called wall-eye pike so long that we just let him ride under that label. In fact, he has a great variety of names, being known in some localities as the salmon, jack, jack-salmon, glass-eye pike, yellow pike, and blue pike. These names were probably tacked on to him because he is such a rover and always humming around for a feed. In the feeding line he has all the other fish backed off the board, he feeds day and night and has an awful appetite. He's so darned hungry at times that he just sits in with his own family and eats up a few of his children, which is going some, even for a fish.

The fact that the wall-eye is a great old family producer is the reason he is with us in a goodly number in most streams and lakes. After he fathers a family of a hundred thousand husky young pikers, and the little fellows have learned to wag their tails, he figures that his Rooseveltian duty is performed and he strikes for other waters, leaving the youngsters to shift for themselves.

He never travels alone, but joins in with a bunch of other roving wall-eyes and thereafter travels in a school. He probably does this because he thinks that the other fellows may locate a feeding-ground and he would miss it. For this little reason, old man, when you land a wall-eye in a bay or pool, just keep on fishing thereabouts, for it's a hundred to one shot that you have struck a school of feeding fish, and you can get a well-filled stringer if you play close to them.

Where you find him in numbers one day does not mean that you will find him there the next, as he flits around without a route or schedule. In no matter what depth of water he is in you will always find him bottom feeding, and he is a clean-cut feeder, making his meals on fish as a general thing, although he also likes a crawfish or frog now and then, but his natural food is minnow and pan-fish. To his clean diet we can blame the sweet taste of the old rascal when browned to a turn in a spider.

In the lakes you will find him in the small bays, where the minnows are generally thick, across the mouth of the bays and in the channels between lakes and off shores where the water runs from about eight to twenty feet in depth. In the river he hangs out below rapids, dams and log jams, and in these pools is a fine place to cast for him, using live or artificial baits, weighted with a dipsey sinker to carry the bait down to him. He also likes the sand-

bars in rivers, and wading along a bar, casting on both sides, is a good way to locate him.

One peculiarity of this old boy is the fact that when you hook a large one you may get the impression that you have snagged your line. I know of eight big fellows caught last season ranging from nine to twelve and a half pounds that were hooked, and the lucky anglers who hooked 'em all thought they had snagged their line on a log. The reason for this I do not know, it may be that the bait was slowly passing the big fins and they were too darned lazy to move to snap their mouths shut on it and take a rest before swallowing it. Or it may be that the fish were so gorged with food that they simply took the bait as a matter of course, and went back to sleep before swallowing it.

This was the case with a twelve-and-a-half-pound wall-eye that I landed last season. The fish was caught on one of the hottest July days, by a cast over across the mouth of a small bay. The lure was a greenbacked white-bellied Heddon's underwater Dowagiac minnow, and the only one in that neck of the woods. When the first pull came on the line and with continued reeling I got no response, I thought that I had snagged an underwater windfall. We paddled over straight above the apparently snagged line, gave it a jerk, and the play opened up with a rush. The jerk on the line had force enough to bring him right up to the top, and he kicked a

bucketful of water in my face as he turned and made for the bottom again. The whole thing was so sudden that I nearly took a Brodie out of the canoe and started swimming for shore. Three times he was brought to the side of the canoe, fighting back and forth with a series of snappy jerks in between, before he said "uncle," and came into the canoe.

I had the pleasure last season of reading the obituary of 50 wall-eye pike weighing from six pounds to fourteen and a half, and the record of these big fellows makes good dope for the fellows who like to take a shot at the finest tasting fish that ever graced the spider, and, at the same time, who is not afraid to admit that he sometimes fishes for other fish than the trout, bass, or musky.

What stands out the strongest in the data on these 50 old-man-sized wall-eyes is the fact that 26 of them were caught in July and 15 of them in August. This certainly shows the wall-eye up as a hot-weather sport, and you can take it from me, these pike sure have made the fishermen feel good when they were probably skunked on bass during those hot days. Four were landed in September, three in October, and two in June. So we mark a big red cross on July and August for a try at the wall-eyes this season.

In the matter of baits, we find that 34 answered to the wiggle of the minnow, which shows without a doubt that the minnow is the natural food of the

wall-eye. Of these minnows, the cards stack up 14 to the mud minnow, eight to the chub, six to the shiner, four to the perch, and two to the sucker. Making a good lead for the mud minnow, which is by far the best minnow bait in the whole minnow family. The fish do not seem to be able to resist the dark brown and golden wiggle of the mud minnow, and the fact that it is a hardy cuss gives it more life on the hook than the other minnow.

Following up the bait dope we find that ten of these wall-eyes fell to the artificial plugs, and that all of these plugs were of the underwater variety. The colors or the lures that teased 'em onto the stringer shows up five for the green and white combination, four for the rainbow, and one for the perch effect.

Six old boys answered to the signal of the pork-rind and three of these rinds were rigged with a small spinner to add to their luring value. Of the 34 minnows as noted above, 10 of these had the help of a spoon or spinner to make them more attractive. This making 13 of the total number on which a spoon or spinner was used.

Surprising to many fishermen will be the fact that 28 of these big fins were caught between 10 a. m. and 4 p. m., a time o' day when a lot of the boys are enjoying a snooze in a shady spot on shore, and equally as interesting is the fact that nine of these were caught right around noon when the sun is doing

its darndest to drive the fishermen into the shade. Fourteen were caught in the late day period from 4 until 10 p. m., and eight answered to the call in the early hours from 6 until 10 a. m. Being by instinct a hungry nature, it looks like these big wall-eyes take no notice of the time in feeding and feed right through the day when other fish are a bit off the feed. In the late evening fishing it is interesting to note that the wall-eye will often take the fly, and casting a red ibis or a white miller fly in the white water below a dam or rapids will sometimes bring a rise out of this bottom fish. I noticed this one evening last season while loafing on the shore at the bottom of a piece of fairly rough water. I was hitting the pipe after an evening meal and noticed a swirl as a fish took a butterfly from the surface, so I thought I would see how the bass were feeling in that piece of water. Making a few casts, I felt a fair strike and started him in to the shore and was a bit surprised at the style of his fight, no long runs nor surface stuff, but an awful bunch of tugs for a four-ounce fly-rod. The whole game was clear in a few moments, when I netted a two-pound wall-eye, so I whipped out the white miller a few times and took three nice wall-eyes from that rough little pool. The fly was used as ordinary bass fly.

As to the weather conditions, 38 of these fish were landed when the sun was clear and the day fairly hot, eight came to net when the day was cloudy, and

four were caught after dark. Evening fishing for the wall-eye is, as a general thing, good, and letting the bait down to them at that time will bring good results.

The method of fishing for these old men of the tribe shows up trolling as the manner in which 22 came to grief, while casting brought in 18 and still-fishing has 10 to its credit. In still-fishing for the wall-eye the depth of the water should be ascertained and the minnow lowered to about a foot or two above the bottom, and it is well to move the bait around slowly from side to side. The wall-eye will take the live bait and move off slowly with it for a short distance and then generally stop and swallow the bait, but should he keep on moving, just slip him the strike by raising the tip of the rod sharply. Striking when the fish first takes the bait and starts away will simply tear the minnow in two or jerk it out of the pike's mouth. And the bait must not be allowed to lie on the bottom; the wall-eye, like all other fish, has his eyes in the top of his head and he sees what's above him and not below.

Although not a savage swashbuckling fighter like the musky or pike, the wall-eye kicks up quite a bit o' fuss before you get him into the boat, and while playing a big fellow of this tribe between the strike and the landing net he puts quite a strain on light tackle by the heavy, husky pulling tugs; sort of like the swing from side to side of a bulldog after he

gets a grip and decides to stick until the last pull. Following the past performances of fifty nice-sized wall-eyes we find nearly half of them answered to the call of the underwater troll.

In trolling, the boat was, as a rule, moved very slowly, and this method is the most successful in trolling, as the wall-eye is not a fish that will chase after a bait, you have to place it as conveniently as possible to him in order to make him shake a tail and go for it, and if it is moving too rapidly he will sit back and wait for the next one. He is not the energetic, savage, darting villain of the musky and pike class. You gotta go more than half way to make him take an interest, the fact that he is always on the feed never gives him a chance to feel the pangs of hunger like the other game fins. In casting for him the cast should be long, and slow reeling will be found most effective.

The home waters of these heavy-weights placed 38 of them in the lakes and 12 from the rivers. It is pleasing to note that none of the lakes were mud bottoms or sluggish waters, as the wall-eye prefers the clear and cold waters and he just dotes on the rocky or gravelly bottoms, while the river wall-eye makes a specialty of sticking around where the water has a bit of current. He likes to hang out below the dams and in the waters where the current has worn away the banks, making deep pools with a swift flow through them.

Shooting a glance back over the dope sheet, we find that the minnow is the great little enticer for the wall-eye and that the little old mud minnow, from the stream and creek, commonly called the Molly chub, is the lively little wiggler that just tickles them to death. (Get that, tickles 'em to death.) And in the artificials, it is a toss up in the matter of colors between the green and white and the rainbow.

In the matter of time o' day the midday stands out with a record that will make a little wall-eye fishing look mighty good to some of the boys who have let this period slip by because they figured it wasn't much use to try for the game cusses in the heat of the sun. When it looks bad for most any other fishing because of the sun and heat, take a little flier at the wall-eye and see if you can raise a big one.

For the fellow who thinks that still-fishing is out of his repertoire, let him take a light ten-foot rod and do a little still-fishing for the wall-eye and be sure he will find some sport and skill necessary in the handling of a fair-sized pike, and have his tackle in good shape at the wind-up.

A new thing in trolling for the wall-eye is to take the usual rig for lake trout and go after them in the deeper waters. I took a shot at his game last season and rounded up a number of fine fellows ranging from three and a quarter to seven pounds.

This trolling was done in a piece of water with an average depth of 20 feet, in places running from 10 to 30 feet.

The rig for this deep trolling is easily assembled and it will certainly take your bait down to them. Take an eight-ounce, cone-shaped sinker and attach it to the end of your line with a swivel, then take three pieces of line about three feet long and swivel the first piece to your line about two feet above the sinker, the next piece swivel on a foot higher, and the third piece a foot above that one. On the ends of these three lines swivel on an eight-inch piano-wire leader, because the big wall-eyes have teeth that will cut through a gut leader. To your three leaders attach a single or treble hook as you prefer; on each of these hooks bait with a minnow, mud, chub, or shiner about six or eight inches long. Let your line down and find bottom, then troll along very slowly. The big wall-eye loafing along the bottom will strike very mildly for his size and may, or may not, make a slow move with the bait. To save losing any of your good line in case the sinker becomes caught on the bottom, an old piece of line that has become weakened should be swiveled on the end with the sinker attached, so that it will break at that point and you lose nothing but the sinker. In working this rig successfully it is necessary that the sinker follow the bottom while you are trolling, and you must troll very slow to get the big fellows.

Last season with this rig I hooked two fine wall-eyes at the same time and they sure made a strenuous fight when they started on their jigging down in the deep water. A small, No. 3 spoon placed before each bait makes the lure more attractive, or you can use an Archer spinner instead.

I have found the Lowe-Star spoon in the smaller sizes, both singles and tandems quite attractive for the wall-eye. The silver and golden flashes of this spoon with the added lively wobble of the twirling spoon seems to wake 'em up down there in the cool reaches.

Although the wall-eye hasn't made the reputation for fighting of his friends the trout, bass, or musky, there is a lot of credit due him for his being on the job all the time, and handling him with light tackle is a game worthy of any of the keen fellows who answer to the call of the water trails. Here's hopin' he gets a bit of credit for the joy he has brought to many anglers through taking the bait when they least expected it.

## FIFTY PIKE AND HOW THEY CAME TO GAFF

A REVIEW OF THE BAITs, THE TIME AND  
THE CONDITION OF THE WEATHER  
WHEN THESE PIKE WERE LANDED

For downright cussedness, old man, you got to tack the blue-ribbon on the pike. This vicious old wolf of the weed-beds and rushes, known by a dozen other names and particularly named as pickerel by a big bunch of the knights of the rod and reel, is about the meanest all-round fin in the whole society of the watery recesses, but the big thing that stands out in his favor, besides the fact that he puts up a game scrap, is that he has a whopping big appetite and seems seldom able to fill the feed-bag to the extent that he won't take a chance at another morsel as it flashes past him in the water. That old hungry feelin' is sure a lucky thing for many of the boys who might otherwise chalk up a goose-egg for the day's fishing.

He's a right-close cousin to the musky, and a fair-sized pike will put up as neat a fight as you'll find in a few days' paddle, however, unlike the musky, it is seldom he breaks water, unless it be right at the

last moment before you gaff him. And here is a little real dope on his nature: You may have played him a bit and bring him up to the boatside, thinking that he is all in. It's a good bet clean across the board, old-timer, that he will make a rattling quick and gamy fight right at this time, and many of the big fellows have made their getaway through a final snappy fight when they appeared all in and ready for the stringer. That final scrap, when he kicks the water in your face and leers at you with his mean-looking eyes before he makes a straight-away run for about 40 or 50 feet, as you push on the thumb pressure, is bound to be a lively few minutes, and when you finally slip him the gaff you can feel sort of lucky. In fact, a pike is never really landed until you have him sizzling in the spider for the evening chuck.

The similarity of appearance in the face and general contour of the pike, musky and pickerel is such that it has caused more argument than the age of Ann. All three of the outfit have a mean-looking mug and the same number and kind of fins, the flattened head with the protruding lower jaw set with dagger-edged teeth, although in coloring and markings there is a distinct difference. The body color of the pike varies greatly according to the waters in which it is found, but as a general thing it has a greenish yellow back and sides with yellow spots which have the appearance of being daubed on the

fish with a paintbrush and they run longways with the body and are of no special design or size. The sure way to correctly call the name of these cousins and get it right every time is to take a "look-see" at the cheeks and gill covers. On the musky the cheeks and gill covers have scales on a very narrow strip on the upper half or less than half; while the pike has scales on the entire cheek and the upper half of the gill covers, and the pickerel has both cheeks and gill covers entirely covered with scales. Having gotten this dope out of our system, we will now proceed with a line of stuff about this game boy that will make some of the "holier than thou" anglers who have an opinion that the pike is not worth fishing for sit up and wipe their glasses, or at the very least make 'em snort out a few more snorts as they sit on their front porch doing their day's fishing.

Regardless of the fact that a well-known writer recently stated that the record weight of the largest pike caught was 16½ pounds, and that there is no authentic record of larger pike known, here is a layout of dope on the last kick of 50 pike ranging in weight from 12 pounds to 29 pounds, and the baits, lures and conditions under which they answered to the call of their masters. These 50 game old pike were caught in waters ranging from Lake George in the east, to Minnesota lakes on the west, and from the Canadian waters of the North to the Indiana lakes, and on the sun-kissed days of May

right through until the snow-flurried days of October — range and time enough to give us a fair idea of what teases the old roughnecks out of their hunting waters.

In the matter of baits, passing our lamps over the score-card, we find that 14 of the 50 pike were caught on artificial plugs, 12 answered to the flash of the spoon, ten took a wallop at the minnow or chub, four came to gaff via the frog, and ten couldn't resist the wiggle of the pork-rind.

Of the colors of the artificials, which by the way were the ordinary-sized bass plugs, the white with a red head and the green back and white belly come in neck-and-neck with six each to their credit, and the rainbow color comes walking in with two chalked up for it. No doubt the brighter-colored lures make this strong finish because they were used on days that were overcast or cloudy, as nine of the 14 were caught on days of that condition of weather. And on a day of this kind the white plugs make the most attractive lure for most any game fin. They are easily seen in the water and seem to awaken an awful curiosity on the part of the fighters, yet, on a day of this kind, they are not so flashy under water that they scare the fish, which is often the case on a bright, clear day, when the water is smooth and the sun shoots its light down to considerable depth — at such time, the rainbow, perch, and darker-colored lures are more effective.

Here are something new in baits, something just a bit different and everyone of them a good lure.

(1) A hand made Orley Tuttle bucktail crawfish, a killer for bass. (2) A small size Orley Tuttle hair Devil Bug for trout. (3) Joe Welsh Blue Devil Darning Needle, a floater that brings the big trout and bass up to the surface strike. The transparent wings on this lure are wonderful and few fish seem to be able to resist it. (4) A Palmer Grasshopper, cork body, one of the most natural looking flies in the game and a sure killer for surface fishing. (5) The Emerson Hough Bucktail Fly, the long wiggling hairs of which seem to set the trout crazy. For wild water it is particularly effective. (6) An Ed Wyman Floating Bass Bug. For stream fishing this fly I have found particularly taking and it is tied with the skill of an artist. I have one of these bugs with a record of 209 small-mouth bass. (7) A Palmer floating Millar, fine for late evening fishing for trout. (8) Peckinpaugh Midget Bucktail Shiner for trout. (9) Peckinpaugh bass size Bucktail Shiner, both mighty fine fly rod lures. (10) Peckinpaugh floating Trout Midget and (11) Peckinpaugh floating bass bug. These floaters are tied in standard patterns and are very effective lures. (12) A Hildebrandt Bucktail Silver Shiner Minnow can be used either with the fly-rod or with small sinker and spinner for bait casting rod and good either way for bass and trout. (13) The larger size Tuttle Devil Bug, great for large big trout and bass. (14) Tuttle's Hair Mouse, new and striking and a fish getter. (15) Ed Wyman's famous Hairfly, a most effective and taking fly for small-mouth bass in the stream, striking in design and cleverly tied, the wiggling hairs of this fly seem alive and force the fish to strike.

Following along through the dope sheet of the last kick of the fifty pike we find some of these old barbarians answered to the twirling lure of the spoon, the fascinating wiggle of the minnow, the juicy taste of the pork-rind, the kicking crawl of the little green-backed frog — variety enough for the appetite of any pike.

