NEUFCHÂTEL CHEESE is named after the town of that name in northwestern France. Cream cheese is usually made from milk having about 6 per cent fat, while Neufchâtel is made from ordinary 4 per cent milk. Cream cheese is also marketed in a number of combinations or flavorings, a popular form containing pimiento peppers.

This group of soft cheeses can be made with little trouble and at small expense for equipment. Although now largely produced in factories, they can be manufactured at home for family use. Frequently also the surplus milk of a small dealer can be marketed advantageously as Neufchâtel, cream, or pimiento-cream cheese.

While these varieties of soft cheese are highly regarded, their real food value is often unappreciated. When served alone or in any one of a multitude of dishes they are palatable and appetizing as well as nourishing.

CHARACTERISTICS OF THE NEUFCHÂTEL GROUP OF CHEESES.

CHEESES of the Neufchâtel group have been produced in the United States almost exclusively by a very few factories whose methods were not readily available to the public and whose extensive and high-priced equipment created the mistaken notion that it is not practicable to make these cheeses except upon a factory scale. The methods of manufacture of Neufchâtel and cream cheese and their modifications are, however, simple, and the equipment needed for making them in small quantities is not elaborate; therefore an excellent opportunity is offered to produce at low cost a fresh, wholesome, and attractive food for home use. Since Neufchâtel and cream cheese may be marketed upon a small scale, they often offer to dairymen an exceptional opportunity for the disposal of surplus milk.

The cheeses of this group are perishable, and their selling prices are somewhat higher, pound for pound, than the harder cheeses. They are coming more and more into common use, however, because, in addition to their rich flavor and high nutritive value, they may be used with other foods to form many appetizing dishes. When cheeses of this group are to be sent to market, special, though inexpensive, equipment is necessary in order to obtain the greatest efficiency of time and labor in molding them into marketable form.

An expenditure of from \$10 to \$25 will provide proper equipment for handling the cheese from several hundred pounds of milk. Such equipment should enable the dairyman to make and market cheese directly to the consumer at less cost and in fresher condition than that shipped from a more distant point. The fact that fresh cheese can be obtained readily will tend to increase its consumption.

THE MANUFACTURE OF NEUFCHÂTEL AND CREAM CHEESE.

In this bulletin the production of the Neufchâtel group of cheese is considered from two points of view, (1) for home consumption and (2) for marketing on a small scale.

QUALITY OF MILK.

The quality of milk is the first consideration in the production of good Neufchâtel or cream cheese. Milk which is sour or has undergone any abnormal fermentation should not be used. By the use of fresh, unripened milk without any perceptible change in the acidity, the normal fermentations which are necessary for cheese of high quality can be controlled. Milk for cheesemaking should not be allowed to absorb any odors or taints, and the garlic flavor, especially, should be guarded against.

CLEAN UTENSILS.

Cleanliness of utensils is another essential in producing cheese of high quality. The following system is advised in washing milk and cheese utensils:

1. After using, rinse with cold water.
2. Wash with hot water to which a washing powder has been added. Always use a brush.
3. Rinse in hot water at a temperature above 150° F.
4. Steam or immerse in boiling water for five minutes.
5. Do not dry the utensils with a cloth but place them in a clean place free from dust.

RIPENING THE MILK.

The cheese is made by allowing the acid and rennet, or other curdling agent, to act simultaneously upon the milk. If great care has been used in the production and subsequent handling of the milk, the cheese may be made by adding rennet and allowing the milk to sour normally. A rather rapid development of acid is most desirable, as this tends to eliminate undesirable flavors, hastens the making process, and prevents losses of the curd. The lack of uniformity in ripening often requires a more definite means of controlling the acid fermentation, which may be accomplished by the use of a "starter."

THE USE OF STARTERS.

A "starter" is a quantity of milk that has soured and which contains large numbers of acid-forming bacteria. If the cheese is made in small quantities for home consumption, a starter is probably not advisable. The advantages of a starter over the natural souring are:

1. It hastens the coagulation of the milk.
2. It suppresses undesirable fermentations that may cause excessive losses of fat and curd.
3. It aids in suppressing undesirable flavors and produces more uniform cheese.

A starter of *Bacillus bulgaricus* may be used instead of the ordinary lactic-acid starter, but it is recommended only when there is a special demand for it.

STANDARDIZING THE MILK.

In making cream cheese for the market, milk testing about 6 per cent butterfat is most satisfactory. With 4 per cent milk available, if one-third of the quantity is run through a cream separator and the cream added to the remaining two-thirds, milk testing approximately 6 per cent is obtained. If the milk tests only 3 per cent it will be necessary to separate one-half of the quantity and add the cream to the remaining half. This method gives satisfactory results for home manufacture, but for more extensive operations it is advisable to use a Babcock tester in order to standardize the milk accurately.

The following diagram illustrates an easy method of determining the proportions of milk and cream of different per cent of fat needed to make up 6 per cent milk:

<i>Cream and milk on hand.</i>		<i>Proportions to be used.</i>
34 per cent cream.	6 per cent milk desired.	2 parts cream.
4 per cent milk.		28 parts milk.

The desired per cent of fat in the milk, in this case 6, is placed in the center of the square. At the upper left-hand corner the per cent of fat in the available cream is placed, in this instance 34. Immediately below, in the lower left-hand corner, the per cent of fat in the available milk is placed, which in the instance cited is 4. Next subtract diagonally across the square the smaller from the larger numbers and place the differences in the upper and lower right-hand corners respectively. In the upper right-hand corner 2 represents the number of parts of 34 per cent cream, and in the lower right-hand corner 28 represents the number of parts of 4 per cent milk necessary to make 6 per cent milk. If it is desired to make up a definite quantity of 6 per cent milk, for example, 60 pounds, the pro-

cedure is as follows: 2 added to 28 makes a total of 30 parts of 6 per cent milk. The quantity of 34 per cent cream necessary is $\frac{2}{30} \times 60$, or 4 pounds, while the quantity of 4 per cent milk is $\frac{28}{30} \times 60$, or 56 pounds.

PASTEURIZATION.

It is not always practicable to pasteurize the milk to make cheese for home use, but if the cheese is to be marketed it is very desirable to do so. When milk is pasteurized for cheesemaking it becomes absolutely essential to use a "starter" to obtain uniform results. It is advisable, also, to use the milk as soon as possible after pasteurization. Ordinarily, pasteurization is accomplished by heating the milk in a pail, can, or vat to a temperature of 145° F., and holding at that temperature for 30 minutes, after which it should be quickly cooled to 80° F. before adding the starter for ripening. The advantages of pasteurization are as follows:

1. It destroys disease-producing organisms.
2. It tends to reduce losses and increase the yield.
3. It aids in eliminating undesirable flavors.
4. Quality of cheese is more nearly uniform from day to day.

MAKING THE CHEESE.

The process described is identical for Neufchâtel and cream cheese, except for a few minor differences which will be mentioned.

Setting.—Unless otherwise noted, 30 pounds, or about 3½ gallons of milk, is the unit used in these directions; that quantity can be handled conveniently in a shotgun can. For smaller quantities any enameled or heavily tinned pail is satisfactory.

If a starter is added, it is advisable to use a quantity equal to 1 or 1½ per cent of the milk; while smaller quantities may be used, the proportions suggested are usually the most satisfactory.

Neufchâtel is made from ordinary milk, while the cream cheese requires milk containing about 6 per cent of butterfat. Milk for Neufchâtel is warmed to 80° F., and one-half pint of starter is added and thoroughly stirred in with a long-handled spoon or milk agitator. Then 8 or 10 drops of commercial liquid rennet, diluted in half a cupful of cold water, is added to the mixture, thoroughly stirred, and the can of milk set away to coagulate at 80° F. Powdered pepsin, which is cheaper than rennet, may be used instead, in which case a quantity equal to one-half of a medium-sized pea, dissolved in a cupful of cold water, is used. Fresh junket tablets also may be substituted for rennet. One tablet is dissolved in 10 tablespoonfuls of cold water and 3 tablespoonfuls of the solution used. For cream cheese a slightly larger quantity of the curdling agent is desirable.

For cream cheese the milk is warmed to 83° F., the process being the same in other respects. When starter is not used in making either kind of cheese, the process is unchanged except that after thoroughly stirring the milk it is set away, at the temperature described, for several hours before the rennet or other curdling agent is added.

After the milk has been set away to coagulate it should be kept as nearly as possible at the same temperature. Under normal conditions, after about 15 or 18 hours, about one-half inch of whey collects upon the surface of

the curd or coagulum; on the top of the whey a scum of fine white curd particles sometimes collects. This formation of whey indicates a normal fermentation. When the fermentation is abnormal, the coagulum is more or less convex, puffed, or inflated, and there is little, if any, whey on the surface.

A gassy fermentation of the curd does not necessarily render a cheese unfit for consumption; but for best results, both as to flavor and economy in handling, that condition should be prevented.

Under ideal conditions the milk usually begins to coagulate in the course of a few hours, but is allowed to stand undisturbed for from 15 to 18 hours. It is advisable to set it so that the curdling occurs during the night, and if the cans are not provided with covers they should be covered with a close-meshed cheesecloth in order to exclude dirt.

Draining.—After the setting period, when whey has collected upon the surface of the coagulum, or when the milk is firmly clabbered, the contents of the can or pail are poured upon a strong drain cloth. (See fig. 1.) The can may be shaken slightly before pouring, in order

FIG. 1.—Pouring the curd into the drain cloth.

to loosen any curd which has a tendency to adhere to the sides or bottom. Unbleached cotton sheeting, which can be obtained in yard widths, has proved to be the most satisfactory material for drain cloths. For a small-scale operation the cloth may be thrown over a pail, can, or wash boiler and the ends tied securely about the draining receptacle. The curd or coagulum should remain undisturbed in the cloth for 3 or 4 hours, after which it should be worked toward the center of the cloth in order to hasten the draining and get it in better

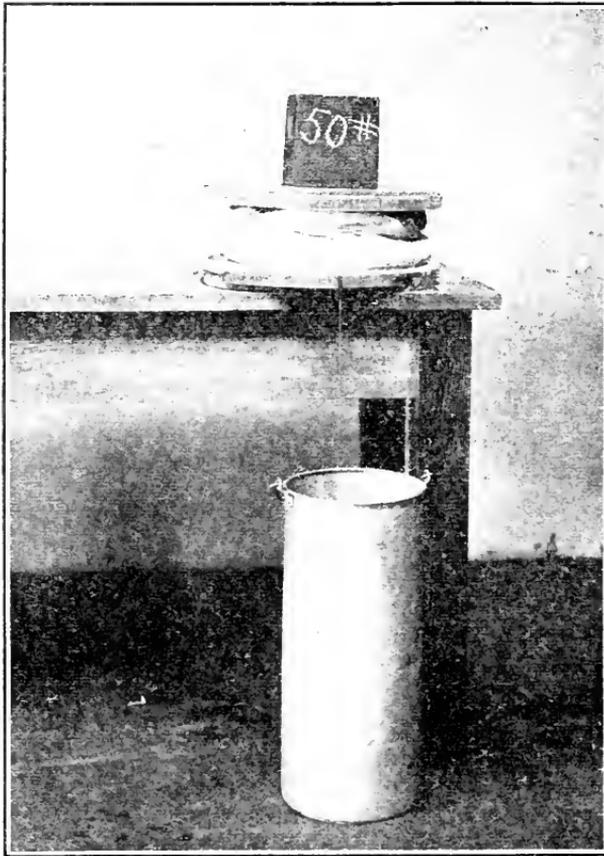

FIG. 2.—An improvised cheese press.

condition for handling. Drainage is allowed to continue until most of the visible whey has escaped and the curd appears rather dry as compared with its former mushy condition. Then the four corners of the cloth should be drawn diagonally across and tied. For home consumption, and especially when it is not cooled, the curd should be allowed to drain for a longer time before pressing.

Cooling the curd.—

While the cooling of the curd is very desirable, it is not absolutely necessary.

The object of cool-

ing is to facilitate the more rapid expulsion of whey during pressing. Cooling also seems to harden the curd so that it does not pass so readily into the meshes of the drain cloth and thereby interfere with and retard the expulsion of the whey. The bags of curd are placed on ice, or cracked ice is placed about them and left for a few hours.

Pressing.—After cooling, several bags of the curd are piled together between two boards and a weight of 50 pounds placed on top. (See fig. 2.) Frequent rearrangement of the bags will hasten the process. After this weight has been left on the cheese overnight, the curd should be in flat cakes. For Neufchâtel it is preferable

to press the curd from 30 pounds of milk until the pressed curd weighs $4\frac{1}{2}$ pounds, while for cream cheese it should weigh about $5\frac{1}{2}$ pounds. Special care should be taken in determining the yield of cheese in order to obtain a uniform quality from day to day, which can be done by weighing the curd. The manner and length of time of pressing determines, in a large measure, the texture of the cheese.

By using a screw press the curd may become too dry and gummy, but under ordinary conditions there is little danger if improvised equipment is used. (See fig. 3.)

Working and salting.—After having been properly pressed the cakes of curd are salted and worked with a potato masher or butterworker, or run through a food chopper to produce a smooth, buttery consistence.

Fine, dry salt is sprinkled over the curd at the rate of about 2 or $2\frac{1}{2}$ ounces to 10 pounds of curd, or about two level tablespoonfuls to the curd from 30 pounds of milk. (See fig. 4.) The

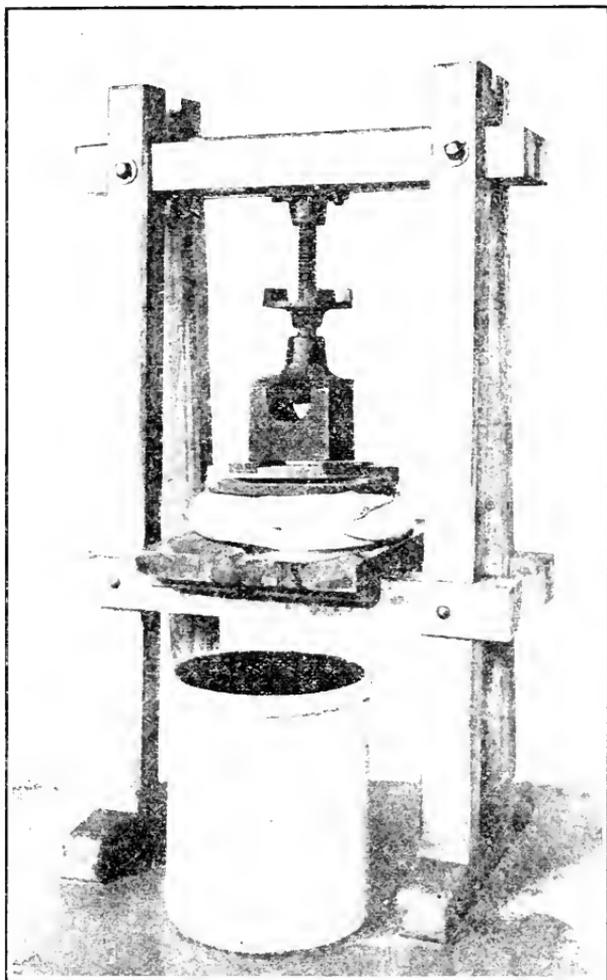

FIG. 3.—A screw press.

quantity of salt may be varied to suit the individual taste; the quantities recommended, however, usually give the best satisfaction. If the curd is worked with a potato masher the addition of salt aids in obtaining the proper smoothness of the cheese.

When cheese is made for home consumption it may be placed in a glazed crock or porcelain dish immediately after salting and held

at a temperature as near 50° F. as possible until consumed. Under favorable conditions it will keep in good condition for from 6 to 12 days. When cheese is kept a few days at a temperature of 60° to 70° F., it will become disagreeably sour. It is most palatable

FIG. 4.—Salting and working the cheese.

immediately after it is made, for then it is fresh, soft, and sweet. When very cold, or after having been kept for some time, it does not have so fine a flavor.

Combinations with Neufchâtel and cream cheeses.—Finely chopped pimiento peppers may be mixed with either Neufchâtel or cream

cheese at the time of salting. Such cheese has a mild though pronounced flavor and is very popular for sandwiches and salads. The pimientos seem to have a certain preservative effect and tend to cover up "off flavors" that may develop. About 1 pound of the chopped pimientos is added to 12 pounds of cheese, or about one-half pound for the cheese from 30 pounds of milk.

While there are numerous other cream-cheese combinations, there are two that are worthy of especial note—olive-pimiento cream and Roquefort cream cheese. Both of these flavoring ingredients should be added at the rate of 1 part to 10 parts of cream cheese. When Roquefort cheese is uniformly incorporated with cream cheese it gives to the combination a rich and pleasing flavor very similar to Roquefort cheese, though milder.

Molding.—Cheese for home consumption need not be molded. When marketed a special device is necessary in order to shape the cheese into a commercial package. Neufchâtel, cream, and pimiento cheeses require a special style of package. While there are numerous devices for molding, many of them are not suited for meeting market demands. As a result of considerable experimenting the attachments described below were devised to fit the ordinary food chopper and proved to be very satisfactory for handling the several kinds of cheese.

For molding small quantities of cheese the following equipment is desirable: (See figs. 8 to 12.)

1. A food chopper.
2. A hopper.
3. Two molding attachments for chopper.
4. A cheese conveyer.
5. A cheese cutter.

When used for molding, both the knives and the plate should be removed from the chopper; otherwise the cheese will go through with great difficulty. The cheese hopper is a boxlike arrangement clamped to the top of the food chopper to prevent the scattering of particles of cheese upon the worktable. The cheese is poured into the hopper at short intervals, since it is not advisable to keep the hopper more than half full, or the feed screw will not force the cheese so readily through the hopper. If the hopper is full the cheese may become too "gummy" and will not only be difficult to force through the chopper, but will adhere to the long-handled spoon used to push the lumps of curd into the machine. It is advisable to use a spoon in order to keep one corner of the hopper free of the cheese and, by allowing the escape of air, facilitate the grinding of the cheese.

The lips of the molding attachment are fastened to the chopper by means of a ring. The attachment for molding Neufchâtel cheese is cylindrical and is about $1\frac{1}{2}$ inches in diameter at its delivery end.

The cheese, forced through this attachment, comes out in the form of a roll or cylinder.

Pimiento cheese is forced into a special glass jar smaller than a jelly glass or a paraffined wood-fiber container held horizontally over the end of the Neufchâtel attachment so that the cheese reaches the end of the container and flattens out without difficulty. (See fig. 5.) If the pimiento cheese is to be used in a short time, the wood-fiber containers are especially recommended, as they are less expensive than glass jars. If the cheese is marketed directly to the consumer, the glass jars may be returned and used again.

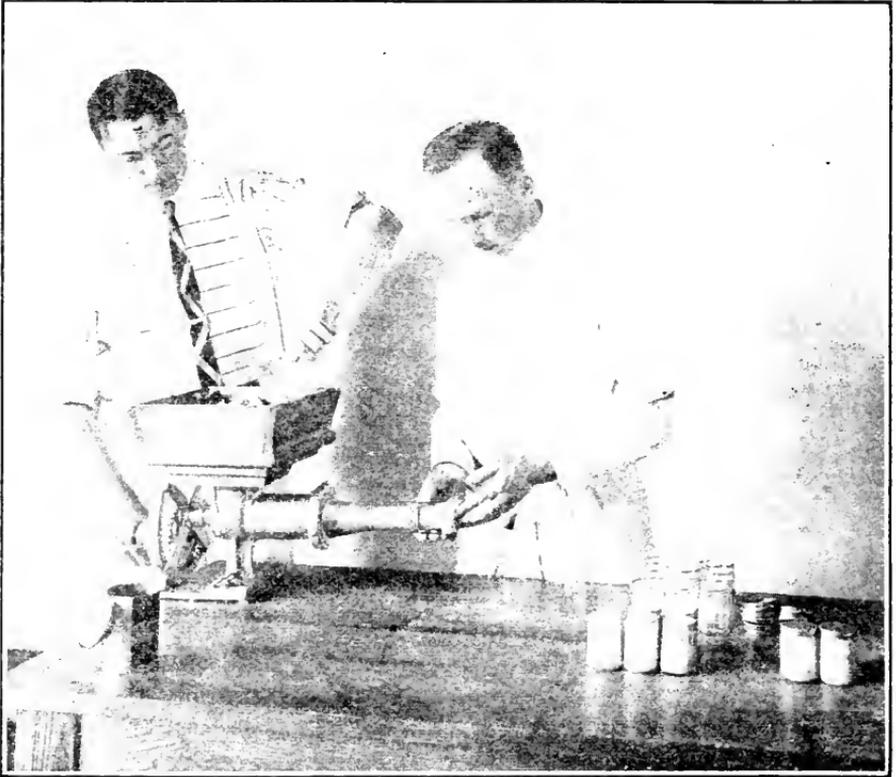

FIG. 5.—Filling jars with pimiento-cream cheese.

The attachment for cream cheese is rectangular at its delivery end. By its use the cheese may be molded into smooth, ribbonlike bands which, as in the case of Neufchâtel cheese, may be cut with a wire into pieces of the desired size.