As to the spoons used, they run small in size, ranging from No. 3 to No. 12 with an average of No. 7, and out of the 12 caught on this flashing invitation, nine were caught by trolling. In material, six were nickel finish, three enameled white, and two brass, while one was nothing else but the half of a clam shell. Do you get that, old scout? Half of a clam shell for a lure; just tack that info up on the wall for future reference when you are out somewhere and find that your spoons are back at the camp. And what makes this little old clam shell stand out like a house afire, is the fact that the rollicking old pike that answered to its coaxing glide through the water was a 29-pounder — which pike, by the way, is some fish, take it from your little brother of the swishing line and the humming reel. Can you slip your thoughts into high and see the driving rush he makes for a getaway; feel the burn on the thumb, the strain on the tackle, and offer the little murmured prayer that the gods of the outdoors are with you and that the tackle holds? And when I slip you the dope that this old flat-headed

wolf was caught on a stormy, cold morning in May, you know, boy, that he sure had a kick in his tail from his wintering in the cold waters, that he had not lost through lolling around in the sun-heated waters of the summer months. Ye gods! what a scrap, and all for the half of a clam shell. Remember the clam shell, old top, and may its fame never grow less.

Of the ten pike landed through the fascinating movement of the minnow, six of the minnows were rigged up with a small spinner or spoon, while the minnows ranged from shiner, mud minnow, and river chub down to one caught on a small perch, while the four frogs that landed winners were topped off with a bit of red flannel, which touch of color, or color combination with the greenish backs of the hoppers and white bellies seemed to make an attractive lure for the pike. The pork-rind certainly rides in nicely with ten to its credit, which sure places that juicy dainty right up in the front row, and, believe me, we haven't heard the last from the pork-rind in the fishing game by any means. The more it is used the stronger hold it gets on the fishing fan, and rigged up with a piece of red yarn or red flannel, as six of these ten were rigged, it makes the old cusses sit up on their tails and their mouth water. Nine of the ten pork strips had a small spoon or spinner linked on in front to make it an added attraction to the hungry pike.

The months in which these pike signed up with the "drys" are scattered all through the fishing season, with September standing out with fourteen, followed with October, which has ten to its credit, July eight, June seven, August six, and May five, all of which goes to show that the pike has an appetite right through the season and that he is particularly on the feed at the tail end of the season when his mouth is again in good shape. August slips in with six because of the fact that the pike's gums are very badly swollen during the last two weeks of that month and he is practically off the feed during the day at that time, or at least not in much humor to take a crack at a lure; he probably feels more like yelling for the dentist than anything else. At this same time a majority of the lakes are in bloom, or working, as the guides term it; that is, the underwater weeds and growth have come to seed, and the water is filled with small, minute particles which give it a seedy, cloudy, or milky appearance. Although some writers argue that the fish do not feed on minnows and live food during this period, but live on the vegetable matter in the water, I have found that late night-fishing in the shallows and small bays will get a strike when you cannot excite them during any other time of the day. At night it is probably not as much work for the hungry fins to snap up a meal as it is in the daytime, or perhaps the minnows, tired out by the lively swimming of the day, are lying

around hitting the hay, and the big fellows simply have to swim along and swallow them. Whatever the scientific reason may be, that doesn't worry me a hellovalot, but I do know that taking a wallop at 'em at night, after I have cast my arm off during the day and cussed my tongue off into the bargain, generally means a few fish for the frying pan for the next a. m. If you are going after the pike during August, slip a little flashlight into your kit and give them the once-over on an ink-black night; that little old light will save you fish and your disposition when you get a backlash, and you're sure to get it.

Reckoning the time o' day that these husky fins preferred to take their feed, a glance at the dope sheet shows us the early fishing from 4 a. m. until 10 a. m. cleans the pot to the tune of twenty-four; the late fishing from 4 p. m. until 10 p. m. runs close with eighteen; and the midday fishing from 10 a. m. until 4 p. m. walks in with eight. The habit of the pike to feed early and late, especially in the warm weather, lines him up with other game fish that make their main forays at that time.

Off the edges of the weed beds and way down among the underwater weed growths where the shadows were deep and dark the old bushwacking pike made his hangout and like most of the hold-up breed he does not favor the bright light of the sun when most active in a foray upon the weaker fishes.

As to the weather, the cloudy or overcast day

looms up with thirty-four and the bright and sunny days sixteen, while twenty-four of the pike were caught when the water was ruffled by a slight breeze, fourteen when the water was broken and rough from a fairly strong breeze, and twelve on a calm day.

The home waters of forty of these pike were located in lakes and ten of them lived on rural routes in the rivers. The majority of the lakers were caught off the edges of lily pads, weed beds, and rushes and in among the submerged weed growths. Most of the river pirates were caught off the points jutting out into the river, near windfalls and logs, along bends where the river had dug into the banks and near partly submerged brush heaps. Quite a few of the lakers caught in September and October were taken near the inlets and outlets, in the shallows, where the feeding was good; the moving waters at these points being alive with minnows and pan-fish who were, themselves, feeding on the food carried down by the moving waters.

Thirty-six came to grief through casting and fourteen were caught by trolling, and the tackle used varied from light bass casting outfits to the heavier outfits used by some fishermen when after the musky, although the light-tackle sportsman dominated the events. The steel rodsters show up with thirty-seven and the split bamboo with twelve, while one was caught on a long bamboo pole and this old

“ he-whop ” a 19-pounder, fought for forty minutes.

Way back in 1770 old Doc Brookes indited a book to “ those who angle in pursuit of fishes,” and this old worm-eaten book shows that the Doc had a keen idea of the rascally pike and his greedy, vicious nature. Here’s a few words quoted from this old-timer of the early days: “ This Fish is of so voracious Nature, that he will swallow another Fish almost as big as himself. Certain it is with his ravenous disposition he will not spare his own Kind. A Pike caught in Barn-Meer was an Ell long, and weighed thirty-five pounds; it was presented to Lord Cholmandeley, who ordered it put into a Canal in the Gardens, wherein were abundance of several Sorts of Fish. About twelve Months after his Lordship drew the Canal, and found that his overgrown Pike had devoured all the Fish, except one large Carp, that weighed between nine and ten Pounds and that was bitten in several Places. The Pike was then put into the Canal again, together with Abundance of Fish with him to feed upon all of which he devoured in less than a Year’s Time; and was observed by the Gardener and Workman there to take the Ducks, and other Waterfowl, under water; whereupon they shot Magpies and Crows, and threw them into the Canal, which the Pike took before their Eyes.”

With old Doc Brookes, who has long passed to his reward, and it should be a good one for his ef-

fort to wise up the early-day fishermen, we agree that he had the right dope on the Pike, although he does shoot in a bunch of cap. letters in his writings. Last season, I sat in at the swan song of an eleven-pound pike that put up a game old fight and when he was cut up for the spider that evening we found a three-and-three-quarter-pound wall-eye pike reposing in his innards. And the condition of this wall-eye showed that it had just been swallowed shortly before the pike was landed — what an appetite this old cuss must have had to gorge a fair-sized wall-eye and then pick his teeth on a small-casting spoon, or was it merely his innate inheritance of viciousness passed down to him from some of those earlier barbarians about which old Doc Brookes wrote in the little old worm-eaten book which I treasure so highly.

Whatever the standing, in the sport of fishing given to the pike by some of the ultra-exclusive rod wielders, you gotta give him credit for being on the job most of the time and that you can get him most anywhere. And also to the pike, we give thanks because he has gladdened the hearts of many fishermen who have neither the time nor the bank roll to lay out for a thousand-mile trip to the home waters of the gamer fins in their native haunts. At that, old top, if you take a flier at him in the fall, after the first frost has golden-tinted the great outdoors, you will find he has a snappy kick in his tail

and a keenly alive bunch of gray matter that will make landing him a battle to feel proud of. And for all of this, I say give the devil his due, and don't pick him up out of the water by the eye sockets because he sure has a sharp lay-out of teeth and he knows how to use 'em.

## FISHING TACKLE, OUTDOOR EQUIP- MENT FOR CAMP, TRAIL, LAKE AND STREAM

THE FOLLOWING ARTICLES HAVE BEEN TESTED AND  
TRIED-OUT UNDER RIGID CONDITIONS AND  
THEY CARRY MY UNQUALIFIED  
APPROVAL

During the past few years as editor of the *National Sportsman Magazine*, fishing editor of the old *Chicago Herald*, the *Chicago Daily News*, and author of a series of articles on fishing, hunting and the outdoors for over fifty of the leading daily newspapers of the country I have had thousands of requests from sportsmen asking for my opinion on this or that in the tackle line, or what I thought of this particular piece of kit, or would you carry this line of food in your duffle bag on a two-weeks' canoe trip. Although having fished from the bent-pin stage up to now and toted a rifle or shotgun from as far back as I can remember, there were many lines of goods that I had not used, therefore was not familiar with them and could not give an honest opinion on their value in the woods or along the waters.

To be both square with my readers and fair to the maker of a particular piece of kit about which query had been made and with which I had no experience or knowledge as to its material, workmanship or adaptability for the outer's use, I instituted in the *National Sportsman* a Tryout and Testing Department, giving the maker of any piece of outdoors outfit the privilege of submitting his goods, same to be put through whatever paces I wished to give it during the work-out, my report to be published, and from which I could base a definite and worth-while reply to a reader.

During the past year and a half I have tried out and tested 364 pieces of kit; of these I have favorably passed on and reported 168 as being in my judgment high class in material and first class in workmanship, and worthy of a place in any sportsman's outfit. On others I have reported either conditions that could be corrected, or that certain stuff was not of a grade or value enough to receive a favorable report.

Following is a selection of reports that have been made on goods that have been submitted by the maker, without any strings tied to them, and upon which I have passed as being right and of value to a sportsman who prides himself on having a kit that he can show to a pal and feel that it will stand the gaff in camp, on the trail or waters. These goods were all given a thorough workout

under far more rigid conditions than they could ever receive with ordinary usage, some of the tests extending over a period of six months to a year before being completed, and it is a pleasure to me to place my unqualified endorsement upon them. The trying out of these different pieces of kit, under varying conditions, has been one of the most interesting and instructive things that I have ever handled, and if the outer derives any value from the many hours devoted to the work I will feel that the effort has been rightly placed and that the work has accomplished even more than the good that was originally intended.

### PFLUEGER-SUPREME CASTING REEL

PFLUEGER-SUPREME CASTING REEL.— Made by the Enterprise Mfg. Co., Akron, Ohio. For a reel that minimizes backlashes to zero and makes a clever caster out of an amateur in a day's casting, the Pflueger-Supreme reel which is combination level-winder, anti-backlash, freespooler, certainly is a tool that takes all the work out of casting and adds pleasure to the sport. No more cussin' from tangled lines nor tired fingers from guiding the line evenly on the spool. The level-winding part of the reel remains stationary when casting, thus avoiding the frictional wear on the line and on the level winding part of the reel. As you start reeling in, the line

is picked up by the carrier and laid on the spool as evenly as the thread on a new spool. The level winder is encased, which makes it dirt, sand and water proof and the carrier only works while the line is being reeled in. The gears which are generated spiral toothed are always in mesh which makes it impossible to strip them, the clutch taking hold automatically when the line is reeled in. The automatic thumbers set on the inside of the end plate make the reel anti-backlash; as the tension of the bait diminishes, these thumbers slow down the spool and as the bait drops on the water the spool stops. A mighty handy part of the reel is the adjusting screw with a dial regulator on the end plate by which the tension of the thumbers can be regulated to the weight of the lure. A complete twist of this dial and the reel is a free-spool, level-winder for the fellow who wishes to thumb the reel without the help of the automatic thumbers. The reel is finished in the dull satin silver which throws no flashing signals to the waiting fish. It is built right and of fine material and will last a fisherman a lifetime. For night-fishing, when the big ones are out, it is a wonder worker. The Pflueger-Supreme reel carries the usual guarantee of the Enterprise Mfg. Co. as to quality and service.

## TELARANA NOVA LEADERS

TELARANA NOVA LEADERS.— Imported by Joe Welsh, Pasadena, Calif. The Joe Welsh Telarana Nova Leaders are wonders in the leader line. They are made of one length, without a splice or knot in it, and any fisherman knows the value of this feature alone in a leader. They are quality goods and wear till the cows come home; they carry more strength in their make-up than one would expect in a leader and you never have to worry about leader troubles when using them. Besides the strength and durability of these leaders, they have a color that blends in with the water and are practically invisible; they throw no reflections whatever and seem to blend in with the water in such a way that they cannot be seen at all. I have one of these leaders that has been used two years and it has not shown up any weakness, fraying or bad spots; it should be good for another season or the openers anyway. They come in sizes for most any kind of fresh and salt water fishing and can be had up to nine feet in length without a knot. When you figure that you can use a Telarana Nova Leader all season you gotta admit that it is some leader. Without a doubt this leader is the greatest development in the leader line since old Daddy Walton was in the game. When the water is crystal clear and the light brilliant and you have tried the ordinary

gut leaders, throwing their reflection like a bright streak in the water, just tie on a Telarana Nova Leader and note the results in the creel. For their strength, the fact that they are knotless and that they are practically invisible in the water these leaders are recommended as being right and they should be carried by every fly-fisherman.

### PFLUEGER-REDIFOR ANTI-BACKLASH REEL

PFLUEGER-REDIFOR ANTI-BACKLASH REEL.—  
Made by the Enterprise Mfg. Co. Akron, Ohio. Well, fellows, you lads who have a hankering to get into that great little old sport of tossing the plug, spinner and pork-rind, minnow or frog to the big chief of the weed beds, via the short casting rod and haven't the time to learn the art of thumbing the line, Cheer up! You can do it with the Pflueger-Redifor A-B-L. reel and in a half an hour or so. Of course, it takes a little more time than that to get accuracy and distance, but you can make a mighty big start without any trouble in a half an hour anyway. Just f'rinstance. Two seasons ago I took a youngster up north to learn the game, gave him my Pflueger-Redifor A-B-L., told him about it and in an hour he had three bass, by evening he was quite good at casting and two days later after fishing all day with him, my old guide thought he had been

casting for two or three years. It does the work. It makes backlashes a darned hard thing to produce with it and it is a boon to the fellow who wishes to learn, but figures that he hasn't got the time to dope out the thumbing control and the mystery of backlashes. It is a wonder worker, automatic in action without anything to get out of order, all you have to do is cast. The anti-back-lash end is controlled by centrifugal thumbers on the left flange of the spool. The generated spiral toothed gears with which this reel is fitted run longer and smoother than the ordinary spur toothed gear. The hardened steel pinions run in phosphor bronze bushed bearings and ride on agate jeweled cups. End play in the spool is controlled by adjustable tension oil cups and the reel is fitted with a click and drag. The dull satin finish of the German silver is a winner and the low spool, long barrel design is ideal. It is a thoroughbred. The cast is not retarded by the thumbers, they do not act on the end plate until the lure slows up the pull on the line and that is when you want them to work. For night-fishing it is a dandy tool. It certainly is death on backlashes. Material and workmanship are of the best right through the entire reel and it is a fine high class tool at a moderate price.

## FLY ROD WIGGLER

FLY ROD WIGGLER.—Made by the W. J. Jamison Co. 736 So. California Ave., Chicago, Ill. Along comes Jamison with the very, very latest, the Fly Rod Wiggler, a nice little minnow shaped wooden bait that looks so nice that you feel like wearing it for a watch charm. A little fellow  $1 \frac{3}{4}$  to  $2 \frac{1}{8}$  inches long that don't even press down a pair of postage scales enough to hardly pull the indicator down below the starting line. And say the way the two advance models of this bait made the small-mouth bass fighting mad to get to them last Fall was a caution; large trout are also very partial to it. With a fly rod just a bit stiffer than the very light trout rods say a five to six or seven ounce rod, they cast free and easy with just a trifle more pull than a fly, in fact they cast and lift easier than a large bass fly or a small spinner. They come in varied colors and are fitted with one double hook. When you use it in the weeds, turn the hook points up and let 'em stay down when casting clean water. It wiggles along twelve to fifteen inches below the surface but it is a floater and can be used for surface fishing by retrieving it slower. Now that bass and pickerel fishing with the fly rod is developing more and more each season, this lure should be a mighty popular bait as it is undoubtedly an interest creator among the bass and picks. It looks and acts like a

minnow and with a small weight ahead of it works fine on the ordinary bait-casting rod. Also great for deep trolling for wall-eyed pike, land locked salmon, etc. It is made just as strong and perfect as any of the rest of Jamison's goods and more you could not say for a lure.

### HEDDON'S DOWAGIAC CASTING RODS

HEDDON'S DOWAGIAC CASTING RODS.—Made by James Heddon's Sons, Dowagiac, Mich. The Heddon's split-bamboo bait-casting rod is a mighty fine one and made right all the way through and at the same time you can get it in price from four dollars up to twenty-five and a good rod that does not stagger your bank roll. Even from the lowest priced ones up you get a good rod and the topnotcher is 'a winner. I have used these rods from the old one piecer up to the No. 15 and they all work well. The bamboo is selected, the ferrules of German silver, shouldered, hand welt and satin finish while the guides are agate and hardened steel. The construction of these rods is on the one-piece demountable style and that gives you a long tip and short butt; this style allows free whip to the tip giving the bamboo a chance to bend with all its natural resiliency, throwing the bait with practically no strain on the wrist or arm. They are full of action, yet strong and sturdy and a tool that you can handle with pride

on any lake or stream. They look and act the part of a thorobred. The fact that the ferrule is set well below the center of the rod, down towards the butt eliminates the chance of breakage at the ferrule as the bend of the rod centers well above the ferrule. Care in selection of bamboo, thoroughly seasoned, and then care and skill in manufacture as well as the Heddon name behind the rod as a guarantee for workmanship and material means that the Heddon rods are right in every way.