The cheese is delivered from the attachment on a canvas conveyer, supported by rollers, which turn with sufficient friction to cause the plastic curd to be firmly pressed together as the cheese is automatically pushed forward. (See fig. 6.) The first cheese that passes through the attachment often "frills"; that is, it presents an irregular surface, but later the difficulty becomes less marked, and the

cheese comes out with a surface well defined and smooth. "Frilling" occurs more often in molding cream cheese than in Neufchâtel.

Cutting the cheese.—Cream cheese and Neufchâtel cheese may be cut into cakes of the desired size by means of fine wires drawn over a rectangular-shaped framework. (See fig. 11.) The use of this simple equipment makes it possible to cut half a dozen cheeses simultaneously and prevents delay, so that one person may do the grinding while another cuts and wraps the cakes.

Wrapping the cheese.—After cutting the cakes they are slowly carried along by the carrier and eventually fall upon a flat form upon which tin-foil wrapping papers are laid. These papers may be

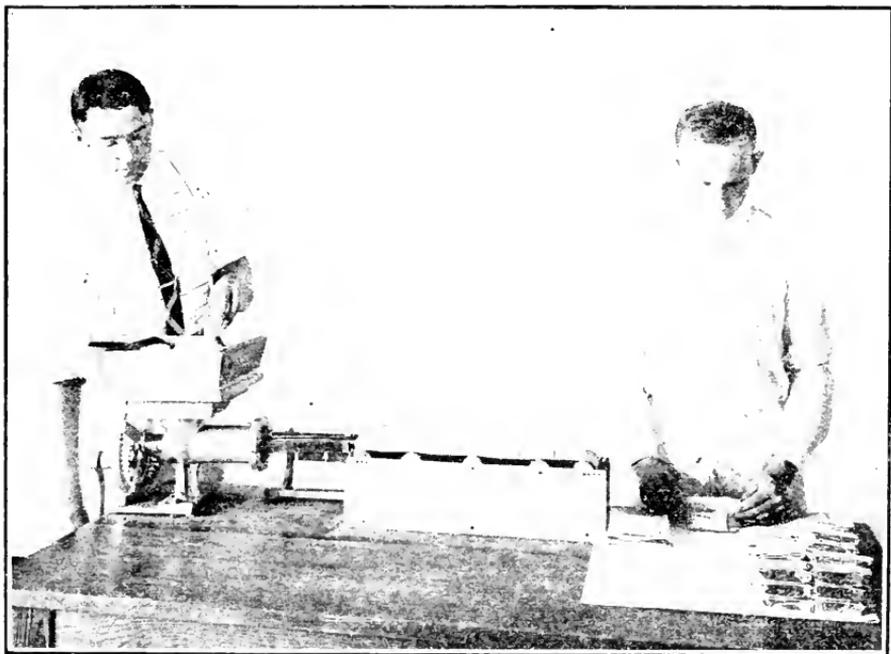

FIG. 6.—Molding and wrapping cream cheese.

held in place by a cleat or clamp. In many cases it is more convenient to take the cheese directly from the carrier, but when the person who does the wrapping is kept very busy the platform may serve as a place where several cakes may accumulate, thus allowing the grinding operations to be continued. While one person is engaged in filling the hopper and molding the cheese another is kept busy cutting and wrapping. In wrapping, the cheese is placed in the center of the paper, each side of the paper folded over, and the ends turned down, to cover the cheese completely. (See fig. 10.)

Yield.—One hundred pounds of milk containing 4 per cent fat should yield from 14 to 16 pounds of Neufchâtel cheese, while 6 per cent milk should give an average yield of from 17 to 19 pounds

of cream cheese. With milk testing less than the above, a smaller yield and a lower grade of cheese will be obtained. Although there may be slight seasonal fluctuations in the solids of milk, yet for the most part the yield of cheese, other conditions being equal, is almost directly proportional to the per cent of fat. There may be variations in yield of cheese, however, due to mechanical factors, such as longer pressing.

Neufchâtel cheese is sometimes made from skim milk, in which case it is used for cooking and baking purposes. Commercially, there are other grades of Neufchâtel made from one-half or two-thirds skim milk. Such cheeses are labeled as made from "partially skimmed milk" or "skimmed milk" as the case may be.

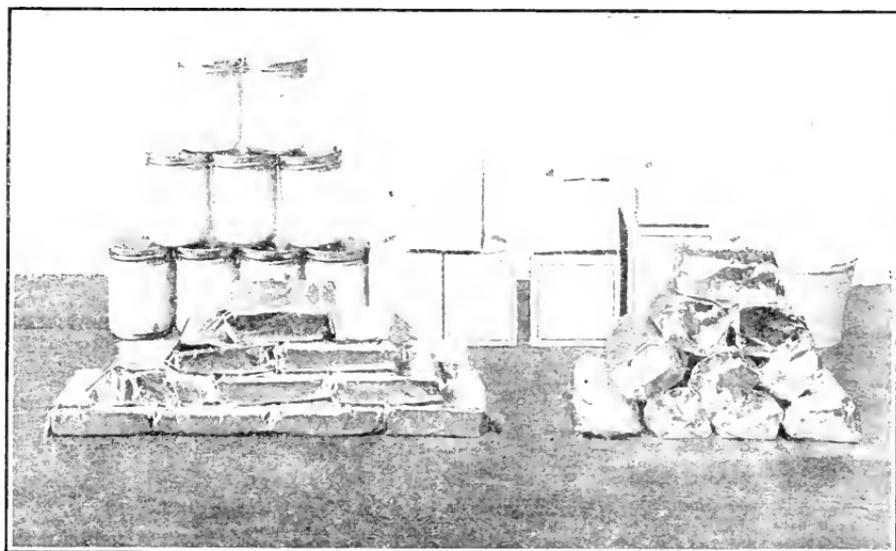

FIG. 7.—Types of packages.

Packages.—Tin-foil or aluminum-foil wrapping paper which has a parchment paper inside is generally used in wrapping cream and Neufchâtel cheeses, since it gives each package a bright, uniform, and attractive appearance. (See fig. 7.) Great care should be taken to wrap each cake neatly and securely in order to exclude the air as much as possible. Any "frilling" or other irregularities may be corrected by drawing the foil tightly about the cheese. Careful and skillful wrapping tends to increase the length of time the cheese is salable. The yellow or amber-colored mold which often spreads over the cheese should be prevented as much as possible, not because it may render the food harmful or poisonous, but because it causes deterioration and renders the cheese less appetizing.

The standard Neufchâtel package is cylindrical, about $1\frac{1}{2}$ inches in diameter by $2\frac{1}{2}$ inches long, and weighs about $2\frac{1}{2}$ ounces net.

Standard packages of cream cheese are about 3 by 2 inches and 1 inch thick, and have a net weight of about 3 ounces. The pimiento cheese is marketed in 3 or 4 ounce glass jars, each packed full and covered with a disk of paraffined paper and screw cap.

COST OF MANUFACTURE.

When made upon a small scale the cost of the various items of making these kinds of cheese for market purposes is difficult to ascertain. The cost of manufacturing them on a farm scale would probably be quite different from the cost of manufacturing them on a factory scale. The figures given are based upon the use of 200 pounds of 4 per cent milk, valued at \$2.40 a hundredweight, which is made into cheese twice weekly with equipment costing about \$25. The cost of the equipment depends, of course, upon that already available and that which may readily be improvised. Under average conditions the approximate cost of the various items of expense involved in making the three kinds of cheese is enumerated as follows:

COST OF MAKING CREAM CHEESE.

With 200 pounds of 4 per cent milk a dairyman should be able to make 24 pounds of cream cheese, and with the skim milk 12 pounds of cottage cheese in addition. At present cream cheese is marketed in 3-ounce packages. Figuring conservatively, the yield from 200 pounds of milk, then, would be about 120 packages of cream cheese and 12 pounds of cottage cheese. Assigning a value of 6 cents a pound for the latter, and subtracting the amount received for it, the cost of the milk used for cream cheese would be reduced from \$4.80 to \$4.08. The cost of milk for each package of cream cheese, then, would be \$0.034.

The cost of special equipment necessary for handling the cheese may be proportioned as follows:

1 food chopper.....	\$8.50
6 shotgun cans.....	5.10
6 drain racks.....	4.50
2 molding attachments.....	2.00
1 carrier.....	1.25
1 thermometer.....	.60
1 hopper.....	.50
1 cheese cutter.....	.50
6 yards of cloth for draining.....	.75
1 pail.....	.85
1 agitator or stirrer.....	.25
2 spoons, long-handled.....	.20
	<hr/>
	25.00

A good food chopper should last 10 years, a drain rack 5 years, and a shotgun can about 3 years. Figuring a yearly depreciation of about 20 per cent, the depreciation charges would be \$5. The interest at 6 per cent on the investment would be \$1.50, and the interest and depreciation charges per cheese would be $1/12000$ of \$6.50, or \$0.00054.

The labor would require half an hour to pasteurize the milk, about $1\frac{1}{2}$ hours to make the cheese, and another half hour to mold it, or about $2\frac{1}{2}$ hours, actual time for the various operations. However, while in pressing it would require but a few minutes to handle the cheese, the entire pressing operations would extend over several hours. It is assumed, therefore, that the time not used in working with the cheese could be utilized in some other manner. The total labor charge would be 50 cents, figuring labor at 20 cents an hour. The labor charges would then be $1/120 \times 50$, or \$0.00416 for each cheese.

Figuring the cost of pasteurization and separation as 1 cent a gallon, the charge for each cheese would be \$0.00192. It would require about 50 pounds of ice for the 24 pounds of cheese, which would make the ice cost about \$0.00016. Figuring the rennet at \$10 a gallon and the salt at 1 cent a pound, the charge would be \$0.00005, and \$0.004 for tin foil at 90 cents a pound:

Milk.....	\$0.03400
Interest and depreciation.....	.00054
Labor.....	.00416
Pasteurization and separation.....	.00192
Ice.....	.00016
Salt and rennet.....	.00005
Tin-foil wrapping paper.....	.00400
Per cheese.....	<u>0.0483</u>

COST OF MAKING PIMIENTO-CREAM CHEESE.

Pimiento-cream cheese is made practically the same as cream cheese, with the single exception that pimiento peppers are added. The cheese is usually marketed in 4-ounce glass jars, which may be obtained in gross lots for about 2 cents each. Pimiento peppers cost about 40 cents a pound and are added to the cheese at the rate of 1 pound to from 10 to 20 pounds of curd, as some people prefer a higher proportion of the peppers. The figures given are on the basis of 1 pound of peppers to 12 pounds of cheese. The labor charge will be somewhat greater for pimiento cheese than for cream cheese; the labor charges are figured at $3\frac{1}{2}$ hours instead of $2\frac{1}{2}$, as in the case of cream cheese. There would then be a yield of 26 pounds of cheese, costing \$4.08. When pimiento cheese is produced under the conditions outlined the cost for each jar may be summarized as follows:

Milk.....	\$0.03457
Interest and depreciation.....	.00055
Labor.....	.00593
Pasteurization and separation.....	.00196
Ice.....	.00016
Salt and rennet.....	.00005
Glass jar.....	.02000
Peppers.....	.00666
	<hr/>
Per jar.....	.06988

COST OF MAKING NEUFCHÂTEL CHEESE.