### BABY CRAB WIGGLER

**BABY CRAB WIGGLER.**— Made by James Heddon's Sons, Dowagiac, Mich. When Heddon thought of imitating the little old crab, that succulent food of the enterprising bass and other game fish, they sure hit the bull-eye right plumb in the center. For a something different bait in the artificial line with a wiggle, dive and crawl of the crab tied up in its make-up the crab wiggler has been making the game fish strike in that swirling curve that almost takes the hair off the head as the game rascals drive into it. I have had very fine luck with the crab wiggler finished in the natural crab color, especially for bass and big wall-eye pike and the smaller baby crab wiggler is a wonderfully good lure for stream bait-casting for small-mouth bass. It is a floater and sure has a great wiggling crawl in

the water. I had the best results by working the crab wiggler through a series of short jerks of the rod, that is by giving the tip of the rod a slight jerk, then making a couple turns on the reel handle followed by another slight jerking movement and so on until finally reeled in. About the second jerk, which gives the crab wiggler a sort of backward, darting crawl like the real crab, some old "he-bass" generally gave it a crack and the fun was on. Like all of the famous line of Heddon's Dowagiatic baits, the crab wiggler is made right both in material and workmanship. The enamel finish of the bait is excellent and it stands up under mighty rough usage without cracking or chipping. The new scale finish, underlaid with red and with a golden tint to the side scales is a rattling attractive lure any time, while the white finish I have found particularly good for night and moonlight-fishing as well as on a cloudy or dark day. The natural finish crab color makes a 100% winner for fall casting when the crabs have become a bit scarce, although this finish I have found good all through the season. The crab wiggler is a worthwhile artificial in any kit.

## WILSON WOBBLERS AND GETSEM BAIT

WILSON WOBBLERS AND GETSEM BAIT.—Made by the Hastings Sporting Goods Works, Hastings, Mich. The whole family of Wilson Wobblers are

good baits but the one that stands out way ahead of the rest is the old reliable fluted wobbler. This little old bait has a record as a fish getter that will make the rest of the family wiggle some to beat it. It has the most natural travel through the water possible to obtain by whittling a chunk of red cedar and it darts in through the water in a smooth swing that resembles the live bait to a fare-you-well. I know of many old musky, husky to the weight of from 25 to 35 pounds, that have answered to the last call at the inviting wiggle of the white Wilson wobbler with red flutes. And bass, say old-timer, it makes 'em crazy to get at it. The cupped Wilson wobbler is a good surface bait for the shallows, it travels on the top and has a bit of an erratic crawl that attracts attention, while the winged wobbler dives to a depth of about four feet and is especially good for the warmer weather when the fish are down deep looking for a little cool spot. The Six-in-one wobbler has an adjustable visor that can be moved to regulate the diving depth and make the wobbler do anything from a surface crawl to as deep as a six foot underwater swim and the motion it takes is attractive to the game fins. Of the whole outfit, however, I personally stack my chips on the white, red fluted wobbler, I am never without it on the fishing waters. The Getsem bait is a weedless plug in imitation of a chunk of pork and it can be cast right into the middle of a bunch of weeds or lily pads

and come out without bringing the weed bed with it. It is a weedless bait. It should be reeled slowly and make the strike quickly when the fish strikes and don't be afraid to give it a strong strike as the arrangement of the hooks to keep the bait weedless make this necessary. For the weedy places where the big ones hang out, the Getsem is a livewire winner. The whole Wilson family of Wobblers and the Getsem are A-1 in material and workmanship and they are good lures.

### SHANNON TWIN SPINNER

SHANNON TWIN SPINNER.—Made by the W. J. Jamison Co., 736 South California Avenue, Chicago, Ill. I take off my hat to the Shannon Twin Spinner, it is certainly a winner. On sight, the experienced fisherman will at once see its practicability and get it for his tackle box. The spoons are small and are attached onto swivels at the ends of piano wires which bend up from the eye of the hook, and the big winning point for the bait is that the spoons do their flashing spinning right above the point of the hook. Often a bass will strike at the spoons and on many lures the distance of the spoon from the hook makes it possible for many of the fish to be lost through not hooking them. Not so with the Shannon, the game fish that strikes the spoon strikes the hooks at the same time. This spinner comes

either with a red fly or plain with a weight for keeping the bait right side up. The idea of putting the spoons above the hook was doped up by Jesse P. Shannon, a fisherman than whom there is no better, and a thoroughly practical fellow. I found this spinner entirely weedless, the wires upon which the spoons are swiveled and the whirling spoons themselves acting as weed-guards, and the bait comes out of the thickest weeds without a trailing bunch of bait-hiding weeds. The bait without the fly makes a fine lure used with the frog, pork-rind or minnow and is just right for casting, while the weighted fly makes a small-mouth bait that gets the fish. I find that the spoons spin very well when the bait is reeled in slowly and also in trolling, they still wiggle around and shoot their flashes even at the slow speed of that style of fishing. Taking the bait all around, it is certainly right in every way, material, workmanship and the big point remains that it is a fish getter and I feel sure the fellow who uses it will never be without it.

### HILDEBRANDT NIGHT BUG AND BUCKTAIL SHINER

HILDEBRANDT NIGHT BUG AND BUCKTAIL SHINER.— Made by the John J. Hildebrandt Co., Logansport, Ind. These two new lures of the Hildebrandts are right in line with the new era in the

fly game. The Night-Bug is tied to resemble a night moth and the yellow, brown and white combination with the luminous body makes a cracking good lure for night fly-fishing. This is a floating fly and used with a small aluminum spinner it makes a strong play for the bass at night and that is the time to get the big ones. The fly is well tied and has twin hooks working out of the under side of the body. The Bucktail Shiner is light enough for the fly-rod and still large enough to be attractive, and the move of the bucktail hair in the water makes a rather enticing lure for game fish. More and more the hair fly will be used and this bucktail minnow tied on a No. 1-0 sneck hook is a pleasing departure from the usual run of flies. This fly is a good lure for a dark day especially and I have found it successful for both bass and trout. Both these lures are well made and tied with the usual skill of the Hildebrandts and for the angler who delights in trying the new stuff, and wants to try it with the idea that it will help him land the big ones, these two flies can be recommended as good dope and worthy of the try on the next fishing trip.

### PFLUEGER-SURPRISE MINNOW

PFLUEGER-SURPRISE MINNOW.—Made by the Enterprise Mfg. Co., Akron, O. Here is an excellent artificial minnow, and it is a natural fellow at

the same time, it does not need a bunch of metal adornments to make it do a wiggling darting dive and the swim of a live minnow. It is of red cedar, the best all-round wood for making an artificial and it is finished in all the popular color designs with a crackerjack waterproof porcelain enamel that stands up under any kind of casting without cracking or chipping. It is of minnow shape and what makes it do the wonderful lively swim under the water is the mouth-shaped cut or groove on the front underside, and right where the mouth ought to be anyway. It is a very effective lure, of the semi-surface class, riding about ten to fifteen inches under water when reeled in at the ordinary fishing speed and it goes deeper if speeded up, floating when you happen to stop to untangle a backlash. A few seasons ago I had one of these minnows along up north for a workout, it was cold and snow flurries made casting a bit of rough work. For two days the game ones had been off the strike, the pal and I had thrown them everything in the outfit without much success. I had loaned my pal the one Pflueger-Surprise minnow, a perch colored affair and that afternoon he landed a five pound fifteen ounce small-mouth bass and five others that just tipped the scale a tremble below fifteen pounds, all with this Surprise Minnow. It seemed the big ones could not keep away from it. My own string was not large enough or heavy enough to mention that day. After a lot of coaxing,

and then actually stealing this plug away from the pal, I had quite a nice bit of sport with it. It is still in my outfit a trifle battered and dented from two years' use, but it still gets the fish when it is hard to interest them in hitting the lure. For its natural minnow-like movement in the water, the fine finish and good workmanship I commend it to the bait-caster as a rattling good lure.

### PFLUEGER ALL-IN-ONE MINNOW

PFLUEGER ALL-IN-ONE MINNOW.— Made by the Enterprise Mfg. Co., Akron, Ohio. This new bait of the Pfluegers is a very good one and will no doubt be as popular as their Pflueger-Surprise Minnow which is sure a dinger in the plug line. The All-in-one bait is a combination floater and underwater affair and is made of selected red cedar. The enameling is of water-proof porcelain and is practically indestructible. Continued casting among the shore rocks, windfalls and logs failed to more than nick it on the sharp edges—no cracks or chips were noted. This hammering of a plug among rocks, however, is treatment no angler gives his artificials, but it shows that the stuff stands up under exceptional hard usage. The minnow is mounted with two hand-forged treble hooks with patented fasteners which allow hooks to be removed and attached quickly. There are four metal planes with each min-

now, one to give it a rotary motion; one keeping the minnow well on the surface and throwing a natural ripple similar to live surface-swimming baits; one to make it dive shallow with a wiggle like a crippled minnow, and the other diving deep with the same darting minnow-like motion. These planes can be changed instantly to meet all conditions of water. Made in the killing colors and luminous for night-fishing. This lure proved attractive to bass, pike, musky, and the green and white to wall-eye pike. The new four-hundred-page catalog of the Enterprise Mfg. Co. is one of the most comprehensive books on fishing tackle issued for some time and deserves a place in the library of every fisherman where it can be used for reference. The original leaping-bass design on the cover is a corker and will make you pant for the call of lake and stream. The "Pflueger Guarantee" of workmanship and material is behind this new bait, and it will live up to that guarantee.

### LOWE-STAR SPOON

LOWE-STAR SPOON.—Made by the Enterprise Manufacturing Company, Akron, Ohio. This spoon is so swell looking that, honestly, fellows, you hate to throw it into the water, but, say, when those gold and silver sides start flashing down in the watery recesses it takes a mighty tame game

fish to lie still and let it go revolving past without said game fish taking a walloping crack at it. And, believe me, the way the musky go for that shining-spoon makes your teeth rattle to think of it. I have one Lowe-Star Spoon, a No. 1-0, that is completely bent double from the hammering crack of a big old musky; he sure must have been most highly interested in that little old spoon to smash it like that. This spoon was a silver and gold on one side, and red enameled concave side with a feathered trebled hook trailing along behind, partly red and white feathers with a dash of peacock. It just made the pike and musky stand right up on their toes to get a chance at it, and this size and style is worth a place in any tackle-box. For bass-casting the silver and gold spoon of smaller size made an attractive lure used with minnows and pork-rind. These spoons are made strong and of good material, and they stand the rough work of trolling in snaggy and weedy waters. For the pike family—the musky, pike, and pickerel—they stand right out like a house afire and they get the fish.

## HILDEBRANDT SPINNERS

HILDEBRANDT SPINNERS.—Made by the John J. Hildebrandt Co., Logansport, Ind. As soon as a fellow talks of spinners in the fishing game, he just naturally thinks of Hildebrandt. These spinners of

the famous Slim Eli, Standard and Idaho shapes have a name for spinning and sending a flashing invitation to the game fins that is irresistible to these husky tailkickers. I have used many of these spinners, both the singles and tandems and they have always merrily spun through the water, free and easy which is just what they are intended to do. A number of years ago I had the pleasure of meeting the originator of this line of spinning lures, John J. Hildebrandt, now passed to the Great Master of all waters. He was a keen angler, a true sportsman and a fine gentleman and his work on devising lightweight spinners for fly-fishing for bass as well as bait-casting for these bronze-backed warriors has been of great value to the fishing clan. These spinners are hand made and made right, just as good now and with as much care as when "Old John" Hildebrandt used to turn them out himself. The reversible hinge allows the spoon to reverse when playing a fish so that there will be no interference from weeds and rushes in retarding the playing of the fish. The Slim Eli style spinners spin very close to the shaft, the Standard style spins medium close and Idaho spins wide. I find the Standard shape best for ordinary fishing, the Idaho for roily waters and the Slim Eli for clear and fine waters. The tandem standard 3 size spinners is a great bass casting-bait and for the very bright day the black Slim Eli #3 1/2 is a crackerjack. Taken right through

the deck, the entire line of Hildebrandt spinners are right in material and workmanship as well as being great game fish attractors.

### TUTTLE'S DEVIL BUG

**TUTTLE'S DEVIL BUG.**— Made by O. C. Tuttle, Old Forge, N. Y. Along comes Tuttle with a little old bass bug that he has been hogging all to himself and a few friends for a few seasons and believe me it is a great little lure. It is made of hair in the natural colors, browns, grey and white, and what it looks like to the bass and trout I do not know but it looks more like a mouse than anything else or a large doodle bug whatever that is. The loose hairs on the back and the bunched tail have a lively move in the water and the game fish simply cannot let it get away from them. It is tied on a single hook and snelled with a good strong gut. For night-fishing it is a winner, it certainly gets the fish. Not only in casting is it good dope but in trolling it shines. Blow a little dry-fly oil on one of these Devil Bugs and let it float down around the boulder into the quiet spot behind and the rise you get will nearly throw you off your feet. I have one of these bugs that took 203 bass and 17 trout, the largest bass a 4 3/4 pounder and the largest speckled beauty an even two pounder. Made in a larger size this bug ought to interest the musky and I am going to have

Tuttle tie one for try-out on that big ruffian of the underwater. The whites and greys in the smaller sizes make good trout lures, they have extended hair wings that give them the appearance of a white miller. These bugs are made strong and solid being wrapped with fine wire and will hold up for many a cast, in fact they are practically indestructible. A good lure, made right and of good material all the way through.

### THE "RAINBOW" REEL

THE "RAINBOW" REEL.—Made by A. F. Meisselbach Mfg. Co., 26 Prospect St., Newark, N. J. The newest fly reel, the Rainbow, is a good-looking black baby, and during the opening days of the trouting season made good with me with a wallop. This reel is light and at the same time strong, and, although the reel weighs but  $3 \frac{1}{4}$  ounces, it is durable and of rigid construction. It is built to stand rough usage and it will stand up under any amount of hard working. The bearings are of phosphor bronze, and although the reel is small in general, just fitting snugly into the hand, the straight walls, which are only slightly narrower than the frame itself, will accommodate 35 yards of enameled line with ease. For compactness it is to be given credit. It is a perfectly balanced reel, winds lightly and rapidly, and it runs very smoothly and true under

These artificial minnows are classed with the "little fellers" not because they interest the little fish, but because they follow the new departure in the plug line of making smaller lures which are lighter to cast than the ordinary bass sized plugs. Musky up to 38 pounds have been caught with the plugs shown here, as well as many large pike and bass. Incidentally the smaller plugs make a rattling good casting lure for the stream raised small-mouth bass.

No. 1 is a Hanson's Irresistible Minnow; No. 2 is a Bite-Em-Bate; No. 3 a Rush Tango Jr.; No. 4 a Liar Convertible Minnow; No. 5 a Baby Creek Chub Wiggler; No. 6 a Baby Crab Wiggler; No. 7 a Jim Dandy Bait; No. 8 a Tango Midget; No. 9 a Jamison Struggling Mouse; No. 10 a Getsem Bait; No. 11 a Schoonie's Skooter minnow.

The little fellows are mighty interesting lures to the game fish, are light to cast and they wiggle and dart into the affections of the sophisticated game fish with ease.

all conditions and angles. A feature of value is the ease with which the reel can be taken apart for oiling and cleaning. You just press the "takeapart" slide and the reel comes apart in two pieces without any loose screws, springs, or "thingamajigs" to get lost, or later to be put in the wrong way. For quality, strength, and high value the "Rainbow" is to be commended, and the simplicity of its make-up adds to the general all-round worth of the reel. With the name "Meisselbach" behind it, with the big reputation of the famous "Takapart" preceding it, the "Rainbow" starts out with a cleancut record that it will live up to in every way.

### "TAKAPART" REEL

"TAKAPART" REEL.—Made by A. F. Meisselbach Mfg. Co., 26 Prospect St., Newark, N. J. Way back in the dim and dusty past, when Hector was a pup and I, myself, a bit of a kid, I hit the mid-west fishing country on a visit. Up to this time I had followed the streams with fly and live bait, but out around the lakes of Michigan and Wisconsin the bait-casting stunt with the short rod was quite the thing. I dropped into a tackle store, with a very small bank roll and a desire to get a good short rod and quadruple-multiplying reel at a low cost for learning this game. The salesman was honest and a good fellow. I thank him to this day that he

sold me a Takapart reel. I still have it in my outfit and it is a veteran of many battles with the game fish family. It is a trifle scarred and bumped, but it still runs with freedom and balance. It is as good a tool to-day as it was the first time I met a backlash in the bait-casting sport. The frame of this reel is made out of one piece of tubular metal, there is nothing to work loose, the spool is of German silver. It has a solid steel shaft and the pivots are turned right on the shaft and they fit into bronzed bushings in the end plates. The hardened gears run fine and true and my old reel shows no wear on gears or bearings from many years' constant use. The adjustable screw bearing cap on the off end plate can be used to regulate the running of the spool. After a fellow gets a bit used to casting he can loosen the bearing cap a little and the spool moves more freely and his cast will be improved in distance and accuracy. This reel comes in the free spool model also. It is the simplest reel to take apart in the whole game and you cannot help getting it back together the right way. Not a screw to turn and you cannot throw it out of adjustment when you put it together again. For a real low-price reel that is 100% worker and one that will stay right, you will have to travel some to find one better in value than the Takapart. It is a remarkable reel and more remarkable is the low price at which it is sold.

## RUSH'S TANGO·MIDGET SURFACE BAIT

RUSH'S TANGO MIDGET SURFACE BAIT.— Made by the U. S. Specialty Co., Syracuse, N. Y. Carrying the same old familiar crawling, swimming motion of the minnow, with the darts and dives of the regular Tango Minnow, the Tango Midget comes along in a small size that is going to put it right up in front as a lure. This little fellow is a wonder and a sure-fire fish getter. It is great for large-mouth and as a small-mouth bass lure of the artificial plug line it is a winner. I found it a fine casting plug for river use for small-mouth, even better than the Tango Jr. which is a good bait for that tribe. You can get this bait either with one trebled hook or with a single hook that rides point up and this last one is weedless. I prefer the single hook and did not lose a strike with it. I have never found a wooden plug that was finished any better than the Tango, the enameling is exceptional and it stands up well under all kinds of casting. This bait is ideal for shallow water casting and it makes quite a wake in its travels through the water. It is a great little fish attractor and it's a hundred to one shot that it will be more of a success than its predecessors in the Tango family by which it will be seen that it will have to go some.

## PFLUEGER GOLDEN WEST FLY-CASTING REEL

PFLUEGER GOLDEN WEST FLY-CASTING REEL.—  
Made by The Enterprise Mfg. Co., Akron, Ohio. The Golden West reel is a tool to be proud of. It is a fine reel of high quality and beautiful in appearance. It shows by every earmark of skillful workmanship, that it was designed for strength, style and for practical use. It is of excellent balance and action and an angler should be highly pleased to have one in his outfit. The end plates are of hard rubber, two to each end and between these rubber plates is one of aluminum, which makes for strength and lightness. The crank is flush with the end plate and the handle is so shaped to make it impossible to catch the slack line, in fact the oil cup, crank balancing weight, and click button are all shaped to avoid snagging the line, this rounded shape of the parts that generally catch the line, instead, throwing off the line if it should happen to circle any of them. A good point about the reel is the click which is so adjusted as to take a strong pull when the line runs out and very light resistance when reeling in. The click spring, click tongue, ratchet and pivots are of steel. The countersinking of the screws holding the cross bars adds to the appearance of the reel. The Golden West fly reel well may be called an aristocrat of the fly reel family and it certainly looks and

acts the part. It is a high class tool in workmanship and material and it runs true to form. For the fellow who wants a fly reel to show up well with a fine fly rod, and do good work at the same time, the Golden West is the reel he is looking for.

### PFLUEGER LUMINOUS-TANDEM SPINNERS

PFLUEGER LUMINOUS-TANDEM SPINNER.—  
Made by the Enterprise Mfg. Co., Akron, Ohio. I believe there is hardly a fisherman who has been at the game any length of time who has not used a Pflueger Luminous-Tandem Spinner. Very few tackle-boxes are to be found that do not have this killing lure included in the layout of baits and once you use it, fellow, you take 'em along on every trip after the bass, musky, pickerel and pike, while the wise ones who go after rainbow trout early in the season when the fly plays a slow game take the smaller size for these kickers. I have particularly found the Luminous-Tandem very effective in the warm weather when the bass are down deep and hard to make hit the artificial. Then I cast well over the pools and let the Luminous-Tandem sink down where the bass are, reeling in slowly. Used this way when it is hot, it gets the bass. On a cloudy or dark day this bait is excellent and trolling in deep water or when the surface is broken by the wind it makes good with a

walloping strike. The larger sizes make a fine trolling bait for musky, pike and pickerel, they ride deep enough to go half way to these low lying rascals and using them off the edges of the weed beds and over the sunken islands and rocks beds usually brings good results. For the evening and night-fishing they are very attractive, the luminous sides flashing an inviting call for a fight from the game ones. And the way the big ones strike it shows that it makes them fighting mad. Of course, you must expose the spinner to daylight in order to have the luminous part shine well at night. The fact that the spinners revolve in opposite directions, I believe, helps a lot to make this lure attractive to the fish as the broken light shafts caused by the alternating turns of the spinners no doubt gives a distinctive flash under the water that the fish notice more than an even flashing light. In material and workmanship they are right all the way through.

### PFLUEGER-AVALON SALT WATER REEL

PFLUEGER-AVALON SALT WATER REEL.— Made by the Enterprise Mfg. Co., Akron, Ohio. Here is as finely adjusted, cleverly made tool as you ever hope to play your thumb upon. It runs so smoothly and evenly that you hate to have a big fish give it the fast spinning turn, you feel like putting it in a

glass case and making the saalams to it every day for luck. But after you have used it a few times and held the high jumping "silver king," the tarpon, and halted the speedy run of the king fish and barracuda or brought the amberjack to gaff with it you know then, old-timer, that besides looking like a thoroughbred of reels it also is a thoroughbred of the reel family. It is made of German silver, satin finish, with hard rubber and discs interleaved with German silver and the one piece cast cross plates with extension shoulders which pass through both the front and back plates prevent any shearing off of the cross plate screws as well as other troubles due to old style construction. It has generated spiral tooth phosphor bronze gears and the bearings are phosphor bronze bushed. The Pflueger-Williams drag handle on this reel can be adjusted to any tension desired while playing the fish and this drag handle is so attached that it cannot work loose or drop off. On the edge of the front plate is a mighty fine attachment; this is a button by which the adjustable drag handle stop can be operated without running any chances of the fast revolving drag handle injuring the fingers or hand, and if you have ever tried to beat a reel handle to it for speed with a big fish on the business end of the line you know the value of this button off where it is. The Pflueger-Avalon is made in eight sizes carrying from 150 up to 500 yards of line and is adaptable for all

kinds of salt water fishing. The record tarpon landed, a 215 pounder caught September, 1916, at Coden, Ala., by W. G. Oliver of Birmingham, was landed on a Pflueger-Avalon reel and this same reel had played over a hundred large tarpon that season and ran just as smoothly and fine as when new. This is a reel that you will not only be proud of but one that you will find efficient in every way a reel should be. Made right and of selected materials, with the regular Pflueger-Bull-dog guarantee behind it, means the highest quality in an article and that the Pflueger people are backing their goods to be satisfactory to you.

### KINGFISHER LINES

KINGFISHER LINES.—Made by E. J. Martin's Sons, Rockville, Conn. The line is a very important part of the tackle lay-out and when a fellow starts for the fishing waters he wants to go with his mind at ease that every part of the kit is right and ready to do its share in holding and landing the big ones he always expects to connect up with. When it comes to the lines and you make a selection of this important piece of kit and they are Kingfisher lines you can rest assured that you have goods that will stand up for just a bit more than is claimed for them. That is one reason why Kingfisher lines have the big following among all classes of anglers.

They deliver the goods every time. They are made right and of the best kind of raw materials and each line is tested and given a close inspection before it is allowed to go on to do its work for the fisherman. For many, many years, Kingfisher lines have been adding to their reputation by the class and style of the different lines turned out. Kingfisher on the line spool means the best that can be put into the line, the best in labor and material and they are back of every line they turn out, willing to make good any defective line that may accidentally get by the rigid inspection at the factory. I have used many yards of Kingfisher line, many yards of other lines and I have yet to find a Kingfisher line that did not satisfy. Naturally, Kingfisher is not the only good line on the market, but it is a leader among leaders and it is there with the quality when you need it and that is when you have an old "he-whop" on the hook end and a bunch of nervous jumps on the butt end. It holds the fish — what more could be expected of a line besides the fact that it wears well and with a bit of care will last a long time.

### PALMER CORK BODY FLOATING GRASSHOPPER

PALMER CORK BODY FLOATING GRASSHOPPER.—  
Made by M. Palmer, 991-Summit Ave., Pasadena,  
Cal. Boys, when you look at this grasshopper, ev-

ery instinct in you yelps right out that it is a cracking good lure — and when you try it out on a stream with just a little bit of a kick to it you then and there know that your first impulse was correct because, if there are any old “he-whop” bass, trout, be it brook, rainbow or brown, hanging around within sighting distance of that floating little hopper, there will be a crack like the snap of a mule skinner’s snake whip as the game fin makes his dashing drive for what he thinks is the succulent body of a real live hopper. They take ’em just that way and the fight of a bass taking a hopper from the surface is a fight to remember and recount with spirit during the winter months. And for looks, why you can’t blame even a wise old granddaddy tailkicker, for being fooled, it is just plum natural like. Just ordinary cork body, natural color with two wings of what seem to be sparrow feathers and legs, but it is tied so blamed natural like that you know you have a real bait before you even hit the water trails. Last September while fishing a bit of stream-waters I had two of these hoppers along and my two pals, after my first day with them, lost their gentlemanly feelings and dropped so low as to horn these self-same hoppers out of my tackle-box while I made the evening chow. They had me two to one and said I was trying to hog the game. Any bait that makes a tackle-swiping villain out of a perfect gentleman in one day’s fishing has gotta be some bait. The

workmanship is good, the bait is right and here's hoping Palmer lives to tie many of them.

## PECKINPAUGH NIGHT BUG AND BUCKTAIL SHINER

PECKINPAUGH NIGHT BUG AND BUCKTAIL SHINER.— Made by E. H. Peckinpaugh, 2105 East 14th St., Chattanooga, Tenn. My first use of the Night Bugs made by "Peck" down Tennessee way was at the tail end of last season and they sure were good lures for bass, the luminous bodies showing up strong to the bass and making a hit with them. Now Peckinpaugh has improved them to the extent of darkening the bodies and only making the heads luminous and the erect wings of these bugs ride a bit of water like a live moth or miller, and with a little help in the way of a twitch to the fly rod you certainly can make 'em appear alive. I found the yellow winged bug quite an attractive fly for the late afternoon fishing at the tail end of the season especially when the yellow butterflies were strong on the wing, and the brown winged moth appearing bug with the streaming hair tail about the best for the night-fishing. At the opening of the present trout season the Bucktail Shiner was quite effective for trout on the Pike River in Northern Wisconsin and the white bucktail with the red feather streamers in the shape of a tail made the trout strike with an

awful lot of steam. These bugs and shiners are well made and strong and the bugs have good balance on the water which makes a bug more effective. The small-sized shiner tied on a number eight hook is quite good for smaller trout but for the big man's sized rainbow the larger shiner was very attractive.

### REINFORCED SILK-WOUND DE LUXE STEEL FISHING RODS

REINFORCED SILK-WOUND DE LUXE STEEL FISHING RODS.— Made by W. H. Tallett, Watertown, N. Y. The silk-wound bait-caster certainly stands out as a "prince" of steel rods. Working a few bass right in the middle of weed beds, I derricked and pumped them in an effort to spring or break the rod — giving it a series of rough workouts that was a shame to any self-respecting rod and fisherman. The rod came back without any evidence of the extra strains and pulls to which it was subjected. It stood the rough stuff like a regular soldier and the silk winding in my opinion adds a hundred per cent to the value of the steel rod. It slows the action and cuts out the excess flexibility of the steel, reducing the whip and feel to the same speed and swing of the split-bamboo. I found the rod to be water-proof, and after being under water for four hours noticed no bad effects from the water. The patented multiple reinforcement at the joints

where extra strain comes on a rod gives added strength at this point and adds greatly to the entire strength of the rod, as any rod is only as strong as its weakest point. I found this style of a steel rod so much to my liking that I sent Mr. Tallett an old steel fly-rod and a pet bait-caster to have them wound with silk, as he makes a specialty of taking any old steel rod and winding it all the way with silk. To the fellow who has side-stepped the steel rod in the fishing game, a Reinforced Silk-Wound De Luxe Steel Rod will show him a few things about steel rods that will make him sit up and wipe his glasses.

### OSPREY LINES

OSPREY LINES.—Made by Lou J. Eppinger Co., 68 East Congress St., Detroit, Mich.' The Osprey pure Italian silk casting lines made by Lou J. Eppinger are mighty fine lines, they live up to everything that Lou ever said about them and then some. They are well made, of even weave and they have a lasting quality about them that makes a fellow get another Osprey when his old one at last is ready to be taken out of the casting class and relegated to the trolling department, and at that it's due to quite a bit of good work in that end. It wears well and has a long life as a casting line and I have never been disappointed in the value in casting life I ever

got out of an Osprey line. All the way through the Osprey lines are good and they are worthy of a place in any bait caster's tackle-box. The fifteen and twenty pound test lines make excellent bass lines and the twenty-three pound test is a dinger for pike or musky although the thirty pound test made especially for musky casting and not as bulky as an ordinary line of that test is the real stuff in the musky game. The Osprey lines are a good line with full value for the price at which they sell.

### BEETZEL REEL

BEETZEL REEL.—Made by the Redifor Rod & Reel Co., Warren, Ohio. There are more good points combined in the Beetzal reel than you would ever think could be tied up in one package. It's a pippin, this self-thumber, level-winder, free spool wonder; it does everything but spit on the bait and the beautiful thing is that it does every little thing well. There is a centrifugal thumber on the inside of the left flange of the spool which prevents over-running and backlashing and on the front is a line carrier that travels back and forth on a worm gear laying the line on the spool evenly, and when the spool is thrown into free, this carrier drops down and does not come in contact with the line at all as the cast is made. As the line is reeled in the carrier flops up on the job, picks it up and lays it, smooth

and even for the next cast. In the free spool end there are no levers nor plugs to manipulate; when you cast, the pull of the line frees the spool with the line touching nothing from the spool itself to the rod guide. The cog and pinion are in mesh at all times, whether spool is free or in gear. That is due to the make of the pinion gear which slides lengthwise on the axle, therefore you cannot strip the gears. The Beetzel is exceptionally strong and durable and built on the old-line pattern of the famous quadruple-multipliers. The Beetzel is built right, the materials used are of the best and it does what is claimed for it; it is a level-winding, anti-backlash, free spool reel; and the only trouble being that they are hard to get, as the Redifor people have never yet caught up with the orders, and one reason for this is that it gets a lot of extra hand work and testing before they will let you have it.

## BABE-ORENO AND MIDGET SURF-ORENO

SOUTH BEND BABE-ORENO AND MIDGET SURF-ORENO.—Made by the South Bend Bait Co., South Bend, Ind. Here are two small winners in the plug line, they have just as much kick and wiggle in the water as their famous parents, the Bass-Oreno and the Surf-Oreno and believe me, they have a bit of work cut out for them to surpass the records of these two good ones. To their advantage is the

size, they are both small fellows and I found the Babe-Oreno especially attractive as a live casting plug for small-mouth bass. For early spring, late fall and early in the morning fishing in mid season, the little Midget Surf-Oreno is a fine lure, it kicks up quite a stir in the water and it attracts the game fins. For surface fishing it is a crackerjack and you get very few short strikes with it. The Babe-Oreno is a good semi-surface plug and it goes deep in the water with the famous darts and dives of the old man Bass-Oreno, the faster you reel it the deeper it goes. I know of a double play made last season with the Bass-Oreno, two bass on one cast, an 8 1/2 pounder and a 3 pounder, which is some fishing and especially if you consider that they were caught in a very civilized lake. That's the kind of a wiggle the Babe-Oreno inherits from his pater and it sure seems to be the move that attracts the old he-whops. As with the other South Bend plugs, the workmanship is good and the enamel strong and free from cracks and they will stand some mighty rough handling without cracking. These two little fellers should be in the tackle-box and to the fellow who has never used any of the real small plugs he is due for a surprise when he tries them out. For the light tackle angler they will be found fine casting plugs for the light rod and they whip out in great shape. The small lures are getting more popular because they are great little fish getters.

## " BEEN THERE BAIT CASTING HOOK "

" BEEN THERE BAIT CASTING HOOK."— Made by the Becker-Sheward Mfg. Co., Council Bluffs, Iowa. The " Been There " is a weedless, snag-proof hook and when you can say that for a hook and mean it you are saying something. I cast one of these hooks repeatedly into thick lily pads and underwater weed growths, baited with frogs and minnows, and they came through clean and brought out the bass. The most of the time you have to go right into the weeds for your bass and with this little old caster you sure can shoot it in without hooking a raft of weeds. The " Been There " is a tandem affair, the forward hook is a hand-made Sproat and the twin hooks in the rear which straddle the bait are hand-made Snecks. There is an easy working spinner on the shank of the forward hook and it is close up to the points, which is the logical place for it, while the rear hooks are weighted underneath, which keeps the frog or minnow upright. I found the use of the forward hook fine with pork-rind, simply detaching the rear hooks which are linked on to the forward hook. This linked chain also came in handy to shorten up the hooks for smaller-sized baits. This is an all-round good hook and can be secured with or without a spinner. I prefer it with a spinner and think it makes it more effective.

## THE BOOSTER BAIT AND THE PRODUCER WEEDLESS HOOK

THE BOOSTER BAIT AND THE PRODUCER WEEDLESS HOOK.— Made by J. G. Henzel, 1313 South Fairfield Avenue, Chicago, Ill. I first met the Booster Bait in a funny way. I was fishing a very "civilized" bit of water one afternoon without much luck, when a fisherman rowed past with a fair string. I coaxed the info out of him as to his bait and he slipped me one. It looked like a miniature pincushion with a red top and a white belly and short wings on the sides, of yellow with tails of orange. Taking another turn around the weedbeds late that afternoon I landed a few nice ones on this Booster affair, which sure boosted my average that day. The colors of the bait are attractive and the maker says the taste and smell also attracts the fish, although of the latter statement I cannot verify, as in casting I do not think the fish take time enough to smell or taste what they strike. However, I do know that this bait is a good one and I use it quite frequently and always with good results. I find that it works well with the Henzel Weedless Producer hook. This hook is equipped with a swivel and a No. 3 spoon and a looped piano-wire weed guard, and the No. 5-0 Kendall Sneek size is a good bass and pike size. The Booster takes the place of natural bait and brings in the bacon, and can be used with any kind of a hook, either spooned or plain.