Figuring a yield of 15 pounds of cheese per 100 pounds of milk and each package weighing $2\frac{1}{2}$ ounces, the cost of making one Neufchâtel cheese may be summarized as follows:

Milk.....	\$0.02500
Depreciation and interest.....	.00033
Ice.....	.00013
Labor.....	.00269
Pasteurization.....	.00120
Salt and rennet.....	.00005
Tin-foil wrapping paper.....	.00400
	<hr/>
Per cheese.....	.03331

MARKETING.

Neufchâtel, cream, and pimiento-cream cheeses are sold by the box. The wholesale price of a cheese is usually 2 or 3 cents less than the retail price. Cream cheese retails for about 15 cents a package, Neufchâtel for 7 cents, and pimiento cream at 15 cents a jar.

RETURNS FROM 100 POUNDS OF MILK.

Upon the basis of the calculated cost of manufacturing and at current prices for the cheese, the following returns should be obtained per 100 pounds of 4 per cent milk, viz. for cream cheese \$9, for Neufchâtel \$8.40, and for pimiento cream \$8.85. After subtracting the estimated cost of making the cheese from 4 per cent milk, valued at \$2.40 a hundredweight, there should be a net profit of \$6.14 for cream cheese, \$6.22 for Neufchâtel, and \$4.45 for pimiento cream. Rent and cost of marketing are not considered.

POSSIBILITIES.

The desirability of making these varieties of cheese upon a small scale and successfully marketing them depends upon the skill of the maker and his ability to obtain a direct and ready market for his product. When cheese is made and delivered once or twice a week, a dairyman is in far better position to serve the public by selling a perfectly fresh product than the larger manufacturers, working at a

distance, who are obliged to dispose of their cheese several days after it is made, and who must pay the additional expense of boxing and shipping. If the cheese is marketed directly upon a small scale it is not necessary to put it into the flat boxes, as is the case if it is handled commercially. The cheeses may be disposed of satisfactorily by placing them in one large box and piling one cheese upon another. When cheese of this type is delivered upon a milk route the use of a special box provided with two compartments, one for ice and the other for cheese, is advisable during the warm periods of the year. Pimiento-cream cheese, because of its keeping quality, is particularly adaptable to small-scale operations. When sold in glass jars it is sold as readily as the product of the larger manufacturers. With a direct outlet, arrangements may be made to use the jars again and thereby reduce the cost of marketing.

When suitably situated it should be practicable for many dairymen to supply cheese to a neighboring town at good prices for their milk and extra trouble. It should be especially feasible for the milk dealer to dispose of his surplus milk in the form of cheese; in fact, in some cases for some of these kinds of soft cheese he would receive as much as or more than for the milk. By beginning in a small way the milk dealer should be able to develop a trade in fancy cheeses, such as cottage, Neufchâtel, cream, and pimiento cream, and by selling direct to the consumer he could compete successfully with larger manufacturers.

KEEPING QUALITIES OF THE CHEESE.

When wrapped in foil and put into a cold place immediately after making, cream and Neufchâtel cheeses should keep from 6 to 12 days without developing objectionable flavors; usually cream cheese seems to keep somewhat better than Neufchâtel. If pimiento-cream cheese is placed in the customary jars and held at 50° F. or below, it should be still palatable at the end of a month. These products develop a sourish taste rather quickly when held at a high temperature. The temperature, therefore, is by far the most important factor concerned in regulating the keeping qualities of the cheese. There may be considerable variation in both the salt and water content of the cheese without causing much deterioration.

EQUIPMENT FOR MAKING NEUFCHÂTEL AND CREAM CHEESES.

Little equipment is needed for making these cheeses for home consumption, and many satisfactory substitutes may be found for that mentioned. When the cheese is marketed on a large scale a greater outlay is desirable in order to handle it efficiently.

Floating dairy thermometer.—The use of a reliable and accurate thermometer is imperative if uniform results are to be obtained. A

thermometer of this kind is not expensive, and when not in use should always be kept in the case.

Starter bottles.—Pint milk bottles, which may be covered with glass tumblers, are needed for holding the starter, although the size of the containers depends, of course, upon the quantity of cheese made. Pint fruit jars also can be used; and may be covered with bowls.

Shotgun cans.—These cans are usually 9 inches in diameter, 20 inches high, and hold about 4 gallons of milk. For work on a small scale a 10-quart, heavily tinned or enameled pail may be used satisfactorily.

Rennet and pepsin.—Commercial liquid rennet and powdered pepsin have been found to be satisfactory curdling agents. Fresh junket tablets also produce good results.

Milk agitator.—A stirrer is desirable to cause a uniform distribution of rennet or starter and to aid in preventing a too rapid rising of the cream. A long-handled spoon may be used if only a small quantity of cheese is made.

Draining rack.—The rack shown in figure 1 is rectangular, 13 inches wide, 36 inches long, and 10 inches deep. The corner posts extend $1\frac{1}{2}$ inches beyond the strips at top and bottom, with the top rounded, so that a ring may fit over them. The bottom slats fit loosely into notches and are removable for washing purposes. The materials required are 4 corner posts $1\frac{1}{2}$ by $1\frac{1}{2}$ by 10 inches, 9 strips 1 by $\frac{3}{8}$ by 36 inches, and 6 strips 1 by $\frac{3}{8}$ by $12\frac{1}{4}$ inches, notched to receive bottom slats, all made of pine. A cloth is fastened upon each frame and the contents of one can poured upon each cloth. For small-scale operations an orange crate or a boiler or pail may serve the same purpose.

Drain cloth.—Unbleached cotton sheeting is recommended for this purpose. A fine-meshed cloth gives strength and aids in preventing losses of fat and casein. The size of the cloth depends upon the nature of the draining rack. Each cloth should be 45 inches long and a yard wide, with the ends hemmed. After use each should be quickly and carefully washed and dried in order to increase the period of its usefulness.

Press.—If a screw press is available, its use is to be recommended. A 50 or 60 pound weight, such as a can of water or bucket of stones, left upon the curd overnight usually proves to be satisfactory. (See figs. 2 and 3.)

Curd worker.—For small-scale operations a bread mixer or a potato masher may be used to give the curd proper consistence and to incorporate the salt. When working on a larger scale a butter-worker or food chopper will serve the same purpose.

Food chopper.—A food chopper with special attachments and a hopper are essential for molding the cheese into the desired forms. Depending upon the quantity of cheese handled, satisfactory food choppers may be obtained in three sizes, costing about \$2, \$5, and \$8.50. (See fig. 8.) The smaller machines may be used in handling Neufchâtel and pimiento-cream cheese, but cream cheese requires the large size for making the customary flat packages. The large machine is to be recommended if the weekly output of cheese amounts to a few hundred pounds, although the medium-sized machine would probably do the work as effectively, only more slowly and with more labor.

Cheese hopper.—The hopper consists of an open box 3 inches deep, made of maple, with sides sloping outward about half an inch. The

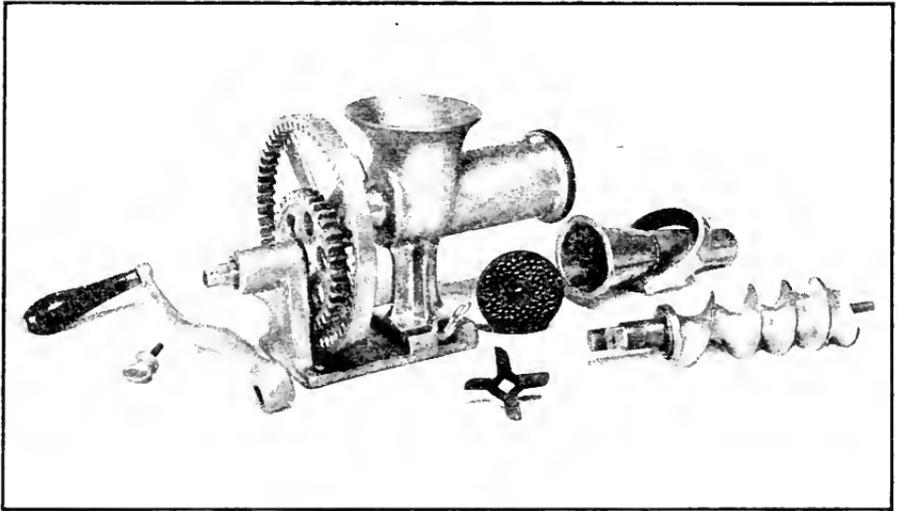

FIG. 8.—Grinding and molding equipment.

box has a hole in the bottom $3\frac{1}{2}$ by $3\frac{1}{2}$ inches. To the bottom of the box a board five-eighths of an inch thick is screwed, which has a hole corresponding to that of the box. The hopper is fastened to the food chopper by means of a beveled strip of wood and button, as indicated in figure 9. The base of the box will probably have to be grooved in order to allow the wheel to turn without friction. The materials required are (1) two quadrangular-shaped pieces of wood 3 inches high, five-eighths of an inch in thickness, and whose tops measure $9\frac{3}{8}$ inches and the bottoms 8 inches; (2) two pieces of similar shape, except that the tops measure $11\frac{1}{2}$ inches and the bases $10\frac{1}{4}$ inches; (3) one piece $10\frac{7}{8}$ inches long, $10\frac{1}{8}$ inches wide, and three-quarters of an inch thick; (4) one piece $9\frac{3}{8}$ inches long, 7 inches wide, and three-quarters of an inch thick; and (5) one piece 7 inches long, $4\frac{3}{8}$ inches wide, and five-eighths of an inch thick.

Neufchâtel attachment.—The attachment for molding Neufchâtel and pimiento-cream cheeses consists of a tin form having a conical shape with a tube attached. The cone has a 2½-inch base which gradually tapers down to a tube whose diameter is 1½ inches. (See fig. 10.) The distance from the base of the cone to the tube attached is 3½ inches; the tube is about 5 inches long. A vertical lip about one-quarter of an inch across makes it possible to connect the tube to the food chopper; the attachment fits into the ring of the chopper.