## SCHOONIE'S SKOOTER BAIT

SCHOONIE'S SKOOTER BAIT.—Made by J. R. Schoonmaker, 945-Walwood Place, Kalamazoo, Mich. Here is a bait that comes so close to actually swimming like a real live minnow that it sure fooled some big bass and pike to give it the once over to their sorrow. It has an easy smooth gliding movement from side to side, natural and life-like and if you give it a short jerk, or switch the rod a bit the Skooter shoots to one side like a minnow darting when you frighten it. Reeling in the Skooter slowly makes it swim like a minnow on its way to nowhere in particular and a little faster on the reel puts a kick into the movement as if the bait were swimming in a darting glide out of danger. I like the Junior size particularly as it is smaller and weighs but  $\frac{5}{8}$  of an ounce and makes a fair-sized plug for the casting rod. All the way around the bait is right in workmanship and materials and it stands up under mighty rough casting. I gave it a bit of tossing among the rocks and windfalls as well as the shore boulders and outside of a few expected nicks and scars this rough work did not injure it at all. The Skooter is a good bait, it gets the fish and I blame it entirely on the movement it has in the water. When at rest the bait is a floater, when moving it glides just below the surface and it sure glides.

## KING MINNOW NET

**KING MINNOW NET.**— Made by the W. H. Reisner Mfg. Co., Hagerstown, Md. How to get minnows for bait with the least amount of trouble is solved by the use of the King Minnow Net. This net is a strongly built piece of kit and will stand up under the usually indifferent handling of a net. It is of the folding style and packs into a very small space, which makes it convenient to carry. It is built on the style of an umbrella in the framework, with the net at the ends of the ribs. A great way to use this net, and always have a supply of minnows at no trouble at all, is to tie a stout twine to the ring of the net and sink it on the bottom of the lake or stream where the minnows are, then tie a small log or piece of two by four to the other end of the twine for a float. Drop a bit of oatmeal into the net and leave it there a day or so, to attract the minnows and shiners to the feeding-ground, and you can raise your King net any time and supply the bait pail. This net surely is a time-saver and a right good thing.

## McCORMIC MERMAID BAIT

**McCORMIC MERMAID BAIT.**— Made by the McCormic Bait Co., Kalamazoo, Mich. One of the latest new ones is the Mermaid plug and she is a

wiggling wobbling nimble Miss. She has a side to side up and down motion with a few quick wiggles and darts like a frightened minnow. She is more of a surface lure than anything else, making her swim into the caster from an inch to about ten inches under water according to the speed of reeling in and when she flits along the surface she makes quite a lively wake which is attractive to the game fish. For night-fishing she is a dream and although armed with three triple hooks, her proclivity to keep well on the surface keeps her practically weedless. I took some nice bass out of the lily pads with this bait and found that nearly every strike was a winner, due no doubt to the fact that the bait stays on top and the hooks being underneath the fish in nearly every cast striking from below, were easier to hook than had they struck from the side. This old girl is made of red cedar and has a coating of celluloid enamel that stands mighty rough casting. The bait is good all the way through and the shape is a bit different which gives it the peculiar moves it makes in the water. It is a fish getter and the majority of strikes are saved which is a worthy record for any bait.

### CREEK CHUB WIGGLER

CREEK CHUB WIGGLER.—Made by the Creek Chub Bait Co., Garrett, Ind. For downright looks

you simply have to doff the hat to the Creek Chub Wiggler. It certainly does imitate in natural color the real creek chub, even down to the silvery scales. For the game fish that is really looking for a bit of feed, the color scheme of the creek chub wiggler should make a hit, not to mention the wiggling wobbling movement of the bait when reeled in through the water. It is life-like in looks and in motion and any fellow who has used the real creek chub will know that this bait will make a sure enough appeal to the big fins. It floats when not in motion and can be used as a surface, semi-surface and deep-water lure. A small metal plate in the mouth of the chub gives a fine bunch of wiggles and wobbles and by moving the plate and reversing it you have a surface splatter lure that sure kicks up a nice little disturbance in the water when reeled in fast. I found the natural color creek chub a good bait for bright or cloudy days as I have found the live creek chub in the past. The workmanship and material are very good and the plug stood up under quite a bit of rough handling in among the windfalls and rocks without being damaged, in fact it stood the gaff exceptionally well, the enamel being a hard finish that does not crack or chip.

## KEEP-'EM-ALIVE FISH STRINGER

KEEP 'EM ALIVE FISH STRINGER.—Made by the Watkins Mfg. Co., Howell, Mich. This stringer does just what the name says, that is, keeps the catch alive until the fish are taken out of the water. If you have no live box at camp, you can tie the stringer to the dock and the fish will live for several days. The stringer is made up of ten separate safety-snap hooks attached to a chain with a swivel, and each hook is for a fish; this keeps the fish from crowding and the weight is evenly distributed. There are no projecting points to catch and gather weeds, and to take off a fish in the string means simply to unsnap the hook on which the fish is located. The stringer is four and a half feet long and additional hooks can be attached if desired. It will hold 75 pounds of fish distributed on the hooks, and when not in use rolls up into a small space and can be carried in the pocket. You can string a few fish in the early morning fishing, and take a shot at casting in the evening, and you are not trailing a bunch of dead fish around during the hot day. The Keep-'Em Alive Stringer is well made and it is a handy clean-cut piece of kit.

## HANSON'S IRRESISTIBLE BAIT

HANSON'S IRRESISTIBLE BAIT.— Made by Wm. B. Hanson & Co., 939 Pollmey St., Pittsburg, Pa. Just when you think you have seen about the last thing in artificial baits along comes another plug with some certain little groove, nick or twist that when you give it a tryout it develops a wonderful gait in the water. And that is what the Hanson Irresistible Bait has tacked up to its credit. There is a little projecting end of wood sticking out in front and on top of the bait that controls the depth at which the bait dives, this keeps the plug from going down too far and scraping on the bottom looking for snags. And for motion it has one of the most tantalizing fishy moves as it comes reeling in through the water, just like a live fish with a few darts and dives mixed in to give it a bit of ginger and make it attractive to the game fish. It is fitted with two trebled hooks. The bait I used had large-sized hooks, these I reduced to smaller twin hooks and it made a rattling good bait. The material and workmanship are first class and the finish of the bait is attractive. Any fellow can stock this plug in his tackle-box and feel that he is carrying a bait that will help him get his share of the big fellows.

## OLT'S O. K. SPINNERS

OLT'S O. K. SPINNERS.—Made by Philip S. Olt, Pekin, Ill. The Olt's spinner artificial bait is a bit different from any other spinner and it sure has an attractive movement in the water. The three spinner style has three V shaped hand made spinners swiveled together and attached to these is a trebled bucktail hook in the natural colors with a dash of red in the center. This I found an especially attractive bait for deep-water trolling being a great little enticer for pike and wall-eyes. The fact that there are four swivels on each bait adds to its value as a trolling lure, there is not so much inducement for the line to kink and twist. The graduated size of the three spinners gives the lure the appearance of a minnow or shiner in the water and the spinners spin well at any speed fast or slow in deep or shallow water. The spinners are of aluminum and flash just about right in their twirling glide through the water. With a light dipsey sinker hooked on, this bait makes a fine casting lure and medium fast reeling gives about the best results. The bit bait is handsome and well made and the material used is right.

## PETERS' SPOON-SWIVELED INSECT BAIT

PETER'S SPOON-SWIVELED INSECT BAITS.—  
Made by the Peters' Bait Co., Knox, Ind. Not at all bad is the verdict on these baits. I find particularly that the Grasshopper and Bee bait are mighty effective in early morning and late evening bass-fishing, when the bass are feeding close in, and for stream casting for small-mouth these two styles were very good. Fish them mid-depth and also let them go with the current a bit. The bass fly is something different in flies and is all rubber, double looped red rubber, with a silvery head and tail of what looks like dentist's rubber dam; this last-named stuff tails out behind like a pork-rind and has a yellowish-brown tint, but it's the nervous floppy wiggle in the water that I blame for interesting the game fins. There is a barrel swivel fore and aft of the spoon which is just the right size for bass work. I, however, changed the split rings from the No. 12 to a No. 15, and found that the smaller size met my personal taste better than the larger rings. This bait is for use "as is" and requires no live or natural bait to help it along.

## SCHILLING'S LUCKY ANGLE SWIVEL SPREADER

SCHILLING'S LUCKY ANGLE SWIVEL SPREADER.  
— Made by Henry A. Schilling, 1722 Harman St., Brooklyn, N. Y. This lucky angle swivel is of more value to the salt water fisherman in tidal waters than to the freshwater tribe although I gave it a tryout through a nice piece of pike water with spoon on each bait end and trolling along at an easy moving speed hooked a four pound pike and the spreader took a direct pull at once, owing to the bend made in the small connecting length and it worked well until the pike was brought to net. A little later in the evening we hooked two pike at the same time and the game sure was interesting, each pike seemed to have picked out a different spot on the bottom to which he was trying to speed in an effort to rub out the stinging hook, and they certainly cut up a wonderful commotion as they were worked up close to the boat. This was the first time that I had ever hooked two fair-sized pike on the same line at the same time and they made quite a fight in their fright, probably one scared the other. And the "lucky angle" worked right all the time. A slight pull on either end of the angle immediately throws it into a straight line and there is no strain on the angle that subjects it to breakage. For still fishing if you want to use two baits it is a handy ar-

rangement and in fishing a deep spring hole in forty feet of water in a Wisconsin lake a number of times we hooked the second bass as the first one was running away with the minnow he had taken. In trolling it prevents kinking in the line. For general trolling, still-fishing and general tidal fishing either surface or bottom as well as surf casting it is a handy working little piece of tackle.

### THE LIAR CONVERTIBLE MINNOW

THE LIAR CONVERTIBLE MINNOW.— Made by the Dickens Bait Co., Fort Wayne, Ind. The Liar bait is another of the wobbling, wiggling wooden plugs that delight the bait-caster and although it is not startling in shape or color it has a motion in the water that attracts the striking game fish. It is a floater, of course, and can be used as a surface bait at which time it has a peculiar skipping movement that makes it attract the fish. If you have to go down deeper for them it is a simple matter to slip the body hook out, put it in again on the other side and you have an underwater lure that darts and wiggles into the affections of the game fins when they are down below and in this swim through the water it kicks along on no set route but works on an erratic course that gives it the appearance of a swimming, darting minnow. Working it slowly through the water seems to give it the most attractive motion.

It comes in black as well as other colors and the black lure should make good — I have found this color very effective, both on a bright day and on a light moonlight night. The bait is well made and serviceable and the enameling stood up well under the rough tossing I have given it. I found the black liar very good for pike and the white with red head very good for surface casting for bass. This new entry into the plug family is a worth-while lure and it is a fish getter.

### REF'S BASS BUGS

REF'S BASS BUGS.— Made by C. C. Refner, 8 South Dearborn St., Chicago, Ill. Ref's Bass Bugs are well made, solidly tied and neat and they get the fish. They are tied along eighteen standardized patterns, not the standard patterns of the oldtime fly but new in name and style and among the whole lot I have found the Carter Harrison, Clarke's Fancy, Zane Grey, Peet's Favorite and Wilder's Discovery mighty good for the stream-raised small-mouth. Many of the other patterns are no doubt equally as effective, but the fact that I was getting plenty of strikes with the ones above sort of kept me from changing to the others. These bugs are along the modern line of the floater, the body is of cork, the wings and streaming tails are well set and the hook will not twist around. For stream fishing

or small-mouth bass they are excellent and I have had pike and wall-eye take them. They are easy to cast and ride top-up, on the water. What made 'em look good to me was the long streaming hair tails and also hair wings on some of them and say, boy, I wasn't fooled a bit on that hair stuff, but the bass were, they thought it was something to eat. The active wiggle of the hair makes these bugs seem alive as they come through the water. The fly-fisherman is certainly missing something in the game if he does not carry a few of these bugs in his outfit.

### WYMAN HAIR FLIES

WYMAN HAIR FLIES.—Designed and tied by Edward Wyman, 4456 Sidney Ave., Chicago, Ill. These flies are sure great killers, the combination of hair and feathers make a lure that certainly attracts the bass, pike and musky; in fact they are so deadly that a fellow should not use one of them unless he is sportsman enough to be satisfied with a few fish and is willing to throw back uninjured the rest of the game fins he is sure to attract with these flies. It must be the active movement of the hairs that makes them so interesting to the game fish. The new bait-casting flies can be used with the short casting rod and with a small spinner, say a number three size, they are a wonder for bass. And these flies are made so durable that they stand up under

The bait casting reel is a very important end of the bait caster's tackle. Much depends upon its smooth running qualities. I believe the angler who goes after the game fish casting the plug, minnow, frog or pork strip with the short rod should always select as good a reel as he can possibly afford, even to the point of cutting down a bit somewhere else.

Illustration number one is the Shakespeare level-winding reel, a mighty fine running tool. The line carrier that works across the front of the reel lays the line evenly and assists in making the next cast clean and true.

Illustration number two, is a Meek No. 3 reel, one of the famous Kentucky style reels that assisted in making that fair state as famous as did the blooded horses and bluegrass. This reel after nine years' use runs as fine and true as the day I fell heir to it.

Illustration number three is another famous Kentucky reel, the Milam, made by one of the earliest reel making families of that state. This Milam is as clean a cut tool as you will find in many a day's travel and it makes casting a pleasure to the user.

Illustration number four is the famous Meisselbach "Takapart," a low priced reel that is worth a lot more than it sells for. This reel is a great tool, it casts free and easy, runs smoothly and will stand more rough usage than the law allows and you can take it apart by simply unscrewing the end plates. I have a twelve year old "Takapart" that is still a mighty good reel and countless fellows have learned casting with it.

unheard of usage. I know of two flies that landed over three hundred bass and they are still in good enough shape to be used for some time. These are the hair flies about which I wrote in the October and November 1917 issues of the *National Sportsman* and the new bait-casting flies are equally as effective and well made as those about which I wrote at that time. Last season the largest musky on record for that season was caught with one of these flies used with a spoon. The workmanship is of the best and the materials are A-1. They will stand the gaff of unlimited casting and attract the fish, all a fellow has to do is handle the rod, enough skill to land 'em, and you will get the fish with the wiggling hair fly.

### SHAKESPEARE LEVEL WINDING REELS

SHAKESPEARE LEVEL WINDING REELS.— Made by the Shakespeare Company, Kalamazoo, Mich. The Shakespeare level winding reels from the low priced "Superior" up to the higher priced "Professional" are well made tools and they work well in action on the water. They are simple, practical and efficient. They lay the line evenly on the spool and make for accuracy in casting, reducing the line troubles to a minimum. With one of these reels you do not have to watch your spooling of the line, nor tire the fingers by gripping the rod above the

reel and guiding the line onto the spool. The even laying of the line on the spool by this level winding reel makes backlashing a hard thing to accomplish if you keep the thumb on the reel spool in making the cast and the level laid line makes thumbing the outgoing line an easy job. The thumb just naturally lays right on an even wound line. The line carrier which is solidly built into the reel proper travels back and forth on a single endless screw bar, a gear which meshes with one on the reel handle and on every turn of the handle the line carrier must work across and back along the screw bar. This carrier does not cause friction and retard the cast as some suppose, as it moves evenly along with the line as it is laid on the spool and as the line pays out it moves in unison with the line as it comes off the spool. In fact this reel is an aid to accuracy and distance in the cast as the undivided attention can be given to the lure or bait in its flight. It is well designed and accurately made and the materials are excellent. It takes a lot of tiring finger work out of a day's fishing. For night-fishing it is a mighty fine tool and for playing a heavy fish, where keeping the eye on the game one is essential in playing and landing, it is 100% efficient. Made right with materials that are right makes it worthy of any tackle kit.

## “ Y & E ” AUTOMATIC-COMBINATION REEL

“ Y. & E. ” AUTOMATIC-COMBINATION REEL.—  
Made by Horrocks-Ibbotson Co., Utica, N. Y.  
This is certainly a well made and finely adjusted tool  
and a reel that does quite a bit of the work in play-  
ing a game fin via the flyrod route. It sure is a  
pleasure to hook a four pound rainbow trout and  
then play him with one hand, the rod arching to a  
wonderful curve and the little finger by just the  
lightest pressure taking away the slack and holding  
the big one from making the snag as he heads in and  
down stream for a getaway. The style B size  
weighs but eleven ounces, is made of aluminum and  
balances well on a sturdy rod for the big ones. The  
bearings are tooled steel and the reelspool rides  
smoothly and works every time you wish it to; it  
never got out of kilter once while I used it on the  
Oconto River with some of the husky brown trout  
of that stream nor on the Manistee with the game  
rainbows of that river. Some fellows object to the  
automatic reel because it gives one an advantage  
over the fish, but I like it because you are free to  
play a game fish with one hand and there is no  
chance of fowling the line while taking it away from  
the fish and you sure can keep slack out with it. For  
lake trout fishing it is a dandy and when these big  
ones start cutting up in eighty feet of water it comes

in mighty handy, especially if you are playing them on a light, long rod. It is very simple to manipulate and it does the work handsomely for which it is intended. In trolling with it I had a wonderfully interesting fight with a twelve pound pike on a light rod. For a one handed battle it was a dinger and the reel acted like a thoroughbred.