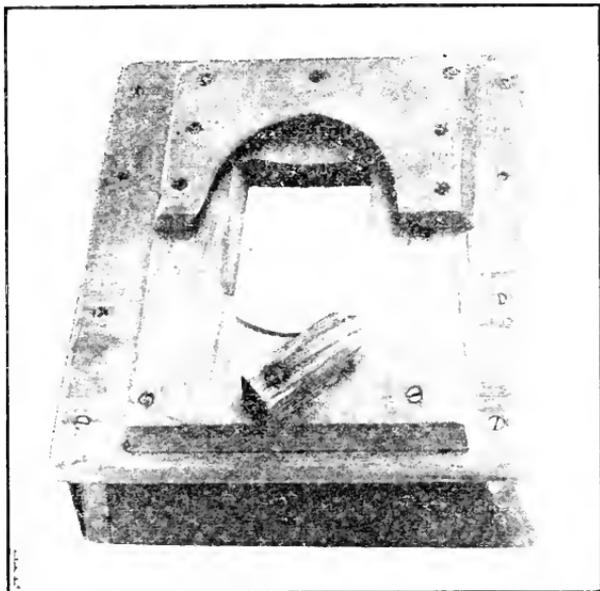

FIG. 9.—Under view of cheese hopper, showing method of attachment.

Cream-cheese attachment.—The cream-cheese attachment consists of a ring to which a rectangular-shaped molding tube is soldered. (See fig. 10.) The base of the tube is 2½ inches wide and fifteen-

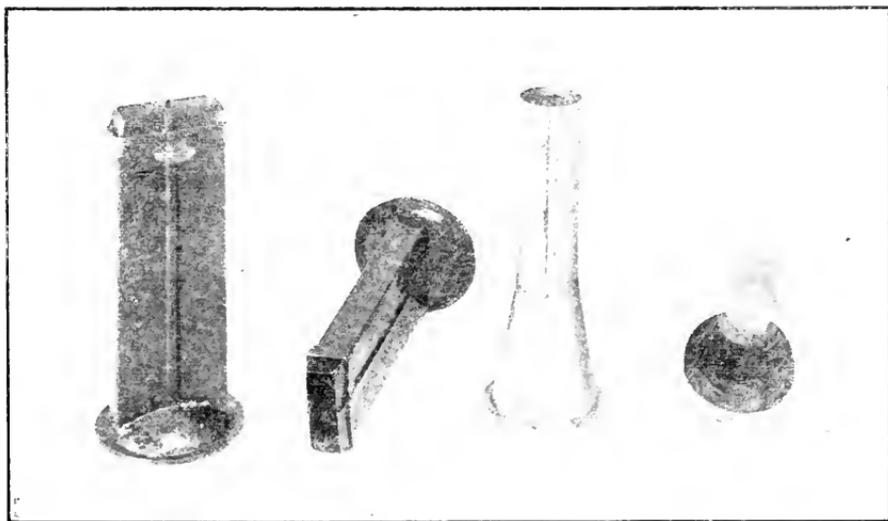

FIG. 10.—Molding attachments for Neufchâtel and cream cheese.

sixteenths of an inch thick. The delivery end of the tube, which is 2½ inches wide and three-quarters of an inch thick, is cut back one-third of an inch at each corner and V-shaped pieces of tin removed.

The lips of the tube are then drawn together until there is about one-sixteenth of an inch of free space at each corner.

Belt conveyer.—The belt conveyer used in removing the cheese as it leaves the attachment is shown in fig. 11. It is a rectangular-shaped box, 20 inches long, 6 inches wide, and $4\frac{3}{4}$ inches deep, with the ends and top removed. Five bearings fit into the notches on one side and holes on the other side in two strips of iron fastened to the upper edges of the two open ends of the box. A $3\frac{1}{2}$ -inch canvas belt runs snugly though not tightly upon the rollers. The materials required are two pieces of maple $4\frac{3}{4}$ inches wide, one-half inch thick and 20 inches long; four oak rollers $4\frac{3}{8}$ inches long and $1\frac{3}{4}$ inches in diameter; one oak roller $4\frac{3}{8}$ inches long and $1\frac{1}{2}$ inches in diameter. The rollers have a one-sixteenth-inch clearance and are beveled one-eighth of an inch from bearing to outer face. In addition, two 20-inch strips

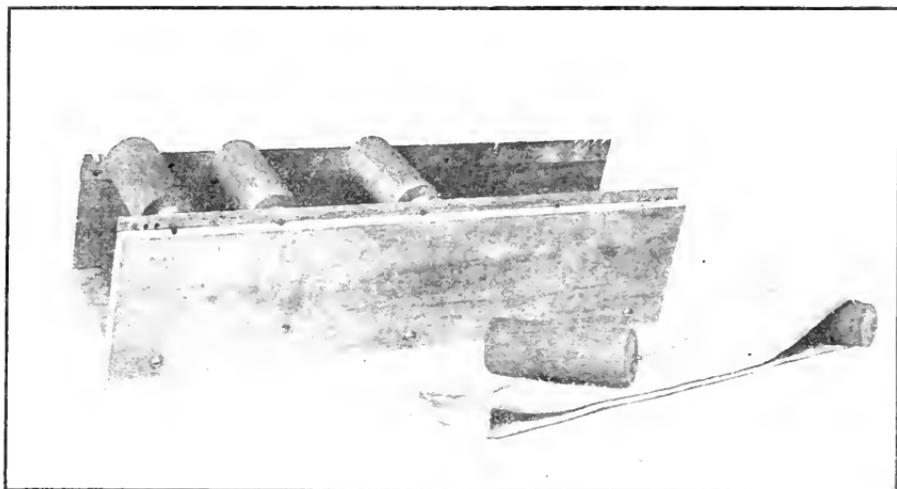

FIG. 11.—Belt conveyer.

of galvanized iron 1 inch wide and one-eighth of an inch thick are needed. In both ends of one of these strips of iron there are four outward-slanting notches which are one-half inch deep and one-eighth inch wide, and evenly spaced between the ends there are three additional vertical notches of the same size. There are 11 one-eighth-inch holes in the second iron strip, corresponding to, parallel with, and of the same height as the bottom of the notches of the first strip. The boards and strips of iron are joined together by means of screws.

Cheese cutter.—A cheese cutter consists of a rectangular framework of poplar over which 7 fine wires are drawn. (See fig. 12.) The wires are fastened by means of iron pegs or screws to the outer edge of two half-inch strips 15 inches long. The strips are 5 inches apart, parallel, and are supported by 3 vertical pieces of wood 5 inches long, 3 inches wide, and one-half inch thick. Each of these

supports is hollowed out in order to give plenty of space for cutting the cheese. The vertical supports are held in place by means of a single flat strip $13\frac{3}{4}$ inches long, seven-eighths inch wide, and one-quarter inch thick. The wires are placed $2\frac{1}{2}$ inches apart and the supports $6\frac{3}{4}$ inches apart. All connections are made with 1-inch screws.

Tin-foil paper.—Tin foil covered with parchment paper is generally used to wrap the cheese (cream or Neufchâtel), although of late aluminum foil has been used quite extensively. The dimensions of the foil are $4\frac{1}{2}$ by 6 inches, and it is purchased by the pound.

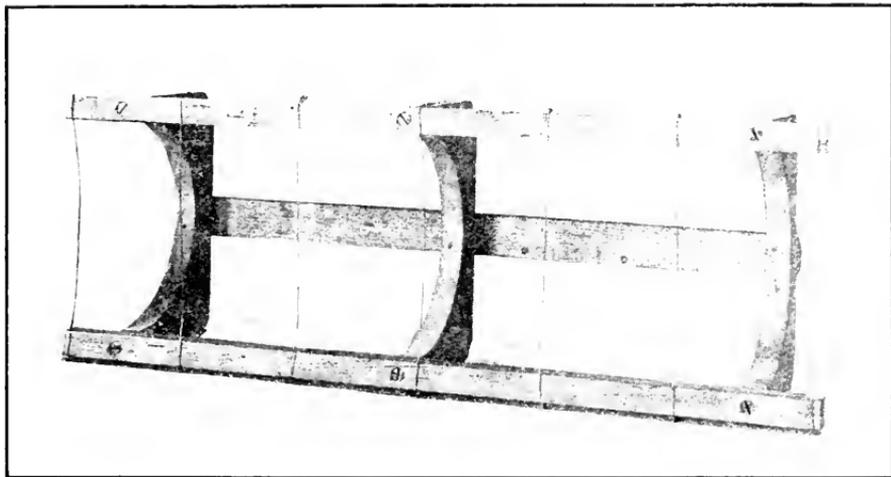

FIG. 12.—Cheese cutter.

SUMMARY OF DIRECTIONS.

The following outline for making the Neufchâtel group of cheeses is based on 30 pounds or $3\frac{1}{2}$ gallons of milk.

Except as noted, the process is the same for Neufchâtel as for cream cheese. For Neufchâtel cheese use whole milk that tests 4 per cent, and for cream cheese use milk standardized to 6 per cent.

If it is desired to pasteurize, heat the milk to 145° F., hold at that temperature for 30 minutes, then cool to 80° F. for Neufchâtel and 83° F. for cream cheese. If the milk is pasteurized, a starter must be added.

Add half a pint of a good starter or clean-flavored sour milk and stir well. Rennet is then added at the rate of one-third of a cubic centimeter (about eight drops), diluted in a cup of cold water, stirred in thoroughly, and the milk set aside to curdle. In place of rennet, powdered pepsin (one-half the size of a pea) dissolved in a cup of cold water, or one-third of a junket tablet dissolved in a like quantity of water, may be added. In making cream cheese it is ad-

visible to use a very slightly larger quantity of the curdling agent than for Neufchâtel.

If the milk is not pasteurized, warm or cool it to the temperatures mentioned above, add starter and rennet as described, and set away to curdle.

If starter is not used, the milk is set away for several hours, at the temperature described, before the rennet or other curdling agent is added. After thoroughly stirring, the milk is set away at the same temperature to curdle. In either process the time necessary for proper curdling is from 16 to 18 hours. It is often convenient to set the milk to curdle overnight.

Pour the coagulum or curdled milk upon the drain cloth and allow it to drain from 2 to 4 hours, or until practically no whey drips from the cloth and the curd is comparatively dry.

Scrape the curd toward the center of the cloth and tie the diagonal corners of the cloth together to facilitate handling.

If ice is available place the bag or curd in crushed ice and leave it for 3 hours or longer. If ice is not available allow the curd to drain an extra hour or more.

Place the bag of curd between two clean boards, put a 50-pound weight upon it, and let it stand. Pressing should cease when there is a yield of about $4\frac{1}{2}$ pounds of Neufchâtel or about $5\frac{1}{2}$ pounds of cream cheese. This will take about 6 or 8 hours. If a cider or other screw press is available the time required for pressing is about $1\frac{1}{2}$ hours.

Remove the curd from the cloth into a pail, sprinkle two level tablespoonfuls of fine salt over the curd, and thoroughly mix with a potato masher until it has a smooth, buttery consistence. Running the cheese through a food chopper or working it with a butterworker produces the same result.

Place the cheese in a crock or enameled dish until ready for use.

Mold the cheese into commercial packages by means of the food chopper, special attachment, and cheese cutter.

Wrap in tin foil or aluminum foil, or pack in glass jars.

Keep the cheese at a temperature of 50° F. or below until consumed. At that temperature Neufchâtel and cream cheese should keep from 6 to 12 days, and pimiento-cream cheese should keep nearly a month.

THE USE OF NEUFCHÂTEL AND CREAM CHEESE IN THE DIET.

In nutritive value these cheeses compare favorably with other staple foods, especially meat. They are easily digested when taken in moderate quantities and in combinations with other foods, and, being rich in protein and fat, they easily replace such foods as meat, fish, and eggs. There are many foods with which they combine to

form appetizing and attractive dishes that are easily and quickly prepared. These cheeses may be used in a greater number of ways than other varieties because they are soft in texture, blend well with most foods, and are rich in protein and fat. Perhaps the most desirable ways to serve them are in the forms of salads, sandwiches, and similar dishes.

The Office of Home Economics, States Relations Service, in cooperation with the Dairy Division, has made the following studies of cheese cookery:

Either cream or Neufchâtel cheese may be combined with such foods as olives, green peppers, pimientos, pickles, different kinds of nuts, various vegetables, and nearly all fruits. In addition to the desirable blending of the flavors of cheese and the other ingredients, the combinations give spice, color, and attractiveness, increase the food value, and afford a variety of dishes easily and quickly prepared.

The following recipes illustrate a few of the many ways of serving these cheeses. Cream or Neufchâtel cheese may be used in each of the following recipes unless otherwise noted:

SALADS.

PLAIN CHEESE SALAD.

Cut the cheese into small pieces and scatter them over lettuce leaves. Serve with French or mayonnaise dressing.

CHEESE AND PIMIENTO SALAD.

Stuff canned pimientos with the cheese and cut in slices. Serve on lettuce leaves with French or mayonnaise dressing.

OLIVE AND PIMIENTO-CHEESE SALAD OR SANDWICH.

Add cream or Neufchâtel cheese, chopped olives, and pimientos in equal parts. Salt to taste and form into a roll or mold. Cut into slices and serve on lettuce leaves with French or mayonnaise dressing.

CHEESE AND LETTUCE SALAD.

3 leaves of lettuce (chopped).	$\frac{1}{2}$ teaspoon salt.
1 cheese or 4 tablespoons.	$\frac{1}{8}$ teaspoon paprika.

Mix ingredients, roll into balls, and cover with toasted bread crumbs. Serve plain or on lettuce leaves with dressing.

TOMATO AND CHEESE SALAD NO. 1.

Choose medium-sized tomatoes, peel, and slice very thick. Drain well and wipe each slice. On top of each put a thick layer of cheese, mixed with chopped green peppers. Cover all with French or mayonnaise dressing and serve on lettuce. Pimiento peppers may be used instead of or with green peppers.

TOMATO AND CHEESE SALAD NO. 2.

Stuff cold tomatoes with cream, pimiento-cream or Neufchâtel cheese. Serve on lettuce leaves with French or mayonnaise dressing.

TOMATO AND CHEESE SALAD NO. 3.

Mix with the cheese chopped pimientos, celery, and olives. Season with salt and paprika. Wash and remove centers from fresh, medium-sized tomatoes, and fill the cavity with the seasoned cream cheese. Serve on lettuce leaf with salad dressing.

BLANCHED GREEN PEPPERS AND CHEESE SALAD.

Blanch peppers, cut off large end, then remove centers and put peppers on ice. Mix with the cheese:

$\frac{1}{2}$ teaspoon salt, 1 dash paprika, 6 stuffed olives, chopped fine.

While soft, press into the hollowed peppers, chill, and cut into slices. Serve on lettuce leaves with mayonnaise, or use as a garnish.

RADISH AND CHEESE SALAD.

Select medium-sized radishes, wash and scrape out the centers, adding the part removed to cream cheese to which pimientos or nuts have been added. Mix well and fill radishes with mixture and serve on lettuce leaves with dressing. This cheese combines well with almost any vegetable or fruit to make salads and sandwiches.

CHEESE AND VEGETABLE SALAD.

Slice thin some peeled tomatoes and cucumbers. Make a quantity of cheese balls, heap them on lettuce hearts in the middle of a flat dish, and put little piles of cucumbers and tomatoes alternately around them. Cover with French or mayonnaise dressing and serve.

POTATO AND CHEESE SALAD.

Salad dressing.	$\frac{1}{2}$ cup of water.
1 egg.	Mustard or curry powder.
$\frac{1}{2}$ teaspoon of salt.	1 cheese or 4 tablespoons.
$\frac{1}{4}$ cup of vinegar.	Diced potatoes.

Add to well-beaten egg the other ingredients and cook over water until thick, then add the cheese and stir until melted and smooth. Pour over the potatoes, which have been cubed or diced, and mix well. Chopped celery, sweet peppers, or celery seed change the taste and give variety.

CHEESE AND CELERY SALAD.

1 stalk celery.	$\frac{1}{2}$ tablespoon of paprika.
2 cheeses or $\frac{3}{4}$ cup.	2 tablespoons of finely cut celery tops
1 teaspoon of salt.	and lettuce leaves.
2 tablespoons of ground pecan nuts.	

Separate the celery, clean thoroughly, and place on ice until crisp. Mash cheese until soft, and add salt, paprika, and ground nut meats. Dry the celery, fill the hollow part with the cheese mixture, and roll in finely chopped parsley or celery tops. Cut into 2-inch pieces and serve on crisp lettuce leaves with French dressing.

PRUNE AND CHEESE SALAD.

Cream the cheese with mayonnaise and to each half cup of the mixture add one-quarter cup of English walnut meats, broken. Roll into tiny balls and place inside seeded prunes which have been cooked for 10 minutes in lemon juice and water. Serve on lettuce leaves with mayonnaise.

PINEAPPLE AND CHEESE SALAD.

Place slices of pineapple on lettuce leaves, cover with slices or pieces of cheese, and serve with mayonnaise dressing.

PEACH AND CHEESE SALAD.

Peel large peaches and cut into halves; remove stones and put on ice; place on lettuce and add a spoonful of mayonnaise. In center of each place a ball of cheese.

ASTORIA SALAD.

4 large figs.	8 large dates.
1 teaspoon lemon juice.	$\frac{1}{2}$ cup almonds.
1 cup of cheese, creamed.	

Add the lemon juice to the cheese, salt to taste, and beat thoroughly. Remove stones from dates. Add figs and almonds, chopping all together and beating to a smooth paste. Add cheese mixture and mix well together, form into molds or balls, and serve on lettuce leaves with salad dressing mixed with an equal quantity of whipped cream. Maraschino cherries may be used instead of figs.

HONOLULU SALAD.

Put a slice of raw or canned pineapple on a nest of lettuce leaves. Mix one-half cup of cheese with a pimiento pepper; add a dash of salt and cayenne or tabasco. Form into balls and place one in the center of each slice of pineapple. Serve with mayonnaise dressing.

CHEESE SALAD AND PRESERVES.

Place pieces of the cheese on lettuce leaves and cover with French or mayonnaise dressing. Serve with currants or other fruits, preserved in honey or sugar.

NUT AND CHEESE SALAD.

Cover whole blanched almonds with cheese and form in egg shapes. Roll in finely ground almonds. Pile in nests of lettuce leaves. Serve with mayonnaise dressing. Peanuts and many other nuts may be used equally satisfactorily.

PEAR AND CHEESE SALAD NO. 1.

Mix chopped pecans with the cheese, form into balls, roll them in finely chopped nuts, and place in cavities of California white pears. Serve on lettuce leaves with mayonnaise.

PEAR AND CHEESE SALAD NO. 2.

Wash ripe pears and cut in two (crosswise). Scoop out the center from one half and fill the pear cup thus made with the cheese, to which chopped nuts, salt, and paprika have been added. Cover with the other half, chill, and serve with mayonnaise.

CHEESE AND FRUITS.

CHEESE AND CHERRIES.

Select large whole cherries; wash, drain, and stone. Fill the centers with cheese and serve on lettuce leaves with mayonnaise. The cheese may be prepared with nut meats or pimientos before filling the cherries.

CHEESE AND DATES.

Select large, firm dates; wash, drain, and stone. Stuff with cream cheese seasoned with salt and paprika. Chill and serve on a nest of lettuce leaves with mayonnaise or special cheese dressing.

CHEESE SURPRISE.

Select tart apples of uniform size; core, pare, and steam in a sirup of 1 cup of sugar to 2 cups of boiling water until soft. When cool place on the ice to chill thoroughly. Season cream cheese with salt and paprika and mix together until soft. Cover the apples with the cheese mixture. Chill again before serving. Serve on lettuce.

CHEESE AND APPLES.

Mix with one cheese 12 dates (seeded and chopped) and 1 tablespoon of chopped pecan nuts. Wash and core good eating apples and fill the centers with the cheese mixture. Chill and serve on crisp lettuce leaves with French or mayonnaise dressing.

FROZEN CHEESE WITH FIGS.

Mash two cheeses and beat them with half a cup of stiffly beaten cream until smooth; flavor, and sweeten to taste. Put into covered pail or mold and bury in ice and salt for 4 hours. Slice in pieces 2 inches thick and cut round with biscuit cutter. In the side of each piece put a preserved fig or some other fruit.

TOMATO RABBIT.

2 tablespoons of butter.	$\frac{3}{4}$ cup of milk.
2 tablespoons of flour.	$\frac{1}{8}$ teaspoon of soda.
$\frac{3}{4}$ cup of stewed and drained tomatoes.	
5 cheeses, or $1\frac{1}{2}$ cups.	

Cook the butter and flour together, add milk, and as soon as the mixture thickens add tomatoes and soda. Then add cheese and seasoning. Serve on toast, whole wheat, or Graham bread.

BAKED CHEESE AND TOMATO.

Select good whole tomatoes, remove part of contents, stuff with cheese, and bake. Green peppers may be used in the same way. Serve hot.

CHEESE SANDWICHES.

CUBAN SANDWICH.

Between two slices of bread place lettuce with a little salad dressing or salt on it, then a slice of cheese, and finally thin slices of dill pickles or a little chopped pickle.

TOASTED CHEESE SANDWICHES.

Plain bread and butter sandwiches with fairly thick slices of cheese between are toasted, and on picnics or at chafing-dish suppers are often browned in a pan in which bacon has been fried.

CHEESE AND JELLY SANDWICH.

Spread slices of bread with a layer of cream cheese, then a layer of jelly. Place another layer of bread on top to form a sandwich, then toast.

CHEESE-DATE-NUT SANDWICH.

Season cream cheese with chopped dates and nuts and serve as sandwich filling for graham crackers.

CHEESE FOR SANDWICHES.

Add salt, a few drops of vinegar, paprika, and a speck of mustard to one cream or Neufchâtel cheese. Mix thoroughly and spread between thin slices of bread. Anchovy essence may be added to the mixture if desired.