### MILAM RUSTIC NO. 3 REEL

MILAM RUSTIC NO. 3 REEL.—Made by B. C. Milam & Son, Frankfort, Ky. Here is a reel from the famous home of the reel, Kentucky, and made by the people who are credited with being the first in the field. They have been making reels so long that they could not help turning out a good tool, and the Rustic No. 3 is a mighty good one. Right at the start do not get the idea that the Rustic is the best reel the Milam outfit make, it is not, but it sells at a very low price and from the fine running free movement of this reel any angler who knows anything about reels realizes as soon as he uses the Rustic, that the same high grade workmanship and materials have been put into this reel as those which go into the higher priced ones. The Rustic is designed along the lines of the popular bait-casters, a 2 inch by  $2\frac{3}{8}$  inch spool, that low style which gives good control to the thumb. It carries 100 yards of casting line and is strong and sturdy, light

and well balanced and it runs very smoothly. The pinions and pivots being of hardened tool steel and the bushings of high grade bronze and the pinion points ride in jeweled cups. The angler who thinks you cannot get a good reel for bait-casting at anything under a high price needs only to try a Rustic to find out that he can get a very finely set reel at a price that won't even make him nervous. It is one of the smoothest running low-priced reels that I have ever used and it stands the grilling grind of continuous casting day after day without showing up a weak spot. It is a good looker and a fine caster, the material is high-grade and the workmanship the same as on the higher-priced famous reels of this famous family of reel makers. It is a pleasure to say that I have found the Rustic reel one that any caster can buy with the feeling that he has secured a tool that will prove equal and better than his expectations. A low-priced reel and a mighty good one.

## EVINRUDE MOTOR

EVINRUDE MOTOR.—Made by the Evinrude Motor Co., Milwaukee, Wis. If there is any little old part of the outdoor kit that has shot more joy into the fishing game than the Evinrude out-board motor, I have yet to find it. And this joy stuff is not only due to the Evinrude because it is an out-

board motor that can be attached to most any boat, but to the bit outstanding fact that it is a motor that takes you somewhere and gets you back again without a lot of fussing around the engine and a lot of little things going bad and stopping their work at the wrong time. The Evinrude motor is built right, it is built on a line that makes it far stronger than the ordinary requirements of the outer and that is one reason why it holds up like a royal flush when put to the test. All the way through the most minute details of construction are given close attention, and good workmanship together with first-class materials makes a motor at the finish that will deliver the goods and not kick out its insides doing it. I have kicked my Evinrude through weed beds galore, in among the windfalls and rocks, let every old amateur motor running fiend around my camp use it and it still purrs like a happy kitten when it gets the spark. It is fool proof and anyone can run it without the fear that it will go up in the air. It is really made for the amateur and everything is simplified to make it run right for the fellow who don't know much about the engine game. The automatic reverse and the Evinrude "Sure-catch" Trolling Attachment are great little points that make the Evinrude a boon to fishermen. Taken every way the Evinrude is a wonderfully efficient out-board motor and I fully recommend it for a high-class piece of equipment that will deliver the goods at all times.

## THEROZ MESS KIT

THEROZ MESS KIT.— Made by the Basic Products Corporation, Woolworth Tower, New York City. Here is a downright handy, clever piece of outdoor equipment that has not a single error chalked up against it in make, material or value to the outer. It does everything that is claimed for it and does it right. I packed one of these kits over water and woods trails of the North woods on a recent trip and for service, value, speed in doing its part of the trip, it is a pleasure to give it an A-1 credit for being right in every way. It is a mess kit that will make the entire meal quickly and with no trouble at all, it packs or rather nests into a small space about  $3\frac{1}{2}$  inches by  $6\frac{1}{2}$  inches, weighs a little less than two pounds including a can of fuel, makes an easy carry for the pack or duffle bag and when it is rainy or cold just set it up in the tent, pour in the beans, soup and coffee and the whole meal cooks merrily in about ten minutes; while you are packing away this food you can fry a few strips of bacon, sausage or fish and the meal is over without any trouble at all. The fuel used is a preparation made from alcohol, cut into cubes, which does not go liquid while burning and you carry them right in the kit. For the quick meal it is there every way from the Jack and the cooking parts are large enough to hold enough for you and your pal at one cooking.

Made of aluminum it is strong and serviceable. After using this kit I knew it was right so I shipped it over to the kid in France feeling sure that he would find it invaluable in the cold old trenches in the Vosges in Alsace this winter. I feel that this kit should be a part of the regular issue to the boys in the trenches and that it would be found indispensable by them.

### THERMOS BOTTLES

THERMOS BOTTLES.—Made by the American Thermos Bottle Co., 35-37 West 31st St., New York City. To write a report on the Thermos bottle is just like writing a bunch of side-lights into one's life because I have used the Thermos in my home, in hotels, on the trail, in camp, on hunts and on the water and I have yet to find the time that a Thermos bottle was not a mighty valuable thing to have around. In the cool days of the fall fishing when the wind and spraying water, tintured with the cold of the Northland, cuts and whips about you, there is nothing that can give you more pep and heat when you need it than a swig from the Thermos bottle, be its contents tea, coffee or your favorite beverage. Far out on the trail, along the old tote roads after partridge in the fall with a well filled Thermos, means a little warm stuff any time you feel like it and no trouble to have it warm, no fire

to kindle, nothing but off with the cap and down with the drink. Some fellows pride themselves on "roughing it." I pride myself on "smoothing it" in the woods or on the waters and one of the greatest little smoothers is the Thermos bottle. In the winter time, before starting on a hunt, fill a Thermos and leave it behind at the camp; of course you take another one with you, and say, pal, when you come in cold and wet, you can get up a good warm feeling by taking a bit out of the reserve bottle before you busy up with the camp work for the evening meal. In the summer it is a pleasure to have the cold drink from the Thermos, but for downright real service in the fall and winter, the heat you can sip from one of these bottles is really a life saver. Rig up a Khaki cover for the bottle and a shoulder sling and you have a fine piece of kit that is well worth the weight of toting along. Cut down somewhere else in the weight, but take the Thermos with you. It is right in every way.

### KAMPKOOK STOVE

KAMPKOOK STOVE.—Made by the American Gas Machine Co., 724 Clark St., Albert Lea, Minn. The American Folding Kampkook Stove is a nifty little stove that folds into a steel case the inside of which is part of the stove, overall, about 14 inches by 8½ inches by 3 inches and the whole thing only

weighs eight pounds. Nothing loose to get mislaid and lost and can be set up in working order in a minute. The two burners throw a powerful lot of heat and they burn right along no matter how hard the wind blows. This is sure an ideal stove for the camp, auto trip or canoe and it is very very simple to operate and no chances of it blowing up. For a quick, hot bite it is a dinger and can be gotten going while you are thinking of gathering wood for a cooking fire. No loose odds and ends to screw together when you want to set it up, just pull off the lid, push down the automatic legs, pump up the air for the gas and set on the spider. All the way around this little light weight of the camp stoves is a good worker and it has a neat, classy look when tagging along on the auto. It is strong and durable and made for outdoor use and will stand quite a bit of rough handling and bad weather without falling down on the job when you want it. Ordinary gasoline is the fuel.

### PELLETIER HAND-MADE SNOW-SHOES

PELLETIER HAND-MADE SNOW-SHOES.— Made by Jud Landon, Inc., Schenectady, N. Y. Three weeks before I received the pair of Pelletier snowshoes for a tryout and test I bought two pairs for use at my permanent camp to replace two pairs of

another make which had become sagged and broken. This makes four pairs of Pelletier snow-shoes at my cabin up North, which should be a fairly good tryout in itself. A pair of snow-shoes that will stand up under the rough going of burnt-over and slashings are right in the snow-shoe line, and two of these pairs have stood the gaff of rough usage for three years and are in good shape now. A snow-shoe is a part of the kit of the outdoors man that must be right. You depend upon it to get you way out and back again, and there is nothing that will give a fellow the "creeps" as much as a snow-shoe going to pieces when he is six or eight miles in the timber in close zero weather. That's why I say get a snow-shoe with a reputation behind it for high-quality material and workmanship; when you need 'em, you need 'em bad. These Pelletier snow-shoes are not a fancy-looking affair, fact is they look almost crude, but for service and high value in materials they cannot be surpassed, as only the best quality stuff is used in making them. They are not a snow-shoe sold for decorating a den wall, but for keeping you going in the snow. And they have the proper balance which is an essential in snow-shoes that are right. And besides this, Jud Landon's guarantee is behind every pair of Pelletier snow-shoes absolutely against all defects, and that is worth a lot to any sportsman.

## TELESCOPE COT BED

TELESCOPE COT BED.— Made by the Telescope Cot Bed Co., 538 East 79th Street, New York City. Peg these points up for the Telescope Cot Bed, it is roomy, strong, serviceable, and packs into a small solid bundle. The Standard size which I tried out and which was used as emergency bed at Timber-edge Lodge and packed to the near-by camps on other lakes stood the gaff of all kinds of usage without showing up any weak spots in either frame or canvas parts. This Cot was dumped in the water in running Rainbow Rapids in the Wisconsin River and fished out about a mile below the rapids and made just as comfy a bed that night as any other time; the wetting did not damage any part of it nor swell the wooden legs. It is an all-around comfortable bed and carries well. Regardless of the desire of some of the boys to "rough it" in the woods, if you sleep right, you can stand any kind of rough stuff and be full of pep, and sleeping in a Telescope Cot Bed is my idea of sleeping right in the cot line. This cot folds up into a bundle about 24 inches long by 7 inches deep with a width of 5 inches, and I found it very handy to roll the blankets around it and cover the entire bedding with a tarp. It can be thrown up in a minute or two and there are no little thingumajigs to lose or get out of order. The trestle-work braces take up all sag and the increased

height from the ground makes it doubly valuable in cold and damp weather. It is made for wear and it lives up to that reputation, and, given the usual good care a fellow gives to his kit, it should last for many years. By the way, the iron is rust-proofed and you can get a mosquito-netting canopy that is mighty handy in the woods and along the water trails.

### THE RED-E FOLDING BROILER STOVE AND OVEN

THE RED-E FOLDING BROILER STOVE AND OVEN. — Made by the Red-E Company, 20 East Broad St., Columbus, Ohio. The Red-E is certainly a stove of class and usefulness and with the Red-E Oven makes a team in the camp cooking line that sure delivers the goods. The stove folds into a very flat pack as does the oven and the two of them go into a khaki case that carries well in the pack sack or pack harness with the duffle bags. It can be set up in less time than you can write it. Why it practically sets itself up. With the back to the wind the smoke goes with the wind and you cook in peace and comfort while any old sized wood feeds it. To cook with the Red-E is to eliminate all the dirty, smoky end of the game and you have plenty of pan space. After the coffee gets going good and the can o' vegetables, slip these along one side, just touching the side and they stay simmering while you lay out a

fish on the broiler and let 'er go. And by the way just slip a strip or two of bacon on top of your broiling fish and let some of the bacon taste work in — man, it's great. While I managed the broiler and general cooking my pal baked as fine a pan of biscuits as you will meet at home and I'll say that the wall-eye pike I broiled was as good as any that "Eddy" ever broiled down at "Pop June's Oyster Bay" in Indianapolis and he sure had a rep for broiling. And here is a point not to be overlooked. It folds with the smoked part in and a clean outside always. All the way through the Red-E outfit is efficient and thoroughly practical, it is welded and riveted, no solder, and strong, compact, easy to use. The stove alone is a winner, but with the oven it is there both ways from the Jack.

### COMFORT SLEEPING POCKET

COMFORT SLEEPING POCKET.—Made by the Athol Mfg. Co., Athol, Mass. I like to go into the out-of-the-way places, to the places where the fellows expect to rough it, but I never rough it if I can possibly avoid it, and the greatest little old avoider to roughing it in the sleeping-bag game is the Comfort Sleeping Pocket. It makes you think of your home-town bed, and you feel just as comfy as could be on the air mattress of the Comfort. My Comfort is the feather-weight style, rolls up into

a roll about 8 x 25 inches with a blanket, and weighs eleven pounds. I stuff this into a duffle-bag and strap it on the back with another duffle-bag in a pack harness, and I am ready for any kind of hiking, have a decent water-proof bed, light in weight, and with the head flap propped up at night it makes a little tent for any condition of weather. The outside covering is of balloon silk, the inside of felt, and the air mattress keeps you away from dampness and cold. The fact that the Comfort has snap-buttons down the entire side makes it easy to air, and there is none of the sweating due to some of the closed sleeping-bags. You have a clean bed all the time and one easy to get into and out of on short notice. For sleeping in the open and where you must pack light the Comfort is an excellent addition to the kit, and it is made of the finest material and the workmanship is of the best. You can inflate the mattress by lung power in a couple of minutes and there is no pump necessary. Every way the Comfort is high quality and there is class to it from every angle of the sleeping game. Comfort in name and in delivering the goods.

### PERFECTION CAPE

PERFECTION CAPE.—Made by the Athol Manufacturing Co., Athol, Mass. When I received this cape and even before I had taken it into the woods

and along the stream, I knew that it was just the article that many, many sportsmen had been looking for. It was a perfect garment and there has been a call for something along its line for a long time. The cape is made of rubberized silk, it reaches from the neck to the shins and weighs but 19 ounces. It is made on the poncho style with a rattling good neck device that comes from Mexico which can be wrapped around the neck and snapped shut. This absolutely removes any chance of those little streams of water that trickle down your neck with the ordinary cape or rain shirt, especially if you happen to get a good brimfull of water on your hat and bend back too far. It has snap buttons that open down both sides and arms and all the body heat goes out these openings, thus you are subjected to no annoyance of sweating up the inside nor is there any discomfort from the heat. The arms are good and roomy, you can cast, row, cut the campfire wood, in fact do anything that requires active swinging movement without any binding or catching in the garment anywhere. It packs in a small space  $1\frac{1}{2}'' \times 4'' \times 8''$  and comes in a neat, nifty leather case. For the amount of good it does it sure packs in the smallest possible space and can be dropped in the packsack, in the pocket or creel and carried along ready for the rain you expect, but hope will not materialize. It is equally as handy for the motorist as well as the angler, hunter or hiker. On the way to the fishing

country I had to change a tire and while it was raining very heavily I kept free from being wet by using it and had plenty of room to do the operation. In material the Perfection Cape is high class, the workmanship of the best and it is a practical, useful garment designed by a fellow who knows what is needed by the outer.

### FUMO MOSQUITO AND FLY CHASER

FUMO MOSQUITO AND FLY CHASER.— Made by the Taplex Corporation, Broadway and 34th St., New York City. Have you ever wanted to do a bit of night-fishing, either the moonlight stuff or the simon-pure black night game when the big bass are doing their surface frolic, you would have gone, it's a ten to one shot—but darn those pesky, friendly little buzzing mosquitoes. They always try to whisper secrets in my ear and take a bit o' toll in the way of a bite or two. You can play the night game now—play it to a fare-you-well, get the big bass, have the joy of night-casting and tell the whole darned mosquito family to go to——. Just take along a Fumo burner and a little box of Fumo Incense, fill 'er up, light it and place it in the canoe and it's a good-bye to the winged pests. And say, old-timer, it smells like a cross between a Chinese Joss House and a gilded palace—your nostrils fill with a pleasing whiff of an oriental perfume and for the life of me

I cannot see why a mosquito hates it so much, it smells so restful and nice that you would think they would be tickled to death to sit around and enjoy it. But it certainly drives them away and you can cast in peace and comfort. I backed the canoe right plumb into a weedy bay at the head of a tamarack swamp right in the home of millions of mosquitoes, set the old Fumo agoing and they cleared right out and I sure cleaned that bay for a couple nice big bass. Besides chasing the buzzers away, Fumo is worth smelling any old time and I set 'er going in the cabin of an evening while we pass out the bunk around the fire on the reasons why the big one got away.

### TAPLEX HANDY WARMER

TAPLEX HANDY WARMER.— Made by the Taplex Corporation, Broadway and 34th St., New York City. The Taplex Handy Warmer is a sure enough cold weather friend. One in each side pocket after a few hours in a duck blind in the cold morning temperature when the ducks like to fly makes a fellow thank the big chief for sending them along for a tryout. No smoke or smell and with one loading, so help me Hannah, if they didn't keep nice and warm for over seven hours, fact is I had to regulate them a bit from being too darned warm. They are just a nice size, enough to clasp the hand

around and give you a good warm grip and with the hands warm and the feet warmed by a couple pair of wool sox, say, cold weather ducking has no terrors at all. The fuel with which you fill the stove looks like a cross between a scrambled bunch of cobwebs and soot but it certainly is surprising what a small amount of it will produce in the line of good warm heat. And by mixing a tablespoon of pulverized charcoal with the old burnt out ashes of a loading of the fuel you get another shot of heat for six or seven hours. A tube of charcoal, enough for five loadings costs you a jitney which is cheap enough in these High-cost days. There is no chance of a fire on the person if you cart one of these stoves in the pocket. I gave it every opportunity to play a trick on me but it just went along and produced heat of high or low degrees as I regulated it by closing the covering or opening it. Not a bad piece of kit at all and well worth the fellow's time to carry along if he goes out where the cold weather makes cold hands, an unexpected delight.

### THE McMILLIN AUTO BED

THE McMILLIN AUTO BED.—Made by the Auto Bed Co., Bellingham, Wash. For a compact handy bed that sleeps two people very well, without any sagging and rolling together, the McMillin Auto Bed is right. It is not complicated and can be

set up under the top in a few minutes, and everything is ready for the night. The materials used in the bed are strong and it is well made, the canvas sling being made of 10-ounce goods and ropebound for strength. The fact is the seat cushions support the weight of the back, shoulders, and hips, prevents sagging and takes up the weight and pull that you would suppose drags on the top. The iron supports and canvas weighs but twelve pounds and can be wrapped in a roll about 4 inches by 2 feet long and can be strapped on the running-board, or the iron rods can be stored under the back seat. With the side curtains dropped you are protected from wind and rain, and sleeping high and dry from the ground you have a mighty comfortable bed.

### KEEN KUTTER JR. SHAVING SET

KEEN KUTTER JR. SHAVING SET.— Made by the Simmons Hardware Co., St. Louis, Mo. This shaving set is the whole deck in a nice case, a place for everything and everything in its place or you can take what you need out and carry it with you, but the case is so compact and handy that the logical thing to do is to stick the whole outfit in the pack and have the tools of the shaving game all in one place when you need 'em. And by the way a shave in the morning in the woods is just as fine a thing as the

A. M. shave in the city, it makes you feel clean and fresh and with the pine air it's a great feelin'. The razor itself is a neat little tool and it shaves clean and right, while the blades stand up under quite a few hairy races over the jaw. There is a good strop with the outfit and a sharpening arrangement to hold the blades that any kid could work and put an edge on a blade. And there is as nifty a lather brush in an individual nicked case as you will find in many a day; it's a short, rubber-handled affair with a good hair brush that works like a charm on the face. I was particularly fond of the brush in the outfit. The soap is of the stick variety and it comes in a nicked case with a movable bottom so that you can shove it up with the finger. The entire case full is handy, neat and useful and if you tote it with you there is no chance of forgetting something. Like other tools with the Keen Kutter name on them this razor will help make that name popular with the fellow who likes a face tool with a keen edge and that will shave well at all times. The razor is built with an angle that practically makes it impossible to use it any other way than at the proper slant to get the most effective cutting edge.

### STONEBRIDGE FOLDING LANTERN

STONEBRIDGE FOLDING LANTERN.—Made by the Stonebridge Mfg. Co., 23 Warren Street, New

York City. This lantern is a valuable addition to any kit and it is very simple with nothing to get out of order. The one I have been using for five years is the galvanized iron model, with aluminum reflector and extra heavy mica windows. This lantern has had some mighty hard service, been tramped on and sunk under the water a number of times as well as packed considerable and outside of a few dinges does its part as a lantern as well now as it did the first time I lit it. Besides the fact that it folds into a small flat pack, the big thing that can be said of it is that it will not blow out — get that with its full force, old man, it's a lantern that will not blow out, regardless of the gale. This lantern has been knocked over, kicked over, and fell over and when righted still cast its light — and I never expected it to blow up and send the outfit to kingdom come. And, no matter where you are you can always buy a few candles for it. Taken four ways from the jack it is some lantern and I always feel pretty good when some fellow, who had previously kidded me about the candle affair, comes through with the acknowledgment that it is sure some lantern. It is in fact a very practical lantern and as it is used by the U. S. Army in many departments it must be able to stand the rough and ready wallops and still be on the job as a lantern.

## SCHILLING'S AUTO-CAMP

SCHILLING'S AUTO-CAMP.— Made by The L. F. Schilling Company, Salem, Ohio. This is surely the entire camp and bed wrapped up into a little compact long bundle that straps onto the running-board of a car and doesn't take up hardly any room at all. It looks nifty on the board, and who of the crowd would suspect an entire camping quarters snugly in place for instant use. Your side curtains all up and you have a handy dressing-room in the car and can step right into bed, and say, when you mention beds in connection with the Schilling Auto-Camp, you mean real beds, for the bed which carries springs of a combination of the woven wire and link variety, like those on the Schilling, sure is some bed. There is no sag to it, you sleep right. And it is full 48 inches wide and 72 inches long of sleeping space, which is roomy enough for two, and three can bunk in it on an emergency. The frame is of pressed steel and swiveled onto the running-board. All parts are attached, and you cannot lose or forget 'em. Steel parts are enameled and rust-proof. The tent part or shelter top is of heavy 12-ounce U. S. Khaki, and an extension spring attached to the foot-rail keeps the top taut. The camp can be erected complete in about five minutes and about the same amount of time is necessary to take it down and stow it on the running-board. In manufacture

the Auto-Camp is first-class, and in material it is of the best quality. As a real nifty, cozy, and complete camp in compact form, either when set up or packed, the Auto-Camp can be fully recommended to any outer who likes to sleep snug in his own bed instead of taking chances in any old bed he is likely to find wherever he stops.

### DANZ BAGS

DANZ BAGS.— Made by Summers Mfg. Co., Los Angeles, Calif. This is certainly a fine piece of equipment and shows at once the car-marks of a practical man as the designer. The bag is a combined shell and game bag and is equally as good for hunter, hiker or fisherman. The first impression gained is that the pocket in the back should be higher, but this is wrong, it is placed just right and carries well with a full pocket of game or fish. For hunting, shells are carried in the four front and side pockets and are very accessible; for fishing these same pockets hold the tackle and the small pockets on the flaps accommodate the smaller sinkers, hooks, and what-not of the tackle-box, while the game pocket eliminates the creel, being one in itself. It can be worn with or without a coat and it carries snug and balances well. The standard khaki duck of which the bag is made is excellent material and it is doubled sewed, leather bound and strengthened

by rivets. In hiking the smaller kit can be carried in this bag and an ordinary pack or duffle-bag carried above it, or for going light it will carry sufficient kit and a light tent can be carried above it. For a mighty handy, efficient, and well-made piece of outdoor equipment, the Danz Bag is right in every respect and its material stands the gaff of rough treatment.

### KAPO KANTSINK GARMENTS

KAPO KANTSINK GARMENTS.—Made by the Kapo Manufacturing Co., 114 Bedford Street, Boston, Mass. The Kapo product is a life saver, whether it is made into a belt, waistcoat, canoe cushion, or any other kind of outing kit. I took my Kapo waistcoat, tied a dead weight into it, threw it into the lake one evening and it was serenely floating when I came down to give it the once over in the morning. I let it stay in the water the entire day and took it out that evening and the only thing that was changed was the fact that it was very wet, and who would not be willing to be considerably wet if they were hauled out of the water twenty-four hours after they were dumped into it, and be taken out floating right side up? For canoeing for pleasure it should make a fine thing to have about, either as the waistcoat or in the shape of cushions; and on the stream where there is a lot of white water the waistcoat would be a good thing to have along for the

spill that often takes place. It is strongly made and well tailored and considering what it will do is very light, mine weighs just one and one-half pounds and it does not interfere with casting at all. I prefer the waistcoat because of the freedom to the arms. The fact that the U. S. Battleships are fitted with these garments show they have stood up under far harder tests than a sportsman would ever have to put them to. When it's blowing just a bit rough and the canoe is taking the sea with considerable wobble, there is a comfortable feeling to the game when you know there is a Kapo right handy.

### EVER READY AUTO BED

EVER READY AUTO BED.—Made by the Stoll Mfg. Co., Denver, Col. Just bore two little holes in the running board and attach the Ever Ready Auto Bed with the bolts that come with it and you are ready for the outdoors, ready with a good bed and a tent over it, that can be set up in about three minutes and everything set for a good night's rest. The reason of the treat of a good night's rest is because the bed is made with real live steel springs that won't sag with two big heavy weights. There is sure real sleeping comfort in the bed and you wake up in the a. m. feeling fit for a full day's casting or hunting. The mattress is light and strong and especially constructed to keep out the cold and it has

a homey feel to tired shoulders and hips. The tent part of the kit is made of close woven Army duck and it is storm-proof. A very good thing in the make-up of the tent is the ventilators in the side flaps which give you a bit of air without the bugs and 'skeeters that generally go with it in the outdoors, because they are insect proof. The Ever Ready is a simple arrangement to set up and when it is set up it is very solid and substantial. For an Auto bed that is compact and handy it is to be recommended and at the same time the material and workmanship on the Ever Ready is all that could be desired in equipment of this kind. For sleeping comfort the bed is equal to any bed in your home. And you can pack as high as five blankets in the lay-out without making it bulge out of shape. It carries well on the car making no noise nor rattle and is the real goods in every way.

## AEROTHRUST MOTOR

AEROTHRUST MOTOR.—Made by the Aerothrust Engine Co., La Porte, Ind. The Aerothrust motor sure can take a canoe or rowboat through the weed beds and rushes without any trouble, and wherever there is enough water to float your craft you can go with the Aerothrust, and that certainly is an advantage to be chalked up to its credit. In material and manufacture, for quality and workmanship,

this motor certainly comes clean. The cylinders are cast en bloc, the crank-shaft and connecting rods are forged from a solid piece of high-grade carbon steel, and all pins and rings are hardened and ground. It will stand the gaff of hard rough going. All parts are accurately machined, assuring alignment and the least possible wear. The new pitch to the propeller will give a speed of ten miles an hour with the engine running at 1600 per minute. I got an average of eighteen miles to a gallon of fuel and think it will run a little better than this if economy of operation is practiced. The magneto gives a good spark on a half turn of the crank, and during a month's workout the motor caused no trouble to speak of, and it was operated by six or eight different people more or less expert at the engine game. In all details the Aerothrust Outboard Motor is well made and strongly constructed and it is a valuable addition to the boating end of the game.

### HOPPE'S NITRO POWDER SOLVENT NO 9

HOPPE'S NITRO POWDER SOLVENT No. 9.—  
Made by Frank A. Hoppe, 1741 N. Darien Street,  
Philadelphia, Pa. Here is an oil that will remove  
the residue of any high-power powder as well as  
black powder; it is great stuff for the bore, as it  
keeps it from rusting and corroding and at the same

time it removes metal fouling. You do not have to use a brass brush with this solvent and in this way adding to the life of the barrel. It is also fine for rubbing over the outside of the gun as a preventer of rusting. After cleaning I found that it would remove leading and fouling by running a piece of cotton cloth soaked with the oil through the barrel, as the mixture acted as a neutralizer on anything left in the barrel. It is good dope for any kind of a bore and is particularly effective in the high-power rifles, including the 22 caliber. I also found that it was a good plan to run a rag or two, dipped in the oil, through the barrel before firing, but in such case it is necessary to dry the bore thoroughly before firing. It is equally as good for shot-guns, revolvers, and, in fact, any kind of firearms, and one big thing in its favor is that it is not made of combination of acids, as a matter of fact no acids are used whatever. It is a merit nitro-solvent oil and is easily used in all guns.

### RAZ CREEL HARNESS

RAZ CREEL HARNESS.—Made by W. D. Humphrey, Pendleton, Oregon. Here is certainly an ideal creel harness, it is a rattling good piece of kit. The entire weight of the creel full of fish rests on the bottom straps that run under the basket which is the logical place to carry it. There is a circling

strap running around the creel and from rings the straps run under the creel and up to the other side of the circling straps, the bottom straps are braced by two straps across longwise under the basket and these are reinforced by two zinc strips. The harness is very easy to adjust, you simply run the circling straps through the openings in the basket and buckle them on the inside. Besides holding the creel in a snug position to the body it takes but a moment to unstrap the harness and remove the basket entirely which makes it a simple job to wash the basket and keep it clean and sweet. It is easily adjusted to any carrying position and will fit a creel from numbers three to six inclusive. I have sewed on leather reinforcements to my creel heretofore and made a sort of harness, but the leather soon became foul and rotten from repeated washings. Nothing like that happens with this harness, it does not collect dirt and it stays clean which is something to be glad for with a creel layout. It is made very strong and it sure is durable, being made of Latigo leather and the buckles and rings nicked. The straps are all copper riveted, no sewing to tear out. Taking the Raz harness every way around it is a fine high-class, useful piece of outfit and something that will make the stream wader pass up a little prayer of joy when he owns one.

## PARR FOLDING FROG BOX

PARR FOLDING FROG BOX.— Made by the North Star Spinning & Mfg. Co., 1834 University Ave., St. Paul, Minn. Here is an excellent little carrier for the live frog that is a real handy and useful affair. When closed for packing to the camp it folds into a compact small space and packs flat without making any bulk at all. The sides and tops are of galvanized wire and the ends and bottom of sheet metal. It will not rust and it is built strong and sturdy, the ends being held close by strong springs; from either end the bait can be taken out without trouble, the springs bringing the end closed snug as soon as the frog is removed. I carried two dozen frogs three hundred and fifty miles by train, ten miles by auto and the last three by trail and the frogs were in good shape when they reached the bass. The fact that the ends close by strong spring pressure makes 'em "fool proof" and you cannot forget to shut 'er up again. You can slip the box into the pocket for the hike home. And for an emergency minnow bucket you can hang it over the side of the boat and have live minnows any time. Taken all the way round the Parr Folding Frog Box is a clever piece of kit, it is made right and one of them ought to last a fellow a lifetime in the fishin' game, and the fellow who invented it sure must have been a fisherman because it makes the old style frog basket look like an "also ran."

## DUXBAK CLOTHING

DUXBAK SPORTSMAN'S CLOTHING.—Made by Utica-Duxbak Corporation, Utica, N. Y. Hanging on the peg in my cabin, Timberedge Lodge, as I write this, is an old worn hunting jacket that has been my pal on many a hike in quest of feathers, furs and fins. Great has been the service of this coat in days of rain, of sunshine and of snowy flurries, through timber, burnt-over and slashings, along the rushing stream and placid lake waters. This coat is dear to my heart, it has been a faithful servant, always ready and willing to serve. Rough has been the treatment I have given it for the past ten years, but it has always stood up to just a bit more than I could expect of it. It has kept me dry when everything else was wet, warm when the cold winds whipped through the pines or while sitting waiting for the whirr of wings in the duck blind. When I jam my arms into the sleeves of this old coat, I feel as nobly clad as any knight of old in his shimmering armour of burnished steel and chain. It is good for many more days on woods and water trails. It is a Duxbak coat, 10 years young. That is the only trouble with a Duxbak coat, they last so darned long and a fellow gets so fond of the Comfy feel of one o' them that he hates to throw it away. Every way through in wear, fit and style I have found the Duxbak a premier piece of out-

door clothing. The Duxbak garments are water-proofed and they keep you dry, that is something when you can always figure on an average of wet days when in the woods. They are strong and well made and the style of the garments for different wear are made with just the special features that make such garments right handy for that particular end of out-doors sport. Writing this tryout has been one of the easiest things I ever had to do, because I have used this line for ten years and expect to use it for many more. If I could not get any new garments of Duxbak, I feel that the ones I have will still be wearable when my time comes to pass on to the happy hunting ground. And here's hopin' I get a layout equally as useful to wear over there. That's how good I have found them.

### BRADLEY SWEATERS

BRADLEY SWEATERS.—Made by the Bradley Knitting Co., Delavan, Wis. When a fellow buys a sweater he looks 'em all over and hopes he has picked the best, but when he once buys a Bradley he never bothers again about what he'll buy the next time if he ever has to buy one because it's a hundred to one shot that he will go in and say "Gimme another Bradley Sweater." And the reason is that he has had more downright good wear and value out of the first Bradley that he knows he is satisfied and

that the Bradley is what he wants. And this is all because the Bradley people make a true value sweater, a garment that has snap and style to it and a helova lot of wear to it. I have a Bradley that I bought five years ago, one of the Navajo coat styles, that has kicked around with me on many a trip and had more rough usage on hike and trail, through burnt-over and brush country and what-not and yet to-day this old piece of kit has enough style and hang to it to look toppy when worn in the city or at a golf club. The reason is that it was made right — made of the right stuff at the start and made to wear. The only thing I cannot see is how the Bradley outfit can put so much value into a sweater that will last so long. When can a fellow wear one out and have to buy a new one? It seems to me that they will last a lifetime and for that reason I say that a garment like a sweater that generally gets out of shape and hang, that is made so that it wears like iron, and still looks the part of a thoroughbred after long use and still holds its shape and style is an article that I can recommend as being right in every respect. The Bradley sweater is that kind of a sweater, it is full value any time and in a class by itself.

## "WEAR-EVER" ALUMINUM WARE

"WEAR-EVER" ALUMINUM INDIVIDUAL CAMPING OUTFIT.—Made by The Aluminum Cooking Utensil Co., New Kensington, Pa. This little old compact outfit is certainly a dinger. For a number of years I had in my outfit one of the U. S. army mess kits, but when I lamped this "Wear-ever" stuff and compared the weight with the old kit, I shot the old army pal up into the garret and have used the new one ever since. I find it very convenient and can pack enough bacon, salt, pepper, and other dope for a couple of meals right inside the cup and pot and carry the whole thing in the neat strong khaki bag which slings over the shoulder out of the way, although I have rigged it with snap hooks and snap it right onto my pack. Before I had used aluminum in the outdoor trips some of my pals said it would hold the heat too long and be inconvenient in that way. This is, in my opinion, not a fact at all, as I find that when you are preparing a meal in the outdoors the tendency is for part of the meal to get quite cold while you are getting the balance of it in shape, and I feel that what heat the aluminum does hold is to the advantage of the outfit and makes for a better, warmer meal. For an all-round good compact outfit for use on the hikes from lake to lake, or on the trail when you are going light, the "Wear-ever" Individual outfit is a decided improvement

over the home-made affair, and the beauty of the outfit is that you are carrying no excess weight or kit. The outfit consists of a pudding pan or plate, a bucket or pot with cover in which you can brew some fine coffee or tea, a cup, fork and spoon, and a frying-pan with a folding handle. This handle is holed for the use of a stick to lengthen it if desired, and the whole affair nests into a small pack. Aluminum is the right stuff for the cooking kits, and "Wear-ever" on the bottom of a pan means the same as sterling on a piece of silver.

### BROADBILL DUCK CALL

BROADBILL DUCK CALL.— Made by N. C. Hansen Co., Zimmerman, Minn. This is certainly a fine duck call and with a little practice you can make the calls of any duck. Of course the majority of the wild duck species will answer the call of the Mallard which is easily learned on the Broadbill. The beginner at calling will find this a simple call to master and the old-timer will be delighted with it. It is very well made and the materials are good. All around it is high class and will mean a good flight of ducks if used right. I have had one in my duck outfit for a number of years and it is in just as good shape now as the day I took it out of its box and made my purp stand on his ear looking for the bird. It was originated by an old-time hunter and pat-

terned after one he had used for years and it naturally should be good when doped up by a duck-hound.