CHEESE PASTE FOR SANDWICHES.

$\frac{1}{2}$ cup of tomato ketchup.	1 teaspoon onion juice.
2 tablespoons chopped pecans.	1 teaspoon of salt.
2 cheeses or $\frac{2}{3}$ cup.	$\frac{1}{4}$ teaspoon paprika.

Cream the cheese and mix with the other ingredients. Spread between thinly cut slices of bread. This will make sufficient paste for about 24 ordinary sandwiches.

CHEESE AND JAM SANDWICHES.

Brown bread.	Cheese with jam, marmalade, or pre-
Cheese.	served ginger.

Slice bread thin and spread with layer of jam or marmalade; strawberry and peach flavors give best results. Spread a layer of cheese over jam and cover with another slice of bread. Press and serve.

CHEESE AND VEGETABLES.

CHEESE AND POTATO PUFFS.

1 cheese or 4 tablespoons.	$\frac{1}{2}$ teaspoon of salt.
1 cup hot seasoned mashed potatoes.	1 dash of paprika.
1 egg.	$\frac{1}{2}$ teaspoon parsley chopped fine.

Mix cheese and potatoes, add salt, parsley, paprika, and yolk of egg well beaten. Fold in the stiffly beaten white of egg, place by spoonfuls on a greased pan, and bake until a golden brown.

CHEESE-POTATO CAKES.

Mix one cheese with $2\frac{1}{2}$ cups of cold mashed potatoes; season with salt, pepper, or a little paprika. Form into cakes and fry quickly in a little fat.

CHEESE ROLLS.

A large variety of rolls may be made by combining legumes—beans of different kinds, cowpeas, lentils, or peas—with cheese, and adding bread crumbs to make the mixture thick enough to form into a roll. Beans are usually mashed, but peas or small Lima beans may be combined whole with bread crumbs and cheese, and enough of the liquor in which the vegetables have been cooked may be added to get the right consistence. Chopped spinach, beet tops, or head lettuce may be used instead of the legumes.

CHEESE AND BEAN ROAST.

1-pound can kidney beans or equivalent of other cooked beans.	Bread crumbs.
3 cheeses or 1 cup.	Salt.

Mash the beans or put through a meat grinder. Add cheese and bread crumbs enough to make the mixture sufficiently stiff to be formed into a roll. Bake in a moderate oven, basting occasionally with fat and water. Serve with tomato sauce. This dish may be flavored with onions, chopped and cooked in butter and water.

CHEESE AND CELERY RELISH.

Cut stalks of deep-grooved celery into pieces about 2 inches long. Fill grooves with Neufchâtel, cream, or pimiento cheese and serve with bread and butter as a salad course or serve as a relish.

TOMATOES AND CHEESE.

Broil slices of tomatoes, season with salt and paprika, place on slices of bread, cover the broiled tomatoes with seasoned cheese, and place in oven until cheese is melted. Serve at once.

CHEESE AND PARSLEY BALLS.

Season the cheese and mold into balls, chill, and roll in finely chopped parsley. Serve as garnish or on lettuce leaves with French or mayonnaise dressing.

CHEESE AND CEREALS.

Cheese may be combined with many breakfast foods. It can be melted with the "ready-to-serve" breakfast foods or simply served with them, and it may be cooked with the home-cooked kinds. This is a very rational dish as regards the proportion of nutrients and may be served as the principal item of a breakfast menu, thereby eliminating the meat. It may be served without milk and sugar.

OATMEAL WITH CHEESE.

2 cups of oatmeal.	1 tablespoon of butter.
1 cup of cheese.	1 level teaspoon of salt.

Cook the oatmeal as usual. Shortly before serving stir in the butter and add the cheese. Stir until cheese is melted and blended with oatmeal. The cheese flavor may be increased or decreased by the quantity added. Wheat breakfast foods (parched or unparched), corn meal, and hominy may be prepared in the same way.

CHEESE WITH MUSH.

Cheese may be added to corn-meal mush or to mush made from any of the corn or wheat preparations now on the market. The addition of cheese is particularly desirable when the mush is to be fried. Simply put the cheese in with the meal and cook until well blended. It fries much more satisfactorily and has a rich, desirable flavor.

BAKED CHEESE AND RICE.

1 cup of rice.	3 cheeses or 1 cup milk as needed.
----------------	------------------------------------

Cook the rice in salted water, and put into a buttered baking dish alternate layers of rice and cheese. Pour over them milk enough to come halfway to the top, cover with bread crumbs, and brown in the oven.

CHEESE AND EGGS.

DEVILED EGGS WITH CHEESE.

Deviled eggs are very much improved by the use of cream or Neufchâtel cheese mixed with the egg yolk. The cheese prevents the crumbling of the yolk, as is usually the case with deviled eggs. Beat the eggs slightly, mix them with the other ingredients, and cook over a very slow fire, stirring constantly so as to melt the cheese by the time the eggs are cooked.

BAKED EGGS WITH CHEESE.

4 eggs.	$\frac{1}{4}$ teaspoon of salt.
2 or 3 cheeses or from $\frac{2}{3}$ to 1 cup.	Few grains cayenne pepper.
1 cup of fine, soft, stale bread crumbs.	

Break the eggs into a buttered baking dish or into ramekins, and cook in a hot oven until they begin to turn white around the edges. Cover the mixture with crumbs, cheese, and seasoning. Brown in a very hot oven so that the cheese is brown without the eggs being cooked too much. White sauce may be put over eggs before the cheese mixture is added.

CREAMED CHEESE AND EGGS.

3 hard-boiled eggs.	Speck of cayenne.
1 tablespoon of flour.	4 slices of toast.
1 cup of milk.	2 or 3 cheeses or from $\frac{2}{3}$ to 1 cup.
$\frac{1}{2}$ teaspoon of salt.	

Make a thin white sauce with the flour, milk, and seasoning. Add the cheese and stir until melted. Chop the whites of the eggs and add them to the sauce. Pour over the toast, then cut the yolks in small pieces and sprinkle over the whole.

CHEESE OMELET.

2 eggs.	$\frac{1}{2}$ tablespoon of butter.
2 teaspoons of milk.	$\frac{1}{4}$ teaspoon salt.
1 cheese or 4 tablespoons.	Dash of pepper.

Cream the cheese until soft, add milk, then the well-beaten yolks of the eggs, and then the stiffly beaten whites. Place a little butter in an iron skillet and when hot pour in the omelet. Cook until brown, then place under flame in an oven until slightly dried out on top, turn, and serve on hot platter. Season with salt, pepper, and butter.

SCRAMBLED EGGS WITH CHEESE.

3 eggs.	$\frac{1}{2}$ teaspoon of salt.
3 cheeses, or 1 cup.	Pinch of nutmeg if desired.
1 tablespoon of chopped parsley.	

CHEESE SOUFFLÉ.

3 eggs.	5 tablespoons of honey.
$\frac{1}{4}$ teaspoon of salt.	$\frac{1}{4}$ cup of sour cream.
1 cheese, or 4 tablespoons.	

Beat cream and cheese until smooth. Add honey so that it is well blended, add yolks, then beaten whites. Fill pastry cases and bake 25 minutes. They will puff over the cases. If preferred, they may be baked in custard cups instead of cases. Serve with cheese sauce made by heating thick cream and cheese, blending with spoon and beater.

MISCELLANEOUS CHEESE DISHES.

Cream or Neufchâtel cheese may be used in preparing many dishes which may take the place of or supplement meat dishes, as well as in the recipes given below. It is not recommended to use them instead of American Cheddar or other cheese, but to show the many ways of using them satisfactorily. Since these cheeses are not ripened, they have a mild-cheese flavor in contrast to the strong-flavored cheese. The Cheddar cheese is often cheaper, has a more pronounced flavor, and when obtainable should be used in the regular way.

When these cheeses are made in the home, and are therefore not so expensive, or when a mild-cheese flavor is desired, or when the other cheeses are not easily obtainable, they will be found very acceptable in preparing many dishes, a number of which are given below. The nutritive value of the menu and the number of palatable dishes which may be served will be greatly increased by their use.

In many recipes calling for cheese the omission of butter and the substitution of a smaller quantity of skim milk or water for whole milk is very desirable and more wholesome because of the high fat and water content of the cheese.

PIMIENTO AND CHEESE ROAST.

2 cups of Lima beans, cooked.	Bread crumbs.
2 canned pimientos, chopped.	Salt and pepper.
2 cheese or $\frac{2}{3}$ cup.	

Put the cheese, beans, and peppers through a meat grinder. Mix well and add bread crumbs until stiff enough to form into a roll. Brown in oven, basting occasionally with fat and water.

FRIED BREAD WITH CHEESE.

Cut stale bread into thin pieces and put two pieces together with cheese between them. Dip in a mixture of egg and milk and fry in butter or other fat.

CHEESE SAUCE.

1 cup of milk.	From 1 to 3 cheeses or from 4 table-
2 tablespoons of flour.	spoons to 1 cup.
	Salt and pepper.

Thicken the milk with flour and add cheese just before serving, stirring until melted.

This sauce may be used in preparing creamed eggs, to pour over toast, with macaroni, rice, Welsh rabbit, or for baking with crackers soaked in milk.

CHEESE AND MACARONI.

1 cup of macaroni broken into small pieces.	1 teaspoon of onion juice.
1 tablespoon of chopped green peppers.	1 teaspoon of chopped parsley.
1 tablespoon of butter.	3 cheeses or 1 cup.
	Salt and pepper.

Cook the macaroni in boiling water until tender; rinse in cold water, and cook parsley, onion, and green peppers in a little water with butter. Mix all ingredients together with the cheese and bake in a moderate oven about 15 minutes.

PLAIN CHEESE AND MACARONI.

Cook macaroni until done, drain water off, add salt and pepper and cheese, stirring until cheese is melted. Serve at once.

CHEESE, RICE, AND TOMATO.

1 cup of cooked rice.	$\frac{1}{2}$ of medium-sized green pepper.
1 teaspoon of salt.	$\frac{1}{4}$ of medium-sized onion.
1 cheese or 4 tablespoons.	3 medium-sized tomatoes.

Cook tomatoes, onion, and green pepper 20 minutes. Add cooked rice and seasoning, then the cheese. When melted, pour over heated crackers or toast.

SAVORY CHEESE.

3 slices of bacon.	1 tablespoon of milk.
1 cheese or 4 tablespoons.	$\frac{1}{4}$ teaspoon of salt.
$\frac{1}{2}$ teaspoon onion juice.	Dash of paprika.

Crisp the bacon and break it into small pieces. Mix cheese seasoning and milk with bacon. Heat thoroughly and serve on toast or crackers.

CHEESE FONDUE.