## FLY-TYING MATERIAL

FLY-TYING MATERIAL.— Made by C. H. Shoff, 405 Saar Street, Kent, Wash. The line of fly-tying materials carried by Mr. Shoff are of the highest quality and the assortment is varied and complete. Although I have not used material from all of his stock, what I have used was up to A-1 in every respect, and some few exceptional pieces of goods have been secured from him that are not generally in stock. His peacock and wood duck feathers are fine, and the matched feathers carefully selected. Mr. Shoff has written an excellent little booklet on "How to Tie Artificial Flies" with a chapter on how to make your own leaders. This book should be read by every fellow who anticipates the pleasure of tying his own flies, and it can be secured free by sending a two-cent stamp to Mr. Shoff to cover the cost of mailing. To the boys who have never tied a fly there is a lot of sport due to the feeling of making the fly that coaxes the big fin into the creel, and with first-class materials such as Shoff handles and a bit of practice many killing patterns can be tied with a little patience.

## OLT'S GAME CALLS

OLT'S GAME CALLS.— Made by Philip S. Olt, Pekin, Ill. For quite a good many years Olt's Game Calls have been famous throughout the great duck regions of the mid-west section and they deserve every bit of the fame that has come to them. The call I used during the last season, however, was not one of the regular ones but Olt's newer adjustable duck and crow call. A mighty big advantage of this call over the ordinary one tone duck call is that it can be quickly adjusted to call the particular call of any of the ducks and it is equally as easy to set it for calling crows. One does not find it necessary to carry an assortment of calls, the adjustable call taking the place of many of different tone. The call is well made and entirely of hard rubber which does away with any metallic sound often found in calls and it will not shrink or swell in damp weather. Mr. Olt has put the experience of many years at hunting game birds into the character of this call and when you use it, you know that it was designed and made by a practical duck man. Much sport can be had with this call shooting crows as it is easy to bring them within gunshot by using it. Of course you must know the call of the bird to be imitated in order to give the correct tone to your calling; knowing this, you cannot help but find it successful. At the same time the more crows the sports-

men kill off helps protect the nests of the real game birds.

## HEINZ FOODS

HEINZ 57 VARIETIES.— Made by H. J. Heinz Company, Pittsburg, Pa. If there is one little thing that adds spice to the camp commissary it sure is the Heinz line of food products. They certainly break up the monotony of the usual camp diet like a 16-centimeter shell wallops the first line trenches. Old-timer, it makes you smack your lips to even think of the variety that can be added to the camp table by a varied selection of these wonderful goods with the snappy flavor. The best meal you can think of, that has tickled your palate in the city has nothing on a camp meal well done when served with a dash of Heinz Ketchup, or some of those pickled mixtures like the India relish. Yeah Bo! You gotta hand it to Mr. Heinz for putting up a line of pickled fancies that would make any old meal appetizing. I have used the whole deck and back again, everyone of the fifty-seven and it is hard to tell which is best. They are all good from the oven-baked beans to the Cream Soups and Fig Pudding. Before I started taking Heinz along to my fishing camp, all the meals had about the same taste and flavor; about the fifth day, everyone was on edge about the cooking, and carried a grouch right along.

Then I started with a little assortment of the Heinz good things to eat. After that you never heard a peep out of the worst old growler of the bunch and that's one reason why I have Heinz in many different styles in the cabin cupboard. It is surprising what you can do in the way of making tasty sauces and relishes with a few bottles of these goods and they tone the stomach up at the same time that they taste so good. They are put up clean, pure, and sanitary and the name of Heinz on a food product is just as much a mark of worth as the 24 kt. on a piece of jewelry. And Oh Boy! They are easy to open, you don't need a jimmy.

### ANKER'S BRAND BOUILLON CAPSULES

ANKER'S BRAND BOUILLON CAPSULES.— Made by the Royal Specialty Co., New York City, N. Y. Here is the chance for the sportsman to take the real fresh meat flavor on the trail in a compact form and know that he is carrying a supply of food-stuff that is really made from meat and concentrated to the utmost. Drop one or two capsules into the pot of soup and it takes on a flavor that makes it a most palatable dish, or when you come in tired and cold from the lake or trail, heat a little water and slip a capsule into the tin cup and you have a bracer that will hold you together until the feed-bag is ready

for the evening chuck, and say, boy, it will give you an appetite like an old sea dog. It's clean and pure and as nutritious as the broth of fresh meat, with none of the unpleasant flavor sometimes found in preparations of this kind. And the big winning feature besides the high food value and the compactness, is the fact that each bit of extract is put up in a sealed capsule which is sanitary, clean, and free from chance contamination. This is good stuff for the commissary and gives a change from the usual line of flavors found in the camp menu. After the first couple days out, if the "tummy" goes wrong with the change of diet, just try these capsules for a day or so and it will help put the digestive organs back into good shape. The fact that Anker's Brand Bouillon Capsules are ready for instant use and can be prepared in a moment's time, and that they are pure, clean, and wholesome, commends them for the use of the outer.

## WHITE HOUSE COFFEE

WHITE HOUSE COFFEE.—This coffee made by the Dwinell-Wright Company, 311 Summer Street, Boston, Mass., is certainly the goods when it comes to getting up a coffee that has got the real aroma and flavor, which, when it comes stealing into your tent in the morning, will snake you out of bed like a team of horses; once you get that fragrant smell.

of White House Coffee in your nostrils, it won't take you very long to wash up and make a bee-line for the breakfast table.

I have tried and tested a two-pound can of Ground White House Coffee recently, and for a number of years I have used it at the house, and believe me, it is great. I have about sixteen different ways of making coffee, and the boys all tell me that my coffee is good. I am a modest guy, but I am so fussy about making the coffee that I don't blame the boys for saying that I make it right.

Point No. 1 on making good coffee is to have the coffee-pot absolutely clean. Don't let any of the brown scum or deposits remain on the side of the pot or in the spout when you rinse it out. Then you can make your coffee by allowing one tablespoonful to each cup, and one extra tablespoon to the pot, pour on your freshly boiled water and stir the coffee which rises to the top down underneath the water, then allow it to draw for five minutes, but don't boil, pour slowly so as not to stir up the grounds.

No. 2 Recipe:— Make the same allowance of White House Coffee for each cup as above, wet the coffee a little in the bottom of the pot and let it stand while you are mixing up the flapjacks, then fill the pot with cold water and let it come to a boil, boiling not more than two or three minutes, take it off the fire and let it stand for three or four minutes

before serving. Don't let coffee stand and get cold in the pot any way you make it, it kills the flavor. You cannot make bad coffee with a good coffee like WHITE HOUSE, if you simply follow out directions above.

## TECO PANCAKE AND TECO BUCKWHEAT FLOUR

TECO PANCAKE AND TECO BUCKWHEAT FLOUR. — Made by the Ekenberg Company, Cortland, N. Y: Here is a pancake flour that has the added value of malted buttermilk mixed in with it to give necessary punch to the flour to produce delicious food. The buttermilk is reduced to a powder and mixed right in with the flour and say, old-timer, if you want to make the old homey kind of pancakes with the milky flavor, you can do it without toting any milk along if you use Teco. This buttermilk, besides making the pancakes easily digestible adds to their nutritive value, fact is, it produces a cake that is deliciously different. They have a taste that won't come off. Not only in making A-1 pancakes does Teco shine as a flour, but you can use it in many different ways around the camp. It makes a crackerjack good bannock and for a sour dough bread you gotta go some to beat it. I think that the flavor to many things can be improved greatly by using Teco Pancake Flour instead of ordinary

wheat flour. Most any kind of fish or meat, when rolled in Teco before frying will make a dish fit for a king. Teco Flour is good all the way through and as a tip to the outer, write the Eckenberg Co. for their booklet "Campfire Cookery." It is full of tried recipes for out-door cooking, that will be found of value for the camp menu.

### RY-KRISP

RY-KRISP.—Made by The Original Ry-Krisp Co., Minneapolis, Minn. For the fellow who goes into the woods and along the water-trails, Ry-Krisp is great stuff. It's a bread baked dry and hard, but not as hard as the old hardtack, and it has a great many advantages over that old piece of the commissary. The first time I bought it for a trip to the woods the two pounds never reached the woods, because the family liked it so well that we ate it before starting north, and ever since that time I have had Ry-Krisp in the home menu. We often substitute it for toast in the morning and munch a bit of it any time, and it sure is a great little stomach regulator. For the woods, it makes it unnecessary to bake bread, and from some of the bread the fellows bake in the woods—deliver me and my little tummy. Ry-Krisp will not become soggy, and a bunch in the hunting-coat pocket answers the bread question in the woods. It is an ideal camp bread

and is very agreeable to the taste. Besides all this, it is really a wonderful health food, and it's a hundred to one shot that many of the thousands suffering with stomach trouble would fall to it with glee if they knew what a fine thing it is. It is made entirely of ground rye and a bit of salt and that is all, but for downright good stuff for the system, in camp or home, I am behind it with both feet because it put my cranky old stomach in first-class shape and that is one reason why I am for it. Forget your bread troubles and take along Ry-Krisp. It keeps indefinitely, that is if you can keep from eating it faster than you figured on.

## FARWELL & RHINES' FLOURS AND FOODS

FARWELL & RHINES' FLOURS AND FOODS.—  
Made by Farwell & Rhines, Watertown, N. Y. I have always found that with the change of location, air, water, and diet, incurred when on a hunting, fishing or canoe trip, a man needs an effective laxative. One of the best is Farwell & Rhines' Table Bran; and the best thing about it is that you can take your "medicine" without knowing it. If I am mixing up a batch of flapjacks, or a pan of biscuit, I put in three heaping teaspoonsful of this table bran; it improves the flavor, while acting in a perfectly natural way as a stimulant to the lower di-

gestive tract, and keeping a man "regular." Farwell & Rhines make a number of special flours, and their Cresco and Gluten flours are put up especially for people with diabetes and dyspepsia. Personally, I am one of those disgracefully healthy specimens, so I didn't need the Cresco or Gluten products, but I tried them out several times just for flavor and cooking properties, and because I know there are some brother sportsmen who are afflicted with poor health who will be glad to know that these special "diet" flours cook up as appetizingly as the untreated goods, while at the same time filling the doctor's orders. The terrific appetite that the outdoors gives the average sportsman demands something that will "stand by" a man, and I can especially recommend for this the Farwell & Rhines K. C. Whole Wheat Flour and their Crescent Graham Flour. Biscuits, flapjacks, and bread, made up from either of these, are more laxative than the white flour product. Graham flapjacks are in my estimation a lot healthier than others made of ordinary wheat flour. For a breakfast food that will stand by you for a heavy day's casting, paddling, or hiking, I want to recommend strongly that you try Chesco Grits, or the Farwell & Rhines Barley Crystals. The former tastes mighty good, old-timer, when you slice it up cold, fry it, and eat it with maple syrup — m-m — man!

## GRAPE-NUTS

GRAPE-NUTS.—Made by the Postum Cereal Company, Battle Creek, Mich. Many articles of food carried into the woods will not give you half the pleasure and food value of Grape-Nuts, and in many cases a fellow does not tote along this tasty cereal because he does not know of its value as a food and the wonderful good it does to have something in the grub sack that will give him a change in diet from the usual flap-jacks and bacon, especially at the early A. M. meal, not to mention the fine taste it gives to the evening meal as a wind-up dish. It is easy to pack and always ready for a quick lunch. It contains high food value and although four or five tablespoonsful are all right for the city diet, believe me, after hitting a fair to middling trail or portage, a great big bowl of Grape-Nuts makes a better impression on the appetite and you sure enjoy a good strong helping. The first time I took Grape-Nuts into the woods, my supply lasted about three days instead of a week. I never knew how good they really were until I got out-o'-doors where the craving for just such a food develops mighty fast overnight. I find that taking them out of the original package and placing them in air-tight tins keeps 'em crisp and fine. One of the greatest little hunger satisfiers is to put a pouch of, say, a couple handfuls of Grape-Nuts in your pocket when you

start on a hike or fishing trip from the head camp and off and on during the day put a few in the mouth and munch them; this not only keeps down your hunger but it makes the mouth feel mighty good when you want a drink and no water in sight. At the same time your system is getting just the supply of natural cereal food that will balance the heavier foods one generally packs away while in the woods. This is especially of value to keep you in good condition and at the same time you have the pleasure of eating an appetizing dish that is a real palate delight along the woods and water trails.

### INSTANT POSTUM

INSTANT POSTUM.—Made by Postum Cereal Co., Ltd., Battle Creek, Michigan. This product is a concentrated extract made out of whole wheat and molasses. The manufacturers state that there is nothing else contained in it. Take a teaspoonful of this dry powder and stir it into a cupful of hot water, and in a jiffy you have a delightful bracer with a flavor not too dissimilar from that of a mild high-grade coffee. When you are out in the woods, or you come in from a morning's fishing in the cold, drizzly rain, and you feel that you want something hot that will go right to the spot to warm you up and make you feel cheerful again, and at the same time give you a little something in the way of food

value, all you have to do is go to the can of Instant Postum and make it up as described above. There is no caffeine or other drug in this article. It is absolutely pure and contains only the concentration from wheat and molasses, but there is absolutely no trace of the taste of molasses in the appetizing flavor of Instant Postum. I can recommend this product unqualifiedly as a bracer which is both delicious to the taste and of real food value to the camper, especially recommended to those people who are unable to drink tea or coffee with comfort.

### GOSSOM'S QUICK MADE POWDERED SOUPS

GOSSOM'S QUICK MADE POWDERED SOUPS.—  
Made by B. F. Gossom, 1345A Beacon Street, Brookline, Mass. Samples I have tried out and tested were Gossom's Pea and Lima Bean Soups. These are put up in handy little rolls which occupy very little space. You wet up the powder with a little water and then you pour in boiling water and keep it on the fire for 15 minutes. You can make up a dandy tasting soup with this specialty without much trouble, and it is all the manufacturer claims it to be. It tastes just like the good hot steaming soup the wife makes up for you at home, and it is hearty and satisfying. As a camp commissary proposition that stands out on account of its all-round merits, I have got to hand it to Brother Gos-

som's preparations. You can't get a concentrated soup which has more food value value in less space than this, and let me tell you if you go ahead and get a sample and make it up according to directions, you will go to it with a vim and zest that will be one mighty little fine round of pleasure while you are sinking it into your system. Be careful when you are wetting up the powder at first to make it thoroughly smooth, and you will join with me in saying that Gossom's Powdered Soups are the real article. These soups can be secured in quite a variety of vegetables to satisfy most any appetite, namely green pea, yellow pea, lima bean, black bean, celery and mushroom, enough variety, in fact for even a jaded appetite.

*Endorsed by U. S. Government Officials*

## Individual Instruction in Rifle Practice

With a Chapter on Revolver Shooting  
—Unabridged Edition

BY COL. A. J. MAC NAB, JR., U. S. A.

The science and art of shooting (written by an expert) the Military Rifle and Revolver is described and illustrated in a clear and comprehensive style that makes the student's progress accurate and complete.

The subjects of Aiming, Position, Vision, and Trigger-pull are all treated in a manner both interesting and instructive. The chapter on Revolver Shooting describes in detail how to shoot the new Smith & Wesson 45-caliber Revolver, which uses the 45-caliber Automatic Cartridge, and is the *last word* in Revolvers.

*Outdoor Life:* "One of the most practical, clear, and concise books on rifle and revolver shooting for beginners, both in civil and army circles, published. It actually tells how to learn to shoot as nearly as it seems possible to explain the matter in print."

*16mo. Cloth. Illustrated .....Net 75c*

# Streamcraft: An Angling Manual

By DR. GEORGE PARKER HOLDEN

The author has written a volume which will be of great interest to those of the angling fraternity. It deals with the selection, care and rigging of the rod, the art of casting, trout habits, lures and their use, including some stream entomology, the angler flies and how to tie them, including a description of the most successful trout and bass flies. The style is always sprightly and lucid, even in the most technical parts. No other volume on American angling is so authoritative and comprehensive. Handsomely and elaborately illustrated. Eight full page colored illustrations and numerous black and whites. The book in size handy for the pocket.

Net \$2.00

3-4 Turkey Morocco .....\$7.50

# The Yellowstone National Park

The World's Greatest Wonderland

America's Only Geyser Land

By GEN. HIRAM M. CHITTENDEN

An entirely new and revised edition with new plates and new illustrations of this remarkable classic of The Yellowstone. Ever since its discovery, more than forty years ago, the Yellowstone Park has grown in popular interest. Its natural wonders surpass anything to be found in like compass elsewhere in the world.

To these attractions have been added others in the form of wonderful mountain roads built by the Government, and a system of hotels and camping facilities which make traveling through the Park a delight quite apart from its scenic interest.

The 1918 edition of The Yellowstone is the most comprehensive book on the Park ever published. It gives a complete history of that region, as well as a full scientific description of its natural wonders. It is also an admirable Guide Book.

*Handsomely illustrated on Cameo paper, and three-color cover jacket showing Yellowstone Falls in its natural beauty; also an elaborate map .....Net \$2.00*

### Bass, Pike, Perch and Other Game Fishes of the United States

BY JAMES A. HENSHALL, M.D.

*Author of "The Book of the Black Bass," Etc.*

The most comprehensive book on American Game-Fishes published. It describes in detail ninety species and varieties of the game-fishes inhabiting fresh water lakes and streams east of the Rocky Mountains, and the marine and brackish waters of the Atlantic and Gulf coasts.

In addition to a brief, technical description of the fishes for the purpose of identification, the popular description and account of their habits, habitats and everything relating to their environment is full and complete; the whole comprising a valuable compendium and text book for the angler with bait or artificial fly.

The style of descriptions of the various fishes is new, lucid and entertaining. The suggestions and directions for angling, and of the tools and tackle recommended are in Dr. Henshall's best style, and can be confidently recommended and relied on as they are in strict conformity with his own practice and experience which cover a period of more than fifty years.

*Many illustrations, frontispiece and cover jacket in full color.*  
12mo. Cloth .....Net \$2.00