1 cheese.	3 teaspoons of milk.
$\frac{1}{4}$ cup of fine bread crumbs.	$\frac{1}{4}$ cup of hot water.
$\frac{1}{4}$ teaspoon of salt.	2 eggs.

Cream the cheese and add salt, hot water, bread crumbs, and milk, then the well-beaten yolks of the eggs. The well-beaten whites are then gently added. Pour the fondue into a greased baking dish and place in a pan surrounded by hot water. Cook in a slow oven about 30 minutes or until firm. Test in center with knife.

BERMUDA RELISH.

Arrange slices of Bermuda onion on toast with salt, pepper, and a drop of tabasco sauce on each; then add a thin layer of cream cheese. Bake long enough to melt the cheese.

CHEESE TOAST.

1 cheese, or 4 tablespoons.	$\frac{1}{2}$ teaspoon paprika.
$\frac{1}{2}$ teaspoon of salt.	

Slice bread thin and cut into round pieces with biscuit cutter. Cream the cheese, add salt and paprika, spread evenly on bread, and brown in oven.

CHEESE CRUSTS.

Cut some stale bread in slices 2 inches thick. Trim crusts and spread with one tablespoon of cheese. Season with salt and paprika. Lay in baking pan and brown in oven.

CHEESE BALLS, FRIED.

$\frac{1}{2}$ cup of dry brown or victory bread crumbs.	$\frac{1}{4}$ teaspoon of salt.
1 cup of cheese.	$\frac{1}{4}$ teaspoon of mustard.
1 egg.	A few grains of cayenne pepper.

Mix ingredients, shape in small balls, and fry in deep fat.

FROZEN CHEESE.

4 cheeses, or $1\frac{1}{2}$ cups.	2 eggs.
1 quart of milk.	$1\frac{1}{2}$ cups of sugar.
1 pint of cream.	

Beat the cream and cheese together until smooth. To the well-beaten yolks of the eggs add the sugar and vanilla to taste, and the milk. Strain and freeze. When partly frozen add the well-beaten whites of the eggs.

CHEESE RELISH.

1 cheese, or 4 tablespoons.	1 tablespoon of butter.
2 tablespoons of Roquefort cheese.	2 green peppers.
$\frac{1}{2}$ stalk celery.	$\frac{1}{2}$ tablespoon of paprika.
1 large Bermuda onion.	

Rub the cheese and butter to a smooth paste, then add the paprika and the onion, celery, and pepper, chopped fine. Chill and serve with hot toasted cracker.

CHEESE DRESSING.

1 cheese, or 4 tablespoons.	$\frac{1}{4}$ teaspoon mustard.
1 egg.	$\frac{1}{2}$ teaspoon salt.
$\frac{1}{4}$ cup cold water.	1 teaspoon sugar.
1 tablespoon vinegar.	

Beat the egg until light, add salt, sugar, and mustard, then water and vinegar, and cook over boiling water until thick. Then add cheese and beat until light and smooth. Serve when cold. A variety of salads may be served with this dressing. Chopped hard-boiled eggs, shredded pepper, and chopped olives, mixed and served on lettuce leaves with this dressing, make an excellent salad.

Whole tomatoes, with centers removed and the center filled with chopped cabbage, make a good salad with this dressing.

CHEESE SPOON BREAD.

1 egg.	$\frac{1}{2}$ cup of corn meal (white).
1 cheese, or 4 tablespoons.	$\frac{1}{2}$ teaspoon of baking powder.
1 cup of milk.	$\frac{1}{2}$ teaspoon of salt.

Heat milk, salt, and corn meal in double boiler for 5 minutes. Add cheese, and when melted and cool stir in the baking powder, then add the beaten egg. Bake in greased muffin rings or bread pan about 20 minutes.

CRACKERS AND CHEESE.

1 cheese, or 4 tablespoons.	2 tablespoons of milk.
1 egg.	$\frac{1}{2}$ teaspoon of salt.
3 drops of onion juice.	

Soften the cheese, add milk, seasoning, and the yolk beaten until lemon colored, and lastly fold in the stiffly beaten white of the egg. Place spoonful on toast or crackers, heat thoroughly, and serve.

GINGERBREAD.

Make a gingerbread, reducing the quantity of sugar. When cold cut in two and put in a layer of the following between the two halves:

2 cheeses or $\frac{3}{4}$ cup.	$\frac{1}{4}$ tablespoon of salt.
2 tablespoons of chopped dates.	Rub to a paste.
2 tablespoons of pecan nuts (chopped fine).	

CHEESE FRITTERS.

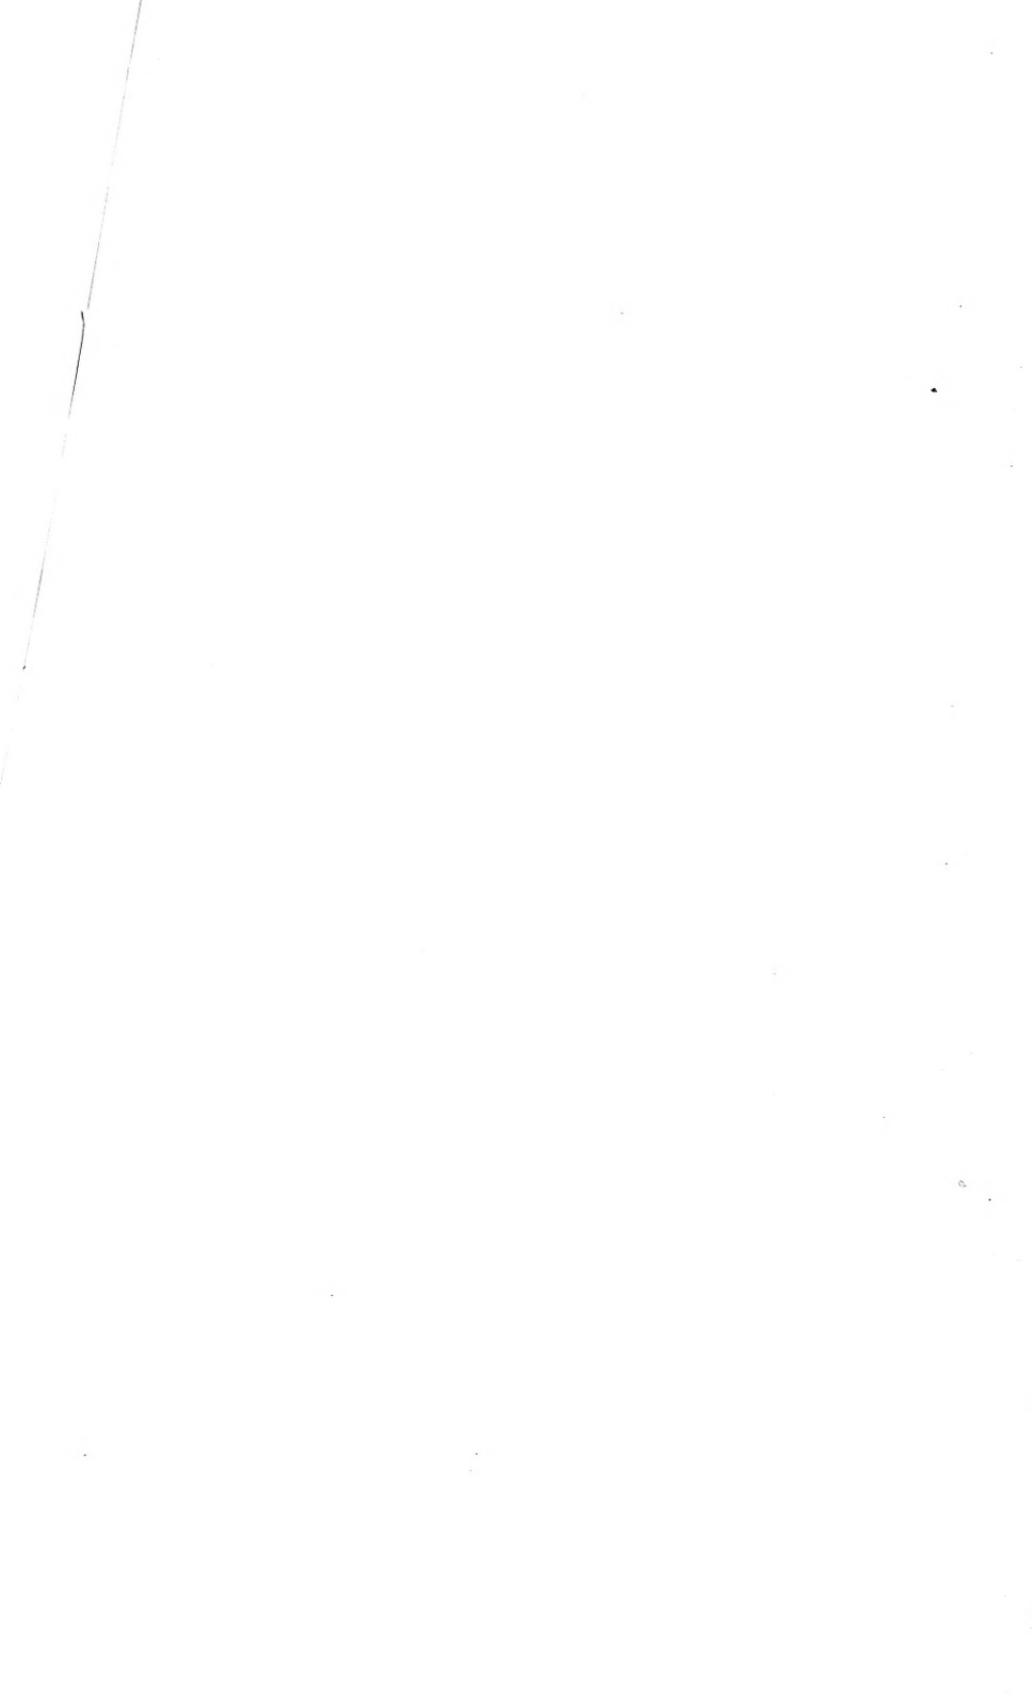

1 cheese or 4 tablespoons.	$\frac{1}{2}$ teaspoon of onion juice, if desired.
1 cup of cooked rice.	$\frac{1}{4}$ teaspoon of salt.
$\frac{1}{4}$ cup of milk.	Dash of paprika.
1 egg.	

Mix rice, cheese, milk, paprika, salt, and onion juice. Beat the egg well and mix with the other ingredients. Drop by spoonfuls on lightly greased skillet and turn when brown. Serve plain or with jelly.

CHEESE CROQUETTES.

Prepare the same as for cheese fritters. Chill the mixture thoroughly, mold into shape, roll in fine bread crumbs, then in diluted egg (1 tablespoon of milk or water to an egg), and again in bread crumbs. Place in greased pan and brown in oven. Serve with tart jelly.
